BOAC and the Bank of London & South America together offer a unique service to businessmen visiting Latin America. This rich area, today only a day away from London by BOAC jetliners, contains rapidly developing countries of great potential. More and more businessmen are being attracted by markets which show increasing promise of expansion, particularly in the capital goods field.

The Bank of London & South America—the only British Bank in South America—will be pleased to advise you on economic and trade conditions. The Bank will also give you the latest information on exchange regulations, Customs tariffs and import controls. With branches throughout the area, the Bank can also help you to make contact with local buyers, agents and distributors.

BOAC offers you far and away the best air travel on the route. Superb *Comet* jetliner services from London fly to Recife, Rio, Sao Paulo, Montevideo, Buenos Aires and Santiago in a matter of hours. There are also fast jet-prop *Britannia* flights to the Caribbean, Caracas and Bogota. Whether you travel First Class or low-fare Tourist, you enjoy BOAC service—utterly competent, friendly, considerate.

We welcome your inquiries. For free booklet "Take a closer look at Latin America" and detailed travel literature write to Information Officer, B.O.A.C. Airways Terminal, Victoria, London, S.W.1. For detailed market information write to the Bank of London & South America Limited, Head Office, 40-66 Queen Victoria Street, London, E.C.4.

Pandora's Box

A FULL and impartial inquiry (which the Postmaster General is being interestingly coy in not yet referring to as, necessarily, an orthodox royal commission) is soon to be set up to make recommendations about the control of television and sound radio after the autumn of 1964; by then the charters of both the BBC and the ITA will have expired and a third television channel will have become technically possible. This week the committee of technicians, for whose report the Government has been waiting, has implicitly cast its vote against screening this third channel in the simplest possible way, that is, by sending out additional programmes which existing sets could receive on Band III and on the present 405-line standards of transmission; apparently in ten or fifteen years' time the size of screen and other technical limitations that we at present accept on 405-line will seem very old hat.

The Government has therefore been given strong encouragement to use the remaining empty spaces on Band III merely to bring the existing television programmes to the few scattered rural areas that cannot at present receive them. Then the brand new third channel would go out on one of two new bands on 625-line transmission, where it would at first be receivable only on new and rather more expensive sets and would require four or five times as many transmitting stations for national coverage as the BBC now employs; but where it will be able to usher in a period when television will become an even more monster attraction in our drawing rooms than it is now. Unless one holds the reactionary view that television is something whose further growth should be craftily suppressed, this recommendation to plan for the future rather than patch on the past is quite obviously right.

The question of who is to control the monster, as well as the existing BBC and ITA services (which will be receivable on the new 625-line sets, even before they themselves go over to 625-line), was, as the technicians thankfully observed, outside their committee's terms of reference. This is the question that will now be referred to the Postmaster General's "impartial inquiry." The commission (let us call it that, for brevity's sake) will be making recommendations about the future of the most important new social force of our age, one that dominates the leisure time of nearly two-thirds of the population. It will be probing into the most controversial box since Pandora's, and one that is capable of generating an almost equal amount of wind. If the commission is not to be blown about in all directions by the gale, it will need to take a stand on certain basic principles.

Anybody who suggests such principles is bound to annoy all parties in this extraordinarily acrimonious debate, which is one reason why the Government seems intent on putting this essentially political problem into commission. But it is the job of a journal of opinion to stick out its neck. As a preliminary contribution to a controversy of which a great deal will be heard in the next four years, there are three principles—or rather acceptances of reality—that we would suggest.

The first of these—which will annoy the BBC—concerns the realities of television finance. Advertising is bound to be a main source of new revenue for the expansion of television. Advertisers are eagerly bidding for more space on more networks because they think that the screen is the most efficient medium for publicising their wares. It would be sensible to reject this source of finance

only if one thought that the viewing public would prefer to see licence fees raised to £5 or £6 a year to pay for the new third channel rather than to tolerate more advertisements (to which the viewing public, if asked whether that was its preference, would reply with a quotation from Pygmalion); or if one held that there was some positive national economic advantage in directing advertisers away from what they regard as the most efficient medium to less efficient ones (which is restrictionist nonsense); or if one held that advertising necessarily perverts anything that it partly finances (with which the Press must beg to disagree); or if one argued that the third channel could best be financed without bringing any new money into television production at all. It is with this last argument that some supporters of the BBC are now toying; they are suggesting *sotto voce* that an excise levy could be laid on the excess profits of the commercial television companies and the proceeds handed over to the BBC, who could use them to finance extra BBC programmes on the new third channel.

The objection to this proposal is not that it is the height of cheek, although there are plenty of people who will say that it is. The objection is that it greatly underestimates the part that televison is capable of playing in the revolution of public entertainment if it gets enough money; it is foolish to block the entry of new money into television so long as there are any programmes which viewers would like to see but which are at present withheld from them on grounds of cost. Everybody knows that some such programmes are withheld at the moment—for example, Saturday afternoon football matches and first feature films. There is therefore the strongest possible economic case, on grounds both of supply and demand, for saying that as television expands it should be at least partly financed by additional advertising; indeed the real question for the commission to ask—and it should be encouraged to be brave about this—is whether the BBC itself should not be empowered and required after 1964 to raise some revenue from advertisements.

THE second basic principle, however—one which this time will annoy the commercial companies—is that there are disadvantages in allowing any programme contractor to raise the whole of his revenue from advertisements alone. Every newspaper editor seeks to keep a strict (though not rigid) balance between his advertising revenue and his circulation revenue; the dangers of excessive reliance on advertising—dangers of loss of flexibility in programme presentation, of debasement of quality or content to suit the lowest common multiple of taste, of gradual centralisation of executive power on managers who are more likely to listen to the ideas of their advertising salesmen than of their editorial or script-writing or artistically-educated staff—are probably nearly as great in television as they would be in the Press (though there is no evidence that they are greater).

It is true that the force of this argument has seemed to decline a little in the past five years: the commercial companies under the ITA have not committed as many sins against Good Taste and Morality as their more hysterical critics in 1955 forecast. But this has probably been partly because their huge profits (and their enjoyment of a sellers' market for advertisements) have put them in an unexpectedly strong position to resist advertisers' pressure, and partly because, after the fuss that surrounded their birth, they have been very sensitive about criticism of the quality of their programmes compared with the BBC's. If two out of three television channels were now to be wholly financed by advertising, both these advantages could disappear. There would no longer be quite the same feeling of obligation for Channel 9 to keep up in quality with the BBC, provided each individual contractor could say that he was not falling below the quality of the programmes offering in his area on the new third channel (and vice versa). The competition from increased opportunities for advertisements on the new channel would do something to cut existing contractors' prices and profits and might make it seem more tempting for them to woo advertisers in any way they could.

A MAIN problem, then, is to find some counterweight source of finance instead of relying wholly on advertisers' money. Undoubtedly, the best equivalent of newspapers' circulation revenue would be for some programmes on the new third channel to be partly financed by the system of pay-as-you-view: the system under which a viewer has to put a coin in a slot on his set before the scrambled pictures of a particularly high cost programme become clear. This might be the only way of making it profitable for film producers to allow first feature films to be screened in people's homes. If television screens are to become larger, it may soon seem as inconvenient to go to a cinema every time one wants to see a film as it would be to go to a municipal wash-house every time one wants to have a bath; and it would be absurd to go on forcing this inconvenience upon the public if there are appropriate technical ways of enabling them to pay the required 4s. or 5s. charge for delivery to their home screens. Many sporting events and quality entertainments (e.g., opera and ballet direct from Covent Garden) could be financed on television in the same way—although the more expensive the show, and the more obviously it were merely a minority enthusiasm, the higher would be the charge that those minority enthusiasts would have to put in their slots.

Unfortunately, the technical possibilities of an early system of pay-as-you-view are a matter of considerable uncertainty, not least among technicians themselves. In any event, nobody suggests that all programmes could or should be financed in this way. So some other more general "mixed system" needs to be devised. One such system could be organised as follows. Empower the BBC after 1964 to sell some advertising spots as a subsidiary source of revenue. Let Channel 9 function as at present, though the number of minutes per hour allowed for advertisements might be looked at again and possibly restricted. Put the new third channel under a new Third Authority, which could let out its facilities partly to commercial contractors (on the ITA model) but also partly to organisations that tendered to put on certain individual programmes (such as the film producers showing first feature films, financed both by advertisements inserted in their programmes and, if possible, by pay-as-you view). The money from licence fees (which at present goes wholly to the BBC) and from tender prices (paid by contractors for Channel 9 or third channel programmes) could then be allocated among all television programme-producing organisations as an equivalent of newspapers' circulation revenue. The principles for dividing

this "circulation revenue" would have to be a matter for detailed debate; in part they might be determined by impartial audience viewing figures, but a heavy element of subsidy for higher quality or educative or public service programmes could and should be included.

If under this system producers were still found to be financing themselves too unhealthily heavily from advertisement revenue, then the best scheme would be to impose a tax upon television advertisements. The money raised by this could be put into the pool for distribution as "circulation revenue." If it were felt to be politically too embarrassing to propose that the BBC should accept advertisements—and this suggestion would surely rouse thunderous protests from *The Times*—then the advertisement tax money could be used as the sole source feeding the pool of "circulation revenue." The pool could then be distributed according to appropriate circulation criteria to the two commercial channels alone, and the BBC could go on financing itself by licence fees as at present. An essential feature of both schemes, however, would be that all three channels should be under different authorities—the BBC, the ITA and the Third Authority. This is necessary to secure diversity of control—a point that is important in order to enforce the third basic principle on which the commission should firmly take its stand.

THIS third principle is the vital but neglected one of free speech. It is an extraordinary feature of this timorous age that, for reasons which lie deep in the traditional British mistrust of all new gadgets, we have never allowed our television producers the same freedom as we have rightly demanded for our newspapers. If Parliament passed a law forbidding national newspapers to take an editorial view in favour of any one political party on any controversial subject, there would rightly be a massive outcry against this intolerable display of censorship and dictatorship and political thought control. Yet this is the system that we still apply to television and sound radio, although the (suppressed) political views of those who are responsible for bringing television programmes to the screen are already more variegated than those of the owners of the national press.

Probably some elements of political censorship will still remain even after the opening of the third channel brings a whole flock of new programme-producing companies on to the air. In the present state of political timidity, it is likely that the commission will still regard full freedom of comment as far too dangerous a doctrine to propound. But it should make very sure that it helps to accelerate the pace of advance away from the miserable gag that was put upon the airwaves up to the day that the BBC monopoly was broken in 1955. Until 1955 the only controversial subjects that were allowed to be discussed really fully on the air were those on which the two main political parties were able to express coherent and "balanced" views, one against the other. Whenever one side had a good case and the other side found a subject embarrassing, the matter had to be avoided out of "fairness" to the embarrassed party; whenever all the major political parties avoided inquiry into a controversial subject—such as whether farmers were wasting taxpayers' subsidies—the BBC kept its head down. When manufacturers fixed prices in secret courts, when trade union shop stewards terrorised individual dissenters or rigged elections or fomented wildcat strikes by spreading untrue rumours among their members, when landladies refused to take in coloured immigrants or employers refused to give them jobs, the most important means of communication in our time felt obliged to abstain from inquiry and comment.

Since 1955 progress on this front has been remarkable. "Panorama" and other programmes of inquiry are now among the most important probing searchlights into dark places that our newly informed democracy has got. On the whole, the BBC's record here has been better than commercial television's—largely because commercial television, whose very existence is the subject of violent political controversy, has had a greater incentive to keep as clear as possible of political complaints. But there is no doubt that the advance to freer comment since 1955 has been due to the fact that those complaints no longer all go to one address; they may go to either of two central authorities, and to any one of half a dozen programme-producing companies as well as to the one public corporation. The powers of inhibition wielded by jealous politicians and established vested interests have been blunted as the bodies whom they bombard with their protests have become more diffuse. The most important single reason why the new channel should be put under a third authority, separate from either the BBC or ITA, is that it is very desirable to make them more diffuse still and thus advance the day when a free air will be taken as much for granted as is a free press.

HERE, then, are a foundation of basic principles on which the coming commission should take its stand, and some much more tentative suggestions about how they might be brought into effect. Upper class public opinion is so fiercely divided on this matter (including, basically, on the question of whether the expansion of television is a good thing at all) that it is inevitable that any article about it should cause many people exasperation and give many others offence; among the upper tenth of the policy-making part of society this is the most captious, curious, crosspatch and crossbench controversy in public affairs today. That is why the most important immediate question is what sort of "impartial inquiry" the Government is going to set up.

One temptation before the Government might be to seek to avoid political controversy at all costs, and to cajole some prominent Opposition politicians to come on to the inquiry together with prominent Government ones; that would result in a report propounding a certain type of compromise recommendation, which would probably be very bad for the country. A second temptation would be to decide that the important thing is to try to minimise annoyance to every disparate interest already established in television; that would result in a different sort of commission and a different sort of compromise, which would certainly be even worse for the country.

A third course would be for the Government to accept that basic policy towards television is essentially a matter for bold decision by the Government itself, for it to lay down certain principles, and then to set up an essentially organisational study group to recommend the best mechanism to translate those principles into practice. This third course would be the course of statesmanship. But it will be as surprising as it will be welcome if the Government adopts it.

Peking Bids High

Mr Khrushchev is not altogether favourable to claims of his Chinese ally for great-power status

For some time before the summit conference in Paris it was evident that Chinese criticism of Mr Khrushchev's concept of peaceful co-existence amounted to a definite opposition to his policy of reconciliation with the United States. When the summit came to grief, some observers promptly concluded that China, in political alliance with a faction inside the Soviet Union, had exerted a decisive influence in persuading Mr Khrushchev to make a scene, not a settlement, in Paris. There is, however, no conclusive evidence that Chinese disapproval was at any time sufficient to make him change his policy, if he had not had other reasons for changing it. All that can be said on the evidence is that the outcome of the encounter in Paris has no doubt given great satisfaction in Peking.

The possibility that some kind of agreement would be reached at a meeting of the heads of governments of the three western powers and the Soviet Union, in the absence of China, was certainly a matter for considerable apprehension in Peking. The indications were that the Chinese communists did not trust Mr Khrushchev to represent their special interests at the conference table, even if they had been ready to forego China's claim to participate in any great power conclave as one of the big five. Indeed, Peking formally declared that China would not be bound by any agreement that might be reached in Paris. This attitude may be expected to show itself again whenever there is a new attempt to bring about either a four-power summit or a direct Soviet-American rapprochement.

Mr Khrushchev, however, has now urged, in his speech in Moscow on May 28th, that China should take part in the next summit conference along with India and Indonesia. This is in part a manifestation of the Soviet leader's new intransigence towards the West, for in the immediate preliminaries before the Paris summit he made no attempt to press any Chinese claim to membership; and the proposal (made in 1958) that Poland and Czechoslovakia should participate in order to equalise the representation of the two blocks was long ago dropped. The demand that China should attend the next summit is one that is hardly calculated to revive American enthusiasm for such a meeting. But if it is an annoying proposal for Washington, it can hardly, in the context which Mr Khrushchev has given it, be palatable to Peking either.

India and Indonesia are not communist countries; they are countries with which communist China has recently been, and still is, in sharp political conflict; the influence exerted over them through economic aid by the Soviet Union cannot be matched by China; and last, but not least, Peking does not admit their right to the great-power status it claims for itself. This status, as defined after the last war by permanent membership of the Security Council of the United Nations—and by the original constitution of the Council of Foreign Ministers—is considered to belong to the five nations thus identified, and to no others. It is sometimes overlooked that China holds this privileged rank in the United Nations, though Formosa, not Peking, appoints its delegate. For the Chinese People's Republic to be now nominated by Russia for membership of a summit conference in company with India and Indonesia is not so much a favour as a rather offensive piece of patronage for Russia's Far Eastern ally. Mr Khrushchev said in the speech just mentioned that "what the Americans needed was taking down a peg or two"; it seems that he thinks the same medicine would do the Chinese no harm.

Silence sometimes speaks louder than words, and the almost complete lack of Chinese news reporting of Mr Khrushchev's visit to India and Indonesia in February showed unmistakably that this Asian tour did not have the blessing of Peking. Instead of hailing it as a diplomatic triumph of the "socialist camp" in winning two great uncommitted countries of Asia away from the influences of Western imperialism, the Chinese press and radio treated it as a trivial matter unworthy of comment. Mr Khrushchev, for his part, while he neglected no opportunity to glorify the achievements and might of the Soviet Union, carefully refrained from associating his country with the cause of China in the latter's disputes with its neighbours. Diplomatically, as far as can be ascertained, the visit could hardly have been less helpful to China, and the mere fact that it was made at such a time with so little consideration for Chinese interests was a demonstration that Mr Khrushchev did not regard the wishes and feelings of the rulers of the most numerous population in the world as being of any great account. Here he may have made a mistake.

PEKING'S ideological onslaught on Mr Khrushchev's policies was launched in April, a month before the Paris conference, in a series of press articles which were given the greatest possible circulation inside China. The occasion was the ninetieth anniversary of Lenin's birthday; the theme, the "unshakable truth" of Lenin's teaching that wars are inevitable as long as capitalist imperialism continues to exist. This "Leninist principle," according to the *People's Daily*, "is definitely not outmoded and never will be." But who, among those who accept Lenin as an authority, had said it was? No names were mentioned, but every word of these abstract theoretical discourses was for Marxist-Leninist readers—and in communist countries every party member knows that such a campaign must have a definite political purpose—an attack on the repeatedly expressed views of Mr Khrushchev. The Soviet leadership was in effect being accused of deviation and heresy; China was setting itself up as the guardian of the true faith in a world in which even the country of the October Revolution was backsliding.

The challenge was too obvious to be ignored in Moscow, and Mr Kuusinen of the party presidium was put up to make a reply in a speech on April 22nd. His argument that "one must not fail to note the emergence of mighty forces which act against war" must commend itself to a western audience. But if it is a question of Leninist doctrine—and Mr Khrushchev, who attacked Stalin and led the return to Leninism, has exposed himself to attack on these premises—it is clear that the Chinese have the better of the argument. Lenin certainly did not believe in peaceful co-existence, except as a temporary expedient, and to argue that his views would be different if he were alive in 1960 is the kind of speculation that can hardly prevail over a dogma founded on scriptural authority.

Ideologically, the Chinese communists thus have the edge on Mr Khrushchev. In practical politics also they seem to have forecast the course of events more correctly than the Soviet leader. Mr Khrushchev, with his sanguine temperament, appears genuinely to have believed that by peaceful persuasion and propaganda he could get the Americans to abandon Berlin, and that he had in fact obtained some kind of assurance of American withdrawal in his conversations with President Eisenhower at Camp David. Had he indeed been able to get his way on Berlin at a summit conference, it is highly probable that he would have been happy to forget all about Formosa in a gladsome, if temporary, reconciliation with America. But Peking over the last six months has shown itself confident that American imperialism was incorrigible—in western language, that America would not surrender Berlin, and that the Khrushchev-Eisenhower flirtation would come to nothing. Party Chairman Mao can now congratulate himself on having been right.

ALL this time communist China and the United States have remained in a limited diplomatic contact; the meetings between the American and Chinese ambassadors in Warsaw initiated two years ago have never ceased. But the discussions have so far made no headway against the obstacle of the American military alliance with the Chinese Nationalists; Peking refuses absolutely to give any pledge not to try to conquer Formosa, which it claims to have the right to do as a matter of domestic jurisdiction. There is no sign of any breaking of this deadlock. The situation, however, does not stand still. The Chinese communists know that they will obtain the position of strength to which they aspire only by entering the select company of nations that possess nuclear weapons. Specialist estimates of the time needed for communist China to produce such weapons, on the assumption that the Soviet Union does not help, vary considerably, but it seems likely that, if the regime remains intact for the next five years, it will have become a nuclear power within that period.

If, on the other hand, conditions were to appear favourable for a limited war, Peking might at any time resume the offensive against Quemoy and Matsu. Already, since the breakdown of the summit conference, there have been rumours of such an intention; it may have been these that prompted the decision of the American government a week ago to send a force of 120 aircraft to south-east Asia for a "training exercise." Although it is extremely improbable that Mr Khrushchev would encourage the Chinese to aggravate the existing international situation by provocative action in the Formosa Strait, the renewed tension in world affairs increases the risk of local outbreaks at the points of maximum conflict. There is a need for Anglo-American consultation about post-summit possibilities not only in Europe, but also in the Far East.

Turkey's Fresh Start

Last week's military coup gives Turkey a new chance; but democratic government is easier to destroy than to restore

IF imitation is flattery, the western democracies have cause to feel flattered by the number of countries old and new that have aspired to model themselves on the Anglo-Saxon forms of government. But without the necessary experience and equipment the goal is easy to miss. The list of countries in which democratic forms have been overthrown by the armed forces has lengthened in recent years. When these countries have been far away in Asia, or even not so far away in the Middle East, the western democracies could afford a sense of detachment. But when the army overthrows a parliamentary system in a member of Nato, as it did in Turkey on May 27th, the West feels uncomfortable.

It is not simply that, although the new regime has been prompt to acknowledge its Nato obligations, the country may possibly become engrossed in an internal struggle for power during which its external commitments will inevitably take second place. Equally important is the fresh demonstration of the fragility of democratic institutions in some of the members of the organisation whose *raison d'être* is to defend political freedom. In France the parliamentary system virtually broke down two years ago; in Italy it is creaking badly, although not yet dangerously; in Germany, it has not yet been subjected to an effective test. Portugal is no longer the conspicuous exception that it was. Clearly, not only the Turks themselves, but Turkey's allies as well, are deeply concerned that last week's coup should lead—as its authors assert they want it to do—to the swift renewal of Turkish democracy, not to its preservation in the deep freeze.

Let it be admitted that Mr Menderes had been heading for trouble for a long time. In recent weeks his apparent determination to ride roughshod over the mounting and increasingly demonstrative opposition brought matters to a head. But was the situation yet so desperate that it really needed the desperate remedy of an army coup? In the forty-eight hours before the army struck there were some signs that the government might be preparing to back down; in particular, Mr Menderes made what was taken to be a conciliatory gesture when he announced on May 25th that the parliamentary commission investigating the opposition's activities, originally scheduled to last for three months, had finished its labours in one. Further peaceful demonstrations by students and others with the army's collusion—and even under its protection, combined with increasingly strong pressure from the United States and other allied governments and the recent example of what happened to Dr Syngman Rhee, might have brought Mr Menderes and the former president, Mr Bayar, to their senses in time and obliged them to run the gauntlet of genuinely free elections.

As it is, a crisis in democracy has been resolved by non-democratic means. For the Turks, who have been through it all before, this is a retrograde step. After the end of the war, fifteen years ago, the very young and untried

Turkish democracy contended with rigged elections, martial law, a censored press, and intense political instability and uncertainty. Eventually it won through to the free elections of 1950 and the firm establishment—as it seemed then—of a multi-party system of parliamentary government. And this was achieved, not with the help of the army, which remained aloof on the sidelines, but largely through the good sense and realism of Mr Ismet Inönü, then both head of state and leader of the Republican People's party, and his colleagues.

This time it is Mr Inönü who has remained on the sidelines, and the army that has stepped down into the political arena. This may be a pity; it is not necessarily disastrous. General Gursel and his colleagues may show good sense and self-restraint in their turn; the cynics who say that army officers who carry out political coups always pay lip service to democracy, but always leave it at that, may prove to be wrong. In Turkey the army, although excluded from politics since the early days of the republic, has had a long tradition as the agent of modernisation and political change; in the 1908 revolution, the army played a principal part in forcing the Sultan to restore the constitution of 1876. In its latest intervention in politics, the Turkish army can point to one fundamental difference from other contemporary military coups; it has taken action, not because it is disillusioned with parliamentary government and wishes to substitute something more efficient, but because, as it says, it wishes to preserve Turkish democracy from those who were apparently prepared to trample it down in order to perpetuate their own power.

So far the army's actions do not belie its words or its proclaimed aspirations. Having carried out what must have been one of the most gentlemanly, efficient and bloodless of military coups, it has, it is true, banned all political activity for the time being, dissolved the national assembly and arrested all the previous cabinet together with almost all the Democrat party deputies. But the new caretaker cabinet contains only two military men, apart from General Gursel himself; the rest are mostly civil servants, professors or intellectuals. Journalists, students, and others imprisoned for political reasons, have been released. It is true that some government journalists have been locked up, but the professed intention is to restore the freedom of the press, and for the present the new rulers may be entitled to the benefit of the doubt.

An authoritative commission of legal professors has been set up to draft a new constitution and a new electoral law. The present constitution is an amended version of the one introduced by Ataturk in 1924. Through the years a more liberal interpretation of this constitution has served to accommodate the gradually developing Turkish democracy. But there is a case for more efficient checks on the power of the executive, by, for instance, introducing an upper house in the legislature and increasing the powers of the head of the state over the head of the government. General Gursel has also referred to a constitutional court and to the need for specifically reaffirming the secular character of the Turkish state; the late government was often reproached with exploiting religion for political purposes.

Political processes, however, do not function by grace of constitutions alone. It can be easy enough to push a democracy off the rails, especially when it is swaying badly anyway; but to get it not only back on the rails again, but smoothly running as well, is another matter. A suspended democracy does not simply stand still; it loses ground. General Gursel has declared that he wishes to prepare the way for free elections and will then withdraw; there is no need to doubt that he means what he says. But all the leading men of the late government party are now under arrest, and unless they are given a clean sheet by the tribunal that has been set up to inquire into their activities, they will not be able to fight the elections. It does seem unlikely that they will get their discharge—although the best way of dealing with them might well be to set them free to try their luck.

The hope that a purged and chastened Democrat party might have contested the elections has faded with the disclosure on Wednesday that practically all its deputies were in custody. Other parties may be encouraged to take the field, especially as the new electoral law is to be based on proportional representation. If the Democrats are able to fight at all they are bound to lose heavily, although they may yet profit if the interim regime, gravely concerned as it is said to be with the country's economic difficulties, feels compelled to reverse some of the previous government's vote-catching economic policies.

In the meantime, however, though the elections may be free in the strict sense, the Democrats have been discredited in advance, made ridiculous, and virtually suppressed; and the army has made clear its will that the RPP will return to power (although the party does not seem to have had a part in the coup). To put it mildly, in the forthcoming elections Turkey will not be making the free choice that it was able to make for the first time ten years ago. Nor, since it is inconceivable that any politician or party will try to challenge the army's wishes, will the loser in the contest be given, as the RPP was given in 1950, the same unfettered opportunity to meet and accept the most difficult and fundamental challenge that can face any political party in a newly emerging democracy: the challenge of peacefully accepting a defeat at the polls and surrendering power (and all the perquisites that go with it) to its opponents. One wonders, too, whether even if the loser gains a respectable numerical strength, which cannot be taken for granted, it will feel itself free to oppose in parliament as vigorously as an opposition should oppose in a healthy democracy.

In his famous declaration of July 12, 1947, which is considered to mark one of the turning points in the development of Turkish democracy, Mr Inönü described the situation for which he was then working as, among other things, one in which "the citizen at large will view with confidence and tranquillity the possibility of having the government powers in the hands of one or the other party." After the 1950 elections this state of affairs seemed to be realised. Over the last half-dozen years, it has seemed to be disappearing as a result of Mr Menderes's policies. Last week's coup may have taught a needed lesson. But the cost could turn out to be high.

At this early stage, however, it would be wrong to assume that it necessarily will be. Twice before the Turkish army has intervened in politics; on both occasions it was moved by reforming and relatively liberal ideas; and on both occasions its intervention ended in dictatorship. But in 1908 and 1920 the Turks were contending with strong external pressures that put the very existence of their country in jeopardy. Today Turkey's territorial integrity is guaranteed by powerful allies who have immediately recognised the new regime and whose own self-interest (apart from any more altruistic motives) will make them give all the support they can to the re-establishment of Turkish democracy.

General Gursel and his military colleagues feel themselves to be the heirs of Ataturk, and although Ataturk was no democrat himself, their action last week can reasonably be represented as a logical projection of the ideas upon which Ataturk's republic was originally based. The composition of the new government and of the constitutional commission suggests that the army is ready to work with the most liberal and progressive forces in the country. The new rulers will have the mistakes and the experience of the last fifteen years to guide them. And in Mr Inönü, if he is able and willing to take up the reins again, either as president or premier, Turkey has a politician of national stature, whose record assures him of the support of the army and large sections of the people. Outsiders can only share General Gursel's hope that he and his colleagues will succeed in bringing "sunny days" to Turkey; there is nothing else we can do.

NOTES OF THE WEEK

THE SUMMIT

Never Again?

What future does the summit idea have now? The fall-out of recrimination, reconsideration and regret has been unusually wide and dense. Mr Khrushchev wants to bring in China, India and Indonesia: the last (if for no other reason) in fulfilment of a personal promise to President Sukarno in February. Mr Nixon now puts his trust in the traditional methods of diplomacy and, apparently, in discussions in the United Nations. General de Gaulle thinks methodical diplomacy can get the powers back to the top again, but not "the impassioned debates of United Nations delegates." Sir Anthony Eden, musing on ITV, has supported summitry in principle but believes that substantive questions (like Berlin) ought not to be raised there. Mr Philip Noel-Baker, the one Nobel peace prizewinner among them, told the Commons in Monday's debate that if the heads of government

> were to meet for, say, two or three weeks as delegates to the assembly of the United Nations, and to do it regularly every year, they would find that nothing like the Paris fiasco could occur.

Whatever else happens, the next expedition to struggle up the weary slopes looks like being a very different affair from the one that never left base camp in Paris.

The heaviest blow against the argument that the summit alone offers a means of direct and effective negotiation with Mr Khrushchev was struck by Mr Herter in his statement to the Senate Foreign Relations Committee on May 27th. Mr Herter declared that in all conferences since Stalin's death

> the Soviet representative, no matter how highly placed he might be, was bound by the collective decisions on basic policy matters made prior to his departure from Moscow. Any substantive changes in these positions apparently required reference back to Moscow before they could be undertaken.

This may explain why, from the beginning in Paris, the United States did not believe that Mr Khrushchev could alter his claims on the U2 flights.

The new Soviet talk of wider summit membership brings out once more the unsatisfactory nature of the four-power summit, itself a vestige of the rusted-up machinery of postwar settlement. Yet Mr Khrushchev's suggestion does not do much more than reduce it to absurdity. Once Indonesia is in, what powers can rightly be denied admission? Mr Khrushchev is veering back to Mr Bulganin's airy proposal in January, 1958, that, besides the Nato and Warsaw Pact powers, "such countries as India, Afghanistan, Egypt, Sweden, Jugoslavia and Austria" should also participate in summit meetings. The plain fact is that every extra seat at the summit reduces the prospect of serious negotiation. The necessary dialogue is one between the Americans and the Russians. Britain, France, India, Indonesia, the United Nations itself, can play a part in bringing the two together at the conference table. But only the two can determine to talk there. When they do, the two-power summit is still the best place for them.

New Tory Voices

Backbenchers on both sides of the Commons spoke up in Monday's post-summit debate for bringing China into the international community, and Mr Selwyn Lloyd was stirred to explain how he hoped to bring the Chinese into the talks on disarmament and the suspension of nuclear tests. The House was not inclined to blame the Americans for the summit breakdown: Mr Jack Jones's summary ("We have a right to ask this fellow [Khrushchev] who the hell he thinks he is") was explicit. But there seemed a growing impatience with United States policy in the Far East. A new Tory member with diplomatic experience, Mr Gordon Campbell, admitted American difficulties but wanted to see China in the United Nations in 1961. Another new conservative, Mr Edward Gardner, complained that the Americans were "utterly incapable of logical thinking . . . or of saying what they propose to do about it." Precisely what advice Mr Selwyn Lloyd could offer in the lobbies of the Seato conference in Washington later this week is hard to know; but he can hardly have left the topic quite unmentioned.

The Chinese themselves seem determined to keep the U2 incident on the boil, and to keep Mr Khrushchev boiling with it. On May 26th Peking issued its hundredth complaint against American sea and air intrusions since September, 1958. The Chinese claimed a total of 242 sorties on 68 occasions by American planes over Chinese territory (chiefly opposite Formosa), and alleged that "the notorious U2 strategic reconnaissance plane has repeatedly intruded. . . ." On the 28th Mr Khrushchev intervened, telling shock workers in Moscow that if U2 flights from Japan over either the Soviet Union or China were resumed, the Soviet government "will be compelled to take the most resolute measures." Just as President Eisenhower's Paris statement seemed to leave open the question of future U2 flights over Chinese territory, so Mr Khrushchev was not entirely explicit that he would unleash Marshal Malinovsky at his allies' slightest bidding.

As if to disabuse both Tory MPs and Soviet shock workers of any illusions about American policy in the Far East, the White House announced on Tuesday that Mr Eisenhower would be visiting Generalissimo Chiang Kai-shek on his way to Japan next month. And Mr Herter told the Seato council that the United States had no intention of recognising China. The political temperature in the Formosa Strait is steadily hotting up.

THE COMMONWEALTH

More Cwthmanship

Mr Alport, the Minister of State at the Commonwealth Relations Office, rounded vigorously on critics of his

department in a speech at the Royal Commonwealth Society on May 26th. Flatly denying that any new thinking was called for in the light of the impending run-down of the Colonial Office, he insisted that all the Colonial Office staff that was fit to be used was being (or would be) used. He based his approach on what may be called the first principle of Cwthmanship: that the reconciliation of independence of ex-colonies with membership of the Commonwealth is a highly specialised, extraordinarily delicate, enormously difficult operation which the CRO is alone trained to do. Why? Is it because Foreign Service people and colonial civil servants are far too tactless and hamhanded to cultivate the delicate and exotic blooms that grow in the Commonwealth glasshouse? This is what seemed to be implied.

Before anyone shrinks in fright from breaking a pane of glass by unauthorised interference, Mr Alport may be asked a few questions. He says that Colonial civil servants (presumably meaning the 4,000 members of HM Oversea Civil Service whom he praises in passing) are too specialised to be of use to him: he must have people who know Asia as well as Africa—Cwthmen who can do the job equally under palm or pine. But where is he going to get these men? Either Africa or Asia is too varied for any one man to know well. He says the CRO has made use of ex-Indian civil servants: if so he knows just how specialised *they* had to be. The argument, on the contrary, is that a man who knows something about one part of Africa well, is better placed to understand, appreciate and deal with what is common to another part, and what is different and must be relearned (and he will know how to relearn it—even a language).

This in any case leaves untouched the pressing problem of how emergent African states are to keep their expatriate civil servants. Mr Alport seems to think they will be too touchy after independence to accept them, and the men concerned too dyed-in-the-wool to respond to a new status. He instances the way Dr Nkrumah stopped taking advice from Sir Charles Arden-Clarke after the latter became Governor-General. But the evidence suggests that Dr Nkrumah quite obstinately listens to a lot of advice from his white-skinned civil *servants* lower down—and, what is as important, makes practical use of them. Outside Ghana, this has been noticed; every state says it wants to keep not all, but many of its British officials during the transition period ahead. Even in the offices of British High Commissioners they often say they would like to have some men with Colonial Office experience (if not of their own territory): "chaps we know how to talk to," as they put it. Of course there is a delicate task to be done here; but the complaint is that the CRO is not doing it—and the 4,000 oversea civil servants will fade away in Surrey and Surbiton while the CRO is wrapped in mystical communion with the Commonwealth. However, Mr Alport is not the only minister under fire about this. So are Mr Macleod, Mr Selwyn Lloyd and Lord Hume. Let them get down to it.

KENYA

History Lessons

WHAT is the relevance of Mr F. D. Corfield's history of Mau Mau, which was commissioned by the Kenya government and was published in London this week (Cmnd 1030), to the present situation in Kenya? The immediate relevance, of course, is that it has strengthened the white Kenyans' determination to oppose the African leaders who have served a four-week ultimatum on the government to release Jomo Kenyatta or face civil disobedience. There is a real fear behind this determination—and it is shared by the Governor, Sir Patrick Renison. Mr Macleod this week expressed confidence that a new Mau Mau movement is not gathering momentum behind the back of the Kenya government and the Colonial Office in the way it did between 1950 and 1952; he did, however, admit that economic distress in Kenya is growing, and that excitement and restlessness have again produced a difficult situation. Even if Kenyatta would not return to a ready-made Mau Mau if he were released, the question is whether he could or would convert the new KANU party into another Mau Mau—in the way that Mr Corfield argues that he converted the Kenya African Union from a radical political organisation into a tribal conspiracy.

To this question, officials and settlers have only one answer: he could and would—and it would be dishonourable as well as foolish to let him out to settle accounts with the Kikuyu loyalists who in the end thwarted him. Unfortunately, it is certain that this report by a former administrator will fail to convince KANU that their president is the beast of the apocalypse, and they will continue to demand his release. Mr Nyerere (the very able African nationalist leader in Tanganyika) is credited with the view that it would be better to let Kenyatta out now, while the British are still in power and have 15,000 police and troops in position with which to shepherd him along constitutional paths.

Settlers will retort that the Corfield report suggests that the Kenyatta of 1950, in the changed constitutional and political position of today, would be a match for these police. But is he the Kenyatta of 1950? And are all the tribes of Kenya now Kikuyu-minded? There are questions that need answering before the decision what to do with Kenyatta is finally reached.

One thing is grimly clear: if he really is too dangerous to release now, he will cast a baleful shadow over Kenya's future in the relatively short period of respite that remains before it becomes independent. And once it is independent there will be no safeguards to keep him out of the seat of power.

BELGIAN CONGO

A National Leader?

M. PATRICE LUMUMBA, leader of the *Mouvement National Congolais* (MNC), has emerged from last month's elections as the one Congo politician with pretensions to more than his own provincial and tribal support. In the elections to the Congo's six new provincial assemblies M. Lumumba and his party received 27 per cent of the total vote, and, besides dominating the MNC stronghold of Orientale (centred on Stanleyville), made some significant headway in the Equateur and Kasai provinces. M. Kasavubu's Abako party got only 10 per cent of the total vote, almost entirely from its own Bakongo province which includes the capital, Léopoldville. In the Katanga province around Elisabethville the rival Kanaka and Baluba tribes will be much on a par in the local assembly, with a slight advantage to the Kanaka.

The results of the National Assembly elections, which also took place last month, had not been announced when *The Economist* went to press, but it seemed probable, on the basis of the provincial results, that M. Lumumba would win between 35 and 40 seats to lead the largest single party in a federal house of 137 members. His strength in the local assemblies, which elect federal senators, should also give him useful support in the Senate. The political initiative is, for the moment at least, very much in his hands.

But will it stay there? The Abako leaders now have to make up their minds between the economic advantages to be gained by sustaining the new Congo state, even although the federal government may be controlled by M. Lumumba, or listening to the tempting voices now being heard from Brazzaville as an excuse to start their own greater Bakongo state. It remains to be seen whether the Congo provincial leaders opposed to M. Lumumba will, in fact, contrive to keep the direction of federal affairs out of his grasp—to M. Kasavubu's advantage. The economic talks in Brussels that ended on May 16th may have persuaded the separatists of the primary need for economic expansion within the federal structure; or at least persuaded them to give it a try. This remains the chief hope of preventing total dissolution after independence on June 30th.

HIGHER EDUCATION

Free for All Scholars?

THE report of the committee under Sir Colin Anderson into university awards which appeared on Thursday (Cmnd 1051) is for the greater part of its 135 pages a workmanlike set of proposals which can safely be accepted by the Government. It seeks to end the absurdly

wide variations in the way local authorities make awards, to recommend changes in selection procedure, and to implement the broad principle that all qualified students should be entitled to an award from public funds.

The unsettled question (on which Sir David Eccles has evidently not made up his mind) is whether, after these reforms have been made, well-to-do parents of award holders should be expected to make a contribution towards their expenses at the university (or comparable institution), or whether an automatic "entitlement to free university education should now be created" for the country's brightest boys and girls. Eleven members of the committee (including the chairman and the Principal of London University) voted for outright abolition of the parental contribution even for the wealthiest parents; the remaining four voted for retention of the present principle of the parental contribution and means test—but on a much reduced scale. The difference in cost between abolition and the minority proposals amount to only a little over £1 million a year.

It is tempting, therefore, to plump for the simplification of abolition, rather than retention of what the majority attack as "a special discriminatory tax" on the wealthy. This "tax," however, would be spread, though generally very lightly, over 40 per cent of parents of award-holders. Under the new scale, proposed by the minority, a parent would have to have a gross income of £1,100 a year before he paid £9 a year towards his son's or daughter's higher education (against £83 now) and with £2,500 a year would pay only £142 a year (against £269 now). If he had more than one child, his contribution would be even smaller. This new scale could produce little of the deterrent effect which is now said to keep 2,000 students from applying for university places (though not from alternative forms of professional training)—especially as provision would be made to review hard cases. The extra £1 million a year which the minority wish to save for the Exchequer would be paid wholly by people who can afford it—indeed many of them will already have afforded much larger sums to equip their children with the private secondary education that gives them an admitted advantage when taking the examinations on which universities offer places. Even though the "principle" of free university education for the brightest is one of those useful principles that can now be bought for a relatively few pence, the real question is whether there may not be some more deserving applicants for additional Exchequer largesse even on this comparatively tiny scale.

TRADE UNIONS

Lolly, Not Leisure

THIS week, in selected seaside resorts, the trade union conferences have been in full spate. No fewer than thirty-three unions met in May and a further twenty-eight will meet in June; although most press interest has centred this year on which unions want to blow up Mr Gaitskell with anti-nuclear fission, these conferences, taken together, generally also throw light on the unions' current industrial mood. As usual, the speeches have contained a lot of full-blown militancy aimed straight at the reporters from the national press. There has also been a little heart-searching, albeit rather muted in tone. Following upon Mr Carron's forthright attack on unofficial strikes six weeks ago, the Oxford committee of the normally aggressive National Union of Vehicle Builders, whose members have been involved in many recent stoppages in the motor industry, has secured national approval for a warning against unofficial action. The Amalgamated Union of Building Trade Workers, like the railway clerks and the engineers, has drawn attention to the absurdly low level of union dues.

The most important conclusion, however, is that the unions' planned advance to a forty-hour week has petered out before it started; the current shortage of labour has meant that hours actually worked are mostly a good deal longer than a year ago. What the workers want now is lolly, not leisure; and rising profits have made some employers much more willing to grant it. In engineering, for example, plant "plus payments" have been rising steadily; this not only encourages the engineering unions but irritates those in industries like public service, agriculture and textiles, where pay has fallen behind because it almost coincides with the union rate. Wage claims are therefore being tabled all round; the conferences of builders, motor workers, textile workers, and civil servants, among many others, have already given them first priority. Despite the possibility of "re-interpreting" these decisions—which in the case of the Amalgamated Engineering Union meant that last year's resolution in favour of a 15 per cent wage rise finally turned out as a demand for 2 hours off the working week—it seems certain that this autumn will see a much bigger bout of wage bargaining than last autumn did.

EUROPE

Waverers and Sceptics

A STUDIED ambiguity has characterised government statements on the European question during the past fortnight. Asked in the House of Commons on May 26th whether it was still the government's policy not to join the common market, Mr Macmillan took refuge in the reply that Britain would only act in conjunction with the other members of the Seven. Pressed by Mr Gaitskell to define the government's attitude if the Seven decided to join, he side-stepped lightly: if the Seven had decided to join, then by definition Britain, as one of the group, would have decided too. Afterwards he told Mr Grimond that Britain had not urged the Seven to join the Six; and on May 30th he emphasised that there would be no sudden or unexpected British change of course. All the same the rigid negative of the past has gone. If Britain is not going to abandon its partners in the Seven, no one is letting on where it hopes to lead them to.

These outward signs of the newly open mind reflect a real reappraisal that has been going on inside the British government. No definite new course has been decided upon. But there is a hitherto unknown willingness to consider all kinds of solutions. The change seems to be shared in some measure by the opposition. In the foreign affairs debate on May 30th it was Mr Gaitskell who pointed out that the postwar era, when Britain was the dominant western power after the United States, with which it automatically enjoyed a special relationship, was over; Britain had to learn to live with a new and powerful Europe.

The change so far, however, has not gone far enough to be taken seriously by the Six or to offer the likelihood of agreement with them. In the absence of the basic decision to try to join the European communities (all of them), Britain's friends on the continent are still sceptical of its intentions, while those who do not want Britain in can rest comfortable in the assurance that the British prefer to be out. And if the summit failure has given an impulse to the British desire to come to terms, there is no indications that it has done anything to the Six but strengthen the desire to press on alone, appeasing their neighbours not with any formal association, but with general commercial measures of a liberal nature.

Nuclear Misfire

THE extent and limitations of the British goverment's reappraisal have been demonstrated by its handling of the question whether Britain should try to join Euratom, the atomic community of the Six. A resolution inviting Britain to join has been put forward by the general affairs parliamentary committee of the seven-power Western European Union which links Britain with the Six. It has the backing of the French members of that committee. On Thursday Mr Profumo, Minister of State at the Foreign Office, gave a not unfriendly answer: the British government was now prepared to consider the question. That is a big improvement on the blank negative given by Mr Barber, Economic Secretary to the Treasury, in reply to a question in the House of Commons on April 14th.

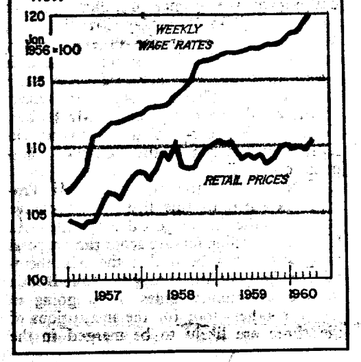
Unfortunately the conditions Mr Profumo attached to this first very tentative gesture to the Six suggest that the idea will fail. The puzzling feature about the proposal from WEU has been that the Six themselves might not find it easy to admit Britain to one community unless it is going to join the others too; for the institutions of the three are likely to be merged in the

near future. Membership of Euratom would inevitably raise the question whether Britain is prepared to go further later on. Certainly only a quite unequivocal British approach, leaving it to the Six to decide whether they were prepared to risk a major distinction between their three communities, and making it clear that Britain was beginning to look at the politics of European union in a new way, had hopes of success.

Far from making a bold approach on these lines the British government seems to have been encouraged by continental hesitations to attach conditions of its own. Mr Profumo made it fairly clear that British membership of Euratom could not be considered unless the general European trade question were settled on terms acceptable to Britain and the Seven. Once again the British government seems to be suffering from a mistaken conception of the realities of the European situation. It has still not sunk in that it is Britain that has somehow to get into the European communities, in its own interest, not the Europeans who are petitioning.

ISRAEL

Old Scores



In the land of milk and honey, memories of times less pleasant pass quickly. Twelve years after becoming masters of their own state, Israeli leaders have grown anxious lest a new generation forget what happened to an older one. Partly to remind those who have grown up in the relative peace and security of a sovereign Jewish state that their elders were not so fortunate, the Israeli security forces tracked down and arrested Adolph Eichmann, once head of the Jewish Resettlement Department in the Third Reich, who is charged with causing the deaths of millions of Jews.

Nobody will waste on Eichmann any sympathy or any regret that he has finally been brought to account for his crimes. During the past few years his presence had been reported in Egypt, Yemen, Syria, Kuwait and Argentina. Mr Ben-Gurion, when he announced the arrest in the Knesset on May 23rd, understandably did not say where the Israelis found him or how they got him before the chief magistrate in Jaffa. He is to be tried under an Israeli law of 1950 for the punishment of Nazis and those who collaborated with them. Israeli jurisdiction in the case is not likely to be seriously questioned, and Mr Pinhas Rosen, the minister of justice, has refused a suggestion that an international tribunal should be formed to preside over the trial.

In Israel and elsewhere there is a difference of opinion about how much publicity should be given to the Eichmann case. Some hold that if the trial is to be an effective lesson to young Israelis, to those Nazi leaders still at large and to the forgetful non-Jewish world, then it must take place in the glare and confusion of television cameras and all that goes with them. Others feel that whatever light may be thrown on the darkest period in the history of the Jewish people, the waves of feeling that may be sent out by such a performance will not be entirely good; nor will the impression created by the zeal of the Israeli agents who tracked and captured Eichmann be entirely what the Israelis would wish. True, there will be scrupulous care that Eichmann receives the judicial treatment which the Jews did not get in his day. His fate, whether death, imprisonment or deportation to Germany, is perhaps the least important factor in the case. Could it be, however, that the retribution that is right for Eichmann will be bad for those who administer it?

WAGES AND PRICES

In the first four months of this year weekly wage rates rose 1¼ per cent—more than they did during the whole of last year. But the cost of living had hardly changed: even with the post-budget price of smoking, the index of retail prices in April was only 0·1 per cent higher than last December and was still 0·1 per cent below its peak in January, 1959.

NYASALAND

Who Helps Whom?

One of the main arguments on which supporters of the Federation of Rhodesia and Nyasaland will rely at the forthcoming constitutional review is that, whether or not federation still makes political sense, it alone "can save Nyasaland from degenerating into an African slum." They will adduce the evidence of Professor Jack who concluded, albeit circumspectly, in his economic report on Nyasaland last winter, that Nyasaland is developing far faster under federation than it could possibly have done alone. Now, however, the opponents of the federation will be able to throw two economists into the other scale—Mr Arthur Hazlewood and Mr P. D. Henderson, who have brought out a new statistical survey* of Nyasaland's position which they consider greatly modifies Professor Jack's suggestions.

In fact their conclusion is hardly a new one. It is that the economic argument has been oversimplified and overemphasised, and that the real truth is that Northern Rhodesia and its copperbelt subsidise both Nyasaland and Southern Rhodesia. If a federation between Nyasaland and Northern Rhodesia could be kept in being, the former would not necessarily suffer at all—indeed, it would be likely to gain more than it does from the present federation, under which Southern Rhodesia takes its share of the copperbelt's useful subventions and forces its partners into fiscal arrangements that are sometimes detrimental to them. The question however is—and at the founding of federation in 1953 certainly was—whether the linking of the two protectorates was practical politics without the accession of Southern Rhodesia, with its control of Northern Rhodesia's communications, its know-how and its commercial importance.

This will be argued. Dr Banda will use Mr Hazlewood and Mr Henderson against Mr Jack, but Mr Kaunda may some day use them in favour of Northern Rhodesia going into independence alone. Yet even Mr Hazlewood and Mr Henderson admit that federation gave impetus to development and drew foreign capital; whatever political changes are made, clearly this advantage is worth keeping. Moreover, Southern Rhodesia restricts the entry of foreign (but not Nyasa) labour into the principal towns of its territory; the extension of these restrictions to Nyasa workers would be a serious thing for Nyasaland. If a break-up of federation caused Southern Rhodesia to stop its present advance away from apartheid-like policies, the social consequences for any Nyasan immigrant workers who still go to Southern Rhodesia would be more serious still.

TORY WOMEN

No Monstrous Regiment

A major question of politics today is not merely whether Labour's image will go on getting fustier, but whether there are any forces at work that may cause the Conservatives' image to become suddenly tarnished again. A conference this week gave good cheer to liberal Tories who maintain hopefully that there are not. At the Conservative women's annual conference in Central Hall on Wednesday, Mr Butler received a remarkably favourable reception from a section of the party which might not normally be expected to wax enthusiastic over a reforming Home Secretary. The bloodthirsty bayings of the bonneted harridans of left wing mythology never materialised, save for a brief flash of the cloven hoof when a sturdy re-enunciation of the maxim "spare the rod, spoil the child" aroused the delegates to fervid enthusiasm. Nevertheless, Mr Butler's declaration of impartiality on

Synopsis of a Showdown

DEBATE continues about the extent to which Mr Khrushchev has been pushed off his own chosen course both by the U2 incident and by divergent forces in the communist world; about the identity of and balance between those forces; and about the exact time when the final decision was taken to put unacceptable demands to Mr Eisenhower and thus to call off the Summit meeting and the President's visit to Russia. Here, without attempting a precise interpretation, we summarise some of the evidence put forward in the controversy.

THE FLIGHTS

The Soviet government has in past years protested against American flights in border areas, but has never previously revealed that some reconnaissance aircraft had flown deep into Russian territory. Mr Khrushchev says that the simple reason why the May 1st flight was publicised was that this time the pilot, and evidence of what he was up to, fell into Soviet hands. Since May 7th Mr Khrushchev has revealed that other deep penetrations occurred as early as 1956, and as recently as April 9th, when "our military . . . let the chance slip by . . . we took them to task."

THE CHINESE

Around April 22nd, the anniversary of Lenin's birth, the Peking press and propaganda system built up an intense campaign of oblique denigration of Mr Khrushchev's enthusiasm for the summit meeting. They saw "no change at all, even after the Camp David talks, even on the eve of the summit conference, in the war policy carried out by the United States government and by Eisenhower personally." . . . "How would it help if this were to be hushed up or whitewashed?"

The Chinese warned "some people who are not revisionists [i.e. not to be confused with President Tito and the Jugoslavs] but well-meaning persons who truly want to be Marxists but get confused. . . . Some of them say that the failure of the American imperialists' policy of atomic blackmail marks the end of violence. . . . We should help to correct their erroneous ideas." Peking repeated its claim that nuclear war would destroy only "imperialism," leaving the communist societies "a truly beautiful future." Mr Khrushchev has publicly rejected this argument.

On May 14th Mao Tse-tung in person, while declaring his support for the holding of the summit meeting on the 16th, said he hoped that those who had thought Mr Eisenhower a man of peace would be undeceived by the U2 incident. (Mr Khrushchev said in Moscow on May 28th: "I still believe that the President himself wants peace.")

In his Moscow speech on May 28th Mr Khrushchev also said for the first time that the West must normalise its relations with China so that China (and other Asian states) could take part in future summit conferences.

THE MARSHALS

In January, when Mr Khrushchev promised a reduction of 1,200,000 troops in the next two years, he left it to Marshal Malinovsky to point out that this meant the demobilising of 250,000 officers.

In April a shake-up in the top military hierarchy advanced the positions of Malinovsky (now defence minister) and of his associates Marshals Zakharov (now chief of staff) and Grechko, and relegated to lower status Marshals Sokolovsky (former chief of staff) and Rokossovsky—both associated with the disgraced Zhukov—as well as Marshals Koniev and Chuikov. Artillery Marshal Nedelin was appointed to the new post of Commander in Chief of Rocket Forces.

Mr Leonid Brezhnev, who in early May replaced the ageing Marshal Voroshilov as head of state, is both a Khrushchev protégé and a party worker with specially close concern with army affairs.

In his Supreme Soviet speeches on May 5th and 7th, Mr Khrushchev emphasised that the U2 incident "must not lead us to halt the process of reducing the armed forces," and that "it is high time one simple truth was grasped: it is folly to spend huge sums on armaments that have become obsolete faster than ever before."

Just before the summit date, a four-day conference between army and party leaders was held in the Kremlin from May 11th to 14th. Marshal Malinovsky, President Brezhnev, and Mr Suslov, the party theoretician, who had earlier been given the task of canvassing the demobilisation plan among the officer corps, were prominent in the conference, from which the marshal came straight to Paris with Mr Khrushchev.

THE CIVILIAN HIERARCHY

The party secretariat was the group most affected by the shake-up just before the Supreme Soviet met on May 5th; the result was that in a party presidium of 15 members the group of party secretaries headed by Mr Khrushchev lost its automatic majority, being reduced from 10 to 6 members.

The last date on which Mr Mikoyan's participation in any major Moscow function was reported was May 8th. When the presidium saw Mr Khrushchev off to Paris on May 14th, all its members were accounted for except Mr Mikoyan and his closest colleague, Mr Kosygin. On May 28th Mr Khrushchev found it necessary to announce publicly that Mr Mikoyan was enjoying a Black Sea holiday.

In Paris on May 16th, Mr Bohlen reported that at the conference table Mr Khrushchev had supported his demands for an American admission of "aggression" with the argument that this matter deeply involved the domestic politics of the Soviet Union. This unprecedented remark was not in his published statement, and has not been revealed to the Russian public.

THE CALENDAR

On April 25th, in his Baku speech, Mr Khrushchev stressed the urgency of the matters to be settled at the summit meeting. There was less suggestion of urgency in the speech on May 5th in which he revealed the U2 incident.

On May 6th the Soviet embassy in Washington stopped the printing of its magazine and removed a whole feature on the President's visit to Russia. (At that time no American avowal of responsibility for reconnaissance flights had been uttered.) From May 6th onwards "indignation meetings" about the flights were organised throughout Russia.

The American avowals of responsibility from May 7th onward were partly based, according to Mr Herter, on the fact that Mr Khrushchev had already said that Russia would take the U2 case to the United Nations, where, Washington foresaw, it would have got "deeper and deeper in a denial of something which was perfectly self-evident."

On May 11th, while Mr Eisenhower was taking personal responsibility for the U2 and describing it as "vital," Mr Khrushchev was casting doubt on the prospects for the President's visit, but not on those for the summit meeting; he said the flights were "not a preparation for war."

Mr Gromyko, in a note delivered on May 10th and at his press conference on May 11th, put forward only the demand that the flights should cease: "The Soviet Union does not want to aggravate matters any more, but there is one condition: provocations of this kind must stop." The American decision to stop the flights was apparently taken the next day, May 12th, but not conveyed to the Russians until May 16th, in Paris.

Mr Khrushchev presented his conditions for participation in the summit meeting privately to President de Gaulle on May 15th for transmission to Mr Eisenhower, and made them public on May 16th at the "preliminary" summit meeting. While he was doing so, and also calling off his invitation for Mr Eisenhower to come to Russia, Soviet officials in Paris were already giving informal reassurances that the Geneva disarmament talks would still go on, and that no Soviet treaty with east Germany would be signed before the postponed summit conference was held. Later Mr. Khrushchev publicly confirmed both points. In Berlin on May 20th, he broke the news to the east German communists that he thought it better to do nothing about Berlin or a treaty before "a heads of government meeting, which, it is to be hoped, will take place in six or eight months' time."

Continued from page 964

the flogging issue, pending the report of his advisory committee, was almost cordially received. The press was poised to point some curious morals in the fact that this reputed conference of floggers was to debate a motion deprecating the predominance of sex and violence in BBC and ITV programmes. In the event, even this debate was rather a good one; instead of being swept unanimously into the minute book on a wave of emotion, the motion was opposed by rational argument and voted against by a substantial minority. The conference passed other motions calling for lower prices from industry, more active participation by Conservative women in trade union meetings (not quite such a joke now as it would have seemed a few years ago) and greater publicity for the Government's grant scheme for modernisation of old houses. The ladies also discussed the 1958 Adoption Act, and asked for a more liberal use by magistrates of their discretionary powers to make adoption orders for illegitimate children without their mother's consent, when all efforts to trace her have been fruitless.

Resolutions passed by Conservative conferences do not of course bind anyone, but they are more important than Mr Balfour, who once said that he would sooner listen to the advice of his valet, would allow. They are not today left to be perused by Mr Macmillan's cook. They are taken as a reliable indicator of the party's basal body temperature. On the evidence of this conference the Tories' constituency activists, and most of these are women, cannot honestly be called a growing threat to liberal ideas; the left-wing brand of conservatism of Mr Macmillan and his followers is apparently no longer an exotic hothouse bloom, but is becoming more firmly rooted in constituency soil.

NATIONAL INSURANCE SCHEME

Prospect Before Us

THE Government Actuary has produced his report on the second of the quinquennial reviews of the national insurance scheme that are ordained by the 1946 Act. But the report's interest lies not in its analysis of the insurance fund's transactions in the years 1954-59, for the old scheme has now entered its last year of life, but in the forecasts of income and expenditure during the rest of this century under the new scheme that comes into force next April.

NATIONAL INSURANCE FUND

(£ million)

	1961–62	1971–72	2001–02
Income			
Contributions :—			
Minimum	462	536	682
Graduated	202	302	546
Non-participating	84	102	120
Other contributions, etc., and Exchequer supplement	287	300	361
	1,035	1,240	1,709
Expenditure			
Pensions :—			
Flat-rate	681	869	1,000
Graduated additions	—	14	214
Other benefits, etc.	317	363	371
	998	1,246	1,585
Balance	+37	−6	+124

These forecasts are summarised in the accompanying table. The chief change that will be introduced by the new scheme is, of course, the provision of graduated additions to pensions for, and graduated increases in contributions from, workers earning over £9 a week. The table shows how much the additional contributions—fixed to begin with at 8½ per cent of earnings between £9 and £15 but, like minimum contributions, subject to five-yearly increases between 1965 and 1980—will bring in. It also shows how little—comparatively—will be spent on graduated additions to pensions, the balance going to keep the insurance fund on a "pay-as-you-go" basis. In fact, for the ten years from 1966-76 the fund is expected to show a deficit of, on an average, £15 million to £20 million a year. But, as the Government Actuary points out, these deficits are less than 2 per cent of the income of the fund. If the assumptions he was told to make in framing his estimates turned out to be even slightly too pessimistic, the fund will remain in balance (on the basis of present pension rates) after all.

It is perhaps worth noting what these assumptions are:

1. a long-term rate of unemployment from 1966-67 onwards of 3 per cent, and for earlier years a rise from 1¼ per cent to 2½ per cent;
2. that the level of money earnings from 1959-60 will increase by 2 per cent a year;
3. that 2½ million people will not participate in—that is, will contract out of—the graduated part of national insurance pensions because they are already satisfactorily covered by a private superannuation scheme.

In addition, however, the Actuary's table assumes that flat rate pensions will remain at their present level until 2001-02, which is political nonsense. The real question affecting the balance of the fund in the next few years will be whether the rise in money earnings will be sufficiently far above the postulated 2 per cent a year to offset the rise in pensions that politicians are almost bound to demand, without a further increase in contribution rates being necessary. On the whole, it seems unlikely.

ALGERIA

A Victory for Hope

THE Algerian local elections, completed on Sunday, are inevitably being claimed in Paris as a victory for General de Gaulle and his policies. Candidates thought to be sufficiently favourable to the general secured 298 out of 452 cantonal seats, the turnout being 56 per cent of the electorate. Organisational triumphs of this kind in Algeria used to be more impressive statistically: there was a 78 per cent turnout in the constitutional referendum in September, 1958, and a 67 per cent participation in the subsequent parliamentary elections. It may be a sign of grace that French officials on the spot take satisfaction from the fact that the new result presents a more accurate

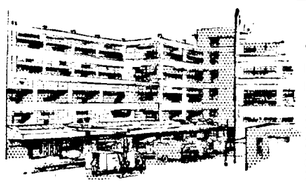
DIRECT AND INDIRECT TAXATION

A strong impression is diffused that indirect taxation is paid by the poor, and that direct taxation is paid by the rich. In precise terms, few persons we know would go this length. When roused to real consideration, most persons are aware that many indirect taxes are paid by the rich. But many allow a prepossession of this sort to haunt their understandings, and it is frequently apparent in hasty speeches and hasty articles. Yet no misconception can be more misleading. In considering all subjects of taxation, we must carefully distinguish between the incidence of an impost and the manner in which it is levied. We must see that there are two questions, *what* people pay the tax which is under discussion, and *how* they are made to pay it. The distinction between direct and indirect taxation, of which at present we hear so much, is simply a question of the manner in which the tax gatherer obtains his money. It does not specify, it does not attempt to specify, which are the parties to whom he comes. Some indirect taxes are, indeed, our sole means of reaching a certain portion of the lower orders. Without considerable duties on tea and sugar, we should never reach many who now pay something to the revenue of the country, and who ought to pay something. But we must carefully bear in mind that much which is called indirect taxation is paid by the rich, as well as the whole of what is called direct taxation. We must not think that the one is the poor man's quota, and that the other is the rich man's quota. It is quite true that all indirect taxation has to some extent an accessory and unfavourable effect upon the lower classes. All restrictions on trade hamper trade, and everything which hampers trade tends less or more to diminish the demand for labour. But this is not merely a poor man's grievance; many of the rich are affected by it at least equally. Whatever hampers trade, lessens the demand not only for labour, but for *capital*.



Why did it happen?

In a new series entitled "AN ACCIDENT ANALYSED" which started this week, *The Motor* brings to light the simple facts behind published accident statistics.

This series, which has been prepared with the co-operation of the Wolverhampton Police, shows how vital lessons may be learned from a consideration of the exact nature of an accident, the errors which led up to it and the way in which it might have been avoided. The conclusions drawn from this analysis are then related to the appropriate section of the Highway Code to bring home clearly and forcibly where individual responsibility lies and the steps which must be taken by every driver before the accident rate can be diminished.

The Motor is one of fourteen opinion-shaping journals published by Temple Press Limited. Each of these publications is a leader in its field—and not only in the home market. *Every year more than 2½ million copies* circulate in 133 countries throughout the world. The specialized journals of Temple Press are authoritative and informative.
It pays to advertise in them.

take the 'FABLED CITIES' ROUTE to KHARTOUM

by BLUE NILE *VISCOUNT* via ROME, ATHENS, and CAIRO

The BLUE NILE Viscount, maintained and crewed by Airwork for Sudan Airways, is the only service that exists primarily to serve the Sudan. Every Monday at Noon it leaves Gatwick Airport (only 35 minutes from London by fast train) and reaches Khartoum next morning stopping at Rome, Athens, and Cairo. If, for reasons of business or pleasure, you wish to break your journey at one of these 'Fabled Cities' and complete it later on you may do so* *at no extra cost*. The same concession applies on the return journey —every Thursday evening from Khartoum.

***VISCOUNT* comfort—ROLLS-ROYCE speed**

The VISCOUNT 831, used for the Blue Nile Service to Khartoum, is larger, faster, and even more luxurious than earlier ones. An unusual feature is the FREE INFORMATION SERVICE on board, which supplies passengers with up-to-date news of Sudanese business, political, and social events—very helpful to newcomers and to those returning after a long leave of absence.

**Athens traffic rights are subject to Government approval.*

picture of the Algerian situation. The advance toward reality is welcome.

The settler extremists, when they did not have a candidate like Mme Lagaillarde, wife of the imprisoned leader of the January insurrection, tended to abstain, in common with the Moslem rebels themselves. Mme Lagaillarde scored a notable success in Algiers, where her list secured all six seats in a predominantly European district ; and other opponents of General de Gaulle's policy were victorious throughout the city. Gaullism's chief support came from the countryside in the departments of Oran and Constantine, where the returns from the reorganised villages were numerically outstanding. But at Sétif the total participation was only 14 per cent, and at Guelma, a French headquarters behind the Morice line, the Moslem rebels contrived to bring about 7,000 blank papers against 12,000 for the single list of Gaullist candidates.

The voting shows a continued settler resistance to General de Gaulle, particularly around Algiers, although it is significant that the extremists can no longer claim to speak for the European community as a whole. More ominously, the character of the Moslem candidates returned does not lend credence to the idea that a third force will emerge. General de Gaulle has placed some reliance on the local voting to produce the long-looked-for *interlocuteurs valables:* although there is again talk in Algiers of round-table consultations on the future relations of the European and Moslem communities, it does not seem that the general can place undue reliance on such a process of reconciliation. But he still has the hopes, however fragile, of the Moslem population who see him as the one man, if one exists, who can still bring about an eventual political settlement.

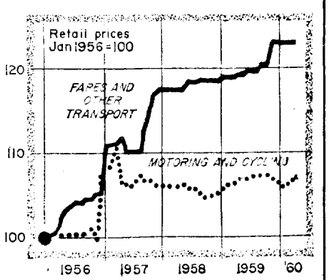
AGRICULTURE

A Training System At Last

SOME time ago responsibility for agricultural education below college level was transferred from the Ministry of Agriculture to the Ministry of Education, and this transfer has now borne first fruit in a report which deserves a warm welcome. An Advisory Committee on Further Education in Agriculture has proposed a nationwide system of agricultural training courses. They will be complementary to practical working experience, generally on an employer's farm, although certain residential one-year courses will be on "teaching farms" attached to farm institutes. Pupils in these different and widely variegated courses will range from fifteen-year-old youths who have never tackled GCE to experienced farm managers who are anxious to get abreast of technical advance or to improve their business practice.

The difficulties in the way of establishing and running such a system are obvious. It is harder to arrange convenient releases for young farm workers than for apprentices in industry. Moreover, farm apprentices are apt, unlike industrial apprentices, to live in ; and farmers, not to mention their wives, may well lack enthusiasm for accommodating part-time workers. Because farming is by its nature geographically dispersed, getting students together in economic numbers is a special problem. More important is a difficulty which the committee has referred to a special working party due to report shortly: that of recruiting—and training for the job —enough teachers of the right kind. This difficulty is the graver since there is an obvious overlap between the manpower requirements of the new training system and that of the already over-extended National Agricultural Advisory Service. Beyond these questions, finally, there looms another not in the ministry's power to answer: what differential reward can be expected by the worker, at any level, who has gained a recognised qualification instead of merely going through the agricultural equivalent of sitting next to Nellie? The National Union of Agricultural Workers has gone on record as preferring the rate for the job to the rate for the man—a preference which if made effective would seriously diminish the attractions of the scheme for the rank-and-file worker.

None of these difficulties, however, ought to be insuperable ; and the reward for overcoming them is potentially enormous. There is a notoriously wide gap in Britain not merely between the best and the worst farming, but between the best and the ordinary passable. To make the best practice common practice is an aim to which public funds can be far more effectively—and economically—devoted than to the massive support of the uncompetitive. Exchequer finance for these training schemes will, in the long run, be a "production grant" of the right sort.



Hobby in Peril

MUCH of last week's committee stage debate on Clause 18 of the Finance Bill—the "hobby farmers' clause"—could have been transposed holus bolus to the other clauses dealing with tax avoidance. Indeed, much of it was. The question of bona fide commercial operation, the question of distinguishing between taxable income and untaxed capital gains, and the wider question of the onus of proof, were all bound to recur in successive contexts throughout the bill. "Hobby farmers" are, however, in some respects a case apart, because for many of them tax considerations are genuinely only a very secondary explanation for their activities. Because farming is regarded as a way of life as well as an economic enterprise, it attracts, quite apart from any tax-avoidance motive, people who are willing to farm at a loss if need be and whose other resources enable them to do so. Because landownership confers prestige it similarly attracts people who are content to buy—or preserve—that prestige even at the cost of a similar loss. And because it offers a field for public service—whether in rural life generally or, in the long run, in improvement of soil and stock by investment and experiment—it attracts some enthusiastic pioneers who carry disinterested and often expensive bees in their bonnets.

Last week's debate saw Conservative backbenchers moving amendments in favour of these people, and the Government harshly but rightly refusing to accept them. The losses incurred by any of these hobby farmers are, in strict logic, just as much an expenditure on gratifying personal tastes as are other people's outlays on, say, travel or playgoing, and provide—again in strict logic —no better a reason for claiming tax reductions. The part-time agricultural pioneer is admittedly a national asset ; but the experimental pioneer who changes his mind and sells out will very properly make as substantial a tax-free capital gain as the man who planned from the first to do just that. The small dog-and-stick amateur farmer or not-very-competent country gentleman, though no doubt often an estimable fellow, is in general a high-cost national liability. He half-uses or misuses land which the trained and ambitious young entry of professional farmers could cultivate properly ; he lags behind in techniques ; he responds sluggishly or perversely to market needs ; he inflates both the price of farms and the subsidy bill. Clause 18 as it stands is unlikely to worry him much. To have weakened it further out of respect for his interests would have been a bad mistake.

Correction.—The reference in *The Economist* of May 28th to M. Opangault as author of the scheme for a United States of Latin Africa should have been to the late M. Boganda of Oubangi-Chari.

THE COST OF TRANSPORT

According to the statistics collected for the index of retail prices, private motoring and cycling now costs only 7 per cent more than it did four years ago, but public transport (including a small allowance for parcel and luggage freight) costs 24 per cent more.

BOOKS

Pegs and Holes

The Ineffective Soldier: *Lessons for Management and the Nation*

By Eli Ginzberg and others.
Columbia University Press. **London: *Oxford University Press.* Three volumes, 245, 301 and 359 pages respectively. 48s. each.**

DURING the war many people looked with some envy at the Americans' apparently lavish availability of both men and materials. But in the critical Battle of the Bulge General Eisenhower was short of reserves. After the war, as Chief of Staff of the American Army, he found that one out of every seven men called up had been judged to be mentally or emotionally incapable of serving effectively in the armed forces in time of war. In 1950, as President of Columbia University, he set up a Conservation of Human Resources Project, of which these three volumes are the report. Its purpose was to try to find out the reasons why such large numbers of young Americans were rejected or discharged, and what had been wrong with the system. The project team had available to it an enormous mass of personnel records and information that had been accumulated by the Services during the war.

There may after all be advantages in having to work against a restricted budget. The Americans started with no thought of any possible manpower shortage, and they were slow to realise there was one. The British, on the other hand, were acutely conscious of it from the very beginning, and made their plans accordingly. It is probable that, in consequence, we made much better use of our limited manpower resources. What may be more important is that we also made more successful efforts to help the individual to produce his optimum performance. Incidentally, it is hard to resist the comment that, in both countries, the navy was far ahead of the other two services in establishing and maintaining a very high standard of selection—perhaps because in terms of manpower it was much the smallest service.

These three books make hard reading. They are wordy and repetitive, with far too much detail for the manager who ought to read them. But even if the first two volumes are skimmed, the third should be read through. It is an attempt to draw out some more general conclusions that may be of help to the community generally and to industry in particular.

Beneath much that is platitudinous and obvious, this report does provide a balanced and cautious study of the problems. It makes it very clear that the answers to them do not lie in any particular gimmick, management technique, or psychological theory. Comparisons between service and civilian life, and between service and industrial organisations, can be misleading, but there are certain conclusions to be drawn that industrial management would do well to consider.

There has been a growing awareness in Britain recently of the difficulty of getting enough trained and experienced men, but it has, perhaps, been assumed too easily that some new selection technique or an executive training course would provide them. This report shows that much more is needed. Initial selection should be based on a clear understanding of the requirement, a knowledge of what is available, and a plan to bring the two into relationship. Selection standards should be related to the real need; in its initial selection the American army set combat standards that only one man in three was ever likely to meet. The project team found much evidence in favour of an educational screen to predict future work performance. They had much less evidence to support a widespread faith in a psychiatric screen.

After initial selection should come further selection in depth before any final decision is taken. And evaluation should be seen as a continuing process throughout a man's career. A large organisation has to recognise the importance of reconciling its need for rules and regulations with the retention of as much flexibility as possible. Because of its size it should be able to provide enough mobility for men to find the jobs best suited to their capacities. Assignment is just as necessary as selection.

In the field of training in industry we have not yet thought long and deep enough about who should be selected for training, how he should be trained, and for how long. Training has not been related to the problem of adjusting a man's needs in his career to a company's demands. We are swinging too far towards the classroom and away from learning on the job.

Perhaps most important of all, in these three books is buried the warning that a man should not be judged by single qualities or by isolated elements of his experience. A man's performance is determined by a highly complex interplay between all his qualities and experience and an environment that continuously presents him with both opportunities and limitations.

Failed Masterpiece

Some Graver Subject: *An Essay on "Paradise Lost"*

By J. B. Broadbent.
Chatto & Windus. **268 pages. 30s.**

FEW would disagree with Dr Johnson's remark that "*Paradise Lost* is one of the books which the reader admires and lays down, and forgets to take up again. None ever wished it longer." If it could weary a man whose capacious mind had been nurtured on holy writ and the classics, and whose accumulation of learning was formidable (though not so formidable as Milton's own), how much more wearisome it is likely to be to the reader of the mid-twentieth century: wearisome because so often unintelligible.

Dr Broadbent's book is not the plain man's pathway to comprehension. Unlike Professor C. S. Lewis's "Preface to Paradise Lost," it is not designed for the novice, eager to tackle an acknowledged masterpiece but hampered by an imperfect knowledge of Milton's aims and assumptions. "Some Graver Subject" is packed with erudition and is written in a style that is often elliptical and allusive, demanding close attention. For students seriously interested in seventeenth-century heroic poetry, it will be of great value; and to the rather larger circle of readers fascinated by the discrepancy between Milton's intention and achievement it offers much that is unfamiliar and challenging.

One of the important points which Dr Broadbent emphasises is that Paradise Lost was something of an anachronism even when it first appeared. The desirability of a Christian epic in Protestant terms had been felt ever since the Reformation. By the time that Milton's heroic poem went to press, the Royal Society was already in being, and the Renaissance culture, in which Paradise Lost is so deeply rooted, was beginning to look a little old-fashioned.

The immense difficulties, personal and literary, that Milton had to confront and subdue are given full weight by Dr Broadbent. He is quite frequently repelled by Milton's idiosyncrasies, and does not conceal his aversion. On the other hand, his appreciation of the formidable difficulties makes his admiration for the triumphs the more warm and discerning.

The most unsatisfactory thing about Paradise Lost is that as a religious poem it has little persuasive power. Milton's theology is partly to blame; but had he not expressly announced that his intention was "to justify the ways of God to men," we should perhaps be less critical of what he actually achieved. It was an impossible project, a magnificent undertaking. Certainly it is a major work of European literature, and one that needs much elucidation. Dr Broadbent's scholarship, allied to his lively interest in the behaviour of men and women, makes him a commentator of unusual penetration.

Gods from the East

The Ancient Gods

By E. O. James.
Weidenfeld & Nicolson. **359 pages. 42s.**

PROFESSOR JAMES sets out to tell the story of the origins and diffusion of religion in the Near East. His study covers that geographical area which modern scholarship has come to recognise as the very cradle of the western mind—the arc which extends from western Asia to northern India, and from North Africa and the eastern Mediterranean to the Aegean and the Graeco-Roman world. In broad outline the story has been known since the great excavations in Egypt, Mesopotamia and Knossos. But archaeology and the decipherment of ancient scripts have, during the last decade, moved forward with extraordinary speed. The time-limits within which the historian works have been immensely expanded (the earliest neolithic settlements at Jericho may go as far back as 8000 B.C.). And new linguistic insights have shown the great measure of contact between archaic civilisations. All this justifies a survey and descriptive analysis of present knowledge, and that is what this handsomely illustrated volume sets out to provide.

It starts with those striking, Picasso-like little figurines in which men of the neolithic age saw an emblem of fertility and the life-force. Out of these primitive representations grew the great cult of the Mother-Goddess and of the young god who was, in a number of religions, regarded as her son. It is an image that has gripped the human mind from the time of Isis and Horus to that of Christ and the Virgin. Professor James discusses the institution of the sacred king and of the seasonal, sacrificial rites in which he participated. Again, one comes to recognise in these archaic and often sanguinary rites the origins of some of the most enduring of ethical conceptions. The prayer of an Assyrian monarch asks the gods to let him be an intermediary between them and his people, to visit upon him the troubles that might otherwise fall upon his nation. In very faint outline, the key notions of mediation and atonement are already visible.

But Professor James's very virtues—his detachment, his inclusiveness, his scrupulous refusal to go beyond available archaeological or textual evidence—lead to an odd perspective. Throughout the book (and the material is arranged so as to make it primarily a work of reference) the history of Judaic beliefs is treated in exactly the same light as that of all the other near eastern religions. But it is surely the immense difference that matters and must be accounted for. Here alone, the step was taken from polytheism to the severe conception of a single omnipotent God. Here alone, the transition was made from primitive rites and propitiatory magic to a consequent and enduring moral code. How and where did this tremendous event occur? We still do not know. Recent scholarship points to some crucial encounter between the idol-worshipping, semi-enslaved Hebraic fugitives or emigrants from Egypt and a monotheistic cult and priesthood established in the Sinai desert—perhaps near the ancient oasis of Kadesh. Digging in sand is, as yet, an unsolved engineering problem and no solid evidence may ever be forthcoming. But the magnitude and singularity of the event are not in doubt and Professor James obscures them by treating it on a level with the worship of Marduk or the cosmological fancies of Egypt.

Parnell's Tragedy

The Fall of Parnell

By F. S. L. Lyons.
Routledge. **375 pages. 42s.**

THE personal and political disaster that overtook Charles Stewart Parnell in the winter of 1890-91, and toppled him from the unquestioned leadership of the Irish nationalist movement into political outlawry and an early grave, is three-quarters forgotten in England, where the comparable scandal of Sir Charles Dilke's downfall is more readily remembered. But the tale of Parnell and Katherine O'Shea and the split in the Irish party is all too familiar in Ireland, where the numerous rights and wrongs of it are still furiously debated, and many legends gather. Dr Lyons, rightly judging that the time for an impartial verdict has now come, has set down the whole story in a passionless, detailed, exact and probing narrative that lays bare the springs of action of the men concerned.

These men were outside the common run of politicians. On the Irish side of the water, they looked with hardly an exception to the future of Ireland, not to their own careers; such men as Michael Davitt or John Redmond were devoted to the best interests of Ireland—however differently they saw them—and not to themselves. In England, to the delight of the unionists, the still titanic Mr Gladstone failed to coordinate his desire for justice to Ireland and his need to keep his party together. The author handles Mr Gladstone's difficulties with particular sympathy, and gives the first adequate analysis of the political pressure that forced Parnell to assert what he must have known to be untrue—that Mr Gladstone did not really want home rule for Ireland at all.

Dr Lyons thoroughly understands his subject; he is also able to bring the past alive in his reader's imagination. One can hear Parnell's voice: in the great scene in committee room fifteen, calling Healy "that cowardly little scoundrel there who dares in an assembly of Irishmen to insult a woman"; or on the hustings in County Carlow, describing some of his former devotees as having "no more brains than would sit cross-legged on the point of a

Have we no watchdogs?

"MY PARENTS *collected information from a dozen schools: this was the most expensive, so they sent me here.*" Thus John Burnett in The Observer reports the disillusioning experience, at a language school in England, of a Greek student whose father pays 20 guineas a week for him to be badly housed, ill fed and scrappily taught. It's not easy to choose in a foreign country. The most expensive *ought* to be the best . . .

It's not always all that easy for the native English customer to know that he's getting his money's worth. A recent pamphlet by P.E.P. recommended setting up a national body to meet this need, and such an official burglar alarm might do a very useful job. Meanwhile, have we no watchdogs?

Well, one of our Sunday newspapers feels so strongly about the duty of dealing in a straightforward way with the consumer that it is making an outspoken policy of reviewing goods and services in his (or her) interest. When necessary, it steps clean over the tactful line preserving advertisers from open criticism—which some people think a very very daring thing to do. But if a newspaper, such as The Observer, can review books and plays without fear or flattery, by what sort of ethical code must it keep mum about other offers to the public? Here is a 'convention' worth breaking.

So The Observer publishes regular contributions by the editors of both *Which?* and *Shoppers' Guide*. And, if you look into its other features, you will find that the people writing in The Observer aim just the same kind of searching questions at a manufacturer's press release as they do at a politician's manifesto. Patience Gray, writing for women, is a good example. So is Gordon Wilkins: his enthusiasm for a new car never blinds him to its faults. Dr. Abraham Marcus's articles, examining the claims advertised by the proprietors of various types of patent medicines, are surprising quite a few people.

Houses, holidays, heducation

Few items cost us more, or can be a greater disappointment than houses, holidays and schools. Turn to The Observer! You won't find every answer instantly, but you will find you're getting a stronger instinct for snag-spotting—and plus-pointing. (When holidays are concerned, I reckon Pierre d'Harcourt's personal information service is invaluable. If you write, he will reply with advice and ideas from his own experience. Did you know? All free, bar the postage.)

Not the least of the interesting things about this paper is its enquiring eye. And Sunday is stock-taking day. **J.B.L.**

pin." One can see John Dillon and William O'Brien smuggling notes to each other in Galway jail, and hear the rasp of Archbishop Croke's pen as he writes: "for God's sake, and country's sake, and conscience's sake, be staunch and steady and no surrender." The story has a sad inevitability that makes it almost impossible to handle ignobly, and gives it an epic grandeur. The author handles it in plain scholarly prose ; he buttresses his judgments with practically all the available manuscript sources, and his book is definitive.

Life of Law

Sir Travers Humphreys

By Douglas G. Browne.

Harrap. 378 pages. 22s. 6d.

SIR TRAVERS HUMPHREYS, whose legal career stretched from 1889, when he was called to the Bar, to 1951, when he retired from the Bench, had few interests outside his work, so it was perhaps inevitable that his biography should be more an account of his cases than a study of his life. Mr Browne has been further handicapped by the absence of any notes or papers, but in the course of his competent if not especially brilliant book, we do catch glimpses of the man himself. Travers Humphreys was a kindly man, blessed with a gentle sense of humour, a fine regard for justice, and a compassion that enabled him to be impartial when dealing with even the most repellent of criminals. He has left no great contribution to criminal jurisprudence to perpetuate his memory, but his conscientious discharge of his duties during his sixty-three years of active legal life earned him the respect, as his personality won him the affection, of his profession.

As Treasury counsel, he appeared for the prosecution in nearly all the famous cases with which he was connected, so that his part was never dramatic. He was, however, briefed for the defence in the Oscar Wilde case, his first *cause célèbre*, an account of which is given by Mr Browne but which adds nothing to the exhaustive delineation by Mr Montgomery Hyde in a volume to which Travers Humphreys himself contributed a foreword. Humphreys prosecuted both Crippen, whose fatal mistake was to leave his wife's heart and lungs buried beneath the cellar floor, having successfully disposed of the rest of her body, and the avaricious Seddon, who poisoned his lodger, Miss Barrow, with arsenic distilled from flypapers. Having rifled her cashbox, Seddon had her dumped into a common grave, and even charged a 12s. 6d. commission on the work he provided for the undertaker. Another macabre case was the trial of George Smith for murdering his three wives in their baths. Mr Browne records Smith's outrageous remark to his mistress, Miss Pegler, to whom he was faithful in his fashion: "I should advise you to be careful of these things [baths]. Women have been known to lose their lives through weak hearts and fainting in a bath." Humphreys also prosecuted Roger Casement, and Mr Browne, in commenting, is both unfair to Casement and hardly abreast of the latest information on the subject. Humphreys's most ridiculous case was the trial of Pemberton Billing in 1918 for criminal libel, during which fantastic allegations were made about a black book that was said to contain the names of 47,000 top people addicted to unnatural practices. A high point of farce was reached when Mr Justice Darling, trying the case, was informed that his own name was included. Billing was acquitted.

The last case over which Humphreys presided was among his most sensational, that of Haigh for the murder of Mrs Durand Deacon. By a strange irony, the hotel that Humphreys selected for his retirement, and where he died in his eighty-ninth year, was that where Haigh had met his victim and from which he took her to her death.

The Riddle of the Sphinx

Oedipus and Akhnaton

By Immanuel Velikovsky.

Sidgwick & Jackson. 208 pages. 25s.

DR VELIKOVSKY is among the happy men to whom life appears well-ordered: patterns and parallels appear before him as he examines history, and myths are not only significant in themselves, but also puzzles to be worked out. Unlike many such people, he writes extremely well ; and whether or not the theory which he expounds passes the scrutiny of the learned, it makes excellent reading. He has examined the broken and mysterious history of Akhnaton, who for a short time imposed a reformed religion on Egypt and then disappeared, leaving behind him records of execration, no tomb of his own, but a confused archaeological legacy, including the wrecked tomb of his mother that apparently contained the roughly buried mummy of his son. By piecing together the evidence with great ingenuity and lacing it liberally with conjecture, Dr Velikovsky has come to the conclusion that the Oedipus legend derives from Akhnaton's personal history, with the sole exceptions that he killed his father only after his death, by defacing his name and memory, and that he knew exactly what he was doing when he married his mother.

Anyone who approaches this book from the classical end cannot assess the validity of Dr Velikovsky's thesis, since nearly all the evidence is from Egypt: one can only say that it is immensely ingenious and stimulating. Two things rouse suspicion: first, that so bold and far-reaching a theory first reaches the world in popular form, displaying in the footnotes a certain reliance on secondary sources, which makes one fear an unconscious selection of evidence ; second, that Dr Velikovsky explains too much. There is not a single detail of the Greek legend for which he does not find a counterpart, sometimes admittedly conjectural. One hopes he is right ; but even if he is not, a well-written, well printed and well illustrated book, which makes one think afresh about one of the greatest of the tragic myths, is certainly worth reading.

Dr Velikovsky rounds off his analysis with a curious chapter on Freud's interest in both his heroes. He cites an occasion when Freud, in the middle of a discussion with Jung about Akhnaton's hatred of his father, fainted and fell unconscious on the floor. Could there be a better climax to a myth?

Representative Radical

Harriet Martineau : *A Radical Victorian*

By R. K. Webb.

Heinemann. 398 pages. 35s.

MOST biographers of Harriet Martineau have concentrated on her eccentricities: in this well-documented and illuminating study Professor Webb is as much concerned with what made her "representative" as with what made her unique. He emphasises her consistency rather than her vagaries. His own book, as he says of Miss Martineau's "History of the Thirty Years' Peace," is "a sustained study from a consistent point of view," an exercise in the history of ideas rather than a diverting portrait of odd human behaviour.

The main problem hidden behind the mass of material is the nature of Victorian

Now London—Montreal in just over 2 hours

(by the clock!)

4.00 p.m. — au revoir London: 6.05 p.m. — hello Montreal. Of course, clocks in Montreal are five hours behind Big Ben. Still it's good going. But the going's always good by TCA's new Giant Jet, the Rolls-Royce powered DC-8. It's swift, smooth and unbelievably quiet. And you fly either First or Economy Class to Canada (from only £17 down, Economy return Montreal, under TCA's Pay Later Plan). This summer TCA, in association with BOAC, offers up to three jet flights a day, as well as other services, to Canada.

Now daily by Rolls-Royce powered DC-8 to Canada

Beginning September—Through service daily to eastern and western Canada

"In the standard of comfort, appointments and silence of running it has few equals in the world, and certainly none in its price range"

(THE AUTOCAR)

The ROVER *3-Litre*

No one feature dominates your impression of this outstanding car. The imaginative good taste of its exterior lines is matched by the flexibility of its performance and the delicacy of its handling. Its road-holding is impeccable under all conditions. The 3-Litre is a particularly fine achievement of Rover engineering. With conventional gear box £1715.5.10 (inc. P.T.) Automatic transmission £1864.0.10 (inc. P.T.) Front wheel disc brakes are now standard equipment.

THE ROVER COMPANY LIMITED · SOLIHULL · WARWICKSHIRE AND DEVONSHIRE HOUSE · LONDON · W.1.

radicalism. Miss Martineau was not only one of its outstanding and most self-conscious exponents: she grew up as the manufacturing class, to which she belonged, experienced "its greater access to confidence and power." She stopped writing at the time of the second Reform Act, which transformed the mood of politics, and died shortly after the onset of the "Great Depression," which (albeit gradually) remoulded the content of politics. She could afford to be optimistic in all her thinking for she never felt what G. M. Young has called the chill in the air. Professor Webb finds the essence of her radicalism not so much in the programme she advocated as in the particular approach she chose to follow in assessing the role of change in her own society. He suggests that this approach was already irrelevant before she died. His thesis is convincing, although there is still a great deal to be found out about other radicals and the extent to which they, too, were "representative." Professor Webb's book is a work of importance in its own right, but perhaps its chief value is that it is a major contribution to that probing of the Victorian mind and temper which is transforming our understanding of the age. Through biography he points the way to future synthesis.

Of course, Miss Martineau is such a superb character that judged even as a biographical study this book has many fascinating features. Her highly publicised mesmeric cure in 1844 posed a challenge to the doctors: it also poses a challenge to the biographer, and Professor Webb rises to the occasion superbly. On the impact of America on her thought and her interpretation of the significance of America, Professor Webb writes as an American with special insight. Only occasionally does he allow his elaborate and impressive apparatus of scholarship to over-press the reader. He certainly forces the knowledgeable reader to compare and to contrast, to look beyond Tynemouth and Ambleside to the wider world which Miss Martineau never ceased to try to interpret.

In Search of the Far East

Northwest to Fortune

By Vilhjalmur Stefansson.

Allen and Unwin. 375 pages. 30s.

THE doyen of Arctic specialists has published, within a few months of his eightieth birthday, another stimulating and provocative book. Its range is wide. "The search of western man for a commercially practical route to the Far East" is the subtitle, and this comprehends many curious and unexpected undertakings. The story of the North West passage itself is there, of course, but it occupies only 25 out of some 350 pages, and its telling, frequently undertaken by others, is not the main purpose of the book.

That purpose is to outline the history of the many other less well-known attempts: for example, the sporadic efforts to sail due northwards across the Arctic Ocean, originally probably Columbus's idea, and one which came to brilliant fruition (frustratingly for the author a week after the proofs had gone to press) in the voyage of the nuclear submarine *Nautilus*. But longer and more romantic in its history, if less exciting in its potentialities today, is the story of the land route across north America. This is recounted more fully: the journeys of the fur traders across the Arctic and sub-Arctic in the eighteenth and nineteenth centuries; of Hearne, Mackenzie, Bell, Murray, McDougall. And, finally, the extraordinary and now almost forgotten epic of those who saw in the narrowness of the Bering Strait the possibility of direct communication between New York and Paris, first by a telegraph cable, and then, believe it or not, by a railway line.

The book is designed to be popular rather than scholarly, and Mr Stefansson has got most of his material from published sources (often obscure and hard to lay hands on). But it is no mere digest of other men's tales. The author's own personality has left its clear imprint; not at the cost of distortion, or unfair quotation, but by the informed comment, by the judgment of a man who understands the environment, and not least by the clear, flowing and very readable style.

Rustic Writer

T. F. Powys

By H. Coombes.

Barrie & Rockliff. 173 pages. 18s.

AMONG the remarkable families reared in parsonages and manses, the Powys family, eleven all told, can certainly hold their own for sheer talent and unpredictability. Of the three writer brothers, Theodore was the most unobtrusive, but not the least original. A countryman who, like William Barnes and Thomas Hardy, found all the imaginative nourishment he required in Dorset, T. F. Powys deliberately contracted out of the mechanised life of the twentieth century. He did not, however, cultivate an archaic Arcadianism, in spite of his bucolic *dramatis personae* and his complete avoidance of the urban and up-to-date. The odd, equivocal, disenchanted, humorous attitude to life and death revealed in his stories is not really old-fashioned or escapist. He was concerned with fundamentals and the things that endure; and he was a religious, though thoroughly heterodox, man, for whom the beauty and pathos and inscrutability of the creatures of this earth provided abundant material for meditation.

Thirty years ago, an admiration for the writings of T. F. Powys was not unusual among the *cognoscenti*. His best work was done between 1923-1931. "Mr Tasker's Gods" came out in 1924, "Mr Weston's Good Wine" in 1927, "Fables" in 1929. He never was, nor ever could be, a writer who would please more than a discriminating minority, for his allegorising habit of mind, his unconventionality and his cultivation of rusticity could only appeal to readers who like to listen to a quiet, quizzical voice.

Mr Coombes claims genius for T. F. Powys, and supports his contention with masses of quotations. His book is written in a spirit of profound, though not blind, admiration. Perhaps the most illuminating literary parallel that he finds for Powys is Nathaniel Hawthorne. To compare him with the major novelists can only invite dissent; but in his small, intense and honest way he was an excellent writer.

Trade Theory Re-examined

Canada in the World Economy

By John A. Stovel.

Harvard University Press. London: *Oxford University Press.* 377 pages. 60s.

THIS timely book has a misleading title. It is, in fact, a rigorous re-examination of the theory of international trade in the light of an equally rigorous re-examination of Canadian experience. Its central concern is a searching critique of Viner's "empirical verification" of the classical Mill-Taussig theory in the celebrated monograph, "Canada's Balance of International Indebtedness, 1900-1913." This is followed by an analysis of the contrasting Canadian situation between the two world wars, with a brief postscript on developments since 1945 and on Canada's peculiarities compared with other rapidly developing countries.

Mr Stovel shows, on most convincing theoretical, historical and statistical grounds, that it is misleading to regard capital imports, even in the comparatively simple circumstances at the beginning of the century, as the main initiating disturbance in balance-of-payments equilibrium and equally misleading to see in relative price changes the principal mechanism of adjustment. The classical theory was "overly abstract," allowing neither for "mutual interdependence between the current balances and capital movements" nor for the part played by income changes in bringing about adjustment. Secular "growth processes" and cyclical factors may operate simultaneously as a "common cause" on both the trade balance and capital movements. The use of too general statistical categories obscures significant distinction; different kinds of investment, for example, may play a fundamentally different role in capital movements, while simple statistical correlations obscure such important considerations as anticipations and time lags.

Mr Stovel attempts a comprehensive synthesis of secular, cyclical and short run changes in his "eclectic theory of balance-of-payments equilibrium," showing effectively the danger of "too much generality." With fuller appreciation of the historical forces at work and improving statistical

records, he hopes for "steady progress in balance-of-payments analysis," which as yet cannot be conclusive or complete.

A contribution to the theory of international trade, this book is also a notable contribution to a better understanding of Canada's besetting problem, the growing current account deficit and countervailing heavy capital inflows, mostly from the United States. It contains much material relevant to the current controversy about Canadian trade, fiscal and monetary policy, including a careful statistical appendix and consolidated figures for the Canadian balance-of-payments from 1900-1957. Though not easy reading (especially the theoretical analysis in Part I) this should prove a most useful book.

Linguistics

Language in the Modern World

By Simeon Potter.

Penguin. 221 pages. 3s. 6d.

THIS is a not quite satisfactory book on a very interesting subject. Its sub-title is "a popular introduction to general linguistics, the science of language." Linguistics, like many another new subject, is still groping for its boundaries, and still more for its main direction; and, in an attempt to overcome this, Professor Potter has tried to cover too much ground in a small space: he has written a rather general account of the structure of language; a quick guide to the main families of language in the world; a short history of philology; and a couple of not very inspiring chapters on the relation of language to thought and society.

Perhaps the least important failing of the book is an excessive number of mistakes in his examples and descriptions: they can be traced in Polish, Turkish, Swedish, Portuguese and even French. But these are of no importance to the uninitiated and do not spoil his argument. A more serious criticism is that, although he speaks much of recent advances in linguistic science, he does not make clear what they are: to take one example, the significance of the phoneme is often mentioned but inadequately defined; it remains principally a comfortable word. It would have been better if Professor Potter had taken a narrower field and treated it in depth: many aspects of language are hardly mentioned—for example the stabilising and even retrogressive effects of literacy and broadcasting, and the difference (mentioned but not discussed) between language as described and what people actually say.

But one must not blame an author for not writing the book that one would have liked to read; and it is the claim in the sub-title rather than the substance that carries what blame there is. If one does not take this as the entrance to a new scientific field, but as an undoubtedly popular account of language on accepted lines, it is readable and interesting.

OTHER BOOKS

L'ASSOCIATION DES PAYS D'OUTRE-MER A LA COMMUNAUTÉ ECONOMIQUE EUROPÉENNE. By Pierre-Bernard Cousté. 302 pages. Fr. 1,500.

DIE EUROPÄISCHE WIRTSCHAFTSGEMEINSCHAFT. By E. Wohlfarth, U. Everling, H. J. Glaesner and R. Sprung. *Vahlen*, Berlin. 978 pages. DM. 63.

A legal commentary on the common market treaty.

EXPANSION ECONOMIQUE REGIONALE ET COMMUNAUTÉ EUROPÉENNE. By Paul Romus. *Sythoff*, Leyden. 372 pages. Fl. 18.75.

LA POLITIQUE CÉRÉALIÈRE EN EUROPE AU SEUIL DE L'UNIFICATION. By Francis-Charles Fabre. *Sythoff*, Leyden. 231 pages. Fl. 15.90.

Each year the Council of Europe and the European Coal and Steel Community sponsor together a research study on some aspect of European integration—social, cultural, political or economic. These two are the latest in the economic series. Dr Romus's study on regional development surveys the different types of assistance to backward areas given by the Six member-nations of the European community and by Britain. It goes on to explain the measures and methods of regional development used by the new communities themselves. The study on grain describes the patterns of production, trade and prices and the methods of market management used by the European states.

LOCKE AND LIBERTY. Compiled and introduced by Massimo Salvadori. *Pall Mall Press.* 236 pages. 18s.

A useful selection from Locke's writings, with an interesting introduction by Professor Salvadori.

LETTERS

Diplomacy and Paranoia

SIR—Mr Charles Janson's analysis in your issue of May 28th of the role of psychology in improving east-west relations after the summit, seems to be grounded on a central fallacy. It is his contention that the mutual fear of the Soviet Union and the United States would be mitigated by the mediation of the leaders of the more stable societies of Western Europe "which will reduce the fear and hatred of the giants and thus the negative projection that their leaders make upon one another."

Leaving aside Mr Janson's debatable assumptions that this sense of insecurity is based on internal rather than external factors in the two countries (the "industrial nomadism" to which he ascribes it is presumably another name for mobility of capital and labour, a state of affairs long recognised as highly desirable in this country, and now being achieved on an increasing scale on the rapidly expanding economies of the European Six), it opens the question of whether the European countries and their leaders do show greater equanimity—in the psychological sense in which Mr Janson intends the word—in the present situation than the two giants. Germany, in the aftermath of the most extreme instance of national paranoia in modern history, exhibits, not calm, but a rigidity that is both unhealthy and unlikely to last; France, only two years away from a military *coup*, is in a mood of indifference to any subjects that do not involve its most immediate interests; Britain, despite the stability of its leadership, has in recent years displayed to the world an extremely unstable public opinion on most international questions where the factor of force is dominant, as evidenced equally by Suez and Aldermaston. Moreover, the apparent equanimity of Messrs. Adenauer, de Gaulle, and Macmillan conceal respectively high delight, quiet contentment, and profound frustration at the collapse of the summit conference.

But even if Europe did at this moment possess a figure of great authority and wisdom backed by a public opinion that was both alert and calm, it is still very doubtful if he could fill the role for which Mr Janson casts him. For his analysis overlooks the fact that in international political relations, which cannot be equated with personal relations, only those who generate tensions can remove them. (Even in personal psychological difficulties this is sometimes true: a group of alcoholics, for instance, can do more to help each other to sobriety than a doctor can for any of them.) The reason is straightforward: unlike personal tensions, these fears, of surprise attack for instance, are not the product of *psychological* aberration but of logical calculations based on the cold facts of the immense *physical* damage that either could inflict on the other—calculations that become daily more intricate both as to time and space the deeper we move into the missile age.

I would agree that the situation is aggravated by the immature political structures of both the Soviet Union and the United States, systems which place an immense burden on one man yet often circumscribe his freedom of action. In particular the U2 incident has exposed very grave weaknesses in the American decision-making process. But the kind of tensions which we see today on a hemispheric scale would exist just as much between two old and deep rooted societies were they both divided by an ideological cleavage and in possession of nuclear weapons.

The debacle in Paris proved that "the spirit of Camp David" was much less strong than had been hoped, and that the attempt to substitute a positive for a negative relationship aroused jealousies and resentments within each block which neither Mr Eisenhower nor Mr Khrushchev was strong enough to control. But it does not prove that there is any substitute for a direct confrontation of the two giants or that there is any place for the mediator, either in the political or in the psychological sense of the word. Indeed, as the fruitless journeyings of Mr Macmillan and Mr Nehru and others have demonstrated, the mediator is inherently doomed to failure

since he is politically or militarily weaker than the other two parties and cannot in the nature of international relations be accepted as any wiser. There is room for much constructive diplomacy on the part of the middle powers, but they cannot hang out their shingles as the doctors of a sick world.—Yours faithfully,

Brill, Bucks. ALASTAIR BUCHAN

Oil

SIR—In your illuminating notes on the oil situation in the issue of May 28th you ask what the prospects are for a price structure for Europe. The fact that you (as do others) talk of a price *structure* rather than of prices indicates that you recognise the recent innovation of Platt's for what it is: not a piece of straight reporting but an essay in deliberate rationalising. It could hardly be anything else, there being so little to report; since in the Eastern Hemisphere almost all the oil moves within vertically integrated international companies, numbering less than ten, the amount of freelance trade is minimal and it is difficult to imagine that this truncated tail could wag the dog, i.e. that the whole industry would, or in fact could, adopt semi-automatically the terms of its narrow fringe. Incidentally, in the sphere of tankers the "spot" charter rates, reactive but unrepresentative as they are, take up a similar position, and one has long since realised that no industry-wide system of prices can be built upon them. Yet "spot" sales (mostly by a few Italian non-integrated refineries) have at least one thing in common with the main flow of oil to Europe: they are also based on Middle East crude, whose prices are adopted also by the Soviets. Platt's, however—playing, as it were, Hamlet without the prince—have now tried to build a "model" based on Caribbean quotations which are mostly identical with US Gulf prices. Many years ago the US Gulf prices (as reported by Platt's) lost their erstwhile significance for the rest of the world, and in that respect they have been known to represent only "Rotten Boroughs." Platt's, recognising that they are trying to put the clock back, endeavour to make up for it by introducing, somewhat arbitrarily, discounts off the nominal Caribbean prices, but the resulting "low" quotations still represent nothing in terms of Europe; anyway they are well above the marginal prices of European refineries.

The source of all these difficulties is this: by virtue of governmental pressures in the USA, in Venezuela and in the Middle East, the (always tenuous) links between the prices in the several parts of the world have snapped and there is now no world market price for oil. A meaningful price structure could be established only if there existed a machinery for co-ordinating, on a world-wide scale, what politics have torn asunder; there are several such systems which could be envisaged of which the much talked-about prerationing scheme, put forward by some Venezuelan and Saudi-Arabian technocrats, is but one. In the absence of some such settlement, or of any endeavour to see the problems in their full perspective, the balkanisation of the oil industry will go on: there will be miscellaneous prices according to the nature and the degree of competition in each area—there is nothing wrong in that. let the chips lie where they fall—but all endeavours to bring the inherently different local situations on to a common denominator are bound to fail, however convenient it may be to maintain the myth of a world market.—Yours faithfully,

P. H. FRANKEL

Aircraft

SIR—In last week's issue you discussed the result of aircraft merger arrangements with particular reference to the position of the Hunting Group. I feel there is a danger that your statement that Huntings have pulled out of the air may be somewhat misleading.

It is, of course, true to say that the Hunting Group's future interest in air transport will be in the form of a small investment and that they have agreed to sell a controlling interest in their aircraft manufacturing company, Hunting Aircraft, to the new British Aircraft Corporation. However, in addition to the retention of a small investment interest in British United Airways and a large minority interest in Hunting Aircraft, the group continues to have considerable interests in aircraft repair and overhaul in Britain, Africa and Canada; in engineering with a strong aeronautical flavour; and in survey throughout the Commonwealth, which includes—as one of the tools—a fleet of some forty aircraft.

The Hunting family business "based mainly on oil and shipping" (your words) still retains, therefore, a substantial interest in various fields of aviation activities which will in future be co-ordinated through the present holding company, Hunting Aviation Management Limited.—Yours faithfully,

Hunting Group R. R. S. COOK
London, W1

Europe

SIR—I could not agree more with the sentence in your leading article on Europe that our choice "is really between full participation and an active estrangement." Mark the word "active"! I also agree fully with your analysis of the sorry history of the estrangement so far and the bad reputation this country has managed to get herself into all over the European Continent.

But is it not time to arouse the British public by leaving aside all the technical complications and calling a spade a spade? Is it not true that this country is in her difficult position for one reason and for one reason only, namely the powerful vested interest of some British industries which has so far prevented successive British governments from taking a more realistic and positive line towards European economic integration? Some industrialists thought and perhaps still think that they can have it both ways: protection behind tariff walls and easy markets abroad. But is it not exactly the Government's job to ignore sectional interests (probably of a short term nature only) when the economic future of the whole country is at stake? The Commonwealth countries have indicated more than once that with one or two safeguards they would not object to Britain joining the common market.

One should perhaps add in fairness that the record of the Labour government in their dealing with Europe was not much better, though socialist parties in Continental Europe implored the British Labour Party "not to drag their feet." Did sectional trade union influence in Britain perhaps take the place of today's objections by big business?—Your faithfully,

London, NW4 WALTER FLIESS

Stocks

SIR—In discussing the application of operational research techniques to stock holding, you said that the Purchasing Officers Association has published some of the pioneer work in this field, but has not yet really attempted to put these new methods over to its members.

This does not quite do us justice. Two months ago we held a successful operational research study group at Christ Church Oxford, under Professor R. W. Revans, of the Manchester College of Science and Technology. A good cross-section of British industry was represented in this group, which worked on a number of practical purchasing and stores problems, and we are planning to extend this type of activity in the future. It is interesting that your suggestion of a ready-reckoner to help the smaller firms to take advantage of these techniques was discussed at Oxford, and we shall encourage this development.—Yours faithfully, J. R. BLINCH

Purchasing Officers Association
London, EC4

Mr. Collins was in full production in 8 months instead of 18

"Our Castlereagh factory was in production in 8 months instead of 18 and the Ministry of Commerce could not have been more helpful."

–Mr. Harold E. Collins, Director and Overseas Production Manager of the Hughes Tool Company of Houston, Texas.

Many companies with far-reaching plans for expanded production–at present hamstrung by restrictions on industrial development locally or by shortage of good labour –have turned to examine the potentialities of Northern Ireland.

Here, in marked and welcome contrast to previous frustrations, they have found positive, constructive answers to their precise needs, in a well-established industrial setting.

In the past fifteen years, 141 British and American manufacturers, large and small, have selected Northern Ireland as the location for their new plants. Some of these companies have had factories built for them by the Ministry of Commerce. Others have been able to plan for immediate occupation and early production in one of the Ministry's Advance Standard factories.

Four such factories to rent are ready now; eleven more are being built. With plentiful trainable labour available; with the Ministry's ability to ease the burden of capital costs and to provide tailor-made amenities and services, Northern Ireland has much to offer to expanding industry.

If your own Company is planning to expand, a fact-finding visit to Northern Ireland could point the way to quick production and profitability. Belfast is less than two hours from London by air.

NORTHERN IRELAND

The Northern Ireland Development Council or the Ministry of Commerce will gladly provide any preliminary detailed information your company may require, and subsequently will make arrangements, as may be needed, for a fact-finding visit. All enquiries will be treated in the strictest confidence.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Battling for the Schools

WASHINGTON, DC

If the ghosts of the Light Brigade had been sitting in the gallery of the House of Representatives last week they would have concluded that Balaclava was child's play. The liberal Democrats who cantered into Washington's valley of death on Thursday, escorting a Bill to provide federal money for building schools, knew that they had to ride between the Republicans' cannons on one side and those of the southern Democrats on the other, straight for a President fingering a half-unsheathed veto; what they were not expecting was that some of their own men would start shooting their horses from under them. That the Bill should have survived this carnage and been passed by a vote of 206 to 189 (though with an amendment embedded in it which may kill it later) deserves a minor mention in the history books. This is the first occasion on which the House of Representatives has voted to supply federal funds for education on a significant scale; the Senate, as usual more liberal in these matters, passed a more generous measure earlier this year. But the debate showed how ingeniously the conservative coalition of Republicans and southern Democrats takes advantage of any gap which opens in their opponents' ranks.

The liberals started last week's debate with the cheering knowledge that they were being helped by both Vice President Nixon and Mr Rayburn, the Democratic Speaker of the House. The support of Mr Nixon, who realised that his hopes for the Presidency would be endangered if he opposed the Bill, brought 44 Republicans to its aid in the final vote. This is almost a quarter of all the Republicans in the House; it is by far the largest number to have strayed from the conservative fold since Mr Charles Halleck, a sharp-toothed nipper of legs, was made the party's sheepdog in 1958. The support of Mr Rayburn was even more helpful. He forced the Rules Committee, the highly conservative group through which all legislation has to pass on its way to the floor and where many liberal measures get stuck, to release the Bill for debate. If the committee had not done so, Mr Rayburn was prepared to reach into his bag of parliamentary tools for the rarely used device known as "Calendar Wednesday" which would have wrested the Bill from them against their will. Its proponents were encouraged further when a couple of proposed changes, either of which would have made it more difficult to rally a majority at the end of the debate, were ruled out of order.

At this point, however, the northern Democrats in Congress fell into an old trap of their own making. Mr Adam Clayton Powell, the Negro Representative from Harlem, sponsored an amendment requiring that funds be withheld from districts in the South which have defied court orders to end racial segregation in their schools. It had been hoped that Mr Powell, who moved a similar amendment to a similar Bill in 1956 and got the Bill defeated as a result, would not bring the matter up again this year. But he did; in an election year a hundred Democrats felt obliged to demonstrate their sympathy for the Negroes by supporting the amendment; and it was carried with the aid of Mr Halleck and a majority of the Republicans. Having thus ensured that the southerners would vote solidly against the Bill, these conservative Republicans, who dislike the whole idea of aid for schools, promptly turned round and voted against it themselves. Without the 44 rebel Republicans who stood fast, this stratagem would have proved fatal to the Bill as instantly as it did four years ago.

But the Bill's death may have been merely delayed. Mr Powell's amendment makes it impossible for the House's version to be accepted by the Senate, where it would undoubtedly invite a southern filibuster. Any attempt at a compromise, on the other hand, will expose the Bill to the whims of the Rules Committee twice more, once in order to get the matter to a conference between the two Houses and once to get it back again. Moreover, President Eisenhower will almost certainly veto a compromise if it provides money for paying teachers' salaries as well as building schools (as the Senate's version does) or if it fails (as the House's version does) to help the poor states more than the rich. It is also possible that the Roman Catholics, by renewing their attempt to get funds for church schools as well as tax-supported ones, will drive a number of Protestants over into the opposition. Faced with these complexities, a member of Congress is tempted to drop his rule book and reach for his prayer book.

In any case, the measure over which the House has been labouring so painfully is only a partial solution, in quantitative terms, to a problem which is largely one of quality. The Bill would provide $325 million a year for four years—enough, when it is added to the funds which the states and local authorities are required to contribute, to build a total of 65,000 classrooms. This is almost exactly half of the present deficit, according to the tally made by the authorities in Washington. If the ordinary building programme continues at its recent rate, the other half of the deficit can be made good by 1965 (when the problem will grow easier because fewer children are expected to be entering the schools). If the deficit has been exaggerated, as some people believe, because local educators are tempted to tell Washington that they are worse off than they really are, the United States would be free of overcrowded and antiquated classrooms sooner.

But the Bill passed by the House does nothing about the other two-thirds of the problem. It provides no money for raising teachers' salaries, although the teachers themselves claim that bad pay is largely to blame for the fact that there will be 135,000 too few of them—roughly a tenth of the total requirement—when the new school year begins next autumn. Even if the country is willing to jog along, as it has in the past, with a number of partly trained teachers, there will not be enough fully qualified recruits to replace those who quit their blackboards because of old age, marriage or the lure of better pay elsewhere.

Nor does Congress make even the faintest pretence of trying to remedy the most obvious weakness of American education: this is the failure to teach enough academic subjects and to demand high enough standards of work. It is, admittedly, up to the forty-thousand independent school districts in the country to decide how they will run their schools, and the Constitution forbids the federal government to intervene directly. But the law passed in 1958, under which 100,000 college students are getting loans to help

them to study sciences and foreign languages, shows that the federal authorities can help to raise standards in an indirect and modest fashion. It is hard to believe that the fear of "federal domination," to which even the progressives genuflect politely, justifies doing nothing at all for pupils below the college level.

It was thus a small and tattered banner which the liberals carried from the field last week. Nevertheless, it added to the evidence that their fighting spirit has revived since last year. Then Mr Eisenhower inflicted a series of defeats on the Democrats in Congress in which the party's leaders acquiesced too humbly. This year the liberals have forced Mr Howard Smith, the patriarch from Virginia who presides over the Rules Committee with a face which grows longer every time he sees a proposal for spending money, to release three major Bills from the clutch of his committee. Mr Halleck, the Republican leader, no longer seems able to hold his forces so rigidly to the conservative line. The credit is due largely to the band of liberals in the House of Representatives who organised themselves as the Democratic Study Group at the end of last year's session. They have been able to apply pressure to the conservative chairmen of committees in the House; better still, by reminding Mr Rayburn of the almost forgotten tingle of liberal blood in his veins, they have brought him to their aid.

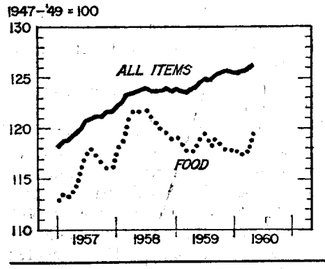
So far this year Congress has passed a measure to help the depressed areas despite the threat of Mr Eisenhower (which he subsequently carried out) to veto it. It has done something, though only time will tell if it is enough, to help the Negroes in the South to win their right to vote. It will almost certainly produce a Bill to insure old people against the costs of sickness, and it will probably raise the minimum wage and provide funds for building more houses. Mr Eisenhower may well veto some of these measures and his decision is usually final because on most issues Congress cannot muster the two-thirds majority needed to override a veto. But the point is that last year, in the name of compromise, Congress rewrote many Bills to give Mr Eisenhower most of what he wanted. This year it shows greater zest for writing the legislation it thinks proper and letting him take the responsibility for rejecting it.

Truth and Consequences

With the questioning of Mr Allen Dulles, the head of the Central Intelligence Agency, under the most elaborate security precautions, and of Mr Dryden, the deputy administrator of the National Aeronautics and Space Administration, the innocent cover for the spy flight of the U2, the inquiry of the Senate Foreign Relations Committee neared its discreet end; it is scheduled to finish this week. The CIA has, in effect, been dismissed from the case, as having no responsibility for important decisions of national policy. But the other witnesses whom the committee has heard—Mr Herter, the Secretary of State, his deputy, Mr Dillon, and Mr Bohlen, the department's Russian expert—failed to convince Mr Fulbright, its chairman, that there was not a deplorable lack of co-ordination in the handling of the incident. He still believes, moreover, that it was a crucial mistake for the President to assume responsibility for the spy flights. This has been criticised widely on the ground that it is unprecedented for the head of a modern state to admit espionage (a point with which Mr Herter had to agree) and on the ground that the admission forced or enabled Mr Khrushchev to take a tough line at Paris.

In his testimony Mr Herter adduced some evidence that the Russians had determined to withdraw their invitation to the President to visit Moscow even before Mr Eisenhower took the blame for the flights on his own shoulders. Mr Herter also said that the government had not neglected a cover story in case one of these flights went wrong. Unfortunately the events refused to fit the cover; when it was realised that the Russians had captured not only the U2 but its pilot, making a clean breast seemed to be the only alternative to involving the United States in a series of falsehoods which would convince neither other countries nor the American people themselves.

The timing of the flight now seems to be a lesser issue, although Mr Herter was forced, under rigorous questioning, to concede that there had never been a specific decision, as far as he knew, not to suspend such flights before the summit. The arrival of the long hours of daylight over the Soviet Union, the importance of the information to be secured, and the fact that flights had apparently been suspended during Mr Khrushchev's visit to the United States, coupled with the invulnerability of the U2 in the past, all combined to induce a certain complacency about the risk; in any case neither Mr Herter nor Mr Dillon—nor, probably the President—knew about this specific flight until it was too late. All of this evidence goes some way, however, to support the views of a number of experts on foreign affairs that one man—preferably the Secretary of State—ought to be given over-riding responsibility for all foreign relations, including military activities overseas, and that he ought to be relieved of the need to attend most foreign conferences. The unlucky Mr Herter was in Turkey when the U2 crisis blew up.



Back in the Black

Government officials are now certain that on June 30th, when the fiscal year ends, the federal Budget will show a surplus of at least $200 million, probably more. This was what the President predicted last January, but in recent weeks revenues have not quite come up to expectations, because the effect of the steel strike last year on corporate profits was greater than had been realised. Now, however, it seems that expenditures have also been less than was expected, partly because foreign sales of surplus cotton have been so good, partly because interest rates have receded and have lightened the cost of carrying the public debt.

The good news that the budget is now approximately in balance and the expectation of a larger surplus next year does not mean, however, that the "temporary" taxes voted during the Korean War (and renewed every year since then) can be dispensed with. Last week the House Ways and Means Committee gave the Administration exactly what it had asked for. The committee set a new temporary limit of $293 billion—$2 billion less than the present temporary ceiling—on the public debt to take care of the seasonal increase in the first part of every fiscal year when tax revenues are low; the so-called permanent limit—which represents the triumph of hope over experience—is $285 billion. The committee also stood fast against any reductions in excise taxes or in the 52 per cent rate of tax on corporate profits; the whole House is expected to approve the Bill this week. There may be more protest in the Senate, which is particularly anxious to end the 10 per cent federal tax on local telephone calls and to cut in half the 10 per cent tax on passenger fares.

Not to extend all these rates of tax would cost the government $2.7 billion in fiscal 1961, which begins on July 1st. Yet the surplus in the next twelve months, with which President Eisenhower wants to start to reduce the public debt, was put at only $4.2 billion last January. Today there are many doubts about whether it will be that big. For one thing, Congress shows no sign of giving the President the more than $700 million in higher postal rates and fuel taxes on which he counted. It shows every sign, on the other hand, of approving higher pay for civil servants and of exceeding the President's Budget in other respects. Spending Bills can be vetoed, though political prudence in an election year sets limits to this. What the President cannot do is to raise the gross national product which determines the size of federal revenues. Last January the gross national product for 1960 was estimated at $510 billion, compared with $480 billion in 1959. But the economy is not displaying all the vigour which was hoped for; no doubt Democrats who believe in "spending for growth" regard this as a judgment on the President's financial conservatism.

CONSUMER PRICES

The American cost of living rose to yet another record height in April, as the result of the sharpest increase in food prices for over two years. However, the cost of nearly all other goods and services also went up a little, except for used cars; prices of these were driven down by competition from compact models.

Show Business—No Business

NEW YORK

On Wednesday evening the cast of "The Tenth Man," Mr Paddy Chayevsky's successful play which is now showing in New York, turned its back on the stage door and attended instead a meeting of its trade union—the Actors' Equity Association. A three year contract between actors and the League of New York Theatres (representing Broadway's owners, managers and promoters) expired at midnight on Tuesday and in the absence of a new agreement Actors' Equity has fired the first salvo in its announced plan to "harass" different shows on different nights by forcing individual performances to be cancelled. There seems to be every prospect that the League will carry out its counter threat: to close down the twenty-two plays running on Broadway if a single show is harassed in this way. The League has now said it will, in addition, file a suit for $1 million in damages against the actors for indulging in an unfair labour practice. Equity is trying to raise the minimum weekly wage from $103.50 to $120 and to improve working conditions, but the real issue is its claim for a pension plan. It points out that both the American Federation of Television and Radio Artists and the Screen Actors Guild have already won pension and welfare provisions. A pension scheme would offer much needed help for the majority of actors, who have been squeezed badly between the increased minimum wages for the chorus on the one hand and the colossal salaries now claimed by the stars on the other.

The League's argument is that to bring a show to Broadway is already an expensive luxury. Producing costs have been inflated enormously because of restrictive trade union practices which require, for example, shadow musicians to sit idly in the wings; because the stars can pretty well dictate their own terms; and because much of the public's expenditure on theatre-going finds its way into the black market for tickets and not to the box office. It is true that a few productions bring fabulous returns to their backers, but the vast majority earn virtually no profit, while a considerable number represent good money down the drain. The League is reluctant to make any concessions which will increase costs, but it is the pension scheme that rouses its real opposition. It is convinced that any concession given to actors over pensions will have to be extended to the eight other unions with which it deals. It claims that pensions all around would add 25 per cent to ticket prices, which are already too high.

This is a dispute which no one wanted. Actors are the most reluctant of strikers (they work on the average only six weeks in the year) and producers with hit plays running can hardly bear the thought of an empty house. Both sides see a painless solution in the repeal of the city's 5 per cent tax on tickets. The city, which is trying to end the dispute, has offered to consider this question, but its own financial position is so difficult that there is no great hope that it will agree to waive this source of income. The current Broadway season has not been notable either artistically or financially and the dispute in which it is ending reflects a fraying of tempers which is regretted throughout the theatre business.

All Up for All-Cargo?

FROM A SPECIAL CORRESPONDENT

If it is true that a starving man can eat anything, the airlines which carry cargo exclusively should have no trouble in digesting the diet of cold shoulder offered to them in recent months by various government officials. Ten years ago the Civil Aeronautics Board granted temporary certificates to six of these airlines and the future looked promising for them. But instead of the "box cars (goods wagons) in the sky" which were promised, businessmen have had to put up with converted passenger aircraft and high charges. This combination of disadvantages has held up the transport of goods by air.

A year ago the few emaciated airlines which are still trying to make a living out of carrying nothing but cargo applied to the CAB for help. But instead of granting them a subsidy or even the right to ask for a subsidy, the CAB responded brusquely that the time had come to find out whether the all-cargo airlines should be allowed to stay in business at all. Since then they have had to spend a good part of their remaining resources on legal costs in a hollow effort to prove that they are actually in good financial health and that their prospects are bright.

Looking elsewhere for help, the cargo airlines tried Congress. What they sought—at least until they got on their feet financially—was legislation to enable them to obtain modern, turbine-powered aircraft specially designed to carry freight. A fleet of these would give the all-cargo lines a chance to survive the recent and growing onslaught of the big "combination" carriers of passenger and freight which are converting their unsaleable piston aircraft to all-cargo service. The sympathetic chairman of the Senate aviation subcommittee, Mr Monroney, introduced a Bill authorising the CAB to guarantee the repayment of private loans made for the purpose of buying cargo aircraft. But the Bill is still locked up in committee.

The opposition, which includes one or two Senators on the subcommittee itself as well as the officials of the large dual-purpose carriers, argues that survival of the fittest is the rule of the skies and that the all-cargo airlines should not be kept alive by government aid when anything they can do can be done better by the combination carriers with their new fleet of converted Constellations and DC-7s. Moreover, opponents of the Bill were quick to point out that no aircraft now flying would be eligible for assistance under it. Friendly witnesses explained in vain that, in aviation, manufacturers who make a habit of building new models before they are certain of a market soon go out of business. Only the Flying Tiger Line has been able to borrow money for new equipment, and it benefited, because it has bought Canadian machines, from the loan guarantees of the Canadian government.

Twice rebuffed, the cargo airlines then fell back on the Department of Defence which is the world's largest shipper of cargo by air. If more of this business were to be sent by commercial airlines instead of aboard the Air Force's own training aircraft,

it might make the difference between profit and loss, survival and oblivion, according to the cargo airlines. Back came the answer from the Air Force planners: more cargo will be shipped by commercial carrier in the future, but the principal beneficiaries will be the overseas airlines, particularly Pan American, Trans World Airlines and the single all-cargo airline which has a certificate to fly the Atlantic, Seaboard and Western. There is a chance that some of this defence business will find its way to the domestic cargo airlines, though not for some time. Meanwhile, they might be awarded contracts for special charters—but only if they can equip themselves with some modern turboprop cargo aircraft.

Now a further blow has been dealt the four all-cargo airlines which still survive: AAXICO, Slick, Flying Tiger, and Riddle. The CAB's Bureau of Air Operations has recommended to the examiner who is conducting the investigation of the cargo lines that they should not be made eligible to receive a subsidy. The big airlines, which carry cargo as well as passengers, received $830 million in federal subsidies to help them get started and still have the right to ask for more. Furthermore, the bureau proposed that only three of the four all-cargo carriers should be allowed to continue operating on regular schedules, possibly because the fourth—AAXICO—suspended scheduled flights when its losses began to mount.

In its recommendations to the examiner, the Bureau of Air Operations suggested that the all-cargo carriers should be allowed to serve military customers if this did not take them too far off their regular routes. But this would be a small bone and no mere bones will save these carriers. They will have to be granted a nourishing federal subsidy if they are to survive. Before this can be done the CAB will have to convince Congress that the public interest requires continued all-cargo service. So far this has not been done.

Duluth as a Seaport

FROM A CORRESPONDENT IN MINNESOTA

For the first time last summer deep-draught vessels were able to travel through the improved channels of the St Lawrence Seaway right into Lake Superior, bringing an exotic taste of foreign lands into the iron mines and grain fields of mid-America—into the Twin Ports of Duluth, Minnesota, and Superior, Wisconsin, 1,500 miles from the Atlantic. The taste was an exciting one but not substantial enough to satisfy commercial appetites in the upper midwest. In their first season of deep water trade Duluth and Superior exported 86 million bushels of grain—double the anticipated total—to Canadian and foreign ports, but dealt with only 17,000 tons (all of it coming across the Atlantic) of general cargo, the profitable packaged goods which bring in larger handling fees; 50,000 tons had been expected.

Last year 235 ocean-going vessels, flying the flags of 17 countries, entered the Twin Ports but only two called there regularly. They were Poseidon Line's *TransErie* and *TransMichigan* from Hamburg. This year only the latter is to call, but Manchester Lines has promised to put a pair of ships into service to Duluth from Great Britain and a Greek company is more or less committed to sending two ships a month to Duluth. In 1959 22 foreign freighters brought 11,681 tons of steel, ferrosilicon, machinery, wood pulp, glass, coffee, twine, liquor, beer, rugs, automobiles and oatmeal to customers in the upper midwest. The vessels left with 4,700 tons of bentonite, clay, machinery, dried milk, flour, honey and tinplate, destined mainly for northern Europe. This was a far cry indeed from the 750,000 tons of goods which businessmen send abroad during the seaway's eight-month season from the eleven states served by the Twin Ports; the larger part of this moves through ports on the Atlantic and the Gulf of Mexico or on Lake Michigan.

Promoters at the western end of the seaway spent the winter trying to stimulate exports and imports through Duluth. While the lake ports were closed by ice commercial representatives travelled far and wide selling the advantages of Duluth-Superior to shippers and shipowners tempting them with the lower charges at the ports on Lake Superior. The principal problem was, and is, the old one of which comes first—the chicken (ships) or the egg (cargo)? Exporters and importers in the upper middle western states are willing to use the port if they can be assured of fast, efficient service. Shipowners, on the other hand, will call frequently only when they know that freight is waiting for them. The extra five days which it takes from ports on Lake Michigan to Duluth and back costs the average owner about $18,000.

Duluth has at least succeeded in eliminating the differential in costs of loading and unloading railway wagons which favoured ports on Lake Michigan. Railways serving the Twin Ports have also raised from two to seven days the "free time" for which goods wagons may stand at the dock without charge to the shipper. Several discriminatory barriers remain, however, among them the refusal of the Maritime Board to include Duluth-Superior as a port of call for American shipping lines which are subsidised by the federal government. And since the seaway reopened in April the picture has remained disappointing in spite of last winter's efforts, with few foreign vessels coming in and practically no export cargoes waiting for them to take away.

More than $3 million has been spent recently to improve berthing areas and equipment for storing and loading grain at Duluth. This year a tank farm is to be built at the port for storing soyabean and linseed oils, lard, tallow and grease, and an effort is being made to get oil and grain carriers, which now sail empty into Duluth, to bring in packaged freight. The port now claims to have the finest general cargo facilities in the country, but some observers feel that the possibilities of this type of trade have been exaggerated. With grain shipments of 125 to 150 million bushels predicted for this year, it looks as if the port's future may lie with the grain trade. This will be encouraged when all the Great Lakes channels are deepened, as they will be by 1962, to take ships with a draught of 27 feet; with the present draught of only 21 feet, foreign vessels cannot take on full loads to Duluth. With the deeper channels all but 15 per cent of the world's cargo ships should be able to reach the Twin Ports, although this is not expected to bring much increase in general cargo trade.

LARGEST MAKERS OF V-BELT DRIVES IN THE COMMONWEALTH

Oregon's Gadfly Bitten

FROM A CORRESPONDENT IN PORTLAND

Most of the accounts in the newspapers of the primary election in Oregon last month—at which voters had a chance to show which presidential candidates they would like their parties to choose—concluded that Senator Morse was hurt badly by his overwhelming defeat, in his own state, at the hands of another Democrat, Senator Kennedy from far-off Massachusetts. Senator Morse's defeats in two other primaries, in Washington DC, and Maryland, were not unexpected, but his personal standing has been so high in Oregon that in 1952 he was able to walk out of the Republican party and into the Democratic ranks without faltering in his political stride.

Senator Morse himself attached great importance to making a good showing against the other Democratic presidential candidates who, whether or not they wanted to stand, were placed on the ballot in Oregon. He upbraided the leading Democrats in the state for not rallying to him as the state's "favourite son" and said vainglorously in his final speech of the campaign:

> The issue is the future of the Democratic party in Oregon for some years to come. If I am undercut, undermined and repudiated in Friday's election, Wayne Morse won't be the only Democrat to go down.

Senator Morse had predicted that he would win 60 per cent of the Democratic votes. In the event, he won only half that many, while Senator Kennedy won a majority of the votes cast for all the Democratic presidential candidates, including Senators Johnson, Humphrey and Symington. No one took Senator Morse's presidential pretensions seriously. But in the north-west it is believed that his political future will be damaged, if it is damaged, not only by his defeat last month, but by his own conduct. If he continues to revile anyone who disagrees with him on the most trifling issues, even loyal Democrats in Oregon may rebel.

In his campaign Senator Morse abused not only Senator Kennedy, but also other leaders of the party, such as Mrs Green, Portland's member in the House of Representatives, who managed Senator Kennedy's campaign in the state. Senator Morse has yet to say a kind word for Mrs Neuberger, who won the Democratic nomination to the Senate seat of her husband who, when he died early this year, was still the object of Senator Morse's relentless enmity. Even so, Senator Morse can count on winning the Democratic nomination again, if he wants, when his term in the Senate expires in 1962. And his record of liberal crusades, often single-handed ones, would make him a formidable opponent for any Republican challenger, particularly as registrations for the primary show that professed Democrats in the state outnumber professed Republicans by about 50,000 in an electorate which numbers about a million voters. The strongest man whom the Republicans could put up would be Mr Hatfield, the popular young Governor. He has just announced that he means to run for re-election in 1962 instead of seeking Senator Morse's seat in Washington, but there is still time for him to change his mind.

Aid On and Off

On the day on which President Eisenhower urged Americans to help the Chilean people in their ordeal by earthquake—the American Army and Air Force were already on the spot with relief services—he also cut off economic aid to Cuba under the mutual security programme. In both moves he had the support of the average American, horrified at the Chilean catastrophe and apprehensive that an even worse disaster might be coming if Cuba were left unchecked with the country being destroyed, not by nature, but by communism.

In ordering that foreign aid for Cuba should end within six months the President was complying with instructions in this year's mutual security authorisation which barred further aid to Cuba unless he determined that it was in the interest of the United States to continue it. Only two programmes were affected, both under the technical assistance scheme, one for advising a farm experimental station, the other for giving training in civil aviation procedures; they employed only nine Americans in all and cost under $200,000 a year. Both were due to end soon unless renegotiated, as was the only programme of military aid, for training a few air force cadets. Congress had made it clear that it wanted assistance for Cuba to stop and if this desire had been ignored a penalty might have been exacted in the form of reductions in the appropriations, still to be voted, for the whole foreign aid programme. Nor was President Eisenhower encouraged to override the Legislature's obvious disapproval of Cuban policy by the official Cuban press's recent castigation of him, after the breakdown at the summit, as a warmonger.

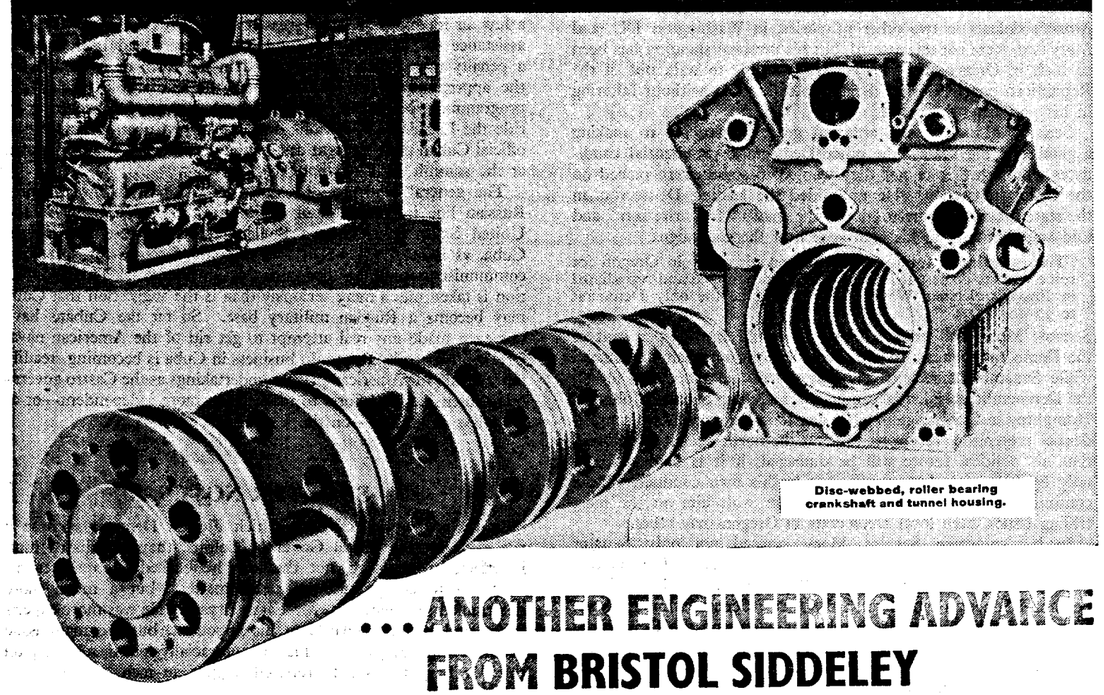
The general tendency of Cuban comment to follow the pro-Russian line in international affairs gives rise to a belief in the United States that, when a Soviet embassy is re-established in Cuba, as it soon will be, it may become a centre for spreading communist propaganda throughout Latin America. This supposition is taken much more seriously than is the suggestion that Cuba may become a Russian military base. So far the Cubans have not even made any real attempt to get rid of the American naval base on their soil. But to do business in Cuba is becoming steadily more trying for American private undertakings as the Castro government intensifies its efforts to make Cuba more independent—or at least less dependent—on the United States.

SHORTER NOTES

In the primary election in which Florida Democrats chose a successor for the liberal Governor Collins, they repudiated him, in effect, by choosing, not the man he backed, who shares his readiness to compromise on racial matters, but a much more determined segregationist, Mr Farris Bryant. He was more experienced and better known than his opponent, but the main issue of the campaign was the question of racially-mixed schools; on this Mr Bryant was not prepared to give an inch.

* * *

Congress has passed a Bill which is expected to slow down the current trend towards an increasing number of bank mergers. The Bill strengthens the powers of the federal banking authorities over such consolidations; in particular they are now required, when deciding whether to approve a merger, to consider how it would affect the competitive positions of rival banks.



* * *

In 1959 the United States paid out $5 billion to other countries in the form of military and economic aid, $500 million less than the year before. Accelerated repayments of credits, mainly by Britain, Germany and France, brought in $1 billion and reduced net outlays to $4 billion, the lowest since the end of the last war.

* * *

In southern California the newest craze for teen-agers—and their elders—is bouncing at a trampoline centre where springy nylon mats are spread over shallow pits. Such centres, christened Jumpsville, Jumping Gyminy or Tumbletown, now number about 175 and are multiplying rapidly. They cost from $7,000 to $10,000 to install, in addition to the price of the land. The operators, who charge 40 cents for half an hour and usually have queues of patrons, hope that bouncing has come to stay and are treating it as a serious form of physical education, which gives scope for real skill.

Maybach industrial diesel engines—from 300 to 1,800 hp—can achieve 16,000 hours between major overhauls...

...ANOTHER ENGINEERING ADVANCE FROM BRISTOL SIDDELEY

Bristol Siddeley Engines Limited produce Maybach* diesel engines. Covering a power range from 300 to 1,800 hp, Maybach diesels are amazingly reliable and have shown that they can achieve major overhaul lives of between 12,000 and 16,000 hours.

The *proven* basic design features of the whole range (straight 4 to 16-cylinder V) are the same, and each unit can be turbo-charged, or turbo-charged and intercooled. The range operates between 1,200 and 1,600 rpm and *combines the best performance and design qualities of high, medium and low-speed diesel engines:* light weight and compactness, excellent thermal efficiency and extremely long life.

Advanced design features

The pistons are pressure-oil cooled. This gives very efficient heat dissipation and reduces liner and gas ring wear to a minimum. The roller bearing, disc-webbed crankshaft is exceptionally rigid within its tunnel housing, and in practice withdrawal is not normally necessary before 12,000 hours running. So low is big end bearing wear that in some cases the protective lead flash has been found intact when examined after 15,000 hours running!

Since the cylinder bore and stroke, and the majority of components, are identical in all models, spares stocks are considerably reduced. And during servicing semi-skilled labour can be used because great thought has been given to easy accessibility and removal of components.

World-wide application

Bristol Siddeley Maybach diesel engines are designed for a wide variety of industrial applications, from stationary and mobile light and power generator sets to oil-drilling rigs and pumping stations. Maybach diesel engines are in service all over the world and have built up an unrivalled record for reliable and economic operation.

For further information please write to: Maybach Sales Manager, Bristol Siddeley Engines Limited, PO Box 17, Coventry, England.

THE WORLD OVERSEAS

The Turkish Takeover

FROM OUR CORRESPONDENT IN ANKARA

THE Turks managed their revolution last week bloodlessly ; no slaughterings, no street mobs, no summary hangings from the nearest lamp-post. The deposed leaders were put in decent quarters in the War College ; President Bayar got a room with a bath. As to casualties, the army last week was mourning its one lost officer, Lieutenant Kalmaz. The curfew in Ankara was lifted four days after the coup and the street scene a week later is almost abnormal in its normality.

The ease of the coup was astonishing. The Menderes regime was repressive and in parts corrupt. In recent weeks it had fouled its reputation by firing on and killing unarmed university students. Journalists were in prison and newspapers suppressed. Yet, so far as one knew, Mr Menderes was still a hero for a large part of the population, especially in the countryside. It was he who had opened the mosques that Kemal Ataturk shut. He was the semi-mystical figure saved by Allah in the Gatwick air crash. Yet nobody lifted a finger to save him. When retribution fell on Mr Menderes last Friday there was hardly a whisper in his defence.

The army had the guns, of course, and that was that. In the remotest parts of Turkey, at least according to the military authorities, the coup was over in three hours. By Saturday evening sixty out of seventy *valis* (provincial governors) had signified their approval of the army's action. The whole government was in the bag. An army spokesman announced on Wednesday that about 400 deputies, virtually the entire Democrat representation in Parliament, were under arrest. There was no resistance, let alone an attempt at counter-revolution.

No reason exists for supposing that the army is not united. Agreement was obtained before the coup, it seems, from the commanders of the first, second and third armies in Istanbul, Konya and Erzurum. Most of the middle and lower rank officers had been against the regime. The firing on the students had sickened the cadets, who played a big part in the army take-over. As for the vast conscript force of nearly half a million men, it obeyed orders, although many soldiers must come from peasant families that venerate Mr Menderes.

This is not a right-wing coup leading to a stuffy military dictatorship. General Gursel is not General Franco. He is not even a Kassim or an Ayub Khan. He represents an important side of the Turkish army—its liberal ideas. In Turkey the élite is two-fold—the intellectuals, and the army. In this operation the two have joined forces. The very first act of General Gursel was to get hold of seven eminent Turkish university professors and sit them down in a room to draft a constitution. His second act was to form a government in which 15 out of 18 members were civilian experts and intellectuals.

The army is now apparently determined to dictate a new start to Turkish democracy. There is no reason to think that General Gursel's promises of free elections are not perfectly sincere. The question is whether a democratic regime can be so easily restored. The former Democrat party, with all its chief personalities arrested, its newspaper out of business, its headquarters and organisation in ruins, is merely political débris. Who will rebuild it? Who will dare to vote for it? Might not General Gursel as well hand over power to Mr Inönü and have done with it?

The Turkish leaders, who have not failed to ask themselves such questions as these, realise that their first task must be to create a new opposition party to oppose the Republican People's party, which will clearly win the forthcoming election. Who will lead the new opposition? There is a terrifying lack of leaders in Turkey. Ataturk is dead. Menderes, who was also a leader, is in prison ; he may even be executed. The army at present stands between the former rulers of Turkey and the revenge of their political enemies. While military rule lasts this revenge may be kept in check. Who knows what will happen when the People's party comes to power?

The Menderes regime had deviated, not only from democracy, but from the main principles of Kemal Ataturk's revolution. Ataturk tried to take the Turks away from Asia and Islam and introduce them to the secular state and intellectual enlightenment. Mr Menderes reversed Ataturk's policy and went back to the traditions of the east, buying votes with promises to build mosques. It was all too dangerous, and what the army did was probably essential. But the blunt surgery has laid the parliamentary system in ruins.

A fundamental difficulty in Turkey is that the two-party system makes almost unavoidable a polarisation of forces between those who are for, and those who are against, Ataturk's revolution. Mr Menderes's Democrat party, while paying lip service to Ataturk, actually turned its back on him. As long as the Republican People's party stands for western civilisation and Ataturk's drive to get Turkey into Europe, any opposition party that is not a mere dummy will tend to attract to it the forces of reaction—Islam, despotism, and the values of the east. There must therefore be a tendency in Turkey, until Ataturk's principles are completely applied, for a reversion to a single-party system. Is this what is now happening?

There is reason to hope that it is not. The Turks, in their genuine passion for everything European, are as keen on parliamentary democracy as they are on the top hat. When even the generals want to make a go of it, there is reason to believe that everybody will make a go of it. Much depends on the wisdom of the present leaders ; most important of these is Turkey's most eminent and experienced man, Mr Ismet Inönü. Perhaps his finest immediate service to the cause of Turkish democracy would be to check the forces of political revenge.

Mr Amery's Hundred Days

FROM OUR CORRESPONDENT IN NICOSIA

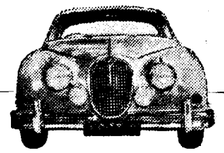
A STATISTICIAN in Cyprus has just pointed out that Mr Julian Amery has now been here a hundred days ; but a Cyprus settlement seems as far off as ever. Just when the elusive agreement on these bases seemed in sight, the marathon negotiations came to a

halt in the most grotesque stalemate: not about one of the original subjects in dispute, which have nearly all been settled, but over the hypothetical question of "cession," that is, what happens to the bases if Britain ever vacates them. Not merely deadlock, which is normal for the Cypriots, but a political *rigor mortis* has set in. Unless the negotiations are resumed very swiftly—and that means in a matter of days—and decisions quickly follow, it will not be possible to get the Cyprus independence bill through Parliament before the winter, and in effect another six months of transitional rule under British sovereignty will be necessary. Nobody knows what political convulsions might be sparked off in the interval.

It is probably hard for the empirical Englishman to understand the intensity of the doctrinaire Greek's feeling over the issue of "cession." Archbishop Makarios's obstinacy derives from an obsession with a principle which, in his contention, is both politically valid and morally just: that if and when the British Government ever decides that the bases are no longer required for military purposes, then they should automatically be ceded to the Cyprus republic. His attitude is reinforced by the Greek Cypriots' present xenophobia, which is perhaps an understandable by-product of their tortuous history as a subject nation. In the recesses of the archbishop's mind is always the fear that Britain might cede or lease the bases to Nato or the Cento powers, which creates a fanciful mental picture of Turks, or Italians, or even Pakistanis or Persians, digging themselves in on his treasured Cypriot soil. Because it is a question of principle, and not of degree or extent (as the actual delimitation of the bases was) the archbishop, significantly supported on this question by the Greek government, is adamant that there can be no compromise: the British must yield.

BRITISH reaction to this twelfth-hour stand appears to have been governed largely by legal rather than political considerations, and in particular by an acute solicitude for the concept of British sovereignty. This, the experts say, would be infringed if Britain should go all the way to meet Archbishop Makarios's demands. Behind the scenes experts have strenuously sought some magic formula that would resolve the deadlock without loss of face; so far, in vain. The nearest approach to a feasible formula would seem to be an express provision that Britain would never dispose of the bases without the approval of the Cyprus republic. But, according to British legal interpretation of the Zurich and London agreements, it would also be necessary to give the same power of veto to the other signatories, that is, to the Greek and Turkish governments. It follows that if Athens and Ankara could be induced to forgo voluntarily their veto power, in order to vest it solely in the government of the Cyprus republic, then a formula approaching the archbishop's conditions would be attained. This would require a speedy and long-sighted decision on a delicate issue by the new Turkish regime; and, of course, the archbishop's acceptance.

It is only fair to point out that many observers outside the archbishop's own camp feel sympathy with the Greek Cypriot position. The British themselves all agree that by far the most likely eventuality, if Britain should ever move out, would be that the territory would pass to the republic. What has lost the archbishop sympathy, and created the impression that it is his obstinacy alone that has caused the deadlock, is his tactics. His theatrical refusal to attend further meetings unless there is a complete British capitulation, his boycotting of the work of the transitional government, his public attacks on British "intransigence"—many of the old tricks and tantrums that did so much to spoil the Greek Cypriot cause between 1954 and 1958 have been brought into play. Naturally, these tactics have tended to harden the British attitude.



Set against the legal complexity of "cession," the rest of the island's affairs are cruelly clear. The economic slump continues, and between 10 and 12 per cent of wage earners are reported to be out of work. Nearly every Greek in the island believes that this economic crisis has been fostered, if not actually engineered, by the British, in order to exert leverage on Archbishop Makarios to accept their proposals on the bases. The more British officials and spokesmen strive to rebut the charge, the more the suspicion deepens. An announcement of new works in the bases with contracts totalling about £2 million in the next four months has done nothing to dispel the bitterness and distrust of the unions—both right and left wing—who this week gave warning of a more "militant" policy. In this agitation the communist-controlled Left is steadily gaining ground.

EQUALLY disturbing is the steady deterioration in the relations between the communities over the past two months. The remarkable phase at the start of the year, when Greeks and Turks stood shoulder to shoulder in opposition to Britain's "inordinate" demands, seems to belong to another era. With every day's delay, the Turks increasingly suspect the archbishop of some deep-seated, Machiavellian design to secure better terms for himself at their expense, and even of plotting in some ludicrously circuitous fashion to bring about enosis. Distrust between the two communities is probably worse now than at any time since the Zurich agreement was signed. Though overshadowed by the bases dispute, a local controversy over the filling of government jobs (the agreement laid down that the Turks should have 30 per cent of these, and the firebrand Mr Denktash is demanding that this provision should be implemented at once) threatens to bring them into head-on collision. How a civil service riddled with communal jealousies will function is another question.

Most serious of all is the way in which the opposition's campaign to scrap the whole Zurich settlement is gaining momentum. At best, it is an alarming trend; at worst, it could be the writing on the wall. As the political deadlock drags on, many Greek Cypriots seem to be going through an almost visible brainwashing process. Lukewarm acceptance of the agreements gives way to sulky resignation; then comes a mood of despair; then a phase of defiance—and the next thing is that the intelligent man who a year ago was pro-Zurich is proclaiming that "the whole business is such a muddle that the only thing to do is scrap the agreements and start again." To thousands of Cypriots in this peculiar psychological confusion, the recent appeal of the Democratic Union party to repudiate the agreements and hold a plebiscite instead has probably acted as a dangerous catalyst; although the party is numerically still very weak.

Ironically, the only relief to this sombre picture has come from the man who superficially seems the cause of all the trouble. The archbishop's firm pledge that he stands by the agreements and will never repudiate them has to some degree rallied his supporters and rebuffed the irresponsible. There are many who seek to impugn his sincerity, in the light of his current tactics, but on this score most observers who know him well still give him the benefit of the doubt. Had there been even the faintest hint of deviation from the agreements in his important statement last Saturday (which went almost unrecorded by the world's press) the effect in the island would have been cataclysmic. On the question when the agreements are to be implemented, however, he displays an oriental disregard which could have fatal results.

With time running out fast, the British Government may have to face another agonising reappraisal of the Cyprus situation, which may even resolve itself into a choice between safeguarding the bases or safeguarding the agreements. The unexpected twists and trends of the past month have shown that while there is a hypothetical danger to the one, there is a menacingly real danger to the other.

Dependable as a Swedish Safety Match

"Clean, efficient, reliable—Swedish safety matches were a boon to mankind when their export began more than a century ago. Today the world takes the dependability of Swedish safety matches for granted.
Swedish business machines have also won world-wide confidence because of their day-in, day-out dependability. That's why you'll find them in offices wherever you travel. Facit of Sweden, one of the world's leading manufacturers of business machines, offers truly international sales and service.
If you want to know more about FACIT and the outstandingly successful Swedish business machine industry, your local FACIT agent will gladly send you a free copy of our brochure 'Why are so many world-known business machines built by Swedes?'—or you may write directly to Atvidabergs Industrier, Stockholm 7, Sweden."

The French Version

FROM OUR PARIS CORRESPONDENT

AFTER Mr Khrushchev's vituperations, none of the western leaders spoke in clear Shakespearean tones, echoing the Queen's anguished cry to Hamlet:

> What have I done, that thou dar'st wag thy tongue
> In noise so rude against me?

And though *Hamlet* was put on in Paris last weekend by the Youth Theatre, nobody expected General de Gaulle—the last of the main actors to give his version of the calamitous summit meeting—to strike a note of remorse or self-criticism. Indeed, of all the participants, the general probably had least reason to feel dissatisfied with what happened.

General de Gaulle's initial distaste for summitry was scarcely secret. It was only in October that France accepted the idea of a summit conference at all, and even then the general's terms ruled out the possibility of holding the conference until after his personal encounter with Mr Khrushchev in March. This meeting duly took place, without any apparent discord; but General de Gaulle was reported to have warned Mr Khrushchev not to expect any western concessions over Berlin. He repeated his thesis—that Berlin was not a good subject for the summit agenda—in public in both Ottawa and Washington, during his American tour.

A meeting of heads of government that would have gone beyond the innocuous lip-service to "peaceful co-existence" and tried to tackle concrete issues involved evident risks for French diplomacy. Any bargaining about Berlin would have placed a strain on the Franco-German alliance, which still seems to be a major plank of gaullist foreign policy. An agreement to ban nuclear tests, on the other hand, would have set France at odds with its Anglo-Saxon partners. The summit fiasco now means that allied unity is not likely to be put to the test, at least for some time to come. The failure of the conference to take place may have aroused some pique in the host's breast, but it had its compensations. If the enthusiastic reports of Mr Alsop and other American correspondents are to be believed, General de Gaulle was the rock of western firmness that saved President Eisenhower from being led into concessions by the British predilection for compromise. Such devotion to the western cause may now be thought to deserve a reward. There are rumours that French claims for a seat in a western directorate, and for American atomic secrets, will get a better response in Washington than they have had.

Mr Alsop's medal of Atlantic valour and virtue has its obverse: it is not to Mr Khrushchev's liking. Accordingly, General de Gaulle has now heard unaccustomed comments from Moscow. For once, it is Mr Khrushchev who has fallen into step with *L'Humanité*, which was always ill at ease with the Russian wooing of the general. Speaking in Moscow on May 28th, Mr Khrushchev tried to explain the adverse vote in the Security Council by the natural solidarity of the "colonial lobby." After a reference to the Suez expedition, he went on to describe the bankruptcy of French imperialism in Indo-China. "And now," he added, "they have waged a war in Algeria for five years against a people that fights with courage for its freedom. In this colonial war France has the backing of the United States." This is a far cry from the Khrushchev who courted the gaullist Marianne with sweet talk about self-determination. The new line sounds in tune with Peking and may prove significant.

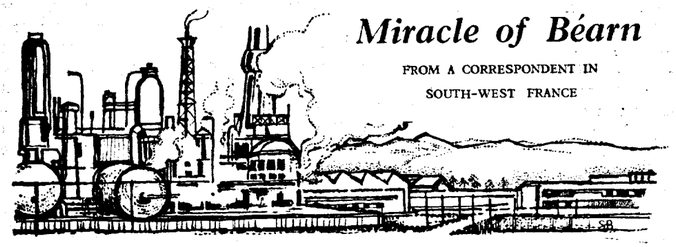
General de Gaulle was aware of this American sympathy and Soviet resentment when he summed up the situation for the French public in a televised broadcast on Tuesday evening. He looked solemn, though relaxed, and tried to keep his address on a high level of generalities. The climb to the summit was, in his opinion, justified because a new voice had been heard from Russia talking of co-existence and peaceful competition. Admittedly, Mr Khrushchev's threat of a separate treaty with Germany was in contradiction with this new spirit, but he was apparently willing not to act upon it. On the causes of the actual collapse of the conference the general would not be drawn beyond the brief comment that the U2 flight, however untimely, was merely a pretext for the Russian behaviour in Paris.

What next? France might still envisage another meeting, if it were properly prepared. But diplomatic channels and not impetuous public speeches or the forum of the United Nations were the best means of preparing the ground. In the meantime, proof had been given of western solidarity, of agreement among the western big three, whatever their shades of temperament and opinion. The alliance would be stronger, and not weaker, if France were allowed to play a more independent part. Short of nuclear disarmament, which should start with the control of missiles, France would have to go on developing its atomic armoury. Finally, as a counterpoise to the greater autonomy of members, there should be a "closer concert" of politics and strategy among those western powers that have world-wide interests.

The rest of General de Gaulle's speech was taken up with a profession of his personal version of the European faith. Behind the Atlantic shield, the old nations of western Europe, looking back nostalgically on the past, can only recover their greatness through unity. The common market is a step in that direction, though arrangements will have to be made not to inflict damage on outsiders. Europe is being built through an "organised co-operation of states," which may, in the (apparently) distant future, pave the way for a confederation. Throughout this passage it was not very clear whether General de Gaulle thought of Britain as included in, or excluded from, the western European structure. Listening to the final peroration, with its argument that the balance of the old continent can only be redressed by creating a western part equal to the Soviet one, one had the impression of a continental calculation from which Britain was left out.

General de Gaulle's vision has not been altered by the mishap in the (on his part reluctant) summit climb. He may have stressed more than usual that France "is an integral part of the Atlantic alliance." He still wants France to play first fiddle in the Atlantic concert and thinks that it should have its own atomic instruments to perform on. Finally, he still seems to consider the leadership of a continental coalition as the best means to achieve his end. This was the first speech in a series. The next one will deal with Algeria, the obvious stumbling block on his chosen path to national greatness.

South Africa's Jubilee



FROM OUR CORRESPONDENT IN SOUTH AFRICA

THE Union of South Africa's 50th birthday celebrations this week could hardly have taken place in less auspicious circumstances. Although the country is quiet, it is in the third month of a state of emergency under which the rule of law is abrogated. Close on 1,900 men and women of all races are in detention; no charges have been laid against them. Political organisations have been banned, newspapers closed down and the air is filled with threats against those that remain free but refuse to be bludgeoned into silence.

The white population is divided as never before, with the non-Nationalists, both Afrikaans-speaking and English-speaking, sullen, frustrated and often cowed into silence. The gulf between the whites and non-whites has seldom been greater. The country's political and economic standing in the outside world is lower than it has been for thirty years; its foreign exchange reserves have dropped by over £33 million in two months. What is more, over-

seas financiers with large interests in the Union have recently emphasised that South Africa cannot hope to attract foreign capital on reasonable terms until it has developed a policy of racial co-existence acceptable to the outside world.

But the prime minister, back in harness after the attempt on his life early in April, has made it plain that while he is prepared to make adjustments to the policy of apartheid, he will not depart from his party's chosen path of "separate development." He will accept some modification of the liquor laws, an easing of the application of the detested pass laws, and the creation of "authorities" through which urbanised Africans can exercise some form of elementary self-supervision where they live. But he will not hear of political rights for Africans in the legislature, or of trade union organisations, although he does favour higher wage scales.

Miracle of Béarn

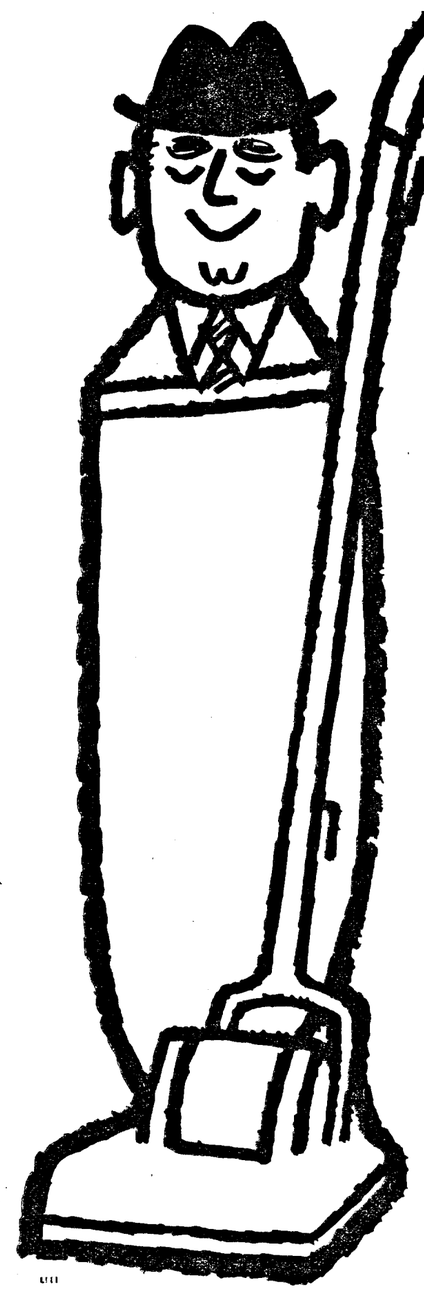
FROM A CORRESPONDENT IN SOUTH-WEST FRANCE

THERE will be some interesting driver-navigator wrangles along Route Nationale 117 between Pau and Biarritz this summer, and quite a few pledges never to touch the stuff again. Especially at night; and more especially when the belligerents think they know Béarn. Fifteen miles west of Pau the first Martians appear, towering luminously over the gentle countryside. Then, just beyond the village of Lacq, one sees their base-camp: a vast bright host of spheres and cylinders and space-age paraphernalia where, according to the *Guide Bleu* and the roadmaps, there ought only to be cows and cornfields. Two or three miles to the south, the twelve-storey towers of a bustling city unmentioned by guides and roadmaps rear up out of nothing.

The explanation is, of course, that Béarn, like its neighbour Bigorre, is a land of miracles. But even miracles have to be earned. When, eight years ago, the Société Nationale des Pétroles d'Aquitaine (53 per cent state-owned) discovered at Lacq one of the world's major deposits of natural gas (280 milliard cubic metres) it had to do rather more than merely sink a shaft and lay a few gas-mains. The gas was deeper (around 4,000 metres), hotter (140 degrees Centigrade) and at a higher pressure (670 kilogrammes per square centimetre) than any other known deposit, and so rich in hydrogen sulphide that it corroded conventional steel tubing within a few hours. Before it could be tamed, special steel alloys had to be developed and elaborate desulphuration plant installed; and before output could be stabilised the storage problem had to be overcome—by piping the purified gas into a hermetically sealed stratum of sand and porous rock (capacity 500 million cubic metres, equal to 2,000 conventional gas-holders) 500 metres below ground level at Lussagnet, 35 miles north-west of Lacq.

Production of the purified gas (98 per cent methane, of twice the calorific value of coal gas) is being limited to four milliard cubic metres a year, so as to ensure for the deposit, which also yields 130,000 tons of butane and propane and 260,000 tons of gasoline annually, a minimum life of thirty years.* A third of the gas is allotted to the production of electricity, 45 per cent to industry, and 22 per cent to domestic consumers. A thousand miles of 24-inch pipeline connect Lacq with Toulouse, Bordeaux, Nantes, Paris, Besançon and Lyons; and this network may be extended in the near future to carry Saharan gas as well and to link up with the gas-grids of the other common market countries. But in order to encourage industrial decentralisation, 40 per cent of Lacq's output is reserved for the south-west. Electricité de France, the nationalised electricity authority, is building a 500,000-kW gas-fired power station at Lacq and another at Bordeaux. Two miles south-east of Lacq, Péchiney have built the world's most highly automated aluminium plant (output: 50,000 tons a year) and five other big companies are building plant for the production of ammonia, acetylene, methanol, plastics and fertilisers. At Lannemezan, to the east, Ugine are stepping up their output of aluminium by 23,000 tons a year. The port of Bayonne is expanding rapidly in order to cope with the exports of its new industrial hinterland.

Almost incidentally, the SNPA has found itself the world's biggest manufacturer of sulphur. As from next December, its desulphuration plant will produce 1,400,000 tons a year—enough to satisfy the needs of all Western Europe. British chemical firms, attracted by the purity, cheapness and low shipping costs of Lacq sulphur, are importing about 100,000 tons this year.



In less than three years, at a cost of £10 million, a new town of 3,000 flats and bungalows has been built on a pleasant wooded site—Mourenx-la-Neuve—three miles south of Lacq. Its layout and architecture are conformist, pre-Mumford and a little cramped, but to workers recruited in the suburbs of Paris and Toulouse it will probably seem like paradise. Two-thirds of its families own their own cars, and the town has already sprouted an American-style used-car lot. Mourenx-la-Neuve will be completed next year with the building of a lycée and a twenty-storey hotel, with a top-floor restaurant looking out on the Pyrenees.

None of this development has made the region less attractive to tourists. There are no dark satanic mills. The colours of this industrial revolution are white, yellow and silver-grey, and the SNPA's installations, impressive by day, are beautiful at night. Sociologists and inhabitants of subtopia will adore Mourenx-la-Neuve. For those whose faith in French good sense has been dented by the Fifth Republic's domestic propagandists, the trip is salutary. Indeed, the propagandists themselves ought to visit Béarn this summer: a look at Lacq might cure some of their complexes.

DISTRIBUTION OF NATURAL GAS IN FRANCE, 1960

* Also in south-west France, Saint-Marcet (exploited by the nationalised Régie Autonome des Pétroles) yields 350 million cubic metres of natural gas a year, and Parentis (Standard Oil) just over 1,300,000 tons of petroleum a year.

HEADS OF FIRMS IN VACUUM CLEANERS SHOULD GET IN TOUCH WITH LORIVAL

(THEY'RE **LIVELY** LADS AT **LORIVAL**)

It's a fact – they're lively lads at Lorival! They're the picked men of the plastics world. Let them help you in production planning, scheduling, lowering production costs and boosting production. You'll get first-class work from Lorival – high finish, true colours, precise accuracy of all repetition parts. So call in Lorival and their lively lads. It's good business for you!

A matter for the MONOPOLIES COMMISSION?

In the Board of Trade Annual Report concerning the Monopolies Commission, it is noted that the suggestion has been made that the distribution of petrol and lubricating oil for motor vehicles should be the subject of an enquiry by the Commission.
If this suggestion were to be adopted it would be for the Commission to determine whether monopolistic or restrictive conditions prevail and whether these practices were against public interest.
What are the circumstances governing the distribution of lubricating oil to motorists in the United Kingdom? The facts are in the column on the right.

* * *

Until such time as these restrictions are discontinued motorists should protect their interests by ordering their favourite brand of motor oil by name.

* * *

Issued by the MOTOR ACCESSORIES MANUFACTURERS ASSOCIATION LIMITED whose principal object is:—"*To promote, by exchange of information and by concerted action, the unrestricted sale and display of accessories, tyres, batteries, oils and other products distributed by Members of the Association to the motor and allied trades*".
94 GLOUCESTER PLACE, LONDON, W.1.

i) In the U.K. the distribution of petroleum products is mainly in the hands of a few large international companies.

ii) To obtain supplies of fuel, unless a serious financial sacrifice is made, a garage proprietor is normally required to enter into a five to twenty year purchasing agreement with a petrol company. Over 90% of all petrol outlets have entered into such agreements.

iii) In their agreements some of the petrol companies, including one of the largest, lay down conditions covering the sale of lubricating oil. Competitive makes of lubricant may not be advertised or displayed on the garage forecourt and must not be dispensed in the service bay.

iv) This means that at the stations "tied" to these petrol companies, the sale of the products of the independent lubricating oil manufacturers is subject to unreasonable restriction.

v) The lubricants marketed by the independent specialist manufacturers are by far the most popular with motorists. Hence, any deliberate curtailment of the sale of these oils restricts freedom of choice.

In reply to the representations of organised commerce and industry, including the mines, urging him to modify his race policy drastically so as to restore confidence in the outside world and racial peace at home, Dr Verwoerd's newspaper mouthpiece has replied that a nation has more important things to worry about than economic prosperity; survival comes first and economics second.

Any hopes there might have been of a new deal in race relations after the "end of a chapter" speech by Mr Sauer, the senior cabinet minister while the prime minister was laid low, have been dashed. Before the Union jubilee Dr Verwoerd, it is true, made a concession to reality by recognising the existence of an urban African population. But that is where his Nationalist opponents begin to argue. However, although the pressures from businessmen inside his party may be strong, there is not the slightest prospect of a crack in the Nationalist front and no hope of any political realignment unless—as some economists believe—there is an economic crisis by the end of the year.

From the African people there comes no news. The proscribed African National and Pan-African congresses have gone underground; their leaders are in jail or detention or in exile and their rank and file frightened into submission. The Indian National Congress, which has not been banned, called for a day of prayer and mourning on May 31st, but it went largely unobserved. Not even the five-day fast of Mrs Manilal Gandhi, daughter-in-law of Mahatma Gandhi, attracted much attention, although she was supported by Mrs Luthuli, wife of the detained African National Congress leader, and the author and Liberal leader, Alan Paton. It has been left to the relatives of detainees to keep before the largely apathetic public the plight of those who have incurred the government's displeasure.

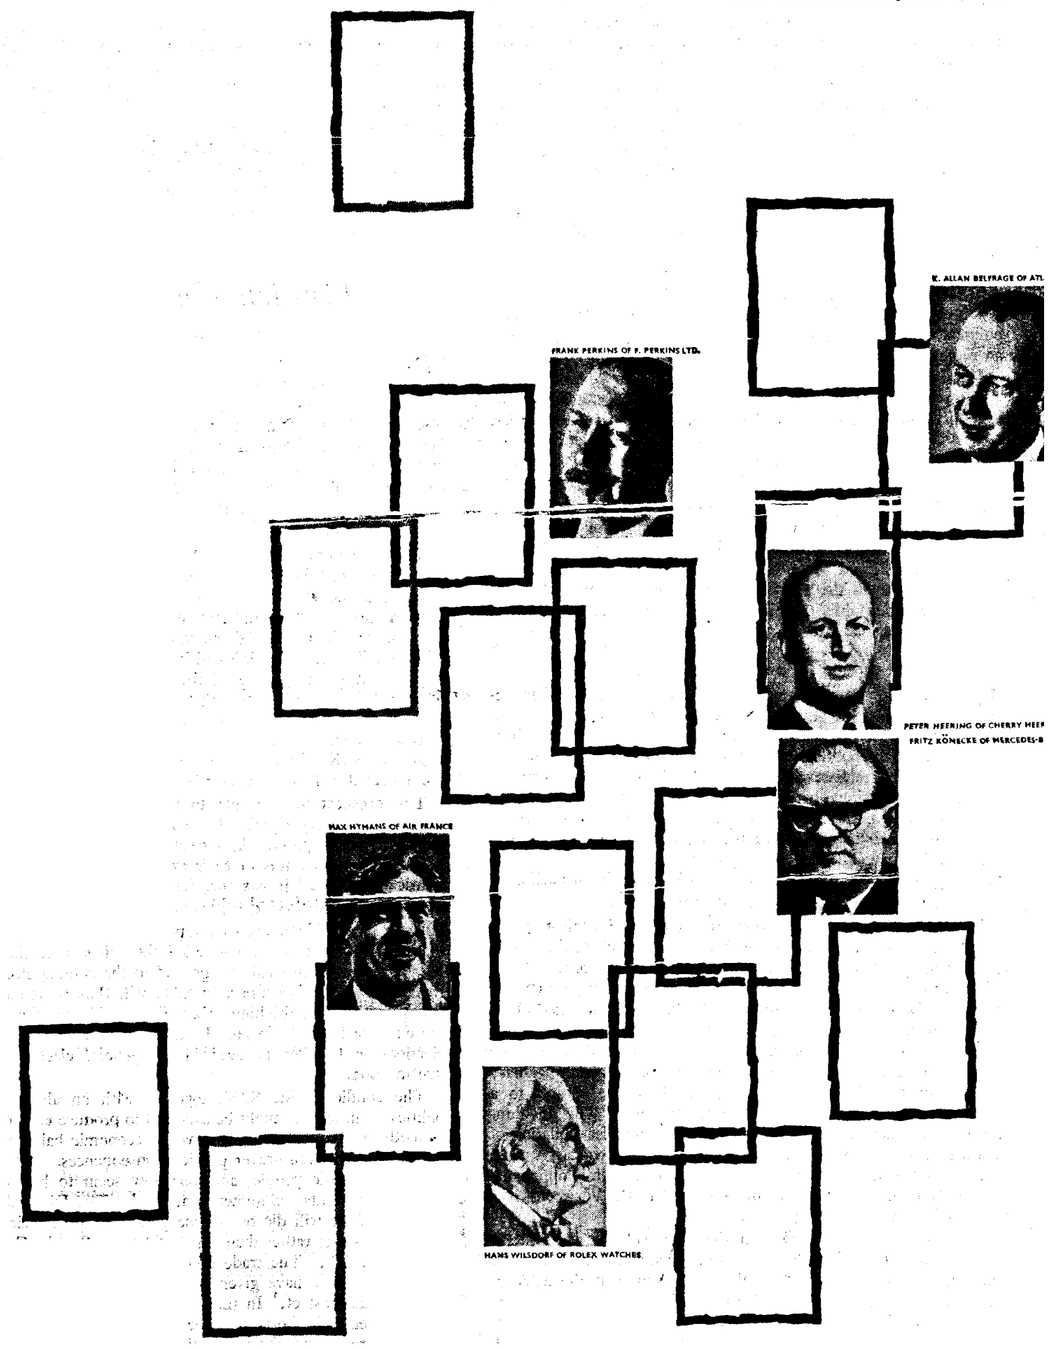
For the time being, at any rate, the non-white political movement has had the stuffing knocked out of it. But the government will not lift the state of emergency because, it is said, it is afraid of what the political refugees and those further afield may be planning. The minister of justice, Mr Erasmus, who virtually ran the country single-handed while Dr Verwoerd was incapacitated, is clearly more bothered about what his political opponents beyond his reach may be doing than by any underground movement at home. Therefore, in spite of pressure from financial interests, the emergency is not likely to be lifted at least until after Freedom Day, June 26th.

This, then, is the sombre political background against which the Golden Jubilee celebrations took place this week in the capital of the once-model Orange Free State republic, Bloemfontein. And whatever chance the festivities had of being truly national instead of primarily sectional were ended with the prime minister's last-minute decision to make his first public appearance since his attempted assassination on the concluding day and to use the occasion for a party political dissertation on the real and imaginary benefits of republicanism—an issue shortly to be subject to a nation-wide referendum among the whites only. This involuntarily turned the occasion into an orgy of Nationalist adulation of a leader who had (in a paraphrase of his own broadcast words) been spared by God with a purpose. Even his erstwhile opponents in the Nationalist party are now saying that Dr Verwoerd is a figure of destiny.

However heavy the entries on the debit side of the Union's balance-sheet, there is also an imposing credit entry. Materially the Union has cause for tremendous satisfaction at the achievements of the last fifty years. The national income has risen from £130 million in 1910 to £1,800 million today, which represents a fivefold increase in real terms. Manufacturing industry, which in 1911-12 contributed 7 per cent to the national income, today contributes over a quarter. Gold production has more than doubled since 1910. Direct government expenditure is in real terms more than eight times as large as it was fifty years ago.

Clearly South Africa's biggest problem will be to maintain the momentum of the economic revolution—a tremendous problem against the background of political instability. Already during the past two years there has been a slowing down in the rate of growth of the economy as a whole, and the future will obviously remain uncertain until the country's race problem is on the way to solution. That is the measure of the challenge facing this sorely-riven country as it embarks on the second fifty years of its existence as a political entity.

Finnish Unions Split



FROM A CORRESPONDENT IN HELSINKI

The conflict inside the Finnish labour movement has now led to the resignation of Mr Reino Heinonen, president of the trade unions' central organisation, SAK. Mr Heinonen was elected fifteen months ago at a time when a neutral leader was needed to hold the balance between the rival left-wing and social democratic groups. Mr Heinonen, who finally resigned in protest against communist influence, is expected to be succeeded by Mr Vihtori Rantanen, a man on the extreme left whose followers openly support the Communists against the Social Democrats.

The Communists and Mr Rantanen's wing joined to refuse membership of SAK to four social democratic organisations. The actual vote was 48 against 43, not an overwhelming majority but enough to set off a chain reaction in the already highly strained atmosphere. The social democratic members had threatened to withdraw if the extreme left had its way, and this process has now begun. At the beginning of the year SAK had some 251,000 members distributed among 32 union organisations. Two social democratic groups have already walked out—including the woodworkers' union, which, with its 17,000 members, was the fifth largest in SAK. Five other groups, with 55,000 members in all, are expected to follow within the next few weeks.

The prospect now is that Finland will have two rival trade union systems, one run by the extreme left and the other by the Social Democrat party. As a result the Communists will have an official union apparatus of their own which will strengthen their political position. It has therefore been argued that the social democratic federations should remain in SAK and carry on the struggle there. There are still, apparently, social democratic hopes that the dissident socialists—called Simonites after their leader, Mr Aarre Simonen—will lose ground in the coming elections and that Mr Rantanen's support in SAK will thus be reduced. But this seems wishful thinking: there is no evidence at present that the extreme left will, in fact, be defeated either in the municipal elections in October or even in the general elections that are due in 1962.

The conflict inside SAK, together with an already strained political atmosphere, might be expected to produce labour troubles, jeopardising Finland's highly sensitive economic balance and perhaps leading to even graver political consequences. But the Finns are a phlegmatic people, and very few seem to be worried by the turn of events. Summer is at hand. The Diet will adjourn and the debate will die out as the politicians turn their attention to green pastures rather than party postures. But the Communists will not be idle. The trade union conflict and the government's obvious weakness have given them an advantage that they mean to make the most of. In the past the Finnish Communists have concentrated their efforts upon the working class, but now they have promised to extend their activities among other groups as well. Once again the Finns' knack of surviving every crisis will be put to the test.

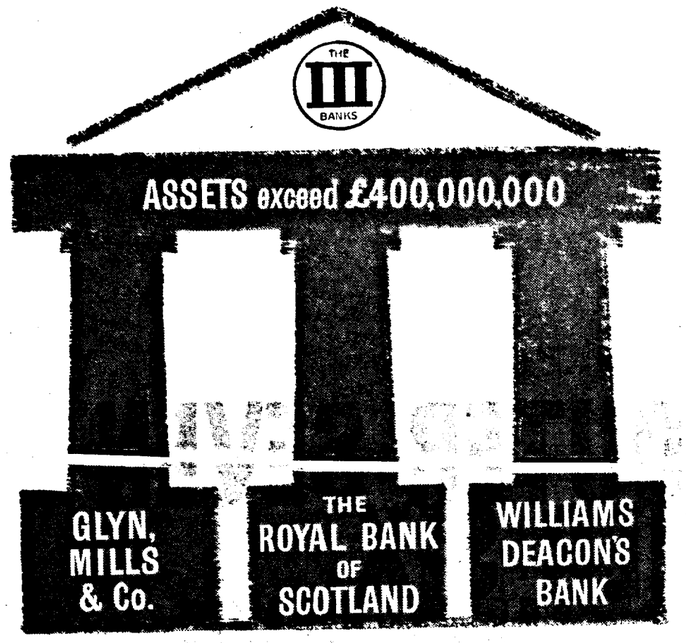
NEW MARKETS—NEW OPPORTUNITIES—NEW COMPETITION

Wherever in the world companies like yours are located—in the U.K., on the Continent, or anywhere else around the globe—chances are you've never been faced with so many new marketing situations, so many new opportunities for increasing your export sales. At the same time, you've probably never had to compete so hard for business.

How are you to meet these new challenges to gaining and retaining business on an international scale?

Nearly 800 companies from more than 30 different countries are finding that one proven way is through investment in advertising—*international advertising*—in TIME, The Weekly Newsmagazine.



During the past two and a half years many of these companies and the men behind them have been featured in TIME's own advertisements in *The Economist*. Some of them, from different O.E.E.C. countries, appear on this abstract map of Europe. Whatever their company or country—TIME is their common denominator, their way of communicating with best customers and prospects the world over.

If you would like to know who advertises in TIME (your competition, perhaps?) and why—or if you'd just like some information on how TIME can help *you*, please ask—

TIME, THE WEEKLY NEWSMAGAZINE, NEW BOND ST., LONDON W.1.

AIX-LES-BAINS, BIARRITZ, BORDEAUX, CANNES, HAVRE, LYONS, MARSEILLES, MENTONE, NICE, AND ROUEN
MONTE CARLO: ALGIERS AND ORAN

Head Office:
54 Lombard Street, London, E.C.3

THE BUSINESS WORLD

Men and Coal

NOT many of the men whose names appear as members of the National Coal Board on the annual report for 1959, published this week, are likely to be there by the time the report for 1960 comes out next year. Sir James Bowman has indicated that he will retire when his term as chairman expires in January ; Sir Joseph Latham, who has worked himself to a point where, at 55, he can no longer carry on with so burdening a job as the deputy chairmanship, is retiring at the end of August to give a new deputy a few months to get run in before the chairman goes ; Mr. R. H. E. Thomas is retiring at the end of June. Of the part-time members, Mr S. P. Chambers and Sir Henry Wilson Smith have gone already. Two other members of the board are not well men. Effectively, therefore, 1960 may see even more of a clean sweep of the board than occurred in 1955 after the publication of the Fleck report. By the beginning of 1961 the core of top management in this huge, monolithic and depressed British industry will have to be in new hands.

So far the Minister of Power has announced no new appointments, though there are hints of one (and on the face of it a most extraordinary-sounding one) to replace Mr Thomas as marketing member. It is never easy to persuade men of the right calibre to accept these brutally responsible, exposed and inadequately-paid jobs at the top of nationalised industries, and the new financial checks which a naturally jealous House of Commons is now forcing upon their capital spending will make it no easier. And coal is, today, a special case. It would perhaps be fair to characterise the chairman's job as a shade more thankless than that of Sir Brian Robertson's at the Transport Commission ; and on the wear and tear of the work, it is sufficient to recall that, among the half-dozen men who in the fourteen years since nationalisation have carried the final responsibilities for British coal, two have worked themselves to death in the job and one has come close to breaking his health.

It is not for the outsider to tip favourites among the obvious " short list " of men of intelligence, experience and character who still, devotedly if surprisingly, soldier on in this constantly beleaguered industry. Not all of them, probably, would care for the concentration and isolation of responsibility right at the centre ; but there are a few, in the regions or at Hobart House, who are manifestly prepared and able to see the industry's problems whole. Being chairman in this industry requires above all strength of character and the ability to give good men confidence, with some saving detachment to stop him from becoming too emotionally involved in the industry's troubles ; it is only with this last quality, which might have eased his personal burdens, that his friends could have wished Sir James Bowman had been more amply endowed over the past few bitter years. To flank the chairman, the board needs both expertise and the widest-ranging intelligence ; and at this difficult time it cannot perhaps afford too many men on the board for whom the synoptic view of the industry from this central level will be a new exercise requiring time to be learned.

ANY such bunching of appointments as this year's throws into relief the particular responsibility of the Minister of Power ; appointments to the boards controlling or supervising four of Britain's most important industries constitute indeed one of the principal powers still reserved to this demoted ministry, which is no longer deemed worthy of cabinet rank. Mr Richard Wood will do well to consider the views that Lord Simon of Wythenshawe set down a few years ago upon this responsibility—indeed, specifically upon appointing the Coal Board—in one of the wisest and most detached notes ever penned upon the whole vexed question of nationalisation.* Lord Simon pointed to the contrast between the boards of good private enterprise in Britain, where executive directors are recruited almost wholly from within the firm and once appointed can be confident, barring misdemeanour, of continuing as directors until retiring age ; and boards such as the Coal Board, where full-time members are appointed for terms of five years or less, with no certainty of renewal and some chance of abrupt removal without compensation, and are quite often brought in from outside. He added :

> Whole-time executive members should be appointed from within the industry for their experience of management, for their efficiency, for their regard for the interests of the public, and as being likely to make part, as board members, of a friendly co-operative team. The minister should, in his selection, be advised by the chairman, the executive directors, and the part-time directors. It is hoped that he would in future increasingly accept their recommendations; in any case, he should never make an appointment without full consultation and without assuring himself that the appointment would be acceptable to all board members.

Not all these precepts are easy to follow when it is the main core of leadership that needs renewal. But the principles of promotion from within the industry—which has now had enough time, since the upheaval of nationalisation, to develop itself some outstanding youngish men—and of acceptability within its higher echelons are no less worth following now.

* " The Boards of Nationalised Industries." Longmans, 1957.

164808

It has to be recognised that lower down in the hierarchy of responsibility for coal—which, after years of being abused for not producing enough, now feels it is being contemptuously written off in most public comment as dead if only it would have the grace to lie down—this wholesale departure of so many top men almost simultaneously can easily depress morale still further. At the base of the pyramid, morale has an easily measured index: the industry showed a net loss of 47,000 men last year, practically all of them in the age groups under 50, and even apart from compulsory retirements it is expected to lose another 50,000 this year, bringing the colliery labour force below 600,000. To a degree this voluntary wastage is convenient in the short run (though the men who go are never the ones the board would most willingly lose); but in the medium run the labour force will soon fall below what would be needed for the output that the board hopes, and the Government purports to believe, that it may be able to sell in the middle sixties. This unhappy state of morale is another major reason why paper plans for the reorganisation of the board's structure probably ought not to be tried out just at the moment —though there are one or two ways in which the usual Conservative parrot-cries of "decentralisation" might actually be given some useful meaning in current operating policy.

The seemingly indifferent and almost cynical attitude which the Ministry of Power has held towards the Coal Board during its somewhat anguished throes of retrenchment over the past three years has not been altogether surprising—given the patterns of political rancour within which this nationalised industry remains hopelessly entangled. The ministerial policy of "freedom of choice of fuels for the British consumer" is, in large part, bogus; but it has to be realised that real freedom of choice, if all the protected interests could be made to stand for it, would still hurt the coal industry much more than any other supplier of fuel. This minister, however, now has what may well be his only real chance to make a positive contribution to the most important of Britain's fuel industries, by giving it a new top management that can inherit and enhance the industry's confidence. Some of his new appointments cannot in any case be delayed; and, since this industry is in no condition to stand the uncertainties of lame duck administration for the remainder of the year, he would also be wise to make his wider intentions regarding the succession clear soon.

Cheques for Trustee Savings Banks?

THIS year the Trustee Savings Banks are celebrating the one hundred and fiftieth anniversary of the founding of the first of their number by a Scottish country minister. At a celebration dinner in Aberdeen on Wednesday Mr Heathcoat Amory, Chancellor of the Exchequer, was guest of honour, and he paid proper tribute to the work of the trustee savings banks in the past. He announced two concessions to help the trustee savings banks collect more money; but he said nothing, in public, on a matter that many of the delegates at the conference feel to be of great concern for their future. The Treasury is sitting on a request to permit trustee savings banks to operate a limited cheque service. Assent to this proposal, the Treasury has pointed out, would require legislation and involve "quite formidable" administrative difficulties. It would also no doubt meet with opposition from the clearing banks and the Scottish banks, whose co-operation would surely be needed.

So procrastination in Whitehall is true to form. But it has caused much annoyance and frustration among the trustee savings banks, and one of the largest and most enterprising of them, the Glasgow Savings Bank, has been moved to direct action; it has introduced a "remittance request service" which falls half-way between the cheque and the direct transfer "giro" system, and is apparently possible under existing legislation. Not all people in the trustee savings bank movement feel that the time has yet come for this show of defiance; but the Treasury is under pressure to make up its mind.

The controversy and the anniversary bring to the public eye an institution, or rather a movement, which plays a larger part in the country's financial life than most people realise. In London and the home counties, only about one person in twenty has an account at a trustee savings bank. But in the north of England the ratio is about one in five and in Scotland it is two in five. The typical customer is the wage earner: an analysis made by the Manchester and Salford trustee savings bank in 1957 showed that getting on for one half of new accounts were opened by manual workers.

TRADITIONALLY, indeed, the savings banks were founded to encourage thrift among the "lower classes"; and this sense of social purpose remains an essential ingredient of their curious hybrid status today. The earliest trustee savings banks were founded separately, and even today each of the eighty-odd banks in different localities is an individual unit, under the direction of its own local trustees. But their activities quickly became controlled by statute. To a large extent, in fact, the banks were turned into agencies for government borrowing. Under the nineteenth century compact, deposits at the savings banks were guaranteed by the National Debt Commissioners, to whom trustees had to turn over all the funds in their "ordinary" departments.

The trustee savings banks faced a major challenge in 1861 with the establishment of the Post Office Savings Bank, which led many of the local savings banks, especially in London, to close. The rate of 2½ per cent paid to depositors by the Post Office immediately became an effective minimum for the trustee banks. The National Debt Commissioners pay the local banks a margin above this (which Mr Amory has now agreed to raise from the present 3 per cent) to provide for management expenses. When interest rates in general are relatively low, as they were between 1932 and 1951, this arrangement is an attractive one for the savings banks, and were it not for the limitation on the amount of each individual deposit both the Post Office and the Trustee

	Deposits in	
	Ordinary department	Special Investment department
November	(£ million)	
1945	489	115
1951	817	116
1955	827	226
1956	812	283
1957	823	317
1958	823	343
1959	859	381

savings banks would at such times have been inundated with money from investors in general, rather than the small man. As it was, deposits in the ordinary departments of Trustee savings banks from November, 1932 to November, 1951 rose from £80 million to £817 million.

When market interest rates are high, however, the fixed rate of the savings banks becomes unattractive: in November, 1959, deposits in the ordinary departments were little higher than eight years before, at £859 million. It was indeed an achievement to prevent deposits from falling (as they did in the Post Office). The Treasury gave a modest fillip in 1956 by exempting the first £15 of interest from tax; more important probably was vigorous expansion of trustee bank branches. In the first decade after the war these rose from about 800 to 1,320. This expansion was made possible by the mutual assistance scheme formed in 1948 by the Trustee Savings Banks Association, under which rich banks make available surplus income to subsidise young and growing banks while their new branches are built up to a self-supporting size.

This expansion has been justified by the activity of the trustee banks in the sphere in which they retain a measure of local independence: their special investment departments. Deposits in these departments, which may be made only by people already having at least £50 on deposit in the ordinary department, are invested at the discretion of the managers and trustees of the local banks, though the range of eligible investments is strictly limited and each investment requires the formal approval of the National Debt Office. Most of these investments are in corporation mortgages—on average about 70 per cent according to the evidence given at the Radcliffe enquiry—and the rest is in Treasury bills and gilt-edged securities, mostly short-term. The trustee banks are thus able to pay a more competitive rate of interest on these deposits; the rates vary at different banks, and have been between 3½ and 4½ per cent in recent years. Balances in the special investment departments rose from £116 million to £381 million between 1951 and 1959, after languishing in the years of cheap money (which favoured the ordinary departments). The trustee banks are relieved that the Government has rejected the recommendation of the Radcliffe committee that local authorities should again be given easy and cheap access to the Exchequer, since this would deprive the banks of their main independent and local investment. They will now be given a further stimulant through the raising of the limit on deposits in these departments from £2,000 to £3,000.

Introduction of a cheque service would represent a step in the other direction, away from savings bank business towards a current banking account. The number of people keeping such accounts is rising fairly fast, as the cheque habit is spreading down the social scale. Traditionally the trustee savings banks in England and Wales have not come much into direct competition with the commercial banks, though in Scotland they have. In the past two years, however, the commercial banks have been making new efforts to widen their clientele; and the trustee savings banks may feel that, unless they offer fuller banking services themselves, they may lose existing customers. The more forward-looking banks recognise that even as a repository for savings their attraction is limited. So the idea of a cheque service is in part defensive, as well as being a venture into new fields.

In some ways the trustee savings banks may be judged well fitted for an extension of this kind. While the commercial banks are seeking to entice wage earners to become customers, the trustee banks already have them. Their banking hours are flexible; on certain days they open in the evenings; and many trustee banks already operate salary credit schemes, under which firms make direct credits to accounts of salaried employees. But the fact is that even these schemes have proved unduly burdensome at times—and nearly always directly unprofitable. No charge is made to the employee on what is nominally a deposit account, while the trustee banks themselves have to pay the commercial banks through which the salary cheques from big companies are channelled.

If a cheque service to customers became general, trustee banks would obviously not continue to pay interest on the current accounts, and might make a small charge. But the difficulties with the commercial banks would remain (and might be expected to increase as the trustee banks became more competitive). The trustee banks would also soon begin to feel pressure on their staff and offices. There seems no justification for a Whitehall ban on the introduction of a new service by enterprising local trustee banks; but it may be premature to suppose that this would do more than supplement their prime function of providing a convenient repository for at least the first part of the family's savings.

Trading in Knowledge

BY A CORRESPONDENT

ARE the payments that a company receives for selling manufacturing know-how the proceeds of selling part of its capital assets or part of its current trading income? In the Chancery division last week Mr Justice Pennycuick held that sales of know-how by Rolls-Royce, amounting to some £15 million between 1948 and 1955, represented a disposition of part of the company's capital assets, and hence that payments for this knowledge should not be counted in computing revenue profits for tax purposes. He, therefore, dismissed an appeal by the Crown from the Special Commissioners, who had allowed appeals by Rolls-Royce against assessment for tax on these receipts. This ruling might be of considerable importance to other British companies at present negotiating to share their special manufacturing knowledge, so far as the terms of contracts are concerned; it would seem considerably to increase the advantage of lump sums for know-how as against royalties on products made under licence, since royalties or even payments for the sale of a patent rank as current taxable income.

Both kinds of trade in useful technical knowledge have been developing considerably since the war, particularly as "diversification" has become so much of a fashion for large aggregates of manufacturing capital. The desire to spread one's risk and one's managerial talent into different fields usually means acquiring knowledge of these fields from others already

operating there: quite often the method adopted is to take over a business in being, but an alternative, particularly when the ideas and experience are abroad, is to buy rights to this expertise. The phrase "manufacturing under licence" means precisely what it says—a permit to manufacture a certain item. The licensor may be an inventor, or a company; the licence may involve a single patent or a group of patents; but it need not necessarily involve patents at all. It may simply be a sale of know-how.

This is a process which has been helped by trade barriers and financial restrictions. In the days of acute dollar shortages when Britain could not import from the United States, American manufacturers were tempted to a variety of courses: to set up wholly-owned subsidiaries here and elsewhere in Europe using American patents and know-how; to establish joint ventures with the same end in view; or to grant manufacturing licences. Under this last arrangement an English firm makes the American product—usually proven already in the USA—with the blessing of the US licensor. In return the licensee usually pays a capital lump sum as an earnest of good faith together with some form of royalty, probably averaging 5 per cent, though in some spheres very much higher royalties are normal. The licensor often makes available his marketing as well as his manufacturing knowledge and experience: he may also loan specialists for a period of time, or even the initial equipment to get the product established on the licensee's production line.

THE basis of a licence is usually a patent which in itself is a monopoly, for a limited period, to exploit a brainchild (16 years in the UK from the date of filing of the complete specification). The patentee, within certain limitations, is entitled to control the production of his invention in those countries in which he has patent coverage. The idea behind the grant of a patent is not simply to protect the inventor and encourage him to go on inventing. It is primarily to have the invention known and used in the country granting the patent, so contributing to the expansion of that country's trade. Many countries, including the UK, build into their patent laws clauses that oblige patentees to give compulsory manufacturing licences if no real attempt to work the patent has been made. These provisions are rarely invoked, but they are a warning that a patent is granted for exploitation; wide patent coverage does not automatically mean wide protection.

In practice manufacturing licences often come about on a strictly *ad hoc* basis. A company may acquire a patent by purchase from an inventor, or develop its own in its research and development department. Its board may consider the idea valuable and approve application for wide patent coverage. Eventually the device goes into production in Britain where a market is built up. All the resources that the company can afford to put into it are spent on developing home sales; there is just not the energy or resources in manpower and money to exploit the device abroad where patent coverage has been granted. Equally, of course, no one in those countries can legally produce the device in question except by compulsory licences (where such provisions apply). But that escape route involves a substantial outlay of time and detective work to get the necessary information to state a case, and relatively few companies apply for these compulsory licences.

However, the president of an American company visiting this country may stumble on the device and decide it has a potential market in his own country; so he applies to the English company for permission to make and market it in the USA. He applies, in fact, for a manufacturing licence. If it is granted and proves successful, the English company may then begin to see the potentialities elsewhere in the world and actively seek out manufacturing licensees in various non-overlapping areas. But it is precisely here that Britain is falling behind the Continental powers, which are already themselves far behind North America in this form of international traffic. Britain is certainly a net exporter of royalties, when she could be a clear net importer.

By accepting a diminished market for its own exports of the goods concerned, the company may well be gaining an attractive, lucrative, and comparatively easy source of income in its place—though licensing is not as simple as it sounds either for the licensor or licensee. Someone once said that a patent is a licence to litigate. It may be equally true that an ill-conceived patent licence is a passport to international litigation.

IF all the snags are not foreseen before the drafting of a licensing contract, there can be trouble—lots of it. But, despite the need for care before the birth of an agreement, licensing is on the increase. In the USA, nearly 2,000 products and processes are patented each week; in Britain, the figure is something less than half that. Few ever see the light of the market place but, of those that do, more and more are seeing more and more market places. American-controlled business firms in the UK employ about 300,000 people, and represent an investment of more than five billion dollars. Many, if not most, of these American-controlled British companies are manufacturing US products under licences granted by the parent companies.

Lawrence Eckstrom, an American lawyer who specialises in international licensing, has said that American products manufactured abroad under licence represent two and a-half times the total value of US exports (over 17½ billion dollars). In 1957, American industry earned itself $238 million in royalties and similar payments from overseas subsidiaries and $140 from other overseas concerns. Of this $28.7 million was by licensing British manufacturers. In the same year, Britain took more in royalties from the United States than any other country—$7.4 million out of a total of $21.9 million. And these figures are probably but a tithe of what they are today, for during 1959, according to America's Bureau of Foreign Commerce, the numbers of business opportunities available including licensing proposals to US companies showed a 73 per cent increase over the 1958 figures. The Bank of England, which until last year had the responsibility for approving all licence proposals involving the export of sterling, cannot give comparable figures for Britain's balance of trade in technical knowledge.

How does a manufacturer set about getting a licence? There are many considerations. For instance, is he more interested in diversifying than consolidating his own interests? If so, the world is at his feet but he must appreciate the dangers of going into fields he knows nothing of. If he is simply seeking new developments in his own manufacturing fields the problems are less difficult. He probably knows his competitors abroad and can come to terms on a cross-licensing basis, in other words share development. More and more firms are integrating their interests in this way. The range of opportunities can be gleaned in a variety of ways: through the trade press, trade associations, a specialised journal already reviewed in these columns, through government departments, chambers of commerce, consultants of various kinds, patent brokers . . . there are many valuable sources. Probably the best ones are picked up by businessmen themselves on trips abroad.

Whether or not a surfeit of research engineers and scientists may ever appear, there is never a surfeit of good ideas or developments, commercial as well as technical. For a company with a wide range of products, research on all fronts is obviously uneconomic. As Mr. A. G. Clark, chairman of the Plessey group, said earlier this year, "First spread your products over a wide range of user industries. Secondly buy know-how and ideas from America or the continent, and avoid depending wholly on your own research." On the other side of the coin, research is an expensive form of pre-investment: the more return that can be squeezed out of it the better: and where a company cannot export directly, the granting of licences helps to pay for future research. The largest companies have been interchanging patents for decades, conscious of their inability to cover comprehensively the whole technological fields over which their interests may stray. Today that interest appears to be spreading further and further down the line: even the smallest firms can benefit from well-planned diversification coupled with sensible manufacturing under licence.

BUSINESS NOTES

CUNARD

The Price of Prestige

WHETHER Britain should retire from the world's foremost ocean liner service, upon which it has long enjoyed pre-eminence, because the company flying its flag there has been unable to accumulate enough out of earnings during a period of rapid inflation to replace its key vessels and does not believe it could raise the money to float new ones commercially, is not an economic question but not a frivolous one either. When the Chandos committee was set up last year it was not, in any case, given this question to answer; it was asked how best replacement could be carried out, and in what form the Government might most reasonably fulfil its election commitment to assist Cunard in replacing the Queens. The committee has, after all, plumped for a new ship to replace the *Queen Mary* of about the size and speed that the company had already in mind, and has turned down suggestions that a smaller ship be built with alternative economic speeds so that it might be transferred to other routes during the lean season on the north Atlantic.

The proposal is for a liner of 75,000 gross tons, with a service speed of 29½ knots, able to carry 2,270 passengers. The 30¼ ft. draught of the proposed new liner, against 39 ft. for the Queens, roughly the same amount of ship, is a sign of change in design in the last thirty years. But even with "open competitive tender to all appropriate shipyards" the committee reckons that the liner would cost between £25 million and £28 million to construct—Cunard reckons that the price would be more like £30 million. And the most that the company itself has available to invest in the *Queen Mary* replacement is £12 million.

The Chandos committee recommends that the remainder, not exceeding £18 million, should be provided by the Government as a 25-year loan bearing interest at 4½ per cent from the date the ship goes into service (and at 2½ per cent if certain borrowings are made during the period of construction), redeemable by a sinking fund of 4½ per cent per annum on the reducing balance. A separate subsidiary, or some equivalent arrangement, would under these proposals, be devised for the new ship; and if at any time "the gross yield on the Cunard investment exceeds an average of 7 per cent" (a phrase swathed in almost impenetrable qualification) the excess would go to accelerate redemption of the loan. But if from the sixth year of service onwards "the gross yield on Cunard's investment" should fall below 3 per cent in any calendar year, for every one half per cent below this the interest on the loan would be reduced by one half per cent for that calendar year.

Finding the Money

WHETHER or not Cunard could ever hope to raise private money again to finance great ships on this luxury service across the North Atlantic, it could never raise it on terms such as these. If one compares the fixed interest rate of 4½ per cent proposed with the variable rates appropriate to Government long-term borrowing—at present 5½ per cent—at which public money is to be advanced for Colvilles' steel strip mill, this loan might be said to offer gilt-edged terms plus an operating subsidy equivalent to one per cent on the loan over the life of the ship (and open to be increased if the return on Cunard's share of the cost were to fall below a certain point). "Gilt-edged" indeed, is perhaps an anachronistic adjective in this context, if one compares the terms at which it is suggested that Cunard should be offered this money with the terms at which a Treasury-guaranteed loan for a public authority in Northern Ireland, another sector of the economy in which Lord Chandos takes a benevolent interest, has been rejected in the London market this week. It should not be ignored that Cunard's contribution to the cost of this vessel would be further reduced by the selective subsidy which it, like other shipping companies, already enjoys—a 40 per cent investment allowance.

Since the Chandos report is not to be published, taxpayers are presumably not to be told how the survey of long-term trends likely to affect travel by sea came out, or given any other long-term estimates of Transatlantic movement by sea and air. By the time that replacement of the Queen Elizabeth becomes necessary, the Chandos committee does note that further knowledge of the effect of airline competition will be available. It has made no recommendations about the replacement of this second liner, though it assumes that when the time comes "H.M.G. would be prepared to assist in a manner appropriate in the circumstances." It also considered any recommendation about the use of nuclear propulsion, in the present case, would be premature.

This Conservative Government has begun lending more public money to private companies more quickly than its Labour opponents ever hoped to put into the private sector by allowing a national insurance fund to buy equities. This particular subvention seems likely to be a more popular one than some of the others; the public may not object to providing the money for what is a real, colourful, and already existing stake in national prestige. Logic might suggest that this latest public provision of more than half the money for an extremely costly private investment ought to be used to give the Government at least some stake in the equity or option to acquire one, on the lines of IFC loans. But the party's doctrinaires would hate this (as would the favoured companies). And one should perhaps not assume that an equity

would necessarily return the Government so much more over the period of the operation. There is a chilling omission, in the summary of the Chandos report that is printed in Hansard, of the least expression of confidence that a liner service across the North Atlantic can in the future continue to be a commercial success.

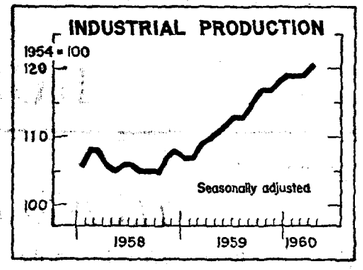
STERLING AND THE ECONOMY

New Curbs Ahead?

Unexciting official figures of the gold reserves and sterling balances, together with economic appraisals of the National Institute of Economic and Social Research and the London & Cambridge Economic Service, have ventilated the question whether, rather than when, further official measures of restraint are to be expected, and what form they will take. It may be assumed that the authorities would prefer to wait until the latest set of restrictions have worked through—and the small call to special deposits does not become payable in full until mid-June. Any action taken before midsummer would surely imply that the pressure was mounting faster than the Government expected at the end of April. But if the external account continues to look weak, there may be a strong case for action in, say, the first half of July to fob off any speculative pressures in the crisis-prone autumn. Particularly if the government has its eye mainly on sterling, there will be a strong case for taking any action in the form of a rise in Bank rate.

The central gold reserves, it was announced on Thursday, rose by £10 million, or $28 million, after the usual instalment of £5 million to the International Monetary Fund on the Suez drawing. This followed a gain of £18 million in April, but if anything was rather better than had been feared in the market for a month that included the summit upheaval and a withdrawal of funds by German banks. On Thursday the German central bank raised its Bank rate from 4 to 5 per cent. At the same time, in an attempt to discourage an inflow of foreign-owned funds, it decreed that no interest should be paid on foreign deposits, in respect of which German banks already have to make especially high non-interest bearing deposits at the Bundesbank. On Thursday afternoon, after the news of Germany's higher Bank rate and Britain's gold figures, sterling rallied a little to about $2.80, after having momentarily dipped below parity.

On Tick



The National Institute has hazarded the forecast that the reserves may perhaps rise by £50 million in the first half of the year and fall by £100 million in the second half. It expects the current surplus over the year as a whole to be much the same as in 1959, looking to an improvement in the second half of the year following the steep jump in imports and stockbuilding last winter; but last year's surplus, estimated at £145 million, was a good deal too small to finance Britain's capital commitments, which are rising rather than falling.

Moreover, there seems little chance this year of covering the net monetary deficit by a rise in sterling balances. Overseas sterling countries, which ran up their balances by £184 million in 1959, have already begun to draw them down: in the first quarter, when overseas sterling earnings are usually high, their London balances fell by £29 million, a rise of £27 million by the colonies being offset by a fall of £56 million by other sterling countries. Spending on imports by these countries is almost certain to rise in 1960 in the wake of last year's higher export earnings; but the fall in London balances in the first quarter may have been attributable rather to special influences, notably the outflow of capital from South Africa—which has reduced the Reserve Bank's sterling and external assets other than gold from £68 million in early January to £39 million (they are now around £30 million). Drawings on London funds may also have been made by Kuwait, where oil earnings may not have risen as much as had been anticipated. These drawings by sterling countries were almost exactly offset by a further rise, by £27 million to £822 million, in sterling balances of non-sterling countries, presumably in response to London's higher interest rates. Bank rate action ought to prevent a withdrawal of these balances in the autumn; but the longer term need is to reduce Britain's short-term liabilities, not to use them as the means of financing long term investment and government grants.

Output and Capacity

Impressions that industrial production had reached a plateau by the beginning of the year are not supported by the latest index figures of output, which suggest a rise to 120-121 (1954=100) in the early estimate for April, against 119 for March. The Treasury reckons that the average for the three months February-April will turn out to have been 2 per cent higher than in the previous three months, bringing the rise since the low point of autumn 1958 to nearly 15 per cent. At this level, industrial production in April would have been 10½ per cent higher than its previous peak in summer 1957. The index of manufacturing output (122, seasonally adjusted) for March was 11 per cent higher than its former peak at the same time in 1957. Production in the engineering and allied industries in March was 12 per cent higher than its former peak, as recently as March, 1958; and production of vehicles was only about 8 per cent above a peak as far back as March, 1956.

These comparisons, and industry's continued ability to push production up, do not suggest that capacity can yet be setting limits to output in many industries. In some that are complaining that demand is exceeding capacity, such as machine tools, the demand is inevitably concentrated somewhat spottily; as a whole the industry's deliveries do not appear to be back to the peak levels of 1957-58. Others which have talked of working to full capacity for months past, such as the motor industry, and which certainly have not yet brought in any major new facilities recently, are still constantly managing to turn out just that much more; motors still provide the main impetus of the current boom, though this month's very sharply moderated figures of car sales on

hire purchase (sales of new cars only about 12 per cent higher than a year ago, against the margins of 40-50 per cent recently recorded, and sales of second-hand cars nearly 16 per cent down) suggest that demand rather than capacity might eventually tend to moderate output. Next week we shall have another survey of industrialists' opinions from the Federation of British Industries; it will be particularly interesting to see how many of these still report that they are working below full capacity.

The scarcest factor of production, undoubtedly, which indeed tends to be the governing factor on what can really be wrung out of plant and machinery, is once again labour. In the first quarter of the year the manufacturing industries were still gaining labour as fast as during most of 1959, though civil employment as a whole was growing only about half as fast as it had been; there may be room for further transfer of people from the slack industries, such as mining, into the more rapidly expanding metals and engineering industries. In the metal-using industries output is not yet up by nearly the 7½ per cent over the November level which industrialists were then telling the National Institute of Economic and Social Research that they could achieve with their existing labour force, but working 4½ per cent longer hours. Since then the standard working week in engineering has gone down (without much affecting working hours or overtime), but these industries' labour force has probably risen by about 2 per cent. Clearly, the economy, apart from one or two spots of depression, is steadily working up towards the limits of what it can do, but it is perhaps not quite at full stretch yet.

IN THE MARKETS

Shadow from Sterling

A weakening of sterling, partly in anticipation of Thursday's gold figures, cast its shadow over the London stock markets this week. The spot rate fell to $2.80⅛ on Wednesday and below par on Thursday morning, though the discount in the forward market fell, and is still further below its interest parity—a sign that there is no serious speculation against sterling. At first the main impact of the fall in spot sterling was on gilt-edged, but on Wednesday it caused losses in all sections of the market, and stockbrokers set off for Epsom Downs in less exalted mood. *The Economist* indicator in the week to Wednesday was down fractionally to 356.3 (1953=100). Gilt-edged had a poor week, and on Tuesday fair-sized sales by the banks were again in evidence: the market's earlier hopes that the authorities would shield it from sales necessitated by the paying up of special deposits are now shown to have been false. Thus it turned out a bad time to bring forward the £5 million issue by the Northern Ireland Electricity Board. The terms—coupon of 5½ per cent, price of 96½, redemption 1979-82, giving a gross redemption yield to latest date of £5 15s. 7d.—looked decidedly attractive at the time of issue last Friday. But on Wednesday the application lists stayed open all day, and no one was surprised to hear that 67 per cent was left with the underwriters, a fate only slightly better than that suffered by the Essex loan five weeks ago in special deposits week.

The choice before the authorities under present policy is not to be envied. Either they take a chance and bring issues forward, risking this kind of flop. Or they prevent the new issue queue from moving forward, creating a bad psychological impression on the market and causing frustration and at times acute difficulty to the intending borrowers. In the long run, the only solution seems to be a change of policy to sell gilt-edged at self-evidently attractive yields. But in present circumstances, given the uncertainty about further measures to tighten credit, the gilt-edged market can hardly be expected to settle down. Meanwhile the flow of issues by industrial and commercial companies continues in full spate. Total capital issues in May, as compiled by the Midland Bank and excluding gilt-edged, totalled £52.5 million, compared with £43.8 million in May, 1959. The total in the first five months was £215 million, a little below the corresponding total a year ago, but the pace has been accelerating. This week the Commercial Union foreshadowed a rights issue of £10 million, as discussed on page 1044.

The Treasury bill rate was again unchanged on Friday before the weekend, at £4 11s. per cent; it remains to be seen whether this week's Bank rate talk will cause the discount market to reverse its earlier reduction in the rate. The Treasury still plainly regards the trend in short-term rates as upward. At the end of last week the rate on new issues of tax reserves certificates was raised from 2½ to 2¾ per cent, the second increase this year.

COMMONWEALTH FINANCE

Formal Convertibility under IMF?

Governors of the twelve central banks in the Commonwealth have been meeting at the Bank of England this week to engage in one of those wide-ranging, general discussions, free from a rigid agenda, which symbolise the informality of present day Commonwealth relations. The Governor of the Bank of England has been in the chair and has had around him the Governors of the central banks of South Africa, Australia, New Zealand, Rhodesia and Nyasaland, India, Pakistan, Ghana, Nigeria, Ceylon and Malaya, together with the deputy governor of the Bank of Canada. No communique is being issued. The discussions have naturally touched on the balances of payments of the separate countries and of the whole sterling area, domestic economic policies, the prospects for sterling, recent changes in sterling reserves, and the financing of the still chronic deficit of some Commonwealth countries in the course of industrial development. There has also been some concern with more specific matters, including the new currencies introduced in Ghana, Malaya, Nigeria, and the strain on reserves caused by the disturbances in South Africa.

The bankers have prepared for the meetings of the International Monetary Fund and World Bank to be held in Washington in September. One of the main subjects that will come up for discussion at the Fund meeting will be the move of a number of currencies, including sterling, to full current account external convertibility under Article 8 of the Fund, which would have the incidental effect of bringing the sterling balances into the official IMF reckoning of a country's external reserves, and would also permit the Fund to accept sterling in repayment of credits. Hitherto most members have sought the protection of Article 14, which was designed to allow countries during the postwar transitional period to contract out of the full rigours of the Fund's articles of agreement.

The Fund experts who have been studying the procedural problem have this week reported that countries should get rid of existing restrictions on current payments before they move to Article 8—under which the Fund has to give prior approval to any new restrictions, as well as to approve existing restrictions. For Britain to make the formal move would be an impressive gesture. The Government has already renounced resort to Article 12 of GATT justifying import restrictions on balance of payments grounds.

MOTORS

Jaguar buys Daimler

Jaguar's purchase of Daimler from BSA has saved it any interference from the Board of Trade's policy of preventing expansion in the traditional areas of the motor industry; the neatness of this move is appropriate for one of the most enterprising firms in this industry. The acquisition adds another million square feet to Jaguar's factory space, roughly doubling it; and the Daimler factory is, conveniently, a five-minute journey from the existing Jaguar plant. The purchase has come at a time when Daimler was trying to enter the market for fast luxury cars and sports cars that Jaguar has made its own—though so far it hardly seems to have touched Jaguar's sales. But it has developed two advanced V-8 engines, of 2½ and 4½ litres capacity, which might interest even a company that makes such successful engines as Jaguar—which is rumoured to be developing its own V-8.

The present Daimler range will be kept in production and Daimler will continue to exist as a separate entity. Eventually one might expect some consolidation of the two ranges either in body shells or engines, though Jaguar will want to keep the Daimler name alive. There seems to be adequate spare capacity in the Daimler works for increasing Jaguar production, which is now 20-25,000 a year; recent Daimler output is unlikely to have been more than a tenth of this. Jaguar may therefore be able nearly to double its production; it is believed to be planning a new model to replace (or be added to) the Mark IX, which has remained basically unchanged for 8 years. A new sports model also might be logical soon, perhaps to apply the suspension developments which are now being tested on the firm's E-type racing model.

BSA has not stated the amount that it received for Daimler; estimates have ranged from £3 million to £6 million. Jaguar paid cash; at the end of July last year it held £3,875,000 in cash and tax reserve certificates, so it should have had no difficulty in paying some such sum by now, after another prosperous year. BSA says that the money received will be used to expand the group's existing engineering activities and acquire others; after deducting Daimler profits, those of BSA were higher in the first nine months of the current financial year than they had been the year before, and a 16 per cent dividend is forecast (against 12½ per cent in 1959). Daimler formed only 15 per cent of the group turnover last year, and probably much less of the profits. Another BSA group subsidiary, Hobbs Transmission, has been able at this moment to announce the first production order for its automatic transmission—from the German Borgward company. The German firm will fit the Hobbs transmission to its 1½-litre Isabella model at an extra cost of £82—the other British automatic transmission in produc-

164808

tion, the Smith, adds £88 to the cost of the Hillman Minx—and eventually plans to make the transmission in Germany. Road tests published in the German magazines *Automobil* and *Motor Rundschau* suggest that the Hobbs automatic transmission improves acceleration by as much as 15 per cent; apparently automatons can now change gear faster even than motoring journalists.

Capacity for Car Bodies

PRESSED STEEL has now revealed, for the benefit of its employees, that its expansion plans (described in *The Economist* of April 16th) will bring the production capacity of the company close to a million car bodies a year. The company never discloses its actual production or capacity; but it is probably making some 600,000 bodies a year at present, so that it is planning to increase capacity by at least 50 per cent. These extra 300,000 bodies will represent a substantial part of the motor industry's total increase in capacity—previous information suggested that 700,000 vehicles would be added to it by 1962. Most of the extra bodies from Pressed Steel are likely to go to BMC and Rootes, its two biggest customers; cabs for trucks made at Bathgate could account for 50,000 bodies a year, but new car models as well from both BMC and Rootes would seem the only explanation for so large an increase in demand for bodies. This might mean another 100,000 cars a year from each company, starting at the end of 1961 or early in 1962. For BMC it would suggest that capacity will exceed previous estimates of 1 million vehicles by 1962; for Rootes it is the first indication of its projected increase in capacity, but apparently additional to its so far undecided plans for a factory in Scotland. Thus it seems that the motor industry may well be adding more like 900,000 or even more vehicles to its capacity, than 700,000. This would bring total capacity over the 3 million mark by 1962.

Pressed Steel has also disclosed that it now possesses 400 body presses, which is about a quarter of the total in the motor industry. Ford, which makes all its own bodies, has 360 and will install 15 or so more before its new press shop at Dagenham is fully equipped. BMC has over 200—140 at Fisher and Ludlow, which makes 5,800 bodies a week for the Austin 7, Mini-minor, Metropolitan and some vans, and 60 at Nuffield Metal Products, where the bodies for the Minor 1,000 are made. About 50 more will be installed in the new press shop at Llanelly, in South Wales. Vauxhall, which, like Ford, makes its own bodies, possesses 420 presses.

BUILDING SOCIETIES

The Halifax in Line

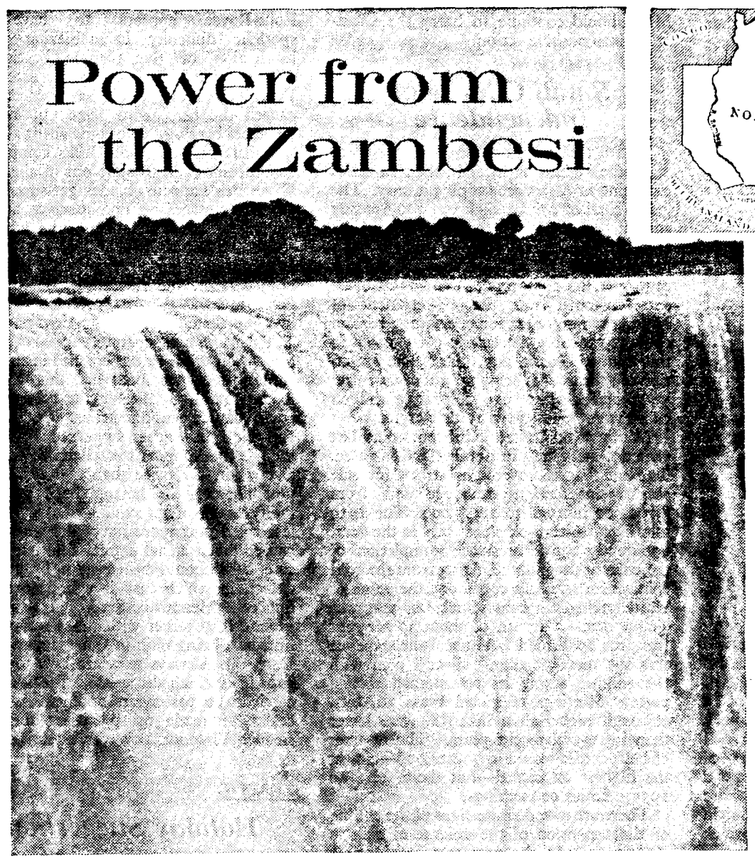
THE Halifax Building Society is not a member of the Building Societies Association, and as the biggest society in this country it is powerful enough to follow its own independent course of action. In December, 1958, it reduced the rate it paid on shares from 3½ to 3¼ per cent, net, and it was not until six months later that the association recommended its members to reduce their rates on shares to the same level. In the meantime, the flow of savings to the Halifax slackened. Once, however, the leading societies were level-pegging on rates the pulling power of the Halifax was again demonstrated—so much so that at one moment the society found it difficult to lend out on suitable mortgages all the money it received. But in the first months of this year the inflow of money to the Halifax began to slacken as it did with almost all other societies.

This fall in receipts and the prospective increase in the tax burden borne by the societies induced the association to recommend an increase in rates and now the Halifax has come into line by announcing that it too will raise its share rate from 3¼ to 3½ per cent, net, and its rate on new mortgages from 5½ to 6 per cent. The association's recommended rate on deposits was left unchanged at 3 per cent, net, but the Halifax has decided to put up its deposit rate to 3¼ per cent, net. Like the other members of the movement the Halifax has had to acknowledge the competitive power of other savings media, and now that it has decided to remain in line the other societies will be among the first to acknowledge its competitive power within the movement.

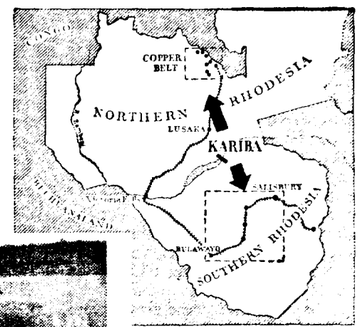
Practically all the members of the association will follow the recommended rates or, in the case of some smaller societies, offer 3¾ per cent, net, on shares. Most of them will raise their share rates this summer. They have to give notice to old mortgage borrowers to increase their rates so that for a few months the squeeze on the margins available for reserve appropriation is intensified. Where those margins are already low, as for example they are with the Co-operative Permanent after a period of rapid expansion, that is not a pleasant contingency to contemplate. As a result the Co-operative has decided not to raise its share rate to 3½ per cent, net, until October when the increased rate of 6 per cent on old mortgages takes effect.

DAVY-ASHMORE

Plant for Steel

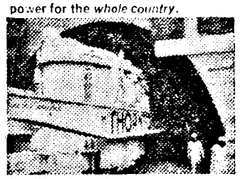


IN considering this week's merger of Davy-United and Power-Gas as an industrial development, it is worth recalling the arguments that some people in the steel industry have put forward for years in concluding that what this country needs is "a British Demag." These steelmakers argued that the manufacturers of plant for the steel industry had insufficient capacity in production or design to meet its demands within the time that it needed its plant installed and working. They were not necessarily right so far as much of the industry's heavy plant was concerned; steel's bunched demand for blast furnaces, steel furnaces and ancillary plant seldom came near employing the builders of these items (which naturally at the same time were complaining of shortage of steel) to full capacity. Demand for the industry's huge and highly specialised machinery, such as rolling mills, on the other hand, did mount sufficiently to press Davy-United, the country's main builder, closer to full capacity; though it was able to subcontract out a good deal of work to big general engineering firms which were becoming less busy on defence ironmongery.



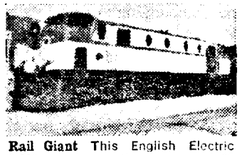
Another argument adduced for some concentration of the steel plant builders' resources has been the possibility of "turnkey" bids for steelworks contracts abroad, and perhaps even at home, though British steelworks engineers are usually too opinionated to give up the opportunity of shopping around for details. British builders have formed consortiums to handle projects abroad, such as the Indian works at Durgapur; but a single comprehensive organisation able to bid for the lot anywhere, such as the redoubtable Demag AG of Duisberg, may have some inherent advantages.

Logic of the Merger



GOOD internal arguments for the Davy-Ashmore merger that has now finally been announced may also have existed in the limitations of resources available even to groups that have been expanding their capacity as fast as these two companies. Neither is entirely specialised in steel. Davy-United makes rolling mills for other industries such as aluminium; it owns a roll foundry in Middlesbrough and a subsidiary, Duncan Stewart of Glasgow, which makes forging presses, sugar refining plant, and Bessemer converters (the group has a joint company with British Oxygen interested in developing oxy-steel processes). Power-Gas links together under one ownership Ashmore Benson Pease, which has built more modern blast furnaces for the British steel industry than any other firm, and builds many other kinds of capital plant for other industries, and Power-Gas Engineering, which is prepared to design, engineer and bring into operation processes and plant for the oil, chemical, and gas industries. Another subsidiary, Rosemount Thompson, makes equipment for the extraction of oil from seeds; and Power-Gas also has an interest in building nuclear chemical plant.

Financially, the merger takes the form of Davy's acquiring the Power-Gas equity and re-naming the company Davy-Ashmore; 17 new Davy shares are offered for every 20 P-G shares. This will bring the new group's issued capital to £5,399,056, of which Davy shareholders will hold 55.9 per cent and P-G shareholders 44.1 per cent. In mid-November, before the intention to merge was announced, Davy £1 ordinary stood at 105s. and Power-Gas 10s. ordinary at 68s. On the eve of the announcement of the terms Davy were 116s. and P-G 97s. After the terms were announced, Davy went up



What Kariba means to Rhodesia: this great source of power is just halfway between the mines of the Copper Belt in the North and the expanding industries of the South—there's power for the *whole country*.

Kariba Into the cavernous transformer hall—carved out of the solid rock—goes one of the ten English Electric single-phase 80 MVA 330kV generator transformers at the Kariba dam site on the Zambesi.

Rail Giant This English Electric 2,000-h.p. locomotive is one of 35 supplied to Rhodesia Railways.

RHODESIA'S DYNAMIC THRUST AHEAD

The eyes of the world are on Kariba, glittering token of future prosperity for all the peoples of Rhodesia. But the Kariba Dam is only a means to an end—the provision of cheap and abundant electricity for developing industries.

The Kariba scheme will bring enormous benefits to Northern and Southern Rhodesia alike: transmission lines will reach north to the Copper Belt—copper is still the main source of Rhodesia's wealth—and south to the more populous areas of Bulawayo and Salisbury, where secondary industries are being built up as part of the government's plan to broaden the basis of the country's economy.

English Electric in Rhodesia. In all branches of power engineering—for *producing*, *distributing* and *using* electricity—The English Electric Company has long been at work in Rhodesia. At Kariba and in the copper mines you will find English Electric equipment. Rhodesia Railways, which have carried out a phenomenal expansion programme since the war, have been supplied with 35 2,000-h.p. diesel-electric locomotives. Many of Rhodesia's modern factories and offices contain English Electric transformers, switchgear and fusegear.

And so the fruitful relationship grows: English Electric gains further experience, which it can use for work in other countries and at home; Rhodesia knows it can depend on the specialised knowledge and vast technical resources which lie behind every contract with English Electric.

POWER FOR PEACE

'ENGLISH ELECTRIC'

The English Electric Company Limited, Marconi House, Strand, London, W.C.2

to 121s. 6d. and P-G to 101s. 6d. The prices were in fact adjusted further to higher dividends, but on Wednesday profit taking brought them down to 117s. 6d. and 98s. 9d.

Davy's profits before tax rose sharply in the year to March 31st from £1,586,000 to £2,300,000; for the year it will pay a total dividend of 22½ per cent (against the equivalent of 15 per cent for 1958-59). For the half-year to March 31st Power-Gas will pay a special interim of 17½ per cent. For the year to March 31, 1961, Davy-Ashmore expects to pay a dividend of 25 per cent. This seems to imply that the cover will still be big, probably about 3 times. Effectively, therefore, the dividend income gross before tax of Davy shareholders goes up from £22 10s. to £25 per £100 of shares and that of Power-Gas shareholders from £30 in the year to September last to £42 10s. in the year to March, 1961. In retrospect that justifies the much greater climb in value of the P-G shares than in the Davy shares. The market was not too far out in its guesses.

COINAGE

Irrational—but Why Clumsy?

It now seems unlikely that Britain will soon follow other Commonwealth countries in changing to a decimal system of coinage—and each year the cost of a changeover mounts. The recent inquiry conducted by the British Association and the Association of British Chambers of Commerce concluded that there was a strong case for the change, but that there appeared to be no great enthusiasm in industry and commerce for it. This week the Chancellor of the Exchequer stated in a written Parliamentary reply that while the Government was studying the report with care and welcomed the widest discussion of the question, it sees great force in the objections to giving up the pound—and unless the pound is given up, a decimal system would have to be a mil system, with units of one thousandth of a pound. This was in fact the system recommended by two Royal Commissions in 1838 and 1843. But a hundred years ago, as now, demonstrations of logic did not prove sufficient to carry through a reform that to many traditionalists appeared scarcely less than sacrilege.

Even if the mental arithmetic of the nation must continue to be sharpened by the odd relationship of pounds, shillings and pence, that is no reason why the shillings and pence should retain their present preposterous size and weight. The Chancellor has now had ten months to consider the admirable suggestions put to him by the new Comptroller of the Mint, Mr J. H. James. These suggestions included a small five shilling piece, of silver; abolition of either the florin or the half crown; and abolition of the farthing, permitting a smaller halfpenny and a smaller penny. MPs should continue to harry the Chancellor into positive action.

Small Change of Independence

Output of the Royal mint in 1959 was the highest on record; the new states emerging in Africa are keeping it busy. The grand total of coins struck was 709,650,207 against 593,201,554 in 1958; and more than 465 million were Commonwealth and foreign coins, an increase of nearly 60 per cent over the 1958 total. The largest overseas customer was the Government of Nigeria whose order for over 1,000 million coins is probably the largest ever known in this country—or in any other. The execution of this order is being spread over several years and during 1959 some 333 million coins were struck in part delivery.

Mintings of United Kingdom coins last year declined, both in number and in value. The number of sovereigns struck for sale abroad in foreign exchange fell from 8,700,000 in 1958 to 1,385,000. The 1959 mintings, which took place early in the year, apparently represented the completion of the current programme. Apart from the gold coinage for overseas collectors, the value of United Kingdom coin struck last year was £6,387,179—a decline of about 30 per cent from the 1958 total. As usual the sixpence was the most popular "silver" coin with the shilling taking its accustomed second place. Mintings of nickel brass 3d. bits, although higher than in 1958, were lower than in several recent years. The number of halfpennies soared to 79,224,000—almost the highest on record—but there were no 1959 pennies or farthings.

There are now definite signs of the ending of the expansion of the volume of coin in circulation. In the past two years prices have been fairly stable and the housewife no longer needs more coins for the same shopping list. But the number of coins struck does not by itself give a true picture of public demand for coins. Since 1947, and more especially since 1953, much of the cupro-nickel coin has been struck to replace the old pre-1947 silver coin being withdrawn from circulation. Of last year's minting of cupro-nickel of £5.9 million some £4.3 million went in replacement. There were also the usual withdrawals of worn coin and the net addition during the year to the circulation was only £1.1 million.

AIRCRAFT

Vanguard in Trouble

The abrupt grounding of Vanguard aircraft follows a long series of relatively minor incidents with the aircraft's Tyne engines, it has occurred a bare month before British European Airways intended to put the Vanguard into service on its crowded holiday routes. Up till now, trouble on the Tyne had been irritating but not critical; Rolls-Royce appears to have had sporadic difficulty in achieving proper lubrication of the turbine bearings, a difficulty that has on occasion occurred with Dart engines too. This has once or twice caused the turbine to seize up; in other instances bearings have come adrift allowing the shaft on which the links compressors and turbines run to shift out of alignment. When this happens, blades get smashed on the compressor; on one instance at least, fragments have flown into the adjoining engine and stopped that too. A week or so ago, it looked as if Rolls-Royce had cured both defects, and preparations were being made to hand the first production aircraft over to British European Airways.

Then, on two separate occasions, one of the 15 compressor discs cracked in an engine running on a test bed; had this happened to an aircraft in the air the consequences could have been disastrous. A defect of this kind has never appeared before, although the Vanguard has been flown intensively now for more than two years. The possibility of its having been due to a faulty batch of material has been more or less ruled out; more likely the cracks were caused by a metallurgical fault, in which case cure should be easy, or by a design defect, in which case it will be extremely difficult. Meanwhile the Vanguard remains grounded, together with the Tyne-powered transport being built in Canada, and British European Airways wonders how to fill the gap in its schedules—for the Vanguard carried 110 passengers and its loss cannot easily be made up by using the much smaller Viscount, however intensively.

TRAFFIC

Holiday Suggestions

Mr Marples has not come up with many motoring ideas for Whitsun; but the very paucity of his assorted collection of proposals is a clear demonstration of just how little any Minister of Transport can actually do at the present time about the problem of road safety at holiday week-ends. The most notable of his artifices, the four-day 50 mph upper speed limit, is to be imposed only on trunk roads, because they come under the direct control of the Ministry; and will be applied on ten stretches totalling only 150 miles in all, because that is about as much as the police can hope to enforce such a limit on. With "clearways"—roads on which stopping is banned at any time—the limit is set by the number of major traffic routes that are outside the 30 mph urban speed limit, that have no pedestrian crossings, no traffic lights and comparatively few accesses, and that have lay-bys for buses and other stopping traffic.

Another 65 miles of these "clearways" are, however, being permanently added to the 42 miles introduced last August. For an extension of the system of alternative routes to main roads, and for a wider use of the double white line, no passing signs,

and devices to alter the setting of timed traffic lights in accordance with the peak flow of traffic, the Ministry can only ask for the co-operation of local traffic authorities—which it does not always get. The regulation of overtaking by the double white line has not been as sensibly applied as it might; and at least one alternative route will not be marked this week-end because the chairman of the local authority concerned has an aversion to this kind of signposting.

It is disappointing, therefore, to learn from Mr Marples' junior minister this week that the government is only "hoping" to introduce legislation on road safety in the next session of Parliament. This is too long to wait for the introduction of more rigorous penalties for driving offences and for any necessary revision of traffic powers between the town hall and Whitehall. The Government and the BBC ought also to think again about the possibility of providing a radio service on traffic conditions and highway safety. This idea, it was stated, has been turned down for the time being because of "practical difficulties." Any such difficulties have not prevented other countries, notably Austria, where it has become a cheaply-run national institution, from providing a daily programme of this kind for motorists.

FOREIGN BONDS

English Law Upheld

The case of the Greek bondholders has reached the House of Lords, as its predecessor did in 1957, and again the

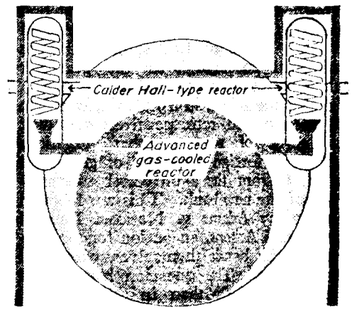
Windscale's Second Wind

Question: When is an "advanced gas cooled reactor" advanced?
Answer: When it makes nuclear power break even with thermal power.

By the side of the burnt-out hull of the No. 1 Windscale reactor, the Atomic Energy Authority is making preparations for its second bid at achieving competitive nuclear power. Along the skyline stand the four reactors of the Calder Hall nuclear power station, prototype of the bid that failed. Nuclear power generated in the commercial versions of Calder Hall will cost anything from 20 to 60 per cent more than power from a good coal-fired station, depending on the efficiency of their designs. It terms of hard cash, costs will range from slightly above to slightly below ½d. a unit compared with about ½d. a unit from the equivalent coal-fired station.

The level of costs

This first bid at competitive nuclear power failed because the cost of building the stations was too high and their thermal efficiency too low to offset it. The AEA is now attempting a technical breakthrough, reducing size quite substantially and simultaneously putting up operating temperatures and pressures in a way that improves thermal efficiency and allows the use of smaller, more efficient, more compact turbines. The "advance" in the new advanced gas cooled reactor design lies in just this increase in temperatures and pressures; the drawing shows how the new type of station (dark shading) compares in scale with the old (light shading). Size goes down, thermal efficiency goes up and costs—on paper—should break even for the first time with thermal power at about ½d. a unit.



Whether they break even in practice will depend on what the Authority learns from operating its £9 million prototype at Windscale when construction work is finished early next year. This is a pilot scale power station, generating 30 megawatts or a tenth of the capacity planned for full-scale commercial versions. It has only been made possible by techniques learnt in building the older Calder Hall type of station; a few years ago, for example, no one could have welded on site steel plates thick enough to contain the gas pressure planned for the new reactor. Even so, commercial versions are not expected to hit the target figure of ½d. a unit for several years; the first advanced gas cooled nuclear power stations built for the Central Electricity Generating Board may not show any striking improvement on the 0.6d. per unit for which the best of the Magnox stations should sell electricity when they reach the peak of their development.

Much depends on how rapidly building costs can be brought down. The first attempt to build these stations commercially may cost in the region of £90 a kilowatt, which is not much lower than the figures that can be achieved now with the best Calder Hall type stations. In time and with experience construction costs are are expected to drop to £70 a kilowatt but the AEA's new computer has recently shaken engineers by informing them that according to its calculations, optimising all the conditions should make it possible to build these stations for as little as £60 a kilowatt. Engineers' reactions are to suspect the computer is playing tricks, but if in fact the machine is right and they are wrong, then there may be more promise in the advanced gas cooled reactor design than anyone now suspects.

What future for beryllium?

Fuel costs in these reactors will be more critical than they are in a natural uranium reactor because of the high temperatures and small size of the new design can only be achieved by using enriched fuel, which is costly especially when made in Britain rather than in the United States. To save fuel, engineers planned originally to use what would scientifically be the most desirable material to contain, or "can," the fuel—namely beryllium.

But while the Authority and its suppliers have worked miracles in overcoming the difficulties of fabricating beryllium, AEA has been finding out that this metal had other disadvantages; and it is no

longer so clear that beryllium is, even in theory, as superior as was assumed to the alternative canning material, stainless steel. Industry has put in hand a substantial beryllium development programme in the belief that the material would be used in sizeable quantities for nuclear power. Four companies, Imperial Chemical Industries, Hawker Siddeley, Imperial Smelting and Tube Investments, are involved; Consolidated Zinc also formed a joint company with the American Beryllium Corporation but as its Chairman explained in his statement accompanying the annual accounts this week the company has held back "pending confirmation of much larger requirements of beryllium metal in future nuclear power stations." Suggestions that the AEA was having second thoughts about the wisdom of using beryllium have so far been indignantly denied. Nevertheless, at Windscale on Tuesday the Authority's own director of industrial research, Sir William Cook, said openly and bluntly that the AEA would not approve the use of beryllium in the first series of commercial advanced gas cooled reactors, despite the fact that it is using a good deal of the metal in its Windscale prototype. He said that a great deal more work, spreading presumably over several years, would be needed before the AEA knew enough about the behaviour of beryllium to say whether it could or could not be used in civil power stations.

How industry will react to this last unequivocal statement remains to be seen.

decision has gone against the Greek bank. The legal history of the dispute, which is of some importance for foreign investors generally, goes back to 1956, when in Metliss v. National Bank of Greece and Athens payment was sought of interest due on mortgage bonds issued in 1927 by the National Mortgage Bank of Greece and guaranteed by the National Bank of Greece. The bonds provided for arbitration in London "in accordance with the laws of England." In 1949 a moratorium was declared; and in 1953 the guarantor bank was amalgamated by government decree with the Bank of Athens. The new bank disclaimed liability on the bonds, but first Sellers, J., and later the Court of Appeal and the House of Lords, held that as "universal successor" to the guarantor bank it could not escape liability.

In the meantime, in 1956, a new decree had been passed, retrospectively amending the decree of 1953 so that obligations payable in foreign currency or gold were excluded from the "universal successorship" of the new bank. This was followed in 1957 by Adams v. National Bank of Greece and Athens, an action for the payment of the bonds themselves, which had become due. The question here was, a little more clearly than in the first case, whether the proper law to be applied was that of England or Greece. Diplock, J., held that it was the former, but last year the Court of Appeal found against the plaintiffs. Now the House of Lords has allowed their appeal: English law must govern the matter, and English law would not recognise a retrospective alteration by a foreign government of the contract rights of English nationals.

The dispute has not been a simple one at any stage—disputes involving the conflict of laws seldom are. To what extent the new decision will become a precedent and how much it depended on the peculiar facts of the case will be more apparent when the full judgments are available. Lord Denning, in particular, seems to have based his judgment on wide principles of natural justice. For the present there will be a widespread feeling of satisfaction at the result. Any defeat of retrospective legislation is to be welcomed; no less welcome is any failure to cut down freely negotiated rights of English investors abroad.

BEDS

Springs of Change

THE British are slow to change their habits of sleeping; since they accepted the divan bed—which now outsells other beds by 2½ to 1—they have shown little desire to experiment. Foam mattresses have grown only slowly in popularity, and now form 8-10 per cent of mattress sales. Some in the industry believe that foam may settle down with this share of the market, which is what it holds in the USA; but the introduction of plastic foam as well as rubber is now reducing the cost of a foam mattress by 20-30 per cent and therefore making it competitive in price with the cheaper interior-sprung mattresses. These form the majority of mattresses sold; the average manufacturer's price of a single interior-sprung mattress was £4 17s. in 1959—having fallen from £5 6s. in 1955—or nearly £7 10s. retail. The cheapest foam rubber mattresses cost over £8, and those made by Dunlop—much the biggest maker—sell mostly in the price range £11 10s.-£27 10s., where they compete with the more expensive sprung mattresses. Bringing foam down into the cheaper price classes should expand its sales.

The plastic that is used for these mattresses is polyurethane, which is relatively cheap and can easily be "foamed" in simple equipment. Mattress makers can therefore produce their own material. Large firms like Dunlop, however, employ more elaborate equipment to produce on a larger scale. Unlike rubber foam, polyurethane does not need to have cavities moulded into it to make it soft enough, and it is produced in large blocks that can be sliced up into mattresses—which saves on production cost. Less material is needed, too, so it is not surprising that firms like Dunlop are beginning to make it on a large scale.

The bedding industry benefited like other furniture makers from the relaxation of hire purchase restrictions; total sales in 1959 were 7.5 per cent higher in value than in 1958. Sales of interior-sprung mattresses rose little over 2 per cent, while those of divans rose 27 per cent; this is interpreted as showing that the industry is succeeding in persuading people to buy a complete new bed, and not to put a new mattress on to an old bed.

NORTHERN IRELAND

Orangemen with Black Spots

LESS than two per cent of the labour force is now unemployed in Britain, and the Government has made a significant start at aiding the worst areas of persistent unemployment through the mechanism of controls and financial inducements embodied in the Local Employment Act which became law on April 1st. By contrast, seven per cent of the labour force is now out of a job in Northern Ireland, and the figure is as high as ten per cent in some parts of that country. Of the 33,000 now unemployed, three-fourths have been without a job for more than a month, and over 40 per cent have been without work for more than three months. At no time since 1950 has unemployment been lower than five per cent; Ulster might be described as a Galbraithean society without the affluence. The efforts of the Government of Northern Ireland to lure new industry to the country received some competition from the similar scheme practised by the British Government during 1958-59: recovery here has made Northern Ireland's plight once more apparent, and a renewed effort is now being made to induce firms—particularly American firms—to go there.

Since 1945 over £42 million has been spent by the Government in the form of grants to firms locating plants in the country, and over £7 million will be spent this year. Fourteen advance factories are now planned or under construction; these are rented at 1s. 3d. to 2s. 6d. a square foot, and even lower rents may be negotiated. The Government will, if necessary, build special purpose factories, and firms wishing to build their own plant may receive a grant of up to one-third of the total cost. Outright grants of up to one-third are also available toward the cost of machinery; and rebates of one-third (raised from 25 per cent in 1958) are given for all subsequent capital expenditure. Finally 10-15 per cent of fuel costs and up to 75 per cent of property taxes may be refunded; and the Government pays a part of the cost of training labour and helps provide housing if necessary.

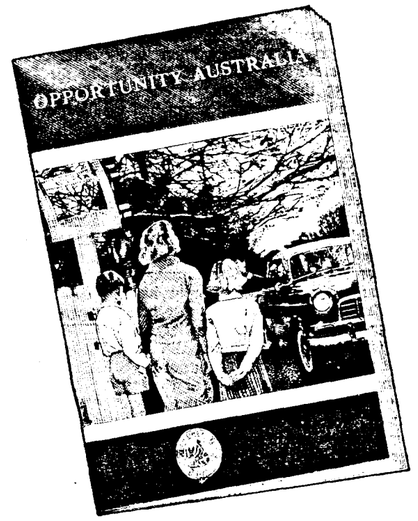
These liberal inducements have not been without success: over 130 firms have come to Northern Ireland since 1945, including Du Pont, Courtaulds and Associated Electrical Industries. Just how successful the Government will be in the future in overcoming the disadvantage of inconvenience to markets is another question. The most suitable industries, the board feels, are those whose finished products have a high value in relation to bulk—e.g., cameras, lenses, scientific instruments, and electronic equipment. But skilled and semi-skilled workers together constitute only 25 per cent of the unemployed; agriculture and construction (and the building of advance factories) account for well over one-third of those needing jobs.

FERTILISERS

Britain and Europe

IMPERIAL CHEMICAL INDUSTRIES this week announced reductions in the prices of all its fertilisers, ranging from 5s. to £1 a ton, effective July 1st. During the year to June, 1961, ICI's nitrogenous fertilisers, which constitute about 75 per cent of the total produced in Britain, will cost farmers from £18 5s. to £25 17s. a ton, before deduction of the fertiliser subsidy paid by the Government; the company estimates that the price cuts will represent savings to farmers of almost £1 million a year. ICI states that the price cuts are based on the higher volume of output expected in 1959-60, and adds that raw material and labour costs are unlikely to fall. Production of nitrogenous fertilisers has continued to rise both in Britain and Western Europe as a whole: a survey recently published by the Organisation for European Economic Co-operation estimates that total production

Boving design and finish ensure ENDURING EFFICIENCY



This solid cast stainless steel runner for Scotland is an example of the high quality of finish to very fine limits which is a feature of Boving turbine runners of all types.

Constant research into design and production methods, backed by the latest advances in technology, maintain Boving Quality at the highest standard. High quality finish ensures high efficiency, increases reliability, and reduces costly outages.

in OEEC will reach 4,597,000 metric tons of nitrogen in 1960-61, of which Britain is expected to account for 450,000 metric tons. West Germany, with an output of about 1,250,000 tons of nitrogen in 1959-60, is by far the biggest European producer.

The OEEC report also provides some interesting comparisons between the competitive methods, or lack of them, in Europe's fertiliser industries. In only four countries—Britain, Sweden, Ireland and Switzerland—are fertiliser prices fixed by manufacturers, without government controls; in six countries, including west Germany, France and Italy, the three biggest producers, prices are rigidly fixed, Government subsidies are given to farmers or fertiliser manufacturers in ten OEEC countries: in 1958-59 these totalled the equivalent of £75 million, of which about half was paid by Britain and about one-third by west Germany.

Within the Commonwealth, consumption of fertilisers has increased almost half again as much as output, though both have risen much more slowly there since 1950 than in the free world as a whole, according to a report published this week by the Commonwealth Economic Committee. The Commonwealth's share in total world output has fallen from 14 per cent in 1946-47 to 9 per cent in 1957-58; Britain remains the largest aggregate producer and consumer, though its share of total Commonwealth output has fallen from 45 per cent in 1949-50 to 36 per cent in 1957-58. Canada is now the only Commonwealth country with a sizeable fertiliser export trade, and this position will be further strengthened by the development, now being undertaken, of large potash deposits in Saskatchewan.

WOOL MARKET

A Better Season

COMMONWEALTH wool growers have fared much better this season than last—though not, perhaps, quite as well as the recovery in world consumption may have lead them to expect. Had they not produced a record clip they would probably have obtained somewhat higher prices at the cost, perhaps, of injuring their market for wool. Total production in the Commonwealth this season is estimated at 2,840 million lb (greasy weight), 140 million more than in 1958-59, with Australia, the largest producer, accounting for over two-thirds of the increase. World production, including the Communist countries, is believed

THE COMMONWEALTH WOOL CHEQUE

	Australia July to April		New Zealand July to April		South Africa July to March	
	Sales mn. lb	Receipts mn. £	Sales mn. lb	Receipts mn. £	Sales mn. lb	Receipts mn. £
1958-59	1,181	190·6	360	53·5	244	33·2
1959-60	1,210	239·4	353	66·4	253	44·1

to have gone up by 250 million lb to a record of 5,600 million lb. Much of the recovery in prices occurred before the new season began, when world consumption was still increasing. A further spurt in prices in August was followed by a sharp break. From October onwards world consumption appears to have remained on a high plateau, and wool prices have moved in a narrow range, save for a brief decline and subsequent rally in February and March. The season is now ending on a steady note. The New Zealand sales finished this week, and little remains of the Australian and South African clips.

Australia can apparently thank Japan for putting an extra gloss on its fleece. Japan has become the biggest buyer of Australian wool this season, bidding at prices that Britain, the biggest consumer, and some other countries could not afford to match. In the first ten months (July to April) of the season Australia has sold 1,210 million lb of wool, about 30 million lb more than in the same months of 1958-59, and its wool cheque has risen sharply by £49½ million to £239½ million; this is just about as much as Australia earned in the same period of 1957-58 when prices, opening at a much higher level, were severely hit by the world-wide recession in the textile industries.

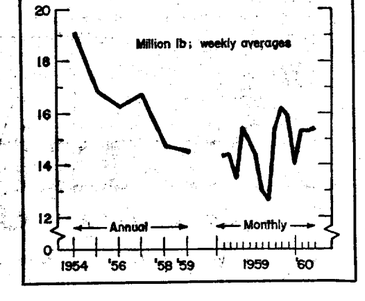
DSIR

Shifting Emphasis

THE annual report of the Department of Scientific and Industrial Research for last year is an altogether brisker and more businesslike document than usual, showing a noticeable shift in emphasis in the type of work that the DSIR is now prepared to sponsor—and in the kind of results it expects. The DSIR now has a sizeable annual income and a full-time spokesman in the government. It is looking for projects whose importance is commensurate with its own new status and there have been some fairly vigorous shake-ups in the work of the research stations. These appear to have been ordered to restrict the number of projects they have in hand "so that proper progress can be made on each of them"—in other words, to stop frittering their resources—and to work to "a limited number of clearly defined objectives," which is another way of saying that they must follow some coherent plan. One example of this changing emphasis is the way that the work of the Radio Research Station has been recast to take in a good deal of the electronics side of space research. Another, and in many ways a much more important example, is the decision to make grants for research into machine tools.

The DSIR already has four fairly big machine tool research projects in hand, a £4,000 investigation at Birmingham University, a much bigger £32,000 programme at Manchester College of Science and Technology, an £18,000 programme at Cranfield and a £15,000 project at Salford. Negotiations are going on about seven more machine tool research programmes which might get DSIR support. The larger question, however, probably extends beyond research and even development into the industry's design resources. The machine tool industry itself is now prepared to contribute towards the cost of further scientific investigation of machine tool design and development, but no one is quite sure how to carry out these good intentions.

BUILDING



Evidence of Inflation?

BUILDING costs in Britain have remained more or less level during the past year and a half, after declining slightly throughout 1958; during this time the volume of construction has risen steadily. Recently, however, there have been some indications of upward pressure on building costs; higher prices and short supplies have been forecast for both materials and building labour. According to an index published by *The Builder*, construction costs have actually risen almost 2.2 per cent in the past year; most of this has been due to higher wages—though costs of material are claimed to have shown a slight upward trend—and the journal predicts that "the recent wage increase will not be absorbed by the industry and the cost will be passed on in the form of higher building costs." According to the Ministry of Labour there are now about 14,000 unfilled vacancies for craftsmen in the building industry, and only about half that number of unemployed craftsmen to fill them. Finally, increasing demand has produced short supplies and delayed deliveries for some building materials, in particular for bricks.

Wage increases of 2½d. an hour for craftsmen and 1½d. an hour for unskilled building workers became effective on April 18th; and both the bricklayers' and woodworkers' unions voted this week to seek even greater increases in next season's wage negotiations. While demand continues to rise, contractors will be able to pass on

COTTON YARN PRODUCTION

In the first quarter of this year output of cotton single yarn was over 200 million pounds. Yarn and cloth production continued to improve (even allowing for the Easter holiday which fell in the first quarter last year). Since the middle of 1959 both have been above the previous year's level.

higher labour costs to their customers—though one might expect the increase to be offset in part by higher productivity. Higher prices for bricks and for imported hardwood and softwood have been balanced by slight declines in prices of cement and some types of constructional steel. Stocks of all types of bricks at the end of April totalled 124.3 million against 148.2 million at the end of March; stocks of Fletton bricks, at 24.4 million, were the equivalent of less than one week's output at the April rate of production.

The value of new construction during the first quarter was £381 million, compared with £389 million in the preceding quarter and £357 million in the first quarter of 1959; after seasonal adjustment there was probably little change in the value of output during the first three months of this year. New housing accounted for £148 million, against £132 million a year earlier; of this total private developers' share was £89 million, an increase of £16 million over a year earlier, while public authorities' new housing totalled £59 million, unchanged from a year earlier. Other new work for public authorities declined slightly, to £105 million, in the first quarter; private industrial building equalled £72 million, the same as in the preceding three months, and other new work for private developers declined, from £59 million in the last quarter of 1959 to £56 million in the first quarter of 1960.

BANK CREDIT

The Full Statement

that, as discussed last week, the slackening in pace has been smaller than indicated by the rise in the crude figure of £26 million. The average ratio of advances has risen to 45.9 per cent, with four of the Big Five around the 45 per cent mark but the National Provincial at 47.5 per cent. Net deposits fell by £6 million in the month, to £6,625 million.

PLASTICS

Getting Warmer

A NEW group of plastic materials that can stand far higher temperatures than any plastics yet known has been discovered by scientists of Artrite Resins, a subsidiary of Microcell. Security restrictions, however, prevent description of the nature of the plastics. Such materials have long been sought by scientists, because poor resistance to high temperatures is one of the biggest weaknesses of existing plastics; most cannot be used at temperatures over 150 degrees centrigrade. Only the expensive ptfe (poly tetrafluorethylene) or some reinforced epoxy resins can stand up to 300 degrees centigrade. One of the new materials does not lose strength until over 700 degrees centigrade; at this temperature it is twice as strong as a normal phenolic resin at 100 degrees centigrade. Another material, the Artrite scientists claim, can stand temperatures of up to 1,000 degrees centigrade, although it can originally be moulded like other plastics, and should not prove vastly more expensive. Only ceramic materials or special steel alloys like the Nimonics could previously resist temperatures of this degree. Some of the materials can be formed into fibres which can be used at far higher temperatures than nylon or Terylene; in their properties and uses they seem likely to fall between these and glass fibre.

All these new materials, so far, are at the stage of pure research; they have been made only in test-tube quantities. Artrite's research has been backed by the Ministry of Aviation; it was directed to the discovery of just some such material as has been discovered—one case where scientists do appear to have discovered what they were looking for. So far expenditure has been small; but now that the development stage has begun it will rise. Artrite hopes that it will be able to have the more easily-produced of these materials in semi-commercial scale production by 1961; these appear to be the materials able to resist over 700 degrees centigrade. The demand for such materials from both defence and civil industry encourages the company to press on with development as fast as it can.

Uses that have been suggested for the new materials include components to go inside such hot-getting vehicles as rockets, fuel cans for nuclear reactors, and on a mundane but perhaps more useful plane, the flame supports of gas cookers. The most important potential effect of this discovery is that it may allow plastics to compete more directly with metals, now that these new materials can stand similar temperatures. They do not seem able to match the strength of metal—they would not, for example, be suitable for the skin of a supersonic aeroplane—but in the many uses where high strength is not needed they may prove competitive. But much more will need to be known about costs and mechanical properties before this can be properly judged.

SHORTER NOTES

The Import Duties (European Free Trade Association) Order, 1960 introduces on July 1st the first reduction in British tariffs on products of EFTA countries. The EFTA rate applies mainly to industrial products, and is generally four-fifths of the full rate; among the exceptions are some composite goods containing hydrocarbon oils, certain steel rods on which the import duty (of £4 10s. per ton or 10 per cent whichever is the greater) was suspended on January 1st, and for which the EFTA rate is free, and bacon, canned pork luncheon meat and other agricultural items covered by the Anglo-Danish Agreement.

★

Britain's terms of trade improved by one point to 88 (1954=100) in April, the same ratio as a year ago, when import and export prices were each three points lower. Export prices rose by one point to 112 in April while import prices were unchanged at 99.

★

The Bank of England is prepared to discount at its official rate not only the acceptances of members of the Accepting Houses Committee (detailed in last week's issue of *The Economist*) but also those of Balfour, Williamson & Co., and Ullmann and Co., whose acceptances thus command the finest rates in the discount market.

★

The total market value of all securities quoted on the London Stock Exchange rose by £6,000 million to over £45,000 million in the year to the end of March, 1960. There was a similar increase in the previous year so that in the last two years market values have risen by over 36 per cent, while the nominal value has risen by 3 per cent. Bargains recorded in 1959 rose to a new peak of over four million.

COMPANY MEETINGS

CAMMELL LAIRD AND CO. LIMITED

1959 A DIFFICULT YEAR FOR THE GROUP

HARMFUL EFFECT OF PROLONGED STOPPAGES OF WORK

WELL-BEING OF UK SHIPPING INDUSTRY—ESSENTIAL PREREQUISITE TO SUCCESS OF COMPANY'S IMPORTANT INTERESTS

BENEFITS ACCRUING FROM LARGE-SCALE MODERNISATION SCHEMES

ADMIRAL SIR MICHAEL DENNY'S REVIEW OF ACTIVITIES AND PROSPECTS

The ninety-sixth annual general meeting of Cammell Laird and Company Limited, was held on June 1st at Birkenhead, Admiral Sir Michael M. Denny, GCB, CBE, DSO (Chairman), presiding.

The following is the Chairman's Statement circulated with the Report and Accounts for the year ended December 31, 1959:

In my first statement as your new Chairman I should like to begin by referring to the work done by my predecessor, Mr J. C. Mather, JP, Chairman of your Company from 1951 to 1959. That period has seen a steady growth in the size and importance of your Group, although 1958, coinciding with a recession both in steel and shipbuilding, showed a decline in profits from the record levels achieved in 1957. On medical advice, Mr Mather relinquished the Chairmanship, which I have undertaken, but I am very glad to say that Mr Mather has found it possible to remain on the Board and to accept appointment as Deputy Chairman. His experience and advice will be invaluable to us and we hope that with care he will entirely regain his former good health.

I must also refer to the death during 1959 of Sir Archibald Boyd, a Director of this Company since December, 1953. Sir Archibald joined Cammell Laird's in 1912 and when the Company's rolling stock interests were amalgamated in Metro-Cammell in 1929, he became an Executive Director and subsequently Managing Director, and finally Chairman of that Company. He was also first Managing Director and later Chairman of what is now The Patent Shaft Steel Works Limited. His engaging personality and wise counsel will be sadly missed by his colleagues.

I should also refer to the retirement from the Board of Mr E. Bernard Jones, OBE. Mr Bernard Jones commenced his service as an apprentice with Laird Brothers and after more than fifty years of service with the Shipbuilding Company, during which time he held successively the positions of Commercial Manager, Chief Accountant, Secretary and Local Director, he retired from active management in June, 1954, when he was elected to the Board of Cammell Laird and Company Limited. I desire to place on record our thanks to Mr Bernard Jones and to wish him good health and happiness in the future.

Although conditions have improved in the steel industry and there have recently been a few more inquiries for ships, 1959 has been a difficult year for the Group. I refer to these difficulties in more detail in my remarks about the various components of the Group. During the year we have continued the policy of ploughing back retained profits into large-scale modernisation schemes, both at Birkenhead and Wednesbury, and these schemes, particularly at the former works, are already beginning to show results.

The well-being of the United Kingdom ship owning and ship operating industry is an essential prerequisite to the continued success of your Company's important interest in the shipbuilding, ship repair and marine engineering industry —as, indeed, it is also to the stability of the United Kingdom economy. The advantageous conditions under which ship operating industries in other countries exist in comparison with our own has clearly become a matter of great import.

ACCOUNTS

CONSOLIDATED PROFIT AND LOSS ACCOUNT

As a result of the difficulties to which I have referred, the group operating surplus for 1959 has been reduced, compared with the previous year, by over £800,000. This has been countered to a certain extent by tax adjustments, and our income from Associated Companies has shown a welcome increase of almost £150,000. Income from trade investments is slightly increased, but other investment income and interest is down, due to realisation of investments during the year. Because of heavy capital expenditure, depreciation charges are more than doubled and the charges for loan and bank interest heavily increased, making the surplus for 1959 before taxation, £427,192, compared with £1,486,704 in 1958. After tax adjustments, we are left with a net group profit of £272,391 against £689,775 in 1958. We must then add the outside shareholders' proportion of the loss of our steel making subsidiary company and taxation and other adjustments in respect of prior years, while for tax reasons we have transferred £346,772 from the reserves of a subsidiary company to the General Reserve of the parent company. There is thus a balance available amounting to £575,541, to which must be added the amount of £10,989 brought forward from 1958. Your Board has given very careful consideration to the question of the final dividend to be paid for 1959. An interim dividend of 3 per cent less tax was paid in October, 1959, and your Board now recommends the payment of a final dividend of 4 per cent less tax for the year 1959, and at the same time, a special payment of 2½ per cent not subject to income tax. This special payment is possible because we have received during 1959 capital profit distributions from an associated company and a trade investment of more than the amount of the proposed special distribution.

CONSOLIDATED BALANCE SHEET

The investment of the Group in fixed assets now totals nearly £14 million.

During 1959 we took a share, with five of the country's other leading shipbuilders, in the acquisition of the business of Brown Brothers and Company Limited of Edinburgh, an old-established and noted company, manufacturing the famous Denny/Brown Ship Stabiliser, ship steering gears, steam catapults and other equipment for the Navies and Merchant Navies of the world. The figure of Other Trade Investments is consequently increased.

Stock in Trade and Work in Progress and Debtors have declined.

We have taken advantage during the year of favourable opportunities for the realisation of some of our Quoted Securities and placed on short term with Local Authorities much of the money so obtained. Creditors are reduced and it has not been necessary to provide so much for current taxation as in the previous year. In spite of these numerous changes the liquid position of the Group has been maintained.

Our Capital Reserves have been increased by profits on investments realised and by the special receipts to which I have referred above and reduced by our own special distribution to stockholders.

The Revenue Reserves of the parent company have benefited at the expense of a subsidiary company for tax reasons, and in view of the substantial relief from taxation following heavy capital expenditure both at Birkenhead and at Wednesbury during 1959 it has been necessary to provide large sums for tax equalisation. Loans to our steel making subsidiary have also been substantially increased.

PARENT COMPANY'S BALANCE SHEET

Apart from the changes to which I have already referred, the main changes in the parent company's Balance Sheet are reflections of substantial transfers made between the companies based on Section 20 of the Finance Act, 1953. These balances will, in time, be liquidated, but it is not possible to say now how long this will take.

CAPITAL COMMITMENTS

Contracts for capital expenditure at December 31, 1959, amounting to £2,638,000 were

£2,420,000 for our shipbuilding subsidiary and £218,000 for our steel making subsidiary.

CAMMELL LAIRD & CO. (SHIPBUILDERS & ENGINEERS) LIMITED

During the year this Company has again been engaged on a varied programme of new tonnage for both the Merchant Navy and the Royal Navy. Nine ships, totalling 86,523 gross tons, were launched during 1959 and four ships, totalling 51,518 tons, were completed.

The highlight of the year was the launching of the RMS *Windsor Castle*, which was performed by Her Majesty Queen Elizabeth the Queen Mother on June 23rd last, and the liner is now approaching completion. Other work in progress includes the prototype guided missile destroyer HMS *Devonshire*, and a 65,000 deadweight ton tanker for Shell Tankers Limited, which will be the largest vessel of this type to be completed at our Shipyard.

The engineering department has built five sets of steam turbine double-reduction geared machinery and four large water-tube boilers. During the latter part of the year the gas turbine installation in the tanker *Auris* was completed and put into service. A full size mock-up of the machinery and boiler spaces of HMS *Devonshire* is also nearing completion.

As forecast in the Chairman's statement last year, ship repairing has experienced difficult conditions and with the small amount of work available the business that the Company has succeeded in acquiring has been undertaken at very competitive prices and it is unlikely that there will be any major improvement in this sphere of activities until there is an improvement in the shipping position generally.

During the year both the new construction and ship repairing departments received a very severe setback due to the strike which occurred as a result of a demarcation dispute last summer. This resulted in a prolonged stoppage of work from April 27th until July 2nd affecting the delivery of three ships which should have been completed in 1959, as well as causing a very considerable reduction in the Company's profits. It cannot be emphasised too strongly the great harm which such strikes cause to the future prospects of the Company's business and consequently to the livelihood of its employees and it is to be hoped that these stoppages can be avoided in the future.

During the year the various schemes under Phase I of the reconstruction have proceeded according to plan. The new plating sheds and additional welding bay facilities, which give greatly improved working conditions, came into production towards the end of the year and I would like to thank the management and all those who work in these shops for the excellent way the changeover from the old buildings to the new ones was effected with the minimum of interference with production. With the exception of the new dry dock, which it is expected will be completed about the middle of 1961, the remainder of Phase I should be completed during the course of the current year.

Although the immediate future prospects for the shipbuilding and repairing Industry are far from favourable I feel confident that with the new facilities and up-to-date production methods, combined with the full co-operation of all concerned, we should be able to compete successfully for whatever business is offering.

It is with great pleasure that I place on record our satisfaction at the award by Her Majesty the Queen of the MBE in June, 1959, to Mr Archibald Lewis Lane, Leading Draughtsman in the Company's Engine Drawing Office.

THE PATENT SHAFT STEEL WORKS LTD. (FORMERLY THE PATENT SHAFT & AXLETREE CO. LTD.)

1959 has been a difficult year for this Company. To the operating loss of £214,333 had to be added £280,928 for depreciation and £394,237 in respect of interest upon money borrowed. To obtain the most favourable tax position for the Group this loss has been met by Subvention Payments to The Patent Shaft Steel Works Limited.

I have already mentioned the death of Sir Archibald J. Boyd. My colleague, Mr. P. B. Hunter, was elected Chairman in his place on July 14, 1959.

As my predecessor explained last year, when 1959 opened, the new plant was nearing completion and all departments of the Works were working short time owing to scarcity of orders. Work on the new plant has continued during the year. Towards the end of the first six months, the new Plate Mill came into operation and the old Plate Mill was closed down on June 13, 1959. Delay in the delivery of certain cranes prevented final completion of the new mill before the end of November.

The first of the existing steelmaking furnaces was redesigned and converted to oil-firing and became operational on August 26, 1959, while the second of the new oil-fired furnaces started making steel on October 21, 1959. Since the end of the year the second old furnace has been converted and is now making steel. Work on the conversion of the remaining two of the old furnaces is in progress, but it is not anticipated that these two furnaces will both be making steel before the middle of this year.

Scarcity of orders and short-time working continued throughout the first six months, but the position then improved and by the end of the year the Company had, and still has, a satisfactory order book.

Neither the planned output from the new plant nor the maximum output of Bars and Sections from the Monway Works has yet been achieved, nor can it be achieved until the furnace conversions are completed and the supply of steel improves. Output and efficient operation have been further limited by the usual difficulties with new plant and finding and training the additional suitable labour needed, a task in which the Company has so far, in face of the current scarcity of labour in the area, been only partly successful.

It has been found necessary during the year to make a number of organisational changes. Mr Basil Prichard, who was Managing Director, resigned from that appointment on December 7th, 1959, and has assumed responsibility for the sales side of the business, remaining, I am glad to say, on the Board. He has, since the end of the year, opened a new sales office for the Company at Edgbaston in the Birmingham area. Mr Bryan Bruce-Gardner, who joined the Board in October, 1957, has taken charge at Wednesbury as General Manager and is in course of reorganising the production and administrative sides to suit the modern plant which the Company now operates.

The Board and the Management have been, and still are, making great efforts to overcome all the difficulties encountered during the year and, though the corner has not yet been turned and there is still much to do, there is evidence that they are succeeding.

As for the future, the order position remains good and the operational efficiency of the plant is improving. On the other hand the Company's shortage of steel cannot be overcome before the middle of this year and there has also been a reduction in selling prices. In addition, the increase in Bank Rate has increased interest charges. Though I hope that the substantial loss shown in the accounts this year will be reduced next year, it is not possible for me to forecast with confidence the extent to which the improved efficiency, for which the Company is now striving, will be reflected in its accounts for 1960.

METROPOLITAN-CAMMELL CARRIAGE & WAGON CO. LTD.

The railway carriage building workshops of Metropolitan Cammell Carriage & Wagon Company Limited were well employed throughout the year. Output of diesel railcars, standard coaches and sleeping cars for British Railways continued and a contract for 349 coaches for the Reef electrified service of the South African Railways was completed.

An outstanding feature was the completion of the first two of five Pullman de luxe express diesel trains ordered for British Railways. The many new features in these trains will provide a higher standard of passenger comfort than in any existing stock. The first deliveries were also made of the 532 Piccadilly Tube cars for London Transport Executive and output of these cars will continue throughout the present year.

Shipments of wagons were made to Pakistan, Rhodesia, Sudan, New Zealand, Nigeria and Angola, but as a result of a general decline in demand the total output of wagons was considerably less than in recent years.

Fewer orders were received from overseas against intensified competition. An order was obtained from Associated Electrical Industries Export Limited for 35 mechanical structures for electric locomotives for the South African Railways. Although the Company received some further orders for diesel railcars, standard coaches and wagons for British Railways, the bulk of British Railways' requirements was allocated to their own workshops. The Company has been closely associated with representations to ensure that private contractors will have the opportunity of competing for British Railways' further requirements of carriages and wagons.

The Company's bus building factory had a satisfactory year. Orders received included 110 Olympic single-deckers for Cuba and 33 of the same type for Jamaica, 150 single-deckers for Ghana and 50 for Madrid. Further evidence of the success of the "Atlantean" rear-engined double-decker was provided by the receipt of orders for 140 more of this type for the home market and two have been ordered for trial in South Africa. The total number of buses delivered was greater than in 1958 and included shipments to Ceylon, Jamaica and Spain.

ENGLISH STEEL CORPORATION LTD.

The Operating Companies worked much below capacity for the first half of 1959. Latterly, however, the prosperity of the motor industry and the demand for consumer durables produced orders which enabled full production to be resumed in the lighter products. Plant for heavier products was fairly well occupied during the first half of the year in completing outstanding orders. The halt in initiation of heavy engineering developments following

financial restrictions in 1957, has entailed a very low order input for heavy products during 1959 and at the end of the year the volume of work in hand for such products was much less than that with which the year commenced.

Steel production for the Group was 464,197 tons, a decrease of 41,463 tons compared with the previous year.

Competition in export markets was again severe, especially from the Continent, but some substantial orders from China helped to offset reduced sales in traditional markets.

In the Heavy Forge the full effect of the restrictions in investment in heavy capital equipment was felt in the latter part of the year. The shipbuilding industry is a large consumer of heavy forgings and orders fell with the declining activity in the shipyards. The retarding of new power station developments and the change from thermal to nuclear plants also lessened the demand for large forgings and there was a marked fall in requirements from both the electrical and general engineering industries. No change in this position in 1960 is yet evident. In contrast, the Drop Forge producing small mass-produced forgings was extremely busy at the end of the year. Much of its output is in the form of components for motor vehicles and tractors for which there is a heavy demand and the provision of greater capacity for the production of drop forgings may be necessary.

During most of the year a limited volume of orders for general engineering castings was available, and restricted railway wagon building programmes throughout the world also reduced requirements for some of the specialised products of the Castings Corporation. The output for the year was, therefore, considerably less than in 1958. Prospects for 1960 are brighter; large orders were received towards the end of 1959 for one-piece bogie frames which will largely occupy during 1960 the specialised plant for the product. A considerable number of heavy castings are required for the new rolling mill plants to be erected in South Wales, Scotland and elsewhere and the capacity for heavy castings is well filled for the ensuing twelve months.

Whilst the plant for railway spring production was very lightly loaded, road spring plant was fully occupied in the later months of the year. The new Tinsley plant, operative in 1960, will be able to cater for the anticipated increased demand for road springs.

The Rolling Mill plant was operated at about two-thirds capacity until the middle of 1959. Subsequently, the demand for rolled products increased remarkably and at the end of the year the plant was working to capacity and there were orders on hand to enable production to continue at maximum rate in early 1960.

Limited world wagon replacement programmes have much reduced orders for railway wheels and axles which are the principal products of Taylor Bros. and there is little prospect of any increase in demand during 1960. The labour force has been reduced and further reductions would have been necessary had not substantial orders been obtained from China, a market not supplied for many years.

Due to lack of orders for new ships, both the Foundry and Forge at Darlington have worked well below capacity in 1959. An increased volume of orders for both forgings and castings —particularly of special types—is being obtained from the electrical and general engineering industries.

The plant erected in Canada by Canadian Steel Wheel Ltd., in which English Steel Corporation has a 50 per cent interest, was opened by Mr Duplessis, Premier of Quebec, in June, 1959. Due to restriction in purchases by the two principal Canadian Railways, sufficient orders for wheels have not been obtained to enable it to work to capacity.

The South African subsidiary, Steel Wheel & Axle South Africa (Pty.) Ltd. has had a successful year, but orders from the South African Railway Administration have not been adequate to keep the plant fully occupied.

Firth-Vickers Stainless Steels Ltd. had a very successful year and benefited considerably from the lifting of restrictions on credit facilities. Much of their output is used in the manufacture of household equipment and motor cars for which there is an expanding demand. Substantial expenditure has been approved for increasing the capacity of Shepcote Lane Rolling Mills Ltd., a subsidiary company of Firth-Vickers Stainless Steels Ltd., and for an increase in the Company's own plant for the production of stainless steel sheet, strip and bar. The forward position appears excellent.

It has been decided not to proceed with the heavy forgings development at the new Tinsley site. Consideration is now being given to another stage of the Tinsley development which includes additional melting plant and new rolling mill equipment for the production of alloy and special steel billets and bars.

The report and accounts were adopted and the dividends, as recommended, were approved.

Admiral Sir Michael M. Denny, GCB, CBE, DSO, and Mr J. C. Mather, JP, were re-elected to the Board and the remuneration of the auditors, Messrs Cooper Brothers & Co., having been fixed, the proceedings terminated.

NORTH MALAY RUBBER ESTATES

The twenty-eighth annual general meeting of North Malay Rubber Estates Limited was held on May 30th in London, Mr R. F. Burt (the Chairman) presiding.

In his Review of the year's operations, the Chairman outlined the results for 1959, and, commenting on the sale of Kuala Dingin Estate (a property of 1,200 acres) said that the Board had no intention to sell any of their properties. However, late last year they received an offer for Kuala Dingin, which they turned down, but subsequently the offer was increased to no less than £250 per planted acre, an abnormal price which the Directors felt could not be turned down.

He added: Out of the total proceeds of Kuala Dingin ($2,600,000 or £303,333) the Company made a capital profit of £218,593 which, with the small credit at Capital Reserve allowed us to pay a tax-free dividend of 1s. 9d. per 2s. share. Our future profits will have to bear the heavy charge of replanting without the help of Kuala Dingin profits, and we therefore propose that the cost of replanting shall be met out of the accretion of undistributed funds which Kuala Dingin has provided.

I need only make a brief reference to the offer by Henrietta Rubber Estate Limited to acquire the shares of our Company, acceptance of which my colleagues and I advocate. The proposed group will be a strong one and will allow of development which each company might find onerous to undertake separately.

The report was adopted.

TIMOTHY WHITES & TAYLORS LTD.

879 BRANCHES THROUGHOUT GREAT BRITAIN

Extracts from MR. G. I. RUSHTON'S STATEMENT AT ANNUAL GENERAL MEETING, 26TH MAY, 1960

SUBSTANTIALLY INCREASED TURNOVER AND PROFITS. Turnover in both Sales and National Health Service prescriptions was again a record for the Company. Trading profit of Group amounted to £2,073,351 compared with £1,859,573 in 1958.

REVALUATION OF PROPERTIES. At Annual General Meeting in 1959 it was stated that Freehold and Leasehold Properties of Company and Subsidiaries were being revalued. Effect of the revaluation has been shewn in Accounts. In Company's Balance Sheet Capital Reserves have been increased by £2,138,296 and in Consolidated Balance Sheet by £4,183,431. Out of this Reserve £705,735 has been written-off Goodwill, entirely eliminating this item from the Consolidated Balance Sheet.

TRANSFERS TO RESERVES. £120,000 to meet estimated liability in respect of pensions not fully provided for under Company's existing pension scheme. £250,000 to General Reserve and £20,000 to Development Reserve.

INCREASED FINAL DIVIDEND. Final Dividend on Ordinary Shares of 17½ per cent less tax, making 27½ per cent less tax for period, compared with 20 per cent less tax in previous period.

CAPITALISATION ISSUE. Proposal is to issue one new Ordinary Share in respect of each Ordinary Share held. Capital Reserve in Consolidated Balance Sheet will, after the capitalisation issue, stand at £1,938,730 and General Reserve at £826,688.

EXPANSION PROGRAMME. Stores at Glasgow and Ipswich opened before Christmas are trading satisfactorily, and those at Middlesbrough and Liverpool will be opened during this year. During year five other shops opened and a further fifty closed. Main effort during 1960 is in alterations and extensions to existing branches. An ambitious programme is being undertaken, thirty branches being the subject of major alterations.

PROSPECTS FOR CURRENT YEAR. Turnover to date well maintained and no reason to anticipate that results for current year will not at least equal those for past year.

THE AUSTRALIAN ESTATES COMPANY LIMITED

A SUBSTANTIAL IMPROVEMENT

SIR DENYS LOWSON ON THE EFFECTS OF A BETTER SEASON

The Annual General Meeting of The Australian Estates Company Limited will be held on June 22nd in London.

Sir Denys Lowson, Bt, the Chairman, in the course of his review, which has been circulated to stockholders, says:

ACCOUNTS

Last year in reporting a gross trading profit of £738,338 I had to refer to drought conditions and a much reduced price of wool; while the sugar industry was affected by the necessity to restrict production under international Agreements. In spite of the fact that further restrictions were imposed in 1959 on the production of raw sugar in Australia, I am pleased to be able to report gross revenue for the year 1959 of £1,240,896, or nearly double the amount in 1958. After taking into account depreciation, interest on our Loan stocks and taxation, and after bringing back £42,000 in respect of taxation provisions no longer required, the consolidated net profit amounted to £468,846 compared with £239,785 in 1958. Of this profit there has been retained by our subsidiaries £214,646 leaving a net profit in the books of The Australian Estates Company Limited of £254,200.

A further £22,400 has been allocated to Staff Provident Fund to make good the loss in effective value of that Fund owing to further depreciation in the purchasing power of Australian currency during the past year. We have made the usual transfer to Debenture Redemption Sinking Fund and we have also transferred £40,000 to General Reserve, which sum is sufficient to cover the first year's redemption requirements of the 6½ per cent Convertible Secured Loan Stock 1971-76.

Stockholders will be aware that the conversion rights attaching to that stock expired in July last year; and commencing in July this year the Company has to redeem annually £40,000 nominal of such stock. It will be seen from the Balance Sheet that in 1958 and 1959 a total of £47,672 of stock was redeemed, so that the Company's redemption obligation for the current year has already been met in full.

Finally we propose to pay a dividend of 8 per cent and a bonus of 2 per cent on the Ordinary and "A" Ordinary stock, which together require £128,579. The Directors are glad to be able to recommend the restoration of the distribution to the level ruling in respect of 1957; and the payment of an additional 1 per cent which may be said to come largely from the good cattle profits arising through unexpected demand from America.

After making these appropriations and allocations to reserve it will be seen that the amount to be carried forward by The Australian Estates Company Limited and its subsidiaries is increased by over £200,000, from £581,285 to £781,364.

TAXATION

I am again sorry to have to report that the Chancellor of the Exchequer has not thought fit to remove the anomaly arising from the treatment of overseas subsidiaries of an Overseas Trade Corporation on a different basis to overseas branches. Many influential bodies have pressed the case for amending the Overseas Trade Corporation legislation in this way; not least because of the importance in this day and age of carrying on business overseas whenever possible through subsidiary companies incorporated in the overseas country and with local participation both as Directors and also often as shareholders.

So far, however, the Chancellor has been adamant, without giving any adequate explanation of this strange anomaly.

PASTORAL—SHEEP

New South Wales and Queensland Sheep stations experienced generally favourable conditions throughout 1959; although Mount Morris and Oolambeyen both had to supply supplementary feed towards the close of the year. Some Queensland properties had relief rains in December, but others missed. Generally all the sheep properties in both States needed good general rains early in 1960.

Better lambings produced 17 per cent more lambs, and the 1959 wool clip was 331,000 lb heavier. Mortality this year was slightly lower. Terrick Stud polled and horned rams had a number of successes at country shows; their fleeces won several awards, and in particular that for Grand Champion Fleece of Queensland at the Brisbane Centenary Exhibition.

Last year I mentioned that Bonus Downs was due for resumption in December 1960. Kyabra as well as a small area of Thylungra, and 45,000 acres of Mount Morris, are also due to be resumed at any time. Following dry conditions in 1958, the Queensland Government granted 5-year extensions of leases to some properties where drought hardship had been established. The Company obtained these extensions for the main areas of Mount Morris and Thylungra, and for Mount Howitt and Chatsworth. The Lands Department have also informed us that a 40-year lease will be granted to Terrick Stud, near Blackall.

PASTORAL—CATTLE

On the cattle side, the selling market has never been more favourable.

Four new leases, Alcala, Longwater, Burnham and Hillingdon, were acquired during the year; thereby increasing our carrying capacity by 7,500 head.

Seasonal conditions were generally satisfactory, although Mount Howitt had low rainfall and very light flooding, and was unable to play its usual part as a fattening depot for the breeding stations. Brandings were satisfactory except for Chatsworth, which suffered from the effects of the poor season in 1958.

SUGAR

Australian production of raw sugar in 1959 was 1,288,000 tons, being some 124,000 less than in 1958; of this total 1,217,000 tons were produced in Queensland, compared with 1,354,000 in 1958.

All Queensland sugar producing areas experienced a favourable season with the result that, for the second year in succession, cane available for harvest was in excess of available sugar markets, and it was therefore again necessary to restrict sugar production. Consequently a large tonnage of cane had to be left unharvested.

The proportion of the raw sugar output exported in 1959 was approximately 56 per cent; Australian home consumption accounting for the balance of 44 per cent. The British Commonwealth Sugar agreement has again been extended for another year; and will therefore now operate at least until the end of 1967.

Kalamia Mill crushed 325,000 tons of cane, compared with 376,000 in 1958; at Pleystowe Mill, 288,000 tons of cane were crushed, compared with 363,000 in the previous year. Both mills achieved a high standard of efficiency. Cane crushed from the Company's cane farms at Kalamia amounted to 16,900 tons, compared with 19,900 tons in 1958.

Bulk sugar handling operated at Mackay, Lucinda Point, Bundaberg and Townsville; and the terminal at Mourilyan is expected to be ready for the 1960 season. Cairns is now the only major sugar port still using the "bag" system; this arrangement being to suit the convenience of certain overseas customers who are still not equipped to handle sugar in bulk.

AGENCY

Sales of wool through the Brisbane and Melbourne stores totalled 182,600 bales; an increase of 19,000 bales over the previous year. Average values were from £3 to £4 per bale higher.

Turnover of sheep and lambs improved considerably; but cattle numbers were lower. Stock values generally were higher, and cattle market prices were particularly good following strong demand from the USA.

The increase in the amount of wool sold by Melbourne has made additional space at the wool store a necessity, and for two years we have been giving careful study to the question of an extension. Our studies have been directed towards the greatest economy in use of space, coupled with the maximum use of mechanisation and modern methods of fire protection.

When our existing store was erected in 1939 a new standard for such buildings in Australia was established. Its equipment has been kept up to date, and it has attracted favourable comment from our own clients and from others interested in the industry. The new extension, planned to allow the display of an additional 1,650 bales, together with storage for another 18,000 bales, will maintain the Company's high standard. Building was commenced at the end of March, and is expected to be completed in November, 1960.

FARMING AND PASTURE IMPROVEMENT

We again thank the Universities, the Commonwealth Scientific and Industrial Research Organisation (CSIRO), and the Departments of Agriculture and Stock in Queensland and New South Wales, for the valuable assist-

ance they have given the Company over the past year.

On the pastoral side the Company has persevered with its Queensland sorghum conservation work, and has also developed more dry pastures in New South Wales, particularly at Raby. The dry lucerne areas at Raby have done well; and apart from beneficial grazing, the new lucerne areas produced 468 tons of hay during 1959. Extensions of Tyrie dry lucerne country will be made in 1960 as results here so far, although not as good as at Raby, are encouraging.

Dagworth was only able to conserve 200 tons of sorghum silage, but the crop gave valuable grazing; at Terrick Stud the position was much the same, though here we were also able to pit 525 tons and obtained useful grazing. In addition, a good crop of 90 tons oaten hay was produced. There was insufficient rain or flooding at Thylungra to attempt any work there. Buffel grass work has continued and there are signs of some success in small trial areas at Dagworth. Terrick Stud will do more in 1960; but so far, Thylungra, owing to drought and dry conditions, has not had any results from the trials that have been carried out there.

At Tanderra some 14,000 acres of brigalow country have been razed; 8,700 acres have been fully cleared and sown to improved pastures. The remainder should be sown during 1960. The cultivated area at this station has already provided Sudan grass grazing for some of our stock; while other areas have been prepared for oats.

Granada has in hand experimental areas for lucerne under irrigation, and oats, and has continued buffel grass planting. Other cattle stations have persevered with their efforts to spread buffel grass in various areas.

WOOL

It is estimated that 4,973,400 bales will be received into Australian Wool Selling Brokers' Stores for the Season 1959/60. If this figure is achieved, production will be a record and exceed that of the Season 1956/57 when receipts totalled 4,886,897 bales.

It is expected that the quantities in each State will be as follows:

	1958/59 Actual	1959/60 Estimated
New South Wales	1,636,481	1,745,000
Victoria	1,293,928	1,425,000
Queensland	724,787	770,000
South Australia	542,041	525,000
Western Australia	440,009	406,000
Tasmania	97,655	102,400
	4,734,901	4,973,400

Although the number of bales expected to be produced in Australia constitutes a record, the quality of the clip varied to a greater extent than usual.

In Queensland, South and Western Australia, the staple from certain areas lacked length and density and carried more dust, due to seasonal conditions. From other divisions in these States wool was up to normal standard. From Tasmania the clip was less well grown and thinner than in most years. Generally the wool produced in New South Wales and Victoria was better grown than in the previous year and carried more condition.

Over the last five years the number of bales sold in Australia and the amounts realised are as under:

Season	Bales	£(A)	Average per lb
1955/56	4,297,338	335,894,936	61.23d.
1956/57	4,886,897	483,030,133	79.99d.
1957/58	4,374,694	337,770,553	62.60d.
1958/59	4,790,282	295,652,526	48.57d.
1959/60 (Est.)	4,973,400	368,000,000	59d. (Est.)

Indications are that the largest purchaser of the Australian clip this season will prove to be Japan, with the United Kingdom filling second position and France third. Eastern European Countries have at times been prominent and support from this quarter has, on occasions, resulted in increased prices for the types of wools which met their requirements.

The following clean costs on Australian Show Floors illustrate market movements during the current season:

	Average 64's	Average 56's
1959—June	122d.	100d.
September	114d.	96d.
December	117d.	95d.
1960—January	116d.	96d.
February	108d.	91d.
March	117d.	97d.
April	117d.	97d.
Early May	114d.	91d.

AUSTRALIAN WOOL MARKETING

During 1959, arrangements were completed to extend the selling season so that sales would take place in every month of the year. Arrangements have now been made for auctions to be held in mid-July, while the 1960-61 season will open at the end of August as usual.

The Commonwealth Government has agreed to the establishment of a greasy Wool Futures Market in Sydney, and operations commenced early in May. This type of market is a new venture in Australia, and its activities will be watched with interest.

WOOL PROMOTION

Following the displays which this Company held in 1958, we again undertook similar exhibitions in the past year at Brisbane and Roma in Queensland, Inverell in New South Wales, and Stawell, Hamilton and Bendigo (the latter with Frank A. Hill & Co.) in Victoria. Early this year we assisted with a wool exhibition at Armidale, NSW, and at our Terrick sheep sale in April a wool display was featured by the Company.

At Buckiinguy the Company joined the local Country Women's Association in presenting a mannequin parade of woollen garments at the station, which attracted considerable local interest.

All these exhibitions covered a range of woollen garments and materials and were organised in conjunction with local authorities and trade interests. While these various displays were not large, comments we have received lead us to think that they have been useful in promoting interest in the wider use of wool. It is felt that wool promotion is most essential in view of the vigorous promotion and selling campaigns carried on by the synthetics industry in Australia and overseas.

GENERAL

In previous reviews I have stressed the importance of season and prices in relation to the Company's results and to the pastoral industry as a whole. I am pleased to say that in 1959 the season was generally good, cattle prices were exceptionally high, and the price of wool increased.

The overall average Australian greasy wool price was 48d. in 1958/59 and firmed to approximately 60d. in 1959/60. Though this is a considerable improvement, it is not high by comparison with prices in earlier postwar years. Costs—particularly in wages—are meanwhile steadily increasing.

During 1959 the Arbitration Court granted a 15s. per week Basic Wage Rise; since then the metal trades margins have been increased by 28 per cent and these increases have been spread widely throughout Australia. Higher costs cannot be passed on to the consumer in our industry as our sales of stock and wool are governed by market rates.

The steady rise of costs has been particularly felt in the pastoral industry, but it is not confined to this field, and is a general condition. The main problem of the whole Australian economy is inflation. The Government has recognised this and has taken measures which, it is hoped, will control the position. They are primarily aimed to reduce the pressure of demand.

It is hard for a developing country to avoid some measure of inflation, and the economy in general is very strong. Employment and production are at high levels and increasing, while all branches of trade are active; great activity prevails on the Stock Exchanges in Australia, and prices of stocks are high. There is a general air of prosperity, progress and confidence.

DIRECTORATE

Since the close of the year, we have suffered a very sad loss through the death of the Marquess of Carisbrooke. He had been a Director for more than ten years, and brought great wisdom and experience to our councils. His passing will be greatly mourned not only by all his colleagues on the Board, but also by a wide circle of friends.

During 1959 two of our London Directors visited Australia. Mr Peter Revell-Smith arrived in Melbourne in the middle of September and was in Australia until the end of October; while Sir Keith Officer was there from the middle of November until the beginning of February.

During their stay in Australia, Sir Keith Officer and Mr Revell-Smith visited the two sugar mills, a number of Queensland sheep and cattle stations as well as branch offices in Queensland and Victoria. Sir Keith also visited some of our New South Wales sheep properties.

The Board feel that there is great value in these visits, which enable them personally to study and advise on the Company's various developments and problems in Australia, to get to know as many as possible of the Company's leaders and managers; and to impress on them the feeling that their difficulties are understood and their successes are appreciated by the Board in London over twelve thousand miles away. Fortunately, the great improvement in air travel today assists the maintenance of contact with our whole Organisation in Australia; which in these days is so vital for any Company operating in another land which now has its own traditions, culture and developments.

STAFF

Our Agency staff in Victoria, New South Wales and Queensland have had to meet

increased competition throughout the year, and have responded well and energetically. Staff of the sheep and cattle stations have continued to give of their best. At the sugar mills, due to limitation of production, our main efforts have been towards increased efficiency, and our studies to improve methods have been continuous.

The present high cost of staff salaries means that, more than ever, increased personal efficiency is essential. The Company has continued its policy of staff training at all levels throughout the Company, and it is hoped that increased management skill may offset to some extent the large increases in staff costs. All the Company staff have given their usual loyal and enthusiastic service.

Any reference to the fine service rendered by all the Company's organisation would not be complete without special recognition of the outstanding service which Mr G. S. Colman, our Australian Director and General Manager, has again rendered during another busy twelve months. The Company owes much of its success at the present time to his courage, vision and foresight over a long period of years.

In expressing our thanks to him, we are also most grateful for the good work rendered by the Assistant General Manager, Mr G. H. Colman, who has continued to develop his knowledge and experience of the business; and now occupies with notable success an important position in our General Management.

FUTURE PROSPECTS

Prospects for 1960 have been generally improved by rain falling throughout the Eastern States, at the end of April and beginning of May.

In Victoria, the situation is considerably changed. Good rains have fallen in almost all parts of the State, and although cold weather may affect growth, stock should now be comfortably carried through the winter, and a good spring ensured.

Dry conditions have been relieved by rain at all of the Company stations in New South Wales, and good falls at Oolambeyan—where conditions have been extremely dry—were particularly welcome. Provided normal winter rains are received, the situation should be satisfactory.

In Queensland there has been no general widespread wet season. However, all our stations received the recent rain, and while seasonal conditions could be considered light at most of the stations, the position is generally satisfactory. Mount Morris and Chatsworth are dry, and we have reduced stock numbers considerably at these two stations.

Wool prices this year are giving a reasonable although not a highly profitable return, and have not shown the large fluctuations of previous years.

The overseas meat market is firm for beef; although the American market is not likely to be as strong as in 1959.

Production at the sugar mills is limited as a result of the International and Commonwealth Agreements; but the recent increase of 1d. per lb. in the domestic price should help the profits of both mills, and provide a reasonable return on the very substantial capital outlays which we have made during the last few years.

In spite of the fact that costs continue to rise, in particular owing to the ever increasing wage awards, we hope to be able to present a satisfactory report to you in twelve months' time.

In extraordinary session the General Meeting also resolved to increase the Capital from Lire 750 million to Lire 1,500 million.

REED & SMITH, LIMITED

INCREASED TRADING PROFIT

The annual general meeting of Reed & Smith, Limited was held on May 27th at Exeter, Sir Arthur C. Reed (chairman) presiding.

The chairman, in the course of his speech, said: It was with pleasure that your Directors were able to forward to you the Annual Accounts for 1959 showing an increase in the trading profit. This satisfactory result was achieved in spite of the difficulties which confronted the Paper Industry during the year.

I reported last year that the lowering of paper prices in the early months of 1959 adversely affected our margins. A few weeks later, the strike in the Printing Trade temporarily reduced the demand from certain of our mills. Business showed a marked improvement in the fourth quarter, however, and thanks to the modernisation of our mills in the last few years, we were able to meet all the calls made upon us. In all the circumstances, it is felt that the improvement of over £74,000 in our trading profits is satisfactory.

With a view to conserving our resources for further capital development which your Board considers essential to meet continuing competition, there has been transferred from Profit & Loss Account to General Reserve £192,657 and this Reserve now stands at £535,000. In view of the better results, your Directors recommend a Final Dividend of 8 per cent less tax, making 12 per cent for the year, which compares with an equivalent of 10½ per cent paid last year.

There has been an increase of some £114,000 in our investment in Subsidiary Companies. This represents the cost of acquiring the whole of the share capital of two businesses during the year, the larger of which is an engineering concern whose facilities will be of considerable value to the Group in the maintenance and development of our plant and machinery. The other is a small business which fits very usefully into our organisation.

STRONG LIQUID POSITION

Turning to the Consolidated Balance Sheet, you will see that our liquid position is strong with an excess of current assets over current liabilities of a million pounds, an improvement of some £167,000 on the position a year ago.

Our Sales Organisation has been operating since last July from new and larger offices in London, and there is no doubt that greater efficiency and better customer service have ensued from the change. Business at our Manchester and Glasgow Offices continues to expand.

Whilst the opening months of 1960 have shown an appreciable improvement in our trade, we have to face very shortly the effects of the initial reduction of Tariffs by the "Outer Seven" under the European Free Trade Area Agreement. The natural resources of the Scandinavian Member-Countries, which give them the advantage of low production costs, will lead to greater competition from their exports of paper to this Country. Our Group's policy of expansion and greater efficiency, however, coupled with our specialisation and variety of product have, I feel, strengthened our position to meet these difficulties and I think we can look to the future with a reasonable degree of confidence.

The report and accounts were adopted.

SPILLERS LIMITED

TURNOVER REACHES RECORD FIGURE OF £89 MILLION

OUTPUT INCREASED IN ALL SECTIONS

ACQUISITION OF SPRATT'S PATENT LTD.

MR WILFRED D. VERNON ON A DECADE OF DEVELOPMENT AND GROWTH

The seventy-third annual general meeting of Spillers Limited was held on May 27th at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, EC2, Mr Wilfred D. Vernon (the Chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended January 31, 1960:

RESULTS FOR THE YEAR

I am glad once again to report a satisfactory outcome of the year's operations. Output has increased in all sections of the Group's activities and the total turnover has reached the record figure of £89 million.

The profit amounted to £4,995,000, of which taxation absorbs £2,500,000, leaving a net balance for the year of £2,495,000. This is some £500,000 more than the corresponding balance for the previous year. In these circumstances the Directors are able to propose a substantial increase in the total distribution on the ordinary stock made up of the interim dividend of 2½ per cent already paid on the £13,125,924 of stock then in issue and (as forecast) a final dividend of 7½ per cent on the £19,688,886 of stock now in issue. This would represent a total distribution for the year ended January 31, 1960, of 9¼ per cent on the augmented amount of ordinary stock and compares with the equivalent of 6¾ per cent on that amount of stock for the preceding year.

On the basis proposed the net amount distributed for the year (including preference and minority dividends) would be £1,185,000, leaving £1,310,000 for retention in the business.

The financial outcome from milling showed some improvement. There was a small increase in the quantity of flour sold; wheat prices fluctuated very little; and ocean freight rates were relatively steady throughout most of the year but with some hardening towards the close. Overall costs rose in the early months of this year and reluctantly we were obliged just recently to raise prices in order to obtain a reasonable operating return.

On the animal foods side there was again a significant increase in tonnage sold but trading was on the basis of lower margins. We look for continued expansion on this side of the business and I am confident that this will be so as a result of the considerable expenditure which has been laid out on research, experiment and the advisory services at the disposal of our customers.

There was an increase of output in the baking section though most of the benefit from this was absorbed by a further rise in wages and other costs. Constant effort is directed to reducing costs through modernisation and close control, but it is difficult wholly to offset the rising trend which had to be reflected a few weeks ago in a small increase in the price of bread—the first for some three years.

Results from other domestic operations have also been satisfactory but call for no special comment.

In the overseas sphere the Rhodesian Milling Company (Private) Ltd. had a reasonably satisfactory year. This company as I indicated last year, has become an enterprise of considerable size but its results are not reflected in our accounts since the policy has been not to pay dividends but to apply the earnings in further development. In Australia our associated company John Darling & Sons (Australia) Ltd. showed some falling off in earnings as a result of exceptionally severe competition in its milling and allied activities.

GROWTH OF THE BUSINESS

I think this is an appropriate time for me to comment upon the growth of the business—particularly over the last decade—and the policy which has underlain it. Put briefly, and with some over-simplification, this has been the consolidation of the flour milling section and the steady expansion of the baking, animal foods and pet foods sections.

MILLING

The milling section has to be considered against the background of a persistent fall in the *per capita* consumption of flour in this country. There has been a move towards a more varied diet following the withdrawal of food rationing and the rise in living standards in the later years of the post-war era. This, despite the intervening increase in population, has meant that the total consumption of flour in the United Kingdom is now rather less than it was immediately before the last war. Such a situation is not peculiar to this country as the same state of affairs has occurred in most, if not all, of the highly developed countries throughout the world. We are playing our part in the industry's efforts to demonstrate to the public the nutritional qualities and economic advantages of bread as a foodstuff. On the manufacturing side our aim has been to streamline our milling operations by concentrating production in large strategically situated modern units which can obtain the greatest efficiency from equipment based on the latest techniques in regard both to manufacture and the handling of raw materials and finished products. To this end we have, since the war, closed a number of our older mills; modernised and extended others and built several new units to replace those destroyed by enemy action. In this way we have sought—and I think I may claim with some success—to place ourselves in the best position to meet the highly competitive conditions arising from the existence of some degree of over-capacity in the industry. From the technical standpoint I venture to say that there is no better equipped milling organisation in the western world.

BAKERY INTERESTS

At the same time we have carried out a complementary policy of substantially increasing our interest in baking. This, as I informed stockholders some years ago, has been done with the dual objective of obtaining some measure of stability in the level of our flour production and bringing us into more direct touch with consumer demand for the finished products of which flour is the principal raw material. In pursuance of this policy we have acquired a number of baking businesses operating throughout the country. In appropriate cases we have modernised and extended existing capacity or centralised production in new plants. Our direct interest in baking in no way alters our main business as millers which is to give the most efficient service to our customers in supplying flour of the best quality at competitive prices. Indeed our experience in the baking field will, we hope, enable us better to fulfil our responsibility as suppliers to the baking trade as a whole.

ANIMAL FOODS

The manufacture of animal foods—and particularly compound feeding stuffs—has long been a most important section of the business. Total production of compound foods in this country has greatly increased and has virtually doubled over the last 10 years alone. To maintain and increase our share of this trade we have constantly extended our numerous modern plants and are now constructing two new factories at Gainsborough and Aberdeen. The former will come into operation in June of this year and the latter should be in production by the end of this year.

On the pet food side our trade is continuing to expand, and in the manufacture of biscuits and meals we hold the leading place in the industry. Our recent acquisition of Spratt's Patent Ltd. should greatly strengthen our position. That company is well established in the manufacture of a full range of pet foods and we believe that the complementary nature of its business will facilitate the successful expansion of both companies' products.

RESEARCH

In company with these developments we have considerably increased the facilities for and personnel engaged in research in the fields of both human and animal nutrition. In my view this is essential in order to offer products which are in keeping with the most up-to-date scientific knowledge and to provide for the evolution of further new and attractive foodstuffs.

TEN-YEAR RECORD

All these factors have contributed to broadening the base of the business and increasing its efficiency. The extent of the growth is illustrated in the comparative figures for the last 10 years published with this report. It will be seen that over the period earnings have expanded with the increase in turnover and capital employed. Virtually all the additional capital required has come from our own resources and we have been conscious of the

fact that since this was effectively provided by the stockholders it is right that they should receive an adequate return on their increasing investment. I am glad that while still making substantial retentions from earnings for modernisation and development, it has been possible over the period to treble the gross distribution on the ordinary stock.

The effect of the considerable capital expenditure and increase in working capital financed internally has naturally brought about a change in the liquid position over the period. Since the end of the financial year we have incurred or are about to incur substantial capital outlay in the acquisition of Spratt's Patent Ltd. and otherwise in the future expansion of the business. This necessitates additional temporary borrowing and at the appropriate stage we shall proceed with the raising of more permanent capital.

CURRENT PROSPECTS

As to our prospects for the current year the volume of business has so far continued at a satisfactory level and I see no reason to expect any material falling off. Though we have to continue with some rise in costs and keen competition, I am hopeful that with the net benefit of new acquisitions the steady expansion of the business and the earnings therefrom will continue. The Directors intend, should circumstances then warrant it, to maintain the interim dividend at 2½ per cent but on the increased amount of ordinary stock now in issue.

VALUATION OF FIXED ASSETS

During the year an independent valuation of the fixed assets, which had been put in hand some time previously, was completed. It seemed to the Directors that it would be appropriate to give effect to this valuation in the Balance Sheet at January 31, 1960, by adjusting the book value of the fixed assets to conform with it and permanently to capitalise a large part of the resulting surplus by the issue of fully paid ordinary shares. This was approved by the stockholders at the extraordinary general meeting on January 29th last, and these transactions are incorporated in the Accounts now submitted to you. The Board consider that the Balance Sheet as amended by the valuation better reflects the capital position of the Group under current conditions.

BOARD OF DIRECTORS

As was announced earlier this year there have been some changes in the composition of the Board. Mr R. A. Twomey has retired after 40 years in our service during which he was untiring in his devotion to our affairs. It was on him, under Mr H. B. Vernon, that the principal burden fell of reconstituting the flour selling organisation to operate under competitive conditions following the end of the long period of Government control. Mr Twomey takes with him our gratitude for his contribution to the success of the company and warmest good wishes for a long and happy retirement. Two new appointments have been made to the Board in Mr H. W. Pratten and Mr W. M. Vernon, both of whom occupied senior positions in the Group. Mr Pratten was for many years Chief Accountant and is now Managing Director of United Bakeries Ltd. Mr Vernon was General Manager in charge of operations in the South East Area. We welcome them both, knowing that their experience of the business will be of the greatest value and I warmly commend confirmation of their election to the stockholders.

I should like to place on record our best thanks to Mr Hosegood for his services as Joint Managing Director and our great regret that he should be compelled to give up this office on grounds of ill health. We are all very pleased however that he has consented to remain a Director.

GENERAL

Our General Manager for the South West Area, Mr E. Corrin, retired on reaching retiring age and has been succeeded by the Honourable William Normand, who was formerly Deputy General Manager in the North West Area. Mr Corrin had spent nearly 39 years in our service and I wish on behalf of all of us to convey to him our appreciation of his work and our best wishes for the future.

To all the management, staff and workpeople throughout the Group I once more express the thanks of the Board and the stockholders for their co-operation and effort which play such an essential part in the success of our operations.

Lastly I should mention a change in the location of our Head Office. Since 1924 this has been situated at 40 St. Mary Axe, EC3, The growth of the business has resulted in the need for increased accommodation and we have accordingly moved to new premises at Old Change House, Cannon Street, EC4.

The report and accounts were adopted and the final dividend, as recommended, was approved.

The retiring directors, Mr W. D. Vernon, Mr L. Hosegood, Mr H. W. Pratten and Mr W. M. Vernon, were re-elected and the remuneration of the joint auditors, Messrs Impey, Cudworth and Co., and Messrs Deloitte, Plender, Griffiths and Co., was fixed.

VIGZOL OIL COMPANY

EXPANSION OF SALES

The Thirty-first Annual General Meeting of the Vigzol Oil Company Limited was held on May 31st at Ealing, Mr Percy Bilton, FInstPet, MSAE (Chairman and Managing Director) presiding.

The following are extracts from his circulated statement for the year ended December 31, 1959:

During the twelve months covered by the Accounts the sales of all products have expanded by a substantial margin. This increase has been achieved in the face of considerable competition which we have been compelled to meet by providing a greatly improved and increased field service throughout the British Isles.

This service to our customers and dealers, which is additional to the increase in the Sales Force mentioned in my last Statement, has necessitated the employment of specialists and the adoption of new sales policies. Increased costs in respect of wages, services and raw materials have also played their part and we have been unable to pass on such increases to our customers.

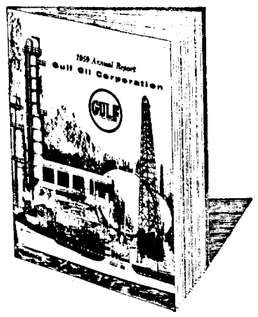
Consequently our Trading Profit shows a decrease from £125,079 in 1958 to £112,383 in 1959. Consolidated Net Profit at £61,213 compares with £64,257 in 1958.

Lubricating Oils.—Sales have again shown a noteworthy increase over the previous year. In particular Motor Oil Sales, where competition continues to be fierce, are making encouraging progress. Our new Diesel Fuel Additive VITASUL which was introduced last year, has been very well received and a satisfactory turnover in this product has been achieved. There is also a demand for VITASUL in foreign countries and shipments have been made to many, including the USA.

Exports have again shown a considerable increase, both from expansion in existing markets and from a gratifying penetration into new territories.

Agricultural Chemicals.—Our long association with the Agricultural Industry has enabled us again in 1959 to extend our penetration into this market.

Spraying Machines.—The demand for our Machines during 1959 was so encouraging that we decided to increase further our range of Medium Volume Sprayers. A new Machine, the YEOMAN 80, has now been introduced and is being well received.



Subsidiary Companies.—During the year your Company purchased the whole of the Share Capital of Liberty Oils Limited and it is anticipated that with the operational savings we will be able to make, this new subsidiary will add a satisfactory contribution to our Group Profits.

Our Dublin subsidiary and the Record Oil & Grease Company Limited have both made satisfactory profits for the year under review.

General.—Sales for the first four months of 1960 show an increase over 1959. Our sales reorganisation is largely complete and I anticipate that the full benefits of our new policies will begin to be felt during the latter part of the current year. Development costs of new products and the specialist training of new personnel take some time in recovery. Your Board therefore are quietly confident that the current year's trading should again show satisfactory profits.

The report and accounts were adopted.

1949-1959 A Decade of Record Progress at GULF OIL

Results of Gulf Oil's world-wide operations in 1959 reflected continued over-all progress. A comparison of the company's major financial and operational activities in 1959 and 1949 emphasizes Gulf's rapid growth over the past decade.

Net income in 1959 was $290,467,000—nearly triple the company's net income in 1949. Sales and other operating revenues totalled $3,170,847,000, compared to $1,123,885,000 in 1949. Based on current shares cash dividends increased from $0·45 per share to $0·97 during the ten-year period. Net production of crude oil and condensate produced rose from 20,000,000 tons in 1949 to 64,300,000 in 1959.

Financial and operational highlights for 1949 and 1959 are presented here.

CONSOLIDATED FINANCIAL DATA	1959	1949
Net Income	$290,467,000	$100,877,000
Net Income Per Share (Adjusted for all stock dividends and stock splits)	$2·90	$1·07
Cash Dividends	$96,876,000	$42,545,000
Cash Dividends Per Share (Adjusted for all stock dividends and stock splits)	$0·97	$0·45
Stock Dividends	3%	—
Total Assets	$3,576,318,000	$1,215,891,000
Working Capital (Current assets less current liabilities)	$690,656,000	$205,848,000
Sales and Other Operating Revenues	$3,170,847,000	$1,123,885,000
Capital Expenditures	$335,771,000	$168,421,000
Depreciation, Depletion, etc.	$260,845,000	$80,488,000
OPERATIONS DATA — IN LONG TONS *		
Net Crude Oil and Condensate Produced	64,300,000	20,000,000
Net Natural Gas Liquids Produced	1,500,000	200,000
Crude Oil Processed at Refineries	33,100,000	18,800,000
Refined Products Sold	39,000,000	18,800,000
Natural Gas Liquids Sold	4,500,000	300,000

* Operations data includes Gulf's equity in all operations in which the Company has an interest.

A copy of Gulf's report will be sent upon request to Gulf Eastern Company, Gulf House, 2 Portman Street, London, W.1, England.

MILK MARKETING BOARD

SALES STILL RISING

MR RICHARD TREHANE'S SPEECH

The annual general meeting of the Milk Marketing Board was held on May 31st, in London.

Mr Richard Trehane, the chairman, who presided, in the course of his speech said:

In the twelve months covered by our Report, milk supplies were similar in total to the previous year: the one was a very wet year and the other almost permanently dry in most parts of the country. For most of the period markets were favourable and as you know we sold a significantly higher quantity of milk in the liquid market. The trend of rising sales has now continued for more than two years and I am glad to report that currently sales are still rising compared with a year ago. Whilst we are pleased with these results, we must remind ourselves, however, that conditions are in our favour. There has been a steady rise in population and the real incomes of the people have increased, whilst the retail price of milk remains low compared with the price of almost any competing product. I am informed that the average working man today has only to toil for seven minutes for his pint of milk compared with twelve minutes twenty years ago. A great deal of work is going on in an endeavour to develop this market and our new Sales Division has made a very satisfactory beginning. We are pleased that this great but traditionally steady market has moved and is beginning to rise. We believe that the scope for further progress is enormous: and the cards are in our favour if we play them boldly and well.

FRESH CREAM MARKET

The fresh cream market has continued to show good progress and we are now selling about as much milk for cream as we were before the war. This is good but not nearly good enough. The dairy industry suffered heavy loss when cream was banned for a long period in the national emergency. The description of favourable conditions in the market which I have given for liquid milk apply even more to the prospective market for fresh cream. We are on the whole poor users of fresh cream and so many of us are not accustomed to its taste and flavour that we go around accepting substitutes without apparent comment and complaint.

CHEESE INDUSTRY

We are working closely with the dairy trade in these developments of our markets. The cheese industry is in good shape and we find that when English butter is available it has a ready sale to the public at higher prices than competing supplies from overseas. Acting on behalf of the producers of milk in this country and believing in the good prospects of expansion of our markets, the Board have devoted substantial sums to advertising, publicity and sales development during the last year. But we are convinced that much more should be done and that this will be profitable investment in the long term. The turnover of the industry is not less than 500 million sterling annually at retail prices—milk and dairy products provide nearly a quarter of the total protein food of the people.

I make a plea to the great distributive organisations—including the co-operative movement which plays such a prominent part in the milk industry—to be even more venturesome in their merchandising and selling methods. The distribution of food has been changing rapidly in recent years and our methods must march with the new trends. The scope and variety of our products, their presentation and packaging, require increasing attention. Constant research is necessary at the producing and processing end as well as in the market. Our milk and dairy products have the great initial advantage of being fresh farm foods and prices for these products are low and a good buy for everyone.

FARMERS' PROGRESS

The dairy farmers of this country have, it is agreed by all, made enormous progress in the last decade. Not only have they produced very much more milk but they have done so with only a very small increase in the size of the national dairy herd. The increase in the herd in ten years was 4 per cent whereas milk output was up by 18 per cent. The average yield per cow has risen by more than 100 gallons in the last decade and the latest forecast of 750 gallons for 1960 is a most commendable achievement. In the process of increasing efficiency on the farms, quite large numbers of small producers have abandoned milk production. We estimate that we have almost 40,000 producers less in our registers now compared with ten years ago. The dairy herds are becoming larger and the yield per cow is still rising.

As a marketing organisation we do our best to assist in promoting efficiency on the farms where I think we have had very considerable success, due greatly to the enthusiasm of the farmers themselves. The Board have promoted improvements in the national dairy herd by rapid extension of the artificial insemination service and the National Milk Recording Scheme has been a firm foundation for better breeding of our dairy herds. In these improvements which we have promoted in the dairy farms, we have found willing and even enthusiastic co-operation of the farmers. We are also reaching the stage when all the dairy herds in the country will be tuberculin tested so that we can soon claim that from both the health and efficiency aspects we shall have a national dairy herd second to none. In the fields of transport and marketing we continue to improve arrangements and to reduce costs.

PRICES

Prices paid to producers per gallon of milk have declined during the past five years; costs of the principal factors in production have increased. Efficiency in the industry has been increasing steadily but the reward of producers in real terms has declined over this period, during which most of the workers in the country have been improving their living standards.

At the review of guaranteed prices this year we had naturally expected that in view of the record of milk producers in recent years, the Government would have raised or at least maintained the level of the guaranteed price, particularly as cost factors were higher mainly because of wage increases. In the event, the decision was to reduce the guaranteed price for milk by a farthing a gallon. The Government, however, did agree to adjust the Standard Quantity, for which the price is guaranteed, by an amount equal to the increase in sales in the liquid milk market for 1959 compared with the previous year. We welcome this adjustment particularly as we are assured that this will be a feature of each succeeding review; we will do all we can to ensure that the adjustment will continue in an upward direction.

THE INDUSTRY'S VIEW

These are some of the factors that provide the background against which the present and future status of the industry must be considered, and in particular, are relevant to the attitude of the Government toward us. The result of the recent review of guaranteed prices and notably the indication of policy contained in the accompanying White Paper, make it necessary for me in turn to state the point of view of the industry. No one can deny that the existence of some measure of subsidy for milk and the interdependence of dairy farming and other products for which there are guaranteed prices entitles the Government to exercise some control of production trends.

We find it strange, however, that for some seven years the Government has been more concerned to restrict expansion in dairy farming than in any other product. It is even stranger when the subsidy on milk is less in total and in proportion than for any other major product and milk is the only one where the guarantee is limited to the Standard Quantity. This represents the amount of milk that is necessary to provide for the liquid market and an adequate reserve. It was fixed in the very different circumstances of 1953, and represented the quantity which it was felt desirable that our industry should produce. In accordance with Part I of the Agriculture Act of 1947 it is that proportion of our production to which the guaranteed price applies. We claim that the great changes that have occurred in our industry and our markets justify a review of the basis of the Standard Quantity. I reiterate that claim. The expansion that the Government would frown on is outside the range of the guarantee so that the economic consequences fall squarely on the producers. If the Government restricts its liability to a part only of our production, so must its concern with the part outside the guarantee be limited.

THE IMMEDIATE TASK

We have an industry whose vigour is second to none. It has shown great resources in pursuit of economic efficiency and in prosecuting markets. Let us have the freedom that is vital to progress without continued economic and doctrinal stricture.

We consider that our immediate task must be to sell in our most profitable markets of milk and cream even more than the likely increase in production. Producers have always backed us in this and we shall continue to devote more of our resources of skill, men, and money to this imperative aim.

OLIN MATHIESON REPORTS ON 1959

Olin Mathieson's 1959 Annual Report, now in the mail to 75,000 shareholders, characterizes the past year as one of "significant progress."

Sales were $702,032,000—a 17 per cent increase over 1958 and a record high.

Net Profits Amounted to $2.81 per Share, compared with 70 cents a share in 1958 when heavy non-recurring write-offs reduced the year's income.

Financial Position Continued to Improve with cash and government securities at the year end exceeding $100 million. Working capital of $259 million was at an all-time high.

Entry into the Aluminum Industry was Completed during the year, making Olin Mathieson the nation's fourth largest fully-integrated aluminum producer.

Long Range Development Programs which are now underway for each division include:

...Major expansion of organic chemical facilities.

...Additional chlor-alkali capacity and modernization of existing facilities.

...New fabricating equipment to broaden the aluminum product line.

...Expansion of pharmaceutical research and production facilities.

...Modernization of kraft pulp, paper and converting facilities.

...New production equipment for sporting arms and ammunition.

...Expansion of research facilities and intensification of all research programs. The 1960 research budget is the largest in the Corporation's history.

Highlights from Olin Mathieson's 1959 Annual Report

	1959	1958
Sales and Operating Revenue	$702,032,000	$601,398,000
Net Income	37,416,000	9,383,000*
Per Share	2.81	.70*
Capital Expenditures	30,190,000	48,192,000
Working Capital	259,249,000	241,475,000
Total Assets	839,170,000	786,802,000
Number of Shareholders	75,000	72,000
Number of Shares Outstanding	13,310,000	13,286,000
Number of Employees	38,000	38,000

*Net income for 1958 before write-off of special charges and gain from sale of investments was $53.5 million or $2.52 per share.

Copies of the complete 1959 Annual Report will be furnished on request.

THE NORTHERN ASSURANCE GROUP

STATEMENT BY THE CHAIRMAN

The following is an extract from the Statement by the Chairman, the Right Honourable Lord Glenconner, which has been circulated with the report and accounts:

The merger with the Employers' Liability Corporation which has now been effected is perhaps the most important event in the history of our Company. For some years now we have been convinced that our operations in America must be considerably expanded if they are to be profitable, and one of the immediate benefits which will accrue to us is that our American business will be joined with that of the Employers' Liability, who have a much larger premium income there than ours, and who have been so successful in that country. It is also a great advantage to have a substantial investment stake in a country which still has such an immense potential.

Employers' Liability are well placed also in Canada, while the Northern is the larger in the United Kingdom, Europe, Africa, Australia and the Far East. The Northern will also bring to the new Company the whole of its Life and Marine business, with premium incomes of some £8 million and £6 million respectively.

We are convinced, too, that the new Company, with its much larger resources, and with a business which is wider spread and better balanced, both geographically and as to classes of business, is assured of a greater future than either the Northern or the Employers' Liability could have achieved separately.

Complete integration over a period of years is, therefore, our aim, for only in this way can the full benefits of the merger be realised. I would like to take this opportunity, however, of saying that reduction of staff, if any, will come about chiefly as a result of retirement and normal wastage. Where it is considered we should not wait for vacancies to occur, the interests of those concerned will be fully protected. At the same time, there will be greater opportunities, as the new Company progressively fulfils its promise.

SUBSTANTIAL LIFE BUSINESS INCREASE

Last year's new life assurance secured a further big advance. Net new sums assured, after deduction of re-assurances, were 17 per cent higher at £44,613,056 compared with the 1958 figure of £38,145,968. In the United Kingdom our Aberdeen Head Office and seven of our branches each secured over £1 million of new business, while Glasgow secured more than £2 million.

After a lapse of twenty-two years, the London and Scottish began to write life assurance in Canada last year; in seven months the business obtained was equivalent to £780,000. Our new subsidiary The Northern Life Assurance Company of Australia also had an excellent first year; it has opened its life portfolio with £2,878,000 (sterling) of business, which exceeded our expectations. Both these subsidiaries must be congratulated on their good start. Our South and Central African branches, while not writing quite the same volume of business as in 1958, secured over £6 million new sums assured.

STATE PENSION SCHEME

Our pensions department made its usual big contribution to last year's life figures. Its work will be affected by the extension of the state pension scheme which begins in April next year. This extension adds a graduated pension related to earnings to the present flat benefit; the additional benefits are modest and employees will not enjoy them fully for many years. Employers can contract out of this graduated extension to the state pension scheme if their own pension schemes provide for their employees a guaranteed minimum rate of pension—a principle known as the preservation of pension benefits.

This puts the matter in its simplest form. In fact, the conditions governing the introduction of graduated benefits, the terms of contracting out for private schemes and for the preservation of pensions are most complex. Indeed, the detailed administration of the new scheme is so heavy that the final regulations have not yet appeared. On such a difficult subject, employers are naturally anxious to get the best guidance and the Northern Assurance Group has sent to the many employers who have Northern pensions policies a booklet designed to help them, entitled "The Effect on Private Pensions Schemes of the National Insurance Act 1959." This has been well received by our policyholders and in the insurance press.

Our individual retirement annuity plan, designed for the self-employed and others, was again well supported last year with new annual premiums of £111,000. In addition we received £82,000 of premiums in respect of our variable annuity scheme, introduced two years ago primarily to enable the self-employed to save for retirement through the medium of ordinary shares. Policyholders in this new scheme have already gained considerable advantage from the rise in the value of ordinary shares.

INTERIM LIFE POLICY

As a result of the favourable experience in the Northern's participation fund, the directors, on the advice of the actuary, increased the interim rate of bonus on participating policies from January 1, 1960, until further notice to £2 8s. per cent, as compared with the previous interim rate of £2 per cent declared after the 1955 valuation. A further valuation will be made at the end of this year, when reversionary bonuses will be allotted in respect of the 1956-60 quinquennium.

FIRE AND ACCIDENT UNDERWRITING

Fire and accident business throughout the world is still passing through a difficult period. A specially unfavourable feature last year was the loss for the first time in many years on the home fire account. This was offset to some extent by fire business overseas which improved to a satisfactory level of profitability, except in the United States. Overseas accident business especially that obtained by way of reinsurance, also proved more unfavourable than in 1958. Our strenuous efforts to remedy this situation are yielding results but not yet to the point of reversing the trend.

In 1959, fire and accident premiums for the Northern Assurance Group were £11,118,727 and £15,488,492 respectively; together they totalled £26,607,219, more than 5 per cent above the 1958 total. This increase has been achieved in spite of the steps we have taken to limit business in territories where experience has been unfavourable. Satisfactory profits continue to be earned in Africa, Australia and Continental Europe. It is particularly gratifying that our branch in Canada, where we celebrate our centenary this year, has again made a contribution to profits after the difficult experience of the past few years.

MARINE RESULTS

The group's underwriting results, however, reflect the continued difficulties in our most important markets. As a result, the loss on the fire account was sharply increased to £717,500 against £130,038, while the accident account showed a deficit of £267,923 compared with £17,041 in 1958. On the other hand, the marine account happily shows an improvement, despite the continued recession in the shipping industry. Freedom from major casualties, more stability in repair costs, and such compensating factors as less crowded waterways and the laying up of less efficient vessels have all contributed to a better result and premium income has been assisted by the higher values of new vessels. Premiums showed a small reduction from £6,605,087 to £6,457,826; the profit transfer for 1959, however, is £413,839 against £58,489 for 1958, leaving the fund at £9,392,708, equivalent to 145.5 per cent of last year's premiums.

PROFIT AND LOSS ACCOUNT

Taking these three accounts together, the 1959 profit and loss account has to carry net underwriting deficits of £571,584, compared with £88,590 in 1958, but there has been a further vigorous advance in the investment earnings of the shareholders' funds from £1,641,622 to £1,792,722 for which the skill of our investment department deserves full thanks. Losses on exchange amounted to £64,931, and were materially lower than the 1958 figure of £196,850, and the group's gross trading profit came out at £1,217,730 compared with £1,401,806. There was a material relief in taxation which amounted to £577,384 and absorbed 47 per cent of our gross trading surplus, compared with £858,463 and 61 per cent in the preceding year. Out of the net profit of £640,346 it is proposed to set aside £150,000 to contingency reserve; in 1958 net profit amounted to £543,343 and £25,000 was so set aside. I should, perhaps, explain that the profits quoted above were reached after deducting contributions totalling £508,324 to the Staff Pension Fund and the Widows and Orphans Fund, which are separately constituted funds administered by Trustees. This figure, as usual, forms part of the general expenses shown in the revenue accounts.

You will recall that my letter of January 22, 1960, advised you of the directors' intention to recommend a dividend of 16 per cent in respect of 1959, with an estimated payment equivalent to 18½ per cent on the capital of Northern and Employers' in 1960. The 16 per cent dividend in respect of 1959 will absorb £602,852 after deducting income tax.

I must mention the retirement after 38 years with the Company of Mr Earl Patton.

We wish him many years of leisure during his well-deserved retirement.

GUEST, KEEN AND NETTLEFOLDS, LIMITED

MR K. S. PEACOCK'S REVIEW

The Sixtieth Annual General Meeting of Guest, Keen and Nettlefolds, Limited, will be held on June 23rd at Birmingham.

The following are extracts from the circulated Statement by the Chairman and Managing Director, Mr K. S. Peacock, for the 52 weeks ended January 2, 1960:

The decision of the electorate at the last General Election was received by your Board with untold relief as it removed the depressing prospect of renationalisation of the Group's steel interests and of having again to submit to disorganisation of our affairs and unnecessary interference with our daily activities and efficiency. It is to be hoped that out of the present thinking of the Labour Party on the subject of nationalisation will come the realisation in good time that very few doctrinaire policies operate satisfactorily in practice.

RESTRICTIVE TRADE PRACTICES ACT

Last year I referred to the operation of the Restrictive Trade Practices Act, 1956 and my feelings on this subject remain unaltered. The provisions of the Act discriminate most unfairly against the manufacturer and the judgments given so far make it abundantly clear that it is virtually impossible for any Association, however impartially operated, to make representations to the Court which can be effective. As I said last year, a number of Associations were formed on the recommendations of the Government of the day in the early 1930's after detailed investigation by the Import Duties Advisory Committee and I question if it is now wise to destroy by legislation the foundations on which these Associations have been built. When we criticise the policy of the Labour Party on nationalisation, it should be remembered that this Act could also be considered as originating from doctrinaire views. I am therefore hopeful that a more commonsense view will prevail and reasonable amendments to the Act will be made which will enable it to be operated on a basis fair to everyone including the manufacturer. This is certainly not the case at present.

THE ACCOUNTS

The Accounts have been drawn up on similar lines to previous years and I think all relevant information is provided, but there is one item which requires some explanation. It will be noted from the Consolidated Balance Sheet that the excess of the market value of quoted investments over their book value has widened from £1,346,703 at January 3, 1959 to £4,799,529 at January 2, 1960. As is well known, Stock Exchange prices moved up considerably during 1959 and your Board took the opportunity to reduce the portfolio of investments. I should mention particularly the sale of 500,000 shares from our holding of 2 million shares of £1 each in The Steel Company of Wales Limited for which we subscribed at par three years ago, as I then reported to you. The proceeds of sales of each investment have first been applied to write down its book value and any surplus has been included in the Profit and Loss Account under "Exceptional Items."

Group turnover with outside customers increased from £208,996,000 in 1958 to £220,807,000 in 1959. The increase of £12 million was achieved in spite of reductions in certain iron and steel prices in the United Kingdom and the highly competitive conditions existing in the early part of the year, particularly in the engineering companies in the United Kingdom.

TRADING CONDITIONS IN 1959

In my Statement last year, when referring to these difficult trading conditions which had persisted from the latter part of 1958, I warned Stockholders that it then seemed possible that the trading results of 1959 would not equal those of 1958 unless there was some marked improvement in general conditions. There were at that time indications of improvement in demand which rapidly increased in most of our companies with the result that the final outcome for the year 1959 has been reasonably satisfactory.

The surplus on trading increased by £1,715,000 to £25,831,899, after charging £1,114,000 more for depreciation, and the total profit after taxation was up by £2,132,000 to £13,414,174.

DIVIDEND POLICY

Your Board have decided that Stockholders should have some immediate benefit from these improvements in profit and accordingly recommend a final dividend for 1959 of 10 per cent, to give a total for the year of 15 per cent compared with 13 per cent for 1958. Your Board, however, are of the opinion that they must maintain the policy of large retentions of profit in order to finance the continuing expansion of the Group and in particular the massive schemes of capital expenditure on which our success so largely depends.

EXPANSION OF STEEL OUTPUT

In a steel works such schemes take a considerable length of time to bring to fruition and it is therefore necessary from time to time to investigate the probable long-term trend of demand for steel products. The British Iron and Steel Federation, in conjunction with the Iron and Steel Board, have been engaged in this exercise for as far ahead as 1965 in regard to the products coming under their responsibility. We have made a similar survey for our own steel works, whose ownership by the Group we consider vital. From this it is clear that, to take care of the likely future demands by our engineering companies on the Group steel works and to replace certain outside supplies, expansion of output at the steel works is required on a long-term basis. This matter has received a great deal of consideration and we feel it necessary to go forward with alterations and expansions at our three steel works at an approximate cost of £20 million. Although your Board have approved these proposals in principle, some variations may take place in these schemes from time to time. The expenditure will be spread over the next five years, but it is expected that the heaviest amounts will fall in the years 1960, 1961 and 1962. Out of the total cost of these schemes only £2,225,000 is included in the total figure of £18,600,000 expenditure outstanding at January 2, 1960.

CAPITAL EXPENDITURE

Apart from this steel works expenditure the Board are likely during 1960 to sanction substantial sums in regard to developments at other Group works, much of it in relation to expansion of the motor industry which from the nature of our business we must of course support.

It is therefore the Board's view that the annual rate of capital expenditure is unlikely, during at least the next three years, to fall below the level of about £18 million which applied during 1958 and 1959. Actual figures are as follows:

	Expenditure in 1958	Expenditure in 1959
U K Companies:	£	£
Steel	7,695,000	7,852,000
Other	6,105,000	5,265,000
Overseas Companies	3,624,000	4,967,000
Total	£17,622,000	£18,084,000

EMPLOYER/EMPLOYEE RELATIONS

From capital expenditure which provides the tools for the job I turn now to our relations with the 76,000 employees on the job.

In terms of days lost as a result of industrial disputes—both official and unofficial—1959 was one of the two worst years for British industry since the war. In these circumstances it is particularly gratifying to report that the Group remained remarkably free of such troubles. Steps to ensure that this satisfactory state of affairs is maintained by the development of a new generation of soundly trained managers and supervisors continue to be taken on a considerable scale. Intake to the various schemes to which I have referred on previous occasions has been assessed as a result of the most careful reviews and estimates of requirements; there is already evidence that the money invested in these schemes will prove in the future to be money wisely spent. The overall numbers of craft, technical and commercial apprentices being trained in the Group increased considerably during the year. Whilst helping to solve the national problem produced by the increasing number of school leavers, the Group intends to help itself and take advantage of this situation by strengthening its reserves of craft and technological skills to meet the needs of its expanding activities.

As usual the results of the year are due to the team effort of all concerned and stockholders will, I am sure, join us in again expressing our sincere thanks for the year's work.

PRESENT TRADING CONDITIONS ACTIVITY—PROFITS—PRICES

Present trading conditions are good and the outlook for the future is promising, with almost all sections of the Group heavily occupied with substantial order books. It must, however, be realised that it is only the high rate of activity in the engineering works that enables them to operate at a reasonable rate of profit, as the improvements in operating efficiency which have been secured in almost every one of our works by our large programmes of capital expenditure have been absorbed by continuous increases in national wage rates which in their turn inflate many other items of cost over which we have little or no control. We have made strenuous efforts to keep down prices of our finished products, but some increases can no longer be avoided.

ATLAS ELECTRIC AND GENERAL TRUST LIMITED

PROPOSED 100 PER CENT CAPITALISATION ISSUE

LORD REMNANT ON CONTINULD REVENUE INCREASE

The fifty-second Annual General Meeting will be held on June 23rd in London.

The following are extracts from the circulated Statement of the Chairman, The Right Honourable Lord Remnant, MBE:

The revenue of the Trust has continued to expand and at an accelerated rate. Gross Income at £1,451,396 is £161,619 or 12½ per cent higher than in the previous year.

Expenses show little change but taxation at £543,216 is £28,817 higher. Net revenue after taxation, amounting to £768,961, thus shows an increase of £134,146 or 21 per cent. The proposed final dividend of 11 per cent on the Ordinary Stock makes a total of 15 per cent for the year compared with the equivalent of 12.7 per cent last year.

Balance Sheet.—Prior to their revaluation, the Trust's investments as at March 31st last had a book value of £11,826,601, which compared with a market value of £28,397,418. The Directors had no doubt that a substantial part of this appreciation of £16,570,817 would prove to be permanent and therefore decided to increase the book value by a sum of £4,500,000, while a like amount has been credited to Capital Reserve. It is now proposed to capitalise this sum and issue 18 million new Ordinary Shares of 5s. each credited as fully paid by way of a 100 per cent bonus to the holders of the existing £4,500,000 Ordinary Stock of the Company. At the same time the existing stock will be converted into 5s. shares with the object of improving its marketability. The valuation of £28,397,000 at March 31st last compares with one of £21,800,000 in the previous year and of £16 million the year before that.

The average gross return on our investments, valued as I have already said at £28,397,000, was a fraction over 5 per cent.

We have still further reduced our holdings of fixed interest securities, viz. Debenture Stocks and Preference Shares, which now constitute only 3.55 per cent in value of all our investments. In doing so we have sacrificed some immediate revenue, as the gross return on the investments sold exceeded 6 per cent, but we believe that we have improved the quality of the Trust's portfolio and we expect to make good the deficiency in revenue in due course.

In considering the prospects for the current year one can see many clouds on the horizon but one uncertainty at least, viz. the possibility of nationalisation of some sections of industry in Great Britain has been removed. There is also no sign of any considerable decline in industrial prosperity. The Trust's revenue in the current year has been maintained and I am confident that the results of the whole year will show continued progress. It is very unlikely however, that the large increase in revenue of the past year will be repeated.

To reduce the disparity between the interim and final dividends on the Ordinary Shares it is proposed to pay an interim dividend next December of 3 per cent on the doubled capital. This is equivalent to 6 per cent on the present Ordinary capital and compares with 4 per cent paid last year.

THE BRITISH DRUG HOUSES LIMITED

GROUP SALES EXCEED £10 MILLION

MR GEOFFREY C. R. ELEY ON IMPORTANT DEVELOPMENTS IN RESEARCH FIELD

The Annual General Meeting of The British Drug Houses Limited was held recently in London and the following is an extract from the Chairman's statement which was circulated with the accounts:

The sales of your Company and its subsidiaries during 1959 amounted to over £10 million. This is more than £3 million higher than last year's figure, which was itself a record, but the figures are not comparable, for during 1959 we acquired the businesses of J. R. Gibbs Ltd., of Paignton and Bristol, and of Rowland James Ltd., of Swansea and Cardiff, and the sales of these two companies for ten months are included in the 1959 figures. If appropriate allowance be made for the effect of these acquisitions, the group sales would still have represented a new record.

The wholesaling side of our business has been extended and greatly strengthened by the purchase of J. R. Gibbs Ltd. and Rowland James Ltd., both of which continue to trade as independent companies, with representatives of your Company on their boards.

Two years ago J. R. Gibbs Ltd. acquired the issued ordinary capital of Ferris & Co. Ltd., of Bristol, a widely respected and old-established business now engaged mainly in the supply of laboratory chemicals and apparatus.

Apart from these extensions of our interest in wholesaling, 1959 witnessed a further encouraging expansion in our own direct wholesaling activities in the London area. Sales increased rapidly and there is every indication that we were right in judging that we had something to offer in this field that was really needed.

LABORATORY CHEMICALS DIVISION

No chemicals in the world have a higher reputation than those sold under your Company's name. They are in regular use in every country where scientific education or industry exists and the increasing appreciation throughout the world of the need for more technological training and the rising tempo of industrialisation are resulting in an ever growing demand for laboratory chemicals. The first large building on our new site at Poole is already in use. This was intended as the first part of a three-stage programme of expansion, but the growth of this side of our business has been such that the remaining two stages are being undertaken immediately. The total cost of this development at Poole will be approximately £750,000.

EXPORT

Our overseas sales of pharmaceutical products and chemicals amounted to nearly 40 per cent of total sales in spite of the fact that our new subsidiary companies are almost exclusively concerned with the home market. Increasingly it has become necessary to conduct our overseas business through subsidiary companies, and during 1959 we formed a new company, British Drug Houses (Far East) Ltd., to serve Singapore and Malaya. We are now about to register B.D.H. (Ireland) Limited and to erect a factory in Dublin. All our previously existing overseas companies reported satisfactory results for the year and particularly good progress was made in Australia, Canada and India.

RESEARCH

The pharmaceutical manufacturer must not only work to improve existing products and their methods of manufacture but also devote a substantial part of his resources to the search for new, more efficient, therapeutic agents which, when discovered, will replace the products in use today. I have always been careful to stress the uncertainties of research. During 1959, however, your company issued two new preparations, a diuretic and a progestational agent, each relying for its action upon entirely new chemical substances discovered in our own laboratories, and each the only substance in its particular field of medicine discovered in a British research laboratory.

Furthermore, as I told you recently, we have just discovered new substances which when tried on animals showed outstanding promise as oral contraceptives. We hope shortly to reach the stage of making these substances available for trial on human beings under medical supervision, but such tests must necessarily take a considerable time to carry out. They must be extensive and exhaustive. Even if all goes well we cannot expect that any results will be available before mid-1961. If the trials confirm the findings on animals and reveal no unforeseen side-effects we shall have discovered a new product for which there could be a very large market. It was this fact—and this fact alone—that made it seem proper to us to inform you of our discovery when you were recently considering a bid for your shares. I would not normally have announced our discovery to you before the Annual Meeting, and even then I might have been more general in my comments. I would stress that, although our discovery is exciting, yet the uncertainties that lie ahead are many, and I would repeat my previous warning that in such matters it is impossible to budget for success. I would add, however, that I feel great confidence and pride in the quality of the work carried out in your company's research laboratories.

ACCOUNTS

The Group Profit before tax amounted to £647,495 (£551,597 in 1958). Profit after tax amounted to £321,395 (£288,991). In my letter of February 17, 1960, to stockholders, I said that we estimated that Group Profit before tax would not be less than £600,000 and that, if this proved correct, we should recommend a dividend of 24 per cent. We now recommend the payment of this dividend, which is covered 1.7 times by the profits for the year. A sum of £60,000 from our Tax Provisions, no longer required, has been added to General Reserve, together with £100,000 from our current year's profits.

I also announced your board's intention to recommend the capitalisation of part of our reserves by the free issue of one ordinary stock unit for every two held. If our recommendation is accepted the consolidated Revenue

Reserves of the BDH Group will still total £1,570,684. As a preliminary to this capitalisation it will be necessary to increase the authorised capital of the company, and we are asking for your approval to increase the authorised ordinary share capital of the company from £1,500,000 to £2 million. After the free issue which we are proposing a balance of £200,000 will remain unissued. We have no particular or immediate plans in mind for its utilisation.

The increases which are shown in the Consolidated Balance Sheet in the totals of Freehold and Leasehold Properties, Plant, Machinery, Fixtures, Fittings and Furniture, Stocks, Debtors and Creditors mainly stem from the acquisition of J. R. Gibbs Ltd. and Rowland James Ltd. The purchase of these companies, together with the repayment of £200,000 of our unsecured loans, resulted in a large increase in the Group's bank overdraft. The portion of this Group overdraft attributable to the Parent Company amounts to £621,857.

So far this year the indications are that our overall business is running satisfactorily and should enable us to give effect to the expectation we have held out to stockholders that we shall be able to distribute a total sum in dividends similar to that recommended in respect of 1959.

On your behalf I would like to thank the Managing Director, his executive colleagues and the staff at all levels, both here and abroad, for the part they have played in what has been a strenuous but reasonably satisfactory year. On their behalf I would like to thank you, our stockholders, for the understanding and confidence you showed recently when accepting our advice to ignore what may have seemed, in terms of immediate advantage, a not untempting offer. We shall do all that lies in our power to see that you continue to feel satisfied with your decision.

The report and accounts were adopted, and at the subsequent extraordinary general meeting the board's capital proposals were approved.

MECCA LTD.

Joint Chairmen:
C. L. Heimann — Alan B. Fairley

Joint Managing Directors:
Walter J. Pickard, O.B.E. — J. S. Crichton

DIRECTORS:

Extract from Accounts to 31st December, 1959.

	1958	1959
	£	£
Trading Profit	659,571	715,068
Tax Provision	290,053	282,924
Profit after Tax and Minority Interests	277,199	328,333
Paid in Dividends (less Tax)	188,933	232,151
Retained	88,266	96,182
Dividends paid gross on Ordinary and "A" Ordinary Shares ...	22½%	25%
Fixed Assets	3,878,064	5,294,853

Annual General Meeting, 31st May, 1960

Fixed Assets have increased by £1,416,789 during the year, and due to further large expansion plans, the Directors have decided to obtain further permanent Capital of approximately £1,465,000 by way of a "Rights" Issue of One new "A" Ordinary Share at 10/- per Share, for every Two Ordinary or "A" Ordinary Shares held on 6th May, 1960, and to enable this to be effected, the Shareholders are being asked to increase the Authorised Capital to £3,000,000, by the creation of an additional 2,800,000 "A" Ordinary Shares. This will then leave 1,391,798 "A" Ordinary Shares available for future acquisitions, although none are planned at the present time.

The Trading Results for the first 18 Weeks of 1960, compared with the same period for last year, show a substantial increase, and subject to any unforeseen circumstances, the Directors anticipate being able to recommend a Dividend of not less than 20% for 1960, on the increased Capital.

CAPITAL:
Authorised: £2,300,000
Issued: £1,754,669
5% £1 First Cumulative Preference £145,000
5% £1 Second Cumulative Preference £138,302
5/- Ordinary Shares £350,000
5/- "A" Ordinary Shares £1,121,367
Quoted London
"A" Ordinary Share price at 1st June, 1960: 27s. 10½d.
High/Low quotation, 1960: 29s. 6d., 26s.

KILLINGHALL TIN

The Thirtieth Annual General Meeting of Killinghall Tin Limited was held on May 27th in London, Mr Jack Addinsell, the chairman, presiding.

The following is an extract from his circulated statement:

The increase in quotas and permissible sales, together with the availability of some extra quota, enabled the mine to finish the period under review with a profit which, in the circumstances, must be regarded as satisfactory.

There was a profit for the year, before tax, of £25,524. Taxation requires £6,166 and your directors are recommending a dividend for the year of 25 per cent.

In my statement issued in May, 1957, I referred to the additional area of the Killinghall rubber estate for which application for conversion to mining was to be made to the State Government. I am now glad to report that the formalities have been completed and the sublease from the Rubber Company for this area, which on survey proves to be about 326 acres, is in process of completion. The recoverable values in this new land, together with those remaining in the present sublease will, it is estimated, occupy the dredge for at least a further 25 years. This figure is, of course, only an approximation and will be affected by a number of factors—such as the incidence of restriction, tin price and operating costs—which it is impossible to forecast so far ahead.

Provided the increased rates of quota continue and the tin price is maintained, the results for the current financial year should show improvement on those of the year under review.

The report and accounts were adopted.

BARRY AND STAINES LINOLEUM

The Annual General Meeting of Barry and Staines Linoleum Ltd. will be held on June 23rd in London. The following is an extract from the circulated statement of the chairman, Mr T. J. Cavanagh:

A year ago I was able to report a welcome increase in home trade turnover following the pre-Budget stagnation, which seems to have become a regular and regrettable feature of present-day trading in commodities that are subject to purchase tax. I also reported that prospects for the current year were better, and that we hoped to expand our business both at home and abroad. This we were able to achieve with encouraging success in linoleum, which is the mainstay of our business.

With increased sales in keenly competitive markets we have had increased expenses which have absorbed a good deal of the extra profit. In addition to this our non-linoleum activities have been less profitable. Our French subsidiary, La Compagnie Rouennaise de Linoleum, was able to increase sales. This company is well situated to take advantage of trading developments in the European Common Market.

Linoleum sales for the current year to date show a satisfactory increase over the corresponding period in the previous year, but expenses also show a tendency to increase; we are naturally doing all we can to expand sales and keep expenses in check. This problem of increasing expenses is not peculiar to ourselves; it is in fact a universal problem affecting individuals and Governments as well as industries. Nevertheless, we are full of confidence in the future, given a fair economic wind and no political interference.

THE UNITED SUA BETONG RUBBER ESTATES, LIMITED

INVESTMENT IN MALAYA

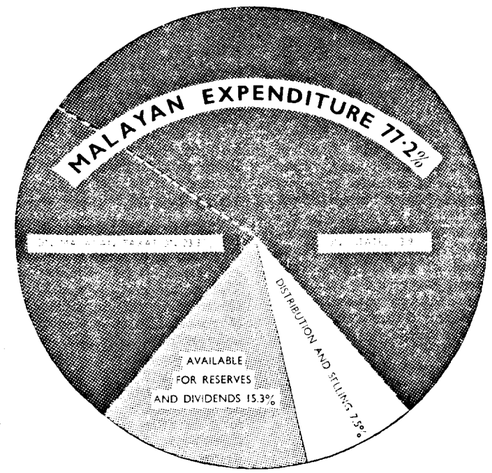
SIR JOHN HAY ON THE OUTLOOK

The Fifty-first Annual General Meeting of The United Sua Betong Rubber Estates, Limited will be held at 19 Fenchurch Street, E.C.3, on Wednesday, June 8th, at 12 noon.

In his statement, which has been circulated to stockholders, the Chairman, Sir John Hay, after referring to the results for 1959, went on to say:

In relation to overseas territories two subjects are topical, standards of living and the rate of investment.

A few facts on these two matters may be of interest.



STANDARDS OF LIVING

It is estimated that the cost of living in Malaya is 3½ times that of 1939. Adjustments in the rates of earnings have been made from time to time and, appropriately, the worker has been the first and greatest beneficiary. It is estimated that his present cash earnings are six times greater than the 1939 rate. I use the term "cash earnings" advisedly for in other respects his treatment has been correspondingly improved. As far as large and progressive estates are concerned, there is in progress a revolutionary change in housing conditions. New dwellings are of a superior and permanent construction, including indoor sanitation, piped water and, in many instances, electric light. His social and recreational facilities have been extended and their scope widened. That these benefits are being appreciated by labour is evident. Mr Sinclair, the Manager of Yong Peng, reports that "a better type of worker is now being attracted to the estates, where facilities for the education of their children and security of employment are invariably better than that available in the town and village, without even losing the lighter side of life such as sports and cinemas." Other managers report a general increase in the standard of living manifested in a variety of ways, the most commendable of which is an eagerness for the better education of children. Other grades in the service are in receipt of payments which more than match any increase in the cost of living and are better off than many workers in England in similar grades. With the worker's earnings adjusted to the price of rubber and those in intermediate and senior ranks receiving a commission on profits, it can be truly said that all in our service are closely identified with the Company's fortunes.

INVESTMENT IN MALAYA

This Company and its associates in the Group have since the war invested or committed to investment in the form of planting and replacement the sum of $143 million. The Group is only a very small part of the whole and if other members of the industry have invested on anything approaching that scale then the total of investment in this form must be very considerable indeed and a very important factor in the Malayan economy. But far transcending this is the yearly recurring expenditure in Malaya. Our accounts show that the proceeds of rubber and tea for 1959 amounted to £3,416,154. This is foolishly represented as something extracted from the country. The diagram below illustrates where in fact the money goes.

It may astonish many who cherish illusions regarding the conduct of overseas enterprises that over 77 per cent goes back into Malaya and that of the balance 7½ per cent is absorbed in distribution—mostly ocean freight—and selling, leaving a moderate proportion (15.3 per cent) available for reserves and dividends. A further fact which may equally astonish many who are impressed with dividends expressed in terms of a percentage on the nominal issued capital, is that the average net dividend paid to stockholders over the past thirteen years averages less than 7 per cent on the capital employed in the business.

THE OUTLOOK

In an earlier statement issued by an associated company, I gave some indication of the statistical outlook for 1960. I see no reason to revise what I then said, but it may be helpful if at this later date I emphasise some points which have since more clearly emerged. The estimated output of natural rubber still stands at 2,103,000 tons which is 35,000 tons in excess of last year and, significantly, Malaya accounts for 27,000 tons of that. Current supplies, which equate closely to expected demand, are likely to be supplemented by releases from stockpiles to the extent of 185,000 tons but of that nearly 65,000 tons had been released by the end of April last. Despite supplies so augmented, the price has risen appreciably. This is due partly to a market technicality which has already been amply explained elsewhere, but it is also in part accounted for by the fact that the first half of the year is seasonally unfavourable to maximum production. It is reasonable to expect that market difficulties will be adjusted soon and with higher outputs in prospect for the latter part of the year there should be an easing of tension between supply and demand. It would be unrealistic to expect a continuance of the present abnormal price nor would its indefinite continuance be desirable, since it would give a strong encouragement to the increased use of synthetics and other substitutes. Already it has resulted in a serious falling off in the demand for natural latex, the form in which the bulk of our output is processed. World stocks in consuming countries are low; further releases from stockpiles may well be required to restore them to a level judged necessary, especially in the present time of political anxiety. All this seems to point to the conclusion that although the present quotation may not be maintained after the market has overcome its technical difficulties, the price should thereafter rest at a highly profitable level for the remainder of the year. As regards our own prospects, we do not expect, in terms of output, to repeat the exceptional performance of last year. On the other hand, sales so far made, amounting to 7,400,000 lb, show an increase of 3d. per lb. over the average of last year and we have contracts outstanding for the delivery of concentrated latex, the equivalent in terms of dry rubber of 4,450,000 lb, at a premium over the price of sheet. But as I have already observed, sales of rubber so processed have since fallen steeply. After this year we expect that our outputs of rubber in all forms will follow an ascending scale and by 1965 they are estimated to be at the rate of 30 million lb per annum.

Chairman's Statement: ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LIMITED

Incorporated in the Union of South Africa

Race Relations in Union and Federation

NEED FOR RECOGNITION OF AFRICANS' RIGHT TO PERMANENT HOMES IN SOUTH AFRICA'S CITIES

Mr H. F. Oppenheimer Reviews Effects of Political Risks on Anglo American Corporation's Plans and Progress

The following is from the statement by the Chairman, Mr H. F. Oppenheimer, which has been circulated to members:

On the 21st of March at Sharpeville, in the course of demonstrating against the pass laws, 69 Africans were killed and 178 were wounded in a clash with the police. As a result of this deplorable event and widespread disturbances in other parts of South Africa the Government proclaimed a state of emergency. This situation has come about at a time when we are called upon to celebrate the 50th anniversary of the formation of the Union. The achievements of the past 50 years are certainly notable, but in present circumstances no thinking South African can look to the future without misgiving, and the feeling is widespread that new methods and new policies are urgently needed if we are to build a truly united South Africa. This mood is by no means confined to the political opposition.

African Discontent

The Federation of Rhodesia and Nyasaland also is going through a difficult time. Here African discontent is not directed primarily against discriminatory legislation but against the existence of the Federation as such. In the economic sphere the high hopes that were entertained when the Federation was formed have been more than realised and all races have shared in the general prosperity. Politically, and socially also, the African population has probably advanced faster and further in the last six years than in the whole history of the country. Nevertheless, influenced by what has happened in quite different circumstances in other African territories to the north certain African politicians in Nyasaland and Northern Rhodesia have succeeded in inducing a large part of the African population in these territories to believe, in contradiction to the plain facts, that Federation is an instrument of racial oppression and that they would be much better off without it. Recently the whole situation has been further complicated and race relations seriously embittered by a number of senseless attacks by bands of African hooligans on both Europeans and Africans. In one case these attacks resulted in the murder of a European woman and the injury of her two children. Barbaric incidents of this sort, which fortunately are isolated and which are condemned by reasonable African opinion, must be countered by firm action, but it is of the utmost importance that the Europeans in Northern Rhodesia, and throughout the Federation, should not allow their indignation at these incidents to divert them from the policy of partnership. I am confident that they will not do so.

The Monckton Commission is faced with the difficulty of reconciling the demands of extreme African nationalists—who are always ready to brush aside the need for efficient Government and economic development—with the responsibility which the British government must feel for maintaining law and order and for raising the standard of living of the masses in these countries which it has taken under its protection.

I am glad to be able to report that, in spite of all these difficulties, operations at all the mines we administer have proceeded normally.

The consolidated profit, after tax, of the Corporation and its subsidiaries, allowing for minority interests, amounted to £7,730,864 compared with £7,181,537 in 1958 and £5,254,540 in the previous year, and was again a record. This satisfactory improvement is due to a substantial increase in income from investments. This, in turn, reflects the record profit levels achieved by the gold and uranium mining industry and by the diamond industry and also the considerable improvement over the previous year in the profits of the copper mining industry of Northern Rhodesia. It was considered by your Board that the increase in profits justified an increase of 1s. per share in the ordinary dividend.

Last year was therefore a particularly successful one for our Corporation, and if it were not for the difficult political situation, the way ahead would be clear for a continuation of the rapid expansion and development of recent years. The disturbances in the Union have gravely affected us in their immediate effects and we are, of course, also deeply concerned about their ultimate outcome. We have always looked to London, and to a lesser extent to the other capital markets of Europe and to America, for a substantial proportion of the finances required for the South African and Rhodesian development for which we are responsible. The recent disturbances have affected these markets to a degree which is not generally appreciated in South Africa. Not only have they caused investors to fear for the safety of their holdings, they have evoked a wave of moral indignation against the present South African racial policy.

Republican Issue

Moreover, the referendum on the republican issue overhangs the market, which is particularly affected by the possibility that if South Africa were to become a republic it might for one reason or another, cease to be a member of the Commonwealth. The consequences for our group are obviously serious. We think it is reasonable to expect that if conditions in the country remain quiet the share market will gradually improve, but, in my opinion, it would not be prudent for us to count on being able to raise sufficient money for a considerable time from the public, either here or overseas, for our new ventures on terms that we would regard as satisfactory. We will, therefore, have to rely to a greater extent than we would normally think desirable on the internal financial resources of our group. These are, fortunately, substantial, and provided we follow a conservative policy there need not be for financial reasons any serious slowing down in the tempo of our new development. It is not, however, only in regard to the in-flow of capital that the adverse effects of Sharpeville and its aftermath are felt. For many new enterprises it is essential for a group such as ours to tie up with leading companies overseas, who are able to provide the essential technical and commercial "know-how." In no fewer than four instances large-scale projects which we have had under active consideration have had to be put into cold storage for the time being, because our overseas associates are not willing to proceed until the political situation in the Union is clearer.

Confidence Unshaken

In spite of all these difficulties, our confidence in South Africa is unshaken and we are determined to continue to play our full part in the economic development of the country. We shall do this not only in our own direct interests, but in order to help to create that background of rising standards of living, which is essential in order to give South Africa a fair chance of dealing effectively with her social and racial problems. In the long run, however, prosperity in South Africa must depend on a general restoration of confidence. Great emphasis has rightly been placed on the need to restore law and order. It is, however, only a preliminary. Even a long period of quiescence will not suffice, unless, at the same time, it appears that successful steps have been taken to regain the goodwill of the African population. Of course, not all the Africans are disaffected, and many people have argued that the disturbances were due merely to agitators and intimidators. There is no doubt that agitators have been busy and that there has been serious intimidation of law-abiding Africans by the extremists. Equally, however, there can be no doubt that there is deep discontent among the African population in the urban areas. That is why the agitators have been so successful. Law and order have been restored, but only at the expense of far-reaching interference with the liberties of the population, black and white alike. Many people in South Africa are convinced that no changes in government policy or European attitudes short of complete surrender to the full demands of the extreme African nationalists would suffice to secure African goodwill. To this one can only retort that you never know till you try. Certainly South Africa's reputation overseas, and relations with the rest of the Commonwealth and the Western democracies in general, would be very different if they could be persuaded that a genuine and determined effort was being made to remove all the reasonable causes of discontent which have provided the background to the activities of extremists and agitators. The difficulty of dealing with an explosive internal situation is vastly increased if the world outside is convinced that genuine grievances exist and that no serious effort is being made to remove them. Only this month that great American, Mr Adlai Stevenson, made this important statement:

"Racialism is hateful whether it is black or white. America, however, can use its influence to advocate African patience and restraint only if there is a clear prospect ahead for African advance. Where this is lacking—as in the Union of South Africa—the extremists will gain increasing influence."

Operation of Pass Laws

The immediate cause of the present crisis was African protests against the pass laws, and it is clear that this legislation, together with the laws governing the sale of liquor to Africans and the unsympathetic manner in which they are sometimes administered, are major causes of interracial friction. In the case of the liquor laws the necessary changes could probably be made without too much difficulty, and it is satisfactory to see that the Government intend to tackle this problem, but when we come to the pass laws, the matter, as is so often the case in Africa, is far from simple. Some provisions covered by these laws are necessary for good government and are very much in the interests of the Africans themselves. It is essential to begin with that there should be an effective means of personal identification, and this, with a people of whom the majority are still comparatively primitive, and in the absence of the necessary statistics which are taken for granted in a fully developed country, is not an easy matter. In addition, since South Africa does not possess either an efficient system of voluntary labour bureaux or (a much more difficult matter) an educated African labour force to take advantage of such a system, it is not necessarily wrong or against the Africans' own interests that for an interim period anyhow, administrative machinery should be maintained by the Government to direct Africans seeking employment to the areas where jobs and proper housing are available to them. There are, however, certain aspects of the pass laws so intolerable to the urban Africans that everything connected with the whole system is included by them in the same condemnation. And what they resent most of all is the provision that the failure by an African to produce his pass to a policeman immediately on demand is in itself a crime punishable by a fine or imprisonment. The other features of the pass laws which do most damage to race relations flow from the pretence that permeates all the legislation dealing with the urban African that he is not a permanent resident where he lives, but merely a temporary visitor with his real home in quite a different part of the country. There was a time when it might have been reasonable to regard the bulk of the Africans in the urban areas in this light. But that time is long past and today, while large numbers of tribal Africans still come to work in the urban areas, there is a very large and increasing African population in the towns whose connection with their original tribal homes has almost or entirely ceased to exist. Moreover, these urban Africans are absolutely indispensable to the industrial life of the country. Nevertheless, they are treated as though they were migrants, and the pass laws and other legislation operate to prevent their obtaining the right of permanent occupation of the only homes they have. If they lose their jobs and do not find another one within a short period, they may be uprooted and forced to go to quite a different part of the country. In this way, families are broken up and the urban African is denied that sense of permanence and security which is one of the prime needs of all human beings. It is difficult to exaggerate the sense of frustration these features of African urban life cause, particularly amongst the growing number of intelligent and educated men who hold responsible positions. And it is these people who are the moulders of African thought and the effective leaders of their people.

It seems to me that what in the first place is required, in order to improve race relations, is that white South Africa should fairly and squarely face the fact that whatever may be done to build up the economy of the reserves, so as to enable them to carry as large a population as possible (and I hope that every effort will be made to this end), there will necessarily remain millions of Africans in and around the European cities who have their permanent homes there and belong to those urban communities just as much as the Europeans themselves. Once that fact is grasped and the consequences that flow from it worked out and acted upon, we shall, I believe, have gone a long way to remove the sense of grievance and frustration which lies behind the present crisis.

It would be idle to pretend that Southern Africa is not subject to serious political risks. But there are very few parts of the world where there are not serious political risks of one kind or another. And in Southern Africa, in spite of all the problems and difficulties, there are solid grounds for optimism. The Union and Southern Rhodesia are multi-racial countries with a comparatively large European population. Europeans are in a minority as compared with the Africans but are certainly not a small and helpless minority to be swept aside or tolerated as the African majority may decide. In Northern Rhodesia the European population is smaller both absolutely and in relation to the Africans. The Europeans, however, occupy a key position in the copper mining industry which is the most important industry in any of the territories that make up the Federation, and on which the economy of the Federation in a large measure depends. Without the Europeans, that industry would come to a standstill. Nyasaland has only a very small European population and must be regarded as almost entirely an African country. Nevertheless, it depends for its economic welfare on very close links with Northern and Southern Rhodesia, and to a lesser extent with the Union. In all these territories the time has passed, if it ever existed, when Europeans could afford to ignore the interests and feelings of the Africans. But that does not mean that the Africans are, or will be, able to get along without the Europeans. In all the four territories with which we are concerned, conditions differ and the constitutional forms which apply to one will not necessarily be appropriate for the others. Nevertheless throughout this vast area, the safety and welfare of all the races who inhabit it are inextricably tied together. Eventually they will be forced to work together, and the sooner this is accepted the better for all concerned.

JOHN BRIGHT & BROTHERS

ENCOURAGING RECOVERY IN PROFITS

The thirty-seventh Annual General Meeting of John Bright and Brothers, Limited, will be held on June 22nd in London.

The following is an extract from the circulated statement of the chairman, Mr Fred Train:

The consolidated profit on trading at £527,591 exceeds the previous year's figure by almost £63,000, which I regard as encouraging evidence of the recovery in the results of our activities. After crediting other income and deducting depreciation and taxation, the profit comes out at £243,631. Your directors recommend a final dividend of 15 per cent, making a total of 22½ per cent for the year, the same as before.

The consolidated balance-sheet discloses a satisfactory increase in net current assets from £2,471,752 to £2,646,724.

The figures now presented reflect the benefits achieved by a vigorous sales policy which enabled us to obtain a larger proportion of available business and to increase our turnover by approximately 30 per cent. Our adaptability for the ever-increasing use of man-made fibres in the production of industrial yarns and fabrics has no doubt been a contributory factor in expanding our markets to such a marked degree.

We have been successful in widening our range of products, a policy which we are pursuing in an endeavour to reduce our dependence upon any one section of industry.

COTTON REORGANISATION SCHEME

It was in May of last year that the Government announced details of its Cotton Reorganisation Scheme stating that it was prepared to contribute up to £30 million towards the cost of trimming and re-equipping the industry, leaving a substantial balance to be borne by those continuing in the trade.

The Scheme was designed to operate in two parts—the first part dealing with elimination of surplus capacity; the second with the re-equipping of those units remaining in production. The Government undertook to pay compensation to those firms which voluntarily offered surplus capacity for elimination. This compensation was conditional upon certain stated minima being attained and upon the industry undertaking liability for payment of compensation to displaced personnel.

We decided to place two of our factories in the Redundancy part of the Scheme. I am pleased to tell you that the closure of these two factories and the increased use of shift-working in other units should appreciably increase the profitability of the Group as a whole. Displaced operatives have been offered alternative employment or compensation at not less than the approved rate.

The second part of the Scheme deals with re-equipment of those mills remaining in operation. Here, the Government offers to assist by meeting 25 per cent of the cost of such re-equipment, the difference to be borne by the industry. Although the advantage we can take is limited by the fact that due to our policy over past years we have already modernised our mills, nevertheless we shall take whatever advantages may be available to us under the terms applicable to this part of the scheme.

As this is the first occasion on which it is my privilege to address this statement to stockholders, it is indeed gratifying to be able to report some improvement in the figures over those of the previous year. The outlook to-day is much brighter than for some time past and even more encouraging is the continuing improvement in trading conditions which allows me to view the current year with great confidence.

FINANCE CORPORATION FOR INDUSTRY

SUBSTANTIALLY IMPROVED RESULTS

CORPORATION'S IMPORTANT ROLE IN FINANCING CAPITAL INVESTMENT

THE LORD WEEKS ON "A BUMPER YEAR"

The fifteenth annual general meeting of Finance Corporation for Industry Limited was held on June 2nd in the Conference Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, E.C., Lieut. General The Lord Weeks, KCB, CBE, DSO, MC, TD, the Chairman, presiding.

The following is the Chairman's statement which had been circulated with the Report and Accounts for the year ended March 31, 1960:

The accompanying accounts cover the year to March 31, 1960. During the period a further £22½ million was advanced to clients whilst repayments amounted to £15,038,125 and outstanding loans (less provisions) rose from £37,048,125 to £44,510,000.

Further commitments as shown in the Note on the Balance Sheet in the sum of £24,072,000 show a decline over the year largely as the result of the greatly accelerated pace at which these loans are being taken up by clients.

The increase in the amount actually advanced to clients was financed by further borrowings from our Bankers and by the profits realised during the year.

Although there are several important and interesting developments under discussion at the present time, no new loan agreements have been entered into in the course of the past twelve months. This is a condition of affairs liable to occur from time to time in a business of this nature, but particularly so in the buoyant circumstances which prevailed in the money market in general for the greater part of the year. The function of your Corporation is to supplement but not compete with normal sources of finance for expansion and development and we are very conscious of our responsibilities in this regard.

PROFIT AND LOSS ACCOUNT

Turning to the Profit and Loss Account, I am happy to report a substantial increase in the amount of Interest receivable less interest on advances from Bankers, partly arising from a net increase in the amount of loans advanced to clients.

The figure of Surplus on realisation of investments, engagement fees and other income shows an increase of £3,095,775 against the 1958/59 figure and has been achieved largely from the profit realised by the sale last December of two million Ordinary Shares acquired in South Durham Steel & Iron Company Limited under the terms of our loan agreement with them.

As I have emphasised in earlier statements, income under this heading is completely unpredictable and subject to arbitrary fluctuations from year to year, but it is nevertheless of great importance in enabling the Corporation to establish a profitable position over the years.

This year to the best of our belief there is no occasion to make further provision against existing loans; the provision we made last year appears to have adequately covered the situation.

It was my hope to be able to report that the restoration of some part of those earlier losses had become possible, but I regret this has not yet been achieved despite the patient and painstaking efforts being directed to this end.

Administration and other expenses and Directors' emoluments are once again maintained at a modest figure in relation to the income of the Corporation and vary very little from one year to the next.

Taxation for the year in the figure of £347,121 would have been very much greater had it not been for the relief afforded by the carry forward of losses from previous years.

The Profit for the year after Taxation amounts to £3,463,589 against which has to be offset the loss of £2,172,998 brought forward from last year leaving a net figure of £1,290,591 available for appropriation.

A dividend of 6 per cent is proposed for shareholders but of the balance, bearing in mind the purpose for which the Bank of England last year paid £5 million in advance of calls, it has been decided to transfer £1 million to General Reserve and carry the remainder forward in the Profit and Loss Account.

One hesitates to prophesy what the future of the general economy will be but I can repeat what I said last year to the effect that I do not consider that any of our limited number of loans or commitments give cause for anxiety. The results of the year under review have been very satisfactory. It will of course be appreciated that the large surplus on realisation of investments referred to above is exceptional and I do not anticipate any comparable figures in the current year. Apart from that, however, and so far as our general business is concerned I have reason to hope that the results for 1960-61 will be at least as good as those of the year just past.

ADDITIONAL SPEECH BY CHAIRMAN AT MEETING

Addressing the meeting, the Chairman said:

My Lords and Gentlemen,—The report and accounts have been in your hands now for some three weeks and with your permission I propose to take them—and the Statement that goes with them—as read.

This is the third Annual General Meeting of the Corporation over which it has been my privilege to preside and after the disappointing results of the two previous years it is a very welcome change to be able to present the substantially improved figures now before you.

The major feature in the improvement is the surplus on realisation of shares in the South Durham Steel & Iron Company Limited—shares which we acquired through the exercise of an option contained in the Loan Agreement under which we undertook to find £22½ million towards the cost of that Company's Development Scheme. Incidentally, I might add that the Development is proceeding on schedule and according to plan.

I must, however, emphasise that the profit arising from such realisation is exceptional and we cannot expect any comparable figures in the current year. Nevertheless, our general business has been satisfactory—interest receivable less interest on advances from Bankers and other income have shown increases—and I would hope that in this respect the current year's results will compare not unfavourably with those of last year.

CORPORATION'S FUNCTION

As you are aware, it was never the intention that your Corporation should compete with the established sources of finance for industry—neither with the Banks as a source of temporary or "interregnum" advances, nor with the capital market as a source of permanent finance. Rather is it our function to provide for the capital requirements of large industrial undertakings which cannot borrow on sufficiently long terms from their bankers and whose new or extended enterprises are not in a sufficiently advanced stage for an immediate approach to the capital market to be either appropriate or practical. It was never the intention that we should become investors in the accepted sense and for this reason—as in the case of South Durham Steel & Iron Company Limited last December—when the opportunity arises to divest ourselves of any part of our loan or commitments, we do so.

By virtue of the exceptionally large amounts involved for a comparatively short period of time, finance in respect of developments within the Steel Industry still constitutes by far the largest part of our business, but we are nevertheless active in other fields also. Moreover, as I said in my statement, negotiations in connection with further schemes of development are proceeding at present although, as it so happens, no new agreements were entered into during the year under review. On the contrary, some of our clients found that the more favourable conditions prevailing during the latter part of 1959 and continuing into this year enabled them to effect repayment of some part of their loans earlier than was originally contemplated. These repayments, however, were matched by a greatly accelerated call by other clients for advances under agreements concluded previously and in the result our balance of loans outstanding at the end of the year exceeded that at the beginning of the year, while the total of outstanding commitments fell to the lowest figure since 1954.

It has been suggested in the past that insufficient information is released concerning the activities of your Corporation, and this year the Board has very carefully considered whether more statistical information could be included with the Annual Report. Obviously we cannot disclose any of the details of transactions with clients until such time as they themselves see fit to make some public announcement. FCI is unlike any other institution in a number of ways, and such figures as could be disclosed would not be comparable with apparently similar figures published by other institutions with quite different structures, methods, or objectives. Furthermore the small number of relatively large loans, occurring at irregular intervals of time and varying greatly in amounts, would make it impossible to discern trends or to link your Corporation's activities with events or other factors in the general economy of the country. It was therefore thought better to publish no statistics than to produce figures which would be more misleading than helpful.

VALUABLE PART OF POSTWAR FINANCIAL MECHANISM

Reviewing the results of your Corporation's fifteen years of existence I believe that your Corporation has come to be accepted as a valuable part of the postwar financial mechanism, although the cases qualifying for our help have been and will continue to be necessarily limited in number but large in amount. It is my considered opinion that the necessity for British Industry to maintain its competitive position by accelerated re-equipment and expansion cannot fail to require your Corporation to continue to play an important part in financing capital investment.

GENERAL

There have been no changes in our Board during the past twelve months and it is once again my pleasant duty to tell my fellow Directors how grateful I am to them for the time they so willingly devote to the affairs of your Corporation and for the assistance they give me at all times.

Members will have been sorry as we were to learn of the sudden death of Sir Findlater Stewart, who was for so many years an active member of the Board of your Corporation. He retired as you will recall on health grounds in July, 1958. Those of us who were privileged to know him intimately have lost a sincere and kind friend.

In January of this year Mr Summers, who had been Secretary of the Corporation for eight and a half years, left to take up another position in Industry. He went with our sincere wishes for a successful future. He has been succeeded by Mr G. Frank whom you see here this afternoon and to whom I extend a hearty welcome on your behalf.

In conclusion I would like to express to Mr Nelson and to his staff the thanks of myself and my colleagues on the Board for the loyal support he and they have continued to give to us and the Corporation over the past year. Although this appreciation expressed by the Chairman sounds somewhat stereotyped, it is especially sincere on this occasion and I am sure all concerned are delighted to have taken part in what I might call a bumper year.

The report and accounts were adopted.

The retiring directors, The Right Honourable The Lord Clitheroe, PC, Mr George Cole and Mr Hugh Weeks, CMG, were re-elected; the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths and Company, was duly fixed and the proceedings terminated with a cordial vote of thanks to the Chairman and Directors for their conduct of the Corporation's affairs, proposed by Mr R. A. Bodey and seconded by Mr A. Craig.

FOY, MORGAN & CO, LIMITED

CAPITAL REORGANISATION APPROVED

MR PETER MORGAN ON THE OUTLOOK

The twenty-fifth annual general meeting of Foy, Morgan & Co, Limited was held on May 26th at the Offices of the Company, 16, Eastcheap, London, EC3, Mr Peter Morgan (the chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts:

The accounts for the year ended December 31, 1959, which are now submitted, show that once again, after making provision for distributions of profits on the same scale as in previous years, we have been able to add a substantial sum to the balance to be carried forward.

Throughout the year there was a steady recovery in the timber trade and in the late summer and autumn considerable activity in buying of softwood took place. This buying was, of course, mainly for 1960 delivery and started much earlier in the year than usual. Consequently, a large part of the work done in the second half of 1959 will be reflected in the results of 1960 and, in fact, sales made to date already exceed the total of sales made for delivery in 1959. I refer to this again later on in my statement.

CAPITAL STRUCTURE

I now turn to the special business of the Annual General Meeting. For some years past your Board has had under consideration the reorganisation of the Ordinary share capital of your Company, which is entirely out of proportion to the assets employed in the Company's business. The Company's issued capital is at present divided into two classes of Preference Shares, both of which are quoted on The Stock Exchange, London, and 1,000 Ordinary Shares of £1 each. All the Ordinary Shares are held by the Directors of your Company and are subject to stringent transfer and pre-emption rights contained in the existing Articles of Association.

The apportionment of the Company's profits under its existing Articles is also out of date. In brief, after providing for Directors' remuneration aggregating a maximum of £30,000 per annum the Board may at present apply the annual profits of the Company available for distribution in the following order:

1. In such transfers to reserves as they think fit;

2. In payment of the First and Second Preference dividends;

3. As to 95 per cent of the balance, in payment of additional remuneration to the Directors of the Company.

4. As to the remaining 5 per cent in payment of Ordinary Dividends.

SCRIP ISSUE

It is now desired to bring the issued Ordinary capital more in line with assets employed in the Company's business and to obtain a quotation for the Ordinary Shares. Resolutions will accordingly be proposed at the Annual General Meeting for the classification and subsequent sub-division of 149,000 unissued and unclassified shares of £1 each into 596,000 Ordinary Shares of 5s. each and for their issue by way of capitalisation of part of the Company's reserves to the holders of the existing Ordinary Shares of £1 each, which will also be subdivided into four Ordinary Shares of 5s. each. Each Ordinary Share of 5s. will carry one vote. Such new shares will be in the form of fully paid Letters of Allotment renounceable up to July 8, 1960. The former stringent transfer and pre-emption rights attaching to the Ordinary Shares will be abolished. Arrangements are being made for 30 per cent of the new Ordinary Shares to be made available by way of placing through the Company's brokers.

NEW ARTICLES OF ASSOCIATION

At the same time the opportunity will be taken to adopt new Articles of Association in modern form. Apart from changes made in order to bring the Articles up to date and to comply with the requirements of The Stock Exchange, London, these new Articles will be substantially similar to those at present in force, including in particular the retention of the existing rights of the First and Second Preference shareholders. They will, however, differ from the old Articles in that the profits of the Company in each year, after providing for Directors' remuneration to an aggregate of £30,000 (as before), will be applied in the following order:

1. In payment of the First and Second Preference dividends;

2. In payment of dividends on the Ordinary capital for the time being in issue aggregating 10 per cent per annum;

3. In transfers to reserve in the discretion of the Board;

4. Any balance remaining shall then be applied by the Board as to one-half in the payment of further Ordinary dividends and as to one-half in providing additional remuneration to the Directors.

The Board may in respect of any year pay dividends out of profits of earlier years, but profits brought forward from earlier years will not be available for payment of additional remuneration to the Directors.

The power to declare dividends will be vested in the Board.

THE CURRENT YEAR

Trading results for the current financial year, as mentioned above, are satisfactory, and in the absence of unforeseen circumstances, your Directors consider that profits before tax for the year ending December 31, 1960, will not be less than those for the year ended December 31, 1959. In such event, your Directors expect to be able to recommend dividends on the Ordinary capital, as increased by the proposed issue, aggregating not less than 18 per cent less tax for the year.

After the capitalisation issue has been made and quotation obtained your Directors will between them hold approximately 70 per cent of the Company's issued Ordinary capital. A copy of the proposed new Articles of Association may be inspected at the Company's registered office at any time during usual business hours on weekdays (excluding Saturdays) before the date of the meeting.

Finally I would, once again, like to pay tribute to the loyalty and splendid work of our Staff who have earned the grateful thanks of myself and my colleagues on the Board.

The report and accounts were adopted and the Board's capital proposals and the adoption of new Articles of Association were sanctioned.

THE CONSOLIDATED ZINC CORPORATION

HIGHER GROUP PROFIT

MR L. B. ROBINSON ON IMPORTANT DEVELOPMENTS IN LEAD/ZINC OUTLOOK

The eleventh Annual General Meeting of The Consolidated Zinc Corporation Limited will be held on June 21st at 37 Dover Street, London, W.1.

The following is an extract from the Statement by Mr L. B. Robinson, the chairman, which has been circulated with the report and accounts for the year ended December 31, 1959:

The voluntary restrictions on the sales of lead and zinc metal and concentrates by world producers during the last seven months of the year and the effect of the import quota imposed by the United States on these products throughout the year made 1959 an anxious year. The average London Metal Exchange price for prompt delivery of lead during 1959 was only £70 15s. 7d. compared with £72 16s. for 1958, but, fortunately, this was more than compensated by the increase in the zinc price from £65 18s. 1d. for 1958 to £82 4s. 8d. in 1959. We benefited considerably from the progress in the modernisation and increased capacity of our smelting plant and also from licensing the Imperial Smelting process to other smelters. We can also report greater efficiencies at the mine at Broken Hill and at our works. Due to these factors we are able to show considerably increased profits for 1959.

The Group profit before mining royalty and taxation amounted to £3,969,759, an increase of £1,241,568.

The consolidated net profit for the year at £2,663,267 shows an increase of £1,045,391 compared with 1958.

The directors recommend a final dividend of 2s. 9d. per share, giving a total distribution of 4s. per share, compared with 3s. for 1958.

The mine production budgets of both the Zinc Corporation and New Broken Hill Consolidated, were again based on an output below their respective capacities. The 10 per cent reduction in working time, introduced in February, 1958, continued to operate throughout the year under review. The outlook for the future has been improved, however, by the removal of restrictions on zinc production in January of this year and it has since been possible to resume full working time.

LEAD AND ZINC SMELTING

At Swansea the closing down of the horizontal retort distillation furnaces in advance of the commissioning of the new smelter operating the Imperial Smelting process was carried out gradually and the last pair of furnaces ceased operations in March, 1960.

The new Smelter was successfully commissioned in March, 1960, and is giving a most satisfactory performance. This new unit, scheduled to produce 30,000 tons of zinc and approximately 15,000 tons of lead bullion per annum, marks the beginning of a new era in the history of metallurgy.

IMPERIAL SMELTING PROCESS

A year ago I reported that the Société Minière et Métallurgique de Peñarroya had decided to install an Imperial Smelting process plant at its works in Northern France.

Since then two other option holders have also signed licence agreements, namely, Rhodesia Broken Hill Development Company Limited, and "Centrozap" National Enterprise on behalf of the Polish non-ferrous metal industry.

A number of other leading lead and zinc smelting interests are also showing keen interest in the process.

ZINC ALLOYS

For the second year in succession production and deliveries of Mazak zinc alloys created a fresh record and steps have been taken to increase our alloying capacity to meet the increasing demand.

BERYLLIUM

In July last year we announced the formation of Consolidated Beryllium Limited in association with Beryllium Corporation of Reading, Pennsylvania.

The production of beryllium metal at Avonmouth has been taken over by the new company and small deliveries of nuclear grade metal are currently being made to the United Kingdom Atomic Energy Authority.

The new company has under construction at Avonmouth a plant to produce beryllium copper master alloy, the demand for which is rapidly growing in the field of electronics and in other industries.

COMALCO

Although our studies into alumina production are still proceeding, the principal efforts of Comalco, which is jointly owned with The British Aluminium Company Limited, were largely concentrated on the proving of power resources suitable for the initial establishment of aluminium smelting and for adequate growth in the future.

Although the magnitude of our task has not lessened, I am happy to say that the results to date of a number of investigations have brought us appreciably closer to the point of making a definite start in the development of the very considerable bauxite resources at Weipa in Northern Queensland and at Gove in the Northern Territory.

OIL EXPLORATION

Frome-Broken Hill Co. Pty. Ltd. in which the Group's subsidiary, Interstate Oil Limited, has a one-third shareholding, continues to be the principal avenue through which our interest is maintained in oil exploration in Australia.

LEAD AND ZINC MARKETS

Since my report to you at the last annual general meeting there have been two important developments in the lead/zinc outlook. First I would like to refer to the import quota situation in the United States which, as you may remember, caused producing companies throughout the world much anxiety. There has occurred, however, in the meantime some change of thought concerning this matter and whereas some producing countries, in particular Australia, have suffered from a severe limitation on their right of entry into the United States, other producing countries have been more fortunately placed and it is now apparent that the opposition to quotas by exporting countries is no longer unanimous. On the other hand the strongest opposition has developed amongst the US custom smelters who have been much embarrassed by the physical restrictions on their freedom to purchase the most desirable feed for their operations. As a result demands have been made upon the Administration in Washington for a reversal of policy and recommendations for an increased tariff are now in the forefront to replace the import quotas. A Bill has been presented in the House of Representatives proposing greatly increased duties to take the place of those at present in force. The outcome of this battle may be known shortly. Alternatively the matter may be shelved until after the Presidential election.

Secondly, a most interesting feature has been the recovery in zinc consumption, particularly in Western Europe, and, as a result, the voluntary restrictions on zinc sales which came into force after the United Nations meeting in May, 1959, were lifted in their entirety at a subsequent meeting in Geneva in early February, 1960. I am glad to be able to tell you that since the lifting of these restrictions the zinc market has shown that present production and consumption are reasonably in balance and that the only immediate problem still remaining is the presence of sizeable stocks in smelters' hands in the United States.

The position of lead, though not so happy, gives some measure of encouragement since the continued restriction on sales has kept the price steady during most of the year and latterly the market has even shown some sign of recovery. The problem remains as to how the stocks which are in producers' hands, both in the USA and outside, can be liquidated without weakening the price structure. It will be of major interest to see the statistical review that will no doubt be available for a possible meeting of the International Study Group early in September. I believe that all producing companies are grateful for the interest which their respective governments have shown in their lead/zinc problems and I welcome the greater spirit of co-operation which has followed the formation of the International Lead and Zinc Study Group. We, ourselves, are still anxious not only to protect ourselves from unduly low prices but also to make sure that a policy of restriction should never result in disorderly markets and exorbitant prices. The threats of substitution are still very plainly apparent and the future position of our metals in the world's expanding industries can best be assured by a moderate price level. Some years ago the late Chairman stated that our companies would be satisfied with a combined LME price for lead and zinc of £175. Since those days increases in our costs have been compensated by greater efficiencies. Hence we see no reason to vary this statement and we suggest that it might apply to all the big producers, at least those outside the USA.

CONCLUSION

We are hopeful that further opportunities will arise in this country and in Australia to broaden the base of the Group's activities.

AMALGAMATED METAL CORPORATION

SIR PAUL BENTHALL'S REVIEW OF ACTIVITIES

The thirty-first Annual General Meeting of Amalgamated Metal Corporation Limited will be held on June 23rd at Princes House, 93 Gresham Street, London, E.C.

The following are extracts from the statement by the Chairman, Sir Paul Benthall, KBE, which has been circulated with the report and accounts for the year ended December 31, 1959:

Before reviewing the activities of our group I would like to refer to the retirement of Mr A. J. Hugh Smith from the Board, of which he had been a member since the incorporation of the Company in 1929, and to thank him on your behalf for the services he has rendered. We must also express our appreciation of Mr R. T. de Poix's services with Henry Gardner and Co., on his retirement from his position as a Managing Director of that company which he joined in 1919. Mr Hugh Smith was succeeded as Chairman of The British Metal Corporation Limited, of which he remains a director, by Field-Marshal Sir Gerald Templer who joined our own Board last November.

The profit for 1959 before taxation is £1,004,652 compared to £817,662 the previous year. The net charge for taxation is £420,048, and after allowing for minority interests, the group profit after taxation is £604,044 compared to £437,109 for 1958. The proposed final dividend of 8 per cent on the ordinary shares brings the total up to 11 per cent, against 9 per cent for the previous year. Owing to the widespread nature of our business, which involves stock-taking in all parts of the world, it is always possible that the information at our disposal in January about the previous year's results may be materially altered when subsidiaries' accounts become available, and we are therefore pursuing a policy of paying a modest but steady interim dividend.

The preference and ordinary dividends absorb in total a sum of £331,937.

THE BRITISH METAL CORPORATION

As is customary, I refer below to some of the more important topics which were the concern of The British Metal Corporation in 1959.

In June our subsidiary, Aerex Limited, sold its business, as designers and erectors of ventilating equipment, to the Bestwood group. The name of our subsidiary has been changed to Metal Investments Limited.

It was mentioned in my statement last year that the BMC, in view of the substantial proportion of its total investment portfolio represented by the holding in Norddeutsche Affinerie, had decided to make a moderate reduction in this holding. The second half of the reduction which had been decided was effected in 1959, and the sale also took place on profitable terms.

Our timber distributing company, Richard H. Keeping Limited, has been sold to Bambergers Limited.

For various reasons the BMC itself has funds which are not at the present time required for financing stocks of metals. The reasons for this liquidity include sales of previously held investments and the continuous ploughing back of part of the annual profits earned. Since the end of the last war there has been little or no opportunity for the Company to employ any substantial part of its resources in the financing of stocks of non-ferrous metals. There seems little prospect that any considerable part of the BMC's resources will be required for this purpose for some time to come and it has, therefore, been necessary for the Company to consider other uses for its funds to obtain income.

As a result of this situation, two shareholdings have been acquired in new fields of investment. The first is an investment in Western Credit Limited, a hire-purchase company.

The second is that BMC, in conjunction with our friends, Consolidated Tin Smelters Limited, has recently, subject to contract, acquired the entire share capital of Wilbraham & Smith Limited, of Gray's Inn Road, London. This company is a well-known wholesale distributor of ferrous and non-ferrous semi-fabricated products.

The British Metal Corporation (Australia) Pty. Ltd. has, after a prolonged period of difficulties, begun to produce regular earnings. The Managing Director of that company appointed three years ago, is full of hope that the profits will rise further during 1960 and afterwards.

The operations of Vivian, Younger & Bond Limited at home were severely affected during 1959 by the high degree of output restriction imposed by the International Tin Council. As a result, this company, who are the sole selling agents for the metallic tin produced by Consolidated Tin Smelters Limited, naturally had much reduced quantities of tin for sale. Fortunately the position should be different in 1960, since the International Tin Council has raised the permissible exports of tin to a very high level.

Despite this situation, the profits of V Y & B in London were as satisfactory as could be expected, whilst the activities of that Company in Nigeria are now, after a long period of teething troubles, on an increasingly profitable basis.

HENRY GARDNER & CO.

Henry Gardner & Co. Ltd. have continued active trading in non-ferrous metals, rubber, cocoa, coffee and other produce. Their wholly owned subsidiary in Malaya, Sandilands Buttery & Co. Ltd., maintained satisfactorily its part in the distribution of general merchandise, mainly consumer goods imported into the territory on an agency basis from UK and other manufacturers.

In Canada, Drew Brown Ltd., showed an improved result and is currently engaged in widening its field of operations into merchandising and fabricating Iron and Steel products.

THE EMPLOYERS' ASSURANCE

RECORD RESULTS

The following is an extract from the statement by the Chairman, Lord Knollys, which has been circulated with the report and accounts of The Employers' Liability Assurance Corporation Limited for the year ended December 31, 1959:

First I must refer to the merger of the Corporation with the Northern Assurance Company Limited, which became effective last month. Your Board is very gratified that by it we—and we believe also our new partners—will obtain the following advantages which we consider to be of cardinal importance.

First, the merged organisation will have an almost ideal geographical distribution of business. Secondly, its portfolio will be balanced satisfactorily as between Life, Fire, Accident and Marine insurance. Thirdly, there is the great financial strength of the joint undertaking. Fourthly, there are the economies, available only to really large units, that are bound to result from the combination of two organisations which in many parts of the world, and notably in the United Kingdom, can eventually operate with branch offices under one management and one roof.

RESULTS FOR 1959

The Corporation and its subsidiary companies earned for 1959 an underwriting profit of £1,530,398, and a total profit after taxation of £1,194,572. These are the best results that we have ever shown, the total profit being a record one.

As was forecast in my letter to shareholders of January 22, 1960, a second interim dividend (in lieu of a final dividend) has been declared for 1959 by your directors, making with the first interim dividend of 2s. 6d. per share a total of 7s. per share, or 35 per cent an increase of 1s. 6d. per share on the total paid for 1958.

After provision for the net cost, £428,750, of this increased dividend, and placing £250,000 to Contingencies Account, the Carry Forward of our Consolidated Profit and Loss Account amounts to £1,806,199, £515,822 more than at the end of 1958.

We suffered, as did most other companies, from the exceptionally heavy volume of Home Fire losses in 1959, but we show a profit in total on the Fire Account, as against a loss in 1958.

The profit for the year was mainly derived from the United States, and it is to the Accident account in that country that it chiefly belongs. Workmen's Compensation has been our greatest source of profit there over recent years and it made a very satisfactory contribution to the total results in 1959. The best improvement was, however, in Motor business, on which a good result was achieved.

We have also had an excellent year, with good profit ratios, on Accident business in Canada and Australia. There was a marked improvement in our United Kingdom results, but losses on Motor and Miscellaneous classes prevented a profit being earned on this section of the account.

Our associated Life company, the Clerical, Medical & General Life Assurance Society, made excellent progress again in 1959 with net new sums assured under Life policies of £13,327,441, an increase of 20 per cent, and a rise in Premium Income to over £4 million.

The Merchants Marine Insurance Company Ltd. had further world-wide growth to report in all sections of its Marine business.

The book value of the Corporation's total investments, including property and associated and subsidiary companies was £50,966,191 at December 31, 1959. This is an increase of £4,511,191 over the corresponding figure for December 31, 1958.

LONDON ASIATIC RUBBER

SIR ERIC MACFADYEN'S ADDRESS

The annual general meeting of the London Asiatic Rubber & Produce Company, Limited, will be held on June 20th in London.

The following is an abstract of the address of the Chairman, Sir Eric Macfadyen, circulated with the report and accounts:

The year's rubber output is again higher. It has in fact risen steadily from approximately 13 million lb in 1955 to 18 million lb in 1959.

Recently we have absorbed the estates of the Oriental Company and are now in the process of absorbing those of the Lanadron Company. Both these Companies have been modernised in recent years and one of the Lanadron estates now carries some 2,000 acres of high-yielding oil palms. We have plenty of confidence in good quality rubber properties, but there is much to be said for having a second string to our bow.

Our aim is not size for the sake of size. We have sold as well as bought land and may do so again for good reason. Our policy aims at the absorption of new estates with good soils and high yield potential and the extension of others where possible with a view to simplifying administration and building up production capacity.

ACCOUNTS

Our average price realised for the year was higher than that of 1958 by some 6¾d. per lb. Proceeds come out at £2,195,003, and gross profit at £942,030. Taxation took £273,986 (£148,100). Net profit after taxation is £668,044 (£381,031), our highest score in 52 years. As £102,707 was brought forward we have £770,751 available—an amount higher by 60 per cent than a year ago. To Capital General Reserve we transfer £147,613 and to Replacement Reserve the large amount spent during the year on replanting, £171,376. Our two interim dividends, which make between them a total distribution of 50 per cent for the year, absorb £349,236, and we carry forward £102,526.

ESTATES

Field work is well up-to-date and replanting of areas approaching obsolescence is being pushed on—1,120 acres done in 1959 and about the same acreage scheduled for 1960. Within the next three years, 5,000 acres of modern rubber now immature may be expected to come into bearing. At our 1959 meeting I ventured a forecast of a 20 million lb crop in 1962. The expanded London Asiatic is likely by then to be harvesting nearer 30 million lb, or twice the Company's 1948 output.

FUTURE PRODUCTION

The Malayan Government is alive to the supreme importance to the country's economy of the plantation industry and has embarked on a far-sighted policy of expansion and modernisation of the industry. There will be downs as well as ups in price no doubt—that will be no new experience. Some of those who recall the change in climate between the 1920's and 1930's are apt to feel apprehensive about the 1960's. But the background to demand and supply in rubber has been strikingly modified. In the old days when industrial demand slackened the whole shock had to be taken by the plantation article. Slump followed boom as night followed day. Now world demand for all rubber is satisfied as to about half from natural and half from man-made products. If and when recession occurs in industry and prices fall, then that part of the market which is governed by price will be a larger proportion of the whole. But the cheaper natural need not fear competition on price. With three shilling rubber high dividends can be earned by all producers—good and not so good. At two shilling rubber there would still be a living for all, although profit-margins would vary as between producers. That would apply also and probably in greater degree between one synthetic and another. At levels below two shillings there might be little incentive to create new facilities for the expansion of synthetic production. If in earlier days the prospects for plantation enterprise were for a feast or a famine, I do not think that is any longer the case. At the present juncture and quite possibly for some way ahead, natural rubber is in short supply: it is in the nature of a premium product. In the near future we may see fluctuations, but they are unlikely to be steep. As for 1960 it looks quite like being as good a year as 1959.

PEACHEY PROPERTY CORPORATION

GRATIFYING ACHIEVEMENT IN TRANSITIONAL PERIOD

In his statement circulated to shareholders with the Report and Accounts, Mr C. W. Hutley, FCIS, AALPA (Chairman and Joint Managing Director) said that whilst the results as such could only be described as fair, the Board were extremely gratified with them since it was felt that they represented an extremely fine achievement in view of the difficulties encountered in the transitional period caused by the change of policy.

He added: Shareholders have been given in the comprehensive Interim Report sent to them last January full information concerning these difficulties and also the future prospects of your Company. In that Report it was stated that, subject to all the reservations and assumptions made therein, by June 1961 the net income of the Group would be running at a rate of £1,100,000 per annum subject to taxation, the servicing of the debenture stock, mortgages and loans and before providing for preference dividend and minority interests. Your Board has great pleasure in informing shareholders that this estimated rate of income has not only been achieved one year earlier than anticipated, but will in fact be running slightly in excess of that figure by June, 1960.

I would, however, reiterate that some of the difficulties and losses of income due to the changeover in policy will still be felt and reflected in the results for the current year to June, 1960.

Your Board is continuing with its policy of expansion and new purchases will be made as and when opportunities arise.

Your Board is giving absolute priority to the question of re-financing the entire Group and when this is achieved it is felt that a direct result would be to improve even further the net income out of the Group's existing holdings.

Finally, I am of the opinion that your Company is in an extremely strong position and if re-financing can be accomplished in the near future, then all will be set for a really large expansion programme.

THE CHLORIDE ELECTRICAL STORAGE COMPANY

(One of the World's Leading Battery Manufacturers)

TRADING INCOME AN ALL-TIME RECORD

The sixty-ninth ordinary general meeting of The Chloride Electrical Storage Company Limited was held on May 31st at Exide Works, Clifton Junction, near Manchester, Mr A. W. Browne, OBE, MIEE (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

Your Company has had a most satisfactory year in which the income from trading has increased by £978,950 to £3,772,992. The net income for the year is £1,473,287, which is some £574,000 better than last year. It is proposed to pay a final Ordinary dividend of 12½ per cent, making 17½ per cent, but if the special Interim of 2½ per cent paid last May on the then issued capital is taken into account, the total for the year under review amounts to 19½ per cent on the present issued ordinary capital.

The income from trading, which is an all-time record, is derived from three main sources, namely, battery activities in the United Kingdom, which account for approximately three-fifths, battery activities overseas, and activities in other industries. All three divisions have made a satisfactory contribution.

The expected increased efficiency resulting from the closing down of certain UK factories is now being reflected in the improved profitability of those parts of our battery organisation concerned with the changes that were made. This reorganisation has also provided a sound basis for large-scale expansion principally to meet the anticipated future demands for automotive and traction batteries.

OVERSEAS

Our overseas companies have produced better results, the only exception being in Australia, where there has not yet been time for the completion of the substantial reorganisation now taking place.

Re-equipment and expansion are also taking place in Canada, and in Pakistan the manufacturing facilities are being completed by the installation of container plant.

The factory in South Africa is producing an increasing range of high quality batteries and in Central Africa at Salisbury the factory which commenced manufacture only last year has made considerable progress by overcoming its initial teething troubles.

In India the results have been particularly good and increasing demands have made it essential to consider material expansion which is being financed by an increase in capital, of which 40 per cent is now held by Indian Nationals after a successful public issue.

OTHER INTERESTS

Our other interests have also had a satisfactory year, particularly United Ebonite and Lorival, and Shires. Both have made a substantial improvement, the latter recovering even more quickly in its sanitary ware business than was expected.

These other activities are also expanding. In the case of United Ebonite and Lorival the increased demands from the battery factories, from the sanitary ware industry, and from their outside customers for ebonite and plastic mouldings, make it necessary to provide increased production facilities at the factory.

Whilst the consolidation and expansion of our established business receives first priority, we do not neglect the consideration of suitable projects for diversifying our business along fairly well defined lines.

At this date our order books are well filled and the sales for the first quarter of the current year are greater than those for the same period last year.

The report was adopted.

WILKES BERGER ENGINEERING COMPANY LIMITED

HIGH LEVEL OF ACTIVITY

The Annual General Meeting of Wilkes Berger Engineering Company Limited will be held on June 21st at the Registered Office of the Company, Princes House, 95 Gresham Street, London, EC2.

The following is an extract from the Statement by the Chairman, Mr R. H. Macwilliam, which was circulated with the Report and Accounts:

THE YEAR'S TRADING

Throughout almost the whole of 1959 conditions were very active in the consumer goods industries—which provide a market for many of the products which the Company manufactures or handles—and this fact is reflected in an 11½ per cent increase over 1958 in the value of the Company's sales. In spite of the erosion of the profit margins of the goods we manufacture due to increasing costs, both the trading and the net profit figures have shown increases. During the first four months of the current year the general level of activity has remained high and the Company has also benefited from an increased tempo in the building industry. Compared with the same period last year, sales have shown a satisfactory increase and, provided no marked setback occurs in the industries we serve, the Company should have another successful year. The continued pressure of rising costs and, in particular, the introduction of the 42-hour week in the light engineering industry have recently forced the Company, in line with other firms similarly placed, to make a modest increase in some of its prices.

As a concomitant of the prosperous conditions now prevailing, the supply position of raw materials—especially steel—has become very tight. Further, there is strong competition for labour in the Birmingham area with the inevitable consequence of a higher than usual turnover of labour and a degree of dislocation of operations.

SOUND FINANCIAL POSITION

The Company's financial position is very sound. The Board is still actively considering ways of using the Company's liquid resources to expand its business but is not yet in a position to formulate any definite plans. We have always to bear in mind, of course, the need to rehouse the Hillcrest factory when the Birmingham Corporation redevelops the present site.

NEW BROKEN HILL CONSOLIDATED

HIGHER PROFIT DUE TO RECOVERY IN ZINC PRICE

The Twenty-fourth Annual General Meeting of New Broken Hill Consolidated Limited will be held on June 21st at 37 Dover Street, London, W1.

The following is an extract from the Statement by Mr L. B. Robinson, which has been circulated with the report and accounts:

The low price level of lead prevailing at the end of 1958 continued during the year, but the price of zinc improved gradually to finish in December, 1959, at £95 3s. 10d. for prompt delivery metal, and the average London Metal Exchange prices for prompt delivery during 1959 were £70 15s. 7d. for lead and £82 4s. 8d. for zinc, compared with £72 16s. and £65 18s. 1d. for these metals respectively during 1958. Despite the incidence of restrictions on sales the higher zinc price, coupled with satisfactory forward contracts and a marked reduction in operating costs per ton of ore, resulted in a trading balance of £1,531,700, compared with £1,037,063 for 1958.

The profit before taxation amounted to £1,190,847, compared with £696,303. There is a net profit of £796,238 compared with £476,317. The directors are recommending a final dividend of 1s. 6d. per share free of tax, giving a total of 2s. 3d. per share compared with 1s. 4d.

For the second year in succession the Company budgeted for an output well below capacity and the 10 per cent reduction in working time introduced at Broken Hill in February, 1958, continued to operate throughout the year under review. Nevertheless, increased productivity and slightly higher overall grade of ore and mill recoveries resulted in metal production in 1959 being higher than in 1958. The tonnage of ore treated by the Company rose by 11 per cent, the production of recoverable lead by 15 per cent and zinc concentrate output was 8 per cent higher.

The recoveries of lead and silver in lead concentrate improved satisfactorily. Recovery of zinc in zinc concentrate fell fractionally but there was an important improvement in the grade of zinc concentrate.

The ore reserves fully outlined and developed ready for stoping or in the process of being stoped as at December 31, 1959, were calculated at 4,100,000 tons assaying 10.8 per cent lead, 2.8 ounces silver and 12.7 per cent zinc compared with 3,600,000 tons assaying 10.5 per cent lead, 2.5 ounces silver and 12.9 per cent zinc.

The plan and cross-sections accompanying the report illustrate the results of some of the work on the large siliceous zinc orebodies occurring in the upper levels. These are now known to extend laterally from our northern boundary to at least 3,500 feet south and provide means whereby production of zinc concentrate could be increased without correspondingly increasing the output of lead concentrate.

An examination of the details of the drilling done on these siliceous zinc orebodies has revealed between Sections 66 and 82, a distance of 1,040 feet, the existence of some four millions of tons of ore averaging 5 per cent lead and 20 per cent zinc, the opening up of which would procure major advantages if the present market conditions for zinc concentrate prevail. Consequently a programme for the development of this ore is being designed and, subject to no adverse change in the zinc price, stope production is estimated to start in 1962.

THE SEA INSURANCE COMPANY LIMITED

EXPANSION O OVERSEAS INTERESTS

MR A. REITH GRAY ON THE YEAR'S DEVELOPMENTS

The Eighty-fourth Annual General Meeting of The Sea Insurance Company Limited was held on May 31st at the Exchange Hotel, Liverpool. A statement by the Chairman, Mr A. Reith Gray, had been circulated with the Report and Accounts for the year ended December 31, 1959.

Before examining the Company's results in detail, the Chairman referred to two important new developments; the formation in the United States of America of a subsidiary company, the American Sea Insurance Company, and the setting up of a branch organisation in Australia where the Company's affairs had for many years been managed by the Royal Exchange Assurance

Owing to these projects and a general expansion of overseas business, the Board had decided to increase the issued share capital from £600,000 to £1,500,000 by means of a one for four Rights Issue to be followed by a one for one free scrip issue.

A Final Dividend of 1s. 1½d. per 5s. share making a total for the year of 1s. 10½d., was proposed and it was hoped that this rate of dividend would be maintained proportionately on the capital as increased by the two issues.

The Chairman referred to the inclusion of the results of a German Subsidiary Company, Deutsche Versicherungs Gesellschaft, in the consolidated accounts for the first time, and also made special mention of two exceptional items, a tax refund of £106,000 received in the USA, and a large surplus on realisation of investments mainly in America.

DEPARTMENTAL RESULTS

Marine premium showed a substantial increase, partly due to consolidation of the Deutsche Versicherungs Gesellschaft figures, and a satisfactory transfer of £154,598 to Profit and Loss Account had been made.

Fire Department premium at £1,803,335 was nearly £200,000 up on 1958 with an increased profit of £57,668 largely attributable to better experience in North America. At home fire losses had shown an alarming rise.

Accident Department premium had risen but a loss of £80,000 was incurred and the Motor account continued to be a problem.

Transfers of £125,000 to additional reserves in both Fire and Accident Departments had been made and a further £125,000 had been transferred to investment reserve.

Beacon Insurance Co. Ltd. had had another successful year and their Life Fund now stood at £11,001,737.

The Chairman concluded with a tribute to the Company's Agents and Staff at home and overseas.

The Final Dividend was approved and the Accounts were adopted.

ARISTON GOLD MINES

MR C. J. BURNS'S STATEMENT

The thirtieth annual general meeting of Ariston Gold Mines (1929), Ltd. was held on May 31st, at the Chartered Insurance Institute, London, EC.

Mr C. J. Burns, Chairman, presided.

The following is an extract from his statement circulated with the report and accounts for the year ended September 30, 1959:

FINANCE

As a result of the year's operations bullion revenue increased by £42,695 to £1,899,604 and with mining costs slightly higher and ore development expenditure some £20,693 more than the previous year the profit before taxation of £335,562 remains substantially the same as last year. Your Directors have, therefore, decided to recommend a final dividend of 10 per cent making a total of 20 per cent for the year under review. This dividend on the increased capital (equivalent to an annual rate of nearly 23 per cent on the old capital) is in line with the forecast made at the time of the new issue of shares in August, 1959. In addition, in the light of the results for the first six months of the current year your Directors have declared an interim dividend of 10 per cent in respect of the year to September 30, 1960. When your Board forecast a dividend of not less than 20 per cent on the increased capital of the Company we had in mind the capital expenditure programme outlined in my Review last year. It is anticipated that this programme will extend to the end of 1961 by which time new areas will have been opened up and a much more detailed picture of the behaviour of the known orebodies at depth obtained. At that juncture it will be possible to review that Company's future dividend policy.

DEVELOPMENT PLANNING

Following the programme of development to depth the decision was taken during the year to sink an internal shaft from the 30th Level at a position 960 feet North from Central Shaft. This shaft to be known as Central Sub-Shaft will be the exploratory spearhead to depth and it will be possible to combine lateral development on the various horizons below the 30th Level, with uninterrupted sinking of this shaft. The positioning of Central Sub-Shaft and of No. 4 Winze was selected to the southerly trend of the orebodies and are 2,140 feet apart.

In view of the projected development to depth it is important to realise that given the similar pattern of orebody exposure below 30th Level as say on 20th Level then the programme of continuous sinking can be considerably postponed. On the 20th Level the increase in ore reserves amounted to some 1 million tons for the whole level. Given a similar pattern the capital expenditure involved in shaft sinking would be spread over a far greater period than at present planned. It is for this very reason that it will be so important to sustain the high rate of deep level development at this particular stage.

To maintain a close liaison with Government so essential to both Company and Government the Company should have a Ghanaian on the Board of Directors. We have been most fortunate in obtaining the consent of Mr C. W. Tachie-Menson, CBE, a most distinguished citizen of Ghana, to act as a Director of the Company, and at the Annual General Meeting I shall have the honour to propose his election.

Mr Tachie-Menson has had a distinguished career in Ghana, his most recent public appointments being Public Service Commission, 1951-56; Chairman, 1957; Chairman, Achimota Constitutional Conference.

The report and accounts were adopted.

THE KUALA LUMPUR RUBBER COMPANY LIMITED

The Fifty-third Annual General Meeting of the members of the company was held at The Rubber Growers' Association, 19 Fenchurch Street, London, E.C.3.

The following are extracts from the speech of the Chairman, Mr Harold F. Copeman:

The position at September 30th last can be briefly summarised as follows:

Sungei Chermang.—Profits brought into account are those for the seven months from March 2, 1959. Profits prior to that date have been taken up in the accounts of the Liquidator.

Jeram.—This company's financial year previously ended in March. A final dividend of 6d. per 2s. share, making 9d. for the eighteen-month period has been recommended. This final dividend has been taken into the Profit and Loss Account of the parent company only in respect of the share capital acquired at September 30th, that is, in respect of 72 per cent of the Jeram capital. Since that date further capital has been acquired and Kuala Lumpur now holds over 83 per cent of the share and debenture capital of Jeram, including a small percentage held by Tamiang. The outstanding debenture capital of Jeram now amounts to only £5,156.

Tamiang.—A dividend of 7½ per cent free of tax for the year has been recommended. This dividend has been taken into the Profit and Loss Account only in respect of the 83 per cent of the capital acquired at September 30th. Since that date further shares have been acquired and Kuala Lumpur now holds nearly 98 per cent of Tamiang's capital. This shareholding is represented by £109,521 or 100 per cent of the Registered share capital and £19,267 or over 86 per cent of the capital issued in the form of Share Warrants to Bearer.

Eastern Sumatra.—The offer to acquire the issued share capital of Eastern Sumatra was not made until after September 30th, the close of the period under review, and consequently none of the profits of Eastern, nor of its subsidiary Sungei Kahang, have been taken into account and no dividend has been notified. It will be recalled, however, that the Kuala Lumpur shares issued in exchange for the Eastern capital rank *pari passu* with the existing shares and are, therefore, entitled to participate in Kuala Lumpur's final dividend. It will be appreciated that the profits of Eastern, including those of its subsidiary, accrue from March 1, 1959, to Kuala Lumpur, which at present owns nearly 95 per cent of Eastern's capital; notice has been given for the compulsory acquisition of the balance.

Kuala Lumpur.—The proposed final dividend of 12½ per cent free of tax will absorb £172,939, based on an issued share capital of £1,383,513. The effect of the limitation on the consolidated profits as indicated above has been to diminish very considerably the profits available for appropriation, which has made it necessary to provide for the replanting programme of the current year partly from General Reserve.

ACREAGE AND PRODUCTION

For the reasons indicated above, it is difficult to assess the worth of the Group from the accounts as published. An indication of the progress and prospects of the Group can be gained from the following summary:

Kuala Lumpur.—Mature: 10,246 acres, of which 68 per cent pedigree. Average yield per acre 758 lb. for year to September 30, 1959. Immature: 3,823 acres. Total planted area 14,069 acres, of which 77 per cent is pedigree rubber. All-in cost approximately 1s. 6d. per lb. Proceeds approximately 2s. 1½d. per lb.

Jeram.—Mature: 4,858 acres, of which 52 per cent pedigree. Average yield per acre 752 lb. for year to September 30, 1959. Immature: 1,849 acres. Total planted area 6,707 acres, of which 65 per cent is pedigree rubber. All-in cost approximately 1s. 6½d. per lb. Proceeds approximately 2s. 1¼d. per lb.

Tamiang.—Mature: 985 acres, of which 83 per cent is pedigree, but all planted between 1928 and 1939. Yield per acre 899 lb. for year to September 30, 1959. Immature: 515 acres. Total planted area 1,500 acres, of which 89 per cent is pedigree. All-in cost approximately 1s. 6½d. per lb. Proceeds approximately 2s. 1¼d. per lb.

Summary.—Mature area: 16,089 acres, of which 64 per cent is pedigree. Average yield per acre 765 lb. for year to September 30, 1959. Immature area: 6,187 acres. Total planted area 22,276 acres, of which 74 per cent is pedigree rubber. All-in cost approximately 1s. 6¾d. per lb. Proceeds approximately 2s. 1½d. per lb. Part of the crop is sold in the East and part in London; part as sheet and part as latex. Proceeds and "All in" costs (including London overheads and depreciation) have been adjusted to the equivalent of London landed. I trust that the foregoing, together with the statistical summary incorporated in the Report, will be of assistance to shareholders.

EXPANSION AND REJUVENATION

Since the last Annual Meeting, the company has made considerable progress, having increased, by amalgamations, the planted area from 14,139 acres in Malaya to 35,678 acres, of which 26,991 are in Malaya and 8,687 in Sumatra. Although we have not reaped the full benefit of the amalgamations in the current accounts, the position next year should be very considerably improved. Unless there is a serious fall in the price of rubber during the next six months, the average price realised for our crop should be higher and this, in turn, should mean increased dividends from Tamiang and Jeram, the full benefit from which will then be available. Furthermore, we shall have the advantage of a full year's profit from Sungei Kawang Estate (formerly owned by the Sungei Chermang Company) and in addition we shall have the direct advantage of nine months' working of Eastern Sumatra's Malayan estate.

We shall continue our policy of rejuvenating the estates by replanting and I would draw your attention to the Acreage statement, which shows the progress made to date. In 1958 over 1,000 acres were newly planted or replanted throughout the group, and in 1959 a further 600 acres were completed. In the current year we plan to complete 850 acres, and for the succeeding six years we have laid down a programme of approximately 1,000 acres per year. This forward planning permits the adoption of the latest scientific methods of intensive tapping, thus providing for the utmost production from the trees before they are cut out.

Since the close of the financial period, Mr Calver has visited Indonesia and Malaya, and Mr Facer, a director of Jeram and Tamiang, has visited Malaya. Both report satisfactory conditions on the estates. I hope to visit both Indonesia and Malaya towards the end of this year.

GENERAL

The plantation industry has been enjoying high prices for its rubber for over a year, but particularly so since September last; furthermore, there has been no reaction as yet to the British and American proposals to reduce their stockpiles. In some ways this is to be regretted, since, in my view, the sooner the natural product reaches a level more competitive with synthetic, the better it will be for the long term interests of the industry.

I have made no specific reference to Eastern's Sumatra estate of 6,779 planted acres, of which 4,706 acres or 70 per cent is pedigree rubber, nor to Tamiang's Sumatra estate, which is leased to an Indonesian. There is no doubt that given normal trading conditions in Indonesia the estate of Eastern would represent a very valuable asset. Current staffing difficulties, combined with the burdensome restrictions on the remittance of profits and capital, and above all the grave political doubts as to the future, must lead to considerable caution in assessing the present position of estates in Indonesia.

The situation in Malaya continues to present a pleasing contrast to other rubber-producing countries of the Far East. The Government, assisted at any rate in part by the continued favourable price of our commodity, is an example of an expanding economy in a newly established nation which must be the envy of others setting out on the path of self-government. The Emergency which troubled us for so many years after the war is a thing of the past, and will be so officially on July 1st next, and the atmosphere is one of potential stability and financial optimism. This happy state of affairs received a check in the early days of April, when the death was announced of the Yang di Pertuan Agong, Malaya's first elected King, and a greatly beloved ruler. His high sense of duty, and his insistence on carrying out his functions as Head of State, whilst in a weak state of health, must have contributed to his untimely end at the age of sixty-four. He will be sadly missed. His immediate successor will have a difficult task in following the late Ruler, and all communities will wish him every success.

Your directors have considered a proposal to sub-divide the present £1 shares into ten shares of 2s. each. With the widening public interest in the rubber share market it is thought that this would be to the advantage of Shareholders generally, and the requisite resolution for the change is included in the special business for the General Meeting.

The Report and Accounts were adopted and the resolution sub-dividing the shares was passed.

LISBON ELECTRIC TRAMWAYS

LORD RATHCAVAN'S REVIEW

The sixty-second Annual General Meeting of Lisbon Electric Tramways Limited will be held on June 22nd in London.

The following is an extract from the circulated statement of the chairman, The Right Honourable The Lord Rathcavan:

It is satisfactory to record an increase in both receipts and passengers for 1959 over the corresponding figures for 1958. The total passengers carried at 381 million is a record in the Company's history and over seven million more than in 1958. It is interesting to note that since the inauguration of our new extensive bus services in 1947, the passengers carried in 1959 exceeded the 100 million mark for the first time.

The increased number of passengers carried has resulted in additional revenue but, despite all our endeavours, expenses have continued to rise. There is nothing further to report regarding our application for an increase in tram fares. These have remained unchanged for no less than 34 years but with constantly increasing expenditure this cannot go on indefinitely and we are hopeful that before long a revised tram tariff will be sanctioned.

During the year, the Company contributed to the State Revenue of Portugal and to the Municipal Revenue of Lisbon the sum of £490,188, an increase of £13,109 or 3 per cent over 1958.

The year's operations have resulted in a profit after all charges and Depreciation Reserve of £46,806. The Directors recommend an Ordinary Dividend of 6 per cent net.

GRAND HOTELS (MAYFAIR) LIMITED

RECORD ADVANCE BOOKINGS

	1959	1958
	£	£
Issued Capital	511,833	400,000
Group Net Assets ...	835,846	469,108

Taxation	171,766	74,029
Dividends	61,189	30,250

Extracts from Mr Maxwell Joseph's Review for the year ended 30th September, 1959.

RECENT ACQUISITIONS AND PLANNED EXTENSIONS

The **St. Ermin's, Flemings** and **Clifton-Ford Hotels** as well as the **Beverley Court Service Flats** acquired last year have now been successfully integrated into the Group and will be making their full contribution towards the Company's profits in the current financial year. Two further London Hotels acquired in August, 1959, the **"Mostyn"** and "Welbeck" (rebuilt and re-named **"The Londoner"**) cannot be expected to make their full contribution towards the income of your Group until the year ending 30th September, 1961.

The Mostyn Hotel has been asborbed into the Group organisation, a good start has been made in modernising it and this hotel should enjoy a successful year. **The Londoner** is to all intents and purposes a new hotel although contained within an existing building. It is now in full operation and offers nearly 130 rooms with private bath and extensive banqueting facilities. Extensions to the **Clifton-Ford** and **Mandeville Hotels** are in the advanced planning stage. The number of visitors to London, encouraged by reduced air fares, is confidently expected to increase in coming years and this development favours your medium-priced hotels. It remains our intention to expand your Company's interests further if and when suitable opportunities occur.

OUTLOOK

We are recommending a final dividend of 15 per cent which together with the interim makes a total distribution of 20 per cent for the year as compared with 12½ per cent and a capital distribution of 2½ per cent paid for the previous year. If the **record advance bookings for the current season** materialise and no untoward factors intervene, your Board look forward to another successful year, in which event it would recommend total dividends of not less than 22½ per cent for the year ending 30th September, 1960.

The Group Interests in London

The Mostyn Hotel — **The Londoner Hotel** — **Green Park Hotel**
Stratford Court Hotel — **St. Ermin's Hotel** — **Flemings Hotel**
Clifton-Ford Hotel — **Washington Hotel** — **Mandeville Hotel**
Beverley Court — **Ashley Court Hotel**
Manettas Restaurant — **Mermaiden Restaurant**

UNION MINIÈRE DU HAUT-KATANGA

INCREASED PRODUCTION

POLICY OF PRICE STABILITY CONTINUED

FUTURE VIEWED WITH CONFIDENCE

The Annual General Assembly of Shareholders was held in Brussels on May 25, 1960, Mr Paul Gillet, Chairman of the Board of Directors, being in the chair.

The Assembly approved the balance sheet and the profit and loss account for the financial year ending December 31, 1959. The latter showed a gross profit of 5,225,030,846 francs. After deduction of the amortisation of the year, the provision for taxes on profits, the interests and the sundry taxes and royalties, the net profit amounted to 3,535,599,030 francs.

The Assembly fixed the net dividend for the year 1959 at 2,200 francs per share (or 220 francs per tenth of a share). Taking into account the interim dividends of 600 francs paid in January, 1959, and of 600 francs paid in March, 1960 (or 60 francs each per tenth of a share), the balance of 1,000 francs per share (or 100 francs per tenth of a share) became immediately payable.

The Board of Directors paid tribute to the memory of its Honorary President, Chevalier Firmin Van Brée, and to the memory of Mr Jentgen, delegate of the "Comité Spécial du Katanga."

The General Assembly re-elected Sir Ulick Alexander, Mr E. Gorlia and Mr L. Wallef as directors and Mr A. Bourgeois as a statutory auditor. On the other hand, Captain C. Waterhouse was elected a director. Mr Hutchinson, for reasons of personal convenience, placed his mandate of director at the disposal of the Assembly.

The General Assembly was followed by an Extraordinary Assembly. The increase of the capital of the company which had been announced had not been submitted to the Assembly, the question still being under examination by the "Comité Spécial du Katanga" whose approval was requested by the statutes.

Sundry minor modifications to the statutes were adopted by the Assembly.

THE ADDRESS OF THE CHAIRMAN, MR P. GILLET

The Chairman expressed the hope that, in the new political frame of the Congo, a mutual understanding of interests would favour judicious solutions which would prove essential if fresh capital was to be attracted to the Congo. The development of future programmes would be largely dependent on the political, economical and social climate that the new authorities would be able to create.

To date, the Company had brought no modification to the normal rhythm of its financial and commercial operations.

The new Luilu plant which had just started operations was one of the principal recent realisations of the investment programme. Other investments were contemplated which would ensure a continuous increase of production.

Although a certain excess of copper production was possible in 1960, the surplus would however be small if the present favourable perspectives of the world economy materialise.

During the first five months of 1960, copper prices had again been subjected to wide fluctuations. Union Minière, however, continued its policy of price stability. The Company deemed that excessive price variations were unfavourable to the interests of industry. It was to be hoped that copper companies would adjust their production to the real needs of the market in order to avoid speculation resulting from surpluses and shortages of metal. Too high prices in particular had the effect of encouraging the use of substitutes.

The Africanisation of the staff had made great progress. The action undertaken would be pursued with a view to gradually entrusting Africans with functions of increasing importance.

The Chairman considered that the future could be looked at with confidence; he expressed the Company's wishes for the success of the new Congolese Government and assured it of its loyal assistance.

The Chairman then exposed the problem of the legal statute of Congo Companies in connection with the future Independence of the Congo. He mentioned that a law was being submitted to the Belgian Parliament which would allow those Companies the choice between the maintenance of their present statute of Belgian Company and the acquisition of the quality of a Congo Company.

The Board's intention was to maintain Union Minière's present statute as a Belgian Company for all operations covering activities outside the the Congo and to form one or several Congo Companies who would be entrusted with the operations in the Congo.

MAIN POINTS OF THE BOARD OF DIRECTORS' REPORT

The mining activity remained centred on Prince Leopold Mine and on the mines of the Western region. The total extraction reached nearly 6.75 million metric tons of ores; about 20 million cubic metres of overburden were excavated. The improvement of the copper market allowed an increase of the programme from the beginning of the second quarter so that the production of the year reached 280,400 metric tons, an increase of about 45,000 tons over the previous year.

Cobalt production reached 8,430 tons, i.e. 2,000 tons more than in 1958; the price was reduced to $1.75 per lb as of February 1, 1959.

Zinc concentrates production amounted to 118,000 tons assaying 60 per cent zinc. An appreciable recovery occurred in the zinc market and prices rose.

Production of uranium concentrates and precipitates at the Shinkolobwe plant were 2,900 tons assaying 72.7 of U_3O_8. The selling price was lowered to $7 per lb of oxide U_3O_8 contained in the precipitates. Deliveries of radium amounted to 101,6 grams.

The Company also produced 13.640 kgs of germanium metal, 99,800 kgs of cadmium, 198 tons of silver and 24 kgs of gold.

The construction of the new electrolysis copper and cobalt plant at Luilu had been actively pursued in the course of the year, which enabled it to start production at a provisional capacity of 50,000 tons of copper a year, at the beginning of April, 1960. It was expected that the final capacity of 100,000 tons of copper and 3,500 tons of cobalt per year would be reached some time during the first half of 1961. The construction of the new concentration plant at Kambove was resumed and it was anticipated that it would be commissioned early in 1961.

The electric power produced by the Haut-Katanga power plants reached 2,182 million kWh.

The personnel force had increased from 20,215 units to 21,146, whereas the force of the conducting staff remained at about 2,200 units. The company had continued its policy of training and promoting its African personnel, which provided for promotion to the conducting staff of the elite of the Congolese employees.

The scholar population continued to increase. Some 20,000 pupils attended the Company schools.

The social atmosphere remained excellent.

ZANDPAN GOLD MINING COMPANY LIMITED

The Annual General Meeting of Zandpan Gold Mining Company Limited will be held on June 28th in Johannesburg. The following is the circulated statement of the Chairman, Mr B. L. Bernstein:

Full scale sinking operations at No. 1 Shaft commenced in July 1959 several months ahead of the time planned when the prospectus was issued in November, 1958. This was possible because the Electricity Supply Commission provided electric power well ahead of schedule.

In spite of delays occasioned by the intersection of water bearing fissures requiring cementation, satisfactory progress has been made in sinking the shaft. On April 25, 1960, it had reached a depth of 3,399 feet and a permanent intermediate pump station on the 2,500 foot level had been excavated. A concrete ventilation wall is being installed in the shaft concurrently with sinking.

The installation of the first of the two permanent 5,145 h.p. winders is nearly complete and it is expected that the second winder will be commissioned before the end of the year. In order to avoid delays in the commencement of a second shaft, when it is required, orders have been placed for hoists, for which there is a long delay in delivery.

The early start on full scale shaft sinking has resulted in capital funds being spent sooner than previously planned. At the end of the year £2,430,161 had been spent and a further £225,044 has been spent during the first three months of this year, making a total of £2,655,205 to the end of March, 1960. The balance of the £3 million obtained from the initial issue of shares will be exhausted in May of this year, some seven months before the £2,500,000 accrues from the issue of the option shares at the end of November, 1960.

Short term loan facilities have been arranged to finance operations between May and November, and these temporary loans will be repaid out of the proceeds of the option issue.

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

The Annual General Meeting of Middle Witwatersrand (Western Areas) Limited will be held on June 28th in Johannesburg. The following is the circulated statement of the Chairman, Mr S. G. Menell:

The arrangement for the acquisition by your company of 87½ per cent of the assets of Rooderand Main Reef Mines Limited was sanctioned by order of the Supreme Court of South Africa, as a result of which 840,448 ordinary shares of 2s. 6d. each in the capital of your company, being the purchase consideration, were duly allotted to shareholders of the Rooderand company. The issued capital of your company is now £1 million in 8 million shares of 2s. 6d. each.

The company's trading profit for the year under review was £528,671 which was £58,844 more than the preceding year. Dividends totalling 1s. 3d. per share were paid for the year in comparison with 1s. per share for the previous year. The major portion of the company's gross income is still derived from its interest in mines in the Klerksdorp area.

The book value of your company's quoted investments at December 31, 1959, has increased by £1,312,517 compared with the figure at December 31, 1958, to £4,288,613. This increase is mainly due to the acquisition of investments from the Rooderand company and the additional shares acquired in Loraine Gold Mines, Limited, as a result of the increase in the capital of that company. The market value of your company's quoted investments at December 31, 1959, was £9,811,248. Since the end of the financial year there has been a decline in share market prices and the market value of the quoted investments of the company at April 30, 1960, was £7,700,056.

Partly through the acquisition of the Rooderand assets and partly through your company's own participations and shareholdings, we have acquired a holding in Western Areas Gold Mining Company Limited, the company which was formed to work the new mining lease area on the West Rand, south of Randfontein. Your company's holding of Feralloys Limited shares has recently been disposed of to The Associated Manganese Mines of South Africa Limited on a share for share basis, for deferred shares in that company.

A vigorous prospecting programme was continued during the year in the Transvaal, the Orange Free State and in the Central African Federation. The map (in the report) shows the location of the company's principal prospecting and other interests. The "Dealesville Block" in the Orange Free State, mentioned in my review last year, was abandoned during the year as drilling results were unfavourable.

In the "Bothaville Block," which covers areas totalling approximately 140,000 morgen of the Bothaville, Odendaalsrus and Wesselsbron districts of the Orange Free State and also in the Wolmaransstad district of the Transvaal, an extensive drilling programme is continuing. Three boreholes have been completed with negative results and a further three boreholes are now in progress.

Since the end of the financial year your company has become interested in a further block of options in the Bothaville district, termed the "Bothaville (Vaal River) Block," situated to the east of the aforementioned "Bothaville Block" and comprising about 25,000 morgen of ground along the southern bank of the Vaal River. No drilling has yet been commenced in this area. The company is also interested in a block of options, the "Bapsfontein Block," comprising some 26,500 morgen in the Delmas and Bronkhorstspruit districts of the Transvaal where a borehole is at present being drilled. The drilling programme in the area east of the Hartebeestfontein and Buffelsfontein mines was continued without any success. One borehole, approximately 4 miles east of the Buffelsfontein mine and 3½ miles north of the Vaal River is still in progress.

In the Central African Federation your company has increased its participation in various exploratory ventures in which it is interested. As a result of the acquisition of the Rooderand company's assets, the various prospecting companies through which these operations are being conducted have now become subsidiaries of the company. Their prospecting ventures include nickel, chrome, copper, graphite and beryllium. During the past financial year work has been concentrated mainly on a promising nickel deposit near Bindura and on other nickel prospects in Southern Rhodesia, and active prospecting is still in progress on these prospects. Small scale mining operations have been commenced on a chrome deposit in the Belingwe area in Southern Rhodesia and it is hoped that it will be possible to extend the scope of these operations as and when the market for chrome ore improves.

BILLERUDS AKTIEBOLAG

Säffle — Sweden

Founded in 1883

Share Capital: Kr. 105.000.000

Board of Directors: Landshövding Bo Hammarskjöld (Chairman), Godsägare G. Liedberg, Direktör K. I. Hising, Riksdagsman L. Cassel, Direktör L.-E. Thunholm, Direktör Anders Smith and Bruksdisponent Å. Pihlgren.

Registered Office of the Company: Säffle.

Managing Director: Åke Pihlgren.

Production for Sale 1959: 130,000 metric tons of dry sulphite cellulose, 130,000 metric tons of paper and 41.000 standards of sawn woodgoods. These figures include the production of Hellefors Bruks AB, a subsidiary of Billeruds AB.

COMPANY AFFAIRS

Royal Dutch/Shell

THE statement issued by the Royal Dutch/Shell group on the outturn in the first quarter of this year sets something of a puzzle. The volume of sales of crude oil and oil products was about 5½ per cent higher—as Lord Godber indicated it would be a fortnight ago. And so was the group's net income. But its gross income was nearly 10 per cent lower. Thus, comparing quarter with quarter, the gross margin on sales fell from 18.5 to 15.9 per cent but the net margin improved slightly from 8.3 to 8.4 per cent. The gross profit at £79.5 million was lower than it had been in any quarter last year and this was due statistically to an increase of nearly 9 per cent in operating and other expenses. In fact, the improvement in net margins was due entirely to the fall of over £10 million to £33.7 million in income taxes.

What changes in policy lie behind these figures? In a complex and international group such as Royal Dutch/Shell it is impossible to isolate one set of factors and say simply: this was the reason. But it is possible to point to some of the more important influences on trading results. As the daily volume of sales went up from 2,668,000 to 2,813,000 barrels while the daily volume of production (including special supply contracts) fell from 2,562,000 to 2,532,000 barrels, it looks as if the group drew upon stocks. As some tax may have already been paid on the oil taken into stock in the past this might help to explain why the tax charge fell. The other reason for the fall in tax would seem to be that the group was taking less oil from Venezuela and more from its own sources in the Middle East and from Kuwait under its contract with Gulf Oil for supplies. The additional overheads of running its own productive outlets at a lower level of output and buying oil from elsewhere to make up the difference may explain why operating expenses have risen. The saving in using more Middle Eastern oil and less Venezuelan oil would seem to lie for the Royal Dutch/Shell group largely in savings in tax. Venezuelan oil has attracted a higher rate of local tax for over a year but it seems to have taken time for Royal Dutch/Shell to re-phase its operations so as to lean a little more on its own and other companies' Middle Eastern supplies—on which the tax burden is lower.

Guest, Keen and Nettlefolds

OVER the last decade the growth of Guest, Keen and Nettlefolds has been remarkable and now in the latest report Mr K. S. Peacock, the chairman, suggests that over the next few years capital expenditure by the group will be at an even higher rate than it has been in the past. The group has made a survey of the prospective long-term demand for steel products and its directors have decided to spend £20 million over the next five years on the expansion of GKN's three steel works so as to meet future demands from GKN's engineering companies and in doing so to replace some outside supplies. The bulk of this expenditure will be in 1960-62 and with substantial sums likely to be sanctioned for development elsewhere in the group, particularly in those plants that serve the motor industry, total capital expenditure in these years is unlikely to fall below the annual rate of about £18 million reached both in 1958 and 1959. But with a cash flow of £17.2 million for 1959 the group is not likely to have many worries on the score of finance. Such a cash flow implies a big earnings cover and it is not surprising that although the ordinary dividend was raised from 13 to 15 per cent for 1959 it was still covered 3.8 times by earnings.

RECORD OF GROWTH

(£'000s)	1951	1955	1958	1959
Turnover	68.333	145.913	208.996	220.807
Total net assets employed	57.388	104.445	145.212	157.723
Trading surplus	9,226	18,777	24,895	26,550
	%	%	%	%
Trading surplus/Turnover	*13·5*	*12·9*	*11·9*	*12·0*
Trading surplus/Net assets employed	*16·1*	*18·0*	*17·1*	*16·8*

Mr Peacock says that present trading conditions are good and that the outlook is promising but he points out that it is only the high rate of activity in the engineering works that enables the group to work at a reasonable rate of profit. Thus last year's increase in turnover from £209 million to £221 million brought only a slight improvement in the gross margin of profit to sales from 11.9 per cent to 12 per cent. At 88s. 3d. the £1 shares yield 3½ per cent—almost a full point below the average return on the shares included in *The Economist* indicator. The earnings yield on the GKN shares however is no less than 13 per cent and compares with an average earnings yield on blue chips of between 8 and 9 per cent. Institutional investors hold about 40 per cent of the GKN equity and they seem hardly likely to part with shares on which the dividend has quadrupled in the last decade and on which the earnings yield remains so high.

Commercial Union

LAST year Commercial Union absorbed North British and Mercantile. The purchase was accomplished largely through an exchange of shares but it included a cash element of £2¾ million. At the time of the merger North British and Mercantile, which transacts a bigger proportion of its business overseas than Commercial Union does, was actively thinking of raising new capital. Its directors, like those of Commercial Union, believed that such an issue was needed in order to augment free reserves held in London, as legislation in overseas countries was tending to freeze local resources. It is not therefore surprising that the merged group is now going ahead with plans to raise new money through a rights issue.

At first sight the size of the issue, which will bring in about £10 million, may look surprisingly big. But the issue is designed not merely to provide the money thought necessary by North British to reinforce its free reserves but to replace the cash used by Commercial Union in acquiring North British and to provide for the additional capital commitments which arise from the continued expansion of the business of the merged group both at home and overseas. The 5s. shares of Commercial Union lost 2s. to 58s. 9d. after the intention to make the rights issue became known.

British Life Unit Trust

THE first new unit trust to be launched since the Falcon trust some four months ago comes from the British Life Office, a subsidiary of the Reliance Mutual Life Insurance. Unlike many recent entries into the unit trust field, British Life is not making a block offer. Its units can currently be purchased at 5s. 1d. each, to yield 3¾ per cent; this return will go up by probably as much as one-half of one per cent if the new provisions in the Finance Bill regarding the management expenses of unit trusts become effective. One of the novel features of the units of this new cash fund is that out of the initial management charge of 3¼ per cent, a discount will be offered for larger applications. The discount will amount to ¼ per cent to applications for over 12,000 units.

Controlled by an insurance company, the trust is to put its main emphasis on the purchase of units through an endowment policy. The policies, which will be for periods from 12 years and for amounts of £1,000 and over, will give the holder both life cover and the opportunity of equity investment. Each quarter's premiums will be used to purchase units at the current market price. Thus when the policy matures, the holder receives these units, which he can either sell or, as the managers hope, keep as an investment. The rate of premium is worked out at roughly half way between the normal rate on an endowment policy with profits and one without profits. For the holder the special attraction of this scheme over, say, the thrift and savings schemes run by other unit trusts, is that he can obtain tax relief on his premiums.

Royal Mail Lines

MR WALTER C. WARWICK, the chairman of Royal Mail Lines, in his annual statement lends cautious support to the views of chairmen of other shipping lines that the lowest point in freight rates has been passed. Mr Warwick says that the company may expect to see a gradual improvement as time goes on. Last year the trading profits of the Royal Mail Lines fell from £2.3 million to £2 million. Trading chiefly with South America and the West Indies, Royal Mail was affected by a further decline in shipments of meat from Argentina but the group's refrigerated cargo ships carried more butter and deciduous and citrus fruits. Outward cargo services to the Caribbean area continued to secure reasonable support from shippers in this country but the results for homeward bound bulk cargoes were seriously affected by the very low level of tramp shipping rates. Profits were also affected by further flag discrimination and by the fall in the value of some South American currencies (reflected in another reduction in the number of passengers crossing the South Atlantic). This has led Royal Mail to employ one ship wholly for cruising.

One of the three new "A" vessels joined the fleet last December and Mr Warwick reports that passenger bookings for these new ships are going well. This addition to the fleet is reflected in the rise from £22½ million to over £31 million in the balance sheet value of the fleet. Commitments for ships building have been halved from £20 million to £10.3 million. Capital expenditure has brought the group's liquid resources in cash and investments down from £7 million to £2½ million and Royal Mail at the end of last year had a bank overdraft of £905,060. Mr Warwick says that arrangements have been made for further overdraft facilities to tide the company over the first few years of the life of these new ships. The ordinary dividend has been maintained at 8 per cent and at 22s. 9d.xd the £1 shares yield 6¾ per cent.

Joshua Tetley

EXPANSION is obviously the policy of Joshua Tetley, which is rapidly absorbing other breweries in Yorkshire and the North of England. Hard on the heels of the proposed merger with Walker Cain of Liverpool it has made a cash bid of £3.3 million for the preference and ordinary shares of the Melbourne Brewery, which like Tetley is centred on Leeds. Melbourne shareholders are offered 23s. for each of the 6 per cent preference shares, 27s. 6d. for each of the 8 per cent preferred ordinary shares and 142s. 6d. for each of the £1 ordinary shares.

Shareholders of Joshua Tetley may be wondering how this deal is to be financed. At September 30th last the group's net liquid assets came to only £65,708. This was before the cash payment of £480,000 made to shareholders in William Whitaker last November as part consideration for the acquisition of that company. Earlier this year Joshua Tetley raised £1.3 million by a rights issue and now it seems possible that another issue will have to be made.

In recommending the offers the directors of Melbourne Brewery say that its net profits for the year to March 31st came to £149,888, against £112,299 for the previous 18 months and they have raised the ordinary dividend from the equivalent of 17 to 22½ per cent. The £1 shares have been a strong market in recent weeks on rumours of a takeover but they put on another 22s. 6d. on the favourable terms of the proposed merger and are now quoted close to the offer price of 142s. 6d.

Turner and Newall

THE interim statement of Turner and Newall for the year to September 30th is of some limited worth to shareholders. As expected the interim dividend has been left unchanged at 5 per cent but the directors report that trading results as a whole have been satisfactory in the six months to March 31st and they anticipate similar trading conditions for the rest of the year. The manufacturing companies have experienced increasingly active trading conditions and although competition remained severe, net trading profits were higher than for the corresponding period a year ago, when the recovery in trade was only just beginning. The Canadian mining company has apparently continued to make a satisfactory profit but Turner and Newall's African mining organisation earned smaller profits (largely because the demand for textile fibres fell). The immediate outlook continues to be bright but in assessing the size of this year's final dividend shareholders should bear in mind the chairman's warning last December that advances in turnover are not necessarily paralleled by corresponding advances in profit. On last year's 20 per cent dividend the £1 shares at 98s. 3d. yield just over 4 per cent.

British Cotton and Wool Dyers

IN his statement a year ago, the chairman of the British Cotton and Wool Dyers' Association reported signs of a revival in business. But then he could hardly have dared to forecast that the recovery in the textile trade would prove to be so strong as to push trading profits in the year to March 31st last up from £209,052 to £427,986. At that time shareholders, too, could have hardly imagined that the ordinary dividend would be doubled, from 5 to 10 per cent.

The improvement in trade has not been confined to any one section; a considerable increase in the weights processed by the wool branches led to a 21 per cent increase

Steel Results

WITH its accounting year changed from September to the end of March, **Consett Iron** stands alone among the leading iron and steel companies in reporting its results at this time. On an annual basis, trading profits at £4,039,224 appear to have run at a rate about 45 per cent higher than that achieved in the six months to the end March, 1959, and profits before tax at £1,997,158 at a rate about 85 per cent higher. Last September Lord Ridley, the chairman, reported that orders were increasing steadily and it is clear that the major improvement in earnings occurred in the last six months of the year to April 2nd last. The dividend is maintained at 8¼ per cent but thanks to big investment allowances it is now covered 3¼ times by earnings. At 31s. 6d. the £1 shares yield 5½ per cent. The fortunes of Consett are largely bound up with the shipbuilding industry, and it has embarked on an expansion programme, costing £28 million of which Consett is providing £10 million from its own resources.

The trading profits of **John Summers** for the six months to end-March show only a slight improvement from £6,900,000 to £7,150,000. This is in line with the chairman's forecast earlier this year, when he said that he did not expect to see much increase in production in the first half of the financial year. The company should however soon begin to reap the benefit from its expansion schemes and to increase its deliveries. Commitments to customers for the rest of the financial year are sufficient to absorb the anticipated production of the Shotton works. At the Shelton works, where the group manufactures heavier steel products, there has also been an improvement both in demand and in output.

Stewarts and Lloyd's interim, maintained at 3 per cent, is payable on the capital as increased by last October's big rights issue. The directors say that the improvement in trade reported by the chairman last February has been maintained. A total dividend of 11 per cent has been forecast for the current year. No forecast has been made by the directors of **Lancashire Steel** but in view of the increase in the interim payment from 2½ to 3½ per cent a total of 10 per cent should not be too much to expect.

STEEL DIVIDENDS

Continued from page 1045

in money turnover; on the cotton side the increase in turnover, though much more modest, has still been appreciable. Substantially better profits have also been earned from the "speciality" section, which includes dry cleaning, nylon throwing, synthetics and recombing. By contrast the subsidiaries of "Slubbers" outside the textile industry—in catering and staff selection—seem to be proving more costly to develop than was perhaps thought when the group set out to diversify its interests. At the moment these subsidiaries have accumulated losses of £48,569, on which however presumably some tax relief is obtainable.

The finishing sections of the cotton textile industry were not included in the original Government redundancy scheme, but a new scheme for this side of the industry is expected shortly (probably before the summer recess). As a precautionary measure £20,000 has been put by "Slubbers" to a contingency reserve. The 5s. shares at 5s. 10½d. yield over 8½ per cent, reflecting in part the unknown implications of this scheme for the finishing end of the textile industry in general and for "Slubbers" in particular.

Consolidated Zinc

IN 1959 Consolidated Zinc Corporation achieved a striking recovery of over £1 million to £2,663,000 in its consolidated net profits despite several unfavourable circumstances. Imports of lead and zinc into the United States were restricted by quotas, and Consolidated Zinc and other leading producers were driven to supporting open market prices by restricting sales in the last seven months of the year. Zinc recovered strongly, the average price for prompt metal in London last year rising by over £16 to £82 a ton. Though the average for prompt lead, at £70 15s. was £2 less than in 1958. Zinc's recovery was some help, but the group also added to its profits the hard way, by modernising and increasing the capacity of its smelting plant, and by improving efficiency in the mines and other works; and it also earned money from licensing its new Imperial Smelting process to other smelters (one of the latest being a Polish state concern). The chairman, Mr L. B. Robinson, says that in Britain the profits from zinc smelting and sulphuric acid showed a substantial improvement owing mainly to the improved performance of the vertical retorts and particularly of the new process plant at Avonmouth; the dividend from British Titan Products was substantially higher; and in Australia, Consolidated Zinc Proprietary again achieved higher profits.

The group spent nearly £3.6 million last year, largely on the Imperial Smelting process plant and the ferrous sulphate treatment plant at Swansea, improvement in the smelting plant at Avonmouth, and the additional sulphuric acid plant at Cockle Creek, New South Wales. This spending was in effect financed by the £3½ million rights issue, and the group's cash resources went up by £2 million to £8 million. Outstanding capital commitments still exceed £7 million.

US import restrictions on lead and zinc remain, but producers have been able to remove restrictions of sales of zinc and the only immediate problem, says Mr Robinson, is the sizeable stock held by smelters in the United States. Lead prices, thanks to the restrictions on sales, have held steady and even shown some sign of recovery, but the problem remains of liquidating producers' stocks without weakening prices. Mr Robinson is anxious that restriction should never result in "disorderly markets and exorbitant prices," for the threats of substitution are still plainly apparent. Some years ago the company said that it would be satisfied with a combined price for lead and zinc of £175 a ton in London (currently £167) and he sees no reason to change that view, for increases in costs since then have been balanced by greater operating efficiency. The group will try to broaden its activities still further, and in the meantime Mr Robinson is satisfied with the development and improvement in efficiencies of the existing interests.

Philip Hill

IT did not come as a great surprise that Philip Hill Investment Trust's dividend of 22½ per cent for the year to March 31st last was not merely bigger than the 20 per cent paid for 1958-59 but was also bigger than the directors' forecast of 21 per cent. What did come as a surprise was the announcement of a one for four rights issue at 22s. 6d. This was well below the then market price of 36s. 9d. and made the rights worth about 2s. 9d. The issue, which will raise £4.9 million, is to be used to extend the trust's investment portfolio which at the end of March was worth £27.4 million. It was only in September that Philip Hill raised £6½ million by issuing debentures and ordinary shares. These issues helped to finance the purchase of Erlangers by the trust's banking subsidiary, Philip Hill Higginson. The effect of this acquisition is seen in the increase in the total assets of the banking subsidiary from £16 million to £34.9 million, in acceptances from £1.3 million to £7.3 million, and in deposits from £12.7 million to £23.1 million.

In an active year for merchant banks the subsidiary's consolidated profits before tax rose from £673,645 to £943,325. This increase does not quite match up to those reported by others in this field such as Hambros Bank and Robert Benson Lonsdale but Erlangers will contribute a full year's profits in 1960-61 and the banking subsidiary should have another successful year. There is also the prospect of another increase in investment income and thus a further increase in the net income of the trust, which rose last year from £723,899 to £1,010,771, seems probable. The increased dividend of 22½ per cent is covered twice by earnings and the directors say that this rate will be maintained on the capital as increased by the rights issue. On this basis the 5s. shares at an ex rights price of 32s. 9d. yield 3.4 per cent.

London Stock Exchange

FIRST DEALINGS:	May 9	May 23	June 13
LAST DEALINGS:	May 20	June 10	June 24
ACCOUNT DAY:	May 31	June 21	July 5

THE recent upward trend in industrial equities came to an abrupt halt on Wednesday when the *Financial Times* Index lost 4.1 points. The main reason for this turn round was the suggestion in the June bulletin of the London and Cambridge Economic Service that the Chancellor may have to take further measures to restrain inflation. In an already uncertain gilt-edged market the bulletin's reference to the need to let gilt-edged prices fall as far as is necessary to make monetary policy effective had a particularly sharp impact. This market was also influenced by the weakness of sterling and reports of further bank selling of Government securities. Over the week 3½ per cent War Loan lost ⅛ to 61⅛ and old Consols 1⅛ to 45⅞xd. Among short-dated stocks 4½ per cent Conversion 1964 lost 1⅜ to 97. Medium and long dated stocks were also weak with 3 per cent Savings Bonds 1965-75 down ⅞ at 73⅜ and 5½ per cent Funding 1982-84 down ⅜ at 101¼.

In Wednesday's dull markets many equities lost the small gains recorded on earlier days and thus over the week *The Economist* indicator fell 0.9 points to 356.3. Steel shares turned lower on some disappointment with the interim dividends and the unchanged total payment by Consett Iron, which lost 1s. to 31s. John Summers lost 5s. 9d. to 74s. 9d. and Colvilles lost all of its previous week's gain and more with a fall of 4s. 6d. to 75s. 6d. Generally, falls were most marked in those stocks which had recently shown good advances. Thus Vickers lost 1s. 9d. to 33s. 3d. and Tube Investments 1s. 6d. to 77s. 9d. Some stocks however still showed good rises over the week despite Wednesday's falls Guest Keen were 9d. better at 88s. 9d. after reaching 90s. 6d. and on the long awaited merger terms Davy and United were 1s. better at 117s. 6d. after touching 123s. but Power Gas over the week lost 1s. to 98s. 9d. losing 2s. 9d. on Wednesday from a peak of 101s. 6d.

Philips Lamps continued to attract Continental support and rose a further 8s. to 201s. and now yield under 1½ per cent. Among other Continental and American favourites Unilever NV rose 9s. to a new 1960 peak of 203s. while Unilever Limited rose 3s. 3d. to 154s. 3d. Ford motor however lost 1s. 10½d. to 112s. 6d. The main interest in motor shares this week however has centred on Jaguar following its purchase of Daimler from BSA. Its "A" shares rose 8s. 10½d. to 61s. 7½d. after touching 62s. 10½d. and BSA rose 10s. 10½d. to 75s. 3d. Textile shares have not always held the previous week's substantial rises and Lancashire Cotton fell 2s. 3d. to 66s. 3d. but J. and P. Coats gained a further 6d. to 44s. 9d. and Courtaulds ahead of next Thursday's dividend and results were 2s. better at 67s. 3d. In a continuing dull oil market Shell Transport lost 1s. 9d. to 144s. 6d. and Burmah Oil 9d. to 44s. 6d.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended May 28, 1960, there was an "above-line" deficit (after allowing for sinking funds) of £12,538,000 compared with a surplus of £7,166,000 in the previous week and a deficit of £29,471,000 in the corresponding period of last year. There was a net expenditure "below-line" of £25,282,000 leaving a total cumulative deficit to date of £76,768,000 compared with £19,428,000 in 1959–60.

THE MONEY MARKET

UP to Wednesday money continued to be extremely short in Lombard Street but, in contrast to its tough stand of the previous fortnight, the Bank of England has given special help, of varying amounts. This has not always been sufficient to keep the discount houses borrowing at Bank rate, which they did on Thursday of last week and again on Monday and Tuesday; but in each case the amounts taken were small. Altogether in May the market was forced into the Bank on eleven days. The ruling rate for funds has been 4½ per cent but rates of 4⅝ and even 4¼ per cent have been conceded at times. On Wednesday however the payment of War Loan dividends was largely responsible for a good supply of credit and money rates soon fell to the basic minimum of 3⅜ per cent and to 3 per cent for money from outside banks. The authorities stepped in and sold back a small amount of bills.

Applications rose sharply at last week's Treasury bill tender from £417 million to £471 million but the discount market, keeping its tender at £98 17s. 3d., again secured another good quota of bills with an allotment of 55 per cent. The average rate of discount fell fractionally to £4 11s. 1.53d.

Did you know that

this nut

could buckle your business?

A steam loco-type crane runs on a track. If the track is faulty—if, for example, a nut is loose on a fish-plate, chair, or sprag, a travelling crane may wobble, tilt, and topple, to end up overturned. The cost of such a mishap is impossible to predict: while it may be measured in time lost, profits lost, it could also very possibly spell a life lost.

Vulcan know

Cranes overturn for a number of reasons—most often for a combination of reasons only discernible to the expert eye. That eye belongs to the Vulcan Engineer Surveyor. He not only knows where to look for the likely faults but is trained to see any potential danger spots in the immediate vicinity. Industrial accidents need never happen if he regularly inspects machinery—your machinery. The inspection *and* protection of boilers and cranes, lifts and hoists is what Vulcan provide. It is a specialist's job. Vulcan are the specialists. That's why insurance brokers know that safety first is Vulcan first.

Vulcan are specialists

May we send you FREE 'Vulcan'—a journal for all users of plant and machinery with reports of accidents and safety hints. Write to Dept. 17.

THE VULCAN BOILER & GENERAL INSURANCE CO. LTD.

APPOINTMENTS

Senior Accountant

Brooke Bond & Company Ltd.

require a qualified accountant with wide commercial experience for a senior position with subsidiary companies in

INDIA PAKISTAN and CEYLON

Preference will be given to candidates who have previously lived in the East and have ideas about the application of modern office methods to a large organisation without extensive mechanisation.

The appointment will be based on Calcutta but candidates must be prepared for some travel.

A substantial salary will be paid and 4 months' long leave will be given in every 2½ years. First class passages and provident fund.

APPLY TO THE FINANCE DIRECTORS OF THE COMPANY at 35 and 37 Cannon Street, London, E.C.4.

CASEWORK CONSULTANT. Applications are invited by the Family Welfare Association for a fully qualified and experienced caseworker with supervisory and preferably some *teaching experience* to work with members of the casework staff consulting upon casework practice and assisting the Head of the Casework Department on maintaining standards of work. Duties will involve giving direct casework supervision *in some cases, consulting with agency supervisors upon* caseloads and conducting discussion groups and other classes designed to raise standards of work. Salary according to qualifications and experience.—Application forms available on request to: The Director, Family Welfare Association, 296 Vauxhall Bridge Road, S.W.1.

ECONOMIC RESEARCH OFFICER

Massey-Ferguson invite applications from suitably qualified men for the position of Economic Research Officer responsible to the Manager, Market & Economic Research.

Applicants should possess a University Degree in economics or commerce, which includes statistics. They should have had several years' experience in research, and especially in making an appraisal of economic trends and in sales forecasting. It would be an advantage if this has been particularly related to farm machinery or other products used by farmers. Duties would consist mainly in assembling, analysing and interpreting economic information having a bearing on the Company's current and future *operations.*

The starting salary for this post which is pensionable, will depend on age and experience, but will be not less than £1,500.

Applications, giving personal history, qualifications and experience and quoting reference No. H4 should be addressed in confidence to:

Director of Personnel and Industrial Relations,
Massey-Ferguson (United Kingdom) Ltd.,
Banner Lane, Coventry.

UNIVERSITY COLLEGE OF WALES
ABERYSTWYTH

Applications are invited for the appointment of an ASSISTANT LECTURER or LECTURER in the DEPARTMENT OF ECONOMICS.

Salary Scales: Lectureships, £1,050—£1,850 per annum. Assistant Lectureships, £900 x £50—£950 per annum. F.S.S.U. benefits and family allowances.

Applications should be sent immediately and not later than June 30, 1960 to the Registrar, from whom further particulars and forms of application can be obtained.

PRESSED STEEL COMPANY LIMITED

ORGANISATION AND METHODS

Applications are invited from candidates between the ages of 35 and 50 for the appointment as Group Organisation and Methods Manager. This executive will be based at Oxford and be responsible to the Company Secretary for maintaining an efficient Organisation and Methods team capable of reviewing, modernising and keeping up-to-date the clerical methods and procedures throughout the Group. A sound knowledge of office machinery and methods and particularly of the latest punched card applications is essential and only applicants capable of making a significant contribution in these fields will be considered. Some travel to other factories of the Group in the United Kingdom will be required. The appointment will be to the permanent staff and will carry a salary commensurate with experience.

Conditions of employment accord with best industrial practice. Applications, with full details of education, *training, experience* and salaries earned, may be made in strict confidence to the Staff Officer, Pressed Steel Company, Ltd., Cowley, Oxford.

MATHEMATICAL STATISTICIAN

The G.E.C. Applied Electronics Laboratories, Stanmore, Middlesex, have a vacancy for a Mathematical Statistician to join a statistical group concerned with the reliability and performance of electronic components and systems.

Previous experience of this work is not essential but some statistical or operational research background would be an advantage. Applicants should possess a degree in statistics or mathematics, and should if possible be able to show evidence of an interest in some specialised aspect of the subject such as, for example, decision theory, information theory or stochastic processes.

The Laboratories provide excellent working conditions in country surroundings close to London. An attractive initial salary will be paid, according to qualifications and experience, and this will be reviewed annually.

Please apply in writing, with full details, to the Staff Manager, quoting Ref. E CPS.

COUNTY OF ESSEX

COUNTY PLANNING DEPARTMENT

Applications invited for following posts:—

(a) *Senior Planning Assistants, A.P.T. Grade IV* (£1,095-£1,250).

Section Heads are required in the Development Control Sections at Area Offices at Chelmsford, Colchester and Wanstead.

Candidates must be Corporate Members of the Town Planning Institute or other appropriate professional institution and have had considerable experience in development control work in the office of a large local planning authority.

(b) *Senior Planning Assistants, Special Grade* (£1,265-£1,470).

(i) In the Detailed Design Section at Headquarters. The person appointed will be required to undertake duties in regard to educational control and housing layouts and redevelopment work and should have aptitude for and experience in work of this nature. Candidates should be Corporate Members of the Town Planning Institute or Royal Institute of British Architects or be well-advanced in their studies towards this end.

(ii) In the Survey and Research Section at Headquarters. Candidates should be graduates in Geography or Economics with Statistics as ancillary subject. The person appointed will be required to assist in the analysis, presentation and reporting upon survey material relating to population, housing, employment and minerals. Preference will be given to a person already experienced in this work and possessing requisite initiative.

(iii) In the Development Plan Sections of Area Offices at Braintree, Chelmsford and Romford.

(c) In the Development Control Sections of the Area Offices at Harlow and Romford.

Candidates for posts (b) (ii) and (c) should be Corporate Members of the Town Planning Institute or other recognised professional institution, or be well-advanced in their studies to this end. They must have had suitable experience in Plan or Control work in the office of a large local planning authority.

(c) *Planning Assistants* (£960-£1,170).

Vacancies exist in the Area Offices at Chelmsford, Romford and Wanstead. Candidates should have had experience in the work of a local planning authority, or be graduates in Economics, Geography or Landscape Architecture, and also be prepared to train and study for a qualification in planning.

Five-day week; medical examination; superannuation. Car reliance facilities in appropriate cases.

Applications, with names of three referees, to be sent to the County Planning Adviser at Broomfield Place, Broomfield, Chelmsford, Essex, by June 18, 1960.

WYE COLLEGE

(UNIVERSITY OF LONDON)

LECTURER IN AGRICULTURAL ECONOMICS

Applications are invited for the above appointment which will be made according to qualifications and experience within the Lecturer grade, scale £1,050 to £1,850, plus £60 London Allowance with Family allowances and superannuation under the F.S.S.U.

Duties will involve undergraduate teaching of economic principles and their application to agriculture and horticulture, and responsibility for post-graduate students. Research interest in the economic aspects of land problems would be advantageous.

Further particulars from the Registrar, Wye College, Wye, Kent, to whom applications should be sent by *June 21st.*

Applicants should be single and between the ages of 25 and 40. They must have a thorough knowledge of accounting theory and practice and be Chartered Accountants or Members of the Chartered Institute of Secretaries.

The position will entail frequent changes of location throughout West Africa, but accommodation will be provided free of charge.

Salary will be between £1,500 p.a. and £1,800 p.a. depending on age and experience. There are pension and benefit plans and passages on appointment and on leave are provided free. Tours are normally of 18 months' duration.

Apply with brief particulars to :—

The Personnel Officer
Trinoil (U.K.) Limited
20-30 Old Burlington Street, W.1.

KAYSER BONDOR LIMITED invite applications for the position of MARKET RESEARCH MANAGER. A thorough knowledge and practical experience of research work is essential. Applicants must also have a sound statistical training and be competent in the application of that background to the compilation and interpretation of all types of research data.
Applications in fullest details to the Distribution Director, Kayser Bondor Ltd., Baldock, Herts.

GOVERNMENT OF WESTERN NIGERIA

VACANCY FOR RUBBER RESEARCH OFFICER

Applications are invited from suitable candidates for the post of Rubber Research Officer.

Qualifications. Honours Degree in Agriculture, Science or in Botany or a good degree in Agriculture followed by two years' post-graduate training and approved experience of experimentation with tropical tree crops.

Duties. To study the agronomic aspects of rubber cultivation in the Western Region in order to ascertain the factors limiting production and to make recommendations for placing the industry on a sound basis ; to recommend measures designed to eliminate the factors preventing full and efficient production and to ensure that necessary experimental work ; to assist in selecting a site for a Rubber Research Station and to help to plan and implement an experimental programme for it ; to initiate and supervise experiments to be undertaken on young or mature rubber on existing rubber plantations in the Region; to initiate a selection and breeding programme designed to produce clones suitable for Nigerian conditions ; to act as Technical Adviser to the Ministry on matters relating to rubber production.

Terms of Appointment. On contract terms for a minimum of two tours of 12-18 months each in the first instance on a Consolidated salary of £2,748 per annum. Gratuity at the rate of £37 10s. for each completed three months' service is payable. Free first class passages for officer and his family on first appointment, and when proceeding on leave, free medical treatment for officer and his family. Accommodation is provided at low rentals.

Applications should be completed in triplicate on the prescribed form obtainable from the Official Secretary (Recruitment Branch), Office of the Commissioner for Western Nigeria, 178-202 Great Portland Street, London, W.1, from whom further particulars may also be obtained.

Closing date, June 15th.

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for *either* an Assistant Lectureship or a Lectureship in the Department of Economics.
Salary Scales :
Lectureships : £1,050 to £1,850 per annum.
Assistant Lectureships : £800 x £50 to £950 per annum.
F.S.S.U. benefits and family allowances.
Further particulars can be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications (six copies) must be received by June 18, 1960.

MARKET RESEARCH

Assistant (lady) required for London Head Office of Industrial Group to assist in producing reports, extracting information and some survey work. Applicants should possess a degree or have previous experience in this work. Progressive salary, commencing from £600 p.a., lunch vouchers, pension scheme. Please write fully to Box 1335.

UNIVERSITY OF ABERDEEN

Applications invited for the following posts: DEPARTMENT OF MATHEMATICS, LECTURER AND ASSISTANT; DEPARTMENT OF POLITICAL ECONOMY, ASSISTANT.
Salaries (revised scales): Lecturer £1,050 to £1,850, Assistant (normally posts) £600 to £950, with appropriate initial allowance. All posts carry superannuation (F.S.S.U.), child allowances and removal expenses allowance.
Particulars and forms of application from The Secretary, The University, Aberdeen, with whom applications (eight copies for Lectureship and two copies for Assistantship) should be lodged not later than June 17, 1960. Applicants overseas may submit one copy.

ENGINEER FOR INTERNATIONAL INVESTMENT INSTITUTION

WASHINGTON, D.C., U.S.A.

The basic requirements for this position are a degree in engineering from a university or professional institution ; some years in industry ; and a successful record in engineering or industrial consultancy.

The work involves the technical analysis of a wide variety of industrial projects in all parts of the world either from written presentations or by on-the-spot investigations. An appreciation of marketing and the ability to make market analyses are also essential.

Applicants (aged about 35-45) should have a broad outlook and experience ; assistance from specialists in any particular field outside the competency of the engineering staff is available as required. A critical and analytical approach with the ability to write clear and concise reports are essential requirements. Fluent English is essential, and other languages desirable.

The successful applicant will be stationed in Washington, but will be expected to make short visits overseas from time to time. All removal expenses for the applicant and his family will be paid and there are generous home leave privileges. The position is permanent and offers a most interesting variety of work ; salary will be commensurate with qualifications and experience.

Applicants should send, in confidence, and in English, a short but comprehensive statement about their careers and background to Box 1331.

GKN

The Guest Keen and Nettlefolds Group of Companies

wish to make the following appointment at their Research Laboratory

TECHNICAL SECRETARY

The Liaison and Information Division of this Laboratory which serves a Group of over eighty companies requires a Technical Secretary who will act as Liaison Officer. He will be responsible for the technical secretarial work of a number of committees, both in the Laboratory and in the Group, and also for general liaison work including the entertainment of visitors to the Laboratory.

Applicants for this post should preferably be under 30 and have some technical knowledge.

Applications, giving details of age, qualifications, experience, etc., should be addressed to :—

THE RECRUITMENT OFFICER,
G.K.N. GROUP RESEARCH LABORATORY,
BIRMINGHAM NEW ROAD,
LANESFIELD,
WOLVERHAMPTON.

THE DURHAM COLLEGES

IN THE UNIVERSITY OF DURHAM

Applications are invited for the post of TEMPORARY LECTURER IN ECONOMICS for the academic year 1960/61.
Applications (three copies), together with the names of three referees, should be sent not later than June 15, 1960, to the Secretary, 38 North Bailey, Durham, from whom further particulars may be obtained.

THE BRITISH OXYGEN COMPANY LIMITED

ECONOMICS AND STATISTICS SECTION

This Economics and Statistics Section investigates financial and commercial problems and produces reports upon them. A Chartered Accountant is required with a practical knowledge of mathematical statistics ; an Economics degree would be an advantage.

Write with full details, including present salary to :

STAFF OFFICER (E/H1024),
THE BRITISH OXYGEN CO., LTD.,
BRIDGEWATER HOUSE, CLEVELAND ROW,
ST. JAMES'S, LONDON, S.W.1.

UNIVERSITY COLLEGE OF THE WEST INDIES

Applications are invited for appointment to research staff of the Institute of Social and Economic Research from persons with qualifications in Economics ; Statistics ; Sociology ; or Government and Politics. Investigations may be made in any part of the British Caribbean territories. Salary scales (under review): Junior Research Fellow £900 x £50 — £1,050 p.a., Research Fellow £1,150 x £50 — £1,450 x £75 — £1,900 p.a., Senior Research Fellow £1,500 x £75 — £2,250 p.a. Child allowance. F.S.S.U. Unfurnished accommodation at rent 5 per cent basic salary or allowance in lieu. Duties to be assumed as early as possible. Appointment for three years in first instance. Passages for appointee and family (maximum five passages). Detailed applications (six copies) naming three referees by July 10, 1960, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Lecturer in Statistics. Salary in the scale £1,050 x £50 — £1,400 x £75 — £1,850 p.a. with F.S.S.U. and childcee's allowances. Applications should reach the Registrar, The College, Keele, Staffs, from whom further particulars and application forms may be obtained, not later than June 30, 1960.

HEAD OF CASEWORK DEPARTMENT. Applications are invited by Family Welfare Association for a fully qualified and experienced caseworker, preferably with supervisory experience to be head of a newly organised department which will contain all of the casework services of the Association. Position will involve planning and development of programmes which include training and experimental use of casework service. Some casework practice, supervision and teaching possible for those interested. An interesting stimulating position for one with initiative and vision. Salary according to qualifications and experience.—Application forms available on request to : The Director, Family Welfare Association, 296 Vauxhall Bridge Road, S.W.1.

CHLORIDE BATTERIES LIMITED

have a vacancy for an

ASSISTANT PERSONNEL OFFICER

(MALE)

Applicants should be aged between 23 and 27 years and should be graduate members, or studying for graduate membership, of the Institute of Personnel Management. A University Degree is desirable but not essential.

Candidates should have completed either National Service or at least a year in some branch of industry.

Training will be given as required and there is scope in the Department for further advancement.

Applications giving full details should be addressed to The Chief Personnel Officer, Exide Works, Clifton Junction, Swinton, Manchester.

MARKET RESEARCH

LINTAS LIMITED, one of the largest U.K. advertising agencies, are looking for a young man or woman under 28 for research into advertising media.

This post involves desk research, and work on the design, commissioning and interpretation both of special analyses of existing data and of ad hoc surveys.

Previous experience of media research problems would obviously be an advantage ; but the prime requirements are clear, analytical thinking in figures and words ; a sound statistical background with a practical, rather than academic, approach to data and techniques ; and an aptitude for concise self-expression, verbally and in writing.

The initial salary will depend on age and experience, and the prospects of advancement are good.

Please write to :
The Media Director, Lintas Ltd.,
Hesketh House, Portman Square, W.1.

UNIVERSITY OF DUBLIN

TRINITY COLLEGE

JUNIOR LECTURER IN SOCIAL ADMINISTRATION

Applications are invited for the post of Junior Lecturer in Social Administration, duties to be taken up on September 21, 1960, or as soon as possible thereafter. The person appointed will be expected to lecture and carry out research in the history, development and organisation of social services. Salary in the range £617 10s. x £47 10s. — £807 10s., with marriage and children's allowances and with membership of a non-contributory superannuation and life assurance scheme. Initial placing will depend on qualifications and experience.
Applications (four copies), giving full particulars and the names and addresses of three referees, should reach the Registrar, Trinity College, Dublin, from whom further particulars may be obtained, not later than June 20, 1960.

LEO

TRAINING TO BE COMPUTER CONSULTANTS

Young qualified accountants who would like to make a substantial contribution towards the improvement of commercial and industrial efficiency are invited to join our vigorous young company as Trainee Consultants.

Full and intensive training will be provided in all subjects related to the application of the Automatic Office to industry, commerce and government before appointment is made as an Assistant Consultant in the Marketing Division.

Here the young consultant will be working among people who have gained a world wide reputation in successful exploitation of the Automatic Office. He will be mainly concerned with analysing requirements and in recommending new systems using a computer. Although based in London he will travel widely and will meet top executives in many spheres of commerce and industry.

The selected applicants will probably be aged between 23 and 27 and will expect a challenging job which will require high *personal* qualities as well as a good analytical mind. Starting salaries of up to £1,250 per annum will be paid, depending on age and experience and future progress should rapidly take the young consultant to the high income range.

Applicants should send brief details of career to date to:—
Manager, Recruitment and Training, LEO Computers Limited, Hartree House, 149-150A Queensway, W.2.

MANAGEMENT CONSULTANTS

The Wallace Attwood Company, pioneers in the field of consultancy related to major problems facing Management, invite men with suitable qualifications and experience to apply for posts on the Company's staff.

Age, preferably in thirties or early forties. *Education and Qualifications*, should include University degree or membership of a recognised technical, accounting or marketing institution. *Experience* should lead up to a position of responsibility in production, accounting, marketing or administration, in which success has been achieved.

The work is hard but interesting ; it offers great scope to men seeking wide interests with opportunities to realise ambitions and to experience a feeling of achievement. Applications, fully detailed, should be sent to :

Ref. 452.
The Wallace Attwood Company,
West Halkin House,
West Halkin Street,
LONDON, S.W.1.

UNIVERSITY OF EXETER

Applications are invited for the post of Temporary Lecturer or Assistant Lecturer in Economic Theory Session 1960/61).
Salary Scales :
Lecturer : £1,050 to £1,850 p.a.
Assistant Lecturer : £800 x £50 — £950 p.a.
Further particulars may be obtained from the Secretary of the University. Closing date for applications 18th JUNE, 1960.

ASSISTANT ACCOUNTANTS

IND COOPE LIMITED

National Brewers,

require young Chartered Accountants for the department of the Group Accountant at their Head Office at Burton-on-Trent. The work will be varied and may well involve spending periods at the offices of Subsidiary Companies in various parts of the country. Limited commercial experience desirable but by no means essential. The Company is prepared to consider May, 1960, Finalists.

Contributory Pension Fund with substantial Death Benefits before and after retirement. Five-day week.

Applications in writing giving age, education, experience and qualifications to Administrative Manager, *Ind Coope Limited, Burton-on-Trent.*

IPSWICH CIVIC COLLEGE

PRINCIPAL: F. METCALFE, B.Sc.(Eng.) Hons., M.I.Mech.E.

Applications are invited for the post of Lecturer in Accountancy from September 1, 1960, to teach accountancy to professional and management students and to develop short courses in Accountancy and related subjects. Teaching and industrial commercial experience desirable.
Salary : Burnham Technical Report, 1959, Lecturer's Scale (men £1,370-£1,550, women £1,100-£1,550). Particulars and application forms obtainable from The Principal, Civic College, Rope Walk, Ipswich.

J. T. HILL,
Chief Education Officer.

17 Tower Street,
Ipswich.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of INVESTIGATIONAL OFFICER in the DEPARTMENT OF AGRICULTURAL ECONOMICS. Candidates should have academic qualifications and/or practical experience in Agriculture, Economics or Accountancy, and for this particular post knowledge of or training in Horticulture would be considered an advantage. Salary scale (at present under review) £550 x £25 to £650 x £50 to £850 per annum with membership of the F.S.S.U. and Children's Allowance Scheme; graduates would have an initial salary of £600 per annum. Investigational Officers may be considered on reaching a salary of £700 per annum (or promotion to the grade of Senior Investigational Officer (salary scale : £900 x £50 to £1,350 per annum). Applications should be sent *not later than June 20, 1960*, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

LIBERAL PARTY HEADQUARTERS

APPOINTMENTS

Immediate applications are invited for the following appointment :—

Director of Research.

Applicants should have high academic qualifications and executive experience in this field.
Salary commensurate with qualifications.
Applications, marked "Confidential", should be addressed to

The Secretary,
Liberal Party Organisation,
58 Victoria Street,
London, S.W.1.

Assistant Statistician

required by the National Coal Board in London. The duties include the examination and presentation of statistical information. Applicants should be graduates in economics with statistics as a special or main supporting subject. Experience in drafting reports and concise presentation of statistical data, together with a knowledge of the sources and nature of general economic statistics is also required. Organisational experience, salary depending on qualifications and experience within £1,085-£1,450 scale, £1,000-£1,410 female. Write to Staff Department (A/SC.2D), N.C.B., Hobart House, London, S.W.1, for application form which should be returned by June 14, 1960.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in GOVERNMENT (with special reference to Africa, the Middle East or the Indian area). Salary scale : £800 to £950 per annum. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than June 27, 1960, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

NATIONAL IRANIAN OIL COMPANY

PRE-ANNOUNCEMENT NO. 22 OF JUNE, 1960

In implementation of Article V, paragraph 2, of the Law dated 15th March, 1957, and in exercise of the powers conferred by the said Act it is hereby announced that :

I. With a view to carrying out the operations desired by the Petroleum Act, Districts VIII, XIV, and XVIII of the petroleum districts of Iran, which are situated outside the boundaries described below, shall be declared as "Open" for a period of six months, with effect from September 1, 1960.

(A) BOUNDARIES OF DISTRICT VIII.

District VIII of the petroleum districts is situated on the south of the arc of latitude of 32°, 0', 0" north, between the meridians of longitude of 51°, 0', 0" and longitude of 54°, 0', 0" east of Greenwich and bounded on the south and southwest by straight lines starting from point (1) at longitude 51°, 0' 0", latitude 30°, 45', 0" thence on a straight line to :
Point (2) at longitude 51°, 30', 0" latitude 30°, 45', 0" thence on a straight line to :
Point (3) at longitude 52°, 0', 0", latitude 30°, 30', 0", thence on a straight line to :
Point (4) at longitude 52°, 0', 0", latitude 30°, 0', 0" thence on a straight line to :
Point (5) at longitude 54°, 0', 0" latitude 29°, 10', 0".
NOTE—The whole area situated within the boundaries described below :
From point (a) at longitude 51°, 0', 0", latitude 31°, 45', 0" thence on a straight line to :
Point (b) at longitude 51°, 20', 0" latitude 31°, 30', 0", thence on straight line to :
Point (c) at longitude 51°, 25', 0" latitude 30°, 45', 0" thence on a straight line to :
Point (d) at longitude 51°, 0', 0", latitude 30°, 45', 0" thence on a straight line to point (a), mentioned above although considered as part of district VIII, is excluded from the subject of this Pre-Announcement since it has previously been committed.

(B) BOUNDARIES OF DISTRICT XIV.

District XIV of the petroleum districts is situated between the meridians of longitude of 51°, 0', 0" and longitude of 54°, 0', 0" east of Greenwich and between the parallels of latitudes of 31°, 0', 0" and latitudes of 32°, 0', 0".

(C) BOUNDARIES OF DISTRICT XVIII.

District XVIII of the petroleum districts is situated between the meridians of longitude of 47°, 0', 0" and longitude of 52°, 0', 0" east of Greenwich and between the parallels of latitudes of 32°, 0', 0" and latitudes of 33°, 0', 0".

II. Any person or company desiring to enter into negotiations with the National Iranian Oil Company for the grant of a concession in any of the above mentioned areas, which will be declared "Open" as from September 1, 1960, should apply in writing to the Board of Directors of NIOC (Legal Department) Tehran, Iran, from September 1, 1960, to March 31, 1961, inclusive. Applications received after March 31, 1961, will not be considered. Applications must be delivered in person or by registered mail to the Legal Department of NIOC in Tehran, Iran, and must be signed by the applicant or by a duly authorized representative of the applicant. Applications must be accompanied by a deposit of £10,000 sterling or its equivalent in Iranian currency, which will be returned to the applicant if his application is not accepted by the Board of Directors of NIOC. Applications must be made according to the following Articles of Pre-Announcement No. 22.

III. Except as otherwise provided in this Pre-Announcement, the terms and conditions of the concession agreement to be established thereby will be governed by the provisions of the Petroleum Act, as amended by the Supplementary Petroleum Law of 1957, and as such as the Board of Directors of NIOC may approve. The Board of Directors of NIOC reserves the right to grant concessions in whole or in part over such areas and for such periods as it may deem appropriate, and to require the payment of Rls. 250,000 (two million five hundred thousand rials) for each 1,000 square kilometres of the concession area. The concession agreement will provide for relinquishment by the concessionaire of certain portions of the concession area at the end of the third, fourth and fifth years after the effective date of the agreement. Such relinquishments will be in addition to any relinquishments required by the provisions of the Petroleum Act. The concession agreement will also provide for the retention by the concessionaire of certain specified maximum areas in the form of development areas, and for the relinquishment of all areas not so retained. The concessionaire will be required to submit to the Board of Directors of NIOC, within a period of six months from the effective date of the agreement, a plan for exploration of the concession area, and to spend a minimum amount of Rls. 250,000 (two million five hundred thousand rials) per square kilometre of the concession area during the first three years of the agreement. The concessionaire will also be required to submit to the Board of Directors of NIOC, within a period of two years from the effective date of the agreement, a plan for development of the concession area, and to spend a minimum amount of Rls. 1,000,000 (one million rials) per square kilometre of the concession area during the first five years of the agreement. The concessionaire will be required to pay to the Government of Iran a royalty of 12½ per cent of the value of all petroleum produced and saved from the concession area, and to pay to the Government of Iran a tax on income from petroleum operations at the rate of 50 per cent of net income. The concessionaire will be required to train Iranian personnel for all phases of petroleum operations, and to employ Iranian personnel in preference to foreign personnel to the extent that they are available and qualified. The concessionaire will be required to establish its principal office in Iran, and to maintain adequate books of account and records in Iran. The concessionaire will be required to submit to the Board of Directors of NIOC, within a period of six months from the effective date of the agreement, a plan for the establishment of refining facilities in Iran sufficient to refine a minimum of 5 per cent of the crude oil produced from the concession area. The concessionaire will be required to submit to the Board of Directors of NIOC, within a period of two years from the effective date of the agreement, a plan for the establishment of petrochemical facilities in Iran sufficient to utilize a minimum of 5 per cent of the natural gas produced from the concession area. The concessionaire will be required to submit to the Board of Directors of NIOC, within a period of two years from the effective date of the agreement, a plan for the establishment of facilities in Iran sufficient to manufacture a minimum of 5 per cent of the requirements of the concessionaire for its operations in Iran. The concessionaire will be required to submit to the Board of Directors of NIOC, within a period of two years from the effective date of the agreement, a plan for the establishment of facilities in Iran sufficient to manufacture a minimum of 5 per cent of the requirements of the concessionaire for its operations in Iran. The concessionaire will be required to submit to the Board of Directors of NIOC, within a period of two years from the effective date of the agreement, a plan for the establishment of facilities in Iran sufficient to manufacture a minimum of 5 per cent of the requirements of the concessionaire for its operations in Iran.

IV. The proposals received after September 1, 1960, but before November 1, 1960, shall be deemed to be received at the same time as those received on September 1, 1960, and shall be examined and dealt with in accordance with the provisions of Article V, paragraph 2, of the said Law. The proposals received after November 1, 1960, shall be considered in the order of their receipt.

V. The proposals received after November 1, 1960, prior to closing of the said districts will be considered by the NIOC only when the outcome of the proposals received in paragraph IV above has been announced.

VI. The submission of a proposal will not create any right for the applicant, the NIOC being free to accept or reject all or some of the proposals received.

NATIONAL IRANIAN OIL COMPANY,
A. ENTEZAM,
Chairman of the Board of Directors.

A cooling area of 3500 square feet and a weight of eight tons make the new giant KARBATE Brand Impervious Graphite Series 6850 Shell and Tube Heat Exchangers from UNION CARBIDE the largest in the world. Packed within the 45 inch shells of these KARBATE Heat Exchangers are 685 sixteen foot tubes, which, laid end to end, would measure out to over 2 miles of tubing. While these figures are impressive, you will find the unit's increased capacity and efficiency are even more so.

These KARBATE Heat Exchangers are in use as sulfur dioxide gas coolers in a process producing sulfuric acid from the petroleum industry's refinery sludge acid. The big exchangers operate in much the same manner as a dehumidifier or air conditioner. Moisture laden corrosive gases flow through the tubes of the vertically mounted units. Water passing through the unit's shell cools the gas and condenses out the unwanted moisture. The end result is a cooled, semi de-moisturized gas ready for further processing into a valuable product. And this is just one of the many uses of KARBATE Heat Exchangers in industry.

This reliable KARBATE Heat Exchanger series is available in lengths ranging from six to sixteen feet. This new series of KARBATE Heat Exchangers is nearly double the size of other models and gives five times more cooling area. And these gas coolers of KARBATE Impervious Graphite are more economical and last longer than coolers made of less corrosion resistant materials.

FREE, write for booklet IE-6 and learn more about how you can profit from KARBATE Impervious Graphite units which provide the required heat exchange with less than ⅓ the area required by carbon steel units. Write to UNION CARBIDE INTERNATIONAL COMPANY, Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, N. Y., U.S.A., Cable Address: UNICARBIDE, New York.

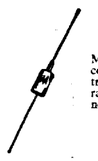
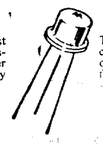
MOTOROLA

will interview for a SEMI-CONDUCTOR DISTRIBUTOR

During the next two weeks



MOTOROLA, a major American electronics manufacturer, seeks a competent firm to distribute its products in the United Kingdom and selected Commonwealth countries. Motorola is a leading producer of advanced-design Semi-Conductor devices, with 30 years of experience in the electronics industry.
Qualified distributors can be assured that they will be handling an excellent and complete product line, designed to meet their customer's varied requirements. The continued excellence of this line is ensured by an extensive research and testing programme which has advanced Motorola to a position of prominence in its field. The efficiency of this programme is apparent in the advances Motorola has made in :



A. POWER TRANSISTORS
Seventy - two different power transistors provide current, voltage and gains for all types of uses.

C. SILICON RECTIFIERS
These Motorola products have made practical the Alternators currently being used in automobiles in lieu of conventional generators.

B. ZENER DIODES
Motorola offers the most complete line in the industry with voltage and power ratings to meet almost any need.

D. MESA TRANSISTORS
The Motorola Mesa is capable of switching speeds of 5 millimicroseconds, fastest in the world.

Motorola is a major supplier of Semi-Conductor devices for military usage. These products are subjected to the most exhaustive and stringent tests. Motorola also offers thoroughly tested units to industry thereby assuring the ultimate in peak performance, dependable operation and long service life.

New geophysical methods have taught us to look at deserts in a new light. Beneath those wastes of shifting sand may lie a whole new world of wealth — beautiful, black, dynamic oil. CEMENTATION'S Geoprosco Group will move in at the drop of a hint with skilled crews to start up the most exciting business in the world — tapping the earth for her buried treasure. Geophysical surveys for a wide variety of minerals are, of course, only one aspect of CEMENTATION. Civil engineering and building (including the supplying of products for the building trades), mining, and specialist engineering in all their ramifications — these are the things that keep the 70 companies of the CEMENTATION Group busy all round the clock, all round the world. So wide is its total range of activities, that the Group can handle any kind of contract, big or small, in whole or in part, anywhere on earth.

Which King, Bezonian?

SLOWLY, tentatively, like a bather in a chilly sea, the British Government is screwing up its courage to decide whether to attempt a full scale plunge into Europe. By its step by step advance, it has already immersed enough of its body to take a traditionalist's breath away. It is already a much bigger revolution in our history than most people give the Government credit (or discredit) for that Britain is now ready, however tremulously and uncertainly, to consider joining Euratom, the European coal-steel community and possibly even something very like a full customs union—if only the major nations of the continent would accept this as a sufficient package agreement.

The probability, however, is that they will not accept it: that most of those now in charge of the German, French (especially), Italian and Low Country governments want full integration with us or none at all. Many, admittedly and embarrassingly, would prefer none. If the present trade talks in Paris end in continued disagreement, one of the most important questions in all our history will be whether Britain should then try to outbid them by offering the full-scale thing. That would mean joining the common market, accepting a gradual integration of social policies, a less gradual integration of economic policies, and the high possibility that this would eventually lead on to radical political coalescence with Europe—the lot. In the suave way in which these things are managed, feelers are already being put out to discover whether British public opinion would react favourably or indignantly to such a momentous decision.

At a guess, British public opinion is at present divided as to at least 80 per cent "don't realise what is happening," as to perhaps 5 per cent long-established devotees on either side, and as to about 10 per cent (especially among top people) "can't make up our minds." The mass 80 per cent of "don't knows" probably do not immediately matter; they will go whichever way Mr Macmillan decides to lead them, unless Labour makes British nationalism a party political issue, which Mr Gaitskell has neither the inclination nor the internal party unity to do. The long-established devotees of merging Britain into Europe are also unimportant at the moment, for the curious and paradoxical reason that so many of their original leading lights are now in high office, and have become somewhat dimmed there. In certain policy-making circles, where the surrender of some degree of national sovereignty is regarded as heresy, nothing is more difficult than for the lapsed heretic to become re-heretical. Consequently, one has got the impression, over the last year or so, that the present Prime Minister—once an ardent advocate of European unity, but always a shrewd calculator of the political main chance—will lead Britain into Europe only when and if two conditions are fulfilled.

The first condition is that the fangs must be drawn from the bitterest (neo and near-Beaverbrookian) opposition that he has always felt he must expect from some sections of his own backbenches. The second is that Mr Macmillan apparently feels that he can afford to be reconverted to good Europeanism only at or near the moment of the positive conversion of the average civil service and ministerial and establishment man. The interesting development of recent weeks is that virtually the whole of the first condition has now been satisfied, and so has a smaller part of the second.

The strength has been drawn from Beaverbrookianism on the Conservative backbenches because all the passes that they stood most resolutely determined

to defend have in effect already been quietly sold behind them, and not one backbencher has yet shown signs of wanting to hang Mr Macmillan from a lamppost. This failure of most right-wing MPs to recognise what has already happened gives an odd air of unreality to the present public debate. All the things that a few months ago were most loudly said to be impossible for any British government to espouse have in fact already been espoused—although the things that were then said to be merely problematical and difficult are taking a little longer. To come down from lofty contemplation of Britain's national destiny to finickety discussion of tariff rates and constituency disadvantages may seem an anticlimatic descent from the mountain to the plain ; but the descent in discussion now needs to be made, for it is by changes in the relative importance of these transient matters that the decision will be, and is being, swayed.

FOR example, Tory ministers used to proclaim from a thousand platforms that Britain could never consider harmonising its outer (e.g., non-European) tariff with the common market Six, because that could involve us in raising some tariffs against the Commonwealth ; now Mr Maudling's assertion that Britain's mind is not closed to the possibility of a full customs union must mean that the Government is considering doing just that. The truth is that there were always only two ways in which harmonisation of Britain's tariff could significantly harm Commonwealth trade, and both have faded. One would have been if it obliged Britain to raise tariffs against Commonwealth raw materials (and thus, incidentally, also to raise raw material prices here) ; this fear has diminished since the common market's List G for outer tariffs on raw materials has proved to be a very reasonably freer trading document. The second fear was that the common market might seriously restrict imports of cheap consumer goods from developing Commonwealth countries like India and Pakistan ; it is now apparent that if Britain and other European Free Trade Area countries went into the common market, they could act as a liberalising force in this regard. This last point—that Britain might serve a more useful purpose battling for freer markets for them and others within Europe than as a marginally more sheltered market for them outside it—has occurred independently to the organs of several Commonwealth governments in recent months.

The Beaverbrookians' second main argument against entry into Europe was that this would betray British agriculture, which Tory backbenchers translated into a wail that it would lose them all their marginal agricultural seats. As a matter of sheer psephological fact, these marginal agricultural seats hardly exist ; the number of Conservative seats that could be lost to Labour through any seriously conceivable swing in the agricultural vote alone, at a time of general industrial prosperity, can be counted on the fingers of one hand. But in any case the original protest was against exposing British farmers to competition from efficient producers like the Danes ; we have swallowed the Danes (with safeguards) in EFTA and now we are supposed to strain at the French. The real agricultural consequence of a full British entry into Europe would be an entry into the Six's managed agricultural market ; the result would be that support for British agriculture might come to take more of the continental form of artificially boosting prices, and less of the better British form of directly paying out subsidies. Many farmers would actually like this ; liberals like *The Economist* would not like it, but liberals are coming to believe that European unity may be worth a (limited) agricultural retreat.

MR MACMILLAN'S problem is therefore not principally to over-persuade backbench politicians ; it is in Whitehall that the real—and sophisticated—arguments against European union are to be found. Generally, these arguments begin by discounting Europe's importance. For example, the economists among the discounters begin by pointing out that only 14 per cent or so of Britain's export trade goes to the common market Six, and by saying that certainly less than a quarter and possibly less than a tenth of this small segment of our exports would be seriously affected by the tariff discrimination now proposed. The " great disaster " threatened by a European trade split must therefore be seen in proportion ; we are being asked, aver the discounters, to sacrifice our traditional independence in order to avert a threat that total British exports may be between, say, 1 and 3 per cent smaller than they otherwise would have been. Similarly, the politically-minded among the discounters can justly query the view that the failure of the summit conference has somehow made rapprochement between Britain and continental Europe more vital—that because that failure has left Mr Macmillan without a horse to ride in next year's Derby, this provides an important new reason for his riding off on his European steed. But neither of these negative arguments meets the most important immediate economic point: which is that, rightly or wrongly, the business ethos created by this idea of common market is leading to a new investment (including American investment) boom among the Six, from which we are in danger of being left out. And neither comes within recognition distance of what is perhaps the most fearful of the political arguments for British participation: that without the counterweight of British influence this united common market could become a foundation for German hegemony over western Europe if Dr Adenauer is succeeded by more grasping successors and President de Gaulle by weaker ones.

More determinedly, some top objectors in Whitehall say that integration of policies with Europeans would really be a synonym for interference by them with our freedom of action at the most embarrassing possible moments. For example, closer integration of economic policies would certainly be an early and necessary consequence of joining the common market ; and " as it is already difficult enough to persuade one government to jump at the right moment to reflation or disinflation, heaven knows how long it would take to move thirteen." Others say that this is the wrong time to mix up our politics with those of France, which will carry the millstone of Algeria round its neck long after we have shed our own liberal embarrassments in East Africa ; if there is a need for us to integrate with anybody (which they deny), these people say that they " would prefer us to become the 51st state of the United States." This last argument is a vestige of the proud British belief that Britain can somehow maintain a special and closer relationship with the United States than Europe will ever forge ; in fact, however, a relationship between America and the new common market colossus is being forged under our eyes at this moment, possibly even closer and more " special " than the Anglo-American alliance. The one special international relationship that Britain undoubtedly does enjoy—that with the Commonwealth—is based on intelligent mutual self-interest : it is not at all clear why this should be strengthened by Britain's isolation from the European continent, or impaired by Britain's closer integration with it.

IT would be foolish to say that there is no force in any of these arguments against entering the common market, with all the possible consequences of this step. Every thinking Briton must make up his mind for himself where he judges that the balance of advantage lies. At present the majority opinion in Westminster and Whitehall is still in favour merely of the step by step approach, of attempting a controlled slide into closer relations with Europe rather than of announcing our willingness to make the great advance and of bidding the trumpets blow. The trouble is that this approach will not work: after each controlled forward step, Britain is finding that its bargaining position is slightly worse than it was after the preceding forward step—and is certainly worse than it would have been if we had earlier attempted the full plunge.

Perhaps if the trumpets blew now, the returning answer—from Frenchmen and Germans who enjoy the dominant position that they hold within the present common market, and from French protectionist interests who would not like to see a further widening of competition and free trade—would be a raspberry. That would be embarrassing, but it would at least let British industry know where it stood. Possibly, however—indeed, at present still probably—the walls that are being run up against us all across Europe might fall at the trumpet's blast. On grounds of the solid balance of advantage, and not on grounds of unthinking emotion, *The Economist* for one has already made up its mind. With due flourish, and after appropriate consultations with fellow members of EFTA, we believe that Britain would be wise to make an offer of full-scale participation in the European common market and community.

Up to the Middle East

The policies of Middle Eastern governments, more than those of the great powers, will determine whether the area may ever cease being a centre of international crisis

SINCE the eventful summer of 1958 there has been a deceptive quiet in the Middle East. On the surface it has seemed as if governments and people had grown somewhat tired of politicking, and might even be beginning to settle down to some constructive activities. True, there have been the familiar alarms and excursions on the Israel-Syria border ; and the continuing smoulder of the ban on Israeli sea-borne trade via Suez. True, the calm has been broken, too, by the recent events in Turkey, the physical buffer between embattled Europe and the Middle East proper. But Turkey, in this as in most other respects, is an exception to the general pattern of the area.

No doubt, the increasingly bare-faced disregard of democratic practices by the Menderes government had shocked those who had come to regard that country as a model of democratic virtues ; but western democratic observers should not confuse their own brand of freedom and democracy with that of other people. There are ground rules which must be obeyed, and if these are broken then there is certain trouble. In 1950, the graft-ridden Turkish administration of Mr Inönü gave way gracefully, and Mr Menderes and President Bayar took over after the country's first free elections. In Lebanon, in 1952, the scandalous activities of President Khoury's government became too odorous even for the Lebanese, and President Chamoun was elected to clean up the mess. By 1958 in Lebanon, as by 1960 in Turkey, the reformers had gone the way of their predecessors, and it was time for another change. By resisting demands for such changes, both Mr Chamoun and Mr Menderes violated the rules that had once put them into office, and both were pushed aside by national uprisings.

Lebanon, fortunately, had an available general to become its new civilian president, but for two years he has had to contend with a parliament elected to support the old regime. On June 12th the Lebanese will begin a month of Sunday elections to choose another parliament ; but the president, General Chehab, will not be affected by the results, and the country does not face the task of restoring civilian government. In Turkey, however, the problem of making this difficult transition does arise, because the army has felt it necessary to assume full control, for a still indefinite period. Elections have been promised by the new military government after a new constitution has been written by scholars. General Gursel may well try to bring Turkey still closer to Europe economically, but it will take time now to convert his country, politically, to the standard western-style democracy to which it has aspired since Ataturk.

THE Middle East is an area of chronic international crisis. For this reason alone, even apart from their real local interests, the great powers have to keep an eye upon it. Old-fashioned imperialism is dead, whatever the nationalists of the area may still say, but the struggle for influence is bound to become more, not less, intense as the world shrinks and the years go by. It is the attitudes of the Middle Easterners themselves that point the struggle and, short of some great clash, will decide it.

In Iraq the government, after nearly two years of self-imposed quarantine, is gradually working its way back into the affairs of the Arab world. The boycott of the Arab ship *Cleopatra* by American dockers enabled Iraq to join in the common Arab outcry against the United States without getting directly tied up with President Nasser. The wise decision

of the Arab foreign ministers to meet at Beirut enabled the Iraqis to agree to attend an Arab League session ; it was no fault of theirs that the Lebanese got the meeting cancelled. Iraqi lawyers recently attended a convention of the Arab lawyers' union at Jerusalem, deep in Hashemite country. Iraqi press comments on the collapse of the summit could not be distinguished from those of the Egyptian press.

On June 4th, General Qasim declared that Iraqis share friendship, cordial relations and mutual problems with Saudi Arabia, Yemen, Syria, Egypt and Jordan. His holding out the olive branch was impressive, but his failure to acknowledge that Syria and Egypt had become one in the United Arab Republic shows that he is not quite ready to meet President Nasser on equal terms. In his international relations, the general's attitude is even harder to define. He still leans heavily towards the communist powers, but seems less likely than he once did to let Iraq become a Soviet satellite. From the western powers he has had only the most considerate treatment. Indeed, the Egyptians who not so long ago decried an "Anglo-Communist" conspiracy to support General Qasim against President Nasser should have recognised British and American tolerance of the Baghdad government as the sort of treatment they long demanded for themselves, and which they are now happily receiving.

ANYONE who has had to deal with Persia will not be surprised that it has not followed the pattern set by its neighbours. The government's answer to a student riot in January was to arrest a hundred orange-sellers and fishmongers and to deny that students had anything to do with the affair. Three days later, the prime minister told parliament that, even if there were a hundred student riots, there were not going to be any political changes whatsoever. Last week's events in Turkey are not likely to have changed Dr Eqbal's mind ; but they have surely given others something to think about.

Not every country can stand the shock of rapid political change, whether restoration or revolution. The special wonderland logic of Teheran means that Persia's rulers would be genuinely surprised if a change were forced upon them. The country is even worse prepared to handle a change of regime, if it should happen, than Iraq was two years ago. Because of the situation created by the Persians themselves, the great powers have had to choose between the country as it is, Shah and all, and the country as they would like it to be, with or without the Shah. The Russians are in no doubt ; they prefer to see him and his government go, and they are working hard to bring about his downfall. The western powers agree that it is better for them if he stays, but there is some question among them whether supporting him means that they have to yield to his every whim and threat.

The Shah has said that there is every freedom in his country, except freedom to commit treason. But the definition of treason there includes every kind of criticism, whether constructive or destructive. If it were revised, perhaps the many Persians—and they are not all orange-sellers and fishmongers —who eagerly await the day of revolution might have a clearer idea of what that day would bring. As things stand now, it is the Russians who, ominously, do the Persians' complaining for them.

The chances of an improvement in great power relations in the Middle East depend, in fact, largely on what the governments in the area can decide to do themselves. It is doubtful as things are whether even decisions agreed upon by all the "summit" conference powers could have any lasting effect. Those governments most directly concerned on the spot would regard with deep suspicion proposals to settle any of the problems which might have been discussed at the Paris conference: the sale of arms, Palestine, Algeria, or the relations of the outside powers with Persia. Their alternating cycles of intransigence and sweet reasonableness, their shifting domestic pressures and their inability to see their own problems in the context of a wider world would be bound, sooner or later, to frustrate the best intentions of the great powers.

A Common Market in Asia?

The logic of adverse terms of trade and clamant economic needs may force the South East Asians to combine

IN a world in which trade groupings are taking shape and tightening up, some Asian countries are coming to believe that they, too, must get together to protect their interests. In the past, nationalist suspicions have stopped them from grouping themselves ; but now there is talk of a new Asian economic organisation, and in particular there is the movement for "Seafet," the South East Asia Friendship and Economic Treaty. Malaya's apparently forlorn initiative in this direction late in 1958 has now won a respectable body of support. Siam, Singapore, the Philippines and, most recently, south Vietnam have approved it in principle ; even neutral Indonesia, while reluctant to tie itself to neighbours who are committed to western alliances, has shown a cautious interest.

This discussion formed the background to the resolution adopted at the March meeting in Bangkok of the United Nations Economic Commission for Asia and the Far East (Ecafe). The commission asked the industrialised countries to help to reduce fluctuations in the earnings from exports of raw materials on which Asian development plans depend so heavily ; and to recognise the Asians' need to export more semi-processed and manufactured goods so as to reduce this perilous dependence. If any detailed address for this appeal was needed, the resolution's reference to the European common market supplied it.

The eagerness of the South East Asian countries to transfer business activity to the hands of their own people confronts them with one common political problem: the overseas Chinese. Indonesia's 1959 decree excluding aliens from rural retail trade has led to an exodus of Chinese and to tension between Peking and Indonesia. Quite apart from the economic problem of replacing the Chinese trader and moneylender, here is a political issue which all the countries concerned may face in common.

This, however, is probably as far as Seafet could go on the political side. The Malayan prime minister, indeed, emphasises that his idea has no political, still less military, content. The communiqué issued after his recent meeting with the president of south Vietnam spoke of cultural co-operation to safeguard "the authentic values of Asian civilisation"; but the heart of Seafet will be economic.

The outstanding common ambition of the various countries is to industrialise, and a common development plan for the region, or something of this sort, has been proposed by the Indonesian ambassador to the Philippines. Yet nothing so far-reaching seems likely. The extraction of raw materials offers little scope for co-ordination. The present unco-ordinated rush to promote manufacturing industries might one day leave a whole herd of white elephants in each country, but freer trade seems a better remedy than attempts at planned siting. The Malaya-Vietnam communiqué spoke of "greater collaboration in mutual aid programmes," but the search for aid and foreign investment is competitive rather than co-operative.

Individual development plans can be compared and advice exchanged in the Colombo Plan Council for Technical Co-operation, to which all the South East Asian countries belong. Technical assistance needs no new agency among the recipient countries. Projects such as the Kra isthmus canal, across the tongue of Siam, which would vitally affect the whole region, cannot be financed, let alone carried out, from within the region by any amount of team spirit. The live topic of the day on the overall development of the region is not greater co-operation among those who need aid, but how Japan can best be brought into co-operation with those who provide it.

In his speech at the Ecafe meeting, the Philippines delegate listed two more likely economic aims for Seafet: the liberalisation of trade within the region, and the improvement of its bargaining position on raw materials prices. On the first point, Singapore has proposed to Malaya that they should work out a list of goods on which they would have a common external tariff and, if made in either territory, no customs duties between themselves. A joint committee is to begin discussions on the plan this week-end, and it is possible that other countries may eventually join in. But the general desire to protect new industries, and the present importance of customs revenues for financing development plans, are serious obstacles here. Indeed, Malaya itself has lately increased some duties on the latter grounds.

AS the report on Asia's trade laid before Ecafe showed, the terms of trade have swung so far against raw materials that Burma, India, Pakistan, Ceylon, and Indonesia can now buy between them (reckoning at 1955-57 prices) £140 million less of manufactured goods than thirty years ago. Gains in volume and price of exports of commodities have been confined to petroleum, rubber and tea, so that even in this field the economy of the region, far from being diversified, is being concentrated. Equally important, fluctuations in raw materials trade make havoc of economic development plans, and as the plans grow the problem becomes ever more urgent. The renewed industrial boom in the West augurs a growth in the raw materials trade in the next few years, but this is only partial comfort to South East Asia if the growth is simply the upswing of a cycle similar to that of the nineteen-fifties. In the past few years discussions on this problem have grown more earnest in a variety of international bodies, producing notably the tin agreement of 1956 ; but the South East Asians are beginning to believe that they must join their forces to negotiate effectively.

Still, they know that agreements on raw materials can be only a partial solution to their problems. Commodity banks might ease the impact of demand cycles ; but artificial prices provoke recourse to synthetic substitutes, and, in general, it is agreed that world demand for raw materials is never likely to grow enough to produce the revenue needed for new development plans. The long-term solution is to reduce dependence on raw materials production by developing processing and manufacturing industries. Since both the West and Russia accept this ambition and are financing it by aid and investment, co-operative pressure on this front may not feature in Seafet's programme. Yet, while the first aim of diversification is greater internal self-sufficiency, the next is the export of semi-processed and manufactured goods within Asia and to the West. For most South East Asian countries, the problem of the competition of such exports with western exports in the region and of their acceptability in the West still lies on the horizon.

In Japan and Hongkong, however, this is today's most urgent problem ; in the case of India, it is growing. The fear of these countries, particularly of Japan, that the new European trade blocks will continue to discriminate against their goods in the European market, and their wish to strengthen their position in the South East Asian market, are both mounting. Accordingly, if Seafet comes into existence, it may confine itself to regional trade and raw materials policy ; but if the idea is taken up by the more advanced Asian countries, it might expand to become a grouping for bargaining on all fronts between Asia and the West.

The Economist

JUNE 9, 1860

THE FRENCH EMPEROR

¶ From the date of his elevation to supreme power in France, there could be no doubt that in Louis Napoleon we must have a scheming and not over-scrupulous neighbour; but for some time there was reason to hope that he saw his interest in, and was prepared to base his power upon, the development of the great material resources of France at home, and the peaceful advancement of French objects and legitimate influence abroad, in tolerably faithful alliance with this country. How this hope,—if but half entertained, yet hitherto most honestly acted upon by us,—has been gradually extinguished, it matters not here to examine. Suffice it that it is now clear that while no doubt bent upon cultivating the internal prosperity of France, the Emperor is likewise determined to carry out, and if need be fight for, certain other aggressive ideas of French policy; and that these are, broadly, extension of the boundaries of France,—subordination of the Spanish and Italian Peninsulas to French influence and dictation,—conversion of the Mediterranean into a French sea, and,—with these to aid,—curtailment of the power and influence of this country. Nor are these "ideas" merely his own:—they have been, are, and will long continue to be, under any form of Government, essentially French. They are ingrained in the passions, the prejudices, and the imagination of the French nation. Hence their danger to Europe and to us. For, although there are undoubtedly in the character and conduct of Louis Napoleon elements of weakness which may be slowly but surely sapping the foundation of the structure he has so strangely, and, to a certain extent, so skilfully raised, he undoubtedly derives an indefinite increase of power from the fact that the policy he has now unmasked embodies the wishes of the very great majority of the French nation. However hateful his Government may be to the higher-minded and more intelligent minority in France, one has but to study the *Debats* and the *Deux Mondes* to perceive that, as far as these objects are concerned, all serious internal opposition is for the time in abeyance.

The Vexatious Litigant

Lest the British wax too smug about America's Chessman case, they should consider a recent British case which was twice as protracted

In English criticisms of America's Chessman case two separate strains of thought or emotion could be detected. The first was a distaste for anything like cat-and-mouse punishment, and the other a feeling, shared by most Englishmen, that our own legal system is incomparably better than any other in the world. We are never more smug than when we contrast our administration of the law with the practices of other nations. On one side we see a balanced justice carefully and swiftly administered, and on the other a mixture of absurdities and delays—especially delays—repugnant to natural justice and those principles of fair play which are the priceless heritage of every English-born man and woman. Is it not written in the great charter that to no Englishman shall right and justice be delayed? It is a warming thought.

But before we become too smug in our criticism of American procedure and the twelve years' delay in Chessman's execution, we might consider an English case (recently concluded) which lasted not twelve but twenty-four years. It was a case in which all the right was on one side and all the wrong on the other; which was started in 1935 and finally settled in 1959; which was dragged out by one legal device after another; which postponed for at least six years the administration of a large deceased estate and the payment of a considerable sum in death duty; which was ended only by the intervention of the Attorney-General. It was not a criminal case like Chessman's. But our English ban on delaying justice is as definite in the civil as in the criminal law; and if we had to choose between giving a condemned man twelve years of life, to which he was not entitled, and keeping a large and unjust civil claim over an innocent man's head for twenty-four years, surely it were better to postpone the criminal's execution.

The facts of this civil case (so far as they can be ascertained) are as follows. In the nineteen thirties a company named Barburizza and Company, Ltd., carrying on a merchant's business in Cunard House, Leadenhall Street, had an employee called Vernazza who for some reason lost his job and brought an action against his employers for wrongful dismissal. His case came up for trial, but the judge never had to decide it. It was so weak that Mr Vernazza's counsel threw up the sponge in court and submitted to judgment, Mr Vernazza being offered by his employers £400 as a gift *ex gratia*. And that, in 1935, appeared to be the end of a not very important dispute.

In fact it was the beginning. The chief shareholder in Barburizza and Co. was a remarkable man named Petronovic, who, presumably, must have been a Serb by origin, but was certainly a resident, and perhaps by adoption a citizen, of Chile; and had amassed a large fortune in London. In 1937, two years after Mr Vernazza's claim had apparently been smashed, Mr Petronovic decided to liquidate Barburizza and Co. and (to make the liquidation possible) personally guaranteed all the company's liabilities. That brought Mr Vernazza out again into the arena, for he turned up in the liquidation proceedings with a claim for £158,982—again for wrongful dismissal.

The fact that he had already lost his case once did not worry him. He admitted that his counsel had submitted to judgment by consent, but declared that as plaintiff he had never consented to the consent. He had been outrageously let down by his lawyers and was not bound by a judgment so wrongly obtained. It was all very strange, but the strangest thing of the lot was that Mr Vernazza, entitled (as he claimed to be) to more than £158,000, took no steps to get on with the case. He seems to have done nothing; the action went to sleep and lay asleep for nearly twenty years. Did ever any other litigant, with a large fortune to win and nothing to lose, let his action sleep for twenty years?

In 1951, Petronovic, then living in Santiago, made his will according to Chilean law and three days later died in hospital. He left one legacy—100,000 pesos to the Radium Institute—and the residue to his son. A certified copy of the will was brought to London and in 1953 it was proved (or whatever the right legal word is in a case of this kind) for £309,708—a very satisfactory inheritance even after deduction of duty. Financially, Mr Petronovic's son was a lucky man, or would have been if he could have touched the money. But between him and his inheritance stood Mr Vernazza and the sleeping law suit. Mr Vernazza's claim had no merit, but could the executors safely neglect it and distribute the assets? Were they to treat the net value of the estate as £309,000 or £150,000? Naturally, they decided in favour of the lower figure. Estate duties of nearly £100,000 were left unpaid. Interest on the unpaid duty went on rising, and the beneficiary presumably went without his due.

In five or six years after Petronovic's death nothing happened; but in 1957 the executors moved to have Mr Vernazza's action dismissed for want of prosecution; and dismissed it was. Immediately, Mr Vernazza appealed against the dismissal first in the Appeal Court and then in the Lords. He lost in both, but on the same day started another action and lost that. Again he took his case up to the Lords and again he lost. To follow the trail of his litigation in detail, and to understand how he managed to foil the executors so long and so often, is impossible; but he certainly took out at least five writs in Chancery, made use of consequential interlocutory proceedings, originating summonses and probably a good many more of these mysterious weapons that the procedure of the British courts puts at the disposal of contending litigants.

If ever there was a vexatious litigant it was Mr Vernazza, and if ever a man showed what a long run for his money a vexatious litigant can get it was again Mr Vernazza. The courts have an inherent right to strike out frivolous and vexatious claims, and by the Judicature Act of 1925 a persistent vexatious litigant can be prevented from starting an action unless he has first received the leave of a High Court judge. But in spite of all the restraints and obstacles Mr Vernazza managed to keep his freedom of action and by process of law to persecute his enemies for nearly a quarter of a century. Why, in the name of Magna Carta, should right and justice be delayed so long?

NOTES OF THE WEEK

DISARMAMENT

Pendulum Play

A SPECTACULAR breakthrough in the search for disarmament seems tantalisingly near, though doubtless out of reach. All that would appear necessary is to induce the drafters of the Soviet proposals of last September to sit down with the drafters of the Soviet proposals of June 2nd and reach a compromise between the two texts. (If, as is more than likely, the same team drew up both plans, then the achieving of a compromise ought to be all the easier.)

Under the September plan, nuclear bombs and rockets would have been left intact until after the abolition of conventional forces. Under the new plan, conventional forces would be the last to disappear. In its first stage, all means of delivering nuclear weapons would be destroyed; in its second, the nuclear weapons themselves would also go, and all production of atomic energy for peaceful purposes, and extraction of nuclear raw material, would be placed under international supervision, in a manner oddly reminiscent of the once abhorred Baruch plan; only in the third and final stage would the armies be reduced to limited contingents equipped to maintain internal order or to act, if peace were threatened, on the orders of the UN Security Council.

Oddly described as no more than "an elaboration of the programme put forward in September," the new Soviet terms in fact amount to a reversal of the September order of priorities, and a return to Russia's more customary demand that the bomb must go first. The pity is that each time the Soviet pendulum swings wildly from one extreme to the other it whizzes past the midway position taken up by the western governments, who patiently stick to the very sensible argument that nuclear and conventional disarmament must proceed together, so that no party to the agreement shall be placed at a grave disadvantage at any stage in the process. Thus, if the Russians would only average out their own two programmes, they might find themselves surprisingly near the western midway position.

Progress and Gaps

MR KHRUSHCHEV garnished the new disarmament terms with even more personal abuse of President Eisenhower and his assistants, and of Dr Adenauer, than before and with some frightening bluster about Soviet power in nuclear rockets—including a claim that the sites of American air bases were "pinpointed on a map" at Russian general staff headquarters, which went ill with his pious denunciation of all espionage ("We are men of lofty morality"). The demand for the immediate withdrawal of all allied forces to their home countries was unhelpful, if familiar. But the more encouraging aspects of the new Soviet formulation deserve examination.

The Soviet leader indicated at his press conference that the UN veto rule would apply to the disarmament process in certain unspecified respects; but the Soviet terms also refer to a two-thirds majority sufficing for most decisions of the international control council. The new terms spell out in more, and quite promising, detail the rights of free access and communication of the international inspectorate. They refer only vaguely to the working out of measures to ensure compliance with the disarmament agreement, but at least the necessity for some such measures is now conceded; and the internal security forces left in being after general disarmament would, it is proposed, be subject to careful supervision, specifically in the case of their movements near frontiers. On these and other points, the Russians are beginning to make concessions to commonsense arguments which they had derided.

What is still most glaringly absent is any recognition of the force of the western argument that any disarmament plan must, to win general acceptance, preserve a balance at each of its stages, so that no power finds itself in special jeopardy. In the absence of this concept of balance, the high priority now given to the destruction of means of delivering nuclear weapons, linked with the equal priority for the abolition of all bases on foreign soil, looks unhappily like a mere attempt to flatter the French, who have shown special concern over delivery mechanisms, and thus to divide western opinion, while still ensuring that the West as a whole cannot accept the terms offered. One wonders when it will dawn on Mr Khrushchev that the way to get disarmament, if he really wants it, is to make it easier for other countries to agree on a common formula, instead of trying to divide them.

HIGH FLYING

The Calmer Russian

AN odd and illuminating sidelight on the U2 affair has come from an apparently authentic source in an east European government. Some time ago the country concerned detected reconnaissance aircraft, presumably American, crossing its territory at a height too great for interception by its own air force. It approached the Soviet government with a request for anti-aircraft rockets capable of hitting the high flying aircraft. Mr Khrushchev's response was, in effect: "Sorry, no rockets for you. What does it matter, anyway? Why worry over an occasional American spy-plane? It's nothing to get excited about."

CHINA

Peking's Doubts

PEKING'S gloss on the latest Soviet disarmament proposals is a militant one: exactly how welcome it is to Russian, let alone uncommitted, ears is open to doubt. Although the Chinese leaders have officially endorsed the Russian plan, their commentaries have been occupied with confident assertions that war is still justifiable in a nuclear age and that a wholesale expansion of militia forces is essential to China's military strategy. China's current drive to expand its militia on a nationwide scale is, in itself, a sizeable obstacle for any disarmament plan to surmount. Peking's ambition, in the words used by the chief of general staff, General Lo Jui-ching, on May 10th, is to organise "a colossal reserve force" so that, "in response to a single order, hundreds and thousands of divisions will rapidly be formed." The Chinese leaders plainly do not believe that the international situation is favourable to disarmament, and one of their chief concerns is to scotch the idea (attributed to the "modern revisionists") that the prospect of outright war can be excluded.

In this vein General Hsiao Hua, deputy director of the army's political department, declared on June 3rd that neither the development of nuclear weapons nor the superiority of the forces of "socialism" over those of "imperialism" meant that the risk of war had disappeared. "To be afraid of war and so to oppose all wars, even denying support for the just wars" was, he said, simply to "bind one's own hands and feet." Thus the Peking *People's Daily*, giving its formal welcome to the Khrushchev proposals on June 7th, contented itself with the reflection: "Of course, we always advocate reduction of armaments to relax international tension, so long as this is possible." As things stood, however, the socialist countries should "strengthen their armed forces to defend their socialist homelands and preserve world peace."

With this Chinese mood only too self-evident, the Seato ministerial conference in Washington last week was not inclined to canvass any radical changes in policy. Mr Nash, the New Zealand prime minister, did, however, press his colleagues to take a long-term view on the merits of recognising Peking. For the State Department, however, Far Eastern policy has suddenly nar-

rowed down to the trial of prestige that President Eisenhower will undergo in Tokyo on June 19th. For Peking's publicists, too, driving on the Japanese agitation, the date is an important one.

MR COUSINS

One Voice

LAST week the 39 members of the executive of the Transport and General Workers Union voted unanimously in favour of Mr Cousins's policy of being beastly to Mr Gaitskell; they intend to cast the union's million votes at the next Labour party conference against Mr Gaitskell's policy of loyalty to Nato, and in favour of an undiluted Clause Four. This is the executive of the union which, up to five or six years ago, followed and upheld Mr Deakin along precisely the opposite road, veering then as far to the right of the Labour party as Mr Cousins is currently to the left of it. Mr Cousins can believe if he wishes (and he does) that this astonishing turn-round is a sign of wholesale democratic conversion to genuine sharing of his personal convictions; everybody else will conclude that the chill unanimity of the executive is a sign that the union's lieutenants now find it as convenient and advisable to agree promptly with the new general secretary as some of them once found it convenient to agree promptly with the old one. It is an extraordinary situation, and not its least extraordinary feature is that Mr Cousins remains a blissfully unconscious dictator; if he had been a deliberate and crafty one, he would have had the tact—as even iron curtain governments generally do—to arrange that at least one vote in the 39 was cast against him.

Another decision taken by the union last week was to nominate Mr Cousins's right-hand man, Mr Nicholas, for the treasurership of the Labour party which Mr Bevan has vacated. After an initial feeling of resentment, some Gaitskellites have come round to muttering that perhaps Mr Nicholas, who has a past record of pro-Gaitskell political views, might be weaned away from Mr Cousins if he is elected to high party office. This is exceedingly unlikely; precisely because he knows that some people would like to set him up as a rival to Mr Cousins, and because he does not want any such role, Mr Nicholas is nowadays constantly leaning over leftwards in his loyalty to his union leader. Nevertheless, Mr Nicholas's nomination provides the Gaitskellites with a subtler opportunity, which they should now recognise and seize.

Handling the Treasurership

THE important question for the future of the Labour party is not whether accession to the party Treasurership would change Mr Nicholas, but whether Mr Nicholas's accession might not usefully change the nature of the Treasurership. Now that voting power at the annual conference has turned sour for Mr Gaitskell, it is vital for him and for Labour's public image that the conference and the national executive should be devalued in importance relative to the parliamentary party. It is still more than possible that this shift of power will have to be dramatised this year by the parliamentary party having to reject a conference decision on defence; the lining up of the TGWU behind Mr Cousins's personal feud with Mr Gaitskell increases the likelihood that there will be an anti-Nato majority on the conference floor at Scarborough in October. Whether this happens or not, however, it is to Labour's advantage that the divorce between the conference, executive and parliamentary party should be pushed forward informally in every possible informal way. One of the obstacles to this informal cutting of links has always been the kudos that has surrounded the office of party Treasurer. This is now, in effect, the only office through which prominent Labour MPs can be elected to the national executive by the votes of the entire conference, as distinct from by the votes of particular sections of it. In consequence, it has come to be regarded as a stepping stone to the eventual leadership of the party, which is why Mr Bevan used to fight Mr Gaitskell so energetically (albeit unsuccessfully) for it in the old days.

If Mr Nicholas were elected to the Treasurership, nobody could possibly regard the office in this old light; the actual duties of the Treasurership—collecting the cash—are not in fact very arduous or important. The main result of his accession could therefore be that Labour MPs aspiring for the party's eventual leadership would no longer feel it necessary to be constantly angling some of the speeches that they make, and some propagandist attitudes that they strike, in such a way as not to lose left wing conference votes. This is a change that is devoutly to be wished, even if it is hardly the change that Mr Cousins can have had in mind when sponsoring Mr Nicholas's candidature.

ROAD DEATHS

Obituary Column

A PATTERN now seems to have been established for editing the daily press at holiday time. While reporters drive, no doubt courteously, to the coast, a single spokesman of the Automobile Association is gratefully allowed to write the same lead story in practically every newspaper. His jovial or admonitory remarks (this time, the public was thanked for its good road manners) are then sub-edited into a preliminary analysis of the road accident figures, which are invariably badly misinterpreted. The present fashion began with the appalling toll of 59 road deaths on Christmas Eve. When Easter came, reporters and leader writers were therefore poised to comment on another tale of terrible slaughter; they duly did so, although the preliminary figures in fact suggested that the death rate over the Easter weekend might be going to be below the normal weekend average. This presumed press clanger at Easter had sunk into reportorial consciousness by the time the Whitsun holiday arrived. What had not sunk in was that when the Ministry of Transport revised their provisional figures for Easter, the total went up by 11 per cent. (These final figures count all those who succumb to injuries within thirty days; a further 5 per cent, who are not counted, die later.) On Fridays, Saturdays and Sundays in England and Wales last year the average daily number of deaths was 18 (compared with the overall daily average of 16). The daily average over the five days of Easter this year was 19.4; this increase of under 10 per cent on the customary weekend rate was not bad for a fine holiday weekend, considering the rapid increase in car registrations, but not as good as was at first expected.

Blissfully ignorant of what the final Easter figures had shown, however, the press this time was determined not to over-report deaths at Whitsun. It accordingly compared the figure for immediate on-the-spot deaths with last Whitsun's figure for total deaths, and proclaimed that the public had driven very safely. In fact, this time the preliminary figures were rather bad. By Wednesday the known total of deaths was already 74 during the four days of Whitsun (Friday to Monday), one more than the figure for Whitsun last year, already a daily total of 18.5 deaths—and it must be expected to rise to a daily total of over 20, when deaths within thirty days are finally counted. Nevertheless the summer holiday-time fluctuations are still not as great as might be expected; the real problem in summer is not sudden slaughter on holiday weekends, but constant Monday-to-Sunday attrition.

Far more pertinent are the figures for Christmas. A daily average of 40 deaths over the 4 days of last Christmas is striking enough; but the Road Research Laboratory's finding that 56 per cent of the deaths over Christmas involved at least one driver who had been drinking is for once a concrete fact about which it should be possible to take action. Present evidence can tell little about the effect on accidents of 50 mile-an-hour zones or clearways or appeals to the public's innate courtesy. What it does show is that more lives could be saved by abolishing office Christmas parties.

EUROPE

Frostbite

THE exploratory toe which the Government dipped into the European water last week has found the temperature pretty chilly. Though Mr Profumo's speech in Paris, when he declared Britain ready to reconsider joining Euratom and the Coal and Steel Community, was well received by the assembly of Western European Union, official reactions from the governments of the Six and from Brussels have been less enthusiastic. Indeed they have forcefully confirmed the private views which the Six made clear to the British before the WEU meeting—that they were not prepared to have Britain in on one or two of their communities unless it joined all three. The practical difficulties of separating the branches of the European tree are too great; and the political obstacles will remain insuperable so long as Britain does not subscribe to the political purpose which all three communities are designed to serve.

Faced with this chilly reception, the Government now appears to be doing its best to withdraw, shivering a little, and wondering what to do next. Officials are drawing attention to the qualifications Mr Profumo made in his speech, when he emphasised that any British move to join Euratom and the Coal and Steel Community must be dependent on a welcome from the Six and on agreement on broader political and economic issues.

There are no signs, however, that such an agreement is anywhere in the offing. On Thursday the trade issues between the Six and Seven were discussed at the meeting of the group of 21 in Paris which was set up earlier this year. At their Lisbon meeting last month the Seven chose to interpret the declared willingness of the Six to talk as a sign that discussions might be resumed on a long term European association. But when *The Economist* went to press there was no evidence to suggest that the Six have any intention of budging from their familiar position—that the long-term problem can be solved by membership of the economic community for anyone who wants to join, and that short-term tariff difficulties can be cleared up by mutual concessions on a most-favoured nation basis.

GERMAN ARMS

A Deterrent for Bonn?

AT each stage in the arming of western Germany with tactical atomic weapons, it has been argued that military necessities and Nato decisions taken long ago made the move unavoidable. Yet each move has added to the destructive and diplomatic power in German hands—a power which many Germans find disturbing, and which is liable to increase the risks of conflict in central Europe. These risks surely outweigh the questionable military advantages the moves were supposed to bring.

Now the Bonn government is moving on a stage further. With the arming of the Bundeswehr with tactical nuclear weapons well under way, it is showing a first overt interest in strategic arms. Herr Strauss, the defence minister, is visiting the United States in part to study the possibility of buying the intermediate-range Polaris missile, a weapon which could reach Moscow from bases by the Rhine. Once again, a military case can be made out for the move. The more numerous and varied the bases for strategic weapons, the happier the soldiers are. Military arguments, however, simply do not justify a step which could radically prejudice the already remote prospects for some sort of easing of relations between east and west in Europe. Nor has the failure at the summit made it easier to justify.

The British, however, are not in much of a position to give good advice. Britain's own "semi-independent" deterrent is said to bring valuable advantages—influence on American policy, the ability to trigger off nuclear war on one's own, if need be. No doubt some of the same advantages can be claimed in Bonn for German possession of Polaris—although the warheads of any weapons the Germans buy at this stage will still be in American hands. All the same, Herr Strauss's visit is an urgent reminder of the need to develop an effective joint political control over the nuclear weapons now being distributed so liberally amongst the allies, as well as of the need to concentrate the efforts of the European allies on the conventional arms in which there are so many shortcomings, instead of on these grand and dangerous symbols of power.

TURKEY

Puzzled Colonels

WITH its military coup only two weeks old, it is still far too early to foretell what the future holds for Turkey. The military regime is already taking sensible steps to put the economic house in order; it is reported, for instance, that the deposed government's huge public works programme is being cut back. The army also seems aware of the danger of letting feelings of revenge and hatred against the old regime get out of hand; a communiqué issued by the military committee of national unity, alleging atrocities on the bodies of students killed in the recent demonstrations, was next day played down by a military spokesman who said that so far there were only rumours, and no evidence, of these atrocities.

But the prospects of a reasonably speedy return to democratic ways remain obscure. The real power in the land at present is the committee of national unity set up directly after the coup. Much, however, about this committee remains hidden; the military ranks of its members have been published (there is only one general but eleven colonels and lieutenant-colonels) but not their names. Whether General Gursel effectively controls the committee, or is himself controlled by it, is unclear; so are the balance of forces and political trends within it. One suspects, however, that its members are not finding it too easy to agree on how best to disembarrass themselves of the political power that they so quickly and easily assumed. General Gursel has let it be known that the military are not sure that they will finish their task within three months, as they originally said, and that if elections cannot be held by October, they would have to be put off until the following spring, because of the winter weather conditions in eastern Turkey.

The general has also told a correspondent of *Le Monde* that he might agree to become the head of a new party which would "defend the principles of the revolution." This suggests that the army, having virtually destroyed the Democrat party as an effective force for the time being, is not too keen to let the rival Republican People's party have a walkover in the elections. But is the formation of a party led by an ex-general and backed by the army the best way of preventing this?

CO-OPERATIVE CONGRESS

As You Are

AT this week's co-operative congress the right-wing delegates on whom Mr Gaitskell relies as a politician effectively jilted him as an economist. The death knell was sounded for the more radical of the Gaitskell proposals for reform of the co-operatives' commercial structure. Since these proposals were put forward two years ago, a surprisingly large body of co-operative opinion had come to accept them as the only way out of the movement's present trading decline. The supporters of reform included not only many of the more progressive retail societies, but also official opinion in bodies as different as the shopworkers' trade union and the communist party.

The changes the reformers wanted to see were many, including the amalgamation of existing societies into larger units and the setting up of chain stores specialising—like private enterprise multiple stores—in profitable lines of dry goods. But more than anything else, they wanted an efficient means by which their concept of co-operative business could influence decisions at the top. The body chosen for this purpose by the "rebels"—as the pro-Gaitskellites unfortunately became known—was an independent Co-operative Retail Development Society. It is the independence of this society that the congress, with its vote in favour of continued control by the existing wholesale societies, has just refused to allow.

The rebels' weakness at the conference lay not so much in dialectic as in tactics. Co-operators, like trade unionists, are always liable to rally to the call of unity and brotherhood, even if they are not quite sure what it is in aid of. The idea of co-operation as a way of life, not to be disrupted by any foibles of fashion or commercialism or competition, also makes a strong appeal. Mr Jupp, the congress president, and a representative—albeit a sound one—of the entrenched co-operative producers, made skilful use of this. "Piecemeal acceptance of

particular gimmicks adopted by our competitors," he said, "without regard for the impact upon the tenets of our reputed faith could easily place us in the situation of a rudderless craft pushed to and fro by every change of wind, current or tide." Such change is of course the essence of successful retailing. That was the reformers' main point. But by their outright attacks on the leadership they laid themselves open to the charge of being radical blacklegs : loyalty to authority then won the day.

The results of their failure are likely to be serious. The co-operatives are now to have chain stores run by their established leaders—leaders whose business record over the past few years has been unconvincing to say the least. Moreover there will be no important body in which the reformers, and the outside experts whom they wanted to recruit, will be able to have a say. A great opportunity for co-operative societies to begin to match their competitors in efficiency has been missed.

EDUCATION

The Sixth and the Secret Service

SIR DAVID ECCLES upheld last week the right of headmasters to give their sixth formers advice on the facts of life, including the risks of being screened if one wants a job in a secret national establishment. Mr William Griffiths, who besides being Labour MP for Manchester Exchange is vice-chairman of the Campaign for Lessening Secret Police Powers, defended the right of sixth-formers to hold their own political opinions. Both contentions are unquestionably right and not in the slightest inconsistent; they came into collision last week only because Mr Griffiths alleged that "men from MI5" had "brought pressure" on a grammar school headmaster "to ascertain from his sixth form pupils the nature of their political allegiances." Sir David replied that the head had not been asked questions about any of his present pupils, while Labour MPs and the popular press (and even one serious newspaper) drew a highly impressionist picture of the secret service warning the head about his boys' political activities and, under pressure, ordering them not to wear Campaign for Nuclear Disarmament badges in school. The picture of widespread MI5 activities in the nation's schools was rather spoilt by the general admission that, whatever they were, they affected only one school.

All this must have produced an exciting diversion in the school, but it seems quite unnecessary. It is agreed that people who want secret jobs must be screened, and it may be that a headmaster is sometimes asked by "men from MI5" about an ex-pupil—who may perhaps have shown a youthful predilection for badges, marches and left-wing politics too. The head may then be moved to mention to the science sixth that even schoolboy politics interest MI5 when a candidate is screened for an atomic energy job. He may perhaps excuse to parents a pedagogic dislike of badges in school on some such grounds. But this, if it happens, is the most indirect of indirect pressure on boys and girls to stick to the Tory line. At worst it seems helpful advice to those who feel they would like to take up spying for a foreign power as their career.

LAOS

Strife Ahead?

ILL-CONDUCTED elections and an absconding prince seem to have deprived Laos of the era of "peace and neutrality" foreshadowed at the beginning of the year after a short-lived army coup. The April elections produced a right-wing assembly. Two weeks ago Prince Souphanna Vong, whose communist Neo Lao Haksat party had been handicapped by the fact that he was in gaol awaiting trial on a charge of treason, escaped with fourteen other communists and gained the guerrilla-controlled region on the border with north Vietnam.

This escape may have spared the Laotian authorities the painful decision whether or not to bring the prince to trial, but it also removed the possibility of a "neutral" cabinet. The government that has now been formed out of the new assembly is, in fact, dominated by the extreme right-wing Committee for the Defence of National Interests. One of the committee's leaders is Mr Tiao Somsanith, the new prime minister, who retains the ministry of the interior which he had held in the previous caretaken government. General Phoumi Nosavan, the committee's "strong man," remains defence minister and has acquired three other portfolios as well. Although the new cabinet also includes some moderates, negotiations with the communists are clearly excluded, and the prospect is one of continued strife.

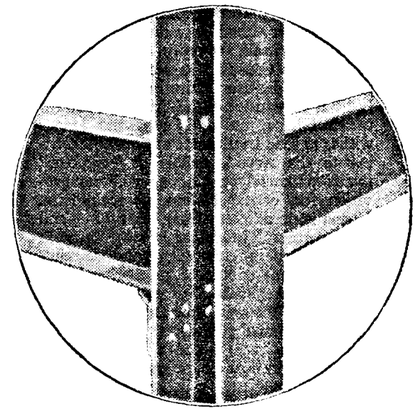
MOROCCO

A Cleavage Manifest

THE verdict of local elections is necessarily inconclusive, but the recent Moroccan ones deserve attention if only because they are the first country-wide elections the country has ever held. Since King Mohammed V, who became his own prime minister before polling day, has promised to turn himself into a constitutional monarch by 1962, last week's municipal and communal elections were, in effect, a dress rehearsal for the general elections that will presumably enable the king to keep his promise. If the rehearsal proves anything, it is that Morocco is, as the evidence has long suggested, a politically divided country. Not surprisingly, both the major parties, the traditional nationalist Istiqlal, and the leftish National Union of Popular Forces (UNFP), claimed victory. The UNFP, with the help of the powerful trade union federation, swept into local office in the industrial centres of Casablanca and Rabat, and at Tangier; the Istiqlal won in the traditional Islamic centres, such as Fez and Meknes; honours were divided at Marrakech.

The elections will, at any rate, have shown the king and the crown prince (now deputy premier) that popular support for the outgoing ministerial team is too strong to be brushed aside. The former prime minister, Mr Abdallah Ibrahim, and his deputy, Mr Abderrahim Bouabid, have declared themselves satisfied with the showing of their UNFP. So, however, has Mr Allal el-Fassi of the Istiqlal, who said, perhaps rather sweepingly:

> Morocco has voted Istiqlal, that is, it has voted for our principles: fidelity to the king, the fatherland and Islam.



Crown Prince Moulay Hassan may well feel that the situation demands repressive measures against the UNFP and the main trade union body. In this he might be encouraged by Mr Douiri, leader of the new dissident right-wing trade union group, who is finance minister in the new government. But it would be a departure from the king's normal approach, and against Morocco's long-term interests, if he were to listen to extremist advice.

WEST INDIES

Jamaica Breakaway?

ON the eve of his departure for Trinidad last week, Mr Macleod received an unwelcome reminder of the fragility of the West Indies Federation. Mr Manley, premier of Jamaica, has announced that a referendum will be held next year on whether Jamaica is to stay in the federation at all. This is bound to disrupt the Colonial Office's timetable, under which it was hoped to get the West Indies Federation off to a start with dominion status before the middle of next year. The working parties, which have been trying to salvage what remained of federation after the collapse of the constitutional conference last September, are due to present their proposals this September, but clearly these will have to go into cold storage until Jamaica makes up its mind.

Mr Manley's hand was forced by Sir Alexander Bustamente, who has used anti-federation sentiment in Jamaica ("higher taxes to pay for the small islands") to assault Mr Manley's government and personal position and has now ostentatiously resigned from the federal party he has been leading. Unhappily Mr Manley is not prepared to go down fighting with his flag flying in the federal cause ; and the referendum is the first sign that he contemplates striking it. Mr Manley may or may not try to word the referendum in a way that will

...stronger....cheaper

The high quality of British structural steel is now recognized by the sanctioning of higher working stresses. More efficient columns and beams, new methods of design and fabrication—all combine to reduce the amount of steel and labour required, and thereby to reduce the cost. The result: an overall saving.

STEEL STRENGTH STABILITY

incline voters to say "yes" to federation (or even confederation); but it is doubtful if he will succeed. It is more probable that he will now find it politically convenient to damp down his own support for the federal link.

The alternative to federation is early Jamaican independence. For a state of 1½ million people, a smallish fish even in the barracuda-infested Caribbean, this will not be anybody's honeymoon. Mr Macleod has the prickly problem of Trinidad's own self-governing constitution to settle on his present tour, but he should find time to call on Sir Alexander and Mr Manley to show them the risks they are forcing Jamaica to take.

GHANA IN PARLIAMENT

Yet Again Farewell

SINCE no country can be more independent than independent the appearance of a Ghana (Consequential Provisions) Bill on the order paper of the House of Commons may seem to have struck a peculiar constitutional note. Did not Ghana make its positively last appearance in what was once known as the Imperial Parliament in 1957 when that Parliament abdicated its sovereignty over the Gold Coast? Curiously it did not, and in requiring British legislation to complete the amicable deposition of its Queen, Ghana is only following the precedents set by India and Pakistan.

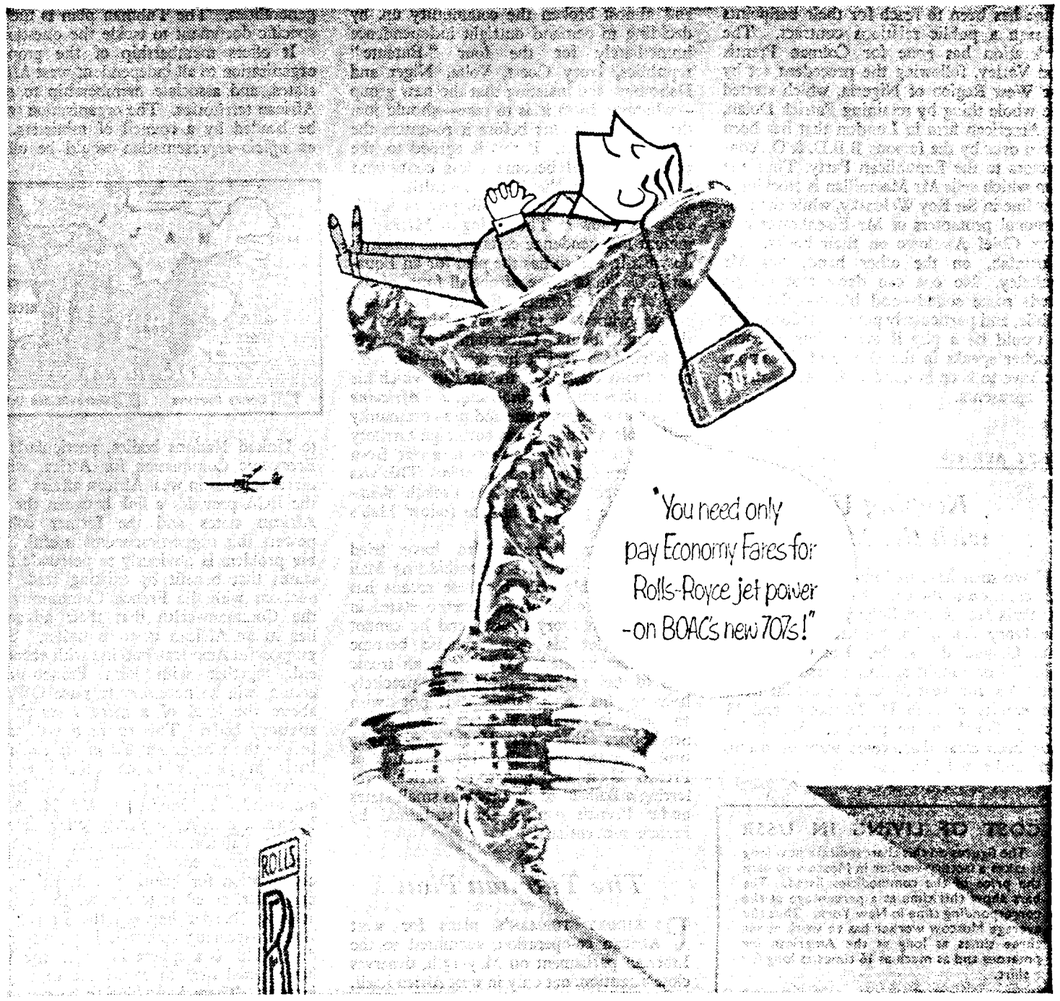
There are now two quite different sets of circumstances under which the sovereign independent countries of the Commonwealth still have their affairs and interests regulated in Westminster. According to the first, a Commonwealth country may voluntarily leave residual powers in the British Parliament itself, as with the power to amend the Canadian constitution, or in some other British institution such as the Judicial Committee of the Privy Council (to which Ghana, unlike Nigeria, no longer wishes to send its ultimate appeals). According to the second, Britain as "mother" makes unilateral concessions with no provision for, or expectation of, reciprocity. Ghana is no different from other "free and equal partners" in making its selection from this gift shop, in return for paying the minimum (verbal) tribute to motherhood that will make the British feel good. Like the Indians and the Pakistanis Dr Nkrumah has picked continued free access to Britain for Ghanaian citizens, where as loyal republicans they will have all the rights of Queen's subjects; and the privileged access to preferential status on the London stock market otherwise reserved to stocks of the Queen's Governments. But while a government can contrive to be open-handed and magnanimous, a private stockholder is a less sentimental party. At present, if any holder of Ghana stocks which enjoy the advantages of the Colonial Stocks Acts feels defrauded he can sue by means of petition of right to the Crown. The one constitutional anomaly which Dr Nkrumah will allow on his side is the continued access of affronted stockholders to the British courts. His government needs the money.

Public Relations MP

THE hour-and-three-quarters debate on the Ghana Bill's second reading shortly before Whitsun was noteworthy mainly for the surprising amount of criticism of the Nkrumah regime from the Labour benches, some of it quite sharp. It came from several different sections of the party; and Mr E. L. Mallalieu's informal summing up of the arguments was delivered in such an accomplished parliamentary manner that one wondered where he had been hiding all these years.

Given the realities of the situation, however, it could be argued that only one MP—and he not among the speakers—was at that moment profitably occupied in discussing Ghana. This was Mr Humphrey Berkeley, a new Tory member who was once the champion hoaxer of Cambridge University before taking charge of political education in the Conservative Party. While Opposition members were arguing the toss whether or not Dr Nkrumah was a good thing, and his own Tory colleagues were deliberately lying low and keeping mum, Mr Berkeley was signing a contract with Dr Nkrumah to become his paid agent in London.

The silences of the Tory colonels in the Commons have not concealed from Accra the widespread prevalence in Tory social circles of the threat blurted out by Earl Winterton—when exasperated, as he often is, by Viscount Stansgate—that, if there is any more anti-settler talk about the Central African Federation on the left, the right will lift the lid off Ghana. The instinctive response of both governments to this chal-



Crawling Cables

ABOUT a million and a half overseas cables trickle sluggishly through London's post office services every month. Messages that arrive from the other side of the world in a few minutes may get stuck for several hours at the Cable and Wireless office at Electra House; the analogy with the crawling traffic between airport and city is no comfort to the business men, private citizens and newspapers who have had to endure infuriating delays because of this bottleneck. The situation, caused by a shortage of staff at Electra House, has got steadily worse over the last six months; it reached a crisis last week when the cable operators threatened to resume a ban on overtime (which accounts for 40 per cent of their work); the threat has been staved off for the moment.

Cable communication with the Commonwealth has become so erratic that one Australian press agency has been obliged to forget about the cheap Commonwealth rates and route its messages through New York by an American cable company. Four weeks ago, after months of strange patience, the Commonwealth Press Union asked the Postmaster General, Mr Reginald Bevins, to do something about the situation. His response was to suspend, indefinitely, the cheap rate night letter telegrams, so that the post office could concentrate on the regular cables. About a third of all cables are sent by night letter and the suspension was a blow to a great many people. It also brought Mr Bevins under fire from the London Chamber of Commerce, which protested strongly and pertinently by saying that any private concern that suspended operations because of an unforeseen staff shortage would soon go out of business. Last week the night letter service was resumed. But under pressure of a growing demand delays in the delivery of cables continue.

The cable office is working with three-quarters of the staff that it considers necessary; the recruitment drive has not wholly succeeded and plans for further mechanisation have not yet borne fruit. The muddle has been made worse by an internal rupture. Most of the dwindling corps of cable telegraphists used to work for Cable and Wireless before it was taken over by the post office in 1950. The transfer has gone slowly, but it has now been suggested that they join the Union of Post Office Workers. This they object to strongly on the ground that the union is too large and diffuse to represent them properly; also to many of them a loss of status is involved in being lumped together with postmen and office cleaners. At the beginning of the year they formed a breakaway union of their own, the Overseas Telegraph Operators' Association, and, in a bid for recognition, banned overtime for a week early in May. Their gesture did not work, although it helped to stop the night letter telegram service. In the view of the post office, the new union has not yet got adequate support.

The post office is clearly in a fix. It is admittedly difficult to recruit workers willing to be on duty at all hours of the day and night. Perhaps it would help, as the operators themselves think it would, if the status of the job were raised. The important thing is for the postal authorities to recognise just what they are risking by allowing their cable service to run down. London is at present a great communications centre; in the competitive world of business and newspapers it may in the future have to be bypassed.

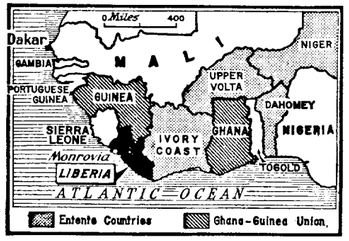
lenge has been to reach for their ballpoints to sign a public relations contract. The Federation has gone for Colman Prentis and Varley, following the precedent set by the West Region of Nigeria, which started the whole thing by retaining Patrick Dolan, an American firm in London that has been taken over by the famous B.B.D. & O., contractors to the Republican Party. Thus the firm which sells Mr Macmillan is stocking a new line in Sir Roy Welensky, while the professional promoters of Mr Eisenhower also have Chief Awolowo on their books. Dr Nkrumah, on the other hand, has Mr Berkeley. No one can deny that Ghana needs some sound—and blunt—advice on public, and particularly press, relations. But it would be a pity if every time a backbencher speaks in the House of Commons we have to keep in mind which government he represents.

WEST AFRICA

Keeping Up with the Malis

Two men have had most to do with the creation of the French Community: and M. Felix Houphouet-Boigny, the premier of the Ivory Coast, has worked on it longer than General de Gaulle. Long and determinedly he fought against premature independence for west African states, incurring the enmity of both Dr Nkrumah and M. Sekou Touré in the process. But it has long been clear that events were outpacing him, and now he has suddenly turned round and almost broken the community up, by deciding to demand outright independence immediately for the four "Entente" republics, Ivory Coast, Volta, Niger and Dahomey, and insisting that the new group —whatever form it is to take—should join the United Nations before it re-enters the community itself. If this is agreed to, the community will become a less continuous association than the Commonwealth.

Why has M. Houphouet-Boigny made this *volte-face* now? The timing of Mali's imminent independence certainly has much to do with it, and so has the plan for an Equatorial Union of three, if not all four, of the republics of former French Equatorial Africa, who want to be as independent as their neighbours, Cameroun and Congo. This could have left his terrain—the remnant (with Gabon) of the area in which his *Rassemblement Démocratique Africaine* party was once supreme and pro-community —the sole remaining non-sovereign territory in west Africa by mid-1961, apart from Portuguese Guinea and Gambia. This was not a tenable position; the French themselves were pressing him to follow Mali's lead.



He seems therefore to have tried to regain the initiative by outbidding Mali itself. Possibly only by these means has he kept the other three Entente states in line with the Ivory Coast—and he cannot afford to let his own republic become completely isolated. Yet this is an ironic end to his policies, for it was precisely because his own state did not wish to share its wealth with its sub-Saharan neighbours that M. Houphouet-Boigny broke up the old colonial federations of French West and Equatorial Africa, preferring a Balkans of autonomous small states under French control—but sustained by French subventions.

The Tubman Plan

PRESIDENT TUBMAN'S plans for west African co-operation, submitted to the Liberian parliament on May 13th, deserves close attention, not only in west Africa itself, but by the western governments—who still have to find ways of organising their economic support for the area. The chief Liberian proposal is the creation of an Organisation for West African Economic Co-operation that would expand exports, increase regional trade, and encourage industrialisation "possibly through creation of a regional market by means of a customs or economic union."

This type of proposal has been rehearsed by other African leaders, although in a more tentative way. Thus M. Sylvanus Olympio, the Togo prime minister, has suggested an African version of OEEC, but prefers to wait until after Nigerian independence before beginning discussions. The Entente countries of the French Community have been preoccupied until now with putting their own house in order, and their reactions are uncertain: Dr Nkrumah has contented himself with generalities. The Tubman plan is the first specific document to tackle the question.

It offers membership of the proposed organisation to all independent west African states, and associate membership to other African territories. The organisation would be headed by a council of ministers, and *ex officio* representation would be offered

to United Nations bodies, particularly the Economic Commission for Africa, with a direct interest in west African affairs. Since the ECA provides a link between the new African states and the former colonial powers this suggestion seems useful. The big problem is obviously to persuade those states that benefit by existing trade connections with the French Community and the Commonwealth that their advantage lies in an African customs union. Some purposeful American backing with economic aid, together with joint Franco-British action, will be necessary to raise OWAEC above the level of a mere research and advisory body. This seems a task to set before the nine-nation aid group set up in Paris in January to co-ordinate western assistance programmes. The new British ambassador in Monrovia, Mr H. A. N. Brown, is arriving at a stimulating time.

The Tubman proposals also envisage a west African educational council and an organisation for health and nutrition. In particular, an effort to remove the existing language barrier between the French and English-speaking countries is already overdue. This is a sphere in which the West has a good deal to contribute in its own interest. There is nothing to be gained by waiting until the common diplomatic language of west Africa is Russian or Chinese.

LEISURE ACTIVITIES

Teenagers Revisited

IN 1947 the Workers' Educational Association published the results of an inquiry into the leisure activities of some 3,000 Ilford schoolchildren. This inquiry has just been repeated*, nearly three school generations later. Many of the results are predictable or easily observable—the steep drop in cinema-going as television viewing has increased, the enormously expanded interest in pular music, the decline in the traditional treet games once enjoyed in common wh much younger children, the enthusiasr for coffee-bar-and-juke-box sociabiliti. In general, the secondary schoolboy girl is much less an older child, much me an aspiring young adult, than his or heredecessor of only a dozen years back. Vat this change means for the sexual *mes* of the young could hardly be elicited questionnaire, but the inquiry showed at today's schoolgirls have a new and devring passion for "love comics." As in 47, grammar-school pupils are shown sl to have far more consecutive and creativeobbies and interests, from handicrafts drama, than their secondary-modernontemporaries.

Moreinquiries of this sort would be valuabl People who make snap judgments (the rising generation are apt (with undersndable adult self-importance) to attribu the defects and qualities of today's young eople to influences deriving mainly from t adult world: parental precept and examp, school curriculum and discipline, econoic opportunity, even bomb-phobia. What ends to get forgotten is something possib more powerful, in the gang-minded teens,than any of these: the standard-settin ascendancy of senior over junior, of sixtee over fourteen and fourteen over twelv—the internal power-system, as it were,of the secret republic of the young. Thatepublic is now developing an unprecedeied sense of nationalist autonomy—comete with extremist (some would say MauMau type) wing. Adult policy-makers woul be wise to keep themselves more informd of one of the most significant but mos disregarded characteristics of "the Tee-age Thing": the rapid turnover of powr and influence as—on the miniature time-scale of the republic's history—generatio succeeds generation.

EAST-WEST RELATIONS

Still Economic Co-existence

WHILE the summit fiasco has cast a cold shadow across political exchanges between east and west there have been no signs as yet of any check in the gradual economic loosening-up between the two worlds. Passengers on the first through rail coach of the new transcontinental service from the Hook of Holland to Moscow arrived in Moscow last week, after the bogies had been changed to adapt the train to Russia's wider gauge. Talks started in London on June 7th to review the development of Anglo-Soviet trade—a follow-up to the trade agreement signed in Moscow in May last year.

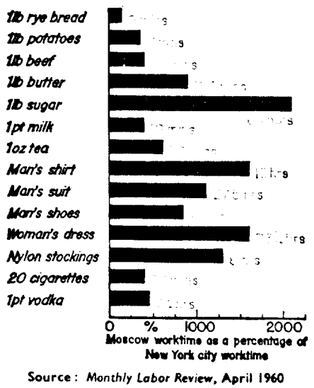
As usual, these negotiations will not be easy. One of the main Russian demands seems likely to be for better outlets for Russian oil. Russian output is expanding rapidly. There may well be a case for the large oil companies concluding long-term agreements with the Russians to bring regular if small quantities of Russian oil into western distributive networks. This might be better than price warfare. But the idea will take a lot of getting used to—and the companies have too much oil on their hands already.

What is clear is that the Russians are interested in a continuing expansion of trade in both directions, an interest that ought to be encouraged. Mr Khrushchev's promise to introduce a new "heavy" rouble, ten times the value of the old, next January 1st, has been seen by some commentators as a prelude to an attempt to get the rouble more widely used internationally, and even to the adoption of a measure of convertibility. This may be fanciful, but there are a good many other signs that the Russians are interested in an increase of economic co-operation between east and west, stretching beyond the needs of bilateral trade.

On both sides there is a good case for a persistent attempt to develop mutually acceptable rules for the conduct of east-west trade, perhaps in the context of the General Agreement on Tariffs and Trade. The vision General de Gaulle painted on Tuesday of a Europe stretching from the Atlantic to the Urals hardly fits the world today. But there are economic forces that work his way, against the political current.

POLAND

Mr Gomulka and the Church

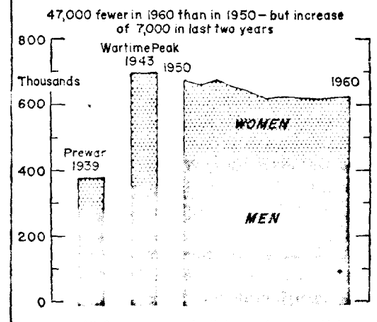


STREET battles over religious issues have recently broken out in two Polish towns. Both incidents appear to have turned quite nasty, but on neither occasion did the police open fire. On April 27th, at Nowa Huta, the trouble was provoked when the municipal authorities began to remove a cross installed on a site reserved for the building of a church. Early last week in the former German town of Zielona-Gora in western Poland, another fight flared up when the local authorities began to take over, for use by the local philharmonic society, a building which had formerly belonged to the German Evangelical church and which, although its legal ownership has never been settled, has in fact been used by the Catholic church since the war.

In both these towns, and especially in Nowa Huta, there may be local factors which make them specially vulnerable to disorders of this kind. All the same, both incidents provide a dramatic illustration of the perpetually smouldering conflict between church and state in Poland. The relatively cordial relations which developed after Mr Gomulka's return to power in 1956 (for the peaceful accomplishment of which he was in fact considerably indebted to Cardinal Wyszynski) did not last long. After various ups and downs, tension between church and state had by last autumn again become uncomfortably high. In January, after a personal meeting between Cardinal Wyszynski and Mr Gomulka, it was decided to set up again a mixed church-state commission, which has since been trying to hammer out compromise agreements on a variety of contentious matters, including the teaching of religion in schools and birth control.

The disturbances will hardly help the unrewarding labours of the commission; any compromises that it may reach are in any case unlikely to be more than temporary and tactical, since the fundamental aims of both sides are quite incompatible. Economic difficulties are already causing a good deal of discontent, and Mr Gomulka may feel it worth his while to make a special effort to get on good terms with the church while his hands are so full in other directions. On the other hand, a number of former stalinists have been gradually supplanting Poles of more liberal leanings in positions of authority and influence. Mr

COST OF LIVING IN USSR



The figures on this chart indicate how long it takes a factory-worker in Moscow to earn the price of the commodities listed. The bars show this time as a percentage of the corresponding time in New York. Thus the average Moscow worker has to work about three times as long as the American for potatoes and as much as 16 times as long for a shirt.

United Steel finds new worlds to conquer....on COAL

UNITED STEEL is a democracy of steel firms which covers four steel-making plants, three engineering plants, one chemical plant and numerous subsidiaries. The stark Jodrell Bank Radio Telescope is perhaps the most famous structure fabricated by the United Steel Structural Company. The steelmaking companies supply vast amounts of steel to our thriving motor industry, to shipping lines, atom and power stations, and to the chemical, cutlery, food, brewing, textile, petroleum and domestic equipment industries.

Search the industrial scene—from jet liners to power stations, from refrigerators to razor blades—and you'll discover that United Steel has played its vital part. Such a vast organisation must make decisions upon a grand scale, and its demand for coal—to provide steam for power processes, hard coke for ironmaking, and gas for processing—makes it one of the major industrial customers of the National Coal Board. Here, the interdependence of two of Britain's greatest industries is a fine example of enterprise and initiative that is both encouraging and infectious.

When your industry is considering the choice of fuel, remember that Britain's major effort in the probing of space is its world-famous telescope at Jodrell Bank—and that this triumph of British science began with the power from coal. Remember, too, that this home-produced fuel will continue to serve you faithfully for decades to come.

Here are some key facts and figures about United Steel's consumption of coal

8½% of a total consumption of about 3,000,000 tons a year is carbonised in coke ovens to produce coke, coke oven gas, tar, benzole etc. The coke is used for making pig iron in blast furnaces, the gas for steel melting and heating processes, and the liquid products for the production of chemicals etc.

Approximately 100,000 tons of coal—burned in mechanically-fired boilers—are used to generate steam for power processes. The United Steel Companies Limited rely upon coal to produce the iron which is the basis of their annual production of nearly 3,000,000 tons of steel.

PROGRESSIVE INDUSTRY IS GOING FORWARD ON

COAL

ISSUED BY THE NATIONAL COAL BOARD

Gomulka may hope to benefit from their administrative efficiency, but they will hardly help him to solve his difficulties with the church. This week's strong attack by the local newspaper at Zielona-Gora on the priest principally involved in the disturbances suggests that Mr Gomulka has decided to take a tough line.

ACCESS TO DOCUMENTS

The Right to Know

IN the course of a curious exchange in the Commons last month Mr Macmillan gave the impression that he thought it was contrary to precedent to place copies of the full text of his Cape Town speech in the Members' Library. Perhaps he misunderstood Mr Gaitskell's supplementary, which followed a much more radical suggestion by a Labour backbencher that it should be printed and circulated as an appendix to Hansard, after the fashion of the American Congressional Record. But although the Prime Minister was quite right to decline emulation of the Americans in this respect, his attitude does provoke a less flattering comparison between the two parliamentary democracies. American politicans pay great respect to the wording of documents. But time and again MPs are heard petitioning the Government to make available texts that are already, somewhere, in the public domain.

Partly this is due to the almost total absence of a parliamentary research staff, so that MPs are kept in an unnecessary degree of ignorance, unless they latch on to some "private civil service" like the Institute of Strategic Studies. But even more it springs from a national habit of being content with approximate truth. As a result there is little incentive for the newspapers to print the full texts which are often available. It is only fair to add that during the Summit conference several papers did so. But no daily paper regularly attempts to be what the *New York Times* takes pride in being, a journal of record. The circle is vicious: the absence of such a journal in itself encourages sloppy habits of analysis and debate.

There are some kinds of document to which newspapers get only too ready access —namely the printed "background information" which, by the law of compulsory plagiarism get transmuted into the correspondent's own analysis. But even the most conscientious commentators are caught by the restrictions on access to unpublished documents of the past. By now everybody knows the contentious background to the major strategic decisions of the last war. The veil starts with the cold war.

To cite one curious instance. In the last volume of Sir Winston Churchill's war memoirs there is a single cryptic reference to a committee over which Lord Attlee presided to consider occupation zones in Europe. In 1943 it made recommendations, which were largely followed, to the European Advisory Commission, on which Lord Strang was the British representative, for the division of Germany into zones and for the joint occupation of Berlin. Sir Winston writes: "At this time the subject seemed to be purely theoretical. . . . The proposals of the European Advisory Council were not thought sufficiently pressing or practical to be brought before the War Cabinet." Yet these proposals dominated all subsequent events in Europe. How exactly did they come about and precisely what arguments were used in their favour? No outside researcher is allowed to find out.

LETTERS

Road Safety

SIR—In your article entitled "Roads in Summer," you say that the ultimate factor in road safety is the driving habits of the motorist.

The principal instrument to encourage the motorist to drive better is intended to be the Highway Code. Part of it is issued with the authority of Parliament, and every motorist is invited to declare his knowledge of it on renewing his licence.

Yet the latest edition of the code contains 94 numbered paragraphs of advice, 55 admonitions to motorists alone based on 17 Acts of Parliament or regulations made thereunder, and includes hints on first aid and a note on the country code. Clearly a quite superb memory is needed to be a good motorist. Your readers might care to test their memories by asking themselves under what circumstances they may not sound their horns.

The Highway Code enshrines the agglomeration of *ad hoc* motoring legislation of the past thirty years, and it is surely time that a few simple rules capable of being remembered were substituted for it, rules simple enough to command the respect of every driver. One such rule might well be "Yield to traffic on your right"; by this simple rule, lane discipline on major roads, confluence at roundabouts, crossings at uncontrolled intersections, drawing away from the kerb, and overtaking, would be easily and safely regulated because each motorist would know and could remember exactly what he had to do.—Yours faithfully,

London, N6 A. J. BURKART

Congo Finances

SIR—The article on "The Unquiet Congo" last month gave a somewhat distorted picture of the situation and of the motives of the parties concerned.

Your correspondent states: "The Congolese want most of the eleven to twelve milliard francs that live the Congo each year as dividends, savings and floating capital to remain there." The balance of payments data, as published by the Central Bank of the Congo, show the total transfers, in millions of Belgian francs, were as follows: 1954, 3,397; 1955, 3,842; 1956, 6,040; 1957, 4,557; 1958, 5,059. The maintenance of free capital movements appeared a legitimate objective to pursue as long as they remained approximately balanced. When political fear turned them into a one-way flow, the effort was made to restrain them by using persuasion (as your correspondent correctly states). When this proved inadequate, exchange control was imposed and a limit to transfers was placed at 10,000 F. a month and not, as your correspondent states, 5,000 F. a day.

Your correspondent states that Belgium is considering undertaking loans in the name of the Congo government from the United States and from the International Bank for Reconstruction and Development, but that the repayment of these loans and the servicing of the interest will be entirely at the charge of the Congo treasury. The purpose of these loans, which carry the guarantee of the Belgian Government, is to finance the continuation of public investment in economically important projects. When similar transactions were undertaken by the United Kingdom on behalf of East Africa or Nigeria, were not also these territories to be primarily responsible for the interest and repayment?—Yours faithfully,

Brussels. A. KERVYN

Surtax

SIR—Every surtax payer will support your suggestion that "it should be a national objective to begin raising the surtax starting level from £2,000 to £5,000 p.a." But is it not equally important that surtax, as a separate entity, should be abolished? Forty-five years ago, in days of a single, standard, rate of tax, a separate and distinct form of surtax was perhaps defensible. Today, when we already have graded income tax at three levels it should be possible to effect considerable economies in tax collection by gathering the surtax money in the form of higher, above-standard, echelons of tax.

Much as one would regret to disturb the gentlemen at Worthing, this change would have many advantages. The not inconsiderable numbers who pay surtax and PAYE could have one single monthly deduction; those who pay on business or professional incomes could pay in the same instead of the succeeding year (which is awkward and confusing); and the taxpayer could complete everything on one form. What are the legal and administrative objections to such a change?—Yours faithfully,

Clent, Worcs. W. DOUGLAS SEYMOUR

BOOKS

Syrup or Scarecrows?

The British General Election of 1959

By D. E. Butler and Richard Rose.
Macmillan. 301 pages. 30s.

MR DAVID BUTLER has long since performed iconoclastic wonders in discovering and publicising what does not influence votes in British elections. In this book—the Authorised (and Revised) Version of the 1959 election according to Butler and a co-author—all the well-established statistics come out patly and utterly convincingly again. We now know (though for old time's or gaiety's sake we like to go on forgetting) that the quality of candidates and constituency organisations, the local pressure groups about agricultural subsidies or protectionism for local industries or rent Acts (which still drive so many politicians nearly neurotic), and the long-standing ritual of constituency campaigns do not in general swing even one voter out of every hundred away from the median national (or at any rate regional) swing. In 1959 the central image of the parties was once again all important. But what was it that created that image, and that has now in the four successive general elections of the 1950s swayed the British electorate so statistically slightly but historically convincingly just that extra vital one or two per cent over to the right?

Mr Butler and his associates, with an engaging mixture of academic research and ordinary reportage and old-fashioned hunch, in a book that carries a slightly perceptible anti-Conservative twang but is mainly written by the Home Secretary's kinsman and is published by the Prime Minister's family firm, start their explanation in what is now the conventional way. "Very roughly" the pattern of British politics is that "two thirds of the working class vote Labour, while three quarters of the middle class vote Conservative." In the 1950s the working classes that we used to know were diminishing fast. By 1959, as almost half the families of Britain have more than one wage earner, the average income of working class households had risen to about £850 a year, while nearly half of all employed working class families had an income of more than £1,000 a year. Although only two of the symbolic new durable consumer goods, television sets and vacuum cleaners, had reached an actual majority of working class homes by 1959, yet "frequently where new goods were not owned, there was an expectation of enjoying them within the foreseeable future." The 1959 election was a test, in some measure, of which party was more capable of recognising and reacting to these changes in a deproletarianising society.

The Conservatives not only reacted to it better, but also began, from the autumn of 1957 onwards, to mobilise the advantages of it in a scientific way. The description of the Conservatives' professional pre-election public relations campaign is the most fascinating part of this book. For example, the Tory public relations men did not say, "You've never had it so good," a phrase that has been mainly publicised by their opponents and is anathema to a scientific Tory propagandist because it is backward looking. What the Tory posters said was, "You're having it good. Have it better. Vote Conservative," which is a very different image-making thing. Meanwhile Labour's propaganda campaign relied not on the advice of professional public relations men but on that of professional journalist-publicists, who have a far less skilled technique. Instead of spending their money on those almost subliminally influential posters and on a centrally-directed pre-election campaign, Labour spent it on circulating long policy statements that had been hammered together with an eye on party unity rather than on image-inoculation. The Liberals' propaganda campaign may have been worse, because the part seemed to be seeking merely for an image of moderation and of avoiding annoyance instead of for imaginative drive; in a Gallup poll in 1959 half of those who were going to vote Liberal said they did not know what the party stood for.

As one would expect from its authorship, this is the best summary and half-explanation of political trends between 1955 and 1959 that has yet appeared. But it is only a half-explanation, and by constant and careful use of qualifying adjectives the authors show that they do not claim it to be anything more. If the story of Conservative political success in the 1950s had been a story of steady and continuous whittling away of the Labour vote, the facts would fully fit the now almost conventional theory here outlined. But in point of fact if a general election had been held in the first nine months of 1952 or any time between mid-1956 and the spring of 1958, the Conservatives would have been out on their ear. Moreover Mr Butler and Mr Rose suggest that even in 1959 the Conservatives did badly at the beginning of the election campaign; that but for an almost fortuitous Tory recovery in the last ten days, they might have found themselves writing a very different sort of book.

It is in its analysis of the major moment of the turn of the tide in May, 1958, that this Nuffield study seems least adequate. As in November, 1952, the moment of turn-round roughly coincided with the beginning of recovery from economic recession, and it is going to be tempting for future historians to suppose that this was the whole explanation. But in both years the swing was far too abrupt for this to make sense. The Tories' autumn recovery in 1952 seemed remarkably coincident with the accession of Mr Bevan's wild men to the Labour executive. The moment of turn-round in 1958 was even easier to delimit. In mid-April, 1958, at the time of the county council elections, a majority of the floating part of the electorate—which may amount in total to one sixth of it—had clearly deserted the Tories. Three weeks later, at the time of the borough elections in early May, dissident Tories had begun to flock back to the fold in sizeable numbers. Only one thing happened between: the outbreak of the London bus strike, and the personalised detestation of Mr Cousins by the middle classes to which this gave rise. As for the reputed Conservative recovery during the 1959 campaign itself, Mr Butler and Mr Rose themselves date the Tory recovery from the moment that Mr Gaitskell devalued himself as a statesman with his income tax pledge.

The repeated story of Tory electoral success in the 1950s seems to have been that their machine first ground a spark from a clash with a bogyman, then the economic weather proved suitable for sheltering that spark as it spread into a flame, and then it was an additional convenience that Tory public relations officers puffed out enough wind to fan the flame picturesquely out among the electorate. In this Parliament, Labour's endeavour should be to imitate the wind, get its own policies into tune with the weather, and not to provide the scarecrows.

Mao's Blooms

The Hundred Flowers

Edited by Roderick MacFarquhar, with an epilogue by G. F. Hudson.
Stevens, for The Congress for Cultural Freedom. 336 pages, £2 2s.

UNTIL Chairman Mao Tse-tung invited "one hundred flowers" to bloom, figuratively, in 1957, it had never been possible to measure the degree of discontent in the largest communist country. Indeed in none other had such an invitation been made (in Hungary and Poland, discontent simply burst the safety valves of party and police control). In six short weeks, timidly at first, then with increasing momentum, party members, leading non-communists, journalists, scholars, doctors, students, writers and artists, business men, civil servants, peasants, workers, religious groups and members of national minorities poured out their grievances in a flood that appears to have astonished the Chinese communist leadership.

How far Mao himself was astonished is difficult to say. Mr MacFarquhar holds the view that Mao launched his liberal experiment with the aim of avoiding a Hungarian-type explosion in China and that he halted it only because it quickly got out of hand. Not everybody will agree with Mr MacFarquhar's rejection of the theory that one of Mao's objects was to bring the opposition into the open, the better to suppress it.

The bulk of this valuable book consists of carefully selected and edited extracts from the speeches and articles of a period that was exhilarating while it lasted. The selection is classified by groups according to source: journalists, students, doctors and so on. Each group is placed in its Chinese context by a brief but illuminating commentary. There is an epilogue, in which Mr G. F. Hudson analyses, with his usual lucidity, the relationship between the hundred flowers period and post-Stalin developments in Russia.

Mr MacFarquhar deserves praise for scholarship and presentation: "The Hundred Flowers" is of lasting value and interest.

Method or Inspiration?

Studies in American Culture: *Dominant Ideas and Images*

Edited by Joseph J. Kwiat and Mary C. Turpie.
Minnesota University Press. London: *Oxford University Press.* 241 pages. 38s.

IN recent years Departments of American Studies, Culture or Civilisation have been established in several American universities and in one English university. The initiative came largely from students of American literature, who felt the need to explore the cultural sub-soil of popular assumptions, prejudices, contradictions and aspirations; subsequently the movement attracted the attention of a few historians and sociologists, and the idea grew that a new field of academic activity had been opened for cultivation. In spite of its rapid development and superficial attraction the concept of "American Studies" speedily found itself suspect in an academic environment in which departmental conformity and precise documentation were highly prized.

It is therefore understandable that an air of apology hangs over this collection of essays—originally planned as a tribute to the late Professor Tremaine McDowell of the University of Minnesota— which claims to give "a sense of the directions that work in the general field of American culture has been taking during the past decade or so." The defensive note is set by Henry Nash Smith's opening question: Can "American Studies" develop a method? His advice is to eschew theoretical speculation and to trust that "a new method will . . . come piecemeal, through a principled opportunism, in the course of daily struggles with our various tasks." For the most part the contributors to this volume seems to have acted upon these principles, and as a result the majority of the essays seem oddly unexciting for men who profess to be pioneers. "Principled opportunism" seems to have meant a search for the contradictions in American culture: Americans respect material success but feel a nostalgia for rustic innocence, they respect organisation but believe in individualism, they tend to challenge American civilisation by drawing upon the armoury of American ideals, they love and fear machines. Some of these antitheses are well described and one might give especial mention to John W. Ward on the symbolism of Lindbergh's transatlantic flight, to Mulford Q. Sibley on the Oneida community, and to David R. Weimer on trade union psychology. Other essays seem so trite that one expects at any page to come upon the scholarly assurance (with respectful acknowledgement to documentary authorities) that Americans are both good and bad. On this evidence one would say that the "direction" of American studies is toward further exploration of the obvious. From these contributions—useful on detail but painfully unilluminating upon the larger problems of culture—the essay by Allen Tate on the Southern imagination stands out like a gleam of light; yet Mr Tate employs no method that would be recognised by an American scholar as such, and prefaces his remarks with the warning that what follows will be "obscure speculation, mere opinion, and reminiscence verging on autobiography." There is also a thoughtful and thought-provoking attempt by Charles H. Foster to apply a general theory of culture derived from Paul Tillich, the theologian.

Is the conclusion then that these various scholars ought to return to the departments in which they were trained and to turn themselves into sound critics, historians or sociologists before it is too late? This would be a pity because there is a field of inquiry that cannot be approached through the more familiar techiques; what does seem imperative is the realisation that the nature of the field calls for inspired guesses and general hypotheses. What "American Studies" require is not a new methodology but imaginative scholarship that knows how to cut the corners.

Buccaneering

The Brethren of the Coast

By P. K. Kemp and Christopher Lloyd.
Heinemann. 255 pages. 21s.

PROSPECTIVE readers should not be put off by the dustjacket. This is no boy's book of pirates, but a serious study of the buccaneers who thronged the Caribbean and South Pacific in the seventeenth and early eighteenth centuries. Commander Kemp and Professor Lloyd approach their exotic subject with commendable restraint. Their book is scholarly and cautious; is even at times a little dull.

But a sober narrative cannot altogether conceal the intrinsic excitement of the story. The original buccaneers were the cattle hunters of the West Indies, who took to piracy as the opportunity presented itself. Operating from their bases in Jamaica and Tortuga, they preyed on all kinds of legitimate commerce and prospered so well that they came to dominate the whole area. The English government was too weak to stand in their way and, indeed, was compelled to enlist the buccaneers in the defence of the Caribbean, licensing them as official privateers in wartime and employing the most prominent of their number in time of peace. The villainous Bartholomew Sharp lent a hand in the suppression of a democratic rising in Bermuda and the sadist Henry Morgan was appointed Lieutenant Governor of Jamaica—a poacher turned gamekeeper with a vengeance. Only in the 1680s did the government recover control of the Caribbean, but by then the buccaneers had found a new hunting ground off the Pacific coast of the Spanish Empire—the South Seas. Here they enjoyed a brief but spectacular heyday until the Royal Navy at last caught up with them after 1720.

The authors devote most of their book to a meticulous reconstruction of the main privateering voyages, based on the journals, many of them still in manuscript, which the buccaneers left behind them. The result, almost inevitably, is an at times monotonous chronicle of mutinies, scurvy, flogging and marooning, enlivened by the occasional bout of shore leave—"wild debauchery accompanied by the continual firing of muskets." One wishes the authors had devoted more space to a discussion of the buccaneers themselves—who they were and where they came from. Was it no more than a desire for quick riches that led the fastidious young scientist William Dampier to join a profession adorned by such luminaries as the infamous l'Ollonois, who was known to have hacked out Spanish hearts with his cutlass and gnawed them in his teeth? At least there was something in common between Richard Gopson, who used to recite aloud from a Greek Testament "to such of the company as were disposed to hear him," and the most bizarre of the Brethren, the Reverend Lancelot Blackburn, who subsequently became Archbishop of York, but still revealed traces of his former vocation by his practice of demanding wine and tobacco in the vestry "for his refreshment after the fatigues of Confirmation." The booty was as miscellaneous as the crews. Bullion was not the

only product of the South Seas, and many of the ships boarded in the quest for pieces-of-eight turned out to be laden with cormorants' dung.

The value of this book would have been even greater had it included a serious analysis of the motives and composition of these crews. But it does at least convey to us the extremes of heroism and degradation that their voyages involved. It is not surprising that later writers like Defoe and Coleridge should have found the recorded experiences of these adventurers so fertile a source of inspiration. Everyone knows that a Scottish privateer was the original Robinson Crusoe, but how many realise that it was an English buccaneer who shot the albatross?

Intimations of Maturity

Progress and Profits in British Economic Thought, 1650-1850

By G. S. L. Tucker.
Cambridge University Press. 214 pages, 27s. 6d.

THE purpose of this book as originally planned was more ambitious than that of most studies of classical and pre-classical economic thought. It was to link the Keynesian picture of the "mature" economy, perennially threatened with stagnation through the decline in the marginal efficiency of capital and the consequent falling off in investment, with the early classics' forebodings of a stagnation induced by the encroachment of rent and subsistence wages on profits; clearing up, on the way, the classics' confusion between profit and interest and that deeper confusion, between interest and the marginal efficiency of capital, which Keynes imputed not only to the classics but also to the whole body of their orthodox successors down to his own time.

In fact, "Progress and Profits in British Economic Thought" breaks off in 1850. It earns an honourable if unexciting place among specialised histories of economic ideas, providing as it does a solid, scholarly and logical comparative survey of the relevant controversies, in book, pamphlet or letter form, from Culpeper and Child through Smith, Ricardo and Malthus to John Stuart Mill. It relates these controversies throughout to contemporary practical economic problems, including war finance, the Corn Laws, overseas investment and migration, and trade fluctuations. It has the negative merit of avoiding, in the author's words, "the temptation to apportion praise or blame among the writers concerned," and the positive merits of clarity and economy in style and exposition. As it stands, however, it is very much a book for specialist students to whom a clearer light on the formation of theory over a limited historical period is a sufficiently good thing in itself. If it were ever complemented by a second volume completing the original plan its interest might be far more than proportionately widened; for implicit in that plan is the possibility of isolating the common characteristic both of Keynesian and of "classical" thought—a constricting emphasis on the working out of given propensities towards a logically necessary final state, to the exclusion of changes in those propensities themselves—and so contributing to a possibly fruitful new evaluation of future lines of advance. It is encouraging to learn that Dr Tucker has not given up the idea of carrying his story up to, and through the Keynesian revolution.

The Question

The Third Rose: *Gertrude Stein and her World*

By John Malcolm Brinnin.
Weidenfeld & Nicolson. 441 pages. 35s.

JUST before her death, Gertrude Stein underwent an operation. When she came to, she asked "What is the answer?" It was not clear, so she said "In that case, what is the question?" These fine words were her last, and they remain answered only in part. We are now in the misty trough between her death and her centenary, which is a bad time for lasting verdicts. At this point two things can be said with fair certainty: first, that this Michelson-Morley experiment in meaning had at least a negative value; second that the language still bears faint but definite marks of having been taken apart by her. The inherent value of her works is another matter. Mr Brinnin's interim verdict is fair:—

> Sooner or later somebody was bound to make such experiments if only to make sure that the landscape of the moon could not support human life. Gertrude Stein brought back proof that, as long as literature involves the responsibilities of the rational mind, the known world is its only planet. She published her findings which, in spite of her hopes, still smacked of laboratory data, and she became famous.

Whatever her works are worth, she was certainly a character in both the high and the low senses of the word. She knew exactly what she must do in life: until age, the effects of fame (which she rightly feared), her experience of the war and supervenient American nationalism blunted her cutting edge, her concentration never wavered. Her confidence was her strength and her weakness. To the unsympathetic reader it may seem only weakness; but, had she doubted or written as Virginia Woolf did, she would have lost direction in the uncharted bush which she explored alone. Her fame came less from her writings, of which the most serious remained almost unread, than from being a character in the other sense: a public figure, a famed collector of pictures, everyone's friend or enemy, greedy, domineering, self-centred, a good talker, and fascinating to those whom she did not repel. Merely as a life, it is worth recording, and Mr Brinnin has made an exceptionally good job of it. He is perceptive, affectionate, but not in the least uncritical. This book can be commended for its intrinsic interest even to those who find Gertrude Stein unreadable.

What Went Wrong in the Pacific

East Wind Rising: *A Long View of the Pacific Crisis*

By Relman Morin.
Alfred A. Knopf, New York. 364 pages. $5.00.

MR RELMAN MORIN has attempted the difficult feat of analysing and explaining the protracted crisis in Pacific relations in terms which the uninstructed layman can follow and enjoy. On the whole, he has succeeded. His method is to convert history into story, and to tell it in human terms. It is not a new method, but the other foreign correspondents who have used it most successfully are generally those who have confined their ambitions within manageable limits of space and time. Mr Morin starts in the twenties and ends in the fifties, and even manages to throw a necessary backward glance into the nineteenth century. His success is the more remarkable for the scope of his effort.

In very broad terms, the author sets out to discover "what went wrong" in the Pacific and, in particular, what, if anything, the United States could have done to prevent the disasters of the communist victory in China and Japan's military adventures. He does not fall into the obvious error of supposing that American policies alone could be blamed for developments some of which were clearly beyond the Administration's control. But he implies that American errors of judgment and sins of omission made inevitable a number of events that might otherwise never have occurred. This, he argues, was particularly true of China, where President Roosevelt's evaluation of the Communists (". . . inasmuch as the Communists and the members of the Kuomintang were all Chinese, they were basically friends") handicapped Chiang Kai-shek and played into the hands of Mao Tse-tung. The Yalta agreement, in effect, gave the Chinese Communists the military and industrial base they needed for their final offensive against the Nationalists.

America's relations with Japan, Mr Morin argues, were bedevilled from the days of the "exclusion" policy before the first world war. The fog of incomprehension was no less dense in this area than between the United States and China. No American Secretary of State could have prevented the military clique from seizing power; but there was no need for Henry L. Stimson to suppose that by exposing the immorality of Japan's attack on Manchuria he could halt its armies.

By selection rather than comparison, Mr Morin has managed to explain a great deal while bringing to life the vanished world of international Shanghai, the China of the war lords and famine, the living habits of

The Observer
AND J. L. GARVIN 1908-1914
A Study in a Great Editorship

ALFRED M. GOLLIN 'Here at last is a detailed, authentic account of exactly how J. L. BUGANDA AND BRITISH OVERRULE 1900-1955
Two Studies

D. A. LOW *and* **R. C. PRATT** The first volume in a series dealing with the encounter of some of the East African peoples with the western world. The two studies are: *The Making and Implementation of the Uganda Agreement of* 1900 and *The Politics of Indirect Rule: Uganda* 1900-1955. Appendixes contain a study of the crisis of 1953-1955, and a copy of the 1900 Agreement. *(East African Institute of Social Research)* 48s *net*

OXFORD REGIONAL ECONOMIC ATLAS
The Middle East and North Africa
Prepared by The Economist Intelligence Unit and the Cartographic Department of the Clarendon Press
This new Regional Atlas extends from Morocco to Persia. It is arranged in much the same way as the first one, with layered reference maps of the different parts of the region; topic maps; and a gazetteer. There are several specially compiled original maps. 10" x 7⅞", 64 *pages of coloured maps* 15-*page gazetteer*, 56 *pages of notes. statistics, etc.* 42s *net*

A SHORT INTRODUCTION TO THE ECONOMY OF LATIN AMERICA
F. BENHAM *and* **H. A. HOLLEY** Part I gives a brief account of the resources and output of the region and the part played by international trade; part II describes recent economic trends in Argentina, Brazil, Chile, Colombia, Mexico, Peru, and Venezuela. *(Chatham House)* 18s *net*

BRITAIN IN THE PACIFIC ISLANDS
W. P. MORRELL The relations of Great Britain with the peoples of the Pacific Islands are here traced from the age of the discoverers to the later nineteenth and early twentieth centuries. The book also discusses the impact of French and German colonial policy upon British interests in the Pacific 55s *net*

THE GREAT CONTEST: RUSSIA AND THE WEST
ISAAC DEUTSCHER The break-up of the Summit Conference gives sharp point to Isaac Deutscher's penetrating analysis of Soviet foreign policy, the nature of the Khrushchev regime, the implications of 'peaceful co-existence'. Coupled with a reasoned exposition of the dangers is a plea for the taking of calculated risks. This is essential reading for all who wish to understand the stresses and tensions of East-West diplomacy. 10s 6d *net*

THE POPULATION EXPLOSION AND CHRISTIAN RESPONSIBILITY
RICHARD M. FAGLEY 'A book on this topic, written for a wide public, is badly wanted, and this book fills the need very well . . . . The first six chapters contain a good summary of the demographic position and outlook . . . . The remaining eight chapters contain a summary of the attitude of the non-Christian world religions towards parenthood and an extended examination of the attitude of Christian churches. The treatment of the latter topic is especially welcome; the discussion of the differing points of view of the churches is informed and just.'
Sir Alexander Carr-Saunders 28s *net*

THE SOCIAL FRAMEWORK An Introduction to Economics
J. R. HICKS In this edition the figures of National Income and its composition used for illustration are now those for 1957 instead of 1938 and 1949. The most important of the other alterations are those concerning chapters Four and Five, on Population. *Third edition* 18s net

BRITAIN'S SCIENTIFIC AND TECHNOLOGICAL MANPOWER

the master-spy Richard Sorge, and much else besides. It is perhaps fair to point out that his account inevitably contains explanations of elementary questions and that it is addressed specifically to an American audience (the British reader, if he reads it unadapted, will have to find out, for instance, what is meant by "the whiff of El Caney and the Rough Riders").

Unenlightened Despot

Frederick the Great: *An Informal Biography*

By Ludwig Reiners. Translated by Lawrence P. R. Wilson.
Oswald Wolff. 304 pages. 30s.

PERHAPS the oddest German tribute to Frederick the Great was Hitler's hysterical attempt, in April, 1945, to reanimate his moribund Eastern Army by congratulating it on being in the same appalling position as that in which "Our Old Fritz" had been undeservedly saved, in 1762, by the sudden death of his implacable enemy the Tsarina Elizabeth. The approaching bicentenary of this "miracle" has not, however, affected Herr Reiners's judgment. Possibly the lack of historical training advertised by his publishers explains his freedom both from hero-worship and from the opposite teutonic tendency to belittle Frederick as more Prussian than German.

But it may also account for the superficiality of some of his political history—his version of that criminal conspiracy, the Partition of Poland, is complicated by remarkable misprints—and for assessments uninformed by modern military criticism in his chapter on "Frederick's Army." Frederick was an outstanding exponent of contemporary tactics, who inherited a well-made machine and applied a natural "eye for country" to his aggressive use of it. But he did not notice the revolution in military theory initiated by Marshal Saxe; and at Jena his slavish imitators eventually paid heavily for his blindness. Herr Reiners evokes the excitement of marches and battles without clearly "appreciating" (in the military sense) the situations into which Frederick's adventures led him.

These criticisms are relevant also to the author's avowed purpose as a portrait-painter, which involves him in the construction of conversation-pieces and battle-scenes requiring accurate details. Nevertheless, he gives us a number of lifelike sketches: old Frederick William, whose "stern sense of duty," inspired by anxiety-neurosis, made him even more sadistically tyrannical in his family than in his state; young Frederick, his sister and his mother forced to defend themselves by hypocrisy and deceit; the public humiliations inflicted on Frederick; and the sharp shocks he administered to his father's ministers and his own friends to convince them that he had buried his youthful follies in his father's grave; his quarrels with Voltaire, entertainingly discreditable to both; and his judicial interferences, which earned him cheap contemporary popularity and a "reformer's" reputation that he did not deserve.

For Frederick's despotism was neither "benevolent," nor even, in the long run, efficient: it was devoted solely to the aggrandisement of Brandenburg-Prussia. It is immaterial whether Frederick was sincere when he wrote his "Anti-Machiavel"—a point about which the author and the most Modern Cambridge History seem equally puzzled. What matters is that the so-called "miracle" of 1762 enabled him to continue his career as the "Great Man" who started Prussia on the path which led it, and Germany with it, to the appalling dilemma of "World-Power or Downfall." For Frederick was a singularly unenlightened despot.

Popes and Politics

Church and State in Italy 1850-1950

By A. C. Jemolo. Translated by David Moore.
Basil Blackwell. 351 pages. 30s.

IN spite of its international character the papacy remains an intensely Italian institution; and in this book Signor Jemolo discusses the local effects of its policies and the extent to which Italian conditions have shaped their evolution during the last century.

His thesis is that the long conflict between the Popes and the anti-clerical politicians who were dominant in the Kingdom of Italy from 1860 until 1914 permanently warped the Vatican's outlook, giving it an ineradicable suspicion of everything liberal, so that, grateful for its release from thraldom, the Church was far too tender with Mussolini, denouncing his crimes, it is true, but laying equal stress on the largely imaginary virtues that Pius XI detected in the conqueror of liberalism and socialism. And today the same attitude has turned the Italian Republic into a "confessional" state, in which social and intellectual life is subjected to oppressive ecclesiastical censorship and in which politics are needlessly kept in the straitjacket of the slogan, "Rome or Moscow," that the Fascists originally coined for their own use. It is no wonder, concludes Signor Jemolo, that in such an atmosphere political cynicism increases and genuine religious feeling dies away.

This indictment of papal policy gains force from the fact that Signor Jemolo, besides being a most scrupulous historian, is both a devout Catholic and a convinced liberal. His book has the supreme merits of ample documentation and absolute fairness—twin guarantees of excellence. It is all the more distressing, therefore, that in some lesser respects this edition of his book is defective. The early part, dealing with events up to the death of Leo XIII in 1903, has been so severely truncated as to be almost unintelligible in places and almost unreadable throughout. The index is very inadequate, and, absurdly, the title does not properly describe the scope of the work—some of the author's most eloquent pages are those describing Italy since 1950, for it is in them that he draws his moral.

Depressed though the author is by the present condition of his country, which he finds more like Franco's Spain than a true democracy, he hopes that a change will come at last. The gradual abandonment of the demand for the restoration of the temporal power of the Popes is an encouraging precedent: if the international détente persists the Church will one day accept the fact. But at present, as Signor Jemolo insists, its blind hatred of communism, and its obscurantist resistance to liberty of thought, founded as they are on a century's misfortune and mistrust, seem, except to the eyes of faith, immovable obstacles in the way of Italy's progress.

Napoleon III's Entourage

The Second Empire

By G. P. Gooch.
Longmans. 335 pages. 30s.

DR G. P. GOOCH is the doyen of English historians, and at the age of 87 he might be expected to be resting from his labours; instead he has written another book, a not unworthy addition to his distinguished corpus of writings. This volume is not a history of the Second Empire, nor is it a biography of Napoleon III; it is a series of portraits and character assessments of the principal actors in the Imperial drama.

The first section of Dr Gooch's book is given to Napoleon and his immediate family, and includes sketches of his wife, his mistresses, the Duc de Morny his half-brother, the Prince Napoleon, Princess Mathilde and Count Walewski, his Polish cousin. To Napoleon himself, whose enigmatic character still baffles historians, Dr Gooch is eminently fair, doing justice to his good nature and magnanimity and censuring him for his lack of statecraft. Half idealist, half adventurer, a blend of Don Quixote and Machiavelli, his tortuous career was followed with critical sympathy by *The Economist* (an example is this week's extract from the issue of a hundred years ago). Walter Bagehot had eulogised him in his "Letters on the French Coup D'Etat," and although he later revised this opinion, he never wholly freed himself from this early fascination. For his portrait of the Empress Eugenie, Dr Gooch has drawn freely on Robert Sencourt's biography. While he does not exaggerate her political influence, he shows that the Empire's two major disasters, the scheme to establish a Catholic Empire in Mexico, and the Prussian war, owed much to her prompting.

The central section of the book deals with Napoleon's ministers, the loyal Persigny, the three able lawyers, Rouher, Barouche, and Magne, who between them transacted all imperial business, and Ollivier, whose liberalising of the Empire, had it been able to continue, might have saved the dynasty. Haussmann, of course, is included, whose

replanned Paris remains the Empire's only permanent achievement. In the final part of the book Dr Gooch depicts the principal figures in the army, the church, the political parties, and the literary world.

Napoleon III's misfortunes were primarily brought about by his lack of political sagacity. At a time when he needed all his ability to deal with Bismark this limited faculty was undermined by ill health, a factor to which Dr Gooch gives full emphasis. In exile he was noble and uncomplaining and enjoyed the unfailing friendship of Queen Victoria, who indeed provided the sarcophagus in which he rests at Farnborough Abbey, surrounded by contemplative monks, the direct descendants of Aelred Carlyle's Caldey community. It is an ironic resting place for a ruler who made splendour and prestige the basis of his rule.

Honeypot

With Dearest Love to All: *The Life and Letters of Lady Jebb*

By Mary Reed Bobbitt.
Faber. 277 pages. 25s.

MRS BOBBITT'S book is founded on letters which her great-aunt, Lady Jebb, wrote from England to her American family, mostly between 1870 and 1900. The sub-title of the book is "the life and letters of Lady Jebb," but with great discretion she has added little of her own and has left Lady Jebb to speak for herself. Well she may: it is clear that she was one of the great charmers of her day, and she now stands disclosed as a remarkably good letter-writer as well. She was the daughter of an American clergyman, and was more than ordinarily attractive and flirtatious. At sixteen, she married an American regular officer, not very happily. He died young; she came over to England in 1870, as a beautiful widow of thirty, and stayed in the celibate Cambridge of her day, when only heads of houses and professors were free to marry. They were all at her feet, from the vice-chancellor downwards, and she was reckoned to have had three proposals on one day. In due course she married Richard Jebb, the classical scholar. This marriage was very happy; he died in 1905, and she survived him by a quarter of a century.

Something of her quality is known already to those who remember the charming and lovely Aunt Cara in Gwen Raverat's "Period Piece," and it is a delight to find her so clever and lively a correspondent. Clearly, she would never have written so well had she lived in a less brilliant society. Her early letters are gay chatter enough, but superficial. After her marriage to Jebb, she matures rapidly, and her letters take on a different character. They would be interesting if her subjects were all unknown; as she knew everyone worth knowing in a brilliant time, their worth is doubled.

OTHER BOOKS

BIBLIOGRAPHY ON INCOME AND WEALTH. Volume VII, 1955-56. Edited by Phyllis Deane. International Association for Research in Income and Wealth. *Bowes and Bowes.* 131 pages. 37s. 6d.

Like its predecessors, this volume gives fully annotated references to material published in more than fifty countries on national income and wealth and related topics. This new volume brings the period covered by the series to twenty years.

BASIC FACTS AND FIGURES. Unesco. *Her Majesty's Stationery Office.* 198 pages. 15s.

This new collection of international statistics on education and culture represents the latest information available to Unesco up to June, 1959. The subjects covered include school attendance, book production, library services, newspaper circulations, cinema attendances and the numbers of radio and television receivers in the different countries of the world. It is possible to look up, for instance, the number of public library readers in Zanzibar or the number of television sets in Hawaii.

PROVINCES OF ENGLAND. By C. B. Fawcett. Revised and with a new introduction by W. G. East and S. W. Wooldridge. *Hutchinson.* 192 pages. 21s.

First written in 1919, this book remains an interesting plea for the transformation of local government into a regional system. There are new maps and statistics.

IBSEN. A new translation by Michael Meyer is appearing in an edition published by *Rupert Hart-Davis.* The first titles are *Brand, John Gabriel Borkman, The Lady from the Sea* and *When We Dead Awaken.* 10s. 6d. each.

Nyasaland: The Economics of Federation

By ARTHUR HAZLEWOOD and P. D. HENDERSON

It is often assumed that the Federation has brought only economic gains to Nyasaland and that the country's prosperity depends on its continuing to be part of the Federation as it is at present constituted. The authors suggest that this picture is over-simplified.
This study in examining the economic and fiscal effects on Nyasaland of the territory's inclusion in the Federation provides material which will be of interest to all. 10s. 6d. *net*

The Future of the Sterling Area

Vol 21, No. 3, of *the Bulletin of the Oxford University Institute of Statistics* is a special issue in which economists not only in this country but also in many other member countries consider the problem as it appears to them. 10s. 6d. *net*

The Free Trade Proposals

Edited by G. D. N. WORSWICK

Two symposia have been written around introductory articles by leading economists who commented on the aspects which seemed important to them. The first was written in 1957, the second in 1959, before and after the breakdown of negotiations for a Free Trade Area. 30s. *net*

VISION

An industrial development demands vision, imagination and industrial 'know-how'. Only when these qualities have been harnessed to straight, clear thinking, and basic principles have been established, can the detailed work start. C.A.S. (Industrial Developments) Limited, conceived the completely comprehensive service for Industrialists. Under the 'packaged deal' which they have pioneered, C.A.S. take the burden off the shoulders of the Industrialist.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Foreign Policy in Suspense

WASHINGTON, DC

To a world asking which of the two possible roads the foreign policy of the United States will now follow, the Americans are returning a maddeningly delphic answer: wait until November. In the three weeks which have passed since the failure of the summit conference it has become clear that no one can make the necessary choice except the sixty million or so voters who will take part in the November election. President Eisenhower cannot make it, since Mr Khrushchev has said that the President is personally ineligible for the high road—that of trying to renew negotiations with the Russians—and Mr Eisenhower, with commendable restraint, has refused to take the low one, which is a return to the uncompromising hostility of the cold war. The State Department is no better placed; even if it is not held directly responsible for the death of the Paris talks, it is unlikely to be entrusted with another patient until it has improved its operating techniques. But the present indecision will not necessarily be ended when the next Administration comes to power. Unless the new President and his Secretary of State can impose their will on a divided country (and a divided government) more efficiently than Mr Eisenhower and Mr Herter have done, they will find it hard to follow either road with a resolute step.

Three major questions remain to be answered before the future course of American policy becomes clear. The first is whether the machinery of government in the United States is equal to the task of running a co-ordinated policy. Senator Fulbright's inquiry into the events leading up to the failure of the summit conference has revealed weaknesses that seem to go beyond mere personal failures on the part of Mr Eisenhower or Mr Herter. For instance, Mr Gates, the Secretary of Defence, has testified that he saw a list of future espionage flights roughly three weeks before the U2 was shot down over Sverdlovsk. It is hard to believe that this paper was not shown to the Secretary of State as well; and yet Mr Herter claims that the senior members of the government never decided whether or not to continue the flights in the weeks just before the conference.

The only conclusion is that, if Mr Herter saw this list of intended flights, he treated it (as he treated the news that Mr Gates planned to order a practice alert of the American defences while he was in Paris) simply as something to be initialled and deposited in his out-tray rather than as a matter which affected the State Department's handling of foreign policy. In the same way, the list of twelve nuclear explosions which the United States wants to carry out in order to see how difficult it is to detect underground tests of atomic weapons seems to have been concocted by the Defence Department and the Atomic Energy Commission. Neither of these agencies is anxious for testing to end yet, in spite of the likelihood of Russian objections, the State Department apparently accepted their list without amendment.

The National Security Council is the mechanism by which different interests within the government are supposed to be reconciled. But, to judge from the testimony given to Senator Fulbright's committee, it hardly came into action at all before Mr Eisenhower went to Paris. It is equally doubtful whether the National Security Council played its proper part in the other crucial issue which decided the fate of the Paris meeting: the terms on which the United States was prepared to sign an interim agreement for Berlin. Most observers in Washington believe that the Americans were ready, if pressed, to be a little more forthcoming than they were at the foreign ministers' talks last year. The opposite impression, however, was given in a number of speeches by government officials in April; many people suspect that these speeches were made in order to calm Dr Adenauer and the domestic opposition, and that the National Security Council never gave due consideration to the effect they might have on Mr Khrushchev. These events reinforce the suspicion (which a number of eminent public men have recently voiced to a committee of inquiry headed by Senator Jackson) that the NSC has failed in its major task of fixing American policy on the most important issues.

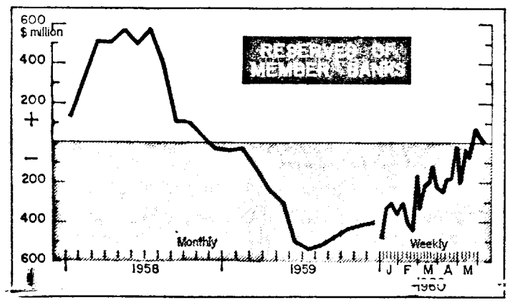
The second major question to be decided is whether the Americans will now conclude that events have narrowed still further the room for negotiating over Berlin. There persists in Washington a faint hope that this question will never have to be answered: the quarrel over the city, runs the argument, may yet vanish like morning mist in some post-Adenauer glow of understanding between the two halves of Germany. But if Mr Khrushchev declines to wait for the dawn, he is liable to find that the chance of a compromise has grown smaller than ever. The Americans' willingness, after his visit to the United States last September, to consider concessions shrivelled under the disapproval of Dr Adenauer and his allies in Washington until, by March, hardly any of it remained; and if Mr Khrushchev does not restrain his attacks on the President he is bound to make the Americans as implacably intransigent as he evidently thought they were when he went to Paris.

But the final choice between intransigence and conciliation has not been made yet. The third, and most important, question to be answered springs from the belief—which the State Department appears to accept—that a major cause of Mr Khrushchev's recent behaviour is the abrupt disappearance of his personal affection for President Eisenhower. This implies that the hope of serious negotiation between America and Russia next year depends largely on the incoming President's ability to reconstruct the link of friendly confidence. At first sight the United States is in no mood to pick a man who will do any such thing. This week's Gallup poll shows that Vice President Nixon, who gets on with Mr Khrushchev as well as a cat with a dog, is the public's favourite for handling foreign policy. The unrepentant faction of right-wing Republicans who always opposed the negotiations with Mr Khrushchev have now been joined by many of Mr Eisenhower's middle-of-the-road supporters. And among the Democrats the followers of Mr Acheson's hard line have been reinforced by the substantial band around Mr Lyndon Johnson, the party's leader in the Senate. Senator Johnson seems to agree with the *New York Times* that Mr Khrushchev has taken off the "smiling mask" which "trapped the West into the summit meeting."

Nevertheless, there are signs that this bipartisan view is still

far from universally accepted. The writers of more than a third of the letters published in the *New York Times*, the *Washington Post* and the *Wall Street Journal* seem to feel that Mr Khrushchev was not wholly to blame for the failure at the summit (and thus, by implication, that the attempt to negotiate with him was not entirely futile). Perhaps the most significant fact is that Senator Kennedy, the last of the candidates to set out his views in detail and probably the shrewdest judge of what the public feels, has gradually taken up a position remarkably close to that of the notably conciliatory Mr Stevenson.

The battle-line of the candidates is now becoming clear. It is, admittedly, unwise to judge them solely on the basis of what they are now saying, since the iron laws of platitude compel all of them to announce that they will be simultaneously firm but reasonable. But Vice President Nixon, in his talk to the meeting of the South East Asia Treaty Organisation last week, and Senators Johnson and Symington in their recent hunt for delegates in California, have all made it clear that they are deeply sceptical of the value of further meetings at the summit. Mr Stevenson and Senator Kennedy, on the other hand, have hinted cautiously that they would be willing to talk with Mr Khrushchev again after a decent interval. This attitude has the support of a substantial number of observers in Washington who suspect that Mr Khrushchev's failure to do business on this occasion does not invalidate the belief that it is going to be very hard ever to do business without him.



A similar dividing line, though not quite such a clear-edged one, separates the candidates on the other main test of their probable policy towards Russia ; this is the amount of money they would spend on extra armaments. Mr Stevenson, while bending a polite knee to the need for keeping America strong, seems to be thinking chiefly of improving the conventional forces without which the Americans' promise to protect Berlin depends (as Mr Eisenhower has admitted) on a threat to use nuclear weapons which is growing increasingly hard to take seriously. Senator Kennedy, although he said earlier in the year that it might be necessary to spend several billion dollars a year more on defence, has not suggested since the Paris meeting that he would be content to recline on a pile of bayonets. To judge from the past statements of the other three candidates, however, each of them is likely to put substantially more emphasis, when they talk of negotiating from strength, on the last word rather than the first.

Admission of Ease

NEW YORK

At the end of last week the Federal Reserve Board acceded to requests from two of the twelve regional reserve banks that they might be allowed to lower their discount rate (the rate they charge on loans to commercial banks) from 4 to 3½ per cent. This change, which seems sure to spread from Philadelphia and San Francisco to the other regions in the Federal Reserve System, was not unexpected. It had been clear for some time that the central bank was easing its brakes on credit by buying Treasury bills in the open market and more recently it had committed itself officially to the view that inflation was for the time being well under control. A clear sign that monetary restraints had been relaxed came in the third week of May when, for the first time in over fifteen months, the commercial banks belonging to the Federal Reserve System did not have to borrow from it in order to keep their reserves up to legal requirements ; the lending capacity of these banks depends on their reserve position and was therefore greater than it had been since early in 1959.

Over the last two years the discount rate has moved in one direction only—upwards. From a low point of 1¼ per cent in the spring of 1958, when a recession was in full swing, the rate was raised in stages until it reached 4 per cent in September of last year. Commercial banks are not, however, expected to be in a hurry to match the Federal Reserve's move by cutting the prime rate—the interest they charge on loans to their biggest and best cus-

tomers—which now stand at 5 per cent. While some bankers do expect an early adjustment in commercial rates the majority take the view that their lending business is too brisk at present for a lowering of interest charges to be called for.

Officials at the Federal Reserve do not think that their modest reduction in interest rates will put undue additional pressure on the country's gold reserves. They were warned in advance that West Germany's central bank was choosing the same moment to raise its discount rate to 5 per cent. But any misgivings this might have caused were counteracted by knowing also that Germany was to suspend payments of interest on foreign deposits to prevent an influx of foreign capital. In fact the Fed was much more concerned lest its move might be interpreted at home as indicating that government officials were expecting the American economy to turn downward. But recently the economic indicators have been telling a somewhat more optimistic story than they were in the early spring and already it has been suggested that the Fed may have to reverse itself later in the year.

Republican Question-marks

Mr Nixon, who is still almost certain to be the Republican presidential candidate, had to draw what comfort he could this week from his victory in California's "popularity contest." In New York, the other big state which he needs to carry if he is to win the election in November, the Vice President's only conceivable rival for the Republican nomination, Governor Rockefeller, has issued a broadside against the policies of the Eisenhower Administration and the failure of Mr Nixon to take a firm stand on the great issues facing the country. Moreover, instead of sulking in his tent, Mr Rockefeller has decided to lead the New York delegation to the Republican convention. There he is unlikely to make much impression on the delegates, unless something happens between now and then to shake their confidence in the Vice President. But Mr Rockefeller's charges of evasiveness and slickness will damage Mr Nixon in November, particularly in New York.

Blandly conceding that it is unusual for a member of a political party to draw its "lacks or lapses" to the attention of the public, Mr Rockefeller said neither the country nor the Republican party could face the future under a banner bearing only a question-mark and reproached Mr Nixon for not making his programme known until after he is nominated. Partly, this is a matter of courtesy to President Eisenhower, but it is also due to the Vice

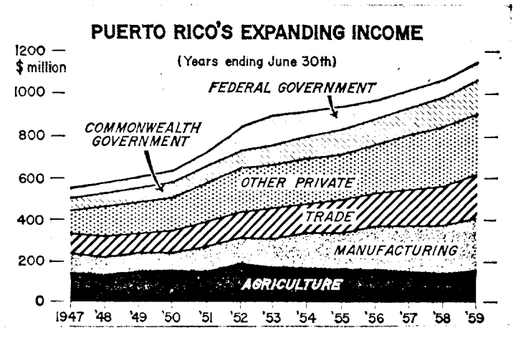
President's reluctance to alienate either wing of the Republican party—the conservatives or the liberals—until he is safely in control. Mr Rockefeller's chief difference with the present Administration is over spending on defence, which he wants to see raised by $3.5 billion a year, but recently he also made a full dress speech on economic growth which was implicitly critical of the President's policies. The Governor is ready to be drafted this year but, if he is not, he is plainly laying the groundwork of his campaign for the Republican presidential nomination in 1964. Such preparations assume a Republican defeat ; otherwise Mr Nixon would be certain of renomination four years from now.

Mr Nixon's supporters found hope in the disarray of the Democrats in New York this week when they chose delegates to their party's nominating convention. But such intra-party feuds are likely to be forgotten when the election comes round. So is the relatively poor showing of Governor Brown, California's "favourite son," whose strength was sapped badly by his indecisiveness in the Chessman case and by the intervention of a Californian lobbyist for old age pensioners. Over a million Republican votes were cast for Mr Nixon, who had no opposition in his party's lists, but the total of the divided Democratic vote was considerably greater. The Vice President did well, given that in California the Democrats outnumber the Republicans by almost three to two. But although this is his own state, he failed to rally as many Republicans in it as Mr Eisenhower did in 1956 and he has yet to prove that he can attract enough Democrats, in addition, to carry it in November.

Title to the Tidelands

Texas declared a half-holiday for civil servants last week, but Louisiana was plunged in gloom when the Supreme Court ruled, after many years of dispute, on the seaward boundaries of five states on the Gulf of Mexico. At stake were the mis-called tidelands, with their reserves of crude oil and perhaps other minerals, that lie under the water. Texas and Florida were granted boundaries stretching three leagues (about 10½ miles) out to sea from their Gulf coasts, but Mississippi, Alabama and Louisiana, like the states lying on the Pacific and Atlantic coasts, were restricted to 3½ miles. Louisiana is the great loser. Almost all of the 1,564 off-shore wells which are producing oil today lie off the Louisiana coast in the disputed zone. Royalties from the drilling leases which have been granted have been kept in escrow ; now most of this $308 million will come to the federal government.

The Court was intepreting the Submerged Lands Act of 1953, an "ill-drawn" piece of legislation, according to Justice Harlan, which required a "shockingly" long opinion. (In fact, it required six opinions in all.) In that year a Republican Congress overturned earlier decisions of the Supreme Court, which had ruled, in 1947 and 1950, that the federal government had "paramount rights" in all offshore lands. Congress gave most of the states title to 3½ miles of tidelands but, to carry out a campaign promise made by President Eisenhower, it assured the Gulf states that they should enjoy their historic boundaries, up to three leagues, if these existed at the time the states became members of the Union, or if the boundaries had been approved by Congress. The Supreme Court was then left to sort out this problem of history.



In the principal opinion Justice Harlan dismissed as oversimplified the contention of the Department of Justice that no state could enjoy a more extensive boundary than the 3½ miles claimed, for international purposes, by the United States. For purely domestic purposes, he ruled, different boundaries might be drawn, and Texas's claim to three leagues had been recognised by Congress in the Treaty of Guadalupe-Hidalgo, in 1848, which ended the war with Mexico. Another opinion recognised a similar claim on the part of Florida, whose three league boundary was approved when the state was received back into the Union after the Civil War. Louisiana, Alabama and Mississippi could adduce no evidence of this kind but they hope that, in equity, Congress will give them as much as has been given to the other two. Many Americans feel that this would only make a bad settlement worse. In their view all the tidelands should belong to the federal government and their resources should be used for the benefit of everyone. To them it is a lucky accident of history that the title to the part of the tidelands which so far has proved the richest is to return to the people as a whole.

Puerto Rico's Example

FROM A CORRESPONDENT RECENTLY IN SAN JUAN

Puerto Rico, the Carribbean dependency of the United States, and its chief under-developed area, is now discovering that pie in the sky may have more power to inspire than pie in the hand. Since 1947 income a head on the island has nearly doubled and at over $500 a year is higher than in any other Latin American country except Venezuela. But the pace of the island's industrialisation, which is responsible for most of this economic betterment, has slowed down in recent years. Attention is shifting there from Operation Bootstrap—the strikingly successful scheme for attracting private manufacturers from the mainland of the United States—to Operation Serenity. This is a philosophic concept first formulated about five years ago which emphasises the improvement of the whole man as a social being. In the words of Governor Muñoz Marin, who is now standing for a fourth term, the nineteen-sixties are to be dedicated to "the grand enterprise of a great education for Puerto Rico."

To some of the Governor's political opponents this shift in emphasis means that the man who for two decades has been the

guide, administrator and inspirer of Puerto Rico is now becoming old and tired. His friends say, on the contrary, that his efforts to put the island on its feet have now reached the happy point at which he can afford to let the poet stir within him and his people. Whichever explanation is right, the work of Operation Bootstrap is far from finished and much of what has been accomplished might be undone if either of the minority parties should win the next election and lead the island to full statehood or to complete independence of the United States. Its special status as a self-governing commonwealth inside the American economic system is unique and this confers many benefits. The Puerto Rican economy has made great strides since the war, but it is not

strong enough yet to face the perils of independence or to shoulder the federal taxes which would come with statehood. Contributions from the federal government provide a substantial addition to the island's income. Without such help its economy might well sink back into the morass from which Puerto Ricans have been emerging.

Among the essential elements in its emergence have been intelligent and devoted leadership, the skilful application of federal funds, free access to the great market on the mainland and exemption from federal taxes. But not the least important factor has been the work of the Puerto Rican Planning Board, which has just published its reports for 1959 and its projections for 1975. Though all of the economic targets set for the end of the nineteen-fifties have not been reached, progress toward them continues to be good. Gross commonwealth product, in current prices, has almost doubled in the past ten years ; so have exports. Investment has reached new high levels, at about $300 million last year, which was 20 per cent of gross production for the third consecutive year. The tourist trade is booming, a new hotel is to be built, and Puerto Rico's dangerous dependence on a single crop, sugar, is being reduced by the growth of industry. Last year 111 new factories went into operation. Wages, though still lower than those on the mainland, have risen sharply, particularly since 1955 (some observers think that this accounts for the slower pace of industrial growth). Hand-sewing and embroidery work done at home, which are typical of low-wage economies, have almost disappeared.

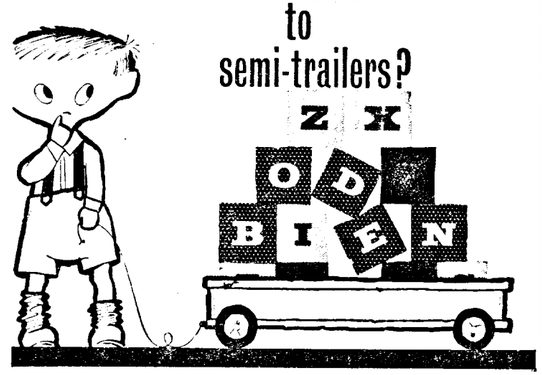
The increase in disposable personal income from $628 million a year ten years ago to over $1.1 billion is visible in many details of life on the island. The number of telephones has doubled in the decade ; so has the money in current bank accounts, while that in private savings accounts has trebled. In the past twenty years the number of vehicles on the roads has gone up by 500 per cent. Only about 15 per cent of the island's 2.3 million people are still unable to read and write ; 95 per cent of the children between the ages of six and twelve are in school, and so are 65 per cent of those from twelve to eighteen.

Unemployment remains the great economic challenge. The population of this over-populated island is still expanding, although the birth rate has actually dropped, in the past decade, from 39 a thousand to 31.9. Meanwhile, however, the death rate has fallen and expectancy of life has gone up. The increase in the population would have been much greater than 155,000 over the past ten years, and the labour force would have risen, instead of falling slightly, if Puerto Ricans had not been able to migrate freely to the mainland. About 42,000 do so, on the average, every year. The big fall in employment has come in agriculture, while jobs have been increasing in manufacturing, trade, and government service. But the roll of the unemployed, which was the chief concern of the planners, has lengthened from 69,000 in 1948-49 to 90,000 in 1958-59, a rise from 11 per cent to 14 per cent of the labour force. Recent analyses show that idleness is greatest among the poorest and most unskilled workers and officials are beginning to suggest that the way to handle the problem may be to treat these people as unemployable and to provide them with a dole. They will not starve on this amiable island, but their continued plight is an affront and an anxiety to a Governor who feels that economic improvement should mean a better life for all.

The projections suggest that, unless there is some catastrophe, Puerto Ricans should be about as well off in 1975 as Americans on the mainland were in 1950. The net income fifteen years from now is put at about $3.5 billion, almost three times the present level. The population is expected to be 5 per cent or 6 per cent greater, but this is not considered to be disturbing if the island's income is to treble and there is a firm plan for distributing it fairly.

Missile on the Move

FROM A SPECIAL CORRESPONDENT



THE Minuteman, the Air Force's latest intercontinental ballistic missile which should have a range of over 6,000 miles, is living up to its name so successfully that it is confidently expected to be in a state of operational readiness—that is, in production in volume and in the charge of units trained to repair and maintain the weapon as well as to fire it—by the middle of 1962, almost a year ahead of schedule. The confidence of the men who are immediately responsible for the project is shared by the heads of the Defence Department so fully that, in spite of their thrifty budget-balancing outlook, they have allowed orders to be placed already for those parts which take a long time to make and on which work must begin while the missile is still being developed if ultimate delivery is not to be delayed.

Hitherto every missile, however important it is that it should be ready quickly and however promising its development, has had to pass tests in three stages. But the prototype of the Minuteman will go straight from the first static tests to the actual flight tests, leaving out the intermediate dynamic tests. This decision came after the mechanism for launching the missile from an underground concrete shaft, or silo, had been tried out with gratifying success. Now the first full flight test—of a prototype, of course—will be undertaken later this year; there will probably have to be some 20 to 30 of these.

The interval between the start of these tests and the date by which operational readiness is promised will be occupied not only by the tests themselves, but by the tooling-up of factories, by actual work on parts which can only be produced slowly and by training the men who will operate the weapon and those who will repair and maintain it. The Minuteman can be fired not only from underground bases but also from mobile ones, such as railway trains ; the instruction of operating crews will begin this month.

By November, crews will have experience of moving these 14-coach trains at random through the regular rail links on ten of the country's railway systems. These crews will not be concerned with the missiles themselves, only with running the trains. But the experience is needed partly to test the stability of the various parts of the missile on a bumping base and the suitability of the train's own design for this new purpose, but largely to make sure that the specially selected crews, whose normal work keeps them away from home and from regular food, rest and recreation for only a day or two at a time, are able to adapt themselves to weeks of being restricted to this one mobile train as sailors are restricted to weeks or months aboard a ship.

Each train will have a command-communications coach, eating and sleeping coaches and possibly one for recreation, medical equipment, food, other supplies and repair facilities to last for weeks and, when the Minutemen are operational, an unstated number of them on launchers or ready for mounting. It would be difficult, if not impossible, for an enemy to destroy a missile on such a constantly moving base. Another virtue of the Minuteman, which uses a solid propellant and does not require the lengthy countdown of the liquid-fuelled Atlas and Titan intercontinental missiles, is that it can be carried for months in a state of readiness to fire. Thus it provides that swift retaliatory power essential for defence against an unpredictable aggressor. The Minuteman is also smaller, lighter, less complex and presumably therefore more reliable than either the Atlas or the Titan—and it is also expected to be almost unbelievably less expensive, costing from $1.5 to $3 million, instead of about $35 million.

Any child who can read a balance sheet can pinpoint the answer to that one . . .

ECONOMICAL HAULAGE

* Semi-Trailers rest idle during loading and off-loading without oncost.
* Engined units work gainfully all of the time while dumb trailers load.
* Semi-trailers give maximum hauling capacity per ton with a minimum of upkeep.
* Semi-trailer haulage techniques are internationally accepted.

BODEN . . . leading British Company in this specialised field . . . design and manufacture semi-trailers which effect spectacular economies in haulage for any concern using more than one heavy goods vehicle . . .

BODEN superlative semi-trailers

BODEN TRAILERS LIMITED, ROYTON, OLDHAM, LANCS.

SHERATON
HOTELS
offer world travelers
54 hotels
in 39 key cities across the U.S.A., Hawaii and Canada

Sheraton Hotels are known throughout the world for high standards of quality and service. Here are a few of the many *special* services we offer international travelers:

- Reservations held if ships and planes are delayed
- Free television in room
- Bilingual departments • Air-conditioning
- Sheraton's Family Plan: (*no room charge for children under 14 in room with adults*)
- Outstanding facilities for banquets, business meetings and conventions

FOR RESERVATIONS at any Sheraton Hotel see your travel agent or write: Alberto De Leon, International Director Sheraton Hotels, Sheraton-McAlpin Hotel, New York City, N. Y., U. S. A.

A growth company

... and growing all the time. Ames Crosta Mills & Company, the Sewage Purification Engineers, has joined the Group. That makes eight companies in all.

Is this growth in size or variety?

Both. The Group's activities include the engineering of gas and coke making plants, refractories manufacture, civil and chemical engineering, and now sewage purification engineering.

But doesn't Group Membership stifle initiative

No. Not in the Woodall-Duckham Group. Each Company is independent and responsible.

Woodall-Duckham Limited
Woodall-Duckham Construction Company Ltd.
W. J. Jenkins & Company Limited
The Stourbridge Refractories Company Limited
Woodall-Duckham (Australasia) Pty. Ltd.

In an election year some of this optimism may be attributed to political dreaming, but even so the island's progress is in marked contrast to the state of its neighbour, Cuba. This does not mean that all of Puerto Rico's problems are solved, or about to be solved. The shack-ridden slums, which might vanish if the money to replace them were not needed even more for education, still shock the traveller's eye. The road west from San Juan is a chaos of traffic for almost twenty miles, bordered by ribbon development, hoardings, and other artefacts of American civilisation. The hotel trade, which is financed in part by capital from the mainland and in part by the Puerto Rican government, threatens to produce a copy of Miami Beach with all the ostentatious vulgarity which too many Americans seek when they go on holiday. On the other hand, the University, with 18,000 students, is flourishing.

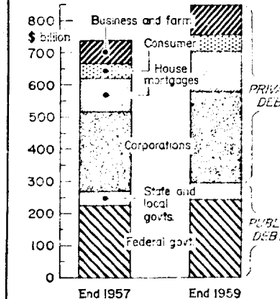
Converging Railways

THE wage increase which a board of arbitration granted last week to the Brotherhood of Locomotive Engineers (the footplatemen) and which is expected to set a pattern for the 200,000 "operating" workers on the railways, is not unduly generous, although, if it is extended to the whole industry, it will cost almost $200 million a year. After bargaining since last September, the men are to receive their first 2 per cent rise next month and will have to wait another year for the second half of the 4 per cent award. Moreover, the union has given up its claim to have the cost of living provision continued. The industry itself, at one point in the negotiations, offered an increase of 3 per cent in wages. A more generous settlement might have made the unions more accommodating on the other very controversial negotiations which are about to begin. These concern antiquated work rules, which the railways claim cost them an unnecessary $500 million a year. Meanwhile another presidential board has awarded the 600,000 or so "non-operating" employees only 5 cents of the increase of 25 cents an hour which they had asked. This award, unlike the first one, is not binding and the men may strike next month.

Both boards evidently took account, however, of the depressed condition of many railways, particularly in the east, where they are struggling with short hauls, unprofitable passenger traffic, and damaging competition from road transport. Here a number of railways are at last adopting a solution which has often been talked about but seldom put into practice: mergers of competing lines. The exchange of shares between the Chesapeake and Ohio and the Baltimore and Ohio which has been announced (subject to the approval of shareholders and of the federal government) is the first step toward the creation of a new railway system which in terms of assets and operating revenues would be second only to the Pennsylvania, the country's greatest railway, and in terms of miles of track would outrank both the Pennsylvania and the New York Central.

The prospect has brought a frank avowal from the New York Central that it would like to be a party to such a merger. This is largely because of its suspicion that the Pennsylvania, through the merger last year of the Norfolk and Western (in which it has a large interest) with the Virginian Railway and the proposed merger of the N & W with the Nickel Plate, is building up a new railway empire. This would control two of the three lines serving the coal fields of West Virginia and Kentucky: the third is the Chesapeake and Ohio. A combination of the New York Central, the B & O and the C & O would create an enormous system, though it would not be quite so monstrous as the merger of the Pennsylvania and the New York Central, which was being talked about two years ago. But bigness by itself does not necessarily bring the economies in operation which will provide the money for modernising equipment and put the railways on a more stable footing.

Black Mail?



FROM A CORRESPONDENT IN COLORADO

SOME Americans are waking up to the fact that it is within their own power to reduce the $600 million a year deficit on the postal services and to help to put the Post Office in the black. About half of the deficit is due to the low third-class rates enjoyed by newspapers and magazines; the other half is caused by the big "direct mail" industry, which sends out postal solicitations (to buy some article or to subscribe to a magazine) at second-class, or "junk mail," rates which are somewhat higher but still do not cover the cost of the service. These solicitations are usually accompanied by an addressed envelope for the cheque, money order or subscription which is being sought and the postage on it—at first class or airmail rates—is guaranteed. If the envelope goes straight into the waste-paper basket, little is lost. But if the householder seals and returns it empty or with a protest against the practice—as many are beginning to do—the cost in postage may be considerable to the original senders. Some of them now plead that business reply envelopes should be used only for the purpose for which they are intended.

First-class rates on sealed letters were raised in 1958 and these are now more than paying their way. Parcels are required to do so by law. Second and third-class rates have also been raised and third-class rates are due to go up again in July, now that the Secretary of Commerce, after investigation, has ruled that past increases have done little harm to the users of third-class mail and that the subsidy from the tax-payer which they enjoy at present ought to be reduced somewhat. Even so, a very substantial deficit will remain. The cure advocated by the Administration is a further increase in first-class rates but there is no prospect that Congress will swallow such unpleasant medicine this year.

Americans who are tempted to take direct action—particularly if, in the course of a day, they have received two or three identical requests for a renewal of a subscription to one of the magazines with a mass circulation—do not always realise the extent to which firms and publishers are themselves the victims of the direct mail business. This is, to a large extent, a monopoly of those who compile lists of addresses. These are never sold outright, for obvious reasons. A firm wishing, for example, to reach 100,000

WHAT AMERICANS OWE

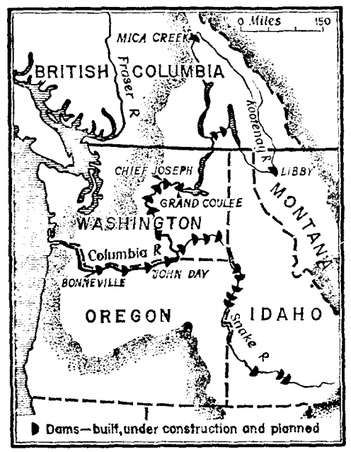
NET DEBT OUTSTANDING

Last year's economic expansion led to a heavy demand for credit—for business stocks and working capital, for new industrial plant and equipment, for private houses and consumers' durable goods; in addition the federal budget showed a large deficit and state and local governments were also borrowing for construction programmes. As a result the total amount owed increased by a record sum—$66.7 billion—during the year; in 1958 the rise was only $40 billion.

Americans who have gardens must entrust the task to the listing company, and must take the risk that the list may contain many duplicate names.

Equal Shares on the Columbia

FROM A CORRESPONDENT IN OREGON



CANADA and the United States, as represented in the International Joint Commission, have at last come to an agreement which opens the way to a doubling of the hydro-electric output from dams on the Columbia River which flows across the boundaries of the two countries. In effect, they have agreed to share equally in the benefits—whether of more electric power or better flood control—from the construction of dams on that part of the 2,000-mile long river which lies in the Province of British Columbia ; and the government of that province, which must also ratify the final agreement, appears to find the new proposals acceptable. When the projects are completed they are expected to add some five to six million kilowatts of capacity to the hydro-electric generators which are already in operation on the American section of the river in the Pacific Northwest states. This is because the new dams will store water which can be released to flow downstream and through the existing generators to make up deficiencies at times when the normal flow of water is low and the demand for electricity high.

The search for a formula on which the United States would pay for this additional electricity, and for the control of high water in the flood season which the new dams will also provide, delayed development of the river on both sides of the international boundary for years. Canadians have, in fact, talked of diverting a substantial part of the water of the upper Columbia into the Fraser River as an alternative to helping to build up the power potential at dams in the United States. The new understanding appears to have ended the prospect of such a controversial step. The most significant of the terms of the International Joint Commission's agreement are:

> The Bonneville Power Administration, which sells all electricity generated at dams owned by the American government in the Columbia Basin, will credit to Canada's account one half of the increase in output resulting from storage dams built north of the border; this electricity will be transmitted from the American generators to consumers in British Columbia.
>
> The United States will pay in cash for benefits which it receives from flood control made possible by these dams; the amount is estimated at between $100 and $150 million.
>
> Each country will finance projects on its own side of the border and the order in which these are undertaken will be determined by mutual agreement on a basis of "co-operative development."

Canada's principal contribution will be to build a series of dams, of which the prime function will be to store water when it is plentiful—when the snows melt, for example—and to release it to maintain a regular flow downstream. Chief among these projects will be a huge dam at the Mica Creek site, about 200 miles north of the border, which would be the world's highest, 740 feet. It would hold back a 73-mile-long reservoir large enough to provide 11,685,000 acre-feet of storage, more than twice that of the Grand Coulee dam, where the reservoir is now the largest in the Columbia system, and would generate a maximum of 1,624,000 kilowatts. Cost of the new construction contemplated on the Canadian side, including the Mica Creek dam, would be about $600 million. This compares favourably with the $1.6 billion which, it is estimated, would be needed if a similar amount of additional storage were to be provided on the United States side of the border, where all the relatively inexpensive projects have already been carried out.

For its part, the United States would add to the generating facilities of the dams which already exist on the Columbia's mainstream. For example, at Grand Coulee, the largest producer of electricity in the chain, capacity, now 1,974 kilowatts, could be increased to 2,880 kilowatts with the additional water being stored in Canada, if six turbine-generators were added to utilise fully the increased regular flow of the river; more generators would also be required at Chief Joseph dam to increase its capacity by 256,000 kilowatts, at Bonneville dam, where the present capacity of 500,000 kilowatts would be raised to more than 600,000, and at other Oregon and Washington dams. All told, the Canadian dams could be expected to increase the output of American dams, now rated at about eight million kilowatts, by from 60 to 75 per cent. In addition, Canada would gain about 2,500 kilowatts, which would more than quintuple the amount of electricity now produced on its section of the river.

Under the terms of the agreement, the United States would pay for the projects south of the border, which would cost about the same as the Canadian dams. It is also possible that the United States will now be able to proceed with building Libby dam, a large storage dam on the Kootenay River in Montana, a tributary of the Columbia. It has been held up because its reservoir would extend into Canadian territory but the IJC understanding provides a basis for resolving this problem; moreover, the construction of Mica Creek and other Canadian dams may make it possible to reduce the size of the Libby reservoir. This fundamental step toward settling the difficulties which have arisen over international development of the Columbia River's resources is of prime importance in the Pacific Northwest of the United States, for the John Day dam is the last link in the hydro-electric chain on the mainstream; when it is completed the only means of gaining additional capacity will be to regulate the flow of the river in ways such as would be made possible by the Canadian storage projects.

There are many detailed calculations yet to be completed, but the view in Oregon and Washington and in British Columbia is that the highest hurdle to co-operative development has been cleared and that additional electricity should be available in 1968, soon after the target date for the beginning of hydro-electric output from the huge development being planned on the Peace River in far north eastern British Columbia. The combination of these two projects promises that a great new industrial frontier will be opened up in British Columbia within this decade and lays to rest, for some time to come, at least, the long-standing fear that the expansion of the Pacific Northwest of the United States will be held up by a shortage of power.

THE WORLD OVERSEAS

French Labour Skirmishes

FROM OUR PARIS CORRESPONDENT

STRIKES by state employees always seem to take French governments by surprise. Yet the most surprising thing about this present week of social unrest—with transport workers, engineers and civil servants taking part, in turn, in cautionary strikes—is that it has been so long in arriving. The Fifth Republic can claim to have enjoyed, until now, a relative peace on the labour front, which cannot be explained by economic factors alone. France's spectacular financial recovery, started by the reforms of December, 1958, has been due, essentially, to two causes. A successful devaluation has diverted an increasing share of the national product (about 13 per cent by now) to exports, while home consumption has been kept in check. Secondly, internal prices were not allowed to rise much more than the increase brought about by the government's own cuts in subsidies and the devaluation itself. A near-freeze of wages has been an important contribution to price stability.

Real wages have scarcely changed in the past year. They went down by one per cent during last summer, remained stable in the fourth quarter of 1959 and recovered by one per cent in the first quarter of this year. The picture is less bright when the comparison is made with 1957, the culminating point of four years of rapid improvement in workers' earnings. The unions claim that real wages have dropped by over 10 per cent since then. According to official figures, the purchasing power of a single man employed in French private industry is now at least three per cent lower than three years ago. Since family allowances are a substantial addition to French working-class incomes and since they have not kept pace with the cost of living, the position of a married worker with children has deteriorated even more. For civil servants and workers in nationalised industries the lag began earlier, and it is no surprise now to find railwaymen, postmen and other state employees in the forefront of the present skirmishes.

Why did the French workers, renowned for their pugnacity, show this restraint for so long? In the second half of 1958 the number of hours lost through stoppages was a record low figure. The prestige of General de Gaulle and fear of a recession combined to keep the divided and politically defeated unions quiet. The number of strikes began to creep up in the early months of last year, once the early pro-gaullist mood had vanished under the impact of the government's austerity measures. In reply the government made some concessions, but a threatened railway strike brought matters to a head exactly a year ago, and M. Debré, using tough language, compelled the unions to call off the strike. This gave the government a precious respite. But now the second round seems to be beginning.

It is highly far-fetched, though fashionable in Paris, to attribute the new wage offensive to the failure of the summit conference. Whatever the intentions of the communist-led CGT, most authoritative observers seem agreed that the recent wave of strikes was spontaneous rather than dictated from above. The strikes were sporadic and local at first, and gathered momentum only after some delay. The leaders of all the unions gave the impression of being led by their troops. The fact that the socialist *Force Ouvrière*, which has no love for Mr Khrushchev but counts a large number of its members among discontented civil servants, is taking an active part should dispose of the too facile explanation that it is all the result of "Moscow's orders."

Financially, the government is now in a stronger position than a year ago, although M. Baumgartner, who succeeded M. Pinay at the ministry of finance, repeats regularly that the financial recovery is too precarious to justify anything more than very moderate increases in wages. If the government has to make concessions to the unions, private industry will have to follow suit. Besides, a substantial rise in the wage bill of the state would disturb the budgetary balance, which is already strained by the continuation of the Algerian war and the initial outlay on an independent nuclear striking force. Politically, the situation is less comfortable than a year ago because the unions are now less enamoured of the regime and the workers are more sceptical about promissory notes for future settlement.

General de Gaulle, bought down to such earthly matters, is faced with a real dilemma. If he gives in to pressure, then wage restraint, the basic plank of the official financial policy, will become shaky. If he resists, he runs the risk of an industrial clash and the political risk of tightening the loose ties between the catholic, socialist and communist unions. Writers and politicians favourable to the gaullist regime are now accusing the government of discovering its vocation for social reform only when it has its back to the wall. The exceptional case of the minister of industry, who reached a timely settlement with the gas and electricity workers, is being quoted as an example of foresight.

Nobody really knows how bellicose the current mood of the French workers is. The government does not seem to have made up its mind on how to tackle the unrest. Its first reaction was a show of strength against the awkward alternating strikes paralysing the Paris transport system line by line ; by Wednesday 68 strikers had been suspended. On Wednesday the government also promised to grant additional wage increases next year and to align the salaries of civil servants with those in the nationalised industries. The first reaction of the unions was that the promise is too vague and too distant. These skirmishes on the labour front are all the more significant since France's political battles are now fought in the factories and fields as well as in officers' messes ; everywhere in short but in the Palais Bourbon, that deceptive relic of a parliamentary past.

Greece and the Arabs

FROM OUR CORRESPONDENT IN ATHENS

WHEN exasperated Greek mothers want to intimidate a naughty child, they threaten: "The Arab will come and take you away!" This week the leading Arab did come ; but he was greeted with so much pomp and circumstance that mother's threat, one assumes, will no longer have any effect on naughty Greek children. President Nasser, of the United Arab Republic, came on a state visit to Greece as personal guest of King Paul of the Hellenes. As his Athens ambassador put it recently, "the president is so fond

of Greece that he is bringing along the whole family." This, naturally, included Mme Nasser and four young children who played havoc with the strict protocol of the Greek Royal Court.

Greek-Arab friendship is a cornerstone of Greek foreign policy not for any reasons of Mediterranean sentimentalism dating back to Pharaonic times, but for very practical contemporary purposes: 80,000 Greeks live in Egypt today at the mercy of Arab xenophobia. Their well-being is one of the Greek government's strongest arguments for maintaining good relations with Cairo. It was, in fact, this solicitude that deterred Greece from extending full recognition to Israel, and which encouraged the Greek government to give President Nasser full backing during the Suez affair.

When the Greek prime minister, Mr Karamanlis, visited Cairo in August, 1957, he received formal assurances that the Greek community would be given preferential treatment over all other minorities in Egypt. There was, however, a touch of blackmail in Arab explanations that this preference could not, unfortunately, be safeguarded by legislation, since this would have set an undesirable precedent. Arab assurances therefore could hardly be expected to stem the exodus from Egypt of Greeks who are coming to Greece or emigrating abroad in search of more secure prospects for the future. Some 50,000 Greeks have left Egypt since the end of the war. The prospects for those who remain are dismal indeed, as more and more businesses and professions become "egyptianised."

THE practical aspect of Greek-Arab friendship embraces the Greek aspiration to turn this country into a "bridge" between the West and the Middle East. There is a bitter feeling here that Greece's outstanding position at the crossroads of Europe, Asia and Africa is not being duly appreciated by the West. This role had actually been entrusted to Turkey, which was chosen to act as liaison between Nato and the Middle East by way of the Baghdad (now Central) Treaty. The Greeks, from the outset, took a poor view of this choice, arguing that it had overlooked the fundamental antagonism between Turkey and Egypt, contenders for supreme leadership in the Muslim world.

The opinion prevails in Greece that Britain's withdrawal from the Middle East and the emergence of Arab nationalism had created a vacuum in the external orientations of the Arabs: nationalism is good enough, but only for domestic consumption; President Nasser's erstwhile flirtations with Moscow proved to be just one aspect of the neutralist practice of milking two cows at once; and neutralism is excellent, but only in time of peace. Greek leaders, both inside and outside the government, are convinced that their country could become Nato's point of contact with the pro-Nasser group in the Middle East, just as Greek-Jugoslav friendship assures the West of a link with Marshal Tito. They feel that Greece has many qualifications for filling that post. Greek relations with all Arab countries have been preserved intact throughout the recent years of transition. The Greek communities scattered throughout the Middle East have earned a good reputation among the Arabs. Politically, this liaison role would greatly enhance Greece's international prestige. Economically it might turn this country into a springboard for peaceful economic and commercial penetration in the vast markets of that region. The Germans seem to be rapidly appreciating this splendid geographic advantage.

There is also such a thing as sense of gratitude in Greece, and the Greeks feel a debt of honour towards President Nasser and the other Arab leaders for their unstinted support for the Greek case on Cyprus. Arab votes were numerically important throughout the five appeals lodged by Greece at the United Nations. The near-solution of the Cyprus problem has not absolved the Greeks of this obligation. As their foreign minister once put it: "Now that the Cyprus question has been settled, the Arabs will know that our friendship towards them has no ulterior motive."

Meissen's 250th Birthday

FROM OUR SPECIAL CORRESPONDENT

FOR 250 years kings, gauleiters and commissars have in turn encouraged Meissen to make porcelain. Last weekend the town stuck a reddish feather in its cap and rolled out an impartial barrel to mark the anniversary and celebrate the survival of its great tradition. The sun shone beneficently, and it was all very gay. Never before, it seems, has there been so great a demand as there is now for the table services and figurines marked with the dark blue sweep of the crossed swords.

The first porcelain was made in Meissen on June 6, 1710. The first big foreign order was placed in 1728 by the Turkish merchant, Manasse Athanas, who asked for 600 dozen cups. Today orders come in from all over the world, from east and west alike.

Sixty per cent of the factory's total output is sold abroad, 16 per cent of it in western Germany. "Hearty welcome," a streamer near the railway station called out to English-speaking foreign visitors, and beside it hung another presumably saying the same thing in Russian. The bridge across the Elbe was garlanded with fluttering pennants composed alternately of the east German and the Soviet national colours. Beneath, the pleasure steamer *Einheit*, dressed overall, manœuvred to and fro with successive cargoes of the brave and the fair, looking for the most part as though they might be in mortal peril of forgetting for a day to hate imperialists and fascists with a proper frenzy.

Happily, the east German Democratic Republic is at long last living well enough to be able to stage a show of this kind without excessive strain or recourse to the subterfuges of window-dressing. In the old streets of the town—Meissen was never bombed—the state-run H.O. (*Handelsorganisation*) demonstrated that it had learned a thing or two about the unbureaucratic processes of vending beer and sausage; and in its crowded restaurants there could be no justifiable suspicion that the bill of fare was much, if anything, out of the ordinary. In Meissen, as everywhere in the Democratic Republic, there are signs of both shortages (chiefly fruit and vegetables) and abundance. (In addition to Rhenish, the Meissen Ratskeller's wine list proffered a variety of Jugoslav, Hungarian, Carpathian, Bulgarian, Armenian, and Chinese wines.) The western visitor no longer has an uncomfortable feeling that he is consuming what is denied the majority of the population. Naturally Meissen's few hotels could not accommodate all the guests. The greater part of the overflow was housed fifteen miles away in Dresden, some of it in hotels that are still very drab. But in their comings and goings visitors could see for themselves unpremeditated manifestations of a substantial improvement in everybody's living.

Originally a royal property (a bow here to the ghost of August the Strong of Saxony), the Meissen porcelain factory has been state-owned since 1918. Consequently, the upheaval of 1945 disturbed its workings less radically than those of many other enterprises. The Russians appreciated what had fallen into their hands, and unhesitatingly kept the factory going under their own management for the next six years. In 1951 they restored it to the German authorities, who made a "people's own concern" of it. Of the factory's present payroll of 1,068 workers, roughly 250 have been there since 1935. Several have a record of 45 years' continuous service. Three were honoured ceremonially last week-end for half a century's allegiance. Obviously only the brashest of *Besserwisser* would presume to teach such a venerable, accomplished and well-endowed grandmother to suck eggs. Party meddling has been on the whole exceptionaliy restrained. Few important factories in eastern Germany have so short a list of westward absconders as Meissen's *Staatliche Porzellan-Manufaktur*.

The quiet artist skilled in painting flowers and birds on teacups does not work any the better for being pressed into a "brigade." Like most of his colleagues, both in his own and other branches, he derives a particular satisfaction from the job and his share in the firm's reputation. He earns, on an average, £12 a week, and pays, on an average, only twelve shillings a week for rent. He appreciates, in theory if not in practice, such communist innovations as the law forbidding the dismissal of workers solely on account of lack of orders, and that insisting upon the dismisser providing the dismissed with a choice of three other jobs. But his wish to be left as far as possible alone has not been altogether respected. About twenty per cent of the technical staff have been

Labour and State in Israel

FROM OUR CORRESPONDENT IN TEL AVIV

A BATTLE for power is being fought in Israel between the state and Histadruth, the all-embracing trade union organisation that did so much to build up the Jewish state and now controls most labour and a great chunk of industry. The battle is being watched with interest by those new Asian and African countries which have felt tempted to copy the structure of Histadruth when building their own labour force. It is doubtful whether they could in fact do so without the special conditions, including the powerful backing of the Zionist movement, that went to the making of Histadruth; all the same, the present struggle between government and labour in Israel may help to clear their minds.

When Histadruth was founded in 1920 it set itself the goal of a society without exploitation. By developing kibutzim and moschavim, settlements without hired labour, it became the spearhead of the Zionist movement. By setting up marketing and production co-operatives, and a big contracting firm, Solel Boneh, Histadruth became a powerful influence in the labour market and in industry. It began a health service for its members and took an active part in starting schools and adult education. Before long, a member of Histadruth could satisfy all his wants within this huge organisation. He would wake up in a house built for him by Histadruth, drive to work in a bus belonging to a Histadruth co-operative, work in a Histadruth factory, and visit a workers' theatre or club in the evening.

Before the inception of the state there was no clash between the interests of Histadruth and the Jewish Agency, then responsible for Zionist settlement. The two worked together and when the state was founded, Jewish Agency officials became cabinet ministers, while Histadruth formed the main reservoir of the key people needed for the new administration.

But once the administration began to take shape, it was apparent that there might be overlapping or even a clash of interests between the government and Histadruth. The first to understand this was the prime minister, Mr Ben-Gurion. He liquidated the famous fighting units called Palmach, which had formed the spearhead in the struggle against the British, despite the fierce opposition by many Palmach leaders in the Labour movement. He maintained that there could be only one army and one command and he carried his point.

HE won his fight, too, when against the will of the left-wing parties he stopped political teaching in the elementary schools. Again he triumphed when the labour exchanges, which had been run by workers' organisations, were taken over by the government. During the elections last summer, a demand was made that the Histadruth health service should also be taken over by the state and it looked for a time as if Mr Ben-Gurion was going to agree, at least up to a point. But at this point the general secretary of Histadruth, Mr Pinhas Lavon, put his foot down. The health service is an important political asset to the labour movement, and there was a real danger that the organisation would lose members if a national health service were started. For the time being the question has been put into cold storage.

Experience over the last ten years has shown that in Israel decisive political action can be taken only if the cabinet and Histadruth leaders agree. The minister of finance was unable to do anything about inflation so long as Histadruth insisted on adjusting the cost of living allowance to the price index every three months, and on signing collective wage agreements every year. Inflation only began to slow down when the minister agreed to adjust the allowance twice a year and to make the wage agreements last for two years. But when the minister recently tried to introduce tax reforms that would have adversely affected salaried workers, Histadruth decided against it and the plan was abandoned.

Histadruth spreads its wings not only over farmers, skilled and unskilled workers but also over the professions. More and more "academic workers," as they are called in Israel, are being drawn into trade unions. But they have considerable difficulty in securing adequate salaries since Histadruth's old egalitarian philosophy dies hard and often an increase in salary among higher grade workers is soon followed by increased wages all round. As this means a turn in the inflationary spiral, and as members of the professions are smaller in number and therefore form less powerful pressure groups than other workers, there has in recent years been a running fight between the professional workers and Histadruth. Last spring the secondary school teachers, who have up to now been in the same trade union as their colleagues from elementary schools, formed a union of their own which Histadruth refused to acknowledge. The minister of education, unable to solve the conflict, resigned and Mr Ben-Gurion has temporarily taken over.

Although for the moment there is an uneasy truce between the government and Histadruth, it looks as if a showdown must come soon. Mr Ben-Gurion has declared more than once that the interest of the state must be paramount. Mr Pinhas Lavon recently countered by saying that Histadruth serves not only its own members but the whole community and that it is the guardian of the ideals of the Zionist movement.

The conflict is the more poignant because it is being fought out in the inner councils of Mapai, the main political party, between people who have worked together for many years. Both Mr Ben-Gurion and Mr Lavon have often proved that they can deal summarily with their critics. The word of the prime minister in the cabinet today carries more weight than ever, and Histadruth's secretary-general has got rid of everybody in the organisation's executive who is not to his liking. They make a pair of formidable opponents.

organised into "brigades." The factory's news sheet has been turned into a militant communist fortnightly churning out unreadable party mumbo-jumbo and obsequious eulogy of everything Russian.

Some of the older hands are understandably concerned lest the quality of Meissen ware should deteriorate through too much interference from unqualified but influential busybodies. The high technical tradition seems to be secured in the factory's own school, with its thoroughgoing five-year term of apprenticeship. It is in the realm of design that debasement of standards is most feared. Such few models and patterns that have been introduced since the war have been the choice of a collective, or committee, composed of some twelve representatives of all branches. The practice is to submit the chosen design in small quantities to the test of the market before it is produced in quantity. It is too early to judge the efficacy of this system. Nothing remarkable has yet come into being. As before, Meissen's most profitable activity is the reproduction of Kaendler's and Acier's figures, and such other eighteenth-century masterpieces as the onion service. As a business concern the factory will continue to produce what the customer wants. In the long run it will be he, not the party, who is always right.

Tangier's Outlook Unsettled

FROM A CORRESPONDENT

PEOPLE in Tangier are tapping their economic barometers, and few of them like what they see. Since the last vestiges of Tangier's free port and free money market disappeared on April 18th with the abrogation of its charter, many of them have given up hope and gone.

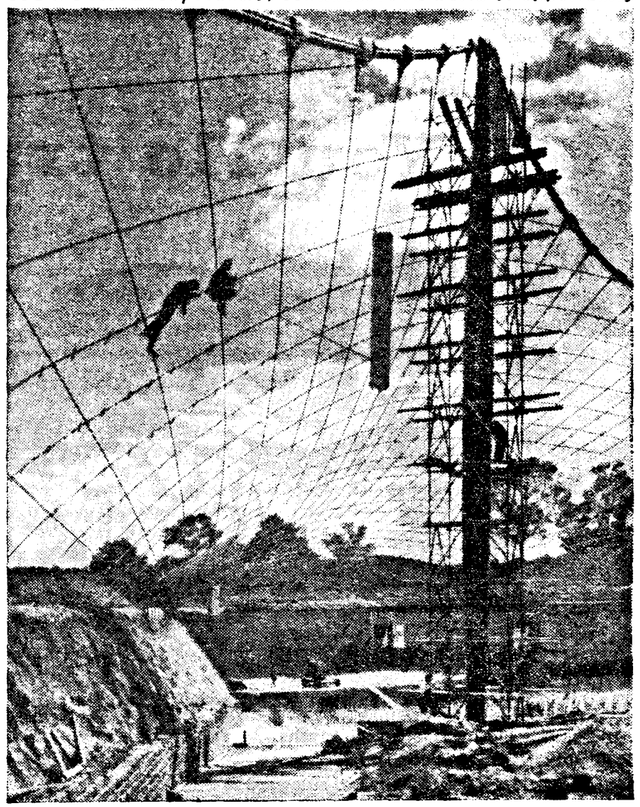
The royal charter was granted by the King of Morocco in August, 1957, a year after the negotiated termination of the international regime, and it was designed to keep alive some of Tangier's special economic and financial status. Under pressure from left-wing nationalist and labour groups, and also from towns and interests jealous of Tangier's privileges, the government announced last October that the royal charter would end in April, but up to the last many people in Tangier thought or hoped that the death sentence would at least be deferred. It was not. Now shops in the highways and banks in the byways are closing. People in what is called the re-export trade are trying to set up shop elsewhere, and the money-changers and currency dealers in their astrakhan caps are beginning to reappear in Lisbon, Zurich and Tel-Aviv. New buildings are being left in a state of suspended animation. The workers and the trade unions, who had been promised so much from the incorporation of Tangier into Morocco, are beginning to wonder what has hit them, and who.

The main practical effects of the abrogation were the extension to Tangier of the import duties in force in other parts of Morocco, the consequent closure of its ring of customs posts, and the insistence that all currency dealings must be transacted through the Moroccan state bank and its agents. It was clearly inconsistent with a planned Moroccan economy that the old privileges should continue, and an indication of their past effect is given by the fact that there used to be nearly 150 exchange houses of one sort or another in Tangier, and 67 banks. Now there are fewer than half a dozen.

Tangier, however, still has its sun, its sea, and its sin. Tourists flock in increasing numbers to its many excellent hotels and night clubs. Plans exist to develop it still further for tourism; they may well be carried out. But other plans to compensate Tangier for the loss of the prosperity created by its former special status are more nebulous. They amount in effect to the development of the port of Tangier as the point of exit and entry for the northern part of Morocco, and as a place of call and oil bunkering for the shipping that goes through the Straits. Both these projects have the potential attraction for the Moroccan government not only of increasing the prosperity of Tangier, but of putting the Spanish presidio of Ceuta out of business. Restrictions on the passage of goods and people across the frontier with Ceuta are, indeed, already beginning to have just this effect.

Plans to develop Tangier in this way depend, however, on improving its facilities and equipment as a port. There is a lot to be done; and, except for the oil bunkering installations which it is hoped will be financed by a consortium of oil companies, it will cost a great deal more money than is or is likely to be available. The harbour must be dredged, breakwaters built against the east wind, and new quays made. Indeed, most of the deficiencies that led the British to abandon Tangier as useless in 1684 still exist.

Singapore's Predicament

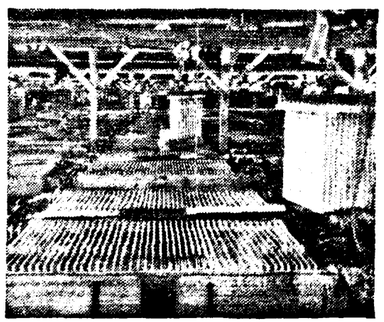


FROM A CORRESPONDENT

THE political atmosphere in Singapore today—one year after reaching statehood—is made up of a curious mixture of sober, intelligent administration, a vague (because essentially baseless) belief in the city-island's ability to live off its own wits, and a paralysing evasiveness about the central problem of the increase in population. The left-wing People's Action Party (PAP) has done much to rationalise the administration; it has won the vitally necessary approval of the business community, which had viewed the PAP's assumption of power with foreboding for the simple reason that socialism has never been possible in Singapore. And yet socialism—as a mood of revolutionary, anti-western puritanism rather than as a manner of ordering an entrepôt's economic affairs—has been the mainspring of the Chinese-speaking masses' fervent support for the PAP.

But the aspirations of most of these people are not being satisfied, with the result that the greatest danger facing Mr Lee Kuan Yew, the leader of the PAP, is that Chinese chauvinism may get out of hand. This would upset his moderate policies and thwart his efforts to get Singapore accepted in Kuala Lumpur as a desirable and harmless member of the Malayan Federation. The PAP has done what it can to clear up the seedier sides of Singapore life, as well as to provide amenities such as open-air cinemas and children's playgrounds. But the real problem is not that of censoring the circuses but of providing bread for the swelling ranks of the unemployed (at least a hundred new jobs must be found each day) at a time when the entrepôt trade is in serious difficulties, when the rival appeal of Kuala Lumpur's new industrial suburb is thought to be growing, and when overseas capital for industrialisation is still inhibited by fears about Singapore's political future.

The public talk of Singapore becoming "another Hongkong" does not appear to be matched by an appropriately vigorous effort to attract capital, despite the setting up of a board to promote industrial development. In fact Singapore's chances of emulating Hongkong seem very slender, since its labour costs are three times as high and it lacks the necessary reservoir of skilled labour. However, the PAP is trying to create the necessary constitutional framework. The Industrial Relations Ordinance was hurried through parliament and became law on February 23rd; the arbitration system established under this law should in theory produce the best possible industrial relations. The new legislation amalgamating the smaller trade unions, and unifying the trade union



AUSTRALIA / country, continent . . . a world of opportunity

Builders give shape to Melbourne's new Music Bowl — an Australian international award-winning design. Australia's prosperity owes much to the recent rapid development of many major industries.
The picture below shows the cellroom at the Electrolytic Zinc Company's big zinc refining plant at Risdon, Tasmania.

FRAMEWORK OF AUSTRALIA'S PROSPERITY

A yardstick over the Australian economy reveals some surprises: 2 out of 3 Australian families own their own homes, and 1 out of 2 run a car; most homes have refrigerators while every second home has a washing machine. Such purchasing power indicates the high annual income per household which averages about £A1600. On the industrial front, Australia has lost less time in strikes than the U.K. for 3 years running now, while her strike losses compare extremely well with Canada's over the last 7 years. During these 7 years, the value of factory production has more than doubled and national income has risen by more than half.
Clearly, Australians are living and working in a fast-developing economy. Against a background of political stability it is attracting some £A100 million private capital investment from overseas each year. Australians look forward with confidence to a continuing trading, manufacturing and financial partnership with Britain. Representatives in the U.K. of the Federal Government of Australia will gladly provide information about trade, investment and migration. Australia's representatives are at Australia House, The Strand, London, W.C.2., and also at the offices of the Agents-General for each State.

Old English proverb: "*All fluids flow*".

Fact. Mild ale, milk of human kindness, meths, myths,
moths, maths, mulligatawny . . . all flow, all anyhow.
Beer downhill, damp uphill, ink everywhere. Sea sideways in lumps.

At home, no problem. Turn hot tap, get cold water.
But in British beehive of industry, buzz buzz clickety click,
flow-control fundamental. Can't pump chemicals Anglo-Saxon drainpipes . . .
can't pour phenolphthalein chipped teapot . . .
can't put new wine old buckets . . . Laughing stock.

So. Modern industrial practice *thinwall piping systems* in (e.g.) chemical
(e.g.) petro-chemical installations. How neat, light, precise, how thin wall,
smooth bore, non corrosive! Everyone pleased. Fluids flow fast, no knock glug.
All enchanted. But how turn corner? All ask.

How? Thin-wall elbows, bends, wiggles, forks, junctions . . .
Who? Wilmot Breeden . . .

Wilmot Breeden first manufacturers in U.K. to undertake large-scale production thin-wall elbows, other etcetera fittings. TRUFLO range (Tru-true flow-flo . . .) Stainless steels, nickel, Monel, Inconel*, Corronel 210* and aluminium. Wilmot "every-British-car-roads-today" Breeden! Sing. Shout. Investigate.*

Wilmot Breeden

Birmingham, London, Manchester, Bridgwater, Paris, Melbourne.

structure, is intended to round off the process of preparing for an industrial society; or, put more bluntly, it is hoped thereby to make sure that the trade union movement can be firmly controlled. If crypto-communist subversion can be contained, this may prove to be the case. Otherwise, the proposed new trade union amendments may actually help the crypto-communists to gain control by removing from office many of the present moderate leaders of smaller unions.

At present the PAP's wild men and the crypto-communists are keeping quiet. This is for a variety of reasons; they would regard a victory in Singapore alone as hollow; for the moment they can hardly improve on the slogans of the moderate PAP; and there is some reason to believe that increasing unemployment will in any case discredit the PAP moderate leadership within a fairly short period. However, it is clear that the trade union leaders are going to press for advances while the going is good, at whatever cost to the confidence of the business community.

Of course, the fundamental predicament of the PAP government is that even if the conditions for excellent industrial relations are created, there is no reason at present to believe that Singapore can industrialise quickly enough to prevent the detonation of the population bomb; half of its population is under twenty-one. About this predicament there is much evasion and wishful thinking. Will not Britain always be around to pour in the necessary capital? Will not Singapore always be such a vital base that the West as a whole could never leave it in the lurch? One of the cleverest and most eminent of Singaporeans closed a discussion of this subject by saying, as though he were drawing a precise analogy, "Yes, we have the population problem to worry about—but then you have the atomic bomb to worry about."

Faced by this apparently insuperable problem, the PAP sees its social revolution (as it naturally likes to think of its activities) as about to be devoured by its children. Inevitably, its leaders cast hopeful glances at the Federation. But what do they see? The glossy factory buildings (although only facades as yet) on the outskirts of Kuala Lumpur; the millions earmarked to be spent on Port Swettenham; the recent decision to build a major airport at Payer Lebar—developments, as the Federation's government makes clear, which are not merely steps towards modernisation, but earnests of a determination not to consider integration with Singapore at any cost; the Federation is itself faced by an unemployment problem of very serious dimensions.

The only faint glimmer of light for Singapore is the announcement by the Federation's minister of commerce, at the Bangkok Ecafe conference on March 16th, that Malaya and Singapore should have talks about the creation of a common commodity market. But even this tentative agreement to talk may founder upon the not unnatural belief in Kuala Lumpur that such an arrangement would be heavily weighted in Singapore's favour. Besides, the present Malayan government is making a bid to create a nation on the basis of vigorous economic nationalism. In the meantime, the PAP can only wait for a change of government in Kuala Lumpur, though most people outside party politics believe that the downfall of the Alliance party could only make matters worse for Singapore. At the moment this great counting-house is in a position of slowly growing, but very great, social peril; it is unlikely that it can survive as an independent community until the end of the present decade.

Cuba's Growing Isolation

FROM A CORRESPONDENT

The triumph of Dr Fidel Castro's revolution fourteen months ago was celebrated joyfully throughout Latin America. The struggle of the rebel forces in the Sierra Maestra had a natural appeal for liberals everywhere, and a special meaning in those countries which know from bitter experience what dictatorships are like. Democratic heads of state hailed the fall of General Batista, newspapers cheered the revolution's victory, and public opinion was solidly pro-Castro; for many months documentary films about Cuba played to cheering audiences throughout Central and South America.

Towards the middle of last year, however, as new and disquieting news came out of Havana, official opinion began to cool. Dr Castro's programme of anti-imperialism, expropriation, and Yankee-phobia has become a little dated; leaders like Señor López Mateos in Mexico, Dr Rómulo Betancourt in Venezuela, and Dr Lleras Camargo in Colombia have already gone beyond it, and Cuba's unsettling influence in the Caribbean disturbs their own economic plans. Argentines who read Dr Castro's demagogic harangues and who see pictures of enthusiastic Cuban crowds on the newsreels are uncomfortably reminded of Perónism. The National Institute of Agrarian Reform run by Dr Ernesto Guevara, who was born in Argentina, sounds suspiciously like the Perónist agricultural scheme that wrecked Argentina's incomparably richer economy.

Dr Castro's impulsive foreign policy and his ineptitude in public relations have further alienated his former friends. His disruptive behaviour at the Santiago conference of the Organisation of American States a year ago, including a sudden request for $3,000 million of United States aid to Latin America, was widely ridiculed, and when a group of his heavily armed followers landed in Chile without passports they were promptly hustled off to jail. Cuban diplomats, especially in Mexico City, have been suspected of interfering in local politics and sponsoring armed movements against the governments of Nicaragua and the Dominican Republic; this disturbs democratic leaders who feel their own positions are none too secure.

In the last few months the gap between Cuba and the rest of Latin America has steadily widened. Dr Castro's biggest blunder was his public bid for the Security Council seat vacated on December 31st by Argentina. This had been set aside, by the now traditional gentlemen's agreement, for Chile, and the Cuban round-robin letter requesting consideration was regarded as foolish impudence.

Half a dozen Latin American nations are larger than Cuba, and Dr Castro's claim to leadership in the area is considered irresponsible. Brazil, which has sponsored its own Operation Pan America, is indignant about Dr Castro's chosen role as spokesman for underdeveloped nations.

Dr Castro still has unquestioned popular support within his own country and a good deal of sympathy among his neighbours to the south ; any Latin American country that becomes involved in a quarrel with the United States summons up resentful memories of economic pressure and intervention by the American Marines. But Mr Herter's careful policy of restraint and patience appears to be paying off. The much publicised conference of underdeveloped countries that is to meet in Havana this September has an embarrassingly lop-sided list of visitors. A number of Asian and African nations have agreed to come, but Argentina, Brazil, Chile and a dozen other Latin American states have sent their regrets. Dr Betancourt at first agreed to send a representative, but changed his mind when Dr Castro declared that he did not consider himself bound by the Rio mutual defence pact of 1947 " because the revolution did not sign the agreement." Faced with a balance of payments crisis later this year and troubled by guerrilla uprisings against his regime in the mountains of eastern Cuba, Dr Castro is also menaced with being sent to Coventry by the other Latin nations in the hemisphere.

Forty Years On

The author of this article was in Russia before and during the 1917 revolution, and has revisited it several times. On his latest visit he returned to some of the places he had known before.

DURING the declining years of the tsarist regime, the public mind of Russia was marked by pessimism and self-criticism. Journalists, lawyers and doctors, while drinking tea round a samovar, would denounce their country's backwardness and compare it unfavourably with the West. Your correspondent remembers talking to some peasants at a railway station in central Russia in 1915 and one of them saying : " Russia is lost ; the French, Germans and English will come and rule her like the Varangians did of old."

The October Revolution brought with it a wave of immense self-confidence. The communists were in one sense successors to the slavophils who had preached that Russia would set an example to the whole world. This was a revolt against the West and its capitalist industrialism. In practice, however, the revolution did for modern Russia what Peter the Great had done for it 200 years before. (In the church in the fortress of Peter and Paul in Leningrad today, one tomb is decked with wreaths and flowers ; it is Peter's.) After the revolution, one would constantly hear Russians say that the task of the immediate future was to bring American methods to Russian industry ; Lenin himself, in his treatise " The Next Problem before the Soviet Power," told the doctrinaire revolutionaries of his party that they must learn from the western capitalists how to run a state.

Your correspondent remembers, during the white heat of the revolution and the civil war, hearing Lenin and Trotsky speak in the Smolny Institute, and talking afterwards to workers and soldiers' deputies, who said that Russia was lost unless revolution broke out in the West. The Russians were then living in an ecstatic state ; in their new religion, world revolution was the apocalypse that would precede a " second coming." When this did not happen, Russian ideas slowly changed. The struggle between Trotsky and Stalin was partly on this issue ; and Stalin was the greater realist.

Today, when talking to the very competent and clear-sighted staff of the Institute of World Economy and International Relations in Moscow, one can see how the Russian attitude has changed to one of calm recognition of the consolidation of the western economic and social system, and of conviction that, nevertheless, communism will triumph eventually, but by other means—by peaceful competition in the undeveloped countries. The West, one's hosts argue, has a great handicap in its record of " imperialist exploitation " ; and the peoples of Asia and Africa will remember this.

WHILE the new religion of communism has undergone this " reformation " and taken on a less emotional form, the old Orthodox Christian religion still survives and many people attend the Orthodox mass who are not communicants, but go to enjoy its beauty and the emotional experience. One incident showed your correspondent that the old religion has sympathisers in strange places. He was being shown Eisenstein's film, " Ivan the Terrible," which includes an impressive scene showing the marriage of Ivan in the Cathedral of the Archangel in the Kremlin. When the film was over, the Russian (a member of the Communist party) who had been detailed to show it, said : " I am not a believer, but I enjoy hearing and seeing these majestic Orthodox services." There is certainly an area in Russian society where the old and the new cultures overlap.

Something like this has happened also in the villages. Collective farming was not quite as unprecedented as is often supposed. Throughout central and northern European Russia in tsarist times, the village " commune," consisting of all the villagers, held the land in common and redistributed it among the peasants every so often.

One can get something of the atmosphere of a *kolkhoz* by sitting in its office while the peasants walk in and out, bringing their problems, generally concerning work in the labour brigades. The conversation had been about the popularity of the collective system. The chairman asked a peasant who had just come in whether he liked it. " Belonging to the *kolkhoz*," he replied, " has the advantage that you can get the best that is going in the way of tools, seeds and manure." And then the suspicious peasant came out in him : " I remember the old landlords," he said, " Now we have the state as the landlord. But, after all, someone must give orders." But clearly the peasants like their individual holdings and are grateful to Mr Khrushchev for lowering the taxes on them and making them payable in money, not in kind.

A return visit to a collective farm in the Ukraine first seen fourteen years ago—not in the best area, but in the sandy tract bordering the forest zone in the north—gives one the impression that the standard of living and output has increased. Nevertheless, the evidence of low productivity is striking. The yield of wheat this last season was about one-third of the west European average. The claim that Russia's butter production has increased beyond that of the United States was not substantiated by the figures given at the collective farms.

There is more freedom of expression than fourteen years ago—though not more than there was before 1917, for the tsarist regime could not effectively suppress opinion in its last days. Fourteen years ago, Trotsky was denounced as a traitor from start to finish. Now, dutiful communists tell you that he helped Lenin at first and then turned traitor. (What his treachery was is not specified, but that is at least an improvement on Stalin's time.)

When a university professor of otherwise " liberal " tendencies was asked his views on " Dr Zhivago," he said that Pasternak's book gave an unfair account of the attitude of the intelligentsia towards the revolution. Anybody who was there during those days knows that it gave a very accurate account of their mental and spiritual agony.

Fings ain't wot they used t'be!

They certainly ain't. In the days of our youth, delivery boys were pimply and pugnacious. Never did they approach the vivacity of this trouser-legged charmer on the bike. And those plastic 'fings' she is delivering have a freshness, lightness and home-appeal never present in grandma's substantial iron and copper kitchenware. Fact is, 'fings' are much better than they used to be, and Shell by developing plastics production on a big scale, is helping to make them even better.

Shell provide plastics fabricators with a full, flexible and outstandingly reliable range of materials : 'Carlona' polyethylene, 'Carlona' polypropylene, 'Carinex' polystyrene, 'Carina' PVC, all in many grades. Shell's output also includes the high-efficiency solvents, intermediates and other chemicals necessary to the plastics manufacturer. Whether it be for plastics, for industrial chemicals or for their agricultural counterparts . . . see Shell. You will soon appreciate the advantages of Shell's marketing methods and technical service.

For further information write to the Advertising Manager, Shell Chemical Company Limited, 170 Piccadilly, London, W.1.

Monsanto

Through creative chemistry, Monsanto turn yesterday's dreams into present-day realities

Now chemists fit tyres for open-air life

TOO MUCH OZONE in the air makes tyres crack. And high concentrations of ozone occur where green vegetation is sparse. This set a serious problem for tyre manufacturers exporting to California and South Africa.

To combat ozone-attack, Monsanto pioneered special chemicals. A big range of these anti-ozonants is now produced under the trade name Santoflex. This range protects many other rubber products as well as car and aeroplane tyres: from conveyor belts to shock absorbers and industrial piping.

Then there are over 20 Monsanto accelerators, which speed rubber vulcanisation and cut manufacturing costs; and there are 12 anti-oxidants, which guard rubber against ageing and deterioration under all conditions.

Monsanto chemicals solve many of the problems met in rubber manufacture, and they help make better, longer-lasting rubber products for home and overseas markets.

It's another way Monsanto brings a better future closer.

Santoflex is a Registered Trade Mark

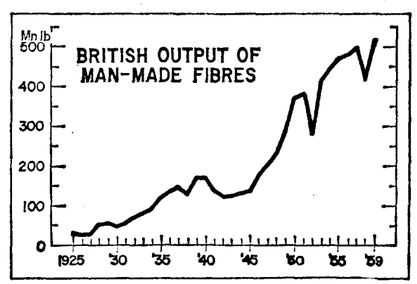
THE BUSINESS WORLD

Diversification: the Case of Courtaulds



"MOST firms in the real world produce many products, frequently add more, and are successful. In the mature industrial economy the diversified firm seems to have replaced the specialised firm of the 19th century," writes a contributor to this month's District Bank Review.* *Certainly diversification is nothing new in business, but in the last few years it seems to have become even more fashionable as a deliberate policy—demonstrating many of the strengths, some of the weaknesses, and above all the desire for self-perpetuation of big business in a changing industrial structure where the profitability of going on doing what you're doing does not stand still.*

One big British company now venturing upon a deliberate policy of large-scale diversification is Courtaulds. Rayon was one of the outstanding, science-based growth industries of the inter-war period; more recently its sales have not kept pace with the growing spending power of the mass consumer. New man-made fibres appeared to compete; Courtaulds went into them, and is still developing fresh fibres. It could increase its share of total business—until 1957, when by buying British Celanese it became virtually the whole British rayon industry. But textiles—even man-made ones—no longer seemed to offer growth in the style to which this group, technically and managerially, had become accustomed. So Courtaulds has now started to live more adventurously.

SHAREHOLDERS of Courtaulds Limited have always had to be patient fellows. In this company's version of stewardship, rewards to the owners of the business have never ranked high, though the company could well afford to be more generous. Instead, it has chosen to keep a large cash surplus and run a gilt-edged fund on the side. Moreover, in recent years the textile industry as a whole has had a rough passage, and rayon, the maid of all work, has suffered like cotton and wool. Recession cut Courtaulds' gross profit before tax to less than £14 million in 1957-58 and 1958-59 (the year ends in March), from an average of over £18 million in the previous four (it has now recovered to £21 million). The 1958-59 dividend for the ordinary stockholders, though raised from 8 to 9¾ per cent (twice covered by earnings), indeed represented a return on the net tangible assets of only 2½ per cent.

Lean years for shareholders, however, left the company with fat reserves—and no problems, once it took the plunge, in finding the money to buy its way in elsewhere. A big adventitious jump in liquidity had followed the forced sale of almost its entire stake in the giant American Viscose Corporation in 1941. After the war Courtaulds expanded old plants and built several new ones (returning to the United States as a producer in 1952); yet its resources have remained far in excess of needs. And with net tangible assets valued at over £130 million, the directors had little fear of being disturbed by a take-over bid.

Its purchase of British Celanese in 1957—for a price that many thought dear—ante-dated the change. That was a defensive move: overnight, the dominant producer of rayon became a monopolist, seeking by rationalisation to win a more profitable share of a protected home market that no longer offered prospects of rapid growth. Ever since the postwar boom was briefly punctured by the 1952-53 recession, when for the first time Courtaulds had to close a factory, the directors had discussed the merits of spreading the company's interests. But it was not until the bottom suddenly seemed to fall out of the rayon market in 1957-58 that the diversifiers triumphed over the conservatives and the new policy was launched.

UNLIKE some textile firms, Courtaulds did not move into strange fields like brick-making and cake-shops. It has carefully shopped around for companies operating in related, but more rapidly growing markets: paint and packaging in particular. The basic research and raw materials of paint manufacture have something in common with man-made fibres—though the markets are different—and Courtaulds has long

* "Is Industrial Diversification Desirable?" by Dr Lloyd Amey, University of Nottingham, *District Bank Review*, June, 1960.

had a big stake in packaging through British Cellophane. Group Developments Ltd. was formed early in 1958, and within a year it bought four small companies in paint and packaging for a total cost of £2¾ million.

Plainly redeployment, if worth doing at all, had to be on a bigger scale. So last December Group Developments concluded a royalty agreement with Glidden International, the subsidiary of a leading American paint manufacturer, which gave it exclusive use of the company's know-how and formulations in Britain. A month later Courtaulds bought for £9.3 million Pinchin Johnson and Associates, the biggest paint makers in Britain after ICI, with large interests in the Commonwealth. Since then Courtaulds has strengthened its textile interests in a small way. It swallowed Harbens, a small rayon firm (later selling the firm's yarn processing facilities to a company that does not make a directly competitive product); and took a step in forward integration (more of a novelty for Courtaulds than for Celanese) by buying Gossard, the corset and garment makers, for £2,362,000. And Courtaulds' experience in making rayon pulp has led to the formation, jointly with the Colonial Development Corporation, of a £10 million company to manufacture in Swaziland unbleached sulphate pulp for the paper and board industries.

At the same time the company started to make fuller use of its technical and engineering resources. Courtaulds designs and builds its own plants, and after obtaining a £4 million contract from Russia for a plant to make cellulose acetate yarn, it set up Prinex Ltd to export complete plants of any type within the general field of the process industries. Since then Prinex has obtained three more orders from Russia, worth about £15 million in all. Courtaulds Technical Services was formed to offer a "package" consulting service outside the group. The design and supervision of the construction of a research laboratory for Pilkington Brothers, the glass makers, and a school of chemistry for Bristol University, each costing over £1 milion, are two of its recent contracts.

WILL the board now digest what it has or quickly add to its responsibilities? The policy is "to make further acquisitions from time to time but only when reasonable opportunities occur and when a careful evaluation indicates that some part of the group's resources could be profitably employed. . . ." There has certainly been no hint—and no historical reason to suppose—that this board would consider setting aside for development only a certain proportion of its surplus cash, and returning the rest to shareholders.

Meanwhile, the merger with British Celanese has begun to pay off. Production and marketing have been reorganised. Celanese, which pioneered acetate rayon (as Courtaulds pioneered the commercial development of viscose rayon), was made responsible for the acetate production of the whole group, and extended its interests in plastics and chemicals, which are sold outside as well as inside the group; the capacity of its petro-chemicals plant at Spondon has been increased by 40 per cent. One measure of the gain in efficiency is that profit margins on acetate yarn and staple went up in 1958-59, though output fell slightly and prices of certain materials, particularly acetate chemicals, were reduced.

Courtaulds naturally kept in its own hands the production of viscose rayon, which Celanese did not make, and which probably accounts for over four-fifths of the group's fibre output. The fabric production of both companies was concentrated and 2,000 looms were scrapped, most of them too soon to qualify for compensation under the Government's reorganisation scheme. A new marketing division was created for the whole group, with the aim of shortening the time between successful research and sales of new products. Direct contact with users and direct advertising to the public on a large scale was something new to Courtaulds—one example of the wind of change now blowing through St. Martin's-le-Grand.

Since March last year Courtaulds has been able to show what happens to profits when a highly capitalised industry works to full capacity. Production has recovered sharply, reflecting the high level of consumption at home and the improvements in exports, but especially the rebuilding of trade stocks. Even now the published figures of British output of man-made fibres do not distinguish between rayon and other yarns, but they help to explain the revival in the group's fortunes—when it is borne in mind that Courtaulds produces about three-quarters of the total, that it makes most of the rayon—acetate and viscose—which in turn accounts for perhaps four-fifths of the output of all man-made fibres. Total output rose sharply to 547 million lb. in the year ending last March, 26 per cent more than in 1958-59, and in March alone output set a new record of 54½ million lb., bringing a final flourish to Courtaulds' year. The preliminary figures published on Thursday show gross profits before tax of £21 million for the whole year, compared with £13½ million for 1958-59, and they exclude the profit from Pinchin Johnson. With a final dividend raised from 1s. 4d. to 1s. 6d., the total distribution is 2s. 6d., against 1s. 11.2d. last year. The proposed one-for-three scrip issue may imply a further increase in the distribution. Certainly the directors do not expect the current year's results to "differ materially" from those for 1959-60. After the announcement the £1 shares rose by 2s. to 70s. 1½d., and now yield 3½ per cent.

Rayon is now middle-aged. Consumption can still grow, but it will not necessarily grow steadily, and gains will have

PRICES—HOW COURTAULDS' SHARES COMPARE

to be fought for against stiffer competition from the natural and new synthetic fibres. As rayon replaced cotton in tyre fabrics so rayon is being challenged by other materials, of which steel cords may prove a more dangerous rival than nylon (this explains Courtaulds' interest in a company making steel cords). While cotton's revival has hurt rayon in dresses—and to a smaller extent in furnishing fabrics—rayon should fare better now that fashion seems to be in a "silk" phase. When rayon lost out to nylon in stockings and lingerie, it took over the lining market (at cotton's expense), and has captured virtually new markets in tufted carpets, cheap suits and as acetate tow) in filter-tipped cigarettes. New developments that impart shrink-resistance and greater strength to viscose staple fibre when wet offer broad opportunities for rayon in sheets, pillowcases and towels, and could help it recover ground in shirts, dresses and skirts.

Courtaulds' textile interests go beyond rayon. It has a half-share in nylon, the biggest of the synthetics by volume, through its joint ownership of British Nylon Spinners with Imperial Chemical Industries. And it now has its own "wool-like" acrylic fibre, Courtelle, which is selling so well that plant capacity is being raised from 12 million to 22 million lb. a year and may well be raised further. Since the merger nothing more has been heard about the production of nylon 6 by Celanese under licence from BNS, but if Courtaulds decided against production because it would be competing against itself (as half-owner of BNS) it may change its mind now that British Enka, the subsidiary of the huge Dutch firm AKU, has decided to make nylon 6. If its half-interest in nylon is included, Courtaulds' share of total British output of man-made fibres goes up to about four-fifths.

It will be some years before Courtaulds' dependence on textiles is appreciably diminished. Of the gross profit of £13½ million in the recession year 1958-59, British Cellophane, the major packaging interest, contributed £2.8 million, or just over one-fifth. Nearly all the rest came from textiles—Courtaulds itself plus its widespread overseas interests, British Celanese and the dividends from British Nylon Spinners—with interest on Government securities providing about 5 per cent.

Profits from Pinchin Johnson and other new acquisitions can hardly make much difference to this picture for some time. Even in 1958-59 Courtaulds' gross profit was nearly eight times larger than the £1.7 million made by Pinchin Johnson (both years end in March). Assuming that the paint company does at least as well in 1959-60 the money Courtaulds spent on buying it will bring a better return than it did from Government securities: in 1958-59 Courtaulds' profits before tax but after depreciation showed a return of 9.4 per cent on the net assets, whereas Pinchin Johnson's yielded 17½ per cent (though if PJ is valued at the price Courtaulds paid, its profits yielded 9.9 per cent). But the improvement in group earnings attributable to Pinchin Johnson will be far short of spectacular.

By moving into related fields Courtaulds is diminishing the risks of diversification. But it has to prove that it can guide the new companies along the right lines, and it must guard against the temptation to foster its new loves at the expense of the old. It can be argued, for instance, that Courtaulds has not yet exploited rayon's market in the wool textile industry to the full.

Courtaulds' liquid resources stood at £28½ million at the end of March last year; since then it has spent about £12.4 million on buying Pinchin Johnson and other companies. The money is there for further ventures—perhaps a bigger stake in packaging—but opportunities can hardly be rushed. Courtaulds' stock now looks a more promising long-term investment; whether the board can turn promise into reality remains to be seen.

How Many Shops?

BY A CORRESPONDENT

GONE are the days when an aspiring entrepreneur or someone simply out of work could turn his parlour into a shop, possibly knocking down the front wall to form a display window and entrance, and garnishing the result with a hotch-potch of manufacturers' display material all over the outside. These shops remain in the side streets of big cities, though part of their *raison d'être*, the risk or the fact of unemployment, no longer prevails. But in the new towns and new estates, "corner shops" are few and far between; planning permission is required for all new building, alterations or even changes of use, and council tenants are allowed to use their houses only for living in.

Responsibility for deciding how many shops there shall be—and where—has thus been shifted from the forces of the market to the shoulders of planning authorities. The debate on "Are there too many shops?" has given way to the debate on "How many shops should we have?" To this question, as to the related ones of where, how big, and in groups of how many, different people have given different answers. The committee on new towns said in 1946 that "the number of shops in old towns is as high as one to 40-50 persons, while in the newer housing estates it varies between one shop to 150 and one to 325 persons"; it came down in favour of one to 100-150. The authors of the Southampton survey of 1953 regarded this as far too few; but their reference to "the consumers' insistence on using dispersed shops" has read strangely ever since the end of rationing and the swing to the high street in the following year. The average actual figure for Britain (excluding service trades) is about one shop for every 85 persons; the number of shops fell by 6,000 or one per cent between 1950 and 1957.

Uncertainty over what would be the ideal figure is not surprising; the problem is a complex one. If there is an optimum size of shop, measured in terms of the population served, it will certainly differ for different trades. If economies of scale extend over any considerable range, a choice has to be made between low shopkeeping costs and a short journey for the customer; if competitive prices can be expected only

when shops of the same trade are present in the same shopping centre, then in order to achieve them the customer's journey, for any given level of shopkeeping costs, will have to be twice or three times as long as if one of any given kind is acceptable. Definite answers to such questions could be given only if (unknown) value preferences could be fed into an (undiscovered) calculus which county planning offices in any case would not know how to use.

In practice the issues are decided "on the merits of the case," with the aid of some rules of thumb developed from common sense or prejudice, partly based on what has happened already and subject to some crude market tests. In the new towns, with populations rising to 100,000, the planners have decided on a three-tier structure with one "central area" shopping centre, several large "neighbourhood" centres and many more "local" ones. Single shops have been allowed, but they have tended to drop out as customers have become more mobile and the break-even point for any given kind of shop has risen. In the case of large new estates there is a two-tier structure—one main centre with 12-30 shops, and subsidiary groups of four or six each.

QUITE apart from their number and position, shops on new estates present some pretty problems. First there is the question of timing; undue delay in opening them is hard on the early inhabitants who have to make long journeys or rely on travelling shops, but retailers do not wish to take up their stand before most of the customers are there. But the large delays which occurred in earlier postwar days are not repeated now, and often retailers come in on a lower rental until the estate is completed.

Then comes the question of design. "In the building of new shops we recommend that consideration be given by planners, builders and architects to the views and needs of experienced traders. The shops should be built to house specific trades." So said the Anglo-American Productivity Council team in 1952, and it has taken all of eight years for its words to sink in. A row of uniform boxes, which to the confectioner spells wide open spaces and to the grocer a short cut to claustrophobia, has been the rule. Only now is a mixture of sizes becoming common, varying in depth as well as in width, and allowing, as a result of consultation with the prospective occupants, for appropriate unloading, handling and storage facilities.

Retailers and local authorities are united on the desirability of rear access for goods, as well as on that of parking space. But there is no accepted doctrine on who should be responsible for providing parking space. The practice of requiring commercial occupiers to provide space on their own properties is growing. Surrey requires space for one car for every 500 sq. ft. of retail selling space, Buckinghamshire one for every 375 sq. ft., and Hertfordshire one for every 400 sq. ft. This is only about one-tenth of what American supermarkets provide; but retailers, in maintaining that parking space ought to be provided out of the general rate fund, are on firm ground at least in pointing to the impracticability of hosts of small car parks.

They are less enlightened in their insistence that the best shop location must face a roar of through traffic; in their despondence about the effects of by-pass routes on old high streets; and in their reluctance to front upon pedestrian ways. Certainly planners might sometimes site their new centres more effectively within sight and walking distance of main roads rather than bury them in some "precinct"; but no one who has wandered down Rotterdam's Lijnbaan—or visited Stevenage—could still hold that prosperity for the shopkeeper is inseparable from diesel fumes and the screech of brakes. Is it not Venice, with its absolute insistence on the separation of vehicular and pedestrian traffic, that represents the city of the future and points the way to pleasant shopping?

WHAT decides who shall occupy the shops when they are built? In the earlier postwar days, when bricks could ill be spared from housing, such shops as were built on new estates had unusually high monopoly values; ideas of "proper" rents were still based on prewar values, and the price mechanism was in disfavour. In the resulting disequilibrium of supply and demand, shops were allocated according to who put up the most convincing case or, it sometimes seemed, according to who stood the right people the right drinks. Whatever the political colour of the council, the Co-operative movement could always make a strong case based on the number of its members on a housing estate, and the need of the retired local footballer was also hard to resist. An attempt by the London County Council to allocate by fixed ratios between the different organisational types was resisted on principle by the multiples.

Nowadays, often through a development company, tenants are charged what the market will bear; often, as empty shells on new estates testify, perhaps a little more. The interested retailer can find out which shops are already taken up and by whom before he makes his decision; thus the "mix" of trades is determined by commercial calculation free of the hazards that would attend any rigid "highest bidders" procedure, or of the distortions that might accompany purely administrative decisions. The disadvantage of a system in which rents are fixed and advertised, and no over-bidding is possible, lies in the fact that for a centre that would support, say, one chemist but not two, or two supermarkets but not three, a premium attaches to "getting in first" through the careful nurturing of contacts. The American situation, where the well-known company or the department store branch, which acts as a draw to others, gets lower rents per square foot, is not yet practised here, or at any rate it is not acknowledged; nor does the landlord or developer agree, as in the United States, to accept a lower fixed rent in exchange for a percentage of the takings.

Administratively, the pattern for the future seems to be settling down into a satisfactory partnership between public control and private enterprise, with now one, now the other, taking the initiative, and the public authority properly having the final say. Both parties suffer from the lack of adequate research into shopping patterns or retail economics, and their likely future trends. Using guesswork in the absence of such research, however, one might suggest, first, that far more thoroughgoing action than is at present contemplated to save the town-centre shopping areas will be the cheapest policy in the long run; and secondly, that fewer but larger suburban shopping centres will be the most profitable as well as the most satisfactory to the de-proletarianised consumer of the sixties and seventies.

The Bull 300 DP Series

(a fully synchronised unit system)

flexible, fast and expandable

Basic Elements	*Basic Speeds*
✱ Card Reader	300 cards per min.
✱ Card Reader/Punch	300 cards per min.
✱ Arithmetic Unit (× ÷ + −)	300 cycles per min.
✱ Printer	300 lines per min.
✱ Programme Unit	

Input/output speeds may be doubled by the addition of further units; and a second Programme Unit can be attached, increasing programme possibilities and enabling even further expansion of input/output units.

The 300 DP Series will expand into an electronic system with the incorporation of one or more of the following units, as required:

✱ Gamma 300 Computer ✱ Magnetic Drum Extension ✱ Multi-Selector and Magnetic Tape Units.

This is Data Processing Equipment with the widest possible range of expansion, applicable to the problems of both large and small organisations.

Specialized Vehicles for Public Service

Municipal authorities in the U.K. spend millions of pounds a year on commercial vehicles and their equipment. Many are designed for specific duties and service conditions. These specialized vehicles and their operating methods provide the subject for special articles in a much enlarged Municipal Transport issue of *The Commercial Motor*, on sale today. Here are some of the informative special features:

Lessons in design that British municipal authorities can learn from overseas.
Desirable features in municipal vehicles as seen by a London local government officer.
Road test of a new light ambulance and a review of the latest ambulance designs.
Coventry City Council use bigger refuse vehicles to combat labour shortage.
The difficulties of refuse collection in London.
The possibility of the electric vehicle staging a comeback in public cleansing.
A forecast of vehicles to be seen at the Public Cleansing Conference.
In addition to all the usual news items.

The Commercial Motor is one of fourteen opinion-shaping journals published by Temple Press Limited. Each of these publications is a leader in its field—and not only in the home market.

Every year, more than 2¼ million copies circulate in 133 countries throughout the world. The specialized journals of Temple Press are authoritative and informative. It pays to advertise in them.

BUSINESS NOTES

THE ECONOMY

A Turn in Prices?

LATE last month 40 per cent of the industrialists who reported to the Federation of British Industries in its four-monthly inquiry into business conditions and confidence still said that their level of output was below full capacity, though many had less unused capacity than in February (when 45 per cent were still reporting some slack in operations). Only 16 per cent of them, when asked whether they expected any factor to limit their output during the next four months, mentioned plant capacity; shortage of skilled labour was the factor most generally expected to act as a brake on output. Britain's businessmen, as sampled in the 714 companies answering these inquiries, still feel more optimistic about the general business situation than they did four months ago; but the proportion recording increased optimism is smaller than in February, and there is still a preponderance answering "Same" (which probably includes a proportion of "Don't knows").

Two of the replies recorded in this latest sampling seem particularly significant. Practically as many firms are now recording a fall in weekly hours worked per operative as are recording an increase. Although this may denote the effect of the cut in standard working hours per week in engineering—which in some firms has meant an actual cut in working time—it suggests that there is little more output to be had by pushing up overtime further. Secondly, for the first time since these inquiries began just over two years ago the majority of the businessmen recording changes in price are reporting that their prices are up. From a group which steadily, during the tail-end of inflation and the period of price stability, had reported that their own prices at least have fallen, this reversal sounds particularly convincing; it suggests that increases in wages, particularly in engineering, are now being passed on at home as well as abroad. One may hope that the increases now being reported have as little reflection in general price indices as the falls that were reported before seemed to have: but none too confidently.

AS BUSINESSMEN SEE IT

Per cent working to capacity	*38*	*50*	*53*	*58*

Orders Still Rising

FROM the indications of this FBI survey, industry's delivery periods would appear to be extending. Far more firms are reporting increases in the rate of new ordering than decreases; the length of order books is growing; many are obtaining more new export orders, though not as many as are doing better at home; and orders for capital equipment, equally, would appear to be growing at a very healthy pace. Work in progress is increasing, though not necessarily from the signs of this survey as much as output in general; stocks of raw materials are still rising; but roughly as many are reporting decreases in the stocks of finished goods as are reporting increases. Once again these businessmen told the FBI that they expected to authorise more capital expenditure in the next four months than in the last four; but this tendency towards increased investment is not as strong as in February.

The level of activity remains uneven: in the vehicle industries and in chemicals plants are operating close to capacity, but in some other sectors, such as the food processing industries, things are still slack.

All in all, the impression given by this eighth inquiry is somewhat in line with that given by an experienced steel merchant this week, looking at his wide range of metal-using customers: "People are generally busy all round, but it's not a boom in the sense that we've had them twice or three times since the war." Many firms are extremely short of skilled labour—and are sending recruiting teams around the country, advertising for interviews with likely staff in local hotels—nor is even workaday labour, for example stokers for coal-fired heating equipment, easy to find. Machine capacity is hardly setting any limits to output at all generally; human capacity is.

EXCHANGE MARKETS

Sterling, Mark and Dollar

THE first effects of the two opposite movements in world money rates on Thursday of last week were favourable to sterling. The reduction from 4 to 3½ per cent in discount rates at two Federal Reserve Banks, discussed on page 1096, brought the rate on United States Treasury bills down to 2¾ per cent, more than 1¼ per cent below London. At the same time, the increase in the German Bank rate from 4 to 5 per cent was accompanied by new measures to deter an inflow of foreign money. German banks are again forbidden to pay interest on foreign deposits (they also have to keep a specially high ratio of minimum reserves with the central bank in respect of such deposits); and the Bundesbank has forbidden the sale of money market paper to non-residents. These stipulations led to some withdrawals of foreign deposits from Frankfurt at the end of last week, and most of these interest-sensitive funds were naturally switched to London rather than New York. A commercial demand for sterling in New York also helped to lift the sterling rate. After the Whitsun holiday sterling weakened a little on selling from Paris, though the spot rate kept just above the parity of $2.80. The rate against the mark was near its lower limit, but this results directly from the fact that the mark is hard against its upper limit on the dollar, at 4.17.

It should not be difficult to deter genuine short-term investment of foreign funds in Germany, simply because there is no organised money market there. But tighter credit will increase the pressure on German banks to borrow abroad, and to continue to repatriate their own funds from foreign money markets. These foreign balances have declined by about 1 billion marks from their peak of 4 billion marks last autumn, and there appears to be scope for further appreciable liquidations. Such liquidations pose a threat not only to the reserves of the country from which the funds are withdrawn but also to the domestic credit policy of the Bundesbank, which in buying the foreign exchange from the German banks increases their liquidity.

Exchange Margins Again

SOME gossip has therefore spread outward from certain foreign dealers in Germany that the Bundesbank may decide to widen its dealing margins, in the hope that an appreciation in the mark against foreign currencies would immediately deter banks from repatriating foreign balances at an exchange loss. After the experience of 1957,

any talk about revaluation or widening of dealing margins is apt to be viewed with trepidation in London. In practice, while there have been a few signs of speculative motives in transfers or retentions of foreign money in Germany, the exchange markets have been comparatively undisturbed by this talk—which is a sign that they do not take it seriously.

It may be pointed out that there are likely to be at least two significant differences from 1957. In the first place, the British Treasury and the Bank of England this time, one imagines, will themselves put the arguments in favour of a status quo (that even a shift which may be desirable in itself may be dangerous because it brings in question the stability of exchange rates as a whole), rather than arguing for a change and thus intensifying speculation. Secondly, and no less important, this year it is in Germany that the economy is bursting at the seams. The Government, the central bank and industrialists in Germany are in grave fear that trade unions will take advantage of over-full employment to secure "excessive" wage increases. Since the German authorities refused to court a rise in export prices through exchange appreciation in 1957, when inflationary pressures were not yet in sight, it would be surprising indeed if they changed their minds now.

STEEL

More Than Ever

Now that fuller results are in for the census of steel stocks taken at the end of March, more reliable estimates of the actual consumption of steel at the beginning of this year can be made: they suggest that in the first quarter Britain used some 3,800,000 tons of finished steel products, more than ever before. The previous peak in consumption appears to have come (allowing for seasonal influences) in the first quarter of 1959; in the first quarter of this year the economy was using 5 per cent more steel than at that time.

During the quarter consumers' stocks rose for the first time in two years—by about 172,000, or 5½ per cent. This represented a rise of 7.2 per cent in the stocks held by private industrial customers, partly offset by a continued decline in steel stocks in the public sector. But if the estimates of actual consumption can be relied upon, even this increase in steel stocks still represented a decline in terms of the number of weeks' consumption in stock—from 11.7 to 11.2 weeks. Consumers are still managing on shorter commons for steel, in terms of their much higher current output, than during earlier periods of peak engineering output.

It is not easy to link up the rise in apparent consumption of steel with output in the metal-using industries; after being much lower than might have been expected during the last half of 1959 consumption appears to have swung upward more than would have been expected during this first quarter of 1960. The Iron and Steel Board reckons that one of the reasons for the difference could be the expansion of the amount of work in progress in the engineering industries; a more rapid recent build-up of work in industries making more complex equipment with a longer production period, such as machine tools and heavy plant, could feasibly be contributing to this effect.

SKYBOLT

Mixed Feelings

For every expert who approves Mr Watkinson's choice of the Skybolt missile for Britain's air defence in the 1960s, there is another who does not. No one doubts that the rocket can be built, but opinion is divided—sharply and irreconcilably—on whether the parent aircraft can be navigated with the accuracy required to release Skybolt at whatever pre-determined point is necessary for it to arrive anywhere near its pre-determined target. These misgivings are shared by both the men who build the bombers and the men who fly them—and are by no means confined to this side of the Atlantic.

What is plain, however, is that Mr Watkinson has hit on a neat solution for the most pressing difficulty facing the British aircraft industry—lack of work. The cancellation of Blue Streak, combined with the normal running down of orders for "ordinary" V-bombers, would have brought military aircraft production to a very low ebb within a year or so. Had Mr Watkinson chosen to replace Blue Streak by a rocket that could put to sea, like Polaris, or one that could travel by rail, like Minuteman, he would have left the aircraft industry beached like a stranded whale. By choosing a rocket that has to be carried on an aeroplane, Mr Watkinson has floated the whale off the beach again. Skybolt implies both additional orders for V-bombers and eventual orders for a V-bomber replacement. It is wholly ingenuous to pretend that the few V-bombers still to be delivered (most of Bomber Command consists of obsolescent Valiants) will be adequate to carry Skybolt in the second half of the 1960s. The V-bombers were designed in 1946; by the time Skybolt is ready for delivery in 1964-65, they will therefore be nearly 20 years old in conception, and those that are in service will be growing structurally weak.

The kind of aircraft likely to be ordered could be a disguised version of the supersonic airliner that Mr Sandys has a yen to build, or it might, since a Skybolt carrier has no need for speed, merely be a modified civil airliner of the VC 10 class.

The cost of this—say, £2 million for each aircraft and three times this sum if it is supersonic—must be added to whatever price Mr Watkinson has contracted to pay for Skybolt before deciding whether the Minister of Defence has bought a bargain or a pig in a poke. But Mr Watkinson does not know himself what this cost is likely to be. Skybolt is an assembly of bits and pieces of other rockets, including the engine of one and the guidance system of another, and it is hoped that for this reason its cost of development will be low. But no one will have any idea of the amount of work that will be needed or the price of constructing Skybolt for another year. The Minister has not signed a firm order for a specific number of missiles; how could he, when it is still not clear whether the weapon will ever go into production? He has left behind a minute of intent which gives his scientist entrée to the drawing offices where the preliminary work on Skybolt is being done. And he has brought back with him a major problem for Bomber Command which relies at present on protecting its deterrent force from surprise attack by remarkable speed in getting its bombers off the ground. Encumbered with Skybolt, they may not get off the ground as quickly as they do now; and the cost of an alternative, the "airborne alert" as practised in the United States, would be prohibitive. It costs £300 an hour, or £7,200 a day, to keep one single jet airliner in the air; to keep even 20 bombers permanently in the air would cost the RAF about £1 million a week. Should this figure, too, be added to the bill for Skybolt?

IN THE MARKETS

Bumping Along

Not surprisingly, in view of the growing expectation that Bank rate will be raised before the summer is out, gilt-edged prices have continued to weaken. The possibility that credit will become dearer has probably been more of a depressing factor in this market than the small amount of further selling by the banks in advance of the closing date for the call for special deposits. The equity market, especially when the general level of yields is still comparatively low, cannot escape from the repercussions of tighter money. This restraining influence has prevented equity prices from moving ahead rapidly, despite the continuation of encouraging reports of higher profits and dividends.

The Economist indicator put on 5.5 to 361.8 in the week to Wednesday. Equity prices have been bumping along at a level about midway between this year's high and low points. This should surprise no one; a balance had to be struck between the possibility of greater credit restraint and higher interest rates and the prospect of higher earnings and dividends. The principal factor making for strength in the London market this week was the rise in prices on Wall Street, where easier credit policies prompted sufficient buying to send the Dow Jones average above 650, the highest point it has reached since the middle of January. The American flavour in the London market was seen in the strong advance of such international stocks as Philips Lamps and Unilever, whose earnings yields are big enough to attract American and Continental buyers but whose dividend yields can have little attraction for investors paying British tax.

COTTON TEXTILES

Lancashire's Good Times

This year the Lancashire textile industry "has it made." Production is high, order books are long and profit margins good. Most mills will be busy right up to the end of the year and probably well into 1961. Spinners are turning out about 15½ million lb of yarn a week, a little less than a year ago, when the recovery was well under way but before millions of spindles had been scrapped under the reorganisation scheme and thousands of workers discharged. For the same reasons cloth output, at about 38 million yards a week, is slightly lower than a year ago. The loss of machinery and labour has been almost offset by more intensive working. Ring spindles have recently been running for 55 hours a week, nine hours more than a year ago, and hours run by looms have increased from 52 to 59 hours a week. Put another way, this means that roughly one-fifth of the total spindles are now on shifts, and about 30 per cent of the looms. Contrary to most expectations the industry as a whole is short of labour, and while the unions have co-operated willingly in shift-working this cannot be introduced faster than extra workers are recruited.

In some ways it is unfortunate that the reorganisation schemes happened to coincide with a world-wide recovery in demand. Certain textiles, such as check fabrics, narrow drills cloths and fine cambrics are exceptionally hard to come by. Merchant converters, anticipating long deliveries from home mills, scoured the world for alternative sources and textiles are pouring in not only from traditional suppliers in Asia (which are limited by quota in the British market) but from Europe and farther afield—including, of all places, Jamaica. Imports from Spain have increased sharply, and Spanish and Dutch yarn is being offered to knitting firms here at prices which after payment of duty are well below domestic prices (the spinners have applied for an anti-dumping duty on Spanish yarn).

Meanwhile the finishing sections—the bleachers, dyers, and printers—are awaiting with some impatience and anxiety the publication of a scheme to eliminate their own surplus capacity. The special committee of the Cotton Board is now completing its proposals, which seem certain to be far more complicated than those for the spinners and weavers. It is hoped that a scheme can be approved by the Board of Trade and laid before Parliament in time to receive authority before the recess in July.

CDC AND IFC

Decision Needed

The report of the Colonial Development Corporation published on Thursday recorded an active and financially successful year in 1959, with a profit after charging interest on capital of £1,334,286, but pointed at the same time to the big uncertainties hanging over the corporation's future. The scope of its activities under present legislation is shrinking as fast as the colonial empire. While CDC is allowed to continue with projects started before countries become independent within the Commonwealth and may provide technical and advisory services, it is not allowed to commit any money for new projects—and it is primarily money that these countries want. Secondly, after undertaking a record number of new projects in 1959 and new commitments since the end of last year bringing the total to £115 million, CDC is coming close to the ceiling of £130 million that it may borrow from the Government at long-term. Until the Government decides to reorganise the capital of CDC on lines such as those laid down by the Sinclair report (which Whitehall has now been sitting on for considerably longer than the members of the committee took to deliver), CDC cannot hope to take advantage of its power to raise £20 million privately. The case for relieving the corporation of the deadweight of special losses incurred in its unhappy early years is very strong, as is the case for extending its sphere of operations to the whole Commonwealth. The formal objection that this involves commitment of Treasury money to independent countries no longer holds water. Treasury money goes to independent Commonwealth countries through other channels, and when it goes through CDC it usually carries some private money with it.

Meanwhile, CDC is seeking opportunities to work in co-operation with international agencies such as the World Bank, the International Finance Corporation and the proposed International Development Association. CDC hopes that in certain cases these organisations may find it convenient to link their funds with CDC's organisation and experience. CDC has already worked together with the World Bank at Kariba, and it has now announced its first venture with the International Finance Corporation. This is in a project to grow and mill sugar cane and produce refined sugar in Tanganyika for the home market. Together with two Dutch companies and local investors in Tanganyika, IFC and CDC are providing a total of some £3 million. This is subscribed in 7 per cent debentures, convertible income notes contingent on earnings, and, except in the case of IFC which gets an option on them, in ordinary shares.

OIL TERMINALS

Supertankers in the Mersey

The average size of oil tankers on order or under construction has grown rapidly in recent years: ships of 50,000 tons and more are now common, though most of those recently completed seem immediately to have been laid up for want of cargoes. But the desire for the considerable economies which these larger ships are expected to bring in the future has produced a need for new terminal facilities in Britain; only Finnart, on Loch Long, can now take 100,000-tonners. Esso and British Petroleum are developing Milford Haven, which can accommodate ships of up to 100,000 tons; Esso is building a refinery there, and BP is building a terminal to serve its Llandarcy refinery. Now Shell has completed a terminal at Tranmere, across the Mersey from Liverpool, capable of simultaneously unloading two tankers of 65,000 tons (and even larger ships on restricted draught), to supply its refinery at Stanlow, eleven miles up the river. Begun eighteen months ago, the Tranmere terminal was baptised this week, for the benefit of the press and sundry officials, with a part-cargo of Kuwait crude delivered by the 38,000-ton *Zenatia*,

Continued on page 1127

ONE peculiarity of the advice on Cunarder replacement tendered by the Chandos committee to the Government—at least as appears from the summary of the committee's report published in *Hansard* last week—has caused some discussion in the shipping industry itself. The committee was asked to consider how the British express passenger service across the North Atlantic could best be maintained so that the Government could decide how it might most reasonably meet its election commitment to assist Cunard in replacing the *Queens*. Instead it appears to have confined its detailed recommendations to the question of a replacement for the *Queen Mary* alone. It assumed that if by the time that a replacement for the *Queen Elizabeth* becomes necessary no major change has occurred in the need for the maintenance of a British express sea service across the north Atlantic and in its commercial prospects that the government would help in an "appropriate manner."

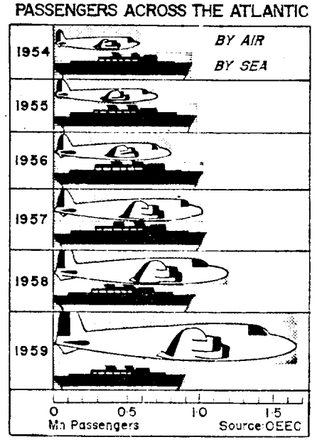
To tackle this problem in halves seems to involve drawing a fairly fine line. The two *Queens* are only four years apart in age, less time than the replacement for one will take to be built. At issue is Britain's stake in the world's most prestigious ocean passenger service: a weekly service, requiring two ships on each five-day run. This can only mean the replacement of both ships; and, if the two new liners are to be of the size that both the company and the committee have in mind, then an investment of £60 million, not £30 million, of public and Cunard's money may eventually be involved.

AS was noted in these columns last week, the published summary is also singularly lacking in any statement of the committee's view whether a liner service of the kind that it recommends to replace the *Queen Mary* is in the future likely to prove profitable. This year attractions such as the Olympic Games in Rome and the Oberammergau passion play have meant increased bookings for the north-Atlantic liner companies. But in the last ten years the number of trans-Atlantic travellers who chose to go by sea has increased only very slightly from year to year. In 1958 and 1959 the number of sea passages actually fell quite sharply, though it is fair to note that Cunard achieved a perceptible increase in its own share of the declining business. Meanwhile air travel across the north-Atlantic has grown fourfold since the early fifties.

The main question regarding traffic therefore, is how far the advent of cheap and fast jet air services across the Atlantic will deprive shipping, not only of any growth, but also of some of the custom it still attracts. The "cheapness" of air transport is only relative. If price were the sole criterion, clearly four or five days in a luxury liner would be better value for money than seven hours cooped up in an aircraft. But time and speed are the trump cards of the air line.

Already, however, one can see developing a habit of "going one way by sea," not only among businessmen and government officials (on "medical advice"), but also among American tourists. The executive, on an expense account, can afford the most luxurious accommodation and service; the tourist, the emigrant, and the student do not normally want it. From this division of the market have originated the various proposals of two American groups to provide cafeteria-cum-dormitory accommodation in monster liners—though these, as proposed, do not appear at all assured economic ventures.

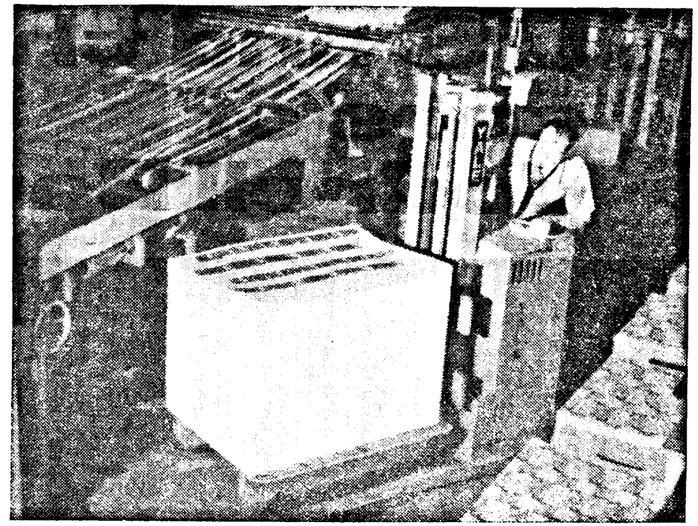
A more viable answer could possibly be between these two extremes—the luxury liner and the floating snack bar. Cunard does not think so; after 120 years of experience in the north Atlantic passenger service the line believes that it knows all the answers. But the impact of air competition is now very severe, and Cunard, despite its belated interest in Eagle Airways, has lagged behind other shipowners in taking an active interest in civil aviation.



COMPETITION from the air has not, however, deterred Cunard's principal competitors on the north Atlantic from replacing their ageing ships. Their new liners are providing more space for tourist passengers and most have dispensed altogether with cabin, or the middle, class of accommodation. All these new liners are also receiving some form of subsidy. The United States government pays a subsidy to meet the difference between American and foreign shipbuilding costs, at present some 50 per cent of the total construction cost, and a differential operating subsidy on the same basis with certain concomitant regulations. The replacement for the *America*, which is soon due, will presumably get this help, as did the *United States*.

The French government pays shipbuilding subsidies similar to the American. But in any case the French Line is owned by the state, and the *France* received a direct subsidy amounting to about three-fifths of its building cost. Holland, being a low-cost shipbuilding country, does not pay direct building subsidies, but low interest loans are available for new ships.

Cunard itself is by no means unfamiliar with government aid. It first came into business in 1840, indeed, as the result of obtaining a mail contract. But in 1903, when it received help to build the *Lusitania* and *Mauretania*, it was the state of world relations then that moved the government to its decision. In the thirties, when the project for the two *Queens* was revived with the help of the government, it was the problem of unemployment that formed the basis for the loans from Whitehall.

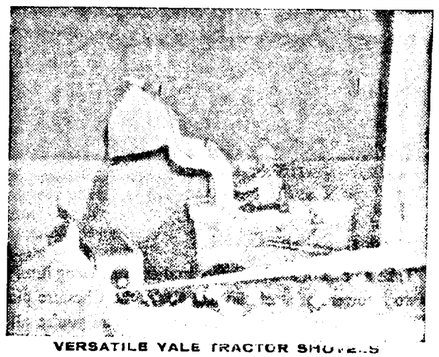


Today it is difficult to think of any comparable "external" motive for assisting this company to stay in a business in which its competitors, both air and sea, get the glad eye from governments; this is direct competition between nations for shipping prestige. The *Shipping World*'s description of the Chandos-approved government commitment this week as "house-flag discrimination" may well be representative of private opinion in the shipping industry. It is also being asked why the commitment to keep a transatlantic service in being should confine the government support to one favoured company. No other British shipping company has yet been offered any selective government assistance, though all lines meet similar problems of subsidised competition all round the world. Suggestions have come from other parts of the industry that two smaller and much less expensive liners, with more flexible opportunities of profitable employment all the year round, might be a more suitable and economic proposition for the next twenty-five years. P & O and Orient, it should be noted, are building two liners of about 45,000 tons gross, to carry as many passengers as the two *Queens*, at almost the same cruising speed, in any trade, for a total cost for the two of about £30 million, without any help at all.

PASSENGERS ACROSS THE ATLANTIC

WORLD YALE & TOWNE REPORT

REDUCE AISLE WIDTHS WITH YALE WAREHOUSER TRUCKS

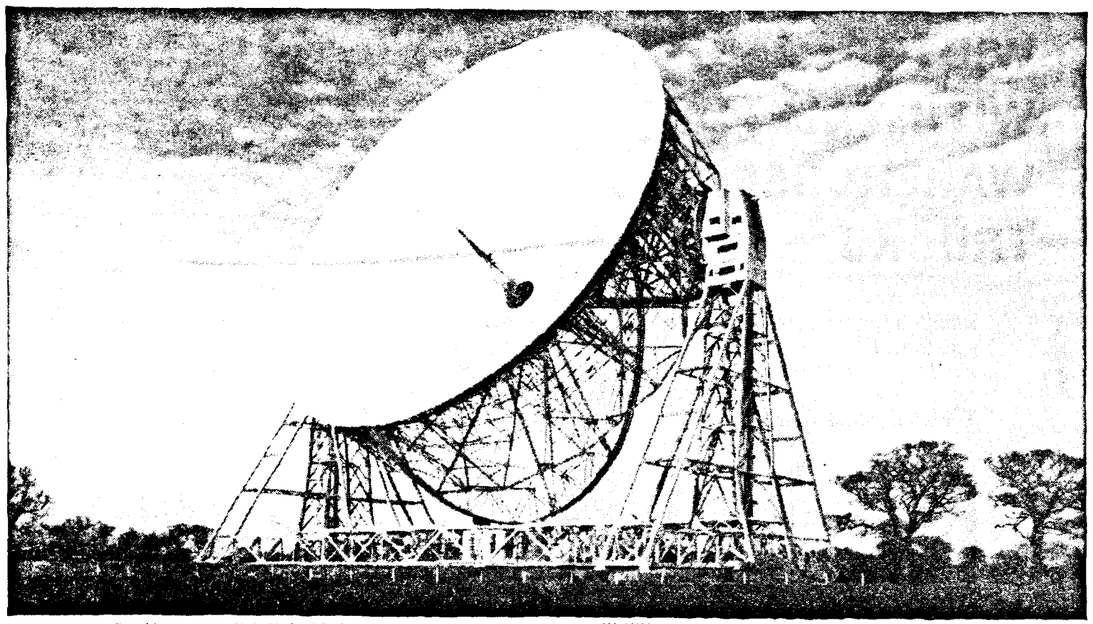


MAIDENHEAD, ENGLAND—This pleasant Thames-side town has thriving industry, too! Here a stand-up Yale Warehouser stacks pallets of carton blanks 13 feet high in a printing plant. You can reduce your aisle widths with Yale Warehousers and store more goods. These trucks manoeuvre easily and turn within their own radius. They lower the cycle time from load to load, and ease of maintenance makes them economical as well as efficient.

FUTURE TYRES MOVED QUICKLY, EASILY

WOLVERHAMPTON, ENGLAND – A top tyre-producing plant uses Yale fork lift trucks to carry palletised sheets of rubber which will eventually become the tyres for those sleek new British cars. Palletising loads saves time and money in every step of manufacturing, from raw materials to delivery of finished product.

VERSATILE YALE TRACTOR SHOVELS SET NEW PERFORMANCE STANDARDS



CAGUAS, PUERTO RICO – 2500 lbs. of raw sugar can go into the feeder in this sugar mill with every trip made by this Yale tractor shovel. With more power than competitive models, safety arms to protect the operator, rugged, simplified design and economy of operation, Yale tractor shovels give more efficiency – 25% more work per hour.

- **Yale makes the world's most complete line of petrol, LP-gas, electric, diesel and hand lift trucks.**
- **All Yale industrial lift trucks are uniformly high in quality, wherever manufactured.**
- **All Yale equipment available in currencies of the free world.**
- **For further information contact your Yale sales and service representative—located in principal cities of the world.**

*US and the ears of Jodrell Bank

Consulting Engineers: H. C. Husband & Co.

Take a bowl of steel 250 feet in diameter. Hang it on lattice-work towers of steel 180 feet above the Cheshire plain. Do mysterious things with electronics. Then you're all set to track a satellite or a moon rocket, or catch the radio waves from outer space. At Jodrell Bank is a telescope with a difference—a telescope that hears, a bowl that listens.

US built all 2000 tons of the Jodrell Bank Radio Telescope. Fabricating, assembling, and erecting the framework and the bowl comprised just one of the many steel erection jobs that come so naturally to the United Steel Structural Company (a subsidiary of the United Steel Companies Limited). If you want some steel made and put up—a bridge, an office block, or even a radio telescope—get in touch with this specialist company. Remember, they're one of US.

the largest tanker yet to discharge in the Mersey.

The new terminal could completely supply the requirements of the Stanlow refinery, which has a throughput of 5½ million tons a year; initially it will supplement the Stanlow and Queen Elizabeth II oil docks at Eastham, six miles away, both of which are limited to ships of 30,000 tons. Total cost of the project is £6 million, divided in an undisclosed proportion between Shell and the Mersey Docks and Harbour Board, which co-operated with the company in the design and construction of the terminal and will share in its operation; the board will receive royalties on each ton of oil unloaded.

Located beside the shipyard of Cammell Laird, the terminal consists of two floating stages, each 366 feet long, connected by a Y-shaped, reinforced concrete jetty to the shore. There are six 20,000-ton crude oil storage tanks, located on 32 acres of land reclaimed from the foreshore of the river; from these oil is sent through a 24-inch pipeline to Eastham, where it is pumped through existing lines to Stanlow. The tide in the Mersey often varies as much as thirty feet, and a large tanker may also rise as much as thirty feet while its cargo is being discharged; this has made necessary some ingenious engineering. The mooring points—six for each stage—consist of circular pontoons which slide up and down steel tubes five feet in diameter, as the tide changes. The largest of these steel tubes is 130 feet long, and weighs over 100 tons; they were produced by Mannesmann AG in Germany, and Shell states that they were not available in Britain when the terminal was being built.

PATENTS

Keeping up with Inventors

PATENT offices in all countries generally seem to suffer from a chronic shortage of staff; and the report from the Comptroller-General of Patents for 1959 shows that this remains entirely true in Britain. The backlog of patent specifications awaiting examination reached 37,068 by the end of 1959. Only 33,653 new specifications were filed during the year—compared with 21,223 in 1950—so there is a delay of more than a year before a specification is first examined. The process of examination may take one or two more years, so that there is an average delay of two or three years between the filing of a specification and its publication.

This sort of delay has been normal for so long that inventors have become inured to it; the Patent Office has done well to prevent it lengthening as the number of applications rises. Many patentees in fact like to be able to keep their inventions secret from their competitors for as long as possible. But the patent system exists to spread technical information, not only to protect inventors; such delays are against the public interest. The only inventors to suffer are those of ephemeral gadgets; by the time they get a patent and would be able to act against infringers, their invention may well have gone out of production. Delays in the registration of trade marks—which have recently been increasing—are more troublesome for industry, because a company will often want to use one soon after creating it. Here there is less excuse for delay, because the searching is done by executive class civil servants of the Board of Trade, not by specially skilled scientists. The Board's policy of moving staff through the trade marks department as part of their normal service, instead of allowing them to become specialists, is thought by some to reduce the department's efficiency. Computers do not seem to be the answer to this problem: people should be able to do the job better and more cheaply, if only the Board could get enough of them.

The chief difficulty of the Patent Office in maintaining a staff adequate to handle its work without delays is that of recruiting science graduates in competition with industry. Only those with first or second class degrees are considered—which is perhaps an unnecessarily high standard—and the basic starting salary is now £655, with extra for post-graduate experience. This is £50-£150 less than a graduate could get in industry; but the patent examiner will, virtually automatically, get promotion to a salary of £2,350, so that by middle age he may be earning about as much as the average scientist in industry. There was a net increase of eight in an examining staff of 408 last year. But even the enlarged staff cannot quite keep up with the rising flood of patent specifications.

Construction of a new Patent Office building on the south bank of the Thames, east of Waterloo Bridge, is now promised for 1963, with completion by the end of 1965; the replacement of the present gloomy Victorian pile off Chancery Lane might do something in itself to aid recruiting. Expansion of the Patent Office library—at present bursting the seams of its accommodation—into a National Reference Library of Science and Invention in the new building will be welcome news to those who use the existing library; but the patent agents, traditionally clustered in Chancery Lane, may grumble at having to move to the environs of Waterloo.

VICKERS

Finance for English Steel

AT this week's annual general meeting of Vickers, the chairman, Lord Knollys, revealed how the plan to raise the capacity of the subsidiary, English Steel, by one third to one million tons by 1963 will be financed. The total cost of this scheme will be about £30 million, including about £4 million for additional working capital. English Steel has made arrangements to cover early expenditure on the scheme by borrowing on short and medium term from financial institutions and it expects to be able to repay these loans, amounting it seems to about £16 million, from the cash flow generated from retained earnings and depreciation provisions once the new plant is in operation. English Steel will also raise £7 million by issuing its own debenture and the balance of £7 million will be provided in the form of further equity or loan capital by the two parent companies, Vickers and Cammell Laird. Vickers will have to put up 75 per cent of this £7 million. This, Lord Knollys said, would come from its own financial resources and should not require a new issue for cash by Vickers itself.

The earnings of English Steel and Vickers will thus be heavily committed for a number of years ahead and the repayment of loans, to say nothing of additional interest charges, will pre-empt for some time the additional profits English Steel may expect to earn from its new capacity. That in its turn would seem to point to continuing restraint on the dividends paid by Vickers, which as the English Steel project gets under way will be affected by the contraction in the aircraft industry and by the running down of shipbuilding orders. Immediately, Vickers' shipbuilding yards still have two years' orders on hand and this year's deliveries will be about the same as those in 1959. Profits from aircraft this year will be lower, though less will have to be charged against development. Profits from the steel interests should be maintained and the trading results from engineering should be good. These prospects lead Lord Knollys to the cautious summing-up that in all this year should be "rather better" than 1959. But the years to follow before the English Steel project is completed do not look as if they will be easy ones for the Vickers group or very buoyant ones for its ordinary shareholders.

ATOMIC POWER

Sir Christopher Looks Again at Costs

SIR CHRISTOPHER HINTON, chief architect of Britain's nuclear power programme and now head of the Central Electricity Generating Board, is the classic example of poacher turned game-keeper: his astringent comments on the high current cost of nuclear power have been a thorn in the side of those industrial consortiums bidding to sell nuclear power stations to him and to public utilities overseas. They must have waited for his promised paper on "The Economics of Nuclear Power in Great Britain" at the World Power Conference

now in session at Madrid with considerable misgivings; but in the event Sir Christopher has proved milder than might have been expected. He has tactfully refrained from giving any estimates of the cost of nuclear power from the first commercial (?) stations now under construction and has started his survey at a point four years hence, 1964.

From this jumping-off point, he puts the cost of conventional, coal-fired power on base load at slightly less than 0.55d. per unit (which is a good deal higher than his own best stations may achieve) and the cost of a nuclear station working under the same conditions at just under 0.6d. a unit (which is as flattering to the nuclear stations as the other estimate may be derogatory to the coal-fired station). The cross-over point, when both types of station will be generating electricity for between 0.5d. and 0.55d. a unit, he puts at mid-1966 and his charts show conventional power levelling off at 0.5d. a unit in 1974. Nuclear costs, on the other hand, continue to fall, dropping below 0.45d. a unit in 1972 and then appearing to flatten slightly. If the plants are assumed to be working not on base load, but to only 60 per cent capacity, the cross-over point does not occur until 1970, when both power plants generate electricity at 0.55d.

Sir Christopher likes his charts to show smooth, unkinked lines with results that are sometimes surprising, but by choosing such a deliberately stylised way of illustrating his points he does avoid the accusation of being too specific about costs that must be highly notional. In his paper he stresses the marked difference to nuclear power costs caused by different rates of fuel consumption, a variable that does not occur in calculating the cost of conventional power. And no one knows how fast a nuclear power station will burn up its uranium until one has been run long enough to find out. But an added difficulty in estimating nuclear costs, which Sir Christopher might have touched on but did not, is arriving at the correct depreciation period. UK nuclear power stations are amortised over 20 years as against 25 for conventional thermal stations but they may not last this long in practice (the Windscale reactors did not), or—alternatively—they may last a great deal longer. When capital costs make up two-thirds of the cost of atomic power, the economics of the station can be given a completely different look by adding or subtracting a few years to the depreciation period—as well as by unstated assumptions about interest rates.

COASTAL STEAMERS

Via Weymouth Only

STEAMER services which the Transport Commission runs all the year round to the Channel Islands from the south coast present almost a classic example of the problem created by a peak demand for transport surging first one way, then the other. People finish their holidays on the islands on Saturdays; so most of the passengers on the ferries to the mainland travel out on Friday nights in the three summer months of June, July and August, and come back again on Saturday a week or two later. During the rest of the year, passenger traffic falls to a much lower level. Freight traffic is not so closely bunched, but the islanders' vegetable and flower crops are all sent to the mainland at roughly the same time.

This would be difficult enough for one steamer service to try to cope with, but there are two, one from Southampton and one from Weymouth. The reason there are still two is that the commission inherited them from the two railway companies that originally ran them in competition with each other. The services together make a substantial loss. Moreover, the total number of passengers has in the last few years been declining as more visitors go by air. For a long time the commission has been discussing with the island authorities how these services might be put into better financial shape, and it has now finally decided on a major reorganisation. For both passenger and freight traffic it will concentrate on the shortest sea route, that from Weymouth, which in future will be the only mainland port. It will use only three ships, instead of five (sometimes more) smaller ones, to carry passengers and probably two for cargo. These five ships will all be modern (three new ones have recently come into service) and there will be "a comfortable one-class standard" for passengers. The commission reckons they will be able to carry the traffic of the two existing services; and that the reorganisation should save it at least £200,000 a year.

This proposal has yet to receive the blessing of the Transport Users' Consultative Committee, which three years ago turned down the commission's application to abandon another of its money-losing coastal steamer services, that from Southampton to Le Havre. The commission is also still losing money on the Clyde steamers, where it has recently modernised its fleet and where, too, the local consultative committee's approval some years ago of the commission's plan for retrenchment was reversed by the government. Elsewhere, the principal steamer services round the British coast to Ireland, the Isle of Wight and the Continent are still profitable ventures. The Folkestone-Boulogne and Newhaven-Dieppe ferries, both now running in the summer only, are claimed to be earning their keep. MacBrayne's services to the Scottish islands, in which the commission has a half interest, are subsidised by the Government.

HIRE PURCHASE

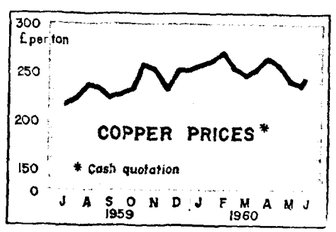
On the Eve

IN April, the last month before the introduction of official restrictions, outstanding hire purchase debt rose by £29 million, bringing the total amount at the end of April to £949 million or nearly £19 a head of the population. The increase was only a little larger than in April, 1959, but in the three months February-April together total HP debt rose by £76 million,

CHANGES IN THREE MONTHS END-JANUARY TO END-APRIL

	in Debt Owed Directly to: Household Goods Shops	Finance Houses	Total
	(£ million)		
1958	−11	+15	+ 4
1959	+15	+51	+66
1960	+11	+65	+76

£10 million more than in 1959 despite the growing burden of repayments. The volume of debt owed directly to finance houses, which do virtually all the motor business, rose in these three months by a quarter as much again as in the same months of 1959; debt owed directly to household goods shops, however, rose less than a year before.



COPPER

Shadow of Surplus

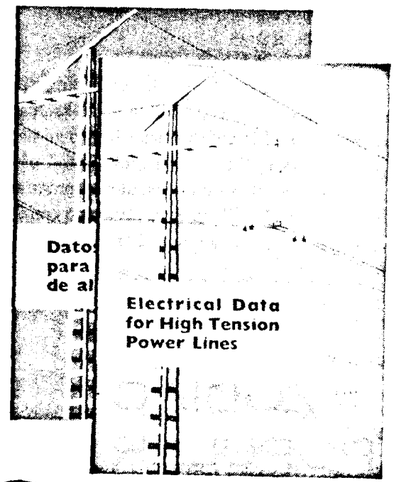
THE surplus that looms in copper as yet finds no reflection in price. World consumption is buoyant and prices are where producers like them to be—high enough to bring good profits and low enough to discourage substitution. In the London market the fall that correctly anticipated the settlement of the strike at two Chilean mines was soon checked, thanks partly to some covering of short sales, and partly because several leading producers affirmed their willingness to cut output rather than face a surplus of perhaps 250,000 tons this year. The latest statement, by the chairman of Anglo-American Corporation, controlling one of the Rhodesian copper-mining groups, stimulated an advance in prices which has been largely held. Copper for three months delivery closed on Thursday at £241 a ton, and the decline in Metal Exchange stocks was reflected in an increase in the premium for cash metal to about £4 a ton.

On the face of it Mr Harry Oppenheimer told shareholders nothing new: after referring to the probability of a surplus in the second half of the year, if there are no further interruptions in production or delivery, he added:

> Such a situation, if it comes about, would be met by an appropriate reduction in supply by leading producers, and the

Question to Power Line Builders:

Is this your problem?



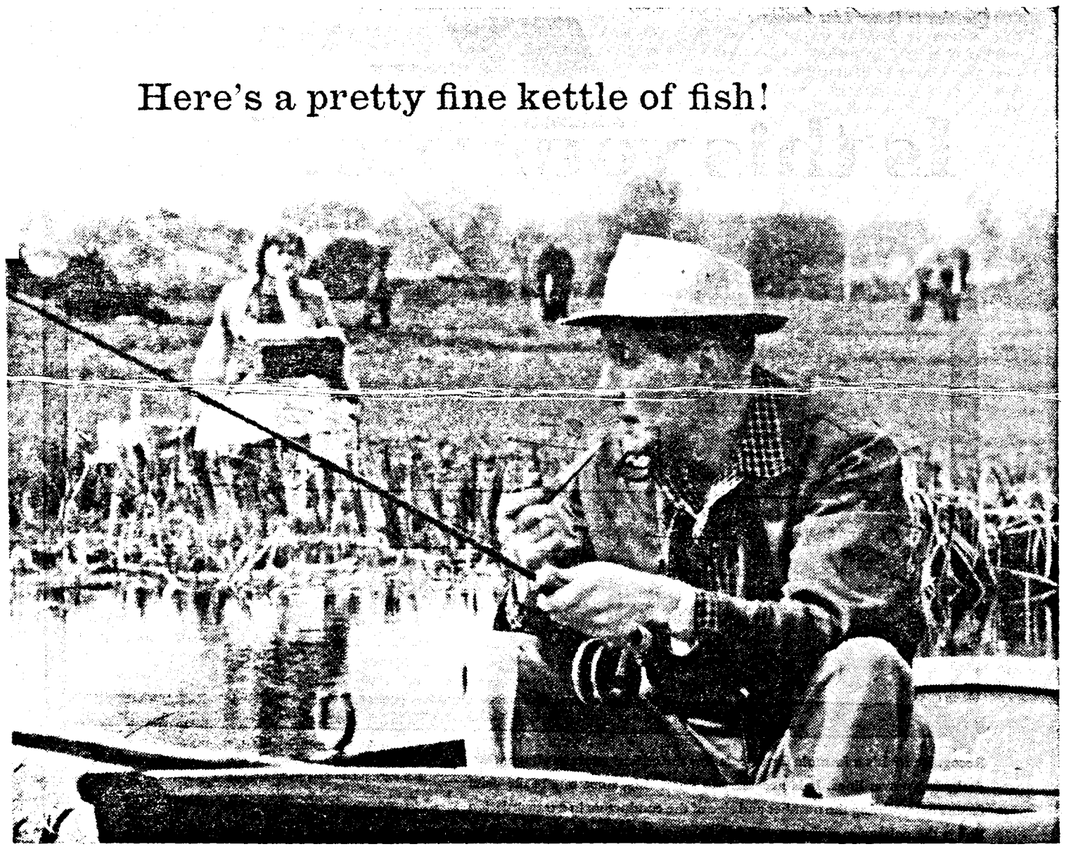
$$E_0 = \frac{4860 \times V^{\frac{2}{3}} \times m \left[{}^{10}\log \frac{2F}{kd_t} + (t-1)\,{}^{10}\log \frac{2F}{d-kd_t} \right]}{\frac{200}{kd_t} + \frac{1000(t-1)}{d-kd_t}} \; kV$$

Recognise it? It's a formula for calculating the critical corona voltage when designing power lines. It is necessary to know this, since one of the chief factors determining the number and size of the conductors in a transmission line is the voltage at which power losses, due to the corona phenomenon, become serious.

The higher the voltage, the greater the difficulty from this cause—and with transmission voltages steadily rising, such problems are being met more and more. To help in solving them, Svenska Metallverken has published "Electrical Data for High Tension Power Lines," written by two of the engineers responsible for the design of Sweden's 380,000-volt power system. With its formulae, tables, and monograms, this is a handy "ready-reckoner" for use when selecting conductors for transmission lines.

This is just one of the ways in which you can draw on Swedish technical know-how when doing business with Svenska Metallverken. Remember, too, there's a good deal of "know-how" in Feral Cable itself—the *reliable* Swedish ACSR.

"Electrical Data" is available in English and Spanish editions, as well as in Swedish. When writing for your free copy, please state which language you prefer.



When planning power lines, consult

Here's a pretty fine kettle of fish!

Fine thing when a chap can't go fishing without seeing black looks—and being in black books. In turn, nobody could blame his wife for wanting to go her own sweet way to town! What they really need of course is a second Ford. If Rosemary had a Popular all to herself she'd have her full share of style and comfort . . . could see the kids to school, herself to hair-do's—and wherever else she wants to go. And he could take the Zodiac and never leave her high and dry! Two-Ford freedom: it's the sensible, peace-making answer for families with minds of their own and budgets to balance. And with the penny-saving Popular, it's the answer to those who wrongly think that running two cars is an expensive proposition.

ZODIAC
POPULAR

ZODIAC £675 : £282 7.6 P.T. = £957.7.6 POPULAR £343 : £146.2.6 P.T. = £494.2.6 BE FIRST ON THE ROAD WITH FORD

knowledge that producers would act in this way is a factor for stability in the market.

Some traders evidently took this to imply that producers have concerted their ideas, which can scarcely have been Mr Oppenheimer's intention. Producers do not lightly cut output. They have never acted in unison in the past, either on the timing or extent of a cut—sometimes acting too late, and sometimes too soon. And they are well aware that the industry is seldom free of strikes for long. Just now the main anxiety is for the Belgian Congo, producing about nine per cent of the free world's copper, as it moves to independence. Many traders, having been bitten before, are in any case now rather chary of anticipating a surplus.

UNIT TRUSTS

A Little More Active

MAY was a brighter month for the equity market and hence for the unit trusts. Over the month the value of their invested funds rose by 2 per cent, from £196 million to £200 million. In contrast to April, when unit holders took out £135,365 more than they put into the trusts, the net inflow from sales in May amounted to £57,550. During the month the managers sold over 600,000 more units than they repurchased. This again suggests that the public was going more for the lower priced units than for the higher priced ones.

Provided there is no sharp setback in prices a further improvement in the net inflow of funds seems likely in June. The month opened with the launching of the new British Life Unit Trust ; it has been followed this week by the first block offer of units for some months. It comes from the Save and Prosper group and is of 2,500,000 Investment-Trust-Units at 6s. 3d., to yield 2.92 per cent. The past record of these units is good but they may have only a limited attraction on such a low yield. Philip Hill, Higginson, Erlangers, the managers of British Shareholders Trust, is not making a block offer but it is circularising its existing unit holders offering them units at a discount of 3d. on the published market price. It thus cuts down its margin between the bid and offered price, leaving only a little available for management fees. At 14s. xd. the units yield 3.32 per cent.

Proposals have already been put forward by the trade unions and by local government authorities for the establishment of unit trusts. Now the General Assembly of the Church of Scotland has given its approval for what will be the first unit trust for church finances. A general investment fund is to be set up with a capital of about £4 million ; this will be split into £5 units held by local churches or other organisations of the Church of Scotland. The units will be sold at a price calculated quarterly and dividends will be paid half yearly. The Church of Scotland was a pioneer in the pooling of church funds 50 years ago ; but since 1958 the Church of England through its Church Assembly Investment Fund has operated a fund for the investment of local church moneys and on which it, too, pays half yearly dividends.

WATERLOW

The End of the Affair

A LONG drawn-out battle among master printers is over. It was clear last month that Purnell had won the day when its control of votes, largely through acceptances of its bid for preference and preferred ordinary shares, was sufficient to defeat proposals of the Waterlow directors that the voting control of the company should be vested solely in the hands of the deferred shareholders. Following discussions not only between representatives of the two companies but also with an important section of those deferred shareholders who did not accept the bid, agreement has now been reached on the reconstruction of the board of Waterlow. Mr Wilfred Harvey, the chairman of Purnell, will become the new chairman and he will bring with him on to the board three other directors of Purnell as well as Mr L. A. Hart of Henry Ansbacher, which acted for Purnell in the take-over negotiations. Sir Harold Gillett as deputy chairman, and four other Waterlow directors will remain on the board. Another four, including the present chairman, Mr Philip A. Waterlow, will retire.

Waterlow is to continue as a separate entity and Mr Harvey and Sir Harold Gillett are to nominate a managing director. The large number of deferred shareholders who did not accept the Purnell offer will now hope for some improvement upon the company's not very happy trading record of recent years, in which, as the recent revaluation of assets revealed, a low return was earned upon the capital employed. They will also expect an early decision from the new board as to whether the proceeds from the various property sales amounting to about £1¼ million are to be ploughed back into the business or released to shareholders as a capital distribution.

DOMESTIC APPLIANCES

Licking Its Wounds

HIRE purchase restrictions were put on this year at a time when domestic equipment was being produced at a record rate ; 70 per cent more refrigerators were delivered from makers in the first quarter than a year before, while washing machine deliveries were up by 6 per cent in value. It will take until the autumn to judge what the long-term effect of the hire purchase restrictions will be, but there has already been a general fall of 10-20 per cent. It is difficult to say how much lower refrigerator sales are than they would have been, because they normally rise in May ; but one big retailer finds they are 50 per cent below its estimate—though as high as a year ago. Retailers had been stocking up in expectation of better sales than last year's ; they now need to reduce their stocks. The large number of imported refrigerators on the market—63,000 were brought in during the first quarter—may prove difficult to dispose of now ; pressure to cut prices at the retail level will strengthen towards the autumn.

Some general reduction in output seems likely. The makers of washing machines have noticed that retailers now seem anxious to reduce their stocks, and have therefore cut orders—anticipating by a few weeks the fall that normally comes in June. This fall in orders is not considered large enough to force cuts in production schedules ; manufacturers normally produce for stock during the summer, to be ready to meet the revival of demand in September. It is only if sales fail to rise to the levels of last year that substantial cuts in production would be made. But retailers, closer to the fall in demand, feel that delays in reducing output will only make larger cuts necessary in the end. Television makers in particular, who made more sets than they sold last year, are urged to cut output before stocks become unmanageable.

MINING EQUIPMENT

Exports for Digging

BRITISH makers of mining machinery, faced with a fall in demand at home and shrinking markets abroad, have allied themselves for strength and formed the British Mining Equipment Export Association. Cuts in the Coal Board's investment programme left the mining machinery makers with surplus capacity on their hands at a time when their traditional export markets, such as South Africa, South America and Canada, were making themselves self-sufficient in such machinery. Home production fell 13 per cent last year to £46.5 million, and exports 4 per cent to £4,750,000. Adding ancillary equipment, the Association estimates that the total value of exports used in mining is £35-£40 million. Attempts to sell in the under-developed countries have not been highly successful, largely, the association says, because the governments of other countries give more support to their exporters of such machinery. It stresses the importance of getting British consulting geologists in at the beginning of any new mining schemes, and claims that other countries ensure this by including the geologists' services among the aid that they supply or else help them to charge below-cost fees: then the geologists, naturally enough, recommend the machinery of their native land. The association, therefore, wants the British government to provide this sort of aid for it. It hopes that the Board

of Trade will establish an overseas mining assistance service, similar to the United Kingdom Railway Advisory Service, which would provide the services of geological consultants free or at part-cost, as under the Colombo plan. With the recent examples of much larger-scale aid for private industry as an encouragement, who can blame it for hoping?

Another practice that the Association complains hits its members' sales is the tying of aid to purchases from the donating country: it would not like Britain to go as far as this. The association is practising some self-help as well as trying to extract aid from the government. It proposes a collective service to provide the industry with information on market prospects abroad and to promote sales; the diversity of potential markets makes it uneconomic for individual firms to do this. In some ways the association wishes to perform the functions similar to that of the Locomotive and Allied Manufacturers' Association for exporters; but the closest parallel is with the Council of British Makers of Petroleum Equipment, which has helped obtain some export orders.

AIR POLLUTION

An Inspector Calls

THE alkali inspectorate, which will soon be a hundred years old, has had a successful if relatively unpublicised career of checking the discharge of "noxious or offensive" gases by the heavy chemical industries. Two more recent developments, however, which are noted in a special review in the latest annual report of the Ministry of Housing and Local Government (to whom, oddly enough, the inspectorate in England and Wales is responsible), have added considerably to its work. The first is the rapid growth in chemical output in Britain since the war, which has also brought in new areas, such as Tees-side, the Humber, and the Essex marshes, and new major industries, such as oil refining, petrochemicals, and the manufacture of carbon black. The second is the Clean Air Act of 1956 which, on the recommendation of the Beaver committee, gave to the inspectorate the job of enforcement where the control of smoke, grit and dust presented certain technical problems, as in the iron and steel industry and at power stations. It also extended its jurisdiction for this kind of air pollution to works already registered under the Alkali Acts.

The alkali inspectors, whose numbers have now risen from fifteen to twenty-two (there are plans to add another five in time) have found that they get results by persuasion and education, with "occasional plain speaking," rather than by threatening prosecution, which has only rarely occurred. For new plants, they find they are usually welcomed at the stage of first design, and from their beginning as an inspectorate they have aimed at getting pollution reduced by "the best practicable means" to a minimum rather than completely eliminated, which may not be economically possible.

Nevertheless, the review mentions a number of industries where control of pollution is not yet satisfactory. In cement production dust is a particularly difficult problem, particularly in the Dartford-Gravesend area of Thames-side, where a third of the country's cement is made. Higher standards are enforced here than at isolated cement plants elsewhere in the country, and prevention is costly to the manufacturers, yet efforts are still being made to reduce the "slip" of dust through chimneys. In the iron and steel industry an adequate degree of control of pollution, the report states, is still further ahead: new oxygen techniques in steel making particularly give rise to serious fume problems. At power stations, where much has also yet to be achieved, the problem has one feature similar to many other industries. The increasing size of the individual manufacturing plant means that tolerances for emission of grit have to be even higher simply because of the greater volume, in absolute terms, of dirt that may be deposited in the surrounding area.

SHORTER NOTES

Following last month's fall in the level of bank deposits, the Bank of England has informed the banks that a reduction of about £1 million to about £74 million would be made in the total of special deposits required from the clearing banks and Scottish banks by June 15th. The banks will be told monthly on the Thursday following the publication of the clearing banks' statement of any adjustment which may need to be made in the amount held in special deposits. So far, £55 million has been placed with the Bank of England as special deposits.

★

The Distillers Company has announced that it will build a plant at Hull to produce acetic acid by a new method developed by the company. Instead of the two-stage method based on ethyl alcohol, used in existing plant at Hull, a single-stage method based on the direct oxidation of a light petroleum fraction will be employed. The plant will cost £2 million, and is expected to be in operation early in 1962.

★

F. W. Woolworth has raised its interim dividend for the current year from 13½ per cent to 15 per cent. For 1959 the company paid a total dividend of 45 per cent plus a jubilee bonus of 6½ per cent.

★

The Road Research Laboratory is building a £500,000 road safety research track at Crowthorne, Berkshire, where in four years' time, it hopes, it will at last be able to concentrate all its activities.

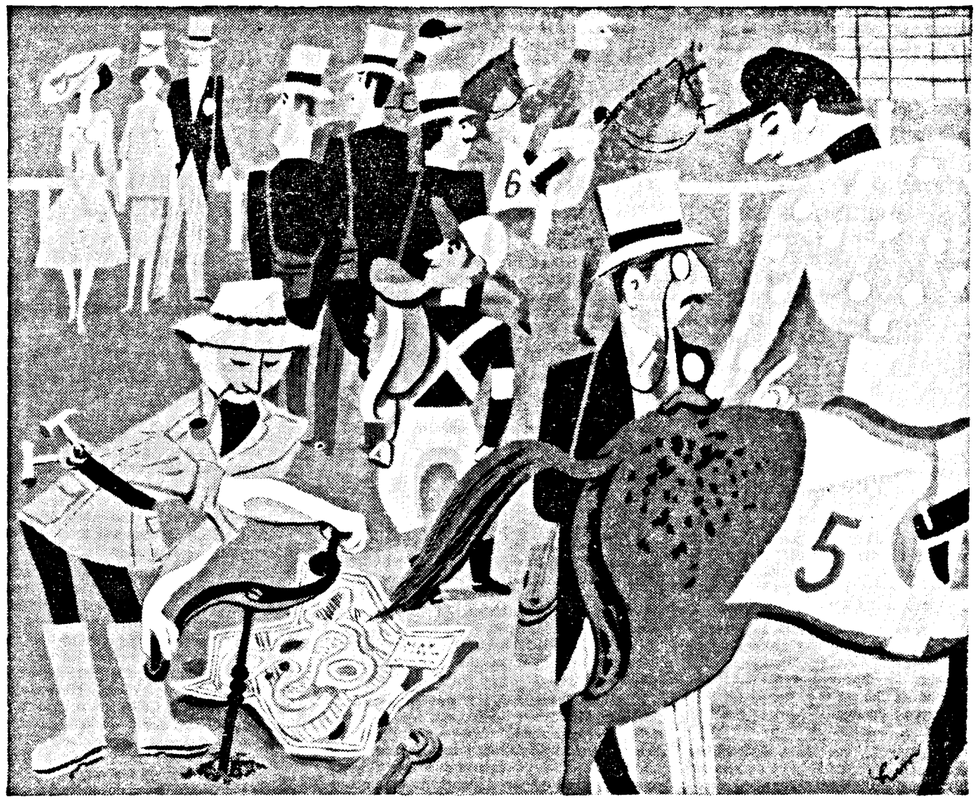
★

International oil companies operating refineries in Cuba, including Royal Dutch-Shell, are reported to have refused the request of the Cuban government to refine some 2.2 million barrels of Soviet crude oil annually which the government is to acquire in a five-year barter deal in exchange for sugar. The government has recently been unwilling to grant the companies the dollar exchange notionally required to buy the Venezuelan crude on which their refineries are ordinarily operated, and the companies have so far been "providing the dollars themselves"; since the crude comes from associated companies producing in Venezuela, this may be largely a matter of book-keeping.

★

Britain's consumption of all petroleum products during the first quarter of 1960 was nearly 22 per cent higher than a year before. There were particularly notable increases in the use of propane and butane, used in liquid petroleum gases (up by a third); and once again of fuel oil (up by 31 per cent, to just under 5 million tons); sales of premier grade motor spirit through dealers rose by 17 per cent, within a rise of just over 10 per cent in total gasoline sales.

★



Following the announcement by the Chancellor of the Exchequer in his Budget speech, the current issue of 5 per cent Defence Bonds will be withdrawn on June 14th and a new issue to be known as 5 per cent Defence Bonds (Second Issue) will be on sale from June 15th. The new issue will have different dates for interest payments, which will be made on June 15th and December 15th. The limit on holdings of the new Bonds will be £5,000 (compared with £2,000 on the present issue) in addition to any permitted holdings of previous issues of defence bonds.

Nature Watching in SCHWEPPSHIRE

NO. 4 GEOLOGY WATCHING The great thing about Natural History is that it is everywhere and whatever is happening that is the thing which is actually there. Genuine geology watchers like W. G. Williman realise that if the dog brings in mud from the garden, it is "typical Tunbridge Wells tertiary deposit". If his ball runs down the slope into the gravel pit from his drive from the 11th tee of Schweith Hill Golf Course, it is because of the "typical contour of the base of a denuded anticline".

Leaving his City job on the Schwop Exchange, "Willie" Williman always field geology-watches on his Thursday afternoons off. Here he is on the lawn at Royal Schwepstow just before the Schwinley Stakes, making "dummy casts" for boring. He hopes to throw light on the problem of the earlier existence of a vast warm sea (Totinvestian) which contains records of semi-tropical ovifauna with well-developed display appendages and exaggerated head pluming.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

COMPANY MEETINGS

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa)

ADDRESS BY SIR CHARLES J. HAMBRO, KBE, MC, CHAIRMAN, AT THE ANNUAL GENERAL MEETING OF THE CORPORATION HELD IN JOHANNESBURG ON 2nd JUNE, 1960

Gentlemen, The Accounts of the Corporation for the year 1959 together with the Directors' Report are submitted for your approval.

Dividend income amounted to £2,245,000 during 1959, virtually the same as in the previous year. Share realisation profits rose sharply by a little over £1 million to £1½ million, largely due to the successful introduction during the year of our two new Kinross area mines, Bracken Mines, Limited, and Leslie Gold Mines, Limited. Other income also showed an increase. The overall result was that the consolidated profit after taxation and after deducting the interest of minority shareholders in the profits of subsidiary companies rose from £1,904,000 in 1958 to £2,857,000. Subsidiary companies retained £1,315,000, leaving the net profit of the Corporation itself at £1,542,000, which, together with £455,000 brought in from previous years, made £1,997,000 available for appropriation.

£300,000 has been appropriated to General Reserve Account, bringing this reserve up to £3 million and £150,000 to Exploration Reserve Account which, together with a net credit on operations during the year of some £99,000, brings this reserve up to £1,314,000.

The Directors have declared dividends amounting to 3s. 9d. per share less United Kingdom Income Tax which is an increase of 3d per share compared with 1958 and absorbed £1,148,000, leaving £396,000 to be carried forward.

In considering the amount of the dividends for the year your Directors had to take into account, among other things, the commitments which lie immediately ahead of us, and in this connection I should now like to review for you the position of the Corporation and the state of its principal investments.

KINROSS FIELD

It is no mean task to launch two new gold mines simultaneously, as we did last year, and the commencement of work by BRACKEN MINES and LESLIE GOLD MINES in the Kinross field is both a notable achievement and a matter of great significance for your Corporation. Drilling commenced in this area in 1950 and the formation of these two new companies follows ten years of strenuous effort in what has proved to be a major gold field, the mineral rights of which are all held by us.

Bracken Mines is to work a lease area of 2,932 morgen, equivalent to nearly ten square miles, and the area to be leased to Leslie Gold Mines is almost exactly the same size. Both companies intend to develop their properties from pairs of circular shafts known as Nos. 1 and 1A Shafts. In each case the initial shaft systems are designed to handle mill tonnages of 90,000 to 100,000 tons per month. Following the commencement of work towards the end of October last full scale sinking of both the Bracken and Leslie No. 1A Shafts commenced in April of this year, and it is expected that full scale sinking of both the No. 1 Shafts will commence in July or August. Progress so far has been very satisfactory and while there are many uncertainties still to be faced it does seem possible that both mines will be able to commence production proper in 1963. In the case of Bracken it is planned to erect in due course a Reduction Plant with an initial nominal capacity of 75,000 tons per month, which may later be extended. At Leslie, which will also have an initial capacity of 75,000 tons per month, extensions to 100,000 tons per month are envisaged as soon as results from underground development warrant this, and, later, capacity will be further increased to an ultimate milling rate of about 150,000 tons per month. The capital requirements of Bracken Mines are given in the Prospectus as £8,500,000 and of Leslie as £10,190,000, making a total of £18,690,000, which figure is sufficient to indicate the magnitude of the venture we have embarked upon.

Towards the end of last year the Boards of Bracken Mines and Leslie Gold Mines, in collaboration with the Corporation and Winkelhaak Mines, decided to raise a portion of the capital required by each of the two new companies by offering shares to the shareholders of the Corporation and of Winkelhaak Mines for subscription at par pro rata to their holdings. The offers were underwritten by the Corporation itself and were warmly received. At about the same time certain other large finance companies were invited to participate in the new mines by purchasing shares in the new Companies from us at a premium. We have, nevertheless, retained a very large stake in both companies, which are subsidiaries of the Corporation and the major part of the burden of providing the necessary funds will fall on us. As shown in the Notes on the Accounts our liability for calls in respect of the partly paid shares issued by the two companies amounted to about £8,800,000 at the end of last year. In the absence of unforeseen circumstances we believe that these demands can be met from existing resources, supplemented if necessary by some short term borrowing. We believe that once these two new mines reach production our substantial interest in them, as well as in Winkelhaak Mines, will do much to maintain and strengthen the Corporation's position as a mining house.

I said earlier in my remarks that the offers at par of shares in the Bracken and Leslie Mines to the Corporation's own shareholders were warmly received by them and your Directors received much encouragement from the number of our registered shareholders who participated in these offers. Since then it has been suggested by certain other parties that I should give some information about the system under which some of our senior executives participated in the Bracken and Leslie flotations and this I am pleased to do.

For over 50 years it has been considered to be in the interests of the Corporation to encourage senior members of its executive staff, who are responsible for recommending the Corporation to risk its money, to risk their money likewise by taking a small participation in its ventures from their inception. Thus in this particular case the participations were offered some eleven years ago in 1949, well before drilling commenced, and the participants have ever since then had to put up their pro rata share of all the expenses of exploring the whole Kinross field, much of which expense was in respect of areas subsequently abandoned as worthless.

Requests for such participations are referred to an independent committee of the Board and participations are only offered under restrictive conditions imposed by this committee. Because prospecting is inevitably a risky business and because ventures more often fail than succeed, executives who participate, more frequently than not lose their money. When a prospect does turn out to be successful they are obliged to provide their proportion of the working capital of any company arising from the business. The result is that they not only carry exactly the same risks as the Corporation in acquiring their investments but in addition are restricted considerably by the Board in their rights of disposal. Your Directors are of the opinion that this system, which has proved over the years to be of benefit to the Corporation, should be continued.

For Winkelhaak Mines, Limited, the pioneer in the Kinross field, 1959 was the first full year of production and 908,000 tons were milled, resulting in a net profit of £504,000. The lease area has been enlarged, without change of lease formula, by 245 claims to 5,363 claims. The extensions to the Reduction Works to increase the nominal capacity of the plant to 90,000 tons per month are approaching completion and work is already in hand for the sinking of a new hoisting shaft, which will be known as No. 2 Shaft, to serve the deeper levels of the mine lying to the north-east of No. 3 Shaft. It is also planned to increase the capacity of the mill in due course from 90,000 tons per month to 150,000 tons per month. The cost of the shaft is put at something under £2,500,000 spread over three and a half years or so, to which has to be added the cost of expanding the Reduction Works and providing the necessary expansion of services. It is believed that working profits from the mine will be sufficient to finance this expenditure and still leave enough to enable an early start to be made with dividend declarations.

ORANGE FREE STATE

In the Orange Free State, ST. HELENA GOLD MINES, LIMITED, increased its tonnage milled by 342,000 tons to the new record figure of 1,810,000 tons. The net profit increased by over £800,000 to £3,090,000. Capital expenditure, mostly in connection with No. 7 Shaft and the completion of the No. 2 Shaft programme, absorbed £1,283,000. Dividends totalled 3s. per share, which is an improvement of 11d. per share as compared with 1958. In March of this year a further dividend at 2s. 3d. per share was declared.

The severe faulting in the No. 2 Shaft area has led to a low percentage of on-reef development there which has slowed the expected build-up in ore reserves and restricted the stoping rate. Values disclosed, however, have been very satisfactory. Good progress has been made with the sinking of No. 7 Shaft, which is now over 4,800 feet below surface, and when completed at approximately 5,500 feet will assist the ventilation of the lower levels of the mine served from No. 2 Shaft. 18 Level crosscut, which is being developed from No. 2 Shaft to the up-thrown block of reef on the President Brand boundary, has passed through the major fault responsible for the up-thrown block. Because it will first be necessary to establish a fairly extensive haulage layout in the area it is difficult to foretell when any significant amount of on-reef development footage will be accomplished.

EAST RAND

At EAST GEDULD MINES, LIMITED, the Main Reef horizon can now be considered for all practical purposes to be fully developed. On the Kimberley Reef the results of development so far show that the percentage payability is low and that gold values are only moderate. Accordingly, unless much better results are disclosed in future development ore from this source is unlikely to make any significant contribution to the mill.

The mine still has a substantial profitable life ahead of it, but at this stage in its life it is faced with difficult problems in winning an increasing proportion of its tonnage from pillars and reclamation areas. Nevertheless, the ore milled during 1959 increased by 106,000 tons to 1,653,000 tons and the net profit for the year improved slightly to £1,683,000. Two dividends totalling 3s. 8d. per unit of stock, the same as for the previous year, were declared.

THE GROOTVLEI PROPRIETARY MINES, LIMITED, was able to mill 2,555,000 tons of ore during 1959. This was a record for the mine, being an increase of 195,000 tons over the previous year. The net profit was £1,394,000 and dividends totalled 2s. 6d. per unit of stock, being 2d. per unit more than for the previous year.

The tonnage milled by GEDULD PROPRIETARY MINES, LIMITED, in 1959 was 879,000 tons and the net profit from mining was £254,000. Income from the Company's investments, principally its holding in East Geduld Mines, Limited and The Grootvlei Proprietary Mines, Limited, was £661,000 and the total profit for the year was thus £915,000. Dividends totalling 9s. 9d. per share were declared, as against 11s. 3d. for the previous year. The profitable life of the mine is now very short and the Company is pursuing an investment policy designed to ensure that after the revenue from East Geduld Mines falls away, there should be some worthwhile assets remaining in the Company. Accordingly, it is intended that in the next few years dividends on Geduld shares will be declared on the basis of twice the amount paid per East Geduld share and the balance of the annual profits, together with surplus funds, will be invested as opportunity occurs. Consideration will be given to supplementing dividend declarations out of income from the new investments when the scale of such income justifies it. The Company's portfolio includes shares in Bracken Mines, Limited, Leslie Gold Mines, Limited, and Winkelhaak Mines, Limited, and among its fixed assets is an area of nearly thirteen square miles of land near Springs, some of which is potentially valuable industrial land.

At MARIEVALE CONSOLIDATED MINES, LIMITED, the extended mill operated for the first full year and the tonnage milled increased by nearly 250,000 tons and amounted to 1,135,000 tons, which is a record for this mine. The net profit was £739,000, an increase of £116,000 over 1958, and two dividends totalling 2s. 11d. per share, as compared with 2s. 6d. per share during the previous year, were declared.

The tonnage milled by VAN DYK CONSOLIDATED MINES, LIMITED, declined by 22,000 tons and amounted to 891,000 tons. The net profit was £345,000 and 1s. 3d. per share was distributed by way of repayment of capital. Because the profitable life of the mine was limited the Company adopted three years ago a policy of selective stoping and development designed to derive the maximum profits from the remaining ore and the benefits obtained from this policy have shown up clearly in subsequent annual results. It is now becoming apparent, however, that the end of profitable mining at Van Dyk is approaching and the general pattern of profits must be downwards.

OTHER GOLD MINING INTERESTS

In gold mining companies not under our administration our principal holdings continue to be in Stilfontein Gold Mining Company, Limited, and Western Holdings, Limited, which paid satisfactory dividends during the year.

GOLD MINING INDUSTRY

The aggregate results of the producing mines of our Group show that during 1959 there was an increase in the tonnage milled, in the net profits and in dividends declared. This is due principally to the full year's milling by Winkelhaak Mines and the greater outputs achieved by all our mines with the exception of Van Dyk and Geduld. An important contributory factor was the marked improvement in the supply of Native labour during the year which our Group Companies enjoyed in common with the South African Gold Mining Industry as a whole. The statistics given with the Annual Report show that the average number of Native employees in service with the Industry increased by 41,000, or 12 per cent, to 380,000 in 1959. The tonnage milled by the Industry increased by nearly 5 million tons to over 70 million tons, yielding nearly 20 million ounces of gold, and the working revenue excluding revenue from uranium, increased by £31 million to £246 million. Working costs absorbed £160 million and the aggregate working profit from gold increased to £86 million. The overall picture of the Gold Mining Industry in the Union of South Africa continues to be one of expansion of gold production, the newer mines in the Kinross field, the Orange Free State and the Klerksdorp and West Witwatersrand districts accounting generally for an increasing proportion of the gold produced. These few figures serve to remind us of the great resources in gold still awaiting development in the Union over many years ahead and also of the vitally important part which the Industry plays and will continue to play in the Union's economy, not only as an earner of foreign exchange but as an employer and as the supporter of many secondary industries.

The estimated production of uranium oxide by the Industry increased very slightly during 1959. The profit therefrom is given at £29 million or apparently £9 million less than in 1958, though I understand that the 1958 and 1959 figures are not comparable due to some mines revising their methods of segregating gold and uranium costs.

The position with regard to production of uranium oxide is that the contracts presently in force for the supply of this material are due to expire between December, 1963, and June, 1967, most of them by the end of 1965. Opinions generally held are to the effect that supplies are at present in excess of consumption, and that stocks of uranium oxide held overseas might increase to such an extent during the currency of these contracts that for some time after their expiry demand will be at a low level. It so happens that none of the gold mines of the Union Corporation Group are directly affected by this problem since uranium values on these properties have not been found to be economic, and uranium oxide production has not been undertaken by them. We are, however, interested in this situation through our substantial shareholding in Stilfontein Gold Mining Company.

I should now like to report briefly on our base metal mining and our industrial and financial interests.

BASE METAL MINING INTERESTS

The chrome ore market remained very quiet throughout the year ended 30th June, 1959, and the scale of operations at the Zwartkop and Groothoek properties of CHROME MINES OF SOUTH AFRICA, LIMITED, was reduced. The Company declared a dividend of 1s. 0d. per share in December last, the same as for the previous year.

SAN FRANCISCO MINES OF MEXICO, LIMITED, had another difficult year. After allowing for taxation, it earned a modest profit of £134,000, compared with a loss in the previous year of £208,000. However, although sales of metals increased, they fell short of production. In particular, sales of lead were difficult to effect and the company had to tie up considerable cash resources in its increased lead stocks.

The improvement in the demand for zinc during the current year has enabled the company to conclude a contract for the sale of its accumulated stocks of zinc concentrates. In the case of lead the outlook is not so bright, but it is hoped that the cash drain currently experienced in financing increased stocks of refined lead will not be of long duration.

TSUMEB CORPORATION, LIMITED, in South West Africa, earned a net profit for the financial year ended 30th June, 1959, of £4,314,000, which is a little higher than for the previous year. The Company declared dividends totalling 23s. 6d. per share and during the cur-

rent financial year has declared dividends totalling 21s. 0d. per share.

OTHER INTERESTS

In the capital reorganisation of our investment company BAY HALL TRUST, LIMITED, shareholders were offered the opportunity to subscribe for shares at par. As a result of the reorganisation of the Bay Hall Trust capital, this Company ceased to be a subsidiary, although the Corporation retains a very substantial interest in it.

Last year the gross revenue of the company increased from £244,100 to £294,100. The £1,200,000 raised by the company contributed only partly to this satisfactory increase, since the new money was not available for investment until the second half of the year. The net amount distributed in dividends increased from £109,100 to £141,300.

In the Annual Report it was stated that, in the absence of any unforeseen setbacks, the company could look forward to a further increase in investment income in 1960.

Subsequently, in May of this year the company placed privately £1,000,000 of 5½ per cent Debenture Stock, 1979/82, at £95 10s. 0d. per £100 Stock to repay temporary borrowings and to enlarge its portfolio of investments.

The year's results for South African Pulp and Paper Industries, Limited, show a profit, after making provision for depreciation, interest on loans, taxation and other items, of £696,000, an improvement of over £200,000. A dividend of 2s. 3d. per share was declared, being 3d. per share more than the declarations for the previous three years. The improved results were partly due to the coming to fruition of some of the heavy expenditure which has been incurred in recent years in stepping up output and efficiency at the Enstra and Tugela mills, and partly to an improved order book. Excellent progress is being made with the new section at Enstra for the manufacture of newsprint and mechanical printing papers, and this is expected to come into operation about the end of the first quarter of next year.

A long term agreement has been arranged with the South African Forestry Department for the supply of pine pulpwood which will enable the Company to double its output of kraft papers from the Tugela plant over the next five years, and an order has been placed for a large new paper machine which it is hoped will be in operation in 1963. The cost of this expansion, which represents a major undertaking, will be about £4 million. A portion of this can be financed from the Company's resources and the amount of new money to be found by the Company should not exceed £3 million at most. In due course the Company will consider in what form this should be raised.

THE BRITISH SOUTH AFRICA COMPANY'S results appear for the first time in our Annual Report following our acquisition of 455,000 new shares in the Company in exchange for 700,000 new shares in the Corporation. These results show that royalty income during the year ended September 30, 1959, reached a figure of £9,396,000, an increase of £3,275,000 over the previous year due to the satisfactory levels at which the prices of base metals had been maintained during the year, particularly the price of copper. The consolidated net profit was £6,584,000 and two dividends were declared, amounting to 6s. 0d. per stock unit as compared with 5s. 3d. for the previous financial year.

EXPLORATION AND NEW BUSINESS

It remains an essential part of the Corporation's business to seek new economic mineral deposits and also to investigate businesses which might offer opportunities for profitable investment.

Some further exploratory drilling was carried out in the Kinross area outside the three lease areas during the year. Much of this was done in the area to the north-west of Winkelhaak Mines, Limited, which I mentioned last year. This work is still in progress and it is not yet possible to draw any conclusions as to the potentialities of this area. In addition, prospecting ventures for gold and base metals involving large areas of ground were undertaken elsewhere.

Towards the end of 1959 the Corporation, in conjunction with Bay Hall Trust, announced that the two Companies had jointly acquired a controlling interest in WILKES BERGER ENGINEERING COMPANY, LIMITED—a small but well-established United Kingdom company specialising in the manufacture and wholesaling of light engineering parts and fittings.

Trading conditions were favourable over the last year and the profit subject only to tax rose from £69,914 to £85,305. Taxation absorbed £44,205 and a total of 20 per cent. was paid in dividends (against 15 per cent.) absorbing £22,050.

It is hoped that this business can be expanded and in due course grow to be a valuable addition to the Union Corporation Group of Companies.

RESEARCH

I think it is fitting to mention that one of our many activities is continuous research in many technical fields. This has led from time to time to the development of new and improved techniques, especially in prospecting, mining and milling. For example, we have developed the run-of-mine milling technique and the electronically controlled mill feed in operation at Winkelhaak Mines and also to be used at Bracken Mines and Leslie Gold Mines. Recently we have been able to release information about a new, small diameter borehole survey device which we have developed.

RESIDENCE

Whilst our investments are widespread it is clear from the extent of the interests which we have fostered here in the Union, in the mining and industrial fields, that ours is mainly a South African business and will continue to be so. In this connection, the question of transferring the Corporation's residence from the United Kingdom to the Union, which I mentioned last year, has continued to occupy our minds, but there is so far no progress to report.

THE UNION'S SOCIAL PROBLEMS

We have been aware for many years that the Union of South Africa, with its multi-racial population, is faced with many difficult and perplexing social problems. These problems have become increasingly more evident in the last few years and in recent months have been brought dramatically into prominence. Towards the end of March of this year disturbances occurred in Native townships in the Vereeniging and Cape Town areas and elsewhere and a state of emergency was proclaimed in terms of the Public Safety Act of 1953, covering all the important urban centres. Following this and other measures, tension relaxed somewhat, and all appears to be quiet at the present time. The troubles concerned almost exclusively certain urban workers, and employees at the mines and at our paper mills were not involved.

Nevertheless, these disturbances, events elsewhere on the African Continent and probably to some extent other unrelated circumstances abroad, have led to a marked fall in the prices of South African quoted securities. Roughly, the effect of this on the market value of our quoted investments would be to reduce the figure of £58,694,198 shown in the Consolidated Balance Sheet as at December 31, 1959, to £46,000,000, that is to say by about £12,700,000 or nearly 22 per cent. It is essential for the well being of our Corporation that confidence in the Union of South Africa is restored as soon as possible.

Following talks between senior executive members of the Transvaal and Orange Free State Chamber of Mines and other important employer organisations, with the object of assisting the Government in its study of the factors that may have given rise to the recent unrest, these organisations have as large employers of labour jointly submitted to the Government constructive practical suggestions aimed at easing racial tension.

Union Corporation has been closely associated with the City of London for very many years and we know how proud it is of the important contriburion which it has made to the economic development of the Union. The City has no doubt that the European, whose roots are so firmly planted in the Union is here to say. Confidence has, however, been seriously shaken by recent events and today it would be very difficult and maybe impossible to raise money in London for any South African venture. The situation is being watched with interest and concern and I believe that confidence would begin to return should any specific measures be taken to promote more harmonious relations with the urban native population.

We in Union Corporation are confident that, provided the problems facing South Africa are tackled energetically, with a basic respect for human dignity and a desire to provide satisfactory outlets for the legitimate aspirations of all sections of the population, a workable structure can be evolved which will permit the full development of the great latent potential of South Africa, to the benefit of all.

DIRECTORS

In July last year Colonel The Lord Robins, KBE, DSO, President of The British South Africa Company, joined the Board of the Corporation. I am sure you will be pleased to hear that Lord Robins has been chosen unanimously as the next President of the Royal African Society and to wish him every success in that office.

One of our Directors, Mr C. T. Pott, recently completed 60 years of service with the Corporation and we extend to him our congratulations.

It only remains for me now to thank, on your behalf, the Management and Staff of the Corporation in Johannesburg and in London and the Directors, Managers and Staffs of the companies under our administration for their great efforts in contributing to the excellent results which it has been our pleasure to place before you.

VICKERS LIMITED

1959 A BETTER YEAR THAN ANTICIPATED

VISCOUNT KNOLLYS' REVIEW

The ninety-third annual general meeting of Vickers Limited was held on June 8th in London.

The Viscount Knollys, GCMG, MBE, DFC (the chairman), presided and, in the course of his speech, said:

1959 was a better year for the Group than was or could have been anticipated a year ago or in the statement accompanying the half-year's figures published last September. In the last quarter of the year English Steel Corporation results, which have such a major effect on the Group profits, rose quite sharply, as the general upturn in steel orders began only in the late Summer; engineering and shipbuilding improved more than anticipated; as did the Aircraft Company as a result of winding up certain contracts. These factors taken together enable a larger trading surplus than forecast for the complete year to be shown.

In 1959 there was a drop in the percentage earned on capital employed in the whole Group. But the overall figure does not, I think, give the full picture. The ratio relating to our Aircraft Company has been affected by the large provisions for development which have been deducted from its trading profit. If we take the combined results of our Engineering, Shipbuilding and Steel interests all over the world and eliminate the Aircraft interests with their special features, the percentage return on capital employed was 10.3 in 1959 compared with 11.1 and 10.9 in the two previous years, which compares not unfavourably with the returns announced by other large industries.

BRITISH AIRCRAFT CORPORATION

One of the most important developments in the Vickers Group which has occurred for some time has been the decision to merge our aircraft interest in the newly formed Company—British Aircraft Corporation. This is a partnership between Vickers-Armstrongs (Aircraft), English Electric Aviation and Bristol Aircraft, to which is now being added Hunting Aircraft.

As a result of this merger our stake in aviation is maintained, but financial risks are spread and shared, and outstanding resources, human and technical, are combined to deal with the competitive situations of the future. That is an encouraging prospect.

ENGINEERING

Engineering continues, as always, to provide an historic and solid base for the Group's activities, both in turnover and profits. Our aim is to maintain our outstanding position, both in traditional and recently developed lines, and at the same time to ensure that we are constantly developing, technically and geographically, new products and new markets. In this we have been active and, I believe, successful. We have, for example, concluded an agreement with Hans. J. Zimmer of Frankfurt-on-Main, whose outstanding designs for chemical plants can be seen in many countries the world over. The newly formed company in which we shall have a 50 per cent interest will not only provide manufacturing work, but will give us a promising footing in the Common Market of the Six.

It is satisfactory to be able to say that all our main engineering works, with the exception of Canadian Vickers and Tractors, are well filled with work. These should show reasonable profits, although we shall feel the effects of the extra cost of the recently granted 42-hour week. Gaps have been filled with new products based on established skills and new markets will spread geographically. I think you will agree that presents a promising picture.

STEEL

Production and fabrication of steel has traditionally been a basic factor in the growth and prosperity of the Vickers Group. It has provided, and continues to provide, a major part of the profits of the Group, vying with Engineering in this respect. It should continue to do so.

For three-quarters of 1959 it produced mixed results. But the upturn in the last quarter, to which I referred earlier, has continued in 1960 to date and should continue in most departments.

The Iron and Steel Board has now approved a scheme for the installation at Tinsley Park, just outside Sheffield, of a 42-in. blooming mill and two 32-in. billet mills and new bar rolling mills. The capacity for billet production will be increased by approximately 250,000 tons per annum and, to provide the additional steel required, three 100-ton electric melting furnaces are being installed. When this addition is completed the total melting capacity of the Group for the production of alloy and special carbon steels will be approaching 1 million tons per annum. The estimated cost of the project is £26 million. Work will start as soon as an industrial development certificate is issued by the Board of Trade. The plant is planned to be in full operation in 1963.

English Steel Corporation has made arrangements with financial institutions for short and medium term finance needed to cover early expenditure on the scheme and estimates indicate that these borrowings can be repaid from cash generated from retained earnings and depreciation provisions after the new plant is in operation.

Of the balance of longer term capital we expect to raise about half by the issue of further debenture stock of English Steel Corporation at a suitable date as the money is required, and the parent companies will, therefore, be called upon to provide the balance, a figure of the order of £7 million, in the form of further equity or loan capital for English Steel Corporation. Vickers' share of this last figure would be 75 per cent, which should be within its immediately available financial resources.

SHIPBUILDING

Our two shipbuilding yards in England have orders which should keep them fully occupied throughout 1960 and 1961. We have had no cancellations this year and indeed the orders for two ships from the Admiralty have been confirmed. New orders are, however, extremely scarce, and for this reason we are particularly gratified to have been able to lay the keel for the new passenger liner for our old friends Shaw Savill. This order was received in the face of such intense competition at home and abroad that one was vividly reminded how essential it is, for our future ability to compete, that managements and labour should never forget even though yards are now full, the part each has to play in enabling competitive prices to be quoted.

AVIATION

I said last year that, in spite of the swing towards the use of jet aircraft even for medium range, I could not believe that the economics of the propeller turbine would not continue to appeal to cost-conscious operators.

The first half of 1960 has, I think, shown the justification of that view. During this time a total of 14 Viscount 810 aircraft have been sold. It seems likely that Viscount sales will continue, albeit at a lower rate than we have been accustomed to, for some further time to come.

During the same period, Trans-Canada Air Lines announced their intention to purchase an additional three Vanguards, bringing the firm orders to date up to 43.

Production work has started on the VC.10, and our sales investigations throughout the world have confirmed our belief that the rear-engined clean-wing concept for future jet aircraft is the right one.

The development of TSR.2 is proceeding to programme and the military importance attached to this weapon is very considerable.

ALLIED COMPANIES

Our Associated Company, Metropolitan-Cammell, has received a number of orders since the end of the year from British Railways and other customers. But to date this year deliveries have exceeded new orders, which are particularly scarce overseas, and the order book is well down compared with a year ago, except in the case of bus bodies.

Our large investment in International Computers and Tabulators (ICT) continues to prosper and we expect its success to continue.

PROSPECTS SUMMARY

As to the prospects of the full year 1960 experience makes me wary. But I can say that it looks like being a good one for our Engineering Companies; steel profits should be maintained; and in shipbuilding deliveries will be on the same level as last year. Though our aircraft trading profits will be lower, provision for development should be considerably less than for 1959. Our Canadian and Australian Companies should improve. Barring unforeseen factors, it looks at this stage as if 1960 may well be a rather better year than 1959.

The report and accounts were adopted.

Bowaters

"More new products in more new markets—that is our simple policy for progress"

Sir Eric Vansittart Bowater, speaking at the Annual General Meeting of the Bowater Paper Corporation Limited at the Royal Festival Hall, London on the 2nd June, 1960.

WELCOMING more than 2,000 Ordinary shareholders to the meeting the Chairman extended a special greeting to those shareholders of the former Bowater-Eburite Limited, now wholly merged into the Corporation and renamed Bowater Packaging Limited. Sir Eric then referred to three resolutions which were to be submitted for shareholders' approval.

The first of these dealt with the increase of the Corporation's authorised capital by the creation of 15 million new Ordinary shares of £1 each, in order to make available sufficient Ordinary shares for the scrip issue; for the conversion into Ordinary shares next July or in 1961 of the balance of the Convertible Unsecured Loan Stock; and to leave some 10 million Ordinary shares available for issue in future should the need arise.

The second resolution dealt with the scrip issue, for which the recommendation was to capitalise the sum of £5¼ million of capital reserves, and to distribute it to the holders of the Ordinary capital in the form of one new share for every five Ordinary shares held by them as of April 22nd last.

Finally there was a resolution to amend the Articles of Association so as to permit of the issue of Stock certificates without the signature of Directors or other Officials of the Corporation, but of course still under the seal of the Corporation and under the supervision of the auditors.

Turning to the affairs of the Organisation, the Chairman said: The decade just ended was for Bowaters one of expansion, development and prosperity, and one which in every year, excepting only 1953, has witnessed an increase in our sales, culminating with 1959 in which year we achieved in sales, production and trading surplus all-time records.

The decade of the "fifties" saw the construction of our various mills in Tennessee and South Carolina, and the acquisition of the Mersey mills at Liverpool, Nova Scotia. In our United Kingdom mills three additional high-speed machines and new power plants were installed; the new Mersey groundwood pulp mill came into operation, as did the multiwall sack plant and corrugated container plant at Ellesmere Port, and Eburite Corrugated Containers as it was then known was acquired and developed. Then, too, we entered the expanding field of household tissues through Bowater-Scott Corporation, and The Bowater Steamship Company came into being. In addition, the programme of modernisation and development of existing plants continued throughout the decade.

During that period we spent on those capital projects and investments the sum of £140 million; our annual turnover increased from £35 million to £117 million, while trading surplus rose from £5.4 million in 1950 to just over £20 million in 1959, of which some 70 per cent was attributable to our overseas interests. This not unsubstantial increase in trading surplus will indicate that our large capital investments over recent years are now paying off.

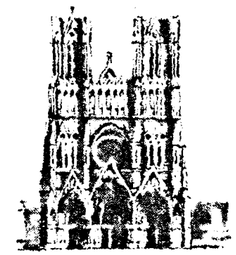
In all those markets which we serve there was, particularly during the second half of the year, a substantial increase in the demand for our products. Broadly speaking, the demand for every kind of paper and paper product is still on the upgrade, and it is reasonable to anticipate that consumption during 1960 will be at a higher level than ever before. Indeed, consumption of newsprint in North America for 1959 was at an all-time record level and exceeded the previous year's by 7.7 per cent, while for the first quarter of 1960 consumption in that continent was 6.8 per cent higher than for the first quarter of 1959. In the United Kingdom consumption of newsprint also increased during 1959, and for the first quarter of this year again increased by an estimated 10 per cent over the corresponding period of last year. All our mills and plants are working substantially to capacity and will, I believe, continue to do so for the remainder of this year.

From time to time I see the comment that Bowaters are essentially a newsprint concern. This today, is wide of the mark; newsprint accounts for little more than 50 per cent of our United Kingdom production and indeed no more than 60 per cent of our overall production throughout the world in 1959.

During the year capital expenditure on new plant and investments amounted to £13¾ million, which to a large extent was financed from our own resources. Despite this, Loan capital was reduced by £3 million, and net current assets improved by £1¼ million.

One of our more recent developments is to undertake manufacture of pitch fibre pipes, used for all forms of drainage and for electric cable conduits. We shall manufacture these pipes at our Ellesmere Port site, in a new plant due for completion at the end of this year.

Bowaters United Kingdom Pulp and Paper Mills had a satisfactory year and its profits were at a slightly higher level than those for the previous year, due in the main to the higher production achieved as the result of new manufacturing facilities coming into operation. The programme of development and modernisation of this company's four mills continues. The Bowater Steamship Company, which now owns and operates eleven vessels, enjoyed a satisfactory year despite the continued depression of the shipping industry, and recently ordered another ship to be built in Dundee, Scotland.



Bowaters in the United Kingdom

The companies formerly comprising our packaging group and now reorganised into one single operating company, Bowater Packaging Limited, continue to develop and expand, despite the highly competitive conditions that continued to prevail. To meet the ever-growing demand for packaging media two new plants are to be constructed, one at Gillingham in Kent, for the production of flexible packaging, the second at Stevenage in Hertfordshire, for production of corrugated fibre containers. Both plants will be completed within the next two years.

Our recently acquired subsidiary, Bowater Perga, is the largest manufacturer of cartons for milk and fruit juices in the United Kingdom, and we are installing new plant at its Gateshead factory and at another existing factory in South Wales to meet the great expansion in demand occasioned by the development of new types of vending machines which are being rapidly installed throughout the country.

A year ago I announced our intention to establish footholds in the European Common Market Area. We have now acquired four packaging plants, two in Belgium, one in Italy, and one in France, all good businesses in themselves and readily capable of further development. Ownership of these four businesses is vested in a new holding company, Bowater Europe SA, with a capital of 140 million Belgian francs—the equivalent of £1 million—the whole of which is owned by the Corporation.

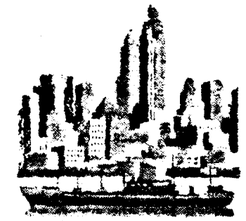
Bowater Europe's plans for further development include the erection of factories in Ghent, Belgium, and at Rheims in France. Both plants should find ready outlets for their

Bowaters in the European Common Market

products, for packaging in Europe is developing rapidly. In short, more new products in more new markets that is our simple policy for progress.

Very naturally the matter of the Outer Seven and the Inner Six has aroused widespread interest, for the solution of this complex problem could well have a profound influence upon the United Kingdom economy. Whatever the ultimate outcome, I am not unduly pessimistic about its possible future effect upon the industries in which we are engaged in the United Kingdom. The demand for all kinds of paper and paper products continues to expand, and I see no reason why paper manufacturers in this country should not continue to enjoy their proportionate share of this growing market. To the Scandinavian countries the United Kingdom pulp market is of first-class importance, and in my view it is a market they will wish to retain and to foster. Paper mills are not built overnight and, as we well know, their capital cost is high; moreover the Scandinavian countries will not wish lightly to give up their traditional European markets merely to ship a greater volume of their products to the United Kingdom. Newsprint has always entered the United Kingdom free of duty, but despite this we have held our own and, indeed, greatly expanded our business during the last thirty years, whilst in respect of our other principal product in the United Kingdom, namely packaging, we have, I believe, little to fear.

Our pulp mill companies in Sweden and Norway continued to operate on a satisfactory basis, and of our Irish subsidiary—Bowaters Irish Wallboard Mills Limited—sales and trading surplus reached the highest levels yet achieved. In Ireland, the advent of the European Free Trade Association may also be a challenge to that company's export markets, and all possible means of further improving efficiency and reducing costs of production are under constant examination.



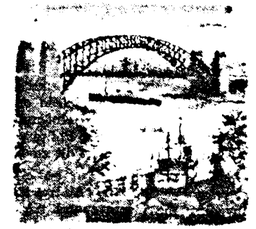
Our associated company, Bowater-Scott Corporation, had a highly successful year, during which it brought into production its second tissue paper machine at its Northfleet mills in Kent and launched a number of new products in the hygienic paper field. During last year Bowater-Scott also entered the European Common Market and a new company, Bowater-Scott Continental S.A., was formed in association with Papeteries de Belgique, the leading paper manufacturers in Belgium. Negotiations also took place with Cartiere Burgo, the largest paper manufacturers in Italy, and a new company known as Burgo-Bowater-Scott was recently established. Through these companies Bowater-Scott expects eventually to achieve a full coverage over the whole of the European Common Market Area.

The Bowater-Scott Australia Company also continued to develop. With the coming into operation later this year of its new high-speed tissue machine the company will be entirely self-sufficient in respect of its paper requirements and will then be operating the only completely integrated unit of its kind in Australia.

Bowaters have long enjoyed important outlets in Australia and New Zealand. During recent years the tendency in those two countries, as elsewhere, has been towards the establishment of plants to manufacture many of the goods previously imported. This, to an increasing extent, applies to newsprint, and to protect our interests in those very important markets, we accepted the invitation of the principal shareholders—the Government of New Zealand and Albert E. Reed & Company—to participate in the management and development of Tasman Pulp & Paper Company, Kawerau, New Zealand. In conjunction with Albert E. Reed & Company we have undertaken the responsibility for the management of the Tasman company and for the engineering and installation of a second paper machine in its New Zealand mills.

Turning to The Bowater Corporation of North America, its consolidated profits on trading for the year amounted to nearly $34 million, an increase of more than $3 million over the previous year. The Canadian paper industry continued to be plagued by the upward trend of wages, costs of materials, supplies and distribution, but, in our case, this was to a limited extent offset by further improvements in efficiencies in manufacturing operations, and during the second half of the year by the substantial increase in the basis of operations of the mills.

Bowater's Newfoundland Pulp and Paper Mills operated on a five-day week basis until July last, when they resumed full-time normal operations. In consequence, the profits of this company in 1959 exceeded those of the previous year. Further improvements have been effected to this mill's manufacturing facilities and it is anticipated that production for the current year will be at the highest level so far achieved. On the other hand, the profits of Bowaters Mersey Papey Company, Nova Scotia, were at a lower level, attributable to the increased costs to which I have just referred. The Mersey company is effecting the complete modernisation of its electrical system, the benefits of which should be reflected in its future operations.



Bowaters in the United States of America

At the mills of Bowaters Southern Paper Corporation, Tennessee, the year began with the successful coming into operation of the fourth machine, but it was not until the second half of the year that the mills were able to achieve full production on all four machines. The resources of the Southern Corporation continued in the main to be applied in the reduction of funded debt. The total repayment over 5½ years has amounted to some £37 million. As a result, the company was able to commence to pay dividends on its Common stock, and the first dividend, amounting to $2,340,000, was paid to the North American Corporation in December, 1959.

Bowaters Carolina Corporation brought its new sulphate pulp mill at Catawba into production in July last, and production by this mill has in recent months notably exceeded its design capacity. It has now been decided to install a paper machine alongside the Catawba pulp mill and if all goes well this machine should be in operation by mid-1962.

The Catawba hardboard mill is on the point of coming into commercial production. This plant, favourably located for the supply of board to the important furniture trade in North and South Carolina and to the building and construction trades, is designed initially to produce 160 million square feet of a new type of hardboard per annum and constituted our first step towards diversification in North America. The second step will be the paper machine we now intend to erect on the same site.

Bowaters in Australia

The year 1959 as it transpires was a good one for the Bowater Organisation. The consolidated earnings of the Corporation exceeded £20 million, and in the light of this and the fact that prospects would appear more favourable than has been the case for the past year or so, we examined the possibility of increasing the rate of dividend on the Ordinary stock. In so doing and taking into account the substantially increased Ordinary capital in issue we came to the conclusion that we would be justified in recommending a final dividend of 2s. per £1 stock unit, bringing the total distribution for the year to 3s. per £1 stock unit, by comparison with 2s. 6d. for the previous year. With regard to future dividend policy, this can of course only be determined in the light of circumstances which prevail at the time when such decisions have to be made. No firm prediction on profits in respect of 1960 is feasible at this time, but figures available to date are encouraging and indicate that the level of trading surplus achieved last year may well be fully maintained.

The level of operations and sales, both for ourselves and in the paper industry as a whole, underwent a considerable change for the better during 1959, and, subject only to circumstances outside our control, the prospects for the Organisation in 1960 would appear satisfactory.

One must qualify such a statement because of the highly unsettled state of the world today. The effects of the failure of the Summit conference upon the world and, therefore, upon industry cannot yet be foreseen. None the less it is my opinion—indeed my faith—that we should continue to plan our developments in the belief that we must at all times be prepared to meet our share of the increasing demand for paper and paper products that is inevitable given a continuance of reasonably peaceful world conditions. To that end we have over the years set out to broaden the base of our activities by diversification, and we see no present reason for changing that policy: on the contrary, all indications would seem to point towards opportunities for development in the future even greater than they have been in the past.

The report and accounts and resolutions to increase the capital and to make a scrip issue were adopted.

Stockholders will automatically receive copies of the complete speech by Sir Eric Bowater. Others who are interested may obtain copies from: The Secretary, Bowater House, Knightsbridge, London, S.W.1.

Telephone Rentals LIMITED

OPERATING TR SERVICES

ANOTHER SUCCESSFUL YEAR

VOLUME OF NEW BUSINESS AGAIN A RECORD

OVERSEAS COMPANIES' CONTINUED PROGRESS

MR W. STUART PHILCOX'S STATEMENT

The thirty-first annual general meeting of Telephone Rentals Limited was held on June 8th at the Registered Office, 197 Knightsbridge, London, S.W.7, Mr W. Stuart Philcox, DFC, MA (chairman and managing director), presiding.

The Secretary (Mr W. J. H. Ainley) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman which had been circulated with the report and accounts for the year ended December 31, 1959:

Before commenting on the results of the year under review, I must refer to the loss we have suffered through the death on August 14, 1959, of the Founder of our business, Mr Fred. T. Jackson.

As a matter of history, Mr Jackson began his business career in 1902 with one of the four private telephone installation companies then existing in this country. Following the outbreak of the first World War, he formed the original Telephone Manufacturing Company Limited to take over the rental companies and to manufacture the equipment required by them. In 1929 this company went into voluntary liquidation in order that two new and completely separate public companies might be formed, one with the same name to concern itself solely with manufacturing, and the other —Telephone Rentals Limited—to take over and to develop the rental interests.

Up to the day of his death, the progress and well-being of these two companies never ceased to be Mr Jackson's predominant interest and as will have been seen his total service amounted to fifty-seven years.

It would be almost impossible in a few sentences to pay adequate tribute to the qualities of this man. We have therefore sent to each shareholder a copy of the Memorial issue of our TR Journal which demonstrates as no words of mine could do the remarkable esteem and high regard in which he was held by so many both inside and outside your Company.

Telephone Rentals has a very strongly developed family spirit and it is as the head of a family that we shall miss him most.

BOARD CHANGES

Towards the end of the year I was elected by my colleagues on the Board to the position of Chairman in place of Mr Jackson and it will be my constant endeavour to maintain the high standard of devotion to the Company's interests set by him.

During the next four or five years your Company is likely to be faced by many problems brought about by the rapid rate of change in many of the fields in which it operates and during that period it will be passing from what might be termed the old management to the new.

With these thoughts in mind we decided to extend invitations to join the Board to two gentlemen who for many years have been well acquainted with the activities of your Company and who have a wide knowledge and experience of affairs in general. I am glad to say that in both cases our invitations were accepted, and you will be asked to confirm these appointments at the Annual General Meeting.

One is Mr F. C. T. Lane who, until his recent retirement, was senior partner in the firm of Chas. W. Rooke Lane & Company, who from the very early days have been our Auditors. The other is Mr J. H. Reed, Managing Director of Ericsson Telephones Limited, with which Company we have had a very close working arrangement for over a quarter of a century. I should perhaps emphasise that there is no financial association whatever between your Company and Ericsson Telephones Limited and that we have invited Mr Reed to join us in his personal capacity.

At the same time, we have taken advantage of Article 87A in our Articles of Association and have appointed as Executive Directors four of our senior personnel. These gentlemen are Mr E. H. Cooper, General Manager, Mr C. Cleverdon, General Sales Manager, Mr T. Sedgwick, Chief Engineer, and Mr E. A. Bradshaw, Manager of our largest operating Branch.

I think you may be interested to know that on December 31, 1959, the average age of the Executive Directors was 53 and that their average length of service was 32 years. We are particularly fortunate in being able to number among our staff such a high proportion who joined us as young men and who have decided to make their careers with the Company. This is certainly not the least of the factors accounting for the family spirit which exists among us and to which I referred just now.

I believe it is true to say that your Company has a good reputation for sound and understanding management, and I have no doubt that the increased opportunity for combining detailed internal knowledge and wide external experience inherent in the steps we have taken will be of great advantage to us during the next few important years.

Before leaving the subject of the Board of Directors, I wish to call your attention to the Special Resolution which will be submitted for your approval at the Annual General Meeting. The effect of passing this Special Resolution will be to increase the basic remuneration to which the Directors are entitled from £400 to £750 per annum and the basic remuneration of the Chairman from £500 to £1,000. The present rates have remained unchanged since the incorporation of the Company in 1929, and it is considered reasonable that this increase should now be made.

THE YEAR'S TRADING

I am very glad to be able to report that once again your Company has had a very successful year. In this country, in spite of increased competition, the amount of new business we did was again a record. Not only was there an increase in the total number of contracts both with new and existing subscribers, but the number of contracts for large installations included in the total was considerably greater, whilst the business was widely spread over the full range of TR Services.

This success was of course largely due to the upsurge in industrial production which developed throughout the country during the course of the year, but it also reflected the concentrated attention paid to training and instruction on the sales side in recent years. In a highly specialised business such as ours it takes a long time to build up and maintain a skilled and experienced sales force trained to act in a consultative capacity, and our strengthened financial resources have enabled us to carry out our planned training programmes without the threat of interruption with which we were so often faced in the early nineteen fifties.

The larger volume of business has naturally added greatly to the burden of work in the engineering and clerical departments at Head Office and in the Branches.

On the engineering side, we have also reaped the benefit of the time and money which for many years have been invested in training and instruction both at our Central Training School and in the field. Our engineers have shown themselves to be anxious to take responsibility and to improve their skill and knowledge, with the result that the work of installing and maintaining a continually widening range of equipment has been carried out with a high standard of workmanship and with increased efficiency and economy.

Included under the heading of training and instruction is our Apprenticeship Scheme which at present covers between eighty and ninety apprentices. The apprentices of today will be the engineers of tomorrow, and I am glad to be able to pay a tribute not only to the keenness and application of the youths themselves but also to the understanding interest taken in them by the older men under whom they work.

During the year under review we completed a quite extensive programme of mechanisation and reorganisation of routines and procedures in the offices. On this account we were able to deal with the greater volume of work referred to above with much less pressure and much more economy than would otherwise have been possible. These measures will greatly assist us to keep under control the rise in overhead expenditure that is one of the inevitable consequences of an expanding organisation.

Our subsidiary company, Electro Rentals Limited, which deals solely with refrigeration on rental, has continued to make steady progress. Certain changes in its sales policy may well lead to an accelerated rate of growth in the future.

OVERSEAS

I can also report that our overseas companies have continued to make satisfactory progress. Although these companies still form a relatively small part of our total enterprise, they are growing rapidly and will undoubtedly make a valuable contribution to the strength of the Organisation. Trading conditions obviously fluctuate from time to time in any one country, including Great Britain, and these overseas operations will add to the stability of your Company.

We believe that it is very necessary to maintain close personal contact between these companies and ourselves and during the year a number of visits by senior executives were made in both directions including a visit by myself to Australia and Canada.

All the overseas companies, with the exception of Canada, traded at a profit during the year and all, except Canada and Paris, paid a dividend either direct or, in the case of South Africa, to our holding company there, Telephone Rentals (South Africa) (Pty.) Limited.

We anticipate that Paris will be in a position to pay a dividend at the end of the current year, but it will still be some years before Canada will be similarly situated. We tend to forget how long it took to establish a profitable rental business in Great Britain during the first quarter of the present century and we shall be wise to reconcile ourselves to a long period of relatively slow progress in Canada.

DIVIDEND

As the result of all these activities, the Consolidated Profit before Tax amounted to £1,294,581, which represents an increase of £170,521 on the previous year and is the highest we have so far achieved.

Taking all factors into consideration, your Directors feel justified in recommending a final dividend of 10 per cent making, with the interim dividend paid in January, 1960, a total for the year of 15 per cent.

As we have found from hard experience, it is most desirable that a company of this nature should as far as possible be able to finance its operations from its own resources. As has been repeatedly stated in the past, the Board would not be prepared to recommend an increased dividend if there was a risk of the liquid resources of the Company being seriously weakened or if the future prospects seemed to make it unlikely that the increased rate could be maintained.

At the present time our liquid resources are satisfactory and I am glad to say that during the first four months of the current year there has been no falling off in the level of business. Unless some completely unforeseen circumstances should arise, we therefore feel we may reasonably anticipate maintaining the payment of the dividend at 15 per cent.

I should perhaps point out that there might be a danger of interpreting the figures of our liquid resources too literally and of failing to view them in proper perspective. The sudden and to some extent unforeseen uprise in the volume of business in the middle of 1959 had the double effect of running down our stocks and of lengthening the delivery period from our principal suppliers. We now find it necessary to plan for a much higher stock level than was required a year or two ago and we estimate that during the current year we shall spend about £1 million more on materials and equipment than we did in 1959.

Turning to the Accounts now before you, I will comment briefly on some of the changes as compared with the previous year.

PROFIT AND LOSS ACCOUNT

Trading income is up by £204,691. Dividends and Interest receivable by £30,656, whilst on the other side Operating Expenses are up by the moderate sum of £16,688, Directors' Emoluments by £21,925 and Depreciation by £30,524.

The increase in Directors' Management Emoluments, which include the emoluments of the four Executive Directors from the date of their appointment, is principally accounted for by special payments to the late Chairman's estate arising under the terms of his Service Agreement on his death and to that extent is non-recurring. The net Profit before Tax at £1,213,827 exceeds the 1958 figure by £136,210.

Profits Tax is down by £12,979 and Income Tax is up by £30,894. Both these items have been affected by the restoration in the 1959 Budget of the Investment Allowance, applicable as from April 8, 1959.

The Net Profit after Tax, but before transfers to Reserves and provisions for Dividends, is £785,853. We have transferred to the Tax Equalisation Reserve £76,000 which is £91,000 less than was required in 1958, mainly due to the special adjustment made last year to cover the difference in basis of the Profits Tax Levy. The sum of £430,420 has been transferred to the General Reserve.

After providing for the transfers to Reserves, and the Dividends on both the Preference and Ordinary Shares amounting to £243,873, as compared with £187,494 in 1958, we are left with an unappropriated Profit balance of £232,255 to be carried forward to 1960. The increase in the amount of the Dividends is accounted for by three things: firstly, the reduction in the standard rate of Income Tax which affects the Preference and the Interim Dividend on the Ordinary Shares; secondly, the Interim Dividend in January, 1960, was paid on the Capital as increased by the Capitalisation Issue in February, 1959, and thirdly, the proposed Final Dividend is at the rate of 10 per cent as compared with 7½ per cent for the previous year.

BALANCE SHEET

LIABILITIES

The Issued Capital was increased by £422,400 in February, 1959, by the Capitalisation Issue, which depleted the Capital Reserves by £241,980, and the Revenue Reserves by £180,420. By transferring the above-mentioned sum of £430,420 to General Reserve we have restored the combined Capital and Revenue Reserves to approximately the figure shown in the last Balance Sheet. The Shareholders' interests, consisting of Capital, Reserves and Unappropriated Profits, amount to £5,363,743, an increase of £465,023 over the previous year.

The remaining items show relatively little change from the previous year and do not call for comment.

ASSETS

The value after depreciation of the revenue-bearing Installations has increased by £307,053 to £4,071,524.

Office Furniture and Fittings, Vans and Cars are up by £8,494, whilst the Freehold and Leasehold Properties show a decrease of £7,704.

The increase of £22,738 in Investments in Subsidiary Companies represents an addition to our Shareholding in the Canadian Companies. The accumulated Canadian losses are still adequately covered by the Contingencies Reserve. Loans to Subsidiary Companies were repaid during the year, whilst the amounts due on current accounts have decreased by £2,726.

Of the Current Assets, neither Stock and Work in Progress, nor Sundry Debtors and Prepayments reflect much change, although as already mentioned we expect to see the Stock figure somewhat higher at the end of 1960.

Our Liquid Resources consisting of Tax Reserve Certificates, Deposits with Local Authorities, Investments and Cash are some £325,643 greater than at the end of 1958, some of the surplus funds having been invested in short-dated Government Stocks.

CONSOLIDATED BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The Consolidated Accounts having been prepared on a similar basis to that of the Parent Company, the material changes have already been dealt with in the foregoing remarks.

As previously stated, the Net Profit before Tax is £1,294,581 and after providing for Taxation, transfers to Reserves and Dividends, the balance of unappropriated Profits carried forward and attributable to the Holding Company's Shareholders amount to £420,486.

TRIBUTE TO EMPLOYEES

In conclusion, I am sure you would wish me to pay a tribute to the ungrudging hard work and willing co-operation of the employees in all sections of the Organisation at home and overseas, without which the results of this quite outstanding year could not have been achieved.

It is no exaggeration to say that, largely through the influence of the Profits Participation Scheme, the interests of the employees and the interests of the shareholders have become identical. To a remarkable degree our employees are conscious of a sense of personal responsibility for the progress and well-being of the Company. Many of them will benefit from the raising of the dividend rate and I can assure you that they will have amply earned the additional recompense.

From the point of view of the shareholders, the most valuable asset is one that does not appear in the Accounts at all—the loyalty and enthusiasm of the men and women who work for the Company.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring directors, Mr F. C. T. Lane, FCA, Mr J. H. Reed, CBE, ACIS, and Mr Campbell Cochran, BL, were re-elected and the remuneration of the auditors, Messrs. Chas. W. Rooke Lane and Co., was fixed.

The Special Resolution amending the Articles of Association having been passed, the proceedings terminated.

Extracts from the Statement by the Chairman

MR. G. E. McWATTERS

which was presented at the 65th Annual General Meeting of John Harvey & Sons Ltd. held on 10th June, 1960, at the Grand Spa Hotel, Clifton, Bristol, 8,

HARVEYS of Bristol

I have pleasure in presenting to you the Report of the Directors and the Accounts for our second year of trading as a Public Company.

PROGRESS

From our records I see that we now have some 6,500 Shareholders. The sales of the Group have again risen substantially during the year under review from £4,279,357 to £4,779,943, or 11.7 per cent. These figures do not fully reveal the increase in sales, as a substantial proportion of our growth has come through increased distribution to wholesalers who, of course, purchase at a lower price. The actual quantity of wine sold has increased by 133,681 gallons to 958,467 gallons.

GENERAL DEVELOPMENT

During the past year the Company has established a number of new Branches and Subsidiaries. At the present time we are building new depots in Birmingham and Glasgow at a cost of £37,000, and £20,000 respectively. These will be fully operational by the end of the summer. In addition we are modernising existing premises in Cardiff and Portsmouth.

Overseas, in May 1959, we established John Harvey & Sons (Belgium) S.A. to bottle and distribute our wines in the Common Market countries.

In August 1959, John Harvey & Sons (South Africa) (Proprietary) Limited was established to select and purchase South African Sherries.

At the same time, in the Central African Federation we set up John Harvey & Sons (Rhodesia) (Private) Ltd. to bottle South African Sherries for sale in the Federation.

John Harvey & Sons (España) Limited is an English Company with a Branch Office in Spain formed 27th January 1960 to license our sole Sherry supplier, Don Zoilo Ruiz-Matoos, to use certain Trade Marks so that our interests in Spain may be extended. His Grace the Duke of Primo de Rivera will be the President of this Company.

These moves secure our sources of supply and ensure that the high quality of our Sherries will be maintained.

We have some 42,000 butts of Sherry at our disposal in Jerez de la Frontera. This I believe to be the largest stocks on hand for any Company in the Sherry trade.

THE HOME MARKET

The reduction of Duty during the recent Budget must eventually benefit the interests of your Company. We anticipate increasing sales particularly during the Christmas period.

The Company's sales force has again been increased and the coverage of our accounts is now more effective.

Our advertising campaign for the three Bristol Sherries, Cream, Milk and Dry, has met with continued success. A special campaign for Bristol Dry has recently started and during the year our advertising activities will be extended.

THE EXPORT MARKET

The Sales Director, Mr. D. B. E. Belson, has just returned from a world tour calling upon the Company's agents overseas. During the course of his travels Mr. Belson covered a distance of 28,000 miles.

I have also visited America and Canada in the year under review.

From the result of these visits we feel that the Company's interests can further be extended. We are not entirely satisfied with the development of the Sherry market as a whole in the United States and consider that more can be done to enlighten the American public on the virtues of drinking Sherry from Spain.

It is our opinion that similar activity should be pursued in the Canadian market.

THE FUTURE

We have learnt with pleasure that according to present arrangements the President of the Board of Trade, The Rt. Hon. R. Maudling, M.P., has kindly consented to open our new Bonded Premises and Offices at Whitchurch on 3rd October 1960.

These premises are now in operation and the offices will be ready for occupation during August.

The amount expended during the past year in building and equipping the Whitchurch premises is reflected in the amount of fixed assets shown on the Balance Sheet.

The development at Whitchurch and the completion of other warehouses and supply points throughout the country now places your Company in a better position to augment the profitability of Shareholders' investments. The past year has been one of laying foundations for the future. The year ahead we have the task of building on these foundations and consolidating our position in the trade.

This we intend to do. Wherever possible a stronger sales drive will be applied not only to our Ports and Sherries but to our Table Wines as well.

Copies of the Report and Accounts may be obtained from the Secretary, 12 Denmark Street, Bristol 1.

WOODALL-DUCKHAM LIMITED

MEETING THE CHALLENGE OF CHANGING CONDITIONS

NEW ACQUISITIONS TO EXTEND GROUP'S INTERESTS

MR T. C. FINLAYSON'S REVIEW

The twelfth annual general meeting of Woodall-Duckham Limited will be held on June 27th at Woodall-Duckham House, 63/77 Brompton Road, London, S.W.3.

The following is the statement of the Chairman, Mr T. Campbell Finlayson, CBE, MSc, MInstGasE, MIChemE, FInstF, circulated with the report and accounts for the year ended December 31, 1959:

In my last Statement I drew Members' attention to the fact that the annual profits of the Group are greatly influenced by the dates on which substantial contracts are completed and brought into account. I explained that an unusually large number of substantial contracts were brought into account in 1958 which had a very favourable influence on the profits of that year.

THE YEAR'S RESULTS

The Consolidated Profit and Loss Account for 1959 shows a profit, before taxation, of £968,594 compared with £1,617,185 for 1958. These figures show a substantial fall when compared with the exceptionally high profits earned in 1958, but they still represent a by no means unsatisfactory year's results. Taxation amounted to £379,672 compared with £757,028 for 1958. After deducting £5,784, the proportion of profits applicable to outside interests, the Group Net Profit for 1959 was £583,138 against £846,179 for 1958. Out of the Group Net Profit of £583,138, profits amounting to £362,442 were retained by the Subsidiary Companies, leaving a net profit of £220,696 available in the Parent Company's Accounts.

A Special Interim Dividend of 5 per cent was paid on the Ordinary Shares in June, 1959, followed by the usual 5 per cent Interim Dividend in December 1959. In my last year's Statement I said that your Directors would ignore this Special Interim Dividend when they came to consider their recommendation for the Final Ordinary Dividend in respect of the year 1959. This they have done and they propose to recommend that a Final Dividend of 20 per cent should be paid on the Ordinary Shares in respect of 1959.

In spite of the adverse factors which continued to operate during 1959, to which I refer later, the value of orders received was £14 million against £10½ million in 1958. The value of work carried out by the Group was £12 million as against £14¼ million in 1958, with the result that the Group had the satisfactory figure of £20 million of unexecuted work in hand at the beginning of 1960.

TRADING CONDITIONS

I emphasised in my last Statement the problems which your Company was facing due to the changing requirements of its Clients in the Steel, Coal and Gas Industries. These problems continue to exist, particularly in regard to the fall in demand for coal carbonisation plants, on the supply of which the Company's business was founded. Whereas the Steel Industry is still installing a considerable number of coke oven plants to meet the growing demand for steel, the present policy of the Gas Industry is to build new plants involving complete gasification of coal or oil rather than the carbonisation of coal. It is very clear, however, that your Directors' plans for providing suitable alternative plants and equipment to meet the changing requirements of the Company's Clients are of the utmost importance, and this policy is being actively pursued. It will be appreciated that your Company's competitors are faced with similar problems, with the result that competition is extremely keen and profit margins narrower than for many years past. Your Directors are making every effort to meet this challenge by exploring new processes, methods and technique, and, where suitable, putting them into operation.

POLICY OF EXPANSION

In parallel with the policy I have outlined for dealing with the changing conditions within the industries with which the fortunes of your Company have been so intimately bound up since its inception, your Directors have been giving careful thought to the expansion of the Company's interests into new fields of activity. I am pleased to be able to report that during 1959 two Companies have been acquired and are now wholly-owned Subsidiaries of the Group. Before describing the activities of these two newly acquired Subsidiaries, I think it will be of interest to Members if I explain the principle on which your Directors feel it desirable to rely in regard to new acquisitions. This principle is to extend the base of the Group's interests within the broad framework of its present activities. It is not your Directors' intention to expand the Group's activities into fields which are completely diverse from the Group's normal activities. Their object is to expand into new lines in fields which are complementary to the Group's business and to aim at creating a number of integrated units, each capable of and responsible for managing its own day-to-day affairs, but sharing an overall common policy and pooling the wide range of knowledge and experience possessed by individual units for the benefit of the Group as a whole.

NORDAC LIMITED

The first of the two new acquisitions to which I have referred is Nordac Limited. This Company has a well-established business engaged in designing and manufacturing equipment for the evaporation of liquids by submerged combustion and in providing anti-corrosion linings for tanks, containers and pipes, using rubber, lead and plastic materials. The Company has well-equipped Works at Uxbridge, Middlesex. This Company, which was acquired as at January 1, 1959, showed satisfactory financial results for the year 1959, which are reflected in the Group Accounts for that year. There are good reasons for believing that this Company's business is likely to show further advances during the next few years. The cost of this acquisition was met by the issue to the Vendors of 185,189 fully paid 5s. Ordinary Shares in Woodall-Duckham Limited.

AMES CROSTA MILLS AND COMPANY LTD.

The second new acquisition is Ames Crosta Mills and Company Ltd., of Heywood, Lancashire. This Company was acquired as at October 1, 1959, for a cash payment of £735,000. As the settlement was not due to take place until March 31, 1960, the Accounts for 1959 are not affected by this transaction, i.e., the profits of the Company for the period from October 1, 1959, to December 31, 1959, have not been taken into the Consolidated Profit and Loss Account, nor has any account been taken of this Company's Assets and Liabilities in the Consolidated Balance Sheet for the year ended December 31, 1959.

Ames Crosta Mills and Company Ltd. carries on a world-wide business in the design, manufacture and supply of apparatus and plant for the purification of domestic and industrial sewage and for the treatment of noxious effluents. There is no doubt that there is a growing world-wide demand for the products of this Company which enjoys a high reputation in the Sewage Purification Engineering field. It owns a well-planned and up-to-date Works and has a highly efficient, experienced and energetic Management and Staff. I look forward with confidence to this Company becoming a progressively more valuable unit of the Group.

Brief particulars of the activities of the other Operating Companies of the Group are set out below:

WOODALL-DUCKHAM CONSTRUCTION COMPANY LTD.

It is a matter of satisfaction to report that the Company secured during 1959 the largest single order it has ever received. This was for a Lurgi High Pressure Coal Gasification Plant and ancillary plant to be built at Coleshill for the West Midlands Gas Board. This plant will make gas from local small coal and will have a capacity of 40 million cubic feet per day. In addition, the Company received a substantial order for a further Coke Oven Plant at the Ravenscraig Works of Colvilles Limited. Since the year end, the Company has received also the order for the additional extension to the Coke Oven Plant at Ravenscraig Works, this constituting the fifth installation to be built for Colvilles Limited. An order has been received for the supply and erection of an Ore Concentration Plant from the Sierra Leone Development Company Limited.

The Company has also been occupied in carrying out substantial maintenance and rebuilding work for the Gas and Coking Industries during the year.

The Company has recently obtained from United Engineers & Constructors, Inc., of Philadelphia, USA, a licence to exploit a Cyclic Catalytic Reforming Process, known as the "U.G.I. C.C.R. Process" for the manufacture of gas by reforming fluid hydrocarbons. Plants built in accordance with this process are especially suitable for large daily outputs.

W. J. JENKINS & COMPANY LTD.

This Company, owing to the restriction of capital expenditure by the Gas Industry, formerly its main customer, has continued to extend its activities into other fields, with an encouraging degree of success which has been assisted by the application of method and work study to all departments.

The modernising of the Works and equip-

ment which has been proceeding during the past few years will materially assist the Company in its endeavours to widen the scope of its activities.

At the beginning of the year this Company purchased the old-established family concern of R. Bradshaw & Company, a small foundry business whose premises adjoin the Company's Works. This Foundry is now a department in the Company's organisation and supplies the iron castings required in its own Works, leaving the small surplus production available for sale.

WOODALL-DUCKHAM (AUSTRALASIA) PTY. LTD.

The past year has brought no basic change in the overall pattern of this Company's activities as outlined in my last Statement. The value of orders obtained during 1959, amounting to £1.4 million Sterling (as against £350,000 Sterling in 1958) was, however, very encouraging and reflects the soundness of the policy of widening the Company's field of operation. Large orders were obtained from Consolidated Zinc Pty. Ltd., for a vertical furnace for the production of zinc, and from the City of Dunedin Gas Department, New Zealand, for a coal carbonising plant.

The Refractories Division has had another rather disappointing year due to very keen competition in a limited market.

Whilst the financial results of this Company continue to fall short of our expectations I believe that a sound foundation has been laid and that the patient and energetic work expended will, in due season, bring its reward.

THE STOURBRIDGE REFRACTORIES COMPANY LTD.

During the year the interests of the remaining outside shareholders were purchased and this Company is now a wholly-owned Subsidiary of the Group. Results for the year were, owing to difficult market conditions, somewhat disappointing, but improvements in the Works have continued and will enable full advantage to be taken of the more favourable market conditions which it is hoped will arise.

UNITED FIRECLAY PRODUCTS LTD.

It is satisfactory to be able to record that the brighter prospects for 1959 forecast in my last Statement have been realised, resulting in satisfactory increased profits.

The installation of the new plant begun early in 1959 is expected to be completed about the middle of 1960. The increased production capacity and the improved facilities which should follow when the new plant is put into operation should have an early and favourable effect on the Company's financial results.

GENERAL

Taking into consideration the adverse factors mentioned in this Statement and having regard to the positive steps taken to counterbalance these by embarking on the new activities described, your Directors anticipate that, apart from unknown circumstances, the profits of the current year will continue at a satisfactory level.

May I, in conclusion, on behalf of my colleagues and myself, once again offer to all those employed in the various constituent Companies of the Woodall-Duckham Group our warm thanks for their efforts which have contributed so largely to another successful year in the Company's history.

to be submitted at the 37th Annual General Meeting in Ormskirk on 30th June, 1960.

HATTERSLEY (ORMSKIRK) LIMITED

Trading Conditions—Higher value of orders received and despatched but reduced profit resulting from keen competition and lower profit margins for valves and fittings.

Halifax Extensions—Transfer of Halifax Works to new premises completed but did not contribute materially to production during year.

M. B. John & Hattersley Limited, Australia—Another year of record sales and profits. Dividend maintained at 10%.

BECK & CO. (METERS) LIMITED

Exceptionally good year with record turnover and profit, but figures unlikely to be maintained. Dividend increased from 25% to 40%. Pump Maintenance Limited still further consolidated its position.

Number of Shareholders : 1,300 Number of Employees : 1,460

Copies of the full accounts may be obtained upon application to the Secretary.

'We in the Thomson Group are at the birth of a new era'

Mr. Roy Thomson

The following are extracts from the Statement of the Chairman, Mr Roy Thomson, circulated with the Report and Accounts for the year ended 31st December, 1959, submitted to the Annual General Meeting of Thomson Newspapers Ltd., on 2nd June, 1960.

I AM happy to tell you that the merger of Kemsley Newspapers Ltd. and Scottish Television Ltd. is already proving an unqualified success, and that prospects are most encouraging.

Considerable managerial reorganisation has been carried out since I have become Chairman and no fewer than 23 executive promotions, including those of six general managers, have been made, nearly all from within the Company. The calibre and vigour which I have found in all ranks of the organisation have been most impressive and I feel that we are creating an exceptionally strong team capable of meeting any strains in the future and calls for expansion.

Mr Iain Stewart, Chairman of Hall-Thermotank Ltd., and a Director of Scottish Television, accepted our invitation to become a Director on 17th March and we warmly welcome him.

I propose to enlarge the Board further by the addition of several other men of experience and stature.

The Company has been organised in three divisions—newspapers, television and general printing, and their activities are well co-ordinated. Although the results of *The Scotsman* and its associated newspapers are not included in the consolidated accounts, these publications operate under the aegis of the controlling company.

Results and Prospects

There was a major change in the composition of the Group with the acquisition of Scottish Television Ltd., and the Consolidated Profit and Loss Account shows the earnings of the Group as thus constituted for the whole of the year. The profits derived from trading activities and from investment income during the year amounted to £3,214,246, and after deducting from the Trading Profits Debenture interest of £111,020 and providing the sum of £1,495,568 for taxation there remains a net amount of £1,607,658 to which has been added £381,613 representing the profit on sales of investments and on redemption of Debentures of the parent company, and a surplus of £167,300 arising on maturity of the sinking fund policies held to provide for the repayment on 31st December 1959 of a subsidiary company's Debenture Stock.

It is proposed that these profits, which together with the surplus on realisation of the sinking fund policies total £548,913, should be appropriated to Capital Reserve where they will increase capital profits of previous years to a total of £637,323; this amount will be available for tax free distribution to stockholders should the financial position in the future warrant such a course.

The net Group earnings for the year, therefore, totalled £2,156,571. After deducting profits attributable to minority shareholders £5,154, adjusting for taxation relating to prior years £19,270, deducing the net taxed profits of £346,610 of Scottish Television Ltd. earned from 1st January to date of acquisition and retaining £1,191 in subsidiaries there remains a balance of £1,784,346, representing the net profit of Thomson Newspapers Ltd. The dividends less income tax on the Preference Stock absorb £305,250, leaving £1,479,096 available for transfers to Reserves and for dividends on the Ordinary Stocks.

It should be borne in mind, however, that this sum includes the exceptional items of £548,913 to which I have referred, and which, as I have stated, the Board proposes to transfer to Capital Reserve. In addition the Board proposes to allocate the sum of £500,000 to General Reserve. The interim dividend of 6% on the Preferred Ordinary Stock paid on 1st September amounted to £91,875, and it is recommended that a final dividend at the rate of 15% be paid on the Preferred Ordinary Stock, together with a dividend of £61,250 net on the Deferred Ordinary Stock.

After allowing for these dividends and transfers to Reserves the carry forward of Thomson Newspapers Ltd. is increased by £47,371 to £321,559 and the corresponding total for the Group is £638,424.

The Consolidated Balance Sheet shows the net assets position of the combination of Scottish Television Ltd. with the former Kemsley Newspapers Ltd. and reserves have been strengthened during the year by no less a sum than £1,097,475. The item of Goodwill reflects the equity in Television and the Board considers that the present earning capacity and profit potential of your new subsidiary fully justify the amount of the increase in that item.

The Sunday Times

Despite the amazing developments which have revolutionised communications during the past few years, the Press is still, and must remain, the most effective and most powerful medium for keeping the people of any country fully informed about what is happening in the world.

Nowhere is this better demonstrated than in the newspaper which my predecessor built up into one of the most famous world organs of news and comment: *The Sunday Times*.

I am very proud of all the newspapers acquired by Thomson Newspapers, but the one whose ownership brings me the greatest pride and the greatest challenge is *The Sunday Times*.

A great newspaper has a personality of its own, which a wise proprietor respects. I resolved from the start that new ownership should not change the editorial character of *The Sunday Times*, and in particular should not alter the high standards of critical judgment, accuracy and independence which this newspaper outstandingly represents. My views on the independence of editors are well known, and there have been no changes whatever in the higher editorial levels of *The Sunday Times*. I have every confidence that the Editor and his colleagues will go on producing a newspaper of the highest journalistic standards, such as they have already established.

The circulation in the first quarter of 1960 averaged 933,519 copies per issue, an increase of 58,871 over the same period of 1959. All the evidence is that old readers stayed, and new readers were won and kept because they found that *The Sunday Times* was the best Sunday newspaper in the country.

Regional Newspapers

We have a substantial stake in the popular and highly competitive Sunday newspaper field which aggregates over three million copies each week. The solid strength, however, of the Group lies in our regional publications in the great cities and industrial areas of England, Scotland and Wales.

Such papers deserve the best we can give them in management and editorial services and from the outset we have been carrying out an intensive review of the standard of their premises and plant. My philosophy has been that expenditure to improve production, so that there is always spare printing capacity in hand and to give better working conditions, is always justified. We have, therefore, been planning accordingly.

Newspaper Ownership

I have often said that newspapers and now television are not to me a means to personal power, or instruments of propaganda, but a business. It is as a businessman that I approach the whole problem of their administration. By their very nature newspapers must mirror the image of the people whom they serve; and if this mirror is distorted, and not faithfully reflecting, in the long run it will prove to be bad business.

In closing may I say this. We in the Thomson Group are at the birth of a new era; an era, I am sure, which holds special promise for ambitious men and women to march with our expanding and forward-looking organisation.

THE THOMSON ORGANISATION IN GREAT BRITAIN *Newspapers · Television · General Printing*

SCHWEPPES LIMITED

THE HONOURABLE R. HANNING PHILIPPS

ON A YEAR OF OUTSTANDING ACHIEVEMENT

The sixty-third annual general meeting of Schweppes Limited was held on June 2nd at the registered office of the company, Schweppes House, 1-6 Connaught Place, London, W.2, The Honourable R. Hanning Philipps, MBE (the chairman), presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1959:

The trading year 1959 has been one of outstanding profit after ten years of progressive development of your Group of Companies. Whilst these results have undoubtedly been given an exceptional impetus by the long dry summer, they do reflect the steady growth of the business resulting from the substantial investment that has been made over the years since the war. This has resulted in good contributions of profit from both home and overseas trading. As to the overseas profits in many cases these have been left with our Overseas Subsidiaries to finance further developments or to extinguish past losses incurred during the development stage.

The year under review has also seen the extension of the interests of your Company into jams, marmalades, jellies, canned vegetables and fruits, through the acquisition of the three well-known businesses of Chivers & Sons Ltd., William P. Hartley Ltd., and Wm. Moorhouse & Sons, Ltd. These Companies not only lend themselves to considerable integration of manufacture, distribution and accounting, but the existing resources and technique of our Group in the way of Research, Methods Study and Advertising can be profitably brought to bear in these new businesses. Our Research Laboratory's basic research knowledge on fruits, fruit juices and flavours can be applied to preserves and jellies, the bottling and handling techniques we have extensively applied in our soft drink factories are also capable of adaptation to other kinds of food packing. Your Directors believe that over the next few years these three businesses can be combined into a highly efficient and profitable whole, and their exports, as well as their home trade, further expanded.

To act as a Management Company for these three Companies we have formed a wholly owned subsidiary called Connaught Food Products Ltd., to the directors of which your main Board has delegated the responsibilities of carrying out these tasks.

The total cost to the Company of these three businesses has been £5,031,136, paid as to cash £135,979 and Ordinary Stock at current market values £4,895,157. Their respective assets and liabilities have been consolidated in the Balance Sheet and £50,187 of the Group Consolidated Net Profit relates to their post-acquisition taxed profits.

SCHWEPPES (HOME) LTD.

I referred to this new Company in my statement last year. It takes under its care all home trading in 'Schweppes' brand, and has had a successful first year of operation. The first three months of 1959 opened quietly. Consumer demand, we believe, was somewhat retarded by the continuing cost of meeting payments resulting from the relaxation of the previous Hire Purchase restrictions in the autumn of 1958. However, by Easter 1959 sales began to resume their upward trend, and showed for the rest of the year substantial sales increases for every month, ending in another record Christmas selling period. A fine summer, while undoubtedly a substantial help in these sales results, is not so predominant an influence in our main type of trade, which is the provision of 'mixer' drinks to the licensed trade, a trade which is sustained by a fairly stable consumer demand throughout the year. We also had a good year in selling both Schweppes Squashes and Cordials, and experienced a marked revival of interest in our Pure Fruit Juices. We were helped throughout the year in our costs by buying our sugar and fruit supplies reasonably cheaply, at prices we shall not be able to repeat this coming year.

Rose-Kia-Ora Sales Company.—This Sales Company had a record year for its 'Rose's,' 'Kia-Ora' and 'Suncrush' brands, and secured more than its proportionate share of the substantially increased total trade in fruit squashes and cordials. Whilst the good summer generally lifted all sales of this type of soft drink, there has been keen competition between the main national brands, featuring bonus trading offers in nearly every month of the year, as well as price cutting, all of which has promoted increased volume of sales through the grocers.

The Park Bottling Co. Ltd.—In March 1959 this Company, in which we previously held a two-thirds interest, became our wholly owned subsidiary. Whilst continuing to expand its franchised drink 'Pepsi-Cola' most successfully throughout the year, it has in parallel developed the sales of a complementary orange drink called 'Sparkling Suncrush.' This Company has for the first time made a useful contribution to the Group's profits and we are encouraged by the sales increases persisting into 1960, auguring well for another successful trading season.

Jewsbury & Brown Ltd.—This well-known Manchester Company, now fully integrated into the Group, has had a successful year of operation, making an increased contribution to the home profits.

The Apollinaris Co. Ltd.—This Company, which holds the rights to sell the famous natural spring water of that name, has increased its sales 17 per cent.

Schweppes (Overseas) Ltd.—This Company has had an active year in promoting sales, both by way of export of 'Schweppes' mineral waters, and by expansion of the trade of existing overseas franchises, and the opening of two new franchises in Senegal and Spain. The growth of sales of our Tonic Water, particularly in Belgium and France, has been remarkable. We continue to support these overseas efforts by substantial advertising and other methods of sales promotion so as to ensure both the international fame of our drinks and their general availability.

OVERSEAS COMPANIES

Schweppes (Australia) Pty. Ltd.—This Company has extended its sphere of operations by the purchase of control of existing mineral water businesses in Canberra, and in Perth, Western Australia. It has also opened two more bottling franchises. In Melbourne, where it has outgrown its productive facilities, a new factory is already under construction to take the place of the existing one.

I am glad to report that the Australian Company's profits have reached a new record. Sir Frederic Hooper has recently visited Australia, and found our interests there in excellent shape. Arrangements are in hand for inviting the Australian investor to subscribe for 25 per cent of the capital of this Company, a policy which we believe will be in the long term interest of both ourselves and our Australian subsidiary.

Schweppes (South Africa) Ltd.—During 1959, this Company maintained its satisfactory level of trading profits in spite of the rather more difficult trading conditions they encountered.

Schweppes (Central Africa) Ltd.—This subsidiary finished its trading year with a small loss. The areas it serves in Northern and Southern Rhodesia are passing through a period of strain, politically and economically. Additionally, we have had to meet severe competition from certain American drinks. We have more than held our position and early indications in the new year are that this Company has traded more profitably. There has been a recent meeting in Livingstone, Southern Rhodesia, of the Managements of our African Companies and useful methods of co-operation and consultation have been evolved.

Schweppes (East Africa) Ltd.—This Company is now our wholly owned subsidiary, the minority interests having been purchased by us in the year under review. It again unfortunately traded at a loss, but held its sales against particularly bitter competition from two local Companies handling subsidised American soft drinks. This subsidiary will not quickly get into a profit earning stage, but we are looking to long term development of this particular market.

Schweppes (USA) Ltd. and Schweppes (Canada) Ltd.—Both these Companies achieved considerable increases in sales, and have still further broadened the base of operations by opening up new markets. I recently met there many of our important bottlers and distributors and found them most sanguine and enthusiastic. While we have still much to achieve in these two markets, we already have a well established business on a profitable footing, which gives us a firm basis for further expansion.

PRODUCTION AND DISTRIBUTION

At Home all factories and our distributive organisation have been fully extended this past year; but at all times we have met all our customers' demands, and maintained on a high level our quality and our service. Our chain of factories and depots throughout England, Scotland and Wales ensures that we are quickly able to answer any exceptional sales pressure that may be put upon us. The large new factory we are erecting at Sidcup, Kent, to take the place of our old Vauxhall factory and to relieve the pressure on our Hendon factory, is likely to be ready for operation early in 1961. It will incorporate the most modern bottling and handling methods we have evolved, and is estimated to cost £1 million.

New distribution depots have been built at Blackpool, Leicester and Manchester, and we plan this year to build two large depots at Canterbury and Newhaven. In 1962 a new factory on land we have secured on the Team Valley Trading Estate will take the place of our existing Newcastle-upon-Tyne factory, which we have out-grown.

We are constantly applying new ideas emanating from our Research Laboratory at Hendon and from our system of Methods Study and Operational Research, to secure further working economies through a smooth flow of production and distribution. We have also applied Methods Study to our sales organisation with useful results. By such means we have held down our costs and our selling prices which have remained practically unaltered since 1948

ACCOUNTS

I hope that you will like the new size and shape of our Annual Report and Accounts, which have been put before you in a handy and more legible form.

In these accounts you will note two main changes compared with those of previous years. First, this year we present to you only one Profit and Loss and Appropriation Account—the consolidated account of the Group. Secondly, the Balance Sheet of Schweppes Ltd., the parent Company of the Group, is relieved of all fixed assets except Land and Buildings, which properties it leases to the operating Company, Schweppes (Home) Ltd. Its other main assets now consist of the investments and advances to its subsidiaries. It is the Consolidated Balance Sheet of Schweppes Ltd., together with its Subsidiaries, which shows the full detail of the assets and liabilities of the Group as a whole.

The Consolidated Profit on Trading for the year has increased from £3,238,716 to £4,802,815, depreciation absorbs £823,503, as against the previous year of £625,717, and such increase reflects the cost of the new policy of writing off the Company's properties over a minimum period of 50 years From the profit of £3,776,184 provisions for taxation totalling £1,737,441 is deducted and after deducting minority shareholders' interests and expenses in connection with increase of Capital, and after placing £617,424 to Reserves there is with the amount brought forward from last year a total disposable profit of £2,127,519. Of this sum £801,976 has been carried forward in subsidiary companies compared with £512,663 the previous year, an increase of £289,313. Your Directors recommend a final dividend on the Ordinary Stock of 18 per cent, less tax, which with the 5 per cent net interim dividend paid in October makes a total dividend for the year 1959 of 23 per cent, absorbing £970,194. After deducting £185,717, the cost of the special interim dividend of 5 per cent paid with the final dividend in May last year and the Preference Dividend of £36,425 the balance of profit remaining to be carried forward in the Schweppes Limited Accounts is £133,207.

As you will see from the Ten Year Financial Review included in the printed Accounts, this profit distribution marks a new record in the Company's history.

MANAGEMENT

At the end of a year of outstanding achievement I would like to record our sincere thanks to the Directors, Management and Staff of all our operating companies at home and our subsidiary and associated companies overseas. Their combined efforts over a long period have made our record profits possible. Our congratulations should also go to our overseas Franchise Bottlers whose goodwill and hard work is doing so much to expand the sales of Schweppes in their respective markets.

PERSONNEL

During the year we have continued our efforts to improve conditions of service with our Company with the result that our labour turnover has remained at a satisfactorily low level. We have also improved our methods of personnel training and have done much to open up new opportunities for promotion for any of our employees who have both the desire and the ability to accept responsibility. While wherever possible we fill executive posts from our own Established Staff, in a rapidly expanding business we have to seek some of our management material from outside. To this end we have recruited a number of ex Regular Service Officers to the very great benefit of ourselves and of the Regular Forces Resettlement Service.

OUTLOOK

I expect you would wish me to say something about the current year's prospects for the home companies. Sales of Schweppes Mineral Waters for the first quarter show an increase of 18 per cent. Against this Fruit Squashes are rather less buoyant; and wages and some raw materials are costing us more. As regards our new investment in Jams and Preserves we are not counting on any addition to the Parent Company's revenue from this source. The profits from this section will in any case need to be ploughed back for long-term development.

To sum up, therefore, as it seems unlikely we shall have another exceptional summer like the last we shall have a struggle to equal the figures we have now laid before you. However, I see no reason why we should not come near to doing so.

The report and accounts were adopted and the final dividend of 18 per cent on the Ordinary Stock, less income tax was approved.

The retiring directors, the Right Honourable Lord Rockley and Mr H. A. F. Canfield, MInstCE, MIMechE, were re-elected, and the remuneration of the auditors, Messrs James Edwards & Co., was duly fixed.

PHILLIPS RUBBER SOLES LIMITED

The 33rd Annual General Meeting was held on 9th June, 1960, the Chairman, Mr. Peter Petrie, presiding.

The Accounts for the year ended 28th February 1960, showed :—

Group Profit for the year...	£216,885
Add brought forward	98,538
	£315,423
Income Tax and Profits Tax	£101,000
Transferred to Reserves	55,462
Net Dividends	60,638
Amount carried forward	98,323
	£315,423

The following is a brief summary of the Chairman's Review :

RESULTS. The Group has had an excellent year : higher sales of Phillips soles and heels at home and overseas, and substantially improved results from other subsidiary companies have, together, produced an increase in group profit, before tax, of £28,000.

PRICES. The Company's policy to keep prices of Phillips soles and heels as low as possible is evidenced by the fact that the average price of Superfine Stick-a-Soles is less than 50 per cent above prewar prices. Once again, no increase was made during the year despite substantial wage awards and the higher price of raw rubber, and it is hoped to avoid price increases this year.

MODERNISATION. Progress with the extension and re-equipping of the Manchester Works has been good and the scheme is now more than half-way through.

PROSPECTS. As regards the current year, sales in all branches of the Group are encouraging. There seems no reason, at present, why the Group should not have another successful year.

The final dividend of 17½ per cent—making 22½ per cent for the year—was approved and the Report and Accounts were adopted.

ELLIOTT-AUTOMATION LIMITED

GROUP PROFIT BEFORE TAX EXCEEDS £1 MILLION

CONTINUOUS EXPANSION AT HOME AND ABROAD

MR R. E. F. DE TRAFFORD ON OUTLOOK FOR AUTOMATION

The Annual General Meeting of Elliott-Automation Limited will be held on June 30th in London.

The following is the statement by Mr R. E. F. de Trafford, OBE, the chairman, which has been circulated with the report and accounts for the year ended December 31, 1959:

You will see from the accompanying accounts that in 1959 the net profit of the Group before taxation exceeded £1 million for the first time. Not only is this achievement satisfactory in itself but it represents an increase over 1958 of some £200,000 or about 25 per cent.

This improvement is attributable not only to a substantial rise in turnover but to improved efficiency and I would stress that it was achieved with a personnel not dissimilar in size to that of a year ago. Our constantly improving efficiency and productivity are matters of satisfaction to your board for they endorse the wisdom of having spent over the past two years as much as half-a-million pounds on land and buildings and a further million pounds on capital equipment. It is gratifying that the investment has begun to bear fruit so quickly.

Although capital commitments as shown in the notes on the accounts were low at the turn of the year, the policy of installing the latest type of equipment is continuing and we envisage the investment of substantial further sums on plant and buildings in the year now current. Moreover, research and development continued and will continue on a heavy scale.

RESEARCH EFFORT

Automation depends to a very large degree upon knowledge of advanced techniques in a surprisingly varied number of fields, and this inevitably requires intimate contact with the latest scientific ideas and technologies. The size of the research effort deployed by a Company in our sphere is, therefore, a valuable indication of technical capability. It may interest shareholders to know that at our research and development establishment at Borehamwood some 1,700 employees are engaged largely upon very advanced research and development projects.

You will remember that in order to fund bank indebtedness and to provide further permanent capital, around £2,500,000 was raised at the end of last year by means of a rights issue to Ordinary shareholders in the proportion of one new share of 5s. at 20s. per share for every five shares then held. The issue was subscribed to the extent of more than 99 per cent. of the shares provisionally allotted. The proceeds of the issue were received only at the end of December and accordingly made no contribution to the year's profits.

Since the turn of the year we have acquired for cash the nucleonic instrument business of Isotope Developments Limited which is complementary to our own activity in this field and which is already proving a profitable member of your group. Similarly, we have acquired the business of Black Automatic Controls Limited, whose range of solenoid-operated valves usefully supplements our existing valve interests.

INTERESTS IN COMMON MARKET

We have also been able to negotiate a favourable trade agreement with a French engineering Company. Manufacture de Machines du Haut-Rhin ("Manurhin"), which will involve an investment on our part of approximately £250,000 in the Company on financially attractive terms. The Company which already employs some 2,500 people in large modern factories, proposes under our auspices, to build up an automation business fashioned on our own pattern and should give us a valuable position within the Common Market. We believe that a substantial income from sales and royalties will accrue to us in due course from "Manurhin," on whose board we are to be represented.

FINANCIAL POSITION

Turning now to the balance-sheet at December 31, 1959, I have already referred to the expenditure on land, buildings and equipment. You will see from the accounts that current assets exceed current liabilities by £6,858,478. This figure takes into account the proceeds of the rights issue, but as a result of the purchase for cash of the two businesses referred to earlier which, together with the necessary additional working capital, required about £300,000 and of the continuing general expansion of the business, we are currently again making use of part of our overdraft facilities.

In March of this year a capitalisation issue of one new Ordinary share of 5s. for every five shares held was made to Ordinary shareholders. The result of this operation is reflected in the accounts now before you which show that share capital and reserves, generally referred to as "Shareholders Funds" total £9,122,826.

Group profit before tax amounts to £1,015,630. Profits tax and income tax appropriate to this figure is £493,755 but against this we may set £27,000 arising from the reintroduction of investment allowances. Net profit for the year, therefore, amounts to £548,875 against £458,628 and I would mention that in the year under review there was no contribution from Associated Insulation Products, whose undertaking we disposed of early in 1958.

The Preference dividend required a net £16,758, leaving available for the Ordinary capital on the year's operation a total of £532,117. An interim dividend of 4 per cent paid in December, 1959, cost £77,896 net and was payable on £3,179,440 of Ordinary capital. When I wrote to you in December, 1959, I forecast a final dividend of 6 per cent on the capital as increased by both the rights and the capitalisation issues. This we now recommend at a net cost of £168,256. Thus, out of £532,117 available for the Ordinary share capital, we shall have distributed £246,152 (compared with £189,971 last year), leaving the remainder to be ploughed back into the business. After taking credit for £26,000 of tax overprovided in previous years, the balance remaining to be carried forward amounts to £661,235, against £349,270 last year.

GENERAL REVIEW OF ACTIVITIES

From a review of the accounts, let me pass to a general review of our activities.

Your Group comprises some 50 Divisions, each concerned with a particular sector of automation. Its continued expansion and development has required on an average the addition of some five or six divisions in each of the last years. The process is continuing and it is undoubtedly in this broadening of the base upon which your Company's business is built that lies the promise of a successful future. Among divisions recently formed are one or two whose activities may be of particular interest to you.

One new division has made a successful entry into the high-vacuum field and into the manufacture of highly specialised vacuum equipment and electronic valves. Another has gone into the quality control instrument field which is a rapidly growing one, supplying as it does a range of instruments such as mass spectrometers, plant chromatographs and moisture monitors. Since the close of the year its range of equipment has been further extended as the result of an agreement with the Jarrell-Ash Company of Newtonville, Mass. Further, we now have a relay division manufacturing a range of highly specialised mercury-wetted and other relays of extreme reliability.

In the military field our inertial navigation division is prominently associated with the design and production of the Guidance system of the "Blue Steel" Guided bomb, which has received considerable publicity of late due to its key role in this country's defence system.

The National Cash Register Company Limited, who as you know market our computers for business applications, have recently started selling the new Elliott transistorised machine—the 803—while we have been invited by them to manufacture in this country a very advanced N.C.R. American-designed computer. Our 803 and certain ancillary equipment are finding an increasing market in the United States and in Europe, in many cases for the control of industrial processes.

FOREIGN SUBSIDIARIES

Business abroad and in the export field is showing substantial expansion and is making a valuable contribution to turnover. Elliott-Automation A.-G. formed some two years ago in Switzerland secured in 1959 its first large contract involving the complete instrumentation of an oil refinery. It is envisaged that some of the companies we have formed in Australia, Germany and the Netherlands, will have facilities for at least partial local manufacture. I have already mentioned to you our link-up with France through "Manurhin."

The pioneering and preparatory work in automation in which we have been engaged for some 10 years is beginning to bear fruit. There is now a rapidly growing awareness in this country, and indeed throughout the world, of the importance of automation. It is now beginning to be understood that these techniques can not only make a vital contribution to our economic life, by making us competitive in world markets without straining our limited national resources, but that indeed the scale of demand for our type of equipment throughout the world indicates that from this decade onwards much of our industry is about to change to a new level of automation.

INTEGRATED AUTOMATION SYSTEMS

In all industrial development, automation has come to be accepted as an important factor and because "Elliotts" have such wide experience in all its facets, they should be uniquely placed to take advantage of the increased demand which we can already discern. We have recently formed a new company, E-A Automation Systems Limited, which will have teams of experts able to advise the various process industries on integrated automation systems. I can mention in this connection that your Company has been entrusted with what may well be the largest individual project for a new automated process plant in this country, as well as with other important projects at home and overseas.

CURRENT YEAR'S OUTLOOK

You will expect me to say something as to our hopes for the current year. Our order book has grown considerably and deliveries this year are running well ahead of last year. In other words, business continues to expand and it is the view of your board that our growing number of shareholders, who now total over 10,000, can expect that, subject to unforeseen circumstances, 1960 will again be a year of real progress in the affairs of the Company.

Our thanks are due to the management, staff, and workpeople who are all making their contribution to our progress. I have on previous occasions referred to the youthfulness and enthusiasm of our executive and staff without which we should not be able to achieve this rate of progress. It is a feature of our organisation that it offers exceptional scope for development of managerial ability and this is reflected in the fact that we steadily recruit young people of promise, who find it worthwhile to make a career with us. Herein, we believe, lies another cause for confidence in our future.

LONSDALE INVESTMENT TRUST LIMITED

INCREASED PROFITS, DIVIDENDS AND ASSETS

ROBERT BENSON, LONSDALE'S ACTIVE YEAR

The Thirteenth Annual General Meeting of Lonsdale Investment Trust Limited will be held on June 30th in London.

The following is the statement of the chairman, Mr T. L. McC. Lonsdale, circulated with the Accounts:

There are substantial changes in the Balance Sheet of the Trust as compared with last year. As I forecast in my statement last June, £800,000 was raised in July by way of a "rights" issue to existing Ordinary Stockholders of Ordinary Shares at a price of 16s. in the ratio of one Ordinary Share for every eight units of 5s. held. Subsequently a scrip issue was made in Ordinary Shares in the ratio of one Ordinary Share of 5s. each for every three units of 5s. held on the Capital as increased by the "rights" issue. These operations are reflected in the Balance Sheet in the increase in the Ordinary Capital from £2 million Ordinary Stock to £3 million (quoted in 12 million Ordinary Stock units of 5s. each) and a change in the Share Premium Account from £238,369 to £24,763.

SUBSTANTIAL INVESTMENT OF NEW FUNDS

The book value of the general investments held by the Trust, other than subsidiary companies, is now £5,011,373. This is an increase over last year of £1,288,103, being the net amount invested during the year. At the date of the Balance Sheet the excess of the cost of new investments over the sum received from the "rights" issue had been met mainly by temporary borrowing from subsidiary companies of £363,165. Since the close of the Trust's financial year, the Trust has placed £750,000 5½ per cent Debenture Stock 1981-86 at a price of 97, from the proceeds of which this temporary borrowing has been repaid and some £360,000 made available for new investment. The recent issue of Debenture Stock will bring the total of the Trust's Debenture Stocks to £2,250,000 and broadly restores the gearing of Capital employed, which was affected by the "rights" issue.

The amount of new funds invested during the year to February 29, 1960, was greater than for any previous year in the Trust's history and expressed the Board's confidence in the recovery of profits resulting from the improvement in this country during the year in productivity and industrial activity. This improvement has, of course, been reflected in the prices of British securities and, despite the relatively indifferent performance of the dollar investments held, the excess of the market value over the book value of the Trust's quoted investments increased to £5,052,733 as compared with £3,072,585 a year ago.

INCREASED RESOURCES OF ROBERT BENSON, LONSDALE

As in the case of previous issues of Debenture and Ordinary Stock of the Trust, all the proceeds have been invested in general investments and none in Robert Benson, Lonsdale & Co. Limited, our principal subsidiary. The growth in the capital funds employed by the subsidiary has, in the year under review, as before, been due to the retention of profits and the amount thus retained reached the substantial sum of £302,000. The consolidated Balance Sheet of Robert Benson, Lonsdale & Co. Limited shows that the Share Capital and Reserves now amount to £2,067,979 which does not include the considerable amount of unrealised appreciation in the investments held. The detail of the growth of the Trust's investment in Robert Benson, Lonsdale & Co. Limited and the return received therefrom are shown in the Ten Year Record, as usual attached to the Report, and from this you will see that, as retentions have accumulated, steadily increasing dividends have been received, reflecting the profitable use of the additional resources. From the profits of the year the Company increased its dividend to the Trust from 17½ per cent to 25 per cent on its capital of £800,000.

LARGE INCREASE IN DIVIDEND

The total Gross Revenue of the Trust increased by £134,078 to £629,774. Out of this, the income from general investments amounted to £424,147 and showed an increase of £72,671 over the previous year. This large rise was due mainly to the increase in dividends from British investments and to a lesser extent to the use during part of the year of the proceeds of the "rights" issue.

After deducting Expenses, Interest Payable and Taxation, the net income of the Trust increased to £323,105 compared with £239,965 last year. An interim dividend of 4 per cent was paid in December last and a final dividend of 11 per cent is now recommended, making a total dividend of 15 per cent on the increased Ordinary Capital of £3 million compared with 16½ per cent on the Ordinary Capital of £2 million last year. The 15 per cent dividend absorbs £275,625 net compared with £198,375 net paid out in dividend last year.

FURTHER INCREASE IN INCOME EXPECTED

This year the Trust will receive the benefit of a full year's return on the substantial amount invested last year, and it is at present experiencing an increase of income from British investments at a rate at least as great as last year and, to a lesser extent, from USA investments. Therefore, I am confident that the income from the Trust's general investments will be again higher this year.

The Table of Distribution of Invested Funds shows a lesser percentage invested in dollar areas than previously. The Table is based on market valuation and this fall reflects the better market performance during last year of British investments. Of the new funds invested last year, approximately 45 per cent was invested in dollar securities and the statement shows that about half of our dollar investments continue to be in stocks of Public Utilities and Banks. The Trust has increased its investment in Australia (included under "British Commonwealth") to 3.4 per cent of the invested funds.

ACTIVITY OF ROBERT BENSON, LONSDALE

Robert Benson, Lonsdale & Co. Limited had an active year and, as might be expected in the conditions that obtained, a profitable one. A company operating in this field must look to the good years, such as the past year, to consolidate its strength. The growth in the Company's capital resources, as well as in the special skills of its organisation and in its goodwill and connections, cannot but benefit the Trust's income over the years. Apart from its activities as an issuing house and manager of investment trusts, I draw your attention to two less known but increasingly significant facets of its business: in the Company's Balance Sheet the growth of the deposits made with it indicate the increase in its banking activities; and the Company's reputation for management of investment funds has naturally led to its advice being increasingly sought in connection with the investment of pension funds, a field of activity which is likely to grow.

So far this year Robert Benson, Lonsdale & Co. Limited's business has been well maintained. The country's resources are nearly at full stretch and the general economic outlook seems to be one of trade maintained at a high level but ridden on a tight rein of credit restriction. I should expect this conjunction to involve activity in new issues later this year, in spite of the fact that funds annually accumulated in companies by depreciation allowances and retained earnings are becoming very large and reduce their need to secure finance from outside sources for their expansion.

THE CENTRAL PROVINCES MANGANESE ORE COMPANY

FACTORS AFFECTING RESULTS

IMPROVED TREND OF CURRENT TRADING

MAJOR A. C. HERRING ON THE OUTLOOK

The fifty-second annual general meeting of The Central Provinces Manganese Ore Company Limited was held on June 8th at Winchester House, Old Broad Street, London, E.C.2, Major A. C. Herring, VC, FCA, the chairman, presiding.

Mr T. D. de Deney, FCIS (the Secretary), read the notice convening the meeting and the report of the auditors.

The chairman said:

Ladies and Gentlemen: The Report and Accounts for the year ended December 31, 1959, have been with you for the necessary period and with your permission I will take them as read. (Agreed.)

You will notice from the Report that since our last Meeting Mr T. A. Wellsted has been appointed as a Director of the Company. Mr Wellsted joined the Company in India in 1926 and was Agent and General Manager from July 1953 until March 1958. He subsequently joined the London Office later in that year. We are satisfied that his experience and knowledge of the Company's affairs will be of great value to the Board.

You will observe that the profit for 1959 shows a further substantial reduction, but in view of the remarks which I made at the Annual Meeting in June last I think that you must have rather anticipated that this would be the case.

As I then indicated, consumers at that time held very large stocks of manganese ore and until these were substantially reduced it could not be anticipated that there would be a satisfactory demand. This situation was subsequently aggravated by the prolonged steel strike in the USA.

As regards the actual results, it will be noticed that the balance on trading was £1,066,885 as compared with £1,601,953 for 1958, whilst the net profit for the year, after tax, fell from £511,357 in 1958 to £269,105 in 1959. An interim dividend of 1s. 2d. per unit free of tax has been paid and it is now proposed to pay a final dividend of 1s. 2d. per unit free of tax.

STOCK VALUATION

Turning to the Balance Sheet, the most significant thing to which I must draw your attention is the increase in the stock of manganese ore which you will see now stands at £2,558,052. There has been a steady increase in the book value of our stock since December, 1953, when it stood as low as £659,547. The reasons for this are twofold:—

In the first place, over these years the volume of the stock which we have carried has steadily become greater. This is due to the fact that in the earlier years we had substantial orders on hand but were not able to implement them owing to the shortage of Railway transport, whilst in the last two years, although there has been adequate transport available, orders on hand have not been sufficient to absorb our entire production. Fortunately in the years 1956 and 1957 we recognised this situation by creating an ore stock reserve of £700,000.

This matter has engaged our careful attention over the years and on occasion we have considered making some substantial reduction in our output. There are, however, many objections to this and it is essential that any dismissal of labour should be avoided so far as possible.

The second reason for the increase in the book value of our stock arises from the higher cost of production. This is due to increased wages, royalties and other production costs and has been unavoidable. It is a condition which has obtained in Industry throughout the world.

I am glad to say that there are signs of an increase in the demand for manganese ore and we are hopeful that by the end of this year there may be some reduction in our stocks of certain grades of ore.

Our cash and gilt-edged securities show a falling off, but this of course is owing to the fact that we are carrying a larger stock of ore and have reduced our liabilities for taxation.

In my speech last year you may remember that I was definitely pessimistic as to the short term prospects and I regret to say that my fears have turned out to be well founded. However as regards the present outlook I think it would be right to say that there are now some signs of an improvement in the situation. During the last few months there has been a growth in the demand for our ore and we now have a reasonably satisfactory order book. The export demand has increased and in addition there are prospects that in future there will almost certainly be quite a substantial amount of ore required for consumption in India. On the other hand, there are now additional sources of supply in the world and we must expect that competition will be quite severe and the margin of profit not so great as in some of the former years.

I think we may now look forward with restrained optimism.

Mr. Hardy has paid his usual visits to India to inspect the mines and also to maintain our friendly relations with the Indian authorities and, in particular, our close collaboration with the State Trading Corporation.

MINING OPERATIONS

During the year diamond drilling continued at New Tirodi Mine and also at West Ramrama Mine. Normal exploration work at Gumgaon and Ukwa Mines indicated that the deposits at these two mines continue laterally, the ore in both cases being of good quality. This work will be continued and will be supplemented at Gumgaon Mine by diamond drilling exploration.

The two new Robey electric hoists for the cage and skip compartments at Holmes Shaft, Balaghat Mine, have now been commissioned, which will enable the development of No. 6 level to be commenced. At South Tirodi Mine a certain amount of difficulty was experienced in getting the different types of rock to flow smoothly through the crusher bin, but this has now been remedied and the crusher and conveying system is now working very satisfactorily. Arrangements are now being made at this mine to carry the mechanised operations below plain level.

The opencast pit at Beldongri, which has not been worked for some years, was dewatered successfully during the year and arrangements are now in hand to lower inclines and develop this pit which contains ore of high quality.

Since Mr Hardy's visit to the mines earlier this year the mechanised plants on development work have been brought into full operation again. It has not been necessary to run the HMS Plant except for short periods during the year in order to ensure that the Plant is kept in good condition.

TRIBUTES

Messrs James Finlay & Company Limited have rendered their usual valuable services and to them we would like to extend our great appreciation. I am sure you would also wish me, and it is indeed my great pleasure, to thank the whole of our staff in India and in this country for their co ntinued hard work and loyalty to the Company. It is a source of great pleasure to me that we have such a fine body of people.

I now beg to move: "That the report of the Directors and Statement of Accounts as at December 31, 1959, be and are hereby approved and adopted and that the profits be appropriated as recommended by the Directors."

I will ask Mr Holmes to second the motion and before putting it to the Meeting I will endeavour to deal with any questions which stockholders may wish to ask.

Mr H. R. Holmes seconded the resolution which was carried unanimously.

The Board's proposal of a final dividend of 1s. 2d. per unit, free of tax, making a total dividend for the year of 2s. 4d. per unit, free of tax, was also approved.

The retiring directors, Mr H. R. Holmes and Mr T. A. Wellsted, ARSM, BSc, were re-elected and the remuneration of the auditors, Messrs W. A. Browne & Co., having been fixed, the proceedings terminated.

RAND MINES, LIMITED

(Incorporated in the Union of South Africa)

MR CHARLES W. ENGELHARD REVIEWS PROSECTS

At the sixty-fifth Annual General Meeting of shareholders held in Johannesburg on May 27th 1960, the Chairman, Mr Charles W. Engelhard, after referring to the results of the year's operations and to certain of the Group interests, said:

The Company continues to seek new investments and develop along industrial lines and also has engaged in a certain amount of exploration outside of the Union of South Africa but, nonetheless, it is apparent that the principal investments of the Company are within the Union of South Africa and are primarily concerned with the gold mining industry and to a lesser extent with uranium.

FUTURE OF GOLD

With regard to the future of gold, it is still as difficult as it always has been to project an accurate assessment of when a change in the price of gold might occur. The facts remain basically the same as they were last year. There has continued to be some flow of gold from the United States although at a considerably reduced level from a year ago. It is, however, a fact that one finds more and more discussion of this subject both in Europe and the United States and that people all over the world are conscious that gold and not paper currency still remains the ultimate value and the finest basis for commercial trade. Even the Russians apparently have taken this into consideration when they recently announced the establishment of a rouble which would have a 30 per cent gold cover. Recently several Senators in Washington have taken an interest in this matter primarily because of the sad plight in which United States gold producers find themselves and have expressed concern over the flight of gold from the United States and the dangers of delaying action which would reverse this trend. I believe also that many people are becoming more conscious of the fact that a loss of confidence in paper currency is apt to be far more inflationary than would be a stabilized currency with gold support even though the latter depended on an increased price of gold. It is quite obvious that any action which resulted in an increased price of gold would be of tremendous benefit to the gold mining industry generally and would, among other things, enable older mines to prolong their life with resultant benefits not only to their stockholders but to the economy generally and to the people employed by those mines, both Europeans and Non-Europeans. There is no reason why one cannot expect that this change will develop some time in the reasonable future. It would, however, be an error to assume that it will develop shortly and to look upon it as a panacea for difficulties which may arise.

LOSS OF INVESTORS' CONFIDENCE

I stated earlier on that the quoted investments of the Company had shown a considerable appreciation during the course of the year 1959. This appreciation was naturally based both on improved results and good prospects for continued development. Nothing has transpired to change this outlook and, in fact, the gold mining industry has generally experienced excellent results to date in the year 1960 as far as both production and development are concerned. There has been and continues to be no labour shortage and production remains at very high levels. At present prices, yields on gold mining shares, particularly to those people who have confidence in the future of gold, must be extremely attractive. On the other hand, since the 1st of January there has been a considerable reversal in the trend of share prices which, of course, is based largely on the serious loss of confidence by investors outside of the Union in the affairs of the Union and Africa generally. Whether this loss of confidence is justified or not and whether or not it is based on misunderstandings and misinterpretations it does exist and each incident, whether it takes place within the Union or in some other part of Africa, is apt to aggravate the position. In fact, the situation is such today that in my opinion it would be extremely difficult, if not impossible, to raise money in the United States or either private enterprise or Government purposes on any terms which could be considered even reasonable. While I cannot speak for other parts of the world as directly, I would imagine that the same situation applies elsewhere and unless definite and specific steps are taken to reverse this trend it will become increasingly difficult to implement new ventures in business with resources and know-how from outside the Union and also for that matter, in my opinion, for the Government to finance the implementation of its policy for the economic development of Native Areas.

NEED FOR WORLD ACCEPTED POLICY OF CO-EXISTENCE

Over recent years I have repeatedly expressed my confidence in the future of Southern Africa in general and South Africa in particular. This confidence was not only based on hope and the knowledge of the great resources that exist here but in the belief that people who were able to develop the Union of South Africa to its present state will have the judgment, leadership and courage of their convictions to overcome the obvious difficulties which South Africa must face. Any policy which results in the isolation of South Africa from the rest of the world must inevitably have serious economic consequences to the Union and, therefore, in my opinion, whether the loss of confidence is justified or unjustified, it is clear that from an economic point of view, specific and concrete steps must be taken to revive confidence. It would seem to me that the future of South Africa's economy must depend on the development of a world accepted policy of co-existence between the races in this country so that the respect and confidence of the outside world can be restored. The industrialisation of this country has advanced rapidly during the last twenty years; but if this industrial development is to continue, fuller use must be made of the potential skills and capacities of all the peoples who make up the population of South Africa. This calls for more widespread and advanced education, so that leadership and ability can be developed in all sections of the community, both European and Non-European. It should be emphasized that the Non-European must have the opportunity to improve his standard of living if he is to be encouraged to work alongside the European in the development of the country. I continue to have full confidence in the future of South Africa because I am still convinced that these objectives can be achieved in a proper and reasonable manner.

GUARDIAN ASSURANCE COMPANY LIMITED

Annual General Meeting, June 8, 1960
Chairman: The Right Honourable Lord Blackford, DSO, JP.

EXTRACT FROM THE REPORT AND ACCOUNTS

During 1959, the Group devoted much attention to the problem of increasing the profitability of the business and Shareholders will have been pleased to see that the net underwriting profit from the Fire, Accident and Marine Departments amounted to £872,700 (£685,000 in 1958) and that with the Proprietors' share of the Life profits, the total surplus for the year amounted to £994,200.

Against the background of the difficulties which the underwriting departments have experienced in recent years, attention is also drawn to the improvement in Investment income of £155,500 to £2,144,700, and the increase in the dividend on the Ordinary Shares from 2s. 7½d. to 3s. 6d. a share.

LIFE DEPARTMENT

Net new sums assured 1959	£50,371,001
Net new sums assured 1958	£41,468,832
Gross rate of interest earned	£6 9s. 2d.
Life Fund at end of 1959	£75,395,399

FIRE DEPARTMENT

Net premium income 1959	£9,794,985
Net premium income 1958	£9,187,085
Transfer to Profit and Loss	£217,329

ACCIDENT DEPARTMENT

Net premium income 1959	£19,503,687
Net premium income 1958	£18,937,021
Transfer to Profit and Loss	£397,186

MARINE DEPARTMENT

Net premium income 1959	£3,968,724
Net premium income 1958	£3,421,189
Transfer to Profit and Loss	£258,264
Marine Fund at end of 1959	£4,575,283

PROFIT AND LOSS

Gross investment income 1959	£2,144,762
Gross investment income 1958	£1,989,188
Transfer to reserve	£400,000
Balance carried forward	£420,952
Dividend for year 1959 (1958—2/7½d.)	3/6d. per share less income tax

BALANCE SHEET

Valuation of Stock Exchange Securities at the end of 1959 showed a considerable surplus of market values over the book values of the Company's Investments.

Total Assets of Group £152,000,000

All the Principal Classes of Business Transacted.

The company undertakes the office of Trustee, Executor and Administrator.

Head Office: 68, King William Street, E.C.4.

AB GÖTAVERKEN

(Shipbuilders and Engineers)

GOTHENBURG, SWEDEN

GROUP GAINED SECOND PLACE IN WORLD TONNAGE LAUNCHED IN 1959

WORK ON 125,000 TON YARD PROCEEDS ACCORDING TO PLAN

The fifty-fourth Annual General Meeting of *AB Götaverken* was held in Gothenburg on May 11th, Mr A. Gabrielsson, Chairman, presiding. The following is an extract from the report circulated with the accounts:

ORDERS AND PRODUCTION

The order stock at the beginning of the year amounted to 933,900 dwt. During the year deliveries worth Kr.352 million were effected, as against Kr.457 million the previous year. However, the decline is more apparent than real since deliveries in 1958 included a foreign destroyer on which work had proceeded for a number of years. Four new contracts were signed, in addition to orders for large high pressure steam plants. Shipbuilding orders on hand at the end of the year totalled 773,300 dwt, in addition to ships' repairs, diesel engines, turbo-compressors and steam boilers.

DELIVERIES AND LAUNCHINGS

Nine merchant vessels with an aggregate tonnage of 201,650 dwt and one naval destroyer of 2,050 tons were completed and delivered during 1959, viz:

Three motor tankers, one of 34,100 dwt and two of 19,380 dwt;

One turbine tanker of 41,750 dwt;

Three bulk-carrying motor freighters, each one of 14,120 dwt;

One motor ore carrier and tanker of 34,200 dwt;

One cargo motor-ship of 10,480 dwt;

One destroyer of 2,050 tons.

Ten merchant vessels of altogether 238,690 dwt were launched during the year. Adding the launchings of the subsidiary company (see below), the Group occupied second place among the shipyards in the world in terms of tonnage launched during 1959.

DIESEL ENGINES

The designs of a new diesel engine with ratings of up to 22,000 hp were concluded and the first unit (rated at 18,300 hp) will be installed in a 40,000 dwt tanker scheduled for delivery in 1961.

Main machinery delivered from the new engine shop consisted of 25 diesel engines with a combined rating of 197,300 hp. Sixteen of these engins were delivered to other yards in Finland Germany, Netherlands, Norway, Sweden ind Spain.

THE ARENDAL YARD

Work on the Gmpany's new 125,000 ton yard is proceedinj to plan. Excavation work began in March, 959, and by the end of the year about 300,00 cu.m. of rock had been excavated to obtin a level surface for the yard and a 470 n. long tunnel completed to drain the area. One bay has been filled and another has been dredged; some 150,000 sq.m. of silt and clay have been moved. In August work began on the two graving docks which are being excavated out of solid rock. The yard is schedu'ed to enter production in 1963.

GROUP ACTIVITIES

The following are wholly owned subsidiaries of the company:

Öresundsvarvet AB

AB Göteborgs Skeppsdockor

Rederi AB Zenit

Götaverkens Fönster AB

Götaverken Norsk A/S

Öresundsvarvet enjoyed a record year with the delivery of one motor tanker of 40,300 dwt, two bulk-carrying motor freighters of 16,325 and 16,300 dwt, respectively, and a motor ore carrier and tanker of 27,500 dwt, or altogether 100,423 dwt. Five merchant vessels of altogether 131,125 tons were launched. Total turnover of the Company was Kr.106 million and net earnings Kr.1.5 million.

RESULTS

The Company's net profit for 1959 amounted to (in Kr.'000) 15,020 (15,037) which, added to 6,675 (7,758) carried over from the previous year, produces a total of 21,695 (22,795) available for appropriation, as follows:

	In Kr.'000
Reserve	600
Debt Retirement	1,000
Dividend of Kr.8: per share	4,400
Balance carried forward	15,695
	21,695

The report and accounts were adopted.

DAVIS AND TIMMINS

RECORD GROUP SALES

The 61st annual general meeting of Davis and Timmins, Limited, was held on June 3rd in London.

Mr F. Le Neve Foster (the chairman) presided and, in the course of his speech, said:

The results again show a considerable improvement on those for the previous year. The Group Profit for the year before taxation, but after charging depreciation, directors' emoluments and interest on unsecured loan stock is £252,724 as compared with £198,398, while the net profit after taxation amounts to £135,586 as compared with £106,071 for the previous year.

These gratifying figures are mainly attributable to the increased production and sales turnover which has been achieved. Group sales for the year, both in volume and weight, are a record in the history of the company and show an increase over those for the previous year of the order of 25 per cent. I am satisfied that 1959 has been a year of substantial progress in all departments which augurs well for the future.

The Directors recommend a final dividend of 17½ per cent making, with the interim dividend of 7½ per cent already paid, a total of 25 per cent for the year on the Issued Ordinary Capital as against 20 per cent for the previous year.

Turning to the Balance Sheet perhaps the most noteworthy feature is the realisation of part (5/6ths) of our Trade Investment for £224,607 net which resulted in a cash profit against cost of £144,919 which has been carried to Revenue Reserves. With this addition to our Reserves, the total of our capital and Revenue Reserves (exclusive of the Reserve for future Income Tax) amounts to the substantial sum of £831,385 as against the amount of the issued Ordinary Share Capital of £442,500. In view of the strength of the position thus shown, the Board has considered that the time is opportune to recommend the capitalisation of £110,625 of the Reserves to provide for distribution to the Ordinary Shareholders of one fully paid new Ordinary Share for every four Ordinary Shares held.

Group net current assets, less liabilities and provisions show a very satisfactory increase of £267,140 during the year.

I am happy to say that the general atmosphere of trade in the current year is far better than when I addressed you last year. The Group sales turnover for the first sixteen weeks of the current year shows an average rate of increase of 30 per cent compared with the average weekly rate over the whole of last year.

These figures are naturally reflected in current profits and, provided no unforeseen circumstances arise, we have every reason to anticipate the results for 1960 will mark a further stage of progress and will be such that the Board will be able to recommend the maintenance of the Ordinary Share Dividend at the rate of 25 per cent per annum on the increased Ordinary Share capital, which will result from the capitalisation proposals.

The report was adopted and at a subsequent extraordinary general meeting proposals for increasing the capital and the scrip issue were approved.

HUMPHREYS LIMITED

(Builders and Civil Engineering Contractors)

RAPIDLY GROWING ORDER BOOK

SIR AYNSLEY BRIDGLAND'S STATEMENT

The sixty-eighth annual general meeting of Humphreys Limited will be held on June 30th at Winchester House, Old Broad Street, London, EC2.

The following is the statement by the chairman, Sir Aynsley Bridgland, CBE, which has been circulated with the report and accounts:

The results we have put before you are not unsatisfactory bearing in mind what I had to say in my Statement last year of the difficulties that we had to overcome in the year under review. The trading profit is £53,269, as against £81,493 the previous year—a fall of £28,224, and this fall is wholly attributable to the sharp diminution in turnover brought about by the circumstances in which we were involved by three causes—the credit squeeze, the cancellation by clients of arrangements made for large contracts, and, finally, the time taken to restore our order book from other customers.

In the current year turnover is now approaching a normal figure and our order book is rapidly growing once again. It is fair to assume then that our profits should again commence to rise and for that reason the Board does not feel that our customary final dividend of 9 per cent should be disturbed.

Our current assets of £876,826 exceed our current liabilities of £721,853 by £154,973. The increased volume of work which we have on hand is reflected by the total of work in progress which at £602,506 compares with £425,028; similarly, cash at bank is down from £135,246 to £7,317 and there is now a secured bank overdraft of £160,665. Increased contracting acivity is also indicated by our further investment in materials, plant and tools which at £237,140 shows a substantial increase of £54,928 over last year's figure of £182,212.

To assist in the financing of our new business, the investments quoted on the Stock Exchange have been sold since the end of the year.

SOUTH AFRICA

Shareholders will note that we have not included the results of R. H. Morris (Pty.) Limited, our subsidiary in Cape Town, but the results of the National Quarries (Pty.) Limited are included. Permission to omit R. H. Morris's Accounts has been granted by the Board of Trade and within a period of about two months a supplementary report on that Company's activities will be circulated to shareholders. For various reasons it has, in fact, proved impossible to have the subsidiary's Accounts prepared in time for inclusion in the Accounts before you.

R. H. Morris (Pty.) Limited has had problems on its contracting side during the year under review and we must anticipate, in consequence, that the accounts when they are available will show an adverse balance for the period.

Apart from the contracting side, the subsidiary's factory has been engaged for many years in supplying school furniture for the provinces of South Africa. This work was suddenly withdrawn from us and passed over to what is called the "Sheltered Industries" which give employment to the maimed service and civilian subjects of South Africa. Fresh ground then had to be broken and R. H. Morris have undertaken to supply motor car seats to various motor companies assembling cars in South Africa. These motor companies will be required to pay a substantial Customs tariff on these items which has forced them to seek a local supply for these goods. Our subsidiary was fortunate in being one of the firms in South Africa who could manufacture these goods and in no time it was inundated with orders. At the same time, the Government's policy to place their school furniture requirement with the "Sheltered Industries" failed to meet the situation and our subsidiary was again asked to undertake this work. In the supplementary statement to be issued to you it will be seen that our subsidiary had to hive off the factory and construct a separate company to deal with this increased business.

It is hoped then that in this supplementary report a fuller and more detailed explanation of these moves will be given—this reference is simply an endeavour to give shareholders prior information of the plans the Board are undertaking. I need hardly emphasise that above this are the known political difficulties in South Africa, which have, of course, added to our problems there.

So far as National Quarries (Pty.) Limited are concerned, these Accounts are before you and give a very satisfactory year's results. Profits continue to be satisfactory. I have previously advised you of actions taken to attempt to close the quarry on the allegation that it is despoiling the countryside. Every care is taken to avoid this by the planting of trees, and so long as we continue on this site profits should be maintained at a reasonable level.

FUTURE PROSPECTS

Although I have stressed the difficulties we have had to overcome in this country, which I emphasise were not of our seeking, I think it would be inappropriate to close my remarks without giving you some idea of our future prospects.

In South Africa to prophesy anything about the immediate future would be most unwise, yet one must not forget that it is an immensely wealthy country of vast resources yet untapped. If the political situation could be resolved the influx of capital for development would at first be slow, but as conditions settled it would, I think, reach very large amounts. I feel quite sure we could rely on getting our fair share of the work which would arise out of the developments financed by this new money.

So far as this country and other parts of the world we are interested in are concerned, all that I can say is that we are at present very busily occupied. In addition, further contracts are in an advanced stage of negotiation so that I feel that our temporary fall in profits should not be prolonged and that the normal growth of our business will be resumed. You can, I feel sure, be assured that the Board are most vigilant in pursuing profitable business and many opportunities are being presented to us for consideration.

Once again my colleagues and I wish to express our appreciation of the loyal and energetic services of the Company's staff in our offices and on contract sites both at home and abroad.

FOISTER, CLAY & WARD

EXPANSION PLANS

The Thirty-fourth Annual General Meeting of Foister, Clay & Ward Limited was held on June 9th in London, Mr P. A. Clarke Vincent, FCA, chairman, presiding.

The following are extracts from his circulated Review: There was a net taxed profit of £178,565 (£105,891). The Directors recommend a final ordinary dividend of 6¼ per cent, making a total of 12½ per cent.

The extension of our Mansfield stocking factory was completed. Our half-hose factory at Kegworth was enlarged, all half-hose machines were removed from Middlesbrough to Kegworth and after substantial repairs to the Middlesbrough half-hose factory this was converted into an additional outerwear department. We acquired a small Company owning a knitwear factory and plant in Scotland. At the same time the opportunity arose to acquire a dye works at Loughborough. A new wing is being built at Frog Island, Leicester and an additional floor at Derby. Recently we have also agreed to acquire additional land adjoining our new Scottish factory and a site for a new fashioned outerwear factory at Mansfield. We propose erecting additional factories which we hope will be in operation in about six months' time.

Considerable progress has been made in the expansion of exports. Our turnover for the first four months of the current year is in excess of 1959.

The report was adopted and the capitalisation of £214,500 of the company's reserves to be distributed in the proportion of one new fully paid Ordinary share of 10s. for every ten Ordinary Stock Units of 5s. each held approved.

RUBBER PLANTATIONS INVESTMENT TRUST

The fifty-first Annual General Meeting of The Rubber Plantations Investment Trust, Limited, will be held on June 29th in London.

The following is an extract from the circulated Address of the Chairman, Sir Eric Macfadyen:

The accounts we present for the year to March 31, 1960, show gross revenue of £305,767 (£285,466) including a dividend from our subsidiary whose accounts are not consolidated in the Trust's. After taxation and expenses the net revenue is £160,730 (£142,312). The Directors recommend a Dividend of 13½ per cent (12½ per cent last year), absorbing £142,931 (net). Further, they propose the capitalisation of £172,856 18s. being as to £47,684 the amount standing to the credit of Share Premium Account and as to £125,173 withdrawn from General Reserve; this sum to be distributed to the Stockholders in the proportion of one 2s. Stock Unit credited as fully paid for every ten 2s. Stock Units held. The Directors feel reasonably confident of being able to maintain the rate of dividend for the current year on the Capital so enlarged.

Rubber and Tea still account for more than half our investments and for the greater part of our income, and our rubber interests are predominantly Malayan. The revenue from our Rubber holdings during the year showed little variation compared with the previous year. With the prosperity of this industry in the period whose results will be reflected in our next accounts a further increase in revenue can be looked for.

THE CHARTERHOUSE INVESTMENT TRUST

MAINTENANCE OF INDUSTRIAL PROSPERITY CALLS FOR FULL POLITICAL SUPPORT

SIR NUTCOMBE HUME ON A MOST URGENT PROBLEM

The thirty-fifth annual general meeting of The Charterhouse Investment Trust Limited will be held on June 28th in London.

The following are extracts from the review by the chairman, Sir Nutcombe Hume, KBE, MC, which has been circulated with the report and accounts:

The sale in May, 1959, of 1,000,000 shares of the Trust's holding in The Charterhouse Group Limited yielded £1,339,330 after paying expenses and this has since been invested mainly in a number of carefully chosen securities in this country, North America, Australia and the continent of Europe.

Despite the reinvestment of the proceeds of the sale of Charterhouse Group shares the total number of investments held at April 30 was less by 23 than the 397 held a year earlier. This results from the process of "tidying up" the portfolio and selling off a number of smaller and less good quality holdings in the strong buyer's markets of a few months ago.

In doing all this the total amount invested has exceeded the amount realised and as will be seen from the Balance Sheet there was an overdraft at April 30 of £187,523 which had increased at May 14 to £215,112.

RIGHTS ISSUE PROPOSAL

After careful consideration your Directors have decided to invite you to increase the Authorised Ordinary Share Capital so that a rights issue of 2 new shares for each 5 now held may be made, to produce, after paying the expenses and repaying the Bank, some £738,700 for further investment. After allowing that the new money will earn at the rate of only 4½ per cent per annum for the rest of our current financial year, we can see our way to recommending a dividend for the current year of at least the total of 13 per cent recommended for last year.

NEW INVESTMENT OPPORTUNITIES

The near future may well provide good opportunities to make new investments: for instance, fixed interest bearing securities may have seen their low point and provide not only a satisfactory yield but a chance of at least maintaining the prices paid for them, whilst the recent fall in the prices of equities at the same time as industrial prosperity remains high provides better investment opportunities than for quite a long time past. So far this year there have been far more increases than decreases in the dividends paid on shares held by the Trust.

This view must not however be interpreted as a suggestion that there are not still many dangers ahead for the investor, of which one of the more obvious arises from the growing extent to which the economies and the politics of the countries of the world are becoming more interwoven and dependent on each other.

ART OF MIXING POLITICS WITH BUSINESS

The development of the European Common Market and the Free Trade Area (the "Six and the Seven") is but one example, where mishandling by politicians could do great harm to industrial prosperity. Fortunately, many of those in responsible positions seem gradually to be gaining experience of the art of mixing business and politics.

We must accept the fact that the old principle (a very wise one at the time) of keeping politics out of business seems never likely to return and we are left with the alternative of trying to ensure that politicians understand that their responsibilities now include more than ever before the maintenance of the growth and prosperity of industry and of the millions who work in it.

Men in responsible business positions must likewise realise that they must give much of their time largely on a voluntary basis to the furtherance of the wellbeing of industry generally, and for that reason they must delegate management in their own businesses to well chosen executives. Training and selection for management are therefore becoming more important all the time.

IMPORTANCE OF HUMAN FACTOR IN BUSINESS

Those not directly engaged in commerce and industry and not therefore so directly influenced by the profit motive, seem still to lack proper appreciation of the importance of the human factor in management and to think that the creation of a "blue print" of some organisation to carry out important work is an end in itself. Choosing the right men and giving them the necessary authority does not occupy in their minds the vital importance it demands.

I suggest, therefore, that this is the most urgent problem of to-day; industry the world over is able and willing to play its part in raising the standard of living, but it cannot achieve this objective without full political support, which in its turn demands greater mutual understanding, greater trust and ever closer working between those engaged in Government, business and the trade union movement. We must sincerely hope that 1960 will see a quickening of this process.

LA RINASCENTE

The General Meeting of the Shareholders was held in Milan on May 14th, Dr Aldo Borletti presiding.

The President, after having stated that the general economic situation in Italy "was on the whole good, in fact very good," stressed the relative stability, or rather the slight decrease in the retail prices, from 113.3 to 112.7, as per official data. Also the detailed index shows that the increase in the sales value of La Rinascente and Upim Stores, equal to 14.52 per cent during the years 1958/59 and 1959/60 (from 61 to 70 thousand million) is not due to the increase of prices but to the actual increase in the quantity of goods sold.

We now face a further development of the Company due to three factors: (a) improvement of the economic and financial situation; (b) balanced development of the Company in accordance with the pre-established projects; (c) further progress in the technical organization of the Company.

The value of the goods and supplies amount to Lit. 7.360.141.000; the buildings amount to Lit. 12.668.545.000; machinery, tools and furnishings of the 5 Rinascente Department Stores and 77 Upim Stores are accounted on the balance sheet for Lit. 4.133.182.000 and the shares amount to Lit. 2.291.323.000.

The controlled Company APEM SpA has completed its new important factory at Vimodrone for the mass production of women's wear.

The associated Company Supermercato SpA has operated so far with 6 Stores in Rome and at the present time is undergoing a promising phase in organization and development for a rational distribution in the food line.

The net profit to be divided is Lit. 795.970.000, which gives a dividend of Lit. 6 per share against the Lit. 5 of last year.

At the end of the report the President mentioned the numerous activities of the Company in the Assistance and Social field.

The Agenda was unanimously approved.

WESTERN GROUND RENTS

A YEAR OF EXPANSION

The twenty-first annual general meeting of Western Ground Rents Limited was held on June 2nd in London, Sir Andrew H. Rowell (the chairman) presiding.

The following is an extract from his circulated statement:

During the year the whole of the share capital of five property companies was acquired and the investment in these companies at the date of the accounts amounted to £327,450. Since December 25, 1959, the share capital of a further property company has been acquired and the investment in this company amounts to £228.000. The full benefit of the revenue of the five companies is not fully reflected in the accounts submitted, because these were only acquired towards the end of the financial year. In a full year the revenue from these six new subsidiary companies should be about £44,000.

The profit before taxation amounts to £231,534 and, after providing for taxation of £114,618, there remains a net profit of £116,916, as compared with £96,164 in the previous year. An interim Dividend of 10 per cent, less Income Tax, was paid on the Capital as increased by £100,000 during the year and the Board recommends the payment of a final dividend of 15 per cent, less Income Tax, making 25 per cent for the year on the increased Capital.

ISSUE OF ADDITIONAL CAPITAL

To assist in the further expansion of the Company's activities the Board proposes to issue 400,000 new Ordinary Shares of 5s. each to the Ordinary Shareholders of the Company whose names appear on the Register at the close of business on May 12, 1960, for subscription at par by way of right, on the basis of one new Ordinary share in respect of every four Ordinary Shares then held.

Earnings continue to expand and the Board is of the opinion that future income should be adequate to enable the present rate of dividend to be maintained upon the increased capital.

The report and accounts were adopted.

HARGREAVES (LEEDS) LTD.

ANOTHER GOOD YEAR

EXTRACTS FROM MR HARALD PEAKE'S STATEMENT

The fortieth Annual General Meeting of Hargreaves (Leeds) Ltd. will be held on June 28th at Bramham, Yorks.

The following are extracts from the statement of the Chairman, Mr Harald Peake, which has been circulated with the Annual Accounts:

MAIN ACTIVITIES

The main activities of the group are summarised as follows:

Distribution and carriage of solid fuel
Distribution and carriage of liquid fuel
Technical advice on fuel consumption
Transport by road, canal and sea
Opencast and drift mining of coal and clay
Plant hire and contracting
Quarrying of stone, sand and gravel
Production of tarmacadam and bricks
Production of granular and liquid fertilisers
Printing and publishing
Garage services and vehicle body building

The field is a wide and an interesting one.

During the year the whole of the issued capital of John W. Pearson & Co. Ltd., and of its subsidiary companies—A. W. F. Ltd. and Shotton Bricks Ltd.—was acquired by Hargreaves Quarries Ltd. for £127,250. These companies, which carried on quarrying, contracting and brickmaking in Durham and North Yorkshire, are being liquidated and their business is being merged in Hargreaves Quarries Ltd.

TRADING RESULTS

The year under review has not been an easy one. Sales of solid and liquid fuels have been affected adversely by an exceptionally warm summer, followed by a mild winter. As a result of an agreement between the British Transport Commission and the Central Electricity Generating Board, restrictions were imposed on the delivery of deep mined coal by road to generating stations. Consequently it has been necessary to find other employment for road vehicles purchased for this traffic. Furthermore, the world-wide tendency to use oil in place of coal for many industrial and domestic purposes has caused political pressure to be exercised to restrict opencast coal production. Similar pressure is now being used to curtail drift mining of coal.

Under the circumstances, the Group has done well in achieving a record sales turnover.

The Consolidated Profit for the Group, after providing for Depreciation and Taxation as well as after deducting the proportion of profits attributable to outside shareholders (£21,227), amounts to £260,256. This is slightly in excess of the previous record for the group of £252,002 for the year to March 1957.

An important factor in the achievement of these results has been the high level of expenditure on capital account in recent years. Owing to more competitive conditions there has, in fact, been a fairly general reduction in margins of profit and much of the capital expenditure has been directed towards lowering the costs of production and transport.

DIVIDEND RECOMMENDATION

The directors are again recommending a rate of final dividend which, if approved at the annual general meeting, will bring the total dividend for the year to 3s. per stock unit of £1. The total dividends for the year will, after deduction of income tax, amount to £91,875. £136,288 of the year's profits have been added to Retained Earnings, after setting aside, out of the year's profits, an allocation of £32,093 to Tax Equalisation Reserve in respect of past years.

CAPITAL REQUIREMENTS

Additions to the Fixed Assets of the Group during the last five years have been as follows:

Year ended March 31st				
1956	1957	1958	1959	1960
£	£	£	£	£
345,743	279,116	359,373	440,772	606,696

The directors have adopted a bold policy in regard to capital expenditure. The object of this has been two-fold. In the first place the old-established branches of the business have been provided with the most up-to-date boats, vehicles, plant and machinery to enable our customers, both old and new, to have highly efficient services at a competitive price. These services are supported by a well equipped laboratory and a staff of qualified technicians.

In the second place, capital has been spent freely to accelerate the diversification of the business of the group.

The directors are of the opinion that the time has come when it is in the interests of the stockholders to raise additional capital.

It is, therefore, their intention, in the absence of unforeseen circumstances, to make a "rights" issue to stockholders at an early date of one new share, at a price to be announced in due course, in respect of two shares held at that time by stockholders. An issue on these lines will increase the issued capital from £1,000,000 to £1,500,000 which is the amount of the authorised capital at the present time.

PROSPECTS

The current year has started with profits running at a rate slightly in excess of a year ago. Generally speaking the prospects are good although sales of coal and of oil are becoming more competitive. Our large fleets of barges, lorries and road tankers are fully employed. Quarrying operations are developing well and our business in fertilisers promises very well. Our comparatively small interest in liquid fertilisers is being expanded rapidly with a view to giving to our growing number of farming customers a wider range of products to suit their particular requirements. It is reasonable to expect that the high rate of expenditure on capital account in recent years will have an increasing effect on future profits.

We have a young, enthusiastic and skilled staff whose efforts will, I feel confident, continue to be successful.

AMALGAMATED BANKET AREAS

The twenty-fourth annual general meeting of Amalgamated Banket Areas, Ltd., was held on June 8th in London.

Mr C. J. Burns (Chairman) presided, and the following is an extract from his Statement circulated with the Report and Accounts:

Development has been limited by the monthly mining profits and the grade of ore mined has not allowed sufficient finance to enable the Company to embark on as large a development programme as was thought desirable. It was for this reason that I made representation to the Ghana Government during the year under review that without Government assistance long-term planning for the Company would be impossible. I was convinced on mining technical grounds that given assistance the Company could by intensive and selective development increase ore reserves and by bringing in new orebodies safeguard the monthly mining tonnage by creating fresh points of attack. As a result of this conviction an important decision was taken during the year, namely to maintain development footage and after September last to increase development footage even though at that time no assistance had been given and monthly profits were insufficient to support such large-scale development.

Having considered the problems facing the Company I hope that the results of the year under review and the forecasts for the future will be more clearly understood.

The amount of development to be carried out to ensure the necessary increase in ore reserves cannot be compressed into one year. By reason of the £450,000 advance we now have the finance for exploration.

The development results for the year and those for the current year show quite clearly that the future of the Company lies in the Abbontiakoon Section. They also give us reasonable expectation that the reserves at this section will be maintained whilst operating at a higher tonnage rate allowing the Company to offset in part the drop in production from Fanti and Mantraim. When development has been advanced to 21, 22 and 23 levels a much more satisfying picture should emerge.

The report and accounts were adopted.

Copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Company Meetings Department,
The Economist,
22, Ryder Street, S.W.1.

COMPANY AFFAIRS

Associated Portland Cement

THE pricing policies of the cement industry will be reviewed by the Restrictive Trade Practices Court at the beginning of next year. What the decisions of the Court will be and how they will affect the profit margins of the industry are questions for the future. The present concern of the investor is that while the decision of the Court is pending it is unlikely that the profit margin earned on cement will rise very much. Indeed, the price of cement was again reduced this February and to secure bigger total profits the cement manufacturers are obviously counting on bigger sales. These they seem certain to secure. Associated Portland Cement, which sells about two thirds of the cement used in the British market, expects cement deliveries to rise by between 8 and 10 per cent this year, having risen by 6 per cent in 1959.

What, then, is likely to happen to APC's profits? Last year about 50 per cent of its gross profits came from cement sales at home, about 25 per cent from exports and its overseas investments and the remainder from its investments at home and the sale in the home market of cement products. The increase in profits at home kept pace with the rise in sales, but smaller returns from exports and from cement works overseas kept the rise in trading profits down to about 2½ per cent (from £15,070,000 to £15,466,000). Export shipments continue to decline, though the margin is now slightly better, and it seems possible that APC will earn a slightly better return on its overseas investments this year. But the dominating influence will continue to be trade at home and if, given the latest reduction in prices, the increase in total profits (including those stemming from abroad) keeps pace with the rise in deliveries at home APC will have done very well indeed.

The statement of the chairman, Mr John Reiss, suggests that APC will be putting even more emphasis on the home market in the future. Over the next three years APC plans to add about 1,000,000 tons to its productive capacity at a cost of over £15 million. It has to be assumed that, as in the past, this expansion will be financed by self-generated capital. With liquid resources amounting to over £18 million and with a cash flow of the order of £7½ million, finance should present the group with no great problem. Indeed, as the latest dividend of 11 per cent (against the equivalent of 9.6 per cent) is covered over three times by earnings, some shareholders may argue that this is the year in which the purse strings should be loosened once more. In the past a scrip issue has signalled an increase in income for shareholders and, with another revaluation of assets being made this year, it may do so again. But in buying the APC shares at a price of 71s. 6d. and a yield of 3.2 per cent investors cannot assume anything more than a relatively modest increase in the dividend this year, and they can hardly expect the directors to reconsider what proportion of earnings should be distributed as dividends until the Restrictive Trade Practices Court has had its say.

De La Rue

THE agreement between De La Rue and Compagnie des Machines Bull, the biggest manufacturers of computer equipment in Europe, has stimulated American and Continental buying of De La Rue shares. As yet, however, the results of this agreement can have had only a minor influence on De La Rue's trading profits, and much the greater part of its profits must continue to stem from its interest in the Formica group. Following an increase in sales from £13,858,000 to £17,056,000 in the 53 weeks to April 2nd, the trading profit of De La Rue advanced from £1,500,577 to £2,148,211. Thus its gross profit margin improved from 10.8 to 12.6 per cent. But this is not the complete story, for over the last four half yearly periods the gross profit margin has run from 12.2 per cent through 10.7 per cent and 11.6 per cent to 14.8 per cent. Thus it is clear that in the latter months of the financial year De La Rue was able to make good the reduction in earnings caused by the printing strike last summer.

The amounts attributable to minority interests, which include the 40 per cent interest of American Cyanamid in the Formica group, have risen from £95,067 to £410,133 so that the net profit attributable to De La Rue has gone up by only £61,084 to £730,862. The ordinary dividend has been raised from 20 to 22½ per cent, but the latest payment is made on a capital as increased by the one for five rights issue. This dividend is covered nearly 2½ times by earnings. It is not this dividend so much as the decision to make a one-for-four scrip issue and to pay a dividend of not less than 22½ per cent on the increased capital in 1960-61 that will please shareholders. To look this far ahead suggests that the directors are confident about the outcome of trading this year. The 10s. shares immediately gained 4s. 3d. to 73s. 3d. on these results and on the dividend forecast they have been put on a prospective yield of 4 per cent.

J. & P. Coats

SINCE J. & P. Coats issued its preliminary statement its £1 ordinary stock units have risen by a third in value, but at the current price of 50s. they still yield almost 6 per cent. This is an attractive return by today's standards and it is enhanced not only by the optimistic tone of Mr Robert Laidlaw's farewell statement as chairman but by the strength revealed in the balance sheet. Mr Laidlaw says that, thanks to the steady improvements in machinery and techniques since the war, savings effected at a high level of production in the group's mills can have a significant effect on earnings. This was the case in 1959 and with sales continuing to be maintained at the high level reached by the end of 1959 the prospect is for a further advance in profits. This in turn seems likely to lead to a higher dividend, though shareholders are warned not to read too much into the next interim dividend as the directors intend to reduce the wide disparity between the interim and final payments.

The directors' decision to raise the 1959 dividend from 10 to 15 per cent. seems a reflection of the further improvement in the group's liquid balances as well as the advance in profits from £5¼ million to £10¼ million. New methods of stock control have been introduced and as a result a net short-term debt of £200,000 in 1957 was replaced by a net liquid balance of £3.9 million in 1958. Then last year when stocks were reduced still further, from £36½ million to £33¼ million, total liquid resources rose to £11.4 million. This improvement in liquidity also signals the virtual completion of the group's modernisation programme, on which over £30 million has been spent in the last decade. Only £1.8 million was added to fixed assets last year and capital commitments amount to no more than £733,400.

In the parent company's balance sheet the holdings of shares in subsidiaries have been written up by £11.9 million as a result of various scrip issues made to the parent company by these subsidiaries. Reserves in the parent company now total £21½ million and compare with an issued ordinary capital of £29½ million. Thus, though the directors give no hint that there will be one, a scrip issue looks distinctly possible. It is reports such as these that have put new heart into the market for cotton shares.

J. Lyons

INCREASED expenditure on selling, distribution and advertising in 1958-59 by the J. Lyons group did not immediately produce a commensurate increase in sales. It bore its fruit in the year to March 31st last when sales reached a record level. The extra expenditure on promotion was not alone responsible for the 30 per cent increase in the group's trading profits, from £5.3 million to £6.9 million, for J. Lyons benefited from last year's exceptionally fine summer which must have added to its sales of ice cream and soft drinks. This recovery in profits no doubt encouraged the directors to raise the ordinary dividend from 14⅛ per cent to 15⅝ per cent. This is the third increase in four years and it is in line with the more liberal policy first adopted by the directors in 1956-57. As net profits rose from £1,054,872 to £1,564,627 the earnings cover has improved from 20¼ to 32½ per cent.

The directors emphasise that the advance in profits looks so substantial because results in 1958-59 were particularly bad, reflecting the poor summer and the London bus strike. Thus an increase in profits of the order achieved in 1959-60 in the current year looks unlikely. But the group continues to develop and expand; its new Ariel hotel at London Airport will be opened later this year and J. Lyons has recently joined with Hawker Siddeley in a venture to operate, sell and hire automatic vending machines. The £1 "A" shares at 80s. yield just under 4 per cent.

British and Commonwealth Shipping

FOR the second year in succession the profits before tax of British and Commonwealth Shipping have fallen very sharply. Last year they fell by more than 50 per cent, from £4.8 million to £2.2 million. Somewhat surprisingly in view of the chairman's warning last year that a cut in the dividend rate might be inevitable it has in fact been maintained at 20 per cent. This was made possible because, as the group's investment allowances on building new ships exceed its tax liabilities on current profits, the 1958 tax charge of £767,000 was replaced last year by a tax credit of £431,000. Even so, the net earnings cover has fallen sharply, to 2¾ times. When the group was formed as an amalgamation of Clan Line and Union-Castle in 1956 the dividend was then covered over 8 times. Like most other shipping companies, British and Commonwealth is faced with the problem of sustaining a high level of capital investment in a period of sharply reduced earnings. The group's cash flow last year amounted to £5.7 million and the full accounts will show how much further it had to draw on its dwindling but still substantial liquid resources (which at the end of 1958 amounted to £19.7 million). At 40s. the 10s. shares are little above their low point for the year and yield 5 per cent.

Lonsdale Investment Trust

THE striking improvement in the profit of its banking subsidiary is the principal feature of the results of the Lonsdale Investment Trust in the year to end-February. The total revenue of Robert Benson Lonsdale, the merchant bankers, rose from £576,177 to £898,629 largely as a result of a steep rise in its operational profits (as distinct from its investment income) from

£443,708 to £737,884. Last year was an exceptionally active one for merchant banks and Mr T. L. McC. Lonsdale, the chairman of the Trust, reports that business has been well maintained in the current year, and he expects the combination of a high level of industrial activity and credit restrictions to bring about a further increase in its new issue business. The bank's advice on investment matters is being increasingly sought by pension funds and the increase in its banking activities is reflected in the rise in deposits from £5.9 million to £8.7 million.

By comparison the 20 per cent rise in the investment income of the trust, from £351,476 to £424,147, is less striking but a further improvement is likely this year, for the trust will receive a full year's return on the £800,000 raised by a rights issue last July. Moreover, in the current year a further £360,000 has been invested from part of the proceeds of the debenture placing of £750,000. About 45 per cent of the new money invested last year went into dollar stocks but based on market valuations the proportion of the portfolio invested in dollar stocks fell from 32 to 27 per cent; this reflected the better performance of British securities over the year. The dividend on the trust's £1 shares has been raised from the equivalent of 12⅜ per cent to 15 per cent and at 22s. the shares yield almost 3½ per cent.

Metal Box

THE continued expansion of Metal Box has made its shares favourites with investors, who will be pleased with the preliminary announcement for the year to March 31st last. The ordinary dividend has been raised from the equivalent of 8⅓ per cent to 12 per cent and it is to be followed by a 10 per cent scrip issue. It is not unreasonable to suppose that a dividend of at least 12 per cent will be paid on the increased capital in 1960-61, and on that assumption the £1 ordinary shares at the current price of 76s. 6d. have been put on a yield basis of 3¼ per cent.

The increased dividend is backed by good though not spectacular trading results. Over the full year total sales have risen by 8.6 per cent, from £76,786,000 to £83,392,000 and the gross trading profit has gone up by 6.3 per cent, from £7,825,000 to £8,316,000. In the last six months of the financial year, the gross profit margin at home was slightly better; this is not surprising as the printing strike affected profits in the first half of the year. Metal Box has reduced its prices and, as these results show, this policy has had a dampening influence on earnings. The group is still expanding and the capital profit of £961,000 it gained from selling 750,000 of the 1 million ordinary shares of Steel of Wales that it held will have helped to finance that expansion. The need for self-generated capital to expand in a highly competitive market is reflected in the cover of over 2½ times on the ordinary dividend.

London Stock Exchange

FIRST DEALINGS:	May 9	May 23	June 13
LAST DEALINGS:	May 20	June 10	June 24
ACCOUNT DAY:	May 31	June 21	July 5

HELPED by selective buying by private investors and some support from the institutions, equity prices have again risen gently. Turnover both before and after Whitsun has remained, however, at a low level. Better than expected figures for the May gold reserves did little to strengthen the market in British Funds, which has been affected by some selling by the banks in advance of the call for special deposits by June 15. Over the week, 3½ per cent War Loan lost ⅜ to 61¼ and old Consols a similar amount to 45½ xd. Short dated stocks were generally 1/16 or 1/32 lower, but 3 per cent Savings Bonds 1955-65 were unchanged at 90⅝. Among medium dated stocks 5½ per cent Exchequer Bonds lost 3/16 to 101 1/16, and 3 per cent Savings Bonds 5/16 to 73 7/16. In foreign bonds, interest in Greek bonds has been stimulated by that country's proposed entry into the European Common Market and over the week the 7 per cent Refugee Loan gained 2¼ to 39½.

Over the four day's business to the close on Wednesday *The Economist* indicator gained 5.5 points to 361.8 points. A feature in equity markets has been the persistent demand from the Continent for its favourite stocks. Although closing on Wednesday some shillings below their peaks, Philips Lamps rose a further 16s. 6d. to 217s. 6d., Uniler NV 22s. to 225s. and Unilever Limited 24s. to 175s. Steel shares were helped by the higher interim from Hadfields, which gained 2s. to 25s. 3d. United Steel was 3s. better at 79s., and John Summers 9d. better at 75s. 6d., but Stewarts and Lloyds was that amount lower at 50s. 3d. Following the chairman's statement Vickers gained 9d. to 34s. and among other engineering shares Renold Chain rose by 1s. 6d. to 43s. 9d.

Jaguar "A" has continued to attract buyers following the purchase of Daimler and rose 8s. 9d. to 70s. 4½d.; BSA gained 1s. 3d. to 76s. 6d. Among other motor shares Ford Motor gained 3s. 9d. to 116s. 3d., while Rolls-Royce gained 1s. 7½d. to 48s. 6d. Rumours that Sandown Park, one of London's few race-courses, will be affected by the new Esher by-pass and be redeveloped as a building site, caused a sharp net rise of 10s. in the shares to 61s. 3d., though at one time they had been as high as 67s. 6d. British Industrial Plastics rose 1s. 7½d. to 8s. 3d. on rumours of a take over bid.

Bank shares have been firm and Barclays rose by 1s. 9d. to 55s. 9d., while Midland and National Provincial both gained 1s. 3d. to 84s. 3d. and 79s. 6d. respectively. Among merchant banks Hambros rose by 2s. 6d. to 103s. 6d. and Singer and Friedlander by the same amount to 51s. 6d.

Oil shares were influenced by the better performance on Wall Street and Shell Transport gained 4s. to 148s. 6d. British Petroleum put on 1s. to 52s. 6d. Ultramar, however, lost 1s. 6d. to 39s. 6d.

THE MONEY MARKET

CREDIT continued to be in good supply in Lombard Street up to the week-end. Money rates soon fell to the basic minimum of $3\frac{3}{8}$ per cent and down to 2 per cent for funds from outside banks. On both Thursday and Friday the authorities stepped in and sold back a small amount of bills. After the holiday, however, the market returned to the more difficult credit conditions to which it has become accustomed in recent weeks. The ruling rate for loans rarely fell below $4\frac{1}{2}$ per cent, while $4\frac{5}{8}$ per cent was conceded at times. The authorities gave assistance on both days in varying amounts. This was not sufficient, however, to keep the discount houses from borrowing a small amount at Bank rate. The bank return shows a further rise of £22.4 to £55.9 in the amount of special deposits.

The discount market again kept its bid at £98 17s. 3d. at last week's Treasury bill tender and secured an allotment of 56 per cent. It has received a quota of over 50 per cent at each of the last four tenders. Total applications fell sharply by £47 million to £424 million for the offer of £270 million of bills, allotted in full.

THE CANADIANS

What are they like? They're strong, quiet, hard-working and ambitious. Their dialect differs from one part of the country to another. But they've one thing in common . . . a determination to make their country grow to greatness. That's why doing business in Canada can be such an exciting and profitable experience.

Knowing Canada *and Canadians* is our business. We've been an integral part of Canada for over 100 years. With 550 branches across the country, we can supply you with pertinent information about Canadians and the Canadian way . . . information that could be of vital importance to your business venture.

FREE BOOKLET

"The Bank That Knows Canadian Business" is a booklet describing the complete facilities of "The Bank" in Canada. It also contains facts and growth predictions pertaining to Canada's future. For your copy, write or call our Business Development Representative, Mr. W. H. Browning, 3 King William Street, London, E.C.4.

SUBSCRIPTIONS TO THE ECONOMIST

Annual Postal Subscription by ordinary mail £4.10; overseas £5

By air see below

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

DE LA RUE BULL MACHINES LIMITED

an associate of THE DE LA RUE CO. LTD.

Offer a stimulating career with excellent opportunities to

SYSTEMS ADVISERS

who will be required to carry out investigations and surveys into commercial systems with a view to the sale and installation of punched card and electronic equipment. Applicants should be between the ages of 25 to 35, have previous experience in this field or have commercial accounting qualifications and experience, and some knowledge of French.

The appointment will involve a training period in London and Paris. Salary will be according to qualifications and experience. There is an excellent superannuation scheme.

Please apply in writing, stating full details of age, education, qualifications, experience and present earnings to

Chief Personnel Officer,
The De La Rue Co. Ltd.,
De La Rue House, 84/86, Regent Street, London, W.1
as soon as possible.

GKN

THE GUEST KEEN AND NETTLEFOLDS GROUP OF COMPANIES

Wish to Make the Following Appointment

CHARTERED ACCOUNTANT

A vacancy exists at the Head Office of the Group in Birmingham for a Chartered Accountant, who will join the staff of the Group Chief Accountant to assist in accounting work of the Parent Company and its subsidiaries.

This is an unusually good opening for a recently qualified Accountant under 30 wishing to make a career in industry. Some experience of accounts of large companies and consolidated accounts would be an advantage.

The appointment is permanent and pensionable.

Appropriately qualified men are invited to write, stating full details of age, qualifications, career to date, etc., to the Group Personnel Officer, Guest Keen and Nettlefolds Ltd., 66 Cannon Street, London, E.C.4.

STATISTICIAN

Applications are invited for this post at the National Coal Board's London Headquarters.

The successful applicant should be capable of supervising the technical work of qualified staff and of carrying statistical projects through all stages. A good degree in statistics, or in mathematics or economics with statistics as a special subject, or an appropriate post-graduate degree is essential. In addition, candidates should have at least five years' post-graduate experience in statistical work—including research, preferably in industry.

There are attractive conditions of service, including superannuation and initial salary will be between £1,600 and £2,000 p.a., depending on qualifications and experience.

Applications, giving full details, should reach Headquarters Staff Manager, N.C.B., Hobart House, London, S.W.1, not later than June 28, 1960, quoting X 1782 2D.

MARKETING RESEARCH

A Planning Supervisor is required at the new London Office of British Nylon Spinners Ltd. to assist in a detailed programme of research into consumer purchases of clothing and other textiles. Certain aspects of retailing, advertising and promotion are also being studied.

The successful candidate will be aged 21 to 26 and have a good Honours degree in Economics, Commerce or Sociology. Preferably, he will have a sound knowledge of statistics and experience of handling problems of survey, sample design and analysis. A man with the right aptitudes will be given the necessary training, and this vacancy offers a good future in an interesting field. The work is growing in importance and the man appointed will be expected to grow with it.

Please write to the Personnel Manager at Pontypool, Mon., quoting Ref. M/104.

UNILEVER LIMITED

COMPUTER PROGRAMMER (MATHEMATICIAN)

Unilever's computer operations are expanding, and offer work with considerable variety and scope for initiative.

A young mathematics graduate, preferably with knowledge of or interest in statistics and or digital computer programming is required to join mathematical staff of Computer Department at Unilever House in London. The post will involve liaison with statisticians, operational-research workers, and other technical people, both at home and from overseas.

Salary will depend on age and experience, but for a newly graduated man will not be less than £750.

For the man who is successful in this work the prospects are most attractive and there will be opportunities for transfer to other fields within Unilever at a later stage.

Applications, in writing, should be sent to Head Office Staff Department (WF 60), Unilever Limited, Unilever House, Blackfriars, London, E.C.4.

ADMINISTRATIVE ASSISTANT

S. SMITH & SONS (ENGLAND) LTD.

Young man required in the age group approximately 22-25 years to work basically on wages and salary surveys. Candidates should possess a sound education with Economics and Statistics to G.C.E. "A" Level or Intermediate degree standard.

He must have had at least two years' factory experience, preferably in contact with the shop floor and possess an orderly but flexible mind capable of dealing with and marshalling facts.

He should be willing to accept responsibility and be able to use discretion in discharging it.

The post is available in the Group Personnel Department. The Company are manufacturers of Motor Accessories, Aircraft, Industrial and Marine Instruments, Clocks and Watches.

Applications will be treated in strict confidence and should be made in writing, quoting reference SM. 331, to:—

The Staff Manager,
S. SMITH & SONS (ENGLAND) LTD.,
Group Headquarters,
Cricklewood, London, N.W.2.

LABOUR PARTY Research Department. Socialists are invited to apply for the following posts: Grade I Assistant —preference will be given to candidates with good honours degrees and with experience in economic and industrial affairs. Commencing salary £980 p.a. Grade III Assistant—candidates should have a keen interest in and some knowledge of political, social and industrial affairs. Honours degree, though not essential, is an advantage. Commencing salary £665 p.a. Application forms obtainable from the General Secretary, Labour Party, Transport House, Smith Square, London, S.W.1, to be returned by June 21, 1960.

CENTRAL ELECTRICITY GENERATING BOARD

ASSISTANT ECONOMIST

required in the Commercial Department at Headquarters, London, S.E.1.

The duties include the provision of an economic intelligence service to all Departments, the formulation of long and short term estimates of the future maximum demand, the consumption of electrical energy and appraisals of the probable effect of changes in policy of the Government and of other bodies. Candidates for the post should have a good degree in Economics and a sound knowledge of statistics.

Salary within the range £1,375 — £1,495 p.a.

Applications stating age, qualifications, experience, present position and salary, to the Personnel Officer, 24/30, Holborn, London, E.C.1, by June 20th. Envelopes should be marked "Confidential Ref. EC/211."

BRISTOL COLLEGE OF SCIENCE AND TECHNOLOGY

(COLLEGE OF ADVANCED TECHNOLOGY)

The Governors invite applications for post of LECTURER IN ECONOMICS in the Department of General Studies. Applicants must possess a good honours degree and appropriate experience.

Burnham Technical Scale salar: —
Men: £1,370 x £35(2) and £40 to £1,550.
Women: £1,100 x £28 to £1,240 plus equal pay increments.

Application form, returnable by June 25th, and details from Registrar, College of Science and Technology, Ashley Down, Bristol 7.

NOTTINGHAM AND DISTRICT TECHNICAL COLLEGE

BURTON STREET, NOTTINGHAM.

Principal: D. A. R. Clark, M.Sc.(Tech.), M.I.Mech.E.

Applications are invited for the following vacancy:—

LECTURER IN ECONOMICS

SALARY in accordance with the Burnham Technical Scale as follows:—
£1,370 x £35 — £1,550 per annum.
A salary above the minimum will be paid in approved cases.

Research encouraged. Facilities and equipment available.

Further particulars and form of application may be obtained from the Principal, to whom completed forms should be returned not later than June 25, 1960.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF SOCIAL STUDIES

Applications are invited from suitably qualified graduates for temporary appointment as Lecturer or Assistant Lecturer in Public Administration in the Department of Social Studies at a salary on the revised scale £1,050 x £50-£1,400 x £75-£1,850 (efficiency bar probably at £1,550) a year for a Lecturer, or within the range £800-£950 a year for an Assistant Lecturer, according to age, qualifications and experience. The appointment will be made for one year from October, 1960. Applications (three copies) stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than July 8, 1960.

UNIVERSITY OF DURHAM

RESIDENTIAL COURSE IN BUSINESS ADMINISTRATION

The Sixth RESIDENTIAL COURSE IN BUSINESS ADMINISTRATION will be held at Dunley Castle, Chester-le-Street, Co. Durham, from September 11 to 24, 1960. The course is designed to supplement the formal and informal training undertaken within business firms and is intended to make executives more conversant with the use of a variety of techniques appropriate to the analysis of business problems.

The course will contain a series of case studies and exercises which will be integrated with a lecture programme given by university teachers. It will consist of an appreciation of the contribution of management accounting, statistical, and operational research procedures to the analysis of business information for decision-making purposes.

No special professional or academic qualifications are required of members of the course. The membership will be limited and its composition will depend upon the need to have as wide a representation as possible. The fee for the course is £60. Further information and nomination forms may be obtained from the Director of Studies (Professor D. T. Jack), Economics Department, King's College, Newcastle-upon-Tyne, 1.

OXFORD COLLEGE OF TECHNOLOGY

FULL-TIME B.SC.(ECON.) DEGREE COURSE

The School of Commerce offers a full-time THREE-YEAR COURSE for the external B.Sc.(Econ.) degree of the University of London. Applications are now being accepted for the course, which commences in September, 1960. The examination for Part I is taken at the end of the second year, and that for Part II at the end of the third.

The Part II Special Subjects are:—
INDUSTRY AND TRADE,
and ACCOUNTING

Accommodation in the new College Hostel is available to male students taking this course. Enquiries should be addressed to:—

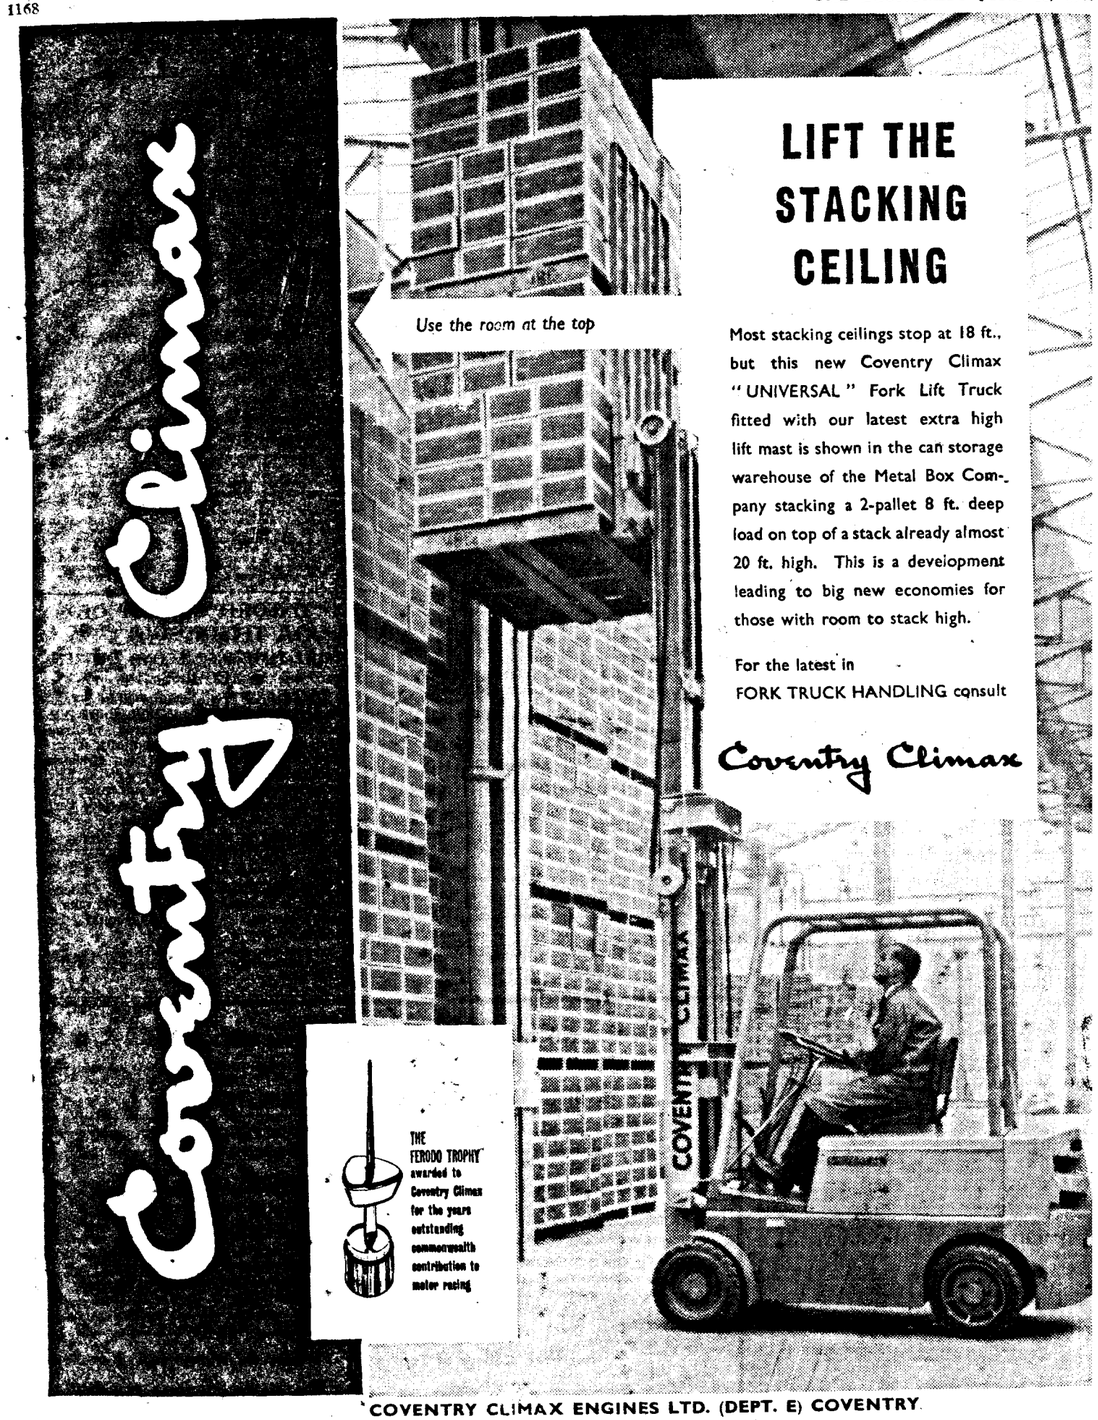
The Registrar,
College of Technology,
Oxford.

CITY OF PORTSMOUTH COLLEGE OF TECHNOLOGY

Department of Commerce

DIPLOMA IN COMMERCE AND ADMINISTRATION

Applications are invited from boys and girls between the ages of 17 and 19 years who wish to prepare for careers in commerce and business administration, for entry in September, 1960, or February, 1961, to this Full-Time (Sandwich) Training Course.



Applicants must hold University Entrance qualifications and be prepared to complete a Four-Year Honours Course which will include each year a practical training period of approximately five months. This may be carried out at the Headquarters or at various branches in the United Kingdom of the business organisations working in collaboration with the College.

The City of Portsmouth Education Authority is prepared to consider applications for Awards from students resident in Portsmouth. Other applicants are advised to consult the appropriate Local Education Authority.

Details and forms of application may be obtained from the

Registrar, College of Technology, Portsmouth, Hants.

Albion Leyland Scammell

BREAK-THROUGH

Leylands drive in to the U.S. market – and add another chapter to the Leyland story

Selling refrigerators to Eskimos is child's play compared with selling British trucks to Americans on their home ground.

But Leylands have done it.

Today, Leyland Group vehicles—7-ton Albion Chieftains—are operating alongside 1,000 U.S.-built trucks in the fleet of Yale Express System Inc.—one of America's 'top-ten' hauliers. And orders for others are beginning to roll in.

What a wonderful proof of Leyland quality.

For make no mistake, what the Americans are sold on is quality . . . the quality which, in their own words "combines excellent workmanship with incredible economy." And here's the proof of that economy:

On stop-start general delivery work, involving between 32 and 40 pickups and drops per day for a five-day week, these Chieftains are returning fuel consumption figures of up to 2.6 miles per Imperial gallon.

Incredible? Well, perhaps so, by American standards. But to us who know Leylands—a commonplace. Just the natural outcome of that extra quality for which Leyland Group vehicles have been famed for years—*and* which is available to you.

Published weekly every Saturday, fifty-two times a year in London, England.

鉱山 . . . minas . . . misimeng . . . mines

Wherever mines are worked, regardless of language spoken, you are certain to hear the words: "Gardner-Denver." The men who mine, the maintenance crews, the engineers and executives have come to respect this world-famous name and the reliable service for which it stands. Just as Gardner-Denver drills have spearheaded mining progress for over a century, so have other Gardner-Denver products earned prominence in oil field, construction and manufacturing development.

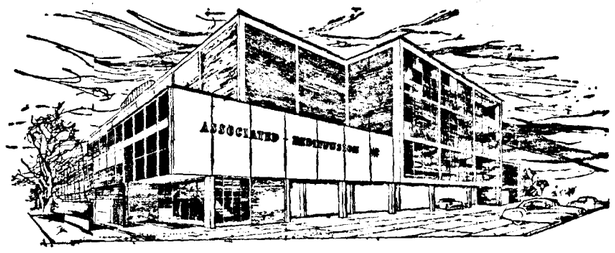
Now, from a fast-expanding international network of plants, Gardner-Denver products and local service are readily available.

GARDNER-DENVER Since 1859

EQUIPMENT TODAY FOR THE CHALLENGE OF TOMORROW

GARDNER-DENVER

Gardner-Denver International Division • Quincy, Illinois, U.S.A.



How many years now since Marconi sent the
first man-made signal bounding through the ether?
How many years since some of us ourselves
tinkered with our first crystal set,
prodding hopefully with the catswhisker,
gently moving the sliding coil until
a tinny burst of Rose Marie brought
station 2LO into our headphones?
That was only the beginning . . .

. . . Everywhere the new wireless was looked
upon as another form of competitive entertainment
designed to attract buyers of sets. In Britain,
this need for trade was linked with the ideal of public service.
'Listener research' produced what the people wanted.
'Informed taste' gave them what they needed.
British compromising genius wedded them together.
It all worked beautifully.
And now Television has brought everything much closer.
The romantic aura which clung to all important, remote figures
has been stripped away to reveal—just ordinary people,
like ourselves, similar in habit and outlook.
Cabinet Ministers drop in for supper to tell us of their plans.
Actresses confide to us the secrets of successful stardom.
Imagine Bernhardt or Baldwin . . .
But it's only just beginning.
What next then?
Improved line standards, intercontiental link-ups, colour.
You can see the shape of things to come
at Associated-Rediffusion Wembley Studios, where
STUDIO 5 IS NOW IN ACTION;
the vast television studio of the future
for the vaster audience
of the future.

FIRST

COMPUTER SYSTEM THAT OPERATES BY READING MAGNETIC INK CHARACTERS TO PRODUCE A VISIBLE RECORD

⑆1234⑈3890⑆ 1738⑈4658⑈ 368

Burroughs High-speed Sorter-Reader

Burroughs Visible Record Computer

THE NEW BURROUGHS B251 VRC (VISIBLE RECORD COMPUTER) adds a new dimension to what is already one of the broadest ranges of computer systems.

The VRC is a fully transistorized computer which operates directly in sterling. It is the first electronic data processing system capable of selecting ledger records and making printed daily entries in individual visible and conventional account records — instructions being read by the Sorter directly from posting media, without any intermediate operations to produce punched tape, punched card or magnetic tape input. It automatically prints current entries and new balances. Management data, so essential to modern banking and commerce, is an automatic product of the computer operation, which may be programmed to produce whatever information is desired.

THE BURROUGHS B101 SORTER-READER brings high-speed automation to the burdensome job of sorting large volumes of documents—such as bank cheques. Operating, like the VRC, from magnetic ink character recognition, the Sorter-Reader sorts up to 1,560 paper documents per minute and is skilfully designed for flexible programming.

The Sorter-Reader, when linked with a Lister-Converter, performs either or both of two functions. It lists cheques at the same speed as sorting, i.e. 25 per second, and gives any required total of these lists. Also all the information relating to a cheque or other document can be transmitted into magnetic tape for subsequent input to a computer.

For further information write to Head Office.

A 3-D DESIGN FOR A 100,000 B.P.S.D REFINERY

(Barrel Per Stream Day)

For an increasing number of Kellogg clients in the chemical and petroleum refining industries, scale models are proving a many-sided solution to the economics of engineering and constructing new production facilities. This is especially true in regard to piping—a major investment in any process plant.
Built by Kellogg's designers, these three-dimensional blueprints largely eliminate planning studies and piping key plans, improve designs, facilitate approval, promote faster construction and reduce operating costs. They supplement conventional drawings of overall layout and piping. The models themselves are also used on the job site to save time in explaining construction details to workers and for use in training operators to run the plant.
Built at Kellogg House, the model shown above is now at Dinslaken, Germany, where it is being used by the BP Benzin und Petroleum A.G. to explain constructional details to their labour forces. It will also be used in the operator-training programme.
Kellogg engineers will welcome the opportunity to explain how the Kellogg 3-D model technique can be of assistance to you in planning and engineering new plant.

6 German Trade Fairs

You are cordially invited to visit the six German Trade Fairs demonstrating a vast range of goodsand the latest developments in production from all parts of the world. Inview of modern traffic rapidly reducing distance, and of the careful coordination of the Trade Fair dates these events in effect constitute one big trading centre. Individual in character and organization, they complement each other as to the products on display. Here you will find your suppliers, here you will win new customers. You cannot afford to miss this unique opportunity of establishing valuable contacts.

We've reserved SPACE for the Big Meeting

How do you meet a man traveling at 18,000 miles an hour, 500 miles from earth? Northrop is already preparing for the next big challenge after the first human penetration of space – namely, rendezvous of men in space.

In all of its Divisions, Northrop scientists, physicists, mathematicians, doctors, and engineers are attacking the many formidable problems. These include altering the course of a vehicle once it has been launched... human factors engineering... environmental stress... weightlessness... food supplies... in-space repair and rescue operations... satellite "filling stations"... new metallurgical explorations... recovery systems.

There is much to be done before men meet in space. Northrop possesses the capabilities and is developing the technologies to help make it possible.

ANNOUNCING

two new Riegel Pulps

MIRACEL

CHLORINE DIOXIDE BLEACHED SOFTWOOD

HYDRACEL

CHLORINE DIOXIDE BLEACHED HARDWOOD

PREHYDRATED to facilitate blending with other fibers

AND NOW THERE ARE FOUR
Balanced Paper-Grade Pulps...
Created by Papermakers for Papermakers

ALBACEL • ASTRACEL • MIRACEL • HYDRACEL

Throughout the free world, papermakers use and like Riegel Pulps...paper-grade pulps that provide the right balance of all important qualities...brightness, cleanliness, strength, formability and proper beating characteristics. To increase the versatility and economy of our pulps, we have developed two new grades, Miracel and Hydracel. These retain all the fine characteristics of Albacel and Astracel... and in addition, have been prehydrated to facilitate blending with other fibers.

RIEGEL PAPER CORPORATION | 260 Madison Ave, New York 16, N. Y. U.S.A.

THE DARK AGES A.D.1960

Strenuous though the efforts of medical science have been to curb loss of sight, greater longevity has brought about an increase in the number of blind persons in England. Since 1946 the figure has increased 25%, and it has been estimated that in 13 years the total will have leapt to 140,000.
What is being done to help these people to lead a fuller and happier life?

The Greater London Fund for the Blind assists no less than 14 Institutions, Societies and Associations. It depends for its very existence upon voluntary contributions. Please help the G.L.F.B.

THIS IS A SPECIAL "CITY APPEAL"

Please help. And if you would like to know more about the work and achievements of the G.L.F.B., send for illustrated publication.

CAIRNCROSS: Introduction to Economics

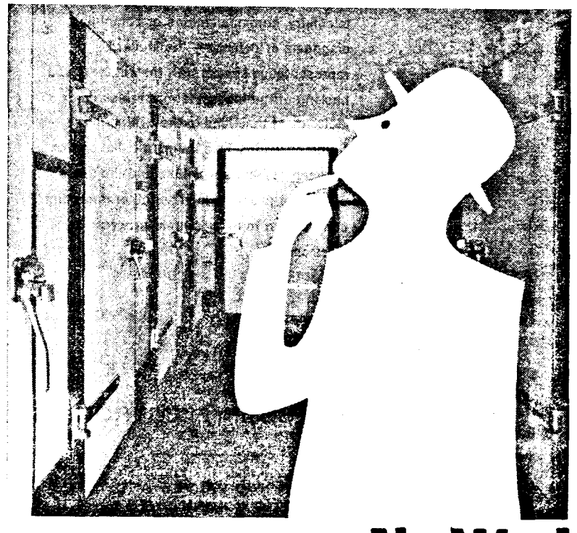
THIRD EDITION

ALEC CAIRNCROSS, *Professor of Applied Economics at the University of Glasgow.*

This has long been one of the most widely used text-books on Economics—the first Edition running into seven impressions. The book is written simply, practically and consecutively, and is therefore easily understood, even by those approaching economics for the first time. There is no attempt to over-simplify, and no part of economic theory is left out merely on account of its complexity.

This book has been extensively revised; a considerable amount of new matter is included in the introductory chapters, and in the part dealing with the Structure of Industry a new introductory chapter on economic growth and development has been included. The chapter on International Trade has been almost entirely rewritten, also the chapters on Money and Employment. The Third Edition thus offers an up-to-date account of present day economics.

Ready July. Price to be announced.



BUTTERWORTHS, 88 KINGSWAY, LONDON, W.C.2

Men in conference

Every working day of the week, year in, year out, Mullard engineers are sitting in conferences with designers of electronic equipment. Each of these engineers specialises in the use of electronic valves, tubes, semiconductors or magnetic components in one or more fields of application. Most of these conferences are held on customers' premises. Some, however, take place in Mullard laboratories or factories where specific problems can be solved by experts on the spot. Whatever the subject of the conference — radar or radio, television or telemetry, communications or computing, diagnosis or defence — the Mullard representative speaks with the authority and backing of the biggest laboratories and factories of their kind in the British Commonwealth. This intimate collaboration between Mullard specialists and the users of Mullard products is yet another important contribution to today's rapid progress in electronics.

Far Eastern Reproaches

THE defeat that the United States has sustained at the hands of the Tokyo rioters is direct and undisguised. How deeply it has struck at the roots of the Japanese-American relationship, and at the new security treaty in particular, has still to be discovered. Mr Kishi's own resignation seems certain: his fall will be acclaimed not only by the militant Left but also by his political rivals in the Liberal-Democratic party, who have played their part in his present humiliation. If the Diet is now dissolved before the final ratification of the security treaty—and this course may be politically necessary—then American policy, as well as prestige, will have been sadly damaged.

To dissolve the Diet, and thus to bow before the storm of extra-parliamentary violence, may be thought constitutionally most undesirable, particularly as the storm must be expected to rage through the electoral campaign. Yet the ballot is now perhaps the only way left to discover the state of national feeling on the security treaty, and to mobilise, if it still really exists, the support that Mr Kishi's policy has hitherto seemed to possess among the silent majority of Japanese opinion. The situation might be retrievable after an election, from which the Liberal-Democrats can still hope to emerge with a majority. But would it be politically, or morally, possible for the treaty to be brought up again, without further revision, if the Socialists were to show an appreciable advance in popular support?

It would be unwise to assume that Japanese-American relations have deteriorated as disastrously as the demonstrators who have hunted Mr Kishi, broken into the Diet building and mobbed Mr Hagerty have tried to make out. But if Japan is still the United States' ally there have been few signs of enthusiasm for the alliance when such support would have mattered most. The Socialists, Communists, Sohyo trade unionists and Zengakuren students have made their point. They would have done so even if Mr Eisenhower and the Emperor Hirohito had braved the worst and ridden into Tokyo on Sunday in their stately, and bullet-proof, Mercedes-Benz. To be received under massive police protection would, in itself, have been a bad blow to any mission professing to bring America's goodwill to its Far Eastern allies. It is questionable just how worthwhile this type of visit ever is.

The taste for trivial peregrination that Mr Eisenhower has been prone to indulge has only the most tenuous connection with diplomacy. The origin of his visit to Tokyo was no more than an easy stopover on the way home from Moscow; to celebrate the hundredth anniversary of Japanese-American treaty relations, although gracious, has never seemed to be more than an agreeable pretext. Certain of Mr Eisenhower's visits—of which that to Delhi was one—have had meaning and validity; but too much of the applause he has picked up in the past six months has not been worth the having. The sound of cheering policemen is apt to pall in most ears. When the policemen start to have sterner duties it is time to reflect on the risks of indulgence and the dangers of having one's state visits interpreted as a serious instrument of state policy.

The Tokyo demonstrations have been directed against Mr Kishi and the security treaty. There have even been socialist disclaimers that their bias is explicitly anti-American. But even if this is accepted, the accumulated resentments of fifteen years have certainly been there for the demonstrators to work off, from the minor irritations of the occupation to the continued American

possession of Okinawa and the Ryukyus. Many Japanese have not forgiven the United States for the atomic bombs used against Hiroshima and Nagasaki in 1945, or the equally destructive fire attacks on Tokyo, Osaka and other cities. There is the belief, played upon by communist agitation, that the Americans would not have dropped the atom bomb on other than an Asian opponent, and the sense of national inferiority, as well as hurt, has influenced many intellectuals. The evolution of Japanese thinking on nuclear weapons, hastened by such impressions as the apparent American callousness about the fate of the fishing boat *Fukuryu Maru* in the Bikinis in 1954, has been against United States military policy ; and the fear of nuclear warfare, in which Japan would be involved by the existence of American bases on Japanese territory, is as highly developed among the Japanese as among any people anywhere. Mr Khrushchev's threats of retaliation against the U2 aircraft in Japan have fallen on a fully-awakened audience.

THE disconcerting paradox of Japanese-American relations is that many of the Japanese who oppose the security treaty are those who took most to heart the political teaching of the American occupation. The Japan Communist party and the nihilistic students are not among these, but with many Socialists and intellectuals the MacArthur ideas of demilitarisation and neutrality, of Japan as an Asian Switzerland, die hard. Their envy of India, which has been able to represent an independent moral stand before the world, is sincere. Since the Korean war it has been borne in on the Japanese that the world would not allow them, and their industrial capacity, to remain neutral. The Americans have encouraged Japanese rearmament, a process that has seemed to contravene the MacArthur constitution. The Japanese parties that have agreed to this, now in the Liberal-Democratic coalition, have been anxious not only to change the democratic constitution but also to push through legislation that has restored government control of education and tightened up the central police powers.

There are strong arguments why Mr Yoshida originally, and now Mr Kishi, should have taken these steps: the Japanese teachers' union has certainly appeared to be under direct communist influence. But the effect has been to increase the distrust felt for the government by the non-communist left, and thereby to strengthen the arguments of those who have demanded co-operation with the Communists. These impulses have been openly stimulated by the propaganda of the Peking regime, which has encouraged socialist visitors, fomented the anti-treaty campaign and underwritten the idea of a security arrangement guaranteeing Japanese neutrality in which the Soviet Union, China and the United States would join.

Since the occupation ended, the parliamentary strength of the Japanese Socialists has never given them more than the bare opportunity of blocking constitutional changes. The incentive to resort to extra-parliamentary tactics against such legislation as the education and police bills, increased by the marxist leanings of many of the leaders, has always been strong. The apologists for these tactics have argued that the conservative governments have never paid any attention to the wishes of the parliamentary opposition and have rammed through their legislation, as Mr Kishi did with his police bill and the security treaty itself. This claim does not, in fact, stand up to an examination of the amount of parliamentary time given to discussion of the treaty ; and the Socialists have themselves helped to bring the Diet into disrepute by their physical violence on the floor of the house. Yet when socialist strength in the country was on the increase (a development that the government tried to counter by an attempt to rewrite the electoral law) the arguments of the right-wing Socialists, and particularly of Mr Nishio, did hold out the prospect that the democratic system might ultimately take root.

The Socialists' failure in the 1958 elections, the subsequent split between left and right, and the departure of Mr Nishio and his followers to found the Social Democratic party ended these hopes that a responsible and coherent opposition would soon emerge. The rioting against the revised security treaty has thus been the outcome of socialist weakness, not confidence ; and the chief casualty has not been Mr Kishi or the United States but the Japanese parliamentary process. At the same time, increasing difficulties in industrial negotiation seem to have persuaded the Sohyo trade unions (whose membership makes up 3.5 million of Japan's 8 million organised workers) that their best prospects lay in political, not economic, activity. The descent to the streets has found them in association with the extremist students (whose pessimistic nihilism is well to the left of the Communists) in the one cause in which they are in easy unity.

It has become abundantly clear that America cannot afford to ignore the views of what is, after all, a substantial section of the Japanese community. The difficulty of fitting democratic principles to the military needs of alliance against the communist block is a familiar one along the entire periphery of the east-west conflict. Japan, by far the most important of the Asian nations in direct association with the United States, may be a decisive test for western policy. The revised security treaty contains substantial concessions to the Japanese point of view compared with the treaty of 1951, but Mr Kishi's interpretation of it would seem to involve Japan in a conflict that might begin in the Formosa Strait. Although the treaty does increase Japanese control of American military movements to and from Japan, the practical power of veto over the use of nuclear weapons is questionable.

In the coming weeks it may be possible to secure the assent of the majority of Japanese to the successful working of the treaty for the ten years it has to run. But the perpetuation of the present state of affairs between the United States and China, in continuing the unnatural relationship between Japan and its greatest neighbour, can only contribute to internal strains and tensions. The problem of American relations with China is not one, as the following article shows, that can easily be settled or that the United States can settle off its own bat. The Chinese, whatever they may say to their Japanese visitors, have been much less anxious than the Russians to bring Japan into effective trading relationships ; Peking might prefer to see the Japanese economy break down for lack of markets.

BUT there are three things that the Americans, and the West as a whole, can reasonably do. The first is at least to show willing in the attempt to bring China into the international community. This need not mean showing weakness: the point is rather to convince China's neighbours that it is Peking's own obduracy and pretensions that are the chief obstacles to co-existence in the Far East. The second is to try to avoid, throughout the debatable lands, the dangerous impression that the West is prepared to forgo its own political principles in placing all its confidence in the parties or regimes that chiefly serve its military convenience. This has played a major part in the Japanese crisis. Even Mr Eisenhower's visit to Seoul might have been impossible if American policy in South Korea had not changed course in the nick of time.

The third object of western policy must be to make it easier for these allies to integrate themselves in the western system. The economic difficulties involved are substantial. But the Japanese are uneasily aware of their present economic dependence on the United States ; their concern is the greater now that the American textile unions are challenging the government's trade policy and a further demand for voluntary restrictions by the Japanese is being favoured in Washington. This is a common problem: Mr Eisenhower will have received Filipino complaints about American sugar policy. In Japan, above all, the United States has made perhaps the greatest of all its post-war investments in hopes, precepts, democratic encouragement and straightforward economic aid. None of this need be lost if the lessons of this week's defeat are acted on with confidence and resolution. But the parliamentary process in Japan will have to show unaccustomed resilience to recover from this month's blows. In its hour of triumph the democratic Left may profitably reflect on whether chaos really serves its purpose—or that of its real enemies. The crisis is only beginning.

Towards Two Chinas ?

President Eisenhower's visit to Formosa does not end an era in American policy, but the need for revision is becoming increasingly apparent—if no less difficult

THREE years ago, it was possible to argue (as *The Economist* did on March 30, 1957) that United States policy in the Far East, whatever its logical shortcomings, had produced a *Pax Americana*. If one could postulate the impermanence of communism in China, one might sustain the view that an alternative government—that of President Chiang Kai-shek on Formosa—deserved unstinting moral and material support. The Nationalist myth of a return to the mainland might even—at considerable risk of world war—have been transformed into something like reality during the Korean war, if President Truman had listened to General MacArthur's advice that American restrictions on the Nationalist forces should be removed. It could even have been argued, on the morrow of the Hungarian uprising and of the almost simultaneous peasant revolt in communist north Vietnam, that revolution on the Chinese mainland could give the Nationalists a desperate outside chance of making the dream come true.

These possibilities, which were never more than hypothetical and would have involved grave dangers to world peace had they arisen and been seized, have now gone. What is left is a situation that is not merely still tense but also increasingly dangerous. The United States is still committed to protecting Formosa from communist attack. American ships patrol Chinese waters and American aircraft overfly the mainland, if the "serious warnings" issued almost every week in Peking are to be taken seriously. Nationalist troops still garrison the offshore islands of Quemoy and Matsu, and although the United States has not committed itself clearly to defending them, it has not publicly disclaimed such an intention or persuaded the Nationalists to withdraw. On their side, the Communists are believed to have been building up their forces on the mainland opposite Quemoy, and have intensified their bombardment of the island.

As China's industrial power develops, and its direct military dependence on Russia diminishes, the inherent dangers of the situation in the Formosa Strait are bound to increase: and on the day the Chinese have their own nuclear weapons, whether these are given by Russia, or, more probably, locally manufactured, the temptation to call America's bluff may become irresistible. Indeed on that day American nuclear power may cease to deter, and Soviet advice may no longer serve to restrain, the Chinese leaders, who make a distinction between "just" and "unjust" wars, who believe war to be inevitable anyway, and who profess to consider that China's enormous population will guarantee the survival of their regime even after a world war fought with nuclear weapons. Although the benevolent eye of Lord Montgomery may ignore (or be ignorant of) this aspect of Chairman Mao's beliefs, the State Department plainly cannot.

The inexorable approach of China's "nuclear capability" raises contingent issues that may well prove insoluble in the present state of American-Chinese relations. What if Peking refuses to associate itself with the United States, Britain and Russia in a treaty banning nuclear tests? What if the Chinese Communists refuse to allow control posts to be set up in their territory or to subscribe to an east-west disarmament agreement? Mr Herter, like Mr Selwyn Lloyd, is aware of the dilemma that these questions raise; and, indeed, the State Department is reported to have given some thought to stratagems designed to obtain China's signature next to America's without actually recognising the communist regime. It would be unrealistic, however, to suppose that Peking would oblige with a signature without exacting a price that would start at American recognition and membership of the United Nations on its own terms, and might include the abandonment of America's entire China policy.

THESE dangers and dilemmas argue the necessity for a change, but they do not make it any easier to get one. The MPs who argued in the last foreign affairs debate in the House of Commons that communist China should be recognised by the United States, take China's seat at the UN and participate in the next summit conference, seemed insufficiently aware of the difficulties. The interminable series of

Sino-American talks, first at Geneva, then in Warsaw, has made no headway because the Chinese refuse to renounce the use of force in furthering their claim to Formosa and insist that the American seventh fleet should withdraw from the strait and leave the Communists and Nationalists to settle a "purely domestic" quarrel without outside interference. It would, however, be as unthinkable for the next American government as for the present one to abandon the Nationalist government. Nor, quite apart from the moral implications of exposing ten million Nationalists and Formosans to communist vengeance or absorption, would such a course be desirable in wider terms.

Would America's other allies, in the Far East and elsewhere, be comforted by a unilateral American denunciation of the treaty with the Chinese Nationalist government? Would Britain contemplate with equanimity the probable loss of Hongkong in the near future if the presence of American power in the background were removed? Even if one disagrees with the notion that Formosa is an indispensable link in America's chain of island defences, would the Philippines—or Australia and New Zealand—be happy to see Formosa in communist hands?

It has been argued, however, that neither American recognition of Peking nor the communist regime's entry to the United Nations need entail the abandonment of Formosa. This argument is the familiar "two Chinas" thesis in another guise: communist China would oust Nationalist China from its permanent seat in the Security Council, but Nationalist China, as an independent republic, would continue to occupy a seat in the General Assembly. Alternatively, there would be a period of UN trusteeship over Formosa, followed by self-determination for the Formosans. This thesis would be more comforting if it were acceptable either to Mao Tse-tung or to Chiang Kai-shek. It has, in fact, been repeatedly rejected both in Peking and Taipeh, which agree only in considering Formosa to be a province of China. The Chinese Communists would probably refuse to take their seat at the United Nations if Formosa remained under a separate, and potentially independent, government; they would certainly not trade their claim to Formosa against the UN seat. General Chiang, on the other hand, might well resist with force an attempt to place Formosa under trusteeship.

Thus presented, the American dilemma seems to offer no way out, and indeed there is no sign that the present administration intends to seek one. There are, on the other hand, important signs of a change in the climate of informed American opinion which the next President and Congress may find difficult to ignore. One such sign was the report prepared late last year by Conlon Associates, Ltd., a San Francisco research firm, at the request of the Senate Foreign Relations Committee. The Conlon report (which of course was not binding on the Senate committee) rejected the present China policy and advocated *de facto* recognition of communist China and the creation of an independent "Republic of Taiwan" (Formosa) which would remain under the protection of the United States.

Is the Boom Ending?

Present American and British business prospects can be compared by reading an American Survey article on page 1205 and a series of Business Notes from page 1229 onwards.

There is further evidence of new thinking in an important new book, "Communist China and Asia,"* in which Mr A. Doak Barnett, now of the Ford Foundation, examines in exhaustive detail every aspect of the present American policy and of possible alternatives. Like the authors of the Conlon report, Mr Barnett lists the disadvantages of the "two Chinas" thesis as well as its possible benefits. Nevertheless, again like the Conlon report, he comes to the conclusion that the benefits would ultimately outweigh the disadvantages. Specifically, he advocates a series of steps designed to enable the United States to emerge from the present impasse and to assume a policy which—at the very least—its allies would find it easier to support than the present one. These steps are:

Increased action to open up certain channels of non-official contact with Communist China and the gradual relaxation of existing restrictions on trade, except on strategic goods.

Effective action to persuade the Nationalists to evacuate the offshore islands and decisive moves to dissociate the United States from their defence.

Efforts to induce some of the United States' major allies to commit themselves to the defence of Taiwan, as well as to persuade a larger number of nations that neutralisation of the Taiwan Strait should be an international responsibility.

Moves to redefine the United States' view of the status of the "Republic of China" on Taiwan, which would make it clear that, while recognising the Nationalist regime's authority over Taiwan and the Pescadores and re-emphasising its pledge to defend these islands, the United States no longer recognises the Nationalists' claim to be the government of the mainland of China.

Action to indicate that the United States acknowledges the *de facto* control of the "People's Republic of China" on the mainland, but that it specifically rejects Peking's claim to Taiwan. Either simultaneously with this action or at an appropriate later time, the United States might indicate a willingness to consider formally recognising the Peking regime, and establishing relations with it, if the Chinese Communists, accepting the fact that the United States intends to continue to defend and support the Nationalists, were willing to reciprocate.

An effort within the United Nations to link the seating of Peking with the simultaneous admission of Nationalist China as a new member, on condition that Communist China purged itself of aggression in Korea by fulfilling certain clearly defined requirements, which should be determined by the United Nations. The United States should continue to oppose the seating of Peking except on these terms, but at the same time it should be willing to accept the majority view, whatever it might be, on the question of China's seat in the United Nations.

Mr Barnett does not claim that any of his proposals would solve the basic problem of United States relations with China. But it is impossible to quarrel with his view that if the United States moved in the direction he prescribes, it would both reduce the present dangers and acquire wider support from its allies, including this country. The next administration can hardly avoid the obligation to reappraise a policy which, in its present form, has had its day.

Gangs and the Police

Some comments on the growth of organised crime and the police shortage

BRITAIN'S crime figures continue to rise. Indictable offences known to the police are now over twice as high as in 1939, and the provisional figure of 675,625 offences in 1959 marked an all-time peak. Although other crimes have ebbed and flowed, reported crimes of violence have steadily grown throughout the postwar period.

It is true that some of these are crimes that were previously left unreported (husbands who hit their wives were not reported to the police in the old slum districts, but are reported in the new housing estates). It is true that there are rays of hope in the news of a definite drop in the delinquency rate among today's 12 and 13-year-olds (interestingly, those who passed out of the toddler stage around 1952) compared with those who grew up in a less prosperous and more spiv-ridden Britain; and that crimes of larceny and breaking and entry declined last year. But as the late 1950s' peak crop of teddy boy delinquents reaches the age of more organised thugdom, the task before the police is menacing. The most disturbing feature of all is the eruption, especially in London, of a new species of organised crime and gang war, on a scale previously unknown in the British Isles.

Present-day gang warfare is the direct result of the protection rackets, evil growths which find their most favourable seed grounds when the protection levies are demanded from "businesses" whose principals are themselves exceedingly loth to complain to the police. The most obvious businesses in point are street bookmaking, prostitution, and many cafes and some clubs with a partly criminal or prostitute clientèle. What should be done to remedy this situation?

One answer is nothing: criminals should be left to carve one another up in Chicago style. As long as they are content to liquidate one another, the law-abiding public is not concerned; indeed, mutual extermination should be encouraged, since it reduces the number of criminals and provides a necessary safety valve for the violence that is an intrinsic part of urban society. This argument, although superficially more attractive to some police authorities than they care to admit, is too outrageous to command widespread support—and also will not work. A policy of apartheid succeeds no better with criminals than with Africans; as a number of incidents have shown, peaceful citizens are inevitably embroiled in gang-generated violence. Moreover the country cannot for ever rely on the gangsters following the present British underworld rules and fighting things out only with knuckledusters and knives; a graver danger will arise for society if and when they start to fight their battles with guns.

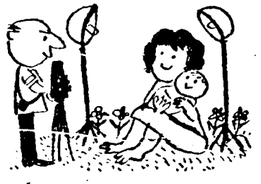
A SECOND and more common answer is therefore that legislative action must be taken to clean up the trades on which the protection rackets thrive. The present Betting and Gaming Bill—which seeks to legalise cash betting, set up licensed betting shops, and stiffen penalties for street betting—may stop knife fighting between street bookmakers' protection gangs, but only if sufficient betting shops are provided to meet public demand. If the number of licensed betting shops is foolishly restricted, the main effect of higher penalties on street betting will probably be that larger sums will be placed with street bookies at one time—thus providing a still bigger bait for racketeers. The Street Offences Act has cleared prostitutes off the streets, but has herded them in low grade cafes (especially all-night cafes) where they and the cafe owners are more easily exploited by the protection rackets.

Allied with this is the problem of the drinking clubs. Anybody can secure the registration of a club, and make it a centre for the sale of drink, on tender of a five shilling fee. In poorer districts such as Stepney and Notting Hill some of the cafes with prostitutes' quarters attached have added liquor sales to their other attractions by registering as clubs in this way. Some of the dens where crooks concentrate have also registered as clubs, so as to become centres for the sale of drinks as well as the planning of crime.

The Government has announced that it intends to introduce new legislation, which will distinguish between clubs run for their members' interests (like the Athenæum and many licensed office canteens) and clubs run by proprietors for gain. There is everything to be said for this legislation, but it will have little effect on gang warfare or the protection racket. It will merely mean that crooks congregate in private houses instead of in clubs, and that clients will pick up prostitutes in unlicensed cafes and near-beer houses (as most of them do now) rather than in the more expensive "clubs" that also sell liquor. On the whole, small unlicensed cafes with disreputable rooms upstairs are more likely than clubs to become battle grounds for different protection gangs, who each claim that the cafe concerned is in their "manor" or territory. Partly, this is because those who have invested heavily in profitable clubs have also generally had enough money to buy off all the big protection rackets.

IT is, therefore, not to new legislation but to the police that the public must look for the suppression of violent crime. Unlike continental countries Britain has never had a national police force; to the outsider this country's 125 different police forces lend an appearance of chaos. But unity is given by the dominating position of the metropolitan police, a London force which contains 17,000 of the country's 70,000 policemen; and by the Home Secretary's financial and administrative powers under the Exchequer grant system and the Police Act of 1919. Regulations made by the Home Secretary are binding on all police forces in the country. In general, therefore, what is wanted is not more centralised control, but more police.

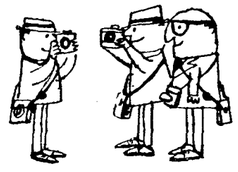
Although there are more police in Britain today than before the war, the metropolitan police are well below pre-war strength, and the crime increase has created a need for many more—especially for more foot patrols. The Home Secretary has recently estimated the shortage of policemen in the whole country as about 12,500. Probably, the true figure is even



greater, for London policemen at present work a 48-hour week ; to reduce this to a more reasonable 44-hour week would result in an 8 per cent cut in the operating strength of the London police. How are these extra numbers to be obtained?

The simplest and most obvious way is by an improvement in pay. Sir Henry Willink's royal commission has recognised this, and is to make a special interim report on police pay before the end of the year. Policemen are certainly not overpaid. A constable's pay ranges from £510 to £695 a year ; a sergeant's from £745 to £795 ; and an inspector is paid from £895 to £960. The police are in fact better off than these figures suggest, since salaries are supplemented by free housing or appropriate allowances, a generous pension scheme, free clothing, and of course footwear. Because the main problem is the drift of established policemen away from the force, rather than inadequate recruitment, there may be a temptation for the Willink commission to weight its recommendations too heavily in favour of still greater improvements in pensions. That would be a mistake ; the desire to avoid forfeiture of benefits already causes many senior men who have lost interest in their jobs to linger on in the force, with a consequent lowering effect on general morale.

Instead, the wisest course will be to recommend a large increase in direct pay, together with a more efficient use of existing strength (a campaign to enrol policewomen would result in the release of many men from clerical and administrative duties for work on the beat), and improvements in hours and amenities. Police hours of work are inconvenient and awkward, and tend to cut them off from the ordinary social life of the community ; this is especially true of married policemen, and a quarter of today's recruits are already married. Housing for these men is good, but there is now a need for modern, well-equipped, section houses for the unmarried.



Another new trend in the police forces is to catch its recruits young—i.e. as cadets aged between 16 and 18½, to whom a special education is given. Already over the last five years the proportion of newly-appointed constables who were cadets has increased from 1 in 20 to about 1 in 4, and wastage of ex-cadets is proving much less than the wastage of other constables ; the commissioner of metropolitan police is therefore basing his present plans on the proportion of half cadets and half recruits from other sources. There is an obvious danger here that British policemen may increasingly become men who have been in some way "set apart" from the rest of the public at an early age. This could exacerbate the present serious deterioration in relations between the general public and the police, which the police bitterly regard as a sign of "lack of public loyalty" to themselves. Relations can be improved in several ways: by the reduction of mutual irritations made possible by the introduction of parking meters, the "ticket" system of fines, and traffic wardens ; and by an improvement in Scotland Yard's archaic contacts with the press. The root of the problem, however, is that while one section of the public criticises the police for not bringing more criminals to book, the police feel that another section is constantly "harrying" them about their treatment of suspects.

Stories of police brutality and "third degree" methods are rare, but the manner in which prisoners are questioned gives rise to legitimate anxiety. Police questioning is theoretically governed by the judges' rules, which are designed to keep it within rigid bounds ; but as everyone knows, these are not observed. When so many "confessions" are made at 4 a.m., public uneasiness is inevitable. How is it that while nearly everyone arrested in England for homosexual offences committed in private confesses his guilt, only a minute percentage of those arrested in Scotland do so? These examples could easily be multiplied. Perhaps the most satisfactory solution would be to give up the pretence that the police can even be expected to be impartial—the fatal flaw of the judges' rules—and commit suspects under arrest not to police stations but to gaol, where they would be in charge of another set of officials.

Snapping It Up

There are now ten million amateur photographers in Britain. To judge from American experience, there may be nearly twice as many soon

"MARELY," said Oliver Cromwell, "I desire you would use all your skill to paint my picture truly like me and not flatter me at all ; but remark all these roughnesses, pimples, warts and everything as you see me, otherwise I will never pay a farthing for it." To-day if anyone requires an unflattering portrait he does not need to go to the country's leading portrait painter to get it. He could get it from almost any one of Britain's ten million amateur photographers, who turn out such items by the hundred million every year. Since Niépce took the first photograph in the 1820s and Jacques Daguerre produced the daguerreotype in the 1830s, photography has turned from a dilettante's hobby into a mass pastime and a sizeable business.

Almost one British family in two now has a camera, according to one leading firm's market research ; one individual out of every five or six claims to be a camera-user. Total retail trade in cameras, accessories, films and processing is now estimated to be over £40 million a year. For most families, quantity does not in any way imply quality; the camera is merely unearthed every summer to take a few snaps of the children and the holiday. The same goes for the average cine-camera user, found by market research to be typically an upper-middle-class man in his late thirties, with two or three children and in the habit of taking his holidays abroad. The people who take their camera seriously, perhaps belong to a club and develop some of their films themselves, are in a tiny minority; according to a recent Odhams survey, such enthusiasm is confined to one adult in forty. This compares with over a quarter who are actively interested in gardening, reading and knitting and over an eighth who are interested in music, motoring and sport.

But British expenditure on photography is growing, and is almost certain to go on doing so; this can be seen by comparing it with that of the world's most camera-conscious country, the United States. It is not for nothing that the caricature of the American abroad has his cine whirring, his exposure meter and filters jangling at his side, and his tripod strapped tightly over his arm. One out of three individuals claims to be a camera-user in the United States, almost twice as many as here ; psychologists assert that taking photographs has now become such an ingrained habit among Americans that pointing a camera has itself become an essential part of seeing a view. Most new trends in camera design and gadgets which become popular on the other side of the Atlantic tend to be followed here. When Americans were using 35 mm cameras and colour, the British were using the black and white box and bellows; now Americans are using the zoom-lens cine with built-in exposure meter, the British are beginning to use 35 mm and colour. The tendency for British amateurs to load themselves down with expensive extras before they have properly learnt how to handle a simple camera is also in imitation of American habits.

In Britain the expenses of the hobby—for a number of reasons, none of which is very creditable—are some of the highest in the West. A goodish camera, which in Germany might cost £8 from the manufacturer, will cost the amateur here up to £26—after carriage, a 50 per cent import duty, a 25 per cent purchase tax (on the price of the camera-cum-duty) and a 40 or 50 per cent retail margin have been added. The import duty was originally imposed in 1921 and was designed to stimulate production of British lenses and aero-cameras—which it has done, but it also applied to ordinary cameras where its effects were unfortunate. Production of high class British cameras is still virtually non-existent and the duty is quite widely evaded by smuggling. Moreover, a 35 mm black and white film costs 6s. 10d. in Britain (because of the dominance of two large producers and the pressure brought by organised chemists, price-cutting competition is thwarted). Developing and enlarging a full set of 36 prints cost a further guinea, making a grand total of just over 9d. a print ; 35 mm colour slides cost around a shilling and colour prints around 3s. 6d. Prices like these make the use even of good cameras a luxury.

Nevertheless, the number of amateur photographers is being increased in two ways. The first is through the brightening up of cheap cameras, through replacing black metal by stylish and cheerfully coloured plastics ; although the total value of British camera production is now falling, the concentration on cheaper machines could mean that the numbers produced are still going up. The industry's other—and much greater—growth element is indicated by the booming imports of the more expensive cameras. Since the scrapping of import controls (except for cameras from Japan), camera imports went up by 40 per cent in value between 1958 and 1959, and so far this year are 65 per cent up again. Most of these cameras come from Germany—though, were the tiny Japanese quota relaxed, as good or better value could be had from there. As things are, the two giants in this country —Kodak and Ilford—import their finer models from Germany, and all the 35 mm cameras recommended after the Consumer Association's tests last year were made in Germany.

The main advantage of 35 mm cameras, and the principal reason for their popularity, is that they are particularly suitable for taking colour. Around one-fifth of all shots are now in colour in England; in America the figure is over one-third; in both countries the proportion is growing. Colour films are divided into those which take transparencies to be shown with a projector and those which produce an actual print ; until recently both the poor quality and high price of the prints made them unpopular. But their prices are now being cut, notably by the Belgian firm Gevaert, and sales are rapidly expanding. The end of the quota has also led to increased sales of really expensive cameras such as Leica and Rolleiflex and to a great demand for electric exposure meters. Increasingly the meter and other gadgets like coupled range finders are built into the camera, in a very reasonable attempt to make the process of taking a film—which at one stage was becoming fearsomely complicated—more simple. But increased automation cannot conceal the fact that a £10 electric meter, for instance, is an expensive luxury when a perfectly good manual light calculator can be bought for 4s. 6d.

THE fact is that the only people who really need some of the expensive equipment that amateurs are beguiled into buying are professionals. A professional may require at least £600 worth of equipment in order to be sure that, from a technical point of view, he can cover any assignment that comes his way. His life is often a hard one. It is made harder by the very low prestige that professional photographers have generally enjoyed in Britain, certain spectacular (and topical) exceptions notwithstanding. From a height that can no longer be called regal, the public has generally looked down on photographers, even more than on journalists, as scruffy individuals who are for ever getting in the way at public meetings and similar events. The profession's papers, of which there are a great diversity, reflect this low state of morale. A few of them are of average interest ; many of the rest seek to relieve their poor lay-out and dreary text with a liberal scattering of nudes. Yet photography can be an art form, in a sense of that term which does not deserve sniggers; they have also been one of the most potent means of mass education and enlightenment in this century.

There are some signs that the potentialities of creative photography, both amateur and professional, are at last being grasped ; the surge of interest in the subject which was shown in the thirties but which has been almost dormant since is beginning to return. The competitions open to the keen amateur are legion ; of these *The Observer*'s current £500 contest is certainly the most sparkling. The development of handy cameras with fast-speed films has also greatly enlarged the amateur's scope, while the number of specialist photographic dealers who really know their onions is showing a heartening growth. Another hopeful sign for the future is the large sums that nearly all manufacturers are spending on greater efficiency and on research—though, despite this, there are still almost as many scales for measuring the speed of films as there are large firms making photographic equipment throughout the world. Above all, colour films are certain to come down in price over the next few years ; and the rates of duty and purchase tax on imported cameras can hardly go up.

NOTES OF THE WEEK

LABOUR

The Manufactured Crisis

LIFE, as Oscar Wilde proclaimed, really can imitate art. In the past two weeks newspapers of every political hue, having no major news for their political commentators to write about, set to work describing a new crisis in the Labour party. By the end of this week they had managed to create one. The first fruit of the news famine was the inflation, in a dozen editorials, of Mr Richard Crossman's latest zestful but hardly carefully considered Fabian broadsheet to the status of an important contribution to political thought—as "an attempt to lead the Labour party back to the left." In fact, Mr Crossman was not trying to lead anybody anywhere (or at any rate, was not succeeding); the conclusions that he drew from his overestimate of communist economic advance sprawled out in every direction at once. Next, a daily newspaper asked Mr Robens if he thought that the advice of party conferences should be heeded; Mr Robens guardedly replied that it should; and was then billed as planning to lead a revolt against Mr Gaitskell. In fact, Mr Robens was at that moment planning to get out of politics altogether.

Then, at the weekend, Mr Wyatt said some of the things about Mr Cousins—the "bully with the block vote"—that many right wing Labour supporters have been thinking (and occasionally saying) for a long time. This was immediately printed in the newspapers under banner headlines, and the editorials began to say that it was shocking that Labour men should be so rude to each other. Sir Tom Williamson agreed with this, but determined to point out that left wingers had been rude to right wingers first; his union has now suggested that Labour's national executive should discipline Mr Michael Foot and the *Tribune* group, who have recently been very rude to Mr Gaitskell (and to Sir Tom). By Thursday of this week, nearly everybody in the comradely party was willing to say things to the newspapers to indicate that he hated everybody else.

This outbreak of personal vendettas has come at a bad moment for Mr Gaitskell. It is now abundantly clear that the best long-term outcome of this year's alarms—for Mr Gaitskell and for everybody who wants to see the rebirth of an effective parliamentary opposition—will be for the zealots at next October's party conference to pass a motion demanding an impossible defence policy, and for Mr Gaitskell then to lead the parliamentary party in a triumphant declaration of independence from the conference. But any such declaration of independence can succeed only if a large majority of the parliamentary party is willing to follow the leader. To whip up that majority, Mr Gaitskell needs to mobilise a peculiar tangle of loyal emotions on his side. The hidden but growing resentments of some Labour MPs at *Tribune's* attacks and Mr Cousins's bossmanship were working in his favour—so long as they remained hidden. Mr Gaitskell reaped advantages from being cast in the role of the dignified victim of the urchin and the bully; now, thanks to Mr Wyatt and Sir Tom, some lovers of respectability on the Labour benches are beginning to think that urchins and the bullies are to be found on his side as well.

Exit Mr Robens

IN accepting the chairmanship of the National Coal Board, Mr Robens has not betrayed the Labour party. His action has aroused no bitterness and little reproach in the parliamentary party. His appointment was not a Machiavellian coup of the Prime Minister's to discomfort his opponents. It has not seriously affected Mr Gaitskell's personal position as leader of the party. Mr Gaitskell can hardly have welcomed the appointment at this particular juncture in his party's misfortunes—doubtless he (and Mr Robens) would have preferred the offer to have come in six or twelve months' time—but far from reeling beneath a treacherous blow, the Leader of the Opposition very properly regards Mr Robens's choice as a legitimate exercise of personal freedom, over which he has no veto rights. After all, it is not unusual for Conservative ex-Cabinet ministers to abandon politics for industry—Mr Alan Lennox-Boyd provides a current example—and there is nothing extraordinary in a former Labour minister preferring a substantial salary and an opportunity of doing constructive work to prospects of office which have grown rather dim. Nor is the chairmanship of the Coal Board exactly a comfortable bolt hole; the industrial implications of his appointment are discussed on page 1231.

Within the Labour party, Mr Robens's departure is unlikely to produce spectacular effects. Despite his humble origin and co-operative-cum-trade union past—at 23 he was a full-time official of the shopworkers' union—he has never been a really important union leader. To some extent he was a creation by Lord Attlee and Mr Gaitskell in their own image of what they would wish a trade union politician to be like. It has been, and remains, important for Labour to have some not-entirely-symbolic figure of a Gaitskellite Working Man in a prominent place on the front bench; but there is now a choice among several other almost equally stolid characters, any one of whom can be gradually elevated to Mr Robens's role.

Yet Mr Robens's departure does have some significance. He is not a monster of ambition but a reasonably able man who wishes to make an effective contribution to society, and his decision clearly indicates that in his opinion the chances of achieving this through the ranks of the parliamentary Labour party are low. Too much should not be made of his sacrifice of a hypothetical premiership, which did not in fact exist; but it still remains true that had he seen any reasonable chance of returning to office he would not have gone to the Coal Board. His leaving Parliament, then, is not a disaster for anyone, but a shrewd, if incidental, comment by a well-tried hand on Labour's political future.

EUROPE

No Room for Illusions

IF there were still hopes in London that some form of loose association between the Six and the Seven could be negotiated, they would seem to have been destroyed by last week's meeting in Paris of the trade committee of 21 set up to discuss this among other issues. The Six made it clear that they were not prepared to discuss any form of long-term outside association at present. Both Mr Maudling and Mr Heathcoat Amory have since expressed disappointment. That is understandable. The British Government has lately been edging, notably, towards a more flexible position on the economic and commercial issues; its spokesmen look for encouragement from its hitherto unfriendly friends across the Channel. Yet what the Six said again in Paris was no more than a repetition of the view they have held both in private and in public for some time past: that in the absence of any radical change in the political attitudes of outsiders, difficulties would have to be met by modest and mitigating liberal measures of a general nature, with the particular issue of real association left unresolved.

All last week's meeting could agree on, therefore, in the way of constructive action, was that there should be further study of the difficulties that would be created by tariff discrimination between the two groups, and that efforts should be made to overcome these difficulties by tariff cuts on a most-favoured nation basis. The committee of 21 is to remain in being to undertake these tasks. This procedure differs in form from the contact committee suggested several times by the Six, but in substance the conception is the same. Provided both Britain and the Six are prepared to make a determined effort to bring their tariffs down, the talks in this committee, elaborated later in the General Agreement on Tariffs and Trade, could give the momentum for a major world-wide movement to free trade.

As Mr Maudling pointed out on Tuesday, however, in his speech to the national press club in Washington, these measures will not begin to solve the essential European problem, even though they may ease temporary difficulties. At present the Six make it plain that the only radical solution for outsiders that they are prepared to adopt is full membership of the community; and, in an encouraging speech to the British Chamber of Commerce on June 1st, M. Jean Rey, president of the common market's committee on external relations, gave it as his opinion that the Six are still willing to have Britain in. This is the crux now as Britain teeters on the brink: do they want us in, even if we decide to plunge? What of the French, with their hitherto built-in veto? The door, if it is open or at least ajar, will not stay so for long. The only right course for us is to try it and see.

RECRUITS

Reluctant Heroes

THE April recruiting figures make gloomy reading. The recent pay increases have so far signally failed to check the downward trend in recruitment; if anything, the trend has been accentuated. The drop since a year ago in the army's vital six-year engagements is particularly striking; even if this April's figures are charitably compared with the monthly average for the whole period April to June last year, they are down 25 per cent. Once again, the close relationship between declining recruitment and disappearing unemployment has been demonstrated. Once again, it has been shown that in a leisured and booming consumer society even quite sizeable rises in service pay do not make the service way of life seem sufficiently attractive. The official spokesmen who still maintain that Mr Sandys's minimum volunteer army (of 165,000 by 1962) will somehow be attained are really trusting to the peculiar hope that between now and then something will happen that will cause the national economy to have things less good.

The services' task is made greater by the limited age groups from which they can hope to recruit. Last year 89 per cent of army recruits were aged between 17½ and 21. Applying this figure to recruitment as a whole suggests that, for last year's figure of 56,000 recruits to be maintained, about one in every 8 of today's 17-year-olds must sign up some time in the next 4½ years. This is perhaps the best statistic for enabling the ordinary man to see the problem in perspective. Of every eight teenagers whom you know, does one of them seem likely to volunteer for the services? The suggestion that perhaps the coming birth-rate bulge will eventually flood the labour market for youths and drive the unemployed into uniform should be small comfort; anyway, the main body of the bulge will not be 17 till 1964. Instead of basing their plans on the assumption of these and other economic misfortunes, the service authorities should recognise that the affluent society is a creature whose very physical development may make it incapable of voluntary self-defence. The obvious alternative to inadequate defence is to accept—as the Americans do—a system of conscription-by-ballot, of selective compulsory service.

ELECTION LAW

The Right Reforms

IN their book on "The British General Election of 1959" (reviewed in *The Economist* last week), Mr David Butler and Mr Richard Rose argued that there is an overwhelming case for re-examination of the present state of British election law. This argument is now being taken up as a political point by some people in the Labour and Liberal parties. Unfortunately the way that they are deploying it is not only likely to bring down a Conservative veto on the reforms that ought to be made, but is liable to channel long-term left wing ideas on how a democracy should be run into some very dangerous directions.

There is a strong and immediate case for liberalising some sections of the present election law. Probably, postal voting facilities should be made available at elections to people on holiday and to people who have moved from one constituency to another within a single city's boundaries (at present only those who have moved right out of the district can claim them). Certainly, it is time to remove some of the absurd restrictions which the law laid on television (but not on newspaper) coverage of some features of the last election. Historically, the legal limit set on constituency electioneering expenditure is now too low; since the present limit was set in 1948, printing costs have doubled.

... and the Wrong Ones

THE object of the new Labour and Liberal campaign, however, is not to liberalise the law, but generally to tighten it further. Their first argument is that the Conservatives exceeded all bounds in their pre-campaign publicity last time (reputedly spending £468,000 odd on their poster and press advertising campaign in 1957-59, against £103,000 on Labour's poster and public relations campaign in 1958-59); and that it is absurd that this expenditure between elections should be subject to no legal control, while individual candidates' expenditure during a campaign is restricted. But if this is turned into an argument by any political party for restricting expenditure on the propagation of ideas between campaigns (i.e., for perpetual limited censorship, presumably including restriction of mass subsidies on printed policy statements), rather than for liberalising controls during the election period, British democracy is going to get on to a very slippery slope. The usual opposition retort is that "at any rate, no one can positively approve of the Conservatives' action in 1957-59 in bringing professional public relations techniques into British politics." Can't one? The burden of the advice given to the Conservatives by the PR professionals—in their role of market researchers into the feelings of the people—was that the image of a forward-looking party, intent on deproletarianisation, was the image most likely to win votes for Tories; if Labour were to recruit professional PR advice about the image of a left wing party that most electors want, the result would not necessarily be deleterious to the future shape of British politics.

Another opposition argument (based on the same assumption that the electorate is available to be hypnotised, instead of waiting to be wooed) is that the £1,400,000 odd spent by industrial concerns in anti-nationalisation propaganda and surveys in 1958-59 was unfair to Labour; the especial danger here is that if the left seeks to control political activity by industrial firms, the right is bound (with equal injustice) to seek to control political activity by trade unions. From all these opposition arguments, in fact, only one point does commend itself—albeit a point that is bound to annoy the Conservatives. There is a strong case for saying that companies should be obliged to tell their shareholders, in their accounts, how much they have contributed to political advertising and to political parties' funds.

SOVIET BLOCK

"Infantile Disorder"

FOR some time it has been obvious that Mr Khrushchev's policy of "peaceful co-existence" is not backed by a consensus of communist opinion, although the Soviet leader has been at pains to deride and dismiss suggestions that his change of line on the eve of the Paris conference could be connected with differences within the communist leadership. Last Sunday, however, *Pravda* itself gave substance to these "imaginary" suppositions by attacking the left-wing deviationists within the communist camp. The pretext for this attack was the fortieth anniversary of the publication of Lenin's pamphlet, "Left-Wing Communism, An Infantile Disorder," in which the bolshevik leader criticised the uncompromising and extremist wings of communist parties, particularly in Germany and Britain. *Pravda* now argues that the infantile disease of leftism still claims victims in the international communist movement.

Pravda singles out two symptoms of the old disease in its new form. One is the mistaken belief that, once in power, the party can "immediately introduce communism and avoid the historic phases of its development." The article is

presumably here referring to China's policy of the "big leap" forward and its efforts to find a short-cut to communism through the communes. Peking, however, has kept extremely quiet about these aspirations for some time, and it is significant that even so *Pravda* should see fit to refer to them so pointedly. The other symptom is the erroneous belief that the whole policy of co-existence is contrary to the spirit of Marxism-Leninism. An article in *Sovietskaya Rossiya*, published two days before the *Pravda* article, criticised equally strongly those leftist comrades "who consider that the smallest worsening of the international situation is a proof of the wisdom of their convictions." A perusal of the Peking press is enough to show where such comrades are plentiful.

It would, however, be idle to expect that the ideological differences of Moscow and Peking will tear the communist block apart. China, the poorer and younger partner, still full of revolutionary zeal, is certainly more attracted by the "leftist" deviation. But the ties between the two partners are still much stronger than the points of dissension. The infantile disease, moreover, is not a purely Chinese affliction. It is prevalent, to a lesser or stronger degree, in all communist parties, including the Soviet one in which last month there were signs that it might be gaining a serious hold. But the newspaper attacks on "leftists" suggest that Mr Khrushchev is getting the disease under control. One reason for his determined attack on it is suggested by *Sovietskaya Rossiya* when it says that left-wing infantilism is becoming particularly serious now that communist parties are developing in so many newly independent countries. Moscow and Peking are not likely to find it easy to share the role of guide and mentor to these new parties.

FRANCE

Crisis of Conscience

THE Algerian war is, in its very nature, the source of ghastly atrocity. Two of the most notorious cases of inhumanity and brutality were revived in Algiers this week during the trial of Algerian Communist party leaders. Absent from the dock was Maurice Audin; paratroopers alleged, in varying versions, that this young scientist escaped from their care; his widow, however, and a committee bearing his name, openly claim that he was strangled during interrogation. Present in the dock was Henri Alleg, the author of *La Question*, the most telling of all the indictments of military torture, which actually mentions the torturers by name. Both cases are three years old, but nothing has been done by the authorities either to refute the allegations or punish the culprits.

A veil of secrecy was chastely drawn over this week's trial, which ended in heavy sentences for five of the accused. But torture is not merely ancient history. Last month, Mme Simone de Beauvoir raised in *Le Monde* the case of an Algerian girl, Djamila Boupacha, who claims that her confession was extorted through torture: the details she gave were enough to turn the stomach of anyone but a sadist. Mlle Francoise Sagan responds to this plea in this week's *L'Express* with the terrible echo: "I cannot imagine that the flourish of trumpets of *grandeur* can drown the shrieks of a young girl."

Horrified by the inevitable cycle of atrocities, some young Frenchmen have refused to serve in Algeria. The number of deserters, in hiding in France or abroad, is estimated at about 3,000. To this must now be added the *non-violents*, young and old, who are trying to introduce Ghandist methods in France to protest against both torture and terrorism. There are also young people who are not content with passive resistance and have consciously chosen to help the insurgents.

The police cannot dismiss all this as a communist plot. The Communist party has hitherto tried to dissociate itself from the extreme movements that are openly defying the law. Some of the young protesters are, in fact, children of the gaullist establishment. The son of a minister took part in the last demonstration of *non-violents*. Among young people held by the police, some bear the proudest names in French literature or art. Even more perturbing to the authorities must be the fact that the protest movements seem to be spreading among the young, and that UNEF (the National Union of French Students) is actively pressing for a negotiated settlement of the war.

BELGIAN CONGO

Secessionary Scares

THE party skirmishing in the Belgian Congo at the outset of the last fortnight before independence on June 30th has not markedly improved the prospect of orderly federal rule. The Belgian authorities proclaimed a state of emergency in the Katanga province on Tuesday to forestall separatist threats in the north-eastern region, where the "cartel" of three minority groups, the Balubakat, Fedeka and Atcar parties, has threatened to secede if the Conakat party refuses to admit "cartel" members to the provincial government. At the same time the parliament in Brussels rushed through an amendment to the Congolese constitution in response to a Conakat demand to end the provision requiring a quorum of two-thirds in provincial assemblies. According to M. de Schrijver, the minister of the Congo, the demand was backed by a Conakat threat to declare independence in the Katanga and immediate secession. The Conakat party emerged as the strongest group in the Katanga in last month's elections, but its efforts to form a local government had been frustrated by the Balubakat and its allies, who had walked out of the assembly and denied the Conakat the necessary quorum.

The outcome of M. Lumumba's efforts to form a federal government in Leopoldville was not known when *The Economist* went to press. His chances seemed to have improved after reports that his chief rival, M. Kasavubu, the Bakongo leader, might receive the position of head of state, leaving M. Lumumba as prime minister. The Conakat leader, M. Tshome, has announced his willingness to negotiate on a federal government, but his reported demand for the two key posts of minister of defence and of the interior in the new federal cabinet will not make it easy for M. Lumumba to make a deal with him. It still seems premature to give credence to a Conakat resolution to turn its back on the Congo and join Northern Rhodesia, although the threat is plainly the party's trump card in getting its way in Leopoldville and Brussels.

This secessionist talk has received a wary response in Southern Rhodesia, where Sir Edgar Whitehead has criticised Belgian "irresponsibility" in abandoning the Congo without preparing adequate parliamentary institutions. Rhodesian troops have now been sent to the Congo border. Sir Edgar seems to expect eventual army control in an independent Congo, although the effectiveness of such a military dictatorship, assuming it could emerge, seems as doubtful as the future of coherent parliamentary rule. The Congo's federal evolution in the next few weeks will be watched as closely in Nyasaland, where the emergency was formally ended on Tuesday, as anywhere in Central Africa.

KENYA

Kenyatta's Shadow

THE Kenya African National Union, of which Mr Mboya is secretary-general, has made two sensible, if tactical, retreats on the Kenyatta issue. By withdrawing the proposal to nominate Kenyatta as KANU's first president, the party has received official recognition and can now devote itself to political organisation throughout the colony in its drive to secure an overall majority when the general election comes along. The party also decided on Tuesday to accept the government's compromise proposal that only African-elected ministers —and not all African-elected members and party officials, as the leadership had demanded—should be allowed to see Kenyatta. Although the government has only met KANU half-way and the party is to continue its efforts to give Kenyatta a wider circle of visitors, the threat to enforce a mass resignation of African-elected members of the legislature will not be carried out.

Since African opinion, whether favourable to KANU or not, will continue to regard Kenyatta as the party's spiritual leader, the disadvantages that the party may suffer by agreeing to keep his name off its notepaper are negligible. Exactly when the government is likely to contemplate Kenyatta's release is another matter. The effect

GIFTS *INTER VIVOS*

Estate duty normally becomes payable by the recipient of a gift valued at over £500 if the donor should die within 5 years. An unanticipated demand for payment of this tax—which may well be unexpectedly heavy—is often a financial shock. Advantage may be taken of the Gift Protection Policy, however, to secure cover for liability to estate duty on gifts *inter vivos*. The cost is usually quite modest.

For example, in the case of a donor aged fifty-five next birthday, to cover contingent liability to estate duty of £1,000 during the first year, decreasing according to the Finance Bill, 1960, to £100 during the fifth year, would normally require five annual premiums of £11. Substantial reductions in rate are allowed for large cases.

of the Corfield report, as expected, has been to harden European opinion, without reducing Kenyatta's prestige among his supporters. It is certainly arguable that the myths that have grown up in the African mind around his detention make him a more formidable threat to Kenya's political evolution than he would be if released. The government will not make up its mind in a hurry, and it may well be influenced by KANU's activities in the immediate future.

The Masai United Front has made it plain that it, for one, regards KANU with the utmost suspicion, despite its moderate appearance. Mr Mboya and his colleagues may find it difficult to surmount tribal differences and prejudices. Nor is the idea of preparing this year for an advance on the Macleod constitution likely to find favour with the authorities. The better atmosphere that has followed the London talks will not necessarily be prolonged.

SOUTH AFRICA

Legalising Tyranny

When the South African government delegate, Mr J. F. Hannah, got up to speak at the ILO conference in Geneva on Monday, delegates from about 25 countries, mostly Asian or African, walked out. Mr Hannah afterwards complained of the "disproportionate and distorted publicity given in some quarters to recent events in South Africa." Biased and exaggerated reporting by local and foreign journalists is, indeed, the South African government's standard retort when confronted with some manifestation of the outside world's disapproval of its policies. It may not, however, find it so easy to brush aside the report on South Africa which Mr Elwyn Jones QC made to the International Commission of Jurists last week; Mr Jones paid an eleven-day visit to the Union on behalf of the commission and was received with every courtesy there.

In his report Mr Jones comments flatly that "the Nationalists regard the rule of law, as interpreted by an independent judiciary, as an unfortunate legacy of British colonial rule of the nineteenth century." He points out that under a regulation added to the original emergency regulations on May 17th, detainees no longer have the right of habeas corpus; in other words, it is no longer possible to make an application to the Courts, such as was made for Miss Hannah Stanton. He also describes one draft bill which would gravely undermine the independence of the South African Bar, and another which would give the government sweeping powers of censorship over the printed word and over films. Mr Jones concludes that if the state of emergency continues and if the proposed legislation on censorship and the Bar is put on the statute book, "the twelve years of Nationalist rule will have finally deprived all non-whites of almost all the human rights and fundamental freedoms set out in the United Nations Declaration of Human Rights," and even those of the whites will suffer "grievous impairment."

This seems a safe conclusion moderately stated; and it is useful to have this warning that a permanent censorship and some control of the legal profession are in fact intended—for the press and the lawyers are two of the few elements still capable of the slightest criticism of, or check on, the actions of Dr Verwoerd and his ministers.

CORPORAL PUNISHMENT

The Voice of Reason

This is not the first time that a public campaign in favour of flogging—or birching—certain criminals has arisen. As the Howard League for Penal Reform reminds us, in a memorandum submitted to the Home Secretary's advisory council, a wave of hysteria gripped the House of Commons in 1863, as a result of an attack on one of its members, and provoked it into passing the so-called Garrotting Act. This Act, which introduced flogging for garrotters, was for a long time hailed as the cause of the decline in the garrotting epidemic. In fact, the epidemic had already subsided months before the MP had been garrotted, which was virtually an isolated instance. Again, before the first world war a similar fit of hysteria, this time affecting the country as a whole, led to the introduction in 1912 of flogging for procuration and living on a prostitute's earnings. In fact, the extent of procuration and the "white slave traffic" had been wildly exaggerated; the public agitation was probably responsible for the increase in cases of procuring that occurred in 1910-14 rather than the effect of it; the two years after the introduction of flogging showed the highest figures for a generation; and after the agitation died down so did the number of cases, to the level of the fifteen years before 1910.

The Howard League's memorandum is so full of reminders of this sort (after all, the league has been through all this before, having given evidence in 1937 before the Cadogan Committee) that one hopes that it will have a far wider readership than the advisory council's sub-committee which is now considering the reintroduction of corporal punishment for certain offences. It shows, first, that such statistical evidence as exists is against the value of corporal punishment as a deterrent. Robbery with violence—a crime against property that, we are reminded, cannot be equated with "crimes of violence," a crime against the person—actually declined after 1948, when flogging was abolished as a punishment for it; it was not until 1958 that the crime showed a big increase. Secondly, the subsequent careers of men who had been flogged or birched were worse than those of men who had not. Thirdly, a small scale survey showed that children who had been birched—young people aged 14-17 were always virtually outside the scope of corporal punishment—showed a high and rapid rate of reconviction, and this punishment had in fact been almost entirely abandoned by the juvenile courts before it was legally abolished.

The statistical evidence—as in all aspects of crime, for which there are no reliable statistics even dealing with its extent—may not be cast-iron. But at least it cannot be cited in favour of the floggers or birchers, and in any case the Howard League does not rely on it alone. The history of corporal punishment is, it points out, "largely a history of outbursts of emotion." Emotion is no substitute for hard-won experience in the treatment of offenders; nor, even if corporal punishment were effective, does that necessarily make it acceptable:

> We consider that the beating of law-breakers . . . is incompatible with civilised standards of decency and justice and with the values which the law is intended to support.

EICHMANN CASE

Israel on Trial

Israeli jurisdiction in the Eichmann case has, after all, been seriously questioned. The secret of the scene of his abduction did not keep and on June 9th the Argentine government rejected an Israeli explanation that Eichmann left Buenos Aires of his own free will in the company of Israeli volunteers. With the Argentine rejection went a demand that Israel should return Eichmann or the matter would be referred to the United Nations. On June 12th, the Israeli government decided not to reply to the Argentine note. By then both countries had taken up a rigid position from which formal diplomacy could not easily release them. It was hoped in Jerusalem that Mr Ben-Gurion and President Frondizi, who were to be in Europe at the same time, might meet in Paris and find it possible to reach some kind of amicable agreement on the Eichmann case.

Outside Israel there is an increasing amount of feeling that there might be a better place than Jerusalem to hold Eichmann's trial. Perhaps this is largely because the Israelis handled the beginnings of the affair in an unexpectedly clumsy manner. The *New York Times* and the *Herald Tribune*, neither of which can be accused of being unfriendly to Israel, have suggested that the ideal solution would be to try Eichmann before an international tribunal or, failing that, before a German court.

The practical difficulties of reassembling an international court to try war criminals would be great, but they could be overcome if the nations of the world were willing to start again what came to an end at Nuremberg. There is, however, little evidence that they are willing to do so. To hold the Eichmann trial in Germany, where the crimes were committed, would give young Germans a useful reminder of their country's past, but it is not clear where in Germany, or in which Germany, the trial could take place. The furore raised in Argentina

and the outcome of next week's Security Council debate may encourage the Israelis to use more conventional methods of extradition in the future.

EGYPT

Trade Missionaries

TRADE missions may do more for the missionaries involved in them than for the cause they are meant to serve. On June 14th, a trade delegation from the Egyptian region of the United Arab Republic arrived in London. Earlier this year a British delegation visited Cairo. The UAR mission is officially described as non-governmental but it is led by Mr Muhammad Rushdi, president of the federation of Egyptian chambers of commerce and chairman of the recently nationalised Bank Misr group of companies. His colleagues represent other state-owned concerns and concerns which may well expect to become state-owned if the present trend is continued by President Nasser.

Mr Rushdi's task is to encourage British manufacturers, especially the cotton spinners of Liverpool and Manchester, to increase their purchases of Egyptian products. Last year the Egyptians bought goods worth £9.5 million more from Britain than they sold here. The last of Egypt's huge wartime sterling balances were repaid as part of the post-Suez settlement and official policy in Cairo now requires that every effort be made to achieve a better trade balance. Sales of cotton, fruit and vegetables and the encouragement of the tourist trade are likely to be the chief topics discussed here. After ten days in Britain the mission will visit Norway, Finland, Denmark and Sweden.

It may be questionable whether the amount of business obtained on such missions from any one country to others is worth the effort and expense of moving them about the world. Sometimes what are meant to be merely suggestions for the improvement of products or services sound like firm orders when heard in unfamiliar foreign surroundings. Everyone, guest and host alike, is anxious to please but when the missionaries return home and the orders fail to materialise some explanations may be called for. But so long as (as in this case) British missions can go to Egypt in January and the Egyptians can come to northern Europe in the summer, trade missions will continue to serve as a pleasant, if not terribly effective, way of finding out how the other fellow does business.

GOVERNMENT SPENDING

Points of Control

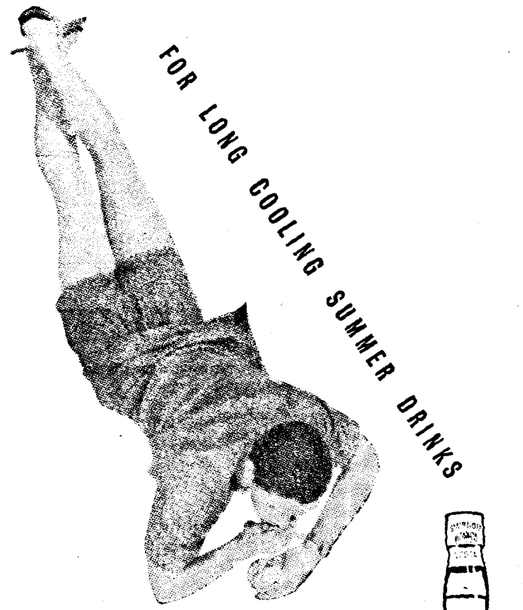
MPs who want to exert control over government expenditure might do well to seize on two points in the cautious, informed and fascinating address which the taxpayers' head gamekeeper—Sir Edmund Compton, the Comptroller and Auditor General—delivered this week to the annual conference of the Institute of Municipal Treasurers at the Festival Hall. First, Sir Edmund joined in a gentle debunking of the traditional "economy paragraph which always appears in the Circular of October 1st in which the Treasury invites the Departments to submit their Estimates for the coming year." As Sir Edmund said, "the wording will vary from year to year as conditions change." In years when the wording is mild, one has always suspected that it has no effect; in years when it is sharp, the hurried cuts that it causes are likely to come in some of the wrong places, involving a wasteful disruption of long-term plans. Sir Edmund allies himself firmly with those who believe that efficient "financial control over existing services depends on gaining time in which to establish the case for policy changes and to plan the changes in an orderly way." For this purpose he drew attention to a comparatively new feature of Treasury control whereby "over the whole field the Departments regularly provide the Treasury with forecasts of their expenditure two years before the year when that expenditure will take place, and these forecasts are revised every six months." It is obvious that this prudent system of long-term forecasting is coming increasingly to lie at the core of the determination of government spending policy, but Sir Edmund declared that "in the nature of things, its results cannot be published." Why?

Secondly, Sir Edmund began publicly to stir a most interesting pot—the problem of more scientific cost accounting for government expenditure. He said:

> As an example, there is the scheme of planning and cost control of the new schools building programme, associated with the name of Nenk whose early death was such a tragedy for the Civil Service and indeed for the country. I am told that the effect of this scheme compared with the old system has been to provide the great increase in school places by the end of 1958 at a cost 20 per cent less than in 1949 in spite of a rise in prices of 120 per cent, and that the resulting saving to public funds over the ten years was as much as £290 million. . . . But it has to be admitted that such demonstrations of efficiency are rare.

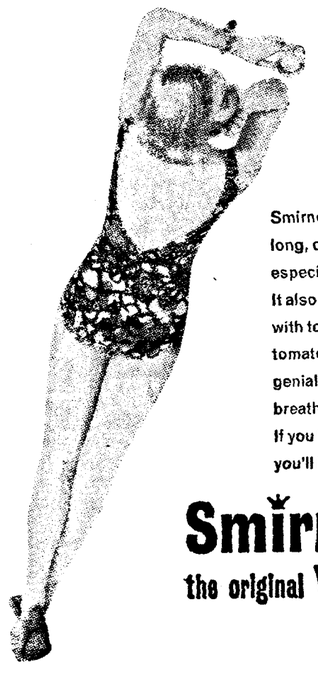
David Nenk, the brilliant Ministry of Education civil servant referred to, died (without a knighthood) of cancer last Christmas. If any inquiring body of MPs wants to provide him with a memorial and to secure some further economies in government spending, it could do worse than dig out details of his system of cost control, and see how far this admittedly bothersome method of perpetually nagging for efficiency (Sir Edmund described it as "the build-up of a priced specification by the interplay of functional requirements with suppliers' estimates of costs") is really being followed in other departments. Especially, perhaps, in the service departments and the Ministry of Works.

SOVIET UNION



Satellite Towns . . .

A CONGRESS of 1,500 architects and town-planners, which ended in Moscow this week, has been discussing ways of speeding up and improving the housing drive in the Soviet Union. The Russian leaders are now making a real effort to do something about the acute overcrowding, now probably the most irksome and distressing aspect of everyday life in Russia. In the current seven-year plan (1959-65), 15 million flats, with a total floor space of 650 million square metres, are to be built in the towns alone, and this target may even be exceeded. The production of concrete is now twelve times higher than in 1953. Stalin's skyscrapers and the ornamental facades of "socialist realism" have long ago been sacrificed on the altar of efficiency. The aim now is to provide each family with its own flat—a tantalising prospect for Russians who have never known such privacy.



The new aim brings its own problems. For instance, the emphasis is now on small units; one-third of the new buildings are flatlets for childless couples or bachelors. But the manufacturers of furniture still go on producing big pieces suitable only for large apartments. The congress also considered the lack of such amenities as gas or electricity in many Soviet towns. It also tackled, without solving, the question of style. Soviet architects have rejected the stalinist mixture of Byzantine and Victorian; but they are still groping after a style of their own which is both functional and pleasant to look at.

Soviet Russia is supposed to be the planner's paradise—but not, it seems, for the town-planners. In theory, a country with state planning and control, rapidly growing new towns and a great need for social amenities, would seem to offer the town-planners vast opportunities for bold experiments. These opportunities, however, have not been seized. Many Soviet towns do not even have a chief architect. They have been allowed to grow and spread haphazardly. Stalingrad now covers as much space as Moscow; Gorki or Kuybyshev match the area of Leningrad. Efforts are now to be made to plan the growth of towns more rationally and to prevent them from sprawling too excessively. One project is to build compact and co-ordinated satellite towns, housing about 150,000 inhabitants each, in the neighbourhood of large cities. Soviet architects and planners give the impression that they are now getting down to

tasks that they should have faced years, if not decades, ago.

... or Sputniks

HOUSING is a pressing competitor for scarce resources. The continuation of the building drive suggests that Moscow has, at any rate for the time being, no intention of changing its economic policy because of troubles on the international front. That this policy corresponds to the wishes of the Russian people was shown last week by an extraordinary letter published in *Komsomolskaya Pravda*. Its author stated plainly that sputniks are fine, but more clothing, utensils, flats or kindergartens would be even finer. The letter was, of course, accompanied by a reply explaining that Soviet rockets are indispensable for prestige or defence and that they have allowed some saving because they have made possible a cut in conventional forces. The letter may even be apocryphal. Yet the fact that the Soviet authorities feel the need to publish it and to refute its arguments shows what are the real aspirations of the Soviet masses —a factor which cannot be ignored when assessing the political situation.

DEFENCE

Twenty-four Hour Girdle?

KEEPING modern jet aircraft in the air is an expensive business. That is why the reports, which followed Mr Watkinson's visit to Washington, that Britain might join the United States in a 24-hour global H-bomber patrol had to be taken with a large pinch of salt. It has now become clear that the doubts were right. Even today the United States itself does not maintain so ambitious a permanent patrol as the public has imagined. President Eisenhower said in January that no continuous airborne alert was maintained at present, although exercises may put some 60 to 100 of the Strategic Air Command's 1,600 aircraft into the air at any one time. The sort of co-operation that is projected between the American Strategic Air Command and Bomber Command is likely to involve mainly logistic co-operation, and the interchange and joint use of bases, rather than the maintenance of a permanent global patrol.

Though the bombers are not to be kept permanently in the air, however, all the experts are agreed that greater efforts must be made to disperse the bases from which the deterrent operates. This news has brought immediate reactions from countries overseas where there are British bases suitable for V-bombers. In Cyprus, in particular, the knowledge that V-bombers have used the base for exercises in the past has aroused fears that the aircraft will be based permanently on the island, an inviting target for Russian missiles. This could be a further obstacle on the stony path to a settlement. Elsewhere in the Middle East political developments make it highly doubtful whether bases can be used for V-bombers for long.

These hazards provide, indeed, one of the reasons for the growing co-operation with the United States. As Britain's old remaining footholds on the traditional routes to the east are lost, the importance of the westward communications across America, to Australia and New Zealand, for example, grows. It is not only in the production of weapons that technical and strategic change is making Britain increasingly dependent on its allies.

ROYAL TOURNAMENT

Charity or Recruitment?

THIS year's Royal Tournament opens at Earls Court on Wednesday. With its non-union cast of a thousand servicemen, an average attendance in recent years of at least 250,000 people, and an 80-year tradition, it might be thought to be a real money-spinner for the service charities to whom its proceeds go. In fact it is in danger of becoming a liability; last year its two and a half week run made a net profit of only about One Thousand Pounds—less than a quarter of the average London flag-day.

It was not ever thus. In 1952, when 376,000 people came, the tournament made £52,000; since it started in 1880 it has brought in nearly a quarter of a million pounds. But expenses are going up. Although participants get only a small allowance over and above their standard rates of pay, last year's total expenses came to £93,000—made up largely of such items as the hire of Earls Court and the installation of equipment to operate the displays (thirty-nine winches had to be put in the roof). At the same time, audiences dwindle. Service training programmes are said to make it impossible to hold the tournament in the obvious months of school summer holidays; and in the long midweek afternoons only a fraction of the hall is filled. The organisers estimate that attendance will need to increase by at least 35,000 compared with last year if they are to break even.

It is arguable that there are more efficient ways of raising money for charity; that servicemen could be better employed than in doing circus tricks; and that items such as that involving the long-obsolete twelve pounder field-gun do not really convey the flavour of British military preparedness today. (Or do they?) But in an age in which the military are increasingly alienated from the population at large, and recruitment drops, the real rationale of the tournament is to show the services in their more attractive aspects. What started as a charity show has become a logical recruiting stunt; it would be wise to draw up its programme with that aim firmly in mind.

The Economist

JUNE 16, 1860

REFORM POSTPONED

"It is serious that a Government should say to a large class of Her Majesty's subjects: 'You are entitled to have a greater share of political power than you now have: you ought to have votes, and you have none: you ought to have representatives, and you have none.' It is especially serious when the class so addressed is a low one in the social scale—when it is presumably an excitable one. But grave as is the evident nature of language such as this, the relinquishment of the measure so proposed is even graver. The abandonment of a Bill for extending the suffrage defeats the hopes created by its introduction, allows those to rule whom it was said ought not to rule, permits those to be still without power who were informed that they were at once entitled to such power, acquiesces in the continuance of political contrivances which have been authoritatively stigmatised as inexpedient and unjust. . . . Whatever may be the latent origin of the present Reform movement, its obvious history is clear. We have told the most numerous class in the country that they ought to have some power: will they be content with none? Statesmen have vied with one another in their zeal for the rights of the "working man." Is the working man, after all, to have nothing? The artisan classes may or may not have definite political opinions; they may or may not have formed a characteristic political creed; but they have (as the phenomena of trades' unions and of strikes show) strong class feelings, strong class prejudices, strong class hopes: considering their education, the facility of organisation proves that they have an inherent political aptitude. Is it safe, is it wise, is it right, is it decent, year after year, to assure men such as these that they are entitled to a place in the constitution, and yet, when the occasion comes, to give them no such place? . . . The failure of this last attempt to solve the question is very instructive. The Government introduced not a measure, but the schedule of a measure. They said to the House: 'There is the outline of a Bill; go into a Committee, modify it as you please.' The event has proved that on a difficult and generally interesting subject it is not beneficial, it is not even possible, for a Cabinet to abandon its constitutional duty of construction. The House of Commons cannot make a Bill in Committee. They may alter details, suggest specific amendments, interpolate coherent or incoherent additions. But they have no large creative power. We hope,—we are even sanguine that we shall not again see "a simple measure." . . . We believe that every future Bill will at least attempt to satisfy the evident conditions of the real problem: we hope that it will give the working men some members of their own; that it will not give them the whole Parliament; that it will not give them a precedent for claiming it.

LETTERS

South Africa

SIR—It is interesting to contrast the present attitude of *The Economist* with its earlier reactions to the Wind of Change. One of its first encounters with this wind took place on April 28, 1860, when it commented as follows on the Reform Bill:—

> "It (the Reform Bill) remains a simple unbalanced lowering of the franchise without a single security against the domination of numbers—it is a concession to unsound principles of the most dangerous kind—a spontaneous and self-imposed sacrifice which will transfer political power from its actual possessors to numerous and unknown classes."

The numerous and unknown classes whom *The Economist* feared were British. Although they misused certain consonants and used different accents, they all spoke English. They practised a Christian religion. Many could read and write. Very few still indulged in witchcraft and it is probable that none were cannibals. They were of the same stock as the "present possessors of political power" and stemmed from the same ancestors. They were loyal supporters of the reigning house. Yet *The Economist* feared them.

These fears today appear frivolous and short-sighted, as indeed they were. The future may also show the present fears and uncertainties of the whites of Africa to be without foundation. Seen against the background of recent events in Rhodesia, Kenya and the Congo, however, it is surely possible to view the reaction of these whites to the Wind of Change with a measure of sympathy and understanding.

The Economist's interpretation of the African "Wind of Change" as a trade wind, beneficial to Britain, and harmful only to those whites in Africa who perversely and stubbornly resist it, may yet prove to be as bigoted and wrong as the opposite extreme view which it held one hundred years ago, when it reacted with similar hysteria to the comparatively mild breeze of change which then gently touched upon England.—Yours faithfully,

Pretoria, South Africa T. C. STOFFBERG

Secret Police

SIR—Does not your note under this heading in this week's issue do rather less than justice to the very serious question that has been raised by Mr Will Griffiths, MP, about the activities of the secret police in regard to schools in this country? No one questions the right of headmasters to inform their sixth formers of the facts of life about security screening for those who want jobs in secret occupational establishments. That is wholly proper. Indeed, it is desirable that knowledge of this kind of fact should be as widespread as possible.

The point really at issue is how important one feels it to be that the fullest encouragement should be given in schools to the questioning of accepted beliefs. It used to be the proud boast of the universities that this, indeed, was an important part of their purpose. This must mean an encouragement of the nonconformist. But this becomes a wildly dangerous proceeding if adolescent and youthful reactions to such an educational process are to be carefully recorded and then in due season handed over to the secret police.

The important thing is that one has to draw the line somewhere; here one has to balance the advantages to the community that derive from an educational system that is as free as is humanly possible and the importance of information about youthful activities to the secret police in the pursuit of their activities. I have no hesitation in the answer that I make on this matter. The secret police are bound to enquire about the activities, political and otherwise, of young men and women taking up work in secret establishments. It should, however, be made very clear to them that in no circumstances should they approach teachers or university lecturers or professors for information of this kind.—Yours faithfully,

STANLEY MAYNE

Campaign for the Limitation of Secret Police Powers
London, SW1

Israel

SIR—For anyone at all familiar with the Israeli political scene some of the "victories" your correspondent attributes to Mr Ben Gurion are most surprising. The battle over the removal of the labour exchanges from party political control was peculiarly that of the Herut movement, and was won only after that party had mobilised nation-wide opposition to the retention of the old system. To imply that Mr Ben Gurion was the initiator of this reform is as incorrect as the references to the cessation of political teaching in schools, which was from the very outset a plank in Herut's platform, and which was regarded by Ben Gurion's party as one of the most outrageous of Herut's non-socialist heresies.

Similarly Herut has fought and is fighting tirelessly against the wasteful welter of competing politically-controlled health services. For its pains Herut has had to contend with much ill natured criticism, but your correspondent has hit the nail on the head when he refers to the party-owned health services as an important political asset. Thus we have the spectacle of an allegedly "progressive socialist" movement obstructing by every means at its disposal the internationally accepted welfare standards proposed by a liberal but non-socialist opposition.

The obvious lesson for others is that with the best will in the world vested interests remain vested interests, whether they be of the left or right, and share an inherent desire to retain their privileged positions even when circumstances no longer warrant them. In Israel the disenchantment with the "Socialist Dream" is growing and there is an increasing body of public opinion which feels that Israel's future demands less doctrinaire policies. Your correspondent would have been fairer to concede that it is the ever growing pressure of this sector of the community which has produced the effects he has detailed.—Yours faithfully,

Dublin M. HARRIS

Colombo

SIR—Your article entitled "Shipping in the Shallows" observed that "the decline in cargo traffic has helped to ease the congestion in ports, even in Colombo." Even if this remark is true of other ports in which there has been congestion, so far as Colombo is concerned it propagates a fallacy which the Conference Lines and their representatives have been at pains to advance as an explanation of the improvement that has been achieved in the rate of cargo handling in the Port of Colombo since the nationalisation of its cargo handling operations in August, 1958.

In 1959 the total volume of cargo handled in the Port of Colombo reached the highest level attained during the last three years. The tonnage of cargo, excluding coal and liquid fuel, handled in Colombo during the three years 1957, 1958 and 1959, computed in shipping tons was as follows:—

Year	Imports	Exports	Total
1957	1,863,787	708,248	2,572,035
1958	1,684,391	642,048	2,326,439
1959	2,062,216	548,309	2,611,184

It is, however, of the utmost importance to Ceylon that the business world should appreciate the fact that, despite an increase in the volume of cargo traffic, the congestion in Colombo has been eased in very great measure and that this has been accomplished entirely by enhanced efficiency in cargo handling operations, consequent on nationalisation.—Yours faithfully, H. SHIRLEY AMERASINGHE

Port (Cargo) Corpn.
Colombo

The Law's Delays

SIR—In your article of last week entitled "The Vexatious Litigant" you say: "if we had to choose between giving a condemned man (Chessman) twelve years of life, to which he was not entitled, and keeping a large and unjust civil claim over an innocent man's head for twenty-four years, surely it were better to postpone the criminal's execution."

It seems to me that you are evading the issue. Surely English indignation was not caused by Chessman being allowed to remain alive for twelve years, though we believe this could not have happened in England. Our anger was aroused by his sentence actually being carried out after such a long period of time.

We may be "smug" in believing our legal system to be more efficient than the American and saying Chessman should have been prevented from postponing his execution. We are surely justified, however, in condemning the actual execution, even if we are in favour of capital punishment for crimes such as those he committed.—Yours faithfully, R. M. LYONS

Rugby

Steel

SIR—I refer to the article headed "A Revolution in Steel" in your edition of May 21st. One modification of the LD process to which you refer, namely LD-AC, was in point of fact developed not in France nor in Germany, but was conceived, developed and perfected, at the Dudelange Works of the ARBED Group in the Grand Duchy of Luxemburg.—Yours faithfully,

Columeta Export Co. L. CLASEN
London, SW1

Wine

SIR—I could not disagree more with your contention that today wine is "just pleasant or unpleasant to drink."

While it is true that today few people have the time for detailed study of vintages and vineyards, nevertheless leading wine merchants would agree that their customers are constantly turning to them for advice on these matters.

Concerning wines unpleasant to drink, I fear you would find in this category the fine burgundies of 1959—if you try drinking them, as suggested, this Christmas. In fact, most of these wines will not have been bottled or shipped to this country by then, and will certainly not be ready for drinking.

On claret, may I assure your apprehensive readers that the best will certainly not cost "£4 or £5 a bottle." Half this figure would seem nearer the mark.—Yours faithfully, D. B. MITCHELL

London, EC4

Christian Stewardship

SIR—Two points should be taken into consideration about Christian Stewardship.

First, if members of the Church of England are expected greatly to increase the amount they give to the Church, other charities are bound to suffer. Secondly, people should themselves consider most carefully what charities and philanthropic needs they wish to support and not just hand this very important responsibility over to the Church council or to any other body.—Yours faithfully, BEATRICE HILL

Keswick, Cumberland

BOOKS

Mariage de Convenance

Trade Unions and the Labour Party since 1945

By Martin Harrison.
Allen and Unwin. 360 pages. 32s.

THE extraordinary alliance between trade unions and socialist politicians that forms the British Labour party has long fascinated observers. Many American liberals, and not a few European Social Democrats, have envied this *mariage de convenance*: the Americans because it was ideologically more coherent than their own parties, the Europeans because it seemed pragmatically more effective than theirs. British Liberals, though repelled by it, have had cause to envy it, too, for as long as the the unions remained loyal, the problem of displacing Labour as "the radical alternative" has seemed insoluble. Tories, for their part, have spent years proclaiming the iniquities, and the imminent breakup, of this alleged *mésclliance;* tales of trade union nonentities obstructing all true reform, or (alternatively) of socialist dreamers messing about in the affairs of the practical British working man, have been staple items in Conservative propaganda ever since Labour mattered enough to be worth attacking.

But despite all this interest, there has not been much penetrating research into the actual relationship of the unions to the party. Mr Harrison's excellent book will do little to dispel the clouds over Labour's diamond jubilee. But it does go a long way towards answering important questions long engulfed in clichés, whether of approbation or opprobrium. He manages, despite grievous inadequacies in the available statistics, to give a fairly precise idea of the proportion of the party's financial support that comes from the unions. Instead of the familiar arguments from abstract principle concerning the respective merits of "contracting in" and "contracting out," Mr Harrison offers an abundance of solid facts about how the system has worked, both before and after the change of law in 1946. He also examines the ways in which the political levy is spent; how, for example, the system encourages a wasteful concentration of largesse upon the few weeks immediately before an election, and even then upon "constituencies which should be fully self-supporting or are rock-solid Labour seats."

He probes far beyond the usual cries of outraged virtue over block voting at party conferences, and does surprisingly well, considering the reticence of many officials, at showing how the unions reach their decisions on political matters. He argues that "the stereotyped image of the unions as a sort of orthodox suet pudding clogging the Party's progress is a potentially disastrous oversimplification." It is true that, in most cases, the unions have, on balance, come down on the side of orthodoxy; but this has been due to circumstances, not to any immutable law of trade union life. A straight fight between the trade unions and the constituency parties, moreover, has been rare; neither side is without its divisions, and, except for some moments in the heat of the Bevanite controversy, the unions have supplied much, often most, of the left wing minority in conference voting.

Even on such relatively well-known themes as the dullness and inadequacy of many trade-union sponsored MPs, Mr Harrison says much that is fresh and perceptive; here, as throughout the book, he has little difficulty in proving that the behaviour of the unions is not nearly so uniform as their critics, both inside the Labour party and out, have imagined. But there has been a general tendency for the trade union MPs "even within their own unions . . . to become unknown, vaguely superannuated figures." After all, for the unions, in all but a few hyperthyroid cases such as the Electrical Trades Union, politics is something of a sideline, and a decreasingly important one, if the author's convincing analysis is correct.

This book is not easy reading: statistics and the alphabetical morass of abbreviated trade union labels make this inevitable. But the burden is lightened by some telling quotations from trade union officials, as well as the more dunderheaded branch resolutions ("We strongly condemn the British terror in Kenya, and also call for the disbandment of the Mau-Mau"). And throughout there is the excitement of following hard, intelligently pursued research as it unfolds. Sometimes Mr Harrison seems reluctant to follow his arguments and his impressively marshalled facts to their logical conclusion, notably in discussing the workings of democracy, and the counterforces of apathy and ignorance, within the unions. This reluctance seems to arise, not from undue deference to trade union sensitivities, but from a certain fatalism about the feasibility of changing any of the existing patterns of behaviour or structural features of the Labour movement. After the Clause Four debate and its inglorious conclusion, one hesitates to differ with him on this point. But history does not stop, even in the Labour party. All Labour supporters who have not lost the instinct for self-preservation had best read Mr Harrison's book—as, indeed, must anyone with a serious interest in the strange ways of man as a political animal.

The Pedigree of Economics

A History of Economic Ideas

By Robert Lekachman.
Harper, New York. London: *Hamish Hamilton*. 440 pages. 40s.

THE history of economic ideas is, in a sense, a specialist's subject. It presupposes in its students an interest in economic theory itself going beyond that desire to be put generally in the picture which prompts the reading of popular introductions to the subject. It has not, accordingly, seemed to offer a very promising field to the populariser. There is, it is true, Mr Heilbroner's lively but extremely sketchy "Ten Great Economists," published some five years ago; but between this admirable near-squib and Schumpeter's monumental "History of Economic Analysis" there is nothing to correspond to that closely-graded range of general economic exposition from which student and general reader alike can choose according to their abilities and needs.

Mr Lekachman's "History of Economic Ideas" fits itself squarely into the space that gapes between "Ten Great Economists" and Mr Erich Roll's "History of Economic Thought." It is very much more scholarly and responsible than the former (though an almost equally "easy read," thanks to its qualities of style), and a good deal less esoteric, as well as shorter, than the latter. Mr Lekachman has obviously and beneficially soaked himself in Schumpeter, but his book is not a sketch-map version of Schumpeter's *magnum opus*. The ideas that he chronicles are not only analytical tools or theoretical conclusions but the operative opinions on policy emerging from the use of those tools and the framing of those theories; the question that he equips his readers to answer is less "by what stages did economic thought reach its present development?" than "what part has economic thought played in the general movement of history?" "The history of my subject," he says in his preface, "naturally organises itself for me around men and problems rather than around concepts and doctrines." This approach has obvious advantages in a book addressed to students for whom economic theory is at most a subsidiary subject. Budding economists, to whom the alternative approach might be more useful if not more congenial, will after all find it elsewhere.

If Mr Lekachman cannot fairly be criticised for following his bent in this respect, his choice of "men and problems" is less thoroughly defensible. A certain Anglo-Saxon provincialism is redeemed when he comes to Cournot and Walras; but it reappears in an almost total neglect of the Scandinavians and a rather cavalier treatment of the Austrians. And one also feels, at the end of the book, something of the sensation of treading on a step that is not there. Mr Lekachman ends his history, abruptly, with Schumpeter's regretful conclusion that capitalism is on the way out. One must, of course, stop somewhere. But it is a pity that so acute and gifted an interpreter should not—even at the price of having to scrap and rewrite for each of the succession of new editions which he can confidently expect—have included a report from the contemporary back room.

Apartheid on Trial

South Africa: *Two Views of Separate Development*

By S. Pienaar and Anthony Sampson.
Oxford University Press. 89 pages. 5s.

WHILE he was in London, Mr Louw, the South African foreign minister, repeated his government's complaint that outside criticism of the Union's racial policy was based on distorted and scrappy information. The Institute of Race Relations, which used to be attached to Chatham House and is run by Mr Philip Mason, has tried to meet this complaint by giving in one booklet the case for and against apartheid. Mr Pienaar, foreign correspondent of the Nationalist newspaper *Die Burger*, and Mr Anthony Sampson of *The Observer*, were charged with the task, neither seeing in advance what the other had written.

The case for the separate development of black and white in South Africa is given about as good a defence as it will ever get. Mr Pienaar is a first-class counsel. He writes succinctly and with swingeing verve. Believing his best weapon to be attack, he accuses Europeans of racial arrogance in coolly assuming that Zulu culture should be wiped out and the Bantu turned into black Englishmen. Apartheid he claims is the Union's way of safeguarding the nations of South Africa, its acknowledgment that the Africans are not a lesser breed incapable of achievement by themselves. To try to denationalise the Africans by multi-racialism is, he argues, as misguided as Lord Milner's attempt to anglicise the Afrikaners or as unthinkable as Americanising Piccadilly (Mr Pienaar should ask someone one day about Piccadilly).

Now that the irresistible force of the Bantu demand for national self-determination has met the immovable object of the Whites' demand for continued national existence (and Mr Pienaar uses this cliché rather too often) the only answer is separate development. In states of their own the Africans can eventually become as free as Ghanaians. And so Mr Pienaar disarmingly continues, filling out his fairly slender essay with long quotations from Dr Verwoerd. His polemic is straightforward; he sticks to the one point, making no attempt to cover up the holes that appear all round him. And at the very end, as a sort of postscript, he mentions that there is also colour prejudice to be taken into account.

Then it is Mr Sampson's turn. He sets out to explain the "new deal" in the Union's apartheid policy, starting from the Bantu self-government bill in May, 1959, and in so doing reveals one after the other the holes in Mr Pienaar's defence. One point that the South Africans gloss over is the proportion of land that has been allotted to the Africans; if the High Commission territories are not included, and there is no reason why they should be, the Africans are getting only 13 per cent of the land. Mr Sampson questions the wealth of the reserves and also the amount of self-government that the "Bantu homelands" will in fact enjoy. But much the most interesting part of his thesis is his complete rejection of Mr Pienaar's creed of African, or rather Bantu, nationalism.

Mr Pienaar writes enthusiastically of the importance of the Bantu developing along their own lines. But Mr Sampson makes the point that the main desire of the African in South Africa is to be part of the main stream of western civilisation and not to be separated from it. The process of westernisation and detribalisation has already gone much too far to be reversed, and it is a dangerous fallacy for the Nationalist government to dismiss, as it does, the urban Africans as "an unattached mass of Bantu individuals."

Although still useful as background information, some of Mr Sampson's argument has suffered from being written some time before Sharpeville and the later developments. But, as an argumentative exercise, the pamphlet is now a complete success, perhaps because the two writers did not know what the other was going to say and are therefore to some extent debating at cross purposes. Mr Sampson is more diffuse than the singleminded Mr Pienaar, and is inclined to get tied up in the intricacies of African nationalist movements. Perhaps it is the fault of television that a reader is greedy for the cut-and-thrust of straightforward debate—and also, on a topical subject like this, for more uptodateness.

Three Hundred Years Ago

1660: *The Year of Restoration*

By Patrick Morrah.
Chatto & Windus. 237 pages. 21s.

THIS book is a readable account of the Restoration of Charles II. It is written in the form of an extended diary, containing beside firsthand reports of the main events snippets of more unorthodox information: duels, murders, the Kirg's lost spaniel, and an account of the family row that followed the Duke of York's marriage to a commoner.

In the confused year following Cromwell's death, no one knew for certain who would eventually succeed him. One point made clear by this book is that Monk, who held the key to the situation, survived and brought about the Restoration without bloodshed largely by holding his tongue until the latest possible moment. It is possible that, by so doing, he saved England from a renewal of civil war.

Mr Morrah's point of view is that of a Royalist. As such, although he never falsifies the evidence he sometimes avoids it, and the picture he gives is perhaps a little over simple. Charles II appears rather differently when one knows that, during the trial of Sir Harry Vane, who was executed for treason in spite of a promise of pardon, he wrote to Clavendon, "he is too dangerous to let live, if we can honestly put him out of the way."

Mr Morrah praises the men of 1660 for their escape from "the gloomy abyss of republicanism," and rejoices in the reverence for tradition that came back with the king; but the struggle for constitutional government had not yet been won, and perhaps Milton was more far-seeing when he lamented

> that a nation should be so valorous and courageous to win their liberty in the field, and when they have won it, should not know how to use it or value it, but barely and besottedly to run their necks again in the yoke they have broken.

It took nearly another thirty years for the yoke to be shaken off. Compared with some issues tradition becomes a triviality.

Nevertheless, Mr Morrah's account is vivid and informative. It contains much authentic and apparently irrelevant detail, but because of this it is a good background introduction to a fascinating period, and has the additional merit of introducing Pepys to any reader who has not yet enjoyed him.

The Enjoyment of Literature

The Art of Writing

By André Maurois. Translated by Gerard Hopkins.
Bodley Head. 318 pages. 18s.

THIS is a light-weight, unashamedly popular book, roughly the equivalent of Mr Somerset Maugham's "Ten Novels and Their Authors" with a few pages of "The Summing Up" thrown in. It is the work of a man for whom both reading and writing are a pleasure; part of *la douceur de vivre* rather than the instruments of a crusade, an exercise in analytic detection, or a participation in protest. It is, accordingly, an obvious cockshy for pleasure-haters and for the conscientiously esoteric; and indeed even readers belonging to neither class may feel at first blush that easy and elegant rehearsal of the familiar (about Rousseau, Voltaire, "Madame Bovary," "Le Rouge et le Noir," for instance) is a waste of his talent—Great Literature Without Tears, mere *vulgarisation*.

Closer attention modifies, without entirely dispelling, any such view. As so often happens when a virtuoso is performing, the first impression of ease and superficiality turns out to be deceptive. Under the smooth slight narrative or *cicerone's* commentary there lies a firm structure of thought and judgment. It is a classical structure, but elastic rather than rigid; form, measure, proportion, good manners, are the qualities that M. Maurois admires, yet he can write with perceptive sympathy about that pathological howl of hatred Tolstoy's "Kreutzer Sonata" and appreciate the uncorseted plenty of Balzac. This tolerance—but tolerance is too weak a word for so positive an enjoyment—one may surmise to be the contribution of the biographer who, in M. Maurois, doubles the critic. He is concerned with the work in itself, but also with the man who wrote it; and while some of the essays comprising "The Art of Writing" are predominantly studies of men (Goethe, Tolstoy, Leopardi, Tchekhov) even those which are predominantly studies of books refer back to the personalities and circumstances of their authors.

The exception is the title essay, which hardly deserves its place. As smooth as any, as well mannered as any, it tells the neophyte writer virtually nothing that Robert Louis Stevenson did not tell him eighty years ago. No doubt there is room in every generation for a rephrasing of the essential lessons of style. But it is hardly to the rising generation of today, whether English or French-speaking, that M. Maurois can be conceived as addressing himself. There is more to be learned about the art of writing from his performance—even when studied through the veil of translation—than from his precept.

Last Fight and After

Out of the Smoke

By Ray Parkin.
Hogarth. 330 pages. 21s.

SINCE a good deal has already been written about the last fight of *HMAS Perth* in the Sunda Strait on March 1, 1942, this book may be ignored. In fact, however, it is something unusual in war books; and the reader will sense its quality from the foreword by Laurens van der Post, who first met the author in a Japanese prisoner-of-war camp, and himself did remarkable work in maintaining the morale of prisoners in such circumstances. Mr Parkin, who was a Chief Petty Officer in the Royal Australian Navy, and had served in the *Perth* in the Mediterranean throughout the tragic Greece and Crete campaigns before joining a heterogeneous and hastily formed force to fight the hopeless battles in the Java Sea, is evidently a very unusual man. Here he writes in the third person, concealing his identity as "John"; but his attractive modesty leaves one in no doubt about his qualities, first as a seaman and a leader, and then as a writer and artist.

The story he tells is in the main that of ten men who swam ashore after their ship was sunk, found and rigged an unwieldy lifeboat, and then sailed her—with very little food or water on board—right round to Tjilatjap on the south-east coast of Java, only to fall into the enemy's hands when they got there. It is a deeply moving tale of self-imposed discipline and unyielding resolution in the face of the most daunting difficulties; and it is comforting to learn at the end that all but one of the ten survived not only twenty-two months on the dreaded Siam-Burma railway, but a terrible sea voyage to Japan followed by another year in the coal mines. But it is not only the author's moral qualities that impress the

"Who's Aware?"

. . . asks a speaker in a certain Jules Feiffer cartoon. "We're aware!" shout a crowd of knowing little men. Are you indeed, fellows? . . .

Mashing day by day through a flurry of newspaper pages, I find I am *always* missing points I would rather have got, reading things I would far rather have missed. The haystack searcher can at least use a magnet . . .

However, the thing became less of a burden to me once The Observer started The Week—which, as you very likely know, is a whole page feature devoted every Sunday to Monday-to-Saturday's news. This is a brilliant idea. Without it, a Sunday paper is like a man who only wakes up on Leap Years. With it, hard-pressed readers can catch up.

"Edited", it says, "by William Clark." I wanted to find out more about W. Clark, the man who does this discriminating for me. I've seen him on the screen, of course, calm, complete, omni-competent. I know the sound of his voice. But what is he really like?

As a result of exhaustive enquiries I can now disclose that behind that solidity of build and manner—he is surely a natural William, not a Bill—there is a self-mocking wit and a decidedly playful temperament. That he is 43. A Northumbrian, from the Border town of Haltwhistle. Also that his friendships range as far and wide as his knowledge and activities—he seems to know every interesting person in the world except me.

Six-day Digestive

Oh well, who cares? I shall resign myself to giving him an occasional curt nod on T.V., and settle down to read The Week. (At least I know where to find that. It's always in The Observer's Weekend Review).

And if you take my tip, you'll do the same. You'll be surprised how much it gives you that you missed before . . . how even a few days' perspective helps the view and stimulates mental digestion. Invaluable, if you're just back from a holiday!

J.B.L.

ADVT.

reader; Colonel van der Post is quite right to see in his literary style and in his deep understanding of ships and of the sailors who work them a resemblance to Joseph Conrad. If Mr Parkin never writes another word he will have given the world something truly memorable in this humbly told tale about the ship that he loved and the ordeal that he and his comrades underwent after she was lost eighteen years ago.

Maya Popularised

Maya: *The Riddle and Rediscovery of a Lost Civilisation*

By Charles Gallenkamp.
Muller. 229 pages. 25s.

THIS is a popular book on the Maya, and it has no claim to originality. Seventy-five pages consist of preliminary matter: the conquest of Yucatan, the discoveries of Stephens and Catherwood in the last century, the growth of knowledge of Maya archaeology, and a sketch of the origin of the American Indian. After this the subject is treated chronologically, with extra chapters on special subjects, like the wall paintings at Bonampák and the Well of Sacrifice at Chichén Itzá.

On the whole, the author has used his sources accurately, and the general reader could learn a good deal from the book. There are some points that need correction: among them is the extraordinary statement that the Incas "had traversed the sharp-peaked mountains surrounding their prospering cities with a network of highways and bridges which defy the imagination" by the seventh century AD; that particular network, which does not defy the imagination, dates from the fifteenth century. In the Maya section proper, the account of the calendar may perplex the reader. Having explained that the *haab* or civil year was composed of eighteen months of twenty days to which "an extra month of 5 days was added," the author tackles the Long Count in such a way that the reader may get it mixed up with the *haab*. He says: "18 *uinals* = a *tun* (a year with the addition of five extra days)." Not only does this imply that a *tun* had 370 days, but also that *uinals* and *tuns* had something to do with the solar year, whereas they are units in the count of days from an arbitrary date long ago.

The book is illustrated with excellent photographs. There is also a series of drawings, but none of them has a caption, or is mentioned in the text, and the reader is left to guess whether most of them represent paintings, graffiti, carvings or figments of the imagination; apart from a section through the Temple of the Inscriptions at Palenque and a drawing of a skull rack, they are not likely to mean much to him. The author's literary style is also a major drawback. He constantly uses words outside their accepted meaning—and not because he is using American terminology, since Webster gives him no more support than the Oxford Dictionary.

On the whole, the reader may prefer the extensive quotations from Morley and others that the book contains to the author's interpretations of their ideas. Morley's "Ancient Maya" is an admirable and quite accessible book, and for those who want something rather lighter there is Eric Thompson's "Rise and Fall of Maya Civilisation." Both are by authorities of the first rank. There was really no need for a book like Mr Gallenkamp's.

OTHER BOOKS

THE JOURNAL OF AFRICAN HISTORY, Vol. 1, No. 1. Edited by R. A. Oliver and J. D. Fage. *Cambridge University Press.* 187 pages. 20s. Vol. of 2 parts 30s.

A warm welcome should be given to the new *Journal of African History*—its first number is out this week—by everyone who is interested in the present as well as the past of African peoples. At a time when new African nations appear on the map at the rate of two or three a year, it is highly appropriate that Britain should offer a serious forum for discussion of their history. It will help them, and it should help us as well, to see the ground more surely under their new-shod national feet.

Projected three years ago, at the second conference of the School of Oriental and African Studies on the history and archaeology of Africa, the journal is now safely launched under the editorship of Dr Roland Oliver and Dr J. D. Fage. The contents of its first issue suggest what one would have expected from the editors: that they can be relied upon to cast their net widely, avoid the snags of narrow-minded condescension towards a subject whose very existence was questioned by the orthodox only a few years back, and invite contributions that will bridge the gaps which lie between written history, oral history, and archaeology.

The historian in Africa has to be something of a jack of several trades. He cannot hope to stick to the printed word. He will lose himself if he forgets the value (and the dangers) of the remembered word. He needs the active co-operation of the archaeologist and the anthropologist. This first number shows a nice balance between these disciplines. It is also good to see that the journal's board of editorial advisers come from several countries, including one African, though not (or not yet?) a Russian.

DOCUMENTS ON BRITISH FOREIGN POLICY, 1919-1939. First Series, Vol. IX: *German Affairs, 1920.* Edited by Rohan Butler and J. P. T. Bury, assisted by M. E. Lambert. *Her Majesty's Stationery Office.* 810 pages. 70s.

With this volume, the third to deal with the year 1920, the proceedings and conclusions of the international conferences that were set up to deal with the peace settlement are at last left behind and publication begins of the British diplomatic correspondence. What we are given here is the correspondence concerning German affairs in the first half of 1920. Some of this still refers back to the peace conferences: the last two chapters cover the failure of the Allied Governments to obtain the surrender to themselves of the former Emperor William II, who was saved by the Dutch, and of other German nationals accused of war crimes, whom the German Government decided to bring before German courts. But the bulk of the volume is taken up with the internal German situation; with the economic and social chaos, the right-wing Kapp Putsch, the left-wing rising in the Ruhr, the Bavarian situation and German separatist movements, the connections between German Communists and the Soviet Government. The central theme so far as foreign policy is concerned is the divergence of the British and French attitudes on all or almost all of those questions, a divergence which had begun before 1920, about which much is already known but which can now be studied in detail. It is not only for this, however, that the volume is valuable. The account which emerges of the German political and social scene at this time, as it presented itself to the British diplomatic service and as they presented it to the Foreign Office, makes fascinating reading, and will be an indispensable source of information for students of the history of Germany between the two world wars. The volume maintains the high standard of editing that has marked the first series from the beginning.

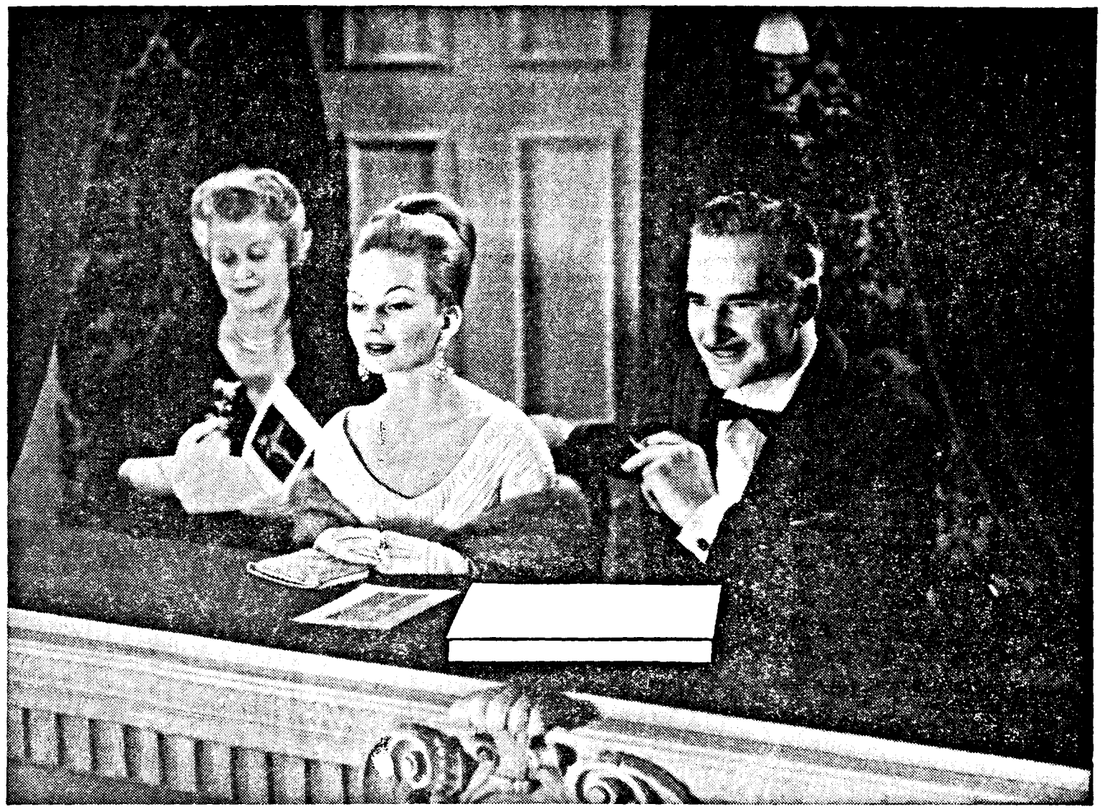
INTERNATIONAL JOURNAL OF ABSTRACTS—STATISTICAL THEORY AND METHOD. Volume I, Number 1. General Editor: W. R. Buckland. Published for the International Statistical Institute by *Oliver and Boyd.* Annual subscription for four issues £5.

The aim of this new abstracting service is to give complete coverage of papers in the field of statistical theory and new contributions to statistical method. This entails the scanning of some two hundred and fifty journals published in various parts of the world in addition to research station papers and the reports of conferences—in all, at least 400 sources of publications. Each abstract is about 400 words long and the sheets of the journal are colour-coded according to a dozen main sections of classification. The presentation is excellent.

BRITAIN'S SCIENTIFIC AND TECHNOLOGICAL MANPOWER. By G. L. Payne. *Stanford University Press.* London: *Oxford University Press.* 479 pages. 45s.

In the spring of 1957, Mr Payne was asked by the President's Committee on Scientists and Engineers to assemble an annotated bibliography of official publications on British technological manpower and education. The official publications bearing at all directly on this subject, according to his listing, total in all some 350-400 pages—most of them, as British students of the subject know to their cost, repetitive and not always reconcilable. It would be unfair to say that Mr Payne has managed to summarise nearly 400 pages in nearly 500: his "everything including the kitchen-sink" approach has added a ponderous but uncritical assemblage of basic data about British education plus, embedded in the pudding, a few quite perceptive outsider's insights into the way British society regards science.

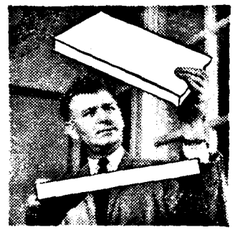
RICARDO ON TAXATION. By Carl S. Shoup. *Columbia University Press.* London: *Oxford University Press.* 285 pages. 48s.



Preoccupied as Ricardo was with the distribution of the national income, it is not surprising that in his "Principles" ("Of Political Economy and Taxation" not merely "Of Political Economy") a full third of the chapters should concern taxation. Professor Shoup, himself a specialist authority on public finance, places Ricardo's tax theory in relation to contemporary controversies both at the analytic level and in practical public affairs; traces his continuing influence on later writers; disentangles cruxes, elucidates ambiguities, and in general applies the whole critical apparatus to an area of Ricardo's thought that has had less than its share of attention. It is unlikely that this job will ever need doing again.

THE INDUSTRIAL CHALLENGE OF NUCLEAR ENERGY, III. *Stresa Conference,* 1959, Part 3: *The Market for Nuclear Materials.* OEEC. 297 pages. 18s. 6d.

A SIMPLE GUIDE TO SHAREHOLDING AND COMPANY ACCOUNTS. By John Wood. *Putnam.* 131 pages. 10s. 6d.



AN ATLAS OF AFRICA. By J. F. Horrabin. *Gollancz.* 126 pages. 12s. 6d.

THE CAPITAL MARKET OF INDIA. By S. L. N. Simha. *Vora & Co.*, Bombay. 311 pages. 36s.

She appreciates our taste

An evening out . . . a box at the theatre . . . and chocolates. A real gala occasion! The chocolates are, of course, her favourite kind. She enjoys them—not realising the part "Thames Board" played in making possible the pretty, *protective* box. The many and diverse uses of "Thames Board" *are* known to boxmakers and leading manufacturers throughout the country. They appreciate the product; it helps to solve their problems of protection and shelf-appeal for the necessities required by to-day's high standards of living.

He thinks we're good too

As a boxmaker he likes talking to us at Thames Board Mills. He finds we have ready sympathy with his problems and our expertise and knowledge really help him. Even the most intricate boxmaking ideas can be effectively put into production through the use of "Thames Board".

Good packaging starts with 'THAMES BOARD'

DOW PRODUCTS *behind today's fine paint performance*

Painting was never easier! Paints were never more beautiful and more durable! From Dow come many of the chemical products that account for the remarkable performance of today's paints.
Latexes developed by Dow, an established standard of quality for interior wall paints, are now finding new uses in high quality concrete floor paints and the new latex metal primers which have brought the safety and convenience of water-thinned paint into automotive plants. And Dow has developed a new acrylic latex which not only makes it possible to use a latex paint on exterior wood, even when damp, but also greatly reduces blistering and colour loss experienced with conventional exterior paints.
Dow is also a basic supplier of phenolics, glycols, preservatives and thickeners. For detailed information on these and other Dow products for the paint industry, contact your local Dow representative or the Dow office nearest you.

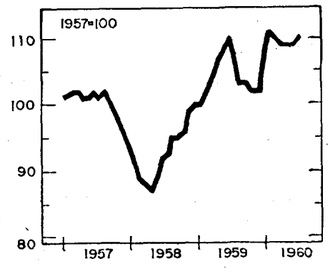
AMERICAN SURVEY



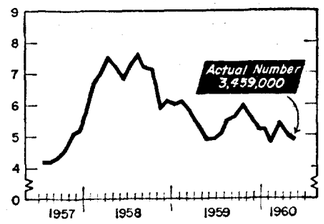
AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Reserve in Reverse

WASHINGTON, DC.

THE Federal Reserve System hopes that it is on its way towards providing a novel demonstration of the art and power of central banking. Traditionally, the Federal Reserve has relaxed its restrictions on the supply of money only after the economy has begun to slide into a recession. Its recent shift towards easier credit is novel because the central bank has abandoned its anti-inflationary policy of tight money in order to stimulate renewed growth in an economy which has not yet shown marked signs of decline. Future events, by demonstrating that in fact the United States is already in a recession, may show that on this occasion the Federal Reserve has done neither more nor less than it has done in the past. But the central bank is genuinely convinced that a recession has not begun and that there is a better than fighting chance that the economy will not turn downwards in the near future.

INDUSTRIAL PRODUCTION
seasonally adjusted



The Federal Reserve places great reliance on its index of industrial production as a guage of business trends. If the United States turns out to be in a recession the index will show that it began in February. The index climbed to a record high of 111 per cent of the 1957 average, on a seasonally adjusted basis, in January, then slipped to 109 in March but edged back to 110 in May. The gross national product is registering only a modest gain of less than one per cent in the current quarter of this year after having risen past the $500 billion mark in the first quarter. Employment rose to a record of 67,208,000 in May, but there were 400,000 fewer jobs in manufacturing industry than there were at the previous peak. The head of the United States Steel Corporation predicted recently that steel output will fall to 57 per cent of capacity during the summer from roughly 62 per cent now and many experts in the industry think the drop may be sharper. The current judgment of the central bank is that little change can be expected in total business activity during the customarily sluggish summer months and that the next test of the economy's ability to show a fresh advance will not come until the autumn. It is this test that the monetary authorities are preparing for by moving away from a rigorous policy of credit restraint.

The essential fact is that the Federal Reserve believes that the present business cycle calls for quite different approaches from those which it applied during the previous postwar upturns and downturns. The underlying economic conditions have changed. So have the psychological attitudes of businessmen and consumers, of buyers and sellers, of lenders and borrowers. The chief differences are that inflationary pressures have diminished and that inflationary expectations have shrunk to the vanishing point. Mr Per Jacobsson, the managing director of the International Monetary Fund, has said more than once that in all likelihood the postwar era of inflation has come to an end. The Federal Reserve—as befits a dedicated central bank—is somewhat less sanguine than Mr Jacobsson, but it is inclined to the view that in future it will have to fight nothing more serious than limited wars against small outbreaks of inflation. It does not believe that it will soon again have to throw all its resources into a desperate attempt to stop a major and sustained assault on the stability of the economy.

There are many reasons why inflationary forces have subsided. One of the most important is the reappearance of competitive pressures in the world at large. Motor cars, textiles and steel are items in which competition from abroad is making itself felt. The wage-cost spiral has been weakened, since businessmen can no longer give large wage increases in the secure knowledge that they will be able to pass on the added costs to their customers through higher prices. Thus a profit squeeze is an ever-present threat. There is idle capacity and the figures published this week show that there are still nearly 3½ million unemployed workers. Commodities, services, and manufactured goods are in ample supply. Above all, there is a profound psychological change in expectations for the future. The belief that higher prices are inevitable has disappeared.

Businessmen no longer add blithely to their stocks in the calm and certain knowledge that higher prices will mean that these stocks will yield substantial profits, nor are they any longer accumulating excessive stocks to protect themselves against potential price increases and shortages of supply. Speculators are no longer purchasing equities in the confident expectation that inflation will increase the value of their securities. Companies are no longer adding to their productive facilities because they believe that if they do not buy now they will have to pay more later. Consumers do not have to stock up on large household appliances in order to be sure of satisfying their needs at current prices. In addition, there has been a powerful shift in the Treasury's budgetary position from a huge deficit in the national accounts to a balance. The government is no longer a substantial borrower and fiscal policy is beginning at long last to provide effective support for monetary policy.

UNEMPLOYMENT
As % of civilian labour force seasonally adjusted

The Federal Reserve began to move away from its tight money policy in mid-winter, when it became apparent that the "roaring sixties" were making a less supercharged start than had been so widely predicted during the closing weeks of 1959 and the opening weeks of 1960. Business activity did not measure up to expectations, and the central bank responded by slowly reducing its pressure on the commercial banking system.

The best measure of this pressure is the relationship between

the reserves of the commercial banks and their borrowings from the Federal Reserve. When the tight money policy was at its most intense during the late autumn and early winter, the Federal Reserve saw to it that the commercial banks' borrowings exceeded their reserves by about $500 million on an average day. As the Federal Reserve moved toward easier credit, the deficit slowly but steadily declined until, during the past few weeks, the commercial banks have had a small amount of free reserves instead of a deficit. The monetary authorities have accomplished this through open market operations. They have bought Treasury bills and have thus increased the supply of money that is available to the commercial banks for lending to their customers.

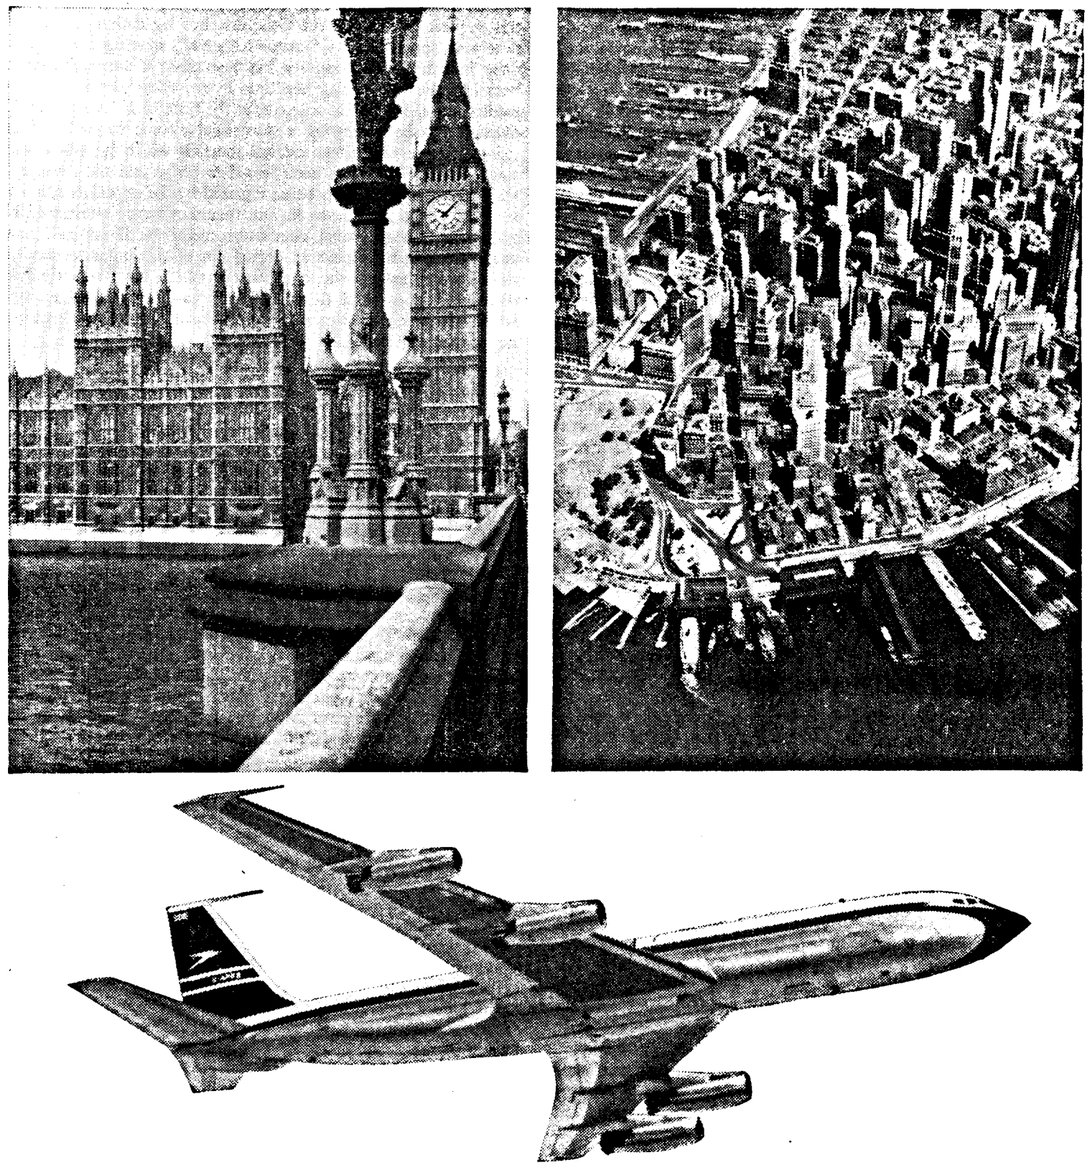
The Federal Reserve considers that it has come all the way from tight money to a position of neutrality, and some people would say that credit policy at the moment is very slightly on the side of easy money. The climactic moment in the continuing shift came two weeks ago when the Federal Reserve Board in Washington announced that it had authorised two of the twelve regional Federal Reserve banks to cut the discount rate (bank rate) to 3½ per cent from 4 per cent—a movement that would inevitably be followed by the remaining ten banks within a short time. A spokesman commented that the board had acted in order to encourage more rapid economic growth. He noted that there was idle productive capacity and that about 5 per cent of the labour force was also idle. The spokesman did not say so, but the central bank believes that there is more unemployment among both industrial facilities and people than can be reconciled with the goals of ensuring maximum employment, production, and purchasing power which were set up for the government by the Act of 1946. The Federal Reserve believes, too, that the idle capacity and relatively large number of jobless are evidence that the economy of the United States is not operating as efficiently as it should.

The cut in the discount rate was dramatic, since the Federal Reserve had delayed its action in the hope that it would be made unnecessary by a vigorous spring upturn in the economy. It did not want to reduce the discount rate if it saw any prospect of again having to increase its borrowing charge in the near future. Moreover, it was reluctant to do something which has been construed traditionally as a warning that a recession is at hand. But the cut would have come sooner than it did if the collapse of the summit talks in Paris had not made the central bank wait until it could be certain that a new cold war scare was not in the making.

The reduction in the discount rate has not, however, as some central bankers had feared, aroused the expectations that a recession is on the way. The Federal Reserve has now completed the first phase of its novel move from tight money to neutrality during a period of prosperity. Normally, one cut in the discount rate is followed by another as the economy slides downwards. But some of the keenest analysts in the central bank believe that the testing period in the autumn will bring a renewed upturn in business. If they are right, the Federal Reserve's shift from tight money to neutrality will have accomplished its objective of helping to stimulate more rapid economic growth, and then the next change in the discount rate may be in an upward direction.

Tripped Up

BEFORE the President left Washington for the Far East it was agreed generally that he would go on to Tokyo as planned unless the Japanese government asked him to postpone his visit. There must be great relief that it did so on Thursday morning after another demonstration that the mobs in Tokyo could not be controlled. Nevertheless, it is bound to be bitter medicine for Mr Eisenhower. This was to be the longest and the last of the good-will missions with which he has been rounding off his Presidency; he has travelled 90,000 miles in all, most of them in the last eighteen months. The cheers in Manila, in Taipeh and in Seoul will not go far to make up for the rebuff to him personally and to American leadership of the free world in what has been considered to be the chief bastion of American strength and of democracy in the Far East.



Even before Mr Hagerty, the President's press secretary, was "clobbered" in Tokyo last week there had been some misgivings in Washington, particularly on the part of Senator Fulbright, the chairman of the Senate Foreign Relations Committee. It has not been easy even for Senator Fulbright to understand why so many Japanese object so violently to the new security treaty with the United States, which makes so many concessions to Japanese national feeling. Moreover, unless it is approved by the Japanese Diet, the far more onerous treaty signed in 1951 continues in force indefinitely. Most of Mr Fulbright's doubts about the trip, however, were dispelled when Mr Herter, the Secretary of State, testified on it before the Foreign Relations Committee. This testimony was in private, but he seems to have argued that for the United States to cancel the visit would be read throughout the Pacific as a confession of weakness and that it would be a savage blow at the Kishi government and at the treaty's chances of ratification by the Japanese.

The visit to Tokyo was announced five months ago—ironically to celebrate a hundred years of diplomatic relations between the two countries—when it was possible to visualise the President returning triumphantly from a peaceful visit to Moscow and the world entering an era of good feeling. Perhaps even after the collapse of the summit conference the President hoped to recover in the Pacific some of the stature as the missionary of peace which he had lost at Paris. If so, he miscalculated sadly the effects of the break-down upon a country which is unwillingly in the very front lines of the cold war. The Administration seems once more to have failed to react swiftly enough to events.

Last Stretch for Democrats

IN a widely ranging speech in the Senate this week Senator Kennedy laid down the foreign policies which he would follow in the White House with all the confidence of a man who feels that his party's presidential nomination is within his grasp. President Eisenhower's misadventures have lent cruel point to criticisms of his failure in the long-term co-ordinated planning which a purposeful national policy requires. But it is precisely the doubts about whether Senator Kennedy is experienced or mature enough to do better which are causing last minute questions about his candidacy; they explain why, in the latest Gallup poll of public opinion, Mr Nixon has once more forged ahead of him. Both the Vice President and Senator Lyndon Johnson, who, though still formally an unannounced candidate for the Democratic presidential nomination, has been deprecating Senator Kennedy's youth, have been making the most of his hasty suggestion, several weeks ago (which he has been explaining ever since), that the President might have considered expressing regrets to Mr Khrushchev about the timing of the U2 flight.

Under these circumstances it is to Mr Kennedy's credit that he has refused to be stampeded and that he put so much emphasis in his speech upon the necessity of disarmament and the danger of doing anything to impede "constructive relations" with the Russians and the Chinese. Although he did not advocate recognising Communist China or agreeing to its admission into the United Nations, without a genuine change in its belligerent attitude, he declared that better communications with mainland China were desirable and that economic and cultural contacts might be

world's largest, longest-range jetliner

BOEING 707 Intercontinental

improved. Such far-sighted reasonableness is positively Stevensonian and this is probably no accident, since a number of liberal Democrats feel, with Mrs Roosevelt, that Mr Stevenson is the President for such troubled times, and that Senator Kennedy should be content with the vice-presidential nomination.

Even Mrs Roosevelt, however, has been unable to persuade Mr Stevenson to do more than admit that he would accept the nomination if it were offered to him. Although he will not endorse any other candidate he still refuses to say that he is one himself or to authorise any activity on his behalf, a sore trial to his followers since it means that they cannot even set up headquarters at Los Angeles where the convention will open on July 11th. Four distinguished liberals who worked for him in 1952 and 1956—Professors Commager, Galbraith, and Schlesinger and Mr Rauh, the head of Americans for Democratic Action—gave up this discouraging fight long ago and are coming out publicly for Senator Kennedy. Certainly now that virtually all the delegates to the conventions have been chosen, Mr Kennedy's strength looks formidable. Exactly how a good many of the state delegations will split their votes is uncertain, but impartial observers give Senator Kennedy about 620 votes on the first ballot out of the 761 which he needs to win. Only Senator Johnson with his 450 or so southern and south-western delegates, approach this total and Senator Kennedy's lead is great enough to set off a stampede—led perhaps by Governor Lawrence of Pennsylvania, whose long-standing doubts about the wisdom of nominating a Catholic may be overcome by the temptation to use his state's big block of votes to carry the winner over the top.

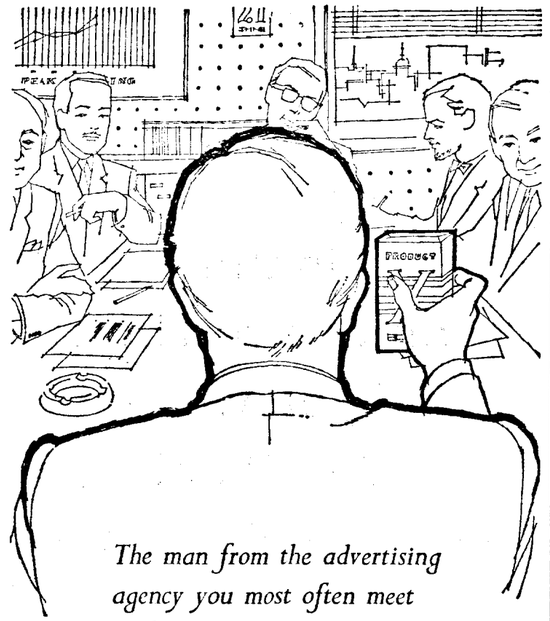
Congressional House Cleaning

With only three weeks to go—suggestions that the session might be resumed after the presidential conventions are not to be taken seriously—the Eighty-sixth Congress is at last hurrying to clean up some of the messes which it has spent so much of its life spreading before the voting public. The House of Representatives is about to consider—and probably to pass—legislation recommended by its Commerce Committee to prevent the manipulation of quiz shows or other competitive wireless programmes and to require disc jockeys to tell their listeners if they are receiving "payola"—gifts in return for promoting particular tunes or recordings. The House's measure takes the form of amending a Bill dealing with procedures for licensing broadcasting stations which was passed by the Senate last year; this means that the Senate can vote on the new provisions directly without wasting any more time—now Congress's most precious commodity—on committee work. If the House does not make any drastic changes in the version which has been put before it, the Bill will almost certainly be acceptable to both the Senate and the President.

Another Bill which is in much the same situation—passed last year by the Senate and reported by the House Commerce Committee this month—deals with additives which are used to colour food and cosmetics. It would allow the Food and Drug Administration to permit the use in small, safe amounts of additives which are known to be unhealthy if consumed in large quantities. The Bill was requested by the Administration after the Supreme Court had ruled in 1959 that the present law required the FDA to forbid the use of such additives entirely. It is perhaps to remind Congressmen—and the cosmetics industry—that this Bill is still pending that the FDA has chosen this moment to ban finally the sale of various lipsticks which poison rats if eaten lavishly.

FDA is also proposing that its powers should be strengthened so that, among other things, it would be able to check the efficacy as well as the safety of new drugs. Nothing will be done about this request by the present Congress, but legislation is expected next year, spurred on by Senator Kefauver's investigation into the drug industry. This inquiry has just made a successful comeback into the vote-getting headlines by revealing that an esteemed medical man, Dr Welch, who was at the head of FDA's antibiotics division, has been drawing a substantial income from the advertising revenue of various medical journals which he edited as a sideline. Dr Welch has been forced to resign and the damage to the agency's reputation is being repaired by the superiors who had such misplaced confidence in him that they never questioned his activities. Congressional candidates might be ill-advised, however, to try to make election capital out of this unless meanwhile they have tidied up the irregularities which have recently been discovered in some of their own finances—the expense accounts which are paid out of public funds—by a couple of determined newspaper reporters.

Frontier State



FROM A CORRESPONDENT IN THE PACIFIC NORTHWEST

When President Eisenhower stopped off at Anchorage this week on his way to the Far East he was paying his first visit to Alaska since it became a state eighteen months ago. In that time it has become clearer than ever that the pace of the new state's economic progress will be governed by its ability to overcome one great obstacle, the lack of adequate transport between Alaska and its markets and sources of supply. The forty-ninth state is rich in natural resources, perhaps even richer than anyone has dreamed. But as yet the possibilities of exploiting them are limited by its geographical isolation. With fewer than 100 in every 10,000 arable acres under cultivation, Alaskans cannot even feed themselves. Foodstuffs, as well as clothing, manufactured goods and other necessities, must be brought long distances from the rest of the states and from Canada by air, water and road, to supply the more than 200,000 Alaskans and the 50,000 military personnel stationed in this front line of defence against Soviet attack from the air.

Anchorage's bustling air terminal does not suggest that transport is a scarce service in Alaska. But air transport is expensive, and many of the passengers as well as much of the cargo are simply passing through. Anchorage is one of the major airports on the transpolar route and, with the coming of jet aircraft, its location promises a great deal for Alaska's future. But at present the high charges for air freight are reflected in price tags which are 25 per cent higher in shops in the south-eastern Alaskan "panhandle" than they are in Seattle and 50 per cent higher in Fairbanks, just south of the Arctic Circle.

In addition to the hopes of lower charges for air freight, plans are well advanced in Canada for extending both rail and road communications northward to tap the Yukon Territory. This would open the way for spurs running off to Juneau, the capital of Alaska, and to other settlements of the south-eastern archipelago. So far Canada has resisted suggestions that it should pave more of that part of the Alaska Highway which is in its territory to bring this up to the standard of the road at its northern end. But, even so, goods are moving over the highway in steadily increasing volume from the United States and Canada to Fairbanks and Anchorage. More goods are also being transported by water now that there are more barges in service on the all-season Inland Passage from ports in Oregon, Washington and British Columbia.

Much of Alaska's economy today depends on the state's importance as a military base. About half of the approximately 110,000 persons employed are military personnel or federal government

employees directly supporting the uniformed services. Many other thousands in the construction industry, in trades, services, and professions owe their livelihood to the presence of the military: Alaska's long-distance telephone and telegraph service, for example, is operated by the Air Force.

Yet this rugged state has a large unrealised wealth in minerals. Some of the gold which the name of Alaska conjures up is still being extracted, but the big mines stand idle because of the low, pegged price of the metal. At least 100 billion tons of coal await economic exploitation. There are deposits of mercury, tin, copper and other metals which lack only an economic link to markets. Perhaps the most promising of all these riches beneath the soil are the reserves of petroleum and gas. Commercial wells have been drilled on the Kenai Peninsula west of Anchorage, and there are possibilities of other rich fields north of Fairbanks. Moreover, Alaska's rushing glacial streams could produce at least 20 million kilowatts of hydro-electric power, less than 1 per cent of which has been developed so far. The problem is to find the manufacturers to whom low-cost electricity is a major consideration and for whose products markets can be found, either in Alaska or, economically, on the "outside."

The most obvious Alaskan resources—so obvious that they are often overlooked as economic assets—are its unprecedented attractions for tourists. The scenery is spectacular and fish and game are plentiful everywhere. Anchorage and Fairbanks have very modern hotels and motels, although not nearly enough of them for the conventions that might well choose to meet in Alaska if they could be accommodated there. One day Alaska may strike a vein of tourist gold as rich as that of the fiftieth state, Hawaii. Some Alaskan businessmen, however, grumble because they feel that too much is made of the polar bears, the Eskimos and the glaciers. Stressing Alaska's wilderness, they argue, will not attract the money so urgently needed to develop industries. The need for investment capital is almost as great as the need for better communications with the world outside. Interest rates are high, as much as 2 per cent above those prevailing in the states below the Canadian border.

The best short-term industrial prospects appear to lie in the fisheries and the forests, neither of which need ever be exhausted. For many years fishing has been Alaska's most productive activity, yielding more in dollar value than all its other primary industries combined. But the forests have begun to gain on the fisheries. On the islands and steep hillsides of south-eastern Alaska stand billions of board feet of hemlock, spruce and cedar, mostly on land designated as National Forest. Federal officials have marked this off into four huge areas, each capable of supporting in perpetuity a major pulp and lumber industry. Private firms have acquired the exclusive right to exploit these timber resources on two conditions: that they will complete the initial processing of the logs in Alaska and will manage the cutting on a "sustained-yield" basis—that is, taking no more than can be replaced by new growth.

Of special interest is the arrangement with the Alaska Lumber and Pulp Company, which has opened at Sitka a cellulose pulp plant with a capacity of 400 tons a day. The firm is a subsidiary of the Japanese Alaska Pulp Company, Ltd, of Tokyo. Seventy-five per cent of the $60 million invested at Sitka is Japanese capital; the rest comes from the United States. The American government encouraged the Japanese investment. Japanese have also been exploring actively the possibilities of developing Alaskan coking coal, iron ore, petroleum and copper. Alaskans have high hopes of the big Japanese market, with its need for raw materials and its relative nearness.

The new state has many problems to solve. Although its population has gone up 74 per cent since 1950, it is still only 220,000 or so and demands for public spending are high, as is usual in a frontier society. There are few roads, and to build them and to provide other public services will put a heavy burden on the individual taxpayer. The schools are an example. Alaska's population is young; the median age is 26 compared with 30 for the United States as a whole. The birthrate is high, about 40 per 1,000 compared with an average of 25 for all the 50 states. One out of every five Alaskans is at school.

Such problems are typical of a frontier community and Alaska, although it has many modern office buildings, streets and services, is still, in many respects, at a stage of development through which older states in the Union were passing a century ago. But Alaskans are tough and are not dismayed by their difficulties. And most of them still seem to think that such challenges can be tackled more successfully now that they are one of the co-equal states than they could have been if Alaska had remained a colonial outpost.

Stitch in Time?

Workers in the needle trades are at last taking a tuck themselves in the rising tide of imports of textiles and clothing which threaten their jobs. In Virginia they are on strike against the Kenrose Manufacturing company—which claims that it makes 6 million $2.98 dresses a year, more than anyone else in the world—largely because the firm has an interest in a similar plant in Ireland, where wages are lower than they are in Virginia. The International Ladies Garment Workers' union, noting that these Irish dresses are to be sold in the United States, wants the company to compensate its workers in Virginia if their earnings suffer from such competition—though no compensation was paid to workers in New England when textile and clothing firms moved south to take advantage of low wages there.

A number of American companies are taking advantage of lower foreign wages by manufacturing abroad and bringing the products—typewriters, for example—back into the United States. But textiles and clothing are a particularly sore point and sorest when it comes to imports from Japan, where men work for 14 cents an hour compared with about $2 in New York. Japan is now sending about $330 million worth of textiles and clothing a year to the United States, approximately a third of the $1 billion worth of exports it sells to Americans; ten years ago the total was less than $200 million. Angered by its failure to obtain enough relief from the American government, the Amalgamated Clothing Workers' union has now authorised direct action such as strikes, boycotts and refusal to work on Japanese materials in order to stem the flow. Mr Potofsky, the president, hopes to persuade the manufacturers to order no more Japanese materials when present stocks are exhausted and is working with them to secure a world-wide, rather than country-by-country, quota on imports of clothing. The straw which broke the back of the Amalgamated—long a supporter of

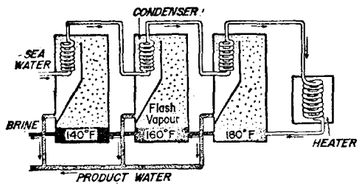
Water Running Out

FROM A CORRESPONDENT IN COLORADO

SOME time this summer a special Senate Committee is to report on America's water supplies—how much will be wanted and how much will be available—during the next twenty years. Estimates of consumption in 1980 have already been made: by then the eastern industrial area is expected to need 450 billion gallons of water a day and the states west of the Mississippi River 150 billion gallons; this is an increase of almost 150 per cent over current consumption. Other estimates are for a rather smaller increase but in either case if additional supplies cannot be found shortages of fresh water may check the economic growth of the United States. Experts have been studying the problem for years and various states and industrial communities have long been concerned about it; but the general public is only just becoming conscious of it.

The main trouble is that water has always been provided so lavishly and so cheaply, even in the semi-arid West where average precipitation is only about half that in the eastern part of the country, that people have been led into taking for granted, and thus wasting, what is a scarce and to some extent an irreplaceable commodity. In cities the householder obtains pure, fresh water for from 5 to 8 cents a ton, while in the dry west, paradoxically, water costs the farmer who uses it for irrigation far less—1 cent for three to four tons brought from the distant mountains right to his fields.

In actual fact effective use is made of only about 10 per cent of the 5.5 trillion tons of water which descend upon the United States each year. Of the rest, 70 per cent re-evaporates quickly and the remainder runs off into the sea. Obviously one way of dealing with the situation is by employing the available supplies of water better. This can be done, for example, by eradicating water-wasting plants such as the tamarisk, the manna-plant of the Bible, particularly prevalent in the dry southwest, or by lessening evaporation from artificial reservoirs. But of more immediate importance is the elimination of the casual attitude which has led people to regard the country's streams and rivers as natural rubbish disposal units, the place to get rid of everything from ordinary sewage to the ever-growing chemical and atomic wastes of today's industry. Eventually communities may draw fresh water from streams only to make up their supplies, re-cycling what they already have over and over again, in spite of many people's squeamishness about re-using their own waste waters.



SOONER or later, however, the United States will have to develop reliable methods of actually increasing its supplies of water. One possibility is to tap the ground water which lies under most parts of the country. But it is expensive to raise, much of it is too laden with natural salts to be usable as it is, and in some places it has already been largely exhausted. Another possibility is cloud seeding to increase the annual rainfall, particularly in the western mountains. The forests in these mountains might also be cut in such a way as to shade the snow-drifts or these might even be covered with some insulating substance, so that instead of evaporating in the sun they would be saved to melt into usable water in the summer when moisture is scarce.

But all of these suggestions take second place, in the public fancy at least, to tapping the ocean by freshening salt and brackish water—an enterprise upon which the Interior Department is now launched with $20 million authorised by Congress in order to find ways of getting costs down to practical levels. But where seawater is concerned, the ironic fact is that so far no process for freshening it promises to be as cheap as cleansing water polluted by man; yet cities which waste their sewage by piping it out to sea have been contending for one of the experimental plants for freshening salt water which are now being financed by the federal government.

There is little prospect that fresh water can be produced from these plants for less than 25 cents a ton, which is from three to five times as much as present prices of water to householders. Where water is merely brackish, however, to freshen it costs much less. Seawater averages 35,000 parts of minerals in a million, or 3.5 per cent, while brackish waters run only from 1,000 parts up to several thousand. Water containing 1,000 parts of minerals can just be tolerated by men and animals, but it is too salty for most plants, that is for irrigation, and not pure enough for the modern industries which are today's great users of water.

THERE appear to be only two basic ways of freshening water—to take the water away from the salts, by evaporation or distillation; or to take the salts out of the water by non-evaporative means. It requires a fixed amount of heat to evaporate a gallon of water whether it contains 1,000 or 35,000 parts a million of salts, and thus by such processes the cost of the redeemed water would be about the same whether originally it was salt or only brackish. On the other hand, if the water contains only a little too much salt, the surplus can be taken out by means of an electrical current which drives the ions, or electrically-charged atoms of sodium and chlorine, out of the stream of water through membranes which bar their re-entry. Less energy is required than for evaporation, and thus brackish water may be purified relatively cheaply by this electrodialysis method. It has been in use for some time to supply drinking water to various places, both in and outside the United States, and has been chosen for the demonstration plant in North Dakota which is one of two under the congressional programme to be built in the central region of the country, far from the ocean, where fresh water is short but brackish water often abundant. The other will be in New Mexico, using a process which is equally suitable for sea water, under which the saline water is converted into steam, which in its turn provides the heat to convert more saline water into steam and then condenses into fresh water.

The programme also provides for three demonstration plants on the three coasts of the United States to convert sea water and for various smaller pilot plants, some of which are already in operation. The site of the demonstration plant on the Atlantic coast is not yet fixed, but it will use one of the various freezing techniques under which ice from sea water is washed free of salt so that it is pure when melted. This process has several advantages, especially that of requiring comparatively little heat, which are likely to make it economically advantageous. The plant being built in southern California will have its heat provided by an atomic reactor and will employ a flash distillation process in which sea water is heated through pressure chambers (illustrated).

The final demonstration plant, on the coast of the Gulf of Mexico, will also use a system by which salt water is heated to steam under very high pressure and run through a series of long tubes with temperature and pressure being lowered gradually and pure water being removed progressively. The virtue of this process is said to be that, although the initial cost in energy is high, the "milking" of pure water produces a relatively low final cost for the total amount of the water that is drained off. Apparently none of the demonstration plants are to use the sun to evaporate sea water; sunlight supplies the energy free but a relatively vast area of salt water is necessary.

While all five demonstration plants are comparatively large, with capacities ranging from 1 million to 250,000 gallons a day, and are intended to test the most hopeful methods of converting salt water to fresh cheaply, there is no assurance that any of these methods will be chosen finally as the most economic way of supplementing America's water supplies. The Department of the Interior expects in fact that the plants will be obsolete almost as soon as they are finished and that by then systems which promise to produce fresh water even less expensively will be in the pilot plant stage.

International BTD-20
wins International acclaim!

Throughout the world, cost-conscious contractors acclaim the BTD-20—the *only* crawler of its size with six-speed, *full-reverse* transmission. The BTD-20 'dozes with 28,300 pounds of push, in first gear, or with 21,000 pounds in second gear, and backs out as fast as 8.4 m.p.h.—moving hundreds more yards daily! With its full range of job-matched equipment, the BTD-20 is providing the BIG power that gets BIGGER profits from the BIGGEST projects. Your International Construction Equipment Dealer will give you full details of the mighty BTD-20.

Salute to the Royal Society

Although Man is today on the threshold of his first journey into space, he has yet to explore the vast ocean depths of his own planet. Well over half the surface of the earth is covered by sea more than a thousand fathoms deep, and millions of square miles of ocean are three times deeper. The astonishment caused by the recent capture of living coelacanths shows how little we know of life in the dark depths that lap our civilisation; for these fish were believed to have been extinct for seventy million years.

Although scientific observations had been made at sea since the eighteenth century, modern oceanography can fairly be said to date from the Royal Society's *Challenger* expedition, which sailed from Portsmouth in 1872. During the next three-and-a-half years this corvette, with a scientific staff under Charles Wyville Thomson, F.R.S.—here seen in the ship's laboratory—circumnavigated the globe and sailed nearly 70,000 sea miles, a distance unequalled for a voyage of this kind. Throughout the long and often eventful expedition an arduous programme of observation and research was carried out, but the scientific task by no means ended when the *Challenger* finally dropped anchor at Spithead in 1876. Nineteen years elapsed before the publication of the last of the fifty massive volumes through which the results were made known: these are still standard works of reference throughout the world.

Today, oceanography is developing rapidly as it becomes more widely realized that its interest is equalled by its practical value. Knowledge of the deep ocean, where slow but immensely powerful flows of water match the swift tides and currents of the surface, is important not only to marine biologists but to deep-sea fishermen and oil prospectors, meteorologists and geologists, seismologists and submariners alike.

This is one of a series of special advertisements issued by Imperial Chemical Industries Limited as a tribute to the Royal Society in its Tercentenary Year, and as a public acknowledgement of the inspiration it has afforded to British Industry.

Packaged Packaging

NEW YORK

WHEN in April the National Packaging Exposition took over Atlantic City, a seaside resort famous for its annual show of beauty queens, there was even more variety in colour and shape to be found in the display of some 10,000 new ideas for packaging. These ranged from a push button spray dispenser for grated cheese to a plastic container with built-in smells to suggest the product within. As self-service stores have swept the country, bringing with them a demand for ready-packaged goods, and as housewives have become increasingly willing to pay for added convenience, the manufacturers of tins and jars, of bottle-tops and bags have doubled their sales in a decade; these are expected to reach $12 billion this year and, if price increases are discounted, volume has risen by rather more than half. Paper products—from the popular milk carton to the ubiquitous paper bag—still claim over 40 per cent of the market; tin cans take second place with 22 per cent of the total, followed by glass bottles and jars with 8 per cent. The plastic branch of the industry is now the fastest growing, but accounts for only 7 per cent of sales.

While there are between two and three thousand manufacturers today, the industry is rapidly moving towards a situation in which a handful of giant companies, each producing a full range of packaging materials, do most of the business. Bigness *in itself* is by no means new to this industry. Back in 1913, the American Can Company made 9 out of every 10 tins produced. Today it has a close rival in the Continental Can Company Inc., and these two split between them three-quarters of the market in tin cans. Glass jars and bottles are another area of heavy concentration, with one firm—the Owens-Illinois Glass Company—doing a third of the business and with most of the remaining market divided between half a dozen large producers.

In paper packaging a distinction has to be made between the paper companies, many of which produce newsprint and pulp as well as paper for packaging, and the firms which "convert" this paper into various types of packaging. At the latter end, with its lesser demands on capital, there are still many small producers, although in the last couple of years there have been a large number of mergers between the two branches of paper packaging. Plastic packaging is similarly split between the manufacture of containers, which is dominated by a few large companies, and that of flexible wrappings where large units are supplemented by hundreds of small companies.

THE distinctive development since the war has been not the accelerated trend towards bigness as such, but the spreading of the larger companies into all types of packaging. Continental Can boasted the first and fullest package of products, and today it is among the four largest producers of tins, glass containers, bottle tops, plastics and all the other major types of packaging with the single exception of milk cartons. American Can resisted this trend for some time, but in the last few years it too has broken out into most lines except glass. Both these companies had sales of over $1.1 billion in 1959, and they each account for about 9 per cent of the domestic market in all packaging materials.

This move to diversify owes much to the fact that the market for tins, while growing at a steady 3 per cent a year, is not growing fast enough to satisfy these two competitors. As costs of production have risen since the war, profit margins have been pared and several important users of tins have responded to higher prices by setting up their own can-making facilities; this trend started before the war but has been accelerating since. In the second place, companies look to diversification to protect them from changes in popular taste.

But the Department of Justice looks askance at this trend; it has one anti-trust suit pending against Owens-Illinois and two against Continental Can; one of these, to divest it of a glass company—the other concerns a merger with a paper packaging company—was to come to trial this week. As yet these cases (which have already been in the air for several years) had not had a generally restraining influence on the industry. But if the Justice Department should win it would be likely to try some more unscrambling in the packaging field.

Nevertheless, the packaging industry was in optimistic mood in Atlantic City. The tin can division has its eye on the postwar "baby bulge" which will soon be weaned to beer—and 40 per cent of all beer is bought in tins. This section is also encouraged by the definite trend toward tinned soft drinks; at present less than 2 per cent of the 32 billion units of soft drinks sold in the year are in tins, but this figure should rise to 7 per cent of the market by 1963. Makers of glass packaging expect their sales to go up with those of cosmetics, drugs and household cleaning products—and with the growing reluctance of supermarkets to return bottles to suppliers. While the market for conventional packaging should thus outpace the growth in the population, it is in the plastic field that the real boom is expected.

Continued from page 1211

free trade—was the announcement that Japan has set a quota of 120,000 men's suits for the American market this year. The American manufacturers and workers thought that they had persuaded Japan to accept a voluntary limit of no more than 30,000. But neither figure is large when compared with the 27 million suits which American manufacturers are likely to turn out this year.

Such pressure for more protection from a large trade union is something new and an embarrassment just as the United States is hoping to spur its own export drive by obtaining fresh tariff concessions this autumn at the meeting of the signatories of the General Agreement on Trade and Tariffs. Supporters of a liberal trade policy point out that Japan is America's second best customer (Canada comes first), and its chief ally in the Far East, and that it must trade with the United States now that it is cut off from its markets in China. But none of this pays the tailor's rent and the Administration is likely to try even harder to persuade Japan to set, and abide by, stricter "voluntary" limits on such exports to the American market. Luckily, Japan has developed other exports. But this is not true of such places as Hongkong, Formosa and the Philippines.

SHORTER NOTES

Reformers in the Democratic party in New York City have driven another nail into the political coffin of Mr De Sapio, the boss of Tammany, the Democratic machine in New York County. They opposed five of his candidates and defeated four of them last week. The reformers, under the leadership of such liberals as Mrs Roosevelt and ex-Senator Lehman, have been fighting "bossism" in the person of Mr De Sapio since 1958 when he forced the party to accept as its senatorial candidate one of his nominees, who later lost the election. Encouraged by last week's victories the reformers hope to replace Mr De Sapio as a member of the Democratic National Committee this year and as head of the machine next.

* * *

A recent survey found that the cost of four years' professional training to the average medical student was $11,642 and that over 80 per cent of his financial resources came from parents or other relatives. Thus medicine as a profession is practically closed to students whose families have incomes of under $5,000 a year.

THE WORLD OVERSEAS

Mob Rule for Japan

FROM OUR TOKYO CORRESPONDENT

Wednesday.

JAPAN'S equivalent of the chief commissioner of Scotland Yard, Mr Zenjiro Horikiri, told the Japanese cabinet after the mobbing of Mr Hagerty at the airport that he could not guarantee President Eisenhower's safety and they had better postpone the visit. It is reported that Mr Horikiri was told that "it's too late to consider such a proposal now." No wonder, perhaps, that Americans in Tokyo have been nervously biting their fingers or that 59 Japanese university professors who strenuously declare themselves to be "pro-American Christians" have begged President Eisenhower by letter to beg off his trip. If the President does not do so, it will not be because his advisers, including Mr Hagerty, are supremely sure that traditional courtesy and friendliness will reassert themselves in Japan before June 19th, but because the President and his advisers are determined to preserve "face."

The Japanese police did not acquit themselves well in the Hagerty affair. They gave it as their opinion beforehand that the demonstrators would not attempt to molest the President's representative or the American ambassador, though the ambassadorial car might be somewhat slowed down on its way into Tokyo from the airport, by the density of the crowds. When a mob halted the car less than six hundred yards from the airport terminal, and proceeded to beat it with sticks and to break its windows with stones while rhythmically chanting "Yankee go home," it took the police seventeen minutes to cover the six hundred yards—and they did not move to the rescue until an American official fought his way through the crowds to fetch them. In the upshot, it was the demonstrators' own leaders, not the Japanese police, who persuaded the mob to give up trying to wreck the Hagerty-MacArthur car. Had the leaders chosen to urge the mob on to worse things, the crowd would probably have obeyed. But the Japanese Socialists' purpose had been achieved. They set out to humiliate, but not to destroy, the President's representative and the American ambassador; and they succeeded.

The following day, Saturday, was in its slightly less spectacular way an even bigger victory for the demonstrators. From dawn until close to midnight, the Socialists, trade unionists and students effectively controlled the giant city of Tokyo. The fact that their behaviour on the whole was non-violent hardly lessens the significance of the helplessness of the authorities. The demonstrators besieged the Diet and the prime minister's official residence next door; watched by thousands of police on guard over the barbed-wire encircled Diet building, the crowd halted a busload of supporters of Mr Kishi and manhandled some of them. There were more crowds singing and dancing all day round the American embassy. And a vast crowd surrounded Mr Kishi's private home, six or seven miles away in Shibuya, and amused themselves by painting its wooden gate red and then destroying it. Almost forgotten amid the turmoil, Mr Hagerty held a couple of conferences with Japanese officials (he met neither the prime minister nor the foreign minister) then slipped away from his hotel in a fast car to catch his aeroplane which had been shifted from the international airport to an American air base thirty-five miles outside Tokyo.

Demonstrators wait outside American embassy.

At his press conference after he had been rescued from his marooned motor-car by an American Marines helicopter, Mr Hagerty had stated his opinion that the demonstrators were, or at least sounded like, Communists. Though he gave as his rather odd reason that they were singing the Internationale, Mr Hagerty is in fact probably quite right. The students who took part in the attack were the pro-Russian, or "moderate," faction of the students' federation, Zengakuren. The main faction, however, are Trotskyists who are much more extreme (they think that Mr Khrushchev and President Eisenhower are both "enemies of the working-class") and who have already announced their intention of being on hand to try to give the President an even warmer reception than the "moderates" gave Mr Hagerty. And the real organisers of these demonstrations (which are very well organised indeed) are almost certainly not Socialists but dedicated and highly trained Communists, who do not care a fig if one student faction calls itself "Trotskyist" and another pro-Khrushchev, provided both do what the communist organisers want them to.

In fact, both do, and so also do the Japanese Socialists and the Japanese trades union federation, Sohyo. Both the Socialist and Sohyo leaders regard what they call "American imperialism," as the "common enemy" of Japan and communist China and both sets of leaders are, or claim to be, fervent believers in a class-war. These leaders, and their backroom communist manipulators, are able to launch at will demonstrations which in Tokyo can now muster some 100,000 persons prepared to carry placards with such slogans as "We Dislike Ike," and perhaps three times that number throughout the rest of Japan.

These numbers might not be regarded as excessive, since Sohyo alone has some three and a half million members, were it not for the melancholy fact that the great majority of the Japanese people seem resigned to merely deploring the demonstrators' more turbulent activities, and that the Japanese police are either unable or unwilling to compel the demonstrators to obey the law. It is simply not true that if elections were held tomorrow a majority of the Japanese people would vote Mr Kishi out of power. But it is true that those Japanese who will vote for Mr Kishi when alone in a booth with a ballot are not prepared to defend him even with their mouths when confronted by an aggressive minority in a public place. This basic fact about Japanese postwar democracy is what makes all the apologies to America that the Japanese newspapers are now busily publishing seem a trifle irrelevant; it also creates justified apprehension among both Americans and friendly Japanese about President Eisenhower's visit.

If—even now at this late date there is still an if—President Eisenhower were to keep his appointment with Japan, one million people would turn out to welcome him; but the obverse side of the medal is that he and the emperor would have a guard of 25,000 policemen, or one-fifth of Japan's total force, while 15,000 Japanese soldiers would be standing by. These precautions are not excessive in view of Tokyo's continuing and worsening demonstrations by students who appear to have abruptly reverted to Kamikaze fanaticism; even the Communists, who are inciting the students, temporarily lost control over them during Wednesday's wild scenes around the Diet. Whether the president fulfils his engagement or overflies Japan will, however, not save Mr Kishi, whose departure is now regarded as a foregone conclusion by all. A dissolution of the Diet after a brief recess is now likewise held to be inevitable. Japan faces its gravest postwar crisis.

The Algerian Seesaw

FROM OUR PARIS CORRESPONDENT

FRENCHMEN must by now be getting accustomed to, or impatient with, their political version of the Finnish sauna. They are submitted alternately to the warm rays of hope and the chilly impact of gloom. At irregular intervals they are assured that the Algerian war is rapidly coming to an end, only to be reminded shortly after that a peaceful settlement is not to be expected for a long time to come. Since declarations of policy are now confined to presidential pronouncements, General de Gaulle's speeches have been turning points.

In February, covered with the laurels of his apparently triumphant resistance to the Algiers *putsch*, General de Gaulle travelled through the south of France declaring that peace was in sight. Shortly after, he crossed the Mediterranean and used different language to the French officers serving in Algeria. He told them

Soviet Oil Flows West

TWO years ago the Russian leaders announced that the Soviet Union was to follow the American example in fuel consumption and switch from coal to oil and natural gas. This radical change is now gathering speed. Geologists are busy prospecting, new strikes are continually being reported and pipes are being laid throughout Soviet territory. The output of natural gas, which was negligible a few years ago, is expected to reach 53 billion cubic metres this year and the planners have just revealed their ambitious targets for the future: by 1980 Soviet production should reach 650 to 700 billion cubic metres, or about twice the present level of output in the United States. The extraction of crude oil is also to develop rapidly; it is scheduled to reach some 235 million tons in 1965 and about 400 million tons five years later.

These are not merely paper plans. Soviet output of crude oil rose from 98 million tons in 1957 to over 129 million tons in 1959 and this year is expected to exceed its planned target of 145 million tons. Future rapid expansion seems to be assured by new discoveries of rich deposits. Baku long ago lost its position as the main source of oil in favour of the oil-bearing regions of the Urals and Upper Volga, which were nicknamed the "second Baku." Now it is claimed that successful strikes in Central Asia, particularly in Uzbekistan, have revealed resources as rich as those of the Middle East. Mr Antropov, the minister of geology, has also claimed recently that the oil reserves of the Caucasian depression (the Karakum desert in the Turkmen republic) should prove at least equal to those of the Gulf of Mexico. Prospectors are now turning their attention to distant Siberia, where some successful strikes have already been reported. The tapping of oil resources here could speed up the development of this fast growing new industrial area.

Soviet planners do not seem to be worried about the extent of their country's oil reserves. Since natural gas is fulfilling an increasing share of home requirements, the Soviet output of oil grows faster than the internal demand, leaving surpluses for export. According to Mr Patolichev, minister of foreign trade, Soviet oil exports rose from 4 million tons in 1953 to 25 million tons last year. A study published in the April issue of *Petroleum Press Service* estimated the total 1959 oil exports from the Soviet block (including therefore, Rumanian as well as Russian shipments) at nearly 17 million tons. Nine-tenths of these exports to the non-communist world were shipped from the Black Sea. The Russians are now building a new pipe-line and modernising the Lithuanian port of Klaipeda to transfer some of these shipments to the Baltic. But the major project is the construction of a pipe-line, nearly 2,800 miles long, to carry oil from the Volga region to the European members of the communist block, all of whom, except for Rumania, have few petroleum resources of their own.

This giant new pipe-line is to start from the Kuybyshev region in the second Baku. It will then run in a single line across Soviet territory to the Byelorussian town of Mozyr. There the line will divide. Its southern branch will cut through the Carpathians and take oil to Czechoslovakia and Hungary. The northern branch will run for nearly 750 miles across Poland and eastern Germany. The planned capacity of the line has not been revealed, but it can be estimated from other data. The Poles, for instance, expect to get some six million tons of crude oil a year for the refining and petrochemical centre to be erected at Plock on the Vistula. Soviet supplies of oil to the German Democratic Republic are to exceed that figure in the mid-sixties. Taking Czechoslovakia and Hungary into account, it is fair to assume that the annual throughput will be in the region of 20 to 25 million tons when the line is completed.

WORK is scheduled to be completed at the close of 1963. All the plans and agreements were signed at the end of last year and preliminary work has already begun; a few miles of pipeline have already been laid in Poland. Poland is to provide some of the pipes, and Germany pipes and pumping material. The Hungarians are to supply instruments for automation, and the Czechs some heavier equipment. The Soviet Union should be the main supplier and is expected to help with its expertise and to provide the more complex pieces of equipment. Each country will be responsible for laying the pipes in its own territory, but all the projects have been dovetailed and synchronised in Moscow under the auspices of the Council for Mutual Economic Aid, better known as Comecon. The "construction of friendship," as the pipe-line is now called in the Soviet press, is to be the showpiece of the communist common market.

that he had no hope of a negotiated settlement, warned them that the conflict would be long-drawn-out, and advised them to capture the weapons that the insurgents did not want to lay down. The general kept quiet in the following months. During that time the army was able to recover its poise after the shock of the Algiers rising, the settlers had a chance to regain some of their hopes, and the disappointment of the majority of French people showed signs of turning into impatience.

On Tuesday, in a televised broadcast, General de Gaulle once again sounded an optimistic note: never, he said, was France nearer to a real solution. His restatement of Algerian policy was tucked away at the end of a rosy description of the French economy and its bright future. In substance, the general's policy seemed to contain little that was new. He reiterated the promise of self-determination that he first made on September 16th, and urged the insurgent leaders to come to Paris to settle "the destiny of weapons and the fate of the combatants": in other words, a cease-fire. The one novelty was the assurance that representatives of groups of all shades and tendencies would be allowed to take part, not only in the electoral campaign, but also in supervising the voting in the actual referendum on Algeria's future.

IN a Gaullist exegesis the tone, the shades of meaning and even the omissions have their importance. The tone this time was conciliatory. The speech contained no humiliating references to surrender and M. Ferhat Abbas and his colleagues were politely addressed as "leaders of the insurrection." The omissions seem even more significant. The speech contained no reference to army supervision of the vote; it did not specifically exclude the possibility of discussing the actual terms of the referendum with the insurgents; and it made no mention of the period of four years which he said in September must elapse before the vote takes place. Are these silences explained by the brevity of the statement or were they intentional, marking a shift in policy in order to facilitate negotiations?

The answer to this question is of the utmost importance when the position of the insurgents is understood. The Algerian government-in-exile has dropped its demand for prior recognition of Algeria's independence. It accepts the principle of self-determination and it agrees that the fate of Algeria must be decided by the free vote of the Algerian people. But it claims the right to discuss the terms and conditions of such a vote before laying down its arms. In other words, the insurgents want to combine the talks about a cease-fire with negotiations about guarantees for the referendum. They restated their policy as recently as the end of last week in Tunis. Since the policy of the Elysée is shrouded in secrecy, one is reduced to something like guesswork about its future course. If the general's speech was preceded by secret contacts in Tunis or elsewhere, the omissions in it could enable the leaders of the insurrection to come to Paris and discuss in a practical way the terms of the referendum without making a fuss about it or provoking the wrath of the French army. If, as seems more probable, they have received no guarantees, then they are likely to repeat their demand that the Paris talks must be concerned with a discussion of safeguards for the vote. The key questions about how and when the referendum is to take place and who will supervise the vote will once again come to the fore. Will General de Gaulle's invitation to Paris still stand if the Algerians insist on discussing more than the conditions of a cease-fire? And will the French army, in that case, accept the risk of a rebel victory at the polls? The forthcoming weeks should provide some answers.

There are differences of opinion over the general's method of alternating hope and disappointment, advances and retreats. The French liberals are still confident that he is practising "salami" tactics, that he will remove all the army and settler resistance layer by layer. The doubters reply that these tactics only lead to missed opportunities and yield diminishing returns. Outwardly, his negotiating position now seems less comfortable than in early February after the collapse of the Algiers rising. The army officers, who had proved in January that they alone determine the success or failure of a settlers' revolt, have had time to recover from the purge that followed in their ranks. MM. Soustelle and Bidault have had an opportunity to orchestrate their protests against the betrayal of French Algeria. The collapse of France's African community, the logical, if rapid, transformation of what was intended to be a federation into a loose association of states all claiming their independence, enables the right wing to prophesy that any intermediate solution in Algeria will rapidly lead to independence there. The Right now issues this warning more vociferously than it would have dared four months ago.

But the war, with its vicious circle of terrorism, repression and torture, has provoked growing protests on the left and among the intellectuals. Popular meetings against the Algerian war have gathered some momentum. The government must have been particularly sensitive to the obvious disappointment of the Mollet Socialists and to the growing opposition among young people, illustrated by motions of the French students' association demanding negotiations with the rebels. It would be entirely wrong to suggest that General de Gaulle's policy is dictated by a wave of popular pressure. The changing mood is simply the result of the passing of time.

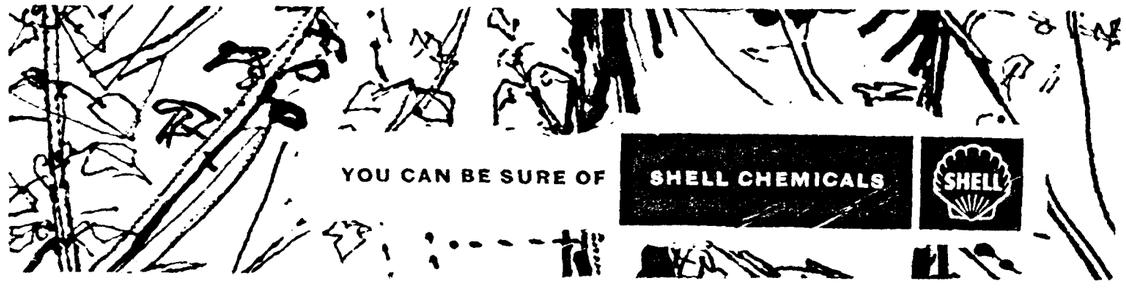
Two years ago a France frightened of civil war chose a monarch who was going to solve the Algerian conflict for it. Several times since then Frenchmen have thought that their wish was coming true. Each disillusionment has spread rather wider the feeling that to achieve their ends they must take part in the political drama and not merely watch it as spectators. The outcome of General de Gaulle's new initiative should not only show whether his tactics have been wise and farsighted. It will also throw light on the very nature of the regime and its prospects of retaining the support of a majority of French opinion.

High Stakes in Morocco

BY A CORRESPONDENT LATELY IN MOROCCO

TWO months ago, when Mr Ibrahim's government was known to be nearing its end, the Moroccan deputy prime minister, Mr Bouabid, gave an interview to a correspondent of the *New York Times*. The only alternative to constitutional government, he said, was the specific acceptance of responsibility by the monarch, ruling either directly or through the most feudal and traditional elements in the country. Coming from one who had been finance minister in all four previous Moroccan governments and who is the leading exponent of left-wing views, the challenge was not to be ignored. King Mohammed did accept it; the new government that he appointed on May 23rd does not correspond at all to political feeling as represented by the two main parties. The king has himself assumed the office of prime minister and has appointed the crown prince as his deputy. In the choice of other ministers devotion to the throne has been given first place. The Istiqlal has limited representation; the leftish National Union of Popular Forces (UNFP) none. On the other hand, the king has pledged himself to introduce a constitution by the end of 1962.

The greatest asset of the new government is that it will be able to act as a homogeneous body, as well as in harmony with the palace. The first government after independence had to be a coalition, in order to meet French insistence that power should not be handed over to an all-Istiqlal government. The second dropped the ministers from the minor party, the PDI, but retained an independent as prime minister. The third, under Mr Balafrej, was almost entirely Istiqlal; but it only served to show that the



Fruitful Solution

Northern Europe, springtime . . . and death. Death to millions of big bud mites (*Eriophyes ribis*). These insects feed on the blackcurrant crop and there may be as many as 10,000 in a single bud. Their continual sucking causes 'big bud' and this shortens the plant's bearing life and reduces its fruit yield . . . *unless the mites are checked.* Formerly, this was difficult. Now, at last, an effective way has been found.

Shell endrin is the answer. Sprayed on the crop in the early spring, it completely clears the bushes of blackcurrant mites. As a result fruit-growers are spared the expense of grubbing up infested, non-bearing plants. Instead they can look forward to twice as much fruit coming from endrin-sprayed crops as from infested ones. As the crop's profitability largely depends on a low level of infestation, growers everywhere have given a ready welcome to Shell endrin. Today this 'fruitful solution' is helping to increase blackcurrant crops in many countries of Northern Europe.

party, having achieved its agreed object of independence, had no consistent programme for the future. The left wing in particular objected to the fact that control of army and police remained a prerogative of the palace. Six months later, in December, 1959, the formation of a government in which both prime minister and deputy prime minister belonged to the left wing of the Istiqlal brought about a split in the organisation within a few weeks. In September, 1959, the formation of a new party, the UNFP, united the dissidents from the Istiqlal with others from the minor parties. Early this year, arrests made in connection with the alleged plot against the crown prince called public attention to the discord between the prime minister's office and the police. The left suspects the palace of stalling over the promised constitution, while the palace knows that there have always been varying degrees of enthusiasm for the monarchical regime within the Istiqlal.

With the crown prince now in the key position in the state, everything depends on the wisdom with which he exercises the powers that are now officially his—as some have claimed that they had already to a great extent been unofficially. There is no doubt about Prince Moulay Hassan's intelligence, wide interests and ambition; but there is less certainty about his capacity for sustained effort, as opposed to the energy which he displays in crises and to his enthusiasm for spectacular initiatives. He has never shown much interest in the pressing problems of the Moroccan poor. He may, too, find it hard to resist the blandishments and demands of his less scrupulous partisans. As regards economic policy, Mr Douiri, the new finance minister, is not likely to be in a hurry to get rid of the team which Mr Bouabid had chosen to work the controlled economy at which he was aiming. He will, however, probably favour increased co-operation with the West and be more disposed to encourage foreign investors.

MEANWHILE, the long promised municipal and communal elections have given the expected results. In the countryside a relative indifference to politics, combined with the system of voting for single candidates instead of for party lists on which the palace insisted, has not revealed any special trend. Voting in the cities, on the other hand, has confirmed that the Istiqlal is strong in the urban centres of traditional culture and the UNFP in the new industrial and administrative capitals, Casablanca and Rabat. Sure of the support of the workers and of a good percentage of intellectuals, the ex-prime minister, Mr Ibrahim, and the ex-deputy prime minister, Mr Bouabid, will be able to form a strong opposition; they will no doubt be able to count on the support of the influential leader of Moroccan labour, Mahjoub ben Seddiq, and at least on the long-range support of Mehdi ben Barka who may now feel less disposed than ever to leave his refuge in Paris. At the best, such an opposition may serve to keep the government up to the mark. At the worst, it may provoke repression which would probably rebound against its authors. Mr Ibrahim has already said that if there is an attempt to "substitute feudal for colonial *contrôleurs civils*," then "those who live in your midst, who know you and know your misfortunes, will know how to defend you." A strong demand for a constitution and parliament, long before the end of 1962, is by no means impossible.

This situation is an inevitable outcome of the protectorate which preserved the theory that the monarch was an absolute ruler, though in fact his position was then merely a facade behind which French officials worked. When French authority was removed, the absolute power became once more a reality—but also a complete anomaly, all the worse for being placed in a constitutional vacuum. The protectorate also failed to train anything like enough Moroccans to work the modern administration which it created. Thus the technical weakness of the administration since independence has made it very difficult to execute any national policy. The gap between aspiration and performance is a constant source of frustration. In these circumstances, none of the governments since independence has had the drive to overcome the Moroccan tendency towards an amiable laissez-faire.

Faced with a somewhat disillusioned people and a rather hungry proletariat, the king has put all the weight of his very great prestige, nowhere yet openly challenged as far as he himself is concerned, behind the new government; and he has given the heir to the throne a task on which not only the prince's own future must depend, but possibly also that of the monarchical regime itself. The stakes are high.

Gatt's Challenge to Atlantic Co-operation

FROM A CORRESPONDENT IN GENEVA

THE sixteenth session of the General Agreement on Tariffs and Trade which ended in Geneva last week dealt with the usual mixed bag of world trade problems. But through many of the discussions there ran a familiar theme—the disquiet and anxiety of the less developed countries outside the north Atlantic area with the policies and new forms of organisation which their rich industrial trade partners are developing.

The surprise of the session was the discussion on the Paris economic meetings. The executive secretary of Gatt, Mr Wyndham White, had been invited in January to present his views to the group of four men who have submitted proposals on the future of the Organisation for European Economic Co-operation and to take part in the activities of the committee of twenty-one on trade problems. Mr White cautiously stated the possible advantages of a reorganised OEEC. But he naturally took due note of the interests of non-European governments and suggested that a revised OEEC should not move beyond consultation in the fields of financial and trade policy and should avoid the impression that a "rich man's club" was being created.

Mr White made these points in Paris without previous consultation with the members of Gatt. They have, however, now underlined them with surprising vehemence. Latin American countries thought that co-operation by western Europe to help underdeveloped countries would mean that aid would go to those countries traditionally linked with Europe. The largest underdeveloped area in the western world, Latin America, would thus go short of help. They therefore made a strong plea for representation in the new Organisation for Economic Co-operation and Development. Practically all non-European and North American countries pointed out that an organisation of such economic weight as the proposed OECD must inevitably affect world trade and impinge on world policies; non-represented countries therefore have a major interest in being associated with the new organisation.

But this immediately raised the question from Latin American, African and Asian representatives: "Are not these matters better discussed in Gatt itself?" Australia made the point that since OECD would represent a very powerful proportion of the total Gatt membership, its views, if unanimously adopted, could virtually commit all the members of Gatt before they had had a chance to discuss them properly. This was a serious threat to the existence of Gatt itself. The Japanese representative pertinently asked why, if the only function of OECD was to be consultation on economic policy, such consultation should not be extended to all important free nations? Why, too, should it be done by a new special body when Gatt is well able to do the job?

The Europeans and the North Americans were taken by surprise both by the strength of the criticism and by the importance attached by all non-European countries to these new plans. The clash showed once more that Gatt is the only forum where all

countries of the free world can discuss their trade problems. Mr White's hand has certainly been strengthened in his efforts in Paris to keep action within the trade field a Gatt prerogative. Unwittingly, perhaps, the non-European countries have thus lent additional support to the French view on this issue.

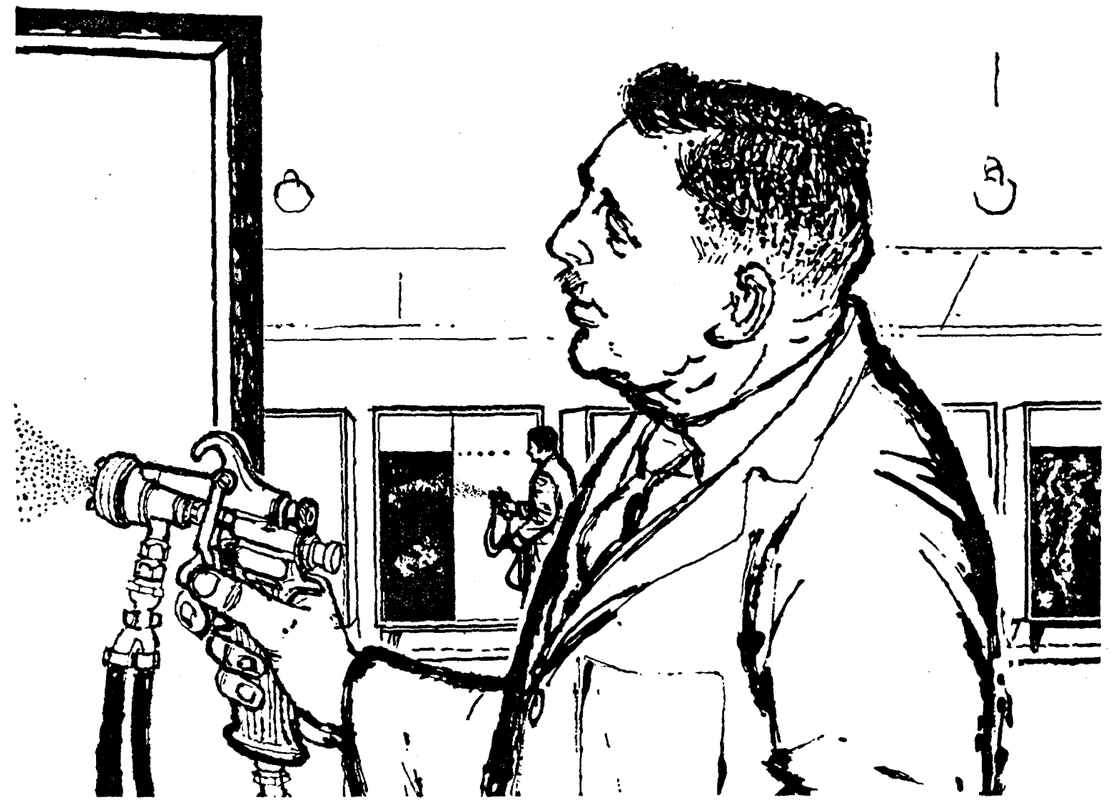
The discussion on the European Free Trade Association in committee was certainly not as friendly as the first public statements suggested. This applied particularly to criticisms made by the United States; some are interpreting its policy in the trade field as one of divide and rule. There seems to be practically no one who considers the exclusion of agriculture from the EFTA agreement to be in conformity with Gatt. But as agricultural policy in the common market has not yet been settled, the members of Gatt did not wish to create a precedent by settling the EFTA agricultural question first. Commonwealth countries found themselves in a dilemma. To approve EFTA's agricultural arrangements because they already have a favourable market in England would give the common market countries the right to ask for a similar blessing.

Preliminary discussions seemed to show that the Seven will have to ask for a Gatt waiver in order to maintain the exclusion of agriculture from their association. This will mean that EFTA countries will have to report periodically to Gatt on their agricultural policy and that a time limit will be set to the exclusion of agriculture from the association. The final outcome will, however, be very much determined by the common market's agricultural policy and Gatt's attitude to it.

Gatt continues to battle with what appears to be the hopeless problem of world agricultural policy. Many countries feel that the mere existence of a forum where they can plead their case against agricultural protectionism is important in itself. But agricultural exporting countries consider Gatt to be more than a talking shop. Personal contacts with representatives of ministries of agriculture and fisheries, direct criticism of agricultural protectionism, collection of information on types and methods of protection, all lead, they say, to a gradual thaw. Despite all the difficulties, and despite the desire of industrial countries to slip off to a safe place in Paris where agriculture can be safely set aside, Gatt is going on trying to find a world-wide solution for agricultural trade problems.

Brazil's Man with a Broom

FROM A CORRESPONDENT



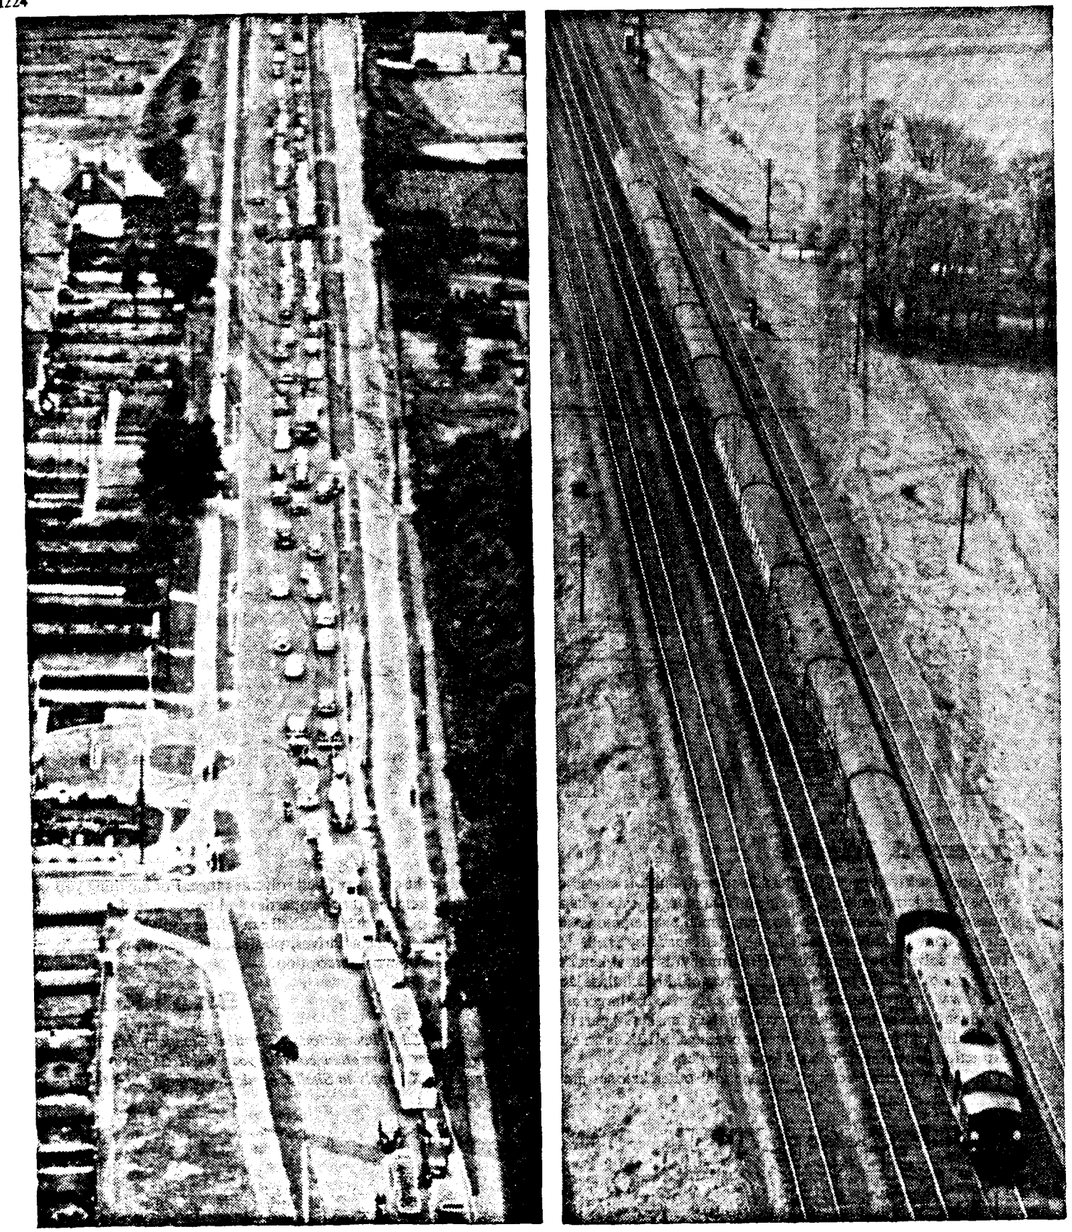
THE popular favourite for Brazil's presidential elections in October is an eccentric but extremely efficient former schoolteacher, Senhor Jânio Quadros. His political career began in 1947 when he was elected to São Paulo city council in opposition to the Social Progress party that then dominated the city. Despite his unkempt appearance and lack of party support, he worked so hard that even his opponents were impressed; in three years he introduced 2,000 measures, 250 of which were made law. In 1953 he was elected Mayor of São Paulo, with twice as many votes as all his opponents combined. The city, the largest in Brazil, was in bad shape, with apparently insoluble problems of transport, housing and finance. Senhor Quadros, working fifteen hours a day, reformed the municipal market, started numerous housing projects, and discharged several thousand superfluous employees. In less than a year he had balanced the budget, and even managed to raise fares without the usual accompaniment of riots and bus-burnings.

The new mayor remained in office less than two years. In 1954, after being expelled from his own Christian Democrat party, Senhor Quadros decided to run for governor of São Paulo, against the formidable opposition of the PSP boss, Senhor Adhemar de Barros. São Paulo, with one-sixth of the nation's 66 million inhabitants, is Brazil's most densely populated state. Senhor Quadros had never campaigned outside the capital, and he was opposed by all the major political parties, and by all the newspapers. He campaigned vigorously and alone, brandishing a broom at meetings as a symbol of his determination to wipe out corruption; to everyone's surprise he won the election. His administration of the state repeated, on a larger scale, his success in the city. When he took office, São Paulo was on the edge of bankruptcy, with a deficit of 6½ billion *cruzeiros* a year. Senhor Quadros discharged 11,000 redundant employees in a single day, cracked down on graft and established one of the most honest and efficient administrations in the history of Brazil. When he left office in 1959, São Paulo was in excellent condition, and Senhor Quadros, by now a national figure, was elected to the chamber of deputies.

Meanwhile Brazil's inflation has continued unchecked. President Kubitschek is criticised for relying on frequent wage increases, immense public works projects, and overtime use of the printing press. In four years the amount of money in circulation has risen from 70 billion *cruzeiros* to 160 billion. The *cruzeiro* has become one of the world's weakest currencies, selling at more than 200 to the dollar, but exports, discouraged by the unrealistic exchange rates, have continued to drop. The cost of living rose 50 per cent last year, but in his new year message President Kubitschek explained that "inflation always accompanies our process of growth," and that the only complaints against his spending spree came from "persons interested in political intrigue and disorder."

Popular anger against inflation has seriously harmed the presidential prospects of Marshal Teixeira Lott, the government candidate, although the International Monetary Fund has come to his aid with a six month credit to tide Brazil over the elections. The marshal, formerly minister of war, is an honest, conservative soldier, who has done much to preserve democratic government in Brazil. But he is 65, with mainly military interests, and he lacks the administrative experience, and above all the fire and drive of Senhor Quadros. Although he has strong official support, he is not backed to win.

Popular support for "the man with the broom" continues to grow. When Senhor Quadros returned to Santos after a trip around the world last year, he got one of the most tumultuous welcomes in Brazil's history. "The Phenomenon of Jânio Quadros," a hastily put together campaign biography, has sold four editions, and his followers have distributed millions of brooms, from the standard sizes to lapel-pins. Public support has come in from important politicians of every party, from mayors, deputies, senators, governors and even generals. While Marshal Teixeira Lott hesitates to make a public statement, Senhor Quadros is actively campaigning all over the vast stretches of Brazil, hard-working, unkempt and unpredictable; as one admirer put it, he is "a cross between Jesus Christ, Lincoln, Lenin and Charlie Chaplin." He looks like having a good chance of being Brazil's next president.



Lacquered lustre

The spray softly hisses . . . and a silk-smooth finish is misted on to a piece of modern furniture. This gleam and gloss that delights the eye owes much to nitrocellulose lacquers, much to the ketone solvents used in them . . . solvents such as the MIBK made by Shell.
Its high solvent power makes MIBK (methyl isobutyl ketone) particularly sought after by the manufacturers of nitrocellulose lacquers. The low viscosity solutions it gives enable them to use larger amounts of diluent, and so to reduce the cost of their finishes. Apart from its use in this and other types of surface coatings, MIBK is an excellent extraction solvent, particularly for antibiotics.
MEK (methyl ethyl ketone), acetone and other ketones are to be found in the extensive Shell solvents range. For anything you wish to know of ketones, their properties and uses—indeed, of any solvents—get in touch with Shell. Shell can advise you—and supply you with ketones, solvents, additives, plastics, detergents . . . with industrial chemicals of every description.

Shell Ketones

The choice is Yours

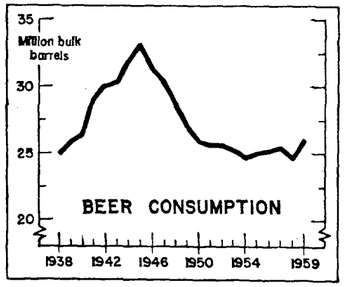
An announcement by BRITISH RAILWAYS

THE BUSINESS WORLD

Mild or Bitter

TWOPENCE a pint off the duty and the heat of the summer pushed beer consumption up last year. A few more swallows do not make for everlasting summer in brewing, but there is more hope than there was that the long decline in beer consumption may have been arrested. The big fall in consumption from its wartime peak came in the late nineteen-forties and over the last decade consumption has remained reasonably stable at between 24 million and 26 million bulk barrels a year. The growing number of young consumers and prospective changes in the licensing laws should help the brewers to hold on to a market of this size. But the prospect that the market might continue to shrink unless they do something about it has made the brewers wake up their ideas. The instrument of change has been, as it was in the past, the merger and the further concentration of ownership in the industry has brought economies in production and distribution.

Such big breweries as Ind Coope, Whitbread, Watney Mann, Flowers and Guinness have made the running and will go on making it, for, because of the size of their market, they are best able to judge and to exploit any changes in taste. Tastes have changed. Bottled beer has grown in popularity; nationally it accounts for nearly 40 per cent of all the beer drunk. Bottled sales dipped slightly in the last year or two, but the regional variations, with a 60/40 relationship between bottled and draught in the South and a 20/80 relationship in the industrial North suggest that there are still markets to be tapped. Fashion has recently swung towards the higher gravity and more expensive beers, away from the milds towards the bitters and pale ales; and it may be moving away from the cask-conditioned draught and naturally-conditioned bottled beers towards the chilled and filtered, lighter-coloured beers. Lager beers, which as yet take only a tiny proportion of the British market, appear to be growing more popular with younger beer drinkers; and the British industry is now making a determined effort to wrest control of that market away from the Danish and Dutch brewers. Ind Coope has put a lot of money into the production and promotion of "Skol" and among others Watney Mann and Whitbread have begun to sell it in their pubs. Mr E. P. Taylor, a newcomer to the British but not to the Canadian and American markets, has "Carling" to sell. Guinness is about to market a lager in Ireland.



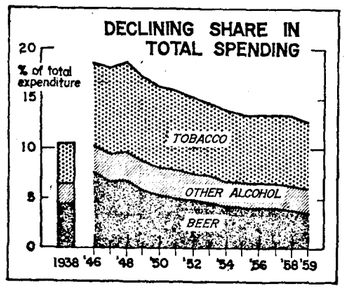
This changing market is served by an industry that, because of wide seasonal variations in demand, always has spare capacity on its hands in the dog days. Without any undue strain it could produce upwards of 30 million bulk barrels of beer a year. While it would be wrong to dub a fifth of the capacity "excess," it is right to say that some of the capacity, particularly that owned by small, local brewers, has not been used at its economic optimum, simply because the market has not been there. The desire to rationalise production in order to secure economies of scale and to reduce overhead costs by keeping the mash tuns full has led to mergers, and it is largely as a result of these amalgamations that the number of brewing establishments in this country has been reduced by about 100 in the last ten years or so to about 300.

HAVING spent money on improving the traditional batch process, the big breweries are leading the industry towards the threshold of a technical revolution. The idea of a continuous brewing process is not new, and no one seems very clear how exclusive some of the patents are. Russian brewers have been mashing and boiling continuously for some years, and New Zealand beer (of lager type) and some Canadian beer is produced by continuous fermentation. What the British industry is doing is to set up pilot plants to make the brewing process continuous throughout. Courage-Barclay is experimenting with continuous boiling and mashing, and Guinness is setting up a fully continuous experimental plant; both are associated with the Brewers' Society in their projects. Watney Mann is also installing a fully continuous plant, though the continuous fermentation plant is of its own design.

It may take five years before the industry makes certain that the fully continuous process has a commercial future. Enthusiasts believe that it has and are prepared to speculate about its economic implications. They argue that such a plant, because it saves production and storage space (and for lager beers also storage time) will cost less than a traditional plant to build and to run; that it will save labour, though this is not very important in a capital-intensive industry that employs only 70,000 people in brewing, compared with about 500,000 engaged in some way in the distribution of beer; and that it will ensure a more accurate and consistent control over quality.

It may, however, mean a beer that tastes different but less difference between brands. If the experiments succeed, an opportunity for reducing costs will be presented to the brewers. How far, however, will this overcome an understandable reluctance to scrap existing batch capacity ?

Continually the brewers have to balance the economies of large-scale production (which make for centralisation) against the costs of transport and distribution (which make for decentralisation). Beer in the barrel costs less to shift than beer in the bottle. But beer in the bottle has better keeping qualities. Much thought has therefore gone into the problem of reconciling the economies of centralised production, and a longer life for the beer, with the diseconomies of long-distance haulage. Canned beer has been introduced, but it is more expensive than bottled beer and apart from " sales of convenience " does not seem likely to command much of a market in this country. The answer for most of the big brewers seems to be at the other end of the scale—the bulk tanker truck. In these beer can be transported from the centralised brewery to the local bottling or casking plant or, even, to the local public house if it has specially installed tanks.



Bulk tanker delivery can also be used in the exploitation of the market for draught beers stored in a canister and sold in the bar under pressure. These have much the same taste and keeping qualities as bottled beers and several breweries —Flowers, Watney Mann, Whitbread and Guinness among them—have been actively promoting their sale. Opinion is divided as to whether or not these may become the beers of the future. Some argue that this market will be confined to the " special " and more expensive beers with a comparatively small turnover and that the high cost of the canister rules it out for really widespread use. Others reply that, as the wooden barrel is in any case on the way out, why bother to look for another substitute when the canister provides an efficient and acceptable solution for the brewer and publican alike ?

The public house is not the only point of sale for the brewer, but it is his most important one, especially for cask draught. As much as three-quarters of the brewing industry's fixed capital is tied up in public houses. It is a tie in more than one sense, for nearly 60,000 out of the 70,000 on-licensed premises are brewer-owned and their beers tied. The tied house is historically the result of the monopoly conferred by the licence and, though that particular link may now be weakening, the brewers, having invested so much capital in the public houses, are most unlikely to surrender control over these retail outlets. They would, however, admit that there are still too many pubs. About 3,000 have been closed in the last ten years, but that still leaves many that earn an inadequate return for both the tenant and the brewer. The series of mergers that have taken place have made it easier for the brewers to close down competing and uneconomic " pubs " and to spend money on those that have remained open. The sale of sites has released much-needed capital but the number of " super values " that can be obtained, except in busy shopping centres, can easily be exaggerated.

It is what they can gain in production and distribution, rather than from what they can gain as property dealers, that has made the brewers huddle more closely together, if not in outright mergers, under a protective umbrella put up by such a company as Whitbread. So far, the " headline " mergers—Barclay and Courage, Ind Coope and Taylor Walker, Flowers and Green, Watney and Mann—have been in the South and Midlands. But as the activities of Northern Breweries, Joshua Tetley and Scottish Brewers show, the habit is catching. The desire among many brewers to grow bigger can be honestly rationalised in terms of economic savings. But there are also competing ambitions at work and the thought that " if I do not do it someone else will "—and he might be an outsider.

Some groupings that are emerging are defensive: against competition from other industries for the customer's shillings; against intrusion from outside; and against each other, so as to balance bargaining strengths. Half the breweries in this country are still private companies but with the problem of death duties looming large the small brewer faced with the competitive thrust of his bigger brothers is finding it more difficult to resist the temptation to sell out, while the going is good. Some small local breweries will remain, but it seems likely that the industry will become increasingly dominated by big regional groups. For the time being many of the locally brewed draught beers will be kept on (and if the continuous process proves a success, that may give brewing on the spot a further lease of life). But the bottled and canister beers, on both of which a better margin is earned by the brewer, seem more likely to come from the dominant breweries.

Because they can bargain with each other on equal terms the regional groupings may lead to a wide interchange of beers for sale in the tied houses. That certainly is the aim of those brewers who have ambitions to be national in the sense that Guinness and Bass-Worthington are, in looking for sales in the free trade and other brewers' tied houses. Among those with such ambitions are Ind Coope, Watney Mann, Whitbread and Flowers. Their most potent weapon against the smaller brewery is direct advertising to the customer, and their most useful bargaining card with each other is the reciprocal trade agreement.

How far their ambitions will be gratified depends on their relative bargaining strength. Big concerns can create a demand for their brands by advertising and may thus force a weaker company's hand. But it costs money; and each individual national brewer is promoting his own beers in competition with others equally as powerful and as ambitious. All of them, big and small alike with the exception of Guinness, own public houses. Having locked away their capital in the pubs, they are all anxious to ensure that the margin they get, whether from their own beer, some other brewer's or from wine, spirits and soft drinks, is under their control and gives them an adequate return on the money they have invested. To let another brewery sell in one's own tied outlet often means a fall in the sale of one's own beer and the brewer who owns the pub wants a cut of the profit. Guinness has always got round this problem by offering the local brewery the bottling profit as well as a wholesale margin. However reluctant they may be to give up the bottling profit, the other brewers with a big output may have to do so—first, to save in distribution costs and, secondly, to secure enough outlets.

In a market that is not likely to grow very rapidly the brewers are continually juggling with a number of variables. What they may gain from large scale and full capacity in brewing may be lost in part in higher transport costs. What they may gain from a more rational pattern of distribution may be lost in part in higher promotion costs. Thus while the big groups may gain in income at the expense of the smaller breweries, competition between themselves will keep margins down. The total profits of the industry cannot therefore be expected to rise exceptionally quickly. The industry, moreover, will still need capital: the bulk tanker costs more than the dray, the canister more than the barrel, the can more than the bottle, and the new public house-cum-restaurant more than the old beerhouse.

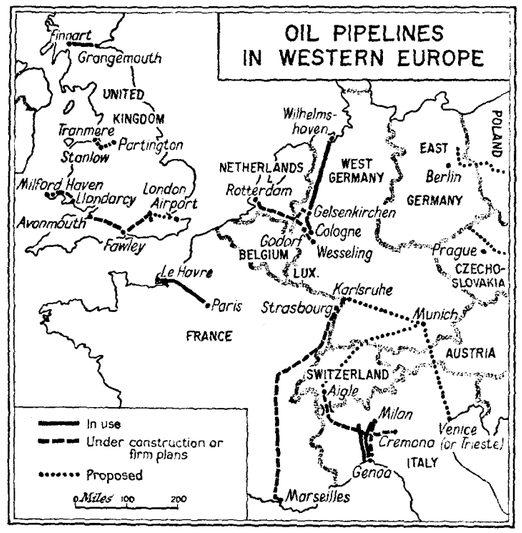
Recently, the gross return that the big and medium sized breweries have earned on capital employed has fluctuated between 15 and 18 per cent, with the very big brewers securing a slightly higher return than the others. If the big groups in the industry can keep the return close to 18 per cent in the future they will have no reason for self criticism or self doubt. But for the shareholder, who has seen yields brought down by the prospect of mergers, that does not seem to hold out the promise of any rapid growth in capital values. He has this consolation: the best companies in the industry are now governed by scientific and managerial intelligence, rather than by intuition and family traditions, and they are more efficient and lively than they were ten, or even possibly five, years ago. A mild, rather than a bitter, prospect confronts him and the industry—though the beer itself may be bitter rather than mild.

Pipelines Arrive in Europe

Whenever any new long-distance transport route is laid down, it inevitably cuts across many people's private property ; but few such routes, nowadays, are themselves also private property. This, ostensibly, is why certain MPs backed by a number of local authorities and landowners (and by the Society for Individual Freedom) are opposing a private bill now in committee in Parliament that would give the Esso Petroleum Company powers to acquire compulsorily a right of way across land on the routes along which it intends to lay a 12-inch pipeline from Fawley to near London Airport and a 6-inch line (or possibly two) from Fawley to Avonmouth.

This is the first public protest—indeed, almost the first public interest—that such pipelines have evoked. It is by no means the first such pipeline, or the first bill enabling such rights across land along the route to be acquired compulsorily. The BP Trading Act of 1957 (covering the line now being constructed from Milford Haven to Llandarcy) and the Shell (Stanlow to Partington) Pipeline Acts of 1958 have similar provisions. The Esso pipelines are to be buried under at least 2 feet 6 inches of cover: Esso wants to buy simply the " easement " of way beneath and of access to the line at any time, and the landowners regain freedom to do anything on the earth above except put permanent foundations down there. It is offering for this right a minimum once-for-all payment of 2s. a yard run 12 feet wide ; payment for the right alone is therefore equivalent to £121 an acre, but in the case of dispute there would be recourse under the bill to arbitration. (A price of 3s. per yard run—but 40 feet wide—was paid by the North Thames Gas Board for a similar easement in respect of a 24-inch pipeline taking petroleum gases from Shellhaven, Coryton and Canvey to Romford.) The details, however, are less important than the fact that such arguments may well be repeated, and multiplied, in future: for pipelines are likely from now on to play an increasing role in the transport of petroleum (and other commodities) in Britain, as well as in the rest of Western Europe.

Most of the pipelines planned in Britain are products lines, from refineries to markets or large consumers. " The time is now approaching or has been reached," said Mr Christopher Brunner of Shell-Mex & BP in a public lecture in 1958, " when pipelines may show economies for certain of the biggest centres of consumption, including some very big customers and some of the main urban agglomerations." Esso's line to London Airport—and another that has been suggested to feed the airport from refineries on the Thames Estuary—would carry aviation gasolines and turbine fuels direct to this point of very heavy specialised consumption, as lines built during the war for defence purposes already supply most major military aerodromes. The Shell line from Stanlow to Partington and Esso's line from Fawley to Severnside are designed to carry feedstocks to chemical plants. Lines being considered from near London to Birmingham, and from the Thames Estuary up into Essex and Hertfordshire might be used for more general long-distance distribution of petroleum products. The 1,200-mile pipeline network laid during the war to supply aerodromes in Southern and Western England is being used to a certain extent by some companies to move products sold to the Government ; some use may be made of these lines for commercial sales. Only the line that BP has laid from Milford Haven to Llandarcy, the one this company already uses from Finnart on Loch Long to Grangemouth and the one being put in to link the new Shell terminal at Tranmere with Stanlow, are lines to carry crude oil from the point at which tankers land it to refineries where port facilities are inadequate to dock the largest tankers.



This pattern is in contrast with the much larger pipeline construction now occurring on the Continent, where most of the big commercial projects are crude lines to inland refineries (though Nato has a very large products pipeline network in Western and Central Europe). In Britain one can hardly be more than 80 miles from the sea, as Birmingham is, or much over 100 miles from any sizeable tanker terminal: in Western Europe the comparable distance, Mr M. E. Hubbard of BP told the World Power Conference in Madrid last week, is about 300 miles. Even that, in comparison with, say, North America, represents a fairly deeply indented coastline and Europe has also extensive natural and manmade waterways. So pipeline transport has taken some time to become as competitive on this side of the Atlantic as it is quite generally on the other. Its advent is the result, on the one hand, of its own peculiar economics: on the other, of the recent development, location, and balance of the petroleum markets inside Western Europe.

THE economic peculiarities of a pipeline arise from the fact that this means of one-way continuous transport, utilising the liquid or gaseous nature of the cargo that moves through it, represents a substantial immovable investment along a single fixed route (which usually, however, is shorter than most supply routes serving the same points). Its costs are almost entirely fixed (except for pumping power); the cost per ton-mile of freight along it varies much less with distance than in most other transport, but almost wholly with the extent to which its capacity is used, falling sharply up to the maximum practicable capacity of a pipe (10-day, say 30 million tons a year for a 32-inch diameter line). This capacity is set by the diameter of the pipe and the maximum permissible pressure possible inside, and by the pressure gradient that pumping power can apply from one end to the other.

This ultimate capacity sets an inflexible limit on throughput, though the initial capacity of a large pipeline can be multiplied as the demand builds up by putting in more pumping stations. The viscosity of the liquid in the line, however, in practice, sets another limit. Most heavy fuel oils would need preheating or even reheating to pump along a line, whereas most crudes are pumpable—which has been significant in European pipeline development.

Rapid as the postwar growth of oil consumption in Europe has been, it has not yet developed many areas of consumption justifying a pipeline. Paris is one: since 1953 it has had the Trapil pipeline from refineries near Le Havre and Rouen. London has its own port and Thameside refineries. A products line is planned from Ravenna to Milan, and possibly another to Munich from the refineries to be built at Karlsruhe—which will themselves be fed by crude lines from the Mediterranean coast. The most rapid growth of consumption in the Western European market, however, has been in fuel oil, which pipelines cannot conveniently transport. But if residual fuel oil cannot be piped in, crude can: and the development of consumption is thus making for refinery expansion inland, at the end of lines from tanker terminals such as Rotterdam's Europort or Lavera, the terminal being enlarged near Marseilles.

The main axes of crude pipeline development in Western Europe are from north-western terminals to the Ruhr and Rhineland; from the Marseilles area to Strasburg and

Karlsruhe; and possibly from Italian terminals to Switzerland, Bavaria and Austria. The coal kingdom of the Ruhr is a big and growing centre of oil consumption and petrochemical development, with good transport by river and rail, both of which are, however, becoming overtaxed and are liable to delays in winter: its existing refineries have been developed partly on German crude and partly on crude brought in barges down the Rhine. A 28-inch, 245-mile pipeline from Wilhelmshafen to Cologne and on to Wesseling in the Rhineland came into operation in January, 1959: a 24-inch line from Rotterdam running 180 miles to Gelsenkirchen, Godorf, and Wesseling, will be opened in July and may in fact be working already. The lines from the Mediterranean coast are primarily planned as a means of vastly reducing the distances that oil has to be transported to reach Central Europe: it is 465 miles from Lavera to the refineries at Karlsruhe, against 1,750 nautical miles farther to Rotterdam plus 340 miles inland from there.

These proposed lines represent firm commitments, by joint companies including local companies as well as some of the international major oil companies. There are various, possibly competing, projects for lines from Italian terminals northward. ENI, the Italian state-owned gas and oil concern, plans a line from Genoa to Pavia, branching to Milan, Cremona and (via the St. Bernard tunnel now being driven) to Aigle in Switzerland; this could easily be extended to Munich or beyond. Other proposals include a direct Genoa-Munich line backed by Saudi Arabian oil interests and a line from Venice or Trieste north into Austria and hence west into Bavaria.

Inland refinery capacity in Europe is going up, by say 1963, to some 45 million tons per annum against 25 million tons today. This will bring Western Europe's total refining capacity to, say, 120-125 million tons a year by 1963—against 100 million tons, with a throughput of 70 million tons in 1959, of which indigenous crude oil accounted for, say, 10 million tons. The crude pipelines planned to feed these will have an initial capacity, by 1963, of, say, 35 million tons a year, but will be planned for an ultimate annual capacity, with extra pumping,

of, say, 80 million tons. When all these lines have been constructed, including one alternative or another from Italy to Bavaria, some excess of transport as well as of refining capacity would seem likely to emerge. And in the context of developing competition in these Central European markets for petroleum it should be noted that Russian exports to the West may also be facilitated by pipelines. The 2,800-mile line planned from Russian oilfields (described in an article on page 1217) is designed primarily to supply satellite countries: but its terminals near Prague and on the Oder would greatly increase convenient capacity for exports of Russian oil to the West—which last year, already, may have been equivalent to about 10 per cent of total consumption in western Europe.

These refineries inside Europe will take some time to develop demand towards their full capacity: and the nature of pipeline economies will press operators to divert the largest possible volume of crude through the lines feeding them to reduce transport costs. The effect upon other means of transporting oil—and competitive fuels—seems likely to be very marked as the new lines come into operation. Barges on the Rhine, and railways in Germany, France, Italy and Switzerland, seem certain to suffer; but the development of shorter-haul oil distribution from new and enlarged inland refineries may, on balance, increase the volume of oil transported by road: though product lines such as Esso's in Britain substantially reduce, for example, the number of road tankers running from Fulham to Heath Row—four 4,000-gallon tankers to fill a Boeing 707. Onward transport of Middle East or Saharan crudes by pipeline from Mediterranean ports will very significantly reduce growth in the demand for ocean tankers during a period when many new tankers are still being launched—quite apart from various plans to transport oil and natural gas across the Mediterranean from Africa.

No country in Europe imposes on pipelines the "common carrier" obligations that the United States does for interstate lines. Few European countries, indeed, have any relevant legislation whatever, apart from France, though all, like Britain, can give companies constructing lines the right of compulsory purchase. Some have a degree of control over pipeline charges and rates: others, through turnover taxes, levy taxes on movement by pipeline along with all other transport. The European conference of Ministers of Transport which reported on pipeline development last September proposed some co-ordination of the various countries' laws involving pipelines: as several of the major lines now planned would cross national boundaries, with consequent changes in tax treatment, joint rules may well develop.

In Britain, so far, nobody has suggested special legislation on any general scale—until the recent protest at giving powers of compulsory purchase to a private firm. It is fair to note that in Britain, as on the Continent, the next decade seems likely to see a much larger development of pipelines—perhaps the largest non-Governmental development of any transport system this century apart from the electricity grid and super-grid. A pipeline may obtrude a little more on private property, through less on public amenity, than power lines do. Behind the development of crude and product lines may come a national high-pressure gas grid for natural and coal-based gas: even some limited hydraulic transport of coal from pithead to power station. It is fairly safe to reckon that, if so, protests at the invasion of property rights will grow, against nationalised even more than against private industries; and it is likely that over the years there will be demands for some new kinds of specific legislation for this relatively new kind of transport.

BUSINESS NOTES

ANXIETY IN THE MARKETS

Bank Rate Timing

THE first call for special deposits at last became payable on Wednesday, and the City duly turned its eyes to the Bank rate board. The gilt-edged market, indeed, already appears to have discounted not only 6 per cent Bank rate but 7 per cent. Tuesday's falls in this market brought War Loan below 61, within a fraction of the lowest point ever reached—on September 20th, 1957. At a yield of 5¾ per cent. it is presumably an even better buy for the long-term investor that Mr W. F. Andrews of the Unilever pension fund pointed out two months ago. While the uncertainty about future credit restraints persists, large-scale buying of gilt-edged can hardly be expected. The fact remains that the current level of yields is highly attractive, whether by the historical measure or the measure of current alternative investment outlets; and investors in the past few months have shown that they are not insensitive to yields.

The Bank rate fears have also unsettled the equity markets, which had earlier been encouraged by last week's upturn on Wall Street; by the week-end the *Financial Times* ordinary index, at 328.6, was within 2½ points of its level on budget day, an achievement that inspired the more impatient of chart-minded commentators to pronounce that this year's fall might be no more than a secondary reaction after all. But on Tuesday the market fell, largely because newspaper reports and official figures of retail sales suggested that the current measures of restraint were having little effect. This was followed immediately by the news that Hoover was dismissing 800 men and that BMC and Vauxhall were cutting production. Equities fell more sharply. The fact that the market thus moved the same way on consecutive days for reportedly opposite reasons no doubt makes an interesting subject for study, not least into some rationalisations of stock market movements. The more relevant fact is that equity prices for weeks have had little room for manœuvre. If the economy moves too far ahead under its own steam, that increases the possibility of new official restrictions; if the prospect of such restrictions grows more remote, that is likely to be a sign that trade is less buoyant. On Thursday the market steadied after the

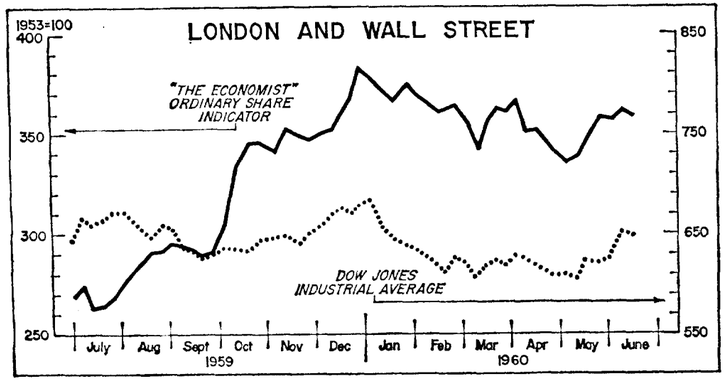
announcement of no change in Bank rate, but resumed its fall on publication of the May trade return.

Is a rise in Bank rate imminent? Even if the authorities feel that existing forces are bringing the domestic economy under control, Bank rate would be the natural instrument to see sterling through a summer in which the balance of payments is in any case weak on current account. If Bank rate is to be used effectively in this way, timing is obviously all-important; a move taken too early may have worn off by August, while a move left late may be ineffective if strong pressures have already been built up.

Restrictions Begin to Bite

THE abrupt dismissal by Hoover of 10 per cent of its labour force shows, as it may have been intended to do, that the fall in sales caused by the hire purchase restrictions has had enough effect on manufacturers' orders to make large cuts in production necessary. Even in the past week retailers' estimates of the fall in sales to be expected have risen; those who then quoted a general fall of 10 per cent now mention a figure of 14-15 per cent, though there are big regional differences: in some areas falls of 50 per cent are mentioned. Makers had expected sales this year to stabilise at a lower level than last year's; coming on an already weakening market, the effect of the restrictions may well have been strengthened. In the long term, however, sales may stabilise at a higher level than the present; after the holiday season, prospective buyers may begin saving up deposits again.



The fall in orders from retailers is much larger than the fall in sales, because retailers now wish to cut their stocks to match this lower rate of selling—which can mean that some retailers take nothing from makers for a while. In cutting output, makers cannot match such fluctuations in orders; but they have to cut it to equal their expected deliveries for several months ahead. As stocks are normally built up during the summer for the autumn selling boom, they have to consider the limits on the stocks they can hold: Hoover, as the largest producer, has the biggest stocking problem. It therefore needs to take the most drastic action—and it has certainly shown no reluctance to do so. Other makers admit to a fall in demand, but have not revealed any plans to cut output.

THE MARK

Zurich Unruffled

THE most encouraging financial news of the week has come from the exchange markets. Around the week-end suggestions that the German authorities might be considering a widening of the dealing margins or even a revaluation of the mark became more widespread, and some people saw an ominous familiar sign in a prompt denial of any such intention by Dr Erhard. Yet despite the publicity given to the rumours and to the continuing increase in the Bundesbank's external reserves, there appear to have been few speculative movements. The forward premium on the mark has widened a little, but at around 4½ pfennigs it represents a percentage premium on the spot rate of only about 1½ per cent on an annual basis. In 1957 this premium reached 15 per cent, and presumably some of the speculators who burned their fingers then have no intention of doing so again.

London dealers report that comparatively little speculative money has gone to Frankfurt; and on Wednesday sterling made a show of strength, rising against the dollar to $2.80\frac{5}{16}$ as a result of buying orders from Paris and New York. The further fall in the United States Treasury bill rate, to just under 2.3 per cent, has increased the attraction of London as a centre for short-term investment. The London Treasury bill rate rose slightly at last week's tender to 4.6 per cent, and the differential of about 2¼ per cent over New York is still twice as large as the cost of forward exchange cover. The German banks must be expected to recall more of their funds to their own market, and the tightness of credit there may suck in other funds despite the official barriers that have been set up against them. But movement of funds to take advantage of high interest rates is one thing, and speculation is another. So far, at least, this year's rumours about the mark come into the category of last year's about the dollar—much talk about it, little money on it.

OVERSEAS TRADE

No Rise in Exports

WHILE this week's news from the domestic economy has suggested that new restraining measures may be less urgent than some people had been assuming, it is impossible to draw similar comfort from the customs returns of overseas trade in May that were published on Thursday. These show no sharp new deterioration, but they tend to confirm earlier indications that the current surplus this year has been running below its level a year ago, which itself was too low. Export shipments in May, it is true, reached a record value of £317.5 million, £10 million more than in April. But the Board of Trade estimates that the rise was rather smaller than should have been accounted for by normal seasonal influences; after making what allowances it can for these influences, it puts the May export figure at £298 million, virtually the same as the corrected figures of the two previous months and some £10 million below those for January and February. It now seems certain that exports this year have been stuck on a plateau. They were still 11½ per cent higher in the first five months than a year before, but the increase was not continuing.

UNITED KINGDOM TRADE

(Recorded values; £ million per month)

	Exports fob	Imports cif	Re-exports fob
1958	264·7	312·3	11·8
1959	277·5	332·5	10·9
1959—1st quarter	263·9	313·6	11·1
2nd quarter	281·8	327·8	10·7
3rd quarter	263·5	327·9	9·9
4th quarter	300·8	360·7	11·7
1960—1st quarter.	306·8	374·9	11·7
1960—January	316·3	367·0	12·0
February...	295·8	364·4	9·4
March	308·1	393·6	13·8
April	307·3	373·5	11·5
May*	317·5	390·4	11·8

* Provisional

Imports, meanwhile, continue at a high level, and while the rate of increase appears to have slackened it does not appear to have stopped. Between April and May there was a rise of £17 million to £390 million, and the seasonally adjusted figure is at a new peak. In the first five months of 1960, total imports, valued cif, were 18 per cent higher than a year before. The May figure was swollen by delivery of Boeing aircraft to BOAC, which may have reached a value of £10 million, and these trade returns are not inconsistent with the view that after the sharp rise in the last quarter of 1959 and the first quarter of 1960, the underlying trend of imports may be levelling out. It is export performance, as a Treasury minister pointed out this week, that is disappointing and disconcerting.

COAL

The Politician as Industrialist

IF one wants a politician as chairman of the National Coal Board, Mr Robens may do no worse than any other and better than many. An appointment from the Labour party has, for the politicians selecting him—presumably Mr Macmillan and Lord Mills—two advantages. It might offer a pink coating, possibly palatable to the miners, for the inchoate intentions that these politicians cherish of transmogrifying the industry. And if the time should ever come when this chairman, in the interests of the industry, might feel it worth resigning on a point of principle and presenting his case to the public against the politicians—which ought to be one of the ultimate services that chairmen of these nationalised industries could render the nation, though none has yet felt it necessary or advisable on any given issue—his protest might easily be written off as a matter of Labour prejudice.

Mr Robens, as a politician, has paid considerable attention to fuel and power, including coal, and firmly believes in public ownership. The possible implications of his subtraction from the Labour party succession are considered on page 118; in this industrial context it may be noted that the appointment, formally in the gift of Mr Richard Wood, the Minister of Power, will incidentally remove the best-informed Opposition spokesman on Mr Wood's responsibilities. In the field of labour relations, which are of great importance in any industry as labour-intensive as coalmining, Mr Robens has experience as Minister of Labour and of late as an adviser on a construction contract. His experience of business management is limited and remote—years ago and in the Co-operative movement, one of the few organisations which Conservative politicians might consider worse-managed than a nationalised industry. It is only fair to add that strength of character and the ability to encourage good men, rather than expertise, are required in this key post; and that Mr Robens says he has obtained some guarantees from Mr Macmillan against being required to denationalise the industry—though nobody imagined this was on anyway. If Mr Robens, in considering the appointment, has had to try to get a clear idea of what the Conservatives would like to do with or to the coal industry, he deserves sympathy: this exercise has all the charms of trying to take a firm grip on a jelly.

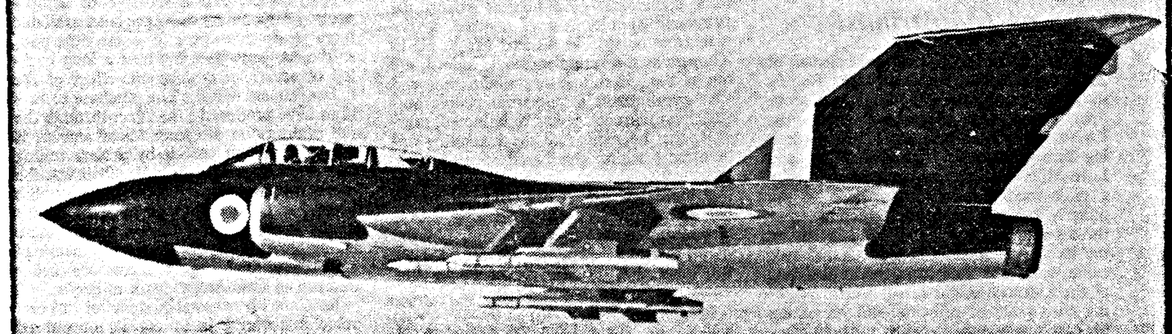
Manning the Board

IT is partly because no businessman of sufficient calibre will consider so exposed and relatively unrewarding a job as chairman of the Coal Board that certain union officials have been encouraged to assume that this and other appointments to the board lie partly within their prerogative (though the NUM, officially, does not claim this): they might well dislike a wiser appointment more. The fulminations of some communist office-holders against the rumoured appointment of another gentleman from outside to succeed Mr R. H. E. Thomas as marketing member, indeed, are one of the few things that might commend that appointment to impartial people outside the industry. It has to be noted, however, that opposition to the marketing appointment within the board seemed fairly unanimous—though the board was not at the outset in any sense opposed to an outside appointment in marketing, never one of its strongest departments. In the event, this apointment was not among those announced by the Minister of Power this week.

Mr Robens will become a deputy chairman of the board from the beginning of October and take over when Sir James Bowman leaves the chairmanship in January. Sir Joseph Latham, who will be leaving at the end of August, will be succeeded by Mr Humphrey Browne, chairman of the West Midlands Division and former director-general of production of the board, from September 1st. The pattern of succession in the board's history happens never to have given the key post of deputy chairman to a mining engineer, and it seems only right that it should now pass to one; and Mr Browne is one of the industry's outstanding personalities. This appointment will give the board two deputy chairmen until the end of August, when Sir Joseph Latham departs; but it may also tend to weaken the commercial representation on the board. There will no doubt be other appointments to come fairly shortly; but as the list now stands the need will be to balance the weight of trade union and labour representation with financial, economic, or commercial ability. It may well be that the wisest course would be to revive—as a permanency and not a temporary arrangement—the system of having two deputy chairmen to flank the new chairman with one on the business side as well as an engineer.

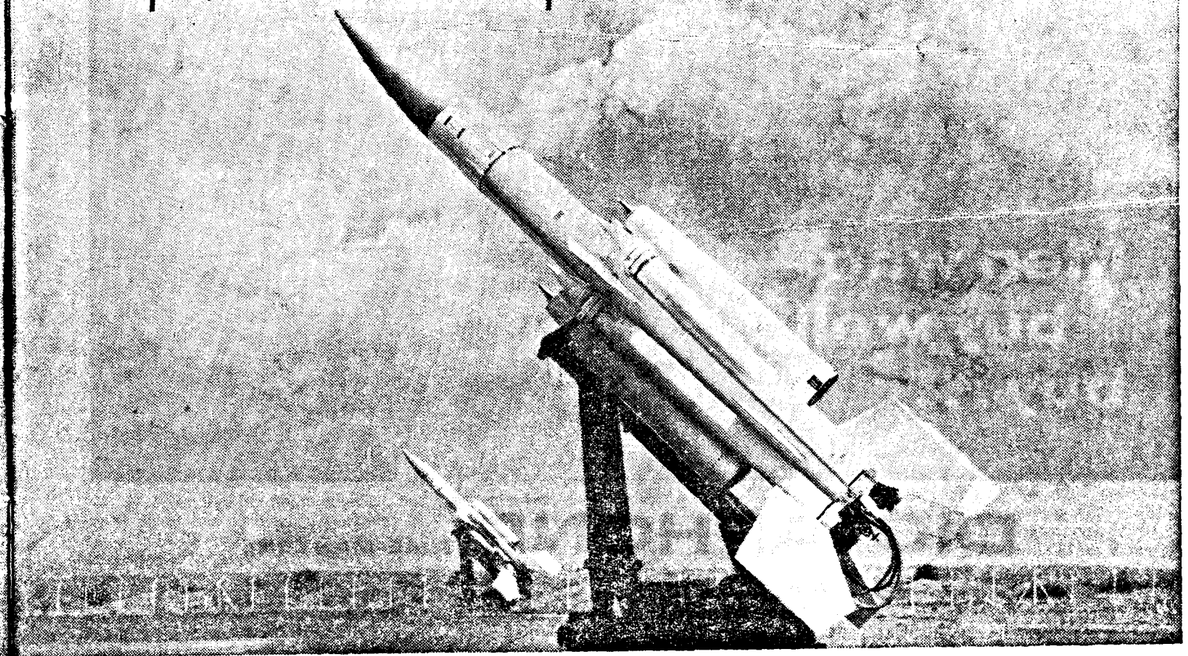
MOTORS

Signs of Autumn



THE cuts in output that have been announced by BMC and Vauxhall are small, but they are the first for a long time. Coming with the news that total imported car registrations in the USA were down in April, by 10 per cent compared with a year before, for the first time since the present boom in imported car sales began—British registrations were down by 20 per cent—and with signs that home sales are beginning to be affected by the hire purchase restrictions, it seems that there may now be beginning a new and less easy era for the motor industry. Vauxhall has only cut its output by 25 a day from a rate of 1,250 a day, by ending Saturday overtime work. It blames this on two apparently rather contrasted factors: the fall in sales to the USA, where it sold 30 per cent fewer cars in the first four months of this year than a year before, and a shortage of components. At home its cars have been available more freely than most for some time past, so the company does not have a long backlog of orders to cushion the effect of the fall in demand that the hire purchase restrictions have produced; the effect through the fall in prices on the second-hand market is now begining to be felt by dealers selling new cars. Canada, where Vauxhall was the best-selling imported car last year, has bought even more this year; but the unions in the home motor industry, hit by these higher imports are lobbying, and hearings on a claim that imported cars are being dumped in Canada are about to begin.

BMC, with a total output of 16,000 vehicles a week, is to cut its output of sports cars by 200 to 1,050. It says this cut is only the result of a desire to avoid overstocking of dealers in the USA before the seasonal fall in sales begins at the end of the summer. About 90 per cent of BMC's sports cars are exported, most of them to the USA. In the first four months of this year BMC's sales in the USA were 3½ per cent higher than they had been a year before; but there has been a general decline in dealer confidence since imported cars began to sell less well, and this move by BMC may well be a recognition of dealers' fears that they will be overloaded with stocks which will have to be sold at a discount.



New BMC Plants

TEMPORARY checks to output are not holding up the motor companies' arrangements to expand. The British Motor Corporation's plans outside its traditional areas are already taking concrete form. Work on the new Fisher and Ludlow domestic appliance factory on Merseyside began early in May, and that on the new commercial vehicle and tractor factory at Bathgate, in Scotland, was inaugurated at the beginning of June. Negotiations for the site of its third new factory, to make body pressings and sub-assemblies at Llanelly, have now been completed, and building will start soon. All these new plants should begin production by the end of 1961; the effect on vehicle output, when the plants reach full production, will be that capacity for tractors will be more than doubled, from about 15,000 a year to 37,500, while that of lorries will rise from 35,000 a year to 50,000. So far as cars are concerned, the capacity for Austin 7s and

Round-the-clock defence
intercepts aircraft hundreds of miles out—

far up into the stratosphere...

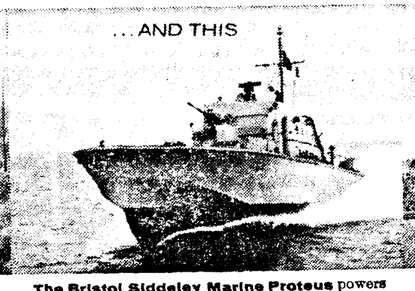
...AND BRISTOL SIDDELEY SUPPLY THE POWER

Bristol Siddeley Engines power the whole of the RAF's round-the-clock defence which shields Britain from possible air attack.

The defence system is made up of Bristol/Ferranti Bloodhound ground-to-air guided missiles, powered by two Bristol Siddeley Thor ramjets, and Gloster Javelin all-weather weapon carriers, powered by two Bristol Siddeley Sapphire turbojets.

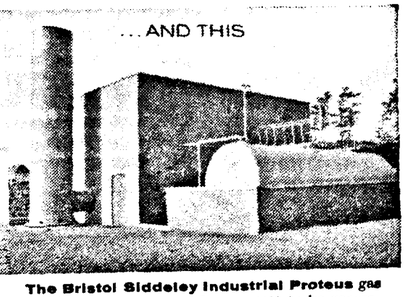
These two types of weapon carrier complement each other, and their radii of action form a series of interlocking defensive cones which extend out from the coastline to an effective range of several hundred miles and far up into the stratosphere.

No known manned aircraft in service has a performance which would enable it to outclass or evade this round-the-clock defence.



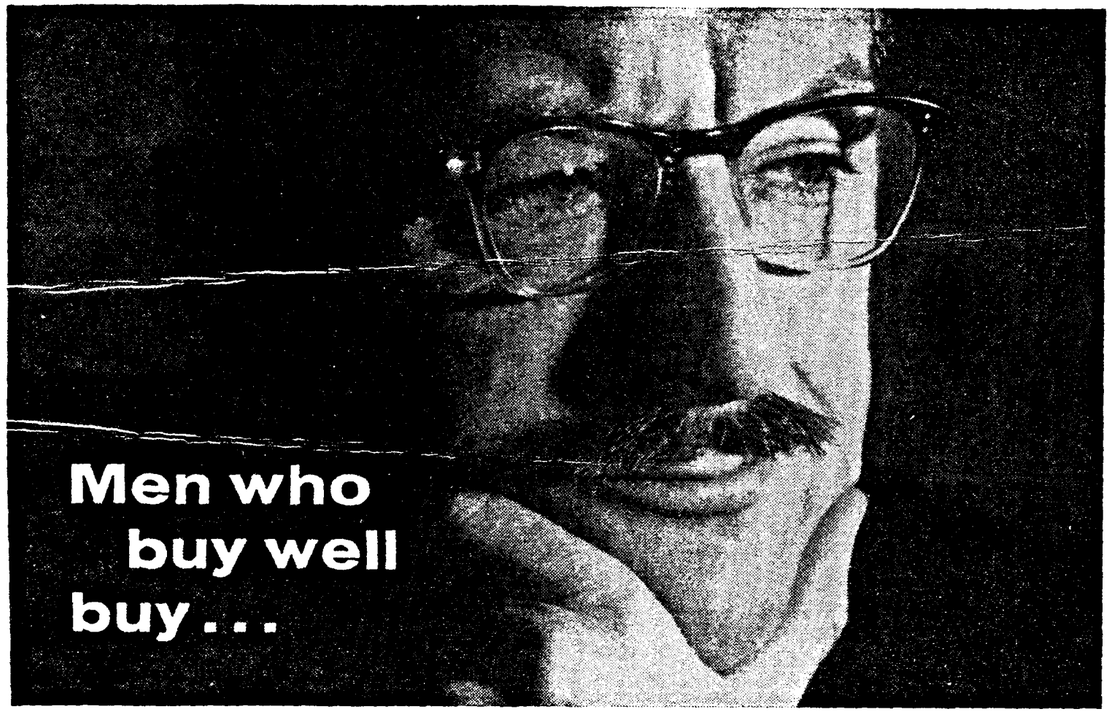
BRISTOL SIDDELEY ENGINES LIMITED

POWER FOR THIS



Bristol Siddeley Maybach diesel engines power Britain's fastest express train—the British Railways "Bristolian". Two Type MD 650 engines, developing a total of 2,300 hp, give the "Bristolian" a top speed of over 90 mph. Over 200 Maybach diesels have been ordered by British Railways alone.

...AND THIS



The Bristol Siddeley Marine Proteus powers the world's fastest naval vessels, the "Brave" class Royal Navy patrol boats, built by Vosper Ltd. Three Proteus deliver a total of 10,500 hp—propel these 96-ft boats at over 50 knots. The Marine Proteus is quick-starting, flexible and reliable.

...AND THIS

The Bristol Siddeley Industrial Proteus gas turbine engine powers a 3-megawatt turbo-generator. Designed for peak-lopping and stand-by generation, this new pocket power station will deliver full power within 2 minutes of a cold start for a lower capital cost than any other type of installation.

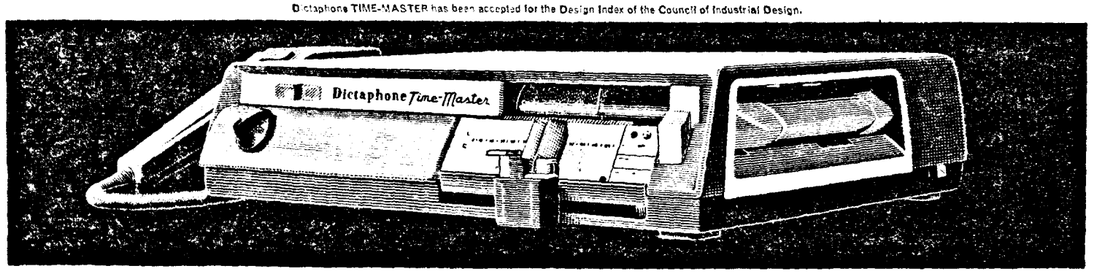
DICTAPHONE TIME-MASTER

Men who value quality and service are the men who buy Dictaphone Time-Master, because the Time-Master is the quality dictating machine. The Time-Master isn't a gadget to be played with for a few months and then discarded. It's a precision instrument designed to save time for a man whose time is valuable.

Dictating with Time-Master is as easy and pleasant as normal dictation to a secretary, but it is much more convenient and time saving. No matter where your secretary may be, you simply speak, and immediately your thoughts are on *permanent* record. Time-Master has these unique advantages because only Time-Master has the DICTABELT record.

Especially designed for dictation and twenty years ahead of other recording media, the Dictabelt is exclusive to Time-Master.

Permanent recording on the Dictabelt makes accidental erasure impossible; gives crystal clarity; makes the true economy of one-use handling.



THE DICTABELT

Visible recording gives instant place finding, prevents confusion, saves time.

Easiest to handle. You can fit a Dictabelt on the machine in two seconds, dictate, then have it transcribed; you can also post or file a Dictabelt like a letter.

Dictaphone TIME-MASTER has been accepted for the Design Index of the Council of Industrial Design.

Dictaphone Company Limited, 17-19 Stratford Place, London W.1. Phone HYDe Park 9461. Branches throughout the British Isles.
The words DICTAPHONE, TIME-MASTER and DICTABELT are registered trade marks.

Mini-minors will be increased from the present 200,000 a year to 400,000; the Llanelly plant will probably make body pressings for these cars, for assembly at Longbridge into Austins and at Fisher and Ludlow's into Mini-minors. In all, about £40,000 vehicles will be added to BMC's capacity by these plants; the space freed and the new factories to be built in the Midlands may add more, with larger supplies of bodies coming from Pressed Steel.

Farewell to the Sphinx

THE demise of the Armstrong-Siddeley car shows how difficult it has become to make a profit on small-scale production of cars in Britain today. The Sapphire was made at a rate of 12-20 cars a week, and it simply could not cover the cost of overheads —especially as it had a steel body, with a consequent high cost of the dies to amortise. Only Jaguar, with its high production rate —over 500 a week—and Rolls-Royce, which also makes rather more cars than Armstrongs did, and sells them for twice as much, now seem able to make luxury cars profitably. The specialists in sports cars, such as Aston-Martin and Lotus, do not have such high overheads because they do not use steel bodies; nor does Bristol, which is continuing to make cars for the moment. Its output is only about one car a week, and can hardly be significantly profitable; but the company has done much work on the use of glass fibre for cars and boats, and makes bodies for Lotus, so it may have some plans to exploit these developments under its own name. The low tooling costs of construction in glass fibre construction make it suitable for small-quantity production. Armstrong-Siddeley will retain an indirect interest in car production as assembler of some 400 Sunbeam Alpines a week—rather more profitable a rate of output than its own.

The change in the character of the Armstrong-Siddeley, from the medium-sized middle-class car of prewar and early postwar days to the luxury Sapphire, might seem at first to have contributed to its decline. But the simple reason for that change was that labour accounts for most of the cost of a hand-made car, and this cost does not vary significantly with the size or quality of the car. But the bigger it becomes, the higher the price that can be obtained, and, as J. A. Gregoire wrote of his experience with the Tracta car before the war, the smaller becomes the loss—though neither he nor Armstrong-Siddeley could close the gap between revenue and expenditure. This explains why the small- or medium-sized quality car that was once so common has now disappeared from the British market with the sole exception of the Rover, which has itself grown in size since the war. Hence the popularity of the mass-produced car which beneath a disguise of walnut veneer and the name of

What Price Growth?

BY A WALL STREET CORRESPONDENT

EVER since the decline in equity prices set in last January, Wall Street has been puzzled by the performance of a small but diverse group of issues generally classified as growth stocks. In the recent general revival in prices induced by the cut in the discount rate, shares in "cyclical" industries like steel and motors which fell earlier by between 30 and 40 per cent have made only a slight recovery and aircraft and oil issues, favourites of the 1955-57 bull market, are doing no more than move up slightly from very depressed levels. The outstanding performers have been utilities and the growth stocks.

In the second half of 1959 most of these growth stocks shot up to what were then considered vulnerable levels, but contrary to most expectations they continued to advance when other equities fell. The cult in them looks to capital gains rather than yield. Normally, New York market analysts pay a great deal of attention to yield and price-earnings ratios. A "cyclical" issue normally sells at from eight to ten times its annual net earnings per share, to yield four to five per cent. Some of the groups favoured by institutional investors, including electrical equipment, drugs, office machines and chemicals, sell at 15 to 20 times earnings, to yield between two and three per cent. The growth stocks, embracing electronics, "leisure" and sports activities, sell at anywhere from 30 to 100 times current annual earnings and often provide little or nothing in dividend yield.

Enthusiasts of growth stocks do not consider these astronomical ratios a deterrent and they have rationalised their enthusiasm. Some of them start with the empirical view that earnings per share of industrial companies grow at an average annual rate of 4 per cent and that therefore investors are willing to pay an average of 16 times earnings for this rate of growth; where earnings promise to grow at an annual compound rate of 50 per cent for the next five years a share can then reasonably sell at 100 times current earnings. This represents 13 times its projected 1965 earnings. More sophisticated rationalisations than this have been put forward but all of them involve a number of questionable assumptions about future earnings—and the advocates of growth stocks go further than most by projecting earnings for a four to five year period instead of the normal six months to a year. They argue that the growing stability of the economy permits longer range projections, and that there are a few companies whose growth seems so assured that they can sell at ratios that would be out of the question for run-of-the-mill issues.

More conventional analysts admit that, despite their low yields, the leading growth shares merit a high price-earnings multiple, citing such established issues as International Business Machines (with a 22 per cent growth rate and a price earnings ratio of over 40), Polaroid (40 per cent growth rate and a ratio of over 50) and Texas Instruments (35 per cent growth rate and a ratio of 40). These companies have proved over a number of years that high growth rates in earnings can be sustained. Yet many less seasoned issues, with a more doubtful future, are placed in the same select category. While some can boast an impressive performance over the past few years, this is either because they are relatively new companies starting from a low base, or because they are in relatively new fields—bowling, boating, electronics—in which sales have been rising at a very rapid rate. For many of these companies future growth depends on additional financing (which may dilute earnings per share) or on the absence of competition (which is unlikely as long as their own records attract attention) or on a continuation of prosperity (which, over a four to five year period, is at least open to question).

INVESTORS, who are constantly seeking fledgling IBMs or polaroids, seem to be unconcerned by such considerations. Nor are they bothered by the rapid pace of technological advance which can easily make a process currently producing profits obsolete, or by the fickleness of the Pentagon in shifting its defence contracts. The public seems to be all too willing to accept the idea that today's growth rates will prevail tomorrow. Even some of the growth stock enthusiasts deplore the widespread tendency to put the stamp of approval on any stock currently showing an improved rate of earnings and the equally widespread faith in growth by association, which implies that any company operating in the same field as an IBM or a Texas Instruments deserves a similar price-earnings ratio. So far these caveats have had no effect.

But the current craze for growth may founder just because it is now becoming so undiscriminating. Few stocks have a chance to live up to the high hopes and higher prices that investors are putting on them. If, for example, Polaroid, which must be rated as a genuine growth issue, continues to grow at its present compound rate it would eventually emerge as the nation's richest corporation. The trouble is that the cult of growth is itself in a growth stage. It is reminiscent of the extraordinary demand for radio and aircraft issues that was so dangerous in the late 1920s. Then the comment was that investors were discounting not only the future but the hereafter. The same comment seems just as valid today.

old quality cars such as Riley and Sunbeam can satisfy a desire of the consumer to be conspicuous without the cost to the manufacturer of small-scale production.

BANKS AND HP

Still the Whipping Boy

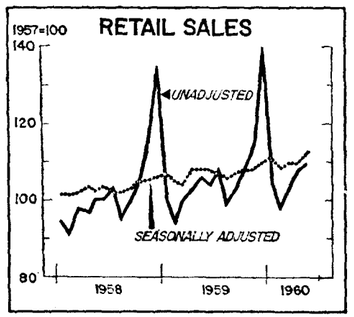
SINCE the last time the banks laboured under official restraints on their lending they have acquired large stakes in the country's largest hire purchase finance companies ; but that has not generally softened the bankers' general feeling that hire purchase is the source of many of their troubles —and is a particular threat at times of credit restriction. Mr David Alexander, general manager of the National Commercial Bank of Scotland, outlined this week in his presidential address to the Institute of Bankers in Scotland his general feelings about the new set of restrictions, and his remarks have found wide sympathy among bankers. While Mr Alexander cannot feel any enthusiasm for special deposits, the scheme is at least "preferable to the credit squeeze as formerly imposed." (There are some thoughtful bankers who would disagree with this on the ground that while the official "request" was self-evidently an expedient that had to end, special deposits may be a more durable control that is difficult to lift.)

But with one further action Mr Alexander finds himself in "hearty agreement." He refers of course to the re-imposition of hire purchase controls.

> At the very least, they persuade me to accept special deposits with better grace, and I think that their proper use may help us to get rid of special deposits rather more quickly than would otherwise have been the case.

It is not clear whether Mr Alexander is merely approving the current hire purchase controls (which for most articles are not too far removed from the self-limitations that the hire purchase companies themselves should have set down on grounds of commercial prudence), or whether he is arguing that "proper" control of hire purchase would allow the banks to go free. Other bankers are now worried by the high rates that some finance houses are offering for deposits, and foresee a new diversion of credit business away from the banks. As bankers, they and the Bank of England should realise that the market in credit operates on the same basic principles as any other market ; restrictions in supply in one sector driving up price (interest rates) in another. The moral, as the Radcliffe committee recognised, is to act on the market for credit as a whole, by using interest rates.

COMMONWEALTH FINANCE



An Institution Too Many?

WHILE the Colonial Development Corporation waits on the Government to decide whether it shall be allowed to continue its active business as colonies become independent countries, the Commonwealth Development Finance Company announces that it has succeeded in increasing its capital—but is still doing very little business. CDFC was set up in 1953 after demands at a Commonwealth conference for a new institution to fill an alleged gap in Commonwealth financing; ever since it has been evident that the gap is not in institutions but in ability to find the money. In the past year, CDFC has increased both classes of its capital, placing more "A" shares with big industrial and commercial companies and more "B" shares with the Bank of England—and, for the first time, with central banks of some, but not all, central banks in overseas Commonwealth countries; Rhodesia and Nyasaland, India, Malaya, New Zealand, Pakistan and South Africa have subscribed. The company has not been able, as it hoped, to fortify this increase from £4.2 million to £7.3 million in issued capital by its intended debenture issue, so its bank advances have been reduced only from £7.2 million to £5.9 million. But it is not clear that CDFC has the right organisation to channel funds efficiently into Commonwealth overseas development. Earlier this year Sir Nutcombe Hume, chairman of the Charterhouse group who is also for the time being chairman of the Colonial Development Corporation, aired the prospect of a merger of CDC and CDFC. It seems a good idea.

RETAIL TRADE

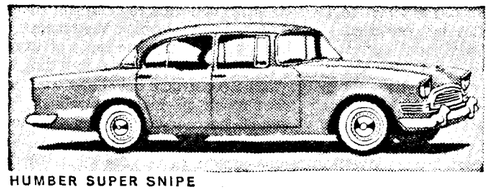
Unrestrained in May

EVEN after making allowance for the usual seasonal factors, May seems to have been at least as good a month for retail business as April and was possibly even better ; and the retail trade statistics do not suggest that durable goods shops suffered any widespread loss in the first month following the re-introduction of restrictions. Their sales, according to the Board of Trade, "probably showed some modest reduction as compared with the high level of a year earlier"—when buying had been particularly high following the purchase tax cuts and, even without credit controls, more than could have been expected this year. On the other hand, in anticipation of the purchase tax cuts, spending on durables in the pre-budget period last year was somewhat depressed, thus exaggerating the apparent margin of growth in the earlier months this year.

This complicating factor, as well as the different incidence of Easter, bedevils any comparisons of consumer expenditure in the first quarter of this year and last. The straightforward comparison shows that, in real terms after making allowance for price changes, 15 per cent more was spent on radio and electrical goods at the beginning of this year and 8 per cent more on furniture and floor coverings. Beer-drinking was up by 7 per cent and smoking by 6 per cent —both unusually large increases, but in the case of beer, this only reflected the low level last year. And 6 per cent more clothing and 2 per cent more footwear were bought in the first three months of this year in spite of the lateness of Easter. Shops selling clothing and footwear have also done well since then and in May their sales were better than last May although the latter included Whitsun trading.

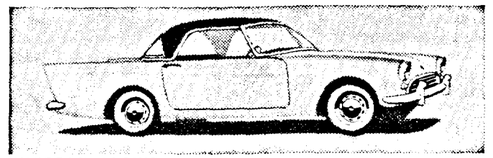
The underlying trends in consumer spending can most easily be followed in the series of quarterly figures which are now adjusted not only for price changes but also for seasonal influences. As yet only three such figures are available for the first quarter of the year ; the most striking of these shows tobacco consumption to have been at a new high level—2 or 3 per cent above the average for the last nine months of 1959. On the other hand, consumption of drink was lower than it had been since the first quarter of last year ; and purchases of clothing were fractionally below the record level reached in the last quarter of 1959.

B.O.A.C.



A Hard Bargain

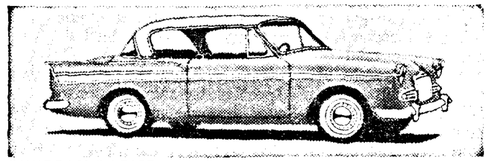
WHAT happened to BOAC negotiators in their recent dealings with the small local airlines of South, Central and East Africa ? They seem to have come off badly in negotiations to decide how much of the traffic BOAC should carry in and out of those territories. It has just been announced that BOAC, two of the local airlines and British United Airways (the merger recently formed between the two independent airlines, Hunting and Airwork, in this country) will start third-class services to east and central Africa in October, operating twice daily with a special cut-price flight once a fortnight. What has not been announced is the fact that BOAC, the giant among three pygmies, will be allowed to carry only a quarter of the traffic, sharing in equal proportions with British United Airways while the local airlines of central and east Africa



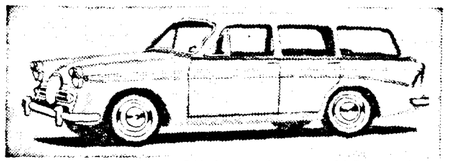
You get a

TOUCH OF GENIUS

in everything made by ROOTES



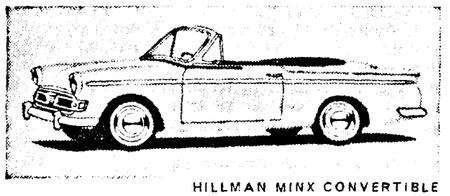
HUMBER SUPER SNIPE



SUNBEAM ALPINE

Every one of the wide range of cars made by Rootes has that extra something—that 'touch of genius'... showing itself not only in the elegant yet functional styling but also in performance, safety, luxury and economy. When you sit in any ROOTES car—Limousine, Saloon, Convertible, Estate Car or Sports model—you are immediately impressed by a gratifying sense of well-being; just as though it had been made specially with *you* in mind.

SUNBEAM RAPIER



SINGER GAZELLE ESTATE CAR

HUMBER — the ultimate expression of ROOTES genius for making better cars. Here elegance, luxury and power are brilliantly combined to offer you the finest value at the price today.

HILLMAN — the family car with the quality finish and performance . . . unbeatable at its price, the result of continuous development over 28 years.

SUNBEAM — the cars that give a new meaning to sports driving. The Rapier . . . luxury with performance that has won fame in Europe's toughest rallies. The new Alpine, sweepingly elegant—100 m.p.h.—and at an astonishingly low price.

SINGER — the car for the connoisseur. Beautifully appointed, supremely comfortable, and high performance with economy. Another example of ROOTES value and that extra 'touch of genius'.

A better buy because they're better built!

have half of the traffic out of each of their territories reserved specifically to them. And if during talks to be held next week South African Airways insists on an even larger share of traffic, the joint UK airlines' share may well fall to less than half. This seems a most extraordinary arrangement, and it shows the extent to which a big airline can be held to ransom by small operators who choose to use the granting or withholding of traffic rights as a means of screwing concessions out of their big, so-called "partners."

Is the hand of the African airlines to be seen also in the modest price cuts finally agreed? The new third-class fare to Entebbe, to take one example, is £104, only £4 less than the coach class service that used to be flown by the independent airlines. The new Skycoach service, which at £88 offers a really worthwhile fare cut on existing fares, is to be flown only once in two weeks, an arrangement which BOAC diplomatically describes as being geared to estimated demand but which looks to the outsider like an arrangement designed to pay lip service to an awkward commitment to lower fares while diverting the minimum amount of traffic from ordinary flights. Was it for this that the government huffed and puffed and threatened that BOAC might leave the International Air Transport Association? How IATA headquarters in Montreal must be laughing.

CONVERTIBILITY

Success Story

THE board of management of the European Monetary Agreement, which is the same board that previously ran the European Payments Union, has a success story to tell of the first year of convertibility. Its first annual report points to the "new climate" that followed the formal exchange freeing at the end of 1958, supported in 1959 by sound domestic economic policies and favourable circumstances for Europe. Formal convertibility, which added little in itself to facilities previously available in free markets, gave an impetus to the dismantling of many other restrictions on trade and payments. By the end of 1959, the report estimates, Western Europe had liberalised about 90 per cent of its imports from North America on a 1953 base, compared with 70 per cent at the beginning of 1959. Restrictions on international movements of capital were eased, leading to a big increase in movements both of short-term money market funds and of long-term capital.

The capital markets of Western Europe and North America became much more closely linked; and there was an outcrop of international investment trusts, which are estimated to have attracted over $300 million since the beginning of 1959. Direct investment has also continued to increase, and net private direct investments by the United States in Europe rose from $173 million in 1958 to $439 million.

On their technical activities, the managers of the European Monetary Agreement report that they have had little to do—which is itself a sign that convertibility has been working smoothly. Only three countries—Greece, Turkey and Spain—have drawn medium term credits from the European Fund. And only one country, Greece, has made any significant use of the multilateral system of settlements. This is not surprising, since the system operates in such a way that settlements take place at the extreme of the notified exchange dealing margins that is most unfavourable to the country taking the initiative in using the settlement mechanism rather than the exchange market. What the system does is to provide a limited guarantee to central banks against exchange rate alterations. If a member country devalues its currency, for example, other members can ask that their holdings of that currency be converted at the old rate. This additional deterrent against devaluation has yet to be tested. But in November last year Sweden did in fact widen the dealing margins for the krona (which had previously been particularly narrow); apparently only one country exercised its right to present krona for settlement at the previous selling rate for dollars.

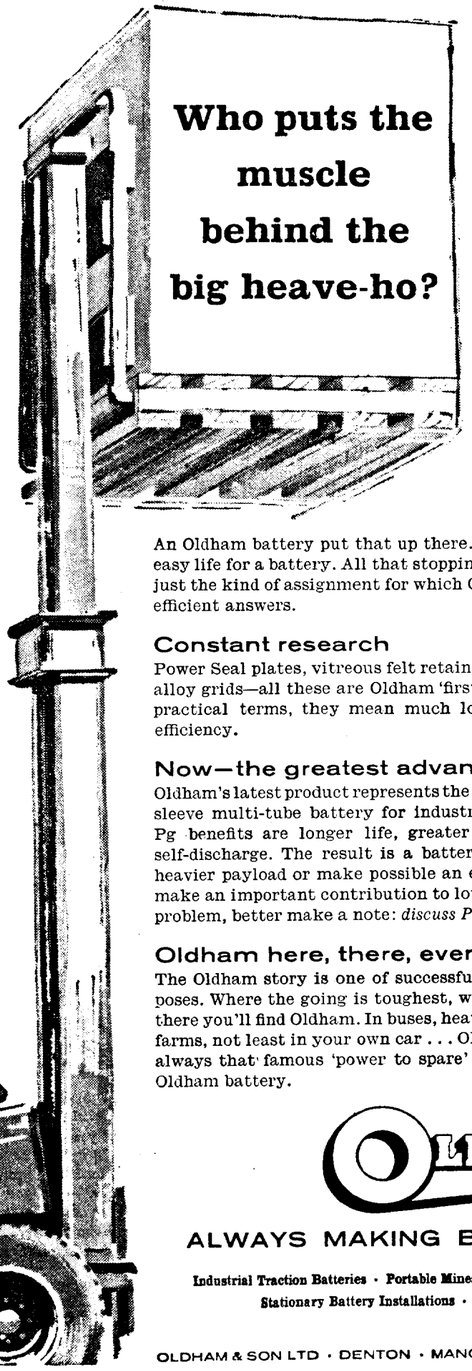
CONSTRUCTION

Uneven Boomlet

CONTRACTORS' orders for new construction work rose sharply in the first quarter of this year, reaching a record total of £478 million. This was an increase in value of £53 million over the final quarter of 1959—when an even bigger increase was recorded—and compares with a total of £402 million in the first three months of last year. Work for public authorities accounted for £199 million worth of last quarter's new orders, compared with £182 million in the previous quarter and £173 million in the first three months of 1959. Of this amount £62 million consisted of orders for new public housing; other new orders by public authorities rose from £121 million to £137 million, though this included a number of large and long-term contracts, such as railway electrification projects, the Bristol-Birmingham motorway, the duplication of the Blackwall Tunnel and construction of a reservoir.

Demand in the private sector also continues to rise, though unevenly. Private housebuilding orders totalled £132 million last quarter, compared with £115 million in the preceding three months and £118 million a year earlier; orders for industrial building increased to £80 million, against £55 million in the first three months of last year, and orders for other private construction—mainly commercial building—rose by over ten per cent, to £67 million. The Federation of Civil Engineering Contractors has claimed that in the past three years private industrial construction work on hand has fallen substantially; though exact comparisons between new orders and work completed are difficult, if not impossible, to make. The federation also estimates that the order load for public works has fallen by £56 million since the end of 1958.

This uneven nature of the increase in demand has produced both strains and surpluses in the industry. Contractors are short of skilled labour, but long on engineers and managers. Bricks—used primarily in housebuilding—are in short supply, and there have been occasional shortages of reinforcing rods. At the same time there is a considerable surplus of heavy constructional machinery—particularly concreting and black-topping machines, medium-sized excavators, crawler tractors, rollers and scrapers. Civil engineering contractors (at least those that do not engage in building as well) continue to complain that this surplus capacity—which has resulted in sharp competition for some types of work—could easily be put to use if roadbuilding and other public constructional works were increased. But much of this idle machinery (some of which has become idle on account of cutbacks in opencast coal mining) is obsolescent; most of the heavy engineering plant which can also be used for industrial or commercial building seems now to be in use.



PRICE MAINTENANCE

Enforcement in Court

THE Imperial Tobacco Company this week obtained an injunction in Chancery Court, before Mr Justice Russell, restraining Mr Peter Deeming, who owns a chain of cut-price food shops in Wolverhampton, from selling Players Medium cigarettes below the price at which Imperial specifies that they shall be sold. The action was brought under Section 25 of the Restrictive Trade Practices Act, which gives manufacturers the right to enforce resale price maintenance individually; after having warned Mr Deeming of its price-maintenance policy, the company sent a clerk to one of his shops, where the clerk bought ten Players cigarettes for 1s. 11½d. instead of the standard price of 2s. 0½d.

Cases of this kind reach the courts comparatively rarely; Imperial has had only one previously, which took place last November. But despite the fact that the retailer's margin on a package of cigarettes costing 4s. 1d. is only about 5d.—the bulk of the price being tax—the tobacco companies are often forced to warn retailers against cutting prices, and to threaten them with an injunction under Section 25 of the Act if they do so. This sanction on prices is apparently fairly widely used in one or two other industries—motor accessories, for example—though other industries, notably food manufacturers, appear entirely to have given up using it.

After pointing out that co-operative dividends are allowable on cigarettes notwithstanding resale price maintenance,

An Oldham battery put that up there. And powering a fork-lift truck is no easy life for a battery. All that stopping, starting, tilting, stacking. But it's just the kind of assignment for which Oldham are always finding ever-more-efficient answers.

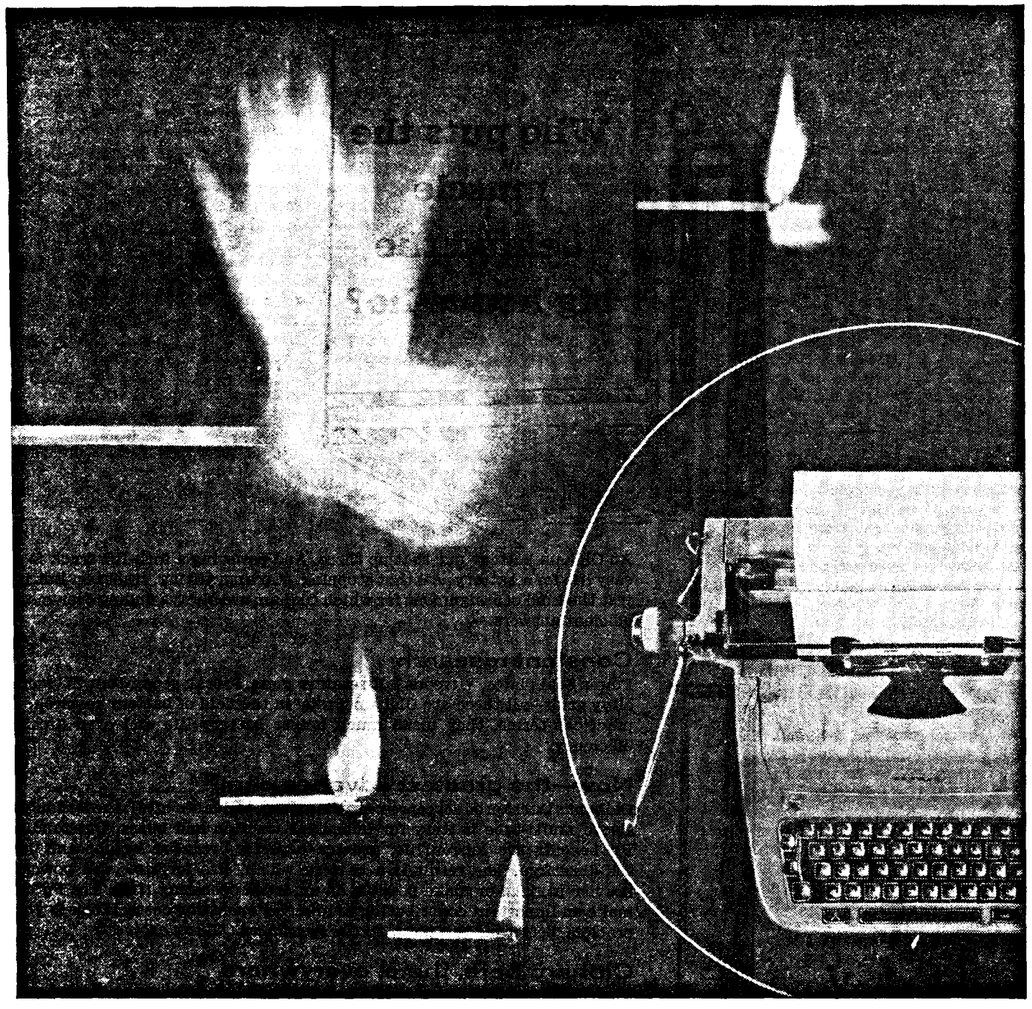
Constant research

Power Seal plates, vitreous felt retainer mats, Fibrak separators, 'X' metal alloy grids—all these are Oldham 'firsts' in the field of battery research. In practical terms, they mean much longer battery life and even greater efficiency.

Now—the greatest advance of all!

Oldham's latest product represents the greatest advance of all: the Pg double-sleeve multi-tube battery for industrial traction and buses. Outstanding Pg benefits are longer life, greater capacity, reduced weight and low self-discharge. The result is a battery which, size for size, will power a heavier payload or make possible an extended operating time. The Pg can make an important contribution to lowering operating costs. If this is your problem, better make a note: *discuss Pg with an Oldham engineer.*

Oldham here, there, everywhere



The Oldham story is one of successful development for many diverse purposes. Where the going is toughest, where battery failure is unthinkable—there you'll find Oldham. In buses, heavy trucks, aircraft . . . down mines, on farms, not least in your own car . . . Oldham batteries mean longer life, and always that famous 'power to spare' performance that's built into every Oldham battery.

Dependable as a Swedish Safety Match

"Clean, efficient, reliable—Swedish safety matches were a boon to mankind when their export began more than a century ago. Today the world takes the dependability of Swedish safety matches for granted.
Swedish business machines have also won world-wide confidence because of their day-in, day-out dependability. That's why you'll find them in offices wherever you travel. Facit of Sweden, one of the world's leading manufacturers of business machines, offers truly international sales and service.
If you want to know more about FACIT and the outstandingly successful Swedish business machine industry, your local FACIT agent will gladly send you a free copy of our brochure 'Why are so many world-known business machines built by Swedes?'—or you may write directly to Atvidabergs Industrier, Stockholm 7, Sweden."

thus giving co-operative stores a better position than other grocers, Mr Justice Russell pointed out that sale conditions do not have to be specifically agreed by the retailer, since under the Act it is no defence for a retailer to claim that he knew of the condition but did not agree to it. At this point the defendant commented: "I believe your lordship's own views (on price maintenance) are like mine." To which the judge replied: "I did not say that."

S. G. BROWN LTD.

Sold with Strings

THE Admiralty has taken a year to sell S. G. Brown Ltd., the gyro-compass and instrument maker that it unwillingly bought in 1942 because its then owners would not take Admiralty orders. The buyers are de Havilland Holdings, now part of Hawker Siddeley, and the American Bosch Arma Corporation, a big maker of gyro equipment and already possessor of a cross-licensing agreement with Brown. The price paid for the company has not been revealed by the buyers or by the Admiralty—which says that it is against its normal policy to reveal such facts about commercial transactions. The fact that this asset has been built up with public money does not seem to affect the departmental attitude; however, if a question is asked in Parliament—and the somewhat emotional reaction of Labour members to the sale of a nationalised company makes this probable—the Government may be hard put to maintain silence on this point. The net assets of the company were valued at £1,172,760 on March 31, 1959, the last date for which balance sheet figures are available; but its profits, which had been £114,000 before tax in the year to March 31, 1958, amounted to only £5,821 in its 1958-59 financial year. The Admiralty does not seem to have chosen the most auspicious date to sell the company.

The fall in profits in 1958-59 is attributed by the company to the effects of the shipping slump; but sales fell only from £1,800,000 in 1957-58 to £1,600,000 in 1958-59, so that other factors must have been involved in so drastic a decline in profits. A purchase price of about £1 million, which has been mentioned, would have sounded low in relation to the figure of net assets and the 1957-58 profits; but the 1958-59 figures would have made any such calculation rather meaningless. The conditions that the Admiralty has attached to the sale may have made its task more difficult, though there are said to have been quite a number of bidders. The conditions were that the sale should not create any monopoly; the purchaser should be able to develop the resources of the company to the full; it should not affect the cross-licensing agreement with Bosch Arma; and it should not bring the company under foreign control. This last condition ruled out Bosch Arma as a sole buyer, though it might otherwise have been the obvious choice.

Now, by bringing in de Havilland as the majority shareholder—foreign interests may not hold more than 49 per cent of the stock of the new company being formed to operate Brown—Bosch Arma has been able to get a manufacturing foothold in Britain, and so should be better able to compete with Sperry. De Havilland already uses Brown as a sub-contractor; its interest is an example of the change in the character of Brown's work. Originally this was chiefly marine compasses, then aeronautical gyro instruments, and now rockets. De Havilland and Bosch Arma state that their resources will allow Brown's activities to be extended into new fields; Bosch Arma, it should be noted, makes computers and automation equipment.

ROLLS-ROYCE

Second Choice

A YEAR ago, Rolls-Royce was given a severe slap in the face by the French nationalised aero-engine manufacturing company Snecma which signed an aero-engine agreement with the American Pratt and Whitney company rather than with Rolls-Royce. The inducement was the amount of capital that Pratt and Whitney was prepared to make available for investment in France—a sum that Rolls-Royce felt it could not match. Now Rolls-Royce is making a limited come-back by signing an agreement with its old licensee, Hispano-Suiza—limited because as things go in France, Snecma, being government-owned, can always expect to get preferential treatment over the privately owned Hispano-Suiza when orders are being handed out.

Snecma engines have successfully ousted all other designs in French military aircraft, although their quality is by no means outstanding, and the only occasion when foreign-built engines are used is when the aircraft is built with an eye to the foreign markets, like the Caravelle, or when no Snecma-built alternative exists. The immediate reason for the Hispano-Suiza agreement is to provide engines for a Franco-German freighter project, the Transall, which will be powered by Rolls-Royce Tynes and for an anti-submarine aircraft. There is little doubt that the company would prefer to supply the engines for the Transall direct from its own factories in Britain, but the French industry would presumably not stand for this, so the only alternative is to arrange for its construction in France. Fortunately for Rolls-Royce, Snecma has made little or no effort to build big turbo-prop engines, and Pratt and Whitney can give little help in this direction.

CREDIT INSURANCE

All for the Best?

AFTER their annual meeting in Seville last week the international association of credit insurers (the Berne Union) issued a comforting statement suggesting that it has competition in credit terms under control. For instance, members "confirmed their view" that where credit insurance for capital goods is required the maximum credit period after delivery for even large contracts should not be more than five years. Comforting, but does it hold? The five-year limit for capital goods is no more than a gentlemen's agreement, and members know well that on occasion insurers, on their own initiative or under pressure from their governments, have displayed an ungentlemanly ingenuity in finding a way round the rule for some particularly tempting export business. At times their conscience may have been eased by the knowledge that the credits were granted by government-sponsored institutions (as in the sale of German ships on seven years' credit) but this is of no solace for the British or other exporter who loses the contract.

The collective conscience of the Berne union has restrained open competition in credit terms—more successfully, perhaps, than might have been expected. But there is certainly a risk that such a loosely constituted association, on which governments are not directly represented, may be less able to hold the line as the pressure for longer credits intensifies. The development of new financing institutions could turn its flank. The British Government represented at one remove through the Export Credits Guarantee Department, may soon have to consider whether Britain's export trade is best served by letting the union get on with the job as well as it can, or by seeking a more effective system of control through direct negotiation between governments.

INTERNATIONAL CREDITS

Argentina and Rhodesia

TWO important international credits have been announced recently. The Argentine Minister of Economy, Senor Alsogaray, has stated that a group of French and German banks have granted Argentina credits equivalent to $150 million, repayable over seven years at an interest rate of 7 per cent. The money, he said, would be used to purchase capital equipment in Germany and France. Argentina's need for capital will also be pressed by the President of Argentina, Dr Frondizi, in the course of his coming state visit to Western Germany. This has been openly admitted by the Argentine Ambassador in Bonn who has said this week that the search for capital would be one of the objectives of the President's visit to nine European countries. Another matter to be discussed is Argentina's concern lest the development of rival European trade groups may affect the traditional Argentine exports of meat, grain and fruit. These developments reflect Argentina's urgent need for capital of any kind, from any source and for all kinds of purposes. Countries on the Continent of Europe are evidently being more forthcoming than the United Kingdom.

Nor are British investors at present enthusiastic about Africa. The Chase Manhattan Bank of New York has agreed to grant the Federation of Rhodesia and Nyasaland a three-year credit of $10 million. It will carry interest at 6 per cent. Repayments are due to start 18 months after the credits have been drawn on. The Federal Minister of Finance, Mr Macintyre, recalled that the 1959-63 development plan provided for expenditure of £77 million, of which £37 million was to be borrowed from local and overseas sources. It now seems, he said, that raising money in London would be more difficult and that the Chase Manhattan credit would help to fill the gap.

RESEARCH

Designing Lenses by Computer

A LONG-TERM research project designed to develop better methods of making lenses is one of the first to be financed by the DSIR under its new research policy. This is intended to ensure that projects do not die because the university in which they are being carried out has not the funds to continue them after a short-term DSIR grant ends—as it did after a maximum of five years, and an average of three. Grants will now normally be made until the end of the next quinquennium of the university concerned and can be made for seven years, as they have been for this study of lens design, which will be carried out at the Imperial College of Science and Technology. It is worth £9,400 a year, and is intended to allow Dr G. C. Wynne, research director of the Wray Optical company, to develop his ideas on lens design—one of which is to apply computers to the subject. Before he feels ready to do this effectively he wants some fundamental theoretical work done ; this the DSIR grant will make possible.

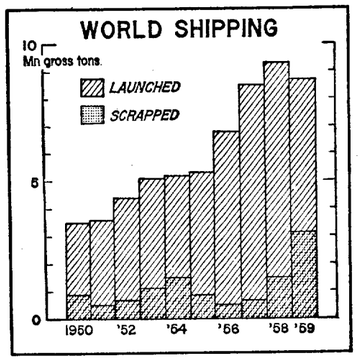
It is theoretically possible to make better lenses than are now made and since the design of lenses is so much a matter of theory and calculation computers might be used in this. But the advantages of these lenses would be limited to special applications, where high accuracy is needed. Better lenses would not necessarily become available for cheap cameras, for example : we already know enough about these simpler problems. Scientific instruments are likely to be the chief beneficiaries of this research—or perhaps photographic reconnaissance equipment for defence requirements. These applications may seem esoteric ; but it is impossible to tell what research of this nature may eventually produce, and funds to cover the modest cost of this sort of development of promising ideas can be among the best investments that a government research organisation can make.

COMMON MARKET

Aids to Investment

FOR an uncomfortably long time British firms have had to take (or defer) policy decisions about trading and investment in the common market without knowing whether Britain will eventually join or at any rate try to do so. Some have already taken the plunge by establishing subsidiaries or linking up with local firms ; some think it best to wait and see, while others no doubt feel that they ought to explore the possibilities but do not know where to start. A handy introduction to investment in the Six* has now been published by the Association of British Chambers of Commerce. There can be no "Best Buy" : what suits one firm will not suit another. Germany and Holland treat national and foreign firms alike, and offer no special inducements to investment (though the German provincial authorities offer some advantages in areas of surplus labour).

In Belgium too foreign investors have no special status, but the government has recently introduced a number of concessions, such as subsidised interest rates and interest-free loans for research and the development of new products. France and Italy offer some inducements for foreign firms ready to face a hideously complicated tax system. In France these apply to the depressed areas ("zones critiques") but they are not available in their present form beyond the end of 1960. Facilities include long-term loans at 6 per cent interest, an equipment grant, and a five-year suspension of local rates. And in Calais, one such zone, land is being offered, complete with services and access roads, for £820 an acre.

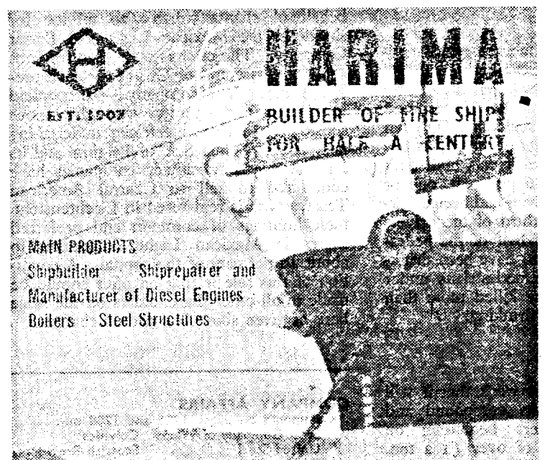


SHIPPING

Scrapping—to Capacity?

SHIP owners have little doubt that they will see the end of the present world-wide recession only when most of their older cargo vessels and tankers have been sent to the breaking-up yards and most of the present substantial surplus of tonnage has been eliminated. The rate of demolition has been rising quite sharply, with attractive prices now being offered for steel scrap, particularly in the Far East, which in turn have stemmed from the revived demand from the steel industries. From a postwar low of about half a million tons in 1956, the year of the Suez-induced shipping shortage, scrappings rose to not quite three-quarters of a million tons in 1957, and then doubled to nearly 1½ million tons in 1958. Last year, according to the latest reports to reach Lloyd's, at least 3.1 million tons of shipping were broken up. But the world's shipyards have meanwhile been launching a great deal more new, faster and more efficient ships, at the rate of 8 million to 9 million tons a year in the last three years. And the industry is now doubting whether in fact the breakers can handle much more tonnage for scrapping than they are taking already.

Just over a million tons of ships were broken up in the last three months of 1959, of which almost half was done in Japan and Hong Kong. Reports of scrapping in the first quarter of 1960 are not yet complete, but it seems likely that the total will be a little lower. At present 362 ships of 1.8 million tons already sold for breaking-up are awaiting demolition ; this is about the same as three months ago. It would appear, therefore, so some observers in the industry argue, that the limit of the scrap yards' capacity to break up ships is perhaps in the region of 4 million tons a year.



If this is so, then scrapping will have to go on for some time before the burden of surplus tonnage is lifted from the freight rate market. This applies to oil tankers even more than to dry cargo operations. While the laid-up tonnage of dry cargo shipping has now fallen to 1.8 million tons, about a third as much as at the peak just over a

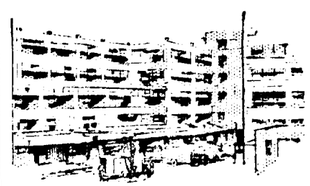
Décor at 40,000 feet

In a modern airliner, passenger comfort and contemporary furnishings are the concern of top designers. Intensive research goes into the spacing and angling of seat accommodation and the provision of a restful, luxurious atmosphere. A first-rate feature on the furnishing and design of airliner interiors appears in *The Aeroplane and Astronautics* on sale today. Articles in this feature include:



A Continental airline company's approach to furnishing its latest jet aircraft.

A directory of manufacturers of passenger airline furniture and equipment.

Sketches and notes on various aircraft, detailing their interior furnishing and design—including the Russian turbine liner the "Il.18".

With all the news in articles and pictures.

The Aeroplane and Astronautics is one of fourteen opinion-shaping journals published by Temple Press Limited. Each of these publications is a leader in its field —and not only in the home market. *Every year, more than 2½ million copies* circulate in 133 countries throughout the world. The specialized journals of Temple Press are authoritative and informative. It pays to advertise in them.

year ago, the total tonnage of tankers laid up, 3.6 million tons at the beginning of this month, is almost as high as it has ever been, and the number going into lay-up is still rising. New tanker launchings this year, moreover, are likely to approach another 4 million tons or so. Yet the scrapping of oil tankers has lagged behind that of dry cargo ships. Only a quarter, or about half a million tons, of the ships scrapped in the first nine months of last year were oil tankers.

TELEVISION

Coin-Box TV for London

A COIN-IN-THE-SLOT scheme for the rental of television sets is to be made available in the London area for the first time by British Relay Wireless. Known as "Slot TV," the system consists of an ordinary television set with an electric meter attached: 2s. in the slot provides current to the set for about three hours, or rather less than an average evening's entertainment for most British viewers. The company will introduce the scheme both for wired relay sets and conventional receivers. Fixed rentals for the sets are 9s. 3d. a week for a 17-inch model and 11s. a week for a 21-inch model (wired relay rentals are slightly higher but include radio); amounts collected through the slot in excess of the weekly rental are refunded quarterly in cash or may be used towards credit purchases of television sets or other domestic appliances from the company. Marathon Holdings and Investment (Glasgow), which British Relay Wireless bought earlier this year, has been operating coin-box rental in Scotland and the North of England for almost two years.

Nobody knows exactly how many television sets are now on hire in Britain out of the 10½ million now in use; it has been estimated that a third of those produced may be rented rather than sold. There are about 400,000 wired relay sets, which receive programmes by wire from a central station which receives them in the conventional manner and then re-transmits them on a different carrier frequency. Well over half of these wired relay sets are supplied by Rediffusion Ltd., which also rents conventional receivers; Rediffusion has experimented with coin-box rental on a small scale in the North of England, but does not intend to introduce it on a large scale for either wired relay or conventional sets at this time.

Coin-in-the-slot television, or "pay as you view," is likely to be considered by the broadcasting committee, which the Government intends to set up in the near future, as a possible means of financing some of the programmes of a third television network. But the present coin-box schemes, which may be in greatest demand in hotels, boarding houses and the like, would seem to give little indication of potential demand for "pay as you view" systems (most of which involve considerable technical complication) which are intended as a means of paying for special programmes rather than for standard service on a rented set.

SHORTER NOTES

The index of retail prices was unchanged in mid-May, at 110.3 (January, 1956 = 100), one per cent higher than a year ago.

*

Air traffic was booming on the North Atlantic during the first quarter of the year, which is traditionally a time of slack travel. The number of passengers was nearly 20 per cent higher than a year ago and between a third and a quarter of the 228,000 who bought seats were carried by one airline, Pan American. It carried twice as many passengers as its nearest rival, Trans-World Airlines, with BOAC coming third. At the beginning of the year BOAC was neck-and-neck with TWA, but by March the American airline had established a decisive lead. Nearly three-quarters of all people flying the North Atlantic now travel third class, a quarter go first class and a minute fraction buy tourist tickets when they can.

*

The Commercial Credit company of Baltimore, third largest sales finance company in the United States, has joined the Amstel Club, the association of leading hire purchase finance companies in Europe (including United Dominions Trust in Britain) acting as each other's agents in financing import and export business.

*

The Road Research Laboratory has concluded from its study of the high death toll on the roads last Christmas that the combination of bad weather and drink accounted for most of the 150 fatal accidents. Only ten per cent of the accidents occurred on dry roads: for three-quarters it was both dark and wet. In at least 56 per cent, one or more of the persons involved had been drinking alcohol. Nearly a third of the drivers involved and more than half of the pedestrians killed are known to have been drinking beforehand: of the pedestrians under the age of 60 who were killed more than three-quarters had been drinking.

*

Fisons announced this week that it will reduce the prices of its compound and superphosphate fertilisers beginning on July 1st by an average of over £1 a ton. The company estimates that the price reductions will save British farmers nearly £1 million in 1960-61; a similar price cut was announced earlier this month by Imperial Chemical Industries.

*

Barclays Bank has transferred its branch clearing, handling 50 million vouchers a year, from London to Northampton. Opening the new premises this week Dame Evelyn Sharp, permanent secretary to the Ministry of Housing, said that her one regret was that the other banks were not following Barclays' example.

*

Ordinary passenger fares on British Railways went up last Sunday, June 12th. In April, at the time these increases were announced, it was said that the regions would have authority to introduce variations. In the event, this element of freedom was confined only to the point at which the fares "taper" would start. All six regions are charging the full farthing a mile increase, making the ordinary fare (second class) 2½d. a mile, for distances of up to 200 miles. For longer journeys the rate per mile diminishes, on four regions, up to a distance of 275 miles, where the previous fares of 2.1d. a mile up to 300 miles and 2d. a mile thereafter still operate. In the western region the taper ceases, and the old fares apply, above 272 miles. The sixth region, the southern, has no journeys approaching 275 miles except on the continental and Channel Island services (and through bookings to places in other regions): so only on these services is the region charging the previous rate of fare.

*

Hambros Bank has made an offer on behalf of clients worth £20 million for shares in the Mexican Light and Power Company. The offer is of US$20 for each common share and of US$13 for each preferred share. This company is incorporated in Canada and operates through various subsidiaries a large electricity undertaking in Mexico. Sofina S.A. of Belgium and its associated and subsidiary companies have contracted to sell to Central American Trust, which is registered in Liechtenstein, their holdings of common and preferred shares in Mexican Light, amounting to about 40 per cent of the capital. A condition of this sale is that an offer should be made to all other shareholders on the same basis as given above less certain charges.

GOLD LESS IN FAVOUR

A special survey at a turning point in monetary policy

The Barclays Spread Eagle means banking over a surprisingly large part of the globe: the Barclays Group boasts 3,600 branches in 45 countries, the largest branch banking network in the world. It has been built on a principle stemming from the earliest days of banking in this country. The private banks which combined to form Barclays had their own long histories; and they provided the foundation for a system of Local Head Offices which lodges in the hands of local people a broad measure of the control of the Bank's affairs.

THE WAY OF AN EAGLE

Over the past forty years, as the English Bank has carried its name to so many places abroad, it has been natural for the system of decentralisation to accompany it. "Money is our business" in Scotland, in France, in the Mediterranean, in Africa, in the West Indies; and branch managers abroad, as in England and Wales, can deal with practically any banking question you put to them. But if they have to refer to higher authority most of them need go only to their Local Directors in Norwich or Nairobi, in Liverpool or Lagos, rather than to a remote head office in London. The system has its origins in the distant past; but there are good grounds for thinking it very well adapted to the needs of modern business.

THE BARCLAYS GROUP OF BANKS

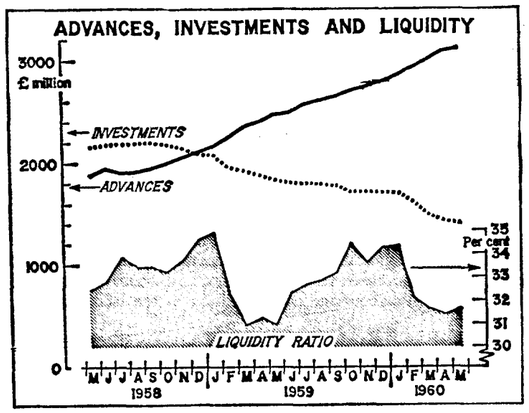
Full Circle?

A BACKWARD glance now at the last survey in this series in 1958—last year's survey was torpedoed by the printing dispute—neatly covers the whole period during which the banks have been free to lend as much as they wish. The squeeze-by-request that ended so dramatically and so suddenly two years ago is now being replaced by the squeeze-by-special-deposits, which introduces a technique of central banking control that is entirely new to Britain. The reimposition of control thus poses two broad questions for the bankers. On the one hand, how will the new weapon work, and how far will it necessitate a re-casting of accustomed banking habits? On the other hand, does this quick return to control mean that the freedom and the opportunities the banks have enjoyed in these two years have to be regarded as wholly exceptional, a brief interlude in a regime that is bound to be one of discipline at most times?

It is much too soon to try to suggest final answers to these big questions; but many of the data that will help to shape the eventual answers are to be found in the experience of these eventful two years, and especially in the large changes they have brought about in the banking structure.

The magnitude of those changes is not, even now, generally appreciated. At the time of our banking survey in mid-June 1958, a mere two weeks before the credit freeing, there had been no sign that a decontrol of bank lending might be—or even could be—used as a major instrument of reflation. In the spring of that year, so far from preparing for big new demands for loans and new opportunities for lending, the banks were looking rather to the opportunities in the gilt-edged market; many of them were disposed to turn any excess of liquid assets into high-coupon bonds. Indeed, the possibility of continued support of this kind was being cited as an assurance that the authorities would have no difficulty in preventing any resumption of credit expansion at an undue pace. Nobody then supposed that a lifting of the "directive" controls over advances, should that be conceded, could quickly give rise to a dramatic increase in lending, and to a major transformation in the pattern of bank assets.

It was in this atmosphere that the first decisive step was taken. But at the outset, in early July, it was not made clear whether the decontrol extended beyond the ending of quantitative, as distinct from qualitative, control over advances. It is doubtful, indeed, whether the authorities intended to go all the way at that stage. But that signal was enough to send the bankers scurrying one after the other into participations in hire-purchase finance houses and then, without a pause for breath, into a frenzied launching of instalment-type personal loan schemes. Revolutionary changes that had been discussed academically behind the scenes, often without even hypothetical decisions being taken, and that most bankers might have expected to see introduced, if at all, only gradually and at some rather remote date, had been swept through in a few weeks—often with little further thought. There was much shaking of heads in City circles; and among the head-shakers were some of the bankers who were themselves being carried along by this extraordinary and unexpected tide.



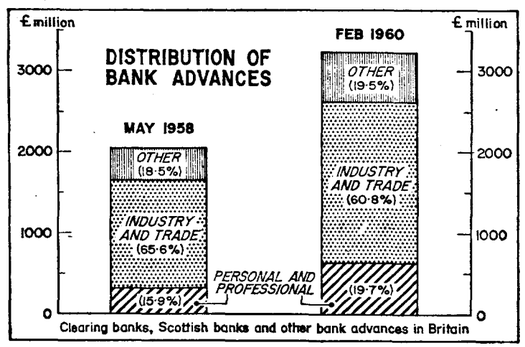
BUT these exciting developments that hit the headlines of the popular press were only the beginning of the revolution. They played a tremendously important part, but played it indirectly—by touching off other movements of much greater magnitude. The bankers who had supposed that a public long accustomed to restrictions on bank lending would react only slowly to an ending of the squeeze had left out of their calculations the psychological impact of the personal loan schemes, and of the other much-publicised indications that the banks were bidding one against the other in their eagerness to do business. The demand for the new-style personal loans has not been insignificant; but it has been small beside the huge torrent of demand for conventional overdraft facilities that stemmed in the first instance from this evidence that the bankers wanted to lend, and then quickly gathered a great momentum of its own. It is this movement, and not the success of the novelties, considerable though that may have been, that has brought about the transformation in the banks' balance sheets.

The surge of demand mounted rapidly to proportions unprecedented except in the immediate aftermath of war; and then, having surpassed all expectations during the nine months or so of acceleration, went on for longer than anyone had thought probable, at only a little below the peak rate. The aggregate of outstanding advances of the clearing banks, excluding the distorting transit items that are grouped with them in the usual statements and also excluding lendings to the nationalised industries, rose during the twelve months to May, 1959, by £577 million, or by no less than 32 per cent; in the ensuing twelve months they rose by a further £665 million, or 28 per cent, in spite of the fact that towards the end of the period official warnings to the bankers and the threat of recourse to the new weapon of special deposits had exerted some retarding effect. The growth over the two years thus amounted to £1,242 million, or 68 per cent. At the same time an additional £12 million was lent to the nationalised industries, bringing their fluctuating total of working capital requirements up to £75 million, and raising the grand total of all clearing bank advances to £3,134 million, net of transit items. To find a faster rate of growth it is necessary to look back to the wild speculative boom that so disastrously followed World War I: advances then rose by 80 per cent in fifteen months. In modern times the fastest climbs had previously been the 20 per cent of the "reconversion" year 1946 and the 17 per cent caused in 1951 by the effects of the post-Korean boom in world commodity prices.

The Radcliffe Report

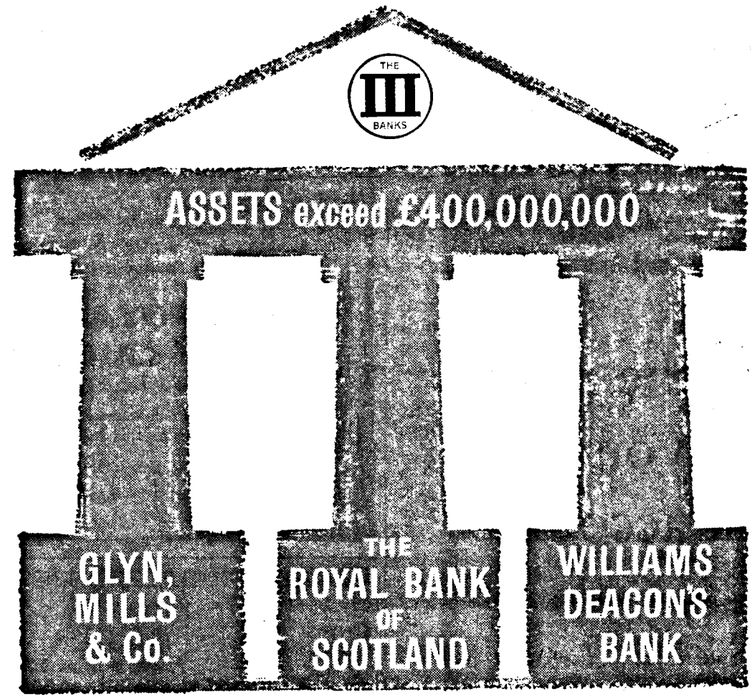
The report of the Radcliffe committee and the great weight of evidence submitted to it will remain in the centre of monetary analysis and monetary debate for years and perhaps decades. Indeed, there can be few people who have yet digested the material, especially the vast range of oral and written evidence. First attention was naturally paid to broad principles of policy and to the new light shed on domestic banking and finance: lengthy summary and comment on these main aspects was given in these columns on August 22 and 29, 1959 (following publication of the report), and on March 19 and 26 last (following publication of the evidence). In two later articles in this survey a correspondent turns the spotlight on two other spheres: what overseas central bankers had to say of their attitude to the problems the committee was considering; and secondly, the new information (which for the most part was the first substantive information to be made publicly available) shed on international banking in London and the influences bearing on the flow of foreign funds.

This huge increase in outstanding bank advances was not, however, accompanied by anything like a corresponding growth in the total volume of bank credit—thanks to another tidal movement that was equally unprecedented, both in duration and in magnitude. Since, at the beginning of the period, the banks had hardly any cushion of liquidity beyond the 30 per cent minimum, the demands for advances very quickly left them with no alternative but to sell investments. Until the liquidity squeeze of 1955 it had been widely believed that the banks would never be able to sell gilt-edged on any considerable scale; but even the large sales effected (at considerable cost) in that year had not prepared opinion for the



possibility of selling on the huge scale of these past two years. The liquidations began in October, 1958; by the following May they had reached almost £380 million, including perhaps £80 million of bonds redeemed at maturity. In the twelve months to last May the gilt-edged portfolios were run down by a further £444 million, making an aggregate net decline of around £800 million in two years (no exact figure can be given since the division of bank investments into gilt-edged and other investments is not available for May, 1958). This represented a reduction of portfolios by roughly 40 per cent, and was the equivalent of 12½ per cent of the amount of gross bank deposits outstanding at the beginning of the period. This is a rate of decline far surpassing anything experienced during the nineteen-twenties, when the "scissors" movement of advances and investments is generally regarded as having been most clearly in operation.

NEEDLESS to say, an unloading of bank investment holdings on this wholesale scale could not have been achieved without the active participation and contrivance of the authorities—not even, it seems safe to assume, if the selling had been allowed to cause a much steeper rise in gilt-edged yields than has in fact occurred. At first it was logical to suppose that if the authorities did indeed regard the upsurge in advances as a desirable agency for reflation, they would seek to supply the banks with additional liquid assets so as to save them from the need to unload gilt-edged on the market. The supply of liquid assets could not, however, be increased at will, except by the process of offering them in exchange for longer securities; and since the authorities had clearly set their faces against any policy of deliberately trying to force down long-term rates, the process of exchange could take place only as and when the banks' offerings of stock impinged on the market.



Almost at the outset, indeed, as was evident in the market at the time (and as the official evidence to the Radcliffe committee later confirmed), the "departments" showed reluctance to take any but the shortest stocks except at prices below the market level. But after this early hesitancy they evidently decided that the aims of the reflationary policy required them to cushion the market against such shocks. Hence, though the banks themselves normally received something less than the market price, the market itself was not forced to register a corresponding movement—until the abrupt toughening of tactics in February last.

During the first half of the period this policy could, perhaps, reasonably be represented to be simply one of "smoothing," because there was a good offtake of stock by other investors. Although this demand did not fully match the banks' sales, it could be argued that these were not likely to continue at the full rate, and that, as they slackened, the outside demand would absorb the surplus stock temporarily accumulated by the departments. Unfortunately, at the very time when the banks' selling did slacken, in the third and fourth quarters of 1959, the outside demand dried up altogether and became instead a stream of sales to swell the selling of the banks. Thus in the last three quarters of 1959 (the latest period for which figures are available) the net intake of stock by the departments was on an ascending scale. From October, 1958, to December, 1959, inclusive, the intake was no less than £429 million, of which £138 million related to the last quarter. There can be no doubt that the absorption in the first quarter of 1960 was bigger still—for the clearing banks' portfolios were then reduced by £229 million.

Over the whole two-year period, however, this £800 million reduction in the banks' gilt-edged holdings was accompanied by an expansion, on balance, of only £165 million in their aggregate liquid assets. Hence the reduction of these two broad categories of assets, considered together, was sufficient to finance just over half the additional lendings. The other half was provided for by an increase in deposits: the additional liquid assets permitted gross deposits to grow by £688 million, subject to a small decline, on balance, in the liquidity ratio. The growth of net deposits was

rather smaller than this. In the first year, indeed, it amounted to no more than £230 million, or 4 per cent; but in the second half of 1959 it speeded up rapidly. Thanks to a flattening of the curve —seasonally adjusted—in the latest five months, the rise over the year has been confined to £372 million, or 6 per cent. Over the two years it amounts to 10 per cent. This, although strikingly less than the rate of growth in advances, still represents the fastest credit expansion since the Daltonian drive for ultra-cheap money in 1946, when net deposits rose by 16¾ per cent. The fact that so large a part of the new advances has in effect been provided for by the sale of other assets to the public can be regarded as a direct consequence of the refusal of the monetary authorities, even when their aims were reflationary, to take any leaf from the Daltonian book.

As a result of the effort to continue the funding policy so far as possible, and thus to keep a leash on bank deposits even while advances were soaring free, the change in the banking structure has been an even more radical one than would otherwise have occurred. Two years ago, the ratio of advances to deposits, though much above the extraordinary level to which it dropped during the war, was still far below the prewar level of around 44 per cent—not to mention the 54-55 per cent that had obtained in the five years before the world slump of 1931. It stood then at around 30 per cent, appreciably below the postwar peak touched in 1955 ;

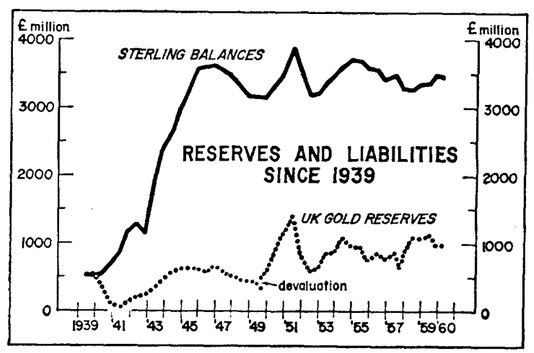
and few bankers envisaged any prospect of a return to the prewar ratio, even over an extended period. There was even doubt whether some of them would have wished to see a recovery go all the way. But in this brief burst of intense activity it has done so ; last month the average ratio was 45.8 per cent—and until the new official restraints it even seemed that it might soon begin to scale the dizzy heights reached in the later twenties.

Necessarily, the investments ratio has moved no less dramatically. The incubus of massive holdings of gilt-edged securities, which began to pile up in the prewar phase of cheap money, had grown steadily more oppressive during the war and postwar years. By 1954 the investment portfolio represented no less than 36 per cent of bank deposits, and bankers had come to despair of ever again getting within sight of the proportions to which they had been accustomed in former times of flexible money rates. Now, after the huge sales of these past two years, the proportion is back to 20 per cent, the level obtaining during the earliest days of the prewar cheap money drive: in each of the years 1925-32 the annual average ranged from 14 to 19 per cent.



This approach to the pattern of bank assets that obtained in the heyday of bank lending has one very important implication for the future. It means that the banks are no longer, as the Radcliffe committee rightly assumed only a short time ago, significantly underlent. For the first time in the twenty-year history of official efforts to control bank advances (as distinct from deposits) the natural instincts of bankers do not run diametrically counter to the restraining aims of the authorities. This should mean that the new-style squeeze may work, at least at the banking end, with less friction than did its predecessors ; though if it equally relies upon direct or so-called "quantitative" pressure, as distinct from pressure imposed through interest rates, it may be hardly less susceptible to frustration through the activities of other lending institutions. It also means that the experience of these past two years is for the most part a non-repeatable one. Though advances may in due course be released from the new squeeze, they cannot in the foreseeable future be expected to soar as they have lately done, since most of this movement represents a quick once-for-all readjustment from an unnatural condition long enforced by arbitrary directives.

Sterling's Weak Point

Not London's international banking business—but simply Britain's failure to earn a big enough current surplus to finance overseas investment

GIVEN the build-up of pressures on Britain's domestic economy, to say nothing of last month's deterioration in the international situation, sterling has so far been holding up well this year. The basis of confidence built up after the British authorities' brave actions of 1957 and the move to convertibility at the end of 1958 has not suddenly melted away. Overseas observers in general continue confident that Britain will take the necessary actions to prevent a depreciation of the currency. They are willing to keep their funds in London while interest rates are attractive. So there seems a good chance that if adverse pressures do develop this summer a straightforward rise in Bank rate may be adequate to contain them. Yet these more favourable omens for the months ahead should not divert attention from a longer-run continuing weakness in Britain's external payments.

On the crude but relevant comparison of the total of Britain's quick assets in gold and its external liabilities in sterling, it needs to be repeated, there has on balance been little progress since the end of the war: the sterling liabilities are still about three and a half times as large as the gold. The massive accumulation of external liabilities repayable on call was the biggest single facet of Britain's financial weakening by the war; yet, despite the continuous (which is not to say sufficient) efforts of the Treasury, and despite the automatic improvement in the ratio to gold reserves brought by the 1949 devaluation and the more respectable improvement in 1958, the underlying weakness has remained. So the economic controllers have never been able for long to take their eyes off the movement of the gold reserves month by month.

To achieve an improvement in the balance of reserves to liabili-

ties, it is not sufficient for Britain merely to earn a current surplus. The surplus has to be large *enough* to cover external capital commitments. These have been persistently large; private exports of capital, despite the continuing restrictions, have been around £300 million gross, mainly in the form of direct investments by oil companies and others. There has been an important inward flow, of probably about £100 million, but possibly more in the latest years; but this has been offset by the increasing calls on the public purse for overseas loans and grants, now running at an annual rate of as much as £150 million. In a long-run study presented at the Radcliffe inquiry just over a year ago, the Treasury reckoned that in order to release £150 million for repaying sterling liabilities or increasing the gold reserves, the current surplus should be of the order of £450 million.

In no postwar year has the current surplus come anywhere near that figure. The 1958 surplus was at first put at £455 million, but this was later pared down by over £100 million. In 1959 the surplus fell to £145 million. This year it may be no higher. The average for the last five calendar years is about £165 million.

The figure of £450 million, the Treasury emphasised to the Radcliffe committee, was to be taken as "illustrative only," rather than "as a standard by which performance should necessarily be judged." For "this will depend on external as well as internal conditions." The figure simply means "that in present circumstances the United Kingdom should conduct its internal policies in such a way" that resources of this order of magnitude should be released for external use.

Can one be satisfied that the United Kingdom has conducted its internal policies in such a way? External conditions, surely, could by and large hardly have been more favourable. The weakness of commodity prices has at times hit export markets in primary producing countries, which are especially important to Britain. But this influence has been mild by prewar standards; and it has improved Britain's terms of trade by 10 per cent since 1957, which is no mean compensation. After their great and sometimes forgotten upsurge immediately after the war, Britain's exports have been sluggish by comparison with those of its major competitors in Europe. As a result, it is these countries that have piled in

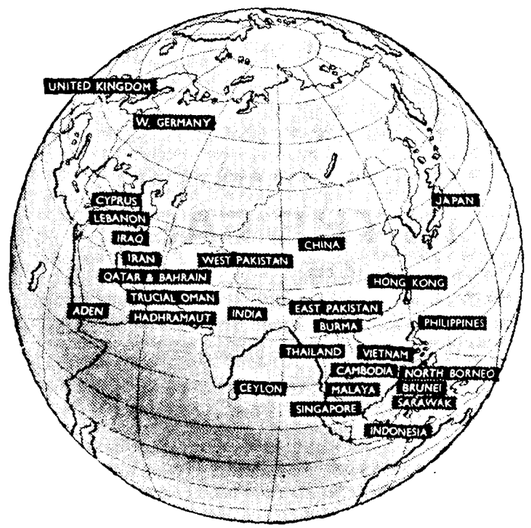
gold and foreign exchange to their reserves. Britain's reserves, which to a large extent have to support the trade of the whole sterling area, are now, at around $2,850 million, no larger than the average of those of the leading countries on the Continent.



This weakness in Britain's international reserves is periodically attributed by some critics to sterling's international function as a banking currency. That function, certainly, has for short periods intensified adverse pressures. But the real weakness has been the simple one of Britain failing to earn an adequate current

A NEW CYCLE?

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. An effective credit information service and skilled assistance and advice are available to United Kingdom merchants and manufacturers seeking new business connexions in Asian markets.

surplus. Over the run of years the overseas sterling balances have been remarkably stable; on balance, they have not been drawn down. Their composition, however, has changed considerably.

In June, 1957, the Bank of England told the Radcliffe committee how, broadly, it expected the sterling balances to move in the future. It is interesting to compare this prognosis with what has happened. Balances of the non-sterling countries were not expected to change much; in practice they have risen considerably, from £691 million in March, 1957, to £822 million in March of this year. Balances of the independent sterling countries were expected to fluctuate, and they have done; allowing for the change in composition of this group as Ghana and Malaya have become independent, there has been a fall of about £100 million in these balances in the past three years, to £1,774 million, though they are now £100 million higher than a year ago. The balances of the colonies, it was expected, might well fall appreciably; in fact they have hardly changed, at £900 million. Finally, in the fourth category of sterling balances, those of the Middle East—which the Treasury does not however show separately to the public—were plainly regarded as unreliable. They are closely dependent on the fortunes of oil, as well as of Arab politics. Thus in the past year Iraq has been converting sterling into gold, dollars and European currencies in order to display its break from London; while Kuwait is believed to have drawn on its sterling balances as a result of over-estimating its revenues from oil.

THE net result of these movements is that total overseas sterling balances at the end of March, excluding the holdings of international organisations, were at just under £3,500 million, broadly the same as they were three years earlier; while the gold reserves, at £993 million, were nearly £200 million higher, despite special payments to the International Monetary Fund which have increased Britain's second-line reserves. The composition of the sterling balances, however, has changed significantly. Holdings of non-sterling countries, as has been seen, have risen; and the whole of this increase has been in the balances of individuals and private institutions. A subdivision that the Treasury chooses to publish only occasionally shows that while between end-1957 and end-1959 holdings of central banks and other official funds in non-sterling countries fell, those of "other funds" rose from £282 million to £470 million. Together with the holdings of non-official funds in overseas sterling countries, this brought total "private" overseas sterling balances above £1,000 million, compared with £764 million two years earlier.

These private balances, it is generally assumed, are the most volatile, being sensitive to shifts in confidence. At a time when sterling is suspect, so the argument runs, there is more danger of a withdrawal of funds invested by a Swiss bank to secure a small turn in interest than a withdrawal of sterling securities that form the reserve of a West African marketing board. Yet it would be difficult to assess the significance of this distinction today. On the one hand, a substantial part of the private holdings, as has been seen in past crises, represents a hard core of commercial working balances that are not withdrawn even at the height of a crisis. On the other, a country in the throes of industrial development can in practice mobilise its sterling reserves without dire consequences. Almost certainly, the biggest withdrawals from London at the time of the 1957 crisis were those made by India; and while the 7 per cent Bank rate successfully caused a change of heart among the bankers of Zurich, it could do nothing to alter the financing needs of the planners of Delhi. The fact that commercial balances are more sensitive than balances of central banks can cut both ways.

The fact is that London's international banking business in the postwar years has itself caused few long-term disruptions. Just because it is so large and so well spread, it appears to have had, so far, an inherently self-balancing character, withdrawals of deposits by one group usually being offset by increased deposits from others. This is the more impressive because so little progress has been made in strengthening the cash base in the form of gold and dollar reserves. Over the run of years the mechanism through which overseas countries keep foreign reserves in London has not been a source of weakness; it has shored up a different weakness, Britain's inadequate current surplus. At times Britain has in fact managed to invest a deficit; what it cannot do is repay its debts with one.

Central Banking Abroad

Central banking in the end will always be a mystery, not because it is too difficult to understand but because it takes concentrated work to keep up with. . . . So it is necessary to do two things: (1) to let everybody know that the System is anxious to explain what it is about . . . (2) to make sure that those people who do take the trouble to become expert on these matters . . . can find in them a complete rationalisation for past action, and therefore a fair basis of comprehension of future actions.

Mr Winfield W. Riefler, special assistant to the chairman of the Federal Reserve Board, in evidence to the Radcliffe committee.

IF monetary policy is to be taken seriously, then the evidence of overseas central bankers to the Radcliffe committee deserves careful digestion. What is the right relationship for the central bank with the government? Should the central bank operate directly on the long-term rate of interest? What should be its attitude to financial intermediaries, special deposits or reserve requirements, and to telling the public what it is doing? The central problems with which the Radcliffe committee grappled, and which continue in the forefront of debate, are not peculiar to Britain, and the testimony submitted by leading central banks overseas throws valuable and unjustly neglected sidelights on Britain's experience.

The committee submitted to the overseas central bankers a questionnaire on relationships between the central bank and the state, the nature and efficiency of monetary controls, the relevance if any of "general liquidity," the constitution of central banks and their recruitment of staff, the case for publicity, and, where relevant, the views held about the sterling area. The central banks of the Netherlands, South Africa, the United States, Australia, Ceylon, India, New Zealand, and Rhodesia and Nyasaland provided written memoranda; the first three also supplied oral evidence. One may regret that some other central banks did not give evidence, but one cannot complain about those that did. In particular, the evidence of Dr Holtrop, president of the Netherlands Bank and of the Bank for International Settlements, merits near-classical status.

Recent monetary experience has amply demonstrated that the old simplicities in the technique of monetary control are no longer

valid. On the one hand, the wider responsibilities of government have effectively reduced the central banker's elbow room; on the other hand the limited nature of the response to traditional central banking operations both within and outside the banking system as conventionally conceived has raised the questions of whether those operations should be extended to new fields or whether there is need for more elaborate monetary controls.

The Radcliffe evidence reveals the wide variety of possible arrangements, varying closely with recognisable national inclinations. The central bank, almost everywhere governed by statutes more complex and precise than the nebulous British variety, nowadays finds itself somewhere between the one extreme of more or less complete subordination to the State, and the other extreme of being hived off to cultivate independently a carefully demarcated cabbage patch. The Governor of the Bank of Ceylon illustrates the dangers of the first extreme in recording the political dismissal, on superficially legal grounds, of his predecessor.

Towards the other extreme, the Continental preference, of which Dr Holtrop's evidence is a masterly exposition, is for more or less complete independence of the central bank in a specifically narrower field than modern opinion in Britain generally regards as appropriate. Dr Holtrop openly rejects the British Treasury's view that "monetary management is predominantly an instrument of general economic policy."

> I would say that it is not correct that monetary policy is only one of the instrumental possibilities of general economic policy. I think that monetary policy is a thing of its own . . . (Q.11854).

This apparent narrowing of the central bank's scope is put still more starkly: "I do not think that we continually live in a situation where the central bank's policy has an active influence upon the economy." Much British opinion will be shocked. To Dr Holtrop, however, this is not narrowing the scope of the central bank, but a rounded conception of its functions based essentially on the view that money can be and should be neutral in the economic process, so that monetary stability stands as something in its own right: "One should have sound monetary policies whatever further aims one strives for." The pursuit of a stable price level, in this view, can be disentangled from other economic objectives—reflecting perhaps some scepticism of Keynesian economics, as well as close acquaintance with monetary chaos.

THIS gives the central banker a clear cut task of dealing, as Dr Holtrop puts it, with "anything that might lead to monetary pressures." It will not be his concern to direct economic activity but to avoid price instability—"I therefore want to draw the line at the financing, and not at the decision to spend" (Q.11815). Admitting that Government departments may disturb equilibrium, he would admonish but would not need to take frustrating action if the Bank were not called upon to provide inflationary finance (QQ.11810-11 and 11857). This general philosophy seems to underlie the recent actions of the Bundesbank in Germany, stiffening its monetary policy in default of a tightening in the government's fiscal policy.

In practice, not surprisingly, the hard formal lines of division between Bank and Government are softened. Dr de Kock is consulted about the Budget in South Africa (Q.9308), and although Dr Holtrop makes independent decisions about Bank rate—he is not given to the package deal (Q.11868)—he has frequent consultations with the government. Mr Winfield W. Riefler of the Federal Reserve, while agreeing that "independence from the executive" is "the essential part" of his position, stresses the importance of working "in accordance with national economic policies" and he is at great pains to stress the close interchanges with the Treasury (QQ.9399-9400, 9597).

The advantage—dare one say the Blessing?—of having an independent-minded central banker to wag a finger and in the last resort to act is undeniable. Dr de Kock, echoing approval of the Fed's concept of "independence within the government" as approximating to his own position in South Africa, would tell the country of a major disagreement with government policy (Q.9294). Yet a long way before the final crunch, the dice may be against the Bank when governments assume so many economic responsibilities, and particularly if, as in the United States, monetary responsibilities are diffused among a number of agencies (memorandum, para 2). Are those who long for the Bank of England "to assert its independence" yearning for the unobtainable in a country where the government, having undertaken so many responsibilities, must in consequence retain the final power? This apart, political traditions count: the British tradition hardly provides for, say, the American toleration of independent pronouncements of official policy from governmental agencies.

IN their technical job of controlling commercial bank reserves, the overseas central bankers generally give Bank rate second rank. This is partly a recognition of the impotence of short-term rates in underdeveloped money markets (and most money markets other than London and New York are underdeveloped), but it also stems from the belief that a direct attack on liquidity via availability may be more effective than indirectly via cost. From asserting his belief that Bank rate "is one of the important factors in the decisions and the policies of the banking system" (Q.11816) Dr Holtrop retreats under relentless questioning to the admission that with a move in Bank rate alone—a purely technical move—

> I would not expect that change to affect in any important way the actual amount of lending by the banks, but only short-term foreign investment and the movement of short-term funds (QQ.11870).
>
> If I used the Bank rate as a means of influencing monetary policy I should also look to other means (Q.11873).

These other means comprise regulation of bank reserves through open market operations and the cash ratio.

For the United States, Mr Riefler is quite unequivocal in stressing the Fed's direct concern with bank reserves and its operation on them through the open market.

> The discount rate is mainly a disciplinary instrument by which we keep discounting from being attractive to the banks at a time when reserves are deficient (Q.9807).
>
> The fundamental thing we do is operate on the reserve position. If we ever forget that, we are gone (Q.9818).

The range of supplementary weapons in use throughout the world has been fully discussed in a monograph for the New York Federal Reserve Bank by Mr Peter Fousek, and was discussed in these columns about the same time as the central bankers' evidence was being digested (*The Economist*, November 22, 1958). In that evidence, open market operations, where practicable, receive the highest favour from the central bankers. Quantitative regulations of the ceiling variety receive nods of modest approval from the Netherlands (memorandum para. 57) and New Zealand (memorandum paras. 41-42), although in association with other measures. Moral suasion was used by all in varying degrees, but awareness of its limitations, as of those of exhortation, was general. Selective controls are given qualified approval. From New Zealand comes affirmation of the possibilities of its own version of variable reserve ratios (memorandum para. 76) though from the Federal Reserve a discouraging report on its own ratios (memorandum paras. 83-84, and QQ.9493-7). In Australia, government securities are incorporated in the liquidity ratio, while in New Zealand the banks have, since 1943, stayed out of the market. These different systems must of course be assessed in the light of widely differing banking environments.

The Investment Management Service of Lloyds Bank

THE SERVICE

Lloyds Bank's Investment Management Service has been offered to customers and others for many years and is administered by experienced officials of the Executor and Trustee Department.

THOSE TO WHOM THE SERVICE SHOULD APPEAL

Broadly speaking, the service is designed to be of use to those who, through lack of time or business knowledge, ill-health, age or frequent absence abroad, find it difficult to give their investment affairs the regular and careful attention required in these times. It promises the application of a sound investment policy, allied to the routine care of the investments, but it is not intended for the speculator.

HOW THE SERVICE WORKS

If you decide to make use of the service, the investments will be transferred into the control of the Bank. You will be asked to sign a simple letter of request, incorporating instructions to the Bank either to act at its discretion or else to refer to you before making any changes in the investments.

In formulating the investment policy, regard will be paid to your own personal circumstances and special needs and wishes; the investments will be kept under regular review in conjunction with a firm of stockbrokers whom you may nominate.

The Bank will deal with any notices received in respect of the investments, thus removing the danger of your overlooking the value of "rights" offers, allotment letters, etc., and the necessity of taking action within a certain time limit.

Each year the Bank will send you a statement giving full details of any dealings during the year.

Finally, the arrangement can be ended and the investments transferred back to you at any time.

Our normal fee for this service is £2 a year for every £1,000 of securities placed in our charge.

HOW TO OBTAIN THE SERVICE

If you are interested, you will want more information than is given here. Preliminary details can be obtained from the Managers of any of the Bank's branches and, if necessary, arrangements can be made for you to see an official of the Bank's Executor and Trustee Department which administers the service at its area branches throughout the country.

LLOYDS BANK LIMITED

340 reporters give you the story of Canadian business today

For the businessman interested in Canada, Imperial Bank gathers information from more than 340 trained reporters—the Imperial branches that stretch from Halifax to Vancouver Island. From them, our head office collects information on the latest developments and trends in Canadian business.

When you require such details as plant location, labour availabilities, taxation, etc. . . . Imperial Bank will be pleased to help you. A letter—or a visit to our offices in London—may save you many hours and facilitate your Canadian plans.

RESERVE FUND - - - - - -	**£500,000**

The Ionian Bank was incorporated to finance trade with Greece and extended its activities subsequently at the beginning of the century into the Levant and the Middle East.

It has recently still further extended into the fields of investment and merchant banking for which it is now equipped to provide an efficient service on most favourable terms.

Does this stress on directly influencing bank reserves, together with the narrow view of Bank rate, mean that interest rates count for little abroad? Not at all. There was wide agreement on the immense importance of the long term rate. Perhaps *faute de mieux*, central banks with less developed money markets expressed more willingness to operate on it than those with developed markets. The Australian central bank, admittedly, points to technical difficulties in operating in its long-term market (memorandum para. 31); but the Reserve Bank of India, besides stressing the familiar objective of "maintaining orderly conditions in the bond market" regards open market operations in bonds "as an instrument of monetary policy by controlling the cash base of the commercial banks" (memorandum para. 19).

Paradoxically, it is where the scale of government financing has become so great as to provide the central bank with both the necessity to smooth out substantial monetary disturbances and the opportunity to use debt management for policy ends that reluctance to embody long term operations into policy is most strong. No doubt the memory of cheap money and stable bond market policies is unpleasant, but it may be questioned if those nasty things we saw in the postwar woodshed should dominate us for ever after.

Dr Holtrop states clearly his own case against acting on the long-term rate. It follows from his precise delimitation of the central bank's function. The long rate is admitted to be of prime importance ; it "determines the range within which Bank rate will fluctuate" (Q.11841); but Dr Holtrop is adamant against trying to influence it as a central banker, and agrees to take it as one of the facts of life (Q.11842). The long rate is the "result of an achieved monetary equilibrium between saving and capital expenditure") he agrees with Sir Oliver Franks, so that, in effect, the Netherlands Bank's defence of monetary equilibrium involves non-interference with the long rate (Q.11851).

SOMETHING of this delicate but fundamental distinction infuses the elaborate championing of the Fed's "bills only" doctrine of open market operations which Mr Riefler undertook in his oral evidence and in part of his written evidence (published not with this memorandum but in the *Federal Reserve Bulletin*, November, 1958). In diagnosing a credit situation, the Fed faces

> the problem . . . in differentiating between market developments that reflect forces originating in the economy and those that reflect the response of credit markets to the technical money position established by the Federal Reserve System. (*Federal Reserve Bulletin*, p. 1261).

The Fed is certainly closely concerned with the whole structure of rates—"that is how we learn what is happening" (Q.9792)—but it aims to influence them, not to manipulate them. There is the technical difficulty of precise manipulation—"You are always playing the tune by ear" as Sir Oliver Franks puts it—and there is the psychological difficulty that direct intervention in the medium and long term markets might so affect expectations as to result in "an unsustainable level of prices or yields," which the Fed, reasonably, would regard as "spurious." It therefore prefers to seek changes by altering the credit base by action on banks' excess reserves, putting pressure on the short end of the market, rather than on the rate of interest directly. The pressure will percolate, as intended, to the complex of rates with the aid of arbitrage, and especially with the aid of "the high degree of substitutability of security instruments that exists for many lenders and many borrowers in the credit and capital markets."

Technical ability to operate with such confidence only at the short end has a twofold support. First, resembling the position of the independently minded central banks on the Continent, but in strong contrast to that of the Bank of England, the Federal Reserve is not intricately involved in support of the US Treasury's financing, and to that extent gains flexibility. Secondly, and following from this, there is a very large, absorptive market, outside not merely the Federal Reserve but also the banking system, for short and long term government obligations. This, as Professor Sayers commented, "is a really critical point in the argument" (QQ.9738-46). Another critical point is whether the banking system as a whole is committed to take up the Treasury's offers of bills ; if it is, as in Britain, then official operations at the short and long ends of the market plainly have entirely different effects.

NONE of the central bankers questioned the committee's concept of "general liquidity" which has caused so much academic heartburn since appearance of its report. The question of non-bank intermediaries, Dr de Kock said, worried him as long ago as 1946, but he confessed to having done nothing about them (Q.9363). He was in no doubt that they could create additional spending —and hence additional income and in turn additional savings (memorandum 46). This contrasts with Mr Riefler's assertion (with which the report clearly disagrees) that "these intermediaries are unable to lend more than savers have decided to place with them" (memorandum para. 102). Australia and New Zealand are aware of the problem ; but again we must turn to Dr Holtrop for exposition. Without agreeing with Professor Sayers that intermediaries other than commercial banks create liquidity, Dr Holtrop went in the direction of bracketing them, as indeed Dutch law provides, with banks (Q.11822). At the same time:

> Liquidity in the hands of trade and industry, in the sense of its holding money and liquid claims on the banking system and on Government, implies the power to dishoard, i.e. . . . to disturb monetary equilibrium. . . . This power . . . seems to me to be an inherent part of our economic system of free enterprise and I cannot think of any means to control this power without destroying this system. (Memorandum para 96).

If he had gone further and considered the role of financial intermediaries in mobilising this "power to dishoard," Dr Holtrop would have been very close to the Radcliffe committee's own much disputed position.

How is this extra-banking liquidity to be tackled if control of the intermediaries is either not possible or not adequate? Nobody grappled directly with this question, but Dr de Kock did offer a policy resembling the Radcliffe report's proposals for debt management, of operating on the whole structure of interest rates as a means of affecting demand in particular sectors by the impact on liquidity (memorandum, paras 18-28). This policy has been applied in South Africa during the last few years, to the satisfaction of the Reserve Bank. (But Dr de Kock admits that "the problems of debt management are not so complicated for us as they are in the UK and US" (Q.9307). Its application elsewhere comes up against not only theoretical questionings but also against the central bankers' reluctance to exercise overt influence upon the long term rate.

Most of the overseas central bankers agreed about the need to inform the public widely and systematically about monetary policy: the least forthcoming was the Governor of the Bank of Rhodesia and Nyasaland, a Bank of England man. The first and most dedicated exponent of the importance of central banking research and public relations is of course the Federal Reserve System—which, Mr Riefler says, "would not have the power and independence it has been given if it were suspect. . . . Confidence in our motives is most important" (Q.9551). The Bank of England itself now recognises the need for a stronger information department, though it would hesitate to go so far as the Federal Reserve. The day is no doubt still distant when the Old Lady holds seminars for professors of economics.

More Light on Scottish Banking

It is somewhat less difficult than it was to see what banks are doing north of the border

EVENTS during the past year have contrived to cast more light on the Scottish banks and their methods of working than they have enjoyed—or been subject to—for many years. The third amalgamation between Scottish banks in the past decade was completed in September, 1959, and the size of the new unit created, as well as its unusually large stake in hire-purchase finance, drew attention to its competitors also. The publication of the Radcliffe report a month earlier had provided both information and comment on the differences between banking practice in England and in Scotland. Then in February the evidence supplied to the committee produced the first series of monthly figures, for the years 1951 to 1958, that has been available since the Macmillan report in 1931. And, finally, when calling for special deposits in May, the Bank of England differentiated between England and Scotland by requiring 1 per cent of deposits from the English banks and ½ per cent from the Scottish banks.

The Radcliffe report gave the principal distinctive features of Scottish banking as (1) the right of note-issue still enjoyed by the Scottish banks; (2) the higher proportion of their deposits that are interest-bearing; and (3) their practices in relation to interest rates and charges. The fact that rates and charges are agreed among the banks was held to be responsible for Scotland being "one of the relatively over-banked countries of the world." The ratio of bank offices to population in Scotland is 1 to 3,000, compared with 1 to 4,500 in England and Wales. In the interwar years, when there were still eight banks operating independently, competition for business led to an increase of about 50 per cent in the number of bank offices in Scotland. A reduction could be achieved only by diminishing the number of banks, and a desire to create units of a more economic size has been one of the main reasons for the three amalgamations that have been effected in the past ten years. The fusion of branches is slow work, however, and the process has still a considerable way to go.

THE Radcliffe committee pointed out that the Scottish banks act as a "tight cartel" in fixing interest rates and charges. Deposit interest rates are ½ per cent lower and lending rates ½ to 1 per cent higher than in England. There are special reasons for this. The lower rate paid on deposits is explained by the much higher proportion of interest-bearing deposit accounts in Scottish banks—53 per cent of total deposits as against 39 per cent in England. From the Radcliffe figures at December, 1958, it appeared that a 1 per cent rise in Bank rate at that time would have cost the Scottish banks £3.8 million in deposit account interest but would have increased income from advances, call money and discounts by only £3.3 million. The Radcliffe committee saw this as having an influence on the size and the composition of investment portfolios. As in England, the average life of investments has been shortened, but in 1958 the proportion of short bonds was 20 to 30 per cent of Scottish bank portfolios as against about 50 per cent in the clearing banks.

This larger commitment in longer dated gilt-edged securities may possibly have affected the Scottish banks' lending policy in the period of freedom after mid-1958. It is impossible to make any direct comparisons with clearing bank experience because the Scottish banks even now do not publish their monthly figures. On the basis of the totals of their balance sheet figures, mostly at different dates, Scottish advances rose in 1959 by 27.6 per cent. The rise in clearing bank advances between December, 1958 and December, 1959, was 32.6 per cent. Investments at the balance sheet dates were down by only 14.5 per cent in Scotland, compared with 19 per cent in England. The analysis of advances made by the British Bankers Association for February, 1960, shows a rise of 31.2 per cent in clearing bank advances

	Balance sheet date	Deposits	Changes in Advances (£ million)	Investments
British Linen Bank	(30. 9.59)	+7·1	+ 6·1	− 4·8
National Commercial Bank	(31.10.59)	+4·6	+32·1	−29·1
Clydesdale & North Bank	(31.12.59)	+7·3	+ 7·7	− 1·5
Royal Bank of Scotland	(31.12.59)	+2·4	+13·8	−11·2
Bank of Scotland	(29. 2.60)	+9·0	+ 5·9	+ 1·2

since February, 1959, and a rise of 30.5 per cent for non-clearing banks. From this fragmentary evidence one may conclude, very tentatively, that bank lending increased rather more slowly in Scotland than in England but that the pace may possibly have speeded up in later months.

The most recent balance sheets show that the experience, or the policy of the different Scottish banks has varied considerably. Even allowing for the spread of five months between the earliest and the latest figures, some banks obviously had less need, or were less willing than others, to sell investments to meet demand for

PERCENTAGE OF DEPOSITS

	Advances		Investments	
	1958	1959	1958	1959
British Linen Bank	32	36	50	41
National Commercial Bank	29	41	43	29
Clydesdale & North Bank	22	31	48	46
Royal Bank of Scotland	34	44	30	22
Bank of Scotland	31	33	43	43

advances. As a result there are now quite wide differences in the deployment of funds between one bank and another. The National Commercial, the new grouping which does up to a third of the banking business in Scotland, shows the most vigorous switch of assets, with 41 per cent in advances and 29 per cent in investments in 1959—reversing almost exactly the ratios of a year earlier.

THE total employed in loans and investments ranged in 1959 from 66 to 76 per cent of deposits, and this raises the difficult question of liquidity and the effect of special deposits. For the clearing banks, the special deposits scheme operates as a supplement to a minimum liquidity ratio of 30 per cent of deposits; but, as the Radcliffe report pointed out, the Scottish banks do not observe any common convention in this matter. They are free to decide for themselves, in the light of experience, what liquid assets they require to hold at any particular time. Any attempt to calculate a liquidity ratio is complicated by the fact that the cover which the banks hold for their note issues is not segregated but is included in the item "Cash and balance with the Bank of England." A note-issuing bank does not require to hold a large cash reserve (apart from its note-issue cover) because the till-money of its branches consists mainly of its own notes, which are not "in circulation" until they have crossed the counter and consequently do not have to be covered. Then the fact that there is no settlement of clearing on the same day in Scotland as in the Town clearing in London reduces further the necessity to hold cash; and the high proportion of Scottish deposits in deposit

Why do I deal with a Merchant Bank?

Quick decisions? Certainly. By dealing with principals, I am able to get rapid decisions. Japhets, for example, are specially equipped to provide short-term finance for industry or trade and are able to smooth out difficulties relating to these operations. They provide acceptance credits, commercial letters of credit, arrange collection of bills and handle all types of foreign exchange transactions, including 'spot' and 'forward' purchases and sales. With correspondents throughout the world, Japhets are particularly well-placed to give personal attention to problems concerned with international trade.

accounts also reduces the banks' need for immediate liquidity.

Obviously, without the fulcrum of a minimum liquidity ratio, the lever of special deposits can have no certain impact on the banks' lending operations. On the other hand, their smaller holdings of short-dated bonds make the Scottish banks more vulnerable to pressures of this sort than are the clearing banks. It is possible that the Bank of England may have had some of these points in mind when it called for special deposits of only ½ per cent from the Scottish banks as against 1 per cent in England. More probably, however, the decision was related to the very different employment situation in Scotland. Unemployment still exceeds 3 per cent and the migration of skilled workers to areas of over-full employment in England arouses anxiety about the future. As a sop to Scottish opinion, therefore, the ½ per cent differential was tactful; but the concession may be more apparent than real, for this first call was in any case mild and will influence lending policy not through its absolute amount but through the fear that, if advances continue to increase rapidly, larger amounts may be called for until advances are checked.

It would be much easier to decide whether or not the authorities were treating the Scottish banks fairly or otherwise in this matter if the banks themselves were to provide more adequate and timely information on their operations. The Radcliffe committee opened their books for past periods, with no ill effects; and the mechanism of special deposits will now make possible calculation of Scottish monthly deposits by an indirect route. Last-ditch delay by the Scottish banks in regular publication can only lose them goodwill.

Overseas Money in London

Where it is and what affects it

In February, 1959, overseas money on deposit with London banks amounted to £1,128 million—almost exactly the same amount as the central gold reserves at that date and comprising about one-third of overseas countries' total sterling balances. The Radcliffe committee has made public for the first time not only the size and distribution of these foreign funds, but also their significance in the domestic banking system and the influences affecting them.

Only 26 per cent of these deposits was held by the clearing banks, Scottish and Northern Irish Banks and the Bank of England. Nearly three-quarters was held by four groups of "outside banks" for which overseas business is of special importance. The British overseas banks held 40.7 per cent; the American banks in London 8.5 per cent; other foreign banks 13.4 per cent; and the Accepting Houses 11.3 per cent. Between December, 1951, and February, 1959, total overseas deposits with these outside banks increased by over three-fifths; the commercial banks, unfortunately, made no past figures available. It is a pity, too, that the fast-growing foreign banks submitted neither written nor oral evidence.

The main work of the outside banks includes foreign exchange dealing; the finance of overseas trade (and on a much smaller scale, of domestic activity in Britain); the employment of the surplus funds of numerous overseas banks and other overseas residents; and, for the Accepting Houses, the wide and flexible range of activities, domestic and international, comprised in merchant banking. A prime characteristic of these banks is that liquidity is kept much higher at the clearing banks—partly because it is much less stable. Sir Edward Reid of Baring Brothers, chairman of the Accepting Houses Committee, stated that whereas fluctuations in clearing bank deposits tend to even out, the Accepting Houses may "have a few very large [accounts] which can fluctuate very much within a few days" (Question 6002 in the Radcliffe evidence). From the Eastern Exchange Banks comes the similar comment that big drawings by customers are commonplace (Q.4693). And Lazards' evidence at the Bank rate tribunal in 1957, it may be recalled, demonstrated just how sharp fluctuations can be.

Pride of place in maintaining liquidity goes to money at call in the discount market, the Eastern bankers stressing their need to keep liquid profitably, since their deposits are largely at interest, in competition with Continental banks and to some extent with hire purchase companies (QQ.4689-4708). The combined holdings of these outside banks provided perhaps 30 per cent of the discount market's funds at the end of 1958. At other times the proportion has been much higher, but since 1956 local authority loans have drawn more funds from these institutions, especially from the accepting houses and foreign banks (other than the American banks). Since the Radcliffe committee reported, more overseas money has been channelled into hire purchase houses—including in some cases the counterpart of dollar deposits taken by London banks.

Bill holdings, descending the traditional liquidity ladder, come next quantitatively, except for the overseas banks, which have shown a tendency to increase them at the expense of money in the market; like the Accepting Houses, they display a growing preference for Treasury bills over other sterling bills, whereas the smaller holdings of the foreign banks show the opposite trend.

The overseas banks and the Accepting Houses, giving evidence in February and March, 1958, showed gilt-edged holdings at end-1957 considerably larger than their bill holdings; but the reverse was true of the very much smaller portfolios of foreign banks. The bulk of these holdings was in "money market" bonds of less than five years maturity. Eastern banks tended to hold longer dates, tax-free interest being one consideration (QQ.4755-6). In an appendix to their evidence, presumably supplied early in 1959, the Accepting Houses noted a recent disposition to hold slightly longer dates, but, like a similar tendency noted in the discount market at the time, this was doubtless based on the not unreasonable view while Bank rate stood at 7 per cent that gilt-edged were more likely to rise than fall. But gilt-edged holdings of these outside banks in total were £34 million lower at end-1957 than six months before, reflecting no doubt liquidations during the summer exchange crisis.

		1,127·9

Although, as the Radcliffe report points out, these banks do relatively little domestic banking business, they are important as granters of acceptances which help buyers to raise money and also add in a small way to the liquid assets upon which the UK commercial banks can expand credit. More-

over, the substantial acceptances and advances granted to overseas customers, notably by the British overseas banks, may involve a drain on London funds. It follows that the manner in which the banks react to domestic monetary measures is of considerable importance.

BOTH the Accepting Houses and the British overseas banks conform broadly to clearing bank practice in a number of spheres, although the Accepting Houses reserve flexibility in deposit rates (Q.5796). The Eastern banks pay quite high rates for some money from abroad (Q.4639), but as at least 90 per cent of their London resources are drawn from abroad, they claim that they do not really compete with the clearing banks (QQ.4634-8). These outside banks are expected to follow in principle general guidance on lending policy laid down by the Government or the Bank of England to the commercial banks, though response to the official credit squeeze was by no means uniform. The Canadian banks had agreements among themselves and an immediate conference on a change in Bank rate; their London rates would be aligned to current market rates (QQ.4473-5). The Eastern banks admitted to dislocation by a high Bank rate; business "takes a little time to adjust itself (QQ.4718-9), although in their overseas areas of operation the local central banks often insulated rates from London. The Australian and New Zealand banks "get together, and most of the changes are completely automatic"; they change their selling rates for sterling to reflect the rise in interest rates (memorandum para 1, and Q.4358).

Evidence of the impact of Bank rate on overseas money, so often the spark of controversy, brings out the variety of influences upon the movement of funds to London. The Canadian bankers stated that money tended to accrue automatically in London as a result of trade (QQ.4450, 4469); Australia and New Zealand, however, restrict the movement of funds by exchange control

1959, February.....	459·5	96·4	151·3	127·5	834·7

(Australasian banks' memorandum para 1, and QQ.4527-9). The most sensitive to Bank rate were the Eastern banks, though they, too, reported local restrictions on the movement of funds (Q.4713). They did indeed testify to their competition for funds, the main source of which was "excess deposits in countries in which we are banking," but the attraction of London depended primarily on confidence in sterling. The general manager of the Chartered Bank explained (in February, 1958) that

> the only time we saw appreciable sums coming to this country which we could attribute to a change in the Bank rate was in the beginning of 1956 when the jump was from 4½ to 5½ per cent. There was already confidence in sterling, and that was a purely economic jump (Q.4750).

None the less, a big interest differential could exert a substantial

pull. Both the African and the Canadian banks reported switching by customers into UK Treasury Bills (QQ.4341, 4500-16)—incidentally, providing a reminder that a fall in foreign deposits does not necessarily indicate a fall in total claims on London. With the exception of the Eastern banks, however, which depicted themselves as conducting a world-wide struggle for deposits, and spoke of "a critical level" at which extra funds might be drawn in (QQ.4745-6), the evidence was fairly strongly against interest rates as a big influence on the movement of funds. This is partly attributable to uncertainty about the exchanges and partly to the falling into line of interest rates elsewhere—in Canada, for instance, and Australia and New Zealand. In the two years since most of this evidence was given, it should be added, funds have become much more sensitive to difference in interest rates and in the ease of borrowing in the main financial centres.

The effect of interest rates on acceptance credits was said to be generally small. "A considerable amount of trade has to take place whatever happens, and taking place it has to be financed" (Accepting Houses memorandum, paras 27, 42). There may, indeed, be switching from debentures to bank overdrafts or acceptances if money rates are high, though this was not "substantial." The main determinant of the volume of acceptances, the houses declare, is the volume and value of Britain's overseas trade.

THE evidence of the British overseas banks on the effects of tighter money on lending prompts an extension of the Radcliffe report's description of the domestic market: the sterling area, and indeed countries beyond it, tend to be a single credit market. Because customers switched deposits into UK Treasury bills, the liquidity and lending power of Canadian banks fell (QQ.4500-16), while Australian and New Zealand banks were affected by domestic liquidity requirements (Q.4545). For the banks in Africa, the British credit squeeze diverted demand from London to overseas branches (Q.4341), while the Australians experienced a diversion by Continental importers from bill finance in London to overdrafts in Australia (QQ.4548-53). The Eastern banks detected a contrary "tendency to push things a bit towards Germany . . . every time sterling becomes too dear as a means of finance" (Q.4721). The emphasis here is all on the effect of interest rates in diverting, rather than in discouraging, demands for accommodation. The one positive attempt to regulate demand was reported by the Australasian banks. In order to discourage the flow of money into financing the wool trade

> we put on a differential rate, almost a penal rate, so that it was up to the level of the foreign rate; then they tend not to make the switch [from external to internal credit] quite so much. (QQ.4609, 4602.)

But it is not clear that borrowing was not switched in the end. A ray of "orthodox" light beamed momentarily from the memorandum of African overseas banks only to be dimmed in the presence of the committee; the banks' spokesmen asked for deletion of a sentence stating that "overdraft rates have to be increased . . . to check the increasing pressures of demand from local would-be borrowers" (para 14). "I can never recall putting up our rates merely as a deterrent to borrowers," averred Mr R. D. Smith of Barclays DCO (Q.4427).

But the bankers would not dismiss interest rates as irrelevant. Bank rate retains its psychological influence (for example, in Australia and New Zealand, Q.4627). The African banks said that local central banks might engineer some insulation against London rates (Q.4437); and they felt that prolonged high rates discouraged colonial development and trade, and had a disintegrating effect upon the sterling area (QQ.4430-1). They were not alone among practical bankers in asserting that high interest rates were at once ineffective and unjustifiably disruptive.

The **NATIONAL BANK** *Limited*

Gold Less in Favour

Although greater world confidence in the stability of currencies has reduced hoarding demand for gold, turnover in the London market has increased substantially

EXCEPT in insulated markets such as India, where the demand can be satisfied only by smuggling, the price of gold has been unusually stable in recent months. During 1959, despite many political alarums and the immediate effects of the devaluation of the French franc, the world price of gold expressed in US dollars and as quoted in the free markets varied within the narrow range of $35.05 and $35.14. It closed the year at almost the lowest point of this range and this year, after a gradual recovery to around $35.12, it has fallen back to $35.09, despite the collapse of the summit meeting and the talk of difficulties for the dollar and for sterling.

The price of gold is no longer so sensitive to political and financial ups and downs. The collective move to non-resident convertibility at the end of 1958, being successful, was bound to usher in a period of stability in the gold market; and most countries have also eased exchange controls on their own residents. Greater confidence in currencies has reduced the desire to hoard gold. This attitude has also been strengthened by the growing evidence that inflation has been arrested. At least for the relatively sophisticated European investor, there is less incentive to invest in lumps of gold or even in the gold certificates that are now being made available in such diversity. In either case the investor forgoes interest or dividends; and many investors evidently put more hope in a rise in the price of ordinary shares than on a rise in the official price of gold, which would have to be initiated by the United States Treasury.

Notwithstanding this greater stability in the market price of gold, turnover in the London market is estimated to have increased by rather more than 50 per cent in 1959. Much of this increase represented the transfer to London of a considerable amount of gold dealing that used to take place in Continental markets when non-resident sterling was still sub-divided between American account and transferable sterling, and many sellers of gold from outside the sterling area (including Russia) took advantage of the modest turn that could be obtained by using such markets as Zurich.

London's increased turnover also reflects larger world output of gold. Estimates of the Union Corporation suggest that in 1959 world production, excluding that in Soviet Russia, reached a record 32,400,000 ounces compared with 30,300,000 ounces in 1958. Of last year's total, nearly 85 per cent came from the Commonwealth. Production in Soviet Russia remains wrapped in mystery—which has not prevented a host of different guesses. Imports of gold into the United Kingdom show a considerable increase in Soviet gold coming to the London market in 1959, to 7¼ million fine ounces, worth some £90 million.

Most of the transactions in gold in the London market represent operations of central banks. These have received a new impetus over the past year as a result of the continued flow of dollars from the United States into European reserves. A substantial part of these dollars has been converted into gold through the London market. Foreign central banks and monetary authorities have the right to convert dollars into gold in the United States at a cost which, including commission, works out at $35.08¼ per fine ounce. For tactical reasons, however, and in particular in order not to appear to be taking part in a flight from the dollar, many European central banks have been prepared to pay a higher price than the US parity in order to convert their dollars into gold in the London market. This is one of the reasons why from April until October of last year, and again in the first months of 1960, the dollar equivalent of the gold price quoted in London has been in excess of the US parity of $35.08¼.

IMPORTS OF GOLD BULLION INTO THE UK

Others	1,390	847	155	170
Total	24,003	27,643	10,789	4,650

Another type of central banking operation in gold, however, has largely ceased, following the transition at the time of the move to convertibility at end-1958 from the European Payments Union to the European Monetary Agreement. The EPU monthly settlements were made not at the prevailing market rates but at the nominal parities of the members' currencies, which gave rise to profitable opportunities for central banks using the gold market. Under the European Monetary Agreement, nearly all settlements take place through the ordinary machinery of the exchange markets.

HOARDING demand for gold has fallen off not only in Europe but also in the Middle East. One reason is that the authorities in India have been catching up with the highly organised smuggling traffic. Their victory may be detected in the large scale dismissals that have recently occurred in the staffs of international air corporations operating in India. The Indian government has also taken the initiative in issuing special rupee notes for circulation outside India and particularly in the Persian Gulf area where Indian currency has been in circulation for many decades. Previously, the gold used to be sold in India against rupee notes which were smuggled out of India and then exchanged for sterling in the Persian Gulf territories such as Kuwait and Bahrein. Now this can no longer be done so smoothly, since the rupee notes against which the gold is sold in India are no longer legal tender outside the country.

The market in gold has during the past year been somewhat broadened by the appearance of gold certificates intended to simplify the purchase of gold. The first major initiative was taken about a year ago when Samuel Montagu made arrangements with the Bank of Nova Scotia for issuing gold certificates which would be interchangeable and provide for delivery of gold in London or Canada. In October of last year this scheme was extended to include the Deutsche Bank, Frankfurt, and Union Acceptances, Johannesburg. Other firms that have taken a hand in the issue of such certificates include Johnson Matthey, the French Bank of South Africa (in collaboration with the Banque de l'Indochine), the Guaranty Trust Co. of Canada (in collaboration with the Toronto Gold Marketing Co.) and the International Gold Corporation of Johannesburg (in collaboration with the Standard Bank of South Africa). Some of these certificates have been in bearer form and have thus run into trouble on the Continent of Europe, being held to constitute an infringement of the monopoly of currency issue in Switzerland and Germany. The certificates were designed to provide an easy way of securing a hedge against devaluation of currencies in terms of gold. So far they have found few takers.

MARKS AND SPENCER LIMITED

TURNOVER EXCEEDS £148 MILLION

ACCELERATED EXPANSION AND TRANSFORMATION OF STORES

"ST. MICHAEL" THE HALL-MARK OF QUALITY AND VALUE

99 PER CENT GOODS OF BRITISH MANUFACTURE

The thirty-fourth Annual General Meeting of Marks and Spencer Limited was held on June 9th at 67 Baker Street, London, W.1.

Sir Simon Marks DSc, Hon FRCS (Chairman and Joint Managing Director) who presided said:

Ladies and Gentlemen:

May I take it that in accordance with our customary practice, the Directors' Report and Accounts may be taken as read?

PROFIT AND LOSS ACCOUNT

Our Net Profit for the year amounts to £9,081,000 compared with £7,709,000 last year after providing £8,725,000 for Taxation compared with £7,350,000.

Including £2,491,000 brought forward, the total amount available for distribution is £11,572,000. The Directors recommend a Final Dividend on the Ordinary and "A" Ordinary Shares of 27½ per cent making, with the Interim Dividend of 12½ per cent, a total of 40 per cent for the year. Last year, the equivalent dividend was 31¼ per cent.

RESERVES

We propose to transfer £3,611,000 to the General Reserve. After the capitalisation for the Scrip Issue, the General Reserve again amounts to £11 million.

With the balance of £2,407,000 in the Profit and Loss Account, the total Revenue Reserves amount to £13,407,000. The Capital Reserve remains at £19,323,000.

PROPERTIES

We have spent £6,069,000 during the year on the acquisition of new sites and the development and modernisation of our Stores, of which £1,367,000 has been charged against our Profit as Repairs and Maintenance.

After providing a sum of £943,000 for Depreciation on our Properties, Fixtures and Equipment, these now stand in the Balance Sheet at £51,294,000 compared with £47,525,000 last year.

STOCK

Our Stock-in-Trade is £11,098,000 compared with £9,153,000 last year. Including stocks of raw materials held by our Subsidiary Companies, our total Stockholding is £12,076,000 compared with £10,219,000.

CASH

Our Cash Balances and our holdings of Tax Reserve Certificates and Treasury Bills amount to £11,052,000 compared with £10,549,000 last year.

We repaid at the beginning of the year the loan of £1 million at 5½ per cent.

Our receipts for the year from bank and other interest amounted to £263,000 compared with £212,000.

GENERAL SURVEY

It is with satisfaction that I am able to report continued progress. Our volume of turnover reached the record figure of £148 million compared with £134 million the previous year, and net profits after taxation have risen to £9,080,000 from £7,700,000 in the previous year.

The impressive advance made by the business during the past decade can be seen in the 10 year statement which has been issued with the accounts. In that period there has been uninterrupted progress in our turnover from £65,800,000 in 1951 to over £148 million in 1960, and our net profit after taxation has risen from £2,500,000 to over £9 million. Our policy throughout has been based upon the expansion and modernisation of our stores, the progressive upgrading of St. Michael goods and the building up of the goodwill and the confidence of our customers.

The cumulative investment we have made over the years has been responsible for a remarkable transformation of the business and our policy will continue to follow the established pattern of development which has shown such satisfactory results. We have, since 1951, invested over £37 million in the business drawn entirely from our retained earnings. Since the end of the war, from 1946, the total invested amounts to £42 million.

There is no doubt that the policy of ploughing back profits year by year has enabled the business to grow to its present gratifying position. Our properties now stand at more than £46 million. It is clear that our profits benefit most substantially since no interest charges are incurred on this considerable sum.

Last year the expenditure on building and modernising our stores amounted to nearly £4 million. This sum does not include the land and sites we have acquired for incorporation in our building programme at some future date. We have continued to concentrate on the development of our existing stores where we have traded successfully for so many years. During the past year we have completed major projects at 22 stores. They were operating for varying periods and were so able to make but a partial contribution to the year's results. Fuller benefits will be derived from them in the next year's trading. So far this year we have in hand 24 substantial new schemes which will be opened during the course of the present year and building operations will be starting shortly at a further 12 stores. The projected cost of building and modernisation this year is nearly £5,500,000, making the combined expenditure for the two years the largest programme of store development we have carried out over such a period.

By reason of their size and their high standards of construction our buildings may take up to two years to bring to fruition. In order that the rhythm of our development may be maintained and systematically carried out many of our future plans are in an advanced stage of preparation for the many interesting new schemes we have in mind.

The programme of expansion we envisage during the next three years may involve an investment of the order of £15 million. Finance will continue to be drawn mainly from profits retained in the business, but in order to accelerate our building plans for many of the important properties which have yet to be dealt with, we have thought it desirable to secure additional funds. We have therefore arranged with the Prudential Assurance Company to borrow £5 million by means of Debentures issued at 97½ per cent. They are at an interest rate of 5½ per cent and are repayable in 30 years. Half of the total sum is to be taken up in June this year and the balance in June 1961.

I believe that we have succeeded in making our stores most inviting and attractive to our public. Their spaciousness provides splendid shopping facilities and creates a beautiful background for St. Michael merchandise. They have been described by many of our customers as "a Fairyland." During the past months we have invited many distinguished local citizens, including mayors and councillors, medical officers of health, hospital officials, and representatives of women's associations, to see the arrangements we make behind the scenes for the staff. More than 8,000 people have attended "Open Days" in 177 of our stores. There has been much favourable comment in the local Press and we have received many letters from our visitors telling us how impressed they were with the amenities provided for the staff and particularly with the success of our campaign for clean stores and clean food.

"NO SMOKING PLEASE"

Last year we pioneered a campaign asking the public to refrain from smoking in our stores. In the United States and most Continental countries smoking in shops, cinemas and theatres is prohibited because of the serious fire hazard where large numbers of people congregate. "No smoking" is a practical precaution which can do much to obviate an unnecessary risk. Where foodstuffs are displayed its unhygienic effects are obvious. Our customers find the smoke-free atmosphere most agreeable. Its beneficial effects on health are especially appreciated by the staff, who have to spend so many hours daily on duty in the stores. It gives me great satisfaction to acknowledge the

splendid co-operation of our customers in complying with the request "No Smoking Please."

ST. MICHAEL GARMENTS FOR ALL THE FAMILY

The confidence of the public in our goods has been gained over many years of trading. The growth in the volume of business clearly demonstrates that we have given satisfaction to our customers.

Our brand name St. Michael is without doubt the most popular trade mark in the country and the goods which bear its name are exclusive to Marks and Spencer stores. The range and variety of St. Michael garments for all the family grows each year to meet the general and wider requirements of the public at prices well within their reach. But price is not the only factor—it is the quality and beauty of the materials, the fashionable styling and the high standards of manufacture which count in the last analysis. St. Michael is the hallmark of quality and value and our fine goods at inexpensive prices attract 7 million customers to the stores each week. Their goodwill is one of our greatest assets which we prize most dearly.

Our reputation grows year by year, for the policy of upgrading St. Michael merchandise is the constant preoccupation of the directors. The endless quest for improvement forms the core of all our efforts for goods are the lifeblood of the business. The increasing prosperity enjoyed by the public has engendered a growing demand for our merchandise. The high standards of attire of every member of the family mirror a social revolution in better taste and higher living standards in which Marks and Spencer are playing a prominent part.

THE TECHNOLOGICAL APPROACH TO MERCHANDISE

There are remarkable changes taking place in the textile field. New man-made fibres and new materials in ever increasing variety have come to swell the ranks of the traditional wool and cotton fabrics. Our technologists keep abreast of this profusion of interesting scientific and technical developments in order to select the most promising fibres which can be converted into desirable fabrics for St. Michael garments.

We are in close touch with the basic producers as well as with manufacturers in all branches of the textile industry. We stimulate and coordinate their activities in order to produce fabrics with special properties and finishes which we know the public want. By canalising this exploratory work in our own hands we are able to bring the benefits of technical progress to the customer very quickly. I am happy to say that our friends welcome our collaboration for they appreciate the constructive initiative we are taking.

I have spoken of the development of man-made fibres, but I must add that wool and cotton have also benefited considerably by the application of new processes which have given them improved properties so popular with our customers.

Last year we organised the production of well over 100 million square yards of materials of various kinds which were used in the manufacture of St. Michael garments. The function of the technologists is to specify, standardise and assist in the control of the quality of this vast yardage of materials. This fundamental work enables our executives to organise with assurance and confidence the production of the large quantity of finished garments we sell.

FOOD DIVISION

I am pleased to say that there has been a progressive growth in the sales of our Food Division which last year reached £24,500,000. We continue to concentrate mainly upon speciality bakery products and selected and graded fruit, for it is in these fields that we are able to bring our technological approach to bear most effectively. We test and specify the ingredients of St. Michael bakery products and co-operate with our suppliers to maintain process control at every stage of manufacture.

The painstaking technological work we are carrying out is making a great impact upon our suppliers. They have built new bakeries, enlarged their existing factories and installed modern equipment in order to meet the increasing demand of our public. St. Michael fruit is specially selected and graded at strategically sited growing and packing centres in this country and abroad. The large scale on which this is carried out enables us to sell high quality fruit at prices the public can afford to pay. The distribution of supplies of all our foodstuffs to the stores has been organised to ensure that they reach the customer in fresh condition.

The importance of hygiene and cleanliness in the handling, storage and display of foodstuffs at every stage from the factory to the store counter is ever present in our minds. We have won a fine reputation for the high standards we maintain. In the factories, too, I am happy to say, the same high standards are kept. Our suppliers co-operate most readily with us for they recognise how much the public appreciate our clean foods policy.

COSTS OF ADMINISTRATION AND SIMPLIFICATION OF PROCEDURES

We attach the greatest importance to maintaining control of the costs of operating the business and our success in so doing is continuing to make an important contribution to the profits. By cutting out unnecessary procedures we have simplified the work of the administration both at Head Office and at the stores. Since we have been working under one roof in our new headquarters the task of streamlining our organisation has been facilitated.

In 1957 we mounted an exhibition of our simplified methods which received considerable publicity not only in the national but also in the international Press. It has already been visited by representatives of over 1,500 commercial and industrial organisations from this country, the Commonwealth, the USA and the Continent. In addition we have had visitors from more than 60 Government Departments and Local Authorities as well as from Hospital Boards and research institutions.

The exhibition has clearly stimulated a growing awareness of systems which produce a proliferation of unnecessary forms and documents. In our own case we found that they spread confusion and occupied the time of many people at great and unnecessary cost. We are particularly proud of the tribute paid by HM Treasury to the work of simplification we have carried out. Their Organisation and Methods Bulletin of February, 1959, states that "it is a most refreshing approach to the problem of excessive paperwork. . . . There is always a dividend to be obtained from the challenging approach."

TRIBUTE TO MANUFACTURERS

We have been happy to entertain over 1,000 of our manufacturers recently at a series of receptions in our new offices. These occasions have given me and my colleagues on the Board the opportunity of getting to know our friends more personally. We have been able to show them our building and merchandise exhibitions which enable them better to understand and appreciate the scope of the work we are carrying out. They for their part have built new factories, extended their plants and installed modern machinery in order to meet the demands of our growing business.

I have on many occasions expressed my appreciation of the valuable co-operation we receive from our suppliers, and the confidence we have in them is shown by the fact that 99 per cent of our goods are of British manufacture. The unique relationship we enjoy with them has been built up over many years of joint effort to extend and improve the range of St. Michael merchandise. The success of our combined endeavours is to be seen in the volume of turnover we now report. I thank our friends for their splendid work in the past year and look forward to our future progress together.

TRIBUTE TO STAFF

It is my pleasure once again to ask you to join me in thanking the staff, both at Head Office and in the stores, for their devoted work.

We pay particular attention to creating desirable working conditions. The impressive range of amenities we provide is a source of pleasure and satisfaction to all the members of our staff. They have splendid meals at very modest prices in attractively appointed dining rooms and enjoy most comfortable staff quarters. The medical and dental counselling schemes we have operated for many years have promoted a high standard of health among our employees. The staff dental inspection scheme, under the direction of our Dental Superintendent, has earned generous commendation from the British Dental Association. Its journal states, with regard to our staff, that "the comparatively excellent state of the dental health . . . is an example of what can be achieved by dental health education." We also encourage and support many social and athletic activities in which the staff can participate in their leisure hours.

Our continual concern for their welfare is amply repaid by their warm response. The courteous and helpful service of our sales ladies, which is greatly appreciated by our many customers, is stimulated by a pride in the goods they sell and in the popularity of their stores. A loyal and contented staff is one of the greatest assets any business can have and I am glad to say that we have been able once again to reward their efforts by substantial increases in wages.

We operate two important funds for their benefit. The Marks and Spencer Pension Scheme, to which the Company contributes over 80 per cent of the cost, is designed for men in managerial or clerical positions. The Marks and Spencer Benevolent Trust was set up primarily for the benefit of those men and women who are not members of the Pension Scheme. There are now 322 retired members of the staff or their dependents whose needs are being taken care of by these two funds. Their numbers have more than doubled in the last 4 years and will, of course, continue to grow in the years ahead.

Each case is a matter for individual consideration and we maintain contact with all those who have retired as we still regard them as members of the Marks and Spencer family. The Benevolent Trust, which is administered by a joint Board of Directors and Executives of the Company, deals sympathetically with any problems they may have. For their part, they appreciate the opportunity to participate in the social activities of their local stores and to enjoy the welfare amenities which are still available to them.

The report and accounts were unanimously adopted.

MARKS AND SPENCER LIMITED

THE MALAY COCONUT ESTATES, LIMITED

RECORD RESULT

The forty-ninth annual general meeting of The Malay Coconut Estates, Limited, was held on June 16th in London.

The following is an extract from the circulated review of the chairman, Mr R. Geoffrey Buxton:

Owing to a world shortage of Copra crops, very high prices were recorded throughout the year, and there was a further small improvement in our 1959 crop. The combination of these favourable conditions produced record results for 1959 in spite of a slight increase in costs, due mainly to higher wages, reflecting the enhanced price of rubber. The all-in cost, including bonuses and commission, rose by £1 16s. 4d. per ton, while the price realised, at £73 18s. 5d., was £12 16s. 9d. per ton higher than in 1958.

The net profit, before tax, amounted to £85,212 against £62,351 in 1958. Taxation takes £35,265 against £27,075 and, after adding £400 provision for taxation no longer required, and proceeds of Fixed Assets sold, there remains with the carry forward brought in from 1958, £48,561 to be dealt with.

Your Directors intend later in the year to recommend the capitalisation of Reserves to bring the Issued Capital of the Company more into line with the capital actually employed in the business.

It is estimated that, with a better crop, the prospects for 1960 are very encouraging.

NATIONAL BANK OF GREECE

Société Anonyme

Established in 1841

THE DEVELOPMENT OF THE BANK'S OPERATIONS

THE ROLE OF THE COMMERCIAL BANKS IN AN EXPANDING ECONOMY

The Annual General Meeting of the National Bank of Greece was held in Athens on April 30th 1960.

In his address to the shareholders the Governor, Mr Dimitri E. Helmis, reviewed the satisfactory financial results for the year 1959 which have permitted the distribution of a dividend equal to that of 1958, namely, Dr. 80 per share (10.9 per cent of the nominal value).

The year under review saw a further expansion of the Bank's operations. The main features were a large increase in deposits (from 8,080 to 9,911 million drachmae), a higher total of loans and advances (which rose from 8,667 to 9,875 million drachmae), and, as a result of the increase in business, higher gross earnings (from 497 to 529 million drachmae).

In 1959 the National Bank of Greece provided 27.1 per cent of the total credits extended to the Greek economy and 68.4 per cent of the short and medium term loans and advances to trade and industry. Deposits made with the National Bank of Greece represented 45.0 per cent of the total deposits with Greek Banks and credit institutions, excluding the Bank of Greece.

The following are some of the more important points made by Mr Helmis: Greece is perhaps the sole example of a country striving for economic development which is at the same time governed according to a genuinely democratic regime and enjoys highly developed social institutions. Respect for individual freedom, though not incompatible with a quickening in the rate of economic development, nonetheless tends to make the realisation of the objective a much more complicated matter.

The Government has attempted to reach a solution which would satisfy the claims of the Greek people, and in this it may be said to have succeeded. The original Five-Year Programme has now taken final shape and was announced by the Prime Minister to the Greek people on April 9th of this year.

The basic aims of the programme are a rapid increase in national income and the creation of more opportunities for employment. It is widely realised, however, that the question of broadening Greece's relations with rapidly expanding foreign economies is one of great importance to the future of her own economy. Special stress has therefore been laid on the need for Greece to secure a steady improvement in productivity and to become increasingly competitive.

The recovery in public finance, the stability of prices and the satisfactory development of external accounts during the past few years represent stable achievements, thanks to which it is now possible for Government activity to be devoted primarily to the organisation of economic development.

The Governor further said that the commercial Banks in Greece should be numbered among those agencies which could make a decisive contribution to the realisation of important economic objectives. The Banks were in constant touch with the private elements in the economic life of the country and had full and up-to-date knowledge of the prevailing market conditions. They were therefore in a position to estimate more accurately the prospects which were discernible and consequently to weigh the real possibilities of influencing existing trends in the direction of longer-term objectives. The view that the commercial Banks should take a more active share of business risks and should lend more systematic support to business firms by making capital contributions is one which does not run counter to the historical development of the banking system and which corresponds to the needs of the existing situation.

The prestige and scale of operations of the National Bank both at home and abroad, the close links which it was fostering with the leading credit institutions in other countries, and its wide knowledge of the problems of the industrial and business world made it an agency which was particularly well suited to attract capital and business enterprise and to act as a liaison between Greek and foreign interests.

BOOKER BROTHERS, McCONNELL & CO., LIMITED

(Commonwealth Merchants and Traders, Sugar Producers, Shipowners, Engineers, Manufacturers and Rum Distillers and Merchants)

SOUND PROGRESS BY BOOKER GROUP

SUGAR HAS DIFFICULT YEAR

FLOURISHING INTERESTS IN BRITISH ENGINEERING AND CANADIAN WHOLESALING

SUCCESS OF POLICY OF DIVERSIFICATION

SIR JOCK CAMPBELL ON ROLE OF CAPITALISM IN UNDERDEVELOPED COUNTRIES

The Sixtieth Annual General Meeting of Booker Brothers, McConnell & Co., Limited, will be held in the Council Room of the London Chamber of Commerce, 69 Cannon Street, London, E.C.4, on Tuesday, July 5th, at 12 noon.

The report and accounts for 1959 were posted to shareholders on June 11th, together with an illustrated *Review of the Year* which includes the Statement of the Chairman, Sir Jock Campbell. The following is a shortened version of the Chairman's Statement:

FINANCIAL RESULTS

The net trading profit of the Group after tax and all charges was £1,248,751 compared with £972,683 in 1958. There were also capital profits of £160,224; against £239,561 in 1958. Excluding capital profits, the return on shareholders' money went up from 7.4 per cent in 1958 to 8.6 per cent in 1959. Your directors are recommending a final Ordinary dividend of 9d. per share free of income tax, making 1s. per share for the year. The total Ordinary distribution in respect of 1959 takes £477,009 compared with £381,608 for 1958.

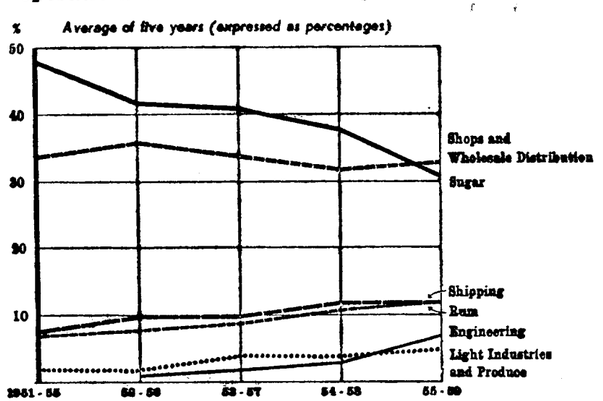
CAPITALISATION

We are recommending the issue of one share for every ten now held, by capitalisation of £477,009 from capital reserves. Though it would be logical to capitalise more of the capital reserves of the Group we cannot do so without incurring undue expense. Your directors hope to maintain next year's Ordinary dividend at not less than 1s. per share on the increased capital.

SUGAR

232,000 tons of sugar were produced in 1959 on the estates in British Guiana for which Bookers are responsible—20,000 tons less than the year before. This decrease was due to the preceding two years' drought followed by unseasonable rain. Sugar cane ripened when it should have been growing; and grew when it should have ripened. This odd weather brought a plague of insects and rats. And the free market price, at which we sell 40 per cent of our sugar, was abysmally low. The result of all this was that sugar profits tumbled to only 20 per cent of the profits of the Group after tax. It was a remarkable achievement on the part of the board and management, technical staff and workpeople of Bookers Sugar Estates that the profits were no worse.

This year's negotiated price under the Commonwealth Sugar Agreement is £44 8s. 10d. a ton, which is 13s. 2d. less than in 1959, and with other factors this might spell even lower sugar profits for 1960. But the weather has been better and British Guiana may obtain higher export quotas this year, so we may be able to produce and sell 250,000 tons of sugar or more. We hope that this, together with the fruits of increasing efficiency in field and factory, may minimise the effects of a reduced negotiated price and thoroughly unremunerative prices for free market sugar and molasses.



Tropical agriculture is more hazardous than most. It is vital to the economy of British Guiana, to the standard of living of her people, and to the prosperity of Bookers' many other businesses there, that the sugar industry should continue to be able to face and overcome the hazards.

CONSTITUTIONAL ADVANCE IN BRITISH GUIANA

As the outcome of a Constitutional Conference held in London this March, it has been agreed that a new constitution should be introduced in August, 1961 giving British Guiana full internal self-government, subject to qualifications about Ministerial control of the police and arrangements for the public service. Moreover the British Government have accepted the principle of the future independence of British Guiana subject, in two or three years' time, to both Houses of the British Guiana Legislature passing resolutions asking for independence, and subject to a further conference thereafter to consider when it would be practicable to implement the request. These new constitutional plans have been received with mixed feelings by politicians and people in British Guiana. In particular Dr Jagan's majority party—the People's Progressive Party—object that independence was not granted at one stroke. And many others feel that from now until August, 1961, is too long to carry on without changes in the present colonial constitution.

I certainly do not want to see British Guiana remain a dependent colonial territory. Moreover I want to see a fully elected Government having the whole responsibility of governing. Internal self-government in 1961 represents a great new constitutional stride forward. Bookers' duty and desire is to continue as at present to do everything within their capacity to serve and to work with the Government elected under the new constitution. British Guiana and her leaders and people are going to need all the help they can get from all over the world to enable them to strengthen and to build upon the economic foundations of their country. But in the last resort it is only the confidence of the Government and people themselves in the future progress and prosperity of their country that can generate external confidence towards British Guiana. I hope that the opportunities and the challenge of self-government, and of a great fresh measure of responsibility, will inspire new unity and purpose, and a new will in the whole community to plan and to work together for the good of all.

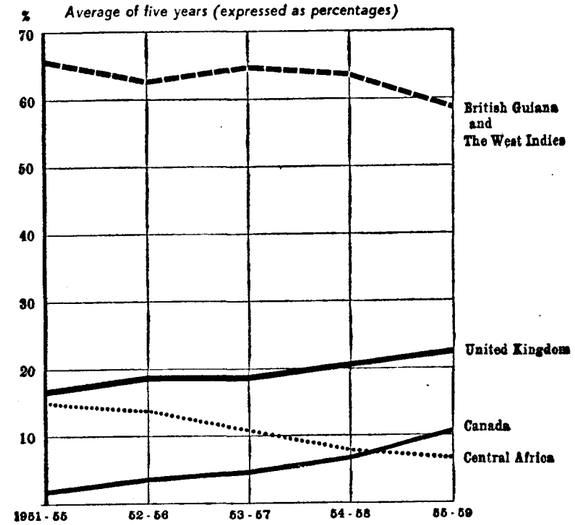
The proportions in which Bookers' various trading operations have contributed to profits

SHOPS AND WHOLESALING: IMPORTANT ACQUISITION IN CANADA

Our shops and wholesale distributive companies doubled their rather meagre profits of 1958. Profits in 1959 included for the first time those of Taylor, Pearson and Carson (Canada), which does a broadly similar business in Alberta and British Columbia to our other businesses selling motor car parts and domestic appliances in Western Ontario, Manitoba, Saskatchewan and Alberta. This acquisition has effectively doubled our interests in Western Canada and extended them from the head of the Lakes to Vancouver Island. All these companies increased their sales in 1959 and produced as a whole highly acceptable profits. 18 per cent of the Booker Group profits after tax came from Canada during 1959 (compared with 49 per cent from British Guiana and the West Indies, and 30 per cent from the United Kingdom).

Our shops and agencies in British Guiana did very well last year. So did our established shops in Trinidad; although Fogartys, which we only bought in 1958, have not yet got properly going. Our wholesale and retail grocery businesses in London and the Home Counties made a loss again. Their management has been greatly strengthened, their efficiency and service improved, new shops have been opened and old ones refurbished or converted to self-service. All this has increased expenses and overheads. Although sales have significantly increased, they have not yet reached full potential. When they do the profits should come.

IMAGINATION AND WISDOM NEEDED IN CENTRAL AFRICA



Shops and agencies in Northern Rhodesia had a rather better year. In Nyasaland sales were up, which was remarkable in such tense and tragic times, but profits fell. As I write, in April, Dr Banda has, I am happy to say, just been released from prison (but not yet some of his lieutenants and many of his followers). The Monckton Commission are at work in Central Africa, and Mr Macleod's visit has apparently done much to set the scene for restoring African confidence and progress. We in Bookers, with our businesses in Northern Rhodesia and Nyasaland, have a direct as well as a moral stake in what happens. I have previously expressed the view that no form of federation or association in Central Africa can command African acceptance and support if its effect, however veiled, is to inhibit African constitutional progress in Northern Rhodesia and Nyasaland, and to sustain European domination. The choice in Africa does not lie between continuing white supremacy and early effective African constitutional advancement. The catastrophic events in South Africa have finally shown that the doctrine of white supremacy is as dangerous and unworkable as it is wrong and inhuman. African constitutional advancement there must be. The choice lies between its achievement by constructive and imaginative statesmanship or in violence and bitterness.

African nationalism is a reality. It is realism, not idealism, to recognise it. Miss Margery Perham in the March issue of *Optima* (a quarterly review published by Anglo American Corporation of South Africa) writes "It is difficult to see how Africans . . . can find the dignity and self-expression they need, with the experience of civic life and of economic development, except by following the rest of the world through the stage of nationhood." And in the same article "The Western nations, if they want to complete the emancipations which, voluntarily and involuntarily, they have set in motion, will have to go on paying the penalty of their former domination in patient understanding, in unrequited aid, largely through international channels. . . . Altruism has, indeed, become the best policy."

SHIPPING HOLDS THE LINE: HANDLING SUGAR IN BULK

Bookers' shipping interests consist of two cargo liners plying between Liverpool and British Guiana, and coasters based on Liverpool and in British Guiana, with ancillary services. They did very well to keep their profits up. Your Board decided, after much thought, to approve the building of a 10,000-ton ship to carry sugar in bulk, which is the only form in which our important United Kingdom and Canadian customers will, for the most part, in future be prepared to buy it. Work on the bulk sugar storage and handling installations in British Guiana is going according to plan. The considerable expense should be justified over the years by concomitant economies.

How Bookers' four main trading areas have contributed to profits

SUCCESSFUL YEAR FOR RUM

United Rum Merchants had a bumper year. They sold more of all their main brands—*Lemon Hart* Jamaica, *Lamb's Navy* and *Black Heart* Demerara—than in the previous year. Their export sales were also up, particularly in Canada. More *Tia Maria* liqueur too was sold in the United Kingdom and export markets.

ADVANCES BY ENGINEERING BUSINESSES

Our Engineering group did splendidly. They produced 18 per cent of Bookers' profits. The sugar machinery manufacturing companies both had record sales, orders and profits. The lion's share of their business is for export. George Fletcher in Derby made 50 per cent more sugar machinery in 1959 than in 1956 when the company joined Bookers. Duncan Stewart in Glasgow produced sales and profits far in excess of anything we had expected. The sugar machinery highlight of the year was the toughly competitive sale, in partnership with Vickers-Armstrongs (Engineers) of £10 million worth of beet sugar machinery, including two complete beet sugar factories, to the USSR. An exciting new plan is to establish the Triveni Engineering Works in India, in partnership with the Sawnhey family there, to manufacture sugar machinery under licence, and possibly other suitable kinds of machinery as well.

Sigmund Pumps had an excellent year with their industrial and process pumps, and with their *ThermoPak* accelerator pumps which are proving so successful in the quickly widening market for small-bore domestic heating systems. Reliance Manufacturing Co. (Southwark), who make electronic components, also had a record turnover.

LIGHT INDUSTRIES: EXTENSION IN TRINIDAD

The companies in our Industrial Holdings group made 15 per cent more profit than in 1958. In British Guiana, printing, drug manufacture and balata bleeding all did well. The produce companies did not do badly. Carpet wholesaling in the United Kingdom became more difficult.

An important new development for our Industrial Holdings group is the decision to open a new lithographic printing company in Trinidad in partnership with Brown, Knight & Truscott. The political and economic climate of Trinidad appears thoroughly favourable for investment.

BOOKER INVESTMENT IN BRITAIN AND CANADA—AND STILL IN BRITISH GUIANA

This statement includes two graphs. The first (see page 1272) illustrates the proportions in which, over five-year periods, Bookers' various trading operations have contributed to profits. The second (page 1273) illustrates, also over five-year periods, the proportions in which profits have come from British Guiana and the West Indies, the United Kingdom, Central Africa and Canada. These graphs are designed to indicate trends. They show that we have made great headway with new investment, in the United Kingdom and in Canada, in engineering and in shopkeeping, to insure against the variegated hazards of tropical enterprise. All this new investment has been done without in any way holding back the progress of our business in British Guiana.

Now that we have successfully strengthened and broadened Bookers' foundations, it is important that we should not let our new businesses in the United Kingdom and Canada start to overshadow our endeavour and investment in underdeveloped tropical countries. Investment in each must be complementary to the other; so that each may fortify the other.

ADAPTABILITY TO CONDITIONS IN UNDERDEVELOPED COUNTRIES

The fortunes of the West, as indeed of the Soviet Union, are inexorably bound up with the fortunes of Africa and Asia. The future of the new nations depends upon the development of their economic resources. Western private enterprise all too often fights shy of the difficulties and hazards of investment in emergent countries in favour of good times at home. And taking a short-term view there are obviously attractions for shareholders and boards of directors in investing in going concerns in the affluent societies compared with the long haul of building new production in new nations. But vast numbers of the producers and customers in the world of the future will be in Africa and Asia. This massive fact is, perhaps, too often viewed in political terms as a threat instead of a promise; and so the challenging opportunities for western private enterprise to take a share in the future of these countries are obscured and the dangers exaggerated. The new nations will provide possibilities of successful investment for those businesses imaginatively and flexibly willing to appreciate the other man's point of view. There is a great deal to be said for investing in the future, as well as in the past and present.

The governments of new nations, in the face of formidable social and economic problems, have no straightforward choice between capitalist and communist systems of economic development. Whatever doubts they may have about communism, many of them have doubts about capitalism too. Strong central planning and control by their own governments seem essential to the progress of most of these countries. Private enterprise can never do enough; and often shows too few signs of being willing to do its full share. Western governmental and quasi-governmental aid still falls sadly short of what is required. These new nations must get money and help from wherever they can. Nor is it any use expecting emergent governments to give political hostages to capitalism, while at the same time expecting them to refuse the "strings" of communism. The people of Africa and Asia are not going to adapt themselves conveniently to the ways of industrialised western societies and all become projections of Sheffield or Detroit. It is western capitalism which must, if it is to survive, adapt itself to, and become part of, the historical processes of these nations. The best way to ensure that British private-enterprise capital plays an increasing part in the future of these countries is simply for British companies to establish successful investment in them. The more successful investments there are, the more the economy will develop, the more significant the part they will play in the economy, and the more they will be accepted as a necessary and desirable factor in the economy—provided, of course, that they are not identified, as in the past, with political domination or illusions of racial superiority.

None of this is to say that investment will flow uphill, as it were, to these countries in the face of adverse financial and economic conditions. There is a sellers' market for capital, which must be attracted not repelled. I am convinced that capital can be attracted on terms wholly compatible with national dignity. I hope that Bookers, among many other and bigger companies, can point the way to complementary investment at home and overseas. In addition to the projects I have already mentioned—new shipping for the West Indies, printing in Trinidad, and sugar machinery manufacture in India—our other developmental plans in tropical countries include: cocoa production in British Guiana—up to 5,000 acres over the next few years if all goes well; a 500-acre irrigated tea estate in Nyasaland from which we hope to start selling tea in 1961; and sugar production in Northern Nigeria in partnership with the Federal and Northern Nigerian Governments—this is still at the pilot stage.

I should add that it is not our policy in Bookers to make new investments merely to get bigger. It is to grow stronger, to protect what we already have, and to use our resources of management and organisation as fruitfully as possible.

SOURCES OF BOOKER FINANCE

Though bank overdrafts of nearly £3.9 million of which £2.3 million are in Canada, might seem high, the use of increased bank borrowing by our operating subsidiaries is fully appropriate as a means of financing part of their fluctuating current assets, e.g. sugar and other produce; and it has enabled us to free parent company funds to provide the money needed for investment in new businesses.

Shareholders are getting the benefit of the gearing effect of bank borrowing, and there is not yet any substantial hard core of borrowing requiring replacement by new capital. Your directors are not therefore thinking of suggesting an issue of shares for cash at present. (Over the past ten years we have neither raised new capital nor issued shares for the acquisition of a new business, yet our profits have increased fivefold.) This is not to say that the time will not come when the expansion of the Group may justify a new share issue for cash.

PROSPECTS

As for 1960 our results should not compare too badly with 1959, but I cannot at present forecast a rise in profits.

This year's profits have as always depended upon the skill and work of the men and women who compose the Group. When discussing Bookers' energetically decentralised management, people sometimes say "So the responsibilities of the Board of Booker Brothers, McConnell & Co. are largely financial." I always reply "On the contrary, they are largely human." Our main job is to generate conditions throughout the Booker Group in which men and women can use their talents to full purpose and find satisfaction in serving and balancing the interests of shareholders, customers and the community.

THE FINANCIAL TIMES LIMITED

A SATISFACTORY YEAR'S RESULTS

LORD POOLE'S REVIEW

The Thirty-second Annual General Meeting of The Financial Times Limited was held on June 14th at Winchester House, Old Broad Street, London, EC2, The Lord Poole, CBE, TD, the chairman, presiding.

The following is his statement which had been circulated with the report and accounts for the year ended December 31, 1959:

The Financial Times has had a satisfactory year. We produced bigger papers, sales increased and advertising revenue reached a record figure. For these excellent results our thanks are due in a very marked degree to the efforts of all our staff. The only check to our progress was in the affairs of our printing subsidiary, St Clements Press, which as I anticipated in my speech last year would be the case, suffered from the seven weeks stoppage in the general printing trade during the summer and was also affected by the problems involved in the move to new premises.

Economic conditions during the year were favourable to our fortunes. The recovery in British industry, to which I referred last year, continued, with production and exports up, the pound sterling stable and the Stock Exchanges, if anything, rather too active. The general election returned the Conservative party for a third period of office with an increased majority and that provided further support to business confidence. The opportunities for expansion thus presented were made full use of by both our editorial and business staffs.

PROFIT AND DIVIDEND

In the accounts submitted for your approval the consolidated profit of the Financial Times group for the year ended December 31, 1959, amounted to £649,990 compared with £1,052,618 for the preceding accounting period which was for the eighteen months to December 31, 1958. The trading of *The Financial Times* itself was very satisfactory but as the Directors' Report makes clear, the consolidated figures were affected by the adverse trading of St Clements Press.

After allowing for the tax changes and adjustments for the two periods and the interest of outside shareholders the profit attributable to *The Financial Times* for the twelve months is £381,909 compared with £695,433 for the previous eighteen months. A final dividend of 20 per cent is recommended making 35 per cent for the year, excluding a non-recurring interim payment of 3½ per cent made a year ago to meet the special circumstances arising from the change in our accounting date. The balance of unappropriated profit and general reserve carried forward at the end of the year was £1,916,584 compared with £1,680,297 brought in.

The balance sheet reflects the taking over of the new building and the additions to plant and machinery. The financial position is sound with ample cash resources.

HIGHER SALES

The Financial Times ABC sale figure for the six months ended December 31, 1959, was 109,374, a striking increase on the figure of 86,004 for the corresponding period of 1958. At the present time the daily average sale is over 120,000 copies a day. The demand for the paper has been spread over all our main areas of distribution and it is gratifying that sales have increased not only in London and the Home Counties but in the industrial areas of the country and abroad. The efforts of the Editor and his staff over the past decade are now seen to be reflected in the establishment of *The Financial Times* as the recognised daily paper of the business man and the man of affairs, and in its growing influence and importance overseas.

The editorial contents of the paper were further expanded during the year and a number of new features introduced. Among them mention should be made of the printing daily of dividends, cover and yield, as well as the closing prices with the year's "highs and lows" of some 2,000 stock exchange securities. Another development has been the expansion of the Saturday issue. We are more than ever convinced that quality is the basis on which we should aim to progress.

ADVERTISING GROWTH

Advertisers have acknowledged the value of *The Financial Times* by a marked increase in their use of its columns. We are glad that the paper has maintained its pre-eminent position for financial advertising both of company meeting reports, British and overseas, and new issue prospectuses and statements. It is also most gratifying to report a still further and substantial advance in the volume of industrial display advertising. Our revenue from advertisements last year increased by 22 per cent—a figure which shows that our progress in this direction was not merely a reflection of improved external conditions but the result of solid intrinsic merit. Of the total revenue derived from advertising 54 per cent came from display advertisements; 27 per cent from company meetings; 11 per cent from classified advertisements and 8 per cent from New Issues. All these figures include insertions by foreign advertisers. We have a special department that deals with this side of our business and its success is, I think, an outstanding example of enterprise and initiative.

During the year we completed the move from our old editorial and business offices and from our printing works in Portugal Street to our new building, Bracken House. I need not repeat what I said last year about the advantages of our all being under one roof. If we had not moved when we did it is difficult to see how we could have dealt with the expansion of the past year. Even so, our editorial, printing and publishing departments were set a severe task and have had to improvise during the inevitable gap betwen ordering new machinery and its erection.

I will now refer to our subsidiary companies.

ST CLEMENTS PRESS

The accounts of our printing subsidiary, St Clements Press Limited, reflect a substantial loss, partly attributable to the long and costly printing strike last summer, and partly to the effects, not yet wholly eliminated, of the removal of its works to our new premises at Bracken House.

During the year, faced by an accentuation of the swing from letterpress to photogravure for the printing of popular magazines, we decided to close the Speaights division of St Clements Press. Production there ended in February and its assets should be realised at a profit.

All our production is, therefore, now concentrated at Bracken House, where we have, within a stone's throw of St Paul's Cathedral, a magnificent modern plant designed to work to the most exacting production schedules that our customers may demand.

HISTORY TODAY

Our other subsidiary, History Today, enjoyed a successful year. This monthly magazine is now well-established and had an average net sale for 1959 of 22,067. The sale today exceeds this figure. Some 5,000 copies a month are sold in the USA, where the combination of scholarship and readability which distinguishes History Today is as much appreciated as it is over here.

INDUSTRIAL & TRADE FAIRS

I should also say a few words about Industrial & Trade Fairs, the Exhibition company in which we are partners with the George Newnes Group. The company has already established a reputation for well-organised industrial exhibitions. Last year it organised an Industrial Photographic and Television Exhibition in London, which is being repeated this autumn, and an International Transistor Exhibition. In the autumn it will be running the Factory Equipment Exhibition in Manchester and earlier this year it was responsible for a successful Engineering Materials and Design Exhibition at Earls Court. At present it is actively engaged in organising a large scale British industrial exhibition in Moscow next year, which promises to be a major event in the UK's export drive, and will be concerned with the arrangements for a reciprocal Soviet exhibition at Earls Court later in the year.

PROSPECTS

The current year has started well for *The Financial Times* but it is too early to make predictions as to the final outcome. As you will see from the balance sheet, the company is in a satisfactory financial position with ample resources for any future developments.

I have in passing paid tribute to the work of the staff, but I would like to conclude by saying on behalf of the Directors and Shareholders how grateful we are to the whole staff in all departments for their successful efforts during the past year.

The report and accounts were adopted.

THE EVER READY CO. (GREAT BRITAIN) LIMITED

(Manufacturers of Dry Batteries)

RECORD SALES, PROFITS AND DIVIDENDS

INCREASED EXPORTS

STATEMENT BY THE CHAIRMAN MR E. N. ROWBOTHAM

The Annual General Meeting of the Ever Ready Co. (Great Britain) Ltd., will be held on July 6th at the head office, Hercules Place, Holloway, London, N.7.

The following is the statement of the chairman Mr E. N. Rowbotham which has been circulated with the Report and Accounts for the period from March 1, 1959 to February 27, 1960:

It is with the deepest regret that I report the death of Mr R. O. Allston on April 3, 1960. Mr Allston joined the Company in 1926 and was appointed a Joint General Manager in 1954. He was chiefly concerned with the home sales of the Company and was largely responsible for building up our very successful Van Sales Division.

RECORD SALES, PROFITS AND DIVIDENDS

The Report and Accounts which accompany this Statement deal with the operations of your Company for the period of fifty-two weeks from March 1, 1959, to February 27, 1960, and I am glad to be able to report to you once again on another year of successful and satisfactory trading. Earnings have increased and constitute yet another record in the history of your Company which has been fortunate enough to enjoy increased sales and profits for seven years in succession.

In view of the good results achieved this year the Directors recommend that a Final Dividend of 15 per cent be paid, making 20 per cent for the year on the Ordinary Stock as increased by the Scrip Issue made in July 1959. Stockholders will remember that a Special Interim Dividend of 7½ per cent on the Ordinary Stock was declared by the Directors in respect of the period ended February 27, 1960, and paid at the same time as the Final Dividend last year. This, in effect, meant that the effective rate was equivalent to 16½ per cent on the present Ordinary Stock.

REDUCED SELLING PRICES

The improved earnings which I have reported to you have been due not only to increased turnover, but also to the continued increased efficiency of our production methods. During the past year the Company has expended £225,000 on extensions to buildings, including the purchase of the freehold of its main office buildings at Hercules Place, London, N.7, so that now all the main properties of the Company are freeholds. The Company has also expended £470,000 on the modernisation and improvement of plant and machinery and further substantial expenditure under these heads is envisaged in the coming year. The cost of zinc increased during the year, but most other material prices remained steady. In view of the overall savings in cost and in accordance with the policy which the Directors have pursued for many years they decided to make reductions in the retail prices of a number of the Company's Radio Batteries in the home market as from March 1960. Your Directors are confident that these reductions will further stimulate sales at home and will therefore be of advantage to Stockholders as well as to the Trade and Consumers. We shall continue our endeavours to reduce costs of manufacture by efficient and economic production methods so offering to our customers, both at home and abroad, first-class products at fair and attractive prices.

INCREASED EXPORTS

Berec International Ltd., having expanded its representation, achieved sales which were substantially greater than last year's record. I would like again to pay my tribute to the work of the Representatives, Distributors and the Staff of Berec International Ltd. and also to all employees of our group of Companies, both at home and overseas, whose efficiency and hard work have been largely responsible for the production of such encouraging figures. On behalf of the Stockholders and Directors I thank them all for their co-operation during the past year.

In recent years your Directors have given careful consideration to the question of extending the Company's trade on the continent of Europe, particularly with relation to the setting up of the Common Market and the Free Trade Area. As Stockholders are aware, we have had for many years an investment in two companies in Germany manufacturing dry batteries and towards the end of the year agreements have been reached whereby your Company acquires substantial interests in other countries on the continent of Europe. The considerable increase in the Capital Commitments of the Group which this year are £1,032,809 compared with £515,682 last year is largely due to these acquisitions. I am confident that the successful conclusion of these and other negotiations will greatly strengthen our position on the continent of Europe and throughout the world.

Following the policy to which I referred last year of re-valuing the Fixed Assets of the Company so as to bring the figures in the Company's Balance Sheet more in line with the actual position, your Directors during the year decided to re-value the investment in Eveready South Africa Limited. Our investment in this Company was made in 1945 and due to very successful manufacturing and trading in Africa it has steadily increased in value. Your Directors decided that it would be reasonable to re-value this investment and as a result we have placed a sum of £537,781 to the credit of Capital Reserve as you will see in the Accounts. These shares are now held through a 100 per cent subsidiary company and this has caused a reduction in both the Book Value and the Market Value of Trade Investments shown in the Parent Company's Balance Sheet, but has no effect on the Consolidated Balance Sheet.

During the year we purchased a further holding in a company making carbon rods for use in dry batteries, which now becomes a Subsidiary instead of a Trade Investment and, in consequence, the Trade Investments shown in The Ever Ready Company (Great Britain) Limited Balance Sheet have fallen and the amounts invested in Subsidiary Undertakings have increased.

FINANCIAL POSITION FURTHER STRENGTHENED

The Consolidated Balance Sheet shows that the Company's liquid financial position has been further substantially strengthened. The surplus of Current Assets over Current Liabilities (including Deferred Liability for future taxation) has increased from £3,848,391 to £4,102,288. Stock-in-Trade has increased from £2,599,403 to £2,984,234 due to increased production. The immediately available Cash Assets of the Company have increased from £2,727,816 to £2,866,473. Income from other investments has increased from £60,722 to £99,357.

We are fortunate this year in that the taxation charged is not substantially greater than last year, although profits have increased considerably. This is due partly to the fact we have received this year a substantial sum of interest on Tax Reserve Certificates which is not liable to tax, and partly to the fact that we have received the benefit of increased Capital Allowances during this year.

PROGRESS OF BATTERY OPERATED RADIOS AND POWER PACKS

The number of dry battery powered radio sets produced by all the leading radio manufacturers now exceeds the number of mains operated and car radio types. In 1954 25 per cent of the radio sets sold in this country were dry battery operated, but by 1959 this proportion had increased to over 50 per cent and is still increasing.

Three years ago we introduced a new range of compact "Power Pack" batteries for use in radios and other transistorised equipments. These batteries are rapidly achieving universal acceptance as the best source of power for a wide variety of such equipments and we anticipate a substantial increase in sales during the coming year. Action has already been taken by your Directors to extend one of our Midland factories and increased production will commence during the Autumn.

CURRENT TRADING GOOD

The current year's trading to date is encouraging and I am pleased to tell you that sales at home and overseas are in excess of last year.

THE METROPOLITAN RAILWAY SURPLUS LANDS COMPANY LIMITED

The Twenty-seventh Annual General Meeting of The Metropolitan Railway Surplus Lands Co. Ltd., will be held on June 23, 1960. The following is an extract from the Statement by Sir Bernard D. F. Docker, K.B.E., the Chairman, issued with the Report and Accounts for the year ended March 31, 1960:

Profits and Dividend.—Gross rents at £480,560 showed an increase of £58,944 and net rents were £44,405 up at £356,682. In the final result the gross profit was £433,965 against £342,338 last year, an increase of £91,635 and, after providing for taxation, the net profit was £226,570, a very gratifying increase of £49,306 over the net figure of £177,264 earned in 1958-59. We recommend a final dividend of 5 per cent. This will absorb £121,317 and leave £106,618 to carry forward compared with £86,287 brought forward. The dividends for the year will, therefore, amount to 8½ per cent compared with the equivalent of 7 per cent for the previous year after taking account of the capital increase by the scrip issue in July, 1959.

Consolidated Balance Sheet.—Over £700,000 of the £900,000 expansion in our assets represents outlay in freehold and long leasehold property held for investment which is reflected in an addition of a little over £700,000 in our Bank loan. Our secured loans and Bank overdraft, however, together amount to under £1,100,000, against a Balance Sheet total nearly all invested in property in excess of £6 million.

Acquisitions during the Year.—New investments during the year included such commercial properties as the London Leather Market in Bermondsey, the modern office block known as Lever Chambers, Bolton, let as a whole to the Ministry of Works, and the 113 flats and the 135 houses in Mill Hill being the property assets of The Hale Property Trust Ltd., the whole of the share capital of which we acquired for £300,000. Nevertheless our main efforts have been directed to acquiring properties for development as permanent investments for the parent Company or for re-sale by the trading subsidiary. Purchases of this character include the Gascoyne Cecil Estate of freehold ground rents in Liverpool, which expire in the main within 20 to 35 years, an Estate of freehold ground rents at Grimsby expiring within 25 and 72 years, and a central redevelopment site in Middlesbrough. The scale of re-development we propose for the latter is considerable. Our plans, which will include the provision of extensive blocks of shops and offices, may call for an investment of up to £1 million. In the case of another central redevelopment site in an important provincial town negotiations have reached an advanced stage for the grant to us of a long term lease for development in the main of shops and offices. These are apart from sites for smaller schemes in other provincial centres. We have agreed recently to make our first investment overseas. This is a project in Adelaide, South Australia which will, over the next two years, call for an outlay in the neighbourhood of a quarter of a million pounds. Some of these projects will take more than a year to reach the productive stage, but we feel sure that they will eventually prove beneficial.

Ortem Estates Ltd. The Whelmar Property Co. Ltd.—After referring to the substantially increased contributions made by the trading subsidiary, Ortem Estates Ltd. and the joint venture with The Metropolitan Railway Country Estates Ltd. in The Whelmar Property Co. Ltd. and the satisfactory prospects before both concerns the statement continues:

Prospects.—I have referred on previous occasions to the probability that when times seemed propitious we should raise a debenture or secure individual mortgages to obtain permanent finance on suitable terms for expansion. Our secured loans amount to only about £200,000. We are aware of more than one important financial institution very willing to put substantial financial resources at our disposal when we want them. We recognise that any further substantial expansion will almost certainly require borrowings on a more permanent basis and we have such arrangements under regular consideration.

Our rent roll continues to expand satisfactorily. Before the end of the war we realised that the continuing fall in the value of money made it unwise to commit ourselves to re-lettings on long term leases. Regular increases in our rents on revision can be expected as well as additions arising from decontrol and from further acquisitions. Not forgetting the time lag before our major re-development schemes can begin to earn a significant return, the short term outlook for our investment programme is satisfactory. The immediate outlook for our property trading activities is encouraging. Looking ahead, to next year, unless there is a setback in our present buoyant economy at home, my colleagues and I hope to present accounts which show a further improvement.

THE INDUSTRIAL AND GENERAL TRUST

The seventy-second annual general meeting of The Industrial and General Trust, Limited was held on June 9th in London.

Sir Edwin S. Herbert, KBE, LLB (the chairman), presided and, in the course of his speech, said:

Before turning to the Accounts, I should like to refer to the issue made in January last of £2 million 5½ per cent Debenture Stock, 1982-87. This Stock was issued at 99½ per cent and was payable as to 50 per cent on application on January 27th last, the balance of 49½ per cent being payable on June 1st. The raising of this money has coincided with a recession in Share prices which has enabled us to invest at least half the new money on a more remunerative basis than appeared possible when we decided upon the issue. The final call has only just been paid and although some part of the amount due was invested ahead of payment the remainder is being kept as liquid as possible to enable us to make more permanent investments as and when favourable opportunities occur.

I should, however, make it clear that equity holders should not expect an immediate benefit to accrue to them from this new money. The rate of interest we have to pay on it is high and it will take time to obtain the advantages the Board foresaw from the issue of this additional capital. At the same time, the return on the money so far invested is rather better than we originally expected.

As from April 1st last we decided to dispense with registration fees. This will represent some small saving to purchasers of our Stocks and Shares and we feel that any step which lessens the cost of investing is to be welcomed. We wish that the Government in considering Stamp Duties would follow our good example.

Our gross Revenue, at £1,948,000 is £136,000 more than last year; this increase arises partly from the buoyancy of Revenue throughout the period but also from the greater return we have received from the new money raised in January, 1958.

After deducting tax and working expenses net Revenue amounted to £1,018,144 which with £292,093 brought forward makes a total of £1,310,237 to be dealt with. We have transferred from this sum £225,000 to General Revenue Reserve to bring it up to £1 million.

At a little under £43 million the valuation of our investments is £11 million more than last year and compares with the net cost in books of the investments of about £12½ million.

The upward trend of our revenue has continued into the current year and if it continues, as it may well do, the results should even better those you are now considering. However, you should not build too much on this improvement as much may happen before the end of March next, to disturb conditions as they are today.

In matters of management you will agree, that we should always be thinking of the future as well as the present so that continuity is secured. We have been doing that and are making certain changes for the purpose. Mr Ockford is giving up his position as Managing Director and is becoming Deputy Chairman with certain executive functions. Mr Bussy moves up to Manager and Secretary and Mr Talbot to Investment Manager.

The report was adopted and the final dividend of 12½ per cent, making 22½ per cent for the year, was approved.

THE WIGGINS TEAPE GROUP

(WIGGINS, TEAPE & CO. LIMITED)

ANNUAL REPORT and ACCOUNTS of the WIGGINS TEAPE GROUP for 1959

PRODUCTS

THE GATEWAY RANGE
(*a*) Watermarked papers for commercial use—writing, ledger, air mail, index board, blotting, cheque stamps, office systems, etc.

(*b*) Printing and drawing papers—coated art paper and board, chromo, gummed, cartridge, detail, tracing, chart and recording, etc.

BANKS, BONDS, MANIFOLDS AND CONTINUOUS STATIONERY

"NO CARBON REQUIRED PAPER"—the time saving copying paper.

PACKAGING PAPERS
Glassine, greaseproof, pure vegetable parchment, glazed imitation parchment, tissue, M.G. Sulphite, foil backing, and flexible packaging materials.

TISSUES
Industrial Base Papers
Photographic, dyeline, ferro prussiate, plastic laminate, abrasive, oil and air filter, etc.

COMMERCIAL AND PERSONAL STATIONERY AND ENVELOPES

DISTRIBUTION CENTRES—
United Kingdom: Belfast, Birmingham, Bristol, Cardiff, Edinburgh, Glasgow, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham.

Overseas: Dublin, Cape Town, Port Elizabeth, Durban, Bloemfontein, Johannesburg, Salisbury, Ndola, Nairobi, Lagos, Karachi, Bombay, Madras, Calcutta, Singapore, Kuala Lumpur, Hong Kong, Tokyo, Melbourne, Adelaide, Sydney, Perth, Wellington, Auckland, Christchurch, Buenos Aires, New York, Beirut and AGENCIES throughout the World.

SALIENT POINTS

Net Profit after taxation and minority interests ...	£2,749,512
Debenture Interest	128,545
Preference Dividend	98,471
Ordinary Dividend	1,099,541
Net Profit (including £74,215 being Pre-acquisition profits for 1959 of companies acquired during year) retained in Group	1,422,955
	£2,749,512
Net Current Assets including Proceeds of Rights Issue	16,353,763
Fixed Assets	22,089,680
Trade Investments	712,379
Total Capital Employed (including Debentures and Loans)	£39,155,822

EXTRACT FROM STATEMENT BY MR L. W. FARROW, C.B.E., CHAIRMAN

STATE OF TRADE AND SALES: The state of trade in the paper industry improved during the second half of 1959 and order books towards the end of the year looked much more healthy than they had done for several years.

I am glad to say that the trade of the Wiggins Teape Group shared in this improvement and the turnover of the Group for the year broke all records.

In spite of a continuance of import restrictions in many overseas markets, to which reference was made last year, our trade overseas again achieved a new record in 1959. In the first half of the century our exports were almost entirely to countries outside Europe. During the last seven years we have been extending our activities in Europe with some success and our sales to this market now amount to some 20 per cent of our total exports.

PRODUCTION: I am glad again to report a new record in the volume of paper produced at our mills in 1959.

SELLING PRICES AND COSTS OF PRODUCTION: There was no general change in selling prices in 1959, though during the first half of the year trade was very competitive and in some grades of paper prices were shaded downwards. Costs of production showed a small reduction over those of 1958. This was brought about by increased output and lower prices of some raw materials, but such reduction was partly offset by increases in wages and salaries.

NEW DEVELOPMENTS: Your Directors have decided upon further developments which are being commenced during the current year. These new projects are as follows:

(1) The paper making machine at our Chartham Mill is unable to meet the current demand for tracing paper, so it has been decided to erect a second machine at that Mill.

(2) The demand for certain types of tissue paper made at our Bridgend Mill has outrun the capacity of the plant there. It has, therefore, been decided to install a fifth paper making machine.

(3) The demand for the Group speciality papers continues to increase, so it has been decided to close our one machine mill at Roughway, in Kent, to reconstruct the paper machine and thereafter to install it at our Hele Mill in Devonshire.

(4) We have also decided to devote a considerable sum on modernising our coating plants.

In the overseas markets, the continuance of import restrictions in India has led to an almost complete cessation of the importation of our high grade commercial papers to that market. We are, therefore, in negotiation for the acquisition of a majority interest in a company owning a paper mill in India. Should these negotiations prove successful, we propose to alter the paper making machine and its auxiliary plant to enable high grade papers to be made there.

In order to increase further our considerable export trade, we are planning to add to the number of our overseas branches.

PROSPECTS FOR THE CURRENT YEAR: The sales of the Group continue to expand and the profits for the first four months are substantially greater than those for the similar period of 1959. Subject to circumstances beyond their control, your Directors are hopeful that the results for 1960 will be better than those for 1959.

MINERALS SEPARATION, LIMITED

The fifty-fifth Annual General Meeting of Minerals Separation, Limited will be held on July 7th at Winchester House, Old Broad Street, London, EC.

The following is an extract from the Statement by Mr J. N. Buchanan, the Chairman, which has been circulated with the Report and Accounts for the year ended December 31, 1959:

For the first year in the history of the Company, the Gross Profit of the Group passed the £1 million mark, being £1,108,161 against £818,717. Net Profit after Tax and Tax refunds advanced to £596,775 from £406,540. After adjustment of Profits attributable to outside shareholders, the balance applicable to the Parent Company was £492,682 against £327,366.

If you accept our recommendation, the total dividend for the year will be 1s. per 5s. unit. This is a moderate increase upon the comparable dividend declared last year on a smaller Capital: the Gross dividend this year takes £400,000 against £330,000 last year. If the new Capital proposals, as outlined in the Directors' Report, are approved the new Authorised and Issued Capital will be £2½ million. It is intended to use the funds from this new issue in further extension of our existing subsidiary and allied companies, in acquiring new subsidiaries as and when opportunity arises and in adding to our general investments.

The summary of figures attached to the end of this statement shows the 10 year record of the growth of the Group. We have added this year a classification of investments which we hope will enable members to get a general view of how the Capital is spread. For this purpose we have taken the date of December 31, 1959, and combined our quoted investments at market valuation on that day with our unquoted subsidiary and other investments at Directors' valuation on the same day. It should be borne in mind that such a valuation varies from day to day and therefore should be regarded as giving a general picture only. Changes in value and new purchases and sales can alter the percentages appreciably. From this classification you will see that our largest holding in any one investment was that in Mercury Securities, which is, *inter alia*, the Parent Company of Messrs S. G. Warburg & Co. Ltd. A close second comes our investment in Foundry Services. Another feature which may interest you is our mining interests. The growth in our total funds has diminished the relative importance of these. They are, in our view, a group which requires constant watching and attention. Moreover, events may happen which call for quick and substantial changes in such investments. For instance, since the turn of the year we have sold our Gold shares and increased our interests in Tin. For the rest, our portfolio follows the customary pattern looked for in an Investment Trust Company.

CLASSIFICATION OF INVESTMENTS

as at December 31, 1959, based on market valuation for quoted securities and Directors' valuation for unquoted holdings (including subsidiary Companies).

	Per cent
Mercury Securities Ltd.	24·4
Subsidiary and Allied Companies:	
Foundry Services Group	21·5
Others	9·4
Mines and Mining Finance:	
Rhodesian Copper	6·7
Gold, Diamonds, Tin, etc.	5·8
Banks and Finance	6·0
Food, Hotels & Stores	5·9
Rubber (Plantations and Merchants)	5·2
Public Utilities	3·4
Electrical and Engineering	1·3
Building and Construction	1·3
Unclassified and Cash	9·1
	100·0

NOTE:
The Company's direct holdings in U.S. investments included above amounted to about 8 per cent of the total. In addition there is a substantial indirect interest through the underlying holdings in other companies, particularly in the first two groups above.

SUMMARY OF GROUP BALANCE SHEETS, PROFITS AND DIVIDENDS 1950 TO 1959

	YEAR ENDED DECEMBER 31st

J. LYONS & COMPANY LIMITED

MR I. M. GLUCKSTEIN'S STATEMENT

The Annual General Meeting of J. Lyons & Company Limited will be held on July 5, 1960, at the Trocadero Restaurant, Piccadilly Circus, W.1.

The following is the Statement by the Chairman, Mr I. M. Gluckstein, which has been circulated with the Report and Accounts for the year ended March 31, 1960:

It is with deep regret that I have to record the death during the year of two Directors of the Company, Mr George W. Booth and Mr Kenneth M. Gluckstein.

Mr Booth had been Secretary of the Company from its incorporation in 1894 until 1952 and a Director since 1898. He had been in regular attendance at Board meetings until but a short time before his death in September last. We all felt for him the highest respect and affection and his contribution to the Company's development was outstanding.

Mr Kenneth Gluckstein had also served the Company with great ability during the whole of his business life. He was appointed to the Board in January, 1950, and his loss at the early age of 47 cut short a career as full of promise as it had been of performance.

In December last Mr A. J. Jenkins, who had for 46 years given unremitting and valuable service in the Teashops Department and had been a member of the Board for the last 13 years, retired. We held him in high esteem and greatly miss him. We hope he may long enjoy his retirement.

In February Mr H. J. Scott, the Company's Engineer-in-Chief, was appointed an Employé Director. Mr Scott joined the Company in 1923. An expert in fuel technology and thermal engineering, he has had with us a wide experience and shown qualities for which we welcome him as a member of the Board.

The Report and Accounts submitted with this Statement are for the 66th year of the Company which ended on March 31, 1960. They include the Balance Sheet and Profit and Loss Account of the Company and the Consolidated Balance Sheet and Profit and Loss Account of the Group comprising the Company and its subsidiaries.

THE YEAR'S TRADING

From the Company's Profit and Loss Account it will be seen that the balance from trading account is £5,583,951 compared with £4,359,946 for the previous year, and the net profit for the year is £1,399,255 compared with £905,256.

We are proposing an increase in the final dividends of 4d. per unit on the Ordinary and "A" Ordinary stocks and of 0.8d. per unit or share on the Proportional Profit stock and "B" Proportional Profit shares. The proposed final dividends together with the interim dividends paid in December last will absorb £610,055. The dividends paid and accrued on Preference and Preferred Ordinary stocks amount to £311,499. The balance of the net profit for the year is £477,701; after adding the balance brought forward from the previous year and deducting a provision against subsidiary companies' indebtedness and the amount written off goodwill purchased during the year there is a balance of £450,586 carried forward in the Profit and Loss Account.

These figures are an improvement on those of last year. But too much must not be assumed from such a comparison, since last year's figures were bad and in any event one year's figures taken by themselves are not a suitable guide where plans are made on a considerably longer view. As with most other businesses there are likely to be fluctuations from year to year, and some of the factors leading to them cannot possibly be foreseen. The wonderful summer of 1959 certainly helped some of our activities including, of course, both ice cream and soft drinks, but more important, there was a general improvement in trading conditions in the country and we shared in it. We are engaged in many branches of the food trade and benefit from this diversity, for circumstances which are against us in one trade may possibly favour us in another.

DIVERSITY OF THE BUSINESS

The Company started as caterers and almost the whole of our development has stemmed from that original business. It was to satisfy our early catering requirements that we started a bread and cake bakery, a kitchen department, and the blending of tea. It was a natural development that we should, at various stages in our history, supply the public through retailers for consumption at home. Thus started our factories and our wholesale selling departments, of which the most important are Tea and Coffee, Bakery and Ice Cream. All these products are now distributed throughout the country and some throughout the world.

The Tea department was our first expansion beyond catering. We developed a packet tea marketed nationally through grocers' shops and in the course of time other lines have been added. Our next major development was in the field of cake and flour confectionery. Here the products are more perishable and fluctuations in demand from day to day are added to the long term seasonal fluctuations. In consequence this section has its own system of selling and distribution quite apart and different from that best suited to sales of tea and coffee. The third main development was of ice cream, where again the nature of the product sets special problems in both production and distribution. Refrigeration is required at all stages and a maintenance service to ensure that the products are maintained at proper temperatures up to the time of retail sale. Weather probabilities have to be taken into account and, although there is a growing demand throughout the winter, the trade is obviously one which we must expect to be seasonal and particularly susceptible to the vagaries of the climate. Added to these are a number of other activities in the food trades, soft drinks, for example, and especially our "Sunfresh" orange drink.

It was natural that we should make retail sales over the counter in our Corner Houses and Teashops, which now offer a wide range of foodstuffs. The Corner Houses also sell over the counter wines and spirits and these are also sold, of course, by mail order from our well-known Hop Exchange Cellars.

Our service departments, as the name implies, were started to serve the needs of the Company —transport, laboratories, printing and carton making, building, as well as engineering workshops for we found it better to manufacture as well as to design some of our specialised food production machinery and catering equipment. The histories of these service departments show a recurrent urge to become revenue earning by undertaking work for others as well as for ourselves. Some services are provided by subsidiary companies. One was formed to do the repairs to our motor vehicles and this grew to include vehicle body building, first for ourselves and then for others. In addition it is now engaged in retail activities, including public garaging and the operation of petrol and service stations. Another subsidiary, James Hayes & Sons Ltd., commonly known as Hayes Laundry, also does considerable business for the general public as well as for the Company.

But catering and food are essentially our business and our principal aim is still to buy our basic materials in world markets and to sell to the public through our own catering establishments, through wholesalers and multiples and through the tens of thousands of retail shops and other outlets all over the country. In all these varied activities widely different types of manufacture, distribution and marketing are required.

DEVELOPMENT

Among the more interesting of our developments during the year I would mention Instant Coffee. For some years past we have felt that although we were retaining our hold on the market for ground coffee there was a growing demand for instant coffee, which we ought to meet. We have made a satisfactory start.

Our Frood department introduced a new range of frozen cooked products which we are marketing under the name "Flavour Seal." The food is packed in a plastic bag and it is only necessary for the consumer to heat it in boiling water before serving. This special process we have developed retains the flavour, which is unaffected by heating. Flavour Seal has been launched successfully in London and we propose to extend its distribution and development during the coming months.

Increased demand in the area led us to build a new and larger bread bakery at Bristol; it is one of the most fully automatic bread plants in the world. We have also opened a new bread bakery at Crawley, Sussex, one of a ring of smaller bakeries round London designed to relieve pressure at Cadby Hall.

In August last it was announced by the Hawker Siddeley Group and ourselves that a jointly owned company named Primapax Ltd. had been formed to operate, sell and hire vending machines. The new company in no way affects the position of either group in other fields where they will continue to function with complete independence, but it was felt that the long experience of the one in engineering and the other in food merchandising would make a sensible association in developing automatic vending in Britain.

At the end of the year we transferred our carton making operations from central London to Alperton, Middlesex, where we have modern premises which allow of more economic production and room for expansion.

Our Canadian Company has entered into an agreement with the Hudson's Bay Company whereby it has acquired their tea and coffee business, including their blending, roasting and packing facilities for those products in Vancouver. This should assist it in expanding its area of economic distribution into the prairie provinces and British Columbia; hitherto its distribution has been mainly confined to Ontario and Quebec.

LEO

Leo Computers Ltd. had the privilege of a visit in March last of HRH The Duke of Edinburgh. The honour was greatly appreciated and his interest in the problems and understanding of the processes was an inspiration and encouragement to all.

The W. D. & H. O. Wills Branch of The Imperial Tobacco Company, who were Leo's first customer, and the Ford Motor Company have each now ordered a second installation. Further computers are being made for other customers and Leo's advisory service and their computing service continue to be in great demand.

Work has meanwhile proceeded on the development of Leo III, an advanced computer embodying both the considerable experience of operating the existing models on commercial work and the new components, such as transistors, whose reliability has now been proved.

THE ANGEL, ISLINGTON

We continue our policy of modernising our premises. The Angel Café needed the expenditure of a considerable sum, but the County of London Development Plan provided for the compulsory acquisition of the premises in a few years' time. This ruled out the heavy expenditure necessary. We therefore approached the London County Council and reached agreement with them for its earlier acquisition.

Once more, I wish to express our thanks to all the Company's employees of all ages and in all sections of the business for their hard work and loyalty. Many of them have been with us for long periods and there are now over 600 still with us who have qualified for the presentation of a gold watch which we give on completion of 40 years' service.

THE FINANCIAL NEWS LIMITED

ALL PUBLICATIONS PROSPERING

LORD POOLE'S STATEMENT

The Sixty-second Annual General Meeting of The Financial News Limited was held on June 14th at Winchester House, Old Broad Street, London, E.C., The Lord Poole, CBE, TD, the chairman, presiding.

The following is his statement which had been circulated with the report and accounts for the year ended December 31, 1959:

The accounts before you reflect a satisfactory year for the Group's publications, notwithstanding the printing dispute which stopped publication of all except *The Financial Times*. *The Financial Times* itself was not affected by the dispute, but the periodical and general printing activities of its subsidiary St Clements Press were at a standstill for some seven weeks. This combined with the disturbance to production resulting from the move to the new building contributed to St Clements Press sustaining a loss during the year which is reflected in the accounts.

The accounting period which ended on December 31, 1958, was for 18 months and although it provides the only figures available for comparison with those under review no true comparison between the Profit and Loss Account for the two periods is possible. The profit of the group for the year ended December 31, 1959, before charging taxation, amounted to £772,142. This is rather less than two-thirds of the figure of £1,202,679 for the 18 months to December 31, 1958, but after account is taken of the tax charges and adjustments for the two periods and the interest of outside shareholders of The Financial Times Limited and its subsidiaries the profit remaining attributable to The Financial News Limited is £263,505 as against £418,524 for the preceding 18 months. This provides adequate cover for the final dividend we are recommending of 20 per cent which together with the interim dividend of 15 per cent makes 35 per cent for the year.

Turning to *The Financial News* Balance Sheet the only significant change is the elimination of the item freehold and leasehold premises. This is the result of the disposal of premises at Grocers' Hall Court, formerly occupied by the *Investors Chronicle* who now have accommodation in our new building. The consolidated balance sheet reflects the technical completion of the new building and the installation of new plant and machinery when St Clements Press entered into occupation of their new printing works in the middle of last year.

I will now briefly review the activities of the companies comprising the Financial News Group.

"THE FINANCIAL TIMES" AND ITS SUBSIDIARIES

A copy of my statement to the stockholders in Financial Times Limited, in which the affairs of the company are fully discussed, is being sent to all shareholders in Financial News Limited. It will be evident that *The Financial Times* has made still further progress and increased its circulation during the year.

"THE INVESTORS CHRONICLE"

The year was marred by the six weeks' printing strike last summer. Because of this, we had to be content with a very modest increase in profits. An emergency edition was published throughout the dispute, and the interruption to normal publication, fortunately, did no damage to the firmly established goodwill of the *Investors Chronicle*, from either the circulation or the advertising viewpoints. Current profits are very satisfactory. A year ago, I was able to report that in the second half of 1958 sales were a record at over 30,000 copies. That record was left well behind in the corresponding period of 1959, when the average net sale exceeded 40,000 copies. This achievement is the more remarkable in view of the fact that rising costs, following the settlement of the dispute in the printing industry, forced us to raise the price of the paper to 1s. 6d. last October. I am glad to report that in 1960 to date sales have been still higher. In considering these figures it has to be remembered that the *Investors Chronicle* is unique in its field, being the only investment weekly to publish an audited circulation figure.

One hundred years ago, on June 9, 1860, the first issue of the *Money Market Review*, which was later amalgamated with the *Investors Chronicle*, was published. We are planning to celebrate the centenary of the merged papers appropriately. As part of the celebrations, we shall be publishing a special survey of financial, economic and investment trends throughout the last century. Such special surveys apart, the *Investors Chronicle* continues to be indispensable reading for all those concerned with the management or investment of capital. It endeavours never to forget that an important part of its duties is the strengthening of the law's protection for small investors, and it was honoured to find that a member of its editorial staff was invited to sit on the Jenkins Committee which is to consider whether and how the Companies Act and the Prevention of Fraud (Investments) Act need amending.

"THE BANKER"

The Banker has had another eventful year and achieved a further increase in revenue in spite of the dislocation caused by the printing dispute. Editorially, one of the highlights was the opportunity afforded by the appearance of the Report of the Radcliffe Committee on the Working of the Monetary System. *The Banker* distinguished itself by quickly presenting a detailed summary and appraisal, which has been widely appreciated, and followed this up with a series of critical commentaries by eminent contributors from different schools of thought. The readership of *The Banker* continues to grow, especially overseas; it is read in no fewer than eighty countries. Leading world bankers see it each month, and, outside the banks, it is read by industrialists, senior administrators, investors and economists.

"THE PRACTITIONER"

This monthly journal continues to maintain its pre-eminent position among medical publications. During the year under review its circulation and advertisement revenues were at record levels.

"THE ECONOMIST"

The Economist Newspaper Limited, of which your company holds 50 per cent of the share capital, has continued to show growth in all departments. Its profits were affected by the printing dispute, but not as seriously as was at one time feared. The staff of *The Economist* is to be congratulated on its success in maintaining publication under most difficult conditions. The Economist Intelligence Unit has considerably expanded the scope and range of its work, and this trend will undoubtedly continue in the future.

PROSPECTS

The current year has started well. All the publications in which your Company is interested are soundly established and prospering. However, the difficulties of St Clements Press

are not yet resolved and it is too early to make predictions as to the final outcome. I would conclude by saying on behalf of the Directors and shareholders how grateful we are to all staffs in all departments for their efforts during the past year.

The report and accounts were unanimously adopted.

AUGUSTINE INVESTMENTS

(formerly The British Canadian and General Investment Company, Limited)

PROFITS FORECAST EXCEEDED

MR R. E. BROOK ON CURRENT TIDE OF PROSPERITY

The forty-ninth annual general meeting of Augustine Investments Limited was held on June 9th in London, Mr R. E. Brook, CMG (the Chairman), presiding.

The following is an extract from his circulated statement:

In February an Offer for Sale was made of a substantial proportion of the Company's Stock, and there is little that I can add to the picture then drawn except that a welcome increase in the final results, through all the marginal items accumulating in our favour led to our forecast of profit for the year proving conservative. The upshot was a net profit before tax of £280,000 as against the estimate of "not less than £260,000."

The trend of turnover in both the optical and printing fields continues favourable, so that although overheads have resumed their upward rise (with special reference to pension schemes which the Board have been considering as a matter of policy for some time and have now decided to inaugurate to fit in with the new National Insurance Act, and also to the unfortunate increase in taxation on Companies), the Board hope to maintain the new enhanced level of profits through the present year. They therefore feel that the stockholders (who now number nearly 1,000) should share in the current tide of prosperity and are proposing an increase in the final dividend to 25 per cent as against their previously expressed intention of recommending 22½ per cent.

To bring your information up to date I need only add, first that despite the effects of the printing strike the results on this side showed an improvement on the previous year, thanks to the strenuous efforts of the management at the time and of all the staff since it was over. Next, the optical business continues to expand, largely within its own establishment but also by the occasional purchase of the few good practices that are offered, for which purpose, as indeed for other promising investments, we continue to have ample funds available. Finally, our incursion into the broadcast relay field (through Viewline) is going through the inevitable teething troubles and our capital investment is likely to reach £125,000.

I should like to take this opportunity of publicly welcoming Mr H. M. Croome, who joined the Board as Managing Director last November. He is already fulfilling the purpose of his appointment, which was to give the Board more direct knowledge of operational developments and to enable us to investigate and undertake fresh activities as they might arise.

The report and accounts were adopted.

THE DRAYTON REGULATOR AND INSTRUMENT COMPANY

The eleventh annual general meeting of The Drayton Regulator and Instrument Company Limited was held on June 13th in London, Mr P. H. Lloyd, TD, DL (the Chairman), presiding.

The following is an extract from his circulated statement:

The Profit for 1959 after taxation amounted to £143,320 and the consolidated profit to £144,443. Your directors recommend a final dividend of 15 per cent, making a total for the year of 22½ per cent.

Wherever we look opportunities for expansion of our business appear and additional departments, subsidiary companies or associated companies are being arranged in order to take advantage of the more promising of these.

Shipping Industry.—Many large ships have been equipped with Drayton automatic controllers for refrigerated spaces. Additionally several large liners are being equipped with Drayton pneumatic controllers for space heating.

Medical Field.—The development of an automatic control system for autoclave-type sterilisers referred to in last year's review has been highly successful. Market interest is high and a gratifying number of orders is being received. Arrangements have been made for manufacture of this product in America under licence to the Wilmot Castle Company, of Rochester, New York.

Brewery Industry.—As a result of our activities a number of applications for Drayton controllers has appeared in this field. Exploration of these possibilities is continuing with promising results so far.

Drayton Controls (Heating) Ltd.—This subsidiary has now been formed and is developing satisfactorily. A number of new products have been put into production.

Drayton Johnson Ltd.—In my last report I mentioned that this Company had been formed jointly with The Johnson Corporation of Three Rivers, Michigan, USA. I am pleased to say that even in its first year of operation, it has made a profit.

Drayton-Southern Ltd.—With a view to expanding further into the industrial instrumentation field, a Joint Company has been formed with Southern Instruments Ltd., of Camberley, to trade under the name of Drayton-Southern Ltd. The share capital is to be held equally between the two Companies. I feel this Company has a promising outlook in a wide field of activity.

Finance.—To carry out all these projects your Company will, of necessity, eventually require additional finance. The time for such an operation is, however, not yet ripe. In the interim, suitable arrangements for the immediate requirements have been made with the Company's Bankers.

The Future.—I believe we will be fully capable of improving our relative place in the industries in which we are engaged and I look to the future with confidence.

The report was adopted.

ADAMS PEAK TEA ESTATES

The fortieth annual general meeting of Adams Peak Tea Estates Limited was held on June 13th in London, Sir Charles Miles, OBE (the chairman), presiding.

The following is an extract from his circulated review:

The profit for the year ended December 31, 1959, after charging Depreciation, is £20,739, against £27,302 for the previous year.

Upkeep expenditure was practically the same as in the previous year, but sales proceeds fell by some £7,700, mainly due to the smaller crop produced. The shortfall in crop occurred chiefly at Derryclare Estate and is partly attributable to the unfavourable weather experienced.

During the year the quota on the shipment of High Grown teas was re-imposed, with the result that shipments to the United Kingdom amounted to 352,866 lb., as compared with 617,526 lb. in 1958. The changes in the Export duty also became effective from June 1, 1959. Under the new arrangement the total duties paid averaged 88.37 cents or nearly 1s. 4d. per lb., so that this burden increased by approximately 2d. per lb.

With regard to the current year, our crop to the end of April is 353,910 lb., showing a satisfactory increase of 37,919 lb. when compared with the same period last year. However prices being received are at present below those ruling at this time last year.

The report and accounts were adopted, and a dividend of 10 per cent approved.

BENGUELA RAILWAY COMPANY

At the Annual General Meeting of the Company held in Lisbon on 30th May, 1960, the following distribution of profits for the year 1959 was approved:—

		1959 Escudos	Comparative Figures 1958 Escudos	1957 Escudos
Net Revenue		165,402,010	141,114,021	104,845,260
Deduct:—				
Percentage to Portuguese Government	15,150,965			
Deductions in accordance with the Articles of Association	11,176,519	26,327,484	24,150,541	26,180,487
Balance available for distribution		139,074,526	116,963,480	78,664,773
Add:—Transfer from General Reserve		46,496,191	—	60,000,000
		185,570,717	116,963,480	138,664,773
Distributed as to:—Debenture Service:				
Redemption of 4% Debentures		16,294,810	16,294,810	16,294,810
Interest on 4% Debentures for year 1959		8,779,630	9,911,091	9,695,417
Interest on 5% Debentures for year 1959		16,100,000	16,100,000	16,100,000
		40,974,440	41,411,901	42,088,227
Dividend of 12½% on Share Capital		82,500,000	75,000,000	99,000,000
Transferred to Dividend Equalisation Reserve		—	3,044,119	19,964,060
Advance Redemption of 4% Debentures		62,818,670	—	—
		185,570,715	116,963,480	138,664,773

Notes:—New 5% debentures to the nominal value of Escudos 69,240,000, repayable as from 1st July, 1971 and redeemable as to 10% and a reduction on the earnings of the railway whether or not so called before the end of the Concession in the year 2001, will be issued forthwith in exchange for 5% Debentures Limited for cash at a discount of 10%.
Companhia Caminhos de Ferro Limited owns all the Debentures and 50% of the Equity of the Benguela Railway. 80.5 Escudos = £1.

THE NATIONAL BANK OF NEW ZEALAND LIMITED

EXTRACTS FROM THE STATEMENT BY THE CHAIRMAN
MR. ARTHUR H. ENSOR

To be presented at the Eighty-Eighth Annual General Meeting on July 7th 1960

Balance Sheet and Profit and Loss Account

Current, Deposit and other accounts at £70,043,000 show an increase of £9,686,000 but, in view of the severe restrictions upon banking operations in New Zealand, which immobilise a considerable portion of our resources and restrict lending to our customers, the Bank's profitability is accordingly limited.

While the assets side of the Balance Sheet shows an increase in advances at £40,328,000, which is £3,101,000 higher, the average lending during the year was actually less than last year.

These factors, coupled with the ever increasing overhead costs, particularly salaries, and the effect of import controls on our exchange profits, have materially affected our earnings in New Zealand but, fortunately, to offset those adverse conditions, we have been able to improve our earnings in London.

The result is that our profit at £299,602 is only slightly less than last year.

From the net profit, £100,000 has been allocated to General Reserve. In January last an interim dividend of 4 per cent., less income tax at 7s. 9d. in the £, was paid and the Directors now recommend for your approval a final dividend of 5 per cent., less income tax at 7s. 9d. in the £, leaving a balance of £156,695 to be carried forward.

Business Development

Although business activity has continued to be rather restrained, the number of our accounts has again increased at a rate which must be considered satisfactory.

Whilst we have not opened any new Branches since my last Statement, the number of agencies has been increased by seven, bringing the total of branches and agencies to 165. The substantial programme of branch modernisation and rebuilding is being continued.

Overseas Trade

During the past year there has been a marked improvement in the balance of payments position. This has been achieved without further recourse to overseas borrowing and despite the repayment of £11.6m. borrowed in the previous year and a further £11.9m. invested overseas to provide for the repayment of loans due in 1961.

With one exception, the earnings of all the major export products increased. Meat receipts declined somewhat from the record level attained in 1958, owing to the more competitive conditions in the United States beef market and lower values for lamb in London.

The severe import restrictions, although somewhat relaxed during the year, resulted in import payments being less than the low figure of 1958.

Although the position is now more encouraging, there is not yet a sufficiently large cushion of reserves to justify the complete abolition of restrictions on overseas payments.

Credit and Monetary Policy

In accordance with official policy, the Trading Banks' loans and advances have continued to be curtailed, and the average monthly figures were lower than in the previous year. However, by the end of 1959, owing chiefly to the substantial increase in overseas earnings and Reserve Bank advances to the Government, the volume of money in the economy had increased sharply.

This increase in liquidity, coupled with the effects of the General Wage Award made in October, 1959, reduced rates of taxation and increased Government expenditure, presents a possible threat of renewed inflation.

Experience elsewhere tends to confirm that, where there is a large number of vigorously competing claims for a limited volume of resources of capital, labour and management skill, the position may soon be transformed into one where the economy moves ahead too rapidly regardless of the consequences. With the careful application of sound fiscal and financial policies, however, there is no reason why the balance of the country's economy should be upset.

Finance

Hire purchase finance has never, by overseas standards, been used extensively in New Zealand, but it is increasing and will no doubt be further encouraged as a result of the Government's decision to introduce a television service. Official policy has been to discourage this type of finance and the Capital Issues Committee has not approved new capital issues for companies engaged in hire purchase. The result has been the growth of a large number of small "£10,000" companies which are permissible without official consent. There are differing views in regard to the wisdom of the extensive use of hire purchase finance, but its development is proceeding rapidly in many parts of the world and it has become a part of the accepted economic life of a community. It is, therefore, very much in the national interest that some indication should be given of official policy on this subject.

It is reported that the Government intends to introduce a Bill to permit and regulate Unit Trusts. This would be a welcome move. At present there is a shortage of available investments on the New Zealand Stock Exchange but, with the industrial development which is taking place, this position may gradually be improved.

Industrial Development

The past year has witnessed a considerable upsurge in industrial development, much of which has been associated with overseas capital. Plants under consideration include a merchant bar steel mill, a wire drawing plant, plastics factories, an oil refinery and several textile factories including a cotton mill. In addition, the practicability of basing an iron and steel industry on the extensive iron sands deposits and the possibility of utilising the potential hydro-electric power resources of Lakes Te Anau and Manapouri in South Island for large scale aluminium smelting are also being investigated.

These are ambitious schemes but it may confidently be expected that the mobilisation of New Zealand's capital and resources, together with a significant contribution from overseas, will enable the proportion of the national income derived from the manufacturing industries, which for many years has shown only slow growth, to be substantially increased. Such development will, in the long run, not only provide employment for the rapidly growing labour force but will bring to the economy a welcome diversification which should help to relieve the balance of payments position.

The New Zealand Government has encouraged the establishment of new industries. An Industrial Development Fund has been set up to make additional allocations of overseas exchange to industries that are considered able to make a valuable contribution to the country's economy, but it is to be hoped that nothing will be done to encourage industries which must be regarded as uneconomic and requiring undue tariff protection. No discrimination is made against overseas organisations who wish to establish subsidiaries or enter into some arrangement with local companies, and overseas capital will be welcomed, particularly when associated with New Zealand capital and management in the development of economically viable undertakings.

Primary Industries

Whilst a great deal of attention has been focussed recently on the extension of manufacturing industry in New Zealand, it is salutary to remember that the greater part of New Zealand's economic strength is still, and in the foreseeable future will continue to be, derived from the country's highly efficient and productive grassland farming.

Whereas, in the case of the newer industries, the greater emphasis is necessarily placed on production, in the case of primary industries there are, in addition, the problems of marketing.

I have already remarked upon the rather changed situation in the United States beef trade which, although still offering reasonable returns to the New Zealand producer, is not now as favourable as hitherto. The recent substantial fall in butter and cheese prices from the admittedly high levels reached in the later months of 1959 has given rise to some concern in the New Zealand dairy industry over future marketing trends, but New Zealand producers have shown their determination to meet fair competition effectively and, in future, basic prices determined by actual market realisations over a period replace the system of guaranteed prices tied to estimated costs of production.

New Zealand wool prices this season have been generally firm at an average of some 25 per cent. above the preceding season and receipts are expected to show an increase of approximately £25m. However, the need to meet increasingly active competition from synthetic fibres has led wool growers' organisations in several of the chief producing countries to make a joint review of publicity and marketing policies.

That the New Zealand Government and the various producer and marketing organisations are well aware of the importance of solving these marketing problems has been shown by the increase in the number of trade missions to the Americas, Europe, Africa and Asia, and by the larger number of commercial representatives established in many important overseas trading centres. The changing patterns of trade in Europe have particularly occupied the attention of the New Zealand Government and producers' bodies, both as they affect the prosperity of the country's major market, the United Kingdom, and as they may affect New Zealand's trading relations with the various countries and groups concerned.

Future Prospects

The past year has produced considerable speculation about the direction of New Zealand's development and a great deal of encouraging news about present progress. New public works schemes are continuing to be undertaken and each year some are brought to completion.

Thus, whilst it is necessary to make reservations and cautionary comment in any survey of human affairs, we can be optimistic that, wisely led, the constant endeavour of the New Zealand people, who have already achieved so much, will transform the promise of the present into further solid achievement.

Copies of the Directors' Report and Accounts can be obtained from the Secretary, The National Bank of New Zealand Limited, 8 Moorgate, London, E.C.2.

THE ROCK INVESTMENT COMPANY

The Forty-first Annual General Meeting of The Rock Investment Company, Limited, was held on June 16th in London, Sir Cyril Black, JP, DL, MP, FRICS, FAI, chairman, presiding.

The following are the main features from his circulated statement for the year ended December 31, 1959:

Capital Position: A further £324,605 Ordinary stock was issued for cash at 25s. per £1 unit; the total capital reserves have now risen to £208,219 at the end of 1959. The book values of our properties rose to £812,909.

Property and General Revenue: This has risen from £24,975 to £41,716. This large increase must be regarded as very satisfactory.

Group's Earning Potentialities: The Consolidated Profit and Loss Account does not indicate the full earning potentialities of the Group. New developments either completed or nearing completion will contribute substantially to our revenue.

Dividends: An interim dividend of 6 per cent, less income tax, has been paid. The directors recommend a final dividend of 2 per cent, less income tax.

Capital Structure: It is proposed to reconvert stock into 3,415,260 shares of 5s. each. The balance of the authorised share capital consisting of 146,185 Ordinary shares of £1 each will be sub-divided into Ordinary shares of 5s. each.

The Future: We anticipate that the steady and continuous progress we have made will be maintained in the future.

The report and accounts were adopted and the changes in the Group's capital structure approved.

HIGHAMS LIMITED

EXPANSION AND RE-EQUIPMENT

The fifty-second ordinary general meeting of Highams Limited will be held on July 6th in London. The following is an extract from the circulated statement of the chairman, Mr Alec E. Higham, OBE, JP:

I am very gratified to be able to report another increased profit for the year just ended and also that your Board are recommending that the dividend for the year shall again be 20 per cent.

It is a matter for satisfaction that sales are appreciably higher than in the previous year. Stocks are large, but not unduly so when considering the character and the widening range of our trade. Full production has been maintained, and during the year new plant has been installed at a cost of approximately £90,000.

In order to strengthen our position by availing ourselves of the most modern production methods and also to expand our output, we have purchased a large modern mill which will become a very important weaving unit in the Group. It is hoped to start production there by the middle of 1961. The ultimate result of this will be the full automisation of the entire weaving capacity of the Group. The approximate cost of the full Scheme, which may take about 3-4 years to complete, will be in the neighbourhood of three-quarters of a million pounds, spread over this period.

The development to which I have just referred reflects the measure of your Board's confidence in the future and also in the ability and competence of Managers, Staff and Employees.

UNION INSURANCE SOCIETY OF CANTON

The Annual Meeting of the Union Insurance Society of Canton Ltd., was held on May 26th in Hong Kong, Mr J. F. Macgregor, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine. The net premiums for the year amounted to £2,938,547. After releasing £125,000 to Profit and Loss Account the Marine Fund stands at £4,146,674.

Fire. The net premiums for the year amounted to £3,902,261. £173,848 has been transferred to Profit and Loss Account. The Fire Fund stands at £2,199,934.

Accident and General. The net premiums for the year amounted to £5,490,520. After transferring £24,642 to Profit and Loss Account the Accident and General Fund stands at £2,449,907.

Profit and Loss Account. Interest, dividends and rents amounted to £611,594 and transfers from Underwriting Accounts to £323,490. The profit for the year appertaining to the Society is £513,171.

The total premium income in the three Underwriting Departments of the Union Group of Companies amounted to £12,331,328 in 1959 in comparison with a figure of £12,189,480 in the previous year.

It was in 1835 that the foundations of the Society were first laid in Canton, China.

Your Directors are pleased to mark this 125th anniversary of the Society's founding by increasing the final dividend to two shillings and six pence per share.

F. FRANCIS & SONS (HOLDINGS)

ENCOURAGING RESULTS

The fifty-ninth annual general meeting of F. Francis & Sons (Holdings) Limited was held on June 14th in London, Mr Frank Fox (Chairman and Joint Managing Director) presiding.

In the course of his circulated review, the Chairman, commenting on the encouraging increase shown by the Accounts, said that the Group profits before taxation had risen to £443,146 as against £292,796.

He continued: Whilst there has been no extension of the packaging interests during the present year, apart from increasing turnover of the packaging companies, there has been an extension of the engineering interests.

I have said from time to time in my reports that we were expansionist minded, and this is still in the forefront of our thoughts and deliberations.

For the first quarter of this year the sales of the Group show an increase over last year of 31 per cent. This is accounted for by increased sales in every section of the Group. We hope to keep this increase going and improve upon it if at all possible.

The Chairman concluded by paying tribute to the efforts of all their workpeople, staff and to his colleagues on the various subsidiary Boards for their efforts during the period under review.

The report was adopted and the total distribution of 23 per cent for the year approved.

SUBSCRIPTIONS TO THE ECONOMIST

Annual Postal Subscription by ordinary mail £4 . 10 ; overseas £5

By air see below

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

COMPANY AFFAIRS

Interim Steel Dividends

THE interim reports recently published by the steel companies have in some cases been accompanied by higher dividends, but they have given only a slight boost to steel shares. For the first time the **Steel Company of Wales** has published half yearly figures and these amply justify the directors' decision to raise the interim dividend from 3¾ to 5 per cent. Sales for the six months to April 1st amounted to £70.9 million, compared with £125½ million for the year to October 3rd last, and they are thus running about 15 per cent above the rate for 1958-59. Trading profits at £14.6 million are up by about 28 per cent. On this basis a total dividend of 12½ per cent would be covered nearly three times and the shares on this conservatively estimated dividend would yield just under 5½ per cent.

The directors of **Colvilles** are likely to adopt a conservative dividend policy for some time to come in view of the heavy capital commitment in Ravenscraig. Although the interim dividend has been maintained at 6 per cent it is being paid on the capital as increased by the conversion of a large part of the convertible debenture stock. Trading profits for the six months to March 31st rose from £5.1 million to £7.9 million and net profits virtually doubled, from £2.1 million to £4.1 million. On this basis equity earnings are now equivalent to 94¼ per cent for the year which provides an extraordinarily big cover on a 14 per cent dividend. Production of steel ingots and castings amounted to 1,036,374 tons for the first half of 1959-60, against 1,442,000 tons for the whole of the previous year and the directors say that capacity is fully employed in most sections. The dividend yield is 3.6 per cent but the indicated earnings yield is 24.2 per cent.

The interim dividend of **United Steel** has been raised from 4 to 6 per cent and in the 24 weeks to March 12th trading profits amounted to £10.5 million, against £17.6 million for the full year to end-September, 1959. They are thus running about 30 per cent above the rate for 1958-59. Sales at £63.2 million are up by about 25 per cent. United Steel has recently announced a £32½ million expansion programme. This will be financed largely through retained profits but some additional capital is to be raised later. As last year's dividend of 15 per cent is covered over three times by earnings some increase in the final payment seems likely. A 20 per cent dividend would put the shares on a yield basis of just under 5 per cent.

Brewing Shares

JUST as the industry has become more lively so has the market in brewing shares. Mergers and take-overs have become almost commonplace. The latest is the bid by **Scottish Brewers,** which has been expanding in recent years, for all the preference and privately owned ordinary shares of Robert Younger of Edinburgh. One 5½ per cent preference share in Scottish Brewers plus 2s. 6d. in cash is offered for each of the 100,000 5 per cent preference shares in Younger and a cash payment equivalent to £6 10s. for each of the 120,000 ordinary shares in Younger. The terms, like those in other recent brewery take-overs in the North of England and Scotland, are not ungenerous.

Further south, **Watney Mann** has been an active bidder and, having sold the Stag Brewery site, it is one of the brewers seeking further productive capacity. Only recently it acquired Phipps Northampton and Ushers Wiltshire and it is negotiating for the purchase of Wilson and Walker. Earnings from its new subsidiaries are not consolidated in its half-yearly report. Even so, Watney Mann's gross profits rose from £1,230,435 to £1,893,071 and its net profits from £618,910 to £987,129 in the six months to March 31st. In the same period Phipps earned a gross profit of £500,894 and a net profit of £253,794. Watney Mann's interim has been duly set at 6 per cent, as the directors indicated that it would be, and these results and the directors' statement that trade has continued to be good and that the full year's results should show a considerable improvement suggest that the directors may be able to do better than their earlier promise to pay a dividend of not less than 17 per cent on the increased capital.

Unlike Watney Mann and the other brewers, **Whitbread** has not gone in for the full scale merger. The controlling family has been anxious to preserve its interest and Whitbread has acquired minority holdings in other breweries and has extended its trade agreements. The desire has been to preserve the local connection, but one of the effects for companies that have come voluntarily under the protection of the Whitbread umbrella has been to take them out of the reach of bidders. The interests that Whitbread has thus acquired have been hived off in the Whitbread Investment Company. Holders of the "A" and "B" shares in Whitbread are now to be offered shares in the investment company in the ratio of one WIC share for every £2 nominal held. The shares are offered at 22s. 6d. each on a prospective dividend of 5¼ per cent, covered nearly 1.2 times by earnings. The dividend yield is thus 4.9 per cent on the equity of a comparatively low-geared investment trust whose portfolio is made up solely of brewery shares. The sale of just over 2,300,000 shares in the investment company means that technically it is no longer a subsidiary company of Whitbread. In theory WIC could buy shares in Whitbread but that is not the directors' intention. But clearly this latest move makes doubly sure that the loosely knit grouping led by Whitbread is kept intact and it brings in £2,600,000 in new money to the group. What they intend to do with that money the Whitbread directors have not yet said.

Marks and Spencer

IN the last ten years the profits ploughed back by Marks and Spencer have amounted to over £37 million. Over the same period sales have risen from £65.8 million to £148 million; net profits, rising from £2½ million to over £9 million, have more than kept pace with that advance; and dividend payments have risen more than fivefold, from under £1 million to nearly £5½ million.

The rapid increase in sales has been based in part on additions to selling space through the building of new stores and the expansion and modernisation of existing ones. Twenty-two major projects were completed last year, when total capital expenditure amounted to nearly £4 million. Twenty-four further schemes are now in hand and the expansion programme over the next three years is likely to involve the spending of about £15 million. With last year's cash flow amounting to £4½ million and liquid assets of £11 million this would seem to present little difficulty to Marks and Spencer. But in order to speed up the building plans the company is to borrow £5 million on a thirty-year 5½ per cent debenture. This is to be issued to the Prudential Assurance Company, which has a large equity shareholding in the company, in two portions, half this month and the remainder in a year's time.

Additional selling space would not on its own have produced such a record in growth as Marks and Spencer can claim. The directors have placed great emphasis in making their stores and the products they sell attractive to the public. This applies particularly to the food section, which now contributes about one-sixth of total sales. The projected programme of store development, bigger than any ever carried out by the company before in such a short period of time, indicates that Sir Simon Marks and his fellow directors are confident that Marks and Spencer will at the very least hold on to its share of the retail trade.

House of Fraser

MOST shareholders in House of Fraser will believe that the dividend for the year to January 31st last has been maintained at 40 per cent. But the directors in their preliminary profits statement have incorporated a profits tax interim of 5 per cent into the total payment for 1959-60. In that

sense, and that sense only, the dividend can be said to be 45 per cent, against 35 per cent for 1958-59. Does this mean therefore that in looking ahead shareholders should expect a dividend of 40 or 45 per cent in 1960-61 on the capital as increased by the proposed five per cent scrip issue? They will hope that Mr Hugh Fraser will make this clear.

Including a full year's figures from Harrods, although that group was not acquired until over half way through the financial year, gross profits rose from £4,874,000, on the basis of the combined totals of Harrods and the House of Fraser in 1958-59, to £5,539,000. The gross profits of Harrods rose from £2,245,000 to £2,784,000 and thus it contributed about two thirds of the total increase in profits. Including pre-acquisition profits, the combined net profit works out at £2,704,000 and this raises the cover on a 40 per cent dividend to 1¼ times. But this may effectively overstate true earnings, for there is no indication so far of the amount the company is now having to pay in interest for the £15 million in cash that it had to find to pay Harrods shareholders. No indication has been given as yet whether a capital issue will be made to fund part of this sum. Nor has there been any mention of property sales—one way which Mr Fraser has used in the past to raise new funds. It is perhaps significant that a surplus of £9 million arising from a revaluation of the Harrods properties in 1957 has now been written into the balance sheet so that they stood at £21½ million at the end of last January, against £10½ million. The House of Fraser shares now stand at 48s. 7½d. and allowing for the scrip issue they would yield 4¼ per cent on a 40 per cent dividend or just under 5 per cent on a 45 per cent dividend.

Booker Brothers McConnell

DESPITE the poor price for sugar last year and the continued slump in shipping freights the net profits of Booker Brothers McConnell rose in the year to December 31st from £972,683 to £1,248,751. This shows how successful the policy of diversification has been. Last year the engineering section contributed 18 per cent of net income, only 2 per cent less than sugar manufacturing, and for the first time ever less than half Booker's net profits came from British Guiana and the West Indies. The group's interests in Canada are growing rapidly and last year its subsidiaries there earned 18 per cent of total net profits, reflecting largely the recent acquisition of Taylor, Pearson and Carson, the car dealers.

The balance sheet reveals another sharp increase in net fixed assets. The rise from £10,306,388 to £12,192,698 reflects not only the latest Canadian acquisition but further work on the construction of the bulk sugar store and wharf. This project accounts for just over half of the outstanding capital commitments of £1,121,113; but £260,417 of a loan arranged to finance this new plant still remains undrawn. Bank overdrafts amount to £3,873,431 but nearly all of this is on the account of the subsidiary companies. Some of the parent's funds previously used to finance subsidiary companies' current assets have thus been released. At times this year the group will have no need to borrow at all from banks in the sterling area; but, there is little likelihood of much change in the group's Canadian overdraft of £2,291,592 for besides exchange control difficulties the directors are unwilling to remit sterling to Canada when in their opinion the Canadian dollar may be overvalued. Sir Jock Campbell, the chairman, says that the time for a new capital issue may come "sooner than we expect." Meanwhile medium or long term financial arrangements, as are being used to provide funds for the bulk sugar plant, may be made for similar big projects in the future.

On the capital as increased by a 25 per cent scrip issue the tax free dividend has been maintained at 10 per cent. This represents, however, a bigger effective increase than two per cent in the dividend from trading, for in 1958 the equivalent of two per cent of the payment came from a capital profits reserve which has now been exhausted. A further 10 per cent scrip issue is now proposed and the directors hope to maintain the 10 per cent dividend on the enlarged capital. Sir Jock Campbell is understandably cautious about the results for the current year: he says that the engineering, retailing and rum interests should do well but that shipping remains "becalmed" and sugar as always is "an unknown quantity" although a better crop is expected. The 10s. shares at 35s. 6d. yield 5 per cent on the forecast dividend.

Commercial Union Assurance

THE rights issue from Commercial Union, which was foreshadowed by the chairman last month, will raise just over £11 million. Shareholders are offered 11,225,500 5s. shares on a one-for-four basis at 20s. each. Despite the size of the issue it is not being underwritten. Before the terms were announced the shares stood at 62s. 7½d. and gave a bonus element in the price of the rights. A dividend of 40 per cent (against 45 per cent) has been forecast on the increased capital but the shares fell to 60s. on news of the terms. At this level the rights are worth 8s. a share and on an assumed ex rights price of 52s. the 5s. shares yield 3.85 per cent, compared with a yield of 3.75 per cent on the current price and dividend.

The new money will replace the cash used in acquiring North British and Mercantile, which itself was planning to raise new capital to increase its free reserves in London at the time of the merger. It will also provide for the additional capital commitments which stem from the continued expansion of business both at home and overseas.

London Stock Exchange

FIRST DEALINGS:	May 23	June 13	June 27
LAST DEALINGS:	June 10	June 24	July 15
ACCOUNT DAY:	June 21	July 5	July 26

THE Whitsun account ended on a bright note with the *Financial Times* index gaining 6.3 points on the last two days of the account. This advance reflected not only the continued revival in Wall Street but also a further stream of good company results. After a steady opening to the new account, markets have slumped, first on fears of further credit restriction and a rise in Bank rate and then on the news that Hoover is to dismiss 800 men. On Tuesday and Wednesday the *Financial Times* index lost all its previous gains and more with a fall of 7.7 points. Fears that the clearing banks would have to make further sales to meet the call for special deposits receded at the weekend and led to a steadier tendency in British funds, but this was short lived for the possibility of an early increase in Bank rate brought further falls. Over the week 3½ per cent War Loan lost ⅜ to 60⅜ after touching a new low for 1960 of 60¼; old Consols also lost that amount to 45⅛ xd. Among short dated stocks 4½ per cent Conversion 1965 lost $\frac{7}{32}$ to 96¼ and 2½ per cent Exchequer 1963-64 ¼ to 91$\frac{9}{16}$. Falls in medium and long dated stocks generally ranged up to ¼ and 3 per cent Savings Bonds 1965-75 were that much lower at 73$\frac{3}{16}$, but 3½ per cent Funding 1999-2004 lost $\frac{1}{16}$ to 65$\frac{1}{16}$.

Over the week *The Economist* indicator fell 2½ points to 359.3. Selling however has not been widespread but there have been very few buyers in the market this week. Shares of companies making consumer durable goods suffered sharp falls; over the week Hoover "A" fell 6s. to 42s. 6d. and Vactric 4s. to 26s. 9d. Among the giants of the electrical industry falls were not so large, General Electric lost 1s. 3d. to 38s. 6d., English Electric 1s. 6d. to 39s. 6d., and EMI 9d. to 48s. 9d. The Hoover statement caused a decline in hire purchase shares and United Dominions Trust lost 4s. 4½d. to 147s. 6d.

Despite further encouraging statements and higher interim dividends from more steel companies only the shares of those companies which have actually reported this week recorded gains. United Steel were 1s. 6d. better at 80s. 6d., and Colvilles 1s. 3d. at 77s 3d. These both closed below their best as did Steel Company of Wales which showed a net gain of only 1½d. at 45s. 7½d. after touching 49s. Both John Summers and Stewarts and Lloyds lost 3s. 6d. to 72s. xd and 46s. 9d. xd. Among motors Ford Motors after reaching a new high of 120s. 3d. lost 4s. 6d. to 111s. 9d., and British Motors lost 1s. to 17s. 10½d. but Jaguar "A" showed a net gain of 1s. 7½d. at 71s. 10½d. and BSA rose 2s. to 78s. 6d. xd.

Among the Continental favourites Unilever Limited lost 6s. 9d. to 168s. 3d. but Unilever NV were unchanged at 225s. while Philips Lamps showed a net rise of 1s. 3d. to 218s. 9d., after touching 225s.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended June 11, 1960, there was an "above-line" deficit (after allowing for sinking funds) of £17,324,000 compared with a deficit of £31,234,000 in the previous week and a deficit of £23,408,000 in the corresponding period of last year. There was a net expenditure "below-line" of £9,534,000 leaving a total cumulative deficit to date of £162,384,000 compared with £111,332,000 in 1959-60.

THE MONEY MARKET

THE discount market syndicate at last responded to the Bank of England's pressure at last week's Treasury bill tender and lowered its bid by 4d. to £98 11s. 6d., marking a rise of 1s. 4d. in its discount rate. Its allotment of bills, which had been above 55 per cent at the previous four tenders fell sharply to 29 per cent. Total applications for the £280 million bills offered rose by £77 million to £500 million, near the all time peak of £516 million. The average rate of discount rose by just over 1s. to £4 12s. 1.79d.—and interest allowed on special deposits has thus been increased to 4⅝ per cent. Wednesday's Bank return shows that these had risen a further £18.8 million in the week to the required amount of £73.7 million.

Money has continued in short supply in Lombard Street but the authorities have given a small amount of special help on most days. This was sufficient to keep the discount houses from borrowing at Bank rate except on Tuesday, when two or three houses had to take a small amount. The ruling rate for loans has again rarely fallen below 4½ per cent and 4⅝ per cent has been conceded for larger sums.

APPOINTMENTS

UNILEVER MANAGEMENT SERVICES

Applications are invited from men who can justifiably claim a wide range and high standard of management competence, coupled with successful innovation of modern management practices in industrial or commercial concerns.

Openings occur in the ORGANISATION DIVISION, which provides for Unilever Companies and Departments advisory services akin to those of the professional Management Consultant firms. These are permanent staff appointments supplementing personnel promoted from within. They are based in London, but involve a little mobility in the U.K. Opportunities for service overseas could arise later if desired.

Essential requirements:

Age—in the range 36-50.

Several years' experience at good levels of management responsibility in manufacturing, marketing, or financial control.

Some experience of participation in "general management" or professional consultant service at senior levels.

Comprehensive knowledge and experience of contemporary practices in the management field, including organisation problems and policy development.

Some years of remuneration above £3,500 per annum.

Applications should give in summary form as much information as possible about qualifications, positions held, nature of responsibilities, scope of experience and salary growth.

All applications and information submitted will be treated in strict confidence if marked "Confidential (Ref. C/310)," and addressed to—

THE HEAD OF PERSONNEL DIVISION:
UNILEVER HOUSE, LONDON, E.C.4.

Unilever

MASIUS & FERGUSSON LIMITED

RESEARCH ASSISTANT

A vacancy occurs for a young female graduate in the Research Department to assist in the planning and interpretation of market surveys and analysis of sales statistics.

An attractive salary will be paid to the successful applicant who should have had at least 12 months' experience in Research, and be capable of working with a minimum of supervision. Aptitude for figure work is essential.

Applications, which should be in writing and will be treated in confidence, should be addressed to A. H. Munroe, 2 St. James's Square, London, S.W.1.

A Hire Purchase Company in the North of England
require a

GENERAL MANAGER

with experience in Hire Purchase or Industrial Banking. The Company is expanding rapidly, and has excellent growth prospects. It is expected that in due course the General Manager will be appointed to the Board, and salary, etc., will be in keeping with this.—Box 1338.

MARKET RESEARCH ASSISTANT (lady) required by London Head Office of industrial group to assist in producing reports, extracting information and some survey work. Progressive salary, commencing from £600 p.a., lunch vouchers, pension scheme, no Saturday work.—Applicants, either graduates or with experience, should write to Box 1342.

THE DURHAM COLLEGES

IN THE UNIVERSITY OF DURHAM

Applicants are invited for the post of **RESEARCH ASSISTANT** in the Department of Social Studies for one year in the first instance from September 1, 1960, to work on a survey (supported by the Joseph Rowntree Memorial Trust) of social services for old people in the area of Tyneside and selected parts of County Durham. Salary range £700-£900. Applications (three copies) to Professor Morris-Jones, Department of Social Studies, 29 Old Elvet, Durham, not later than July 1, 1960.

EXECUTIVE ASSISTANT required for national committee concerned with educational aspects of T.V. Salary in range of £650 — £750. Brief particulars of age, education and experience required. Fuller particulars to applicants invited for interview.—Box 1340.

MINISTRY OF LABOUR. Psychologists (Vocational Officers) required for three unestablished posts at Industrial Rehabilitation Units, one in Cardiff and two in the provinces. Possibility of establishment by open competition later. Age at least 21 years. Qualifications: Good honours degree in psychology or equivalent and preferably with post-graduate training or experience in occupational psychology. Work involves aptitude testing and vocational guidance. National salary scales: Men £595 (at 21) — £950 (at age 30 or on entry if over 30)—£1,260. Women £595 (at 21)—£945 (at 30 or on entry if over 30) — £1,242.—Particulars and application forms from Ministry of Labour, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting G80/OA.

MIDDLE EAST TECHNICAL UNIVERSITY

The Foreign Office invite applications for an

ASSISTANT REGISTRAR

at the

MIDDLE EAST TECHNICAL UNIVERSITY, ANKARA

Candidates should be graduates, minimum age 25, and preferably with some experience of college or university administration. A British Registrar, to whom the Assistant Registrar will work, is already in post.

Salary within the range £810-£1,000 p.a. (subject to United Kingdom tax) according to age, qualifications and experience. Also *non-taxable* foreign allowance of approximately £710 p.a. (married) or £370 p.a. (single) to cover increased cost of living. Children's allowances. Rent allowance. Contract with Foreign Office for initial period two years. Return passages paid. Application forms and/or further information from Room 139, Foreign Office, London, S.W.1.

ONE ARTS GRADUATE

required in

PUBLICITY DEPARTMENT

This is a new appointment for a recent graduate, male or female, in an old-established engineering concern. The work is exciting and exacting in all publicity fields. The candidate selected must have an immense capacity for hard work, the ability to work under pressure and show evidence of mechanical aptitude.

WRITE BOX TE.345,
C/O 191 GRESHAM HOUSE, E.C.2.

ASSOCIATED TELEVISION LTD. require Statistical Clerk for Research Department. Successful applicant should be about 25 with degree in Economics or Social Sciences with at least two years' business experience. Good salary, excellent prospects in expanding Company.—Write full personal details to Personnel Manager, ATV House, 17 Great Cumberland Place, London, W.1.

WORKERS' EDUCATIONAL ASSOCIATION

DEPUTY GENERAL SECRETARY

Applications are invited for this post. Salary according to qualifications and experience on scale £1,300 x £75 — £1,700 a year. For application form and further particulars send stamped addressed foolscap envelope to the General Secretary, Workers' Educational Association, 27 Portman Square, London, W.1. Closing date for receipt of applications, July 9th.

THE MANCHESTER COLLEGE OF SCIENCE AND TECHNOLOGY

(Faculty of Technology in the University of Manchester)

APPOINTMENT OF

LECTURER IN INDUSTRIAL ADMINISTRATION

The Governing Body invites applications for a Lectureship in Industrial Administration in the College of Science and Technology, with the title and status of Lecturer in the University of Manchester.

Candidates should possess a good degree in economics, commerce, administration or some branch of Technology, with experience in industry in a managerial capacity. Experience of research in any of the above fields would be an advantage. The lecturer will be expected to deal with management subjects from a general management viewpoint, and to undertake research.

Salary according to qualifications, in the scale £1,050-£1,850 per annum. Superannuation under the F.S.S.U. Family allowances.

Conditions of appointment and form of application may be obtained from The Registrar, The Manchester College of Science and Technology, Manchester 1. The last day for the receipt of applications is July 2, 1960.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of SENIOR LECTURER or LECTURER IN ECONOMIC HISTORY (with special reference to the period between 1500 and 1800). Preference will be given to candidates who have a special interest in European Economic History. Salary scales per annum: Senior Lecturer, £1,925 to £2,325; Lecturer, £1,050 to £1,850. Initial salary and status according to qualifications and experience. Membership of the F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than June 25, 1960, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF DUBLIN

TRINITY COLLEGE

JUNIOR LECTURER IN SOCIAL ADMINISTRATION

REVISED ADVERTISEMENT

Applications are invited for the post of Junior Lecturer in Social Administration; duties to be taken up on September 21, 1960, or as soon as possible thereafter. The person appointed will be expected to lecture and carry out research in the history, development and organisation of social services. Salary in the range £712 10s. x £47 10s. — £902 10s., with marriage and children's allowances, and with membership of a non-contributory superannuation and life assurance scheme. Initial placing will depend on qualifications and experience. £75 of the salary will be regarded as expenses allowance.

Applications (four copies), giving full particulars and the names and addresses of three referees, should reach the Registrar, Trinity College, Dublin, from whom further particulars may be obtained, not later than June 27, 1960.

MSL *have been retained to advise on the appointment of an*

ECONOMIC INTELLIGENCE OFFICER

A bank proposes to appoint an Economic Intelligence Officer to build up from a base in London an Economic Intelligence Department to serve its needs for systematised access to up-to-date information on current commercial, industrial and financial situations and trends.

The Economic Intelligence Officer will be responsible to a director in London and will initially be required to establish personal contact with the bank's senior managers in order to assess their needs and formulate effective methods of meeting them.

Candidates should be aged 35-40 and should have had experience of analysis or research in a relevant field: which will not normally have been gained by men already in commercial banking. A degree is not essential. Starting salary: £2,000-£2,500 according to age, qualifications and experience. Other benefits include non-contributory pension scheme. Prospects of advancement exist.

Please send brief details in confidence, quoting reference S.2437, to D. M. H. Evans. In no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED, 17, Stratton Street, London, W.1.

DEVELOPMENT ENGINEER

Applications for the post of Senior Development Engineer are invited from chartered Mechanical or Civil Engineers, preferably experienced in High Vacuum metallurgy and design work. The advertising Company is engaged in developing vacuum furnace and high vacuum equipment activities and the post will involve both the approval of specifications and estimates for equipment and the control of production for subsequent contracts. An ability to apply modern production techniques is therefore necessary. This new appointment by an expanding and progressive engineering concern will be located in Lancashire; it will command a good salary.

Applications must detail age, education, academic qualifications, experience, and should be addressed to:

REF. 455,
THE WALLACE ATTWOOD COMPANY,
CHANTREY HOUSE,
ECCLESTON STREET,
LONDON, S.W.1,

who are acting on behalf of the Company in the first instance.

WIMPEY

Applications are invited for the appointment

of an ASSISTANT in the ORGANISATION and METHODS Department

The work involves the design and introduction of Administrative procedures, form control and office mechanisation.

Previous experience in O. and M. work is essential.

Write, giving details of education, qualifications, experience, and salary required, to:—

GEORGE WIMPEY & CO., LIMITED,
27, Hammersmith Grove, London, W.6.
Ref. 978 E

COMPUTER PROGRAMMERS

Applications are invited from PROGRAMMERS, preferably experienced in LEO COMPUTERS, for full scale Data Processing Project.

These vacancies exist in the North London area with a Company offering substantial commencing salaries and attractive conditions of service.

Apply in confidence to Box 1337.

CYANAMID

CYANAMID OF GREAT BRITAIN LIMITED

require a

MARKET RESEARCH OFFICER

who will be responsible directly to the Manager, Market Research and Statistics.

Applicants, in their late twenties, should have a good honours degree in Economics or Chemistry; special knowledge of the paint and/or plastics industries would be advantageous.

Important requirements are imagination and drive, with the ability to think logically and write well.

Suitably-detailed applications should be addressed, in complete confidence, to:

Personnel Manager,
CYANAMID OF GREAT BRITAIN LIMITED,
Bush House, Aldwych, W.C.2

COLLEGE OF ESTATE MANAGEMENT (Incorporated by Royal Charter). Applications are invited from Economics Graduates for a newly created post of Assistant Lecturer in Economics *within the scale £900 x £35 x £40 — £1,150* with contributory superannuation benefits under the Federated Superannuation System for Universities. Preference will be given to applicants with an interest in Land Economics. Commencing date September 1, 1960.—Forms of application and further details from the Secretary, College of Estate Management, St. Alban's Grove, London, W.8. Closing date for applications, July 1, 1960.

ACTUARIAL STUDENTS

The Guardian Assurance Company Limited has vacancies for several actuarial students who have passed one or two parts of the examinations of the Institute or Faculty. As a result of rapid expansion in recent years, there are good opportunities for advancement. Facilities are given for daytime study and there are substantial salary increases for success in the examinations.

Write, stating age and salary required and giving brief outline of experience, to the General Manager, 68 King William Street, London, E.C.4.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER in SOCIAL ADMINISTRATION. The person appointed will be required to undertake research and to assist in the teaching of *social administration with special reference to the problems* and organisation of the Hospital Service. Duties to commence on October 1, 1960. Salary on a scale £1,050 to £1,850 per annum with membership of the F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than July 4, 1960, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

MONASH UNIVERSITY

CLAYTON, VICTORIA, AUSTRALIA

Applications are invited for appointment to *SENIOR LECTURESHIPS* and *LECTURESHIPS* in: ENGLISH, HISTORY, ECONOMICS (Lectureships only), PHILOSOPHY (Lectureships only), MODERN LANGUAGES (French or German).

Monash is a new University, founded near Melbourne in 1958 to relieve the pressure on the University of Melbourne. While it will provide the traditional range of disciplines it aims to integrate them more closely than usual. For those with new ideas, initiative and energy it offers rare and challenging opportunities for development. It is expected that about 450 students will be enrolled in 1961 and that the number will rise to approximately 8,000 in 1968.

Salary scales (subject at present to upward revision which, it is confidently expected, will be of the order of 12½ per cent.): Senior Lecturer £A2,200-£A2,600. Lecturer £A1,500/£A2,100. Superannuation similar to F.S.S.U.

An allowance for travel and removal expenses will be made to an appointee coming from outside Victoria. The University will arrange temporary accommodation for the appointee on arrival, and will assist him to obtain suitable housing in Melbourne.

Study leave will be available.

The newly appointed Professors of Physics (Dr. R. Street, Senior Lecturer, University of Sheffield) and of Biology (Dr. A. J. Marshall, St. Bartholomew's Medical College, London) have recently visited the site and are at present available for personal inquiries in this country.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close on *July 18, 1960*.

BTR

in their expanding

ORGANISATION AND METHODS DEPARTMENT

require

A PROCEDURES AND METHODS INVESTIGATOR

also

Partly furnished quarters at one-twelfth basic salary rental. Tours 10-18 months, but leave normally taken in long vacation. Free first-class passages. Children's U.K. maintenance grant up to £150 p.a. and passages assistance.

Applications (eight copies), giving age, qualifications, experience and names of three referees, should be sent to Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W.C.2, by July 7, 1960.

BBC requires PROGRAMME ASSISTANT (British subject) for the EAST AFRICAN SECTION of its AFRICAN SERVICE in London.

Duties include writing, adaptation and production of talks and feature programmes for transmission in English and Swahili in the BBC's African Service.

Qualifications: Journalistic and broadcasting experience an advantage. Keen interest in and knowledge of African and international affairs. Recent experience in at least one of the East African territories and good knowledge of Swahili essential. Salary £1,230 p.a. (possibly higher if qualifications exceptional) rising by five annual increments to £1,580 maximum p.a.

Detailed applications giving full particulars of education, qualifications and experience to Appointments Officer, BBC, Broadcasting House, London, W.1, England, marked (reference 900/1/290 E.C.) within fourteen days.

RHODES UNIVERSITY

GRAHAMSTOWN, SOUTH AFRICA

Applications are invited for the following posts, from January 1961:

PROFESSOR OF COMMERCE
SENIOR LECTURER IN STATISTICS

The salary scales are:
Professor £2,200 x £100 — £2,700 p.a.
Senior Lecturer £1,500 x £60 — £2,040 p.a.

A vacation subsidy bonus, as in the Public Service, is also payable. Previous experience and academic qualifications may be taken into account in fixing the commencing salary.

Full particulars and application forms may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in South Africa and London, on *July 31, 1960*.

UNIVERSITY OF CAPE TOWN

SENIOR LECTURER IN COMMERCE

Applications are invited for the above-mentioned post. Candidates should have had a thorough training in Economics and competence in statistics is desirable. They should specify any special qualification they may possess in one or more of the following subjects: Business Administration and Finance; Industrial Administration; Marketing and Statistics. Preference will be given to candidates with special qualifications as a business executive will be an advantage.

The salary scale is £1,200 x £60 — £2,000 per annum. The successful applicant will be expected to assume duty on February 1, 1961, or as soon as possible thereafter.

Applications (in copies of testimonials should state age, qualifications, experience and research work completed or in progress, and give the names of two referees whom the University may consult.

Two copies of the application should be sent to the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, from whom further particulars should be obtained by July 22, 1960. A third copy should be sent direct by airmail to the Registrar, University of Cape Town, Private Bag, Rondebosch, Cape Town, South Africa, to reach him by the same date.

The Council reserves the right to appoint a candidate other than one of the applicants or to make no appointment.

STAFFORDSHIRE COUNTY COUNCIL

COUNTY PLANNING AND DEVELOPMENT DEPARTMENT

Applications are invited for the appointment in the County Planning and Development Department of a Planning Assistant (Research) on A.P.T. Grade IV (£1,065 — £1,220 per annum).

An Honours Degree is required in geography, economics or public administration, together with experience in research with any Institution, a University or in local or central government.

The person appointed will be mainly engaged on survey and research work for the Development Plan and its implementation.

The Council are prepared to grant lodging allowances of 35s. per week for a period of six months and second-class railway travel home every two months during the initial six months to married applicants maintaining a home outside the geographical County. Consideration will also be given to the granting of financial assistance in appropriate cases towards removal expenses.

Applications, giving details of age, education, qualifications, present and previous appointments, experience and the names of two persons to whom reference may be made, should be sent to D. W. Riley, County Planning and Development Officer, 41a Eastgate Street, Stafford, not later than June 30, 1960.

Relationship to any member or senior officer of the County Council must be disclosed. Canvassing will disqualify.

H. LYASS,
Clerk of the County Council.

SECRETARY/RESEARCH ASSISTANT required by Merchant House for Commodity Research Department. Commencing salary £750 p.a. Five-day week. Non-Contributory Pension Scheme.—Write to Box 1339.

SOMERSET COUNTY COUNCIL

COUNTY PLANNING DEPARTMENT

TWO SENIOR ASSISTANTS, £755 — £1,070

Applications are invited for the above permanent posts, one in Headquarters Survey and Development Plan Section and one in Area Office, Yeovil.

Applicants must be corporate members of the Town Planning Institute or hold similar professional qualifications or have a degree in Economics, and have had experience in a planning department.

Application forms obtainable from the undersigned must be returned by June 28, 1960.

R. W. DALE,
County Planning Officer.

41 Upper High Street,
Taunton,
Somerset.

CENTRAL OFFICE OF INFORMATION invite applications for a post of INFORMATION OFFICER (unestablished). This is an opening for a candidate with a serious and informed interest in current affairs, able to write from source material clearly presented, concise and accurate reference information papers. The successful candidate would be required to specialise in Commonwealth, including Colonial, affairs. A university degree, or equivalent qualification, is essential. Salary £1,205 to £1,445 (men); £1,130 to £1,389 (women). Five-day week; 22 days' annual leave.—Write, giving full details of experience and qualifications, to Manager (PE.199), Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

EDUCATION AND COURSES

COUNTY BOROUGH OF BOURNEMOUTH

BOURNEMOUTH MUNICIPAL COLLEGE OF TECHNOLOGY AND COMMERCE

Principal:
M. L. Yates, M.A.(Comb.), M.Sc.Tech., Ph.D., M.I.Mech.E.

Full-time and part-time courses are provided in preparation for the following:

B.Sc. General (New Regs.) (Chemistry, Physics, Biology, Mathematics) } University of
B.Sc. Engineering (Electrical, Mechanical) } London External
B.Sc. Economics (Accountancy, Government, Industry and Trade) }
Higher National Diploma Sandwich Courses in Mechanical Engineering Accountancy.

Provision is made for students' social and athletic interests.

Applications for admission should be addressed to the Principal, from whom any further particulars required may be obtained. Telephone Bournemouth 20844-5.

SECRETARIAL TRAINING, especially for university graduates and older students, six-month and intensive 14-week courses.—Write Organising Secretary, Davies's, 58 Holland Park Avenue, W.11. PARK 4654.

EXPERT POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write to-day for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (G59 2), **METROPOLITAN COLLEGE, ST. ALBANS**
or call at 30 Queen Victoria Street, London, E.C.4.

BUSINESS AND PERSONAL

Director of American news agency with comprehensive first-hand knowledge of international affairs (political, economic, and social) is free to act as consultant or write analytical reports for two or three Companies with international interests.

Please write to Box 1341.

SECOND-HAND BOOKS. The Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences you may wish to sell (*periodicals excluded*).

THE WORLD'S FINEST CAMERAS.—Leica, Rollei, Contaflex, Retina, etc., now freely available. Illustrated booklet free from Wallace Heaton Ltd., The Camera Specialists, 127 New Bond Street, London, W.1.

PRINTING at less cost than duplicating, even short runs, even when well illustrated—and at what speed! William Rempner Ltd., 36, Brooke Street, Holborn, E.C.1. Chancery 6588.

OPPORTUNITY KNOCKS—and now's the time to answer! Open the door to a dozen bottles of 11 Cid Amontillado Sherry and let us hours of leisured pleasure.

REMPLOY SPONSORSHIP SCHEME

Send for details which show an attractive proposition to manufacturers.

Write to the MANAGING DIRECTOR, REMPLOY, LTD., 24-28 BUCKINGHAM GATE, S.W.1, or telephone VIctoria 6621 (12 lines).

THE RT. REV. AMBROSE REEVES, Bishop of Johannesburg, will speak on "The Pass Laws and Slavery" on Thursday, June 23, at 2.30 p.m., in Leinestone Hall, Broadway, S.W.1. Annual Meeting of the Anti-Slavery Society, 296 Vauxhall Bridge Road, S.W.1. All welcome.

INVEST IN WESTON-SUPER-MARE CORPORATION

Trustee security
MORTGAGE LOANS

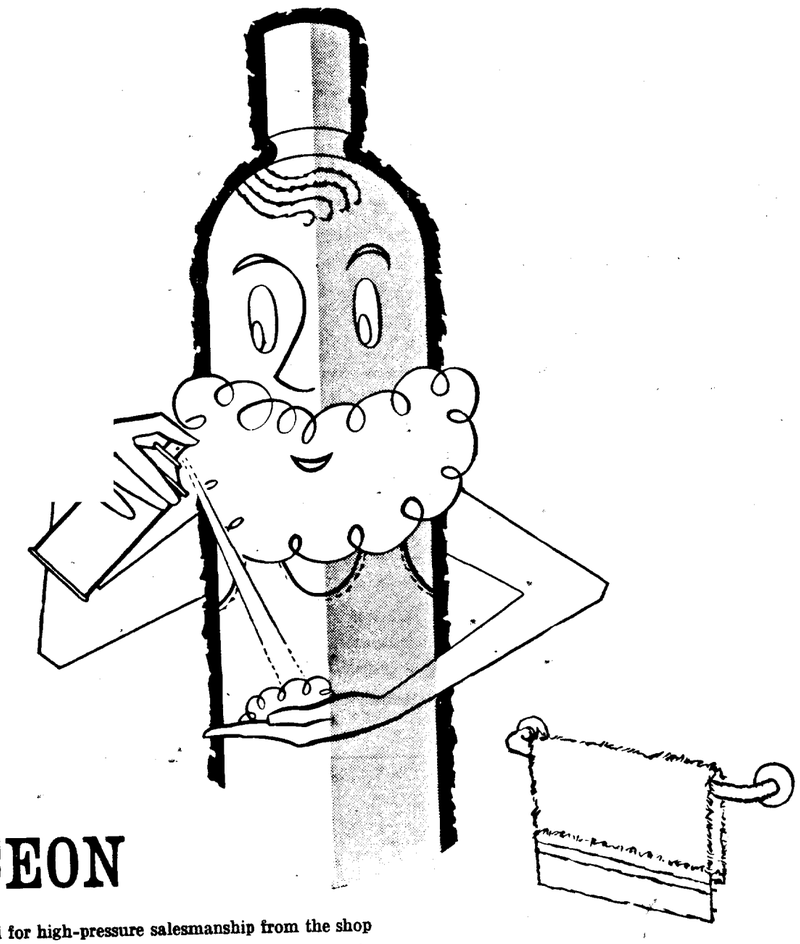
CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability). DIVIDEND NOTICE. Ordinary Capital Stock. At a meeting of the Board of Directors held today a dividend of Two per cent. on the Ordinary Capital Stock has been declared in respect of the year 1960 payable on Canadian funds on August 1, 1960, to shareholders of record at 3.00 p.m. on June 24, 1960. By order of the Board. I. F. Tuttle, Secretary. Montreal, June 15, 1960.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability). DIVIDEND NOTICE—PREFERENCE STOCK. At a meeting of the Board of Directors held today a dividend of Two per cent. on the Preference Stock was declared in respect of the year 1960 payable on August 1, 1960, to stockholders of record at 3.00 p.m. on June 24, 1960. By order of the Board. I. F. Turner, Secretary. Montreal, June 15, 1960.

VALUABLE COCONUT ESTATE FOR SALE

in the Island of Trinidad, West Indies



SALE PRICE: £270,000

An attractive investment yield is assured on a product that is sold, under a guaranteed price, to the local factory.
An agricultural property in Trinidad, owned by an individual domiciled in the U.K., would attract local Death Duties at a very reasonable level. Such a property would not be aggregated with U.K. property for U.K. Death Duty purposes.
There are conventions with the U.K. relieving double taxation.

Full particulars from:

FITZPATRICK, GRAHAM & CO., 95a CHANCERY LANE, LONDON, W.C.2

Registered as a Newspaper. Advertised as Second Class Mail. P.O. Office Dept., Ottawa. Printed in England by St. Clements Press, Ltd., London, E.C.4. Published by The Economist Newspaper Ltd., at 22 Ryder Street, London, S.W.1. Telephone: WHitehall 1511. Postage on this issue: U.K. 4d.; Overseas 6d.

ISCEON

No need for high-pressure salesmanship from the shop assistant — it's the aerosol packs that sells this shaving cream. Put products like this into press-button packs, and sales go up as though jet-propelled — jet-propelled by Isceon. Non-inflammable, non toxic, and chemically stable, Isceon aerosol propellents are available in many forms for many purposes. Amongst them are :—

ISCEON 12 ($CC1_2F_2$) all-purpose propellent

ISCEON 11 ($CC1_3F$) as a pressure modifier

ISCEON 114 ($CCIF_2.CCIF_2$) for use with foams, etc.

Have you a product which, with a little enterprise and ingenuity, would be a sales 'first' in an aerosol pack? Ask our research people for advice and help — they will gladly tackle any problem in this field.

DURGAPUR mills are rolling

DURGAPUR IS IN PRODUCTION—ON SCHEDULE!

By 30th April, exactly to the target date set when the contract for the Steelworks was signed, the Blooming Mill Plant was ready for service. At 9.45 a.m. on Monday, 9th May, the Davy-United 42" Blooming Mill, designed to roll more than a million tons of steel a year, rolled its first 7-ton ingot. Forty-eight hours later the 32" Intermediate Blooming Mill started up; and now the Continuous Billet and Sleeper Bar Mill is also coming into operation, ready to deliver the raw material for India's other development plans. So now, Durgapur steel is beginning to be a real force in India's industrial future.

DAVY-UNITED at Durgapur.

As well as being main contractors for all the Rolling Mill Plant, Davy-United are responsible for the Iron and Steel Foundry and the Central Engineering Maintenance Department, which are already in production, the Sleeper Plant and the Wheel and Axle Plant—in fact, for over a quarter of the entire Steelworks.

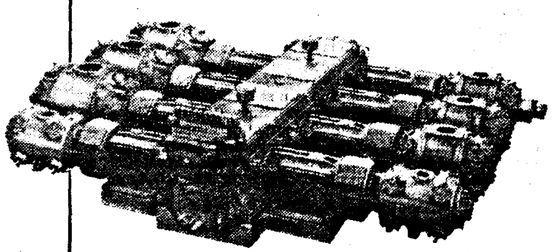
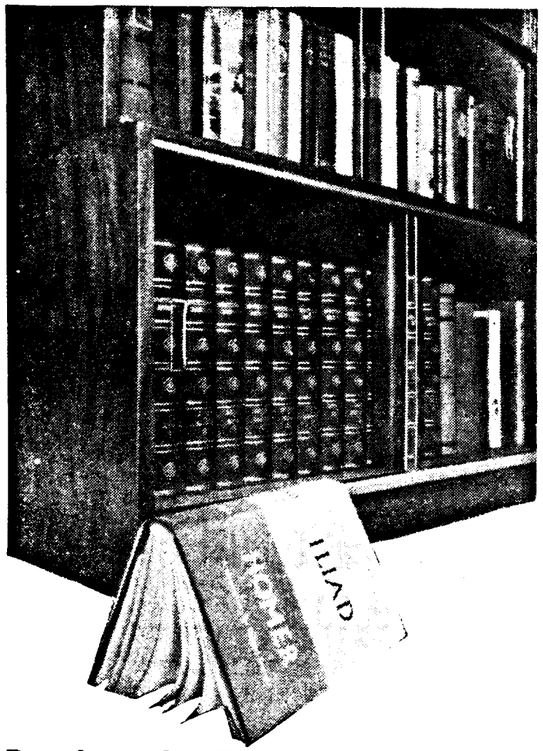
NOW...TWO GREAT NAMES



on one complete line of centrifugal and reciprocating compressors

This nameplate stands for teamwork between the U.K. and the U.S.A. It identifies each precision-made product in the complete line of Clark centrifugal and reciprocating compressors with motor and gas engine drives, manufactured in Glasgow by G. & J. Weir Ltd. These heavy-duty units, designed and engineered in the United States by Clark Bros. Co., are built with traditional British craftsmanship and are available for purchase in sterling. All parts of WEIR-CLARK compressors are identical and fully interchangeable with comparable Clark equipment built in the United States and under license in France and Italy. For complete performance and application data, write to:



CLARK BROS. CO. DIVISION, *Dresser (Great Britain) Ltd.*
197 KNIGHTSBRIDGE, LONDON S.W.7

WEIR-CLARK multi-stage, horizontally-split centrifugal compressors are extensively used in the refining and chemical process industries. These world-famed compressors are built in seven case sizes having from two to ten impellers each. Capacities of 2,000 to more than 150,000 cfm.

WEIR-CLARK motor-driven compressors are available in two, four, six and eight cylinder sizes. These units utilize the balanced/opposed design principle for vibrationless operation. They are widely used throughout the refining industry and as industrial air compressors in general industry.

Putting the Gods in their place

You may take a delight in the doings on Mount Olympus, but if you leave your terms of reference littered all over the lounge you'll bring down the wrath of your own bright-eyed Athene and find a Greek tragedy being enacted in your own home. What you need is a temple which can be devoted to your favourite gods. The word for your Greeks is Minty.

Minty bookcases are designed on classical lines, built to last and capable of expanding to enshrine every inhabitant of the Olympian community. Behind their sliding glass doors Zeus and his many relations can be housed in dust-free comfort, and the tidiness which your wife regards as a myth can become a happy fact.

Minty sectional bookcases can be started from as little as £10.16.0 —on deferred terms if you wish. You can see and buy them (together with Minty furniture) only at Minty Centres. These Centres are situated so that Minty is within reasonably easy reach of most people, but if for any reason you can't call, Minty will be glad to send you catalogues and full details of ordering by post. Write to Dept. E 9, Minty Ltd., 44-45 High Street, Oxford.

Geographical surgery for Europe's new artery

The seven mile road tunnel being driven through Mont Blanc, Europe's highest mountain, will shorten the motorist's journey from Paris to Rome by 124 miles. It will be the world's longest road tunnel, providing an Alpine link—open all the year round—between France and Italy. No longer will the snow-bound roads of the mountain passes be a barrier to European communications and trade.

The Mont Blanc tunnel will take three years to complete and will cost an estimated £11,700,000. About four miles of the tunnel are being driven from the Italian side and the contractors, Società Italiana per Condotte d'Acqua, are using Atlas Copco equipment exclusively. Atlas Copco compressors, rock drills and Sandvik Coromant drill steels have been chosen for this project, regarded as a major contribution towards the unity of Western Europe.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Six Per Cent

IN and by itself, the increase in Bank rate to 6 per cent on Thursday was a sensible stitch in time. To say this will be controversial. There is a strong school of opinion in Westminster and in industry, and perhaps even in the City, which will complain that the Chancellor has put in this stitch after looking at reports of economic pressure that were already out of date; according to this view, the signs of advancing inflation which have worried him—the buoyant retail trade figures in May, the disappointing performance of exports in that month, and industrialists' answers to the FBI questionnaire which were written at about the same time—all represented springtime blooms which by mid-June were already visibly withering on their stalks. What the Chancellor should have looked at instead, the critics will say, were the recent sackings by Hoover, the signs that other producers of durable consumer goods may be already beginning to feel the draught of his hire purchase restrictions and perhaps of a natural and cyclical decline in orders, and this week's news that the rise in bank advances has at last been virtually checked. By going to 6 per cent at a time when the boom was probably already past its peak, the Chancellor will be accused of running the risk that he may turn fading prosperity into an actual recession.

It is possible that events will show that the boom did indeed pass its peak earlier this month, and that Thursday's action was therefore unnecessary. But on the signs at present available Mr Amory could not possibly know for certain, and nor can the critics. The policy decisions which had to be taken this week were decisions that had to be made at a moment of considerable uncertainty. This is always a thankless sort of decision for a politician to face, but certain starting precepts are useful at such a time. Be humble in prophecy, but deliberate in action. Decide which is the greater danger, inflation or deflation—not necessarily greater just in terms of probability, but in terms of which could do the more damage at this opening of the season of sterling's greatest customary strain; and then resolve to act against that. Do not spend too long staring into the clouded crystal, but look in the book. The most appropriate book to look in first is a history book.

There is, at first sight, something very familiar about the course of Britain's economic problems so far in 1960. Most of the foreign bankers and economists now visiting London—and this is the season when they are here in flood, and the views that they will carry home with them are important—have recently seemed to be united in the judgment that they were attending a movie which we have all seen several times before. In the first four reels of the movie, according to this view, the Government has passed from January measures of restraint, through a February railway wage surrender, to an April budget that was designed to be just sufficiently stern to contain inflation, provided that everything else went exactly right, and then in the early summer to new and "special" forms of credit controls that seemed to be mainly designed to avoid resort to control through higher interest rates. The fifth stage, according to custom, is an economic debate in Parliament during its short working period between the Whitsun and summer recesses, in the course of which Government supporters congratulate the Chancellor for "acting so promptly this time" and Opposition members castigate him for "threatening full employment."

Britain last passed through all five of these stages in 1955 and 1951; it passed through three or more of the five of them in 1957, 1949 and 1947. And the

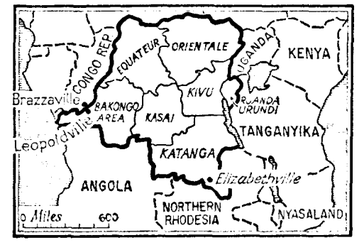
lesson from the history book is consistent. In each of these five summers those who feared that the Government was being too timid proved correct. The Chancellor had to resort to sterner measures in an atmosphere of crisis in the autumn. There was an autumn budget and the suspension of convertibility in 1947 ; devaluation in 1949 ; a new monetary policy in 1951; another autumn budget in 1955; and another new monetary policy in 1957.

In three of the five instances, moreover, the autumn measures of restraint were imposed just at the moment when the consumer boom was in fact slowing down of its own accord, so that production in the following year stopped rising ; but prices did not stop rising, because the increases in cost generated during the period of overdemand worked their way through into market prices during the new period of underemployment. Meanwhile, the Government had done its best to persuade both the country and itself that the measures it had taken in the autumn were bold and resolute ; it could cite the damping down of overdemand that followed them as a sign that resolution had paid off, but it had also to point to the continuing price rises as signs that to reverse these measures too early might be dangerous. So it continued to impede a recovery in production for longer than anybody would have thought necessary or desirable if it had earlier acted in time.

WAS there a danger that, without action on Thursday, the same story might have been about to repeat itself this time? Mr. Amory's critics would no doubt say that any resemblance between 1960 and earlier years is entirely coincidental. There has always been less danger of really deep economic crisis this year, it might be said, because foreign confidence in sterling and domestic confidence in reasonably stable prices are so very much stronger now, and because the central reserves are higher after three good years. There is a greater danger this year, it may be added, that the boom might already be spilling its way over into recession; it has been a boom very largely dominated by demands for motor cars and other consumer durables, which are notoriously subject to a trade cycle of their own, and the fall in these demands *post* (perhaps not entirely *propter*?) the imposition of hire purchase restrictions suggests that this particular cycle may already be over its top.

But nobody would gainsay these points. Similar points of reassurance or apprehension could be made in each of the previous summers that led on to crisis, as compared with the situations that had existed in earlier years. In the summer of 1957 it could be said that the state of demand was much less inflationary than it had been in the summer of 1955 ; in 1955 it could be said that the drain on the gold reserve was much smaller than it had been in 1951 ; in 1951 it could be said that there was no threat of the ultimate defeat of devaluation as there had been in 1949 ; and in 1949 it could be said that the internal balance of Sir Stafford Cripps's economy was much more satisfactory than the balance of Dr Dalton's and Mr Shinwell's in 1947. Yet in each of these years the Government's failure to take action in the summer obliged it in the autumn to take action which a stitch in time would have enabled it to mitigate or avoid.

There were therefore two questions that Mr Amory should have asked himself when pondering whether to take action on Thursday, each looking at the period immediately ahead but each with these past experiences in mind. Was there any possibility that the effects of continuing overdemand, the lengthening of British delivery dates, the recent disturbing failure of exports to rise as fast as imports, the increase in costs which industrialists say is already working its way into their accounts, and the recent strong foreign preference for the mark might lead to an intensification of the usual July to September strain upon the pound ? It would be presumptuous to say that there was a probability of any of these things happening, but to say that there was no possibility would have been mad.



Secondly, if experience with a diminishing boom does prove that an increase in Bank rate to 6 per cent was in fact unnecessary, will a few months of increased restriction during the period of sterling's usual maximum seasonal strain be a major and lasting misfortune for the economy ? Or should it then be easy enough (and in some ways a positive advantage) to be able to plan the next budget on a re-expansionary course; to decide that economies in the October estimates need be applied only to the reduction of waste and not to the postponement of desirable educational and other social plans ; to lift the hire purchase restrictions in time to meet the winter unemployment peak ; to press down the accelerator the more smoothly as one enters the next straight precisely because one has been able to see more clearly into it as a result of taking this present dangerous corner with a cautious edging to the right?

THE way in which these questions have been phrased will show to what extent *The Economist's* own answer would coincide with Mr Amory's. It will also show to what extent we are now apprehensive that his emphasis in policy threatens to go quite considerably wrong. We do not pretend to know which is the more probable in the months immediately ahead, inflation or deflation. We do know which, in the months of sterling's usual seasonal strain, would be the more dangerous. This provides a strong case for any action which will have its maximum effect in safeguarding the immediate security of sterling in short-term dealings across the exchanges; for such action a rise in Bank rate is by far the best implement. But rather different considerations apply to the increase in the call to special deposits that was also made on Thursday morning, and very different considerations indeed to the economies in public investment to which the Chancellor referred on Thursday afternoon. An increase in Bank rate is easily reversible. An increase in special deposits (to judge from Australian experience, and from our limited experience here) probably takes longer to wreak its effect, and is certainly likely to take longer to reverse. Economies in public investment, by their very nature, cannot take effect until well into 1961, and it is far too early to pass judgment that 1961 is going to be an inflationary year. The signs are rather that it may be the reverse.

If by September the period of usual seasonal strain on sterling has passed without incident and if durable consumption shows sure signs of turning down, the Chancellor should then proceed promptly to planning a budget of tax reliefs and to other reflationary measures. The policy of raising Bank rate now, in short, should be accepted with frank recognition that it might be wise to reverse it in the autumn, that it might merely be a sensible policy of *reculer pour mieux sauter*. It was a necessary step because a policy of immobility might have proved to be a policy of *rester pour pis reculer*. That is probably bad French. It would certainly have been even worse economics. But to decide here and now to fall into a policy of longer term restriction, to mistake inflexibility for rectitude, that would be worse economics still.

Congo Express

M. Lumumba's efforts to hold his inheritance from the Belgians together deserve western sympathy and support

THE Congo's emergence as an independent state next Thursday is a capital event in African affairs. Not even Nigeria's appearance on October 1st can eclipse the dramatic test that M. Lumumba, his allies and his rivals are about to undergo. The grand assize is sitting. If the Congo does survive as a recognisable entity in the coming months, black Africa will consider that it has justified beyond question its capability for self-government elsewhere. If it disintegrates, as a good number of eyes covertly watching it from the south and east confidently expect it to do, the resistance to African emancipation in Africa's remaining colonial or semi-colonial territories could stiffen into horrified rigidity. Either way the problems of British policy will not be diminished.

The picture of the Congo, seen from Salisbury or Brussels this month, differs markedly from that presented at the conference of African independent states at Addis Ababa. The personal struggle between M. Lumumba and M. Kasavubu ; the threats of secession from the Katanga province ; the breakdown of local administration and the health and sanitation systems ; the mounting evidence of a reversion to tribal division and conflict—all these serve to stimulate European expectations of disaster. The African impression is very different. In Addis Ababa (and in other capitals besides) it is the last-minute Belgian manœuvring to place the trusted M. Kasavubu in power, the encouragement of Katanga secession by European industrial interests, and the troop movements in Northern Rhodesia and Angola that make most stir. This attitude is not only the outcome of obtuseness or the unreasonable suspicion of European motives. It is the measure of the image of European policy that African nationalism automatically conjures up when confronted with its own crises and excesses ; and the blame for that is not entirely African. It is an image that will be confirmed in African eyes if western policy is content to wait, with arms folded, for M. Lumumba to seek his own salvation wherever he can.

The present European recrimination against the Belgian authorities for their hasty abandonment of the Congo largely misses the point. The Belgians have never been under any obligation to white Africa to maintain the *cordon sanitaire* between Brazzaville and Lake Tanganyika ; no one can be compelled to conduct a police action for Dr Verwoerd or Sir Edgar Whitehead. The only legitimate criticism against Brussels is that, right up to the Leopoldville riots in January, 1959, it failed to envisage any circumstances in which the Congolese should be prepared for responsible self-government. As a result, the Belgian record in the Congo, for all its considerable labours and successes, is sadly destined to be written off in African history as the classic example of rapacious colonialism. To the African mind the manner of the Belgian withdrawal follows logically on the circumstances of the original royal acquisition. No sense of political mission ever succeeded in imposing itself: as a result the many Belgian criticisms of British colonial policy in the past fifteen years make peculiar reading today.

It is probable that, outside the unlikely event of a wider African political unity coming into being, the Congo's existing borders will eventually give way to new groupings that seem less artificial in the context of African allegiances and geographical facts. The Bakongo ambition to dominate a political grouping with some sense of historic and geographic unity in the lower Congo basin is not necessarily either unreasonable or ignoble. It can equally be argued that the form of economic community that is evolving in the Katanga and Northern Rhodesia encourages, inevitably, a common sense of identity when set against the interests of more pastoral and poorer communities in the vicinity. The real question is how such changes in the system of frontiers, linguistic as well as economic, that European rule has imposed can best be brought about.

AFRICAN nationalism is itself a patchwork of ambitions and pretensions. The boundaries it wishes to erect can on occasion be no less arbitrary than those of a self-seeking colonialism. Violent disruptions may still be unavoidable. Even so, changes contrived by European interests—and the machinations involving the Katanga have prompted a number of suspicions—can only arouse further African resentment.

M. Lumumba, having mustered the necessary parliamentary majority at the eleventh hour, is now determined to make the Congo work within its existing borders. How far Belgian activities since the elections last month have hampered his efforts remains uncertain. Other African leaders on the threshold of power have been able to rely on a dominant political party whose authority has become apparent in the preliminary struggle for independence. The natural outcome has been the unitary state that M. Sekou Touré and Dr Nkrumah have constructed: Mr Mboya is at present engaged in organising a colony-wide party of this kind in Kenya. M. Lumumba's intention to follow suit after independence is bound to be prejudiced by the continuing tribal and provincial consciousness in the Congo, and by the very federal system that the Belgians are leaving behind. It is clear from Wednesday's vote for the president of the senate that M. Lumumba's rivals mean to keep him on a very tight rein.

The Belgians have themselves lifted the last barrier to one-party rule in the individual provinces at the insistence of the Conakat leaders in Katanga. Even so, the best chance of orderly evolution rests with M. Lumumba and, as the federal prime minister, he will fall heir to the one effective source of central authority: the 25,000-strong *Force Publique* under its Belgian officers. If M. Lumumba fails to reach a workable arrangement with the provincial leaders, the temptation to enforce military control, however limited his resources, will be strong.

Western policy is still hesitant about supporting M. Lumumba's efforts to build a national state. His position is certainly weak, but his very weakness suggests that he will be prepared to accept support wherever he can find it. Whatever the concern of other African leaders, like Dr Nkrumah, to ensure that the Congo does not fall apart and provide political ammunition for white African publicists from Algiers to the Cape, independent Africa cannot sustain the Congo as Ghana once supported Guinea. The West should learn from the lesson of Guinea that African leaders left to stew in the juice of impoverished independence will inevitably turn to Moscow.

The eventual consequences of Soviet aid never appear as calamitous as imminent internal collapse for lack of funds. Congolese politicians have already turned up in Peking, and the Chinese have shown that they are prepared to intervene to some purpose wherever they can in Africa. The political orientation of the Congo in the coming months will be every bit as important to the West as the success or failure of General de Gaulle's efforts to reach a settlement in Algeria before the nationalists there resort, in desperation, to active alliance with the communist block.

The worst outcome for the Congo, and for its neighbours, would be if the centrifugal forces there were to bring about its disintegration before the remainder of central Africa has contrived to put its house in order. The former French colony of Congo has still to decide whether its future lies in association with the Bakongo peoples, or with the three other Equatorial states to the north. Portuguese Angola is still a question mark on the political map. Katanga's impulses to join Northern Rhodesia would have greater purpose if Northern Rhodesia possessed its own African government. A good many false openings and blind alleys will have to be explored before central Africa discovers its destiny.

To give this process a chance the Congo will have to be held together for as long as possible. The development of the Indonesian pattern of dissidence and revolt in the centre of Africa could be disastrous. The six provinces have some reason to make common cause for the moment, if only to ensure their own economic viability. This has been the chief Belgian argument: it can still come about, if the Americans and Belgians are prepared to back up M. Lumumba.

African leadership has embarked on a perilous course that can only arouse increasing fears of balkanisation. As our special correspondent reports on page 1345, west Africa is now engaged in a confused conflict of personal rivalries and ambitions. The divergences of African opinion have been made all too manifest at the Addis Ababa conference. The notion of "African identity" is already being obscured by differences between Ghana and Nigeria, between Mali inside the French Community and the four Entente states that are on the verge of leaving it, and between marxist Guinea and the Cameroun government of M. Ahidjo that employs French troops to keep down its communist rebels. If the Congo now adds to these elements of disunity and dismemberment in the new Africa, the whole liberal argument for African self-determination will be thrown into question with increasing force in those white African communities where it has never been accepted. Yet any such counter-attack can itself only add to the opportunities for communist exploitation. The wind force in Africa is mounting with express speed.

Algerian Armistice?

General de Gaulle must run risks in Algeria if French influence in Africa is to survive. The gamble is worth taking

THE Algerian rebels are going to talk in Paris: now the difficult part begins. The danger, even the probability, of failure has been reiterated on all sides this week. This caution is perfectly explicable, and it does no harm after the wordy optimism that has blown about Paris for five unregenerate years. Yet what may be needed more, if the difficulties of the coming weeks are to be surmounted, is the certain and abiding conviction within France of all that a Franco-Algerian settlement can do and bring about in Africa and in the Middle East. France can win more than peace in this gamble. When many Frenchmen are counting the cost of a settlement to themselves, the nation must grasp the wider opportunity. This is the speech that General de Gaulle has still to make.

The great, and perhaps decisive, change that has taken place in Algeria is that General de Gaulle has committed himself to negotiations with the rebels. He has to press ahead now; if the talks break down he will be the loser and MM. Soustelle and Bidault the only gainers. Officially, the Elysée maintains that there are just three topics to be discussed: a ceasefire, the disposition of weapons, and the future of the rebel combatants. These were the terms of General de Gaulle's offer on June 14th. The immediate question to be decided is whether the rebels are prepared to start within this formula.

Publicly, they are not. M. Ferhat Abbas's reply on Monday was in the name of the provisional government of the Algerian republic; and it declared that the French position was still distant from its own. The talks could thus founder if the rebel delegation, or even its initial envoy, insists on political preconditions that General de Gaulle is unwilling, or unable, to concede: no previous exchange has got beyond this point. Yet the studied moderation of language in the general's new offer, and the secrecy with which both sides have surrounded the preliminary moves, suggest a tacit understanding that it is now the talks, not the preconditions, that matter. Even so, each side remains under pressure from its extremists; every official assertion that nothing is, in fact, being given away neither helps the talks nor prepares opinion for any compromise settlement. The rebels' refusal to despatch their envoy in a French plane speaks eloquently of their suspicions.

For the moment, the opponents of compromise, on each side, have been unable to act with the force and decisiveness that they could wish. The Europeans in Algiers have not fully recovered their nerve since the collapse of the January insurrection. They seem to be awaiting a call to action from Paris, which MM. Soustelle and Bidault, without another General de Gaulle to summon up from Colombey, have been reluctant to give. The cantonal elections last month, even if they produced no effective third force, revealed the numerical weakness of the European extremists. Even so, if the Paris talks come to anything, the diehards must be expected to try their hand at some stage. Then, as before, the outcome will depend on the army.

SINCE January, the army in Algeria has been purged of its openly dissident officers, and it has kept aloof from the settlers. The danger is that it may insist that General de Gaulle upholds his promise to give it sole supervision of any Algerian referendum. It is plain that the army must remain on the spot with authority to preserve order; but it would be intolerable if this extended to military control of the polling booths. The gamble that General de Gaulle seems to be relying on is that, whatever it did not do in January, the army showed growing unwillingness to persevere in outright insubordination without a political lead from metropolitan France. The army professes to believe that in a true vote Moslem opinion will still incline towards France; if this belief is strong enough it has reason to comply with General de Gaulle's policy now.

At the same time, the Algerian rebels in the field are at their weakest, militarily, since the early years of the revolt. This seems to have tipped the balance in the leadership in favour of negotiation, although it may have been a narrow decision. At the very least, the rebels must feel inclined to test General de Gaulle's offer before confiding themselves to the distant, and dubious, mercies of a Chinese alliance. The need for this effort in Paris as the last alternative to inviting active communist intervention in North Africa has been powerfully argued in Tunis, Rabat and Cairo.

The clinching factor for General de Gaulle in attempting a compromise at this hour seems to belong less to the favourable situation in Algeria than to the unfavourable one rapidly developing in the French Community. The community has reached a turning point this month with Mali's accession to independence and the determination of the four Entente states in west Africa to become independent before deciding the terms of their continued association with France. The recognition of the Algerian rebel government by any, or all, of the states now emerging from French tutelage would be a stunning blow to France's commitment and influence in Africa, the very role on which General de Gaulle's national policy greatly depends. Everything now is at stake.

More than once in the past two years the political constellations governing an Algerian settlement have seemed more hopeful than they do today. General de Gaulle's tactics have evolved in uncertainty, evasion and nuance; even now there is no indication of a political programme beyond the promise of self-determination itself. He has spoken, at times, of partition; if this is still in his mind, the negotiations with M. Ferhat Abbas may soon run into deadlock. For the past two years it has been difficult to decide whether the Elysée has been following a consistent, if secretive, policy in Algeria, or merely reacting to events as they have imposed themselves on the general's understanding. General de Gaulle's chief purpose now may be to sound out rebel views on the form a compromise could eventually take. This exploration is indispensable. But unless he is then prepared to act with determination, and within the hard realities that a compromise with the rebels demands, the talks had been better not begun.

The Scarcest Commodity

British architects, building trade employers and Mr Gaitskell have all made strong attacks on the current use and misuse of urban land. But all parties should face some uncomfortable economic realities

BEHIND the complaints of ugly misuse of land made by the Royal Institute of British Architects (which has been holding its annual conference at Manchester), behind the report that there is a crisis in "Land for Housing" just issued by the National Federation of Building Trade Employers, and behind Mr Hugh Gaitskell's attack (in his speech to the Durham miners) on real estate speculators, lie some desperately uncomfortable economic facts. These are basically the outcome of sheer unshiftable arithmetical and geometrical relations. But they are so thoroughly masked by legislation, regulation and the institutional peculiarities of the real estate market, that wishful thinkers find it especially easy to pretend that they do not exist. This is the justification for restating the geometrical truisms and economic banalities which follow.

First, the geometrical truisms: an acre is an acre; a mile is a mile; within so many miles' radius of any urban focal point, only so many acres exist. The occupation of those acres by any given number of people, whether at work or in their homes, implies a given average density of building; this density can be lower in one area only if it is higher in others.

Next, the consequent economic banalities. The price of land within the sphere of attraction of urban centres is inevitably, on any reckoning, extremely high. Whatever use any site within the geometrically limited total is put to, other strongly competing uses must be sacrificed. This is equally true whether the reckoning is that of the free market or the internal accounting of an authoritarian planned economy, and whatever the balance struck between the claims of housing,

productive enterprise, public buildings, traffic, and humanly essential breathing space. The use of scarce and intrinsically expensive land as if it were plentiful and intrinsically cheap is misuse, comparable to the use of drinking water in the desert for shower baths. Preventing such misuse is an essential social job. To the address of Mr Gaitskell: that is the job of the land speculator. Buying, holding, and selling to the highest bidder, the speculator ensures that what is intrinsically scarce shall be appropriately priced and intensively used. He does not "drive up" prices; he makes a profit out of their necessary rise, which is quite another matter. If he misjudges and prices fall, he loses. (Whether this particular service is, in an expanding economy, so effortlessly rendered that its reward is too much of a windfall—and whether consequently some larger proportion of that reward should be taken back by the community—is another question. See below.)

To the address of the British Architects: the clash between the economic need to use central sites for the most intensive purposes (notably for the essential commercial nerve centres called offices) as intensively as possible (that is, getting the maximum of floor space into each site) and the visual requirements of pleasing design is not a clash between evil and good, between Mammon and the anti-ugly angels, but between two genuine social aims. (Whether present institutions, standards and habits allow a proper weight to the second of these aims is another question. See below.)

To the address of the Building Trade Employers: to complain that building sites are getting uncomfortably expensive and enforce an uncomfortably high price for the houses built on them is merely kicking against the pricks. Confronted with an absolute scarcity of land, people must recast their ideas about what constitutes an uncomfortably high outlay on housing—in proportion to the rest of their budgets. So must the providers of that housing. (Whether the present publicly imposed restrictions which intensify the present scarcity need modifying is another question. See below.)

WHAT has been said so far could apply to any scarce resource with an intensely inelastic supply. Land is, however, a special case in almost any society and particularly in Britain today. No other market is so distorted, so imperfect, so jerky in its action and so hemmed in by the effects—intended and unintended—of public regulations. The jerkiness is virtually inevitable. Buildings are long-lived; changes of ownership, whether of freehold or lease, occur at long intervals and sporadically; land effectively on the market at any particular moment is only a scattered fraction of the total. Hence a large part of the difficulty in planning, whether according to strictly productive criteria or wider social ones. Hence also the very strong case for subjecting the push and pull of the commercial market to much more social intervention than is appropriate elsewhere. The immediate advantage of developing sites A, B, C and D as separate entities when they come on the market is generally much less —materially as well as visually—than that of developing all four as parts of a related whole.

Another consequence of the slow turnover of land is, in an expanding economy, to make the man in possession automatically into a successful speculator. The urban or suburban freeholder (or long leaseholder of 30 or so years' standing) is typically occupying a large site which he could not begin to afford at its present market price; mere priority in date of birth gives him a current bonus in elbow room—and an eventual bonus in hard cash to him or his heirs—quite unrelated to his original valuation. To the absolute geometrical limitation of sites is added the limitation of availability—and the price of the available residue of land for new building is correspondingly higher.

To enforce a continuous reshuffle of land occupancy corresponding to its increasing scarcity would certainly be intolerable; but herein lie both the justification for compulsory purchase in instances of extreme need (a case which the Government accepts) and the case for a capital gains tax on land transactions (which the Government has not accepted yet, but for which there are very strong arguments). The 100 per cent development charge which the 1947 Act attempted to impose was a cumbrous failure, and has been abandoned; but some milder fiscal device serving a similar general purpose is overdue.

IT is inevitable that the general density of development should in practice always lag some way behind what is demanded by the real scarcity of land; but in Britain the lag is enormously lengthened. Outside the towns a social judgment, with which few would quarrel, has instituted "green belts" which cannot be built on at all; while similar judgments, whose wisdom (as the building employers' report vigorously argues) it is possible to question, impose low densities on such building as is allowed elsewhere. About the æsthetic and social merits of high and low density endless argument is possible; at least it will be agreed that compact village-type development and the best designed of the new housing estates make much less mess of the countryside than does low density building consisting of bad houses badly laid out. Here the British architects and the building trade employers join hands—or ought to; local authorities should be both reconsidering their development plans (which are often based on an underestimate of the demand for housing) and strengthening their architectural staffs.

The other great lag-producing influence, which both fixes millions of acres of urban land in uneconomic use and actively perpetuates urban hideousness, is rent restriction. Every occupant of a rent-restricted dwelling is being subsidised to live wherever he lives at present—typically in urban areas where land is scarcest and often in comparatively land-greedy terrace housing rather than a land-minimising flat. Simultaneously, he is confirmed, whatever his income, in the belief that an immovable low rent, and the standard of living in other respects which an immovably low rent permits, is his inalienable birthright.

The result is two-fold. Because rent-restricted tenants are immovable, the land their houses occupy is not available for more intensive building; often whole areas are degenerating because of rent control over the majority of local houses, and nobody is going to build desirable new residences on any sites that do fall vacant beside these rotting near-slums; the smaller residue of available land that is appropriate for building desirable residences is thereby made more costly. Building on that available land is consequently more costly too; the confrontation of the resulting high economic rent with the prevailing low rent mentality produces a situation in which private enterprise is helpless and public enterprise carries a shockingly heavy subsidy bill. "Urban renewal" essentially waits on full and final repeal of rent restriction.

Nothing will make it possible for today's and tomorrow's population to live as spaciously as did yesterday's within a given urban radius. Nothing justifies pretending that space is available when it is not, or that it is cheap when it is precious. Nothing will make the inter-related problems of land use and land values, of planning and individual and social rights, of legitimate expectations and the needs of a changing situation, of the proper calculus of costs, other than appallingly complicated. But at least this complexity is likely to be better handled if all concerned remember that a mile is a mile, an acre is an acre, and that one does not take shower baths in the desert.

Two Million Innocents Abroad

Fashions are changing for Britons who take their holidays overseas

LAST year, of the 30 million Britons who are estimated to have taken an annual holiday, no fewer than 2¼ million went overseas. For their grateful foreign hosts, British tourists have become as much a matter for statistical boasting as the rate of industrial expansion behind the iron curtain. Unfortunately, the statistics are often no more reliable. As the accompanying table shows, the number of British visitors claimed between them last year by Italy, Switzerland and Spain alone amounted to 2½ million, which is a quarter of a million more than the total number of Britons estimated by the British Travel and Holidays Association to have gone out of this country at all. Of course, "visitors" in the table includes all who travel for business as well as for pleasure, but the largest part of the discrepancy, as the footnote to the table shows, arises because most of the popular ways of totting up tourists' heads lead to large-scale double-counting. Nevertheless, certain obvious trends stand out.

Country	British visitors in 1959 ('000s)
Italy	1,458 (a)
Switzerland	636 (r)
Spain	510 (a)
	or 362 (s)
France	500 (s)
Germany	494 (r)
	or 1,750 (a)
Belgium	334 (s)
Austria (1958)	264 (r)
Netherlands	161 (r)
Norway	63 (a)
Yugoslavia	40 (a)
Greece	37 (a)
Portugal	29 (a)
TOTAL	at least 4½ million

Note:—
(a) = Arrivals counted at frontiers; this will include varying numbers of mere transients.
(r) = Registrations at hotels; though probably more accurate than (a), it omits campers, caravanners and so on, while double-counting those who stay at more than one hotel.
(s) = Special systems. Belgium divides the numbers of nights spent in hotels by the average length of British stay; Spain gives a revised figure for *bona fide* tourists. So do the French: their rough figure is probably more accurate than most being about one-fifth of all British arrivals in France.
(*Sources*: governments concerned.)

Although Thomas Cook nowadays offer a flourish of exotic holidays to any casual enquirer—including an African safari, a round-the-world trip (for £797), and fifteen days in Accra—overseas tourism for the Briton still overwhelmingly means going to Europe. And within Europe the flow of British tourists which before the war went to France and Germany seems now to have been partly diverted to Italy, Switzerland and Spain. Italy's impressive figure of a million and a half British visitors last year is no doubt wildly misleading. Nearly half of Italy's foreign visitors last year were "excursionists" (the OEEC definition of a transient who stays less than 24 hours); the British total thus presumably includes every passenger who fretted away two hours between planes at Ciampino. Switzerland is statistically a long second, with 636,000 registrations at hotels and other establishments; interestingly, despite the popularity of winter sports, between three and four times as many British visitors still go there in August as in January. Spain is comparatively discriminating in its count of heads: though it claims 510,000 British arrivals last year, it admits that only 362,000 of these stayed any length of time. Spain has been climbing the list rapidly; being generally sunny and (more important) relatively near and cheap, it is ideal territory for the travel agency package-dealer.

Germany's position in the table is higher than it is in British travel agencies' bookings. Many of its British visitors seem to be better off or more experienced tourists, travelling independently; they include a large number who annually motor through Germany on their way south simply in order to use the autobahns, spending a night or two on the way. Among the minor holiday centres, Greece's figure of 37,000 British visitors last year may seem unimpressive, but it has tripled since 1956; this is the biggest percentage increase of any country in that period, and one the British agencies and Mr Onassis alike are doing their best to encourage.

What do the British seek on their foreign holidays? One might hope that the new yen for Italy (last year, it had 27 per cent more British tourists than in 1958) indicated a growing love of culture, or even of scenic beauty. But the area whose popularity has grown fastest among Britons is the Adriatic coast, a featureless and largely cultureless expanse of sand; evidently the Briton's first main trait abroad is the desire to lie in the sun. His second is apparently a love of bourgeois (but not extravagant) comfort. Returns from Italian hotels reveal some interesting comparative information about the three main tourist nations. Americans dominate the "luxury" hotels. British and Americans share the less luxurious "first-class" hotels about evenly. In the "second-class" hotels British and Americans are outnumbered by the Germans, who dominate the "third-class" hotels, the

youth hostels, and the camping grounds. Last year, though British youth hostellers spent more than 400,000 nights in foreign hostels, there were still more than three times as many German campers in Italy as British and Americans combined.

Like everybody else, the British tourist insists on his inalienable right to take his holiday at the least comfortable time of year. Italy, for instance, is typical in suffering three times as many foreign visitors in August as in May. Many bookings for cross-Channel passages in late July and August are made up to a year in advance. Those that are not made a year in advance by cautious planners are likely to be made at the very last minute. There is almost a close season for summer holiday bookings, especially among the car-owning classes, in the spring and winter months; it is always Whitsun, the Automobile Association reports sadly, which reminds the potential motoring tourist that nothing is yet fixed, and sets him thereafter to sending in applications for car passages at the rate of 2,000 a day. These excessive peaks of tourism are the planners' despair; an infrastructure capable of dealing with the constantly expanding August rush is a liability for much of the rest of the year.

EVERYWHERE the trend is towards getting on to Continental roads, and off the railways. Among those who have no car of their own (or who do not trust themselves to drive on the Continent) coach tours have done well since the end of the war, when shortage of rolling-stock put an end to the old rail tours. Coaching's continued popularity is rather surprising, for today a coach holiday is relatively expensive—perhaps £55 or £65 for 14 days, compared with what is probably the most representative of agency holidays, the 10-day stay in one place (the "poor man's fortnight") for £30 or £35. Coach passengers, however, are clearly a fairly conservative group; one agency has worked out the average age of its coaching clients as fifty-six.

The real threat to established habits comes from the car. In 1937 the railway steamers carried 32,000 British cars on their French routes. In 1949 they took little more than twice that number. Last year they took almost 200,000—and the air-routes took another 85,000 cars. There are on average three passengers per car. These are ordinary travellers going to ordinary places; the value of the petrol coupons issued by the Italian government to British motorists has risen from 12½ million lire in 1951, to 108 million in 1957, and 359 million lire (£205,000) last year. The AA reckons that car bookings to the Continent will be up by 10 per cent this year.

But total bookings almost certainly will not be. Although travel agencies guard their figures jealously, for fear of tipping off their rivals in a highly competitive market, there is evidence that the boom in packaged holidays abroad is slowing down; some people are staying at home, and others are going less far than before—Northern Europe instead of Italy and Spain. Italian bookings have dropped sharply. Some of this reflects the once-in-a-decade pull of Oberammergau, some probably the unfavourable comparison of last year's disastrous weather in Southern Europe with Britain's ideal summer (and the hope that it may happen again this year). But a lot of it may be a sign of a new desire for independence. Whole new classes are growing accustomed to the idea of planning their foreign holiday themselves, taking their own car to roam where they will; it is becoming unsmart to go on a package holiday two years running.

All this adds up to trouble for some travel agencies; early booking is the essential of the trade, and by now some fingers look like being burned. This is particularly true of the small agencies; unrestricted by licensing laws, they have sprung up by dozens in the wake of the bigger businesses. But even if their part of the trade declines, it seems fairly certain that, given delivery of the new car, the continuance of economic prosperity, and a more typical British summer or two, the new milords from this country will go on pouring into Europe—in their millions.

NOTES OF THE WEEK

LABOUR

Troubled Waters

So long as Mr Gaitskell remains leader of the party, Labour will not go neutralist or unilateralist or pacifist. On the whole, the party's long-awaited statement of defence policy this week is more notable for its courage than for its wriggling. Inevitably, it does wriggle a bit. It seizes at the strong case (on grounds of efficient division of labour) for saying that provision of the west's nuclear deterrent should be left to America, and then uses this as an excuse for muttering some conveniently anti-nuclear views. It contains the essential pledge of loyalty to Nato, but it wishes that Nato would not have so many dangerous and effective weapons lying (or flying) about. It thinks that the alliance as a whole (not merely Britain) should rely much more on conventional arms and much less on nuclear deterrents; the West should never threaten to use the H-bomb first. It agrees (by implication) that American strategic bombers can remain here, but does wish that the Thor bases in Britain (which are vulnerable, as well as angering Mr Cousins) would go away.

Too much should not be made of all this. If a Labour government returned to power, it would keep Britain in Nato even when and if the other Nato members turned down this statement's ideas about which weapons General Norstad should be allowed to use (and in what proportions). Before Labour has much chance of coming back to power, Thor missiles will be out of date anyway. The equivocation about American bases—the worst part of the statement—is a rather half-hearted gesture towards one of the schools of party tacticians which has been advising Mr Gaitskell on how best he can avoid defeat at next October's party conference at Scarborough; the idea is that some unions (especially the Amalgamated Engineering Union) which have been committed by their own conferences to what have been assumed to be unilateralist policies—but were, in fact, much more specifically anti-American-rocket-base motions—might feel that they can vote in October for this statement.

If the new policy is turned down at Scarborough by a pacifist vote, Mr Gaitskell will try to mobilise the mass of the Parliamentary Labour Party to divorce itself from the conference's decision—and will resign if he fails. The fairest comment on this week's statement is that Mr Gaitskell has resolutely refused to change his basic views in order to avoid the showdown that could lead to this divorce, but also that he is not willing deliberately to court it; presumably this is because he is increasingly uncertain whether he would be followed in divorce action by the majority of Labour MPs—and, still more doubtfully, by the majority of his immediate lieutenants, many of whom have recently shown obvious signs of speculating whether his enforced resignation from office might not improve their own main chance of the succession. Yet every day that passes makes it more and more evident that only when Labour MPs have cut themselves free from their thraldom to the conference can Labour begin to rebuild itself as an effective radical force.

. . . and No Oil

ANOTHER incident this week should have rubbed home how difficult it is for Labour to formulate a progressive policy so long as its party constitution keeps it beholden to private pressure groups at its conference instead of to the general electorate. The National Union of Mineworkers is a pressure group which wields 687,000 conference votes and which thinks that industry should be obliged to buy all the coal that its members dig before anybody should be allowed to import fuel oil. Labour's national executive has now painfully hammered out a party policy on fuel. Mr Wilson revealed its main content last weekend.

It would be an exaggeration to call it a total surrender to the miners' demands. It is one of those familiar Labour documents of the Gaitskell era whose details are not quite as bad as its general tone implies. It represents a compromise between the pound of flesh demanded by an entrenched pressure group outside Parliament, and the few shillings' worth of *sottises* that the intelligent leaders of the parliamentary party can bring themselves to accept as "politically necessary" and perhaps "not too obviously damaging" to the policies which they really want.

This is an impossible way to run the affairs of a left wing party. The case of coal shows this even more clearly than the case of defence, for a left wing party should always be instinctively in favour of advancing the new instead of protecting the old. The effect on Labour's image before the public is disastrous. These "policy documents" nowadays pour out from Labour's national executive with one main propaganda aim: they are written in a way that seeks to persuade important voting blocks at the annual conference (whether they be blocks of left wing nationalisers, semi-pacifists, or industrial protectionists) that official party policy is nearer in temper to the policies they desire than in fact it is. The result is that the general public, which usually does not like the policies of left wing nationalisers, semi-pacifists, and industrial protectionists, takes this claim at face value. This week it should have been the Government that had an unhappy time over fuel and power policy, because it has had to cut back the nuclear power programme which it planned at the time when it wildly overestimated future oil and coal costs just after Suez. Labour's quite unnecessary formulation of its own fuel plan has managed to divert critics in mid-assault on fuel-foolish Tories to the familiar task of hitting the still more fuel-foolish Opposition.

EUROPE

Tiptoeing Forward

DESPITE the cool reception in the capitals of the Six for the first hints from Britain that it might be prepared to join Euratom and the Coal and Steel Community, a further step forward has now been taken. Last Friday the foreign ministers of Western European Union, to which these seven governments alone belong, agreed to set up an *ad hoc* committee to discuss whether Britain could in fact join. The committee held its first meeting in London on Wednesday. Its members are the ambassadors of the Six in London and Sir Roderick Barclay, deputy under-secretary at the Foreign Office, who is in the chair.

Not all the omens are propitious. The choice of a British chairman, natural for a meeting in London, could be a disquieting reminder of the experience of the Maudling committee on the free trade area. Little was achieved at the meeting on Wednesday. The ambassadors of the Six explained that they had no instructions yet. Nor have all the obstacles to British membership of the two communities been overcome—either in Whitehall or in the Six continental capitals. All the same the new step is important, and, as far as Euratom is concerned, the imagined difficulties on the British side—shortage of trained men, the problem of sharing knowledge acquired from the Americans—are likely to disappear under scrutiny.

But the dialogue that has just begun between Britain and the Six is bound at some stage to bring Britain up against the main objection of the Six—that if Britain wants to attach itself to the two lesser branches of the European tree it must in the end join the third and most important, the Economic Community, as well. For the Six have designed their three communities to serve one political idea, an increasing European integration, and to further that aim they may take steps as early as next year to merge the institutions of the three communities into one. As yet the British Government has not made up its mind to join all three communities. But now that it has started to talk with the Six, it would be most damaging to turn tail and retreat.

Leading the Seven

BRITAIN'S direct contact with the Six is bound to lead to anxieties among the other members of the Seven. That is why pains have been taken to inform them of everything that is going on and reassure them that Britain is not going to do a deal with the Six on its own. Obviously Britain cannot and should not abandon the group it has done so much to form. All the same, what the Seven do will in the end depend on where the British lead them. If Britain eventually reaches an understanding with the Six that it can join the economic community as a full member, then the Seven can be fitted into that context too—as full members or as associates.

There is a considerable body of opinion in the countries of the Seven that would welcome such a move, for to remain outside the common market is a pretty disagreeable prospect for countries heavily dependent on trade with it. But for Austria, Switzerland and Sweden there is the problem of their neutrality, which, they feel, precludes them from close political engagements. Appropriately enough, Mr Selwyn Lloyd and Sir Roderick Barclay left London for Vienna the day after the meeting on Euratom. The realities of Austria's problem will be rubbed home for Mr Lloyd by the fact that Mr Khrushchev is to visit Vienna next week, when he is expected to demonstrate the advantages of neutrality to the Austrians by offers of more trade.

All the same it would be wrong to imagine that the problem of neutrality is an insuperable obstacle to an agreement between the Seven and the Six. If the British once decided to join the common market, Austria and Switzerland could conceivably be fitted into it without certain of its institutional commitments. The crucial decision may be Sweden's, whose neutrality is neither an imposition from outside, like Austria's, nor an inherited though ageing doctrine, like Switzerland's, but a considered policy closely related to the struggle between east and west. The Swedish attitude may determine how far the rest of Scandinavia is prepared to go. A good many Swedes accept the fact that a European customs union—even a federation—will come one day. What they have to decide is whether they can afford to sit down and wait for several years, as many of them would like to do, when the community of Six is developing with unexpected speed.

COMMUNIST BLOCK

Bucharest Jamboree

THE meeting of the communist clans (from 46 countries) in Bucharest this week was plainly inspired by something more than friendly interest in the achievements and plans of the Rumanian comrades who have been holding their third party congress. The gathering was comparable to the meeting of the world communist movement in Moscow in December, 1957. Mr Khrushchev himself headed the Soviet delegation, and all the Communist leaders of eastern Europe were present except for Mr Gomulka who, rather curiously, was delayed in Warsaw until Thursday and Enver

Hoxha, the Albanian leader, whose absence was unexplained.

It is plain that Mr Khrushchev went to Bucharest in order to put the communist movement in the picture, as he sees it, about its relations with the capitalist world. The breakdown of the summit conference probably caused a good deal of doubt and uncertainty in the communist block; more important, Mr Khrushchev's policy of "peaceful co-existence" has not been universally accepted in Moscow and in Peking it is being, in effect, openly challenged. An article last week in *Red Flag*, the Chinese communists' chief theoretical organ, suggested that Peking did not intend to knuckle under to recent criticisms in the Russian press of its views on the nature of imperialism and the inevitability of war.

Mr Khrushchev took up the Chinese challenge on Tuesday when he made to the Rumanian party congress an important pronouncement in which he tried to provide a theoretical justification for his view that Lenin's belief in the inevitability of imperialist wars is no longer tenable in modern conditions. He said that now Russia and the whole Socialist camp had emerged as powerful forces one cannot go on "mechanically" repeating what Lenin said in quite different historical conditions. In due course, according to Mr Khrushchev, only a few capitalist states would be left "as small as buttons on a coat"; how could one then go on repeating that wars were inevitable because some capitalist countries still existed? The Russian leader said that if Lenin could rise from his grave he would take those people who still hold such views "by the ear" and teach them a lesson. This and other uncomplimentary references (by implication) to the Chinese cannot be well received in Peking, although the speech has been enthusiastically acclaimed in the capitals of eastern Europe. Peng Chen, the Chinese delegate in Bucharest, made a firm, though restrained, rebuttal of Mr Khrushchev's views. It remains to be seen whether Peking will eventually let the Russians have the last word.

Jugoslav Heretic

One notable absentee from the meeting in Bucharest this week was any Jugoslav representative. If one had been there, however, he would not have been very comfortable. However much communists in Moscow, Peking and elsewhere may disagree about the great and cloudy issues of peace and war they can always come together in comradely abuse of the one agreed heretic, Marshal Tito. The Jugoslav leader's comments on the breakdown of the summit conference—he failed to put the blame squarely and entirely on the West—have put him more firmly than ever in the communist doghouse. *Kommunist*, the Russian ideological journal, has added its measured criticism to Peking's persistent, vituperative sniping. And in Bucharest, on Tuesday, Mr Khrushchev strongly criticised the Jugoslav leaders for their refusal to co-operate with the rest of the socialist camp. Marshal Tito's refusal to acknowledge that it is necessary to have a socialist camp at all is, indeed, an unforgivable sin in more orthodox communist eyes.

Marshal Tito, for his part, continues to propound his views on the inability of the great powers to settle the world's problems. Without wishing, he says, to try to create any third block, he believes that if the smaller, uncommitted countries would bestir themselves more actively, they could play a useful role by helping to create a better atmosphere in the world. These ideas were expressed in the joint statement issued on Monday at the end of President Nasser's visit to Jugoslavia; and Marshal Tito will no doubt be discussing them with other visitors, from the Sudan and Indonesia, for example, later in the summer. But whatever success the marshal may, or may not, have in improving the international climate, the Russians and the Chinese will unite in condemning his efforts as a device to gain influence among the uncommitted countries.

THE HEALTH SERVICE

From Beads to Taxes

On Monday morning, the Minister of Health told his listeners at the opening of the National Hospital's centenary celebrations that the health service had not cast a blight on the hospital but had promoted its growth and enlarged its influence. On Monday afternoon, Sir Arthur Porritt, the new president of the British Medical Association, declared the organisation of the health service to be a dismal failure. Are these two statements contradictory?

The National Hospital for Nervous Diseases, founded as a tiny charity through the efforts of two sisters who raised £200 by selling ornaments made of beads and shells, had become one of the great centres of neurological medicine, surgery and research in the world long before the health service had been thought of. But the fruits of its work can now be carried to other hospitals in Britain, where, thanks to the resources of the health service, neurological units have been established. And the National Hospital itself could hardly be carrying out its extremely elaborate and expensive investigations and procedures if it could not rely on public funds.

It was not, in fact, the reliance on public money that Sir Arthur Porritt was deploring, but the machinery through which it is channelled. To run the health service he would substitute an "independent corporation" for the Ministry of Health, a corporation in which the medical profession would have at least equal representation with the layman and which would be free from parliamentary scrutiny for its day-to-day conduct. Sir Arthur is chairman of a professional committee now investigating all aspects of the health service, and his proposals are important as showing which way the committee's mind seems to be turning. But they are quite unrealistic. Even if the BBC and the University Grants Committee were as universally accepted as ideal organisations as Sir Arthur seemed to think, Parliament is not, and should not be, willing to shed any of its responsibility for a service costing £750 million a year. Now that taxes have replaced beads and shells, the taxpayer as well as the doctor and the patient has a right to be heard.

STRIKES

Not So Bad

Last year's loss of 5.3 million working days through industrial disputes was the second highest for any year since before the war; two-thirds of the lost days were accounted for by the six and a half week stoppage in the printing industry, with the various strikes in shipbuilding and motor vehicles adding another tenth. As more than 5,000 million days are worked in British industry every year, even last year's loss was no more than one tenth of one per cent of the days worked; in America the loss is regularly twice as high. Much of the alleged sacrifice of output that even this tiny figure suggests was not lost in fact but was made up by working overtime after the disputes were over. Strikes in Britain are certainly a less important source of general industrial wastage than sickness, absenteeism or restrictive practices.

WORKING DAYS LOST PER 1,000 EMPLOYEES

Industry	Annual average, 1949–1958*
Shipbuilding and repairing	2,000—5,000
Water transport and docks	1,000—1,500
Road passenger transport	500—1,000
Coal mining	500—1,000
Motor vehicles and aircraft	250— 500
Iron and steel	250— 500
Iron foundries	100— 250
Printing and publishing	100— 250
Railways	100— 250
Goods transport by road	100— 250

* The figures include days lost by workers indirectly involved. The estimates are therefore given as broad ranges.

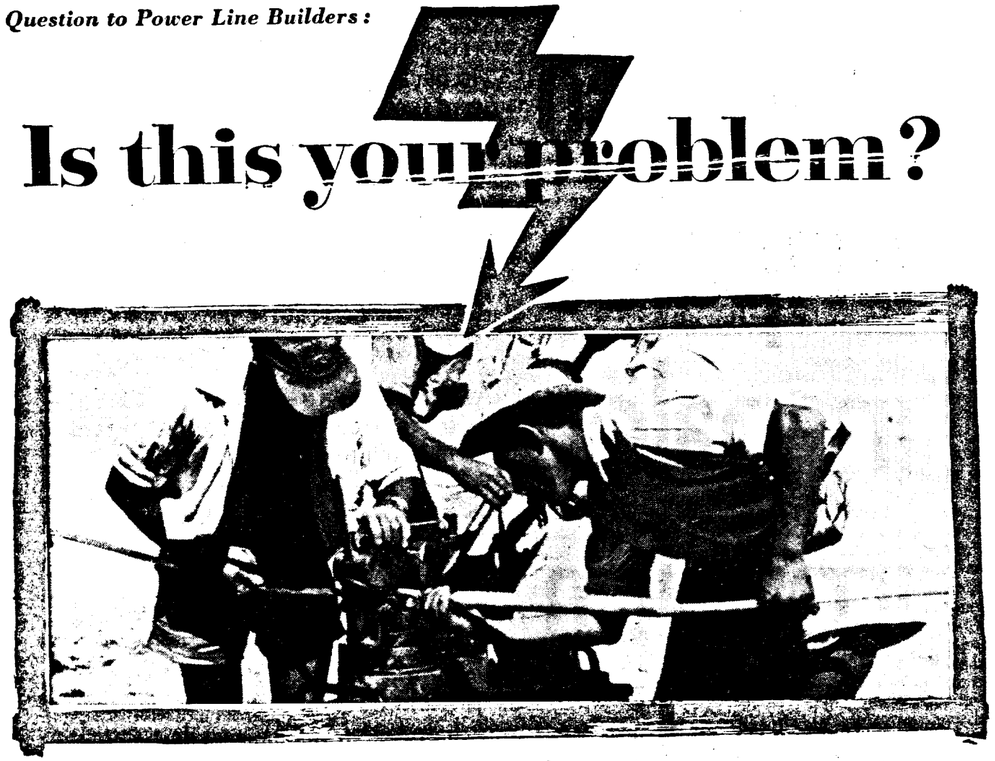
Despite the publicity given to strikes in the motor industry, the industries with the worst records are still mostly the old and depressed ones, as the table below shows. Far away at the head of the league come those hardy perennials, shipbuilding and the docks; an unofficial strike in the Liverpool docks, where trouble has been endemic ever since the dispute between the "blue" and "white" unions started in 1954, is going on at the moment. Next most seriously affected are road passenger transport (bus strikes) and coal mining; the latter usually has as many stoppages each year as all the others put together, but they tend to be short and sharp. At the other end of the scale, less than one hundredth of a day a year has been lost through disputes since

impalco is backed by the unmatched commercial and technical resources of I.C.I. and Aluminum Company of America.

impalco was formed by these two great companies to give improved technical and supply service to industry.

impalco extrudes, rolls, draws and fabricates aluminium and aluminium alloys.

impalco delivers from stock the shapes and sizes most in demand by British users.



impalco sells through the world-wide sales organisation of Imperial Chemical Industries.

impalco aluminium products are obtainable through your I.C.I. area sales office.

Question to Power Line Builders:

Is this your problem?

Simple? Maybe . . . but splicing electrical conductors—even if they are Feral Cable—has to be done properly if the finished line is to be a first-class job. In fact, the splicing is of A1 importance for the proper functioning of any transmission line. It is not only a matter of knowing how it should be done, but of seeing that the work is carried out correctly at every joint.

For good electrical connections, both the conductor wires and the aluminium sleeve have to be carefully cleaned before the splice is made. It is important, too, that the sleeve should extend for an equal distance on either side of the joint. Other precautions are also necessary, such as seeing that the steel core is not damaged when the outer layers of aluminium conductor are cut away.

When customers are confronted with problems of line construction, Svenska Metallverken is always prepared to help in finding solutions by drawing on the extensive know-how which is available in Sweden. Come to think of it, there's a lot of know-how already gone in to making Feral Cable—*reliable* Swedish ACSR—available in such quantity and quality.

When planning power lines, consult

SVENSKA METALLVERKEN

Manufacturers of Feral Cable

Job done properly? When once a sleeve has been clamped on, it may be difficult to see whether it has been properly positioned over the joint. To provide an easy method of checking, Svenska Metallverken has developed this Position Gauge, which shows, quickly and precisely, whether the sleeve is centred or not.

All tools and fittings necessary for ACSR line construction are supplied by Svenska Metallverken, in addition to the Feral Cable. When required, too, experts are sent out to help line builders with construction problems.

1949 in such industries as boots and shoes, flour milling, drink, chemicals, and (not surprisingly) white collar employment.

FAR EAST

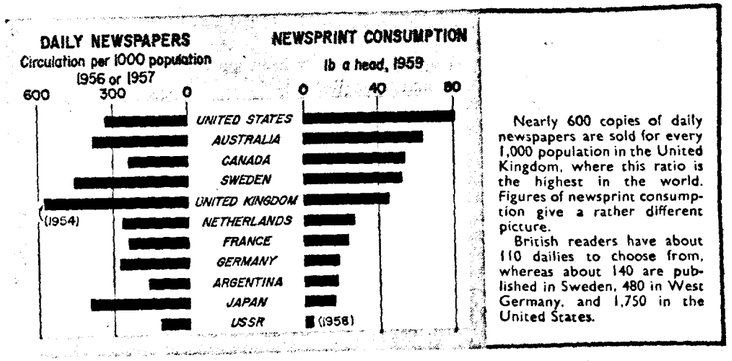
Tour of Subtopia

In spite of local successes, President Eisenhower's tour of the Far East leaves only the flavour of mortification. The visit to Japan was planned as an appendage of the visit to Moscow; the visits to the Philippines, Formosa, South Korea and Okinawa were ancillary appendages to the visit to Japan. In the event, the president only visited places of sub-presidential significance. Japanese mob politics having unexpectedly raised the overwhelming question of whether Japan was to be committed or neutralist, the rest of the tour was relegated to the level of a parochial charity fête. The cheers of Manila, Taipeh and Seoul were no more than a much needed solace in a heart-chilling performance.

The president's reception in South Korea was the most interesting because the least predictable. President Syngman Rhee having departed (after the tour had been arranged), the attitude of his supplanters to his erstwhile protector was a matter both for doubt and investigation. The outcome was favourable. Washington had adjusted itself with conspicuous nimbleness to the change in South Korean politics, and President Eisenhower found on his arrival that his Administration was accepted as a friend of South Korea and not merely of a particular faction.

Okinawa showed the other side of the picture. Originally the president had intended only to make the briefest of stops at the airport, but since the whole schedule had been relaxed after Japan dropped out, the visit to Okinawa was stretched to a couple of hours and a tour of the capital. A large force of Okinawan policemen and American marines failed to prevent a cordon of snake dancers from forcing the president to return to his aircraft by helicopter. The demonstrators were making the point that though they did not dislike Ike, they liked the Japanese more.

Now, and for the next few years, Okinawa ranks high in importance among the strategists of the Pentagon, and recent events in Japan have, if anything, increased this importance in their eyes. When the missile gap is closed, the strategists may change their minds, but until then the United States is as wedded to its rights in Okinawa as the British, for less obvious reasons, are to theirs in Cyprus. The Americans are becoming acutely aware of the problem, so irritatingly familiar to the British, of the value of a base in a territory in which they seem increasingly unwelcome.



GERMANY

Partisans in Bonn

Political life in Bonn, remarkably quiescent after the summit failure, has revived now that Dr Adenauer has returned from his three weeks' holiday in the Italian alps. It has not taken long for it to become clear that the Chancellor is more than ever convinced that his unbending policies towards the communist world are right, and that they are best carried out by him and him alone. Since the Paris fiasco, the Social Democrats have made determined overtures for a bipartisan foreign policy. Dr Adenauer maintains that the only possible bipartisan policy consists of support for his own.

It is a disappointing position for the Social Democrats. Ever since Mr Khrushchev reopened the Berlin question they have been tending to swing into line behind the Bonn government in face of what they regard as a threat to a basic national interest. In May, before the summit meeting, Herr Ollenauer wrote to Dr Adenauer outlining the points where the Socialists were in agreement with his policies and offering further discussions. Formally, at any rate, the areas of agreement are large. The Social Democrats are all for a firm line on Berlin. Whatever their original doubts about the rearmament of western Germany, they recognise that the ties with the western alliance must now be preserved. They feel, like Dr Adenauer, that disarmament offers the best starting-point for east-west talks. They appear to part from him only in the suggestion that the atomic armament of western Germany should be held in check, and in the hope that a zone of limited armaments might open the way to serious talks on German unity.

Both west German foreign policy and domestic politics could, in fact, benefit from a more friendly exchange of ideas between government and opposition and a search for common ground. But Dr Adenauer evidently feels that he can gain greater electoral advantages by seeking to isolate and divide the opposition than by working with it. In any case, differences in attitude remain. While Dr Adenauer seemed to find it difficult to conceal his pleasure at the summit failure, and evidently views western Germany as the front-line post of a beleaguered civilisation, the Socialists see the failure in Paris as a sad setback for a process of discussion with the east which must continue until Germany is reunited.

Nearly 600 copies of daily newspapers are sold for every 1,000 population in the United Kingdom, where this ratio is the highest in the world. Figures of newsprint consumption give a rather different picture.

British readers have about 110 dailies to choose from, whereas about 140 are published in Sweden, 480 in West Germany, and 1,750 in the United States.

PENSIONS

Beyond the Welfare State

An increasingly damaging case can be stated against national insurance, especially as it concerns old age pensions. As insurance the scheme is a fake, adjusting premiums neither to risks nor to benefits. As a remedy against poverty, it is stingy to the indigent minority and it imposes irrelevant and elaborate cross payments on everyone else. Moreover—the case for the prosecution continues—the whole cumbrous machinery is becoming superfluous.

Such justification as it ever had rested on beliefs that are rapidly becoming outdated: that the working masses, earning little and often unemployed, simply cannot save for retirement, and that they typically constitute a *Lumpenproletariat* to whom thrift is alien. The National Insurance Act of 1959 began dimly to recognise the way that things are going, by allowing firms with adequate private insurance schemes to contract out of the additional "graduated" contributions it imposed (and out of the related graduated additions to pensions); but it did not go far enough in encouraging contracting out, and it superimposed the new system on the existing generalised welfare scheme, instead of setting out to recast it.

This case against the Act has been excellently stated in "Pensions for Prosperity,"* a pamphlet sponsored by the Institute of Economic Affairs. The pamphlet goes the whole hog. It thinks that the 1959 Act should be repealed and replaced by a residual public scheme for odd-men-out; encouragement should be given in specified

* "Pensions for Prosperity." By Arthur Seldon. Barrie & Rockliff. 48 pages. 3s. 6d.

ways to private pension schemes run by businesses, friendly societies, trade unions, clubs and churches; eventually national insurance should be progressively wound up, contributions repaid to working contributors, and a more generous national assistance scheme should then be left to serve the needy. The plan is coherent, well documented, and attractive. It is important because it shows the way that policy is likely to go as people begin to realise that the "public sector" of consumption in Britain today is over-extended and, more important, wrongly constituted for a prospering society. But one warning is worth uttering: those who wish to push forward amendments in either or both respects are more likely to be quickly successful if they do not allow themselves to become too strongly powered by an irrational distaste for all forms of public enterprise "mutuality." It is a mistake to suggest that a peculiar moral splendour automatically attaches to any act conceived in individual economic independence and a peculiar moral obloquy to the use of any public services.

PUBLIC SCHOOLS

Cutting The Rate

NOBLE hearts will beat more easily as a result of this week's decision by the Lands Tribunal to reduce the rateable value of Shrewsbury School to £9,500. Neither the school's governors nor Shrewsbury council had been satisfied with a local court's decision in 1958 to reduce the gross rateable value of the school from £14,000 to £10,000; the school said that the figure should be reduced further to £8,750, and the council said that it should actually be raised to £15,000. This difference proved too large to be bridged by the gentlemenly agreements that most of Britain's other 160 public schools have made with their respective rating authorities; the case, complicated by massive sets of documents arguing the various notional ways of deciding the total rent of an institution that is never likely to be rented as a whole, then went to the tribunal. Its findings, unless appealed against on a point of law, are final; they are obviously more satisfactory to the school than to the council.

This is a relief to other boards of governors besides those of Shrewsbury. Although they have mostly agreed any revisions in rates that followed from the 1955 Rating and Valuation Act, there was a feeling that if Shrewsbury council had won its case these agreed revisions would have looked too generous. Appeals for rate increases could then have followed. The decision will also help the eleven public schools that have still to agree with their local councils on their new assessment.

The decision by the tribunal was entirely a technical matter of rating; but inevitably the arguments before the tribunal embraced the whole field of public school finance. Higher rates would have meant higher fees, with the prospect of yet another squeeze on the pocket of the upper middle class parent. Unwelcome though this would be, however, it is not an argument for keeping down rateable values—a policy that would shift the burden of helping public schools on to the shoulders of local residents, a singularly unfair method of subsidy when a boarding school recruits its pupils from all over the country. National policy enters into this matter only in so far as a slightly dubious ceiling to public school rates is actually provided for in section 8 of the 1955 Act; but Shrewsbury, especially with its new assessment, is well below it.

INDONESIA

Dr Sukarno's Superiors

RETURNING to Indonesia after his foreign tour, President Sukarno made a speech on June 10th reminding the politicians that he was now not merely head of state but also chief executive, under the decrees he had issued before his departure. He added: "I have only two superiors above me, first, God almighty, and secondly, the people's consultative congress." Since the people's consultative congress does not yet exist, the Indonesian president was being too modest. The president, however, is now completing the new *Gotong Rojong* (mutual aid) parliament; in response to complaints that the 261 members he had nominated in March included too many communists or fellow-travellers, he has hand-picked 22 new members of whom 16 are Moslems. The main Moslem party, Masjumi, however, remains unrepresented because of its connection with the rebellion in Sumatra and Celebes.

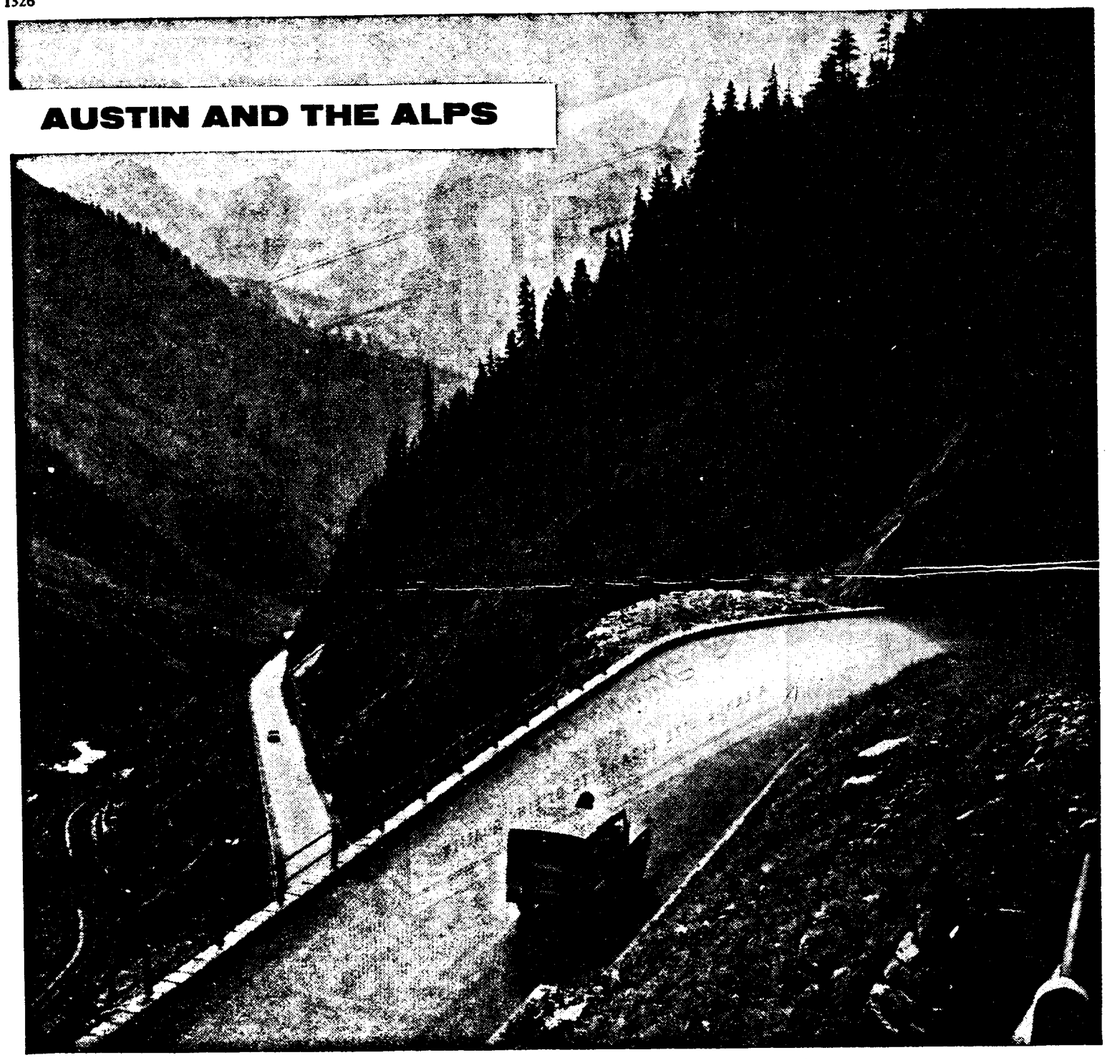
The function of the "mutual aid" parliament is to help the government, not to criticise it. It is hard, however, to disguise the fact that criticism and opposition are on the increase. The new Democratic League, formed after President Sukarno's departure as a protest against his plan for a single-party state, includes Moslems and nationalists of various shades who are participating as individuals and not as representatives of their parties. To the Democratic League and the Masjumi should be added the more militant rebels who proclaimed a rival government more than two years ago and a federal union of Indonesian states (RPI) last February. Also in opposition, though no longer in active politics, is the respected former vice-president, Dr Hatta, who has just spent a few days in this country after a stay in the United States. Just before leaving Indonesia, Dr Hatta wrote a magazine article strongly criticising Dr Sukarno's failure to produce a more effective remedy for Indonesia's ills than blueprints that remain unimplemented. If Dr Sukarno's remaining supporters grow tired of their leader, they could do worse than turn in Dr Hatta's direction.

CAMBODIA

Throneless Head

IT would be ungenerous not to welcome Prince Sihanouk's acceptance of the general demand that he should become head of the Cambodian state.

Since Cambodia regained its independence under the Geneva agreements of 1954, which ended the Indo-China war, Prince Sihanouk has dominated his country's politics, whether in or out of office. At the time of independence, he was still king, but he took the unusual step of abdicating to form a political party, the Popular Socialist Community or Sangkum, which has since won two general elections with overwhelming majorities. He was succeeded by his father, the Cambodian sovereign being chosen by the numerous royal family from its own ranks. After the king's recent death, the prince created a regency council pending the next choice of a sovereign. This procedure did not meet with the favour of the army or politicians, who felt that only the prince, as the uncontested national leader, could become head of state. The regency council has now resigned and the constitution has been amended to allow the prince to become head of state without re-ascending the throne and in the absence of an alternative sovereign. Cambodia remains a monarchy, however, and Prince Sihanouk has taken an oath of fidelity to the vacant throne.



At the beginning of the month, Prince Sihanouk submitted his policy of "neutrality and peaceful co-existence" to a popular referendum and obtained the overwhelming majority that had been freely predicted. Whether he blows hot or cold, it is impossible not to be impressed by the success with which the prince has pursued his policy or by his capacity to confound the knavish tricks of his opponents. Cambodia now receives economic aid from the United States, Russia, France, China, Jugoslavia, Czechoslovakia and Japan, from the Colombo Plan and from the United Nations. Plotters against his life have fled to neighbouring countries and the prince recently denounced the machinations of the local communists who, he said, took their orders from north Vietnam. The only shadow in the picture is that the prince, who suffers from a heart ailment, has been resting and dieting to reduce his weight. His recovery is essential for the stability of Cambodia.

UGANDA

Historical Reminiscence

TALKS between the Colonial Office and members of the Ugandan legislative council began in London on Wednesday. The battle here is not mainly about when Uganda should become independent, but whether an independent Uganda should be democratically ruled or whether it should

EVERY YEAR between 350-400 motorists break down or get into difficulty on the 7,000-feet-high Grimsel Pass in Central Switzerland. 30-year-old Roman Sidler's job is to rescue them. Just that. To find them on the precipitous road . . . to repair their cars or tow them . . . and to see them safely on their way. And to do this job he uses an Austin Gipsy—the one he is driving in the picture.

MOUNTAIN CONDITIONS

If you've ever driven on an Alpine pass you'll know how steep they are . . . how the narrow road twists and snakes between the crags and sheer rock on either side . . . how it climbs and climbs until you think you simply *can't* go any higher.

It's not surprising break-downs occur. Cars are tested to the utmost by these roads, and the thin atmosphere and overheating produce highly unusual engine conditions.

TOURING CLUB OF SWITZERLAND

That's why the Touring Club of Switzerland operate this rescue service. For all the summer months, from early June until late October, when snowfalls close down the pass completely, Roman Sidler aids the traveller. Every half-mile or so along the mountain roads there are telephones: calls for help are passed immediately to Herr Sidler. His Gipsy is fitted with a radio system which flashes a signal whenever he is required—wherever he may be.

THE PULL OF THE GIPSY

Driving in the mountains requires the highest qualities of a vehicle. Of the Austin Gipsy he drives, in service since early 1958, Herr Sidler says: "The Gipsy pulls really well in these mountains. Its suspension and gearbox are first-class, too. And we always get excellent service."

Here are some more features of the Gipsy:
'Flexitor' rubber torsion suspension that needs no maintenance. 62 b.h.p. petrol or 55 b.h.p. diesel engine. 4-speed syncromesh gearbox with power take-off; high and low ratio auxiliary with f.w.d. All-steel body. Canvas hood or removable hardtop (£50 extra). Overall length 11' 7". Max. drawbar pull 3,000 lb.

AUSTIN

THE AUSTIN MOTOR COMPANY LIMITED
LONGBRIDGE · BIRMINGHAM

be a loosely-knit country in which the royal privileges of the Kabaka of Buganda and the lesser tribal chiefs are resolutely maintained. If the position in Uganda seems complicated to a British layman, he can perhaps be helped towards clarity if he makes certain imaginative assumptions. First, that everybody concerned is white; this should assist the inquiring liberal, who tends to be baffled by inability to sort out into black and white a dispute in which both sides are black. Second, that the Buganda traditionalists are clad in cocked hats and knee-breeches; this should avoid confusion with the strictly twentieth-century tensions in most other African territories. An obstinate king: demands for constitutional reform: trouble about taxes: inflammatory literature: for the Wild Report (which advocated democratic elections) read the Rights of Man. Most western countries have been here before.

The Kabaka and the lesser chiefs deserve as much sympathy as other traditional rulers who are marooned by the rising waters of change; but the struggle between hereditary privilege and nationalism is one in which there can be little doubt about the final outcome. Nor can any satisfactory way out be found by laying emphasis on separatism for Buganda. While the separate independence of many very small African territories has been sanctioned by its European-drawn boundaries, Buganda is separated from Uganda as a whole only by the rapidly vanishing barriers of tribalism. It is important that they should vanish. Across the border, Congolese independence is only a week off; the restrictions which were placed this month on assembly in certain border areas of Uganda recognise a real threat that could be wafted across the frontier.

It is possible that the newly-formed United National Party—which bills itself as a party of moderates—may be able to draw support outside Buganda as well as inside it; if it did succeed in gaining support as the party of a united Uganda as well as the upholder of local kingship, it would bring off a remarkable double. But it is more likely that modern nationalism will ultimately be triumphant. The British Government, in its qualified acceptance of the Wild Committee's recommendations, made it clear that country-wide elections must precede discussions on the future of the chiefs or on Uganda's political structure. The present talks stem from what were basically African proposals for an African state; that they are opposed by an African king should not disguise the fact that it is generally best for kings, of whatever race, to yield in the end.

ANTIQUES

Still Rising

As usual the antique dealers at their annual trading fair at Grosvenor House complained that it is getting harder and harder to come by their wares; but as usual there was a sumptuous display. And although there is pressure on the organisers to relax their date line of antiquity, a committee of experts still vetted each exhibit and allowed in only those made before 1830.

When the fair closed this week, some 25,000 people had visited it over its fourteen days. But the really big business is done mainly on the first day; although it may seem hard to believe that pieces of furniture at £4,000 or more have to be snapped up, the exceptional antiques are likely to be sold within a few hours of the fair's opening. American dealers were fewer: they have been declining in numbers over the last few years. Perhaps they have become suspicious that prices are inflated for the dollar market; in any case they can nowadays buy more readily at home than before. This lack of attention from the Americans does not seem to displease the dealers so long as the British are buying instead, which now seems to be the case. It was quite clear at Grosvenor House this week that prices of fine antiques are still rising and that the market remains very firm.

TRUST TERRITORIES

Hares and Tortoises

UNITED NATIONS visiting missions are now working overtime to keep the Trusteeship Council fully appraised of the progress of its charges. The mission to Tanganyika heaves an audible sigh of relief, in its latest report, at the harmony and racial peace which pervade that territory, and its encomiums to the British are only slightly less effusive than those to Mr Nyerere and the Tanganyika African National Union. Independence is round the corner, the report says, adding urgently that what is now wanted is capital to maintain the territory's economic impetus and a scheme to enable the British administrators to stay on (Commonwealth Relations Office kindly note).

Some of this optimism may be misplaced; but Tanganyika is no problem compared with neighbouring Ruanda-Urundi. The visiting mission there has now gone off to concoct its report which will not be ready until after the neighbouring Congo is independent. The UN will probably endorse Belgium's plans—to create a "Community of Ruanda and Urundi," to convert the two hereditary rulers into constitutional monarchs (as Britain has tried to do to the Kabaka of Buganda), to set up local councils, provincial councils and a joint community council. Who Belgium intends to use for councillors is not much clearer than it was in the Congo. Belgium, says the Resident General of Ruanda-Urundi, intends "to subordinate the granting of independence to an indispensable probationary period of democratisation"; to this, too, the visiting mission is unlikely to take much exception, for Belgium also proposes to bring Ruanda and Urundi delegates to Brussels for a conference in August. The precedent for a quick retreat thereafter is ominous, and the United Nations may find that it has to provide an international "*force publique*" to keep the Watutsi and Bahutu apart.

LAW

Decline at the Bar

THE forebodings about the state of the Bar expressed in *The Economist* early this year (January 9) have been confirmed by the annual statement of the Bar Council for 1959. Although 88 barristers began practice during the year ending last September, 112 abandoned the Bar, leaving the profession with only 1,923 practising members, probably an all-time low. The figures make the report of Mr. Geoffrey Lawrence's committee on partnership at the Bar all the more urgent; but it now seems, despite many meetings, that this report will not be issued before the autumn. Meanwhile a positive step has been taken by the council in entrusting the Young Barristers' committee with the task of ascertaining the reasons that have caused barristers to cease to practice during the last five or ten years and the fortunes of those who have stayed. The idea of getting the patient to report on his own condition is an excellent one, and the young barristers will be helped to conduct the project by the National Institute of Economic and Social Research. They should concentrate on defining the exact financial difficulties that deter able young men from practising at the Bar.

This year the Bar Council has certainly done all it can to improve the lot of those who have any briefs at all. Fees are up at Assizes, Quarter Sessions, Magistrates' Courts, and Courts Martial. The council should now settle the vexed question of the scale of fees for devilling and bring the present haphazard system of payment to an end. Discussions have taken place with the Law Society about assimilating the professional examinations for barristers and solicitors, but with no apparent concrete results. The sooner assimilation is brought about, the better for everyone—but especially the Bar, whose exams remain a disgrace to a profession that takes pride in calling itself learned.

RAILWAY ADVERTISING

"The Choice is Yours"

THE advertising convention against "knocking copy" has, where identifiable brand products are concerned, a hardly less than Mosaic force. (Indeed, it is hard to think of any one of the Ten Commandments which is as generally and conscientiously observed.) To say that a rival's

product stinks, shrinks, explodes, rots the lining of the stomach, or merely constitutes the worst bargain since Esau's pottage, is simply Not Done; and the taboo on overt aspersions generally includes not only individual products (which are, after all, backed up by the law of libel) but the whole class of goods or services to which the advertiser is asserting his own competitive superiority. True, one may gently imply, without actually asserting, that soap in general (as distinct from those superior detergents Foamo and Whizzo) leaves a revolting scummy ring round the sink; or that any producer of synthetics who gives the public to understand that there *is* a substitute for wool is a shocking liar; or that coal fires are (by comparison with So-and-so's oil furnace) grubby and drudgery-producing, or that central heating is (by comparison with a coal fire) un-cosy and inhuman. A really brutal comparison, openly and unambiguously presented, is however a revolutionary rarity.

The British Railways Executive's current display advertisement sets a new standard in brutality. It juxtaposes aerial photographs of (a) an express train speeding majestically on its way, and (b) an immobile block of cars, coaches and lorries solidly wedged in a subtopian avenue. It hardly needs its four-word caption—"The Choice Is Yours." No specific product is "knocked"; but the invitation not merely to buy a railway ticket but to refrain from buying petrol, oil, tyres, or coach seats, not to mention the family car itself, could not be plainer—or, one can in present circumstances reasonably add, more salutary. The road interests could, of course, hit back. Another pair of photographs could with equal justice show the beginning or end, rather than the course, of the journey; the independent and carefree motorist loading up or unloading at his own door, the harassed and burdened train passenger queueing sheeplike at the platform gate or the station bus-stop amid jostle, soot, uproar, and peremptory yells of "*Mindjerbacks!*" And that might, in a different way, be salutary too.

The convention against specific "knocking" is probably sound. It rules out a lot of dirty fighting in a game where temptation is strong. But an occasional glimpse of those facts of life which the convention does so much to conceal has its undoubted uses. For once in a way, two cheers at least for British Railways.

SHORTER NOTE

On June 11th, we said that Mr Humphrey Berkeley, the Conservative MP, had been retained by the government of Ghana as its public relations adviser in London. Michael Rice Ltd., the public relations firm of which Mr Berkeley is a director, has now informed us that the contract has been signed with the company, not with Mr Berkeley personally; and Mr Michael Rice therefore protests that our statement was a "fundamental error."

LETTERS

The D-Mark

SIR—The persistent firmness of the D-Mark and the resulting influx of gold is likely to cause much embarrassment both to Germany and to the rest of the free world. The only natural and really effective way of checking it would be for the German authorities to allow the development of a moderate degree of inflation, just sufficient to restore equilibrium. Since, however, the memories of 1923 seem to rule out that solution, the next best thing would be to discourage the influx due to speculation on a revaluation of the D-Mark.

Ours is a cynical world, and official denials of intention to revalue the D-Mark are not likely to carry sufficient conviction to check and reverse the speculative demand for D-Marks. What is needed is not words but action—some form of legally binding guarantee by the German authorities against revaluation.

This is not so fantastic as it sounds. Actually there is at least one precedent for it. In 1957 the Netherlands Bank bought forward D-Marks, in an effort to discourage transfers of Dutch funds to Germany for interest arbitrage, under the guarantee of the Deutsche Bundesbank. This fact has never been disclosed beyond a vague reference to it in the Annual Report of the Netherlands Bank for 1957 to having been "greatly assisted" in its sales of forward marks "by an arrangement with the Deutsche Bundesbank."

If only some such operations were to be undertaken now and if the facts were officially announced it would, I think, effectively dispose of revaluation rumours. For nobody would imagine for a moment that the Bundesbank would give such guarantees unless it was fully satisfied that a revaluation was out of the question.—Yours faithfully, PAUL EINZIG
London, E.C.4

Gallup Polls

SIR—In your interesting review of "The British General Election of 1959" by D. E. Butler and Richard Rose you say that the authors seem to suggest that "... but for an almost fortuitous Tory recovery in the last ten days, they might have found themselves writing a very different sort of book," and later state that the authors "date the Tory recovery from the moment that Mr Gaitskell devalued himself as a statesman with his income tax pledge."

These interesting observations have now become almost one of the myths of the 1959 Election. There is no evidence from the public opinion polls that this in fact did happen. On the contrary if one looks at the figures on voting intention from August to October one finds that there is nothing in *them to indicate a switch of any significant* size. The figures below show the position on the dates when the polls were published:

	Con. %	Lab. %	Lib. %	Don't know %
31st August ...	42·0	37·0	7·0	14·0
14th September	43·0	36·0	5·0	16·0
21st September	42·5	39·0	8·0	10·5
28th September	43·0	41·0	6·0	10·0
5th October..	41·9	40·6	4·1	13·4
8th October..	44·2	40·6	7·3	7·9
Weighted average	42·8	39·5	6·3	11·4

If the "Don't knows" are excluded from the calculation then the position on voting in Great Britain as shown by our polls as against the actual result was as follows:

	August	Poll published on polling day %	Weighted average of six polls* %	Actual result %
Conservative ..	48·9	48·0	48·3	48·8
Labour	43·0	44·1	44·6	44·6
Liberal and Others.....	8·1	7·9	7·1	6·6

* A weighted average is necessary because samples are not all of equal size.

It will be seen that—allowing for the errors inherent in the sample size being used i.e., between 1,000 and 2,000—except for a slight gain to Labour and a *fall* in the "Don't knows" there is nothing significant in the changes shown during this period. It seems more true to say that little happened during the election to alter voting intention but that there was a slight increase in Labour support. I would draw your attention to the fall in the "Don't knows" during this period as it is yet another of the election myths that there was an increase in the "Don't knows" during this election.—Yours faithfully, R. M. SHIELDS
National Opinion Polls Ltd.,
London, EC4

Election Finance

SIR—In your trenchant comments on the inadequacies of the existing electoral laws, you seemed to miss the point of Labour and Liberal complaints. To a large extent they are based upon the belief that their parties suffer at the polls because only the Conservatives can afford to run their party organisation on a large scale and in a businesslike manner.

It is quite possible to reject the placing of limitations on politically relevant advertising on the grounds that proposals so far made to level down expenditure are of doubtful efficiency—or else so efficient as to be a threat to what many regard as their right to free expression. But it might be worth considering a dissipation of grievances by narrowing the gap through the levelling up of the resources of Labour and the

Liberals. Two possible ways come immediately to mind:

1. An increase in the individual dues and trade union affiliation fees paid to the Labour party. (This would increase the party's cash resources, if not its independence of the unions.) The Liberals would not, however, benefit.

2. The provision of an Exchequer grant for use by party headquarters, to be given all candidates who save their deposits. This grant, made annually or after each election, could be a flat rate sum or calculated according to votes received, or constituency campaign expenditure. The poorest party, the Liberals, would benefit most in proportion to their current income; the richest party, the Conservatives, would gain relatively least.

As long as a feeling, however well or poorly grounded, exists among two of the three parties that the election law is unfair, ways of removing the grievance must be canvassed in hopes that the government may see fit to appoint a committee to investigate the charges and consider a variety of reforms with regard to their practicality, efficacy and intent.—Yours faithfully, RICHARD ROSE
Nuffield College, Oxford

*

SIR—Your notes on electoral law prompt me to suggest some changes which would save public money—and introduce a little more competition into our elections.

Firstly, since the principal parties seem to have plenty of money the present free distribution of an election address by the GPO should be abolished. At one per household this represents some 30,000 unsealed envelopes. At 2d. each this costs the public some £250. An extravagant candidate who sends an address to each person might well cost the public between £500 and £600 in postage. This seems quite unnecessary. An enthusiastic party could, after all, arrange its own distribution; a wealthy one could pay.

Secondly the requirement of £150 deposit should be abolished. This merely helps to shield the two major parties from inconvenient competition, and narrows the range of choice in front of the elector. It should be replaced by a fixed nomination fee which would not be returnable. This could be purely nominal e.g., £5 or it could be £25 or so. It might well be fixed to bear some relationship to the costs involved by putting an extra name on the voting slip—whatever that cost might be. If fixed at £25 or over, it should deter the purely frivolous, without preventing the steady emergence of a new party.

If the fact that these suggestions come from an ex-Liberal candidate be the subject of adverse comment, may I quote Kipling:

"The toad beneath the harrow knows
Exactly where each toothpoint goes.
The Butterfly upon the road
Preaches contentment to the toad."

—Yours faithfully. JOHN G. WALKER
Gomersal, nr. Leeds.

Jamaica

SIR—I was somewhat surprised by your conclusion that our premier is either a half-hearted federationist or a political trimmer. Both suggestions are quite untrue. If anyone were in doubt they had only to listen to Mr Manley's moving broadcast call to the people of Jamaica on the subject of the forthcoming referendum.

Mr Norman Manley's Government has been suffering constant irresponsible sniping from the Opposition on the subject of federation. When Sir Alexander Bustamante, in desperate search for an issue on which to challenge the government, finally decided to come out against federation the premier's decision to meet the challenge with a referendum was the correct one.

The next step is to secure revision of the federal constitution on lines that Jamaica, with half the population of the West Indies, can accept. Given this indispensable condition, rest assured that Mr Manley—with his party united behind him by the Bustamante challenge—will fight for Jamaica's continued participation in the federation. And, given a constitution that he can sincerely advocate, the premier will win the referendum.—Yours faithfully,
Kingston, Jamaica ROBERT KIRKWOOD

Common Market

SIR—You now advocate full-scale participation in the European common market, and discount the importance of the conflict that this would create with the Commonwealth preference system. I agree with your assessment. But in the past, concern with the Commonwealth connection has not depended merely on the uncertain advantages of preferential trading arrangements. It has also depended upon the idea of the sterling area as a co-operative monetary mechanism. The sterling area countries have a common interest in resisting the impact of fluctuations in economic activity originating from outside the area, and in doing so by methods which may involve the use of quantitative restrictions against, and the suspension of convertibility of sterling for, non-members of the area. If Britain becomes a full participant in the European common market, it will become infinitely more difficult for such co-operative resistance to be organised, should the need arise.

This argument, arising from the monetary rather than from the commercial facet of the *Commonwealth connection*, has been made inapplicable in present circumstances by the Government's policy. The formal return to convertibility has set the seal on a series of measures which, since 1953, have proclaimed the abandonment by the present government of any intention of using the sterling area as a co-operative means of defence against slumps. Convertibility is king, having driven out other objectives which might make its authority questionable in less favourable circumstances than we have lately enjoyed.

Should something happen to upset the monetary arrangements to which the present government have committed themselves, and bring back into vogue the idea of a sterling area monetary club, the incompatibility between the latter and full participation in Europe will have to be taken seriously. The fact that you do not consider this indicates no more than that *The Economist* holds the views on monetary policy which one knows it holds; in other words, that present arrangements ought to be permanent, and the sterling area monetary club, with its implications of limited convertibility and discriminatory quantitative restrictions, forever bygones. Not all of your readers, however, agree with this suppressed premise of your argument. Some may remember that the gold standard restored after such painful effort in 1925 had to be abandoned only six years later, and by a government of the same political complexion as that which had restored it.—Yours faithfully,
Stanford University, J. R. SARGENT
California

Israel

SIR—The suggestion by Mr M. Harris that Herut is responsible for much of Israel's social progress is almost as ludicrous as that which refers to the ultra right-wing successor of the Irgun Zvai Leumi as "liberal."

Your correspondent was, of course, correct when he gave Mr Ben-Gurion's administration credit for a number of far-reaching measures of reforms. The Israel Labour party of which Mr Ben-Gurion is the leader and which since the establishment of the state has been the senior partner in the coalition government, is well known for its non-doctrinaire approach and for its determination to place nation above party.

Mr Harris says: "In Israel the disenchantment with the 'socialist dream' is growing." In fact at the recent general elections, Labour gained considerably.—Yours faithfully, H. PINNER
London, NW4

Language

SIR—You note the "fear that the new European trade blocks will continue to discriminate . . .". I think most of us know what is meant, but, as *The Economist* is a leading, unchauvinistic contributor to the clearest English, perhaps here is an opportunity for you to unblock an Anglo-American difference in spelling. Wouldn't "bloc" (which was filched anyhow, regardless of the spelling) have been a little more useful here?

Lord Keynes is reputed to have suggested, during the negotiations for settling Lend-Lease claims, that the Americans might pay rent for 300 years' use of the language. A reasonable suggestion, his American counterpart is said to have replied, but there would be a counter claim for repairs and renovations. Presumptuous—but was there just a bit of truth in the idea?—Yours faithfully,
Washington, DC JOHN O. COPPOCK

BOOKS

Manifesto of a Whig

The Constitution of Liberty
By F. A. Hayek.
Routledge. 580 pages. 45s.

RETURNING after a fifteen-year interval to the theme of "The Road to Serfdom," Professor Hayek offers not a merely topical sequel, another super-pamphlet, but a major work, written *sub specie aeternitatis;* a deeply considered manifesto on freedom and unfreedom and the institutions favouring each. That manifesto falls into three parts. The first shows "why we want liberty and what it does"; the second examines, via history and jurisprudence, the safeguards to liberty developed by western man; the third applies the principles thus disclosed to "some of today's critical social and economic issues", notably various aspects of the welfare state. This triple structure is a magnificent achievement, the work of a first-rate mind in the service of a high ideal; but its magnificence is that of the leaning Tower of Pisa, skewed at its foundation and pointing a long way out of true.

The skewness derives from Professor Hayek's perfectly legitimate definition of freedom by reference to its opposite, coercion. "'Freedom' refers solely to a relation of men to other men, and the only infringement upon it is coercion by men" —this is manifestly more useful, as it stands, than those more figurative definitions that equate freedom narrowly with civic participation, or subjectively with Stoic or Christian non-attachment, or sloppily with power. But what constitutes coercion? "Such control," answers Professor Hayek, "of the environment or circumstances of a person by another that, in order to avoid a greater evil, he is forced to act not according to a coherent plan of his own but to serve the ends of another." Later, he identifies this control with the power of arbitrary command. Anything short of arbitrary power backed by force leaves its object free to adapt himself as he chooses; his freedom, consequently, is unimpaired. It follows that "coercive" power should be monopolised by the state and kept to a minimum; a minimum permitting, as Professor Hayek later concedes, the coercive use of taxation for a substantial range of public purposes, but emphatically excluding such interference with private decision as inheres, for instance, in nationalised monopolies, compulsory state insurance, or interventions in the pricing process.

To define coercion thus narrowly is perfectly permissible, but unrealistic. For what people feel as lack of freedom—in Professor Hayek's own sense of relationship with other men—is subjection to duress, however exerted; by an employer wielding powers of dismissal, a landlord wielding powers of eviction, a buyer or seller wielding power to deal on Jacob's terms, no less than by a "coercive" authority in the defined sense. Competition minimises such pressures; but even given no more departure from textbook competitive conditions than is implied by the sheer indivisibilities of an advanced, highly specialised economy, occasions of duress must arise as unforeseeable circumstances catch one or another group with their heads in Chancery and enable others to apply a half-nelson. Not all such victims can be extricated; not all should be. But to exclude the exercise of state power as a countervailing safeguard against private duress (from blackmail downward) is to diminish, not increase, liberty as normally experienced. Any such conclusion raises a conflict—freedom against freedom; for its implications clash with the practical requirements of that palladium of liberty the Rule of Law, in whose name Professor Hayek would deny all discretionary latitude to administration. Such denial demands either a more detailed exercise of foresight than any legislature can manage, or the abandonment of any attempt to mitigate duress. No liberal would disagree with Professor Hayek that administrative discretion is an evil; but that evil requires to be weighed against others unrecognised by his definition of coercion.

In Part III this semantically-induced bias, though still operative, matters less than does a value judgment assailable only in value terms: the judgment that equality does not matter at all. Professor Hayek has no difficulty in showing that absolute equality is inexpedient, or that equalitarian tax policies produce deplorable material results, or that inequality is inherent in progress (which will always benefit some before it benefits all), or that there are no objective standards of "social justice"; or in gaining agreement that envy is the most ignoble of the passions. But there is more to a dislike of extreme inequality than envy; nor are the unfortunates alone in disliking it. Human solidarity, however imperfect or limited, is as much a fact as the desire for material betterment; the conflict between them is unfortunately a fact as well, but no higher law dictates that solidarity should always lose. Some of Professor Hayek's analyses (for instance, of monetary policy, trade union powers, town planning, conservation) are unaffected by this attitude; in others (for instance, of social security, taxation, education) he is led, despite his shrewdness, to total unrealism. Unrealism, indeed, pervades this section; there is a paradoxical contrast between his earlier emphasis on the organic, dispersed and unforeseeable elements of social development, on the need to recognise the impossibility of assembling all relevant facts in one head, and his personal propensity for dogmatic extrapolation. Trend after trend, in field after field, is identified, prolonged into the future, and shown to end up in the concentration camp that is its only possible final term. Professor Hayek's certainty remains astonishingly unshaken by the failure, over fifteen years, of so many mixed economies and welfare states to progress even a single step down the predicted road to serfdom.

Yet there is not one point in "The Constitution of Liberty" that does not need to be pondered. The dangers that it proclaims are real, even if contingent; the conflict between solidarity here and now and maximum material advance—to be valued on behalf of those very individuals for whom solidarity dictates a concern—needs to be faced, whatever the terms of its resolution; the perversities engendered by inflation, punitive taxation and protection of special interests need to be exposed; the doctrine of justification by bare majority, regardless of consensus, needs to be pilloried. Above all, perhaps, there is need for that "recognition of ignorance," as Professor Hayek puts it, which respects the inarticulate and the intuitive elements in the social heritage, leaves scope for scattered experiments and spontaneous insight, prefers the pluralist to the unitary solution. The appeal of "The Constitution of Liberty" is in the last resort from the blueprint to the growing tree, from Bentham to Burke—with a due and emphatic reminder that Burke was not a Tory but a Whig.

In a Strange Land

The Jewish Immigrant in England 1870-1914
By Lloyd P. Gartner.
Allen & Unwin. 320 pages. 30s.

SOME series of language books are published in twin volumes, one containing the grammar, the other the reader. "The Jewish Immigrant in England" by Lloyd P. Gartner, an American scholar, seems to stand as the grammar to the reading-book of Israel Zangwill's novel, "The Children of the Ghetto," which was first published in 1892.

This is not, it should be hurriedly said, its intention. Mr Gartner mentions Zangwill only twice (in the index only once), and "The Children of the Ghetto" not at all. But anyone who knows the novel will be astonished at the close similarity of the material chosen by the two writers. Nothing mentioned as significant by Mr Gartner is omitted by Zangwill. Both here and there are the new progressive Yiddish newspapers and theatres, the famous Berners Street Club to which the Jewish socialists resorted, the pathetic "greeners" sweated—if they are lucky—by employers, themselves barely above the poverty line. Here and there are the little *chevras* or conventicles whose continued existence so much annoyed the big synagogues, the respectable established English Jews worriedly begging the new arrivals to anglicise themselves as quickly as possible. Here and there, in life and in fiction, are the very same people, the well-meaning Jewish Member for Whitechapel, the unhelpful Chief Rabbi, and that lovable gentle man whom we know from Zangwill as Reb Shemuel.

Mr Gartner's book will, however, interest more people than those who welcome it as a background to literary history. Although his writing is clumsy and his vocabulary often rather odd (e.g. *townlet, unsynagogued, memoiristic*), his chapters on the trades practised by the immigrants, and on the movements, almost wholly abortive, towards exclusively Jewish trades organisations, are a useful and interesting contribution to the history of the English working-class movement. What he has to say about the specifically literary and religious culture of the immigrants, for which he has scoured, among other material, much Yiddish ephemera of the period, is extremely valuable. Moreover his general conclusions on the effects of this vast unorganised immigration on the immigrants, on established English Jewry and on the community as a whole, seem moderate and sensible.

It is where his subject is culture in a less elevated sense that Mr Gartner's book seems to fall disappointingly short. We know, and indeed he tells us, that Jews left eastern Europe to escape poverty, cruelty and conscription. We know of the difficulties they had in adapting—or not adapting—the habits they brought with them to the new environment. But we need to know and are not told how these Jews lived in the communities they left. Had they there, despite the poverty and cruelty, a patterned and satisfactory cultural life, or were they there as strangely, as uneasily placed as when they first came here?

And, when they did come here, if we want to arrive at some real understanding of their domestic and social lives, of what they ate and what they wore, of how they played the Hamburg lottery and muttered against the evil eye, it is to Zangwill we must turn. Mr Gartner's chapter on the society seen in this light is his poorest, and on these aspects of immigrant life the present-day sociologist will still find Zangwill his best grammar and guide.

Gold Rush

Klondike: *The Life and Death of the Last Great Gold Rush*
By Pierre Berton.
W. H. Allen. 475 pages. 30s.

IN 1897 and 1898 about 100,000 men *and* women, predominantly European by origin, predominantly Protestant, went to seek their fortune in the Klondike goldfields. About a third of that number reached Dawson City, of whom about a half bothered to look for gold; and of these only 4,000, or one quarter, found any. All but a dozen or so of these lost the wealth it gave them in a matter of months.

"Who would have thought that, in spite of its steps of solid ice, its banshee winds, its crushing fall of snow, and its thundering avalanches, the Chilkoot [Pass] was to be the funnel through which the majority of men would attain their goal?" To ensure against mass starvation the Canadian government had enacted that food and provisions which weighed hardly less than one ton had to be carried by each stampeder into the goldfields from outside. The Chilkoot trail, 600 feet higher than the less popular White Pass but more direct, was too steep for draught animals. The load had to be humped on human backs; it had to be done in winter when the trail was not running slush. Each party then had to build a good boat and navigate more than 500 miles of perilously rapid water and, on arrival at Dawson, build a log cabin to keep out temperatures of 60° below zero.

Mr Berton has brilliantly—at times, one wickedly thinks, just too brilliantly (but who could resist it?)—recorded this mass movement, carefully selecting a cross-section of the thousands of individual odysseys, each of which would today have been best-sellers, and with great restraint and compassion tried to analyse the motive force that drove them from the vanities of the naughty nineties to the insanities of vicious heroism and its reverse.

> In all the written memoirs of the gold rush there is scarcely one note of regret, except the general regret that it ended so soon. Though few of the writers found any gold, it turned out in retrospect to have been a golden period for them.

They discovered themselves and, whether they liked what they found or not, they had grown in wisdom. One of the stampeders was the author's own father, who brought him up for the first twelve years in Dawson, where he inherited part of the fever and learned all his compassion, the two best ingredients for writing such a book as this.

Without compassion a writer with the source material he so laboriously collected, and tempted by the now fashionable psychological approach to sagas of this kind, would have drowned the heroism, the vice and the *genius loci* in disagreeable diagnosis. Mr Berton quotes E. B. Browning's line, "all actual heroes are essential men, and all men possible heroes," and dissuades the most misanthropic of us from condemning out of hand scoundrels like Soapy Smith. The text of the sermon at Soapy's funeral, "The way of the transgressor is hard," is Mr Berton's text for this whole magnificent saga. It is left, mercifully, to the reader to speculate about Lemmings and the "death wish," about the Klondike's gold, to quote a recent psychoanalytical study of money—"a deposit of accumulated sublimation, and by the same token a deposit of accumulated guilt"—and to ponder on the undeniable fact that it is better to travel hopefully than to arrive. This is a very fine book indeed.

Freeing the Philippines

The History of United States Naval Operations in World War II, Vol. XIII: *The Liberation of the Philippines 1944-1945*
By S. E. Morison.
Oxford University Press. 365 pages. 45s.

PROFESSOR MORISON'S previous volume was devoted chiefly to the landing in Leyte Gulf in October 1944, and to the prolonged sea battles which followed. Here he carries on the story of the campaign in the Philippines with an account of the assaults on Mindoro (December 15, 1944) and on Luzon (January 9, 1945) leading to the recapture of Manila. But after General MacArthur had accomplished that purpose, on which his eyes had been focused ever since he was expelled from the Philippines early in 1942, he undertook a whole series of minor amphibious expeditions to clear the smaller islands of the group and retover the oilfields of Borneo; and it is difficult to feel that they had any appreciable influence on the progress of the war. The general was, however, undoubtedly right in his view that the Bonin and Ryuku islands offered a better line of approach to the Japanese mainland than Formosa and Amoy on the China coast; although Admiral E. J. King adhered so stubbornly to the latter purpose that the strategy to be pursued after the fall of the Philippines was not agreed until a very late date.

There was little actual sea fighting during the period covered by this volume, for the simple reason that after the battle of Leyte Gulf the Japanese Navy was in no condition to offer serious opposition; but a small Japanese cruiser and destroyer force coming from Indo-China did succeed in arriving totally unheralded off Mindoro on December 26th. Luckily it retired without taking full advantage of the surprise it had achieved. The chief opposition to the Allied expeditions came from the Kamikazes (suicide bombers), which caused a good deal of trouble; and during the Mindoro operation Halsey got his Third Fleet so successfully intercepted by a typhoon that he lost three destroyers and suffered a good deal of damage to other ships. Nevertheless by January 9th he was ready to sweep into the South China Sea, where in ten days his carrier aircrews sank 132,000 tons of shipping and totally paralysed Japanese shipping traffic.

Professor Morison considers that the decision that the British Fleet should take part in the final phase of the main campaign against Japan rather than be placed under MacArthur for the subsidiary landings in Borneo was "typical of political intervention in military strategy" and "probably mistaken"; but he produces no valid arguments to support either statement, and it is difficult not to feel that a little more generosity of spirit might have produced in the American historian's mind a fairer view of the reasons why Churchill and the British Chiefs of

Staff were so determined to go on to the end and to be in at the kill. Compared with some of Professor Morison's earlier efforts this volume does not sustain the reader's interest nearly so well, and the space given to Kamikaze attacks on individual ships and to the many minor assault landings does seem rather excessive ; but he has probably reserved some of his best material for the final volume of his series, which will overlap chronologically with this one.

Gaullist Consulate

The Fifth Republic

By Dorothy Pickles.

Methuen. 222 pages. 15s.

De Gaulle's Republic

By Philip M. Williams and Martin Harrison.

Longmans. 286 pages. 25s.

CURRENT events are a stiff test for the historian. The Fifth French Republic is scarcely two years old. Its origins are contested, its present is controversial and its future is uncertain. Its story is still the province of the eyewitness, the partisan, the pamphleteer. These two books try to look at the new regime dispassionately, to analyse it and to set it in perspective. It is not an easy task.

Mrs Pickles concentrates on the constitutional framework of the new republic. Diligently and systematically she explores, in turn, the ambiguities of the new constitution, the reduced part attributed to parliament, the new disequilibrium between the legislature and the executive. Since the executive is now, theoretically, two-headed, she studies in detail the powers of the President. She also has a useful chapter on the institutions of the French community and views even the Algerian question from a constitutional angle. All this is clear, accurate and interspersed with interesting comments like this shrewd remark:

> He [General de Gaulle] is a uniter, and Parliamentary government is essentially the organisation of divergences, with a view to reducing them to coherent alternative policies.

The book shows to what extent the whole constitutional system is dependent on the presence of General de Gaulle. The general could easily claim "*La constitution c'est moi.*" One cannot, therefore, help wondering whether it was really necessary to devote so much accurate research to the study of a scrap of paper, which is twisted every day to suit its beneficiary and is unlikely to survive him.

Mr Williams and Mr Harrison have a more realistic method. Theirs is an analytical chronicle. After an excellent balance sheet of the Fourth Republic and a more controversial account of its fall, the authors proceed to a description of the unfolding of the new reign. The narrative, interrupted for a brief glance at the institutions, runs on to the beginning of 1960. It is brisk and packed with information, and it takes in its stride all important issues, including the Algerian question. For all this, admirers of Mr Williams's previous study "Politics in Post-War France" may be slightly disappointed. Then he had a wealth of information and time to sift it in order to reach cautious conclusions. By comparison, the new book, written in collaboration, reads like an able and intelligent English summary of events described in *Le Monde* for the last two years.

The epilogue was written shortly after General de Gaulle's apparent victory of last January, when the collapse of the Algiers rising prompted immediate optimism. The authors could thus conclude that "In Algeria the stage was set for a new act." Soon after, however, the general travelled to Algeria to assure the officers that war would go on as before. The confidence the authors placed in General de Gaulle's ability to exploit the situation may still be justified by events now. Even so, their analysis hardly does justice to the difficulties he will have to surmount in the coming weeks.

Both books are written from a nice liberal angle. Both, while dazzled by General de Gaulle's glittering personality, deplore the political void surrounding him. Neither has the vivid imagery of the eye witness, the passion of the partisan or the sweep and depth of the historian's vision. But the story of the gaullist consulate is only gradually being unfolded. In the meantime, readers will be grateful for provisional guides. As such these two books are accurate and competent.

Pre-Conquest People

The Anglo-Saxons : *Ancient Peoples and Places Series*

By D. M. Wilson.

Thames and Hudson. 231 pages. 30s.

THE discovery at Sutton Hoo of a complete warrior burial (except for the body, which was unaccountably missing) marked the beginning of a new epoch in Anglo-Saxon archaeology. The hoard of superb polychrome jewellery, and the problems raised by the missing body, stimulated public interest. The scarcity of written records makes the work of the archaeologist of particular importance in the pre-conquest period, and this book is a popular account of the discoveries made to the present day. The major finds are illustrated and discussed, and there is a brief introduction covering the general history of the period.

The book is chiefly interesting for the variety of material it discusses: from weapons and jewellery to the significance and artistic quality of the ornament in the great Anglo-Saxon manuscripts. It also affords considerable evidence of the diversity of Anglo-Saxon trade and foreign connections. The finds include Egyptian glass, bowls from Alexandria, and garnets and cowries from the Far East. The Anglo-Saxon merchant traded goods of British origin, hunting dogs, furs, linen, slaves, horses and weapons, for "purple and silk, precious gems and gold rare garments and spices, . . . sulphur, glass, and such-like things."

The days are gone when pre-conquest England was thought to exist in a state of semi-barbarism; in such things as embroidery (opus Anglicanum), and in illumination, English artists produced work of European reputation. The days are also gone "when the philologist, the art historian, the historian, and the archaeologist could ignore each other," and Mr Wilson's book is an attempt to cover a wide field.

To anyone not yet acquainted with the richness of the artistic contribution of pre-conquest England, this book is a stimulating introduction; like its predecessors in this series, it is extensively illustrated by drawings and photographs, and it contains a short bibliography to encourage further reading.

OTHER BOOKS

Paperbacks :

The latest Penguin *reprints* include:

THE ORIGINS OF LOVE AND HATE. By Ian D. Suttie. 238 pages. 3s. 6d.

HOMOSEXUALITY. By D. J. West. 200 pages. 3s. 6d.

This book was reviewed in *The Economist* on November 19, 1955.

ANNA CHRISTIE, THE EMPEROR JONES, DESIRE UNDER THE ELMS. Plays by Eugene O'Neill. 206 pages. 3s. 6d.

ENGLAND UNDER THE STUARTS. By G. M. Trevelyan. 559 pages. 7s. 6d.

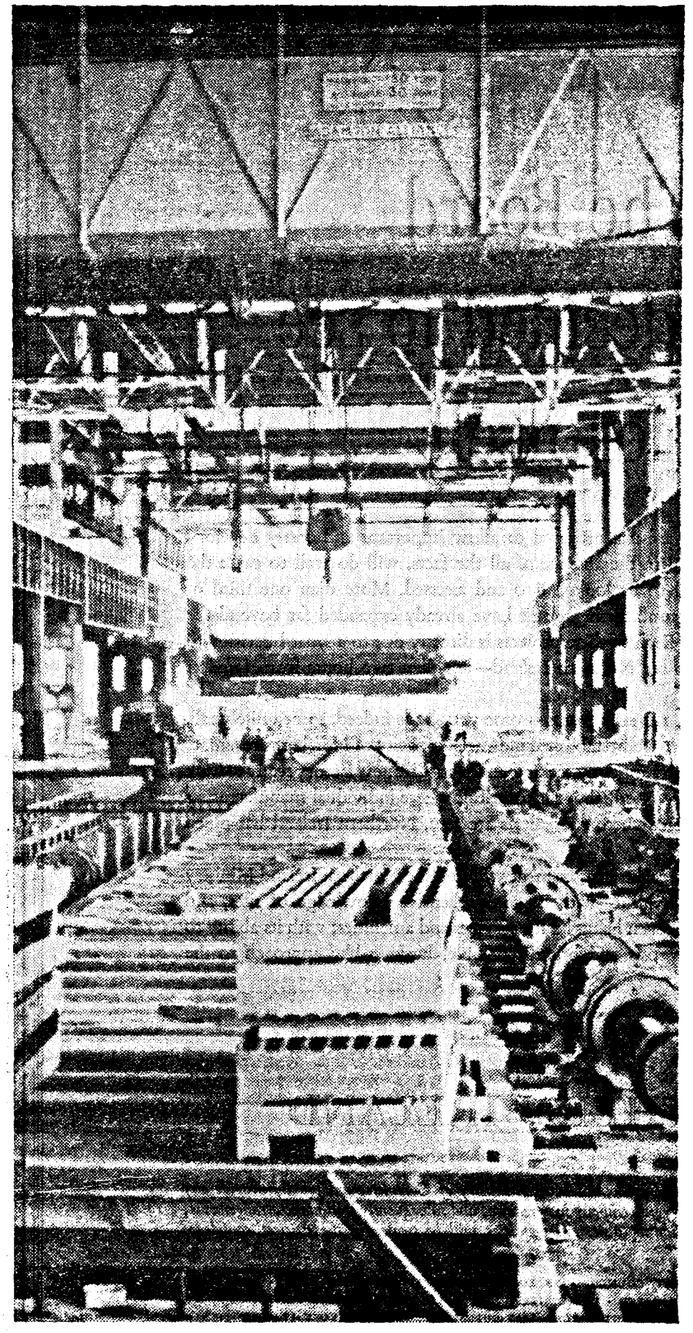
New books published by Penguin include:

LORCA. Selected and translated by J. L. Gili. 167 pages. 3s. 6d.

WHY EVIL? *A Biblical Approach.* By John James. 123 pages. 3s. 6d.

THE RISE AND FALL OF ATHENS: *Nine Greek Lives.* Plutarch. New translation by Ian Scott-Kilvert. 318 pages. 5s.

SELECTED WORKS. Cicero. New translation by Michael Grant. 272 pages. 3s. 6d.



THE PENGUIN BOOK OF NARRATIVE VERSE. Edited by David Herbert. 477 pages. 5s.

INDIAN PEOPLE IN NATAL. By Hilda Kuper. *University of Natal Press.* London: *Bailey Bros. and Swinfen.* 325 pages. 35s.

THE CORONATION OF CHARLEMAGNE: *What Did It Signify?* By Richard E. Sullivan. *D. C. Heath & Co.*, Boston, Mass. London: *Harrap.* 115 pages. 10s. 6d.

TEACH YOURSELF INVESTMENT. By W. L. B. Fairweather. *English Universities Press.* 191 pages. 7s. 6d.

In recent surveys made into share ownership, it was found that one of the major criticisms made by small shareholders was the lack of information and advice available to them. Mr W. L. B. Fairweather has made an admirable effort to fill this gap. He explains clearly the basic principles of investment and the many and varied types of marketable securities that are available to the investor. For those whose mathematics are a little shaky this book will not always be easy to follow, but those who persevere to the end, including the appendices on how to calculate yields and understand balance sheets, should find investment not only more interesting but probably more rewarding as well.

A 150 ton overhead crane about to lower one set of hot leveller run-out table rolls into position. The mill-stand will go at the end of this view. The cooling banks are on the left.

Britain's latest 4-high Plate Mill

A progress report from Consett

THERE is no change in the Consett skyline by which to measure the immense developments taking place there.

Only if you approached from the south would you see it, below the crest, on a huge platform cut in the hillside—Britain's latest plate mill. Nearly half-a-mile long, each of its 5 bays big enough to hold a cathedral, it will be one of the most up-to-date steel mills in the world.

Even at dawn there are men working there. Work is pressing on fast. Most of the roof is on and everywhere there are orderly piles of equipment which the overhead cranes are moving into position. Every piece is marked with a special colour code so that the erectors can identify it. Run-out tables and cooling banks are all ready, and the electric furnaces where the slabs of steel are reheated before rolling are almost complete. Some of the shears are already installed (the biggest can cut through nearly 2 ins. thickness of steel), and they are making good progress on the 4-high mill-stand itself.

Consett's new mill is designed to produce 10,000 tons a week of the best steel plates obtainable anywhere. Britain's position in world markets will be much reinforced when it starts rolling later this year.

CONSETT
IRON COMPANY LIMITED

CONSETT, COUNTY DURHAM

TELEGRAMS: "STEEL PHONE CONSETT"

The Board that decided to see for itself

Company Executives who are not prepared to allow important and costly development projects to be debated in the absence of all the facts, will do well to cause the merits of Northern Ireland to be looked into and assessed. More than one third of Northern Ireland's new manufacturing plants have already expanded far beyond the scope of the original plans. Each of these projects is directly due to a Board decision to send a fact-finding team to see Northern Ireland—less than two hours from London by air—for themselves.

In the past fifteen years, 141 such plants—some very large indeed, some quite small, have been added to the large, well-established industrial capacity of Northern Ireland.

To an expanding company urgently seeking an up-to-date new factory ready to walk into, or a site for one, where good labour is plentiful, where individual manufacturing needs can be amply met and where restrictions are few, Northern Ireland has much to offer.

A company requiring to make an assessment will find the Northern Ireland Ministry of Commerce more than helpful—with its comprehensive knowledge of sites, and factories (four ready now; eleven being built), services and amenities; with its ability to ease the burden of capital costs and bring a flexible, business-like approach to the business of expansion.

NORTHERN IRELAND

The Northern Ireland Development Council or the Ministry of Commerce will gladly provide any preliminary detailed information your company may require, and subsequently will make arrangements, as may be needed, for a fact-finding visit. All enquiries will be treated in the strictest confidence

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

New Spartans

WASHINGTON, DC

A PROPHECY is in order: last week's events in Tokyo may prove to have shaken the Americans more deeply than almost anything else in the last decade. The President of the United States who came into office saying "I will go to Korea" is now going out of office being told "You cannot come to Japan" and something more than humiliation is involved. The failure of the summit conference marked no more than the failure of a diplomatic move upon which most Americans had embarked hesitantly and reluctantly a mere nine months before. The cancellation of Mr Eisenhower's invitation to Japan shows that the foundation upon which the United States has constructed its whole policy for the past fifteen years is riddled with termites. Last weekend, at the annual gathering in Virginia of the advisers of the Secretary of Defence, the admirals and the airmen were reportedly unrolling the map—of alternative bases to those in Japan—which they had hoped would not be needed for these ten years. To suggest, as the *New York Times* seemed to be suggesting on Monday, that the President's minor successes in Manila and Taipeh can be balanced against the major defeat in Tokyo is, as Mr Joseph Alsop succinctly puts it, "byzantine twaddle."

It is not surprising that the Americans are reacting like a man suffering from shock. For one thing, they are groping for oversimplified (and sometimes false) explanations. Following the lead of Mr Hagerty, the President's press secretary, almost all of them have exaggerated the extent to which the riots were directed by a hand from Moscow. In the newspapers' ritual descriptions of "red-instigated, snake-dancing" mobs the homeric epithet seemed last week to have returned to American prose. If the communists were really as influential as this, the State Department might as well give up the hope (which it still nurtures) that the United States can hold on to its bases in Japan.

In the same way many commentators have jumped to the conclusion that the disturbances were a direct consequence of the breakdown of the summit meeting. No doubt the discovery that U2s have flown from bases in Japan has increased the nervousness of Japanese pacifists. Any embarrassment which the communists might have felt about joining in the riots before the conference broke down has certainly vanished since then. But, as Miss Marguerite Higgins of the *New York Herald Tribune* recognises in a despatch from Tokyo this week, the main responsibility for the demonstrations seems to lie with an odd coalition of neutralists, pacifists and screwball students. These would probably have come out in the streets to protest against the Japanese-American treaty in any case; all the communists did was to egg them on.

The instinct to look for a familiar scapegoat is a sign that the country is rattled. But the successive shocks from Paris and Tokyo have also been an unexpected stimulant. The foreign aid programme, which had seemed to be dying from a slow haemorrhage, is suddenly alive and kicking again. On the day when Congress heard that the President's trip to Tokyo had been cancelled, an unusual alliance of Republicans and liberal Democrats in the House of Representatives took the unprecedented step of adding $200 million to the funds recommended by the House's appropriations committee. Historians ought to refer to this event as the Louisiana sale. Both Mr Passman, the hitherto unchallenged aid-cutter-in-chief in the House, and Senator Ellender, who describes the programme as a "throwaway," come from that state. The Senate will almost certainly add some more money. Even if it does not, the amount which Mr Eisenhower requested this year has been cut by only a seventh—less than foreign aid has ever been cut before in his Administration.

This is of course a good thing, even if it only confirms that Congress's willingness to spend money on the needs of the cold war varies in inverse proportion to the width of Mr Khrushchev's smile. But the extra spending into which America is being jolted by the event of the last month will not necessarily be well-chosen spending. Last week, while the House of Representatives was appropriating its extra $200 million for foreign aid, the Senate was adding more than $1 billion to the President's defence budget. Only some of this is relevant to the military problems of the moment. Senator Douglas persuaded his colleagues to provide the money for 25,000 more Marines, and Congress has allotted Mr Eisenhower $400 million more than he asked for to modernise the Army's ageing weapons. These improvements in the conventional forces are necessary (though they are not enough) if the Americans are to have any hope of defending either Berlin or Japan without calling in the nuclear bombers. The reasoning behind some of the other additions, however, is less obvious. It is not at all clear that another aircraft carrier or a comparatively small number of extra missiles would have frightened Mr Khrushchev out of doing what he did in Paris or stopped the Tokyo rioters from rioting. No conceivable increase in expenditure on nuclear weapons will be enough to give America such overwhelming superiority that—in the hopeful view of Senator Lyndon Johnson—the communists will back down because they feel that they have no alternative.

THE fact is that the disasters of the last month have rallied an extraordinarily wide and diverse assortment of people under a single banner; the spartan slogan on it reads "Strength before Joy." All these people agree that Americans must forgo some personal comforts and spend more of their resources on increasing the country's strength. What their unanimity conceals is a difference over the meaning of "strength." They include Democratic intellectuals such as Professor Arthur Schlesinger, Jr, who calls the latest of the pamphlets which he circulates privately within the party "The Big Decision: Private Indulgence or National Power?" They include liberals in Congress such as Senator Clark of Pennsylvania who, like Professor Schlesinger, wants the goverment to spend more money on schools, houses, hospitals and public transport. They include Republicans like Governor Rockefeller of New York, who wants to do many of the same things but also wants to build a country-wide system of shelters against atomic fall-out. And they include those like Senator Symington and Mr Joseph Alsop whose chief preoccupation is to expand America's military power.

All of them would probably find it necessary to spend something more on defence. But the significant division within the ranks of

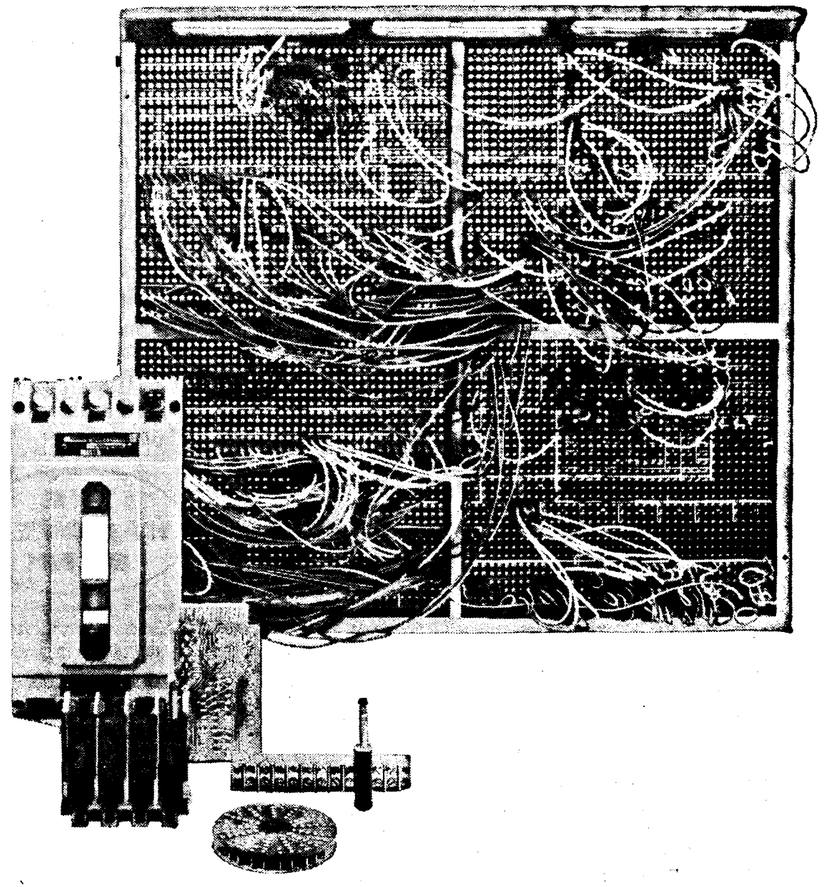
these new Spartans is between those who think that an increase in economic and social strength is the surest way of reviving America's standing in the world and those who think that this can best be achieved by a demonstration of armed might. The danger is that the hasty and unreflective tightening of the belt into which the United States has been shocked by the humiliations in Paris and Tokyo may give the biggest increase in spending to the military. It is worth noting in this context that last weekend's Gallup Poll reported that half the Americans surveyed, a sharply increased proportion, now think that war with Russia is inevitable—and that a third think that it will come within five years.

A historian will find something familiar in the temper of the second, or military, kind of Spartanism. Its advocates tend to think that President Eisenhower, like the boy with the fox in the legend, should have concealed his knowledge of the U2 flights under his cloak and kept a stubborn silence even as it gnawed his vitals. They are liable to insist that the State Department abandon its recent policy of encouraging liberal movements in Asia and Africa in favour of standing by tried and true (even if not very democratic) friends such as General Chiang Kai-shek. The result might be that America, like Sparta, would stay strong in terms of foot soldiers, but, like Sparta, it would almost certainly pay a price. The price would be a growing isolation within the walls of its military alliances; a gradual withering, at home, of those forces of growth and change which keep a society vital; and a surrender to the rival Athenians of leadership in the realm of ideas and imagination. It is small consolation to recall that Sparta won its military contest with Athens when one sees how Athens captured the history books.

Rush Jobs for Congress

CONGRESS, having dawdled and dreamed away most of the session, woke up last week to the fact that only three weeks remained before the Democrats must leave for their nominating convention at Los Angeles. Senator Johnson, the Democratic leader, just back from rounding up votes in Texas, ordered full speed ahead in Washington. Senators, growing increasingly short-tempered, have met late into the night, at 9.30 in the morning and even on Saturday to establish a legislative record that Mr Johnson, a presidential hopeful himself, could exhibit proudly at Los Angeles, and that the Democratic candidate, who is far more likely to be Senator Kennedy, could display later to the voters.

With all the press of urgent legislation, including the Japanese treaty, it may seem odd that priority was given to raising the pay of government workers (including postmen) to the tune of about $746 million a year. But this is a measure of such appeal to members of both parties in an election year that there is every likelihood that Mr Eisenhower's certain veto will be over-ridden. To do this meant, however, that the Bill must be sent to the President in good time, so that Congress would have a chance to reverse him. After such a display of liberality, the Senate concluded that it would be irresponsible to reduce any tax, even the irritating 10 per cent excise tax on travel and on local telephone calls. Instead it voted, like the House, to extend all such temporary levies.



No one stands to benefit politically until 1964 from the passage—almost by acclamation in the end—of a constitutional amendment giving a modest voice in presidential elections (though no representation in Congress and no home rule) to the hitherto voteless residents of Washington, DC. This amendment, destined to be the 23rd, must be approved by 38 of the 50 states before it goes into force. It is the issues lined with political gold which are likely to give the most trouble. One, the introduction of federal aid to schools, has been dealt with by both houses, but they can meet to compose their substantial differences only by courtesy of the conservative Rules Committee of the House. Its Republican members are under great pressure from Mr Nixon, the almost certain Republican presidential candidate, to give the opposition no ground for accusing his party of sabotaging the education Bill. Neither of the other two measures which look essential politically has been passed by either house. That raising the minimum wage in steps from $1.00 an hour to $1.25 and bringing about 4 million more workers, most of them shop assistants, under the law is not likely to cause much trouble. But to agree on a measure to show old people that Congress is alive to their need for medical care will be harder. The House Ways and Means Committee has voted a limited programme of federal grants to enable the states to do more for those who are needy, but the Democrats in the Senate are determined to try to reshape this stop-gap to make such medical aid a matter of right under the federal social security system.

Financial Experiment

EARLY this month the Treasury made use for the first time of the authority given to it by Congress last year to refund some of the government's obligations before they reach maturity. The issue affected was the huge $11.2 billion worth of 2½ per cent bonds falling due in November, 1961; if the whole amount had had to be dealt with at once, the refinancing operation would have been almost unmanageable. Therefore the Treasury offered to exchange about half of these bonds immediately for either a four-year note at 3¼ per cent. or an eight-year bond at 3⅞ pet cent. The old bonds were selling at below par but the exchange was made at face value; thus holders were being offered securities that would pay them more for longer than those which they held—and the exchange was not subject to the capital gains tax. The experiment was timed to take advantage of the fall in interest rates which had just been confirmed by the lowering of the discount rate at the Federal Reserve Banks. But the unenthusiastic reaction of the market suggests that businessmen are far from being convinced that interest rates are not going up again before long or that the time has come to plan for safety by investing in government issues.

Without the present low levels of interest rates, however, the Treasury would not have been able to try this experiment—or at least it would not have been able to include the long-term bond. For the Treasury is still forbidden by law to pay more than 4.25 per cent in interest on any issue with a life of five years or more. It has thus been forced by the high cost of money to rely on short-term borrowing; this in turn means that it will be involved constantly in refinancing operations, of which the one coming up in November, 1961, was only one bad example. But this month's advance refunding proved that even now money is not cheap enough to get the Treasury out of its difficulties; while in the end the new four-year note was oversubscribed, so that the full $3.5 billion could be allotted, only $321 million of the eight-year bond, instead of the $1.5 billion which had been hoped for, was taken up. The Treasury has therefore made practically no progress towards achieving its ambition of lengthening the maturity of its debt although it has lessened substantially the refinancing problems which it faces next year.

The fact that even under these conditions the best that can be done with a long-term bond does not appeal to investors gives the Treasury yet another argument with which to prod Congress into raising the ceiling on the interest which the government may pay. Yet although only a few months ago this measure was held to be one of the most urgent before the Legislature, it is now accepted that no change will be made in the limitation at this session. Whether or not the present decline in interest rates will last it, with the accompanying decline in inflationary pressures, has given Congress an excuse for postponing action on a measure which is politically unpopular.

Some of the world's most advanced electronic products...are developed after a local Allied Chemical representative acquaints a manufacturer with Allied Chemical's B&A® Electronic Grade chemicals, Plaskon® molding compounds, Harmon® vinyl dispersions and Allied Chemical's many other special products for the electronics industry...and offers him the assistance available from Allied Chemical whenever he has a problem.

The Bull 300 DP Series

(a fully synchronised unit system)

flexible, fast and expandable

Basic Elements	*Basic Speeds*
✱ Card Reader	300 cards per min.
✱ Card Reader/Punch	300 cards per min.
✱ Arithmetic Unit (× : +−)	300 cycles per min.
✱ Printer	300 lines per min.
✱ Programme Unit	

Input/output speeds may be doubled by the addition of further units; and a second Programme Unit can be attached, increasing programme possibilities and enabling even further expansion of input/output units.

The 300 DP Series will expand into an electronic system with the incorporation of one or more of the following units, as required:

✱ Gamma 300 Computer ✱ Magnetic Drum Extension ✱ Multi-Selector and Magnetic Tape Units.

This is Data Processing Equipment with the widest possible range of expansion, applicable to the problems of both large and small organisations.

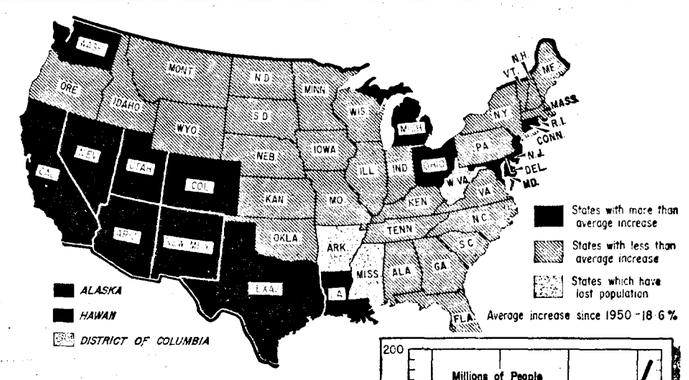
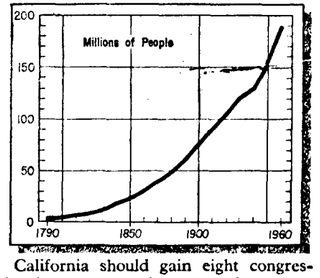
Breadbasket Politics

MUCH against his will Mr Nixon has been forced to risk his own prestige by coming to the help of Governor Davis of North Dakota, a fellow-Republican who is running, in next week's special election, for the remaining four and a half years of the term of Senator Langer, who died late last year. Governor Davis is opposed by Representative Burdick, who in 1958 became the first Democrat to be elected to the House from this traditionally Republican state. Mr Burdick was for many years the legal adviser of the left-wing Farmers' Union, the strongest farmers' organisation in the state, and his slogan is "Beat Benson with Burdick." It is an attractive one in an almost entirely agricultural state where the income of farmers fell more last year than it did anywhere else. Mr Benson, the Secretary of Agriculture throughout the Eisenhower years, is widely held to blame because he favours lower price supports for farm products and less dependence on Washington for farmers, and because he introduced the soil-bank plan which takes farms right out of production in order to reduce surpluses; this has produced "ghost towns" in North Dakota.



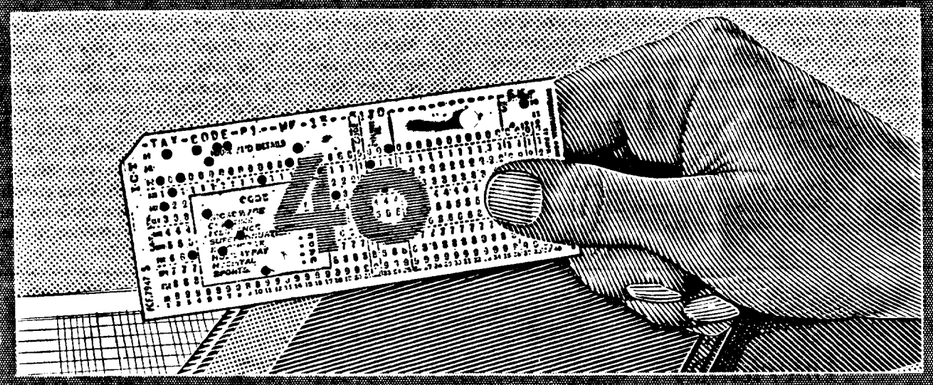
It would hardly be true to say that the Administration's farm policies are on trial in North Dakota: they have been condemned. Governor Davis himself has said that Mr Benson has lost the farmers' confidence and should go. And Mr Nixon, gingerly grasping the prickliest of his domestic nettles, admitted on Monday that the conflict between the Administration and Congress had left the farmers and the American people "stuck with the present programme which everyone admits should be changed." Even so, Mr Nixon only lifted a corner of the curtain on his own farm programme when he supported the idea that all countries with surpluses should donate large amounts of food to the United Nations for distribution to hungry peoples (an idea which he said the President had intended to put forward at the summit conference) and when he endorsed Governor Rockefeller's proposal for building up a reserve of foodstuffs against the possibility of an atomic war.



Mr Nixon gave no hint of whether he will come out in favour of higher or lower agricultural price supports, though he did indicate that he would be more generous than Mr Eisenhower, in an effort to reach a long-term solution of the farm problem. What happens next Tuesday in North Dakota's curtain-raiser to the election is certain to affect the farm policies which both parties adopt at their conventions. For North Dakota is only one of a number of mid-western states in which the Republicans stand to lose seats in both houses of Congress—even if the growth of cities and suburbs elsewhere means that the farm states no longer have their old influence on the outcome of presidential elections.

How Many Americans?

THE preliminary results of the decennial census taken on April 1st are disappointing to many people: to the Bureau of the Census which had calculated that there would be 180 million Americans on that day and discovered that there were only 179,500,000; to the states which will lose seats in Congress or gain fewer than they had hoped (the constitutional reason for the census is to enable congressional representation to be adapted to changes in the distribution of the population); to the many cities which found that the number of their residents had declined for the first time in their history. But at least their disappointment may assuage that of the Census Bureau. Indignantly convinced that they have been maligned, and concerned at the loss of state subsidies, often paid on a *per caput* basis, and of political influence which results from a decline in population, several cities are conducting their own rechecks of the official count. These may push the total over the 180 million mark, particularly since a final calculation has still to be made of servicemen, merchant seamen, travellers, and so on.



But, disappointments apart, the increase since 1950 is still a record-breaking 28 million, nearly as much as the total population of the country a century ago; this results from the high birth rate and low death rate during the decade. And the figures confirm trends that were already obvious—the movement westwards and the movement to the suburbs where two-thirds of the increase in population took place. Cities such as New York, Washington, Detroit, Minneapolis, San Francisco may have lost people, but the metropolitan areas around them have all gained far more. Ceasing to be a rural country fifty years ago the United States is now no longer an urban one; it is suburban. The population of a number of industrial states in the north-east have increased more than the national average—Delaware has gone up 39 per cent and Maryland 31—and the greatest of all rises—77 per cent—is in Florida, which now ranks tenth among the states instead of eighteenth. But the other big gains have been in the far west and California's increase of 47 per cent has brought almost 5 million extra people into that state since 1950. This has confirmed that within a couple of years California is certain to pass New York's 16.6 million to become the largest state.

California should gain eight congressional seats when the census figures are complete and redistricting begins—after the coming election. With about 490,000 persons to a district, Florida will gain four seats and New York and Pennsylvania will each lose three. New Jersey, Ohio and Maryland are likely to get an extra Representative each and Illinois, Nebraska and Kentucky to lose one each, while Texas and Michigan may get only one extra seat apiece instead of the two which both had expected.

How large must a small firm be-

-before punched card data processing is a sound investment?

A 12-MAN FIRM HAS FOUND I·C·T 40-COLUMN EQUIPMENT PROFITABLE

Punched cards are *not* the prerogative of large firms. Some I·C·T 40-column users employ over a thousand people; others as few as twelve people. But in all these firms, I·C·T punched card machinery is doing quickly and efficiently the job of saving time and money.

Where I·C·T 40-column equipment can help YOU

It will mechanise your sales and purchase accounting, and produce your statistical records. This small punched card unit will tackle stores and stock control, invoicing, payroll, hire purchase accounting, expenditure control and costing; in fact, it will help you wherever you need accurate accounting and statistical information quickly.

The equipment can be delivered promptly; it occupies very little space; it is easy to install, and simple and very inexpensive to operate. You may find that the basic punched card machines — Auto Punch, Sorter, and Tabulator — will meet your present needs. But if at any time the volume and complexity of your work grows, other machines in the range — Summary, Reproducing, and Electronic Multiplying Punches; Interpolators and Interpreters — are there to ensure easy, rapid and economic expansion.

Write to us at I·C·T

We have over half a century of data processing experience behind us — and this is at your service. We will be glad to discuss your problems with you, and make a survey for you, without obligation, to see where a 40-column punched card system could help *your* business.

I·C·T

I·C·T manufacture 21-, 40-, 80- and 160-column punched card equipment, as well as small and medium-size computers operated by punched cards, punched paper tape, or magnetic tape.

International Computers and Tabulators Limited

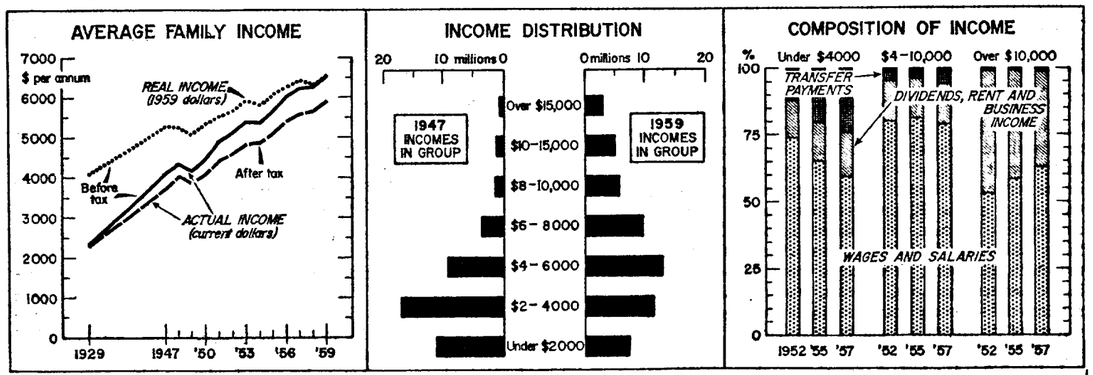
Atomic Hold-up

THE United States Court of Appeals has now upheld, by two to one, those liberals who maintained, in the days when the much-disliked Mr Lewis Strauss headed the Atomic Energy Commission, that the commission could not be trusted to put the interest of the American people before that of big business. This is, at least in effect, what the court was saying when it stopped work on a nuclear power station which was nearing completion in Michigan. But in doing so the court also held up, if only temporarily, most of the programme for making commercial use of atomic energy—and the slow progress of this programme has been another reason why liberals have criticised the commission.

In order to enable a start to be made on building an approved atomic reactor before all the incidental research is finished, the AEC has normally issued construction permits at an early stage and has left the question of safety to be decided finally only when the plant is completed and application made for an operating licence. The AEC considers the construction permit to be no more than provisional approval but in the view of the court the Atomic Energy Act makes an operating licence almost automatic once a construction permit has been granted and therefore requires that the safety of the plant should be certified at the very beginning. The majority of the judges argued that once enormous sums—over $80 million in the case under consideration—had been invested in an atomic reactor, the economic pressure on the commission to certify it for operation, even if safety was not assured, might be irresistible.

The court held that in the case under consideration, that of a fast breeder reactor, the first of its kind in the United States, being built by a group of electricity companies on the shores of Lake Michigan near Detroit, with two million people living within thirty miles, it was essential, if the intention of Congress was to be carried out, that the commission should declare that the plant was undoubtedly without danger to the public health and safety and that there were compelling reasons why it had to be in such a populous area. That neither of these declarations could be made was the contention of the three trade unions, led by the automobile workers, all powerful in Michigan, who brought the case originally. They argued that property values—of houses belonging to their members —would be depressed in the neighbourhood if the plant were built and that jobs would become scarce because other industrial undertakings would be frightened away. If the decision stands—an appeal is expected—then the AEC's procedures will have to be revised drastically and progress will be delayed on the other reactors which are now being built by private enterprise under the same conditions as the one in Michigan.



Dividing the Waters

FROM A CORRESPONDENT IN COLORADO

IN a dry land, arguments over water are violent because people know that they are fighting for their future: the supply of water sets the limits of economic growth. Nowhere is this truer than in the basin of the Colorado River, whose 1,450-mile course through the desert takes it into three states, past Nevada and California, and then 80 miles through Mexico, which thus also has a claim upon the water. Tributaries of the river rise in two more states—Wyoming and New Mexico. Unfortunately, although the Colorado drains an area one-quarter the size of the Mississippi basin, its flow is less than one-thirtieth of that of the Mississippi. And people in dry country need more water than people elsewhere. Thus it is not surprising that there has been a 50-year war over the Colorado River. Usually it has been conducted by legal means, but Arizona once called out its National Guard and commissioned a gunboat for a short time; no shots were fired, however.

The federal government has built mighty dams, the greatest of them being Hoover (once Boulder) Dam, to control and store the waters. So far most of the benefits, in the shape of water and electric power, have fed the booming growth of southern California, which has expanded on the assumption that it could continue to draw more and more water from the Colorado. Meanwhile, Arizona has had to let thousands of acres of irrigated farms revert to desert in order to provide water for its own booming population.

Over thirty years ago California promised the other states of the Colorado basin that it would never draw more than 4,400,000 acre-feet a year from the river (an acre-foot covers an acre one foot deep and amounts to 325,851 gallons). But later California signed

The 45 million families and 11 million unattached persons (those not living with relatives) in the United States in 1959 received altogether an income of $362 billion in the year—a record total and an increase of 6 per cent over 1958.

The most noticeable change in the composition of personal incomes in recent years has been the growing importance in the poorer groups of transfer payments, mainly insurance and welfare benefits; the rise in these is explained by broadened coverage and higher rates of payment under social security schemes and by the increased number of people of pensionable age.

Source: *Survey of Current Business*, April, 1960.

additional contracts with the federal government which it claimed gave the state the right to 962,000 more acre-feet and recently it has actually withdrawn more than 4,400,000 a year. In 1952 Arizona took its grievances to the Supreme Court. What California relied upon, and what its smaller neighbours feared, was that the very act of putting the water to useful purposes might have given California a firm legal claim upon it. Traditionally in western states the first user of water wins the right to use it forever.

The Supreme Court hears such complicated matters through the intervention of a "master" whom it names to sift the issues and to recommend a decision which it may or may not follow. The first master in this case died; and the Supreme Court appointed in his stead a New York lawyer and former judge, Mr Rifkind. After five years of work, wading through many thousand pages of testimony and exhibits, he has made his preliminary recommendations. If the Supreme Court approves them, California will have received a staggering blow. Its claim to a special position as "first in time, first in right" has been denied and federal law is to prevail.

When the river provides as much as 7,500,000 acre-feet a year for the use of the lower basin, California is to have 4,400,000 (instead of the 5,362,000 which it wanted), Arizona 2,800,000 from the main stem (plus another million from the Gila River) and Nevada 300,000 acre-feet. In dry years the states would share the available water in the same proportion; when there is a surplus Arizona and California would each get half of it. In general, California would get less water than it is taking now and Arizona would get enough more to re-arouse hope for its $1 billion Central Arizona Project. This is a scheme, shelved in 1949 partly for lack of an assured supply of water, to transport a million acre-feet yearly through the world's longest tunnel to Arizona's fast-growing Salt River valley, where it would probably start an even bigger boom. The Indian reservations which depend on the Colorado have also had their rights to several hundred thousand acre-feet a year confirmed.

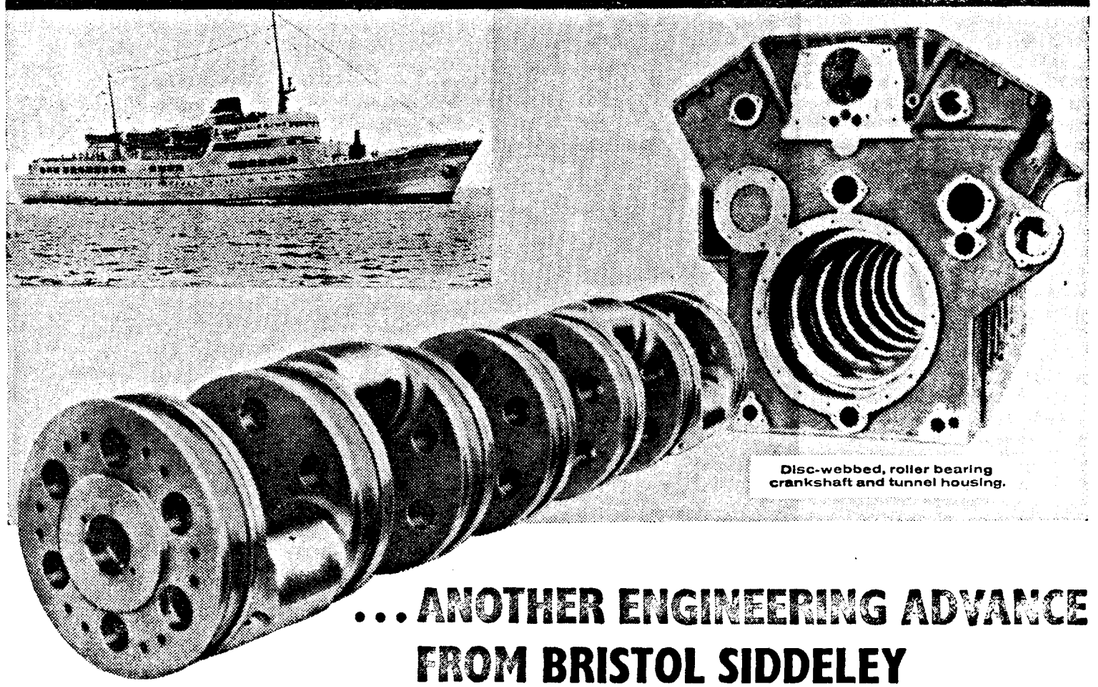
The main loser is the Metropolitan Water District of Southern California, which has already spent hundreds of millions of dollars to distribute Colorado River water clear down to San Diego. Ironically, it has just completed a huge extension of this system in the firm expectation of more water, not less, from the Colorado. One effect of the Rifkind recommendations is to increase the chances that voters in California will agree, in November, to spend $1.75 billion on California's own schemes for taking water to the state's arid south. It would be brought from the Feather River in the northern part of California, where millions of acre-feet still run into the sea every year, clear to its southern tip. The MWD's system of distribution could be connected to such an alternative supply.

Judge Rifkind asked the parties to the suit to submit their comments upon his recommendations by June 10th. California, as might be expected, denounces them as "new law and bad law" and goes on to hit out at the continued use of water for irrigation when it is needed by people and by industry. This is a view which is gaining ground in the West because a year's supply of water for a family will irrigate only a third to a half acre of farmland. Arizona, of course, approves and in this is joined by the upstream states which supply 99 per cent of the river's flow, Colorado, New Mexico, Wyoming and Utah. They are not involved in the dispute. They have been given half the river's flow at Lees Ferry, the official dividing point between the upper and lower basins, for their own future development. But they fear that if California's claims were to be upheld, their share might be endangered. The federal government is building the $750 million Colorado Basin Project, which will store water at four big reservoirs for future uses, such as the development of an oil shale industry in western Colorado.

It is not certain, of course, that the Supreme Court will accept the Rifkind recommendations without important changes. And no division of the water can end conflicts over it. For the flow at Lees Ferry is on the average less than 14,000,000 acre-feet a year rather than the 16,500,000 which would be needed to fulfil all the legal claims on the river. (Mexico was allocated 1,500,000 acre-feet yearly by a treaty in 1945.) Enough water for the people and the industry which are in prospect for the Colorado basin will have to be provided by new sources or new processes, such as cloud-seeding, the cleansing and re-use of water, or the desalting of sea water and brackish supplies.

SHORTER NOTES

Performances have now been resumed at nineteen of the twenty-two theatres on New York's Broadway (three productions which had been doing poor business were closed permanently) after an unexpectedly quick settlement of the actors' strike—or the managerial lock-out, according to which side one was on—which had closed them all on June 2nd. Although the managers had declared that they could afford no concessions at all, they gave the actors most of what they wanted—salary increases and a pension scheme, the first in the industry and the chief issue in the dispute. But the basic problem of the unsound economic position of New York's theatrical enterprises remained unsettled. It is perhaps a pity that the strike did not last long enough to force other interested parties—restaurants, hotels, etc.—to bring pressure on the Mayor to give up the tax on theatre tickets.



* * *

The Civil Aeronautics Board has approved an increase in passenger charges for the twelve domestic airlines: fares will go up by 2.5 per cent plus $1 on every one-way ticket; this means an average increase of 5 per cent, but the actual increase will be more for short flights and less for long ones. The total amount was less than any of the lines had asked for, although probably as much as they had hoped for; it should bring in about $84 million a year altogether and enable the companies to earn 10.5 per cent on their investments over an extended period, the rate of return which the board considers to be satisfactory.

* * *

In Nashville, Tennessee, one of the southern towns where Negroes, by staging "sit-in" strikes and economic boycotts, have tried to assert their right to be served at lunch counters in the shops, the battle seems to have been won. Under a plan worked out by the Negroes and the shop-keepers who have been suffering from the boycott, Negroes have gradually started to be served at slack periods, in six establishments, although they agreed that they would stay away on Saturdays and at rush hours until white customers became used to the idea. Nashville is the first of the towns where there has been violence over this issue to reach a peaceful solution. But five towns in Texas and two in North Carolina have also desegregated their lunch counters and no shop affected has reported any loss of business.

Maybach marine diesel engines—from 400 to 1,700 hp—can achieve 16,000 hours between major overhauls...

...ANOTHER ENGINEERING ADVANCE FROM BRISTOL SIDDELEY

Bristol Siddeley Engines Limited produce Maybach* marine diesel engines. Covering a range from 400 to 1,700 hp, they are amazingly reliable—have proved that they can achieve major overhaul lives of between 12,000 and 16,000 hours!

The *proven* basic design features of the whole range (straight 4 to 16-cylinder V) are the same, and each unit can be turbo-charged, or turbo-charged and intercooled. The range operates up to 1,450 rpm and *combines the best qualities of high, medium and low-speed diesel engines:* light weight and compactness; excellent thermal efficiency; and extremely long life.

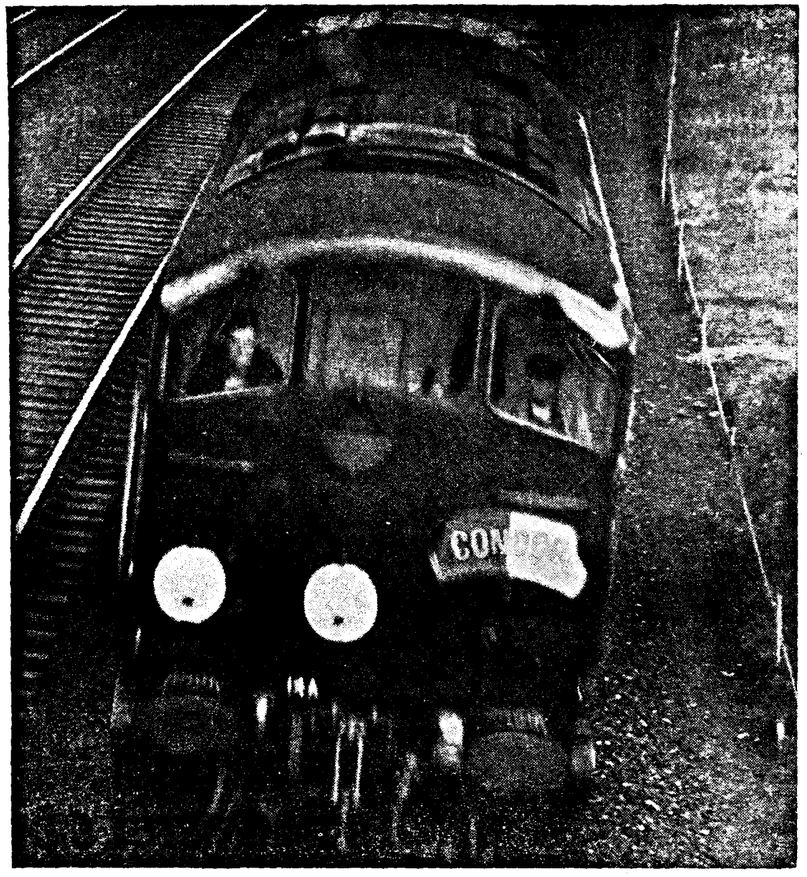
Advanced design features

Pressure-oil cooling on the pistons gives very efficient heat dissipation and reduces liner and gas ring wear to a minimum. The roller bearing, disc-webbed crankshaft is very rigid and withdrawal is not normally necessary before 12,000 hours running. So low is big end bearing wear that in some cases the protective lead flash has been found intact after 15,000 hours running!

Since the majority of the components, in all models, are identical, spares stocks are considerably reduced. Furthermore, each unit is so light and compact that it can be repaired by replacement, and because great thought has been given to accessibility and component removal, much more semi-skilled labour can be used. Again, because of the small size of the engines, the naval architect has much wider design scope—especially with diesel/electric propulsion installations.

World-wide application

Bristol Siddeley Maybach marine diesel engines are suitable for all types of ships, from fishing vessels, large ferries and coastal vessels to ocean-going merchantmen. Maybach diesels are in service all over the world and have built up an unrivalled record for reliable and economic operation.



Bristol Siddeley Maybach diesel engines up to 3,000 hp for high-speed craft.

A range of engines for high-speed craft is also available. Rated at 400 to 3,000 hp and operating up to 1,800 rpm, these engines are specially designed for fast naval craft, police and customs launches and fast passenger boats.

For further information please write to: Maybach Sales Manager, Bristol Siddeley Engines Limited, PO Box 17, Coventry, England.

THE NEW LOOK OF TODAY'S

LONDON MIDLAND

Into the gathering dusk rushes the Northbound Condor—British Railways' crack express freight train. Covering the 402¼ miles from London to Glasgow while its twin covers the 402¼ miles back from Glasgow to London. Collecting goods one afternoon, delivering them often before breakfast the next day.

The fastest way from London to Glasgow, the fastest way from Glasgow to London. Twin stars of a service which already includes 600 Express Freight trains every weeknight. All travelling at passenger train speeds: all timetabled, all regular, all reliable.

As they speed across the country they pass many signs of the changing face of today's London Midland. New stations. New flyovers. New signal boxes. New freight terminals. New railheads. New powerful diesels haul the trains. New redesigned wagons carry the goods at speed in safety.

What does it all add up to? Prompter service: quicker delivery. Fewer headaches for the Transport Manager. Fewer delays for the customer.

Today's London Midland is a great national asset. An unmatched door-to-door service catering for the needs of every customer, large or small.

All at competitive rates.

How can today's London Midland help you? Your Station Master or Goods Agent will be glad to show you.

TODAY'S LONDON MIDLAND

TO AND FROM LONDON, THE MIDLANDS, THE NORTH AND NORTH WEST

GETS IT THERE SOONER. GETS IT THERE SAFER

THE WORLD OVERSEAS

West African Manoeuvres

FROM OUR SPECIAL CORRESPONDENT

THE decision of M. Houphouet-Boigny, the premier of the Ivory Coast, to demand independence for the states of the "Entente" (Ivory Coast, Upper Volta, Dahomey and Niger) and to lead them out of the French Community before he leads them in again (if he does) has produced very mixed reactions in the West African capitals that are now fast becoming hotbeds of international diplomacy.

In Dakar, there was dismay and mortification. An independence which leaves a strategic base in France's hands and provides for financial and diplomatic co-operation which only made sense when several other partners were in the partnership, has become dust and ashes, for all the fanfares (ready-wired in advance) that have duly sounded. In Conakry there is grim satisfaction, and the calculation of future chances. In Monrovia there is relaxed benevolence. In Accra there is a mixture of triumph and irritated disbelief: M. Houphouet-Boigny has had to admit dramatically that Dr Nkrumah, prophet of African independence, was right all along—but he is still Houphouet-Boigny, still entrenched, formidable, conservative and determined to remain a power in Africa. His "Entente" still encircles Ghana and enjoys common frontiers with Guinea and Nigeria while yet dividing them all from each other. In Lomé there is relief that Togoland now has an alternative large state with which it can associate itself if it proves impossible to stand alone—a tactical advantage that Mr Olympio impressed on Dr Nkrumah at their recent let-bygones-be-bygones meeting.

In Guinea and Ghana, of course, Mali's independence, like Togo's, has all along been denounced as a spoof, and both have considered whether to try to block its membership of the United Nations on the ground that its agreements with France leave it a disguised dependency. But this has also been aimed at M. Houphouet-Boigny and, behind him, at French imperialism, the Aunt Sally of every African démarche (as yet even more so than apartheid). In both, M. Houphouet-Boigny's move is still decried in powerful quarters as phony independence, a front for French colonialism; but it is obviously going to be a great deal more difficult to persuade the Afro-Asian block of this. The leader of the "Entente" states (this is decidedly the feeling in western circles) has ditched Mali, but has stolen a march on Conakry and Accra.

There has thus, for the moment, been no real brotherly reunion of anti-colonialist comrades; though this may come. Dr Nkrumah and Mr Olympio, prime minister of Togo, have shown how quickly, at least in personal relationships, African leaders can compose quarrels and forget name calling (and even frontier brinkmanship). In Guinea there was real satisfaction at the way in which both Senegal and Ivory Coast co-operated in uncovering the unholy plot against its regime by malcontents and adventurers whose caches of rifles and automatic weapons were unearthed and are now on show in an exhibition at the "Permanence"—the party headquarters—in Conakry, and whose agents are in gaol or (in some cases) under the earth themselves. In Accra there is a feeling that M. Houphouet-Boigny must be made to work his passage; for three years he has (as the Ghanaians see it) done France's dirty work. If he now backs Ghana, well and good; but he must denounce French atomic tests, recognise the Algerian rebels (or at least denounce the Algerian war), and make sure that even if he joins a French community for the sake of French markets and investments, that community shall be as innocuous an organisation as the Commonwealth. Then the grand march to African union under Dr Nkrumah's (much reinforced) leadership can be resumed; and there are Ghanaians who think that, with careful diplomacy, M. Houphouet-Boigny could be drawn along this path.

There is more scepticism in Guinea. M. Houphouet-Boigny's position is there analysed under the Marxian antinomies. Ivory Coast is the core of the "Entente"; it is relatively rich, and it is a country (like Ghana) of small proprietors often employing proletarian labour from the underdeveloped northern states, with which it is therefore in social conflict. It needs to develop them, if it is to form any organic unit with them, but it has not the wealth to do this, even if it were willing to put such a brake on its own rapid development. It must therefore seek future French subventions, which will at once lead it back to partnership with French colonialism—yet without solving the economic problems of Upper Volta and Niger. These, in the Guinean view, can only be solved by an African marxist revolution in the classic Guinean manner—the denunciation of all foreign aid, and the mobilisation of the energies of the liberated people (after which fraternal aid from the peoples' democracies can be relied on to meet immediate deficiencies). The correct move is therefore to detach Ivory Coast from the northern states by penetrating them with the appropriate ideology. The *Parti Democratique Guinéen* is not without hopes of doing so, encouraged by the success its ideas have had in Soudan, the weaker member of the Mali partnership. A school for training activists is being set up.

Yet even in Guinea a single viewpoint does not exist. There are moderates there who would leave it to the "Entente" to find its own solutions. The question in Guinea always comes back to the estimate of how far communist penetration has gone—how well Russian grafts on the stock of African collectivism have taken. This is not at all certain. True, M. Sekou Touré looks at West Africa through marxist spectacles, but he removed them smartly enough when he found that the draft three-year plan contained an explicit avowal of complete socialism; the printed draft will be found to be without these interesting passages when it appears in a week or two. Thus the iron ore and bauxite consortia have been quietly reprieved, though it may not follow that Alcan will decide to go ahead with the new bauxite project costing $150 million—to which only $10 million has been committed so far. Though Conakry has lost its sparkle, and become a fair imitation of the drab, post-revolution capital, *planteurs* are tolerated upcountry, and the famous Coast trading companies struggle on.

The Russians have, however, made Guinea's independence pos-

sible, and thus at one remove forced M. Houphouet-Boigny's hand. Their contribution has been twofold—the loan, which gave the country a line of credit on which to continue trading, and moral support and constant excitement. The Ilyushin transports have continually flown parties and delegations in and out, making Guinea feel it is the hub of the African revolution. Flattery has been laid on with a trowel. (Westerners have quite lost the Disraeli touch, vastly to their disadvantage.) The actual economic projects have been few: the Russians have improved the airport and built roads (so have the Americans) ; the east Germans are putting up a printing plant ; the Czechs have printed the handsome notes of the new currency, by lithography on unwatermarked paper ; and there is much other activity which has given rise to the useful rumour of thousands of trucks and tractors being landed. But, in spite of Russian gifts and imports from the communist block, the Guineans were glad to buy consumer goods in Britain and Sierra Leone to ease immediate shortages, caused by the non-convertibility of the Guinean franc, which has cut trade with France and the West to a vestige. Reuters, in competition with Tass, has concluded an agreement to be the agent for the official Guinean press agency. Against perhaps 3,000 French and western technicians and administrators in Guinea, the whole Communist block (which works as a team) has rarely more than 150 personnel at a time—though the planes arrive almost daily bringing new ones and taking others away.

This, however, is enough to make the ordinary Guinean begin to talk about "les pays amis" or "nos vrais amis." The Russians are planning ahead on the ancient African maxim of "Soffle, soffle, catchee monkee." They have as yet no advisers in key positions, even though the Czechs are (helped by the plot) reorganising security and defence. But they are indoctrinating the "second layer" of Guinean politicians and administrators and, by taking 300 students, hope to indoctrinate the rising generation. Their intention seems to be to cut off M. Sekou Touré's retreat at the right moment.

THE manœuvre is sufficiently obvious to have alarmed the moderate Ghanaians. They recognise ominous mental signs in some of their colleagues lately returned from Russian tours, who talk about collective farms and Russian loans at 2 per cent without strings. This has a variety of consequences. There is little doubt that the World Bank's decision on the revised Volta barrage will be a critical moment ; if the plan is turned down, or finance is offered on distasteful terms, the voices in favour of supping with the Russians will get much louder.

But the other consequence is the importance of the path that M. Houphouet-Boigny now treads. By opting for complete independence, he suddenly presents the Russians with a much larger field than even Guinea and Ghana for their operations—but also one that may be too large for them to compass. Russian aid to Guinea is at once spectacular and cheap because concentrated: spread throughout west Africa it would be much less impressive. And if M. Houphouet-Boigny joined the ranks of the African leaders who are determined not to exchange an old for a new master, or even a shadow of one, the going would be much harder. Much will therefore depend on the terms on which M. Houphouet-Boigny parts with the French and works with Niger and Upper Volta ; and also on whether the African leaders can work together or are divided by jealousies, perhaps especially the jealousy over who is the real champion of African independence. In this, as perhaps other matters, the Africans would be advised to study the parable of the vineyard. The West on the other hand, flinching at the onset of communism, might consider the parable of the wheat and the tares. It is easy to make mistakes in Africa—even for Chinese, confident that they can teach Guineans how to grow rice on the collective farm system.

Rebels with a Passport

FROM OUR PARIS CORRESPONDENT

THE Algerian conflict is moving towards its moment of truth. Direct negotiations between the French government and the leaders of the insurrection, whatever their outcome, will reveal the respective positions of the two sides. Should the prospect of a compromise appear in the process, the scarcely-veiled threats of the French opponents of a negotiated settlement will be put to the test of political action. If the talks break down, the limits beyond which each side is unwilling or unable to move will be made plain. But, as in any drama, the climax of clarity is preceded by confusion, shifts of position and sudden changes of fortune. On Monday, hopes soared high when the insurgents agreed to send a delegation, headed by M. Ferhat Abbas, to Paris. On Tuesday, there was astonishment when the mere sending of a preliminary envoy was bogged down in quarrels over the ownership of the plane and nature of the permit. Beneath the quarrel of prestige and procedure lie differences of substance. To understand this incident and similar ones that are likely to follow, the fundamental positions of the protagonists must be assessed.

General de Gaulle is driven by two contradictory forces. He needs peace to consolidate his position at home and to try to carry his principles of foreign policy into practice. On the other hand, the origins and nature of his regime, his own conception of the part the army should play in society, prevents him from accepting a solution which would hurt the feelings of the majority of French officers and thus lead, if not to a clash, at least towards a divorce. The attempt to reconcile these two conflicting tendencies explains the waverings and ambiguities of gaullist Algerian policy. Last week, General de Gaulle made his bid to get the Algerians to Paris, not by any explicit new pledges, but simply by omitting from his statement passages that had been considered unacceptable by the insurgents on previous occasions. This method has the advantage of enabling the general to retreat, if he chooses, and of allowing his ministers to assert that on all controversial questions official policy has not changed.

What matters, however, is that the insurgent leaders saw in the general's silence enough "progress" to justify their coming to Paris. Their reply reiterated the previous position that talks about a ceasefire and about guarantees for a future vote cannot be separated. It admitted that the gap between the two sides remains wide. Yet, like the general, the leaders of the insurrection chose to emphasise the need for negotiation rather than the differences. It requires the wishful thinking of French journalists to interpret this position as a sign of weakness bordering on surrender. Whatever their losses in the field and shortage of weapons, the insurgents can carry on their guerrilla war. The predominance of the young in a population living in poverty and unemployment makes recruitment easy for a nationalist underground movement. Even the rebels' military position might be improved shortly by Chinese help.

Internationally, the Algerian government-in-exile is now stronger than, say, at the beginning of this year. The failure of the summit conference had a double result. It freed the hands of Mr Khrushchev, who is no longer bothered by scruples towards gaullist France ; this, in turn, made it more urgent for the United States that the Algerian conflict should be brought to an end. Last, but not least, all observers have been struck by the renewed confidence of the insurgent leaders after their recent discussions with the Chinese. Mao Tse-tung apparently assured his visitors that, as their conflict was part of the general "anti-imperialist struggle," they could rely on Chinese assistance however long the war lasted. The aid offered, it is claimed, was very impressive. Naturally, the prospect of increasing reliance on communist China must be as distasteful to middle-class leaders like M. Ferhat Abbas as it is tempting to intransigent Algerians of the younger generation. Its very existence, however, rules out the theory that the rebels have agreed to send a delegation to Paris because they had no other alternative but imminent surrender.

The journey to Paris involves undoubted risks for the insurgents. Any commander knows that a truce, and the prospect of final peace, can sap the fighting spirit of his troops. What is true of a regular army is even more of a problem for guerrillas. Hence the emphasis in M. Abbas's appeal to the Algerian nation on the need for vigilance, and the fact that the struggle is far from ended. The appeal also tries to explain that the government-in-exile took the risk of negotiations because it hopes, in this way, to achieve its aim of independence. A free vote, it argues, can only result in a massive Moslem vote for independence. Ceasefire negotiations must, therefore, be combined with talks about guarantees that the vote will really be free.

The two positions can now be contrasted. The insurgents want simultaneous talks and a ceasefire to be followed in quick succession by demobilisation on both sides (and the rapid evacuation of French troops), their own transformation into a political movement and a vote under dual—or international—control. General de Gaulle wants the insurgents to accept the ceasefire and, then only, to start discussions, together with other Algerian representatives, about the terms of a future referendum to take place after a good period of *apaisement*. The French army would remain on the spot for a long time to guarantee that everything works according to plan. In other words, the insurgents are asked to fit into the slow evolution, envisaged by the general, and leading finally in his opinion to an autonomous "Algerian Algeria" closely tied with France. In their present form, the two positions are irreconcilable. The forthcoming talks should show whether either side is willing to make concessions of substance, and the presence of French forces on Algerian soil may soon be the heart of the matter.

In deciding on French concessions, General de Gaulle must keep only one internal obstacle in mind—the mood and obedience of his military subordinates. The political champions of French Algeria, who sat in conference this week in the town hall of Vincennes, have well-known names but relatively little popular following in France. Such is the general weariness with the never-ending war that President de Gaulle could get a massive popular endorsement in France for any peaceful solution. MM. Soustelle, Bidault, Lacoste and others are important chiefly as a brains trust for political forces across the Mediterranean. Many of the million French settlers in Algeria are convinced that their very existence is at stake and they are certainly ready to come out into the streets. But M. Soustelle and his colleagues are intelligent enough to have drawn the lesson from the events of May, 1958 and January, 1960 that a settlers' revolt acquires political significance only when it is backed by the active support, or the benevolent neutrality, of the army. Hence the present prudent tactics of the *ultras*. They have set up a new organisation (the Front for French Algeria—FAF) and are gathering signatures to extend their movement beyond Algiers. Meanwhile they wait. But the present quiet of Algiers is deceptive.

These tactics have proved wise so far. General de Gaulle, having encouraged the insurgents by silence, has now allowed his ministers to reassure the officers and settlers more explicitly. The favourable reply of M. Ferhat Abbas was accompanied in the French press by commentaries, inspired by the ministry of information, that talks would be limited to military matters, and that the French army would stay in Algeria. M. Delouvrier spoke in the same vein in Algiers and rumour has it that the army dropped leaflets over rebel territory urging the guerrillas to surrender because their leaders had already done so. It is in this context that the Algerians' reluctance to send their envoy in a French plane can be understood. The rebels still fear that they may be led up the garden path and want to avoid any signs of inequality. The French authorities had to give in and change their plans. It has thus been plain from the start how perilous the actual negotiations are bound to be.

There are some factors favouring an agreement. The leaders of the insurrection, having taken the risk of psychological relaxation among their troops, will not want to leave Paris empty-handed. The middle class leaders want to avoid the Chinese alliance which looks inevitable in the event of a break-down. General de Gaulle, for his part, knows that failure this time would both strengthen his opponents on the extreme right, and, on the left, combine opposition to the war with struggle against the regime. It would also damage his international prestige. But the crucial question remains whether General de Gaulle can find a formula acceptable to the insurgents which he will be able and willing to impose on the French army.

Medicine for Turkey's Economy

FROM OUR CORRESPONDENT IN ANKARA

MILITARY coups suggest violence, bloodshed and uncertainty, and tend to discourage foreign investors. The West should therefore realise that Turkey's recent coup, as seen from Ankara during the first few weeks, is clearly a determined attempt to abandon the economic nonsense of the previous regime and get back to financial soundness and good sense. The soldiers are in power in Turkey, but they have installed a government of experts, technicians and intellectuals which, at least on paper, could hardly be bettered. The economic posts in the new cabinet—finance, commerce, works and planning—are in the hands of civilians, who are all believed to have sensible ideas about what should be done.

Nobody, of course, knows how long these men will stay. They are only a provisional government until the army, through the promised free elections, restores democracy. That may be in six months ; it may be in a year. Fortunately, a provision is being inserted in the new constitution now being drafted allowing non-political technicians to remain in office. Some of the key men may thus be expected to stay on after the elections, so that continuity will be preserved. The provisional government has already got some important things under way. An economic planning board has been set up, with one of the top ministers as its chairman, to draw up a long-term investment plan for Turkey ; this is something Mr Menderes always managed to wriggle out of. The board will have the advice of two distinguished Dutch economists, Professor Tinbergen and Dr Koopman, and will work in close contact with the United Nations experts who for many years have been poring over Turkey's problems.

The planning board, the first to be set up in Turkey since the time of Kemal Ataturk, will closely scrutinise the welter of economic projects, some of them almost blatantly electoral in intention, in which the previous government was wallowing. Priorities will be allotted which will be based on the degree to which any particular project helps to earn, or to save, foreign exchange. In this way it is hoped that Turkey's chronic trade unbalance will be diminished.

Each project will be decided on its merits. Irrigation and reafforestation will be given high priority ; so, too, probably, will tourism. Plans for a new steel industry on the Black Sea coast at Eregli may or may not be adopted. Dunlop's proposed factory near Istanbul, will, for certain reasons, be scrapped. The replanning of Istanbul, an immensely expensive operation, will be brought to a halt. Dreams like the Bosphorus road bridge will be quietly forgotten. Eventually, a hard core of sensible development will be welded into a plan—probably a five-year one.

On the agricultural side the government has also taken a wise and courageous decision. It has told the peasants bluntly that

they will not get the higher prices for their corn promised by Mr Menderes. This will not be popular. But here the coup was fortunate, or clever, in its timing. The peasant in June is too busy to mind much about anything. Furthermore, by a great stroke of good fortune, this year's harvest is likely to be the best for many years. This will mollify the peasant and should provide, for the first time since 1953, Turkish wheat for export. If prices can be kept low, which the new rulers are clearly making a great effort to do, the peasant will not find his purchasing power reduced but possibly even increased.

Turkey has fearful problems ahead, many of which have been concealed in recent years by the more superficial disease of a trade deficit. There is a combination of a galloping birthrate (three per cent per annum) with grievous soil erosion, which is lowering food production, and deforestation of the Anatolian plateau which is little short of a national disaster. On top of this, there is vast hidden underemployment, both in town and country which is constantly aggravated by demographic factors.

The new government, in Churchillian style, has declared its own policy to be "the tightening of belts." There will be no devaluation. There will be (for the moment at least) no new taxes. Foreign aid will be expected, not courted. Budgets are to be balanced, inflation countered, and Turkish exports, by judicious investment, made competitive on world markets. Turkey's long downhill gallop has ended, the long uphill trudge begun. It is a journey which only a strong government with little opposition will be likely to accomplish.

Japan After Kishi

FROM OUR TOKYO CORRESPONDENT

OVER the main gate of the Diet compound in Tokyo on Sunday, June 19th, the day that American Marines were protecting President Eisenhower from demonstrators on Okinawa, there stood a large photograph of Miss Michiko Kamba, the Japanese co-ed who was trampled to death when she and other students attempted to break into the Diet grounds on June 15th. In front of the Diet gate stood large wreaths of artificial flowers. Prayers were being said, and incense burned. In a country where prayers are also said for the souls of broken sewing-machine needles, these ceremonies perhaps have more political than religious significance. The dead girl's father, Professor Kamba, who earlier this year bitterly accused *Zengakuren* of "stealing my daughter from me," has now, like many other professors with less personal reasons, become an ardent advocate of the students' cause, and has taken a solemn vow, in the presence of several scores of thousands of people, to "carry on my dead child's work so that she shall not have died in vain."

But what exactly it is that the students, and the professors, want is not easy to determine. They claim that they are out to defend democracy against Mr Kishi and his "fascist" government. But it was the Diet Socialists, not Mr Kishi, who broke the parliamentary rules and tried by physical force to prevent the staging of a debate they knew they lacked the numbers to win; and it was from socialist not "fascist" fists that police had to be called in to protect the Speaker of the Lower House. Similarly, the students, including Miss Kamba, who attacked the Diet on June 15th, seemed less eager to protect democracy than to destroy its tangible home. The students and the professors bitterly accuse the "brutal" police of having killed Miss Kamba; but, once again, the facts are quite otherwise. After having for some hours endured being poked at with nail-studded sticks and having stones thrown at them, the police guarding the Diet charged the students, whose vanguard tried to retreat while their rear was still being urged forward by leaders with loudspeakers who were careful to remain in a place of safety. Miss Kamba slipped, fell and was trampled to death by fellow-students as well as by police, and a number of other Japanese girls who were where they had no right to be were very lucky not to share her fate. This, however, has not prevented the principal of Tokyo University, Dr Kaya, from putting all the blame on "police atrocities." Japan's *sensei* appear for the time being to have lost the power to discriminate between truth and falsehood as well as between right and wrong.

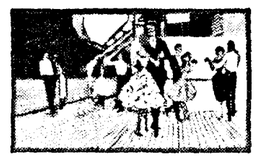
It is the active participation of so many of Japan's intelligentsia in the anti-government crusade now convulsing the country that gives the demonstrations their significance. If the demonstrations were not so heavily weighted with the most vocal members of the middle class it would be possible and permissible to note that although the entire nation is supposed to be seething with unrest, in fact considerably less than one per cent of the population is in any way engaged in the agitation. But while the crusade has the active backing of most of the universities and almost all the newspapers, not much comfort can really be derived by Japan's conservatives from such phenomena as their having received 23 million votes in the last elections two years ago, compared with 13 million for the Socialists, and only one million for the Communists.

The picture becomes even more maddeningly confusing when one asks if the current unrest means that a switch to a Socialist government is possible, only to be assured even by Socialists that this is completely out of the question; a dissolution of the Diet and fresh elections, which the Socialists are clamouring for and the conservatives will probably concede, must, it is said, infallibly result in the Liberal-Democrats being returned to power, and with no great reduction in the number of seats they now hold, which is close to two-thirds. Yet everyone insists that with the passing of the revised Japan-America security treaty through the Diet at midnight on June 18th, Mr Kishi for all practical purposes ceased to be prime minister, and that all that is now left to do is to decide whether his successor shall be Mr Ishii, or Mr Ikeda, or even the hoary but remarkably hale Mr Yoshida.

It is not even possible to say clearly why Mr Kishi is being summarily dismissed. The students, the professors and the press have hitherto declared his twin sins against the Japanese holy ghost to be passing the security treaty and asking President Eisenhower to visit Japan. But the *Asahi*, Japan's largest newspaper and hitherto the treaty's most relentless critic, is now saying that the treaty Mr Kishi negotiated "is a great improvement on the old one." And if one turns to the provincial press, one finds the *Chubu Nippon Shimbun* of Nagoya announcing that one of the things for which Mr Kishi must certainly be punished, and which he will have a hard time justifying to the Japanese people, is his having "called off the scheduled visit of President Eisenhower." To be either a policeman or a premier in Japan would appear to be distinctly purgatorial.

Mr Kishi may well feel rejected by all, for the United States as well as his own party seems to be writing him off as briskly as possible. His own public relations chairman blandly assured newspapermen that Japan was "anti-Kishi but not anti-conservative," and, though Mr Kishi got a no doubt nicely worded note from Mr Eisenhower, Washington appears anxious to have it established that Mr Kishi's imminent fall will not break the heart of the State Department. This ingratitude may not turn out to be very clever. The Japanese will note it, and draw their own conclusions. Writing off Mr Kishi in a hurry is probably not going to make the American bases in Japan any safer. The trouble, however, is that nobody knows how safe or unsafe they are, or how much Japanese-American friction the present upheaval may or may not generate. A Socialist speaker in the Diet declared at midnight on June 18th that the struggle was not ended and would not end until there were no more American bases in Japan. But it seems

Captain Mayhew

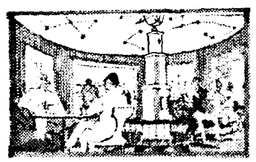


UNION-CASTLE COMMODORE

invites you to look at this pictorial preview of his new command

'WINDSOR CASTLE'

Who's for a bathe? Two swimming pools on deck, each with a verandah-lido. The passengers may be sun-tanned almost before they get to Las Palmas.



Shall we dance? In the lounges or on the decks. The 'Windsor Castle' has an expert five-man orchestra, equally good at 'Grand Hotel' for teatime and cool harmony for the evenings.

Stars of the screen. Film-shows every day, and some of the latest West-End films on every voyage. It's a large and very comfortable cinema, specially designed, and air-conditioned.

Fabulous food. The kitchens, under the command of master chefs, are designed to make every meal a banquet. You have a big appetite in the South Atlantic, three times a day.

Out of the Sun. This gives you some idea of the Smoke Room, Tourist Class: designed by Michael Inchbald, it consists of the Cockpit Bar, the 'Rotunda' Lounge and a Reading and Writing Room.

Appointments for Beauty. Elizabeth Arden has charge of the Beauty Salon. Bond Street elegance at your command, Madam. The best of everything for 'Windsor Castle' passengers, please!

Sheer luxury. This is a De Luxe Cabin, with two most comfortable beds, big cupboard space, big windows over the sea, and a private bathroom with bath, shower and separate toilet.

Children are V.I.P.'s Specially equipped play-rooms for the very young, under the kindly eye of Hostess or Children's Stewardess. Parties, Fancy Dress competitions, Sports and Cinema Shows too.

38,000 tons of luxury, elegance and modernity — the 'Windsor Castle' sails from Southampton on her maiden voyage to the Cape on August 18th. Thereafter at intervals of eight weeks. First Class and Tourist. When will you have the good fortune to sail in her yourself?

the going's good by

UNION-CASTLE

THE BIG SHIP WAY TO AFRICA

Every Thursday at 4 p.m. a mailship leaves Southampton for the Cape. About twice a month liners leave London for the Round Africa trip. Chief Passenger Office, Dept. 5, 19-21 Old Bond Street, London, W.1. Tel: HYDe Park 8400. Or Travel Agents.

highly unlikely that the Japanese people really wish to end their close association with the United States; the Japanese Socialists, temporarily jubilant, could turn out to be as wrong about Japan's future course as everyone else.

EASTERN GERMANY—I.

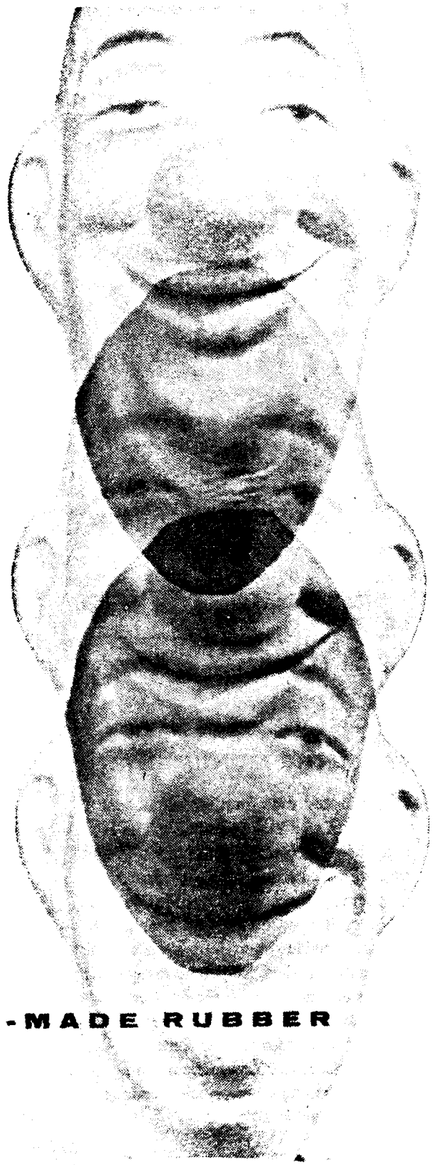
Towards the Promised Land

FROM OUR SPECIAL CORRESPONDENT

IT has to be seen to be believed how unlike each one's officially projected image of the other the two Germanys have become after fifteen years' separate development. Fresh from the European-minded Federal Republic, where they are certainly not spoiling for a war of revenge, the traveller to east Germany is struck disagreeably by the malevolence and mendacity in the caricatures of west Germany's elected leaders that shriek from every newspaper and factory wall, even though he is relieved after a while to note that nobody seems to pay the slightest attention to these hollow cries of wolf. He is just as sharply impressed, and relieved, to discover that the seventeen million Germans confined in the Democratic Republic are living by no means as greyly and fearfully as Bonn's propagandists assert. Economically, things are getting steadily better, not worse, in the Democratic Republic.

One of the declared objectives of the Democratic Republic's seven-year-plan (1958-1965) is to overtake west Germany "in consumption per head of the most important industrial consumer goods and foodstuffs by the end of the year 1961." Cautiously worded as it is, this seemed a fantastic promise when it was first made nine months ago in the circumstances of deprivation then prevailing. Yet this summer it is plain for all to see that the east Germans are once again enjoying most of the creature comforts the lack of which since the war has provoked so much head-shaking among their luckier kin in the west. The men, the women, and the children are wearing markedly better clothes. There are more private cars and motor-bikes on the roads. There are generally more goods in the shops, not merely in the shop windows. The average German's conception of a square meal—plenty of fresh meat or sausage, and beer or wine—is procurable anywhere at a reasonable price. At teatime in the state-run cafés of Dresden, Halle, Cottbus, or Rostock, you can see the same sort of people tucking into the same hunks of cake topped with whipped cream, listening to the same music in the same sort of solid setting, that you can see at teatime in the cafés of Stuttgart, Hanover, Krefeld, or Bremen.

The east Germans still have their grumbles—the continuing scarcity, for instance, of fresh fruit and vegetables (bananas, when they can find them, fetching 1s. 6d. and oranges 10d. apiece), and, among the increasing number of those who can afford such luxuries, the delay in the delivery of cars, television sets, and refrigerators. But the planners confidently claim that these deficiencies will shortly be made good. As for satisfying the pressing need for new houses, the promise is more modest, namely that "the shortage is to be overcome for the most part by 1965." The building programme is now lagging by some 20 per cent.



The beatific certitude with which the regime maps the Democratic Republic's route march to the promised land rests not only on its belief in the superiority of communist practice, but also on the scale of communist international co-operation, in which east Germany is increasingly sharing. The Lübbenau-Vletschau power station, whose faintly smoking chimneys are a landmark for miles around Cottbus, is, for example, already linked with the inter-national electricity grid of the communist countries. Controlled centrally from the lower Volga, the grid can pool, as required, electric power from eastern Germany, Czechoslovakia, Poland, Hungary, Roumania, and Bulgaria, with that from Soviet stations. The grid is to be operating fully in 1965. By then, it is claimed the Lübbenau-Vletschau plant will have expanded enormously. The refineries that are now being built at Schwedt, on the Polish border near Frankfurt-on-Oder, will be ready in 1963 to handle the first oil arriving by pipeline from the Soviet fields near Kuybyshev, 2,500 miles away. Schwedt is to be able to deal with four million tons of crude oil each year by 1965, and, if all goes well, eight million tons by 1968. The bulk of the refined oil will be absorbed by the chemical industry.

The most important part allotted to east Germany by the communist countries' council for economic aid (Comecon), is that of principal supplier of chemicals to the eastern block—mainly petroleum chemicals and their derivatives, but also a considerable quantity of drugs. This is why the headquarters of Comecon's standing committee for the chemical industry have been set up in east Berlin. For the good reason that it is investing heavily in the project, the Soviet Union is highly interested in enjoying its fruits. According to a talkative, mediumweight technician at one of the big chemical plants near Halle, the Russians have so far supported this department of Comecon planning with credits worth altogether DM 500 million (east). At the more knowledgeable but more reticent east German state planning commission in Berlin, they say that the Soviet Union, bent on expanding its own plastics industry, granted credits worth DM 200 million (east) in 1958 specifically to help the Democratic Republic set up new plant for the production of polyvinyl chloride. The Germans have undertaken to deliver 20,000 tons of polyvinyl chloride by the beginning of 1961, and then increasingly more until the debt has been paid.

UNDOUBTEDLY the Russians are also lending a hand in the development of the huge brown coal combine at Schwarze Pumpe, near Cottbus in Saxony, where the rich local deposits—enough for the next sixty years—are being processed largely on the spot (because 60 per cent of lignite is composed of water) into gas and solid fuels and such valuable industrial chemicals as tar and creosote. The catalogue of present developments in the chemical industry is too long to fit into the space of a general article. But it is worth mentioning that east Germany now has the largest plant in Europe for making sulphuric acid from anhydrite, a plentiful ore chemically related to plaster of paris. Production here is to reach 300,000 tons annually by 1963. Sulphuric acid stays at home, and so, for the time being, does virtually the whole of the Democratic Republic's fertiliser production. In short, the prime sources of national wealth are being so intensively and ambitiously cultivated that only the catastrophe of war could now interrupt the east German's improving daily lot.

Of course, there are difficulties, miscalculations, and hitches. As a rule, one hears only of the first. They arise mainly from a lack of the means of investment, of hard coal (hence the frantic exploitation of lignite, at present the source of 90 per cent of the Republic's energy), of good quality steel, of an adequate transport system (electrification of the railways is now being energetically tackled), and of chemical equipment. Even more troublesome is the shortage of both skilled and unskilled labour, which is being constantly aggravated by the unceasing exodus to the west. Some 2,000 women are working in the Warnow shipyard at Rostock alone, and several hundred convicts have been drafted to Schwarze Pumpe. The social and political consequences of the regime's immense effort to incorporate Germany usefully into the communist world will be discussed in a subsequent article.

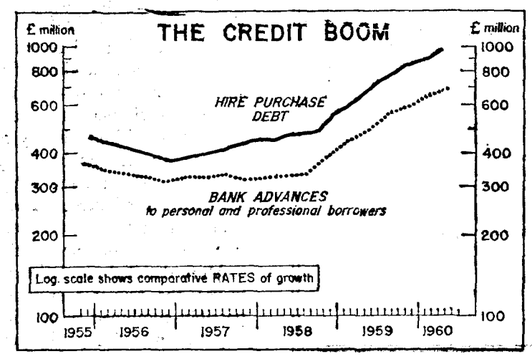
THE BUSINESS WORLD



Regulating Hire Purchase

THE great boom in hire purchase, which in two years has doubled the volume of instalment credit outstanding in Britain and much more than doubled the profits of hire purchase finance companies, now faces threats from three directions. The re-imposition at the end of April of statutory controls on minimum deposits and duration of contracts has inevitably cut away some business (even if only by reducing the amount of credit granted for each purchase), just at the time when a deceleration in the growth of business was due anyway. Secondly, after two years in which bank money has been available for the asking, the banks have clamped down and are not generally prepared to offer new overdrafts and these will now be costing 7 per cent. So the finance houses are again sharpening their efforts to draw deposits direct from the public. And, thirdly, their freedom to do this will soon, for the first time, be circumscribed by a new and permanent statutory control. The form that regulation should take is a matter of keen debate; but the Government has promised legislation for the next session.

The immediate outlook for the finance companies may therefore be consolidation, which after their break-neck expansion will not do any harm. The stock exchange was quick to signal the changed prospect. Hire purchase shares were among the first to fall, and are now in most cases 20 to 25 per cent below their peaks at the end of 1959. Current dividend yields are no longer in the 2-2½ per cent range though at 3-3¾ per cent they are still a full point and more below the average yield on leading blue chips. Investors know that a large part of the profits from the past two years of peak trading has still to be brought into the accounts; and they are impressed too with the dynamic management of most finance houses.

But, even without official restrictions, most observers inside and outside the hire purchase business expect its expansion to slow down. Instalment purchase is subject to a built-in cycle, as increased business carries with it increased commitments to repay. There might in addition be a more lasting check to the pace of growth. For years Britain was far behind communities such as the United States and Australia in its use of consumer credit. The upsurge since mid-1958, with a doubling of hire purchase debt and also of advances by commercial banks to personal and professional borrowers, has changed this picture. Hire purchase and other instalment credit, at £950 million, now accounts for about 5½ per cent of total personal incomes after tax, and bank advances to the personal and professional group, at £680 million, for another 4 per cent. Not all of this can be classed as consumer credit, for it includes finance for small businesses ; on the other hand sizeable sources of personal credit, notably through check trading and monthly retail accounts, are not included in the hire purchase figures and are likely to be financed by bank advances under other headings. So this total percentage of around 10 per cent of a year's disposable income may be broadly the right figure for consumer credit in Britain. Two years ago the comparable figure was 5 per cent.

In the United States, it is true, total consumer credit shown by the notably more comprehensive figures is around 15 per cent of disposable personal incomes. If Britain is to approach this ratio there will have to be marked changes in social habits, notably in people's reluctance to give full and frank details of their personal finances to credit agencies, whose services are essential if the business of credit giving is to be streamlined in the American way. Even in the United States, following the rapid increase after the war, the ratio of consumer credit to incomes has been stuck at around 14-15 per cent for the last five years.

The inference seems to be that competition in the provision of consumer credit in Britain is likely to sharpen. The banks, *it is true, are now under pressure* to curb their total lending, but this time the monetary authorities have not asked for specific discrimination against the personal borrower. Thus hire purchase companies, which in any case are subject to control on terms of contract and to pressure on their sources of finance, are less likely to thrive on business turned away by the banks—as bankers allege they did in the mid-fifties. Nor does there seem to be much

further scope for finance houses taking over credit business done by retailers: most traders who still finance their own goods do it as a matter of policy.

Because they foresee a slowing down of growth in Britain a growing number of finance houses are turning their attention to possibilities abroad. Two leading groups, Bowmaker and Lloyds & Scottish, are establishing jointly a holding company in Switzerland to acquire promising finance companies on the Continent. Leading finance houses in eleven countries (including United Dominions Trust in Britain) co-operate in a loose association designed to pass on business arising from international trade; there seems a possibility that this may in time be extended to the setting up of a joint international company, perhaps in Switzerland, to obtain finance in the cheapest market and operate in member countries' territories in its own right.

While Britain's large hire purchase companies are thus looking outward for further expansion, the medium sized and smaller companies are awaiting the coming legislation on acceptance of deposits from the public with some concern. These smaller companies are generally more dependent on deposits from the general public than the large finance houses, whose connections with banks and other institutions make them less dependent on deposits from the public and at the same time better placed to get them.

The smaller companies may thus come under a new pressure. In the past, it has to be admitted, the power of survival of these smaller companies has been underestimated,

The Economist

JUNE 23, 1860

CONTROLLING SPECULATION

The Act which has long been known as Sir John Barnard's Act, and which has just been repealed, is remarkable as one of the last remnants of the *once* prevalent disposition to regulate artificially the morality of commerce. Sir John Barnard was a very eminent and upright merchant of the last century. Like other traders of his time, he seems to have been deeply impressed by the mischievous speculations connected with the South Sea scheme, which were analogous to those of the railway mania of 1845, and to have believed that the Legislature could prevent the recurrence of similar calamities. . . . The Act further prescribes that, "for preventing the evil practice of compounding or making up differences for stocks or other securities" bought or sold, those who were concerned in such transactions should be liable to a penalty of £100; and all persons who contracted to sell stock of which they were not actually possessed at the time of such sale should be liable to a penalty of £500. The Act has, of course, been wholly inoperative. Half the business of the Stock Exchange has been carried on in spite of it. Trade will not allow itself to be restricted by statutes of this kind, and it is fortunate that it should be so. The motive of the framers of the Act was good, but their legislation was not beneficial. Like every other market, the stock market should be as free as possible. There is no more harm in buying stock deliverable at a distant day than in buying tallow so deliverable—there is no harm in selling either under such circumstances—and there is no harm in selling stock which you are not at the time possessed of; if you have not got it, you must proceed to get it. It is true that all trading transactions that deal with future times and future events have some element of chance in them; what is future is necessarily uncertain. It is also true that all transactions which have an element of chance in them may be made the means of gambling. The buying and selling of all commodities may be made so if the parties to the transactions wish it. But we should not prohibit the ordinary transactions of life because of their exceptional abuses; we must not prohibit regular commerce, because persons who are so disposed may gamble under its forms. The Stock Exchange will now have no peculiar law of its own on this subject: it will be subject to the general policy of the law as to wagers and gambling, but will not have peculiar penalties and special disabilities of its own.

and it may be that in this trade, where personal contact with variegated species of motor dealers is so important, the small company with local connections will always have a place. But whereas in the past official regulation has helped them

stand up to the competition of the big battalions, the new form of regulation being considered is likely to do the opposite.

REGULATION that is directed to the taking of deposits by hire purchase companies—or indeed any finance companies—would be of quite different purpose to the more familiar controls on terms of hire purchase contracts. Control over hire purchase terms has been used by the Government in order to restrain or stimulate economic activity. It is possible to argue that some minimum conditions of payment in hire purchase contracts are in the general interest of finance companies and hirers alike, and that if the companies cannot agree among themselves to adhere to such conditions the Government should impose them; but that is not how the control has been used. Control of deposit-taking, by contrast, is designed to protect the investor. The absence of any such regulation is an anomaly. Legislation was planned some years ago and dropped in despair as the authorities discovered the wide differences of opinion within the hire purchase trade, and shrank from the complications that might be caused for the ordinary commercial banks (which traditionally have never advertised openly for deposits). Since then, the losses incurred by depositors as a result of a number of scandals, some of which coincided with the election campaign, have forced the Government to undertake the difficult task. It has not yet forced the finance houses to a common front; and their representations to the Government have varied notably.

The large companies represented in the Finance Houses Association generally feel that this matter hardly concerns them, as established companies. In their view, three simple stipulations are needed: first, that only public companies should be allowed to solicit deposits; secondly, that any advertisement or circular should state key figures from the accounts, particularly of immediately realisable assets; and thirdly, that balance sheets should be given to depositors as well as investors. These three suggestions are sensible, and should certainly be adopted. The Industrial Bankers Association, representing most of the smaller companies that solicit for deposits, does not object to them. But they may not be enough.

More detailed regulation is possible through three different ways: the registrar system as used for building societies, possibly combined with minimum ratios for liquid assets to deposits and risk capital to total borrowings; informal influence

exerted by the Bank of England; or provision and publication of really detailed regular information. Registration and control by a Whitehall registrar find few sympathies among the finance houses. The parallel with building societies breaks down: first, because finance companies are profit-making institutions and not friendly societies; and, secondly, because there are no simple criteria of what should be their basic form of business. One company may finance cars; another may be in the very different business of discounting finance paper of small retailers; a third may specialise in "bridging" finance. Again, the ratio of deposits and advances to risk capital that is appropriate to UDT is obviously not the same as for a small company just set up. A registrar would thus find it scarcely possible to say: "company A conforms with the general line of business practice, and it seems to be safe." Indeed, one of the dangers of a registrar system would be that it might appear to be making investment safe. And in practice, the immense power wielded by the registrar—which the Chancellor of the Exchequer in this week's debate on the Building Societies Bill again pronounced to be not amenable to appeal to the courts on questions of fact—would probably mean that control was either unduly oppressive or insufficient.

THIS is the case for informal influence through the Bank of England rather than a servant of Parliament. The Bank has been extending its contacts with hire purchase in the past few years, and is anxious to improve them further. But there are difficulties. The clearing bankers or merchant bankers can be in the Governor's room within the hour. Hire purchase companies are not only much more numerous but are spread all over the country. Moreover, the finance houses are not, to say the least, "association minded." Even those that belong to an association take their collective responsibilities rather lightly: "The trouble about us here," a member of the leading association confessed recently in private, "is that we all agree on something and no sooner we're out of the room we do the opposite." This independence of spirit is itself a sign of vigour: hire purchase men are still making money, not serving a profession. But for that reason they are not likely to be very sensitive to ear-stroking.

The third alternative form of regulation, through insistence on full information, may be the best, provided it can be made sufficiently stringent. One would want reports at least half-yearly. All companies should be required to show their provision for deferred charges. And companies should be required to show in detail the character of their business: what goods have been financed, and the periods of the contracts. If they had had to give such information published at a relatively short interval, the companies that have run into trouble would have been exposed to the public considerably sooner. And finance houses already provide most of this information to the Board of Trade for compilation of its aggregate figures.

Naturally, these regulations should apply only to companies that solicit deposits. If they were combined with a general watch by the Bank of England they might prove adequate. Certainly they would be the least disruptive. It is an old adage that no legislation can, or should endeavour to, protect investors completely against fraud or incompetence; and there is no case for bringing deposits in finance houses into the category of investments that the investor has a right to feel are rock safe. The element of risk, after all, is reflected in the turn on interest offered by deposits at most finance houses. The case for regulation is the same as that for all the other forms of soliciting money, whether by building societies, unit trusts or the circulars of licensed dealers. Deposits in hire purchase companies escaped largely through a legal loophole. It is proving a tricky one to close.

Third Thoughts on Atomic Power

FOR the third time in six years, the Government has produced a new nuclear power programme in a courageous if belated admission that its earlier policy was wrong. If matters had been left where they stood at the beginning of 1955, when the country embarked on a £300 million, 10-year nuclear power programme, Britain might have struck an ideal scale of nuclear building large enough to encourage technical progress, but not so large as to burden the country's electricity system with an uneconomic form of power. But two years later that programme was trebled and the bill trebled with it; the amount of nuclear power capacity expected to be working by the end of 1965 was put up 2,000 megawatts to 6,000 megawatts; it is now being cut back by half.

One extraordinary feature of this week's white paper on the nuclear power programme* is that it nowhere says specifically what the revised nuclear power programme is expected to cost. Nor have any of the official spokesmen been prepared to name a figure. This is not the first time that the Ministry of Power has been less than helpful about the economic aspects of atomic energy; twice in four years its failure to spell out in cash and costs the results of changes in the programme have made the policy itself difficult for the layman to follow and even downright confusing. But it is a surprise to find anyone with the precision of Sir Christopher Hinton apparently at a loss for answers.

The presumption can only be that the evasiveness of the new white paper and of its exponents is not accidental. In the last year or so, the Government must have been deeply embarrassed by the detailed nuclear power programme to which it committed itself in 1957 at the height of a fuel panic. Since then, the cost of building thermal power stations has been virtually halved, dropping much faster than the cost of atomic building. The atomic power programme had been expected at the outset to cost £919 million—between £700 and £800 million more than the cost of building 6,000 megawatts of coal-burning plant, which the fall in building costs must since have pushed nearer to the £1,000 million mark. Oil prices have fallen; coal stocks have mounted; and atomic power has begun to look a poor bargain instead of our salvation for the 1960s. The difference in the cost of electricity from a good thermal power station and from an early atomic one has widened to as much as 60 per cent; even on the most optimistic view, the Minister of Power could not promise that

* Cmnd. 1083. HMSO. 4d.

the margin would be much less than 25 per cent before 1970 and on figures he gave (not included in the white paper) the gap looks a good deal wider than this.

It was obvious, then, that the 1957 plan to install 6,000 megawatts by 1965 ought to be radically reconsidered and it was modified by easy stages. By the beginning of this year it had been quietly turned into a 15-year programme to install the same amount of atomic capacity by 1970, five years later than the original target. This was described in *The Economist* last February, when it was already a *fait accompli;* but the reproachful ghost of the 1957 programme refused to be laid to rest until it was duly exorcised in Parliament by the Minister of Power on Monday with a white paper.

THE white paper is most careful not to fall into the trap of replacing one incubus by another that might become equally embarrassing politically in a few years' time. It explains that the Government expects to see 3,000 megawatts of nuclear capacity commissioned by about 1966 in seven atomic power stations already under construction or under tender. It admits that nuclear power cannot compete with thermal power now or for at least another ten years; but it argues, as the core of the new policy, that atomic power is of such potential importance to the British economy as to merit continuous development until it is made economic and that to carry out such development at a rate of building of "roughly" one commercial power station every year "for the time being" seems about right. It forecasts tentatively that this might mean that 5,000 megawatts of nuclear plant would be commissioned by 1968 with the further implication that the remaining 1,000 megawatts of the programme would be installed by 1970. But in cold fact, there is no commitment to install any given amount of atomic capacity by any specific date—merely the intention to build "roughly" one every year, a phrase which may console industry and the scientists, but is elastic enough to leave the electricity authorities great flexibility to accelerate or slow down the building of nuclear capacity.

This is a sensible way of fostering the development of atomic energy if one accepts the underlying assumptions on which it is based. So the Government should have gone to special pains to see that the white paper argued these assumptions with even greater care than it argued the new building plan. Why, for instance, is atomic energy a Good Thing for Britain even if at the present time it is one of which we are in danger of having Too Much? This is a perfectly serious question; the Government still intends to spend £900 million on building atomic power stations even though it is spending it at a slower rate.

The white paper argues that by 1975, fifteen years from now, the power stations of this country will need to consume, in one fuel or another, the equivalent of 125 million tons of coal, and the equivalent of 200 million tons of coal a year by the 1980s. These are astonishingly high figures—about a quarter higher than any estimates previously published—and they suggest that the Central Electricity Generating Board has suddenly and sharply revised upwards all its estimates of future electricity consumption. If it has good reasons for doing so, they have not been disclosed. In any case the Coal Board would be overjoyed at the prospect of being asked to supply such extra tonnages of coal. And why, if "oil seems likely to remain plentiful for many years," is it "not prudent to rely only upon imported oil to supplement coal to the extent implied in these estimates"? What estimates and what extent? There may be good answers to these questions but they are not to be found in the white paper.

It is, indeed, exceedingly difficult to make out any case for a shortage of hydrocarbon fuels, now or in the foreseeable future, that would justify a switch to atomic power to ward off a fuel shortage. The reason for developing atomic power is that it may one day be more efficient than thermal power: this sole justification for the present massive rate of development must not be lost sight of. It is said that between now and 1966 the Government will spend about £400 million on atomic power stations (with atomic fuel costs extra) and £910 million on power stations of all kinds, thermal and atomic. Had the atomic power programme not been stretched out another five years, the total bill to 1966 would have been about £1,000 million; so about £90 million or 9 per cent of the planned expenditure has been saved—or "postponed," since it is still said that the stations will eventually be built. The value of atomic construction postponed is of the order of £120 million, but £30 million of new thermal stations will have to be built to make up the loss in generating capacity.

The cost of power from these nuclear stations is expected to lie between 0.65d. and 0.7d. a unit against 0.5d. a unit from a good coal-fired power station built on the coal fields. Nuclear power therefore works out on these official figures between 30 and 40 per cent more expensively than thermal power.

The whole object of building these uneconomic stations is to discover by experience how to bring costs down and scientists and engineers are by no means despairing of doing so. But the fact has to be faced that there is a wide difference between the skills of the three different design consortiums—now that the General Electric Company and Atomic Power Constructions have come together. There is a difference of nearly £30 per kilowatt between the highest and lowest bids contained in tenders submitted by the consortiums for building atomic power stations at Dungeness and Sizewell; in other words, some tenders are 30 per cent more expensive than others. Since capital cost holds the key to the price of atomic power and accounts for two thirds of its total cost, something must be done to encourage the low bidders to stay in business and encourage the high bidders to get out.

The obvious way to do this is by awarding contracts to those companies that submit the lowest tenders; but so far atomic business has been conducted in this country on the principle of dealing out contracts among consortiums as if they were a deck of cards. Since the first round of tenders, when four groups bid for three orders, there has been no competition. Nor will there be in the future if the Minister of Power is to be taken literally at his word because he has plainly stated that under the one-station-a-year policy all the teams will get enough work to keep them busy, as if their efforts were all of equal merit. He may merely have been using a courteous form of words; if so he is laying himself open to misunderstanding. Sir Christopher Hinton does not owe the "atomic industry" a living, and he should not be obliged to give it one at the expense of the ordinary electricity consumer. And the sooner it is made plain that he has, and is determined to go on having, a free hand in the matter the healthier that industry will be.

BUSINESS NOTES

SIX PER CENT;
SECOND CALL OF SPECIAL DEPOSITS;
STANDSTILL FOR PUBLIC INVESTMENT

A Dubious Package

ONCE again, the monetary authorities have plumped for the package deal; and, just because there is no crisis, the reversion to old habits is difficult to understand and difficult to justify. In the stock market, it has caused justifiable bewilderment. When Bank rate was raised from 4 to 5 per cent in January, there seemed a chance that by moving early and boldly in the use of normal monetary controls the authorities might be able to avoid the dreary cycle of petty measures working laboriously and resulting in a lengthy period of industrial stagnation. The railway surrender in February and the near no-change budget dimmed the prospect; and by invoking special deposits and reimposing hire purchase restrictions at the end of April the authorities showed their leaning towards controls rather than interest rates. But the Bank of England at least could claim one distinctive feature for its efforts this year, that they had successfully kept a little ahead of evident needs—a valuable achievement that has succeeded in reassuring holders of sterling.

Especially in view of the inadequate current surplus, an increase in Bank rate to 6 per cent seemed a natural move some time this summer. There may have been a case for leaving the increase a little later, but the authorities have evidently judged it better to act now and trust that, aided by the attraction of 6 per cent, speculation against sterling does not even begin. They can hardly be reckoning on further measures this summer. The primary purpose of the new package of measures, however, is said to be to restrain the domestic economy. The authorities are particularly worried mainly about wages and the shortage of labour; and they want to reinforce their restraint of bank advances.

By and large, 6 per cent Bank rate seems sensible and justified to meet a contingent threat to sterling. But that cannot be said for the standstill on public investment next year or the further call to special deposits—a further 1 per cent (making 2 per cent) for the clearing banks and ½ per cent (making 1 per cent) for the Scottish banks, half of these additional calls being payable by July 20th and the rest by August 17th. When they were first discussed, the view was expressed in some official quarters that special deposits would be used only as a last resort: they would be a confession of failure. Now they are being imposed a second time within two months—partly, it appears, because if they were omitted it is thought that the markets might continue in their uncertainty. In other words, special deposits are now part of the established machinery. They have not, fortunately, been used in the worst and softest way, and when banks have had to sell gilt-edged to meet their calls the authorities have exacted a penalty and let the market feel the impact in slightly lower prices. Thus interest rates have done some work, indirectly. This second call brings the possibility of further banks sales of short and medium-dated gilt-edged stocks. Would it not be much more straightforward, in every sense, for the authorities to produce these results in the gilt-edged market directly through their own operations?

Stabilising Public Investment

"WE doubt," said the Chancellor in a speech ten days ago, "whether action of this kind could alter the aggregate of public sector investment within a period of 12 to 18 months by more than 2 or 3 per cent without both causing harmful dislocation and defeating its own object by reason of the delays inevitable in carrying the action through." Unless he now has it in mind to correct whatever imbalance he foresees in the British economy in the second half of 1961, his own words provide the most effective criticism of his decision this week to hold public investment in 1961-62 at the level of this financial year, as part of a package of short-term measures.

Programmes of fixed investment in the public sector this year total £1,675 million, providing for a real increase of 6 per cent over expenditure during 1959-60 (as compared with a much sharper increase in private fixed investment). The Chancellor said last week that there was pressure for an upward trend in this investment in the years ahead (he hopes to publish short-term forecasts, beginning later this year) and that expenditure by local authorities may tend to rise faster than in the rest of the public sector. In the House of Commons on Thursday he said that the increased rate of public investment was now beginning to diminish, though there would be small increases in the next two quarters of this financial year. The authorities have obviously decided, in the Chancellor's words, that it may be practicable ... "without what the doctors call 'harmful side-effects' to vary the pace of public investment in a way which can usefully help to mitigate the evil of alternate booms and slumps." Few would disagree with the principle of that. But is this kind of action suited to the shorter-term, finer adjustment of the economy towards which they seem now to aspire?

The Market Fall

EXPECTATION of the rise in Bank rate to 6 per cent had been growing daily in the City. At the end of last week the trade figures, the further small rise in the Treasury bill rate to £4 13s. 7d. per cent, and the Chancellor's reminder that "the demand for capital is likely to be a great deal greater than the available supply over the years ahead," all pointed towards new restraints. On Wednesday this week, figures showing a check to the increase in bank advances in the month to mid-June (discussed in a subsequent note) gave encouragement to the optimists, and led to a little buying of both equities and gilt-edged. The general view that long-dated and irredeemable gilt-edged stocks had fully discounted a 1 per cent rise in Bank rate was almost borne out on Thursday, with falls of ⅜ or less. But the further call to special deposits—a surprising move after the banks had shown a successful impact on advances—plainly carries the possibility of further sales of medium-dated stocks (otherwise highly attractive) and of short bonds, which fell by up to a full point in Thursday. The effect on gilt-edged may be to straighten out the curve of gilt-edged yields by pulling up short-term yields, rather than leading to any big further increase in yields on irredeemable stocks.

Sterling rose immediately on all centres after the Bank rate increase, to $2.80½⅝ on New York and 11.69⅜ on Frankfurt. Earlier in the week it was generally firm, and the small forward premium on the mark narrowed a little.

Equities fell sharply after the Bank rate increase; buyers appeared in the afternoon but the balance was the other way. The *Financial Times* index plunged 8.6 points to 306.3, less than eleven points above its May low-point. In the seven days to Monday's close the index had fallen by fifteen points, or about 5 per cent, to 313.5; then it steadied in midweek. Given the change in the economic outlook, this year's movements have hitherto not been sharp. Thursday's shock was less from Bank rate than from the supplementary measures: bewildered dealers were asking what had happened to make all this necessary.

New issues continue to come forward at a good pace: this week's include right issues of £10.3 million for Gallaher (a one for six issue offered at 30s. a share) and £2½ million for Peachey Property. The weight of issues, which has a natural tendency to increase when bank credit becomes less plentiful, has not yet been big enough to become burdensome—though one can hardly imagine City advisers being enthusiastic about an early date for the massive Richard Thomas and Baldwins operation.

Private Investment Rising Fast

One economic indicator which may have convinced the authorities that pressure on resources in the internal economy is greater than has generally been assumed was the estimate of private capital investment in the first quarter published this week. Capital expenditure by manufacturing industry was no less than 13 per cent higher in volume than a year before; and making a rough allowance for seasonal factors (since there is a particular bunching of these payments in the last quarter of each year) 5-6 per cent up on these industries' capital expenditure in the previous quarter. Expenditure on fixed investment by "other industries and services," which include communications, the distributive trades, commerce and finance, was up by no less than 31 per cent in volume over a year before, and allowing for seasonal factors, perhaps 15 per cent higher than in the last quarter of 1959. These large increases in expenditure were concentrated on building and on investment in vehicles: the current value of expenditure on new buildings went up by 24 per cent over a year before in manufacturing industries and 29 per cent in the other industries and services, and their combined expenditure on vehicles went up by 34 per cent—a "capital" element in demand on the motor industry. In both groups of industries, expenditure on new plant and machinery went up about 8 per cent over a year before.

This increase in fixed investment by private industry so early in the year is considerably more than most people expected. The Board of Trade has not yet published detailed figures showing which particular industries spent the money—nor, indeed, the results of its first inquiry about what businessmen expect to spend in 1960, which will presumably have been taken by now. It seems somewhat surprising that businessmen who changed their minds about investment this year as late as after the election should have managed to get the extra money spent as soon as in the first three months of this year, even though suppliers had built up stocks of some kinds of equipment such as general purpose machine tools during 1959. The first quarter's record shows an increase in business's fixed investment larger, if anything, than these businessmen had forecast: considering the time it takes to get delivery of the larger, custom-built items, one must assume that this capital expenditure will have gone on building up since.

Unemployment Stays Level

By the middle of this month the number of people wholly unemployed fell to 297,079, no more than 1.4 per cent of the total number of employees in Britain. This was no larger a decrease than the Ministry of Labour would normally expect at this time of year, whereas in May unemployment fell a good deal more than seasonally. In the Midlands, London and the Southern counties the percentage is 0.7 to 0.9: in Wales it is down to 2.3; and even in Scotland only 3.2 per cent of employees are out of work. Unless one goes to Northern Ireland, it is not easy to find any substantial pool of unemployed labour, at least, to go on pushing up production.

The number of vacancies notified to employment exchanges, allowing for seasonal factors, was nearly as high as the number of people unemployed at the beginning of June. The increase in vacancies newly notified was more than would have been expected seasonally, though not so much so as in the previous month. With unemployment down to so low a figure it may be that employers are giving up hope of attracting extra people through this normal procedure: certainly there are signs that many of them are making more direct approaches to people—particularly specialists—in work in other firms. In the last month or two, on the other hand, some companies in light engineering, making durable consumer goods, may have been cutting down their notified requirements for extra labour.

BANK ADVANCES

A Check

Rates on bank advances have been raised evenly by one per cent, giving a range of 6½-7½ per cent in England and 7½-8 per cent in minimum rates in Scotland. The banks' deposit rates are up from 3 to 4 per cent in England and 2½ to 3½ per cent in Scotland. Finance houses were to consider their policy on Friday; they are expected to raise both rates charged to hirers and those paid to depositors. No change is expected for building societies, which have already raised rates this year.

The check to bank advances has come quickly—so quickly that some bankers are wondering whether the past month's figures have been subject to special influences in a downward direction just as figures for earlier months were subject to special upward influences. Thanks mainly to reductions shown by Martins and the National Provincial, advances of the eleven London clearing banks together rose on balance by only £3 million in the four weeks to mid-June; and this increase was accounted for entirely by the extraneous items in transit. So true advances were unchanged. The State boards, however, repaid £12 million in the month, so that advances to other borrowers increased by that amount—which would be in line with the wishes of the authorities for a slackening in the pace of growth. The comparable increase in May was £37 million and in April £83 million; the June increase is easily the lowest since the great upsurge of advances began a little under two years ago.

* Excluding all transit items except for ratio of advances to gross deposits.

Despite the slowing down in their advances, the clearing banks again had to make significant sales of gilt-edged in June. Total sales were £29 million (just one half of them by the Midland) and even so the average liquidity ratio fell by 0.1 to 31.5 per cent. Two banks, the Midland and Lloyds, are again below 31 per cent. The rise in liquid assets was kept down to £9 million by the call to special deposits, which took £69.8 million from the clearing banks and £3.9 million from the Scottish banks. Publication of these figures permits by a roundabout route a calculation of the total deposits of the Scottish banks in mid-May, which comes out at £780 million; rather surprisingly, that is below the total shown by the Radcliffe committee for December, 1958. Other incidental information thrown up by the special deposits operation is that in May the National Bank had about £70 million of its £100 million of deposits in Ireland, and Lloyds Bank about £53 million of its £1,273 million of deposits in India.

The Two-Year Upsurge

Classified figures issued at the end of last week on behalf of all banks in Britain round off the two years of peak bank lending. These quarterly figures show that the rise in total advances from February to May was virtually the same, at £213 million, as at the same period last year, though lower of course as a percentage, and about £30 million lower than in November-February last. More surprisingly at first glance, rapid increases continued in the hire purchase and "other financial" groups, which the banks intimated they were scrutinising more closely already in February. The explanation, as in past periods of restriction, is almost certainly that borrowers were quick to draw on their existing overdraft limits. The big personal and professional group also enjoyed a further substantial rise, of £42 million. Total advances at £3,457 million are 70 per cent above their total two years before.

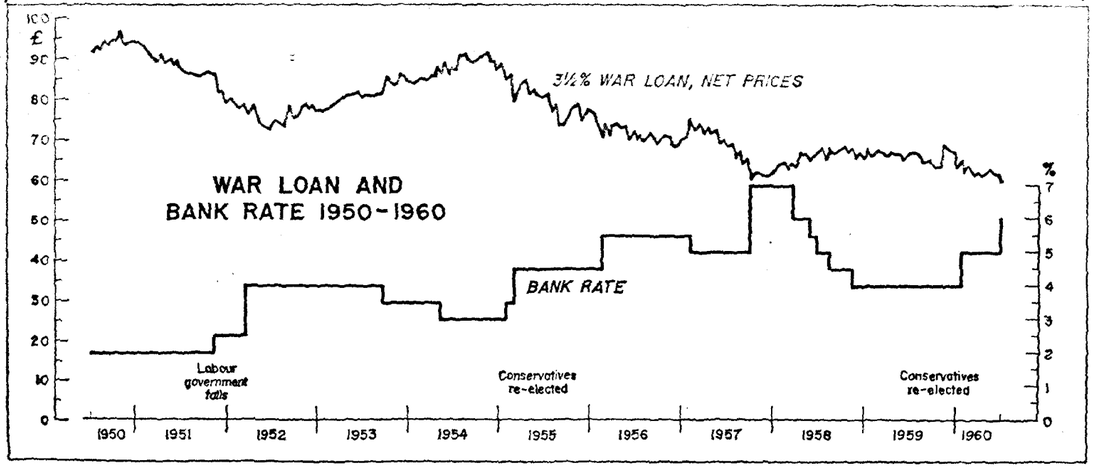
COAL



Critics and the Board

While the appointment of Mr Alfred Robens as chairman of the National Coal Board received a lukewarm welcome from fellow Labour MPs in the Commons this week—though apparently some strong criticism from Tory MPs later in a private meeting of their fuel and power committee—the coal miners and managers continued to voice their misgivings. Mr Paynter hinted that he knew of "a definite Tory plan" to decentralise the industry, which, to anyone familiar with the confusion of mind prevailing in the party and the Government on this issue, is difficult to credit. The colliery managers said sensibly that they would make up their minds about any proposals for reorganisation when they saw them, and would co-operate as wholeheartedly as ever with the new chairman, but remained incensed by the implication that there was nobody inside this industry fit for the top responsibility in it. Some Tory backbenchers, it appears, would have preferred a businessman for the job: where do they suggest one is to be found willing

Gilt-edged in Perspective

Transactions in War Loan were recorded at 60 on Monday—and again after Thursday's Bank rate increase. At this price, the all-time low point reached after the raising of Bank rate to 7 per cent in September, 1957, War Loan has met a psychological resistance point, and more people have wondered whether this is the time to buy. Rather fewer have actually done so, though on Wednesday the market reported more purchases by outside investors than sales. A significant feature of Thursday's reactions was that equities fell much more sharply than gilt-edged.

More controversial is the view expressed in some quarters that the recent fall in gilt-edged prices is the result of a radical change in official policy on the lines recommended by the Radcliffe committee—that the authorities should if necessary take the initiative in bringing gilt-edged prices down. It is true that this year they have rather more consciously taken care that when they take stock from the market they exact a penalty from the seller by offering a price below the market level. Fortunately, the authorities have adhered to this practice since the imposition of special deposits, notwithstanding some earlier suggestions that banks having to sell might be helped out on favoured terms. But as the authorities themselves would be the first to point out, these tactics do not amount to a positive lead to the market: they are seen simply as the appropriate way of letting the market reflect underlying supply and demand. The shift in official tactics amounts neither to the much bigger change to a "Radcliffe policy" nor to a radical change from official open market policy over the past few years. After all, the authorities gave up supporting the market at current prices after the Dalton experiment. Those who blame the recent fall in gilt-edged to a shift in policy should look at the chart. This shows a fall of eight points from War Loan's peak after the election (and the irresponsible talk about giving it a date). Even this fall is much smaller than at the comparable stage of the cycle in earlier years. In the two years to mid-1952 the stock fell 25 points and in the ten months to September, 1955, by 18 points. The fact is that on the long view, gilt-edged have achieved something like stability since 1957. Their long-term depreciation, by almost 100 per cent, was in the ten years before that.

to take on a job so constantly the target of public criticism?

Mr Wood, the Minister of Power, meanwhile took the opportunity to make an entirely non-controversial appointment to the vacancy on the board for a marketing member, following the retirement of Mr R. H. E. Thomas. Suggestions that somebody from outside the industry would be appointed to the job, and somebody whose qualifications did not impress the board, had caused possibly more genuine resentment in its upper echelons than the miners have expressed so vociferously about Mr Robens's appointment: the gentleman concerned is believed to have withdrawn for personal reasons. In the event, Mr Wood decided on a direct promotion to the board of the chief executive in the department, Mr F. Wilkinson, who since 1958 has been the NCB's Director-General of Marketing.

STEEL

Gaining Capacity

AMONG the manufacturing industries which predicted last autumn that they would be spending much more on fixed capital this year than last, one of the most prominent was the steel industry: if the indications that total manufacturing investment jumped sharply in the first quarter of this year give a good indication, the steelmakers are already spending hard. A number of them told the Board of Trade at the end of the year that they expected to spend half as much again in 1960 as in 1959. In May the British Iron and Steel Federation, more cautiously, forecast that steel investment might rise by about a quarter this year: this week the Iron and Steel Board, recording that £99 million was spent last year, said this year's total would show "a substantial increase." There seems no doubt that investment in the industry is now at an exceptionally high level, well above the annual rate of £105 million achieved in 1958.

The Board also in its annual report noted that it expects steel capacity, now 25½ million ingot tons a year, to approach 29 million tons by 1962 even allowing for delays in construction of new plant; and that by 1965 it expects a production of at least 32 million tons to be possible. It has recently, with representatives of the federation, steel consumers, and the Government, been considering the prospects for long-term steel demand in the middle sixties: when it has reached broad conclusions about demand for the main products, it will ask producers to indicate the main developments they have in mind, in order to compile another major development plan for the industry.

MOTORS

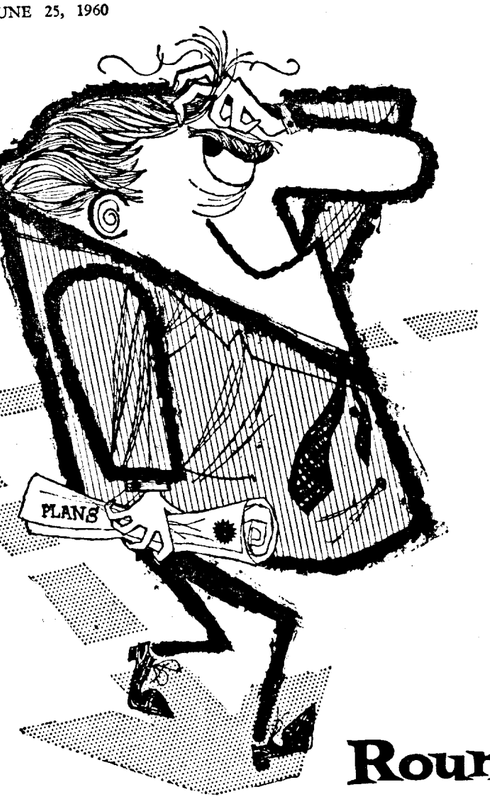
Canadian Damper?

A REQUEST from the Canadian motor industry for protection against British car exports—which at present enter Canada duty-free while other imported cars pay a 17½ per cent duty—following its earlier request that the Canadian customs should inquire whether British cars are being dumped in Canada, has understandably alarmed the British motor industry. Canada is second only to the United States as a market for British cars; last year 14 per cent of all car exports were shipped there—73,000 cars worth £31.7 million—and sales in the first three months of this year rose by 30 per cent while they were falling in the United States. Shipments from Britain to Canada in these first four months nearly doubled to over 40,000, representing 18 per cent of the total value of all Britain's car exports. Stocks have been built up, and shipments can be expected to fall once the summer buying season ends whatever the Canadian government may decide to do. But the effect of any action, equally, would be cushioned for a time by the size of these large stocks.

The increasing sales of imported cars in Canada, which now form nearly a quarter of total registrations, and 60 per cent of which are British, have hit the Canadian industry. Last year its output of 302,000 cars was only some 5,000 more than in 1958, though sales in Canada were 40,000 higher; imports, conversely, rose by 49,000, or nearly 50 per cent. Up to the end of May this year, however, production was 7 per cent higher than a year before. The motor industry is one of the chief manufacturing industries in Canada; despite its American ownership the Canadian content of the most popular cars is now as high as 80-90 per cent. The only American-made parts are such specialised units as the automatic transmission. So complaints from the industry will get as respectful a hearing in Canada as they would in Britain; and when there is a duty of 20 per cent on Canadian cars entering Britain, a preference of only 10 per cent below the absurdly high general duty of 30 per cent that protects Britain's motor industry, the Canadian manufacturer may justly feel aggrieved.

No swift or drastic action to impose a tariff, however, is possible in this case—unless the accusations of dumping are held to be proved, which would require it to be established that British cars are sold to dealers in Canada at lower prices than they are sold at under precisely similar conditions of trade in Britain. In that case an anti-dumping duty equal to the difference between the two prices could be imposed. But the free entry of British cars was "bound" to Britain at the Montreal economic conference less than two years ago, and any general duty could only be imposed with the agreement of the British Government. It would be difficult for Canada to offer concessions on any other import from Britain that would be sufficient to offset the loss of this advantage of 17½ per cent on duty over other car makers, which is presumably the chief factor in Britain's predominance amongst importers in the Canadian market. So far the Canadian government has announced no decision to open negotiations on this subject; clearly they would be hard going.

A Bargain?



THE £3.4 million that Jaguar has paid for Daimler, with its factory of a million square feet, its equipment and goodwill, may well prove to have been a cheap way to expand. It doubles Jaguar's capacity for an outlay of little more than the book value of Jaguar's present fixed assets, and one easily met from the company's cash reserves. So far, Jaguar's plans for its new acquisition have not been announced: Daimler's staff has been told to carry on as before with the production of existing models and the development of new ones. These activities can hardly occupy much of the factory space available, which should offer Jaguar all the room it needs in which to expand its own production. In the long run, Daimler cars will continue to be made, but the fate of the existing models is uncertain; none have bodywork attractive enough to claim retention, and the plastic body of the SP 250 sports model cannot be made economically at the rate that Jaguar would probably desire. If Daimler lives on as more than a name, it may be with its new V-8 engines. The 4½-litre version can give the weighty Daimler Majestic saloon a performance similar to that of the SP 250 sports car, which, in turn, can equal the performance of the Jaguar XK 150; the engine should propel a sports car or sports saloon at a speed that could satisfy the most exacting speed merchant.

PETROL PRICES

One Carat Less Golden

CUTS of a penny a gallon in the prices recommended to dealers for top-grade (100-octane) motor spirit and for the standard 83-octane grades were announced by all the major companies this week: Esso, Regent, and Cleveland, whose medium-grade (97-octane) spirits had been selling at a penny a gallon more than the 96-octane grades marketed by the other majors, brought prices for these down too, into line with the others. The cuts took the form in some cases not of reductions in wholesale prices, but of recommendations to dealers to change retail prices supported by special rebates on the nominally unchanged wholesale prices; wholesale prices of certain "super" grades were in fact increased. This procedure was adopted because sharp competition in the market for gasoline sold to commercial consumers has already involved the companies in big rebates on their posted wholesale prices; the companies had no wish to pass on this penny a gallon for dealer gasolines as well to the commercial customers whose rebate was fixed on the wholesale price.

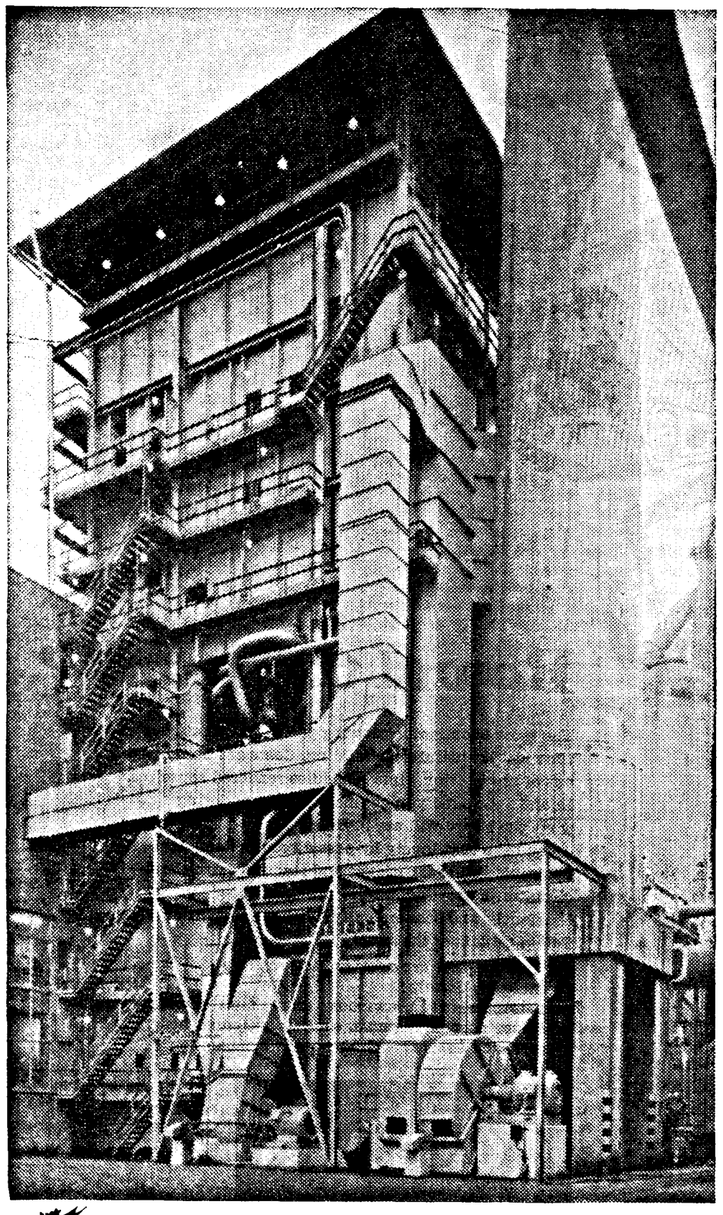
Nobody is attributing these cuts to changes in gasoline prices in the United States or to reductions in tanker freight

Round the bend ?

The most abominable growing pains can afflict even the most beautiful new building. Costs get hammered out of recognition, time schedules rendered senseless. Round and round you go (meanwhile wondering what the Board will say!). Unless—as a man of vision—you take that lovely by-pass direct to Costain. Costain's skills, experience and resources can short-circuit every sort of building problem. Efficiently and economically. Without aspirins.

Call in Costain at the start!

For example, here are a few projects recently completed by Costain:



TRANSISTOR FACTORY, SWINDON · THE KARIBA TOWNSHIP
BEA WEST LONDON TERMINAL · IBADAN TEACHING HOSPITAL
BP RESEARCH STATION · CIBA PROCESS BUILDING

It's never too soon to call in Richard COSTAIN Limited

BUILDING & CIVIL ENGINEERING CONTRACTORS, LONDON, ENGLAND

NEW POWER FROM BLAST FURNACE GAS

Imagine steam so hot it can make a steel pipe glow red as it passes through.

Imagine steam superheated to more than 1,000°F. and then being released at the massive pressure of 3,300 lb. per square inch. It's a long, long way from the kettle on the hob—yet this is what modern steam power has come to in the service of modern industry. Giant forces like this are already at work—for the first time in this country—at the huge Margam works of The Steel Company of Wales. They are providing new power . . . helping to make new developments possible . . . helping to step-up the output of steel. And doing it, what's more, in a most ingenious way.

PUTTING BLAST FURNACE GAS TO WORK

Hot gases from the mighty blast furnaces are now being harnessed more efficiently than ever before to heat a new and very advanced type of boiler at the City of Steel. This is the Benson boiler—invented by Mark Benson in Britain and developed on the Continent. Its installation at the Margam works marks a major advance in the use of steam for British industry. This boiler provides steam at such high pressures that it can be used over and over again before its vast energy is spent.

ENERGY IN ABUNDANCE

First, at its peak pressure of 3,300 lb. per square inch (far higher than the pressure used in modern power stations), it drives a turbine that delivers 9½ million watts of electricity into the works system every hour . . . power that helps operate the great slabbing and rolling mills from which mile after mile of sheet steel is produced. And it will cost less than electricity brought in from outside.

After powering the turbine, the steam—now at a pressure of 650 lb. per square inch—is used to drive two turbo-blowers for the blast furnaces. Finally, even after all this, the steam still has so much life in it that it can be fed into the works steam main to be used in the many processes that go to the making of steel.

GREATER EFFICIENCY

Such advanced use of steam has, until now, only been made commercially at a few major power stations and industrial steam plants on the Continent. Now, in the City of Steel it is supplying the power to make more steel . . . more efficiently . . . more economically. An important step forward. Especially important because, by the encouragement of new ideas and methods, industry can bring us all a higher standard of living without the penalty of a constantly rising *cost* of living.

The Benson boiler—first installation of its kind in Britain—now in operation at the Margam works of The Steel Company of Wales.

THE STEEL COMPANY OF WALES LIMITED

This is Broadsheet No. 18 from the City of Steel

rates, though the official average of these has in fact declined slightly ; some of the companies put the cuts down to economies in the cost of distribution. Essentially, they reflect the softness of the world market for petroleum products, and behind them for crude oil. Even these cuts will probably leave gasoline prices in Britain, net of tax, among the highest in Europe's main markets ; this market, in the words of one executive of a major company last week, " is still pretty gold-plated."

Abroad, the major companies have been forced into much sharper cuts in the dealer gasoline market by the incursion of products from independent refineries sold through quite large numbers of garages that are not tied to any one supplier. Here, through no formal protection except their own acumen in having secured most of the well-placed filling stations on exclusive dealing contracts, the major companies are able to maintain prices which still leave their refineries some margin on the posted prices at which it is conventional to transfer crude in internal accounting. The Jet Petroleum Company claims that it is now supplying about 150 stations—its difficulties in expansion being storage and road tanker vehicles—and there is a little more " fringe " competition around Liverpool and Manchester ; but nothing of the proportions of price-cutting competition in say Germany, Italy or Switzerland. This latest price cut given in Britain, however, raises once again the question how long the posted prices of crude in the Middle East can hold at their present levels—even though cuts in these, which would affect the royalties paid to host governments perhaps more than the discounted prices that the companies are actually realising there, would have considerable embarrassments all round.

THE AMERICAN MARKET

Wall Street Flounders

Our correspondent cables :

STOCK prices on Wall Street have floundered throughout the past week, following the impressive gains in the first week of June when the Dow Jones average of industrials recovered about two thirds of the substantial decline suffered since January. At Wednesday's close the index stood at 645, about 10 points below its peak a fortnight before. The renewed weakness of the market is attributed partly to profit-taking and partly to disappointment that the expected reduction in margin requirements (which now calls for 90 per cent cash down payment) did not materialise, on account of the quick run-up in prices.

Most of the blue chip stocks in the steels, chemicals, and oils groups which moved to the front in the recent rally and gave it an air of solidity have since lost ground, and the market is back on its diet of defensive issues—utilities, food, department stores, and " growth " stocks. Private investors are showing a new burst of speculative zeal—recommendations of market letters and of brokers' wire services have had a large following and interest in new issues has been markedly stronger than in recent months.

Many think that the rise in prices since the Federal Reserve cut its discount rate will continue after the current period of consolidation, which they explain was inevitable after such a fast rise in prices. But this traditional summer rally is expected to be a very selective affair with investors bidding up only those shares that appear to be assured of higher earnings or those being promoted as growth issues and allegedly immune to general economic conditions. While investors feel reasonably confident that business will be operating at a high and profitable level for the rest of this year they are more uncertain about the prospect for 1961. Moreover they are finding it difficult to assess the confused international situation in terms of stock values. On balance the prospect seems to be that the market as a whole will not move decisively in either direction but that extreme favour for specific issues will continue to make itself felt.

BOAC

The New Broom

REAR-ADMIRAL SIR MATTHEW SLATTERY is one of the most competent re-organisers at the government's disposal. In twelve years at Short Brothers and Harland in Belfast, he has fought with tenacity to get work for his company that nobody wanted to give it ; and he created a standard of efficiency in Shorts that it certainly did not possess before and which is not too common in the rest of the aircraft industry either. He moved Shorts out into new industries at a time when diversification was unknown in aircraft circles. A year ago he was asked to turn his attentions to the Bristol Aeroplane Company. In taking over the chairmanship of the British Overseas Airways Corporation from Sir Gerard d'Erlanger at the end of next month, Sir Matthew will have to sweep as hard as ever he has swept before.

Whatever the level of morale in the lower echelons of BOAC, its management record is unhappy and it was beyond even Sir Gerard's considerable powers to weld it into a contented working unit. Four retirements from the Board, including the Chairman and Deputy Chairman, mean that Sir Matthew is not the only new boy and this may make his administrative task easier. BOAC differs from British European Airways in having a notably different chain of command ; in BEA the chairman performs many of the functions of managing director with a chief executive to assist him. In BOAC he does not, for the functions of chairman and of managing director were split on the retirement of Sir Miles Thomas.

BOAC's considerable economic troubles stem mostly from having a world-wide route network with not enough traffic along it to pay for its high overheads. The corporation's answer has been to increase the size of its fleet in order to be able to carry a greater volume of traffic ; it now has to find bodies to fill its seats. It is criticised by other airlines for being over-staffed. This was most obvious at its engineering base and because this was a glaring case it was perhaps the easiest to bring under control, as the corporation is now doing. It may prove more difficult to trim staffs down to size at other points in the organisation and to resist the temptation to leave matters as they are in the hope that expanding traffic will pick up the slack. Sir Matthew has the advantage of taking over his new post when traffic is expanding ; but the corporation is starting on a difficult experiment of cutting fares on routes where demand may not necessarily prove elastic.

ICFC

Competing with the Shareholders

NEW business transacted by the Industrial and Commercial Finance Corporation in 1959 rose to £6.4 million, the highest since 1951. And, says Lord Piercy:

> In the activity following the removal of the restrictions on bank advances, we lost perhaps £2 million of business where we had already made a contact, and no doubt some of which we did not hear.

It is a familiar experience of institutions like ICFC that when credit is plentiful good business goes to others, while business opportunities are likely to increase just when funds are hard to find. And indeed: " More recently the banks have tended to put business our way." ICFC is, however, better placed for funds now than in earlier periods of credit restriction, following its debenture issue of £10 million last summer and a good flow of repayments and realisations. The corporation is now " in funds," and the intention is to keep loans from the banks (who are ICFC's shareholders) stable at about £15 million and draw new finance from the market when required. ICFC feels it has thus a freer hand than when it relied entirely on bank advances ; but it could find the log jam in the market for new gilt-edged issues a still bigger frustration.

Lord Piercy emphasises that his corporation remains prepared to take reasonable risks, and is especially anxious to foster new enterprises and new processes. He reports that the recent credit restrictions have caused " some hesitation " in the revival of investment among firms below giant size. And he still feels that medium-sized firms invest too little year in year out: they are reluctant to start projects and easily discouraged. He is not impressed when their owners tell him: " My plant doesn't stand me in a penny." Lord Piercy simply regards that as a sign that it is ready to be scrapped.

Next page Price Schemes in Lancashire

Price Schemes in Lancashire

WHEN the Restrictive Practices Court, in a famous judgment delivered in January last year, found the yarn spinners' minimum price scheme to be against the public interest the Lancashire textile industry was not alone in concluding that all other such schemes stood scant chance of surviving the rigorous scrutiny of the court. No other section of the cotton industry has chosen to defend its case. The **Association of Piece Dyers** withdrew its scheme of recommended prices last April after being told that it was to be referred to the court, and the **Federation of Cotton Yarn Bleachers, Dyers and Sizers** similarly abandoned its scheme earlier this month, shortly after raising its prices by ten per cent. In practice freedom has as yet made no discernible difference to the prices actually charged.

It would have been naïve to suppose that cotton, any more than other industries, would suddenly give up its predilection for price maintenance: old habits die hard. Some sections of the industry have therefore turned to other methods that they believe will not be registrable under the Act, notably to schemes of "price reporting." A small section, the spinners and doublers of rayon staple fibre, has been running one such scheme for just over a year. Members of the club, which formally eschews any connection with the **Rayon Spinners' & Doublers' Association,** make weekly returns of their sales and prices to a secretariat, which then works out the weighted average price for each count of yarn, and also extracts the highest and lowest price quoted without disclosing the identity of any firm. Once a fortnight the club meets in Manchester to discuss the information.

This system does not necessarily produce identical prices, but it does restrict the spread between individual firms. Even when trade is good, as it is now, a spinner may accept a low price because it fills up his business on a particular count. But if a customer has persuaded him to sell at that price because a competitor is alleged to be selling cheaply, the information disclosed at the meeting enables him to test the truth of the claim. Another way of trying to prevent "weak selling" is to focus attention on costs. At least once a year the members provide an analysis of their costs, from which the secretariat works out the average costs of the five lowest-cost mills in each count of yarn. These averages are then reproduced in the regular returns, in the hope that they will influence the members' pricing policy.

These same spinners spin cotton as well, and apparently they introduced a price reporting scheme first in rayon yarn because it was technically simple and stood more chance of being observed. There are fewer firms in rayon than in cotton spinning; unlike raw cotton, the raw material comes in a limited range of qualities and the prices are universally known. In time, they will no doubt try to devise a similar scheme for cotton yarn. Meanwhile each of the big spinning combines necessarily exerts a measure of price leadership in the counts in which it predominates, and the **Yarn Spinners' Association** is continuing the periodic investigation into costs that it used for its minimum price scheme.

The weavers' past attempts at price maintenance have been so singularly ineffectual that any interest in schemes of price reporting is strictly academic. But the **Rayon Weaving Association** is now introducing, as a pilot scheme, an exchange of costing information to encourage firms to bring their own costs down to, or below, the average and, more hopefully, to encourage realistic pricing. If the exercise proves to be of value it would be opened to all firms, and might eventually be applied to cotton cloth after the rayon weavers merge with the **Cotton Spinners' and Manufacturers' Association.**

THE **Federation of Calico Printers,** which embraces most of the firms that use the roller printing process, is thinking of substituting price reporting for its scheme of recommended prices, which in turn was substituted for its system of minimum prices and market sharing (the "percentage quantum" agreement) in 1955 after the report of the Monopolies Commission. In passing, it might be noted that though the commission recorded the federation's "almost passionate conviction that it is only by such means that a decent living can be ensured . . ." the printers have survived tolerably well. Even in the 1958-59 recession the recommended prices were generally observed—largely, the printers claim, because they are low.

After taking legal advice a price reporting scheme has been drafted. A bureau would be set up "to collect factual information as to prices, discounts, and other terms and conditions of trading." All members would undertake to abide by the bureau's rules, which are summarised below. How far the scheme would tend to produce a close correspondence of prices can only be shown by experience. Certainly the provisions seem to point that way—such as those requiring a new member to submit to the secretary a list of his own prices before accepting a firm order, and establishing the right of the executive committee to inspect a member's "books, invoices and such other records as may be relevant."

It may be a trifle embarrassing for the government that it is now standing ready to spend public money on the elimination of surplus capacity in the finishing sections, before the price agreements on the register have been abandoned or considered by the Restrictive Practices Court. It was certainly a happy convenience that the redundancy scheme for spinners could be introduced after their own minimum price scheme had been shot down by the court. The government and its critics may take some comfort from the fact that Lancashire's remaining price schemes will be referred to the court before too long. Price reporting schemes should not be condemned out of hand; but the more that is known about them, the easier it is for the government, and outsiders, to consider whether there is a case for amending the Act to bring them within its reference.

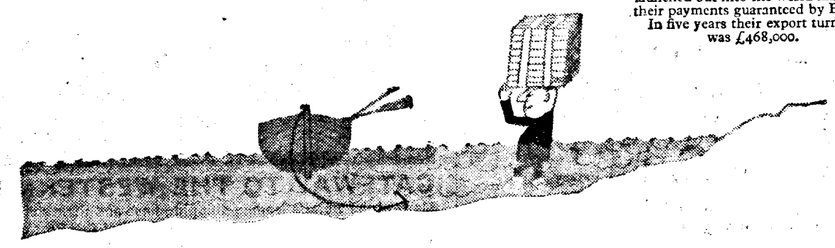
Nor should Lancashire be condemned for doing, or wanting to do, what is equally fashionable among other industries. But it is fair to ask whether Lancashire's apparent reluctance, after being shorn of excess capacity, to step into a more competitive world will impair its chances of revival, and waste the public money that is being pledged on that revival. Is it no more than a coincidence that the wool industry, which in general does not try to restrict competition, has been more successful than Lancashire in holding on to world markets, in circumstances which do not seem all that more favourable than they are in cotton?

Price Reporting—Specimen Proposals

These are the main points of the preliminary draft of working rules for the printers' information bureau:

Members shall furnish a list of the sections in which they are trading or are likely to trade; also their current list of customers, details of the prices per yard they are charging or have decided to charge in future, together with details of any special charges, discounts and other arrangements which affect the price per yard.

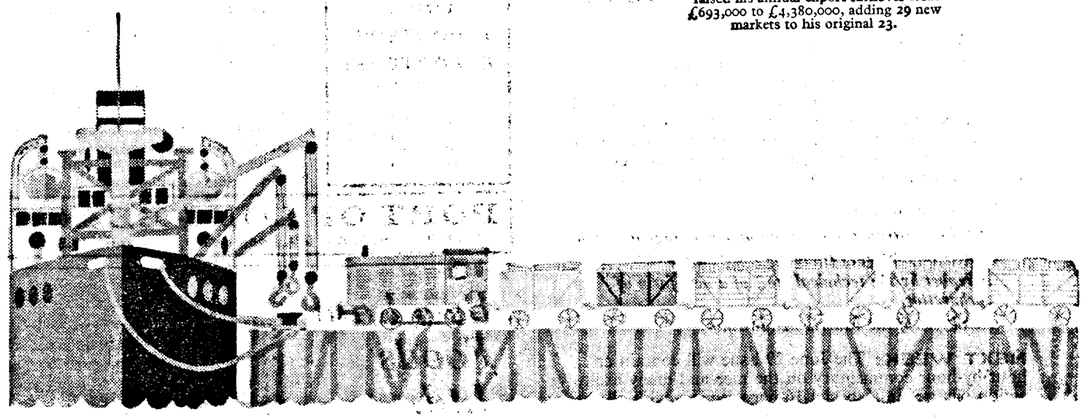
The secretary shall circulate to each member all information received from other members who have declared interest in the same section or sections, though names of customers shall not be circulated unless necessary to identify a particular price.



Any member who decides to alter any of his prices shall before doing so send the secretary details of the changes, and alterations in his list of customers shall also be notified.

Any member who decides to undertake printing in a section in which he has not previously declared interest shall, before accepting any firm order, send an immediate declaration of interest to the secretary, who shall forthwith send him the lists of prices charged by other members of that section. Before or after the receipt of such information, but in any event before he accepts a firm order, the member shall send the secretary a list of his own prices, which will then be circulated in the normal manner.

At the request of the secretary acting on instructions of the executive committee, a member shall make available for inspection his books, invoices and such other records as may be relevant to show that he has supplied information in accordance with these rules.

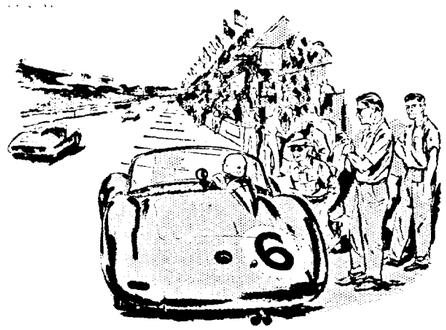


SMALL EXPORTERS

With an export turnover of under £2,000, a company making building components launched out into the world markets—their payments guaranteed by ECGD. In five years their export turnover was £468,000.

LARGE EXPORTERS

Within six years of taking ECGD cover, a maker of internal combustion engines raised his annual export turnover from £693,000 to £4,380,000, adding 29 new markets to his original 23.



ECGD credit insurance has helped many of our smaller exporters to grow big. And by underwriting the sort of credit terms new buyers need, ECGD is enabling big exporters to expand in overseas markets *in spite* of stiffening competition. Eighteen established exporters, each with annual turnovers topping the million-pound mark, took out ECGD cover last year for the first time. *Big or small, have a talk with your ECGD man.*

EXPORT AND EXPAND THROUGH E·C·G·D

ECGD is a Government Department set up to help exporters. Its services are fully explained in the booklet "Payment Secured". Write for a free copy.

See Le Mans through expert eyes in 'The Motor'

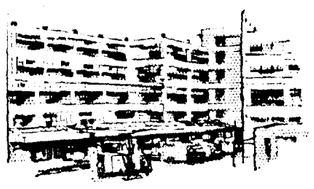
Cosmopolitan Le Mans has the motor-racing world on the edge of its chair. With the same tense excitement and international challenge as an Olympic Marathon, the 24-hour race this weekend is a supreme test of cars and drivers. No motoring magazine gives more coverage to the event than *The Motor*. The special Preview Issue, out now, presents a complete guide to the race. It includes a map of the circuit and pictures of competing cars.

Other features include :—

A fully illustrated description of a new Jaguar which makes its first appearance in the 24-hour race.

A report by the technical staff of a new form of carburettor.

Road test of the Morris Mini-Minor.



NEXT WEEK: The June 29 issue will contain an hour-by-hour commentary on the race and many exclusive action pictures in a special 16-page section, with all the week's motoring news and pictures.

The Motor is one of fourteen opinion-shaping journals published by Temple Press Limited. Each one of these publications is a leader in its field—and not only in the home market. *Every year 2½ million copies* circulate in 133 countries throughout the world. The specialized journals of Temple Press are authoritative and informative. It pays to advertise in them.

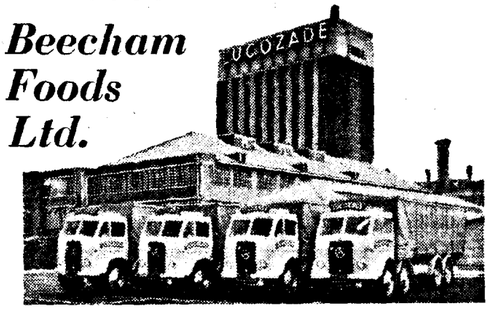
Sixty Nine Years of Specialized Publishing

GATEWAY TO THE WESTERN U.S.A.

Many of the world's leading shipping lines and their shipper customers now use the modern, economical facilities of the Port of Long Beach. Tonnage and ship arrivals are at the highest point in our history. A continuous expansion program is providing new piers, berths and transit sheds which will be available in the near future. We invite inquiries from shipping lines, importers and exporters regarding present facilities and those under construction.



SHIPPING LINES, IMPORTERS, EXPORTERS:
Please write (on your letterhead) for complete details and for "Harbor Highlights," the Port's free, quarterly news magazine.

THE PORT OF LONG BEACH OFFERS:

1. Fast access by truck via non-stop "freeways" to Los Angeles and other Western U.S.A. cities.
2. Modern piers, transit sheds and warehouses.
3. Excellent stevedoring services for all general and bulk cargoes, grain and steel scrap.
4. 10 to 20 minute run from berth to open sea.
5. Dockside rail trackage connecting with major transcontinental railroads.
6. Radar-radio ship pilotage.

ACETYLENE

Toward Self-Sufficiency

THE opening last week by Carbide Industries of a plant to produce calcium carbide and acetylene at Maydown near Londonderry, brings Britain for the first time within reach of self-sufficiency in supplies of this industrial gas. Carbide Industries—a subsidiary of British Oxygen—will produce about 50,000 tons of calcium carbide a year at Maydown, most of which will immediately be turned into acetylene ; this will be pumped to an adjacent plant belonging to Du Pont, where it will be used in making Neoprene synthetic rubber. A similar plant belonging to Imperial Chemical Industries is scheduled to begin making over 75,000 tons of calcium carbide at Runcorn, in Cheshire, early next year; when both new plants are in full production Britain's chronic reliance on imports of calcium carbide—which ran to 76,000 tons in 1958—should cease, at least for a while. Before the second world war—when the biggest use of acetylene was for oxy-acetylene cutting and welding in metal working—the industry was based entirely on imported calcium carbide, much of which came from Norway. In 1940 the Distillers Company built a 100,000 ton plant for the government in South Wales, which it now operates on lease ; and since 1958 ICI has produced about 70,000 tons of calcium carbide a year at its present plant at Runcorn, most of which it uses itself in making solvents and plastics monomers.

In the past few years demand for acetylene has changed greatly: about 60 per cent of the total produced now goes into the manufacture of chemicals, including Neoprene, polyvinyl chloride and polyvinyl acetate, acrilonitrile (used in making synthetic fibres) and chlorinated solvents. Production of pvc is expected to exceed 100,000 tons in Britain this year, demand for other acetylene-based chemicals is also rising, and so is demand for metal working (though much less rapidly). Production of acetylene from petroleum fractions and natural gas is now being carried out in several countries, notably Italy and the United States ; this method has also been considered by British producers, but none has yet found it feasible.

The most important element in the manufacture of calcium carbide for acetylene is the cost of electricity, which explains Britain's comparatively late development in the field. (It may also explain in part Carbide Industries' choice of Northern Ireland, which offers, along with other financial inducements, subsidised electricity as an inducement to attract firms.) The only raw materials used in this process are coke and lime, which are heated together in an electric arc furnace (to about 2,000 degrees Centigrade) to make calcium carbide. To this one merely adds water to produce acetylene (as in old style cycle lamps). It is usually delivered either as a gas or in solution ; in either case about ten tons of steel would be shipped for every ton of acetylene, so the usual practice—as with oxygen—is to ship the calcium carbide to smaller converting plants to make the gas close to centres of demand. Carbide Industries' Maydown plant will be Britain's first large-scale acetylene plant ; British Oxygen previously got all its supplies of calcium carbide from a Norwegian subsidiary, Odda Smelteverk.

BUILDING

More Work for Architects

NEW work commissioned from private architects in Britain in the first quarter of this year reached a record value of £361 million, an increase of one-third over both the previous quarter and the first quarter of last year. According to a survey made by the Royal Institute of British Architects, commissions for new work for public authorities showed the greatest proportionate increase—£110 million against £53 million a year earlier; the value of new hospital building commissioned during the first three months of this year was about four times that of the first quarter of 1959, reflecting the increased share of Government expenditure on hospitals at the beginning of this year. New commissions for educational buildings also rose, to £56 million against £27 million in the preceding quarter and £26 million a year earlier.

Commissions for new housing rose to £126 million, against £94 million a year earlier. About 85 per cent of this total represented work for private developers; while local councils now account for about 45 per cent of the new houses actually built in Britain, many local authorities either employ their own architects or build to contractors' plans which have not been drawn up by an architect. Commissions for banks and office buildings declined slightly, to £20 million. How much of an indication of future building activity (as opposed to potential demand) can be gained from the RIBA's survey remains to be seen. Not only is about half the building in Britain (and almost all the private industrial building) done without using the services of a private architect, but an indeterminate part of the new work commissioned is abandoned before contracts are let and work begun. The credit restrictions already imposed by the Government could have a considerable effect on work commissioned in the first quarter, as well as on work now being commissioned.

The RIBA states that there are now almost 3,100 private architects' practices in Britain, an increase of four per cent since the middle of 1958; the number of architectural staff has increased at the same rate, and now totals over 15,000. But the volume of work has increased at a much greater rate during that time: many offices would like to take on additional staff, but cannot find them, and the RIBA Appointments Department now lists over 300 vacancies in London and the Home Counties alone. This may tend to slow the progress of building work in the design stage unless the volume of new work commissioned declines in coming months.

ANGLO-RUSSIAN TRADE

No Quota for Oil

TRADE talks between Britain and Russia ended this week without producing any striking changes, such as a quota for imports of Russian petroleum. The two sides noted with satisfaction, it is said, that trade had increased substantially in both directions since the five-year agreement was signed in May last year, and reaffirmed that there was scope and desire for a further increase. In the first four months of this year Britain's imports from Russia rose to £15.2 million from £12.7 million a year ago, while exports to Russia, at £14 million, were nearly twice as big as a year ago, and re-exports, largely of rubber, rose by over a half to £1.4 million. This expansion in British shipments mainly reflects the big orders placed here for machinery and equipment, while the increase in imports from Russia is mainly in raw materials rather than machinery and consumer goods. Last year both countries opened quotas for consumer goods to a value of £3.4 million a year, compared with actual imports of about £1.4 million each way in 1958. The new quotas for the year ending June 30, 1961, are increased to £4 million each way, and Britain has more than doubled its quota for Russian machinery and instruments, which goes up from £1.15 million to £2.5 million.

Though the trade of the two countries is currently in close balance, Russia always treats its trade with Britain as part of its total trade with the sterling area, with which it claims to run a substantial deficit. Last year, for example, Russia imported about 165,000 tons of rubber from Malaya, at a cost of roughly £40 million. Russia argues that, to improve its trade balance, it must sell more to Britain, particularly oil, and this is presumably one of the problems to be discussed again later this year. Imports of Russian petroleum are subject to licence, and so far the Board of Trade has evidently not been greatly impressed by the merits of any applicant's case. Imports in the first four months of this year were valued at £580,000, and though this was nearly twice as much as a year ago, it is small cheer to the Russians. Doubtless there are British importers who would welcome an opportunity to buy much more Russian petroleum (which can be had cheaply), if the Government was not more reluctant to upset the miners and the major oil companies than the Russians. The delegations also exchanged drafts of a treaty of commerce and navigation, and agreed that preliminary negotiations on the text should begin in London towards the end of the year.

HARDWOOD & SOFTWOOD

Plus ça change.....

In 1953 the Monopolies Commission, reporting on the supply of imported timber, found that agreements by which importers undertook to buy only through agents on an approved list, and agents undertook to sell only to importers on similar lists, operated against the public interest, should be abrogated and should not be replaced by any other arrangements or undertakings having similar effects. The Government accepted the recommendation, and in 1954 the various sections of the Timber Trade Federation, "under the strongest possible protest," agreed to abrogate their agreements and take appropriate action to give effect to the decision. This they deemed preferable to having an Order made against them, because its terms might be more onerous, and could only be annulled by Parliament, thus prejudicing any future opportunity of appeal. Six years later the softwood and hardwood sections of the trade are facing just such an Order.

Early in 1957 the Board of Trade, having reason to question the effectiveness of abrogation, ordered the commission to investigate whether and to what extent its previous recommendation had been complied with. The commission duly reported in July, 1958, that in hardwood and softwood (but not plywood) the former arrangements had been replaced by others having similar effects. And this week the President of the Board of Trade told the House in a written answer that he had accepted the finding, and was laying an Order which will prohibit the making or carrying out of such arrangements in hardwood and softwood. Subject to affirmative resolution, the Order takes effect on August 8th. Mr Maudling added:

> The Timber Trade Federation have assured me that there had been a genuine misunderstanding on the part of their members as to the purport of the recommendations by the Monopolies Commission in their 1953 report and so of the extent of their own undertakings. Of course I entirely accept this assurance.

FILM PRODUCTION

The Levy—at Home and Abroad

The changes in the statutory film levy, that follow upon the end of the entertainments duty last April but which were announced only this week, are quite small. This levy is paid by cinemas to assist the production of films that qualify as "British." The rate is now to be one-tenth of the excess over elevenpence paid for every seat, instead of one-ninth. The exemption limit for small cinemas is to be raised from £150 to £250, and takings at children's matinees and charitable shows are to be left out in calculating whether this limit has been reached. All told, these changes should mean all of £100,000 a year more for all film production that qualifies. The end of the duty alone meant that another £1 million or more a year is coming back to the producers of all films shown in Britain out of the £7 million a year extra of box-office takings it leaves in the hands of exhibitors. But the extra £100,000 will perhaps help to stem the fall in the total amount collected from the levy. Last year it fetched in about £3.7 million.

British—and other—film producers are rather more attracted at the moment, however, by the prospect of also getting a share in similar forms of special assistance provided by other European governments. The new Films Act will enable certain "co-productions," that is, arrangements between British and overseas producers for the making of "international" films in partnership, to qualify for the British quota and levy. Discussions are now going on about treaties with France and Italy (and possibly also with west Germany if the British unions agree) to make these co-productions fully eligible in each country in which part of the film is made. Both Italy and France provide financial assistance, mostly by levy, to their film makers; the attraction of an arrangement with west Germany would be in getting round the import licensing system that still partially protects one of the best markets for dubbed British films. "International" films of this kind would certainly be more expensive to produce. But getting subsidies from two, or possibly three, governments for the same film will be quite an achievement. On average British films at present receive from the levy rather more than 40 per cent as much as they get from their share of British box-office receipts. But it is not unknown for the occasional film to receive more from the levy than it cost to make.

SHORTER NOTES

The Scottish banks have established a credit clearing, on the lines recently introduced by the London clearing banks.

★

Mr R. A. Butler told the House of Commons on Wednesday that the price paid for S. G. Brown Ltd. would be disclosed to the House, after consultations with the buyers —de Havilland Holdings and the Bosch Arma Corporation. The Admiralty had originally refused to disclose this information.

★

Sir Harold Smith, chairman of the Milford Dock Company, revealed this week that the company has obtained a loan of £128,000 from the Treasury, of which £75,000 has already been advanced, under the Government's policy of lending for development projects in areas of underemployment. The company announced plans in 1957 to enlarge its dry docks at Milford Haven—where both Esso and British Petroleum are now building terminal facilities—to accommodate 100,000-ton tankers. The company also stopped paying dividends in 1957; its expansion plans were postponed indefinitely shortly afterwards, and it was stated that the estimate of their cost is now "substantially" increased.

★

Aluminium Limited and Enfield Rolling Mills, Ltd., are forming a jointly owned company, Alcan Enfield Alloys, for the production of refined aluminium foundry alloys. Enfield's Bradford refinery will be transferred to the new company, and Alcan (UK) Ltd., will distribute the products. Enfield Rolling Mills (Aluminium) will continue to make and market, in its own name, other products such as sheet and strip.

Raw jute prices have dropped since the drought in East Pakistan and Bengal was broken last month. Firsts have fallen from a peak of about £148 a ton cif to the official export minimum of £140 for June shipment, and the minima for July and August shipment have been set at £135 and £130 a ton respectively. Little business is being done, and sellers are offering at prices that discount another reduction in the official minimum prices for the new crop.

★

Joseph Lucas (Industries) and the Collins Radio Company of America have formed a subsidiary, LCE, Ltd, to manufacture electronic equipment, including aircraft navigational and communications radio sets designed by Collins Radio, a leading American company in this field. Production at a factory in North London is expected to begin in September; Collins states that some equipment which it now makes in the United States may in future be made solely in Britain.

COMPANY MEETINGS

BOOTS PURE DRUG COMPANY LIMITED

SALES INCREASE OF £6¾ MILLION WITHOUT INCREASE IN STAFF

BOARD CHANGES ANNOUNCED FOR 1961

MR J. P. SAVAGE ON RESALE PRICE MAINTENANCE

The Seventy-Second Annual General Meeting of Boots Pure Drug Company Limited will be held on July 20th. The following is a Statement by the Chairman, Mr J. P. Savage, which has been circulated with the report and accounts for the year ending March 31, 1960:

We have had a record year. All departments in the business have contributed to this result. Our sales have gone ahead well; our manufacturing efficiency has improved; our expense ratio has fallen; and our profits show a good increase. Our experience in the last twelve months can be summed up quite simply by saying that we have achieved a sales increase of £6¾ million without any increase in staff. This is where the increase in profits has come from.

REVIEW OF ACTIVITIES

We are sending to shareholders this year a Review of Activities. Because of this I have been able to make my Statement to the shareholders briefer than it otherwise would have been.

SALES

Total Sales at home and abroad amounted to £90½ million. This figure, which includes only sales to customers outside the Group and excludes sales from the Parent Company to the Subsidiaries (whether at home or overseas), represents an increase of 8 per cent over last year. Retail Sales, which amounted to £82 million, show an increase of just over 7½ per cent.

MANUFACTURE

Our manufacturing operations have made an important contribution to the increase in profits. This is partly a reflection of increased output but it is also due to improvements in efficiency.

EXPENSES

The expense ratio has fallen throughout the Company. The most gratifying improvement has been in the reduction in the retail payroll percentage despite an increase in salary rates.

PROFITS

Profits before tax amount to £7,560,697, an increase of 51 per cent over last year's figure of £4,997,839. As indicated in the Financial Record in the Review of Activities, profits on capital employed amount to 16.6 per cent. This figure, which reflects the benefit of substantial capital expenditure over a period of years, is not unreasonable. There has been a continued rise in property values since the revaluation; moreover the revaluation did not extend to the shorter leaseholds or to plant and machinery. The capital employed in the business at current values must therefore be appreciably more than the balance sheet figure.

Tax provided amounts to £3,734,693 compared with £2,555,598. This increase reflects the increase in profits: the additional Profits Tax imposed in the Budget is not included as it will only fall on profits earned after the end of the financial year covered by these accounts.

After tax, the net profits of the Group have increased from £2,442,241 to £3,826,004. Of this figure £677,977 has been retained by the Subsidiaries and £3,148,027 represents the profits of Boots Pure Drug Company Limited.

DIVIDENDS

We propose paying a final dividend of 15 per cent making a total of 21 per cent for the year compared with 16 per cent last year.

Hitherto we have paid two interim dividends. Last year 3 per cent was paid on September 30th and 3 per cent on March 31st. For the coming year we propose paying a single interim on December 10th. We have in mind that this should represent a higher proportion of the total dividend for the year than was the case last year. This proposal will avoid very small individual payments and we believe it will be appreciated by shareholders as well as being an economy for the Company.

PROFIT EARNING BONUS

The Profit Earning Bonus for the year (which has been deducted in arriving at the profits) amounts to £702,360 compared with £464,280. The staff have therefore received an increase as well as the shareholders. The results we have achieved reflect the efforts and loyalty of the staff and I am sure the shareholders will agree with me that they have amply earned their increased bonus.

RESERVES

Ordinary dividends for the year amount to £1,646,400 net and preference dividends to £59,259. Goodwill written off accounts for £2,500. This leaves a balance of £2,117,845 profits retained in the business compared with £1,150,010 last year. Depreciation charged amounts to £1,592,951. The total funds retained in the business therefore amount to £3,710,796.

CAPITAL EXPENDITURE

Capital expenditure for the past year on fixed assets amounted to approximately £3 million. This has been financed out of the funds retained in the business.

CASH

The cash position shows a big improvement. Last year we were overdrawn net by £289,882. We have ended this year with a credit balance of £629,612. This reflects the increase in profits and the fact that the tax on these profits is not payable until January 1st next.

STOCKS

Stocks rose during the year by £1¼ million. The greater part of this increase was inevitable and in fact essential to cover the growth of sales, the requirements of a number of big new shops and extensions to many others. In addition the increased call on the factories both for home and export trade meant that stocks at all stages of production had to be built up. Nevertheless after allowing for these factors we feel that a particularly careful watch must be kept on stocks during the present year to ensure that the investment in this field is fully productive.

WAREHOUSES

We have recently completed our programme of warehouse development and now have adequate buildings and equipment for all the main depots. This means that we are now seeing the benefits of more efficient handling and the better distribution of supplies to the branches. At the same time we cannot afford to stand still in this field and by method study and other techniques we are constantly developing improved procedures. Certain long-term projects on which we are working give promise of bringing dramatic changes in the field of warehouse equipment and assembly methods.

RETAIL PROGRESS AND DEVELOPMENT

Our retail sales increase of just over 7½ per cent was achieved this year without very much help from the weather. The exceptionally dry and sunny summer provided a further stimulus to our vigorously growing Photographic business but otherwise tended to keep holidaymakers on the beaches rather than in the shopping centres; and the drought certainly affected the sales of our Farms and Gardens Department for several months. The autumn produced less than the usual crop of coughs and colds; on the other hand, shopping conditions in December were generally better than in the previous year, although heavy rain and floods were a handicap in some parts of the country. However we finally had an excellent Christmas, beating all previous records in all departments and putting on more than 9 per cent increase during the period. The new branches in Birmingham,

Bristol, Loughborough, Neath and Hamilton, and the enlargements in Liverpool, Northampton, Grantham, Aintree and elsewhere made significant and encouraging contributions to the result. We shall of course feel the benefit from these developments right through the current year.

Leatherware and Fancy Goods, Silver, Stationery and Art, Books, Gramophone Records and Libraries in our larger branches, both old and new, deserve special mention, particularly in relation to the Christmas business to which they are so vitally important. Boots Gift Vouchers continued to increase in popularity. Sales increased by 14 per cent during the year and exceeded £1 million for the first time. We have also introduced Saving Stamp Machines into a number of our branches and these are proving very popular. The stamps are redeemable for goods at any branch of Boots at any time. Many of our customers appear to appreciate the convenience of this 'Savings Club.'

The year has also been notable for good progress in the whole of our Toilet business, especially our own Number Seven Beauty series and the many new products which are now flowing from our laboratories and factories.

There was no 'flu epidemic last winter to help our dispensing and chemists business. Nevertheless we have continued to make progress in these departments, helped once again by new products from our own Research, Development and Manufacturing Divisions which have been well received both by our own staff and by our customers.

Much publicity has already been given to our intentions with regard to the development of our shops during the coming year and the years ahead. The standards we have set in our new shops at Birmingham and Bristol indicate the trend in our big store development whilst the new but smaller shops at Hatfield, Boreham Wood and Ubberley, Stoke-on-Trent, are examples of the way we are remodelling the family shop.

We have spent more on retail development this year than last but because of the inclusion of one or two very big schemes the actual number of projects completed in the year was rather smaller. Twenty shops in all were completely modernised and six new branches opened. We have now prepared for an intensified programme for the coming year in which ninety-four shops are included. The highlight of this work is the rebuilding of our branch at the corner of Union Street and Argyle Street, Glasgow, which will ultimately be our largest store. The large new branch at Bradford will be completed and our branches at Cambridge, Bury St. Edmunds, Gloucester and Slough will be open in their new form.

This programme together with numerous improvements in other branches including many installations of self-selection fittings demonstrates our desire to provide branches that are attractive and continue to afford a high standard of service.

PRICES AND PRICE MAINTENANCE

On a number of occasions during the past year the Government called on industry for help in stabilising prices and to bring them down wherever this could be done. Our response was easy in the sense that it always has been the policy of the Company to reduce prices wherever reductions in cost enabled this to be done. Shareholders will remember that this has been done consistently and repeatedly in past years and we are constantly reminded of it by our own trading slogan 'Boots For Value.'

The past year has been no exception and reductions achieved in manufacturing costs over a wide range of goods produced in our own factories, have enabled us to reduce the retail prices of 153 of our own products. The saving to customers resulting from these reductions amounts to £339,000 in a full year. In addition we have been able to reduce the prices of 650 lines which are bought in by us and the prices of which we control ourselves.

For many years it has been the firm policy of the Company to ensure that prices in all our shops are uniform. This of course has applied not only to goods of our own manufacture but also to those we buy. As affecting the latter we have consistently respected the retail prices which have been recommended or laid down by our suppliers.

We are quite confident that this is sound policy both for our own products and for the branded goods of other manufacturers. In consequence we support firmly the right of the manufacturer to control the price of his own products and believe further that the abolition of this right would in the long run bring no benefit to the shopping public. It would result in untold confusion as to prices and would do quite unnecessary injury to the service provided to the public by the retail trade.

We hold no brief for price cutting in the sense that that term is usually understood. But while we believe in the right of the manufacturer to fix his prices and that prices so fixed should be observed, we believe just as strongly that it is the duty of every manufacturer to reduce his prices wherever he can.

INTERNATIONAL DIVISION

Both our export sales and the sales of our seven overseas companies have shown good progress during the year.

The pattern of our export business has changed considerably over the last few years. Our sales of bulk chemicals have declined as a result of intensified world competition. This loss however has more than been made good by the improved sales of our own branded medical, pharmaceutical and veterinary specialities; these products, such as Strepsils for throat affections and Entamide for the treatment of amoebic dysentery, resulting as they do from the work done in our Research and Development Laboratories in Nottingham are unique in their class and are making an increasing contribution to local health facilities in many overseas markets.

The sales of our overseas companies, all situated in the Commonwealth, have increased by over 15 per cent over the previous year and now amount to well over £2,500,000. A growing proportion of this business now comes from local manufacturing resources and is therefore not subject to import restrictions. We believe that this business will continue to grow and will make an increasing contribution to the profitability of the Group as a whole.

We would like to thank the staff of all our overseas subsidiary companies and our agents for all their efforts during the year.

WHOLESALE DIVISION

Our Home Wholesale Division has more than made good the fall in last year's business and the sales for the year have set up a new all-time record.

Included in this total is a welcome increase in the manufacturing business we undertake for other pharmaceutical companies.

I am also particularly glad to report a significant increase in the sales of our medical specialities to wholesale and retail chemists generally, illustrating the confidence that the medical profession in this country has in our branded products. In addition, and despite intensified price competition, there has been an improvement in the turnover of our bulk chemicals. This improvement is particularly noteworthy because we have taken the opportunity during the year of cutting out certain of the less profitable lines from our chemical inventory.

STATE GRADUATED PENSION SCHEME

After long consideration we have come to the conclusion that the interests of our staff at all levels will best be served if we do not contract out of the new State Scheme. Our own Pension Schemes will continue with no diminution in the benefits. This will mean some additional cost both for the Company and for some members of the staff; but it will also mean that staff on retirement will enjoy the full benefits of the new State Scheme as well as their pension under our own schemes. Many members of the staff, and all whose earnings are below the level at which the graduated scheme starts, will pay a smaller State contribution than at present.

We have already consulted groups representative of the staff. They support our conclusions and we shall continue these consultations.

We have always attached the greatest importance to our relations with the staff and our Pension Schemes have been a major factor in ensuring these good relations. I am sure the view the Board have taken will be generally welcomed.

PROSPECTS

Although we are budgeting for increased profits this year, I must warn shareholders that it is on a much more modest scale than for last year, when the figures were affected by the complete replanning of a number of our activities.

THE CHAIRMAN'S RETIREMENT

I shall reach the age of 65 in November of this year and have notified the Board of my intention to retire from the position of Chairman and Managing Director on March 31, 1961.

The Board has unanimously decided that owing to the present size of the Company, the diversification of its business and the rapid expansion which is taking place, the time has arrived to divide the functions of the Chairman and Managing Director.

From April 1, 1961, Mr Willoughby R. Norman will become Chairman of the Board and Head of the Company.

Mr F. A. Cockfield will take over the position of Managing Director and Chairman of the Executive Management Committee.

Mr K. D. Williamson will be appointed as Deputy Managing Director.

The Board has asked me to visit all our Overseas Subsidiaries before I retire and during my absence Mr Norman will be Acting Chairman of the Board and Mr Cockfield will be Acting Managing Director.

UNITED DRAPERY STORES

A Group of Companies comprising over 750 Retail Shops, Department Stores and Distributive Businesses in all principal towns throughout the United Kingdom and Eire

Extract from the Chairman's Statement from the Report and Accounts for the year ended 30th January, 1960.

The Group trading profit for the year amounts to £9,024,834, which is an increase of £1,111,907 over last year's figure. Of this increase, the sum of £425,015 relates to the new businesses acquired this year and last and £686,892 represents increased profits from our previously owned businesses.

A big and important extension to one of our larger stores has been completed and the improved trading results have since been well up to our expectations. Further extensions are in progress or will start shortly on another four of our department stores. We will also complete the building of a number of new branches for our multiple clothing businesses and for the credit group, all of which are being expanded by the opening of new branches wherever suitable opportunities occur.

The diversity of our retail businesses spread throughout the length and breadth of the country is such as to cater for almost every household requirement and items of wearing apparel.

The current assets, after deducting the current liabilities, show a surplus of £11,825,192 and this is almost £4 million higher than last year. We are, therefore, in a good position to take advantage of suitable opportunities for expansion which might present themselves in the future.

The turnover of the Group for the first quarter of 1960 shows a satisfactory improvement over the comparative period in 1959. This increase is, on a percentage basis, higher than at the same time a year ago.

I am hopeful that our widespread interests, which cover the whole of the retail consumer field, will continue to show progressive improvement and provided that no exceptional circumstances intervene, we shall be able, next year, to present again a satisfactory Report.

FARBWERKE HOECHST AKTIENGESELLSCHAFT

vormals Meister Lucius & Brüning

FRANKFURT (M)-HOECHST

The Annual General Meeting of Farbwerke Hoechst AG. was held in Frankfurt (M)-Hoechst on May 11, and the following is a summary of the report presented by the Board of Directors (*Vorstand*):—

Development

The year 1959 was a successful one for the West German chemical industry. The varied range of products put out by this industry steadily opens up new fields of application. This in its turn constantly increases the share taken by the chemical industry in the supply of industrial products. Plastics, foils and man-made fibres in particular are continually gaining new markets. This development affects economic expansion as a whole. The overall increase in the turnover of German industry in 1959 amounted to 9.1% compared with an advance of 13.7% achieved by the chemical industry. The Company's own turnover rose by 17.6% to DM 2,222m. during the same period. The increase of DM 333m., which had not previously been equalled in any other year, was made possible by the planned extension of existing installations and the provision of additional production capacity which had been effected during the preceding years. Investment since 1952 totalled more than DM 1,500 m. Investment activity continued to be centred around the further expansion of the basic petrochemical plants and the erection of further production installations for the polyester fibre *Trevira*. In the traditional fields of activity, too, investments continued during the year.

In 1960, business developments are again expected to be satisfactory, and the first quarter fully came up to expectations.

Turnover

The total turnover of Farbwerke Hoechst AG., including those of its German subsidiaries in which Farbwerke Hoechst has an interest of more than 50%, in 1959 reached DM 2,222m., of which DM 720m., or 32.4%, was exported Most of the Company's exports once again went to European markets. The total turnover can be broken down as follows: plastics, solvents and lacquer components 20%; fibres and foils 14%; dyestuffs, textile auxiliaries and organic intermediates 17%; pharmaceutical products 10%; fertilisers and plant protection agents 12%; and inorganic chemicals and miscellaneous products 27%. Turnover in polyethylene and polypropylene, plastics which are being sold under the branded names of (R) *Hostalen G* and (R) *Hostalen PP*, again rose considerably in 1959. The volume of sales, which increased by 75% compared with the previous year, was limited by existing capacity.

Sales of polyvinyl acetates, which are mainly used as lacquer components in the paints industry, were favoured by the large volume of activity in the building industry. In the case of (R) *Frigen*, which is being used in refrigeration technique and as a propellent gas for dosed sprays, the biggest increase could be registered with aerosols.

In the field of waxes, the new types in particular contributed to an encouraging increase in turnover.

Among man-made fibres, (R) *Trevira*, the polyester fibre, made satisfactory progress. Output was fully sold and the increase in demand is likely to be satisfied during 1960 as the additional production installations come into service stage by stage. Business in (R) *Perlon*, too, followed this favourable development.

Sales of plastic foils distributed by *Kalle AG*, increased steadily. One of the most interesting products in this field is the plastic foil (R) *Hostaphan* which is made from the same raw material as *Trevira*.

Business in dyestuffs experienced a vigorous upturn as a result of the economic expansion over the whole range of the consumer goods industry, and in particular of the textile industry, which set in during the second quarter of 1959. In the case of many products demand exceeded production capacity, and new ranges achieved a satisfactory turnover.

Sales of intermediate products increased considerably in line with the generally favourable market situation for chemical products. Further investments directed at expansion are envisaged for 1960.

The turnover in pharmaceutical products was once again raised during the year. The major share of this development was taken by the oral anti-diabetic drugs, as well as by (R) *Reverin* and by heart and circulation stimulants. The products of *Behringwerke AG*. registered an encouraging increase in turnover. In September, 1959, (R) *Tri-Virelon*, a new combined vaccine which is used for simultaneous protective vaccination against poliomyelitis, diphtheria, and tetanus, was put on the market

In the fertiliser business the Company succeeded in maintaining its share of the market, and enriched fertilisers were in particularly strong demand.

The demand for inorganic chemicals rose so steeply during the year that in the case of a number of widely-used products there were at times delivery difficulties. A further large-scale extension of the caustic lye electrolysis plant was started during the year. The turnover of phosphates manufactured by *Knapsack-Griesheim AG*. continued to develop favourably as a result of the steady increase in the consumption of synthetic detergents. Carbide production at the *Knapsack* plant reached a new peak during the year.

In the group for welding technique and technical gases, sales of oxygen and welding equipment increased considerably in step with the high level of employment in the steel and engineering industry.

The number of chemical plants erected and sold by *Friedrich Uhde GmbH*. rose appreciably during the year. The company's activities included a share in the erection of nitrogenous fertiliser plants in Greece, Egypt and India.

Investments

Expenditure on the further extension of works installations and research institutions as well as on increased modernisation in all fields totalled some DM 254m. This was covered by depreciation to the extent of DM 175m.

In order to meet the growing demand for chemicals, investments will once again be increased in 1960 and expenditure will exceed DM 330m.

Research

With a view to promoting research and development work, a start was made on concentrating all the HOECHST laboratories, some of which are fairly old and most of which are scattered all over the plant, in a modern research centre. The HOECHST Group as a whole employed some 1,900 chemists, physicists, doctors, pharmacists and highly-qualified design engineers at the end of 1959, of whom approximately 800 are active in research and application techniques. Expenditure on research and development rose to app. DM 100m. in 1959 and thus represented some 4.5% of turnover.

Associated Companies and Participations

The Company's two large wholly-owned subsidiaries, *Knapsack-Griesheim AG*. and *Kalle & Co. AG*., were fully merged with FARBWERKE HOECHST AG. during the year in order to make it easier for the Group to adjust its organisation to future developments in economic policy and legislation. At the same time two new subsidiaries, *Knapsack-Griesheim AG*. and *Kalle AG*., were set up, each with a capital of DM 20m., which will run the plants now owned directly by FARBWERKE HOECHST AG. in their own names but subject to the orders and instructions, and for the account, of the Parent Company.

Wacker-Chemie GmbH., München (holding 50%) succeeded in raising its turnover to DM 234m. in 1959. A dividend of 14% was distributed in respect of the business year 1958. Towards the end of 1959, *Wacker-Chemie GmbH*. and FARBWERKE HOECHST AG. set up a new company, *Aldehyd GmbH*., München, in order jointly to utilise processes for the oxydation of ethylene.

Cassella Farbwerke Mainkur AG., Frankfurt (M) (holding 25.1%), distributed a dividend of 14% for the year 1958.

Duisburger Kupferhütte, Duisburg (holding 30.1%), distributed a dividend of 6% for 1958.

Bunawerke Hüls GmbH., Marl (holding through *Synthesekautschuk-Beteiligungsgesellschaft mbH*., Frankfurt (M), 16⅔%), succeeded in utilising its capacity for the production of synthetic rubber to a growing extent, up to full utilisation during 1959.

Abieta Chemie GmbH., Gersthofen, near Augsburg (holding 50%), managed to utilise its plant for the production of auxiliaries for the manufacture of buna products in step with the rise in buna production.

Süddeutsche Kalkstickstoff-Werke AG (holding through *Verwaltungsgesellschaft für Chemiewerte mbH*., Frankfurt (M), 15%) distributed a dividend of 9% for 1958.

Foreign investments reached a total of some DM 96m. by the end of 1959. In 1959 app. DM 12m. was spent on the extension of production installations and DM 7m. on strengthening the sales organisation. A large proportion of the funds invested in production installations served to extend and modernise the caustic lye electrolysis plant of *Electro-Química de Flix S.A*. in Spain (holding 37.5%). This company is expected to distribute once again a dividend of 14% for 1959. Further investments were effected in Brazil with *Fongra Produtos Químicos S.A*. to complete the company's production programme.

Personnel

The HOECHST Group as a whole employed altogether 45,363 people at the end of 1959, compared with 43,328 at the end of 1958. The utilisation of almost the entire existing capacity and the coming into service of new plants required the engagement of new labour to a larger extent than in the previous year.

Balance Sheet

The consolidated balance sheet at December 31, 1959, includes the balance sheets of FARBWERKE HOECHST AG. and of those of its German subsidiaries in which it has an interest of more than 50%, with the exception of housing organisations and welfare institutions. The ratio of assets to liabilities shows an improvement compared with the previous year. Fixed assets show a net increase of DM 100m. to DM 1,083m. compared with December 31,1958. The share capital and reserves on the other hand rose by DM 176m. to DM 880m. and thus, jointly with loans totalling DM 200m., cover the total of fixed assets.

Capital Increases

In 1959 the Company's share capital was raised by DM 94m., and in connection with the introduction of its shares on foreign bourses by a further DM 6m., to a grand total of DM 562m. The shares of FARBWERKE HOECHST AG. were admitted for dealings and official quotation on the Zurich, Basle and Geneva bourses as well as on the Paris Bourse (Marché des Courtiers) last year.

At the Annual General Meeting of May 11, 1960, it was resolved further to increase the share capital by DM 56,200,000 to DM 618,200,000. At the same time the Board of Directors was authorised to increase the capital by up to DM 81,800,000 to DM 700,000,000.

Dividend

At the Annual General Meeting of May 11, 1960, it was resolved to distribute a dividend of 16% for the business year 1959.

SUPERVISORY BOARD

Chesapeake and Ohio Railway Company

Railroad is Physically Strong, Financially Healthy

Chairman Eaton's remarks:

The Annual Meeting of Shareowners of the Chesapeake and Ohio Railway was held on Thursday, April 28, 1960, at The College of William and Mary in Williamsburg, Virginia. The meeting also observed the 175th anniversary of the founding of the railroad's original transportation predecessor, the James River Company, in Virginia, with George Washington as its first president.

Cyrus S. Eaton, chairman of the board, addressed the shareowners of the company as follows:

"Fellow Stockholders:

"We can all take great satisfaction that George Washington, the founder and first president of the Chesapeake and Ohio Railway's predecessor company, excelled as a sound and successful businessman, as well as a superlative statesman.

"Washington was a capitalist, both in theory and in practice. In 1785, when our predecessor company was chartered, he opened its stock subscription books at $200 a share. The enterprise prospered, so that the stock was selling for $400 a share within a few years.

"A question of paramount importance to all of my fellow stockholders today is, I am sure, can we ever again have our stock selling for $400 a share? My answer is, if all the railroads of America could be emancipated from the bondage of federal government regulations, and really be permitted to practise free enterprise, I am certain we could pursue policies that would again bring our stock to the $400 level.

"Our railroad has done well, it is true, because of the extraordinary dedication and devotion of our entire organisation. The C & O probably has the most continuous record of success of any railroad in the world. But we can do infinitely better if the government wraps are removed. You, of course, appreciate that this is a family party, where one can speak with complete frankness.

"Last week I devoted a day in Toledo, Ohio, to inspecting our modern docks and examining our matchless new coal loading facilities. In Toledo we, in fact, have the most modern and most efficient coal docks in the world. We can put 300 cars of coal into a 20,000 ton ship in less than four hours. I am vastly impressed with what the Toledo installation represents in human intelligence, skill and accomplishment.

"From Toledo I went to Detroit for a day at the Ford Motor Company. I spent several hours in the Henry Ford Museum, a building that covers 8 acres, all under one roof. The Museum displays models of all forms of transportation from the earliest times until now, and also exhibits replicas of material progress in many other fields of industry and science.

"My visit to the Museum was made in company with distinguished representatives of our federal government. All of us became acutely conscious of the vast progress that has been made from the days of the ox-drawn covered wagon to the miracles of modern-day transportation. I said to these government representatives, 'We are looking at a thrilling picture of American accomplishment in the fields of science, industry and agriculture over the past 175 years. One is accordingly doubly depressed to realise that, in our political institutions and form of government, we are still back in the covered wagon era.'

"The system devised by our wise Founding Fathers was appropriate for the time when the federal government played only a small part in the affairs of the nation, and when the individual states held most of the authority and made most of the decisions. In recent years, the power and size of the federal government have increased far beyond the point contemplated by the Founding Fathers. Let me just cite an example or two of outworn features of our government.

"A Congressman faced with a primary and a final election every two years has, in effect, an election every year. His mind must therefore be on what will get him votes, so he consistently appeals to the prejudices and whims of the moment. In this way, he substitutes expediency for sound, fundamental principles. With only two years between these Congressional contests, as compared with four years between Presidential elections, frequent conflict is bound to arise between the legislative and executive branches of government. Meanwhile, we are forced to witness the biennial spectacle of candidates from the same party fighting each other in the primaries, and furnishing fuel to the opposition by denouncing each other in undignified fashion. I submit that national elections should be held at four, or perhaps even six, year intervals, and that all federal elective offices should be filled at the same time.

"Let me give you another illustration that seriously affects our railroad industry. In recent years a total of 75 so-called independent government agencies have been created in Washington. The men who run these bureaus are not responsible to either the executive or legislative branches of the government. The occupants of these offices are human, so they are constantly seeking an extension of their powers. Well-meaning though they are, they consume endless time in efforts to interpret statutes. They feel that their main task is to crib, cabin and confine American industry and finance, and all of their ramifications. The railroad industry is the most completely regulated. Management is not permitted to use, on behalf of stockholders, the imagination and drive that are essential to success in the capitalistic system. One of the weaknesses of our government that demands sweeping changes is the vast system of bureaucracy represented by these federal agencies.

"I appeal to you stockholders to take a personal interest in these political problems. The main buttress of free enterprise and the capitalistic system is the stockholder. If all stockholders of all companies would speak up at one time on a given subject, their voices would have a far-reaching effect on the politicians. In my economic philosophy, I believe every man and woman should be a stockholder in some corporation. I should like to see all men and women who work for companies have a personal stake in the ownership of those companies. This would bring labour and labour leadership into partnership with the management of corporations, big and small, and the combined influence would be irresistible.

"We urgently need a revival of the spirit of George Washington, both as applied to business and to government. We urgently need a new Constitutional Convention to bring our federal government up to date and put it in harmony with the marvellous progress of science, business, industry and finance. The Chesapeake and Ohio Railway, I may add, would be proud to extend the superb facilities of our Greenbrier Hotel for such a Constitutional Convention.

"We have neglected George Washington's example and advice. The Father of our Country warned us against entangling alliances. He reiterated, again and again, that we should never let our foreign policies be influenced by prejudices against any other nation. We have flagrantly disregarded these two pieces of sound advice We are now inextricably entangled with one-third of the nations of the world. We are angling for alliances with another third through a lavish foreign aid programme. Finally, we are permitting prejudice to lead us into bitter wrangling with the remaining third. As Walter Lippmann wrote a few days ago, the ghost writers of the State Department and the Defence Department cannot compose a letter or issue a statement concerning any part of the Communist world without employing vulgar and opprobrious epithets.

"These policies that flout the advice of George Washington are burying us under a crushing burden of taxation. If they are allowed to go to the length of flaring into open war, our people will be annihilated and everything that industry and science have created will be utterly destroyed. If the wise man who founded this transportation system and started his country on the road to greatness were alive today, he would move vigorously to restore us to common sense and wisdom.

"For my peroration, may I borrow a couple of lines from Wordsworth. 'Washington! thou shouldst be living at this hour: America hath need of thee.'"

Walter J. Touhy, president of C & O, told the shareowners: "As we enter the 1960s, C & O is financially strong, physically healthy and fully prepared to get its share of business.

"A magazine for investors points out that in the last ten years, the dividend rate of C & O has been raised three times. The present $4.00-a-year rate is in its fourth year and with every indication of its continued stability. I concur in this evaluation of the railroad and I have the strongest faith that the trend of the past will continue into a bright and exciting future."

Vice presidents of the company reported to the shareowners on the progress and outlook of the railroad's activities. Following are extracts from their reports:

C & O's working capital increased more than $6 million in 1959, standing at $60 million at year's end. The debt ratio—the proportion of long-term debt to total capital—is the lowest in thirteen years.

Merchandise traffic revenues in 1960 should surpass the revenues of almost $161 million in 1959. Revenues for the first four months of 1960 were two million dollars more than those for the same period in 1959.

C & O's revenues from coal transportation in 1959 of nearly $162 million were the highest in the railroad industry. Revenues for the first four months of 1960 were $52 million, about the same as those for the same period in 1959. However, the good outlook for coal movements to users in the United States and Canada should give C & O an increase in carloads through 1960.

Cost reduction has produced savings in excess of $42 million in the last six years. At the same time C & O's motive power is modern and well maintained and there is no stronger roadbed or track anywhere. C & O continues to apply the advances of science to the operations of the railroad. For example by the end of 1960, more than 2,000 miles of heaviest-travelled main line will be operated by electronic traffic control. Computerisation is also developing new facts and methods to assist the company's growth.

A total of 8,209,893 shares were entitled to vote at the meeting. Represented in person or by proxy were 7,157,300 shares, all of them voted in favour of the election of the present board: Cyrus S. Eaton, chairman of the board; Walter J. Touhy, president; Herbert Fitzpatrick, senior partner, Fitzpatrick, Marshall, Huddleston & Bolen, attorneys, Huntingdon, W. Va.; Robert J. Bulkley, senior partner, Bulkley, Butler, Rini & Schweid, attorneys, Cleveland, Ohio; Cyrus S. Eaton, Jr., president, Chertsey Corporation, Cleveland, Ohio; Barnum L. Colton, president, National Bank of Washington, Washington, DC; Fay A. LeFevre, chairman of the board of governors, Cleveland Clinic, Cleveland, Ohio; Roger J. Ferger, president and publisher, the Cincinnati Enquirer, Cincinnati, Ohio; M. S. Fotheringham, president and general manager, Steep Rock Iron Mines Limited, Steep Rock Lake, Ontario; and Erwin H. Will, chairman of the board and chief executive officer, Virginia Electric Power Corporation, Richmond, Va.

ASSOCIATED NEWSPAPERS LIMITED

LORD ROTHERMERE'S STATEMENT

The fifty-fifth Annual General Meeting of Associated Newspapers Limited, will be held on Thursday, July 14, 1960, in the Memorial Hall, Farringdon Street, London, EC4. The following is from the statement by the Chairman:

The year has seen a steady progress in the development of your Company. This has been achieved despite the difficulties caused through the printers' strike, which took place last summer.

The strike, which lasted seven weeks, was expensive to all newspapers. It caused considerable losses to our provincial newspaper interests. The national press was affected also, because the strike spread to the ink manufacturers. The national newspapers were able to keep going only by restricting the number of pages and importing ink from France. Since the end of the strike much of the loss has been regained because of increased advertising revenue.

Because of a general intensification of competition within the industry, and a continued rise in costs, I expect profits from our national newspapers to fall in the present year. To some extent this is likely to be offset by increased revenue from our other interests. These other interests are becoming widespread and with expansion continuing, a further decentralisation of management will be of advantage.

ACCOUNTS

The accounts, this year, are presented to you in a new form. We hope that you will find them more attractive and readable than in the past. The profit on trading at £2,313,138 is slightly up on last year. The lower profits on some of our national and provincial newspapers, for the reasons which I have explained already, were counter-balanced by profits of subsidiaries acquired during the year.

The Anglo-Newfoundland Development Company has increased its dividends by 50 per cent, which rate should be held without difficulty. Southern Television, in which your Company has a 37½ per cent interest, has started paying dividends. Our interests in television in Australia already show a substantial return.

There is a credit from the winding-up of the Newsprint Supply Company and its associate Newsprint Supply (Trustees) Ltd. You will see that, as a result of all these matters, the Group profit before taxation at £3,184,802 is £400,000 up on last year.

The charge for taxation benefits to a greater extent from the double tax credits allowed in respect of the increased overseas dividends.

Turning now to the Consolidated Balance Sheet, you will notice the following points. Fixed assets have increased by virtue of the inclusion of assets of West Country Publications, the purchase of which our Group financed. The increase in Trade Investments reflects the further interest in Southern Television and in Australian television. There are other substantial projects under consideration in which we may invest during the current year.

You will also see that we have repaid the £500,000 3¼ per cent Unsecured Loan Stock which was dated May 1, 1959.

Both Balance Sheets show a strong position.

DAILY MAIL

Competition has never been greater between the National Dailies. I am glad to be able to tell you that the sale of the *Daily Mail* under these conditions has been maintained, with advertisement revenue reaching the highest peak in its history.

We are making every effort during the current year to attract new readers by producing through sound and straightforward journalism a lively newspaper which consistently provides the reader with a range of accurate news and well-informed topics.

THE EVENING NEWS

The Evening News, carrying on its policy of strong family appeal, continues to go from strength to strength. It has long been the world's largest selling evening paper, and today sells nearly as many as its two rivals put together. The demand for space from our advertisers increased by more than 24 per cent over the previous year.

SUNDAY DISPATCH

The circulation of the *Sunday Dispatch* remains steady with an encouraging tendency towards an increase. Now that the quality of the editorial content of the paper is becoming more widely recognised, there is evidence that advertisers appreciate the tone of the *Sunday Dispatch* and the competitive rates it offers them.

DAILY SKETCH

Having consolidated its sale position at the end of December at rather over 1,100,000 copies a day, the *Daily Sketch* has shown a steady increase on this figure during the last three months of the financial year.

The paper's vigorous campaigning policy has attracted widespread national comment among readers and on television and radio. We believe that the present formula will command a steadily growing readership.

WEEKEND

It was decided late in 1959 that *Weekend* should be developed as a magazine appealing to every member of the family. In its new form it has made an excellent recovery and the sale is on the increase. *Weekend's* appeal to advertisers therefore is a growing one, particularly as it can offer full colour gravure advertisements at a highly competitive rate.

PROVINCIAL NEWSPAPERS

Our provincial newspaper subsidiaries were, as mentioned previously, affected by the printers' strike. I am very glad to state that throughout the whole period of the strike continuity of production was achieved without break by each of our daily and evening newspapers.

I would emphasise again that the newspapers owned by these subsidiaries are run as local newspapers independent of London editorial control, and serving the interests of the local community with both local and national news and announcements. There is no substitute for your local newspaper.

WHESSOE LIMITED

FUTURE VIEWED WITH CONFIDENCE

MR C. M. SPIELMAN ON DIVERSIFICATION PROGRAMME

The Fortieth Annual General Meeting of Whessoe Limited will be held on July 12th at 25 Victoria Street, London, S.W.

The following is the review of the chairman, Mr C. M. Spielman, O.B.E., M.C., B.A., M.I.C.E., M.I.Struct.E., which has been circulated with the report and accounts:

The year has been one of considerable difficulty for manufacturers of capital plant of our type. Demand has decreased whilst productive capacity has increased. Severe competition has resulted, leading to declining price levels. We, of course, are not alone in experiencing this change of climate and our competitors all over the world have been similarly affected. I believe, however, that we are better equipped than most to face a difficult future with confidence.

ACCOUNTS

The profit for the year after all deductions, other than taxation, has amounted to £990,130 against last year's record figure of £1,229,338, and the profit less tax to £440,130 against £629,338 last year. Whilst the volume of production for the year has been similar to that of the previous year, the proportion completed has been smaller and this has been the main cause of the drop in profit. As has been our practice, no profit has been brought in on uncompleted work except for a further £40,000 on the long-term contract on which we brought in £40,000 in each of the last two years, making £120,000 in all.

Despite the lower value of orders received, gross work in progress has increased from £6,054,416 to £6,881,827, the profit on which, other than the £120,000 referred to above, remains to emerge in the future. However, a considerable proportion of the orders on which work is now in hand was taken with very lean profit margins so that it is not to be expected that the profit level of recent years can be maintained.

Capital expenditure although less than in the two preceding years has been considerable. Nevertheless our liquid position has further improved, the Bank balance and short term investments having increased from £586,719 to £958,078. A large proportion of this sum may, however, be needed for developments we propose.

The Board has given careful thought to the level of distribution and, in view of the good cover, recommends that, despite the fall in profit, the final dividend on the ordinary stock should be maintained at 22½ per cent, again making a total for the year of 27½ per cent.

PROSPECTS

It appears probable that productive capacity, both at home and abroad, for our traditional products will continue to be in excess of demand. We have therefore been giving much attention to widening the range of our products and to introducing new ones of advanced design and manufacturing technique which we think will find markets. To this end we have made arrangements with specialist firms in America and Europe with a view to supplementing our present range. We also intend to expand our production facilities for products for which we foresee a growing demand. We are arranging also for an expansion in our output of heat exchangers, in which field we already hold a prominent position. Market prospects appear good for Shand & Jurs fittings and instruments for storage tanks and ocean tankers; and we plan to increase their production at our Works and to establish manufacture in France.

Although I have had to warn shareholders to be prepared for declining profits, I would repeat that technically our Company has never been better equipped. Our products and services are held in high regard by the industries we serve, and I have no doubt that our strong financial position together with our initiative and ability will enable us to diversify both our products and fields of activity. I have therefore confidence that we are well placed to meet the challenge of the new trading conditions.

PERSONNEL

The deterioration of the markets in which we operate has naturally caused reduced activity in some departments in the Works at Darlington and at our erection sites, leading to reduced earnings for many of our manual workers. This situation has been a matter of considerable regret to the management, but that it has been accepted with understanding is a great tribute to the wonderful spirit that exists in our Company.

The difficult trading conditions have, on the other hand, subjected both management and staff to intense pressure and strain, greater indeed than anything I can recall, and I cannot speak too highly of the admirable way in which they have tackled their work and problems.

To all Whessoe employees—management, staff and manual workers—our grateful thanks are due.

RETIREMENT OF SECRETARY

I cannot close this Review without making reference to the high regard in which all of us hold Mr T. Heslop who retired on March 31st from the post of Secretary, which he has held for 22 years. His successor, whom we welcome to Whessoe, is Mr A. W. Wagstaff. In Mr Heslop the Company has had as Secretary a man of unusual ability, and one who has exercised an admirable influence on all those with whom he came into contact. I am glad to say that he has agreed, following his retirement, to remain a member of our Board so that we shall continue to have the benefit of his experience and his counsel.

WESTERN SELECTION AND DEVELOPMENT

The thirtieth annual general meeting of Western Selection and Development Co., Ltd., was held on June 20th in London.

Mr C. J. Burns, Chairman, presided, and the following is an extract from his circulated Statement:

The profit for the year ended September 30, 1959, £133,867, representing an increase of £38,739 over that for the previous year, was the result of improved stock market conditions and satisfactory operating results from the Ghana mines which still form a substantial part of our investments. The market value of our quoted securities at September 30, 1959, was £841,470 an appreciation over book cost of £322,615.

The improved results for the year under review do, perhaps, justify a slightly increased return to Members, but taking into consideration the stage reached in the Company's Canadian investment, a similar distribution i.e. 8 per cent less tax is recommended. Your Board have kept in mind the finance required to continue operations in Canada and the necessity for retaining sufficient resources and flexibility to carry through all projected programmes.

Of the gold mining companies in Ghana in which we are interested both Ariston Gold Mines (1929) Limited and Ghana Main Reef Limited have returned profitable results commensurate with expectations. Amalgamated Banket Areas Limited, whilst at the moment passing through a highly expensive and most necessary development stage, can view the future with greater confidence, thanks to the generous assistance given to it by the Ghana Government. Bremang Gold Dredging Company Limited has completed its final dredge moves and from now on can look forward to dredging operations unhampered by any major capital expenditure.

The results from Ghana are likely to show even greater returns in the future, providing this Company with due recompense for its financial help and co-operation in past years.

For the past few years our Nigerian investments have been very much in the background, curtailed operations of the tin mining companies reducing the return that might have been expected on the Company's investments. With the recent relaxation of tin quotas we can expect improved returns from our Nigerian investments.

The Company's operations in Canada covering so wide an area require a development stage commensurate with the size of operation.

Your Company's affairs are now in a most interesting stage. In the past, investments in Ghana were considered to be a liability due to the uncertain future of that part of the world. In fact, over the past two years, our investments in Ghana by reference to stock exchange quotation have been strengthened rather than weakened. At the same time our interests in Canada have not yet progressed to the stage where they can contribute to the profitability of the Company. At the moment they must be considered purely as prospecting expenditure and the future must be left to results. Nevertheless, within the framework of a mining finance company your Company has progressed steadily, and given a reasonable return from even one section of the Canadian investments, sufficient resources will be available for even greater expansion.

The report and accounts were adopted.

C. C. WAKEFIELD & COMPANY LIMITED

CHANGE OF NAME TO CASTROL LIMITED PROPOSED

GROUP SALES AND TRADING PROFITS AGAIN A RECORD

MR L. W. FARROW'S REVIEW

The forty-third Annual General Meeting of C. C. Wakefield & Company Limited will be held on July 15th at Castrol House, Marylebone Road, NW1.

In his statement, which has been circulated with the report and accounts for the year ended December 31, 1959, Mr L. W. Farrow, CBE, the chairman, said: In November, 1959, the Head Offices of the Company and certain of its subsidiaries were moved to the new Headquarters of the Group, Castrol House, Marylebone Road, NW1. This building, which is a new London landmark and has aroused considerable interest, was officially opened by the Right Honourable Ernest Marples, MP, Minister of Transport, on February 22, 1960, and on March 3, 1960, we had the honour of receiving Her Majesty Queen Elizabeth the Queen Mother, on an informal visit.

Since the close of the year under review the Company has acquired the entire Share Capital of De-Corrosion Services (Norwest) Limited, Bootle, Lancashire, which specialises in the removal of unwanted deposits on metal. This new Subsidiary, which has been renamed Metal Cleaning Limited, performs a valuable service to industry and its business, though modest at present, has good potential for future development.

GROUP TRADING

It gives me pleasure to report that in 1959, our Diamond Jubilee Year, the Group achieved results which surpassed the records of the previous year. A higher volume of sales throughout the world than ever before in the history of the Group resulted in a trading profit of £4,699,136, an increase of £554,829 compared with 1958.

Notwithstanding the highly competitive marketing conditions under which the Group operates, sales of Castrol reached a record level and this principal product of your Company continued to enjoy the largest share of the United Kingdom market for branded motor oils. It is interesting to record that a recent independent survey showed that more British motorists asked for Castrol by name than for all other branded motor oils put together. There is also evidence that the vast majority of the motoring public in the United Kingdom prefer to be offered a choice of brands of lubricants at filling stations and garages. I am pleased to remind Stockholders that such a policy of non-exclusive trading, which has your Company's full support, is being applied on the new Motorways at the direction of the Ministry of Transport.

Some Stockholders may not be aware that the Group markets a range of high pressure and other lubricating equipment and appliances under the brand name Lubrequipment, manufactured by our engineering subsidiary, John B. Pillin Limited. I am happy to say that sales of Lubrequipment in 1959 were the highest yet recorded.

INDUSTRIAL OILS

For our Subsidiary Companies in the industrial field, Wakefield-Dick Industrial Oils Limited and Fletcher Miller Limited, 1959 proved to be another year of successful trading.

Record sales were achieved by each of these companies, but a reduction in the margins between cost and selling prices led to the aggregate profits returned being substantially the same as in the previous year.

The combined sales volume of these two companies formed a significant proportion of the Group's total gallonage in the United Kingdom and the profits derived from their operations in 1959 contributed materially to the record Group results under review.

NEW SYNTHETIC LUBRICANT FOR GAS TURBINE ENGINES

In my Statement last year I referred to the successful development, following almost ten years of research, of a unique synthetic fluid for the lubrication of gas turbine engines. Experience has proved that this fluid represents the biggest advance yet made in the lubrication of highly stressed turbine engines. I am pleased to inform you that after exhaustive tests, both on the bench and in practical flight trials, Castrol 98, as this product is now known, has been approved by the Air Registration Board and Rolls-Royce Limited for use in Dart and Avon engines. Arising from these approvals, your Company has been supplying British European Airways with Castrol 98 for all their Viscount and Comet aircraft since January 1, 1960.

A world monopoly in the supply of synthetic lubricants for British jets has been held by a major petrol company for ten years. Stockholders will share our pride that we, a British Company, are the first to break this monopoly.

Steps are being taken to promote the use of this lubricant by other airlines throughout the world.

CHEMICAL PLANT

With the completion of the Company's new chemical plant at Stanlow, its output for the year rose by more than 50 per cent in comparison with 1958.

In addition to meeting the Group's current requirements of chemical additives this plant manufactures supplies for resale by Edwin Cooper & Company Limited. Increased sales and profits were achieved by this Subsidiary Company in 1959 and these results encourage us to explore avenues for further expansion in this direction.

RESEARCH AND PRODUCTION

Research is an essential feature of your Company's activities and has played a leading part in the attainment of its eminent position in the field of lubrication.

Your Directors consider that the present Research Laboratories at the Company's works at Hayes, Middlesex, do not allow sufficient space for anticipated future progressive development and they have decided that a separate Research Centre shall be established. In addition to being fitted with the most up-to-date scientific equipment the new laboratories will provide ideal working conditions for our Research Staff. This decision will also facilitate an expansion of the works at Hayes, which has become necessary owing to increasing demands on its productive capacity.

In order further to cater for the future productive needs of the Group, a freehold site adjacent to the Company's works at Rotherhithe, including two wharves, has been acquired. Three acres of land at Blantyre, Lanarkshire, have also been purchased as an extension to the existing premises of a subsidiary, with the intention that the Company's present installation at Glasgow, where expansion is not possible, shall be disposed of and the Group's productive resources in Scotland concentrated at Blantyre.

OVERSEAS TRADING

I am happy to inform you that 1959 proved to be another year of progressive trading overseas. Total sales abroad were greater than ever before and the overall profits obtained from this business exceeded those of the previous year by a substantial margin.

Exceptionally difficult trading conditions in certain overseas markets continued to render our operations in those countries unremunerative. The problems confronting our organisations in the few territories concerned are constantly engaging the attention of your Directors. In one such market, namely East Africa, it has been decided to revert to trading through Agents and to close down the Branch established there in 1954.

During the year, further capital was invested in several Subsidiary Companies overseas where this was considered desirable in the trading interests of the Group.

Following a visit by two of the Parent Company's Management Directors to Australia, the Company's largest overseas market, and New Zealand, it has been decided to embark upon an important programme of capital development in those countries, where our present installations are no longer adequate to cope with an expansion of business. This is a three-year project involving the acquisition of land in a number of States and the erection thereon of offices, works and bulk storage facilities, including ocean terminals. Part of the cost of this development will be met out of the proceeds of the sale of our existing properties in Australia.

ACCOUNTS AND DIVIDENDS

The Consolidated Net Profits of the Group amounted to £1,819,431 (1958, £1,459,412).

Difference on Exchange amounted to £86,741 (1958, £100,617), due principally to the further decline in the free market rate for the Brazilian Cruzeiro.

A sum of £593,269 has been set aside for Depreciation. This exceeds the corresponding figure for 1958 by reason of additions to the Fixed Assets of the Group.

Having regard for the higher profits achieved, your Directors recommend the payment of a Final Dividend on the Ordinary Capital at the rate of 20 per cent, less income tax, making a total for the year of 27½ per cent, as compared with 22½ per cent paid in respect of 1958.

Preference and Ordinary Dividends absorb a total net amount of £637,884 (1958, £516,450). Net transfers to Reserves in the Group Accounts amount to £1,086,079 which includes £1,029,032 to General Reserve (Parent Company £1 million). After these appropriations the Consolidated Profit and Loss Account shows a carry forward balance of £889,295 (1958, £793,827).

Current Assets of £15,932,964 exceed Current Liabilities and Provisions by £8,577,085, an increase of £1,046,209 when compared with the figure at the end of 1958. This is after having paid approximately £250,000 in discharge of the balance of the Company's liability to the vendors of Fletcher Miller Limited.

On December 31, 1959, total Stockholders' interests amounted to £12,519,218, an increase of £1,208,254 over the previous year.

I am sure that Stockholders will agree that the financial results for 1959 reflect another year of satisfactory progress and a further strengthening of the Group's financial position.

EXTRAORDINARY GENERAL MEETING

Ordinary and Preference Stockholders will find enclosed with this Report a Notice of an Extraordinary General Meeting to be held immediately following the Annual General Meeting. The business to be conducted at this meeting is referred to more particularly in the circular accompanying the Notice and includes Resolutions dealing with your Board's proposals to make a one-for-two scrip issue of Ordinary Shares, to change the name of the Company to Castrol Limited and to alter certain of the Company's Articles of Association.

PROSPECTS

Group sales during the first four months of the current year show an encouraging increase over the corresponding period of 1959, but there are indications that costs generally will be higher this year.

Subject to the foregoing comment, if the present sales trend is maintained it is not unreasonable to look forward to another year of satisfactory trading progress in 1960.

MANAGEMENT AND STAFF

I am sure that Stockholders will wish to join me in an expression of appreciation and thanks to our Managing Director, Mr L. M. Broadway, his colleague Management Directors and all members of the Staff of the Group at home and overseas, whatever their duties or degree of responsibility, for their endeavours throughout the year.

The quality of its Staff is one of the Group's most valuable assets and every individual member has made an important contribution to the success achieved during 1959.

WILMOT BREEDEN (Holdings) LTD

The following information is condensed from the Annual Report for 1959 considered at the Eleventh Annual General Meeting held in Birmingham on 22nd June, 1960.

	1959	1958
Net Income from all Sources	1,654,552	1,314,998
Taxation	972,678	782,668
	£681,874	£532,330
Group Net Assets	£8,059,255	£6,492,948
Ordinary Share Capital	£3,150,000	£3,150,000
Ordinary Dividend: Rate	15%	13%
Times covered	2.6	2.5

The Group has 9,000 shareholders and 9,000 employees.

Motor Car Division
The rise in demand for car products has imposed considerable strains on productive capacity. Steps have been taken to deal with the short term problem and long term plans are under consideration.

France
A controlling interest has been acquired in Autocoussin-Dura S.A., the largest manufacturer of car locks and window regulators in France. Sales are likely to exceed £4,000,000 in 1961 — an increase of 100% over a period of twelve months. Practically every French car in quantity production will incorporate components of Wilmot Breeden design, most of which will be manufactured by our French undertaking. Expansion is taking place at St. Dié in the Vosges, which is ideally situated, in the centre of the European Common Market.

Flight and Special Products
Demands from the aircraft industry are increasing. New products comprise "Velflo" circular duct bends for air conditioning and pneumatic conveying installations, and "Truflo" light wall stainless steel pipe bends and fittings for petroleum, chemical, nuclear and industrial process plant.

Hydraulics
Orders are now coming in at a record rate for tipping gears and vehicle bodies and for the new range of Telesig screw pumps. Additional factory space is being provided at Cheltenham for the manufacture of increased quantities of these products.

Electronics
Sales by The Ferrograph Company of in-shore and off-shore marine echo sounders have exceeded expectations. The Ferrograph recorder has had another successful year. The Wayne Kerr Company is introducing several important new electronic measuring instruments.

Australia
The profits of the Australian company were a record. Plans for a major expansion at Melbourne are well advanced.

Principal Operating Companies in the Group — *Wilmot Breeden Ltd., Telehoist Ltd., The Ferrograph Co. Ltd., The Wayne Kerr Co. Ltd., Autocoussin-Dura S.A., Wilmot Breeden (Australia) Pty. Ltd.*

THRELFALL'S BREWERY

RECORD TRADING RESULTS

MR F. CORNWALL ON WISDOM OF BOARD'S POLICY

The seventy-third annual general meeting of Threlfall's Brewery Company, Limited, was held on June 16th in London.

Mr F. Cornwall (Chairman and Managing Director) presided and, in the course of his speech, said: I am pleased to report that the Profit from trading and other income of £1,260,773 shows an increase compared with last year of £193,940, after providing for a loss of approximately £40,000 on stocks held when the Chancellor of the Exchequer reduced the Duty in the 1959 Budget. I am satisfied that the reduction in prices, coupled with the very excellent summer last year, accounted for a substantial proportion of the increased Profit.

The Net Profit of £567,119 after taxation and making the requisite adjustments in respect of prior years' taxation provisions, compared with that of 1959, shows an increase of £122,057. Once again, these figures constitute a record in the Company's history, and enable the Board to recommend an increase of 2 per cent in the Ordinary Stock Dividend, making 24 per cent for the year as compared with 22 per cent last year.

Our Improvement Programme continues by the erection of new Hotels and modernising many others into first-class establishments. Over 30 major alterations are at present being dealt with, and when these are completed, we intend continuing this activity; our programme up to the end of 1963 having already been settled. All this, of course, requires considerable available funds. The result of the expenditure on the properties is now proving the wisdom of our policy, and we are encouraged by the knowledge that those now completed show a satisfactory return, and the improvements effected are appreciated by our patrons.

As no doubt you are aware, it is anticipated that at an early date the present Licensing Act will be subject to revision, the result of which we hope will remove some of the restrictive and irritating regulations applicable at present. The revision of the Act is very much overdue.

Short of anything unforeseen arising, my colleagues and I view the future with the utmost confidence, and will be disappointed if the results of the current financial year do not once again create a new record.

PROPOSED SCRIP ISSUE

Following these proceedings, an Extraordinary General Meeting will be held. Briefly, the Resolutions to be submitted are to increase the Authorised Capital of the Company to £3,750,000; the capitalisation of certain Reserves and part of the sum standing to the credit of Profit and Loss Account, amounting in all to £787,500. The distribution of that sum will be amongst the Holders of Ordinary Stock in the proportion of one fully paid £1 Ordinary Share for every £3 of Ordinary Stock held by them on May 12th last. The effect of this distribution, if approved, will bring the Issued Capital more in line with the assets of the Company and, in the opinion of your Board, the increase in the Issued Capital involved in these proposals is amply justified.

The report was adopted, and at a subsequent extraordinary general meeting the proposed increase of capital and scrip issue was approved.

ULTRAMAR COMPANY LIMITED

CONSIDERABLE PROGRESS IN CONVERSION TO AN INTEGRATED GROUP OF COMPANIES

FINANCING DEVELOPMENT PLANS

SIR EDWIN HERBERT ON GREAT OPPORTUNITIES AHEAD

The twenty-fourth Annual General Meeting of Ultramar Company Limited was held on June 17, 1960 at Winchester House, Old Broad Street, London, E.C.2.

Sir Edwin Herbert, KBE (the Chairman), who presided, said: We have had an eventful year since our last Annual General Meeting and have made considerable progress in turning ourselves from a Group primarily concerned in producing crude oil into an integrated Group of Companies.

REFINING AND MARKETING

Our Agreement to purchase the shares of the Panama Company has recently been carried out and we now own 100 per cent of the shares of that Company.

The Panama Refinery project is under active discussion with a potential partner. The site for the Refinery at Portobello, Republic of Panama, is being cleared. I am sure that participation in this Refinery will be good business for the Ultramar Group.

Golden Eagle, which is wholly owned by the Panama Company, continues to expand its marketing activities on the west coast of the United States in anticipation of the expansion of its Los Angeles Refinery which at present has a capacity of 9,000 barrels per day. Engineering and economic studies for the expansion of that Refinery are being completed.

We announced through the Press early in May that we had formed a new subsidiary company Golden Eagle Refining Company of Canada, to refine crude oil and market products in Eastern Canada, and that an Agreement had been signed with the Newfoundland Government for the construction of a Refinery of at least 5,000 barrels per day. Work on the site has commenced and we hope to have the Refinery on stream early in 1961.

Venezuelan crude oil of our subsidiary company Caracas Petroleum will be imported for the Newfoundland Refinery. We believe that there is an important future in this project. The Newfoundland Government has agreed to purchase its petroleum requirements from Golden Eagle of Canada for a period of 20 years. The consumption of oil products in 'England's oldest colony and Canada's newest province' has been growing at the exceptionally high figure of 15 per cent per annum. Newfoundland has historically intimate connections with this country and we are proud to think that our group should have been entrusted with a development which has an important bearing on the economy of Newfoundland.

I am happy to tell you that Caracas Petroleum has made impressive progress in its marketing activities and has succeeded in marketing its Venezuelan production. It is doing that on a short term basis pending the realisation of plans for refining and marketing based on Panama, the west coast of the USA and Eastern Canada.

I told you last year that our objective was integration. I am convinced that is the right policy for us. Though Caracas Petroleum is disposing of its crude oil production the prices realised are insufficiently attractive to warrant at the present time a vigorous programme of exploration and development in Venezuela, though drilling will have to be resumed if production is to be maintained.

VENEZUELAN INTERESTS

I have dealt firstly with the refining and marketing end of our Group of Companies. However it is important to realise that the major part of our interests is still in Venezuela in the form of Oil Concessions, Reserves of Oil and Gas, and the wherewithal to produce and transport those Reserves. There are also our Venezuelan Royalty Interests which yielded us a Net Income, after taxation, of $1,825,000 for 1959.

Caracas Petroleum's share of Venezuelan crude oil production is currently running at about 15,000 barrels per day. The average for 1959 was a little over 13,000 barrels per day. The increase in production is due mainly to the new field Oritu 307 which has only recently been tied into the Oritupano pipeline system. Mercedes Gas Sales—in which Caracas Petroleum has a 50 per cent interest—are at a record level of 72 million cubic feet per day.

There remains much exploration and development work to be carried out in the Venezuelan Oil Concessions in which Caracas Petroleum is interested.

I mentioned to you last year the oil discovery well in the Dakoa 20 Area, south of the Chain Lots, and the Sanvi oil discovery well. There are the Ipire fields which at the present time have a potential of 3,000 barrels per day but which are shut in for lack of a pipeline. There are also other interesting prospects in the Chain Lots and in the Oritupano Area.

I believe we have great opportunities ahead of us. The oil industry generally is passing through a difficult phase. The enormous expenditure on drilling over the last decade has led to discoveries which will look after world demand for some years to come. But oil remains one of the world's basic necessities and demand is growing apace. Sooner or later, demand will catch up with supply. Nevertheless the Ultramar Group must put itself into a position to have assured outlets for its production. I do not disguise from you that the transitional period presents difficulties, financial and operational. But these difficulties are being energetically dealt with and I feel sure that we shall emerge in a broader based and better position. It is important that we equip ourselves financially to face our tasks and take advantage of our opportunities. Our immediate need is in respect of the Newfoundland project. We have already arranged the necessary dollar permits with the Bank of England to meet the costs of construction.

NEW FINANCE

We have realised that our plans for integration were likely to result in the need to raise additional funds. I referred to this possibility at the last Annual General Meeting. In order that we may proceed with our plans in the refining and marketing fields and adopt a more vigorous programme for establishing, developing and producing oil reserves, it is necessary that we should raise new finance to supplement our revenue from oil and gas production and royalties, and loans to be arranged through Equipment Manufacturers. We propose to raise £3¼ million by way of an issue of Convertible Loan Stock which will be offered to Ordinary Stockholders. Particulars of the issue are being worked out and will be communicated to you shortly. It is our hope that we shall be able to maintain Capital Surplus Distributions to Stockholders during the period of fulfilment of our plans.

FINANCIAL RESULTS FOR 1959

The Report and Accounts deal fully with the financial results for 1959. Mercedes made a net profit of $1,930,000 after taxation and after charging depreciation and depletion of over $6 million. In prior years Mercedes investment in Properties, Plant and Equipment financed from internal resources ran at a high level. In 1959 these expenditures were less by some $5 million than they were in 1958. The actual cash surplus from Mercedes operations in 1959 amounted to over $7 million, which enabled the parent companies to withdraw a like sum in the form of repayment of advances. We expect Mercedes to operate at a profit in 1960 and to continue repayment of advances though at a reduced rate. Mercedes has so far since December 31, 1959, repaid the Parent Companies $2 million in cash.

Turning now to the financial results of Ultramar and Subsidiaries net profit attributable to the Ultramar Group was £1,845,000. This profit includes an exceptional dividend from Mercedes, of £1,995,000 which was declared out of profits earned over a period of years. A transfer of £893,000 has been made out of the year's profits and placed to Capital Expenditure Reserve.

The Consolidated Balance Sheet of Ultramar and its Subsidiary Companies shows that the net assets of the Group have a book value of £12¼ million. Included in these assets are the remaining advances owing to us by Mercedes and Manapire totalling £1,794,000 and advances of £1,864,000 made to the Golden Eagle and Panama Companies.

The Bank Loans of £1,750,000 shown in the Consolidated Balance Sheet are repayable in quarterly instalments over a period extending to April 1964. Net Current Assets total £702,000 in addition to which there are US Treasury Bonds of £295,000 which will be released to us over a period of years.

The Capital Reserve Exchange Surplus stood at £1,529,000 and it is out of that Account we are again recommending the Capital Surplus Distribution of 1s. 6d. per 10s. Stock Unit which will take £497,000.

WESTERN CANADA AND UNITED STATES

Ultramar has continued to increase its investment in Western Canada through its half ownership of Canpet, the other half of which is owned in equal shares by The Gold Fields American Development Co. Ltd. and Apex (Trinidad) Oilfields Ltd. The total capital investment in Canpet, half of which has been contributed by Ultramar, now stands at $5 million and we have agreed with our partners to continue to increase investment in Canadian oil and gas exploration, development and production at least for another two years. We expect that Canpet's oil production will rise to an average of 1,300 barrels per day during the last quarter of this year despite severe production and marketing prorationing. Production at the end of 1959 was 900 barrels per day.

Caracas Petroleum US is continuing to participate in a modest programme of drilling mainly for gas in the State of Texas. Our total investment is $1,700,000. We expect that our share of gas production will reach 5 million cubic feet per day by the end of the year. Production at the end of 1959 was 2 million cubic feet per day.

Mr C. L. Nelson has been appointed Managing Director of the Company and Mr John M. Shaheen has been appointed a Director. These appointments are very much welcomed in our Group.

The Report and Accounts were adopted and the proposed fifth Capital Surplus Distribution of 1s. 6d. per 10s. Stock Unit was approved.

HENDERSON'S TRANSVAAL ESTATES

AN EVENTFUL YEAR

The forty-eighth annual general meeting of Henderson's Transvaal Estates, Limited will be held on July 13th in London.

The following is an extract from the circulated statement of the chairman, Sir Joseph Ball, KBE:

The year which ended in March last proved to be an eventful one for your Company. A capitalisation issue on a one-for-seven basis was made to members; substantial entitlements to shares in the new Leslie and Bracken gold mines were taken up at par by one of our subsidiaries; Henderson's itself acquired control of Witbank Consolidated Coal Mines Limited; and a record dividend on the increased capital has been declared for the year.

The past year was a particularly good one for investment transactions and the group profit under this heading increased by nearly £45,000. The group's investments, the present market value of which can be put at £1,770,000 (as compared with a book value of £1,090,000), are well spread, both on a geographical basis and on an industrial basis.

It will be seen from the Company's own profit and loss account that the year's dividends amounted to £146,000 gross, split into £47,000 for the interim of 4d. per 4s. share (8¾ per cent) and £99,000 for the final of 6½d. per share.

I feel confident that, in the absence of unforeseeable political disturbances having an impact on the mining industry, we should be able to maintain the present rate of dividend in the current year.

KOCKUMS MEKANISKA VERKSTADS AKTIEBOLAG

Malmö, Sweden
(Shipbuilding)

SATISFACTORY OUTPUT MAINTAINED

The Annual General Meeting of KOCKUMS MEKANISKA VERKSTADS AKTIEBOLAG was held in Malmö on April 27th and the following are details of the report presented by the Board of Directors:

SALES AND PRODUCTION

The generally rapidly expanding world economy did not improve the low position of the freight market to any considerable extent. Towards the end of the year, however, the tramp freight level for dry cargoes was somewhat raised as a result of livelier international trade. Even though scrapping of ships was more extensive than in previous years, the considerable additional complement of new shipping led to a continued increase in trade tonnage. Many vessels were permanently laid up.

Slightly increased demand for new tonnage, particularly for bulk carriers, was noticeable towards the end of the year. Competition in the world shipbuilding industry, which had expanded considerably in recent years and has now reached a disproportionate level, reduced shipbuilding prices to such an extent as to eliminate the profit margin in many cases. The shipping companies' demands for increased credit also rose considerably.

As a result of previously booked orders, full utilisation of the yard's facilities could be maintained. The demand for ship repairs and refitting was reduced considerably, but orders on hand for the carriage workshops will afford satisfactory employment during the coming year. To ensure more even employment in that department, investigations are being made into the possibility of further diversifying production.

Invoiced sales amounted to Kr.318 million, as against Kr.323 million for the previous year. The following seven merchant ships were delivered:

Name of ship	Tonnage dw
M/S "VIRIS"	21,880
M/S "VIRTALA"	21,900
M/T "LIDVARD"	19,950
M/T "SIRIUS"	24,550
T/T "F. H. KOCKUM"	35,900
T/T "TEXACO IOWA"	40,950
T/T "STANVAC HORIZON"	41,050

The destroyer "Hälsingland," the submarines "Bävern" and "Illern," and the last three motor-torpedo boats included in a larger order were delivered to the Swedish Navy.

LAND AND PLANT

A considerable part of the former oil harbour area was taken over during the year and plans for its future development are at present being drawn up. During the year a workshop for indoor welding of large ship sections was put into commission. Towards the end of the year, the extension of one of the slipways was completed and it can now accommodate vessels of up to about 90,000 tdw. Development of more efficient methods of storing and handling steel materials is under way.

PERSONNEL

An average of 4,320 workers and 1,257 other staff was employed during the year.

The Board of Directors propose that the 1959 profits of Kr.10.1 million which, together with the balance of Kr.3.35 million brought forward from the previous year, produced a total of Kr.13.45 million, be allocated as follows:

	Kr.
To Reserve fund	1,030,000
To Emergency fund	5,000,000
To Distribution of Kr.6 dividend on Preference Shares against Coupon No. 62 and on Ordinary Shares against Coupon No. 46	3,600,000
Carried forward	3,820,000
TOTAL	13,450,000

The report, the accounts, and the proposals put forward by the Board were adopted.

AMALGAMATED DENTAL COMPANY

ANOTHER YEAR OF SUCCESSFUL TRADING

The fifty-fifth annual general meeting of the Amalgamated Dental Co., Ltd., was held on June 17th in London, Mr Aiken Watson, QC, the chairman, presiding.

The following is an extract from his circulated statement:

Once again it is my privilege to report another year of successful trading.

In the course of my Statement to you last year I took occasion to review the industry particularly as it affected your Company. No significant changes have taken place in the interval to justify any departure from the views I then expressed.

The Borden "Airotor" which received such favourable publicity continues in steady demand despite the natural emergence of competing equipment with an apparent price advantage.

It is not generally realised that operative dentistry creates problems of fatigue for the operator which, if not guarded against, can have serious results. For some years your Company has been studying these matters and I hope that in my next Statement it may be possible to signpost another advance in the progress of the Company.

From time to time I have emphasised the importance to your Company of its marketing organisation at home and abroad. In this connection during the year your Company found it necessary to acquire a retail business in South Africa to protect the outlet for its products in that important market.

In the field of anaesthetic equipment, our hall-mark of quality coupled with the ingenuity of our designers, are assuring us of an increasing share in a growing market both at home and abroad.

The moves and countermoves in the European Trading scene continue to engage our attention. Until there is some clearer indication of a rapprochement or otherwise between the Six and the Seven it would be foolish to do more than prepare.

CURRENT YEAR'S PROSPECTS

Current trading is satisfactory. Granted no major set-backs, the prospects for the current

year indicate results comparable with the year under review.

While our export trade continues to represent no small part of our market, in some territories we have to contend with government sponsored credit from other exporting countries which, of course, we do not enjoy. While lengthy credit may be appropriate to capital goods we are unable to conceive it as healthy trading in dental products.

The sale of part of our holding in an American Associated Company, combined with the new trading arrangements with that Company, as explained in my recent Circular to Stockholders, is not expected adversely to affect the final position. It is intended to continue the practice of an interim distribution and there is every reason to hope that the distribution to Stockholders for the current year will compare not unfavourably with the year under review.

To the Management and Staff at home and abroad I offer in your name our warm thanks for sustained loyalty and high endeavour.

The report and accounts were unanimously adopted. At the Extraordinary General Meeting of the Company held earlier the same day, the reduction in capital, consequent upon the repayment of the First Preference Stock, the increase in capital to reinstate the authorised capital at £4,500,000, the re-designation of the existing 6 per cent Cumulative Second Preference Stock by the deletion of the word "Second" and the declaration of the capital dividend of 5s. for each £1 Ordinary Stock held, were all approved subject to the order of the Court confirming the reduction in capital for which application is being made forthwith.

REPFRANCE

75 avenue des Champs Elysées, Paris

The Ordinary General Meeting of REPFRANCE was held on May 20th, Monsieur Jean Picard presiding. The accounts for the trading year 1959 were approved and showed neither a profit nor loss balance after earmarking for amortisation 67,885,988 francs.

On the balance-sheet the portfolio is shown at a purchase price of 10,718,636,476 francs, and the advances to the prospecting companies as 859,734,254 francs; the net liquid assets of the Company represent 2,750 million francs.

Seven of the holdings of REPFRANCE are now productive, which allows the company to have an interest in the following fields:

	Production 1959	Forecast 1960	Interest of REPFRANCE %
PETROLEUM			
Hassi Messaoud	1,290,000 t.	6,500,000 t.	1·39
Coulommes	154,000 t.	250,000 t.	10·00
Alsace	45,800 t.	—	5·88
Chailly en Bière	23,000 t.	70,000 t.	4·57
Rharb (Morocco)	94,500 t.	—	1·77
Gabon	753,000 t.	850,000 t.	0·42
NATURAL GAS			
Lacq (purified gas)	1,300,000,000 cubic metres	—	0·16

In addition, REPFRANCE has an interest in the recent discoveries of the SNPA at Erg el Agreb and at El Gassi, to the extent of 3.94 per cent, and in that of the Compagnie d'Exploration Pétrolière at Ohanet 101, to the extent of 4.07 per cent.

ARTHUR BALFOUR & COMPANY

IMPROVED TREND OF TRADING

The sixty-first annual general meeting of Arthur Balfour & Company Limited was held on June 20th at Sheffield, The Right Honourable The Lord Riverdale of Sheffield, DL, JP (chairman and managing director) presiding.

The following is an extract from his circulated statement:

In the early months of the year 1959, trading was increasingly disappointing and turnover fell behind the comparable months of 1958. The improvement we had hoped for and anticipated commenced in August, and then was rapid so that the remaining months of the year showed marked recovery and enabled us to reach a turnover figure slightly ahead of 1958 as a whole.

Intense competition continued throughout this trading period with some overall effect on profit margins.

Our overseas subsidiaries, taken as a group contributed rather more in total than had been the case in the previous year.

The profits of the Group before taxation but after exchange adjustments stand at £329,921 and compare with £202,672. Taxation absorbs £162,733 as compared with £83,518.

Steady development and re-equipment was continued throughout 1959 but no major capital commitments were undertaken. Plans for further expansion and re-equipment are in preparation but have not reached a stage that warrants individual mention.

The Board recommend a final dividend of 6¼ per cent less income tax making a total distribution for the year of 9 per cent compared with 8 per cent for 1958.

THE COST FACTOR

Last year I referred to the proportion of our costs which was open to "irresponsible and wanton influences." The events of the year and the widespread publicity they have attracted need little emphasis from me in showing how real this factor can be. At the same time I want to emphasise with equal vigour that all this trouble should be unnecessary, and that with the co-operation of all concerned no such influences have handicapped the operations of your Company. Nevertheless, recent increases in wage rates and reduced hours of work both present a challenge to management in the endeavour to offset the effects and some rise in costs appears to be inevitable.

The early months of 1960 have shown a volume of operations and output which is satisfactory. Not all sections of the plant have been employed to capacity, and if load could be disposed more equally and to better advantage over the various producing divisions the effect would be very beneficial. Nevertheless, the total out-turn value is building up nicely, and how satisfactory it is to see the new Steel Plant justifying the expenditure and producing to its designed capacity.

The immediate outlook is satisfactory. There is every reasonable prospect that the remainder of 1960 will continue the present activity, and in the absence of unforeseen and adverse developments I can be optimistic and forecast the distinct possibility that the results for the current year will show an improvement over those for 1959.

The report was adopted.

GRAND CENTRAL INVESTMENT HOLDINGS

DIVIDEND INCREASED

The First Annual General Meeting of Grand Central Investment Holdings Limited was held on June 21st in London, Mr C. A. Meakin, the chairman, presiding.

The following is an extract from his circulated statement:

The profit for the year expressed in round figures, after deduction for depreciation and administration charges, amounted to £432,000 —this compared with the 1958 figure of £261,000 in the Grand Central (Ceylon) Rubber Estates Limited accounts. The board recommends a final dividend of 14 per cent, making 20 per cent for the year as opposed to a total distribution of 16 per cent in the previous season. The final dividend, however, is payable on the capital increased in February of this year.

The cost of production shows an increase, but I consider that this, which stands at under 1s. 3d. per pound and includes depreciation, replanting and London administration charges, can still be regarded as satisfactory.

Extremely adverse weather in some months of the year was largely responsible for the somewhat disappointing crop which was harvested.

All the estates continue to be in excellent order. Crop for the present year is coming in quite well and is showing an increase, albeit small, over 1959, amounting to the end of April to approximately 120,000 lb.

The report was adopted.

PHILIP HILL INVESTMENT TRUST

The twenty-eighth ordinary general meeting of Philip Hill Investment Trust Limited was held on June 20th in London, Sir Brian Mountain, Bart (the chairman) presiding.

The following is an extract from his circulated statement:

The year under review has been more than usually active for the whole Group and I hope you will agree with me that it has also been a successful one.

The gross income from dividends and interest of £1,091,382 (£855,612) includes an increased dividend from the subsidiary of £100,000 (£50,000).

Philip Hill, Higginson, Erlangers Limited has had another successful year and the consolidated profits before taxation amount to £943,325 (£673,645). Taxation required £458,230 (£356,340), leaving a net profit of £485,095 (£317,305).

Your Board intends to increase the issued Ordinary share capital of the Trust to £5 million by the issue to shareholders of a further 4,375,000 Ordinary shares of 5s. each at a price of 22s. 6d. per share. Your Board expects to be able to recommend dividends for the year to March 31, 1961, amounting to not less than 22½ per cent on the increased capital. The proceeds of the issue will be used to extend the company's portfolio of investments.

Your Board is confident that subject to unforeseen circumstances, the results of the current year will prove to be satisfactory.

The report and accounts were adopted.

SPICERS LIMITED

(Paper Makers, Paper Merchants and Manufacturing Stationers)

UPWARD TREND OF CURRENT PROFITS

The Seventy-second Annual General Meeting of Spicers Limited was held on June 22nd in London. The following is an extract from the circulated statement of the Chairman, Sir Richard E. Yeabsley, CBE, JP, FCA:

After charging taxation and crediting to Capital Reserve the profits attributable to minority shareholders, the Group profit is £430,197 compared with £287,726 last year. Your Directors recommend a final dividend of 7 per cent, making a total distribution for the year of 10 per cent (1958, 8 per cent).

The Group as a whole, at home and abroad, reaped the benefit in 1959 of technical and administrative improvements made in recent years. In this country conditions of trade improved following the removal of controls on hire purchase finance and easing of credit restrictions late in 1958, further stimulated by reduction of purchase tax and income tax in the 1959 Budget. Against ais, certain units, in particular our large Pper Merchanting section and also the convesion units, were seriously, if only temporarily affected by the strike in the printing and allied trades last summer.

In spite of a general increae in consumption of paper, supply still exceededdemand throughout the year and condition remained competitive.

After reviewing the Grup's world-wide activities, the Chairman commented on the sale of British Waxed Wrappags Limited to Wiggins, Teape for the sum € £3 million, and said: Already approximately £1 million has been used or committed an negotiations are currently proceeding on seveal large projects, all of which come broadly wibin the traditional activities of your Company. The purchase of Ihlee & Sankey Ltd., board and paper merchants, has already been anounced. Further announcements will be mae as and when substantial purchases are ompleted. Your Directors' present policy is therefore not to make any payment to Stockholders from the proceeds of the sale in the belef that the whole or a substantial part thereof will be profitably employed within the existin business or in additions thereto.

The Chairman then referrel to the negotiations for a European Free Trade association and stated: In so far as your Company is concerned, our conversion and paper-making interests are unlikely to be affected and as large and independent Merchants and Paper Distributors we have long been importers of paper and boards of all grades both from the Continent and other parts of the world. In this important section of our business we do not foresee at present any factors which should lead to a diminution of the volume of paper we distribute.

PROSPECTS

The profits for 1959 have shown an increase on those for 1958, which is due mainly to improvements and savings in costs made in the various units. The upward trend in the profits of the units retained in the Group was most marked in the last three months of the year and sales of those units for the first four months of 1960 have shown a significant increase. Group current profits are running at a higher rate than those for 1959. Your Directors are now of the opinion that, provided there is no recession in trade generally, the 1960 results will justify the maintenance of dividends for the current year at least at the 1959 total of 10 per cent.

The report and accounts were adopted.

ODHAMS PRESS LIMITED

YEAR OF EXPANSION

The Fortieth Annual General Meeting of Odhams Press Limited was held on June 16th in London.

Mr A. C. Duncan, FCA, chairman, in the course of his speech said: I have decided to retire from the Chairmanship after this meeting and I shall then hand over the Chair to Sir Christopher Chancellor.

The year under review has, on the whole, been one of expansion and development. Following the purchase of the Ordinary Capital of Hulton Press, Ltd., now re-named Longacre Press Ltd., we acquired during the year that of George Newnes Ltd., and, later, that of The Contract Journal Company Ltd. We are satisfied that these acquisitions will materially strengthen the financial and trading operations of the Group as a whole.

Our revenue amounted to £53,645,665, against which must be set Production Costs and other expenditure of £49,706,454. This results in a Trading Profit of £3,939,211. After adding Investment and kindred income and deducting Depreciation and other overhead charges, we have a profit total of £2,955,867, subject to a taxation charge of £1,404,561. The Group's assets now amount to £40,236,965, which is almost double last year's total.

With regard to the current year, trading conditions have continued to be satisfactory, although competition continues to be increasingly keen, whilst the prospect of further increased costs is causing us considerable concern.

The report and accounts were adopted.

WORTHINGTON-SIMPSON LIMITED

ENCOURAGING PROSPECTS

The Sixty-ninth annual general meeting of Worthington-Simpson Ltd. was held on June 23rd in London, Sir Samuel R. Beale, KBE, MIMech.E (Chairman), presiding.

The following is an extract from the chairman's circulated statemen for the year 1959:

It gives me much pleasure to present the results of another year's satisfactory operations. I say satisfactory notwithstanding a drop of £163,428 in the Trading Profit to £1,018,246 compared with last year's figure of £1,181,674. After full provision for all charges, including taxation, a net profit of £476051 is shown against £543,759 for 1958.

The decline in profits is not so great as was anticipated due mainly to a marked increase in the sales of our standard products. During 1959 we both sold and produced more of our standard ranges of equipment than ever before and so far this year the trend continues as a result of which our order book remains at its usual high level.

Prospects for 1960 are encouraging, particularly as fairly substantial shipments of equipment for the £2 million contract for the new power station at Buenos Aires will be made during the course of the year.

In view of these prospects, your Board feels a slightly higher distribution of profits is justified and accordingly recommends that the final dividend on the Ordinary Capital be 12½ per cent less tax, making a total of 20 per cent less tax, for the year.

The report and accounts were adopted.

WEBB'S CRYSTAL GLASS COMPANY

The fortieth annual general meeting of Webb's Crystal Glass Company Limited was held on June 15th in London, Mr R. E. N. d'Abo (the chairman) presiding.

The following is an extract from his circulated statement:

The Group Profit for the year amounts to £111,070 as compared with £56,574 for the preceding year and the Net Profit, after taxation, £57,636 as against £24,659. We paid in January, 1960, an interim dividend of 5 per cent less tax and we recommend paying a final dividend of 7½ per cent less tax, making 12½ per cent in total as against 10 per cent last year.

The results for 1959 are the best since 1955 and all factories shared in the improvement.

Walthamstow.—This Works benefited from a full year's trading after the relaxing of the Hire Purchase and Credit Restrictions in 1958. Our turnover increased considerably and we were therefore able to show improved Factory Profits in spite of rising costs.

Stourbridge and Edinburgh.—Both Works reported increased sales of crystal glassware in the Home and Export Markets despite continuing import restrictions in New Zealand and Australia, our oldest overseas customers.

Prospects.—The sales and orders for the first quarter of 1960 show an improvement over 1959 and your Board are hopeful that, despite the re-imposition of credit restrictions and a tendency for smaller margins, the profits will be maintained.

The report was adopted.

COMPANY AFFAIRS

Convertible Loans

HOLDERS of two big debenture and loan stocks have a last chance to exercise their option to convert into ordinary shares next month. But investors holding the outstanding £5.6 million of Imperial Chemical Industries 5½ per cent convertible unsecured loan stock and the outstanding £20 million of British Petroleum 6 per cent convertible debenture stock are faced with very different problems. **ICI** loan stockholders have everything to gain by exercising their conversion rights. The table shows that the current market price of the ordinary shares offers a substantial premium over the conversion price for those who subscribed to the original issue. Moreover, while gross income from the annual interest on £50 of loan stock is £2 15s., the dividends on the 33 shares that can be obtained in exchange would be £3 14s. 3d. for 1959 ; and there is the prospect of higher dividends in the future. At the current price of 57s. 3d. for the ordinary shares the conversion will give shares with a value of £94½ against the present market quotation of £93¾ for £50 of loan stock—which would fall to around £49 when the conversion rights expire next

	Conversion per £50 stock, 1960	Conversion per £50 stock, 1961	Conversion price, 1960	Conversion price, 1961	Current market price
BP (£1)	16	...	62/6	...	51/-
ICI (£1)	33	...	30/3	...	57/3
Bowater (£1) ...	24	21⅗	41/8	46/3	59/-
Hkr. Siddeley (£1)	34	34	29/5	29/5	28/9

month. Holders who do not wish to convert should clearly sell their loan stock in the market, for otherwise their losses will be substantial.

By contrast, debenture holders in **British Petroleum** would be unwise to exercise their right to convert. With the ordinary shares at 51s., 16 shares would be worth just under £41 against the current price of £48 for £50 of debentures. Investors who wish to hold BP ordinary shares would do better to sell the debentures and reinvest the proceeds. The debenture, however, is attractive for holders interested primarily in income and many may wish to retain the stock in its present form. The issue of this stock in 1958 aroused great interest and was heavily oversubscribed, but the present depressed market in oil equities has changed the picture and it is clear that only half of the original £40 million of debentures issued will have been converted.

Bowater stockholders have one further opportunity to convert their 5¼ per cent loan stock—in 1961 when the terms will be less favourable. It seems likely, however, that most of the £6½ million stock outstanding will be converted next month, on terms that have been adjusted for the recent scrip issue. For the holders of **Hawker Siddeley** 5¼ per cent convertible debentures there is little to be gained by exercising their conversion right this year and they may well prefer to wait at least until 1961 when it should be easier to assess the prospects of the group after the recent mergers. The conversion terms remain the same both for next year and in the following years up to 1964, and they can be exercised in January as well as in July.

Boots Pure Drug

AT 36s. 9d. the yield on the 5s. ordinary shares of Boots Pure Drug has fallen further to only 2.8 per cent, and at this level investors are clearly looking for a repetition of last year's performance when profits rose by 51 per cent to £7½ million and the dividend was raised from 16 per cent to 21 per cent. However, Mr J. P. Savage, the chairman, warns shareholders that, while the company is bulgeting for a further increase in profits for the current year, this is expected to be on a much more modest scale, as last year's figures were affected by the complete replanning of a number of its activities.

The increase in profits stemmed from an 8 per cent advance in sales, achieved without any increase in staff. Profit on capital employed rose from 11.9 per cent to 16.6 per cent, which reflects the benefit of past capital expenditures, totalling £13½ million over the last five years. Capital expenditure last year amounted to about £3 million and in the current year a further £2 million has been set aside for the rebuilding and refitting of Boots branches. The substantial improvement in profits has helped the company's cash position and a net deficit of £289,882 in March, 1959, was transformed into a net credit of £629,612 this March.

Perhaps the best justification for the present low return offered by the 5s. shares lies in the company's ambitious modernisation programme over the next five years. In 1955 only one Boots branch had sales of over £500,000, but by the end of the current year there are expected to be 14 in this category. Changes in stores have also brought changes in the goods sold and the demand from the public is for a constantly wider range of merchandise. Thus the most modern shops are now selling gramophone records, while even in the smaller branches there is a keen demand for the more specialist range of photographic equipment. The photographic business is growing vigorously and should make an increasing contribution to the group's profits. A single interim dividend in December will this year replace two smaller payments. This should please shareholders if not the postmaster-general.

Richardsons Westgarth

SHAREHOLDERS in Richardsons Westgarth were certainly prepared for the worst following the chairman's gloomy assessment of the outlook last year. Gross trading profits in the year to March 31st in fact dropped by only 19 per cent, from £2,088,552 to £1,683,903. But a further increase in depreciation charges from £412,945 to £491,175, and a particularly sharp rise in the provision for trading contingencies from £23,499 to £211,698, more than offset the fall from £391,550 to £252,397 in development expenditure ; and profits before tax fell by more than half, from £1,075,651 to £516,900. After tax of £266,000 (against £465,000) net profits were down by 59 per cent at £250,900. At this level they were insufficient to cover the maintained dividend of 8¼ per cent, which was forecast last year, and which absorbed £301,701.

Orders received during the year have been satisfactory in number but, as the chairman warned shareholders in his statement, this would not be reflected for some considerable time in orders going through the workshops. These orders moreover have not always been at satisfactory prices ; the group has had to take on unprofitable marine contracts to fill gaps in its production programme, and these account for most of the sharp increase in the provision for trading contingencies. Shareholders must await the full accounts for some indication of the present outlook. This may not be so gloomy following the revival in the capital goods trades, although in the shipbuilding and ship repairing business, to which the group is a large supplier of both engines and boilers, there is still no sign of improvement. At 9s. 7½d. the 10s. shares yield 8½ per cent.

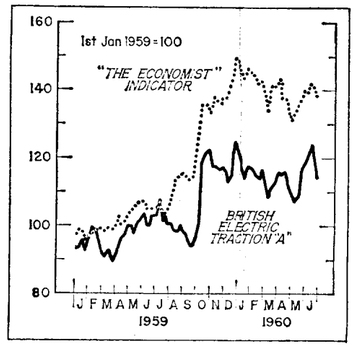
London County Freehold

IN the year to March 31st last net income after tax of London County Freehold and Leasehold Properties rose by 31 per cent, from £446,472 to £585,435. The dividend on the 10s. units has been raised from 10d. to 1s. 1d. Thus last year's forecast by the chairman, Mr T. J. Cullen, of higher profits and dividends has been amply borne out. He then based his estimate partly on the fact that the increases in the rents of existing tenants provided by the Rent Act were to be spread out over several years, so that further substantial benefits would accrue from year to year. A second factor was that certain properties totalling over £1 million were sold as they were required for local development and street improvement schemes. The proceeds were invested in commercial properties to give a higher return and the benefit from this move is partly reflected in the present increase in profits.

As long ago as last September the company amended its trust deed to enable further debenture issues to be made. The 1958 revaluation of properties reduced the ratio of loan capital to about 35 per cent of total assets and the directors intend to raise further substantial sums and invest them in properties to raise the ratio to 55 per cent. It seems likely, however, that at the present time they are reluctant to issue new debentures, which would have to carry interest at around 6½ per cent. At 26s. the 10s. shares yield 4¼ per cent, reflecting the prospect of further growth.

Schroders and Helbert, Wagg

THE financing of Schroders' acquisition of a controlling interest in Helbert, Wagg is to be covered by an issue of £2½ million of 6 per cent unsecured loan stock, 1980-85, which is to be placed privately at £99. Of the proceeds of this issue £2,041,500 will be needed to complete the deal, while the balance will be used for the general purposes of Schroders' London interests.



Schroders Ltd., which controls J. Henry Schroder and also an American subsidiary, is to acquire a 70 per cent interest in the newly formed Helbert Wagg Holdings by subscribing for 210,000 shares at 23s. each at a cost of £241,500. The present directors of Helbert, Wagg and their families have already purchased 90,000 shares at the same price to give them a 30 per cent interest (about double their existing interest in Helbert, Wagg). The holding company has contracted to purchase the whole of the existing capital of Helbert, Wagg for £2,086,000, paying 21s. a share for the 300,000 preference shares and £14 for each of the 126,500 ordinary shares. These terms have been approved by over 90 per cent of the present shareholders, consisting largely of institutions, charities and various family interests.

The holding company is to receive a loan of £1,800,000 from Schroders, which will carry interest at 6 per cent, and this, together with £345,000 from subscriptions to the capital of the company, will cover the full purchase price. Dividends from the new company will thus be kept down, as interest payments of £108,000 will absorb a good proportion of its earnings. From the point of view of shareholders in Schroders, however, this means that the loan stock will be largely self-financing, and there will be little net effect on earnings.

Profits before tax of Helbert, Wagg have ranged over the last ten years between £72,183 in 1952 and £601,682 in 1959, which was an exceptionally good year. Profits in 1958 were £255,233, which the directors believe should be substantially exceeded in the current year. When Schroders was floated as a public company last September the £1 shares were offered at 32s. 6d. and they had risen to 40s. before the news of the merger was given. They now stand at 56s. 3d. to yield only just over 2 per cent on the present dividend basis of 6 per cent ; the market clearly agrees with the directors of Schroders that this acquisition will prove to be of great advantage to the company.

British Electric Traction

ALMOST a year ago Mr H. C. Drayton, chairman of British Electric Traction, forecast profits for 1959-60 of £5,765,000. In fact group profits for the year to March 31st last rose by 26 per cent from £4,615,780 to £5,836,894 which speaks highly not only of Bet's management but of its ability to assess future profits so accurately. The major part of this increase, as was foreseen last year, stems from Bet's large interest in Associated Rediffusion both directly through its own 50 per cent. holding and indirectly through its considerable holding in Rediffusion. For the first time a full year's dividend was received from Associated Rediffusion—a final dividend of 12½ per cent tax free for 1958-59 and a tax free interim of 8½ per cent for

1959-60. This accounts for about 20 per cent of the group's total income ; about one-third of total profits comes from Bet's traditional bus interests. Results from this source have presumably been affected by the general decline in the number of passengers carried as more people own cars.

Fears on this score may have played a part in limiting the dividend increase to only 5 points, from 35 to 40 per cent. This was not as high as had been looked for in some quarters and on the results the 5s. "A" shares lost 5s. to 43s. 9d., for a scrip issue had also been expected. At this level they yield just under 4½ per cent as indeed they did a year ago. Like hire purchase shares at the moment, shares with interest in commercial television have lost a little of their earlier glamour.

British Plaster Board

LAST November's interim statement from British Plaster Board showed a rise of 20 per cent in profits for the six months to the end of September. Plaster board and other products of the company were keenly sought by a booming building industry, but the directors then warned shareholders to expect the usual seasonal drop in earnings over the winter months. In fact profits for those last six months to March 31st fell by 12 per cent compared with the first half of the year, whereas in the previous year the reduction between the two half years had been only 4 per cent. This, however, was a sharper drop than had been expected, as the winter was far from bad and there has been little sign of slackening in the high rate of activity in the building industry. Over the year the group's profits before tax rose by 15 per cent from £2,751,894 to £3,169,610 and the ordinary dividend has been raised from the equivalent of 10 per cent to 11¼ per cent, covered 2¼ times by earnings. This payment disappointed the market and the 10s. shares fell by 4s. 4½d. to 25s. 1½d. to yield just under 4½ per cent. Last year's balance sheet showed capital commitments of £1,376,000 and this may explain the directors' present caution in dividend policy.

Allied Ironfounders

THE £1 ordinary shares of Allied Ironfounders rose sharply last November when the interim dividend was doubled to 7½ per cent. The rise is more than justified by the results for the year to April 2nd last, which show group trading profits up from £2,085,057 to £2,946,352 and net profits doubled from £660,945 to £1,332,394. As expected the dividend is raised from 12½ per cent to 20 per cent and is covered more than twice by earnings. Allied Ironfounders, as a producer of iron goods for the building trade, has stood to gain much from the building boom, and the directors report that business continues to be satisfactory. The company says that sales of cookers and kitchen equipment have not been affected so far by the reimposition of hire purchase controls.

With the closing down of the Australian foundry in March last year the company has no longer been bearing losses by its subsidiary there, which in the previous year amounted to £271,629. Moreover, of the £700,000 set aside last year to meet losses on the sale of its Australian fixed assets, £290,000 was not required and has been written back into the accounts. At 69s. 6d. the £1 shares yield 5¾ per cent.

Caledonia Investments

IN consultation with Baring Brothers, certain members of the Cayzer family have put forward a complicated scheme which will raise for them some £2½ million in cash while at the same time ensuring their continued effective control of British and Commonwealth Shipping, which owns Union-Castle and Clan Line. They are to sell 1,750,000 10s. shares in the shipping company to Caledonia Investments, which is also controlled by the Cayzer family, receiving in exchange for these shares £500,000 of new ordinary stock in Caledonia Investments. A stock exchange quotation is to be sought for this stock which will then be placed in a more marketable

form in 5s. units at around 25s. per unit. This is the minimum price guaranteed to the vendors, irrespective of any further decline in the stock markets before the placing is made.

The current accounting period of Caledonia Investments is to be extended to March 31st next and the directors propose in August to clear off dividend arrears on the preference stock and also to pay a 5 per cent interim on the existing £1½ million ordinary stock. On the enlarged ordinary capital of £2 million they forecast a final dividend for the current period of 18¾ per cent and a total dividend for the following year of 25 per cent. This would be covered 1.3 times by estimated profits after allowing for interest at 6 per cent on £3 million of debenture stock to be placed by Barings.

The proceeds from this debenture issue will be used partly to repay bank overdrafts and partly for general investment. This issue is not without importance to intending purchasers of the new ordinary stock, which will have a still higher gearing: there is already in issue £1½ million 5 per cent preference stock. Income from the trust's other investments, moreover, should cushion to some extent any reduction in British and Commonwealth's dividend, which cannot be ruled out in the present uncertain situation for shipping. But the major part of the trust's portfolio will consist of a 48 per cent holding in the shipping company. At 25s. the 5s. units of Caledonia Investments will yield 5 per cent on the basis of the forecast dividend for 1961-62; a similar return is offered at present by British and Commonwealth Shipping. Neither return is overwhelmingly attractive at the present time.

Unicorn Trust

NOTWITHSTANDING the present uncertainty in the stock markets Unicorn Trust has not been deterred from making an offer of 1,500,000 units at 6s. 7d. to yield £3 7s. 10d. per cent. This return does not allow for any benefit from the provision of the Finance Bill allowing management expenses for tax relief, nor for the increased dividends being paid by many of the companies in which the trust's funds are invested. The managers strongly believe that there will be a number of good investment opportunities in the next few months which justify the raising of fresh money at this time. They also intend to increase the trust's holdings in the European common market countries.

A full response to this offer would bring in about £500,000, but despite the good performance of the units since they were first issued in October, 1957, their attraction at present seems limited. However, the recent response to the offer by the Save and Prosper Group of 2,500,000 Investment-Trust-Units showed that a number of investors are willing to take a long term view and disregard present short-term uncertainties; applications were received for 2,223,759 units or 89 per cent of full subscription.

City of London Real Property

NEGOTIATIONS over plans for the development of the Stag brewery site in Pimlico have lasted many months but approval has now been given for a scheme which provides for three office blocks, a block of 150 flats, a restaurant and parking space for 370 cars. This work will be in the hands of the City and Victoria Property Company, in which City of London Real Property has a 51 per cent interest. Capital commitments in connection with this project amount to £6 million and the balance sheet of the parent company shows other commitments of £1.7 million. In order to finance these developments the company is raising £3¼ million by a one-for-ten rights issue of 65s. a share. In addition, the directors propose to make a one-for-two scrip issue in August and to pay a dividend of not less than 10 per cent on the capital as increased by the cash and scrip issues.

It will be a year or so before the company receives any return on this major project. But its income is still rising: in the year to April 12th last its net income rose from £883,252 to £1,167,462, reflecting in part the acquisition of Wool Exchange and General Investments. At 75s. ex rights the £1 shares yield just under 4 per cent, which is a fair return for a property share that has the prospect of further expansion.

Wiggins Teape

THERE is to be no let up in Wiggins Teape's expansion programme, which between the end of the war and the end of last year cost the company £26.7 million. Early in the current year the purchase of British Waxed Wrappings from Spicers for £3 million was completed. The directors now plan to spend another £3 million on the installation of two new paper-making machines and the reconstruction of a third, on the modernisation of the group's coating plants and on the acquisition of a majority interest in a paper mill in India. Initially these projects will be financed out of the group's own resources which after deducting the cost of the latest acquisitions amounted on December 31st to £3.8 million. But Mr L. W. Farrow, the chairman, expects that in time further fresh capital will have to be raised. A rights issue in preference and ordinary shares last December brought in £3.6 million which was used largely to finance the purchase of British Waxed Papers.

Recently completed projects, including the new machine at Dartford, the Sudbrook pulp mill in South Wales and the new mill in Australia, all made significant contributions to last year's rise of 34 per cent in the consolidated trading profits, from £3.3 million to £4.5 million. In the current year the profits of British Waxed Papers will be consolidated and Mr Farrow says that profits are substantially higher than in the same period last year.

London Stock Exchange

FIRST DEALINGS:	May 23	June 13	June 27
LAST DEALINGS:	June 10	June 24	July 15
ACCOUNT DAY:	June 21	July 5	July 26

FEARS of still higher interest rates have continued to overshadow the stock markets, although prices were steadier after publication of the mid-June bank figures. Turnover, however, has been small, and on Wednesday the number of bargains recorded fell to 10,505, the lowest for over a month. Investors were clearly unwilling to enter into new commitments before Thursday's bank rate decision and the market's reactions to this are discussed in a Business Note. 3½ per cent War Loan fell to an all time low of 60 on Monday and over the week fell by 9/16 to 60 5/16. Among other undated stocks 2½ per cent Consols and 3½ per cent Conversion both fell by ¼, to 44 5/8 xd and 60¼. Falls in short dated stocks generally ranged up to ¼, but 4½ per cent Conversion 1964 lost 5/16 to 96 7/16. Of the medium and long dated stocks, 3 per cent Savings Bonds 1965-75 and 3½ per cent Funding 1999-2004 were both 1/16 lower at 72⅜ and 64⅞.

Japanese bonds have suffered a sharp setback, on account of the uncertain political situation in Japan, though in mid-week prices improved. Over the week to Wednesday the 5½ per cent 1930, Assented lost 13¼ to 165, after touching 158½, and Tokyo Electric 6 per cent Assented lost 10 to 165½ xd, after falling to 160½.

The firmer tone in equities on Tuesday and Wednesday did little to offset earlier losses and over the week *The Economist* indicator fell 6.2 points to 353.1. Among steel shares turnover has been very small; United Steel lost 3s. to 77s. and Colvilles 2s. to 75s. 3d. Engineering issues were also lower but Guest Keen and Nettlefolds were unchanged at 89s. 6d. Despite its good results Allied Ironfounders lost 1s. to 74s. 3d.; Tube Investments fell 4s. to 77s. and Vickers fell 1s. 4½d. to 33s.

One of the few stores shares to show a net gain over the week was Marks and Spencer "A," with a gain of 1s. to 75s.; but Woolworth lost 1s. 6d. to 63s. 6d. and Great Universal Stores "A" 1s. to 47s. 9d. The Continental favourites have continued to be in demand; Unilever Limited recovered most of the previous week's fall with a gain of 4s. to 172s. 3d. and Unilever NV gained 6s. 3d. to 228s. 9d. Philips Lamps with a rise of 12s. 6d. reached a new peak of 237s. 6d. and the shares now yield 1¼ per cent. Persistent American buying of EMI has lifted the shares by 4s. 3d. to 53s.

United Dominions Trust gained 1s. 10½d. to 151s. 10½d. and Wagon Finance 3s. 6d. to 102s. 6d. on the week—possibly because it now seems less likely that new credit restrictions will include sharper controls on hire purchase. Bank shares have generally been quiet, but National and Grindlays Bank gained 3s. 9d. to 41s. 6d.

Gold shares have rallied since their previous week's fall brought the *Financial Times* index of gold shares to an all time low of 63.7.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended June 18, 1960, there was an "above-line" deficit (after allowing for sinking funds) of £36,404,000 compared with a deficit of £17,324,000 in the previous week and a deficit of £23,028,000 in the corresponding period of last year. There was a net expenditure "below-line" of £8,203,000 leaving a total cumulative deficit to date of £206,991,000 compared with £167,248,000 in 1959–60.

THE MONEY MARKET

BANK rate went up from 5 to 6 per cent on Thursday and the Bank of England announced a further call to pecial deposits. Fixed rates in the money market moved up evenly by 1 per cent: the banks' deposit rate to 4 per cent and their minimum rate on call loans to the discount houses to 4⅜ per cent. The increase was widely expected, and the Bank's strong hand has again been felt by the discount houses this week. They had to borrow at Bank rate both on Tuesday and Wednesday, though the amounts taken were small.

At last Friday's tender the discount houses lowered their bid for the £290 million Treasury bills on offer by a further 4d. to £98 16s. 7d., and the average discount rate rose by almost 1s. 6d. to £4 13s. 7.34d., only 5/16 below Bank rate at that time and the highest level for two years. Total applications fell by £74 million to £426 million and thus the market, somewhat surprisingly, almost doubled its allotment to 55 per cent.

In New York too the Treasury bill rate rose this week after its recent sharp falls; the rate on three months' bills rose from 2.292 per cent to 2.613 per cent.

It's easy to get to
BASLE

perhaps the only city in the world bordering on two foreign countries. Known in A.D.374 as **Basilia,** Basle is today world-famous for its chemical and pharmaceutical products, international banking and insurance activities, and the manufacture of heavy metal goods.

And easier still

when there, to contact the Basle Branch of the **Union Bank of Switzerland,** whose vast experience is entirely at your disposal. Travellers' Cheques and Travellers' Letters of Credit can, of course, also be negotiated there.

Did you know that this

drop of water

could sink you financially?

A boiler is designed to supply pure steam at a given pressure and temperature. But if the water used for the purpose contains an excessive amount of undissolved solids, harmful gases or salts, serious trouble may develop, and everything be up with the boiler. The results—delayed production, extra costs and loss of profits could be disastrous.

Vulcan know

The prevention of scale formation and corrosion in a steam raising plant depends upon the correct treatment of the water. And the expert who knows all about that—as about so many other things—is the Vulcan Engineer Surveyor.

Industrial accidents need never happen if he regularly inspects machinery—your machinery. The inspection *and* protection of boilers and cranes, lifts and hoists is what Vulcan provide. It is a specialist's job. Vulcan are the specialists. That's why insurance brokers know that safety first is Vulcan first.

Vulcan are specialists

May we send you FREE 'Vulcan'—a journal for all users of plant and machinery, with reports of accidents and safety hints. Write to Dept. 17.

EDUCATION AND COURSES

UNIVERSITY OF EDINBURGH

DIPLOMA IN MANAGEMENT STUDIES

The full-time course of study leading to the award of the University's *post-graduate Diploma* in Management Studies commences on October 11, 1960. It is intended for young business managers *who are likely* to be promoted to more senior posts and who require to have a broader understanding of business *and its environment.*

The course extends over the three terms from October to June, but members may return to their companies during the two vacations.

Candidates *for admission* should normally be University graduates, but suitably qualified non-graduates may also apply. Entrance standards *are high and only* a limited number of places is available.

Applications should be *made as early as possible* to: Professor Norman C. Hunt, 29 George Square, Edinburgh, 8, from whom full particulars and forms of application may be obtained.

CHARLES H. STEWART,
Secretary to the University.

June, 1960.

CITY OF LIVERPOOL EDUCATION COMMITTEE

COLLEGE OF COMMERCE

Principal: T. Gore, M.A., B.Sc.(Econ.), M.B.I.M., Hon. F.I.L., Barrister-at-Law.

or call at 30 Queen Victoria Street, London, E.C.4.

APPOINTMENTS

AUSTRALIAN NATIONAL UNIVERSITY

RESEARCH SCHOOL OF PACIFIC STUDIES

RESEARCH FELLOWSHIP IN ANTHROPOLOGY AND *SOCIOLOGY*

Applications are invited for a Research Fellowship in the Department of Anthropology and Sociology.

The Research Fellow will be required to carry out empirical research among overseas Chinese communities and to *assist in* the supervision of research in social anthropology and sociology. A doctorate of equivalent experience in social anthropology or sociology and a working knowledge of a language used by Chinese in the South-eastern Asia/Western Pacific region are required.

The salary range is £A1,437-£2,152, with increments of £A65 per annum; initial salary will depend on experience and qualifications. Appointment will be for three years with possible extensions to a maximum of five years. Superannuation is on the F.S.S.U. pattern and allowances are made for removal expenses. Assistance with housing in Canberra is provided. Reasonable field work expenses are met.

Further particulars are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on *31st August, 1960.*

COMPUTER ANALYST

ROBSON, MORROW & CO. have a vacancy in the U.K. for a senior analyst with a good university degree and several years' experience of putting work on to computers, preferably of several different makes. A good knowledge of advanced programming techniques is essential.

The work involves advising clients on the application of various different computers to a variety of industrial and commercial problems, including production and stores control, accounting and clerical procedures. In some cases, it involves arranging the breakdown of a complex procedure and then supervising the clients' team of programmers and coders handling the different parts of the programme.

For someone with the necessary mathematical or statistical training and experience, opportunities will occur in which such specialised experience can be used on special problems.

Knowledge and experience of business and industry would be an advantage, but is not essential, as arrangements can be made to obtain it.

Generous four-figure starting salary, such as would be expected by someone with the required qualifications and experience, and subject to regular review and increase. Five-day week, three weeks' holiday increasing later to four. Non-contributory pension scheme.

Applications, with brief particulars of career to date, quoting ref. No. 20/RM/660, to

Robson, Morrow & Co.,
59 New Cavendish Street, London, W.1.

THE Imperial Highway Authority of Ethiopia requires a qualified accountant whose duties will be the supervision and reorganisation of the accounting and auditing departments of the Authority throughout Ethiopia. He will be directly responsible to management and must be able to prepare budgets and other financial statements. A three year tour is envisaged with suitable leave at the end, first class passage being paid to and from Ethiopia. Most of his time will be spent in Addis Ababa which enjoys a European climate due to its altitude.

Net salary (after deduction of all income tax) £2,500 p.a. The State Bank of Ethiopia currently allows 30 per cent of salary as a foreign remittance. Full details of age, qualifications and previous experience should be given to Price Waterhouse & Co., 3 Frederick's Place, Old Jewry, E.C.2, marking envelopes I.H.A.

STAFFORDSHIRE EDUCATION COMMITTEE

SOUTH-EAST DIVISIONAL EXECUTIVE
DARLASTON GRAMMAR TECHNICAL SCHOOL
(650 boys and girls)

Headmaster: Mr. W. C. Donithorn

This new school (GROUP XV) requires for September or as *soon as possible* teachers (men or women) to teach the following subjects to "O" and "A" level:—

1. FRENCH.
2. ECONOMICS and ECONOMIC HISTORY.
3. BIOLOGY.
4. COMMERCE and BOOK-KEEPING.

Suitable candidates will be considered for departmental and graded posts.

Forms of application may be obtained from the undersigned, to be returned as soon as possible. A list of accommodation is kept at this office *and a lodging allowance* is payable to married men in certain circumstances. A grant towards removal expenses may also be made.

H. K. Simcox, Divisional Education Officer, Education Offices, Walsall Street, Wednesbury, Staffs.

Bowaters

Applications are invited for the post of

ECONOMIST

within the Corporation's headquarters at Knightsbridge, S.W.1. The selected candidate will be required to prepare overseas market surveys and to interpret information on *economic conditions*; also to deputise for the Departmental Head when necessary.

Candidates, either men or women, should be Graduates in Economics with *at least a Second* Class Honours Degree and not less than two years' experience in this type of work.

Please write, in strict confidence, stating age and full details of education, qualifications and experience, to the PERSONNEL OFFICER, THE BOWATER PAPER CORPORATION, BOWATER HOUSE, KNIGHTSBRIDGE, LONDON, S.W.1.

ORDERS for advertisements in *The Economist* are accepted on condition that they are liable to rejection at the discretion of the Editor; that while every effort will be made to publish an advertisement on a specified date, no guarantee is given; and that white on black, reverse blocks or large sizes of black-faced type may be stippled or lined at the *Editor's discretion.*

Rowntree

& Company Limited, York

PENSION FUND INVESTMENTS

The Secretary to the Funds of AN INTERNATIONAL GROUP with its Head Office in Yorkshire seeks an Assistant to specialise in this field.

The Funds are large, old established and still growing. For the right man the post has scope and excellent prospects. The successful applicant could, at present, be engaged in, Stockbroking, Investment Trust activities or Banking. Or he could be a young qualified Accountant with investment interests.

A starting salary up to £1,500 will be paid, provided that, age, previous experience and qualifications meet the requirements for this post.

Detailed applications to Box No. 1348

CENTRAL ELECTRICITY GENERATING BOARD

RESEARCH AND DEVELOPMENT DEPARTMENT

PRINCIPAL ASSISTANT (ADMINISTRATION)

The rapid expansion of the Board's Research and Development Department has resulted in a vacancy in the Financial Section of the Administration Branch at Headquarters, London, S.E.1.

Applicants must have practical experience in cost accounting, budgetary control, and the presentation of management accounting information to senior levels of management.

The successful candidate will be required to become conversant with all of the Section's activities and to assist in the developing of the analysis of reporting and forecasting of financial results. The post offers excellent scope for the expression of original thought and ideas.

Experience of this type of work, in a research organisation would be an advantage. Possession of an accountancy qualification is desirable.

Salary within the range £1,120 — £1,210 p.a.

Applications stating age, qualifications, experience, present position and salary, to the Personnel Officer, 24/30 Holborn, London, E.C.1, by July 11th. Envelopes should be marked "Confidential Ref. LCO.228."

COMPANY SECRETARY required by Civil Engineering & Building Contractor operating in the U.K. and overseas. Must be experienced in all Company Financial and Legal matters and capable of administration of Overseas Subsidiaries and negotiations at director level. Good salary and conditions for the right man.—Write full details in confidence to General Manager, Box 1347.

WOMAN ECONOMICS GRADUATE

Newly qualified female Economics graduate, aged 21/24, required in August/September at West End Head Office. Salary up to £600 p.a. This vacancy is in the Economic Intelligence Department and the duties will include the provision and collation of information on current economic trends in overseas countries. Five-day week. Hours 9-5.30. Luncheon facilities. Three weeks' annual holiday. Apply: Box 1345.

UNIVERSITY OF SYDNEY

Applications are invited for the following positions in the Faculty of Economics:

(1) SENIOR LECTURESHIP IN COMMERCIAL AND INDUSTRIAL LAW.

(2) LECTURESHIP IN ACCOUNTING.

The salary for a Senior Lecturer is within the range £A2,550 — £3,000 per annum; for a Lecturer within the range £A1,850 — £2,450 per annum. In each case cost of living adjustments will be allowed. The salary is subject to deductions under the State Superannuation Act.

The commencing salary will be fixed according to the qualifications and experience of the successful applicants.

Under the Staff Members' Housing Scheme in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on *5th August, 1960.*

UNIVERSITY OF THE WITWATERSRAND JOHANNESBURG

DEPARTMENT OF INTERNATIONAL RELATIONS

DIRECTOR OF STUDIES

Applications are invited for appointment to the above post, for a period of five years in the first instance, as from October 1, 1960, or as soon as possible thereafter.

The salary attached to the appointment is a fixed one at the rate of £2,400 per annum. Provident Fund and Medical Aid facilities available.

Prospective applicants are invited to obtain a copy of the Information Sheet relating to this vacancy from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in South Africa and London, on *July 31, 1960.*

AUSTRALIAN NATIONAL UNIVERSITY

RESEARCH SCHOOL OF PACIFIC STUDIES

Applications are invited for appointment in the Department of Far Eastern History (Head of Department: Professor C. P. FitzGerald) as *READER OR SENIOR FELLOW.*

The salary range for Readers is £A2,802-£3,252. A Reader is appointed to the permanent staff; retiring age is 65, with the option of retiring after the age of 60. The salary and range for a Senior Fellow are determined within the limits £A2,502-£3,102, and appointment is made for an initial period of five years; thereafter it may be made permanent.

The above salary ranges are under review and may be increased substantially.

Readers and Senior Fellows are entitled to one year's study leave on full pay plus contribution towards travel and other expenses in every six years.

Reasonable travel expenses will be paid and assistance with housing provided. Superannuation is on the F.S.S.U. pattern.

Further particulars should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on *August 1, 1960.*

UNIVERSITY OF CAMBRIDGE SCHOOL OF AGRICULTURE

Applications are invited for the post of Junior Research Officer in the Farm Economics Branch. Qualifications should include an honours degree in economics, agricultural economics or statistics. Salary scales are £650 x £25 — £850. This post is eligible for superannuation (F.S.S.U.) and family allowances at the rate of £50 for each eligible child. Applications from candidates who expect to graduate this summer will be considered. Further details are obtainable from the Secretary, School of Agriculture, Downing Street, Cambridge. Closing date for applications, July 27, 1960.

UNIVERSITY OF NEW ENGLAND N.S.W. AUSTRALIA

Vacancies exist within the Faculty of Agricultural Economics for three newly established positions in the fields of Public Administration, Agricultural Economics (Marketing and Demand Analysis) and Farm Management.

Applications from suitably qualified persons are invited for appointment as:—

(1) LECTURER OR SENIOR LECTURER IN PUBLIC ADMINISTRATION.

(2) LECTURER OR SENIOR LECTURER IN AGRICULTURAL MARKETING.

(3) LECTURER OR SENIOR LECTURER IN FARM MANAGEMENT.

Salary for a Lecturer will be within the range of £A1,800 — £A2,100 per annum with commencing salary determined in accordance with qualifications and experience. For a Senior Lecturer the range is £A2,200 x £50 — £A2,600. In addition a cost of living adjustment at present amounting to £A96 per annum is payable (University salaries are at present under review). Provision is also made for superannuation benefits and removal expenses, travel grants for study leave and assistance in buying or building a house.

Further information may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on *August 31, 1960.*

UNILEVER MANAGEMENT SERVICES

Applications are invited from men who can justifiably claim a wide range and high standard of management competence, coupled with successful innovation of modern management practices in industrial or commercial concerns.

Openings occur in the ORGANISATION DIVISION, which provides for Unilever Companies and Departments advisory services akin to those of the professional Management Consultant firms. These are permanent staff appointments supplementing personnel promoted from within. They are based in London, but involve a little mobility in the U.K. Opportunities for service overseas could arise later if desired.

Essential requirements :

Age—in the range 36-50.

Several years' experience at good levels of management responsibility in manufacturing, marketing, or financial control.

Some experience of participation in "general management" or professional consultant service at senior levels.

Comprehensive knowledge and experience of contemporary practices in the management field, including organisation problems and policy development.

Some years of remuneration above £3,500 per annum.

Applications should give in summary form as much information as possible about qualifications, positions held, nature of responsibilities, scope of experience and salary growth.

All applications and information submitted will be treated in strict confidence if marked "Confidential (Ref. C/310)," and addressed to—

THE HEAD OF PERSONNEL DIVISION,
UNILEVER HOUSE, LONDON, E.C.4.

OPERATIONAL RESEARCH

An international professional firm requires additional operational research personnel for its London office. Candidates should have a good class honours degree in mathematics, statistics, engineering or physics and some experience in industrial operational research, and should be between 25 and 35 years of age.

Starting salary will be in the range £1,500 to £2,000 p.a. with good opportunities for advancement.

Applications, which will be treated in strict confidence, should give details of age, qualifications and experience and should be sent to Mr. B. H. P. Rivett, O.R. Division, Arthur Andersen & Co., Roman House, Cripplegate Buildings, London, E.C.2.

GKN

THE GUEST KEEN AND NETTLEFOLDS GROUP OF COMPANIES

WISH TO MAKE THE FOLLOWING APPOINTMENT

HONOURS GRADUATE FOR OPERATIONAL RESEARCH

The Midlands Operational Research Unit of this Group of Companies which is based on Wolverhampton wishes to appoint a young man aged 21/27 to join a team studying management problems in the manufacturing companies of the Group. A good honours degree from a United Kingdom University is essential; the subject of the degree is of secondary importance, although some preference might be given to a Statistician or an Engineer. Industrial or operational research experience is not necessary.

Applications giving details of age and qualifications should be sent to the Recruitment Officer, G.K.N. Group Research Laboratory, Birmingham New Road, Lanesfield, Wolverhampton.

A SENIOR INDUSTRIAL TAXATION APPOINTMENT

is available in one of the country's largest manufacturing groups at its head office in the London area. Applicants must be capable of advising top management on all taxation aspects of a dynamic and rapidly expanding business and of handling the negotiation of its taxation liabilities.

The successful candidate will be 30-35 years and will have gained his technical experience either in the Tax Inspectorate or as a Chartered Accountant with several years' specialist experience in the profession or in industry of the taxation of major companies. Ambition to progress to wide fields of management and the personal qualities to achieve this will be looked for and given the fullest scope.

Applications with brief personal details should be sent in the first instance to Box 1344.

A FEW vacancies exist for junior statisticians in the Statistical Office of United Nations in New York and in the Economic Commission for Africa. Candidates should have a good degree in statistics or in economics allied with statistics and should be intending to follow a career in economic statistics or a closely related field. Salary range U.S. $5,600 to $8,400 tax free plus certain allowances. Normal age range 25 to 35. Applicants should send resumes of training and experience to Office of Personnel, United Nations, New York, or United Nations Economic Commission for Africa, Addis Ababa, Ethiopia.

THE REED PAPER GROUP

requires a

SALES RESEARCH ASSISTANT

A young graduate, preferably in economics, with a good knowledge of statistics is required as a sales research assistant/market analyst in the Market Investigation Section of the Packaging Division Development Department.

The work will include analyses of the Division's operations in the markets for its products; and applicants must be able to co-operate not only with other members of the section but also with senior sales executives. Some experience of or knowledge of the paper making and or packaging industries would be an advantage.

The Department is pleasantly situated at New Hythe in Kent, and excellent conditions of service include a non-contributory superannuation scheme and assistance with house purchase.

Applications stating full details of qualifications and experience should be addressed to:

THE GROUP PERSONNEL OFFICER,
ALBERT E. REED & CO., LTD.,
LARKFIELD, NR. MAIDSTONE, KENT.
quoting reference SPA/PDDD/47.

STATISTICIAN, a Graduate with 2-3 years' industrial experience is required by British Oxygen Gases Ltd., to work from the Head Office of the Company in Central London in a newly formed Department. The work is largely concerned with the solution of problems in the Operational Research field. Some knowledge of electronic computers would be an advantage.—Write, stating full details to the Personnel Manager, Spencer House, St. James's Place, London, S.W.1.
