The cement industry in this country has a proud record for its price policy. There had been no change in the price of portland cement since July 1, 1957 until February 1, 1960, when prices throughout the country were reduced by 2s. 0d. a ton. In spite of increasing costs the cement industry felt confident at the beginning of the year that a higher demand in the home market in 1960 would enable such increases to be absorbed and still leave a margin available for a reduction in price to the consumer. I hope it will turn out to be a good guess. We in the industry are always striving for increasing efficiency, but as we are operating continuous process plants we are naturally much more dependent on capacity or near-capacity working for profitable results than are many other industries.

I do not apologise for profits. On the contrary I say that it is our clear duty to make profits—a duty to our shareholders to whom we have a definite obligation; a duty to all our employees, for profits are the bulwark behind all our wages and salaries and our continuity of employment; and a duty to the nation. After two world wars in one half-century, and in an era of unparalleled rapidity in expensive scientific progress, the nation—indeed the whole world—is hungry for capital. And capital can come only from a saving out of current production. There should be joy all round at the sight of a company increasing its profits and so adding to the national wealth—not to mention its contributions to the national exchequer.

I believe that we have in this country an era of great prosperity ahead of us if we have the common sense to realise that the projected doubled standard of living in a generation must be earned before it can be enjoyed and that inflation must be kept at bay. The Government has a primary responsibility to ensure that our national finances are soundly and economically managed. But the major job lies with our industries.

That the cement industry, and within it our Company, will continue to play its part, I have no doubt.

A copy of the full speech may be obtained on application to the Secretary, Crown House, Rugby.

GRAY'S CARPETS AND TEXTILES LIMITED

HIGHER PROFITS AND DIVIDEND

RIGHTS ISSUE

MR P. L. FLEMING ON FINANCE FOR EXPANSION

The thirteenth annual general meeting of Gray's Carpets and Textiles Limited, was held on April 20th at Winchester House, Old Broad Street, London, E.C.2, Mr P. L. Fleming (the chairman) presiding.

The following is an extract from his circulated statement:

We have made a trading profit in the year 1959 of £419,997, against £278,309 in 1958. After paying tax and bank and debenture interest, there is left for disposal £244,306 out of the profits of the year 1959 and £171,786 from previous years, or £416,092 in all. The way in which your Directors recommend that this shall be appropriated is set out in the Report, from which the Ordinary stockholders will be glad to see that we propose a dividend of 12½ per cent against 5 per cent last year.

CARPETS

Stockholders who have studied these Statements of mine over the last few years may have expected some such improvement, particularly if they were only thinking of carpets. Carpets are only about half of our business, and while our carpets did, as we expected, considerably better in the year under review, so did all our other companies—with the exception of Doris Spinning, to which I shall refer later.

It is difficult so early in the year to say what the prospects for carpets may be, but we see no reason why we should not do as well or better. Our joint venture in New Zealand is just starting production; there are one or two foreign markets to which our exports are increasing; and the verdict of the Restrictive Practices Court does not seem likely to upset the industry.

WOOLLEN MILLS

I ventured last year to express some optimism about our woollen business, John Fenton & David Bradley Mills. This company earned a good profit and has a fuller order book than for many years past. It looks as if profit margins will be slightly lower in 1960, but we can see ahead of us sufficient home and export business to ensure increased output and increased profit. This is a great credit to the Fenton management at a time when by no means all manufacturers are working to capacity, and we are glad to feel that the parent company will now be able to give Fentons the necessary financial support.

Our blanket company, Ratcliffe Brothers, also had a better year, mainly because it increased its production well above the average for this industry. Wages and raw materials are likely to cost us more in 1960, but for this company, also, we hope to be able to provide the money to finance a still greater production this year.

Norman Shaw, our woollen yarn spinners, have never known a year in which fine woollen spinning has been so quiet. That they have made a profit appreciably higher than last year is largely due to going into new fields, and it looks as if an extension in these fields should result in another satisfactory year.

SPINNING

As regards Doris Spinning, I told you last year how the adverse decision of the Restrictive Practices Court on the Yarn Spinners' Agreement had seriously affected the trade and started a price war. Following that came the Government's redundancy scheme for the cotton trade. The Condensor & Allied Spinners' & Manufacturers' Association, of which Doris is a very small unit, decided not to accept the scheme for the elimination of redundant capacity. The result was a complete disruption of the condensor spinning trade: the already marginal profits were turned into losses by short time working due to lack of orders, followed eventually by key labour moving to outside industries. In all these circumstances we decided to close the mill and are taking steps to sell it. Doris used to make a useful contribution to Group profits, but we have to move with the times. Fortunately we have not a large investment in this company.

Norman Scatchard have made a larger profit on their moquettes. We have had to accept the fact that the lower grade moquettes are landed from Belgium at a price, inclusive of duty, which is lower than our cost of production, but our high quality goods are now selling more profitably because of improvements we have made in the planning of our production.

The profits of the Victoria Weaving and Finishing Company showed a very considerable increase and we are confident of doing even better this year. We think that the extra money to which I refer below and which we hope to have available will be put to profitable use in this company.

THE FUTURE

This time last year I said that our expectations were based largely on the Government's policy of expanding consumer demand. This policy gave our customers some confidence, but in fact the spending spree has not really done very much for any branch of the textile industry. The improvement in your company's fortunes is mainly due to my executive colleagues and to those who have the day-to-day management of our subsidiary companies. The implied optimism about the future in these remarks is based largely on the hope that they will now, at last, have some money, so that instead of having to run our various activities on a shoe-string we shall have the means to expand our trade and to exploit new techniques which have hitherto been beyond our financial reach.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the Meeting the Chairman said:

Since the publication of my Statement I have two items of interest for you.

The first is that our profits for the first quarter of this year are more than 25 per cent higher than for the first quarter of last year. This is a completely unreliable guide to what may happen for the whole year but it does, I think, justify reasonable optimism.

The second point is that, as you may have seen in the Press, we have made arrangements to issue new capital. You will be receiving in the next day or two a provisional Allotment Letter which will entitle you to take up one new share at 7s. for every 5s. stock unit held by you on April 14th. This will raise nearly £800.000 and enable us, for the first time since the Company was formed, to plan ahead.

The report and accounts were adopted and at the subsequent extraordinary general meeting resolutions were passed increasing the authorised capital of the Company from £2 million to £3 million by the creation of 4 million shares of 5s. each; dividing the 117,600 unissued Ordinary Shares of £1 each into four shares of 5s. each, cancelling their designation as ordinary shares and cancelling the provision for the automatic conversion of such shares into stock; converting the 2,329,600 Ordinary Stock units of 5s. each into 2.329,600 Ordinary Shares of 5s. each and amending the Articles of Association.

TWINING CROSFIELD & CO.

COMPETITIVE TRADING CONDITIONS

The Forty-third Annual General Meeting of Twining Crosfield & Co. Limited was held on April 26th in London, Mr H. W. Backhouse (Chairman and Managing Director) presiding.

In the course of his circulated statement the Chairman referred to the two occasions during 1959 when the issued Ordinary capital was increased—(a) by way of a one-for-two scrip issue, and (b) by means of a Rights issue.

The Chairman continued: On February 1, 1959, we acquired the old established Red, White & Blue Coffee business and this has, so far, proved to be a useful addition to our trade.

Whilst overall world consumption in 1959 was fully maintained there was a noticeable fall in consumption in the UK and other European countries during the hot summer which provided the first real setback to the growth of the trade since the War and underlined the danger to tea from its many competitors in other beverages and cordials. It would appear that there is a real need for forceful "drink more Tea" propaganda in all consuming countries.

Raw Coffee prices generally have been easier for most grades during the year and this has made it possible for us to pursue our policy of reducing our prices to the consumer on more than one occasion.

The Group Profit before taxation amounted to £158,121 which compares with £138,860 for 1958. We propose a final dividend of 10 per cent on the Ordinary Shares which, with the interim of 4 per cent, is the equivalent of last year's distribution having regard to the alteration of the ordinary capital.

Competition remains as strong as ever and our net profit in 1960 will depend, as it always does, on the market price of tea and coffee. Nevertheless we look forward with reasonable optimism to 1960, particularly since the retail prices of the cheapest packets were quite justifiably increased in February, 1960.

The report was adopted.

INTERNATIONAL NICKEL COMPANY OF CANADA

A DECADE OF PROGRESS

The annual meeting of The International Nickel Company of Canada, Limited, was held on April 27th in Toronto.

Dr John F. Thompson, the Chairman, presided and, in the course of his speech, said:

Net earnings for the year 1959 were the fourth highest in the history of the Company, amounting to $85,100,000, an increase of $45,400,000 over 1958.

As a result of a world-wide rise in industrial activity, our deliveries of nickel in all forms last year reached a new peak at 317 million pounds, contrasted with 205,800,000 pounds in 1958.

The decade of the Fifties was one of progress for our Company. We are now on the threshold of a new decade with even greater promise. Our new nickel development in Manitoba, improvements in production procedures, including some quite radical in nature, reorganised marketing and distribution activities and more intensified research—both process and product—will all contribute to continued growth.

Our annual capacity for nickel production has been increased materially during the past 10 years. In addition, completion of the Thompson project in Manitoba in 1961 will provide the Company with initial capacity for a further 75 million pounds of nickel per year.

Deliveries of nickel increased from 209,300,000 pounds in 1949 to 317 million pounds, a new high, in 1959. Copper deliveries advanced from 221,100,000 pounds in 1949 to the postwar high of 280,800,000 in 1957. Annual deliveries of platinum metals in the decade averaged 315,000 ounces, with a high of 445,000 in 1955. Deliveries for the 10 years totalled 2,670,000,000 pounds of nickel, 2,450,000,000 pounds of copper and 3,150,000 ounces of platinum metals.

Annual earnings in the 10 years 1950-59 averaged $68,800,000, or about $4.70 per common share, and common dividend payments averaged $42,700,000, or over $2.90 a share, including year-end extra payments.

Over the 10-year period, the Company maintained its customary strong financial position and, looking to the future, returned to the business substantial amounts for exploration, plant expansion and modernisation and process improvements. Capital expenditure of $320 million was made in the 10 years chiefly to increase nickel production capacity and improve operations at our plants in Canada, the United Kingdom and the United States.

With the imminence of production from Manitoba, the Company during the latter years of the 1950s intensified its market development activities and market research throughout the world. These efforts are already producing gratifying results in the face of keen competition from other metals and materials. We believe this work will continue to assist in substantially increasing the demand for nickel in the current decade.

Net earnings for the first quarter of 1960 will be significantly higher than the $16,900,000 reported for the first quarter of 1959.

It is expected that demand for nickel during the remainder of 1960 will continue high. This demand can be more than satisfied by the industry's increased productive facilities and by the available nickel supplies.

The report and accounts were adopted.

NEWLY FORMED PRODUCT DIVISIONS ADD GREATLY TO COMPANY'S STRENGTH AND COMPETITIVE POWER

—says Lord Chandos

Difficult Spots Tackled with Vigour

Reviewing the financial results for the year 1959, Lord Chandos, Chairman at the Annual General Meeting of Associated Electrical Industries Limited, said:

Our trading profit for the year, before taxation, but after deduction of other charges, including depreciation and a full year's interest on the 6 per cent Debenture Stock, amounted to £11,098,000 compared with £11,069,000 in 1958.

The total capital employed in the business is £158,280,000. After deducting the amount of the Loan Capital and the Preference Capital, the equity capital employed in the Company is £127,495,000, against a nominal figure of £41,304,000. A 15 per cent Ordinary Dividend, therefore, gives a return on the equity capital of 4.86 per cent.

Electrical Industry—A Growth Industry

Lord Chandos continued: Looking at the electrical industry as a whole we see no reason to alter our view that during the next ten years it will be a growth industry, and that our share of that growth will increase with the increased capacity which we have now installed.

Your Directors are convinced that in this period of the century, the right policy is to be engaged in the manufacture of the whole range of electrical apparatus. This is true of your Group. We do make the whole range, from the smallest transistors to the largest generating plant, from domestic appliances to giant industrial machines. It is by having such a comprehensive range, we believe, that the huge sums which are necessary for research and development can be found, and only in this way is a company powerful enough to maintain and expand its position.

It is to be expected that in so wide a range, certain lines of our manufacture will be subdued, and others will be buoyant. Of course when the general market expands, we would expect to see all sections of the business in an active and profitable posture. This has not been true in 1959.

Lord Chandos then discussed those parts of their business which had been "giving trouble," namely, cables, telecommunications, lamps and lighting, and nuclear power stations, and added: These were the four difficult spots in 1959, and from what I have said, you will see that they have all been tackled with vigour; cables and lamps and lighting by rationalisation, telecommunications by cutting back the effort which we have devoted to them but not so far that we cannot cope with a revival of the business which we expect, and nuclear power by a combination with the Nuclear Power Plant Company. These four are quite a significant part of our total business.

The Chairman then reviewed the other sections of the business, and, continued: The order book in 1959 amounted to £182,282,000. This is slightly higher than that of the previous year.

Export conditions were difficult during 1959, but, despite all the problems, our exports overseas are maintained at a high percentage—round about 30 per cent—of our total business.

After reviewing overseas activities, Lord Chandos turned to matters of re-organisation, and said: As the Shareholders know, on the 1st January of this year the three main manufacturing companies were reorganised into Divisions. We have already enough experience of those Divisions which have been working to know that they are going to add greatly to the strength and competitive power of the Company. The main peak of our capital expenditure is now passed, and the prospects for 1960 would seem to show that our new capacity, even if it is not fully occupied, will be far more nearly so than it was in 1959. This is one of the principal reasons why the trading results for 1959 do not yet reflect the increased capacity which we have installed.

The Company's Liquid Position

The shareholders will notice that the Company has a satisfactory cash balance and is in a highly liquid position. Our cash balance amounts to £11,346,000; of the overdraft of £6,110,000, over £5m. is against the Berkeley Power Station contract and is self-liquidating.

I must mention the recent arrangements for co-operative research which have been reached with A. Reyroile and C. A. Parsons. This combination which still leaves the three Companies competitive in their own fields, is designed—as the circular says—to cover both capital and current expenditure.

In conclusion, prophets are without honour in their own country and sometimes with their own shareholders. It is dangerous to predict so early in the year what the trading results for 1960 are likely to be. I confine myself to saying that the demand for all our products has shown a notable increase, and we are budgeting for increased profits on our ordinary trading accounts. A statement like this must be received with reserve, for although we know of no untoward events that are likely to occur, we can never be certain.

AEI

Associated Electrical Industries Limited

JOHNSON GROUP CLEANERS LIMITED

(Formerly Johnson Brothers (Dyers) Limited)

EXPANSION AND DEVELOPMENT

MR DOUGLAS CROCKATT'S REVIEW

The Annual General Meeting will be held in Liverpool on May 19, 1960. In the course of his review, Mr Douglas Crockatt says:

Economic conditions improved during 1959, yet, after a good first quarter, it proved to be not an easy year for the dry-cleaning industry. Trading was adversely affected by the unusually hot summer weather, when lightweight washable garments were in use for long periods. Competition continued to grow in what has been for years past a highly competitive trade.

MR DOUGLAS CROCKATT, JP

Total turnover (excluding the figures of a business acquired during the year) again showed an increase. Every company in the Group traded at a profit.

After providing for taxation, net profit amounted to £299,000. Of this total £132,000 has been distributed as dividend, pre-acquisition profits amounted to £11,000 and £156,000 has been retained in the businesses. In addition, profits on the realisation of assets amounting to £19,500 were transferred directly to Capital Reserve.

The figures shown in the accounts are not truly comparable with those of the previous twelve months. This year, as was indicated in advance a year ago, contributions to our Non-Contributory Pension Fund, amounting to £30,000 have for the first time been charged as current expenses in the accounts of all the operating companies. The Fund was built up in earlier years by allocations from profits. The total of this Non-Contributory Fund is now £730,000 and of the Staff (Contributory) Pension Scheme £1,155,000. Both Funds (aggregating £1,885,000) are completely outside our accounts. They are vested in trustees and are actuarially solvent.

NEW ACQUISITION

Furthermore, on July 1st last the Company acquired the shares of Bird Ltd., of Newcastle-upon-Tyne, and the figures of that company are included in the consolidated accounts. Chiefly through its subsidiary, Harton Dyeworks Ltd., of South Shields, it operates 47 dyeing and cleaning branches in the North-East Coast area. Bird Ltd. also owns two laundries in Newcastle. The Company, whose members, staff and employees we welcome into the Johnson Group, trades profitably and enjoys a high degree of good will in its local area. An extension of the Harton Dyeworks will be one of the tasks of the next twelve months. Mr Leslie Bird, for many years Chairman and Managing Director of the Bird Group, has joined the Board of this company.

A number of properties owned by the Group have recently been professionally re-valued. The valuations received show surpluses over book values amounting to over £600,000. Accordingly the new higher values will be reflected in the next Balance Sheet. The surplus in each case has been carried to Capital Reserve. The Directors intend, as already announced, to recommend to an Extraordinary General Meeting following the Annual Meeting that a scrip issue of one share in ten be made to Ordinary and Employee shareholders, thus converting a portion of the enhanced Capital Reserve into share capital. In the absence of any unforeseen adverse circumstances it would be the intention to maintain the present dividend on the enlarged capital.

Freehold shop properties to a value of over £175,000 have recently been sold, subject to suitable lease-back arrangements.

CAPITAL EXPENDITURE

The annual capital expenditure of the Group is still substantial and is likely to continue so. A small freehold works has been acquired in the Plymouth area to serve branches in Devon and Cornwall. This plant will very shortly be in operation. A new factory building has been erected and brought into use at the Brighton works of Flinn & Son Ltd., and a portion of the Pullar works at Perth has been re-built. These three new plants have been equipped with the latest dry-cleaning machines fitted with automatic process control.

We express our thanks to our staff and employees in every district for their continued loyal service. The growing personal investments of so many of them in the Group, in Employees shares and in our Works Savings Banks, exemplify the spirit of confidence and partnership which, happily, has prevailed in the Group since its formation.

INSTITUTE OF TAXATION

BUDGET OMISSIONS AND COMMISSIONS

The Annual General Meeting of the Institute of Taxation was held in London on April 26, 1960.

The President, Mr. Frederick Bidston, FACCA, FCIS, FTII, said that the small taxation reliefs proposed by the Chancellor would be welcomed and in particular the scaling down of Estate Duty on gifts inter vivos as recommended by the Institute. The Budget proposals as a whole, however, could only be defined as dull and lacking in decision and positive direction. The Finance Bill was not available at the time, but having regard to what the Chancellor had said in the Commons it was perhaps inevitable that taxation practitioners would be disturbed at the new anti-avoidance proposals. Many uncertainties might result from the withdrawal of relief for losses given against total income or for certain capital expenditure on farm or forestry works unless the trade or profession was carried on "on a commercial basis and with a reasonable expectation of profit." The abuse of double allowance of losses in the early years of a business when set off against profits of another business carried on by the same person could easily be corrected without abolishing altogether what seemed to be an equitable relief.

Mr Bidston said that as from January 1, 1965 entry to membership of the Institute would be through the medium of the Institute's examinations coupled with requirements as to practical experience. As from that date the final examinations of certain other bodies would no longer be accepted in lieu of those of the Institute.

NATIONAL BANK OF PAKISTAN

ANOTHER YEAR OF PROGRESS

The Eleventh Annual General Meeting of the National Bank of Pakistan was held on April 15th at Dacca.

Mr Hoshang N. E. Dinshaw (the President) presided and, in the course of his speech, said:

It is with great pleasure that I present this report at the end of the first 10 years of this great national institution. The occasion is of special significance as the year 1959 is characterised by phenomenal progress in all spheres of national activity and a steady change in the economic prospects of the country.

From the Bank's Balance Sheet, Profit and Loss Account and the Annual Report of the Directors for 1959 you will notice that the Bank records another year of continued progress in all departments of its activities.

The economic activity in the free world showed marked trends to develop on established orthodox economic principles and to discard the artificial controls which had developed during the wars and thereafter.

The economy of Pakistan also showed the effects of more enlightened financial guidance in all spheres. Not only was the thorny problem of refugee resettlement successfully handled, but also the difficult food situation was brought under control, with the result that it has been possible to think of de-rationing wheat from May this year. This happy position is due to greater availability of the foodgrains owing to stoppage of smuggling as also to the increased supplies from USA. The greatest achievement of the new regime has been in restoring financial discipline in the country by following the policy of living within our own means. The new simplified tax policy, collection of income tax arrears, raising of the bank rate from 3 to 4 per cent, checking of black marketing, hoarding and smuggling, have all exercised wholesome influence on the internal economy, while in the external finance the surrendering of all illegal foreign assets, freezing of import licences against which no firm commitments were made, cut in Government's own imports and the Exports Bonus Scheme, have shown remarkable results.

OPERATIONS OF THE BANK

The Bank's total deposits touched the peak at Rs88.45 crores in 1959, registering a rise of 19.56 per cent over the highest figure of Rs73.98 crores last year. At the end of the year the Bank's deposits in Pakistan represented 25.66 per cent of the total scheduled bank deposits in the country as compared to 25.78 per cent in 1958 and 23.47 per cent in 1957. This increase in deposits speaks well for the progressive growth in the number of people we serve and for our rising share in the mobilisation of the country's resources.

The Bank's total advances reached the peak figure of Rs64.99 crores during 1959 as against the corresponding figure of Rs59.93 crores in 1958—an increase of 8.44 per cent. On December 31, 1959, advances stood at Rs55.44 crores.

The profit earned by the Bank totalled Rs1.02 crores, which shows an increase of 8 per cent over the record figure of Rs94.53 lakhs last year.

The report was adopted.

BIBBY & SONS

INCREASED TURNOVER

The forty-sixth annual general meeting of J. Bibby & Sons Limited was held on April 22nd at Liverpool, Mr H. P. Bibby, JP (Chairman), presiding.

The following are extracts from his review circulated with the report and accounts for the year 1959:

The Group profit after charging £200,000 for the replacement of fixed assets and providing £551,941 for income tax and profits tax was £644,057 compared with £574,180 for 1958. Turnover increased from £35 million to £38 million. Lower profit margins in our main division have militated against appreciable improvement. The directors have recommended a final dividend of 4½ per cent making a total of 7 per cent for the year.

Animal Feeds: There has again been an increase in sales in line with national sales but competition has been very keen and profit margins lower than in 1958. Our nutrition research and advisory department has grown steadily in reputation. Our constant aim is to develop new and improved animal feeds, so that we may play our full part in helping our farmer customers towards greater efficiency and profit in their livestock enterprises.

DEVELOPMENT OF "LUMINO"

Our search for an animal protein food of consistent as well as high nutritive quality and free from Salmonella infection led us to the product called "Lumino" and we have played no small part in its development. Lumino is an exceptionally rich source of animal protein factors and we have the sole rights for its use in animal feeds in Great Britain and Northern Ireland and it is now an important ingredient in all our pig and poultry feeds.

Oilseed Processing and Oil Refining: There was an increase in the size of the national "crush" of oilseeds in 1959 but we ourselves processed about the same as in 1958. We experienced a quite appreciable growth in profits which can be attributed mainly to world market prices moving in our favour. The general trend of prices of seeds, oils and cakes has been upwards.

COOKING FATS

Compound Cooking Fat and Lard: Our trade in cooking fats continues to be profitable and Trex remains a firm favourite. Sales of cooking fat for the industrial and catering trade were reduced and the profit margins absorbed by intense competition both from manufacturers in the United Kingdom and from low priced imported lard.

Twirl which was launched at the end of 1958 has made a promising start. Being a liquid oil Twirl is completely free from the suspicion of contributing to heart ailments.

All the above products with the exception of compound cooking fat for the industrial and catering trade reach the housewife directly or indirectly through the grocers and with the object of broadening the base of our grocery trade we have introduced an "instant" mashed potato in the form of a flake and we are selling this product in a limited area under the brand name Quip.

Agricultural Seeds. (Twyford Mill Limited. Conder Seeds Limited): Twyford Mill Limited has had a satisfactory year. Profits and the total value of sales have both increased appreciably in spite of the fact that the national demand for small seeds was considerably less in 1959 than in 1958.

Conder Seeds Limited has also had a satisfactory year.

Kraft Papers. (Henry Cooke and Co. (1932) Limited): The company has had a very successful year in spite of keen competition and both sales and profits have increased.

E. G. Clarke and Son Limited: Early in 1960 your company acquired for cash the whole of the Ordinary and Preference share capital of E. G. Clarke and Son Limited.

We face the future with confidence.

The report and accounts were adopted.

THE LONDON & LANCASHIRE INSURANCE COMPANY, LIMITED

THE HONOURABLE R. M. PRESTON'S STATEMENT

The Annual General Meeting of the London & Lancashire Insurance Company, Limited, will be held on May 19th at 7 Chancery Lane, London, W.C.2.

The Chairman, The Honourable R. M. Preston, DSO, has issued a statement to Stockholders from which the following has been taken:

Nineteen fifty-nine was a year of mixed experience, and while an actual loss on the Underwriting Account had been avoided, the margin of profit was again disappointingly small. The net figures for the combined Fire, Accident and Marine departments were:

	1959 £	1958 £
Premium Income	35,492,101	34,495,074
Underwriting Profit	94,338	106,329
Ratio	0·27%	0·31%

The increase in premium income was encouraging, particularly as there had again been an appreciable amount of deliberate pruning where the business was of doubtful profitability.

Fire Department:

	1959 £	1958 £
Premium Income	13,287,429	13,163,608
Underwriting Profit	78,464	150,319
Ratio	0·59%	1·14%

Home Fire Losses in 1959 were at a record level; nevertheless, it was pleasing to record that the Home Fire Account had still shown a profit.

The General Foreign Field, i.e., excluding the North American Continent, was remarkable for the absence of any spectacular losses and did, in fact, produce a satisfactory profit in 1959.

In North America, the experience remained far from satisfactory.

Accident Department:

	1959 £	1958 £
Premium Income	17,280,194	16,564,057
Underwriting Loss	284,126	343,990
Ratio	1·64%	2·08%

Once again in a number of territories, but particularly in the United States, the trouble spot had been Motor business; and because Motor was the largest section of the Accident account adverse results in that section had a severe effect on the results of the account as a whole.

Marine Department:

	1959 £	1958 £
Premium Income—current year	4,924,478	4,767,409
Transfer to Profit and Loss Account	300,000	300,000
Balance of Underwriting Funds—all years	5,606,671	5,232,759
Ratio	113·85%	109·76%

The Marine Accounts were, as is usual, kept open for three years, so that the transfer to Profit and Loss Account related to 1957 and earlier years and should be viewed against the difficult trading conditions which were reported in that year.

In the difficult conditions which prevailed, it was gratifying to see that the income had increased somewhat and that the Account as a whole remained in such good shape.

Interest and Life Profits amounted to £1,242,831, an increase of £193,780 on the previous year.

As forecast in December last when the capital issue was proposed, a final dividend for 1959 of 1s. for each 5s. unit of stock was proposed which corresponded to last year's 4s. for each £1 unit of stock, and that would make the total dividend for 1959 the equivalent of that paid last year.

The Chairman concluded his statement with a word of thanks to the General Manager, Staff and Agents throughout the world.

PARKINSON COWAN LIMITED

MR HUGH P. BARKER'S REVIEW

The Annual General Meeting of Parkinson Cowan Limited was held on April 25th in London. The following is an extract from the statement by the Chairman, Mr Hugh P. Barker:

Our gross trading profit was £728,000 (£362,000 last year). Offsetting this we have had to increase our depreciation provision to £179,000 (£113,000 last year). The resulting profit before tax of £550,000 compares with £298,000 last year. Our tax bill is heavily increased at £269,000, which leaves a final net profit of £281,000 compared with £199,000 last year. Our earnings on Ordinary Stock calculated on a currently accepted basis show a return of 57 per cent. Your Board proposes to pay a final dividend of 10 per cent and a bonus of 2½ per cent which, together with the 5 per cent interim already paid, makes a total distribution of 17½ per cent for the year, costing £80,000. After allowing for Preference dividends already paid (£21,000) this leaves £180,000 to be distributed among the Reserves and Surpluses of the Group.

The high profits earned in 1959 were a direct result of the boom conditions in the domestic appliance market. We achieved a record output of cookers and increased our share of this market. The appliance business as a whole shows signs of tightening up, and I think it unlikely that 1960 will repeat the performance of 1959, though we expect to do well."

Our Meter and Instrument Divisions had a poor year though towards the end business improved and is now running at a very satisfactory level. We have a first-class range of gas meters, which we are selling on a world-wide basis. Our business in liquid meters is also improving rapidly. Our Industrial Products Division has done well and is steadily expanding; the business of the Division is industrial heating, both for buildings and for drying processes.

My views about the future of this Company have changed very little during these last years. We have a sound business, a good reputation and a catholic spread of interests. We have an excellent executive team, and many of our 3,000 employees have years of loyal service behind them. The pressure of commercial competition is nicely balanced by the pressure of opportunity. In this equilibrium your Directors hope to sustain the interests of our stockholders and employees alike. We expect to have a good year in 1960.

The Report and Accounts were adopted.

Copies of the Report and Accounts can be obtained on application to the Secretary at Terminal House, Grosvenor Gardens, London, S.W.1.

THE ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

MR WILLIAM JACKSON'S ADDRESS

The Fifty-fifth Annual General Meeting of The Association of Certified and Corporate Accountants was held on April 26th in London, Mr William Jackson, FACCA, was in the chair and, in the course of his address, said:

MEMBERSHIP

The membership of the Association has shown a satisfactory increase during the year and now stands at more than 10,500 members. During 1959 432 new members were admitted, which shows a quite substantial increase over the previous year.

The number of new students admitted in 1959 is likewise noticeably higher than in the previous year. This is, I think, a notable achievement at a time when all the professions are faced with the general problem of recruitment. This increase is most welcome and we hope that it will be maintained.

COMMERCIAL EDUCATION

Commercial education here has been allowed to fall into a state in which it can scarcely bear comparison with that in most of the other countries in Europe, and moreover, that has been allowed to happen at a time when our future prosperity depends more than ever on commerce and industry. Extensive and expensive remedies are necessary, but it seems to me that perhaps the greatest single contribution which could be made would be a more general acceptance among employers of the principle of full-time day release to enable their staff to undertake specialised business studies. In the various technologies this principle has long been proved and accepted, in many cases by the very same undertakings as are reluctant to grant similar facilities to their commercial employees. However much facilities may be expanded they will be of little avail unless employers as a whole are ready to allow them to be used.

THE BUDGET

Generally speaking the Budget lacks colour. I appreciate that the Chancellor could not give any extensive relief in taxation but he could have taken the opportunity to simplify taxation and so made it easier for the ordinary taxpayer to grasp. The recommendations in the memoranda submitted by the Accountancy bodies are mainly made in this regard, and I am bound to say that it is disappointing to find that no apparent attention is paid to some of these recommendations.

Schedule 'A' Property Tax should have been considered. I am certain that if every house owner made a maintenance claim on his property no tax would be suffered, and it is wrong for the Chancellor to collect tax from house owners under such conditions.

On the other hand, it is particularly pleasing that the Chancellor has accepted the Association's suggestion of graduated rates of estate duty for gifts inter vivos which are caught by the five year rule; and there will be universal satisfaction at the decision to value a business for estate duty purposes on a "going concern" basis rather than on a "break-up" basis. This also was an earlier recommendation of the Association.

THE "SHELL" TRANSPORT & TRADING COMPANY, LIMITED

LARGER INCOME

The annual general meeting of this company will be held on May 19th in London.

The following is an extract from the circulated statement by the Chairman, The Right Honourable Lord Godber, for 1959:

The year 1959 recorded a rise in the net income of the Royal Dutch/Shell Group of Companies to £175,534,628 from £158,847,430 in 1958. The improvement in income of 11 per cent reflected an increase in sales of crude oil and oil products amounting in volume to 8 per cent, and a rise of 17 per cent in proceeds of sales of chemicals. During the year there was little change in trading conditions in the oil industry, and prices and freights remained depressed. The increase in net income can therefore be attributed to higher volume of sales, coupled with our efforts to keep down costs and expenses.

EXPANSION OF SALES

Sales and operating income at £2,579 million showed an increase of £227 million compared with 1958. Sales taxes, excise duties and similar levies, however, rose faster, to £670 million, an increase of £90 million over 1958. This disproportion was due to increased sales taxes in some countries, and the fact that sales of motor gasoline accounted for a larger percentage of sales proceeds than in the preceding year. After deducting these taxes, receipts from sales and other operating income, at £1,909 million, rose approximately in proportion to volume of sales. Of this sum, £178 million, or 9 per cent, was received from sales of chemicals.

Operating expenses, in which is included the cost of oil and chemical purchases, amounted to £1,403 million. Although these costs and expenses were higher than in 1958 because of the increase in size of operations, they did not rise as much as sales proceeds, amounting to 54 per cent of gross operating income in 1959, compared with 56 per cent in the previous year. This seems a small reduction, but its importance may be gauged from the fact that two percentage points represent about £50 million on gross earnings at their present level. The fall in the ratio is the result of the intensified scrutiny which companies throughout the Group have applied to costs and expenses in all phases of their business. These efforts to reduce costs and improve efficiency will continue to be vigorously pursued.

GENERAL OUTLOOK

Last year I mentioned that 1959 would be a year of economic recovery and renewed expansion. This expectation was fulfilled, except in some primary commodity producing areas. For 1960 general economic growth can be anticipated with confidence. Expansion continues in all the major industrial areas of the world, international trade has revived, and the prices of most primary commodities are firmer than they were a year ago. With a favourable economic outlook there is every prospect of continued growth in demand for oil in 1960, but no reason as yet to expect any moderation in the present intense competition.

The longer term outlook for the oil industry is also of continuing growth. In 1959, as in previous years, the Group has shown that its resources were such as to enable it to keep its place in the oil industry. The strength of our diverse resources, I believe, justifies us in facing the future with confidence.

F.T. PRODUCTS LIMITED

SUBSTANTIALLY IMPROVED RESULTS

The twenty-fourth annual general meeting of F.T. Products Limited, was held on April 27th in London, Mr Eric B. Fernberg (the chairman) presiding.

The following is an extract from his circulated review:

During the year ended December 31, 1959, the growth of your Company's activities has continued as evidenced by the considerably increased Profit (before tax) of £170,892, as against £108,802 in 1958—an increase of £62,090. It should be mentioned that the Company's exports have increased during the year, that the royalties received from foreign licensees were a record and that negotiations for the grant of a licence to Agents in Australia are in an advanced stage.

Your Company's business is continually broadening into industries other than the motor industry and, although the latter still remains our biggest customer, sales to other industries are now very considerable in extent and value.

The published plans of the Motor Industry indicate expansion of production from approximately one and three-quarter million vehicles in 1959 to some three millions in 1962. Your Company is preparing to provide for this potential expansion as well as meeting the rapidly increasing demand from other industries.

With this in view your Board have completed preliminary negotiations with the Borough of Aylesbury in Buckinghamshire whereby a substantial area of land will be taken on long lease from them. The ground landlords will erect on part of such land a factory which will be available early in 1961. Further land will remain on which to expand as and when necessary.

It is recommended that a dividend at the rate of 35 per cent be paid for the year ended December 31, 1959, which will absorb £32,156. There are undistributed profits carried forward of £114,894.

Sales of the Company's products are still rising steadily and, indeed, can be expected to rise in the coming months; the order book is at an all-time high level.

The Directors see no reason (subject to no unforeseen circumstances arising) why the accounts for your Company's twenty-fifth year should disappoint you.

The report and accounts were adopted.

JOSIAH PARKES & SONS

(Manufacturers of Union Locks and Brassfoundry)

The Ordinary Annual General Meeting of Josiah Parkes & Sons Limited was held on April 25th at Willenhall, Mr C. W. Parkes, JP (chairman and joint managing director), presiding. The following is an extract from his circulated review:

Group profit before tax is 14 per cent higher than in 1958. This again reflects further increases in efficiency, for although turnover showed a satisfactory increase, wages and material costs rose, whilst average selling prices tended to fall.

The Board propose to capitalise part of the available reserves and make an issue of one new share for each two existing shares. This will have the effect of bringing the issued share capital more into line with the capital employed in the business.

Whilst we have started the year with very full order books and with the rate of intake still rising, I must sound a warning note. Costs of all kinds are rising steadily and profit margins are contracting despite increased output. Some rise in selling prices seems inevitable, but we have to trade in a competitive market, especially overseas, and it is certain that if our prices increase at a greater rate than our foreign and commonwealth competitors there will be grave danger of losing business to them.

The report was adopted and a final dividend of 14 per cent, making 20 per cent less tax for the year, was approved.

At a subsequent extraordinary general meeting the proposed scrip issue was also sanctioned.

ENGINEERING COMPONENTS LIMITED

The twenty-fifth annual general meeting of Engineering Components Limited was held on April 26th in London, Mr C. C. Griffith, MC (the chairman), presiding.

The following is an extract from his circulated statement: The increasing activity to which I referred in my half-yearly report gained momentum in the latter six months of the year, resulting in a record Group turnover. These figures do not include the sales of the Company we acquired earlier in the year. The substantial increase in turnover has in turn produced a record Group Profit.

After allocation of £6,000 to the Employees' Education and Welfare Fund the profits of the Group amount to £684,247, which, after deduction of taxation of £348,776, and £11,783, retained by the Subsidiary Companies, leaves £323,688, to be added to the balance brought forward from 1958, giving a total balance available of £498,350. Current Assets exceed Current Liabilities by some £1,852,000.

Our efforts in Export markets continue to bear fruit and sales last year showed an increase on the previous year.

Development. During the course of the year we have carried out a considerable amount of research into gaskets for diesel engines, air cleaners, and our products generally and these show much promise.

Prospects. The Motor Industry remains very buoyant, and as we are so closely associated with this we hope to share in their prosperity.

The report was adopted and a total dividend of 20 per cent (15 per cent) was approved.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LIMITED

(Incorporated in Northern Rhodesia)

FINANCE FOR EXPANSION PROJECT

FUTURE PROSPECTS VERY PROMISING

The Fiftieth Annual General Meeting of The Rhodesia Broken Hill Development Company Limited will be held on May 12th in Salisbury, Southern Rhodesia.

The following is from the review by Mr H. F. Oppenheimer, the chairman, which has been circulated with the annual report and accounts:

At this time last year the price of zinc had begun a steady upward movement because of increased demand, and I am happy to say that this improvement continued, so that the average price we received for our zinc in 1959 was some £15 a ton higher than the previous year. On the other hand, the lead market did not show the same buoyancy and the average price received by us during the year was some £5 a ton lower than during 1958.

The profit for the year 1959, after providing £343,000 for taxation, was £885,000, which is nearly £300,000 more than last year. This is very satisfactory as we have been able to appropriate an amount of £400,000 for capital expenditure mainly to meet amounts spent during the year on the expansion programme to which I will refer later, and at the same time we have been able to recommend a final dividend of 6d. which, together with the interim dividend of 3d., makes 9d. for the year. There has been a further welcome decrease in the volume and value of the stores at the mine and this released an amount of £88,000 which was used for financing ordinary capital works.

IMPERIAL SMELTING FURNACE

In January, 1960, you were advised that we had accepted the recommendation of the consulting engineers that an Imperial Smelting Furnace and the ancillary plant should be erected at the mine. Work has already started on clearing the site, and contracts for the erection of the plant are being placed.

The cost of the project is £4,350,000, including additional housing for the increased staff and the installation of a further generator at the Lunsemfwa Hydro Electric Station to provide for the required additional electric power. The station will then be equipped to make full use of the Mita Hills Dam storage capacity.

As I mentioned earlier, we were able to provide £400,000 from available resources for the investigation and preliminary work and the cost of the rights and designs for the process. As we still have a further amount of about £400,000 in hand by way of net current assets the amount to be found for the expansion project is reduced to £3,550,000. The arrangements for raising the sum of £3 million provide for half this amount to be raised by the issue of £1,500,000 of six and a half per cent unsecured redeemable notes in June, 1960; and for the noteholders to have the right to subscribe at 10s. per share for two Ordinary shares for every £1 of notes held in June, 1962. Anglo American Corporation of South Africa, Limited, has undertaken to underwrite both the issue of notes and the provision of £1,500,000 in June, 1962. It is, of course, very difficult to estimate exactly when the money will be spent, and for that reason we have arranged for loan facilities of £1,500,000 to be available to the Company up to June, 1962, when any amounts drawn will be repaid from the proceeds of the issue of the 3 million Ordinary shares to noteholders.

Provided no unforeseen circumstances arise and the prices for lead and zinc remain around the present levels, we expect to be able to retain from profits over the next few years the balance of £550,000 required to complete the project and also the money required for Ordinary capital expenditure at the mine. The new money to be raised, together with short-term loan facilities, will, we hope, make it possible so to gear the capital to be provided from profits that we shall be able to maintain dividends at the rate we have recommended for 1959 until the new plant comes into operation, after which we hope materially to increase distributions to stockholders.

PRODUCTION PLANS

The Imperial Smelting Furnace and ancillary plant is to be integrated with the existing plant and will produce lead and prime Western grade zinc. The leach plant will continue to produce electrolytic zinc. A treatment programme blending mine ore with dump material has been prepared so as to make the best use of both plants. It is planned to mine some 200,000 short tons of ore a year and to draw between 30,000 and 40,000 tons each year from the accumulated dumps of mixed fines tailings and other dump material. Zinc production will be of the order of 50,000 long tons per annum with some additional production in the early years from the zinc concentrate stockpile.

Lead production will be about 28,000 long tons per annum, but this will slowly decrease as ore is drawn from the lower levels of the mine where the percentage of lead in the ore is calculated to be less than is in the ore being currently mined.

ORE RESERVES

The calculation of the ore reserves at the year end was done on a revised basis because experience has shown that too great an allowance was made previously for cavities in the orebody. This factor, together with the inclusion of a new block of ore in the indicated reserves, brings the total ore reserves to 5,870,000 short tons, an increase of 725,000 short tons over last year's figure. The rate of mining contemplated when the Imperial Smelting Furnace is in operation would indicate a life of almost 30 years, but it is impossible to say how much of the ore reserves contained in safety pillars will ultimately be recovered, and for planning purposes, therefore, we propose at present to regard the life of the mine as about 25 years.

Underground exploration is being continued below the indicated ore reserve areas and work will also be carried out to establish whether any additional ore bodies exist in the vicinity of the present workings. On the surface several promising indications of ore have been found adjacent to the mining area and a small tonnage of low-grade zinc ore has been proved at one of them, but no extension of this has yet been found at any depth; exploratory work is continuing. Our Company also owns several properties which are potential sources of ore, and these are being re-examined. At the Star zinc property there is a body of high-grade zinc silicate and limestone deposit which was worked on a small scale many years ago. Diamond drilling to test this property will begin shortly, as it is thought that this ore and the limestone, if available in quantity, will be beneficial to the metallurgical processes.

The outlook for zinc in 1960 is encouraging and the present price of lead is satisfactory. A careful survey of the effects of introducing the new process indicates that there will be a reduction in the costs of production. The new process itself should nearly double the output without materially affecting the life of the mine, and the future prospects are therefore very promising.

Copies of the annual report and accounts may be obtained from the London office of the Company, 40, Holborn Viaduct, E.C.1.

LAMBETH BUILDING SOCIETY

The One Hundred and Eighth Annual General Meeting of Lambeth Building Society was held on April 26, 1960, in London. The following are extracts from the Chairman's Statement to Members:

During the year steady and solid progress has been achieved in all departments. The Total Assets of the Society have increased to the figure of £7,809,797, and the level of Reserves and Liquid Funds shows that the impressive financial strength and stability of the Society have been amply maintained.

The passing of the House Purchase and Housing Act, 1959, was a landmark in Building Society history. Under the provisions of this Act Deposits of up to £5,000 in certain approved Building Societies which have assets exceeding £500,000 and which conform to certain stringent standards of financial strength and conduct can be designated by the Registrar as a legally authorised Trustee Investment. The Act became operative on June 14, 1959, and two days afterwards your Society's name appeared on the first list of Societies to be designated under this Act. Your Society is, of course, a Member of the Building Societies Association.

The Government recently announced its intention of introducing a new Building Societies Bill, but only as this Statement was going to Press has a print of this Bill become available. The Bill will, of course, require most careful study, and any Act passed will necessarily be strictly observed by all building societies. I cannot pretend as yet to have mastered the contents of the Bill, but at first sight it seems that your Society's existing practice approximates very closely to the conditions laid down in the Bill. I can however, safely say that your Board welcomes this new legislation, designed as it is to secure from all Building Societies the high standard of conduct that has always been observed by reputable Societies such as your own.

The very substantial sum of £1,493,971 was received from Investors for the credit of Share and Deposit Accounts during the year, and the total sum held by Shareholders and Depositors

in the Society at the end of the financial year was £7,273,442, an increase of £672,291 over the balances at the close of the previous year.

Your Society advanced during the year the sum of £1,682,538 and over 99 per cent of the number of loans made were on the security of private dwellinghouses being purchased for owner-occupation. By the end of the financial year the total sum owing on mortgages had increased to £6,454,614 and of this sum approximately 98 per cent was secured on private dwellinghouses occupied by the Owners

The recommendation of the Building Societies Association is that each Member of the Association should aim to attain Reserves of at least 5 per cent of the current Total Assets. You will see from the Accounts that the Reserves and Unappropriated Surplus have increased to the figure of £481,821 which sum represents 6.17 per cent of the Society's Total Assets, 6.62 per cent of the total sum due to Shareholders and Depositors and 7.46 per cent of Mortgage Assets. The Reserves required for a Society to obtain Trustee status are 2½ per cent of the Total Assets, so you will see that your Society's Reserves are very appreciably in excess of the minimum required under the Act for such Trustee status.

The Liquid Funds at the close of the financial year amounted to the impressive figure of £1,309,418 representing 16.77 per cent of the Total Assets, and 18 per cent of the total amount due to Shareholders and Depositors.

The Report and Accounts were adopted.

THE RHEOSTATIC COMPANY

EXPANSION IN ALL MARKETS

The Twenty-third Annual General Meeting of The Rheostatic Company Limited was held on April 27th at Slough.

The following are extracts from Mr M. J. Gartside's circulated report to stockholders for the year ended September 30, 1959:

Expansion of the Company's business has taken place in all its markets and in practically all areas of operation and has resulted in a marked growth in the Company's earnings. The net profit was £178,157 (£105,763). Your board recommends a total dividend of 20 per cent for the year (12½ per cent).

Export business continues to represent a very substantial proportion of the Company's turnover. In Europe this business is obtained both from the members of the Outer Seven and from the countries in the European Common Market. Exports to the latter offer the greater potential and have increased substantially during the past year.

The general public are becoming familiar with the use and application of thermostats and temperature controls and with the trade name "SATCHWELL."

We are enjoying a wide spread of activity ranging from small thermostats to automatic control panels for large buildings. This range is spread over our home market, the markets of Europe, the Commonwealth countries and elsewhere.

The trend in the current financial year continues to be in the direction of increase of sales and production. The directors recommend a one for three scrip issue.

The report and accounts were adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

IMPROVED BONUSES IN ORDINARY AND INDUSTRIAL BRANCHES

The Ninety-ninth Annual General Meeting of the Royal London Mutual Insurance Society Limited was held on April 26th at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

Mr E. H. Haynes, FIA, chairman and joint managing director, who presided, said:

The yield on the Society's funds in the year 1959 in the Ordinary Branch was £5 19s. 6d. per cent and in the Industrial Branch £6 7s. 11d. per cent before deducting income tax. The corresponding figures for 1958 were £5 12s. 8d. and £6 0s. 1d. respectively.

I would now like to refer in detail to the position of each of the Society's branches.

ORDINARY BRANCH

The premium income in the Ordinary Branch (including consideration for annuities granted) amounted to £4,559,000, an increase of £196,000 over the previous year. The Fund at the end of the year amounted to £41,585,000, an increase of £2,196,000. The rate of interest earned, after deduction of income tax, was £4 8s. 11d. per cent, an increase of 4s.

The amount paid by way of claims and surrenders during the year was £3,309,000.

The new business results in this Branch during 1959 have proved an inspiration to us all. Not only have they shown an increase for the sixth year in succession but the new sums assured written represent a leap forward in the progress of the Society. During the year 20,700 policies for the amount of £18,773,000 sum assured were issued, this being an increase of £4,499,000 over the figures for the previous year and by a substantial margin a record for the Society.

On with profit policies (other than those which were formerly in the Auxiliary Life Fund) becoming claims, etc., during the current year the Interim Bonus will be at the rate of Two Pounds per cent in respect of each of the years 1956 and 1957, Two Pounds Four Shillings per cent in respect of the year 1958 and Two Pounds Eight Shillings per cent in respect of each of the years 1959 and 1960.

INDUSTRIAL BRANCH

In the Industrial Branch the premium income for the year amounted to £11,014,000, an increase of £400,000 over the previous year. Claims and surrenders amounted to £6,193,000. The Fund at the end of the year amounted to £96,777,000, an increase during the year of £5,949,000. The rate of interest earned, after deduction of income tax was £5 12s. 2d. per cent, an increase of 4s. 1d.

The sum assured on new policies issued in the Industrial Branch has shown an increase for the ninth year in succession. In 1959 new sums assured increased by £1,126,000 to the figure of £24,151,000.

On this occasion I am happy to announce another step forward. Hitherto no bonus has been allotted in this Branch until a policy has been five years in force. In future all premium-paying policies under participating tables will share in profits after premiums have been paid for a full calendar year.

Policies will be allowed an Interim Bonus at the rate of One Pound Ten Shillings per cent per annum.

GENERAL BRANCH

The premium income for this Branch in 1959 was £1,017,000, an increase of £55,000.

The year 1959 has proved a year of increasing success for this Society. The total income of the Society during the year was £23,807,000, while benefits paid to policyholders amount to £9,503,000. The total payments to policyholders since the inception of the Society amount to more than £176 million.

The report and accounts were unanimously adopted.

GILBEYS LIMITED

(Wine Merchants and Distillers)

The annual general meeting of Gilbeys Limited was held on April 28th in London, Mr R. D. Gilbey (the chairman) presiding.

The following is an extract from his statement:

As will be seen from the accounts, the trading profit of the previous year has not been maintained. This was due to several factors and it has been an unfortunate coincidence that in almost every important market in which we operate something occurred to put a brake on the upward trend of profits.

As the amount of profit available is sufficient, the Board feel justified in recommending the same rate of dividend, namely 13½ per cent for the year, on the equity capital as increased in December, 1958.

The proceeds of the issue of Deferred Shares which we made at the end of 1958 have been used partly in reduction of our indebtedness to the Bank caused by our development during earlier years, and partly in further expansion through our subsidiary companies, especially in the acquisition of retail outlets, and also in implementing our policy of modernising and, where desirable, re-deploying our depots throughout England, Scotland and Wales. In particular, we acquired the old-established and highly-regarded business of Edward Rutland & Son, wholesale and retail wine and spirit merchants of Stourbridge. We look forward to substantial progress in Worcestershire and the adjacent counties.

Other plans to meet the changing pattern of trade in this country are under consideration.

In the United Kingdom, 1959 was a year of some difficulty for us, but at the same time of some success and of promise for the future.

The reduction in wine duties, just announced, may confidently be expected to increase consumption, particularly of port and sherry, with which this company is traditionally associated.

After commenting on the Company's overseas activities, the Chairman concluded:

Aided by the zeal and skill of our competent and loyal staff, we confidently look forward to further progress and prosperity.

The report was adopted.

THE BRITISH WAGON COMPANY LIMITED

A YEAR OF STEADY GROWTH

MR R. A. DYSON'S REVIEW

The Ninety-first Annual General Meeting of The British Wagon Company Limited was held on April 22nd in Rotherham, the Chairman, Mr R. A. Dyson, presiding. The profit of the Group after taxation for 1959 was £369,243 (1958 — £261,118) and at December 31, 1959, the Deferred Income amounted to £2,358,996 (1958 — £1,534,432). The following is a summary of Mr Dyson's statement:

This has been a year of steady growth and the satisfactory increase in business undertaken and profits earned is clearly shown. It is particularly noteworthy that once again there has been a substantial increase in Deferred Income, an important feature in considering future prospects.

In marked contrast to 1958 there was no change in the Bank Rate during 1959. Normally this would have made for stability in hire purchase charges, but competition was such that there was a tendency to depress rates. This is not in itself an unwelcome or unexpected development so long as hire-purchase companies insist on reasonable terms in regard to initial payments and length of Agreements.

The Bank Rate was increased in January, 1960, by 1 per cent, with a marked effect on the cost of borrowed money. This has only been partially offset by certain adjustments made in hire-purchase charges. As a result the Company is at present working on finer margins, but steps have been taken to increase the scale and diversity of your Company's activities. For instance, new Offices have been opened at Ayr, Croydon, Gloucester, Guildford, Portsmouth, Scunthorpe and Tunbridge Wells.

Your Banking partners, The Royal Bank of Scotland, Williams Deacon's Bank Limited and Glyn, Mills & Co., have been of great assistance during the year; not only have they been instrumental in providing new sources of business, but also have helped the Company in strengthening its liquid position, which is extremely healthy.

Mention should be made of the most useful work being done by Finance Houses Association on behalf of the national hire-purchase companies. The Association provides liaison with the Government and also affords protection to the public against exorbitant hire-purchase charges.

Recently your Company, in conjunction with The Royal Bank of Scotland, agreed to acquire a 40 per cent interest in Associated Securities Ltd., an Australian Company with headquarters in Sydney. This very well managed and successful hire-purchase company has been in existence for thirty-three years and carries on a business very similar to that of your Company. Your Directors are confident that this will prove a successful investment.

The Report and Accounts were adopted.

METAL CLOSURES LIMITED

MR KEITH D. ERSKINE ON MERGER WITH JOHN DALE LIMITED

The twenty-fourth annual general meeting of Metal Closures Limited will be held on May 19th in London.

The following is an extract from the circulated statement of the chairman, Mr Keith D. Erskine:

The most important event in your Company's affairs during 1959 was the merger with John Dale Limited. The trading activities of the two Companies are naturally complementary and after only six months it is already apparent that material benefits will stem from the integration of the two Companies.

The net profit of the whole Group, before the deduction of minority interests and before taxation, was £831,685. Of this amount Metal Closures Limited, as it existed before the merger, contributed approximately £440,000, an increase of some £30,000 on the record figure for 1958, while John Dale Limited contributed approximately £390,000. These profits, both in total and for each company separately, exceed those forecast at the time of the merger.

Taxation for 1959 amounted to £373,278 leaving a Group profit after taxation and after deduction of minority interest of £421,553.

At the time of the merger your Directors forecast a total dividend for the year of 22 per cent less tax which would have been equivalent to maintaining the dividend at the level to which it was increased last year. In view of the improvement in profits and the continued high level of activity in the first quarter of 1960, your Directors recommend a final dividend of 13 per cent less tax which, with the interim of 11 per cent less tax, brings the total distribution for the year to 24 per cent less tax.

As already announced you are being asked to approve share bonus and consolidation proposals which will result in a holder of an existing 4s. share becoming a holder of two shares of 5s. each.

After reviewing the trading in 1959 of Metal Closures Limited and John Dale Limited, the statement continued:

CAPITAL PROPOSALS

As recently announced, the Company proposes to issue £1 million Debenture Stock. Holders of the Metal Closures £200,000 5 per cent Loan Stock and holders of the 5½ per cent First Mortgage Debenture Stock of John Dale Limited will be given the opportunity to convert their holdings in exchange for the new Debenture Stock. The balance of the new Debenture issue not required for this purpose will be placed, and proceeds of approximately £500,000 will be available for capital improvements and for development. Furthermore, John Dale Preference Shareholders are being invited to exchange their shares for new Second Preference shares of this Company.

Current Outlook.—The trading results for the first quarter of this year are in excess of the 1959 rate of profit—they are substantially in excess of the profit for the first three months of 1959, which were low. Since the beginning of the year we have had to meet increases in raw materials and the reduction in the standard working week to 42 hours. On the other hand, we are continuously improving the efficiency of our operations and the high level of production we are now enjoying reduces the burden of overhead costs.

Unless present trends are upset by unforeseen events we look with confidence to the results for 1960.

APPOINTMENTS

LONDON COUNTY COUNCIL

CITY OF WESTMINSTER COLLEGE, FRANCIS HOUSE, FRANCIS STREET, S.W.1.

Require, September 1st:

1. Female B pursuant to teach MATHS up to A level G.C.E.; ability to teach STATISTICS desirable.

2. Part-time day lecturer (about 12 units per week) for MATHS with ability to teach STATISTICS.

Grade B men, salary scale £2,250–£2,750 rising to £3,150 plus London allowance (£58 or £51); auditions for qualifications and teaching increments within scale for successful candidates.

Application forms from Secretary of College to be returned within two weeks of advertisement date. [1067]

For further appointments and other classified advertisements see pages 490 and 491

UNIVERSITY OF GLASGOW

SIR JOHN MACTAGGART FELLOWSHIP IN ECONOMICS OF HOUSING

Applications are invited for the above Research Fellowship—stipend £1,450 per annum, tenable for a period of three years in the Department of Social and Economic Research. Applicants, who should be qualified in economics or a related subject, will be expected to pursue research into some selected aspect of the housing problem in Scotland under the general direction of the Head of the Department.

Applications should be made before June 4, 1960, to the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHISON, Secretary of University Court.

UNIVERSITY OF GLASGOW

RESEARCH ASSISTANTSHIP IN ECONOMIC HISTORY.

Applications are invited for a Research Assistantship in Economic History. Salary scale £700–£950 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Application (3 copies) should be lodged, not later than May 23, 1960, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHISON, Secretary of University Court.

COMPANY AFFAIRS

Dunlop Rubber

LAST year, Dunlop Rubber earned a better margin on sales and a higher return on capital employed—12¼ per cent, which is the highest for five years. In volume, sales rose by about 8 per cent and in value by about 7 per cent, from £243 million to £261 million. Trading profits advanced by 14 per cent, from £19,760,000 to £22,470,000, and the ordinary dividend was raised from 13 to 15 per cent. No one could argue that this was an unsatisfactory showing. Yet the 10s. shares at 25s. 3d. xd. yield 6 per cent on a dividend covered over twice by earnings. Perhaps investors are waiting for Dunlop to add to its share of the market, instead of simply holding on to what it has before they take a different view. But Dunlop's recent achievements are worth notice. Last year, the group had to bear the increased cost for natural rubber (the biggest item in its costs) and for wages and in some markets reduced prices. Yet profit margins were better. The directors refer to greater efficiency in the factories, reflecting the continuing programme of plant modernisation. Greater use, too, was made of the cheaper synthetic rubber, the proportion going up from 36 to 39 per cent of total consumption.

About 40 per cent of Dunlop's assets are in Britain and they earn about a third of its total profits. Sales in this market, where Dunlop is a big supplier of tyres for new cars directly to manufacturers at margins lower than can be obtained on replacement sales, went up by 7 per cent but profits were "only slightly higher." Moreover, it is in this country in which much of the cost of research and development is borne. Thus much of the advance in profits stemmed from the group's operations overseas. On the Continent and in the Commonwealth, Dunlop apparently finds competition less severe. It is upon overseas operations that Dunlop devotes the biggest proportion of its capital spending: £6½ million out of a total of £10½ million last year. Capital expenditure will run at much the same level this year and working capital commitments are again likely to increase. Last year's additions to stocks and debtors, reflecting increased output and higher raw material prices, were financed partly by an increase in bank loans from £9.4 million to £12.8 million. These are likely to go up again this year. But about 70 per cent of these loans are borrowed outside this country and there are no immediate plans to raise new capital.

Gallaher

OF all the tobacco companies Gallaher has made the biggest strides in recent years. In particular, "Senior Service" and possibly "Park Drive" have taken an increasing share in a slowly growing market, largely at the expense of Imperial Tobacco's leading brands. Imperial Tobacco has a big, though undisclosed, interest in the Gallaher equity, but competition between the two concerns is keen. So far, Gallaher has had the best of it. Imperial Tobacco's share of the market and its profits fell last year. By contrast, Gallaher last year increased its sales by 14 per cent from £244 million to £278 million, its gross profits by 22¼ per cent from £7,754,578 to £9,517,677 and its net profits by 28 per cent from £3,910,292 to £5,004,335. Stocks have jumped from £49 million to £57½ million (largely from bigger leaf purchases) and debtors from £24 million to £27 million. Working capital and the new plant and machinery more than absorbed last year's cash flow of about £3 million and nearly £9 million from the rights issue of ordinary shares and the group's bank overdraft went up from £6 million to nearly £8½ million.

Gallaher recently introduced "Nelson" in the competitive filter cigarette market. In the three months before the budget the group secured yet another increase in the sale of its leading brands. The chairman, Sir Edward de Stein, says it is too early to judge what effect the increase in tobacco duty will have upon consumption but he says that the "directors feel confident that the group's brands will retain, and they hope increase, their share of the trade." Leaf prices are higher; wages have gone up; promotion and advertising costs are rising. All tobacco manufacturers' margins will be down this year but, even so, the Gallaher directors "hope to be able to show as good, if not better, results for 1960." Gallaher shares at 37s. on the 20 per cent dividend (against an equivalent 16⅔ per cent) yield 5½ per cent while "Imps" at 61s. on the dividend increased from 21 to 22½ per cent yield 7.1 per cent. Such a wide differential cannot be accounted for simply by the slight difference in earnings cover. It can only reflect the assumption that Gallaher will go on growing at the expense of Imperial Tobacco. But if Imps is now fighting back more energetically, the standing of the shares is likely to gain.

Rugby Portland Cement

AT the end of last year, Rugby Portland Cement had 7,240 ordinary shareholders. Of these 6,824 individuals, averaging 575 shares each, owned 56 per cent of the issued capital. The remainder was held by institutions. On the scanty evidence available on institutional holdings, this seems a high proportion and it may help to explain why last year's turnover in the shares, at 10 per cent, was almost as low as that reported last week by ICI. As long term investors, the institutions cannot be displeased with their stake in Rugby Portland Cement. For the last fourteen years the group has consistently earned higher profits. It did so again last year, when the trading surplus went up from £1,500,585 to £1,876,965 and the net income from £851,383 to £970,704. The ordinary dividend was left unchanged at 25 per cent on the capital as increased by the rights issue. This disappointed the market but the size of the proposed scrip issue—one new share for every seven held—is such that 25 per cent on the enlarged capital is a distinct possibility. That would put the 5s. shares, standing at 42s. 9d. xd., on a yield of about 3 per cent.

The yield is low but last year's payment was covered nearly three times by earnings and RPC, having delivered more cement to the British market in 1959 than ever before, should continue to enjoy favourable trading conditions this year.

Associated Electrical Industries

LORD CHANDOS is distinctly optimistic about the long-term prospects and, perhaps even more significantly, about the immediate outlook for this giant of the heavy electrical industry. Over the next ten years the electrical industry, he said last week, would be a growth industry, and AEI's share of that growth would expand as the new capacity recently installed took advantage of the expected increase in demand. Moreover, Lord Chandos appears to be confident that this year will bring bigger profits if the improvement in demand for the group's products is maintained.

AEI's trading profits last year were as good as could have been expected: they fell slightly from £15,510,000 to £15,371,000. Lord Chandos pointed to the four divisions of the group which failed to make their full contribution to profits. First, the earnings of the cables division were affected by the price war. Now, however, there are signs that the war is cooling off. AEI's cable division has been rationalised, the number of plants having been reduced from six to four, and Lord Chandos predicts that before the beginning of 1961 there should be an adequate profit on the capital employed in cable making. Secondly the telecommunications division made a loss of about £722,000, largely because the post office suddenly cut its expenditure programme. Since then there has been some recovery in orders, and Lord Chandos looks for "modest profits" this year. Thirdly, earnings of the lamps and lighting division failed to reflect the rise in turnover—but a recent reorganisation may have put this division on a firmer footing. Lastly Lord Chandos confirms that a loss on the Berkeley nuclear power station is inevitable; the £750,000 put aside out of this year's trading profits to meet this loss will, he hopes, be adequate—but it may not be.

Continued on page 484

BP and Royal Dutch/Shell

TWO years or so ago, oil shares were all the rage. They are now out of fashion, in New York as much as London. The yields offered on them are high in comparison with the general run of industrial equities. Yet the giants of the oil world are still earning good profits and have raised their dividends. The average yield on industrial equities is 4½ per cent, one per cent less than that offered by old Consols. The yield on "Shell," at 147s. 9d. on the tax free dividend as increased from 18¾ to 23¾ per cent, is almost exactly on a par with that on old Consols. The yield on British Petroleum at 54s. 3d. xd on the tax free dividend as increased from 8¾ to 10⅝ per cent is more than a point higher, at 6½ per cent. The yield on Burmah Oil, which has holdings in "Shell" and BP, sits between them: its shares at 46s. 9d. yield 6 per cent on the tax free dividend as increased from the equivalent 6⅞ per cent to 8¼ per cent. Few would question the relative ranking of the shares: BP is a net seller of crude and Royal Dutch/Shell a net buyer; BP is far more dependent on the market in the Eastern Hemisphere, where competition has been particularly fierce; and Shell is firmly established in marketing in more countries. Last year Royal Dutch/Shell sold 8 per cent more in volume of oil and oil products and 17 per cent more in value of petrochemicals, with the result that its net income rose by 11 per cent (from £158.8 million to £175.5 million). BP, like Shell, tried to keep costs down, but it was more affected by the depressed level of prices and freights and though the volume of its sales of oil and oil products rose by 4 per cent its net income rose by only £400,000 to £63.4 million.

The arguments for not buying oil shares are well known. Oil is in surplus and will continue to be for the next few years though consumption is growing. There are too many tankers. In many markets oil is being sold below posted prices. The rate of return on new refineries and new marketing outlets is low—and in some areas negligible—and the oil companies have to maintain a high rate of capital spending to hold on to their share of the market. Immediately nothing will alter these facts. Margins have been shaved and the directors of Royal Dutch/Shell no doubt agree with the summing up of the chairman of BP, Sir Neville Gass, when he says:

> In the year 1960 we are expecting an increase in our sales but, again, it would be imprudent, market conditions in the Eastern Hemisphere being what they are, to expect any material increase in the trading margins, though we are paying particular attention to economy in operation in all sides of the business in order to mitigate the effects of the depression in selling prices.

Both groups are keeping a tight rein on operating costs and neither, it perhaps can be assumed, would be unhappy if it managed to sell more oil this year at the same margins as ruled late in 1959.

The arguments for buying oil shares at their present prices and yields are less definite. But they are not insubstantial. Can the giants, in the face of import quotas in the United States, the price-cutting tactics of the independent refineries and the sale of Russian oil hold on to their share of the market? That certainly is their aim. Sir Neville notes that while BP's total sales rose by 4 per cent in volume its sales through associated marketing companies rose by nearly 10 per cent. This, he argues, confirms the trend to cover a greater proportion of total product sales through the group's own direct marketing organisations. Control from the oil well to the filling station over a bigger proportion of total sales by the giants will certainly make it more difficult for the outsiders to elbow their way into the market. In oil both groups may hold their own. In petrochemicals they are adding to capacity; here margins are much higher than in selling oil, though, as Lord Godber, the chairman of "Shell," points out, competition can be expected to become more severe.

HOW far can they bring their capital programmes closer in line with market conditions? To preserve their markets, both have to continue to be big spenders. Last year BP spent £141 million, £3 million more than in 1958. Royal Dutch/Shell along with its associate companies spent £422 million, £35 million more than in 1958, but £30 million of this the directors say was "exceptional." Both have tanker building programmes to complete. Their completion will add to the tanker surplus and BP has now arranged with the shipyards to lengthen deliveries out until 1966. Both groups seem to be prepared to adjust and, if necessary, to trim their spending. Lord Godber says: "we are paying particular attention to projects aimed at reducing costs and improving efficiency . . . our aim is to hold capital expenditure at the minimum consistent with the needs of the business, and it is our intention to pursue this course as long as present conditions in the oil industry continue." Sir Neville says "in present conditions the urgency of the need for new projects is being very carefully assessed and we have achieved some slowing down in the rate of expenditure by deferring schemes or by spreading the period of completion of previously authorised programmes." The balance of spending may have to be altered too. Even a small cut in capital expenditure or a slight shift in its nature has its significance for shareholders, for it alters the claim on financial resources.

The oil giants seem prepared to economise—within limits. How then are they likely to view the claims of their shareholders? The impact of the rights issue by Royal Dutch/Shell was felt as much in New York and Rotterdam as in London. BP is going once again to Switzerland for new money. Indeed what Lord Godber says about Royal Dutch/Shell can be said in almost equal measure about BP:

> Access to the markets of both the old and new worlds creates a security of finance which has not previously been enjoyed by the Group. In addition, new sources of local firms have been opened up by our overseas companies in the countries in which they operate. We have also developed opportunities for financing tankers and other facilities from outside sources.

Lord Godber specifically related the greater availability of capital to the group's dividend policy, saying that it "has always been to distribute to shareholders the maximum compatible with the prudent administration of the business . . . we have, in fact, during the past decade raised dividends fairly steadily." In the future, the oil giants may not be so great eaters of capital as they were and they may look for new money rather more from the capital markets and rather less from self-generated income. They were not ungenerous with their 1959 dividends. Have oil shares been set on one side, as untouchables, for just a little too long? They are no longer the counters for a quick turn as they once were; but they should not be unattractive to the long term investor looking for income.

United Drapery

IN the year to January 30th last, the trading profits of United Drapery Stores rose by 14 per cent, from £7,912,927 to £9,024,834 and, not unexpectedly, the provision for unearned profit on hire purchase contracts also increased (from £553,832 to £685,984). Net profits were 18 per cent higher at £3,845,954 (against £3,252,973). In 1958-59 ordinary shareholders received a dividend of 32½ per cent plus a special interim of 2½ per cent. The total for 1959-60 has been set at 37½ per cent on the capital as increased by the one-for-ten rights issue. The payment is higher than the forecast of 35 per cent made at the time of the issue but the stock market was hoping for a scrip issue and after the announcement the 5s. units were marked down 4s. 3d. to 48s. 6d. They yield 3.9 per cent on the twice covered dividend.

Perhaps the most important point to emerge from the preliminary statement is that the pace of expansion seems to be slackening. The interim report in October showed that in the first half of the financial year trading profits rose by 16½ per cent compared with the first half of 1958-59; but in the second half of 1959-60 they rose by only 12 per cent compared with the second half of the previous year.

United Molasses

IN November the directors of United Molasses said that although profits in the first nine months of the financial year were running at a lower level than in the same period in 1958 earnings would be sufficient to cover an unchanged tax-free dividend of 15 per cent. In the event trading profits fell last year from £5,112,271 to £4,819,675. The demand for molasses may have again helped to offset the effect of the fall in freight rates on United Molasses' profits. The cover for the unchanged ordinary dividend has in fact risen slightly from 1.5 times to 1.6 times. Once again a special tax-free distribution of 3¾ per cent from capital reserves accompanies the trading dividend.

Shipping Profits

THE fall in the operating surplus of **Cunard Steam-Ship** last year, from £5,670,919 to £5,039,666, is not exceptionally large. Thanks to an investment allowance relief of £565,000 (against £493,400) the tax charge was only £149,896 (against £495,177), so that a net surplus of £899,577 compares with one of £1,392,047. Earnings covering the maintained ordinary dividend of 8 per cent thus come to just over 10 per cent. If there had been no relief in respect of investment allowances, earnings would have amounted to just over 3 per cent. Even if there is some recovery in profits the future dividend prospect is not a particularly bright one, for the company has a big replacement problem on its hands. The future will depend on the decision of the Government on the replacement of the "Queens" after it has received the recommendations of the Chandos committee. The yield of 7.4 per cent on the £1 shares at 21s. 6d. is some measure of the uncertainty.

Although freight rates were depressed, the profits of **Liner Holdings** fell only slightly last year, from £2.1 million to £1.9 million. Freight rates are now slightly firmer, and Mr A. C. Tod, the chairman, indicates in his statement that he expects a further improvement in rates on the West Africa, Burma and North American runs. Substantial liquid balances of about £18 million amply cover capital commitments of £7 million, while the unchanged dividend of 13 per cent is covered nearly four times by earnings. At 56s. the £1 shares yield 4.7 per cent.

The trading results for 1959 of **Royal Mail Lines**, which operates largely on the South American and West Indian runs, were not unsatisfactory. Meat shipments from Argentina and Uruguay have continued to fall and passenger traffic was again affected by the economic ills of Argentina and Brazil. Even so, Royal Mail's operating surplus fell by only £291,821 to £2,008,238. This figure, however, is struck after crediting £453,500 (against £445,000) from the contingency and deferred repairs account and after adding £276,879 from surplus on the sale of ships. In 1958 this surplus amounted to £165,087 and was credited directly to the fleet replacement fund. The unchanged dividend of 8 per cent is covered 1.8 times by earnings and at 25s. 9d. the £1 units yield 6.4 per cent.

Cammell Laird

IF any reminder were needed that the shipbuilding industry is facing hard times, it came this week from Cammell Laird. Since September, when the interim dividend was cut from 4 per cent to 3 per cent, the absence of any indication of a revival in shipbuilding orders coupled with the inter-union disputes which have beset Cammell Laird's yards have given little cause for hope. In the event the preliminary statement was gloomier than even the pessimists had expected. Trading profits slumped by no less than 60 per cent, from £1,388,464 to £571,557 and the ordinary dividend from trading has been effectively reduced from 15 per cent to 7 per cent. In addition, there is to be a special distribution of 2½ per cent. The only bright spot in the profit statement is the rise in investment income from £598,860 to £715,996—partly a reflection of the bigger dividend from Metropolitan Cammell Carriage which Cammell Laird owns jointly with Vickers. The 5s. ordinary now stand at 7s. 3d., to yield 4.9 per cent.

London Stock Exchange

FIRST DEALINGS	April 4	April 25	May 9
LAST DEALINGS	April 22	May 6	May 20
ACCOUNT DAY	May 3	May 17	May 31

UNCERTAINTY was still the order of the day in stock markets. Publication of the clearing banks' monthly figures of advances served to heighten fears of credit restrictions. Most investors have adopted a wait-and-see attitude and the amount of business done was small. Gilt-edged stocks were steady until Tuesday when, despite a fair amount of two-way business, they were marked down all round. Some prices improved on Wednesday as a few buyers came in to take advantage of the lower prices, but over the week to the close on Wednesday most of the Funds showed net losses. In undated stocks 3½ per cent War Loan fell ⅛ to 61⅛ and in short-dated stocks 4½ per cent Conversion 1964 closed ⅛ down at 97½. Medium-dated stocks also lost ground with British Electricity 4¼ per cent 1974-79 ⅞ down at 85⅛. Home Corporation loans moved lower in sympathy, 5 per cent LCC 1980-83 closing ⅝ lower at 92¼.

Industrial equities drifted lower over the week but on Wednesday afternoon steel and heavy engineering shares rallied as bargain-hunters came in. Even so, the small gains which ensued were not sufficient to recoup losses sustained earlier in the week. Over the week to Wednesday's close *The Economist* indicator fell 10.4 points to 341.0, its lowest point for the year so far. Steel shares came in for some of the worst knocks early in the week and over the week to the close on Wednesday Steel of Wales lost 3d. to 42s. 6d., John Summers were unchanged at 72s. while United Steel closed 1s. lower at 76s. 6d. American favourites tended to see-saw in line with the erratic mood of Wall Street. Unilever Ltd. dropped 1s. 6d. to 150s. 6d., but in contrast, the NV shares put on 5s. at 194s. 6d. Philips Lamps gained 2s. 3d. to 180s. 6d., and even in the face of the latest denial from Ford of America that a take-over of the English company was planned, Ford closed 3s. up at 104s. 6d., after touching 105s. 6d. Selective buying of heavy engineering shares on Wednesday still left most of these shares lower on the week. Vickers lost 7½d. to 30s. 6d., Guest Keen fell by 1s. to 84s. and Davy-United closed 3s. 6d. lower at 104s. 6d. Electrical shares were helped by the optimistic report from AEI whose shares put on 1s. 1½d. to 52s. 3d.; but English Electric closed 1s. down at 39s. 4½d. and General Electric lost 10½d. at 37s. 6d. Tobacco shares continued to slide with Imperial Tobacco slipping 1s. 6d. to 62s. 9d.

Oil shares were mixed. Late buying from New York on Tuesday helping Shell to gain 6d. to 147s. 3d. Burmah, on the other hand, lost 1s. at 47s. 3d. and BP closed unchanged at 55s. Sharp falls were seen in the gold share market on Tuesday and Wednesday when scattered selling from the Cape occurred. Free State Geduld fell 12s. to 116s. 3d. and Western Holdings closed 16s. 4½d. lower at 118s. 9d.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended April 23, 1960, there was an "above-line" deficit (after allowing for sinking funds) of £16,572,000 compared with a deficit of £29,109,000 in the previous week and a deficit of £23,981,000 in the corresponding period of last year. There was a net expenditure "below-line" of £7,283,000 leaving a total cumulative deficit to date of £106,787,000 compared with £40,239,000 in 1959-60.

THE MONEY MARKET

APPLICATIONS for last Friday's offer of £270 million of Treasury bills fell by nearly £29 million to just under £426 million. The discount market's concerted bid of £98 16s. 9d. was unchanged, tenderers receiving about 51 per cent of their applications against 41 per cent a week ago. The average rate of discount was £4 13s. 0.88d. against the previous week's rate of £4 13s. 1.10d.

Credit conditions in Lombard Street were comfortable throughout the first three days of this week; on Monday a surplus of credit emerged and the Bank of England sold a small amount of bills back to the market. Rates for overnight money have often been down to the clearing banks' minimum of 3½ per cent and even below. There has been a good demand for bills and July maturities have sold at 4$\frac{13}{16}$ per cent. Before the week-end, credit was very tight on Thursday, but a large amount of special help saved the market from recourse to the Bank at the penal rate.

In New York, Treasury bill rates are little changed, with three months' maturities at 3.317 per cent at this week's tender and the 26-week issue at 3.705 per cent.

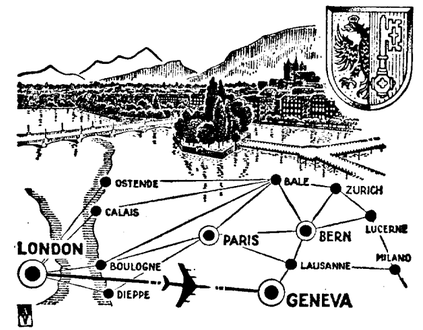
What future for you?

It's fun to read the tea-leaves now and again. To see if there's a letter coming, or some money, or a tall dark stranger.

But you don't plan your life on what you read in the tea-leaves—certainly not your money matters.



The sensible man plans his financial future on Prudential policies. He sees there the assurance that he will have money when he retires, money for his family if he dies, money if his home is burnt down or if he has an accident.

Have a talk with the man from the Prudential. You'll find him a knowledgeable adviser.

Ask the man from the
PRUDENTIAL

It's easy to get to
GENEVA

the ancient city on the beautiful Lake of Geneva. Although known in every country of the world as a meeting place for conferences of international importance, Geneva is also renowned for its great humanitarian, banking, commercial, industrial and tourist activities.

And easier still

when there, to contact the Geneva Branch of the **Union Bank of Switzerland,** whose great experience in all financial matters is at your disposal.

Travellers' Cheques and Travellers' Letters of Credit can, needless to say, also be negotiated there.

and I thought

"What if it were my business on fire?..."

"The whole place a shambles," I thought, "buildings burnt out, stock gone up in smoke. Have I got enough cover? When did I last look at the insurance?"

So I did the sensible thing...

I discussed my problems with THE LONDON ASSURANCE. Most helpful they were. We went through the Fire Schedule together, making sure that the cover for every item was in line with today's values. Then they said, "What about loss of profits?" And I said, "Yes, certainly I need cover for that too." Result was, I ended up with one of their Traders Collective policies which covers me for fire, loss of profits and many other business risks as well.

I sleep a lot sounder at nights since . . .

I wrote to

POTENTIAL MERCHANT BANKING EXECUTIVE

for Henry W. Peabody & Co. of London Ltd., an international merchanting member of the Sale-Tilney Group. The man appointed will be responsible to the head of the finance department to carry out part of the continually expanding work concerning bills, credits, documents, foreign exchange, insurance and merchant banking.

Candidates should preferably not be over 30 and must have had some specialised training in and practical experience of a substantial part of the work and be eager to master the field as the company's world-wide trading requires. Salary to exceed £1,000 per annum, subject to candidate's experience: group non-contributory pension scheme. Opportunities for advancement exist.

Please send brief details in confidence, quoting reference S.2361, to D. M. H. Evans, In no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED, 17, Stratton Street, London, W.1.

Research Officer required for Civil Service Trade Union. Applicants should have a degree in Economics or associated subjects. Experience of both research work and trade union activity desirable.

Salary scale of £1,205 — £1,850 (covered by eleven annual increments). Commencing salary may be adjusted according to age and experience up to £1,410. Non-contributory pension scheme. Five-day week. 30 working days' annual leave.

Applications by May 25, 1960, to General Secretary, Institution of Professional Civil Servants, 28 Broadway, London, S.W.1.

BRISTOL COLLEGE OF SCIENCE AND TECHNOLOGY
(COLLEGE OF ADVANCED TECHNOLOGY)

The Governors invite applications for the following posts in the DEPARTMENT OF GENERAL STUDIES.

1. LECTURER IN ECONOMICS.

Applicants must possess a good honours degree; industrial and teaching experience desirable.

2. ASSISTANT, GRADE B, IN SOCIAL STUDIES.

TOOTING BROADWAY, LONDON, S.W.17.

As soon as possible (1) Lecturer in Accountancy, (2) Tutor, Grade B, Book-keeping and Accounts, (3) 2 Tutors, (Grade A (i) Government and Law, (ii) English. Applicants should hold University or professional qualifications, preferably with related industrial and educational experience.

College provides full- and part-time day and evening courses for professional, University entrance and similar examinations; also courses in business, trade and administrative studies. Consultancy research, and work on publications by staff, encouraged. Salary scales (men):—Lecturer, £1,370 x £35 to £1,550; possible entry above minimum if justified by experience and present position; Grade B, £700 x £27 10s. to £1,150; Grade A, £520 x £27 10s. to £1,000; possible additions for qualifications and training; increments within scale for experience (Grades A and B). Slightly lower scales for women until 1961. London allowance in all cases £38 or £51. Application forms from Secretary at College to be returned by May 13th. (913.)

UNIVERSITY OF QUEENSLAND
LECTURER IN ECONOMICS
within the Department of External Studies.

Applications are invited for the above-mentioned position. Applicants should have an Honours degree in Economics or equivalent qualifications.

Salary £A1,540-£A2,040 per annum.

Further particulars are obtainable from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on MAY 31, 1960.

A LEADING firm of stockbrokers has a vacancy in its overseas research department for a qualified accountant or economist with a good knowledge of French. Working knowledge of German an advantage. Age not exceeding 35. Initial salary according to experience but not less than £1,000 per annum with participation in a bonus scheme. Pension Scheme. Luncheon Vouchers. Good Prospects.—Write Box 1318.

UNIVERSITY OF ADELAIDE
FACULTIES OF ARTS AND ECONOMICS.

Applications are invited for the following appointments in the Faculties of Arts and Economics:

LECTURER IN EDUCATION
LECTURER IN FRENCH
LECTURER IN GEOGRAPHY
LECTURER IN ECONOMICS

Salary scale: £A1,500 x £A80 — £A2,060, with superannuation on the F.S.S.U. basis. This scale is under review and will, it is expected, be increased in 1961.

General Conditions of appointment and a statement about the posts for the information of potential candidates may be had on application to the Registrar or to the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

APPLICATIONS, in duplicate and giving the information listed in the final paragraph of the general conditions of appointment, should reach the Secretary, The University of Adelaide, Adelaide, South Australia, not later than MAY 31, 1960.

STATISTICIAN

The Marketing Research Division of a large manufacturing concern invites applications from men or women aged 25-35 years who have a good degree in statistics or mathematics with post graduate or commercial experience in the application of statistical method to practical problems. The duties will include the application and development of statistical techniques in connection with sample surveys. Good salary and excellent prospects for advancement.—Please write giving full details in confidence to Box No. 1317.

UNIVERSITY OF CANTERBURY
NEW ZEALAND.

Applications are invited for the following appointments:

LECTURER IN POLITICAL SCIENCE in the Department of History and Political Science. Applicants should have an Honours degree. A special interest in the comparative study of political institutions or the analysis of political society is desirable but not essential.

LECTURER IN ECONOMICS. Applicants should have an Honours degree in Economics or a comparable degree. An interest in Mathematical Economics will be appreciated, but is not a condition for appointment.

The salary for a Lecturer is at the rate of £1,250 per annum rising by annual increments of £75 to £1,700 per annum. *Approved fares to Christchurch* will be allowed for the appointee, his wife and children; in addition actual removal expenses within specified limits will be paid.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in New Zealand and London, on MAY 31, 1960.

GOVERNMENT SOCIAL SURVEY

The SOCIAL SURVEY DIVISION of the CENTRAL OFFICE OF INFORMATION requires RESEARCH OFFICER to conduct, and to assist in the conduct of, sample surveys covering a wide range of Social and Economic problems. The selected candidate will be free to devise fresh methods of approach to their problems and will work with highly skilled technical sections covering sampling, interviewing, coding and tabulation. Preference will be given to applicants with a university degree in one of the Social Sciences or Statistics but consideration will be given to applicants with a diploma or full-time experience in a research organisation. The post is graded Information Officer (unestablished). Salary £1,205 to £1,815 (men); £1,180 to £1,389 (women).—Write, giving age, full details of experience and qualifications to Manager (P.E. 1363), Ministry of Labour, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4.

CARIBBEAN
CHARTERED OR CERTIFIED ACCOUNTANT

for progressive commercial firm operating in British Guiana, Trinidad and Jamaica. Applicants should be recently qualified, married, keen to emigrate. Location Georgetown; overseas leave with travelling expenses paid every two years.—Write giving full details of qualifications and experience in first instance to Box D.916, c/o Streets, 110 Old Broad St., E.C.2.

MARKET RESEARCH OFFICER

Massey-Ferguson (U.K.) Ltd., have a vacancy for a Market Research Officer on the Staff of the Manager, Market and Economic Research, at their Coventry headquarters.

Applicants should have a University degree or diploma in agriculture, agricultural engineering or economics. They should have had some experience of conducting surveys and interviews among farmers and be able to prepare reports on such surveys, including statistical presentation. Good working knowledge of agricultural machinery and a basic knowledge of principles of farm management are required.

The starting salary for this post, which is pensionable, will depend on age and experience, but will not be less than £1,500.

Applications giving personal history, qualifications and experience and quoting reference H.1, should be addressed in confidence to the:

MANAGER, RECRUITMENT & TRAINING,
MASSEY-FERGUSON (U.K.) LTD.
BANNER LANE,
COVENTRY.

UNIVERSITY OF BIRMINGHAM
FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited for the newly established Chair of Political Science.

Applications (three copies), together with the names of three referees, should be sent not later than May 31, 1960, to the Registrar, The University, Edgbaston, Birmingham, 15, from whom further particulars may be obtained.

H.M. TREASURY

At least two appointments in the Economic Section for work on economic trends at home and overseas are offered to men or women at least 21 and preferably under 30 with at least a 2nd class honours degree in Economics or related subject. Final year students may be considered for appointment for 5 years, or less by arrangement. Salary within the range £655-£1,150 (men); the starting point being determined by age and experience. F.S.S.U. Application forms, obtainable from Civil Service Commission, Burlington Gardens, London, W.1 (quote S126/60/9), should be returned by May 24, 1960.

FACTORY MANAGEMENT EXECUTIVE

Gentleman trained and experienced in the maintenance of large Factories and Labour Control, will shortly be required as Assistant to Works Superintendent controlling Group of Factories in North of England City.

Candidates for this position, who should be in age group 33 to 40, are asked to include in their applications full details of training, past experience, also of positions held, and should at present be in receipt of not less than £1,500 per annum.

The position is superannuable.

Letters received will be treated with the utmost confidence. Write Box 1314.

BRITISH NYLON SPINNERS LIMITED require a woman, aged 25-45, as an Information Assistant for the Economics Department of their London Office in Knightsbridge. Candidates, preferably educated to degree standard, should have had some experience of library work, with genuine interest in Economics and their application to the textile industry. Excellent working conditions in modern offices.—Apply in writing to Personnel Manager, Pontypool, Mon.

For other appointments see pages 479 and 491

CANBERRA UNIVERSITY COLLEGE
AUSTRALIA

Applications are invited for the new posts listed below.

In 1960 the College will become part of the Australian National University and its present functions will be continued. Further details of the association are given in the information sheets for applicants.

Successful applicants will be provided with facilities for, and encouraged to undertake, research.

SENIOR LECTURER OR LECTURER IN CLASSICS
SENIOR LECTURER OR LECTURER IN HISTORY
SENIOR LECTURER OR LECTURER IN STATISTICS
LECTURER OR SENIOR TUTOR IN BAHASA INDONESIA

NOTE: It is hoped to make more than one appointment in respect of each of the Science posts.

Salary ranges are now under review. At present they are as follows:

Professor: £A3,552.
Associate Professor: £A2,802.
Senior Lecturer: £A2,152 x £A80 — £A2,552.
Lecturer: £A1,502 x £A75 — £A2,102.
Senior Tutor: £A1,302 x £A50 — £A1,452.

Commencing salaries will be in accordance with qualifications and experience.

Further information (including details of special requirements for some of the posts) and the summary forms which must accompany an application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, with whom two copies of each application must also be lodged.

Applications close, in Australia and London, on June 15, 1960.

EDITOR FOR NEW TECHNICAL JOURNAL

Associated Electrical Industries Ltd. is planning a new technical journal to appear in the near future. This new venture will afford a first-class opportunity for a man of ideas, preferably with technical journalistic experience. The Company wishes to appoint an Editor as soon as possible so that he may help to formulate the editorial policy which he will be responsible for implementing.

Applicants should preferably be between 30 and 40 years of age, with an engineering or scientific background and qualifications. The ability to commission, assess and edit technical articles is essential: an appreciation of good typography and layout would be desirable.

Salary will depend on the qualifications and experience but will be substantial and the post is pensionable.

Applications giving full details of age, experience, qualifications and salary should be addressed to:

AEI
GENERAL MANAGER, PERSONNEL SERVICES,
Associated Electrical Industries Ltd.,
33, GROSVENOR PLACE, LONDON, S.W.1.

LEADING STOCKBROKERS REQUIRE STATISTICIAN to assist in their Gilt-Edged Department and eventually take charge of Gilt-Edged statistics. Actuarial qualifications an advantage but not essential. Salary by arrangement.—Write giving details of experience, to Box "S.A.," c/o J. W. Vickers & Co. Ltd., 7 Great Winchester Street, E.C.2.

CHARTERED ACCOUNTANT age under 30, required by C. J. & P. COATS LTD. Good opportunity for first-class man, with prospects of overseas service and residence abroad. Superannuated appointment, attractive initial salary according to qualifications and experience.—Applications in writing to the Personnel Manager, J. & P. Coats, Ltd., 155 St. Vincent Street, Glasgow, C.2, giving full relevant particulars.

3. Approval of the Balance Sheet and the Profit & Loss Account for 1959 and declaration of dividend for 1959.
4. Distribution of shares from the share premium reserve.

This agenda, the nomination relating to item 1 of the agenda, documents mentioned under items 2 and 3 of the agenda with the relevant notes in accordance with Article 42 of the Netherlands Commercial Code, and with the proposals submitted by the Board of Directors, together with the proposals referred to under items 3 and 4 of the agenda, will be available for inspection from today until after the Meeting, and may be obtained by shareholders free of charge at the Company's office.

30, Carel van Bylandtlaan, The Hague, and at the offices specified below.

In order to attend and address the Meeting and to exercise voting rights thereat in person or by proxy:

(a) *Holders of share certificates to bearer* will be required to deposit against receipt
either their share certificates
or evidence that their share certificates have been deposited in open custody with the Nederlandsche Bank

not later than Friday, May 13, 1960, at one of the places mentioned below, viz.:

In The Netherlands
at the Nederlandsche Handel-Maatschappij, N.V., Amsterdam
at the Ras-Associatie N.V., Amsterdam
at the Amsterdamsche Bank N.V., Amsterdam
at the Banque de Paris et des Pays-Bas, Amsterdam
at Messrs. Hope & Co., Amsterdam
at Messrs. Pierson, Heldring & Pierson, Amsterdam
at the Rotterdamsche Bank N.V., Amsterdam
at the Twentsche Bank, N.V., Amsterdam
at Messrs. Schuld & Capadose, The Hague
at Messrs. Pierson, Heldring & Pierson, The Hague
at Messrs. Van der Hoop, Offers & Zoon, Rotterdam
at Messrs. R. Mees & Zoonen, Rotterdam
and at the branches and sub-branches of these banking houses in the Netherlands.
In the United States of America
at The Chase Manhattan Bank, New York.
In the United Kingdom
at Messrs. N. M. Rothschild & Sons, London.
In France
at M. M. Lazard Frères & Cie., Paris.
In Switzerland
at the Crédit Suisse, Zürich.
In Belgium
at the Banque de la Société Générale de Belgique, Brussels, and
at the Crédit Lyonnais S.A., Brussels.
In Germany
at the Deutsche Bank A.G. and the Dresdner Bank A.G., Frankfurt-Main, Düsseldorf, Hamburg and Munich; the Norddeutsche Landesbank A.G. and the Dresdner Bank A.G., Norddeutsche, and
at the Berliner Disconto Bank A.G. and the Bank für Handel und Industrie A.G., West Berlin

and

(b) Registered holders of registered shares must make known to the Company in writing their desire to attend and address the Meeting and to exercise voting rights thereat by not later than Thursday, May 12, 1960, with respect to shares of New York registry, at the office of The Chase Manhattan Bank, Corporate Agency Department, 43 Exchange Place, New York (New York); with respect to shares in Amsterdam registry, at the Nederlandsche Handel-Maatschappij N.V., Amsterdam; and (c) with respect to all other registered shares, at the office of the Company in The Hague or at any of the offices listed in Paragraph A above.

THE BOARD OF DIRECTORS.

The Hague, April, 1960.

APPOINTMENT REQUIRED

ADVERTISER with experience in wide experience, seeks a position (Personnel or a similar work) in the London area. Education and second management course. Interested in more important than welfare commodities. Box 1309.

EDUCATION

UNIVERSITY OF LONDON. A lecture entitled "Speed and Investment" will be delivered by Dr. Ernest J. Pratt (Manager at A.P.M.) on May 5th, at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. ADMISSION FREE, WITHOUT TICKET. Lyndall Urwick, Academic Registrar.

SUCCESSFUL TUITION FOR THE B.SC.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the Intermediate and Final examinations for London External B.Sc.(Econ.) and Part I of the Final examination for B.Sc.(Econ.). Write for FREE Prospectus (B.H.) stating which of the B.Sc.(Econ.) exams interest you. Tuition under the G.C.E. Law, Secretarial, Accountancy, Professional examinations and Degrees from L.W. Scott Hayward, C.B.E., LL.B., Director of Studies (Dept. P.1), WOLSEY HALL, OXFORD.

SECRETARIAL TRAINING, especially for University graduates and other students, 6 months full time course (Pitman's, Gregg, Shorthand, Typewriting, Secretarial duties, Commercial French, Economics, Office Organisation). Also Part I Examinations Courses in Economics and Law. Write today for free prospectus and full details, stating exams you are taking or subjects in which interested, to The Secretary (Dept. E), Hemingford Park Avenue, N.18. PARK 4064.

EXPERT POSTAL TUITION

for Examinations, Universities, Law, Accountancy, Commerce, Secretarial, Civil Service, Management, Transport, Computers, Costing, Economics, Languages, etc. Also many Correspondence Courses in Professional subjects. Write today for free prospectus, stating your interests, quoting exams or subjects in which interested, to the Secretary (Dept. 1), METROPOLITAN COLLEGE, ST. ALBANS or call at 30 Queen Victoria Street, London, E.C.4.

UCON
hydrolubes
help
protect
against
fire

In a large steel mill recently, molten slag was accidentally dumped on a steel plate floor which covered copper hydraulic lines connected to furnace control equipment. The hot slag pierced the steel flooring and melted the hydraulic lines. About 20 gallons of UCON Hydrolubes sprayed out before the pumps could be turned off. Yet, no fire resulted. A serious fire that could have caused extensive property damage and serious personal injury was prevented by using UCON Hydrolubes, the fire resistant fluid. UCON Hydrolubes also provide wear and corrosion resistance equal to petroleum oil.

UCON Hydrolubes are available in a range of viscosities to meet the requirements of various types of equipment such as: die-casting machines, ingot manipulators, furnace controls, electric welders and presses. Conversion of your present hydraulic equipment can be done quickly and inexpensively.

Ask for our FREE booklet IE-4a and learn why UCON Hydrolubes are the economical answer to fire-resistance in hydraulic fluids. Write to UNION CARBIDE INTERNATIONAL COMPANY, Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, New York, U.S.A. Cable Address; UNICARBIDE, N. Y.

Coming home to you...

In every home every day plastics make life happier—less laborious, more colourful, more hygienic . . . Kitchen fittings and utensils; electrical, radio, and television gear; toys; bathroom furnishings and plumbing; decorative materials; gardening goods and gadgets . . .
Their range is almost endless; almost as varied is the number of plastics substances, each with different properties, each tailor-made in the laboratory with special needs in view . . .
Plastics are formulated with care; plastics need care in manufacture, smooth and thorough mixing, careful control of critical factors, dimensional accuracy in the finished product, whether it is sheet, moulding, or extrusion.
Francis Shaw machinery for the plastics industry is the result of long co-operation with manufacturers, constant research and development, and skilled engineering with high quality materials.

An important new machine is the Shaw P4½ inch extruder. With a nitralloy screw channelled for internal cooling, a cylinder fitted with grooved sleeves and with five separate heating zones, this extruder offers sensitive and immediate electronic temperature control. An electrically-heated die-head can be supplied, with five heating zones also electronically controlled.

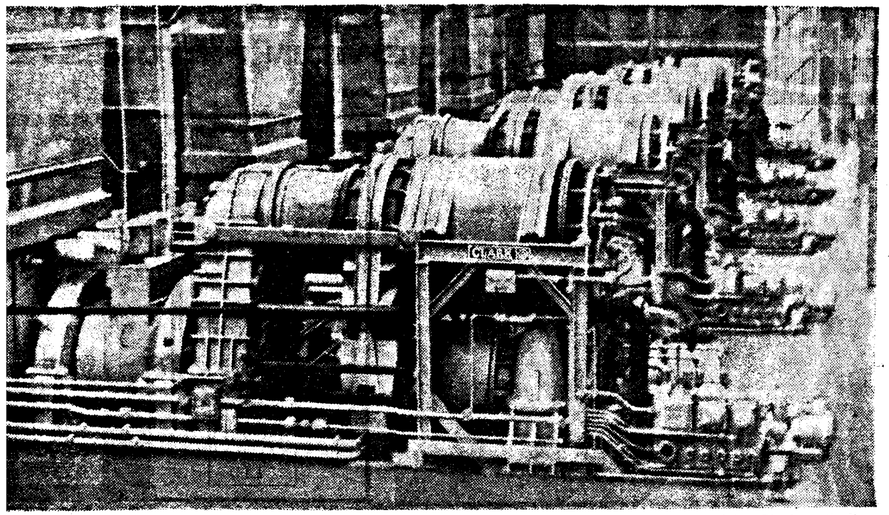
AEI

WORLD ELECTRICAL NEWS IN PICTURES-2

Secrets of the brain. It is a great boon to the surgeon, and to his patient, to be able to trace and localise brain tumours and to detect epileptic areas which the eye cannot see. This is done by "Cortical Electrodes", shown on the skull above, which make it possible to chart brain impulses on a recording device. AEI worked closely with London Hospital to evolve this, the most advanced equipment of its kind in the world

"Banking" power. Why will Blaenau Ffestiniog power station cost about £3 millions less to build and substantially less to run than an ordinary power station? Because AEI water-wheel generators will put night time power into storage for use at peak day time hours. They will pump water uphill at night and re-convert it into power as it falls by day.

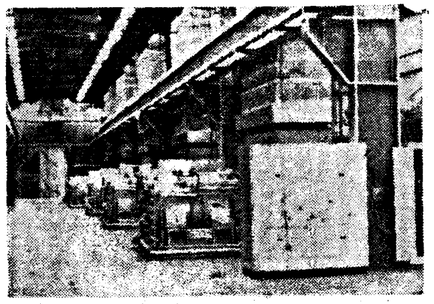
Night walk! Saturday after Saturday for two years these men worked from midnight, when the last train passed, until dawn, laying cables for the electrification of the railway between Gillingham, Sheerness, Ramsgate and Dover. Altogether some 450 miles of AEI cables were installed alongside the 90 miles of track—part of AEI's contribution to faster, cleaner, more frequent trains between London and the South-East.



'Key' man goes aboard. Frank Goodall, 60, has served forty years on the AEI seagoing staff of over 400 Radio Officers who keep seafarers within call of safety in ships and tankers the world over. Besides making, installing, servicing and operating ship's radio equipment, AEI has men standing by ready to fly at a moment's notice anywhere in the world if a replacement operator should be needed.

AEI stands for **Associated Electrical Industries Limited**

Britain's Largest Electrical Manufacturer



33 GROSVENOR PLACE · LONDON · S.W.1

—a single manufacturing company uniting the people, traditions and knowledge of such world-famous names in electricity as Metrovick, BTH, Siemens, Ediswan, Henley's, Birlec and Hotpoint. *With its 100,000 employees, 60 factories, 94,500 stockholders, £133,000,000 capital and £208,000,000 sales last year,* AEI *is helping Britain to compete in the electrical markets of the world.* AEI resources are increasing the world's supply of electric power, AEI research is finding new ways for people to benefit from it. Every working day of the year, AEI delivers an average of £800,000 worth of electrical equipment to its customers.

Five Clark Model 305 Gas Turbines drive Clark vertically-split centrifugal compressors operating in series. The station is highly automated with only two operators required per shift

CLARK Gas Turbines Power Aramco 210,000,000 SCFD Gas Injection Plant

At 'Ain Dar, Saudi Arabia, five Clark Model 305 Gas Turbines are driving Clark Vertically-Split Centrifugal Compressors for the gas injection program of the Arabian American Oil Company. Available fuel for the turbines is sour gas while ambient temperatures soar to unusually high levels.

The 'Ain Dar injection plant draws gas from five gas-oil separator plants at a pressure of 125 psig, compressing it to 2100 psig for injection. Any four of the five series-connected, turbine-driven Clark compressors can provide the necessary pressure ratio for injection. Maximum flexibility is achieved by the use of dual shaft gas turbines. An additional Model 302 turbine drives a 5600 KW generator to power the gas-oil separator plants. Clark Model 305 and 302 Gas Turbines have a standard rating of 8700-9800 bhp.

Proved dependability, minimum maintenance and the low installation costs experienced by other users of Clark gas turbines were important factors in selecting the turbines and centrifugal compressors for the 'Ain Dar plant.

Whether made in Europe, or in the Clark home plant in the U.S.A., all units and components are identical and completely interchangeable. The vast experience of Clark Bros. Co.—in design, manufacture and application—is available to you through the offices listed below.

STEEL - Spring report

The battle for exports: Steelmen optimistic

Last year, over *half* Britain's exports were steel or goods made from steel. So the steel industry has a vital part to play in our struggle to maintain — or improve — our share in the world's increasingly competitive export markets.

If past trends continue, the importance of steel in our exports is likely to grow even greater — particularly as a very large part of our steel exports represent *clear profit* in the import-export ledger.

PAID FOR 2½ TIMES OVER

As a result of its post-war development programme – which will have cost over £1,000 million by 1962 – Britain's steel industry needs only marginal imports of pig iron, scrap and steel. But in view of the limit to the supplies of scrap and to the reserves of home ore, it will become increasingly dependent on imported iron ore. Manganese ore and ferro-alloys have also to come from abroad. These imports cost about £100 million.

But this is more than paid for by *direct* exports of iron and steel alone – value £187 million – without taking into account the steel that is exported in manufactured goods – estimated value about £165 million.

Allowing a debit for our modest indirect imports of steel, the steel industry's overseas earnings are about 2½ times as great as its overseas payments.

WORLD-WIDE TREND

Until the 1914 war Britain prospered by exporting coal and cotton textiles. Increasing use of oil, and the development of textile industries abroad, reduced the demand for Britain's coal and cloth. Over the last 40 years we have had to make drastic changes in the whole structure of our export trade.

The shift has been to goods such as chemicals, machinery, ships, cars and other transport equipment – mainly *goods made from steel.*

STEEL AS STEEL

Steel exports as such have not increased nearly so steeply. To many newly independent countries the possession of a steel works, almost as much as an airline, is the status symbol of the nation which has arrived.

This means increasing competition in export markets. But exports to less developed countries will probably continue to rise. The type of steel exported to these countries, however, will probably change towards products which need for their manufacture the complex and costly plant found in more highly developed steel industries.

Britain should not find it difficult to hold her present share of world exports of steel, at least for the next five years.

World steel exports will probably be about 45 million tons in 1965: if Britain keeps her share of this total, her steel exports will rise by about 5½% annually – probably rather faster than other exports.

PRICES

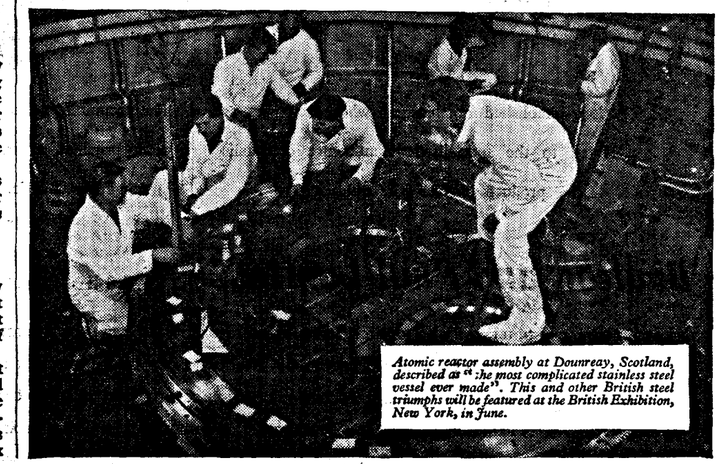
British manufacturers of goods made from steel pay *less* for home-produced steel than their opposite numbers in America and Germany. *This gives them an important advantage in the export markets.*

The future will hold still greater opportunities for British exports, especially in the under-developed areas of the world. The successful exporters will be those who are ready to adapt themselves to changing needs and trends. In meeting the challenge of the 'sixties the steel industry has an essential role.

U.S. to get an eye-opening look at Britain's modern steel industry

New York in June. That's when Americans will be rolling up in their thousands at the British Exhibition. And there they'll see an eye-opening display of what Britain's steel industry can do.

Britain led the world in creating plentiful low cost steel. It was an Englishman, Bessemer, who by inventing his "converter" turned steel from a rarity into an everyday necessity.



Another Englishman, Brearley, discovered stainless steel.

But the accent will be on the modern developments that are putting Britain right in the forefront of steelmaking progress.

One of the highlights of the Exhibition will be 'Ajax' – a new type of British steel furnace that is giving record outputs, 50% above normal.

New alloy steels have been developed for use in atomic reactors – including boron steel, which absorbs neutrons.

Visitors to the Exhibition will learn about some of the superb things made nowadays with British steel, from sports cars to radio telescopes and from precision tools to jet engines. The steel industry will show the vital contribution it is making to Britain's present-day prosperity.

Atomic reactor assembly at Dounreay, Scotland, described as "the most complicated stainless steel vessel ever made". This and other British steel triumphs will be featured at the British Exhibition, New York, in June.

to the Nation

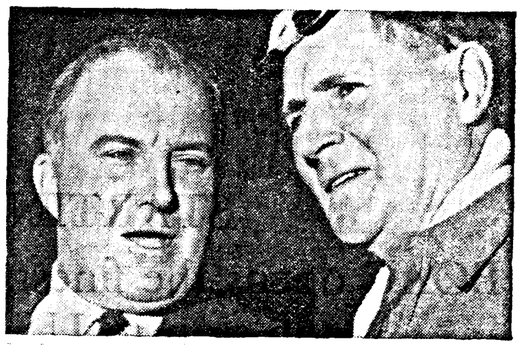
ISSUED BY THE BRITISH IRON AND STEEL FEDERATION

"In the end you're dependent on people"

CAMPBELL ADAMSON, 37, was until March 1 General Manager of Richard Thomas & Baldwin's Redbourn Works at Scunthorpe. Came into steel in 1944, was made General Manager in 1957. Has now been appointed Director and Gen. Manager of the great new strip mill now building at Newport, Mon. Main problem there, he thinks, will be to build as good labour relations with 6,000 men as in much smaller Redbourn. Says, "It is impossible to run a works properly unless you're using the intelligence of every man in it."

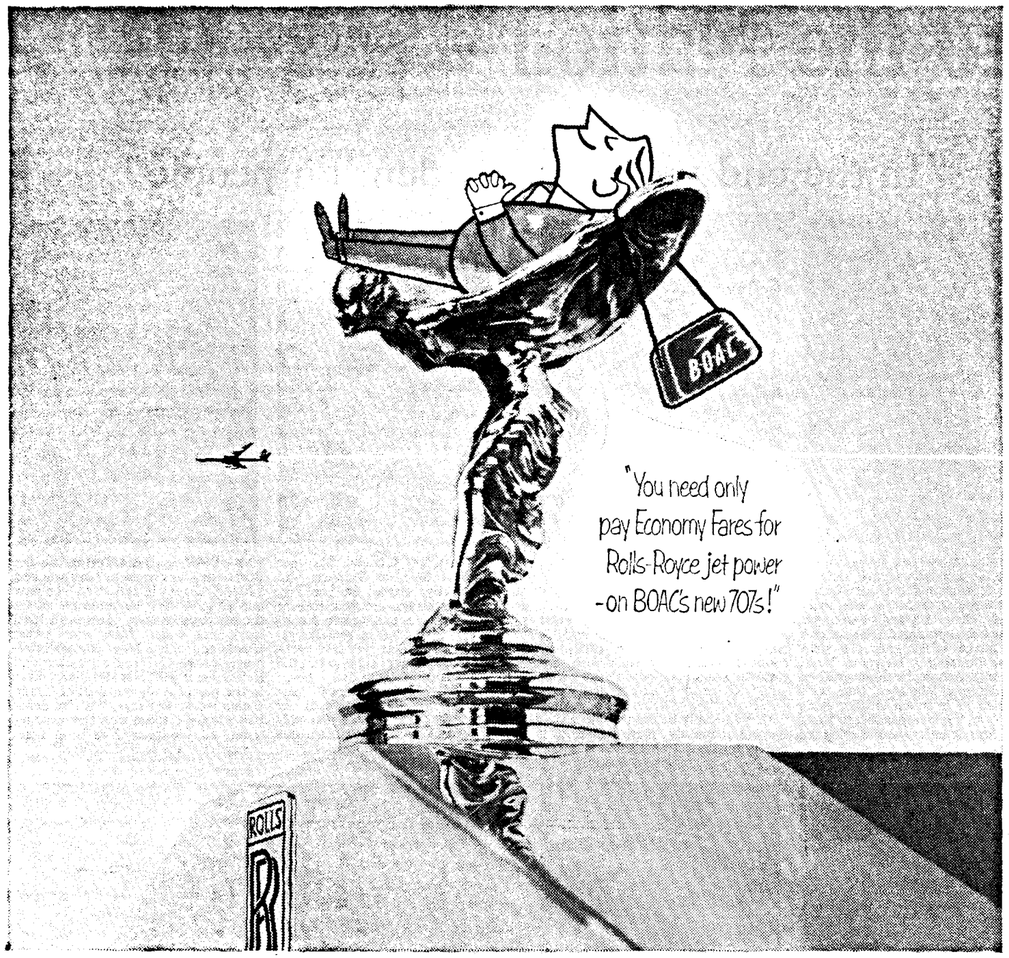
JIMMY ROSE, 65, with two sons in steel, is Chairman of Redbourn's Works Delegates Committee. A Fitter by trade, *he joined R.T.B. in 1934.* Much of the credit for Redbourn's good labour record belongs to him and his committee (he has been Chairman about 15 years). It deals with any trouble a Union cannot solve domestically. "No matter what happens," says Mr. Rose, "we've a method of dealing with it amicably before trouble arises. To put it bluntly, there's more of a family relationship here."

DAVID BIRD, 45, General Manager of Iron and Steel at Stewarts and Lloyds, Corby, started in banking, soon realised this was not the career for him. After a time at Dorman Long, took Sheffield degree in metallurgy. Likes to get broadest possible background of information, is Fellow of the Institution of Metallurgists, holds diploma of British Institute of Management. Stresses modern management methods. "In the end you're dependent on people. You can only run a works of this size through co-operation."



PAT QUINN, 55, First Teemer on the Bessemer Converters at Stewarts and Lloyds, Corby, joined at 14—so now has 41 years' service behind him. Of the old days he says, "It was all hard work and sweat. Men wore sweat towels and clogs. Now you go home much less tired — and a lot cleaner." Relaxation is golf. Has also found time, in the past, for a great deal of Trade Union work. But says, "We've never had a major dispute with the management, all the years I've been here. Everything was settled locally."

EDWARD JUDGE, 51, joint Managing Director of Dorman Long (Steel), Middlesbrough, originally wanted to build bridges. Left Cambridge with mechanical sciences degree, thought steelmaking with Dorman Long would be "all right for a few months". Found it "fascinating", has been there ever since. Built Lackenby Universal Beam Mill – most up-to-date in world – incorporating many new ideas. Says Steel offers tremendous scope for young men prepared to work really hard – mentally. Own career proves his point.



JOHN FINNEGAN, 55, blast furnace keeper at Dorman Long's Clay Lane plant, was born where the furnaces now stand. Did his first shift at 15. Looking back he says, "We did a 56-hour week. The sky was the roof. No matter what the weather, the furnaces had to be slagged and cast every 6 hours." Then, a blast furnace produced 100 tons a day. Now, 1,500 tons. A member of his Trade Union Lodge Committee, he says, "There's a great understanding between the management and the men. Nobody flies off the handle."

W. D. (BILL) PUGH, 55, son of Sir Arthur Pugh (late General Secretary of the steelworkers' Trade Union) went to Sheffield University, and in 1926 to Vickers Works (later English Steel Corporation Ltd.) joining the Research Dept. Since 1955 has been Managing Director of E.S.C. His time there marked by *growth* (he remembers their first 100 ton alloy ingot as a great event; 300 tons now not uncommon) and *diversification* (E.S.C. make some 150 'standard' kinds of steel for everything from cars to Nuclear Power).

JOE MIDDLETON, 58 and the son of a steelworker, was a variety entertainer (top-hat and tails) before joining English Steel Corporation in 1926. "I've never regretted it," he says. Started in the foundry and is now First Hand Melter in charge of an electric arc furnace, responsible for making steel exactly to specification. "It's creative," he says. "You've got a feeling you're doing something useful." "Progress," is how he sums up his time in E.S.C. – bigger and better plant, better working conditions.

Roses All the Way?

THIS issue of *The Economist* goes early to press because at the time when we would normally be appearing on the streets of London, on Friday morning, many of those streets will be closed to commercial traffic as the British people makes holiday. The great mass of the nation are rightly treating the wedding of the Princess Margaret as a splendid, warm, human, sentimental, and dewy-eyed occasion; it is only in the very narrow circles which dull pedants and some parliamentarians frequent that one hears quibbling complaints about the price of the rosebuds or of the ceremonial and against the national engulfment in candy-floss. On this matter, this newspaper is unashamedly on the side of the rejoicing majority, and for soberly considered reasons as well as sentimental ones.

Let the bells ring joyfully and expansively. To those who argue that by celebrating this wedding the British people make too much fuss over an intrinsically small event, Walter Bagehot said all that needed to be said ninety years ago:

> "All but a few cynics like to see a pretty novel touching for a moment the dry scenes of the grave world. A princely marriage is the brilliant edition of a universal fact, and, as such, it rivets mankind. . . . A royal family . . . introduces irrelevant facts into the business of government, but they are facts which speak to men's bosoms. . . . Accordingly, so long as the human heart is strong and the human reason weak, royalty will be strong because it appeals to diffused feeling, and Republics weak because they appeal to the understanding."

The crowds along the wedding route, and the even larger crowds around the television sets, are playing an important if largely unconscious part in Britain's constitutional organism. It is an organism that has served the country almost unbelievably well in these last hundred years of tumultuous change. It has enabled the British people to canalise certain filial or paternal or maternal feelings—which are inseparable from the process of being governed—into a separate and dignified sector of our governing system. Republican forms of government, which are usually first proclaimed at a stage of aroused emotion but intellectual underdevelopment (as in the United States, or Ghana, or Afrikaanerdom), have increasingly had to canalise those feelings on to their ruling politicians, thereby risking either deadening or disastrous results.

So much for the rationalist's reasons for rejoicing at any royal feast. It would be timid, however, to deny that this particular wedding has raised a second and more interesting (because more novel) issue for our governing system to face. The precedent set by this marriage is that a Princess, who is also a cynosure in royalty's magnificent play, is marrying a commoner, and an artistic one at that. Of course there is a change here, and it would be false history to pretend that only the ghosts of dead snobs could regret it. It is a matter of common supposition that there has been a whinnying of court chamberlains all across Europe; the widespread assumption is that some foreign royalties have refused invitations to this wedding because they do not want their own daughters to get the idea that they can marry whom they please. It is a matter of historical fact that the writings of dead constitutional authorities and thinkers show that some of the ablest of them would also have been apprehensive of the innovation. *The Economist*, which in these matters naturally looks back a mere ninety years to the writings of its own greatest editor, must admit that this includes Bagehot.

A wise Court, in Bagehot's view, is one "which stands aloof from the rest of the London world, and which has but slender relations with the more amusing

parts of it." For, he judged sternly, in words that have no doubt been quoted in whispers by any apprehensive court advisers who have dug them up:

> The light nothings of the drawing room and the grave things of the office are as different from one another as two human occupations can be. There is no naturalness in uniting the two; the end of it always is, that you put a man at the head of society who very likely is remarkable for social defects, and is not eminent for social merits.

Bagehot believed that the English "are remarkable for having a great deal of the lower sort of ambition and envy," and that "if the highest post in conspicuous life were thrown open to public competition, this low sort of ambition and envy would be fearfully increased."

The envy and ambition of which Bagehot wrote were purveyed in his day by word of mouth among the upper ten thousand in society. They are purveyed in our day by the gossip columnists of British and foreign newspapers to an audience many thousand times larger than that. That spells out the main problem which might loom behind this marriage for those whose role it is to look after the functioning of the dignified part of the British constitution. But it should not be regarded as casting a blight upon the real delight felt by the masses on Friday's occasion. The task of all concerned is to show that the British social revolution is by now old enough and wise enough and flexible enough to treat this sort of problem as a challenge to be met.

FOR what is it that the timorous would prefer? That royalty should not be allowed ordinary contact with any but its own former (but now narrowing) stratum of society? Or that, once it has made broader contacts, it should not be allowed to feel the same emotions as other human beings? The challenge set by the problems surrounding this marriage is threefold. First, to the bridegroom himself, who today strides between two worlds. The world he is leaving is one where ordinary mortals worth their salt guide their actions by their own ideas, enthusiasms, judgments, and conceptions of charity—which do not (and, at least among the young, should not) exclude occasional puckish unconventionality and reasonable attachment to the main chance. The world he now enters is one where actions need to be guided much more continuously by an unobtrusive sense of public duty, which is perhaps more easily inherited than explained. But that does not mean that it cannot be assimilated by a young man with nous.

Secondly, there will be a challenge after this wedding to the advisers of royalty. They have a social innovation to handle, and there are two pitfalls into which they could fall in the process. One would be to pretend that there is no innovation, and to insist that the new public figure should be made to fit into exactly the orthodox mould. This would be a great mistake, and it is one that traditionalist advisers seem only too liable to make. Is there any real reason, for example, why Princess Margaret's husband should not be allowed in some measure to continue with the artistic profession at which he is skilled, in the same way as Princess Elizabeth's husband at first continued with his naval service? The other mistake would be for royal advisers to take such fright at the innovation as to hide its perpetrators out of sight. If there appeared to be a significant and carefully arranged diminution of the popular Princess's public role, this could have a nationally divisive effect, because by many people it would be resented.

The third challenge is to the press and other organs of public opinion; and here one can only express a hope. It seems appropriate to express it in the same words as *The Economist* used in closing its comment on the last royal wedding. When the bells have stopped ringing and the celebrations are over and the crowds are gone, one may hope that to the loyalty and affection which London and the whole Empire have been demonstrating there will be added an element of delicate consideration for that private life to which even Princesses and their consorts are entitled.

Nato's Frayed End

Will Mr Menderes stop stifling the young Turkish democracy before it is too late?

IT is hardly necessary to underline the irony of the situation in which the Nato foreign ministers found themselves when they met in Istanbul last Monday to exchange ideas about the summit meeting. Representatives of an organisation devoted primarily to the preservation of democratic freedom, they found themselves guests of a member country in a city under martial law, with armed troops at almost every street corner, with schools and universities closed, with the press gagged, and outside their conference building, a row of tanks and demonstrators shouting "freedom". Presumably the Turkish government was apprehensive that those responsible for the demonstrations last week in Istanbul (and Ankara) against the government might try to redouble their efforts this week in order to take advantage of the free publicity provided by the presence of the Nato ministers. It may have succeeded in preventing further serious disturbances; but it is hard to imagine a more vivid illustration of the Turkish government's difficulties than this demonstration of repressive zeal against its own people.

Mr Zorlu, the Turkish foreign minister, told the Nato council that the crisis had been caused by "a handful of youths exploited by certain groups for their selfish political ends". Mr Menderes has gone further and has more than once categorically accused the Opposition of trying to incite the people to revolt. Neither, naturally, has cared to suggest that some of the government's own policies might lie at the root of the trouble. Yet, however widely or narrowly based the responsibility for the present disturbances may be, it is plain that Turkey will not recover from its present state of acute political tension so long as the Menderes government maintains its present policies and attitudes.

The source of Turkey's difficulties can be traced to the fact that over the past half-dozen years the government has increasingly behaved as if it did not intend to abide by the democratic conventions; in other words, as if it intended to stay in power by hook or by crook. This may indeed be unfair to Mr Menderes; but it is the impression he has come to give. The prime minister may believe, sincerely and genuinely, that he knows what is best for Turkey. But his policies, particularly his economic ones, are highly controversial. They can be criticised as ill-judged in intention and inefficient in execution, as placing the government's political advantage before the country's long-term needs.

The criticism has come, not only from the government's political opponents, but also from dispassionate international experts whose chief concern is that the funds for which they are responsible should be put to good use; and the argument cannot be accepted that, without the curtailment of political freedom, sound and efficient rule would be impossible. In spite of serious shortages and other difficulties a few years ago, Turkey's economic development has gone forward considerably under Mr Menderes's government. But the better times that Turkey is at present enjoying are due more to the pressure applied by international experts holding the purse strings of foreign aid than to the curtailment of the "factious" activities of the Opposition.

Yet, in order to shield its controversial policies from legitimate criticism and discussion, the government has, over the years, steadily curtailed many of the generally accepted democratic freedoms. Its suppression of criticism in the press and its imprisonment of journalists have become notorious. It has sought to interfere with the independence of the universities and the judiciary, and at times to impede the activities of the Opposition, both inside and outside parliament. Its final defiance of democratic ways, which sparked off the disturbances, was the decision last month to suspend all political activity for three months while a parliamentary commission, drawn entirely from the ruling Democrat party, investigated the Opposition's allegedly subversive and illegal activities.

THIS commission can suspend all normal judicial processes, close down newspapers, parties and organisations, and keep people in prison without trial. What credence can be given to the findings of a court thus constituted and with such near-dictatorial powers, sitting in judgment on its own political rivals? If there really is a case against the Opposition, why can it not be submitted to the judiciary in the normal way? The government has only itself to blame if many people, both inside and outside Turkey, begin to wonder, fairly or not, whether its ultimate aim is not the ending of the democratic system. No doubt the Opposition, both politicians and the journalists, have acted intemperately. No doubt they would not behave as exemplars of democratic virtue even under the most favourable circumstances; but as they see their freedom of action and expression progressively cut down, it is not surprising that they should hit back with an equal lack of discrimination.

It can be argued that, to some extent, the Turks are the victims of their own early promise. Ten years ago the Peoples' Republican party, founded by Atatürk, was soundly defeated at the polls; it accepted its defeat and allowed the Democrat party, led by Mr Menderes, to take over. This peaceful transference of power was widely hailed as evidence of Turkey's early political maturity; ever since Turkey has been accepted as a fully-fledged democracy and judged accordingly. Ten years is little enough time in which to learn the democratic ropes; and if one remembers how young Turkish democracy is, it is easier to understand what has lately been happening—but not to excuse it.

THERE are many factors today that should positively favour the development of a stable democracy in Turkey. There is no proliferation of small parties, and consequently no likelihood of a succession of weak coalitions. There is no large and active Communist party (or, for that matter, any party of the extreme Right) occupying a large proportion of seats in the parliament and throwing spanners into the parliamentary machine. The two main parties have a common background and inspiration in Kemal Atatürk and his revolution—although the Opposition may contend that the government, by its substantial help to the Moslem religion, is betraying the Kemalist tradition and encouraging reaction.

What is needed—and Turkey is by no means the only country to suffer from this lack—is more tolerance and more willingness on the part of the ruling party to accept criticism and to face the possibility of losing both the glory and the perquisites of office—which, with the acceptance of criticism even though it may sometimes be intemperate, is always the condition of democratic rule. And if Mr Menderes does not manage to display more of these virtues, he may yet find the army thrusting them upon him—although up to now it has carefully dissociated itself from politics.

Turkey's Nato allies, at any rate, must hope that Mr Menderes has seen the warning light. They have this week been given an illuminating insight into Turkey's domestic troubles. And although (like the Commonwealth members) they are chary of enquiring into each other's private affairs, they cannot have failed to reflect on the possible bad effect of these on Turkey's value as an ally. It would be wrong to exaggerate this, since one thing upon which all Turks agree is their determination to repel any Soviet infiltration or attack. Yet if Turkey is either going to go through a period of internal storm and stress, or be battened down under a tight dictatorship, it can hardly remain as satisfactory and effective a member of the alliance as it has hitherto been reckoned; and the United States government and Congress may not consider it quite such a suitable base for American rockets or quite such a worthy recipient of economic aid.

Mr Menderes may reckon that a flirtation with the Russians—he is due to visit Moscow in July—will restore his value in the eyes of his allies as well as providing him with some substantial material benefits. He should rather reflect that it is those on the top of their form who tend to get the most out of their visits to Moscow; if by July he is obviously getting into deep waters at home, the Russians may well feel it is more to their interest to push him farther in than to give him a helping hand.

The Shadow of Parkinson

ONE question confronting the Commonwealth Conference is the future of the conference system itself. These meetings used to be described as "talks," a term that correctly emphasised their deliberate informality; but as the number of member governments grows, procedural formality is liable to develop and to destroy the atmosphere of relaxed privacy and frankness which has given the meetings their unique value. This year eleven governments are represented. They will be welcoming Nigeria to the club in October, and Sierra Leone, it was announced this week, on April 27th next year; they will have to consider the special position of Cyprus, if it wishes to join the Commonwealth.

These three countries illustrate the diversity in size and status of the independent countries which may become eligible over the next few years. In terms of population, British Guiana and Mauritius, for example, are slightly larger than Cyprus; the three East African territories are each larger than Ghana; the Federation of the West Indies is not much smaller. Within five years, as many as twenty independent Commonwealth countries may wish to send prime ministers, or presidents, to the "talks"; one cannot be precise, for some existing federations might dissolve into sovereign components, while others might come into being.

But eighteen is, according to one of Parkinson's laws, the critical limit of membership for any truly effective committee. Once past that point, the gathering becomes a formal assembly, and an inner group emerges which thereafter tends to take all the vital decisions, until it in turn expands and yields to a new inner group. The question before the premiers is whether to allow this to happen naturally, and leave the composition of the inner group to events to decide, or whether to try to lay down qualifications for membership of the conference now. The cases of Cyprus and Sierra Leone seem germane. The admission of Cyprus (which Britain desires) would open the door for other small islands and city-states, like Singapore. On the other hand there is an idea, vaguely attributed to Dr Nkrumah, that a population of two million could be taken as the lower limit for automatic admission to the conferences. This would let in Sierra Leone (and not exclude New Zealand); and four or five more emerging dependencies—the West Indies, and several African territories—would pass the test.

THOSE who would like some line drawn now are revolving schemes whereby a large membership of the Commonwealth itself (which nobody wants to limit) could be reconciled with a limitation of Commonwealth conferences to a size permitting informality. One suggestion is that there should be one group of countries always participating in the talks, and another group which would get invitations in rotation, rather like the permanent and non-permanent members of the UN Security Council. Presumably, as in the UN system, the non-permanent participants would be expected to represent regional or other suitable groupings of the smaller Commonwealth countries. One difficulty about such a scheme is that the number of permanent members would be nearly as great as that of the non-permanent group, in contrast to the numerical relations between the Security Council and the UN Assembly.

To meet this difficulty, it has been suggested that the conference should develop a distinction between "cabinet" and "government"; some premiers would be in the Commonwealth "government" but would not attend the "cabinet" unless asked to do so because of the special needs of the agenda. The difficulty here is that meetings are too infrequent to preserve the status of non-cabinet members. Already, however, there are sub-committees within the existing conference which only certain premiers attend: for example, the "defence group" hold meetings to which the "uncommitted" members such as India, Ceylon, and Ghana do not come. This system might develop within a very large, and almost purely formal, plenary conference. Regional conferences could also, of course, be held; thus the African states might meet in Lagos, the Asian ones in Colombo, to discuss their own neighbourly problems. But this does not help to solve the problem of Commonwealth "summitry"; the special value of these meetings has lain in the personal contact and discussion between premiers from different continents and racial groupings.

One cannot escape the simple fact that the Commonwealth bond rests on equality between member states. To newcomers, therefore, an invitation to the premiers' conference is vital to their prestige—the formal handing-over of the latch-key. But the realities of the difference between substantial states and minor entities cannot go unrecognised, and the essential frankness and family informality of the "Commonwealth talks" must somehow be preserved—in the interests of old members and newcomers alike.

Inside and Outside

THE useful flexibility of the conference's procedure was fully demonstrated as soon as it began on Tuesday. The strict privacy that is normal was breached by a substantial communiqué which the Commonwealth Relations minister issued at an "on the record" press conference. Tunku Abdul Rahman thus achieved his aim of formally raising the subject of South African racialism and its effects on Commonwealth relations, while open conflict was averted by the general agreement to accept Mr Louw's offer to pursue the question in informal talks. In fact, some of the premiers have already found themselves able to express their views to Mr Louw rather more forcibly in such talks than would have been possible in formal session. Mr Macmillan also seems to have used blunt language to him at Chequers about the particular case of the detention and deportation of Miss Stanton—but without result.

It is usual for what goes on outside the conference room to be more important than what goes on inside. This time, apart from the informal contacts between the conference members themselves, there has also been an unusually thick penumbra of other Commonwealth activity in London. Some of this has been genuinely coincidental—the winds of change are blowing too hard today for the evolution of the Commonwealth to be slowed down even for the duration of a Commonwealth conference—but even so, some of those concerned have naturally made use of the coincidence of their presence in London at the same time as the heads of government. Apart from the official delegations from Sierra Leone and Somaliland, Dr Banda of Nyasaland, Sir Edgar Whitehead of Southern Rhodesia, and the governor of Kenya have all been in town. So have the Nigerian federal and regional premiers, while Dr Azikiwe is also on hand. The federal premier, Sir Ababakar Tafawa Balewa, who next week will be negotiating the final details of the transfer of sovereign power to his government in October, stated his views about South Africa on Monday in terms sharper than those used by any of the conference premiers. He is optimistic about the future of the Commonwealth, provided its members work for mutual advantage; but he is quite explicit that it is a club, and that in well conducted clubs, members who embarrass others are asked to leave at once.

The Nigerian premier is on less sure ground when he points with pride to his country's action in not merely boycotting South African goods but also refusing to employ any white South African, of whatever persuasion. Ghana, in contrast, is reported to be welcoming exiled liberals from the Union. (But why has it banned *Drum*?) There are other differences of view between the two West African governments. While Sir Abubakar hopes for limited agreements—on defence, economic policy, and so on—between West African states, he sees no place for a political union, and is publicly sceptical about the likelihood of any newly independent state wishing to join one. In West African politics, this already has an eccentric sound. But it is hardly surprising that Nigeria, whose population exceeds that of all the other West African states combined, should have a distinctive attitude.

APART from Dr Verwoerd, the only head of government absent from this conference is Mr Dudley Senanayake, the newly-appointed prime minister of Ceylon, who is represented in London by one of his ministers, Senator Cooray. His rejuvenated United National party emerged from the March elections, which were supposed to end the lengthy spell of uncertainty after the assassination of Mr Bandaranaike, as the largest party in parliament. But he was unable to find the necessary allies to give him a clear majority; and, after being defeated in a vote of confidence, he advised the governor-general to order fresh elections, which will be held in July. But this interregnum—if the Ceylonese performance at the last United Nations Assembly is any guide—need not prevent Ceylon's voice from being raised to good effect in the London conference.

No Penitent He

MR LOUW has come to London in fighting mood. On his own suggestion he is meeting the Commonwealth prime ministers, in groups, in order to put them right about South Africa's racial policy. There is little sign that he is prepared to heed what they may have to say in return. His performance at his press conference on Wednesday (according to some accounts, his performance during the first of his private talks with the premiers was remarkably similar) suggested that he will no more be impressed than a rhinoceros can be tickled with a straw. Good-humoured and impregnable, Mr Louw expressed surprise at the notion that his government's policies were straining the Commonwealth bond. Outsiders, he feared, were misled by a distorted press or, in the case of governments, by diplomats who were not doing their job. The Commonwealth prime ministers may, like the press or the people who boo outside South Africa House, feel the better for letting off steam; the effect on the Union government may still be minimal.

The "separate development" of the South African business community, which is largely British, and the administration, which is Afrikaner, is bearing its own sour fruit. Mr Louw gave the impression on Wednesday of a man quite unmoved by the businessmen's worries. He was "not in the least" concerned about the drying up of new outside capital. His government would fight back at any boycott. The country was fully able to bear the cost of apartheid (although Mr Louw, skating among the six great volumes of the Tomlinson report, was not prepared to get down to actual figures).

Patently, there are few things more irritating than high-minded uninformed criticism from outside. Mr Louw has every right to point out that there are three million South Africans of European origin who call no place else home. And he can easily carry the attack into his critics' home territory; at his press conference both Nyasaland and Notting Hill were thrown into the British glass house. But only myopia or obstinacy could have persuaded him that there is no basic difference between current British policy and his own government's policy towards Africans. Mr Louw in argument is a more sophisticated edition of the man who counters criticism by asking whether you would like to have a black man marry your sister. What then can the prime ministers find to say that will really impress him? At the end of the journalists' battering, Mr Louw replied in polite perplexity: "Why should I acknowledge what is wrong?"

Afrikaner Split?

IN South Africa, Dr Verwoerd's continued absence from the helm dominates the political scene. Ministers have been to see him in hospital, but have brought back no clear indications of the direction in which his thoughts are moving during his enforced silence. And to the obvious question, when will he return and speak? there is now being added the *sotto voce* question, will his injuries permit him to return and speak? Until these questions are answered it is mere speculation whether his meditations are leading him to thoughts of a "New Deal" such as Mr Sauer voiced a few weeks ago, or whether Mr de Wet Nel's hot attacks on "the mining press," "British priests" and "liberalistic universities" are an accurate reading of an embittered mind in pain which presages a harsher turn to the screw of apartheid.

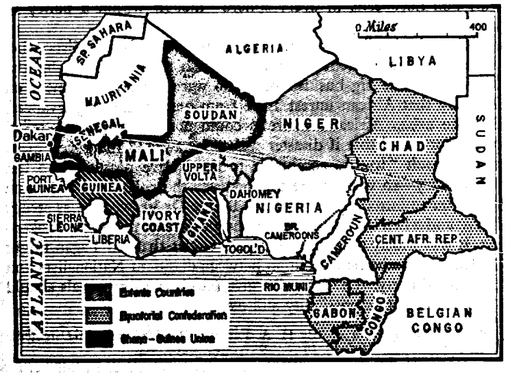
The gap between vanguard and rearguard in the National party's ranks has not been wholly closed by the prime minister's escape from assassination—an escape regarded by the platteland mentality as providential in a more than political sense. While the ministers are divided, Mr Japie Basson has been impelled by an enthusiastic meeting in Bloemfontein to announce plans for the formation of a new party. Mr Basson had been expelled from the National party because he felt that apartheid was being carried too far and in the wrong direction, and also for his stand on maintaining South African membership of the Commonwealth—which now, however, seems to be common ground between him and his former colleagues.

The new "National Union" party is evidently intended to appeal to the "liberalistic" Cape wing of the National party, and it is said that former Chief Justice Fagan will be asked to lead it. In a book published last year* Mr Fagan explained why he, a Nationalist of many years' standing, had broken with the party: he believes that territorial apartheid was exploded by the Tomlinson Commission and that the present policy of "total separation in every sphere" except the territorial is a perversion which will make an explosion inevitable; without being very precise, he has called for "a policy of adaptation" which includes consultation with non-Europeans in every sphere—though within a policy of white leadership.

"Consultation" is now the magic word for Nationalists who, unlike the "impenitent" Mr Louw, wish to draw back slightly. Revealingly, the big businessmen who warned the government on Tuesday that African unrest arose from quite genuine grievances, that the urban African's interests could not be satisfied by tribal institutions, and that if disaster was to be averted the government must consult "leaders acceptable to the Native people," also felt it necessary—so wide is the gap between the rulers and the ruled—to offer to introduce it to some. Before Dr Verwoerd was struck down, and when his position after Sharpeville seemed to be weakening, it was widely thought in business circles that Mr Fagan might be called to lead a new coalition between dissident Nationalists and the United Party. The reception given to the new proposals should show whether this possibility still exists.

*"*Our Responsibility.*" By H. A. Fagan. *Die Universiteits-Uitgewers en-Boekhandelaars (Edms) BPK.* 96 pages. 10s. 6d.

The Other Commonwealth



France's relations with black Africa have taken a highly promising turn, but there are problems to be settled between the Commonwealth and the French Community

IF any of the Commonwealth prime ministers have been assailed this week by nagging doubts about the usefulness of their own association, the sincerest form of flattery may serve to buoy them up. The French Community, in its brief and rapid evolution, is beginning to look more like a commonwealth every day; indeed, this is already the boast of its more independent members, particularly those in Mali and Madagascar that are now on the verge of severing their last constitutional ties with France.

La communauté renovée, to which Mali and Madagascar will belong after they achieve full independence in mid-June, is a much more easy-going club than the one from which M. Sekou Touré's Guinea was excluded in September, 1958. M. Léopold Senghor of Mali has, in fact, declared that the new community need have only three institutions: its head (the President of France), its conference of heads of state and government, and its court of arbitration (designed to settle disputes between members). M. Senghor now says proudly that he is "as free as any Commonwealth dominion."

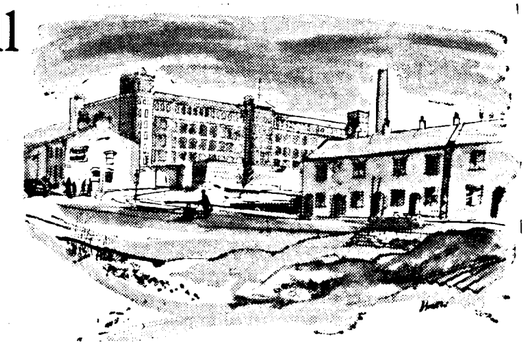
Both Mali and the Malagasy Republic (Madagascar), under the contractual agreements reached in Paris last month, will exercise their own foreign policy (with France looking after their interests in the more obscure embassies) and have their own representatives at the United Nations. This will presumably mean two more UN votes against France on Algeria; M. Tsiranana, the Malagasy prime minister, is already a vigorous opponent of South African *apartheid.* Although Mali is ceding the base at Cap Vert, near Dakar, to the armed forces of the community and the Malagasy Republic is placing Diego Suarez at their disposition (it openly professes alarm at the communist threat to the Indian Ocean), these are acts of conscious sovereignty. The new community is taking shape with a lively sense of association with French culture: Madagascar's first university will be called after General de Gaulle.

Mali and Madagascar are expected to have imitators very shortly. France has undertaken to continue to provide financial aid, both to sustain their budgets and to assist development, a favour that was promptly cut off from Guinea and thereby did a good deal to influence other Africans to retain their direct ties with Paris. Now the other community members in west and equatorial Africa are sitting up and taking notice. M. Fulbert Youlou, prime minister of the Congo Republic, has announced that the four heads of government of the Equatorial union (Chad, Gabon, Central African Republic and Congo) will meet at Fort Lamy in the middle of this month: he said that talks were possible in Paris in June on securing the future "external sovereignty" of the union. At the same time, the Council of the Entente (Ivory Coast, Dahomey, Upper Volta and Niger) has entrusted M. Houphouet-Boigny of the Ivory Coast, its leading spirit, with a special mission to General de Gaulle on his return from America: this is believed to be a mission to express the West African Entente's views on external sovereignty too.

It is greatly to General de Gaulle's credit that he has permitted this evolution of the community's internal relationships to take place without visible opposition. It now puts him to the trouble of having the constitution of the Fifth Republic revised. At present, under article 86, any state becoming independent "then ceases to belong to the community." The terms the general has given Mali are precisely those that M. Sekou Touré would have been glad to accept in 1958. Was Guinea's exclusion simply the outcome of the flaming personal row at Conakry when the general went there on his referendum safari? It may be so.

Yet it can be argued that French, or at least gaullist, opinion would not have swallowed the commonwealth idea eighteen months ago; it was then too closely linked with Algeria's problematical future. The general has not yet budged on Algeria, despite suggestions from within the community itself that to give Algeria community status might promote a political settlement there. This may come, although it has seemed that General de Gaulle still has to submit to his supporters' terms for North Africa. Has the free hand that he seems to possess south of the Sahara been bought, in part, for black Africa by the Algerian rebels?

Although the community has thus become an arena of gratifyingly peaceful African advancement, and one which the Belgian Congo might have been fortunate to belong to, the problems of west and equatorial African political regrouping still remain acute. Mali continues to hesitate between a federal or unitary system of government, partly because it has one eye on potential recruits. While it is argued, with some justice, that it would be absurd for so poor a state to sustain three ministries for everything (one federal and one each in Senegal and Soudan), to form a unitary state now might easily discourage Upper Volta or Dahomey—which were in the original plan for the Mali Federation but have shown a clear desire for some separate identity—from looking at Mali in the future. Both the four Entente states and the four members of the Equatorial union are gradually taking steps to improve their co-operation, chiefly by customs and transport agreements. But the two more affluent among them, Ivory Coast and Gabon, have so far been reluctant to enter any unduly close financial relationship with their neighbours.



UNHAPPILY, the chief issue on which the community members have made common cause is in their dispute with the Ghana-Guinea union. M. Sekou Touré, isolated at Conakry, has been claiming bitterly that a plot, inspired by Paris, exists against him. He has spoken of military camps being built close to his frontiers in Senegal and the Ivory Coast, and of aircraft dropping a million leaflets over his territory. These remarks have been chiefly for internal consumption; M. Touré has had some local political difficulties since he wisely declared last month that communism was not the road for Africa to follow. (He has also, despite the reservations of some of his close associates, patched up his diplomatic relations with west Germany.) But the distrust between him and M. Houphouet-Boigny is self-evident.

This tension is supplemented by the fears that Dr Nkrumah has now managed to arouse among his pro-French neighbours. Aspirations for unity among the Ewe people, who are divided by the existing frontier, have been a cause of angry dispute between Ghana and the new state of Togo, the former French trust territory, which became fully independent on April 27th. M. Sylvanus Olympio, the president of Togo, once a suspected anglophile, has not joined the community, but he is taking care to form a small army, with French assistance, to maintain his little state's sovereignty against Accra. The prime minister of Dahomey, M. Hubert Maga, has sternly rejected an opposition demand for a referendum on union with Nigeria; in this case it is the Yoruba people who live on both sides of the present frontier. M. Maga has said that he regards the Entente grouping as a necessary instrument against the "neo-imperialism" of his English-language neighbours. Still another potential source of conflict is the Bakongo ambition to recreate the ancient kingdom that once spanned the territory that European intervention in the nineteenth century has now divided between the Belgian Congo, the Congo Republic, the Central African Republic and Portuguese Angola and Cabinda. There have already been exchanges between Paris and Brussels with an eye to the succession states' rights.

Yet, despite all this, there are signs that wiser African heads are at last being put together to some purpose. In the face of M. Touré's outbursts, the Mali leaders have moved a fair way towards M. Houphouet-Boigny. Thus M. Mamadou Dia, the prime minister of Senegal, declared last week that the Dakar-Abidjan axis was "one of the realities of Africa." M. Senghor has spoken of the formation of an African common market. M. Olympio envisages steps towards an African economic grouping on the lines of the Organisation for European Economic Co-operation—once Nigerian independence is a fact. The time seems ripe for the leaders of the Commonwealth and the community in Africa, together with states like Guinea, Togo and Cameroun that belong to neither, to try to give specific meaning to their ideals of African understanding. They could find this a much more immediately profitable task than those offered by the normal run of Afro-Asian solidarity meetings. General de Gaulle and Mr Macmillan have discussed Commonwealth-community relations in a broad sense. The need now is to do something on the spot.

THE AFFLUENT RECESSION—I

King Cotton's Farewell

Our special correspondent has visited Manchester's crumbling cotton area.

THE great urban sprawl centred on Manchester, whose blackened houses and cobbled streets stretch with hardly a break for sixteen miles from Stockport in the south to Oldham and Rochdale in the north, has recently suffered a major industrial change. Almost half the spinning and weaving industry on which it has traditionally depended has been closed down. The scars are obvious, though in the long run most of them are going to be welcome. Many mills, with their depressing look of Victorian workhouses, have closed for ever; others have only one of their former array of chimneys belching smoke into the greyish air. Even the methodist chapels—which, with the factories, form the dominant unit of communal architecture—look deserted. Never perhaps has the final curtain been slammed down on half of a great industry so abruptly as here. Yet, as so often in the last ten years, the latest mill closures have had a much less disastrous effect than was at one time feared.

In part, this is because up to half the spindles and looms now taken out of commission had for long been unemployed. But mainly it is because the latest closures have coincided with a general period of industrial expansion and a world-wide upsurge in the demand for cotton. Order books have lengthened and the reorganisation scheme, far from leaving great pools of local unemployment, has actually been attended by shortages of some types of mill labour in some of the cotton towns. The original estimate of 50,000 workers who would be entitled to redundancy compensation—paid half as a lump sum and half in weekly instalments to those remaining out of work—has proved to be much too high. Only between 35,000 and 40,000 workers are now expected to qualify even for the lump sum, while the number drawing

special weekly benefits afterwards will be much lower. Exactly how much is not yet certain, both because a good deal of the scrapping was done only at the last possible moment at the end of March, and because there is still a stack of borderline "compensation cases" for negotiation in every cotton union office. But, despite this, the Manchester area had only fractionally more unemployment than the national average last month and—as a pointer to the future—it is not scheduled as a development district under the Government's new Distribution of Industry Act.

In the shake-up, two groups of people, however, have been hit quite hard. The first group is the older women. Women in the mills seem to have a different set of values from men: they value the human contacts and continuity of work more, and the rates of pay and conditions of work rather less. Thus when a mill closes down, many women feel a considerable personal loss, even though another job with a different circle of people is easily available. Lancashire abounds with stories of women who, after being forced by closures to work for a while in a modern mill, return at the first opportunity to their old place of work, however lacking in amenities it may be. The lump element in the compensation recognises this loss, but the unemployment figures almost certainly do not. For many women who have become redundant have merely returned to their homes and stopped paying national insurance contributions; they are thus no longer registered as unemployed.

THE other group to suffer badly under the scheme have been the mule spinners. The mule spinners were at one time the high craftsmen of the industry and until recently held the distinction—which they never failed to point out to their less skilled colleagues—of employing their own assistants in a semi-autonomous piecework team. But new techniques have borne heavily on these men for some time. Three-quarters of them are now over 45 years old. Mule spindles, which made up 57 per cent of the active spindleage in 1953, had already fallen to 42 per cent by the end of 1959. Reorganisation has greatly accelerated this fall. Their union—the Operative Cotton Spinners' and Twiners', to which almost all mule spinners belong—reflects this. Membership, which many decades ago reached 56,000, stood at 12,800 last year; by the time the latest changes have worked themselves out, barely 5,000 members will be left.

Economics cannot do justice to the plight of these old and sometimes embittered craftsmen, whose stubborn independence has kept them away from any amalgamations with other unions better placed than themselves. But their economic position at least has been mitigated by another major development in the cotton industry since the scheme was announced. This is the extension of shift work.

Lancashire, and indeed British industry generally, has always fought shy of shift work. Employers have doubted its economic advantages, while unions have feared its social effects. But in cotton the savings that shift work makes possible in capital and depreciation costs, especially on new machinery, are beginning to make it a necessity. About one-sixth of the spindles and rather more of the looms are now working shifts of some sort—either "double day," "day and evening" or "all round the clock"—and many more are expected to follow. This presents problems. Quite apart from whether the workers are prepared to accept a scheme in principle (which is decided, usually affirmatively, by ballot after the unions have inspected the workplace to see that conditions are satisfactory), there are the questions of shift premiums and extra public services to be considered and negotiated. In cotton, the premiums which have been agreed are higher than in most industries; they allow for a 16 per cent cut in hours for the same pay for double day shifts and a 20 per cent cash bonus on top of this for nights. But this last is not so generous as it sounds. Most day work is done by women, whereas night work must by law be done by more highly paid men. Increasingly, the men employed on night work are the redundant mule spinners. Even with the bonus, they are now earning about £3 less a week on average than they were before.

THE social problems which shift work raises are rather less easy of solution, though again less serious than expected. Public transport does not always run late enough for some of the women to return from work at 10.30 at night; even when it does, it is often crowded with men who have spent an evening on the beer. Attendance at night classes is impossible for one week in two for those on alternating double day shifts. Young people, whose life is geared to evening leisure, are very chary of late evening work. All these factors together have meant that where a mill changes to shifts and competes for its labour force—as it often does—with local non-shift industries like light engineering, food or chemicals, it may lose a substantial part of its labour force. This is one explanation of the seeming paradox that a declining industry is beset by a labour shortage rather than by an unemployment problem. One's guess is that the labour shortage will continue and hasten cotton's decline. However much help the local authorities provide in meeting transport strains, it is doubtful whether a shift work industry with cotton's record of recurrent unemployment—and with working conditions that caused one in eight union members in a typical branch to be claiming industrial injury benefit last month—can hold out much attraction to young workers in the future.

Despite these obvious sources of friction, one of the most healthy features of the reorganisation has been that good industrial relations have been maintained throughout. One factor in this has certainly been that mills are, by most industrial standards, small units where close contacts continue to exist between managers and workers. Cynics might also suggest that unions whose members are mostly women could not afford to be as militant as, say, miners or engineers; but this is to make a false equation between the southern office worker and the northern factory woman. The important difference between the unions in cotton and engineering is not the sex of the members but the number and availability of full-time union officials.

In engineering the official may be many miles away; in a typical medium-sized cotton community with 9,000 mill workers, the three principal unions have a total of eight full-time employees. These men, and their counterparts in the employers' associations, can deal with a grievance before it has had time to spread. The unions calculate that the extra money they pay out in officials' wages is more than offset by what they save in strike pay. The majority of under-staffed unions in Britain might equally find that to take on more and better paid officials would not only be a more efficient, but also a cheaper, way of managing their straggling domains.

NOTES OF THE WEEK

LABOUR

Bomb Over Labour

WITH great courage and bold clarity, Mr Gaitskell last Sunday reiterated his determination that Britain must remain loyal to Nato: "We must stand by our alliance and retain our defences . . . the contrary policy, pacifist, neutralist, unilateralist, is in present conditions profoundly dangerous to our own security and that of the world." Then on Wednesday, by 38 votes (including those of several communist delegates) to 14, the national committee of the Amalgamated Engineering Union instructed its leaders to demand an end to the "testing (sic), manufacture, stockpiling and basing of nuclear weapons in Great Britain." The engineers have thus done what the shopworkers did, and what Mr Cousins (in the name of his transport workers) will almost certainly do. Within the peculiar voting system that will dominate the Labour party's annual conference next October, there now appears to be a nominal majority for "pacifist, neutralist, unilateralist" policies. But in the Parliamentary Labour Party—that is to say, among the 257 democratically elected Labour MPs—there is, of course, no such majority for unilateralism; nor is there among the mass of Labour voters in the country at large.

Mr Gaitskell now seems to have three courses to choose from. First, he can try to fudge the motion that comes before the annual conference, so that union leaders can pretend that their mandates from union conferences do not forbid them to vote on his side. Perhaps he could succeed with that manœuvre this year, but it will not work for long. Now that the disarmers have captured the block votes of so many big unions, as they long ago captured the votes of the constituency Labour parties, the whole system under which the Labour conference operates has become untenable for any leader who does not hold extremist views. Secondly, Mr Gaitskell could resign. Or, thirdly, he could tell the party conference that he no longer accepts their nominal sovereignty in determining party policy: the responsibility for policy-making must lie instead with the members of the Parliamentary Party, who have been elected by twelve million Labour voters and are much the most representative body in the movement.

Some time, some Labour leader is going to have to adopt this third course. To reduce the annual conference to a purely advisory role—whose advice would often be rejected—would cause a blazing row. There would be squeals of rage from the constituencies and some unions, threats by many local parties to disown their MPs, and rows about the control of funds. But eventually the movement would fall into line. Is Mr Gaitskell going to be the man who makes it do so? Or will he insist on immolating himself and endangering the ideals for which he stands, before handing over to some other leader who will eventually have to take this obvious course.

ALLIANCES

All or None

WITH the approach of the "summit" meeting, diplomatic activity has been whacked up to supersonic speed, and foreign ministers are to be seen landing at yet another conference well ahead of the reverberations of the one they had just left. Mr Selwyn Lloyd, between last Saturday and Wednesday, took part in three separate international meetings—the Cento council in Teheran, the Nato council in a troubled Istanbul, and the Commonwealth conference in London—involving confrontations between 26 different governments. Complete harmony and thorough understanding of each other's thoughts are not easily achieved in these circumstances.

At the councils of the two alliances, the most prominent feature was the natural anxiety of the smaller partners that their specific interests should not be forgotten when the major powers meet. In Istanbul, Mr Lloyd emphasised that the sought-for *détente* with Russia could not be a "selective" one that would leave Moscow free to pick on individual countries. In Teheran Mr Herter gave assurances that the ties of alliance would still be needed even if the world struggle should assume a less dangerous form.

The Central Treaty Organisation (Cento)—still better known under its former name, the Baghdad Pact—consists, since Iraq's formal withdrawal in March, 1959, of Turkey, Persia, Pakistan, Britain, and, for all practical purposes, the United States. Each of its three eastern members has its own internal problems; each is ruled by a single strong man; each depends heavily on aid and arms from its western allies. As Turkey is also a member of Nato and Pakistan of Seato, it is Persia alone that depends wholly on Cento for a place in the allied defence system—and its internal affairs are even more potentially explosive than those of its two neighbours.

The Shah has not, however, failed to seek security elsewhere. Last year, without informing his allies, he began negotiations with Russia for a non-aggression treaty. When he was found out, his allies complained and his gesture failed. The Russians have not forgiven him for wasting their time, and they have taken a sinister delight in carrying on a war of words against him ever since. His position is highly vulnerable, and he only makes it more so by pretending that it is not. His allies will support him as long as he is the legitimate government; but it is Persia, and not who rules Persia, that is important to the free world. Mr Lloyd and Mr Herter may be able to present a case for their friends at Paris, but surely their task would be less arduous if they were confident that these friends were working equally hard to put their own houses in order.

EUROPE

An Open Postern?

WHILE the Six and Seven glower over their economic and political differences, a small door to Britain appears to have been opened in Western European

Union, the seven-power body which Mr Selwyn Lloyd hopes to use as a political link between Britain and the Six. On Monday its general affairs committee unanimously adopted a motion inviting Britain to join Euratom, the atomic community set up by the Six side by side with their common market. The invitation provides at once a test of Britain's intentions in Europe and an opportunity for it to get a footing within the Brussels communities. If it were acceptable on both sides one small unifying factor would begin to operate in a western Europe gripped by divisive forces.

Never an arrangement which presented overwhelming obstacles to British membership, Euratom today would be quite the easiest branch of the European household for Britain to join. There is no major problem of substance, like the Commonwealth tariff question, to be sorted out. There would be no profound political difficulty, like the need to check the spread of nuclear weapons, which inevitably inhibits proposals for pooling nuclear arms with the rest of free Europe.

In the past the British have been anxious to avoid telling other Europeans anything about their military nuclear programme. But today this programme is due for reappraisal, while the French have shown plainly enough that it is possible to run a national military programme with a minimum of interference from Euratom. In the commercial field, where the British hoped to scoop the short-term market for power stations by going it alone in research and development, the steam has been taken out of both the ambitions and the difficulties of the nuclear planners by the collapse of the energy market.

The argument for Britain going it alone always seemed questionable as a long-term proposition. That is why it has already been possible to start a satisfactory partnership on long-range research under Britain's treaty of association with Euratom. Full membership today, extending that partnership, and giving it a political crown, would be a natural and easy further step.

For some time, indeed, the main objections to British membership of Euratom have seemed likely to come from the community itself. With a cold war climate prevailing between the Six and Seven, there is bound to be a suspicion that the British are trying to split one of the six-nation communities from the others. Britain, however, does still have something to offer in the atomic field. There is everything to be said for trying now to establish this relatively painless political bridgehead to the Six.

A Scattering of Joiners

THE compelling logic of events is at last beginning to create a scattered support for British membership of the common market within all political parties. Except for the Liberal party, which is officially committed to a policy of adding Britain to the Six, this is still very much of a minority movement. But a fortnight ago Mr Frank Cousins, of the Transport and General Workers' Union, reiterated on television his private conviction that Britain could not afford to remain on the outside. Thus the ultimate heir to Ernest Bevin, who when Foreign Secretary bore so much of the responsibility for snubbing the Europeans, now places himself in the forefront of those who want Britain to rejoin Europe. For this purpose, though perhaps for no other, it is unfortunate that Mr Cousins does not carry anything like his predecessors' guns within the trades union movement; there may even be a tendency among his colleagues on the general council to be super-nationalist just because he has become supranationalist. However, in requesting a special session of the general council to review the TUC's policy towards the Six, Mr Cousins has been joined by one right-wing union leader, Mr Harry Douglass, of the Steelworkers' Union.

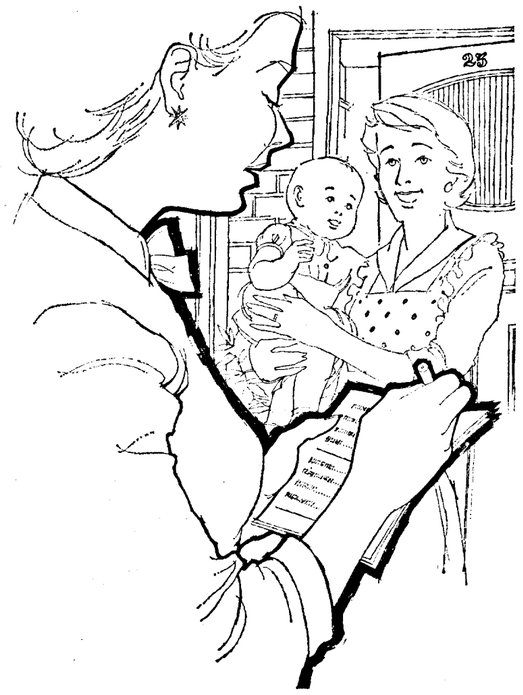
Within the parliamentary Labour party Mr Roy Jenkins, who speaks on economic subjects from the front bench, has just published an article firmly identifying himself with the same cause. He can, however, be under no illusions about the amount of conversion he will have to undertake within his party's own ranks. His senior colleague, Mr Harold Wilson, loses no opportunity of snorting at supranationalism. At the recent Anglo-German conference at Königswinter, right-wing Labour members were falling over each other to get to the microphone and affirm that Britain would never be prepared to surrender any atom of sovereignty.

However, in the Conservative party also there are some straws that may indicate a wind. Mr David Price, a young ICI official who sits for Eastleigh, interrupted a recent pro-European speech of Mr Jenkins's to point out that a minority group within the Tory party was also working for membership of the common market. And, although Mr Thorneycroft still keeps himself a little aloof from this group of European enthusiasts, he has several times exposed the hollowness of the Commonwealth excuse for Britain's not going in.

LOCAL ELECTIONS

Labour's Slippery Slope

THIS year's round of local elections began in the Scottish burghs on Tuesday. They showed scattered net Labour losses: not on any landslide scale, but with a fairly pronounced rightward drift in some factory areas. Next week, the spotlight on expected Labour losses turns to England and Wales. Elections will be taking place on various days throughout the week for just over a thousand urban and rural district councils, in most places to fill a third of the places on the councils but in some to fill the whole of them. Party labels in these "urbans" and "rurals" are too eclectic for the electoral statistician to draw very precise conclusions from them. But next Thursday, May 12th, electors will be called upon to return one-third of the ten thousand councillors in the 402 English and Welsh boroughs; and a scorecard for these is much easier to draw up.



The councillors retiring next Thursday were last elected in May, 1957—shortly after Suez, at a time when Labour was well ahead on the Gallup poll, and when the Opposition was winning parliamentary by-elections hand over fist. In this atmosphere, Labour returned 1,600 borough councillors in 1957. Last May, when the Conservatives led by 1 per cent in the Gallup poll, Labour returned 244 fewer borough councillors than this; very broadly, therefore, any net Labour losses of below 244 next Thursday would suggest that Labour is no more unpopular now than it was a year ago. Between last May and last October, there was clearly a further gain in Conservative popularity; at a very rough guess, Labour's net losses in the boroughs would have to exceed 350 before one could begin to be sure of a further decline in Labour's popularity since October's general election. What the Conservatives must be secretly hoping for, however—in view of Labour's recent demoralisation—is 400 or 500 net Labour losses in the boroughs, which would be the greatest Tory landslide for over a decade.

Two Year Heave?

ANY election nowadays tends to be crucial for Labour. The especially crucial feature of this year's local elections, however, is that some Tories hope to be able to bill them as marking the first year of a two-year operation to "sweep socialism out of its last preserves in this country." There are two bases for this kind of talk.

Labour's main claim to be making a contribution to practical government in this country now rests on its control of the councils of the big cities. At present, 138 of the 402 boroughs due to vote on Thursday are controlled by Labour, which is the strongest single party in a further 23. But, within these totals, while Labour controls only five of the 142 small non-county boroughs (under 20,000 population), it holds a clear majority in nearly half the larger ones (79 out of 177) and in two-thirds of the really big towns or "county boroughs" (where it controls 54 councils out of 83). Nobody is expecting widespread switches in control this year; if the Tories recapture many more than 20 Labour councils they will be doing rather well. This is because only a third of the councillors' seats are up for re-election on Thursday, which means a quarter of total council seats (a quarter of the seats are filled by aldermen). But in May, 1961, when another third of councillors must be re-elected, there will also be aldermanic elections; big gains this year would put the Tories in a good position to secure some quite dramatic changes of control then.

The other source of political excitement next week will be the performance of the Liberals. The Liberals have done quite remarkably well in some recent local council

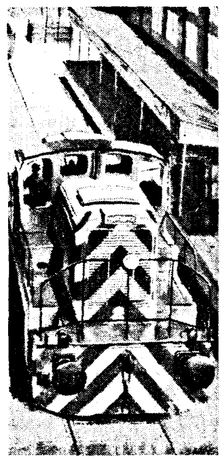
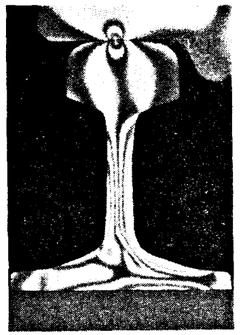
*US keeps the world on the rails

Big developments are taking place on the railways.
US knows. US is in the thick of it.



US is United Steel, makers of Britain's biggest variety of steels and steel products. Individual companies in United Steel are making important contributions to the railways of the future. And to the airways, seaways and motorways . . . but that's a lot of other stories.



2,000 h.p. English Electric diesel locomotive which hauls the Master Cutler train between Kings Cross and Sheffield. Many locomotives of this type are equipped with wheels, tyres, axles and springs made by Steel, Peech & Tozer—plates and sections made by Appleby-Frodingham Steel Company are used in their construction.

Supporting structure for overhead conductor cables, fabricated in quantity by United Steel Structural Company for British Railways. These structures are standardised and made to a high degree of accuracy to ensure interchangeability.

One of the many diesel shunting locomotives designed and built by Yorkshire Engine Company Limited, This "Janus" type, with electric drive and central two-way control, has engines fore and aft of the cab from which a good field of visibility is permitted by the small bonnets.

Stress pattern in a section of a rail under load—part of a research project carried out at United Steel's Research & Development Department, using a transparent plastic model illuminated by polarised light. The Workington Iron & Steel Branch of United Steel specialises in the production of rails and steel sleepers.

If you're concerned with railways anywhere between Waterloo and Wellington, N.Z., it pays to know US.

by-elections. They have consistently increased their share of the vote (to a recent average of 27 per cent), while the average Conservative vote has recently actually dropped a little and the average Labour vote has dropped quite a lot. In a three cornered fight anybody with over 33⅓ per cent of the vote has a chance of getting elected. Most of the 726 Liberals in the borough elections next week (a much higher figure than last time) should therefore be regarded as serious candidates; as only just over 100 of them are defending existing Liberal seats, the scope for possible Liberal gains is quite large.

Many of the Liberals are standing in Labour marginals. On past political form, this would be expected to split the anti-Labour vote and reduce Labour's losses. It may, of course, do so. But if, in spite of these Liberal candidacies, Conservative gains swept above the 400 or 500 mark (thus threatening many Labour councils for next year), and if Liberal gains also ran into three figures (thus dramatically strengthening the left wing alternative to Labour), the implications for the future of British politics would be very interesting indeed.

EAST-WEST RELATIONS

New Life for ECE?

WESTERN governments have given short shrift to Russia's offer to join the new body which is to succeed the Organisation for European Economic Co-operation. The French delegate to the United Nations Economic Commission for Europe (ECE), where the offer was made, pointed out that state trading nations would not fit easily into a body whose inspiration is free trade and the General Agreement on Tariffs and Trade. No doubt the political risk of accepting a member who may merely seek to obstruct the venture in Atlantic co-operation was in his mind too. All the same, the West will look rather silly if it rejects out of hand a Russian offer of the sort of co-operation which it suggested, and Stalin turned down, in 1947 when the Marshall plan was born. The problems of co-operation between east and west which the Russian offer raises cannot be brushed aside altogether.

At the latest meeting of ECE in Geneva, several other governments have made suggestions for east-west co-operation: a joint aid effort in the undeveloped countries; a code of good conduct to help trade between the two blocks, at present constricted by differences in trading methods and philosophy. These seem sensible ideas. The creation of trading groups in western Europe has seriously worried the small east European countries that have always traded heavily with the West. The worry might be turned to constructive purpose if it could be made the starting point of a greater co-operation between east and west in Europe, exploiting the new interest in the outside world that is stirring in the Soviet camp.

In the past both sides have often talked at cross purposes in the ECE, with propaganda aims in mind. Imagination and a genuine will to break down barriers have been in short supply. But some unobtrusive co-operation has been developing in the last few years. The Danube Commission now embraces both communist and free countries. The OEEC's productivity agency has been co-operating with the Poles.

In time there may have to be a more substantial relationship between the new European groups—Six and Seven—and the Soviet world. The difficulty is that, as long as the division within western Europe persists, overtures to the east tend to be exploited by the Russians to divide free Europe further. For the moment ECE itself may still offer the most fruitful field for east-west co-operation, as western delegates have suggested. But once the internal economic divisions of the west are healed, the way may be open to a less tenuous relationship with the communist world.

MOROCCO

The Struggles for Power

THE first assembly of the new all-African trade union federation has been postponed from May 18th till August. The postponement ought to please all sections of political opinion in Morocco, where a confusing struggle for power has been going on at several levels. At the trade union level, two bodies now dispute the right to represent all Moroccan workers: the old-established Union Marocaine du Travail (UMT) and the new Union Générale des Travailleurs du Maroc (UGTM). The new union, which claims that the older is under communist influence, recently held its inaugural meeting at Casablanca under police protection. The older union then called a protest strike, which was supported by the Moroccan prime minister, Mr. Ibrahim. On May Day, there were violent clashes between the rival groups in Casablanca.

This apparently contradictory situation arises from the fact that the police, like the army, remains under palace control, while Mr Ibrahim's party, the Union Nationale des Forces Populaires (UNFP), though still in office, is alleged to have been behind a plot against the state and the person of the Crown Prince, Moulay Hassan. The UMT was one of the forces that supported the creation of the prime minister's party last autumn; and the traditionalist Istiqlal party, of which this new party is a splinter, sponsored the formation of the UGTM as a rival to the established trade union group.

As yet the King of Morocco retains his freedom of manœuvre as arbiter of his country's destiny; but although he must be under growing pressure to assert his authority against the government and the leftist trade union group, he publicly endorsed the government's economic policy at the official May Day rally in Casablanca.

COUNCIL ON TRIBUNALS

Too Small a Voice

WHEN the Council on Tribunals was set up in 1958, on the recommendation of the Franks committee, it was hailed by some people as an important instrument to ensure that the ordinary citizen would always get a fair deal from the state. The publication of the council's first annual report last week has now been greeted with resounding apathy by all concerned. Its functions are far too limited for it to exert any real reforming effect. It is not a court of appeal, nor does it have any executive powers. Its role is wholly advisory and consultative—principally, to inquire whether the work of tribunals is being efficiently and impartially carried out, according to the usual ground rules of bureaucracy.

The council's first year has been passed mainly in gathering information about the work of the various tribunals, and thus bringing the factual reporting of the Franks committee up to date. This task has now been completed and the researches might well be published by the Stationery Office as a "Handbook to Tribunals." On the whole, the council reports that the tribunal system is working well, although it would like to see more legally-qualified chairmen being used. But it has made no attempt to present a sustained analysis of the composition of tribunals or to make recommendations for their improvement. The report complains that there is no fixed procedure for rent tribunals, but fails to suggest a model code.

To carry out its task of supervision, the council relies largely on personal visits to tribunals, of which it somewhat quixotically and inadvisedly gives advance notice. Its members have a right of entry to some tribunals; but to others, such as the National Health Service Tribunal, they are admitted only on sufferance as "members of the public." In some tribunals they are forbidden to retire with the members to listen to their discussions. Both these anomalies should be remedied—if necessary, by legislation. Tribunals are now obliged to consult the council when they make changes in their procedural rules, but no machinery exists for publicising the advice the council tenders. The report recommends that Parliament should be informed both of the advice given and the minister's reaction. Plainly, it should. Equally plainly, Parliament should now hold a searching debate on how and why the 1958 act is not successfully working out.

WHY LABOUR LOST

A Party of Slobs?

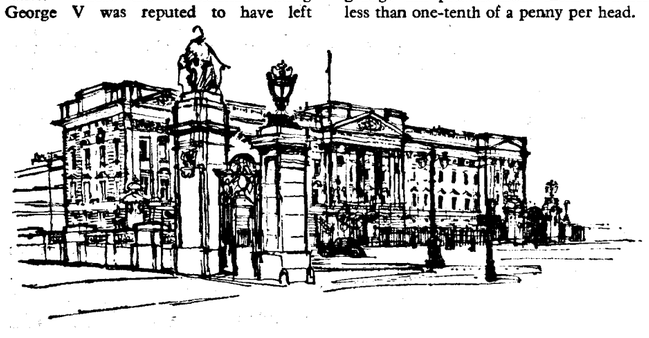
THERE is scarcely a single statistic in the survey of party images among the working class, commissioned from Dr Mark Abrams by *Socialist Commentary*, which

offers the Labour party a ray of hope for the future. Dr Abrams reports that less than half of the working class supported Labour; the remainder were Conservatives, Liberals or not interested. Both Labour and non-Labour supporters identified the Labour party as a working-class party, out to help the underdog, and trying to abolish class differences.

When the same guinea-pigs were asked to name the qualities of a good party, the bulk of the Labour supporters left out all the criteria which they had said were distinctive of their own party. World peace, the prevention of nuclear war and prosperity came first with both groups. Yet only a third of Labour's rank-and-file identify their own party with prosperity, while two-thirds of the non-Labour working class associate prosperity with the present Government. As for world peace and the prevention of nuclear war, neither group sees anything in it between Tory and Labour.

Labour's decision immediately before and after the election to emphasise African issues hardly strikes a rich vein. 43 per cent of the pro-Labour working class, and 51 per cent of the anti-Labour working class, think both main parties believe equally in fair treatment of all races. There is a majority in both groups against giving economic aid to underdeveloped Africa. Both groups are overwhelmingly against further nationalisation; but, when the question was rephrased, both groups supported further government regulation of private industry. The bulk of the men had a good view, and the bulk of the women a poor view, of trades unions.

The Cost of Royalty



THE decorations in London's streets for Princess Margaret's wedding have cost £25,000, compared with £6,000 spent on the Queen's wedding in 1947. The complaints of some Labour MPs about this seem to have been peculiarly ill-directed. These decorations are there to entertain the public, not to please the Princess, who will not have much opportunity to look at them as she drives along the route. The same is true of most of the other "costs of royalty," or rather of the pageantry that the public expects to go with it. What is the total annual bill in a normal year?

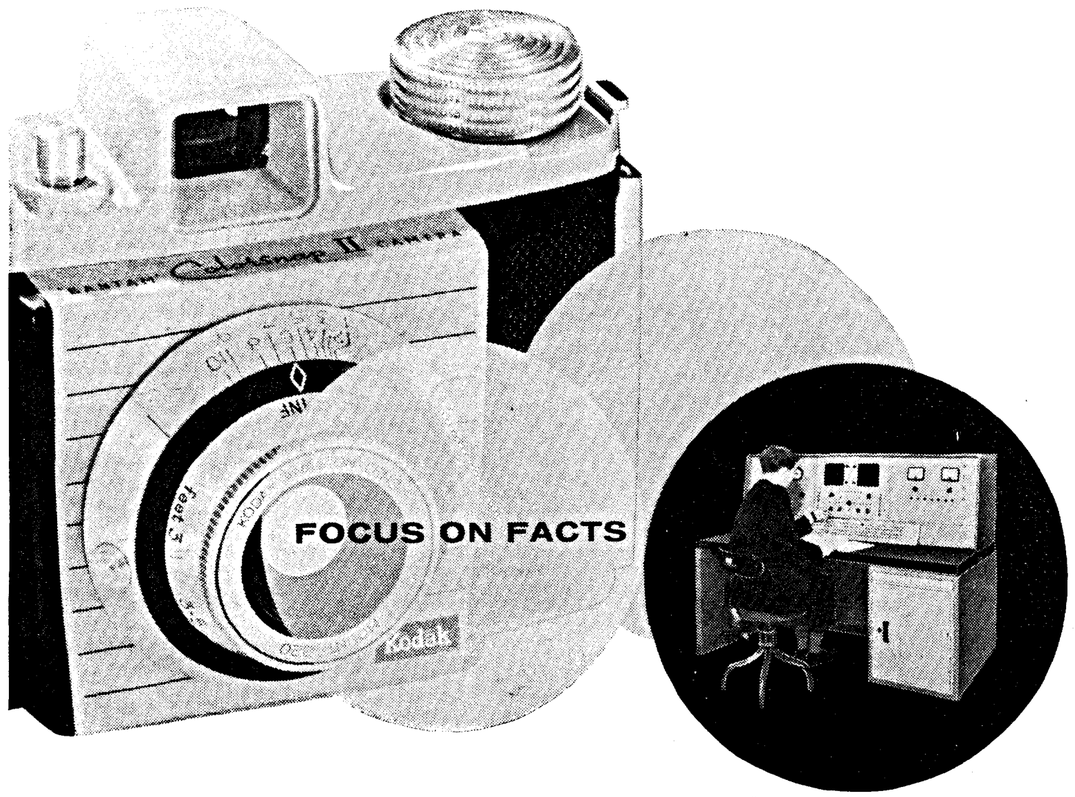
The royal family's income comes from three main sources. The first, which was fixed at the beginning of the reign and which has not since been altered, is paid by Parliament and is known as the Civil List. This provides a total of £475,000 a year of untaxed income for the Queen and her household; but until Prince Charles comes of age, most of the £90,000 which he draws from his estates as Duke of Cornwall is being subtracted from this, so that the net cost to the taxpayer is under £400,000 a year. In the 1930's the Civil Lists of George V and Edward VIII amounted to £470,000 a year; as prices have multiplied threefold or fourfold since then, the real cost of the Queen's Civil List is much less than a third of theirs. As well as making an allowance to the Queen on the Civil List, Parliament pays annuities to other members of the royal family —but (once expenses are deducted) all these are subject to tax. Thus the Queen Mother gets £70,000 of pre-tax income a year, the Duke of Edinburgh £40,000, the Duke of Gloucester £35,000, and Princess Margaret will now get £15,000 a year. Before the Princess married, she got only £6,000 a year.

The second major, if indirect, source of royal income is the Ministry of Works. This ministry pays for the upkeep, alterations, furniture, fuel, gas and water of all the royal palaces, and defrays the salaries of gardeners, porters and even the Yeomen of the Guard. Despite a substantial slimming of palace staffs, the total cost of royal upkeep under this head is going up; it is estimated to be £668,000 this year, an increase of £66,000 on 1959-60. The biggest single item in this sum is the £225,000 to be spent on Windsor Castle (£89,000 going on maintenance, £92,000 on modernisation, and the rest on furniture, running costs and salaries). Another £147,000 is to be spent this year on Buckingham Palace. For the rest, St. James's Palace, Kensington Palace, Marlborough House, Hampton Court and Holyrood House (to name a few other royal residences) take £181,000 between them, nearly all of which is to be spent on "maintenance and repairs." If the taxpayer wants to make further economies on the cost of royalty the most hopeful line (although worshippers of ancient monuments would hate this) would be the abandonment of some of these decaying piles. Princess Margaret and her husband are to live in a small three-bedroom house.

The third source of royal revenue is the Queen's (and her relatives') private fortunes. These are substantial. King George V was reputed to have left £1 million to each of his four sons; since the sovereign pays no tax, this fortune did not suffer the attrition from death duties that have crumpled up many other large estates. Much of the royal family's fortune, of course, is held in art treasures and land; but some is invested in stocks and shares. It is out of income from these that the Queen and the Duke of Edinburgh pay for their private pleasures, such as the Queen's racing stables and the Duke's polo ponies.

The yacht *Britannia*, that most contentious of royal possessions, is paid for out of another account still, that of the Navy. The idea of building this was mooted before the war, but the keel was not laid down until 1948, when the plans were agreed both by the Labour Government and the Conservative Opposition. Quite frankly, this £2 million craft was then accepted as something of an extravagance: as the one gift known to be devoutly desired by a sailor king whose health was then failing. It was designed to enable George VI to visit the Commonwealth by sea. Since he died before it was completed, it has proved something of a white elephant. Its crew of 20 officers and 237 ratings draw salaries of £4,000 a week, regardless of whether the ship is at sea or not; when it is at sea, running costs bring the yacht's total expense up to around £7,000 a week. It is only this additional seagoing cost (for, say, a five or six week cruise?) which can reasonably be regarded as the nation's honeymoon gift to the Princess. Probably few people will grudge this present from them of much less than one-tenth of a penny per head.

"Don't worry, Mr. Waterside—
it's an aluminium grille"



There's no need to protect it from Summer showers.

An aluminium grille is aluminium through and through —

not just a surface coating through which rust will soon appear.

Aluminium doesn't rust!

KODAK CHOOSE EMIDEC

Everyone knows Kodak, and the wide range of photographic goods they produce. It is not difficult to imagine the problem involved in maintaining an efficient production and distribution organisation.

To keep pace with an ever-growing demand, Kodak has now ordered an EMIDEC 1100 electronic computer.

Designed and manufactured by E.M.I. Electronics Ltd., the EMIDEC 1100 is a high-speed computer, using transistor and magnetic core techniques.

Kodak will use the computer to maintain up-to-date records of stocks held at its nine wholesale branches throughout Great Britain. The EMIDEC will also print out invoices and maintain personal accounts and statistics for each of the organisation's 30,000 customers and trade outlets.

EMIDEC computers have been selected by many other large organisations and Government departments including:

AIR MINISTRY · B.M.C. · SAINSBURY'S · BOOTS · R.A.O.C. BARCLAYS BANK · GLAXO · ICI (PLASTICS DIVISION) MINISTRY OF LABOUR · MINISTRY OF PENSIONS · B.E.A.

Write for illustrated literature giving full details of EMIDEC computers.

EE96

Finally the most striking conclusion was the extent to which working class people defined their own class status according to the goods they have bought and not according to their occupation or income. As one might expect, opposition to Labour is higher among those skilled and often unskilled workers who have upgraded themselves into the middle class. According to this survey, Labour is coming to be looked upon as the party of those without pride, aspiration or desire for responsibility.

APPRENTICES

Protest by Youth

THE strike of shipbuilding and engineering apprentices which spread during the past week from Clydeside to the North of England, but then appeared to be faltering, was no doubt a shocking breach of these young men's solemn promises under their indentures. It was disapproved of by the unions, and castigated by the employers. But it was also much more than just a sudden display of juvenile pique. It stems from, and illustrates, the flaws in the whole paraphernalia of craft training in industry. Apprentices in Britain are normally taken on at 15 or 16 for a five year course, during which they are paid a slowly increasing percentage of the skilled craftsmen's wage ; this percentage has altered little over the past forty years, during which skilled craftsmen's own differentials have also declined. As a result of this carefully regulated and collectively-bargained system, apprentices have done increasingly poorly compared with both unindentured youths and even their own girl friends in free occupations outside; while a 19-year-old apprentice may get less than £6 a week after four years in an engineering shop, his girl could well be bringing in £7 as a shorthand typist at the age of 17 (because there is no agreement between the unions and the employers to set a ceiling on her market price). This is a situation that was bound to give rise to discontent.

The unions did not support the strike because the apprenticeship system serves their interests by giving them control over the supply of labour. Some bad employers, who like to use apprentices as cheap labour without providing any really good training, have a vested interest in the present system also. Many good employers say that it is not economic to pay apprentices more because of the restrictions that the unions impose on the work that they can do. Rash-headed as some of the young strikers may be, it is really the system of apprenticeship that should be under the microscope, not they.

GERMANY

Relics of Nazi Justice

THE fact that there are magistrates, prosecutors and judges on the west German bench with a murky past was brought to the attention of the British public in a press conference on March 18th, when the Czechoslovak ambassador did his best to exploit the theme for propaganda. Last week the press was given a more balanced introduction to this question when Herr Gerhard Strecker, a west Berliner who has been investigating the problem, gave a press conference in the House of Commons.

Herr Strecker was first asked to investigate nazis in high places by the west German Conference of Socialist Students. Owing, he claims, to lack of information in the west, he has been forced to get most of his evidence from east Berlin and Prague. As a result, he no longer enjoys the support of the west German Social Democratic party, but he seems under no illusions about his sources of information. To galvanise the authorities into action, he has brought writs of manslaughter against 43 judges. Public interest has been sufficiently aroused to inspire a Bundestag debate.

Herr Strecker made it plain last week that he is not trying to start a legal witch-hunt against all ex-nazis on the bench, but merely to press for the removal of those judges who passed grisly sentences under the Third Reich, and are thus unfit, on the face of it, to administer justice today. He puts their number at around 150, out of over 11,000 judges and prosecutors.

There are two difficulties. Cases of manslaughter which occurred during the war can be taken up only within a fifteen-year period, which expires on May 8th—next Sunday. The Social Democrats are therefore pressing for a postponement of the deadline. And the judge who imposed brutal sentences can still plead that he was merely doing his duty under the law of the Third Reich. However, the real need is not for a series of prosecutions but for swift action by the authorities to remove unsuitable characters from the courts.

This is primarily a matter for the Germans—except in one respect. Many documents on the nazi period are still in the hands of the British and Americans who captured them when the war ended. Yet access to some, particularly those in the Berlin Documents Centre under American control, has been refused to reputable German bodies, including the Social Democratic party ; while the documents themselves are, by all accounts, in a confused state. It seems ludicrous that allied policy should force Germans who seek the truth to go to east Berlin, where the evidence offered for inspection is no doubt selective and the chief state prosecutor is a well-known former nazi himself.

LAOS

Right or More Right?

AFTER last week's general elections, the political choice in Laos is between a moderately right-wing and an extreme right-wing government. This is perhaps not the healthiest of possible situations for a small, exposed, and ill-organised country with powerful communist neighbours.

A communist victory at the polls was ruled out. The leaders of the communist Neo Lao Haksat party, including Prince Souphanna Vong, are still in detention. The party was able to put up only nine of its own candidates to contest the 59 seats in the assembly, though a dozen other candidates also supported its general policy. The conduct of the elections, however, is arousing criticism. Two minor non-communist groups complain of irregularities ; impartial eyebrows are being raised at the news that one communist polled only four votes to his opponent's 18,000. There seems to be a simple pretext here for further communist violence.

The best hope for stability now would probably lie in the formation of a moderate government under the former prime minister, Prince Souvanna Phouma (half-brother of the communist prince). Since his return from Paris for the elections, Prince Souvanna Phouma has taken a firm enough anti-communist line to qualify for support from the army and from the United States, on whose aid the state depends. His Laotian People's Rally is, however, easily outshouted by the more extreme Committee for the Defence of National Interests, whose guiding spirit is General Phoumi, the minister of defence. The general's candidate for the premiership is reported to be Mr Tiao Somsanith, minister of the interior ; but since Mr Tiao was mainly responsible for the electoral arrangements, his appointment would almost certainly provoke further disorders. King Savang Vatthana will need all his wisdom if Laos is not to become the centre of yet another international crisis.

BIRMINGHAM

Inviolate Green Belt

IN 1950, Lord Silkin rightly rejected the London County Council's proposal to build yet another distant housing estate at Chessington in Surrey, and thus took a vital step in making the metropolitan green belt a reality. The present Minister of Housing, Mr Brooke, has now rejected Birmingham's proposed garden suburb for 50,000 people at Wythall, in the interest of protecting a green belt around Birmingham. In principle the two cases look fairly similar. In practice the difference is that Birmingham's factory workers have nowhere else to go.

In 1951, when Lord Silkin refused Chessington, eight new towns were being built as alternatives for London workers and the growth of industry in London was being strictly controlled. Modern Birmingham is differently situated. Its industries are highly prosperous and expanding, its obsolete dwellings and factories are being vigorously scrapped and replaced. Nobody at the Wythall inquiry seriously questioned the fact that extensive new housing is urgently needed for workers in the city. The Wythall project would have met this need in a compact, comprehensive,

and expeditious manner. Mr Brooke's decision to rely entirely upon sundry "overspill" schemes does none of these things because the surrounding counties (who must accommodate the overspill) are not co-operating actively in bringing those schemes into effect.

This is not to say that the Minister is wrong in his attachment to green belts. But has he any right to impose them on reluctant local authorities, and ultimately on industrialists, without actively helping himself? If he believes in rapid dispersal from Birmingham, then he ought to designate two new towns (in which there would be both public and private housing). At the very least he should compel the recalcitrant surrounding counties to provide enough good sites for people leaving Birmingham. Even so Wythall ought probably to have been allowed as a necessary, immediate safety-valve while such broader measures took effect. Mr Brooke will soon have to decide similar questions over the building plans of Newcastle, London, and other big cities. He had better have his alternatives ready before he issues any more vetoes.

BRITISH AGRICULTURE

Peasants' Myopia

THE National Farmers' Union is sending its new President, Mr Harold Woolley, to a personal interview with the Prime Minister, at which the "intense dissatisfaction" of union branches with the recent price settlement will be aired. Clearly the price question cannot be reopened until next year. The pointless gesture of this interview indicates the ineffective malaise and anxiety from which the union is suffering. Cannot farmers now start to look further ahead?

The present system of price guarantees is safe for the lifetime of this Parliament. Thereafter, the basic question is likely to be: what changes must be made in order to align British agriculture with a wider system of European integration? On this big question the union's attitude has so far been extremely negative. Its main preoccupation is that European food surpluses should not be "dumped" here. Any method which "allocates" (e.g., restricts) supplies, such as the International Wheat Agreement and the Bacon Consultative Committee, is acceptable to the union; but anything which savours of increased competition within a wider economic community is not. Yet three basic facts stand out. The great advantage of British agriculture is that it is much more efficient than the agriculture of most of its neighbours. The trouble is that it is also much more highly supported and that the very low incomes of many European farmers would be quite unacceptable here. The problem is to reconcile these two considerations in such a way that European trade in agricultural products can flow more freely, uncramped by the sillier forms of protectionism and artificial markets.

The Six have started to tackle this problem. In some respects they are tackling it in ways that are unwelcome to Britain; but Britain would have had allies in influencing them for the better if we had been a founder member of the group. The problem of bridging the gap between the Southern European peasant and the efficient Dutch or French farmer is not so different from that of integrating British agriculture too. Could not British farmers this time, with an eye on the real opportunities as well as the sectional problems before them, decide to ride with, instead of against, the advancing liberal tide?

LADY CHATTERLEY'S LOVER

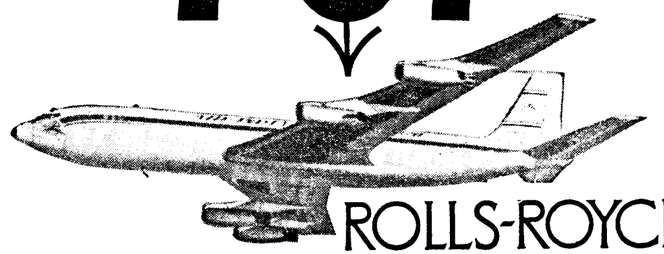
Printers' Censorship?

FOR more than thirty years English readers have been denied the opportunity of reading an accurate and unexpurgated edition of "Lady Chatterley's Lover," and now hopes raised by the proposed publication in a Penguin edition have been dashed by Sir Allen Lane's announcement that publication has had to be "postponed." The printers, who originally agreed to set it up, have now declined to do so—presumably through fears of legal action.

Since its first publication in Florence by Pino Orioli in 1928, when it came out in a limited edition of 1,000 copies sold to subscribers at 2 gns. each, "Lady Chatterley's Lover" has enjoyed world-wide suppression. Even a Japanese edition was destroyed in 1952. The English Customs authorities have never allowed it into the country, and the howls of execration with which it was greeted in 1928 have intimidated English publishers ever since. Until last year, readers had to rely on inferior English language editions published in France. But last spring, emboldened by the season and a United States Supreme Court decision liberalising the federal obscenity laws (the Roth case), a full American edition was finally published. Despite its sober format and high price of six dollars, it was forbidden the use of the United States mails, until cleared by a Federal court order. Since then no fewer than three American paper back editions have appeared.

Sir Allen Lane's bold decision to give the British public an unexpurgated edition—all the more courageous in view of the low price of 3s. 6d.—was doubtless prompted by the new Obscene Publications Act, which for the first time requires books to be judged as a whole, and provides a defence of publication for the public good, if it can be shown that books serve the interests of literature, art or science. "Lady Chatterley's Lover," on any reasonable interpretation of the Act, certainly comes within this exception, and expert advice could now be called to prove it. It would accordingly make an excellent test case; but prosecution is highly unlikely and Sir Allen should lose no time in finding another printer, which should be a reasonably easy task.

Meanwhile it is an intolerable situation that printers should feel obliged (or qualified) to set themselves up as censors to reverse the decisions of responsible publishers, taken after full consideration of the issues involved. The Director of Public Prosecution should recognise this by abandoning the undesirable practice, too often followed, of joining printers as principals with authors and publishers in obscenity cases. Only very exceptional circumstances justify such a course.



The Economist

MAY 5, 1860

REPRESENTATIVES OF GAME

A slight, but somewhat favourable indication that public opinion against game-preserving is operating in the rural districts is to be found in the address of Mr Benyon, at Abingdon, on being elected without opposition as a member for the county of Berks. He said "that certain reports had been very industriously circulated with reference to game on his property. He was not present at the market tables where these reports were so rife, and he was utterly unconscious of their existence; therefore he had no opportunity of replying to them. All he asked was fair play; that they would not condemn him unheard." And then he volunteered an explanation on the subject. He said "a general accusation of that nature could only be met by a general reply; but this he would say, he was as great an enemy to *rabbits* (!) as any one of them. His orders were strict on that point; and, moreover, all his tenants were expressly bound by their agreements to kill the rabbits upon their respective farms for themselves, and to render him every assistance in keeping down those pests of agriculture." This is really no explanation of a charge of game-preserving. The very superfluous anxiety stated to be felt about the destruction of rabbits proves that Mr Benyon's estate is infested with game and gamekeepers; and it is probable that, in spite of the "strict orders", the gamekeepers find it highly conducive to their own profit to keep up "a fair stock" of rabbits as well as a "good head of game". If the tenants had complete control of their farms, as under any rational system of management they would have, Mr Benyon might safely leave the destruction of rabbits to the farmers without stipulations on the subject. But if game and gamekeepers have the run of their farms, as is probably the case, the destruction of the rabbits becomes well nigh impossible. We should like to see the county electors deal somewhat more decisively with these game-preserving candidates.

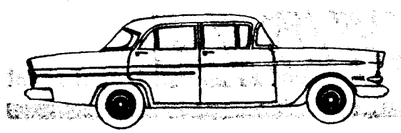
VISIONOMICS*



*** VISIONOMICS**, *a branch of* ERGONOMICS: *the science of designing objects with particular reference to the needs and physical characteristics of their users:* 'human engineering'.

It's easy to tell, even at first glance, how much Vauxhall have concerned themselves with the study of superior visibility. Look at the deep panoramic windscreen with the matching rear window . . . at the low glass line, front, back and sides. Check for yourself how all four wing tips are *easily* visible from the driving seat.

For the driver — an unimpaired view of traffic in front and behind. For the passengers — a first-class view of the landscape. No more cricked necks, blind spots or guess-and-bump parking. Optically speaking — as well as in every other way — you drive better in a Vauxhall. And did you know that you can be *seen* better, too? The front flashers are designed to shine sideways as well as straight ahead. The rear flashers are mounted high and unmistakable. Your signals are decisive and safe.

That's Visionomics — a boffin's word, but one which sums up thoughtful engineering . . . a philosophy of design . . . and a science that is important to you. Visit your Vauxhall dealer, go for a trial run and simply see for yourself that

LETTERS

The Philippines

SIR—It is precisely because we Filipinos have for so long been "last" in our own country that the "Filipinos First" policy was enunciated by our National Economic Council. Originally this was designed to correct an anomalous situation in which the foreign exchange earned by Filipino exporters was largely allocated at the official fixed rate to alien importers on the basis of traditional performance, and enabled the latter to make heavy profits.

The legislative proposals to which you referred in your note of the 23rd April are a different matter. Under the presidential system of government which we follow, these are private bills and, before they are finally approved by both Houses of Congress and signed or allowed to become law by the President, any comment would seem to be premature. In any case, it is difficult to see any ground for legitimate complaint in a proposal which you yourself describe as designed to "bring foreign insurance companies into line with Philippine ones." Why should foreign companies enjoy greater privileges than ours in our own country? Should we be content with "Filipinos Second Best?"

You warn that we will not be serving our own interests if we discourage non-American sources of economic activity. We do welcome foreign investments, preferably in the development of industries rather than in the sterile entrepreneurial activities which have been traditional for foreigners in the Philippines. But we are not prepared to surrender our economy to foreign interests, and must insist on proper and legitimate safeguards by associating Filipino management and capital with such foreign investments.

Other western countries do not seem to find partnership with the Filipinos intolerable; I suggest that the British will not be "serving their own interests" if they allow themselves to be "discouraged" by measures of legitimate self-interest and self-defence taken by the Filipinos.—Yours faithfully,

L. MA. GUERRERO
Ambassador

Embassy of the Philippines
London

A University for Stevenage?

SIR—In your last issue you were good enough, in your comments upon plans for new universities, to salute the spirit of Stevenage in desiring to have in its new town a university. You suggested, however, that this desire was "a bit far-fetched" and that the town should first provide itself with adequate schools.

May I give a few reasons why we in Stevenage do not believe that our hopes are far-fetched? The splendid sites we have available, the opportunities for co-operation between the corporation and a university in planning and building, the presence in Stevenage of two Department of Scientific and Industrial Research laboratories and of industries engaged in electronics and other scientific work offering possibilities of collaboration with a university or college of university status, and the large population (already 1¼ million) within 20 miles of Stevenage, all seem to us to be factors in our favour.

Your reference to schools surprised me. The building of fine schools by the Hertfordshire County Council has been and is proceeding apace, and there were, before the new town came, older schools of high repute. Already there are in Stevenage two grammar schools and 18 others as well as a College of Further Education in course of erection, and there are extensive plans for further building.

It is too early to foresee what it may be possible to accomplish, but I am sure you will agree that our ambitions for a new university or new university college in our new town are neither unreasonable nor unworthy.—Yours faithfully,

ROYDON DASH
Stevenage Development Corporation

American Housing

SIR—The interesting, and, in the main, correct report of your Washington correspondent, "No Room for Housing," draws at least one incorrect implication. This is that people of less than average income are not benefited because many new houses being built are beyond their means.

Repeatedly we have had to emphasise to foreign analysts that families of less than average means neither need to buy new automobiles nor to buy or rent new houses; though in practice many do, especially in the case of automobiles. When a new house is built, a usable house is usually vacated. New families usually do not buy new houses. As you have mentioned before, one-fifth of American families live in different houses today from those in which they lived one year ago. This is possible in the United States where in the first quarter of 1960, 7.2 per cent of rental units were vacant and available for rent and 1.1. per cent of home-owner units were available for sale only.

Many foreign readers also will fail to realise that what we Americans call "sub-standard" in relation to the bulk of our housing inventory would be regarded as acceptable and spacious accommodation in many countries. The mere absence of running hot water or of a private bath for each family throws a dwelling unit into the lower category for our purposes. Slums we have,

The trend behind a trend

"THE LATEST estimates indicate that Britain's expenditure on advertising (around £400 million*) is only a little less than the total spent on research and development (some £450 million).

"But the interesting and encouraging thing is that while expenditure on both have been rising quite fast in recent years, research has been going much the faster. It put on close to 50 per cent in the three years from 1955-58".

This is Andrew Shonfield, economic editor of The Observer, writing in the regular feature 'The Nation's Business'. His articles are followed keenly and closely by a fair section of The Observer's highly intelligent lay public.

A simple count of heads leads one inescapably to the conclusion that Shonfield is a popular economist. And yet his approach to business is highly anti-pop. His first sentence quoted above would fit quite cosily into the financial columns of almost any paper. But Shonfield takes it a stage further. He adds a second statistic that suddenly brings the picture into its true focus.

Writing as he does for a *newspaper*, he can give very topical attention to current trends, but he is always careful to relate them to what will happen in the long run.

Indeed, people who don't much like economics read him as a forecaster. He is a surprisingly accurate one.

Stripy toothpaste

On Sundays in The Observer, Shonfield is one prong of a three-pronged attack on the belief that what goes on in business isn't really anyone's business.

A new financial column 'Something in the City' by Mammon deals with the *people* behind the scenes of big business. Recent Mammon exposés have included the reasons for stripy toothpaste and the growth of the car hire business.

And Sterling in 'Taking Stock' deals with the stock market in an unusually perceptive way.

If you are interested in economics, next Sunday's Observer is as essential as a prescribed text and much much more entertaining. If you aren't, just glance at pages two and three of The Observer next Sunday. You'll find that money can be more interesting than you think. **J.B.I.**

* *Estimated by Mark Abrams in the Financial Times.*

ADVT.

yes. Progress in ridding ourselves of bad areas has been agonisingly slow. But we are gaining speed. With over 60 per cent of our families owning their own homes, with about nine-tenths owning television, with 7 to 9 new family dwelling units being built annually for each 1,000 people in the population, with the private building industry doing research in cost reduction at a time when home buyers insist on more and better quality of houses and household equipment, with typical new houses averaging 1,100 or so square feet, with houses slated for obsolescence this decade unless they are equipped with air-conditioning—this is on the whole a pleasant place in which to live.—Yours faithfully,

ROY J. BURROUGHS
Housing & Home Finance Agency
Washington

Teachers

SIR—Your note last week bristled with references to "take-over negotiations," attempts by the National Union of Teachers to "swallow" other organisations, and talk of a "closed shop," but not with objective truth. You have, for example, failed to mention the NUT's offer to give up its own separate identity if others will do the same, and the fact that the draft constitution, which the union would like to discuss with other teachers' organisations, assumes the disappearance of all existing bodies and would embody guarantees of protection for minority rights. Is this because these facts do not fit the picture you prefer to paint of an organisation out to "swallow both the National Association of Schoolmasters and the Association of Assistant Masters," both of which bodies, I notice, are also the subject of inaccurate references? (The AAM does not have four representatives on the Burnham Committee; the NAS represents only a minority of men in primary and secondary schools and its policy in respect of family allowances is one of temporary expedience pending the achievement of separate consideration of men's salaries.)

You declare that our conference's preference for increases in the basic salary scale before further increases in differentials is due to the control of a feminine and primary school majority. This thesis, too, can be sustained only by the suppression of the following facts: the motion at our conference which sought to confine our efforts in the next salary negotiations to increasing the basic scale only (and which was defeated by a large majority) was moved by an association representing Grammar School teachers (you do not seem to realise that the present differentials give rise to at least as much dissatisfaction in secondary schools as anywhere else); a motion which said that no award should be accepted which failed to decrease the differential between primary and secondary school head teachers' allowances was also rejected by the conference. The majority of delegates at that conference were men; the majority of the union's executive are men; the majority of men teachers are members of the NUT. Only *The Economist*, I fear, could make so bold as to attempt to persuade its readers that the union's efforts to secure the unity of the teaching profession and further improvements in the status and salaries of teachers, were due to the hidden hands of a "monstrous regiment of women."—Yours faithfully,

FRED JARVIS
National Union of Teachers
London, WC1

Shopworkers

SIR—The recent article under the heading "Shopping Labour" contained an abundance of assertions and value judgments, but little in the way of supporting evidence. Along with other seemingly *a priori* truths, the writer of the article claimed that the delegates at USDAW's recent conference had "virtually self elected themselves." What is the evidence for this? Has the writer made a careful analysis of USDAW's election procedure? If not, was it a generalisation from a premise that meetings of some voluntary organisations are poorly attended?

If the latter explanation is the correct one, I look forward to reading in future editions of *The Economist* some of the comments of "virtually self elected" company chairmen, political party leaders, etc., and perhaps even the Bill Carron's of the Labour Movement. On the other hand—perhaps due to recondite reasoning—I have the impression that descriptions like "virtually self elected" are reserved for trade unionists who refuse to be guided by writers who claim to know the kind of policies that "mirror the views of a majority of the twelve million Labour voters." As a Labour voting USDAW member I, too, must confess that I often succumb to such a weakness.—Yours faithfully,

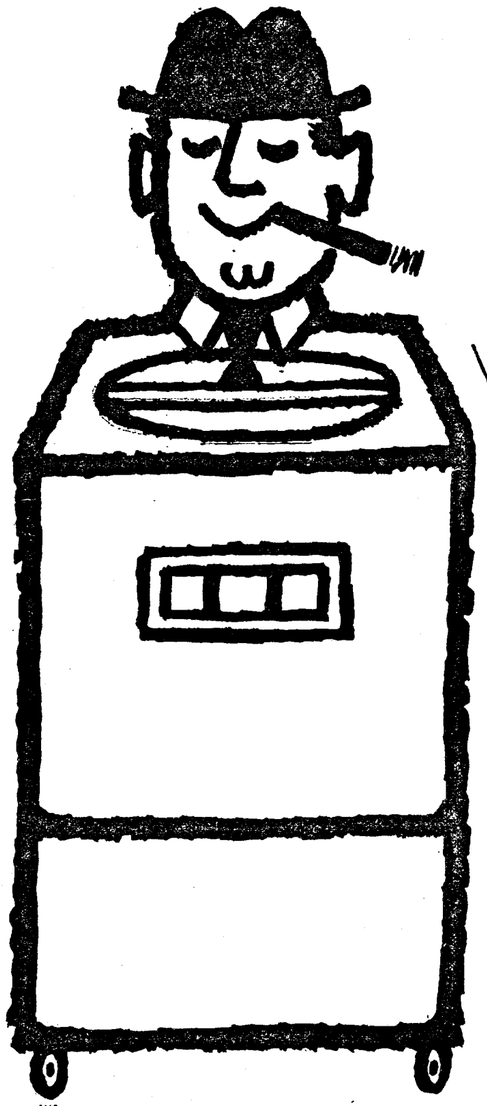
Oxford RON THOMAS

Restrictive Practices

SIR—American experience—despite your disclaimer—supports your opinion that "open-price" agreements can nullify the act against restrictive trade practices. In general, under US law, arrangements which identify specific transactions—sellers, buyers and prices—or which provide a schedule of prices and a tacit assurance so that each seller knows that he can wait forever, if need be, before being embarrassed by another seller's price cut, have been held illegal. The last milestone was the "basing-point" case in 1948. It would seem to be at least worth a try for Parliamentary draftsmen to codify these principles into an amendment to the present act, requiring that agreements meeting the specifications be registered. The more basic problem is what the policy of the Act is to be.

If it is not possible to specify beforehand the restrictive features, or if there are a considerable number of agreements which fall in the twilight zone, the registrar will need the kind of discretion you suggest. Indeed, your last sentence is much too weak; I doubt that there is any case "for waiting until the effect of 'open-price' agreements is more fully known."

It is quite a serious error, however, to identify open-price arrangements with the publication of statistics by trade associations. US law has dealt harshly with the former, but the latter have grown steadily. Their quality varies, but the content is not very different from governmental reports. In part, it is a matter of humouring government, the press, and academic opinion; but for the most part, the firms themselves find the information useful even when it does not permit any understandings on price.—Yours faithfully,



M. A. ADELMAN
Massachusetts Institute of Technology
Cambridge, Mass.

BOOKS

Disunity and Union

The Unification of South Africa, 1902-1910.

By L. M. Thompson.
Oxford University Press. 565 pages. 50s.

PROFESSOR THOMPSON has written the first thorough account of the events that, within South Africa, led to the Union of 1910. It is a fascinating but dispiriting story, which leaves no place for the myth that the South African founding fathers were bound together in a "union of hearts". Motives were as mixed as minds were muddled. Mistrust and dislike were the dominant emotions of many Cape "liberals" towards "imperialists", "capitalists" and the Transvaal in general; of unreconstructed Republicans towards Englishmen and those who fraternised with them; of Natal "loyalists" towards Boers, Indians and those lacking in fervour to the imperial connection.

The ablest politicians, Smuts and Merriman, saw in union the quickest way to the destruction of "Milnerism"; ironically, they found their clearest-headed and most energetic supporters among members of Milner's kindergarten, who believed that they were crowning their mentor's work. In 1904, Smuts wrote to Merriman: "You know with the Boers 'United S.A.' has always been a deeply-felt political aspiration and it might profitably be substituted for the Imperialism which imports Chinese, a foreign bureaucracy and a foreign standing army." But Smuts stood for equal political rights for white men. Merriman did not: his Whiggish principles rejected such "democratic shibboleths"; there was a place for the coloured man within his concept of aristocracy but not for the "capitalist" of the Witwatersrand. (Merriman once described Johannesburg as "Monte Carlo superimposed on Sodom and Gomorrah".) It was Merriman and his followers in the Cape (with the semi-comprehending assistance of Natal) who threatened to wreck the work of the National Convention unless the franchise were altered to the benefit of the rural constituencies; in the final compromise, proportional representation was abandoned and, with it, an important safeguard for the interests of political minorities.

It is an unjustifiable use of hindsight to say that this opened the way to "Boer dictatorship", but it made it probable unless some basis of political division other than racial exclusiveness could be found. In 1909, Patrick Duncan wrote: "The Boers, whatever their differences may be, are in the last resort fenced round by national and racial feelings. The others have about as much cohesive principle as chaff on a windy day." Those who drafted the constitution could not have foreseen that the English in South Africa were to be inept (until too late) in political thought and action: they might have foreseen (for Bryce and Low were in print) that cabinet government within a flexible constitution is not gentle to minorities.

Professor Thompson has used the private papers of many of the principal actors—notably those of Merriman, Smuts, Steyn, Fitzpatrick and Duncan; and he has written an illuminating account of the interplay and conflict of personalities and prejudices which, in the event, produced a draft that the British Parliament reluctantly enacted. To that extent, the Union was made in South Africa—but only to that extent, for power and responsibility both lay in London, and the shape of Union depended upon what the British Government did or refrained from doing. It is bad luck for Professor Thompson that his book was far advanced when the Colonial Office papers for this period were opened to the public; as it is, there are important gaps in his account. South Africa was subjected to one form of imperialism in the era of Milner and Chamberlain and to a different form in the era of Campbell-Bannerman and Asquith. The first form was incompatible with representative government, the second form disregarded the political havoc of the Anglo-Boer War. But the Liberal Government of 1905 inherited the promises made to the Boers on Britain's behalf by Kitchener, Milner and Chamberlain—no extension of the franchise to Non-Whites without the consent of the Whites. Here were two liberal principles in direct conflict. Much remains to be written on the contradictions and dilemmas of imperialism in its silver age.

Farm versus City

Agriculture and Urban Growth

By G. P. Wibberley.
Michael Joseph. 240 pages. 21s.

AT a time when many people (including the present Prime Minister) talked of the necessity of saving every possible acre of agricultural land, and when many acres were in fact being protected on the most specious arguments, Dr Wibberley was instrumental in bringing sound economic sense to bear on the whole confused subject of land use and land conservation. The present book is the culmination of several years' research by Dr Wibberley and his colleagues at Wye College. For anyone concerned with the impact of urban growth upon rural land, this is an indispensable study.

Its one grave fault is the author's "brinkmanship" over reaching conclusions. He is too apt to reiterate that the subject is very complex and that more research is needed, while the different sections (interesting as they are) are not properly related to the book's main inquiry.

Although the author does not clearly say so, this book definitely supports the thesis that agricultural conservation can rarely be worthwhile in a strictly economic sense. The extra costs of shifting or compressing urban development generally much outweigh the agricultural value of the land in question; and this conclusion probably still holds even if the agricultural value is notionally doubled as a compensation (of doubtful validity) for the irrevocable character of its loss. Further, where houses replace fields, commercial crops are at least partly replaced by the bountiful output of back gardens.

Yet Dr Wibberley (like many others) remains unhappy about an England in which the urban area has already absorbed one-sixth of the cultivated land and may eventually absorb—what?: a quarter, a third, a half? At least, he seems to think, we should "replace" the lost food by growing extra elsewhere within Britain, especially as such "food replacement" is generally a much cheaper policy than prohibiting development.

He therefore gives useful summaries of the possibilities of developing hill farming and of land reclamation, but he deals rather cursorily with the larger and more economic possibilities of intensifying production on good or medium land. And he does not really answer the critical questions. What kinds of agricultural development are needed, bearing in mind the losses (mainly to dairying and cash cropping) that urban growth inflicts? How can government financial support be harnessed to a "food replacement" programme? And, assuming intensified production on the best land, at what point does actual conservation become necessary? It is, after all, little use helping farmers to grow more food on land that is then taken for development. Should not development plans and agricultural aid be co-ordinated in advance to prevent this happening?

It is to be hoped that in his next book Dr Wibberley will essay some definite answers to these admittedly tricky questions. Meanwhile, despite its limitations, this book will be of great value to all interested in agriculture and town planning.

Two Views of Human Nature

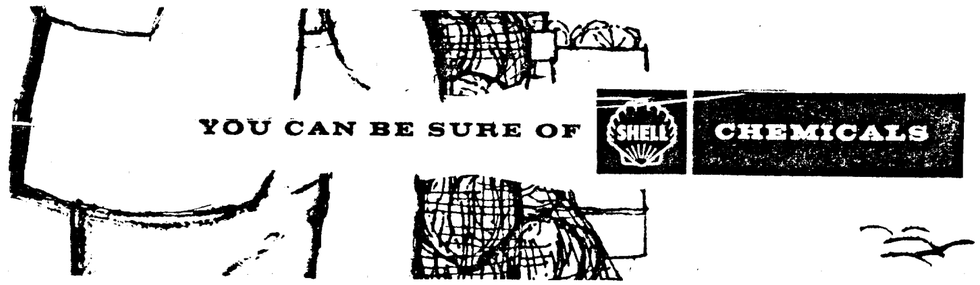
Freud: *The Mind of the Moralist*

By Philip Rieff.
Gollancz. 413 pages. 30s.

Human Potentialities

By Gardner Murphy.
Allen & Unwin. 350 pages. 25s.

TODAY the moralist, or the moral philosopher, is a person who analyses statements about right and wrong, good and bad, without feeling compelled to offer



Fresh to market

Covent Garden Market, London, England . . . destination for many of the cabbages grown in Great Britain. Healthy, unmarked cabbages, that is—cabbages unspoiled by caterpillars and aphids.
To reach Covent Garden, cabbages have to survive the attack of a number of pests. Caterpillars of the small white butterfly and diamond back moth (*Pieris rapae* and *Plutella maculipennis*) eat the leaves, whilst aphids (*Brevicoryne brassicae* and *Myzus persicae*) pierce the leaves and live on the sap. These attacks not only reduce crop yields but spoil the quality as well, making the cabbages unfit for market.
The new systemic insecticide, Phosdrin, is proving a most effective control. It is absorbed into the crop and acts on the insects from within the plant. Thus pests not reached by the spray—those beneath the leaves, for example—are killed by it as they feed.
Soon the plant breaks down the Phosdrin it has absorbed into harmless compounds, and the cabbages can be harvested—and eaten—only a few days after spraying. In Phosdrin, farmers have a versatile insecticide suitable for close-to-harvest application on a variety of crops.

any views of his own. In the original meaning, however, which is the one used by Mr Philip Rieff, the moralist was a sort of lay counsellor in the affairs of life—one who could assess ends in terms of their worthwhileness, and proffer advice on the best way in which to realise those ends.

To think of Freud in this way certainly makes sense. He had a vast first-hand experience of human beings in trouble, and from this experience he derived his ideas of what could, and should, be aimed at, and of the strategies likely to be most successful. We need advice, since "We are forced to participate in the games of life before we can possibly learn how to use the options in the rules governing them." Freud went further, however; he was a metaphysician as well as a moralist, and his strategies are adapted to the world as he saw it, not necessarily to the world as it is. Freud's world is a bleak one. Morals in the ordinary sense are conventions, religions are illusions, and works of art are communicated dreams. Our future will be better than our past only as we learn to accept the fact that our future will never be better than our past. If this sounds contradictory, we are assured that "Freud is the least confused of modern minds because he has no message; he accepts contradiction and builds his message on it."

Yet for all his originality, Freud has deep roots in the European and Jewish traditions, and his theories can often be traced back a long way. Consider, for example, the picture he gives us of the human personality, not the rider that Mr Rieff suggests, but the driver. The chariot of Plato's Republic now has Eros and Thanatos between its shafts partly controlled by the rational Ego: only the Super-ego has been added, a sort of backseat driver made necessary by Freud's view that reason and morality have little to do with one another.

Mr Rieff's account of how all this works out in art and psychology, in politics and religion, is both penetrating and persuasive. He is always sympathetic, but often critical, and his own contribution is considerable. Of all the attempts, and there have been many, to bring out the wider implications of psychoanalysis, this is at once the most substantial and the most readable. It is significant that the book should have been written by an American, for oddly enough the name of Freud carries more weight in the United States than anywhere else in the world today. This may be because a new society is not tied to tradition for its strategies of life. Yet it is unlikely that Freud's pessimism has been fully realised in America; certainly the enlightened stoicism that he advocates does not seem at home in American soil.

To move from Philip Rieff to Gardner Murphy is to leave the world of Feiffer for that of Horace Greeley, Old Vienna for Main Street. Mr Murphy pays tribute to Freud, but will not let him have the last word. With the help of science, Mr Murphy feels, man is master of his destiny and can transform himself just as he has already transformed his environment. We can always find, in widely different contexts, these two views of the hidden possibilities within us. The one sees an ill-fastened Pandora's box, whose evil, or at best primitive, contents will overwhelm us if they escape: the other sees a casket of treasures to be revealed by science or simplicity, or even affluence if it be spread widely enough. Most Americans used to hold this latter view, and Mr Gardner Murphy states it again, soberly and persuasively. Most Russians hold it now, and are taking quite seriously the task of changing the human personality. Perhaps it can be done; perhaps Freud is too resigned, too oppressed by the intractability of human nature once it has set in its adult mould. But Mr Rieff has written a book for grown-ups, while Mr Murphy seems to address himself to clever and very well-educated children. This is not to say that grown-ups are always right.

Comparative Frontiers

Bush and Backwoods

By H. C. Allen.
Michigan State University Press. London: *Angus and Robertson.* 168 pages. 25s.

As a by-product of his work as the only permanent Professor of American History in Britain, Professor Allen has written a stimulating and enjoyable comparison of "the frontier" in Australia and the United States. He spent a year at the Australian National University in Canberra, part of it being occupied in touring the Australian outback. He recognised much in common with American conditions, and much that was different. As a good historian, he determined to track down the reasons. In doing so he was, almost inevitably, lured by that historical jack-o'-lantern, Frederick Jackson Turner's frontier thesis. It has proved to be nothing like so effective in its Australian as in its American application; but in trying to fit Turner to Australia and Australia to Turner, Professor Allen has written a book that throws light upon Australian development.

Professor Allen bases his treatment upon the fact that Australia and the United States are geographically dissimilar. Apart from the fact that rainfall patterns are quite different, there was never any good geographical reason why Australian settlement should have shown the same remorseless western drive as American: the contrast between Western Australia and California is complete and final, and the desert in the middle of Australia is far greater in extent than any in the United States. Historical influences augment these geographical realities. Whereas American settlement began on the Atlantic seaboard, from which the natural movement was westward, Australia was settled first from points scattered around its long coastline. Settlement spread along the coasts and inland, but it had no common focus to compare with the urges that drew the American settlers across the plains. There are many other differences: fewer people came to Australia; there was much less free land; it was farther from the British Isles; immigration from continental Europe was not encouraged; the inland could not support the vast number of family farms that the American Middle West seemed designed to nourish. Professor Allen sees all these differences clearly. Yet he also sees similarities, arising from the sense of freedom that men feel on any frontier in comparison with the confinement that they feel in cities. He might have seen more similarities if he had not confined himself to the sheepman's and gold digger's frontier in Australia, but had looked in more detail at the wheat farmer's and dairy farmer's frontiers. While these were admittedly smaller in extent than the farmer's frontier in the United States, they did breed certain habits of thought and action found also in the United States.

This book is a sketch, but a good one. We ought to have more comparative histories. And they should be written with as much verve as this has been.

Education and Class

Studies in the History of Education 1780—1870.

By Brian Simon.
Lawrence and Wishart. 375 pages. 37s. 6d.

In this lucid and illuminating survey Mr Simon concerns himself primarily with the relationship of changes in educational ideals and policies to the upthrust of new social groups in an increasingly industrialised society. He begins, however, not with the contradictions of the industrial revolution but with the harmonics of the enlightenment, and he ends with the social compromises of mid-Victorian England. In his last section on the forms which those compromises took he quotes witnesses before the Clarendon Commission on the Public

A Review of Commonwealth Raw Materials

VOLUME II

The concluding volume of the Commonwealth Economic Committee's report to the Governments of the Commonwealth on a wide variety of raw materials and sources of energy. It contains detailed studies of the position in each Commonwealth country separately. Numerous statistical analyses up to 1957 with pre-war comparisons are discussed with textual reference to resources and to some important later developments.

Price 35s. (*post 1s. 5d.*)

Volume I, published in 1958, price 15s. (post 1s.), was a general review dealing with the position of Commonwealth countries against the background of world trends.

中国季刊

THE CHINA QUARTERLY

Schools, who were concerned, as he rightly says, with the class issues underlying educational reform rather than with education itself. These class issues are his own leading theme. Although he discusses not only administrative structures but theories of education and changes in curricula as well, he sticks close to the study of the impact of class on educational philosophy and action.

Yet lucid, illuminating and well-documented as this book is, it has a doctrinaire quality that makes for intellectual rigidity. Facts and theories are fitted rather too neatly into an approved Marxist framework. Nothing ever looks incongruous or out-of-place. Given that class is the key to the history of education, does the key open all doors? And were classes quite so clear-cut as Mr Simon often implies? The middle classes, who stand out in this book as the constructive heroes of the new phase of educational advance in the 1780s and inevitably (a word that Mr Simon likes) became the villains of the educational compromises of the 1860s, were seldom a monolithic group. Mr Simon likes to identify them, or at least the politically conscious element in their midst, with radicalism, particularly philosophical radicalism. Consequently, there are only two references in this book to Sir Robert Peel and Sir James Graham and pages of reference to James Mill.

Factors other than class are often seen entirely in relation to it. The subtleties of religious opinion are not noticed, and the contribution of the Church of England to education (as distinct from the resistance to it of sections of the Church) is underestimated. The statements by churchmen that are produced are designed to throw into relief the superior merits of radical and rationalist thinkers with whom Mr Simon is in sympathy. In the account of working-class approaches to education the curious and significant affinities between the views of Cobbett and his Tory opponents are not brought out. Utilitarianism always gets a fuller treatment than its rivals.

In other words this book has a slant as well as a theme, and pays too little attention to the rough edges and twisted spirals of history. To make this criticism is not to detract from the book's many merits. It provides an absorbing anthology of contemporary opinions on education which buttress Mr Simon's arguments. It probes changing social relationships, and it is both well-arranged and readable.

OTHER BOOKS

CLASS IN AMERICAN SOCIETY. By Leonard Reissman. International Library of Sociology and Social Reconstruction. *Routledge.* 302 pages. 42s.

This is the book which, according to some of his critics, Mr Vance Packard should have written instead of "The Status Seekers." It is on the one hand a scrupulous, source-quoting, comprehensive survey of factual evidence about the nature, the roots and the importance of American class distinctions; on the other an analysis of ideas about class as an element in political thought and an influence on sociological investigation. It is authoritative—in so far as any study of the largely intangible and subjective can be so; it is important—as any authoritative study of the social dynamics of the most powerful nation in the world must be important; it is also, unfortunately, dull almost beyond belief and for the most part (though there is occasional tantalising evidence that its author is a normal and lively-minded person who can express himself like a human being) atrociously written. This is perhaps the moment for a vehement protest against the growing habit, among American writers on social topics, of using the word "dimension" when what is meant is "aspect" or "element" or "quality" or any one of half-a-dozen other things. There is room for a figurative use of the term, but when one finds oneself "plumbing a dimension" instead of "studying an aspect" it is time to invoke the rules against wanton cruelty to the English language.

GOLD: *Its Beauty, Power and Allure.* By C. H. V. Sutherland. *Thames and Hudson.* 196 pages. 35s.

This loving book by the Keeper of Coins at the Ashmolean Museum, Oxford, is well described in its title. Dr Sutherland has produced a documented history of man's fascination with gold through the ages. About half the book, and the more absorbing half, is taken up with the ancient world. For anyone with a special interest in coins this work is a must, but the splendid black and white and colour plates have a compelling attraction even to those quite unmoved by numismatics.

CYPRUS GUERRILLA. By Doros Alastos. *Heinemann.* 224 pages. 21s.

The title of this book may be slightly misleading, since although the author is a Cypriot, he did not fight with Eoka, nor was he even, it appears, in Cyprus during the Emergency. But he seems to know the island well, and many of those closely involved in the recent troubles. His account of the emergency and the accompanying political negotiations does not add much to what is already known, but is well-written and remarkably objective.

BRITISH LABOR AND PUBLIC OWNERSHIP. By Herbert E. Weiner. *Public Affairs Press,* Washington. 123 pages. $3.25.

Aimed primarily at an American audience, this brief historical survey sketches the changing aims and emphases in the TUC's lifelong flirtation with public ownership. Reasonable and detached in tone, it is a useful introduction to the subject, although the prose style seldom rises above that of the conference reports on which it is principally based.

THE MERCANTILE YEAR BOOK AND DIRECTORY OF EXPORTERS, 1960. *Lindley-Jones.* 1,514 pages. 42s.

CLASSIFIED HANDBOOK OF MEMBERS, 1960. *The British Engineers' Association.* 608 pages. 21s.

COMMODITY SURVEY, 1959. *United Nations.* 202 pages. $2.50; 17s. 6d.

THE NEW AMERICAN WEBSTER DICTIONARY. Edited by National Lexicographic Board. *New American Library.* London: *Muller.* 414 pages. 3s. 6d.

THE NEW AMERICAN WEBSTER HANDY COLLEGE DICTIONARY. Edited by Albert and Loy Morehead. *New American Library.* London: *Muller.* 543 pages. 4s.

THE TEACH YOURSELF GUIDE TO NUMISMATICS. By C. C. Chamberlain. *English Universities Press.* 190 pages. 7s. 6d.

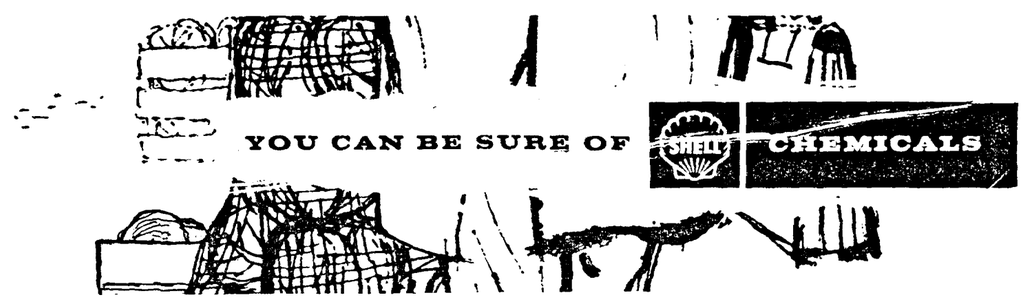
THE WORLD CO-OPERATIVE MOVEMENT. By Margaret Digby. *Hutchinson University Library.* 192 pages. 12s. 6d.

THE CITIES OF LONDON AND WESTMINSTER. By Christopher Trent. *Phoenix House.* 148 pages. 10s. 6d.

THE LITERATURE OF THE SOCIAL SCIENCES. By Peter R. Lewis. *Library Association.* 242 pages. 28s.

UNIVERSITY OF MINNESOTA PAMPHLETS ON AMERICAN WRITERS. Ernest Hemingway by Philip Young; Robert Frost by Laurence Thompson; William Faulkner by William Van O'Connor. London: *Oxford University Press.* 5s. each.

Better outlook for bad weather



Try and part an Englishman, his umbrella and his raincoat: it's impossible. He knows that it's always 'just about to' rain in England. So it's wise to have a raincoat close to hand . . . wiser still to have a lightweight model, say of flexible PVC—the versatile plastic that not only keeps the water off but, as 'rigid' piping, carries it too.

For PVC (unlike the weather) seeks only to please. It can be hard or soft, just as you wish it. The *'rigid' type particularly is finding a new use in* piping . . . so much so that, in many countries, piping, PVC and Carina are synonymous terms. Carina? The range of vinyl chloride polymers made by Shell—suitable for almost every PVC manufacturing process. General purpose, mechanical, paste-forming and, most especially, unplasticized applications are met by one or other of the various types of Carina.

But Carina is only one of a family. Also from Shell come Carinex polystyrenes, Carlona high-density polyethylenes, Cariflex synthetic rubbers, Styrocell expanded polystyrenes and Epikote epoxy resins—as well as base chemicals such as toluene, benzene and xylene. For anything, and everything, to do with thermoplastic and thermosetting products and processes, look to Shell production and Shell skill to see you through.

Shell Plastics

Issued by Shell International Chemical Company Limited. For further information consult your Shell Company (in the U.K. apply to Shell Chemical Company Limited).

U.S. markets computers in Britain.
'G.B.' markets cars in America. Sport is one of their common interests. The world-wide banking service they both enjoy is another.

IT HELPS TO HAVE 84 FRIENDS ALREADY *THERE*

Because *international* banking is our business, we can do quite a bit to help businessmen who are trading overseas.

A letter of introduction to our Head Office, or any of our 84 overseas branches or correspondents, puts the businessman going to North or South America, to Africa, or to the Middle or Far East into close, immediate touch with men who know the local situation intimately.

6,800 of our 16,300 employees are stationed *overseas*. From over 200,000 credit files we can supply credit information on most firms doing business abroad. All of our 84 overseas branches are concerned, too, to help finance international trade.

If you would like to know more about our services to overseas business, our telephone numbers are (City Office) London Wall 1221; (Berkeley Square Office) Mayfair 6600.

Best way to protect your travel money

Our Travelers' Checks are spendable anywhere in the world. We can't help you if you get poor value in a native bazaar, but if your Checks are stolen or if you lose them we pay an automatic, full refund on every Check. Available in convenient denominations at most banks.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Right without Might

WASHINGTON, DC

THERE will be sympathy for Mr Robert Morris of New Jersey in the heart of every boxer who has bravely cried "Let me into the ring and I'll kill him" shortly before waking up on a stretcher in the dressing room. A fortnight ago Mr Morris presented himself to the Republican voters of New Jersey, in the contest to decide who will represent them against the Democrats in next November's election to the Senate, as the white hope of his party's right wing. This wing, which has long claimed that large numbers of conservative Americans are virtually disfranchised because the Republicans, by following the Democrats too far down the road to liberalism, have left conservatives with no one to vote for, looked to the New Jersey primary to prove that a suitable candidate could rally this disgruntled multitude to the polls. Mr Morris duly led with his right against the incumbent Senator Case, one of the most liberal of Republicans, only to be knocked cold by the unexpectedly large margin of two to one.

Mr Morris has since pleaded, in extenuation, that his opponent got powerful last-minute help from influential members of the Administration such as the Secretary of State, Mr Herter, and Mr Mitchell, the Secretary of Labour (he himself had been getting powerful help from wealthy backers for a couple of years) and that in any case he was not running as a conservative. The latter is true only in the sense that he did not actually pin a badge to his lapel; the positions he adopted, and his record as former legal counsel of that harrier of communists, the Senate's internal security sub-committee, clearly placed him well out on the right. He might have added that New Jersey, like the rest of the middle Atlantic seaboard is barren ground for conservatives. But no excuse can disguise the astonishing feebleness of the right wing's performance just when it might have hoped that its bedraggled fortunes were improving.

The political theorists in Washington have recently noted the quiet slipping away, after a long illness, of "modern Republicanism," a concept which was born in 1952 and through which President Eisenhower was expected to liberalise the Republican party. As Mr Eisenhower grows more conservative, his attitude towards social welfare schemes, like the Church of England's attitude towards saints, is that even if old ones are tolerable new ones are not. Even in the Democratic party the proliferation of "moderate" and "down-to-earth" liberals is a symptom of a widespread uneasiness about liberal premises. Many Democrats are worried because the unquestioning loyalty towards farmers and trade unions which liberalism called for in the nineteen-thirties no longer seems valid; because, in education, liberal theories have produced a disquieting decline in standards; and because they have begun to find some of their fellow-liberals too narrowly rationalist (and sometimes too intolerant) for their liking. Thus although dominant factions in both parties are still basically liberal, the faith is no longer as self-confident as it used to be.

Some of the reasons why the right wing has failed to profit from the opportunity this presents are made clear by a book* just published by Senator Goldwater of Arizona. Senator Goldwater, the most intelligent and lucid member of the right wing in Congress, sets out what he believes the conservatives must do if they do not want to be merely diluted liberals. It is a starkly radical programme, quite alien to the amiably sluggish temper of contemporary America. At home it calls for the immediate abolition of subsidies to farmers; the retirement of the federal government from all social welfare activities in favour of private charity (and "if necessary" of local authorities); and a declaration that, even though Negro children in the South have a moral right to go to the same schools as white children, the federal government can and should do nothing to help them to obtain this right. In foreign policy Senator Goldwater, who thinks that "a craven fear of death is entering the American consciousness," wants the United States to stop talking to Mr Khrushchev, withdraw recognition from all communist countries, send arms to the anti-communist underground, and be ready to dispatch a mobile force equipped with nuclear weapons if an uprising occurs.

These proposals are likely to make most strayers from liberalism jump straight back to mother's arms. Even when Senator Goldwater hits on a genuinely tender spot, like the frailties of "progressive" education, he loses it again by talking about the evils of federal aid to schools rather than by asking whether the federal government can do anything to improve the situation. Having said, quite rightly, that there is something repugnant about agricultural policies which pay farmers for not growing crops, he fails to ask whether there would not be something equally repugnant about a policy which made even more Americans abandon life in the countryside. He is, in other words, not an amender but a fundamentalist; and his difficulties illustrate the two great problems of the right wing.

IN the first place, it has not yet worked out a defensible moral basis for its wish to exclude the federal government from the field of social welfare. Senator Goldwater says a good deal about the need for "spiritual values" and self-reliance; but he never seems to realise how odd it is to believe, as he apparently does, that the only effective way of fostering these qualities is to leave a man to face old age and misfortune without the help of the social security programme. Nor does he recognise that the radical lowering of taxes which he advocates would lead to some very unspiritual spending.

Mr William Buckley, the lively young editor of the right-wing magazine, the *National Review*, tackled these problems in a strangely defensive book which appeared last year. To Mr Buckley, the one major criticism that can be levelled against social security is the fact that it is compulsory, although he admits that very few people object to the fact. His argument that this nevertheless constitutes an abridgement of everybody's freedom is like the fable of the emperor's clothes in reverse: the conservative cries out that people have been stripped of their liberty even when they say they can still feel the texture of the stuff under their fingers.

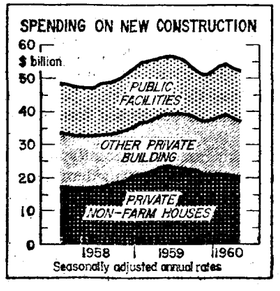
* The Conscience of a Conservative. By Barry Goldwater. *Victor Publishing Company, Inc.* 123 pages. $3.

Hence it is not surprising that the honest-to-goodness right wing numbers only a small minority in Congress. An analysis of the votes on a number of crucial issues last year, made by a conservative organisation in Washington, shows that only eight Senators (all Republicans except for Senator Byrd of Virginia) and 81 members of the House, all Republicans, had a simon-pure conservative record. The reason is that the conservative Democrats from the South, who help the Republicans on most issues involving federal spending, cannot be relied on to vote against federal aid to their rural constituents; last year, for instance, they failed almost unanimously to be properly conservative about rural electrification and the Tennessee Valley Authority. And even among the Republican stalwarts there is a marked reluctance to tread too heavily on the toes of farmers and old-age pensioners.

The right wing's other great difficulty concerns foreign policy. Many conservative Republicans from the Middle West tend to cling to the last tatters of isolationism, whereas the instincts of others in the group lie in the direction of a militant anti-communism. When the latter get down to prescribing what America's foreign policy should be, the result, as Senator Goldwater's book shows, is likely to strike most Americans as unacceptably dangerous. Some of the marginal suggestions—that foreign aid should be cut to the bone, or that punitive action should be taken against Cuba—undoubtedly appeal to a wide audience; but the core of the Senator's policy, which consists of interventionist measures to overthrow communist regimes, is diametrically opposed to the present trend of public opinion.

The right wing is too vocal to be ignored entirely. It has produced several closely-argued books; its views are reflected, in one degree or another, in a number of widely-circulated magazines like the *National Review* and the *American Mercury*; its supporters number two or three newspaper columnists and at least one broadcaster who reach large audiences. But Mr Morris's defeat in New Jersey shows that, in spite of the self-doubt prevalent among liberals, the guardians of conservative orthodoxy have yet to show that they offer an appetising alternative for most Americans.

Cleopatra Needled



Resentment against the long-standing Arab blockade of Israel and against the closing of the Suez Canal to Israeli ships has often bubbled to the surface of American opinion, particularly that of Jewish and trade union groups. But recently it has been boiling over in a manner most embarrassing to both American diplomatic and trading interests. First came the picket line which the seamen's union put around the Egyptian cargo vessel *Cleopatra* in New York and which meant that it could not be unloaded. This was a protest at Arab discrimination against ships trading with Israel which it was claimed by the union had lost American seamen their jobs. It has brought a retaliatory boycott of American shipping at Arab ports, described in an article on page 544. If the American seamen persist in their picketing in spite of the influential pressure being put on them to abandon it, they will be cutting off *Cleopatra*'s nose to spite their own faces. For the Arab boycott, already disrupting both the tourist and the ordinary export trades, can only mean that many more American seamen will lose their jobs.

Since fifty per cent of all American government cargoes must be carried in American ships, the boycott will also make difficulties for foreign aid deliveries to Arab countries. But Congress has been busy this week putting another barrier in the way of foreign aid for these countries and of the whole American effort to maintain constructive relations with the Middle East. In spite of strong pleas from the State Department against what it regards as amateur interference in international affairs, the Senate has passed a foreign aid Bill containing an amendment, already approved by the House of Representatives, which directs the President to distribute mutual assistance in ways which support the belief of the United States in freedom of navigation on international waterways and in the undesirability of recipient countries waging economic warfare against other recipient countries. Senator Douglas, the sponsor of the amendment, declared openly that it was aimed at the United Arab Republic.

There is no reason to suppose that the President will feel obliged to hold up foreign aid for middle eastern countries as a result of the directive, although he, and the State Department too, are in full sympathy with the underlying purpose of ensuring free passage through the Suez Canal for all ships. But whether or not this congressional move has any practical effect, its psychological impact cannot but be harmful. The amendment seems certain to encourage rather than to discourage the Arab countries not only in the new boycott of American shipping, but also in the old blockade of Israel. It offers communist propagandists yet another example of how the United States attaches political conditions to its foreign assistance programme. And it strengthens the Arab conviction, which handicaps American diplomacy so severely in the Middle East, that United States policy in the area is guided not by broad international considerations but by political pressures from Jewish voters at home. It will not be overlooked that Senator Douglas himself is up for re-election this autumn and that all the potential presidential candidates among the Democrats in the Senate supported his amendment.

Political Capital

Last week Washington resounded to the opening shots of the election year hostilities between a Democratic Congress full of presidential hopefuls and a President determined that his successor shall be a Republican. In the House the Democrats passed a $1 billion housing Bill, the first of a series of measures authorising spending for social purposes which the President is determined to block on the ground that they will throw this year's precariously balanced Budget into the red and consume next year's promised surplus. Running a loving finger along the sharp edge of his veto, which cut down Democratic measures at the last session, Mr Eisenhower complained that Congress, bent on reckless spending, was neglecting the rather uninviting list of tasks which he set for it in January. This week he sent a special message to the legislators, asking them to forswear "electioneering" and concentrate on things which are really needed, including an appropriation for foreign aid providing all the money which Congress has just authorised.

The "emergency" housing Bill, which the President is expected to veto if it is passed by the Senate, was approved in the House by only 214 votes to 163; this means that the Democrats can hardly hope to muster the two-thirds vote necessary to over-ride a veto, even though many southern Democrats voted with their northern colleagues instead of deserting to the Republicans, as they often do when questions of spending are involved. There may not be as much Democratic solidarity on other issues such as aid to depressed areas, education, pay for civil servants and a higher minimum wage.

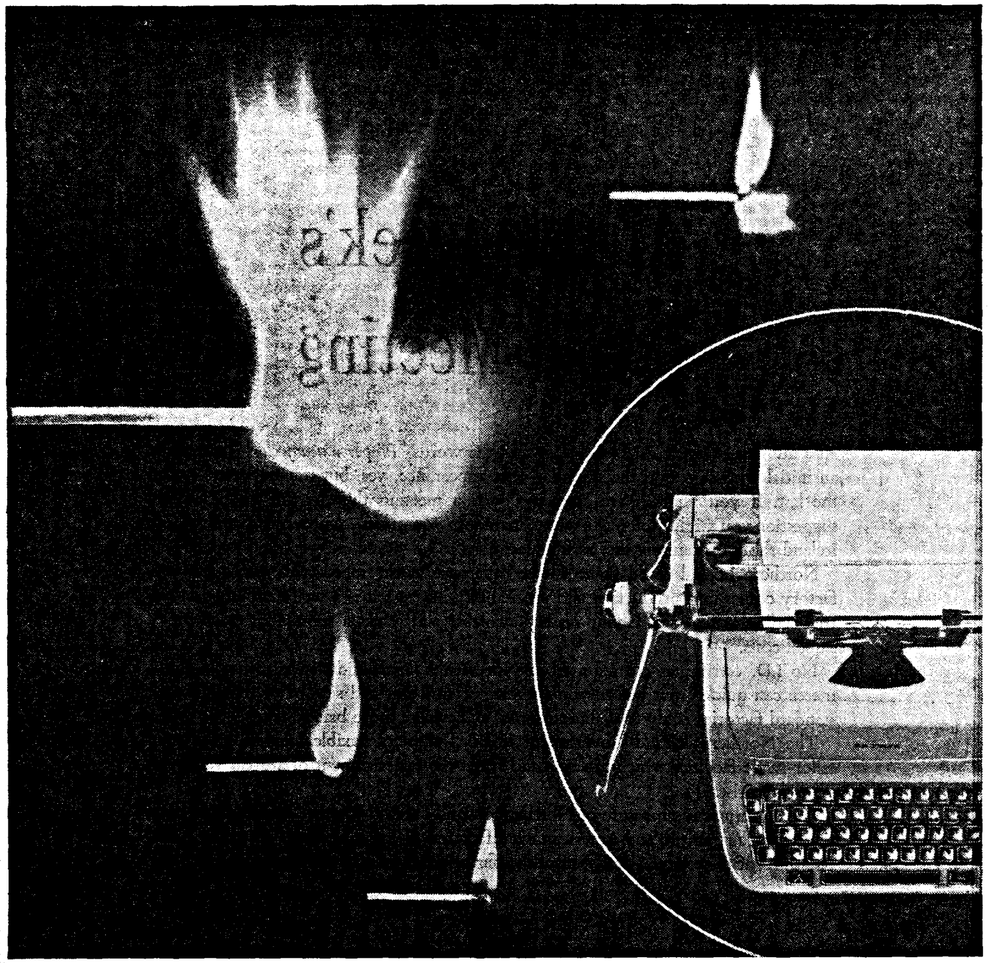
At this week's Board Meeting

At a number of Board Meetings this week the words "*Proposed new factory*" will make an initial appearance on the Agenda—first appearance, yes, but usually by no means the last. If you yourself are attending such a meeting there is one extra positive suggestion you might well make sure to include in your notes—a proposal that Northern Ireland should be among the possible locations to be visited and reported upon.

Northern Ireland could make all the difference to the speed with which the new factory comes into production and profitability, because it is a well established industrial setting with good labour readily available and offers a substantial easement of capital costs.

No I.D. certificates are required in Northern Ireland, and the Ministry of Commerce can quickly put before you a choice of well serviced sites or of three advance standard factories ready to walk into now, and twelve more being built.

The Northern Ireland Government is able, with its flexible legislation, to offer tailor-made facilities which can ease and speed the establishment of a great variety of new enterprises.



It is an impressive measure of Northern Ireland's ability to serve new industry that, since 1945, 141 British and American manufacturers have established plants there. Over one third of these have already expanded far beyond the scope of their original plans.

NORTHERN IRELAND

The Northern Ireland Development Council or the Ministry of Commerce will gladly provide any preliminary detailed information your company may require, and subsequently will make arrangements, as may be needed, for a fact-finding visit. All enquiries will be treated in the strictest confidence.

Dependable as a Swedish Safety Match

"Clean, efficient, reliable—Swedish safety matches were a boon to mankind when their export began more than a century ago. Today the world takes the dependability of Swedish safety matches for granted.
Swedish business machines have also won world-wide confidence because of their day-in, day-out dependability. That's why you'll find them in offices wherever you travel. Facit of Sweden, one of the world's leading manufacturers of business machines, offers truly international sales and service.
If you want to know more about FACIT and the outstandingly successful Swedish business machine industry, your local FACIT agent will gladly send you a free copy of our brochure 'Why are so many world-known business machines built by Swedes?'—or you may write directly to Atvidabergs Industrier, Stockholm 7, Sweden."

Gunnar Ericsson, President of the Facit Group

FACIT

Factories in Sweden and West Germany.
Sales and service offices in 102 countries.

Even so, the Democrats expect to make political capital out of charges that the President is turning thumbs down on progress in order to preserve his Budget.

Its sponsors argue that the housing Bill, which would enable the government to buy up $1 billion worth of private mortgages on low-priced houses, is needed to relieve the shortage of credit which is discouraging new house-building and preventing spending on construction as a whole from rising as much as is usual at this time of year. (On the chart, spending, being seasonally adjusted, shows a fall.) The Republicans deny that any emergency exists in the building trade which would justify such costly intervention. Yet even the Administration is not unwilling to give house-building a little stimulus when there are still clouds over other important sections of the economy such as the steel and automobile industries. The Federal Housing Administration has just reduced the down-payment required on medium-priced houses when it insures mortgages issued by private lenders. It has had the authority to do so since last year, but felt that it would be pointless to use this power until mortgage money became slightly more plentiful, as it has. Builders doubt, however, whether this concession, which costs the government nothing, will do them much good.

Strategy for Sit-Ins

FROM A CORRESPONDENT RECENTLY IN NORTH CAROLINA

MOST of the "sit-in" demonstrations staged by Negro students throughout the South at lunch counters which refuse to serve black customers have been spontaneous, planned and executed by groups acting independently of one another. Most of them have also been carried out not only without leadership from adults but actually to the dismay of many older Negroes who see them as bringing only trouble. Thus the conference held during Easter in Raleigh, North Carolina, was significant in two respects: it brought together for the first time student leaders from over forty communities in ten southern states in which demonstrations have been held, and it introduced an element of active adult support which the movement had not previously had.

The meeting was sponsored by the Southern Christian Leadership Conference; its president is the Rev. Martin Luther King, who organised the bus boycott in Montgomery, Alabama, in 1956 and is the leading exponent of Gandhian "nonviolent resistance" which the students are now copying. Over two hundred people—more than twice the number expected—attended the conference, including a number of white students, mostly from the North, and a few high school pupils; some had recently been expelled from universities, and some were on bail or had served gaol sentences, for participating in demonstrations against racial segregation. The adults included Dr King and several members of his SCLC, and representatives from other organisations of which the most important was the multi-racial Congress of Racial Equality (CORE); they were emphatic that they were not attempting to impose their leadership on the students' activities.

Both students and adults were openly impatient with the "legalistic" methods—damage suits, test cases and appeals to the Supreme Court—advocated by the National Association for the Advancement of Coloured People as the most effective way of fighting segregation. One adult speaker, the Rev. James Lawson of Nashville, Tennessee, complained that the NAACP was interested only in raising funds and in going to court, and referred to it contemptuously as a "black bourgeois club"; emphasis was placed on extra-legal methods, such as boycotts and sit-ins, and on the moral force of passive resistance instead. Dr King with passionate sincerity sees the issue in strictly ethical (as opposed to political or economic) terms; other leaders point out that many of the rights involved are not legal but social, that southern whites have often used the law to delay integration and that court action is slow, remote from the people, and expensive (the high fees charged by some Negro lawyers came in for sharp criticism).

The difference is more than one of emphasis: the NAACP, which has belatedly endorsed "nonviolent resistance", refused to be associated with the Raleigh conference, and future adult guidance for the student movement is more likely to come from the SCLC or from CORE, and from Mr Lawson rather than from Mr King, whom the students respect and admire from afar. Mr Lawson, only 31 years old and an extremely competent organiser who combines moral exhortations with considerable political sophistication, seems to be the more effective leader.

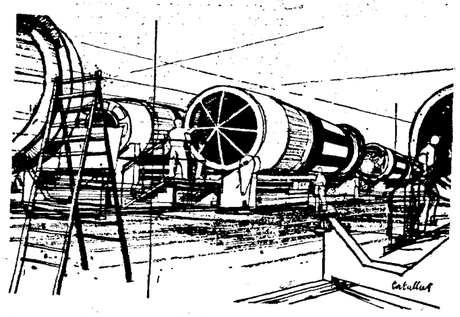
Although it was hoped to widen "nonviolent resistance" to include boycotts—called "selective buying"—of shops which discriminate against Negro customers at any of their counters and to spread the movement to older Negroes, no resolution about boycotts was passed; the students resolved to stay in gaol rather than to pay bail or fines, and even voted to give up bringing suits against white hoodlums who attack Negro pickets—though the legal approach is not likely to be forgotten completely. Mr Truman's recent allegation that communists have inspired the sit-ins is frankly nonsensical: politics—even American party politics—were not mentioned at all. But a regional group, the Student Nonviolent Co-ordinating Committee, was formed to plan future protests; its effectiveness, or lack of it, may become apparent during the summer months when the colleges will be closed and the students will be back in their home towns.

The Chessman Case

THE miserable life-story of Caryl Chessman is finished and it remains only for the State of California to write the epilogue which he—and many other people—hoped for, by abolishing capital punishment. That Chessman would have to die before this could be done became clear when the State Legislature, reflecting the emotional abhorrence which Californians felt for the man and his crimes, refused to take the opportunity of changing the law offered by the Governor when he reprieved Chessman in February. That Chessman would die unless the law was changed had become nearly as clear long before—perhaps to Chessman himself even more than to the lawyers who supported his tenacious fight for life. However much his ingenious efforts to escape his sentence had confused the questions of whether that sentence was justified for his particular crimes, of whether in fact he had committed those crimes, of whether he had had a fair trial, the verdict had gone against him again and again in every conceivable court, state and federal, right up to the Supreme Court of the United States.

This very complexity of the American legal system had saved Chessman's life for twelve years. While observers in countries where justice is more summary are bound to regard it as revolting cruelty to keep a man under sentence of death for such a long period and through eight execution dates, Chessman himself does not seem to have shared this view. And he made good use of his borrowed time, writing surprisingly readable books and becoming an adequate, although narrowly specialised, lawyer for the purpose of working up his own defence. By thus showing that he was capable of improvement, of making a worthwhile contribution to society, he showed also that capital punishment cannot be justified by arguing that any particular criminal is irredeemable. When the state finally executed Caryl Chessman, in defiance of the worldwide protests against his protracted ordeal, it also brought nearer—perhaps much nearer—the day on which California will join the other nine states which have abolished the death penalty already.

Trials of Hoffa



On Tuesday Mr James Hoffa, the president of the largest and most powerful trade union in the country, secured yet one more postponement of a trial which has been hanging fire since early this year. He is accused of misusing the funds of his teamsters' (or lorry-drivers') union and thus of violating the court order under which he was allowed to take office two years ago; if he is found guilty he may lose his $50,000-a-year job. But Mr Hoffa has such a battery of legal talent pleading his cause and he has been so successful in his previous brushes with the law that no one is taking his ouster for granted.

Three years ago, at the hearings of the McClellan committee, which was created to investigate abuses in trade unions, the name of Mr Hoffa, then the power behind the teamsters' throne, became synonymous with undemocratic methods, corruption and infiltration by racketeering elements. The committee itself has at last submitted its reports and shut up shop although, to the grief of the unions, its powers and a relatively small appropriation have been handed over temporarily to the Government Operations Committee, whose chairman is also Senator McClellan. But, although the teamsters were expelled long ago from the American Federation of Labour and Congress of Industrial Organisations and although Mr Hoffa is still deeply entangled in legal proceedings, both of these black sheep seem to be flourishing so far.

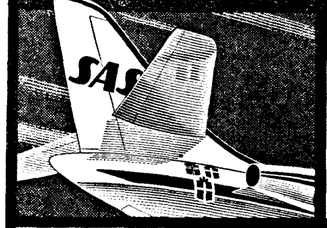
These proceedings go back to the election of Mr Hoffa to the union's presidency late in 1957. A group of rank-and-file members of the union asked a federal court to declare the election invalid on the ground that it had been rigged. Instead the two sides reached an agreement, which the judge, Mr Letts, sanctioned, that Mr Hoffa should take office on the condition that he co-operated with a group of three monitors appointed by the court to supervise the reform of the union. Mr Hoffa has not co-operated and has done his best to undermine the monitors; only by taking rather drastic measures has Judge Letts been able to maintain an anti-

Titanic Future

FROM A CORRESPONDENT IN COLORADO

Both the Titan intercontinental ballistic missile and the Martin Company, which makes it, have been under fire for some months, the company for being inefficient and the weapon for being ineffective. After a series of tests of the Titan had failed, at a time when its rival, the Atlas, was becoming operational, the argument that the Titan should be abandoned and all efforts concentrated on improving the Atlas was altogether too strong for the comfort of the Martin Company—or for that of the thousands of residents of Denver who have found employment during the last four years in its nearby factory. But now the company has been reorganised drastically and the missile has done markedly better in its tests. So the future of the Titan seems assured.

It is now said to be farther along than the Atlas was at the same stage of development and to be more capable of improvement; in particular it is thought to be more suitable for instant launching from underground firing tubes, more adaptable to the use of "storable" propellants, which can be kept in the missile itself instead of having to be pumped in before it can be fired and as a "true two-stage missile" able to carry heavier warheads than the one-stage Atlas—the equivalent of seven million tons of TNT, according to unofficial reports. The Titan B which is now being talked of will have all these advantages and will be entirely self-guided as well.



The Martin Company had contended all along that the Titan's failures on the test range were caused not by inherent faults in the missile but by errors in individual parts of this delicate and complex weapon. Each such failure was followed by the most painful examination and the company itself has also been subjected to similar corrective efforts. Its chairman, Mr George Bunker, moved permanently from Baltimore, Martin's headquarters, to Denver to assume personal command of the 7,000-acre Titan plant in the foothills of the Rocky Mountains. He made ruthless administrative changes so that critics could no longer say that faulty organisation was responsible, at least in part, for the missile's faltering performance. Now the company is again expanding its working force in Denver and its volume of output and its profits have both been better so far this year than in the comparable period of 1959.

To begin with some 70 Titans are to be supplied, with the first expected to be operational by the middle of next year, for the six Titan bases which are being constructed, at a cost of some $80 million or more each, throughout the West. The base near Denver will be double, with twenty missiles instead of ten, and crews are already in training there. Eventually there will be eleven of these bases and it is thought that the last four will be equipped with Titan Bs. The whole complex will cost hundreds of million dollars and each of the huge launchers must be fitted exactly to its particular missile; with so much money already spent on the Titan and its bases, to have abandoned the project would have wasted more than would have been saved.

Meanwhile the huge factory near Denver is a precision assembly line going completely beyond any previous operation of this type, producing not just a machine but a whole electronic complex. Automobiles have only hundreds of parts while a ballistic missile has many thousands and the failure of even the tiniest may send a multi-million dollar Titan plunging to utter destruction. So unusual care must be taken at every step in the manufacture of each of the extraordinarily intricate parts. Like other specialist organisations of the space age Martin needs a fantastically high proportion of scientists, engineers and white-collar workers compared with the actual work force engaged in fitting the parts together on the assembly line; 7,599 engineers, of whom 3,000 are engaged on electronic work, are said to be employed.

Components move slowly about on a floor covering acres, with additions being made and testings carried out at every point, and with remarkably few people all working with unhurried care. The first and second stages of the missile are then put together in another huge building where the Titan pokes upward through seven floors, accessible at each floor. The monster engines are tested separately far up a canyon, with the hideous din sometimes penetrating as far as Denver, 15 miles away out on the plains. Finally the complete missiles, shrouded in canvas to keep out dust as well as curious glances, are sent to their destination, usually by air.

The base of the reactor shell at Latina about to be lowered into position. (Photo by courtesy of AGIP Nucleare, The Nuclear Power Plant Company and Whessoe Ltd.)

Atom power comes to Italy— and Consett steel is at the heart of it

OUT of the flat coastal plain of Latina in southern Italy a huge strange shape is rising among the vine and stiff olive trees.

It is Italy's first nuclear power station, built by a British company (The Nuclear Power Plant Company) in conjunction with AGIP Nucleare of Milan. British equipment and materials are being used, and the vital reactor shell, made by Whessoe Ltd., is of Consett's 'Bearcomo' steel.

Steel for atomic reactors has to have very good 'creep' resistance at high temperatures, and 'notch' toughness at low temperatures (the shells are welded on site in all weathers, and notch toughness means there is much less risk of cracks developing in weld or plate). These two characteristics used to be thought incompatible. 'Bearcomo' combines them.

Consett has provided special steels for Britain's own nuclear power programme. The reactors at Bradwell, Chapelcross, and Calder Hall are housed in shells made of 'Bearcomo' plates.

To keep its commanding competitive position in the field of steel plate, Consett is building a £14 million 'four-high' plate mill which will be the most up-to-date in the world. Work on it is already well advanced: foundations are ready for the mill-stand itself and the great shears; the cooling tables and some of the transfer banks are finished, and the overhead cranes are installed. It will be a mighty addition to Britain's industrial power.

CONSETT
IRON COMPANY LIMITED

CONSETT · COUNTY DURHAM · TELEPHONE: CONSETT 341 (12 LINES) · TELEGRAMS: "STEEL PHONE CONSETT"

Hoffa majority in the group. The present case is being brought by the monitors, but it may be their swan-song. If they lose (and the case is not to be heard by Judge Letts) the board may well be dissolved. Many observers are coming to feel that it was a great mistake, in any case, ever to involve the federal courts in the running of a trade union.

Primary Skirmishes

SENATOR HUMPHREY and Senator Kennedy are concentrating their efforts on West Virginia, where these two liberal Democrats meet next week in the second, and perhaps decisive, encounter of their campaigns to capture the presidential nomination of their party. By comparison, this week's primaries—the elections in which party members have a chance to express their preferences—were small beer. But Senator Humphrey has the consolation that he will not ride into battle bearing the marks of two defeats; in the primary in the District of Columbia he roundly trounced Senator Morse, who is not a serious contender for the Presidency but had been expected to do well in the capital. (Although residents of the District are not allowed to vote in national elections the parties allow them to cast a handful of votes at the nominating conventions.)

There was no preference vote for President in the Republican primary in the District. But on the same day in Indiana Mr Nixon, who is virtually certain to be the Republican standard-bearer, made an unexpectedly impressive showing; he rolled up more votes than Mr Eisenhower won four years ago. The Republicans had given it out—perhaps for reasons of prudence—that, because he had not campaigned at all, Mr Nixon could not expect to do as well in the Republican primary as Senator Kennedy would do in the Democratic one. In fact the Vice President won substantially more votes—401,125 to Mr Kennedy's 351,297.

In the past Indiana has been counted as a Republican state but recently it has been moving in a Democratic direction and, indeed, if all the Democratic votes in the primary are added together (two little-known candidates won over 80,000 votes between them) they slightly exceed the Republican total. This may have been due in part to a sharp local struggle in the Democratic party for the gubernatorial nomination. But it is still striking in a state which in 1956 gave Mr Eisenhower 60 per cent of the total poll and the Republican candidates for Governor and Senator a 55 per cent majority. What Democratic politicians will be pondering this weekend is whether an anti-Kennedy vote as large as 80,000 is a significant protest against the Senator's Roman Catholicism or simply a sign that many Indiana Democrats had no other way of demonstrating their preference for other major candidates, such as Senator Symington, who chose not to stand. But if Senator Kennedy needs comfort he has only to turn to the most recent Gallup poll which suggests that, if he were pitted against Mr Nixon today, he would beat him in the country as a whole by the handsome proportion of 54 to 46. A month ago it was by only 53 to 47 per cent.

Gross Points

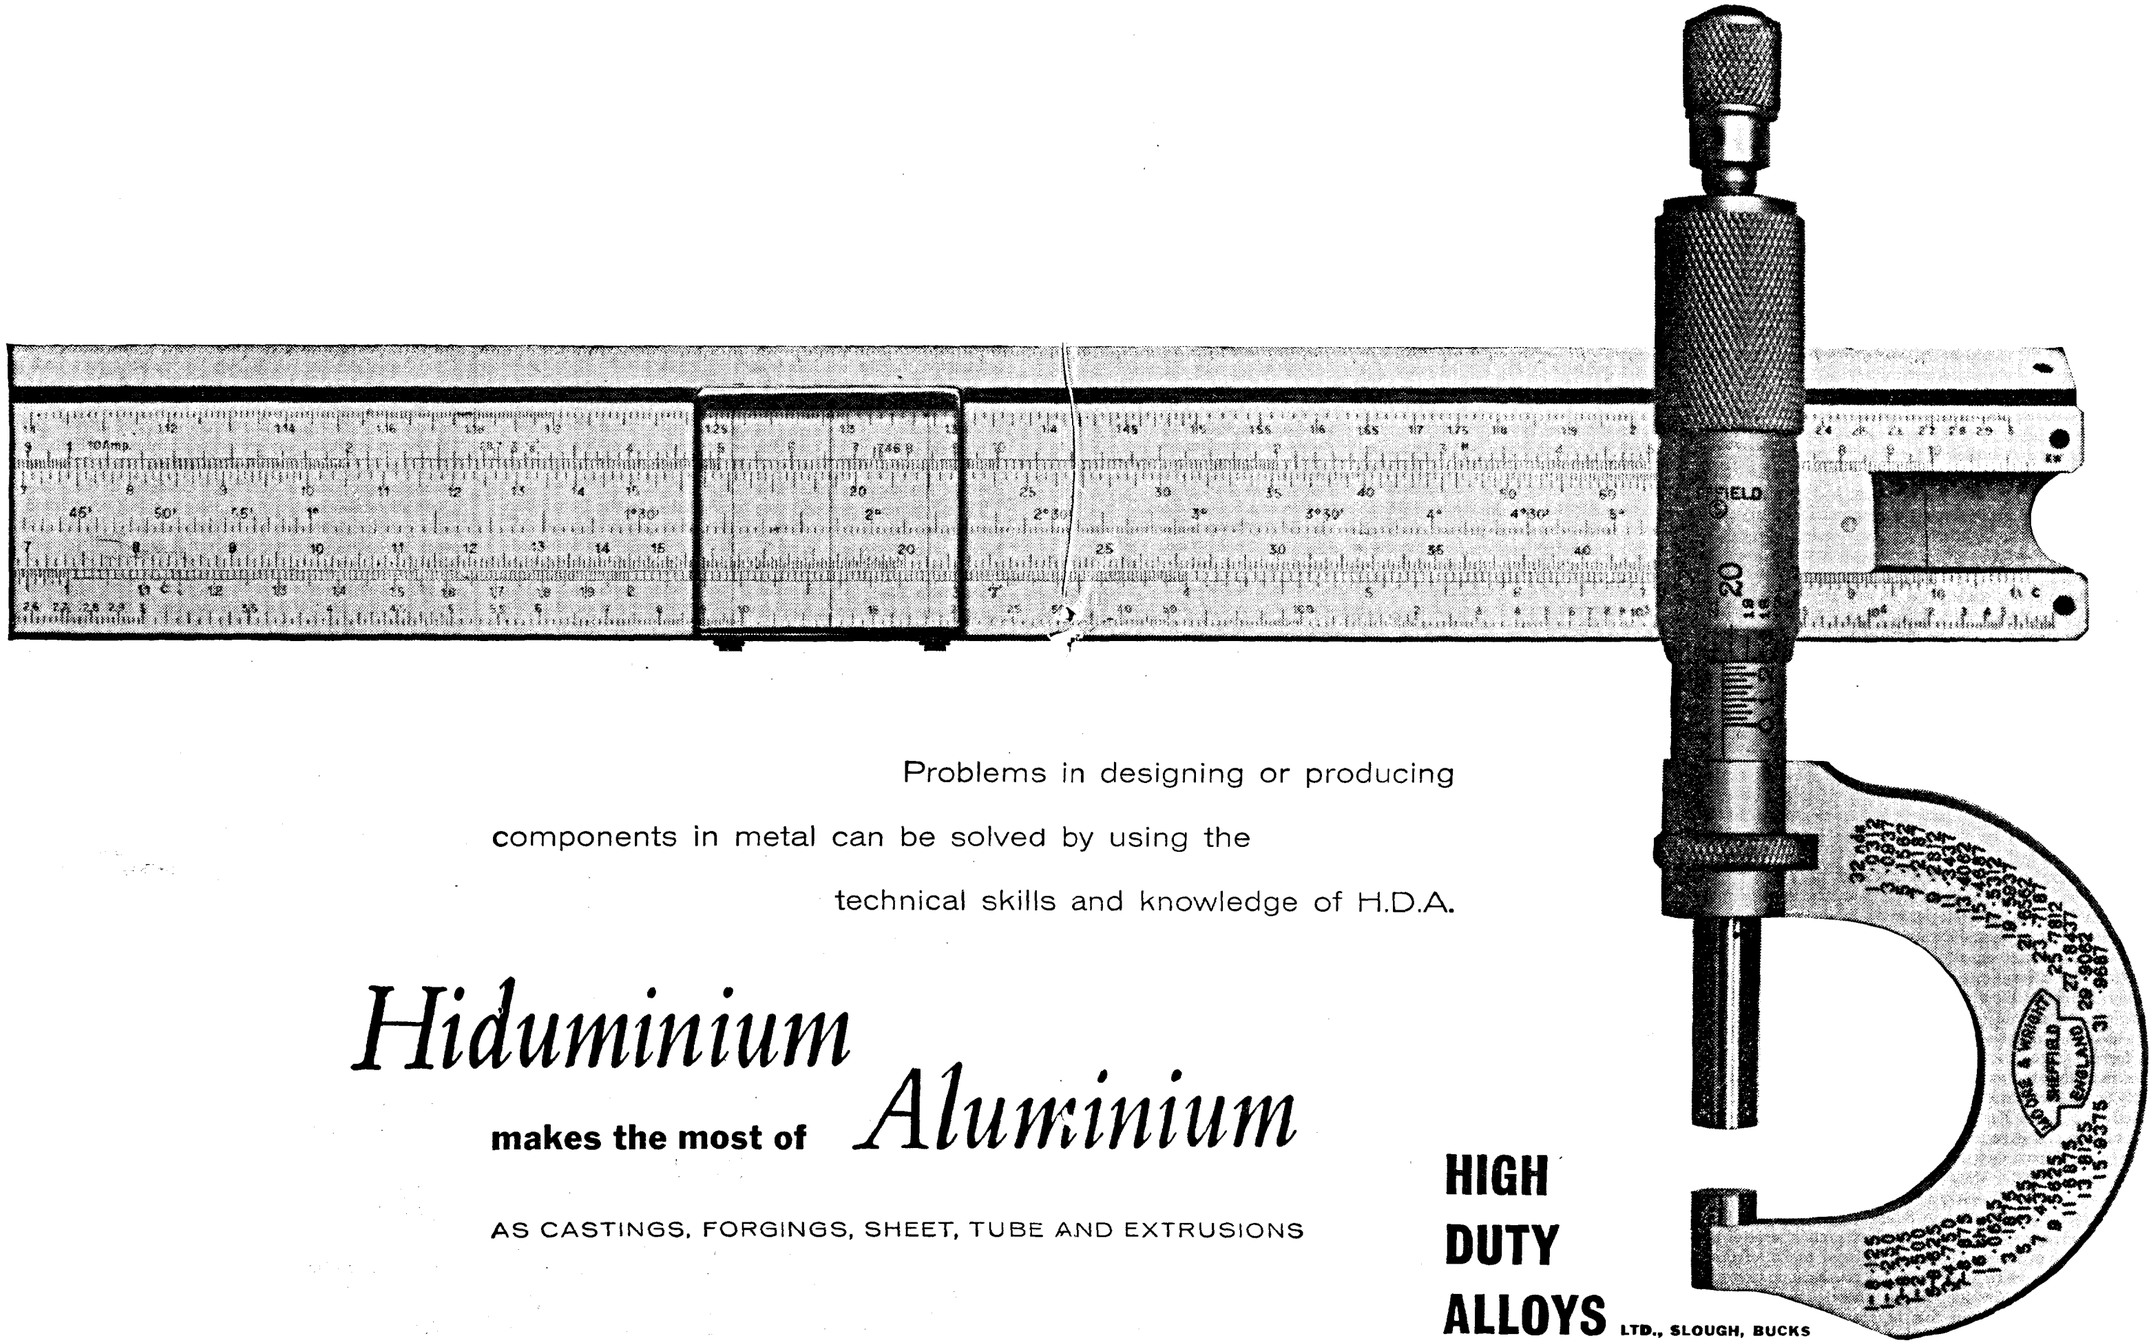
FROM A CORRESPONDENT IN DETROIT

DISCRIMINATION in housing, which is an ever-increasing problem in northern cities, has been carried to a fine point in five suburbs of Detroit which number some of the country's wealthiest people among their residents. Property owners and estate agents in the Grosse Pointe area have set up an elaborate system for the purpose of screening prospective buyers of houses in order to keep out persons whom they regard as undesirable. Applicants for homes are investigated by a private detective agency and rated on a point system according to their speaking accents, occupation, religion, dress (flashy or conservative), degree of "swarthiness," whether their way of living is "American" and whether their friends are predominantly "American." Every applicant must have at least 50 points to qualify; people of Polish or Irish descent need 55, Southern Europeans 60 and Jews 70, while Negroes and Orientals are not rated at all, since they are excluded automatically.

This points system was started fifteen years ago but did not attract public attention until challenged in two recent lawsuits. One was brought by a property owner who charged that estate agents held a mortgage on his house which they refused to let him pay off and which gave them power to veto any prospective buyer. The other suit was filed by Mr Bufalino, a notorious official of the notorious lorry-drivers' trade union, who claimed that he had not been allowed to buy a house in Grosse Pointe because he was "in the union rackets."

Far from denying these charges, estate agents and property owners have obligingly furnished additional details about how their system works and have defended it as "making the best of a difficult fact" that prejudice affects the value of land and houses. The owners say that 1,597 prospective buyers have been investigated fully since the plan was put into operation. Only about 60 per cent scored enough points to qualify for residence in the area. Nothing is said about how many persons were rejected, or accepted, without investigation. According to the form used by the detective agency which carries out the enquiries: "A station in life of sufficient eminence could be capable of producing a passing grade despite all other considerations in this report." This apparently means that someone like Albert Einstein could move into one of the Grosse Point suburbs even if he did not have sufficient points in the rating. But the day after this explanation was given a prominent Detroit psychiatrist, Dr Rosenbaum, announced that he had been turned down when he tried to buy a home in Grosse Pointe, although his wife, who is not Jewish, had been told that she might live there. State officials are now investigating this screening system which the Governor of Michigan, himself a resident of the area, has condemned as "odious and unhealthy."

SHORTER NOTES



The Treasury has decided that, in the present state of the market for government securities, it would be undesirable to use its new system, designed to counteract speculation, under which maturing issues were to be paid off in cash instead of being exchanged, for the refinancing of the $6.4 billion of debt which falls due on May 15th. So holders of the securities will be able to exchange them for either a one-year certificate at 4¼ per cent or a five-year note at 4⅜ per cent; as a result of the fall in interest rates, both will cost the government slightly less than did the similar securities which were offered last February.

* * *

A new helium extraction plant which has been built in Oklahoma at a cost of $15 million will process 70 million cubic feet of natural gas a day. Since the helium content of the gas is expected to average 2 per cent, the monthly recovery of helium should be about 30 million cubic feet. This equals the total capacity of the other four plants which were already in operation.

Mr Diem's Critics Speak Out

FROM OUR CORRESPONDENT LATELY IN SAIGON

MANY signatories of the manifesto demanding urgent and drastic economic, administrative and military reforms that was served on President Diem last week are dismissed in Saigon as lightweights. But the significance of this first political challenge to Mr Diem's mystical absolutism does not lie in the names and records of the would-be reformers ; it lies in the simple fact that a challenge was presented at all.

The group of elder politicians and civic leaders who led the revolt against the palace did not stress their own personal fear of arrest and punishment. But this was clearly implicit in their cautious manœuvrings and in their self-protective arrangement that the foreign press in Saigon would have a copy of their manifesto and a full list of their names as soon as the palace had acknowledged them ; to a visitor, this prudence was by indirection their most serious charge against the regime. Yet, conversely, they would not have been able to meet at all in regular conferences—subject to the normal Saigon ban on more than twenty persons attending—had they been preparing their plans in, say Dr Rhee's Korea.

No one can attempt objectively to measure the extent of the discontent in censored South Vietnam. Among intelligent, educated Vietnamese—government officials, teachers, businessmen, some of the students and the upper middle class generally—there is a vague feeling that the march to "liberty and progress," to use the phrase adopted by the articulate reformers, has faltered and somehow lost its original zest and sense of high purpose. It is certain that the great mass of the people, neither hungry nor profoundly interested in western concepts of philosophical liberalism and parliamentary democracy, are non-communist. It is perhaps not so certain how resolutely they would fight against communist forces which they feared might be strong enough to defeat President Diem's army.

Here is one central paradox. Mr Diem's pet project of establishing "agrovilles"—communities of scattered farmers regrouped around modern facilities in strategic areas—is designed both to protect his people against communist terrorists and to improve living standards. But his critics, equally anti-communist, insist that this policy imitates the principle of the Chinese commune ; imposes forced labour ; prepares the way for easier communist seizure of a community's area ; and in any event spreads discontent among peasants who despite terrorism do not wish to leave their old family holdings for the larger new holdings and who are angry at the removal of their ancestral tombs.

Basically South Vietnam is prospering under Mr Diem. Rice can be exported once more. Farm taxes are down. Education, sanitation and public health have been greatly improved. In any village food leavings are thrown into the garbage with an abandon which would shock the commune dwellers in Mao Tse-tung's paradise. But there is no democratic "nonsense" about freedom of speech or press or parliamentary opposition in South Vietnam. There have been curious family group indoctrination classes reminiscent of the enemy's ideological methods. There are alleged to be anything from 40,000 to 50,000 political prisoners in "re-education centres." Even the champions of President Diem, whose personal probity is not questioned, now murmur that he has allowed himself to become too withdrawn from his people ; that few of his advisers share his shining evangelistic ideals ; that the family group screening him has a bright and eager eye for the main chance ; that there is a cynical acceptance of the prevalence of corruption ; that the regime rejects constructive criticism as *lèse-majesté*, and that President Diem himself is adopting a Confucian complex, seeking, as one intelligent official put it, "to introduce mandarin rule without any mandarins."

There are well-grounded fears that the communists have infiltrated into key services. Undoubtedly the 800,000 refugees who fled south from Hanoi were seeded with trained agents, and many others remained under party orders in the south after the Geneva armistice. The real communist threat, in the opinion of many western observers, is this internal infiltration, rather than stepped-up terrorism. Nor has the army—with the exception of a few specialised units—yet been properly trained in jungle methods. The regime, although anxious, is reluctant to admit these known facts, largely, it is said, because Mr Diem proclaimed last year that the security situation was under complete control and that the terrorists had been subdued. It is recalled also that when one avowed critic of the regime—Dr Dan—was refused permission to take his properly elected seat in the national parliament, western diplomats strongly urged that the ban should be reconsidered, but were informed apologetically by the president's spokesman that criticism of "a symbol of the state" could not be tolerated.

If President Diem permits last weekend's surprise upsurge of critics—lightweight or not—to form a parliamentary opposition, he will have made a notable retreat from his lofty peak of Confucian omniscience. He must know also that in the aftermath of the spectacular Korean upheaval the opposition is consciously playing for American support. Washington is supposed and expected now to be on the side of western-style democratic forms of government in non-communist Asia—whether or not that still alien system is the most effective way to oppose communism.

A Leaderless Korea

FROM OUR CORRESPONDENT IN TOKYO

WATCHING the Rhee regime in Korea collapse was like watching the front of a house fall out into the street. All the rooms were exposed to the public gaze and some very queer things were going on in them. The demonstrating students found in the home of the late Speaker, Mr Li Ki Poong, a wooden box stuffed with cheques worth thirty million *hwan*. The former home minister is reported to have confessed that he ordered the police and other officials to get Dr Syngman Rhee and Li Ki Poong elected, on pain of wholesale dismissal, and that one method used was to stuff the ballot-boxes in advance with a forty per cent Liberal vote. Mr Huh Chung, the new foreign minister and acting president, has spoken of the "wasteful, inefficient and corrupt use" of American aid funds (which amount to several billion dollars).

The spectacle proved so fascinating, with one dramatic incident so swiftly following another, that little attention has thus far been paid to another consequence of the Rhee regime: the fact that

the regime's lack of political conscience was matched and made possible by Korean political unconsciousness. For years, the Koreans' simple aim was to rid themselves of the Japanese. They did so, and got Dr Syngman Rhee instead. Now they have singularly little notion of what to do next. The Korean students' revolt was in a classical Korean pattern: Yi dynasty students more than once led successful attacks on unpopular monarchs, without actually changing the system. Even under Dr Syngman Rhee the students were still a privileged class, who revolted only when the political machine had broken down to an intolerable extent.

All power had become concentrated in the hands of Li Ki Poong and the fifteen "secretaries" who surrounded Dr Rhee and were able to dictate terms even to cabinet ministers. But Li Ki Poong, himself a former "secretary," was suffering from an incurable disease that progressively wasted both his physical and mental powers. His incapacity seems to have been matched only by his wife's rapacity, and Mrs Li Ki Poong, or Maria Pak as the Koreans knew her best, had a blindly loyal friend in Mrs Rhee, just as Rhee himself refused until it was much too late to hear a word said against Li. From Maria Pak's single-minded determination to succeed Mrs Rhee as Korea's "first lady" after the aged Dr Rhee died or retired, there flowed such consequences as the 1958 National Security Law and the misuse of old outmoded American military government laws, that were used last year to gag Li Ki Poong's opponents, as well as the outrageously rigged elections of March this year that finally brought on the students' revolt.

THE American role in Korea has been peculiar. Dr Rhee was not the only Korean leader on the scene, but having once backed him, the Americans continued to do so even when he began getting rid of all his rivals, and even after he persisted in embarrassing his backers by his attitude towards the Korean war prisoners and the armistice and his constant cries about "marching north." But a new American attitude had been in evidence, especially since the death of Mr Dulles. American indignation over the Rhee regime's internal excesses, though genuine, might not in itself have been enough to change Washington's stereotyped admiration of the "staunchest" anti-communist ally. But Dr Rhee also blocked a Korea-Japan *rapprochement*. It also began to become clear that in any showdown between him and his long-suffering people he would not be able to count on the support of the Korean army. Only the historians, however, will be able to try to determine precisely to what extent General Song's historic decision not to oppose the popular revolt had the prior knowledge and approval of the American commander.

The American embassy in Seoul has been at pains to disavow any credit for the Rhee regime's downfall. American officials claim that they did not tell Dr Rhee specifically what he should do, and were equally "non-interventionist" towards the demonstrators. This is cautious, but caution is not wisdom in all situations. It is at least arguable that had the Americans spoken more bluntly to Dr Rhee at an earlier stage of the game, the excesses that provoked the revolt might never have happened.

As Korea slowly returns to an outward normality, it becomes evident that many crucial questions still remain unanswered. President Rhee had lived increasingly in a world of make-believe, but so had most Koreans, including the students who presumably are the country's next leaders. If they are no longer gagged by Dr Rhee's police, they are still politically without direction. The Americans could help here, but there is as yet little sign of anything emanating from them beyond stale political platitudes—"anti-communism," "a free Korea"—and large doles. While the Americans practise this sort of non-intervention, a number of no doubt well-meaning but ageing Korean politicians, all of them ultra-conservative by temperament, are busying themselves with new paper constitutions. It is difficult to resist the conclusion that the real social and economic as well as political reforms that Korea badly needs remain unattempted and that Korea meanwhile is a Pakistan without even an Ayub Khan, since General Song insists on regarding himself as a simple soldier.

In the General's Corner

FROM OUR PARIS CORRESPONDENT

GENERAL DE GAULLE came home on Wednesday crowned with fresh foreign laurels. His American tour was undoubtedly another personal success. After the Canadian prelude came the warm applause of Congress, the compliments of politicians and the welcome of American crowds from New York to San Francisco. French correspondents were not alone in using lyrical terms. Mr Walter Lippmann even appeared to bestow on the general the diplomatic leadership of the western world ; and this was no joke.

Yet the trip seems to have achieved little beyond giving a fillip to the general's prestige and to French public relations. The bulging file of Franco-American differences has scarcely been opened. The talks at Camp David—presumably—mentioned Algeria, since President Eisenhower assured his press conference on April 27th that France remained faithful to the policy of self-determination which had American support. This was sufficiently vague not to preclude new, and more serious, misunderstandings at the United Nations. But French differences with Nato were apparently left untouched and, according to French sources, General de Gaulle did not even make a bid for American nuclear secrets.

The unanswered questions are likely to complicate negotiations at the summit in a week's time. Short of receiving American secrets, France is determined to bang its own way into the nuclear club. In the French view, naturally enough, disarmament must begin with the control and inspection of the means of delivery of nuclear weapons, that is to say of rockets, planes and ships. Since the Big Four are most unlikely to agree on such an ambitious beginning in Paris, France will not consider itself bound by a nuclear test ban accepted by the Americans, Russians and British. And the first French explosion after such a ban would set a precedent for the Chinese.

Lack of progress at the summit on disarmament will be the more dangerous because, in the French view, the Paris conference should leave the German question (and Berlin) alone. General de Gaulle said this plainly in Ottawa but less emphatically in Washington. If the two presidents were preparing their tactics for the summit at Camp David on the assumption that Mr Khrushchev, suffering from temporary amnesia, would forget all his previous pronouncements on Berlin, the warning from Baku on April 25th was a salutary jolt. The question still remains whether the French will stick to Dr Adenauer's stiff line or whether they are now willing to resume negotiations on Berlin from the point where they were left in Geneva last July.

In one way, General de Gaulle has certainly changed. Last year he was allergic to summitry and proved a reluctant climber. He now praises the value of meetings at the highest level and of personal contacts with Mr Khrushchev. For the rest, there has been little in the general's recent utterances to indicate any real change in his outlook on foreign affairs.

Facing journalists in Washington, General de Gaulle rejected the Soviet suggestion that Germany could be a threat to France. "Quite the contrary," he declared. The common market, he said, was an economic and political necessity. He told members of Congress that the inclusion of western Germany in a west European unit would enable a balance to be struck "between two zones comparable in numbers and resources," ensuring an equilibrium

from the Atlantic to the Urals. It may be presumptuous to consider that, economically and strategically, the Six can match the weight of the Soviet block. Nevertheless, this conception is in keeping with the gaullist vision of a continental alliance, led by France.

But in pursuing his grand design (as expressed in *le Salut*), General de Gaulle has become aware of the limitations and contradictions of his tactics. The close partnership with Bonn excludes the balancing act—the choice of alliance between the Soviet Union and the "Anglo-Saxons"—which he had originally envisaged. This was confirmed during Mr Khrushchev's visit to France. General de Gaulle drew the logical conclusion and, during his American tour, took pains to emphasise that France is a member of the western block. He did not, however, obtain as a reward for this faithfulness either a place in a Nato triumvirate, the creation of which he has demanded since the autumn of 1958, or the promise of American atomic secrets.

For all the applause General de Gaulle may well have returned from Washington nearly empty-handed. This will not alter his diplomatic course. He probably remains convinced that he will finally achieve his aims through patience and passive resistance inside Nato. The leadership of a continental coalition and, even more, the ending of the Algerian war would undoubtedly strengthen his hand. He may, therefore, view the forthcoming meeting in Paris merely as a formal, and inconclusive, episode in a drawn-out diplomatic game.

The gaullist approach will not create any complications at the summit if the major French premise—that Mr Khrushchev can be kept happy with a courteous refusal of western concessions—proves true. But if not, if Mr Khrushchev is determined to obtain some concrete results, the solidity of the western position will be put to the test. Will the three western partners prefer to run, united, into a deadlock or will they, at the last moment, admit that their tactical unanimity is merely superficial? To discover everyone out of step but himself would not be a new experience for the general.

Regretfully to Boycott

FROM OUR MIDDLE EAST CORRESPONDENT

THE Arab boycott of American shipping, in answer to the refusal by New York dockers to unload the Egyptian steamship *Cleopatra*, is a genuinely popular movement that has swept the Arab governments along in its trail. It is an open secret that not one Arab government really wants economic war with the United States and that many are apprehensive of the inevitable political consequences of a prolonged dispute.

At a time when even General Qasim is having second thoughts about communist aims, Arab governments are more anxious than ever to preserve a neutral line. President Nasser himself said last week in private conversation that he had no wish to get embroiled with the United States. He could not, however, ignore the strength of Arab popular feeling without forfeiting all claim to leadership of the Arab world, especially since both General Qasim and King Hussein had rallied to his support. Officially the Jordanian and Iraqi governments have nothing to do with the dispute, but both have used government propaganda networks to declare the support of the Jordanian and Iraqi unions for the dockers at Alexandria, Port Said and Suez.

The strength of Arab feeling over this issue has two causes. First, the New York boycott of *Cleopatra* is interpreted everywhere as a Zionist conspiracy to force a free passage through the Suez Canal for Israeli ships and cargoes. This is the reddest of rags to the Arab bull. Second, persistent memories of western domination linger, and many Arabs, particularly the less sophisticated, take positive pleasure in cocking snooks at more powerful western nations, even to the detriment of their own material interests.

The volume of trade affected by the boycott is as yet impossible to assess with any accuracy since neither the Arabs nor the Americans have explicitly stated what further measures they propose to take. The Arabs, for their part, may well extend the boycott. The American airlines are already under a threat, and there is even talk of a general boycott of all things American. Various petty pinpricks in this direction have already been administered.

One encouraging sign is that President Nasser has intimated, again in private conversation, that he will ensure free passage for American shipping through the Suez Canal. This is because the denial of passage to Israeli ships and cargoes has already been widely condemned; similar action against American shipping would create a new and dangerous situation. Indians and south-east Asians have been quick to point out that they would be the chief sufferers if transit through the canal were further restricted.

The Arabs risk having some of their American aid cut off since an Act of Congress stipulates that 50 per cent of the goods shipped under American aid programmes must be carried in American bottoms. If American aid were cut off by so much, what would the Arabs' reaction then be? Probably they would remain obdurate and say they would turn elsewhere for help, but all the aid programmes now in operation in the Middle East have only been started after months of tortuous negotiations. Even if the Arabs' losses could ultimately be recouped, they would certainly suffer dislocation and delays until new arrangements could be made with west Germans, Japanese, communists or even Britain.

The fate of goods shipped on ordinary commercial account is also obscure because it is not known what American exporters are going to do. Will they be content to transfer their shipments to non-American ships or will they support American shippers by refusing shipment altogether? There is a chance that they might compromise by shipping to non-Arab ports in the eastern Mediterranean for trans-shipment to the Arab states. But the extra costs involved in trans-shipment would probably drive Arab merchants to seek new sources of supply. Anyway, the decision may be taken out of their hands by an Arab decision to boycott American merchandise generally.

At the moment the boycott is total from Tripoli in Libya to Basra in Iraq. The position in the Persian Gulf ports is not yet certain and many Arabs who support the boycott are reconciled to the prospect of business as usual in the Gulf on the grounds that the Gulf ports are somehow "different." Elsewhere there is no sign of wavering among the unions or any evidence that governments will take action to enforce a return to work, however much certain politicians may regret the whole business.

Turkish Discontent Boils Over

FROM OUR CORRESPONDENT IN ISTANBUL

ON Thursday, April 28th, Turkish students demonstrated in Bayazit Square outside Istanbul University, shouting slogans such as "freedom, freedom," and "Menderes resign." Police entered the university to arrest the demonstrators and the professors who had sided with them. The students, led by the rector of Istanbul University, Doctor Onar, protested that the police had no right to enter the precincts of an autonomous institution. A violent incident developed into a pitched battle between police on the one hand and students and professors on the other. The latter, though unharmed, picked up large jagged paving stones and threw them at the heads of the police, who used tear gas and fired in the air but without effect. Finally the order was given to fire on the demonstrators. An unknown number were killed and injured. Next day, an even more violent incident took place at Ankara University. The casualties in these and other incidents in both cities have now been given officially as two killed and 37 injured, including 19 police. There are strong reasons to suppose that these figures are an understatement; rumour puts them much higher. A reasonable middle estimate might be ten or a dozen dead and perhaps 150 or so injured.

The official Turkish view of these events is that they are the work of a "handful of misguided students" lead astray by the opposition People's Republican party which deliberately provoked riots in order to discredit the Democrat party government at the time of the Nato conference. But if the riots were really the work of "a handful of students," why was it necessary to impose martial law in Istanbul and Ankara, followed on Sunday, May 1st, by a 24-hour curfew? The same day the newly appointed military governor of Istanbul, General Fahri Ozdilek, issued a toughly worded communiqué forbidding gatherings of more than three to five persons in the street and threatening to fire on demonstrators if necessary. The outside observer was left with the impression that the authorities feared much more widespread trouble than could be perpetrated by students alone.

What is behind these startling events? The government blames the Opposition; others the communists. Possibly the incidents were simply spontaneous. Perhaps the most likely explanation is that the growing excitement and unrest in recent months in Turkey, possibly encouraged and approved by the Opposition, has at last boiled over. The immediate cause of the trouble is a law passed by the Democrat party majority in the Assembly giving extraordinary powers to a special commission investigating what the government calls the "subversive and illegal" activities of the People's party. Although the Turkish constitution gives great power to the National Assembly, many objective observers think that this law is clearly unconstitutional. Leading Turkish professors of constitutional law have spoken out against it.

It is difficult to understand why the government, which can hardly fail to have realised that this extreme step would bring a violent reaction, chose to make it on the eve of the Nato meeting. There is a theory that Mr Menderes wanted to show the western world his strength; that he wished to flout the Americans and show that, whatever happened, he was damned if he was going to be a Syngman Rhee. Throughout recent events there has been a singular parallel between Korea and Turkey—a theme most skilfully played on by the Turkish press, which is now suffering from the most complete blackout. The day after the police had fired on the students at Istanbul University an Istanbul paper showed a picture of mothers weeping for their lost children. The mothers were Korean, but no matter. The impact of the picture was terrific. The complete press blackout has lent a weird atmosphere to the whole affair. All foreign newspapers are kept out of Turkey and no Turkish newspaper may report violent incidents. The result is that the BBC and the Voice of America—perhaps even Radio Moscow—are enjoying an unprecedented popularity.

One explanation why the government set up the commission is that it really feared that the opposition People's party, which is said to have close links with the army, was preparing a military coup. One official said last week: "We had to do it. It was a matter of life or death." The resignations from the army in recent weeks and the People's party's links with the army have evidently made the government doubt the loyalties of the soldiers. At the moment, the vast Turkish army is behaving rather like a large, benevolent elephant, uncertain where to turn but probably so far on the side of legality. In all the recent incidents the demonstrators have shouted "long live the army"; as usual those most hated have been the police. There have been several disputes and even clashes between the police and the army.

With both sides filled with rooted rancour and utterly convinced of their rectitude, there seems no reasonable way out save a general election. This may be what the Opposition is aiming to force. Its redoubtable leader, Ismet Inönü, is 75 or more, and his party must want to fight the next election while this gallant old statesman, now at the peak of his popularity as a defender of Turkish democracy, is in his present indefatigable form.

Misgivings at Karlsruhe

FROM OUR CORRESPONDENT

DR ADENAUER wasted no time at the Christian Democratic Union's annual conference at Karlsruhe last week in making known his mind on a delicate matter in which everybody was highly interested. Less than two minutes after he had begun to speak on the first morning, the 84-year-old chancellor was blandly counselling the curious, both indigenous and foreign, to stop conjecturing who was likely to be his successor. As the official text records it, he then went on:

> You see, ladies and gentlemen, a crown-prince set-up always has something rather unpleasant about it (*laughter*), and it is not even clever. When the moment arrives—and of this, my friends, I am quite convinced—enough people will be there to take over the helm with a firm and strong hand. (*Loud applause.*)

That was all about that: no anticipation, apparently, of the scramble that may well ensue to seize that helm.

This year Dr Adenauer took for granted the indispensability that he claimed for himself twelve months ago in spurning the presidency; and he made it quite clear that he did not expect to feel any more dispensable after another eighteen months in office, when, in his eighty-sixth year, he would once again be offering himself to the electorate as the best possible federal chancellor. Hardly the faintest echo of last summer's eloquent disaffection could be heard. For the ninth conference in succession there was no candidate to contest Dr Adenauer's nomination for the chairmanship. Dr Heinrich Krone, the party's leader in the Bundestag, declared (almost coyly: "I hope I am betraying no secrets") that the Christian Democratic Union would do battle next year with 1958's Adenauer-Erhard device again upon its shield.

Yet it would be inaccurate to suppose that the atmosphere in the Schwarzwaldhalle was wholly one of beaming complacence. Although nothing was said in public, everybody knew that behind the cupboard door which Dr Adenauer and Herr Krone had hastily slammed while the delegates were converging on Karlsruhe, was the still rattling skeleton of the "deep brown" minister for refugees, Herr Oberländer. For the first time in the party's history a secret ballot was demanded when the time came to elect the chairman. Dr Adenauer received 427 of the 441 votes cast. Four delegates voted against him, and ten expressed their misgivings by submitting blank papers.

The fourteen nonconformists were not alone in their uneasiness. Misgivings of one sort or another were aired, if more tactfully, by all the principal speakers, including Dr Adenauer himself. The emergence of the popular 45-year-old chief burgomaster of Berlin, Herr Willy Brandt, as the Social Democrats' likeliest bid for the chancellorship next year, the socialist successes in the recent Bavarian local elections, and the verdict of public opinion polls, had obviously engendered a chastened mood of self-examination. There were some interesting, if very cautious, diagnoses of the party's ailments, and sundry gentle medicines were prescribed.

Among the coffee tables in the lobby Herr Lemmer, the minister for all-German questions, could be heard amiably insinuating how sturdily—perhaps contrary to appearances—he stood up to the old man behind the scenes. Herr Hassel was deviously making the

same point when he suggested that more of the millions of politically uncommitted young people in the country might be enlisted were they made to expect to have some say in things. He spoke of the "resigned allegations" of rank-and-file members, grumbling that they paid their subscriptions and heard no more. "Have we done everything," he asked, "to make membership of the Christian Democratic Union attractive?"

Herr Erhard, who has by no means recovered the prestige he lost through Dr Adenauer's manœuvres last year, thoughtfully explored the possibility of the public losing faith in the Christian Democratic regime for reasons less obvious than its present patriarchal character. The economics minister admitted that he was puzzled to observe that, although the number of wage earners had increased from 13.6 million in 1949 to 20.1 million in 1959 and household incomes during the same period by 122 per cent, so many west Germans were restless and dissatisfied. Was such discontent, he wondered, inherent in a free society? He offered some tentative explanations. Germany's swiftly-expanding material prosperity had undoubtedly bred here and there an unfeeling egoism which in turn had provoked resentment and cynicism. In consequence of the emigrations of 1945 and after, and of the increased mobility of people everywhere today, many Germans might be suffering from deficient social roots. At the same time they had been gradually deprived of a good deal of their former independence. The individual felt at a disadvantage, and uncertain of himself, in the mechanised world of today. Dr Erhard recommended rulers and employers to try to do more to humanise the individual's environment.

Dr Erhard probably came nearest to the mark when he spoke of the contemporary west German's feeling of insecurity, his fear of being either "atomised or collectivised." Above the speaker's head hung the ominous map of the northern hemisphere which Dr Adenauer had ordered to be prepared specially for the conference. It showed the rough political division of the world in splashes of red and blue. Pointing to it in his opening address, the chancellor had spoken of the advance of "atheistic communism" since 1917. For the free peoples of the west, he concluded, there was "only one thing" to do: that was

> Be strong and united, so that we shall not be overrun. . . . Those who want a relaxation of tension, and consequently peace, must pursue a policy of strength. For we can negotiate with Soviet Russia and Red China and the lot only when we are at least as strong as they are.

No one at Karlsruhe openly questioned the venerable leader's bleak, if not hopeless, simplification of the major issue of world politics. Yet it is hard to believe that the whole of the Christian Democratic Union is content with its limitations. If it is, the party must not be surprised to see the uncommitted voters listening sympathetically to counsels that are younger-looking and more adventurous.

Ghana's Cockerel and Cocoa Tree

FROM A SPECIAL CORRESPONDENT

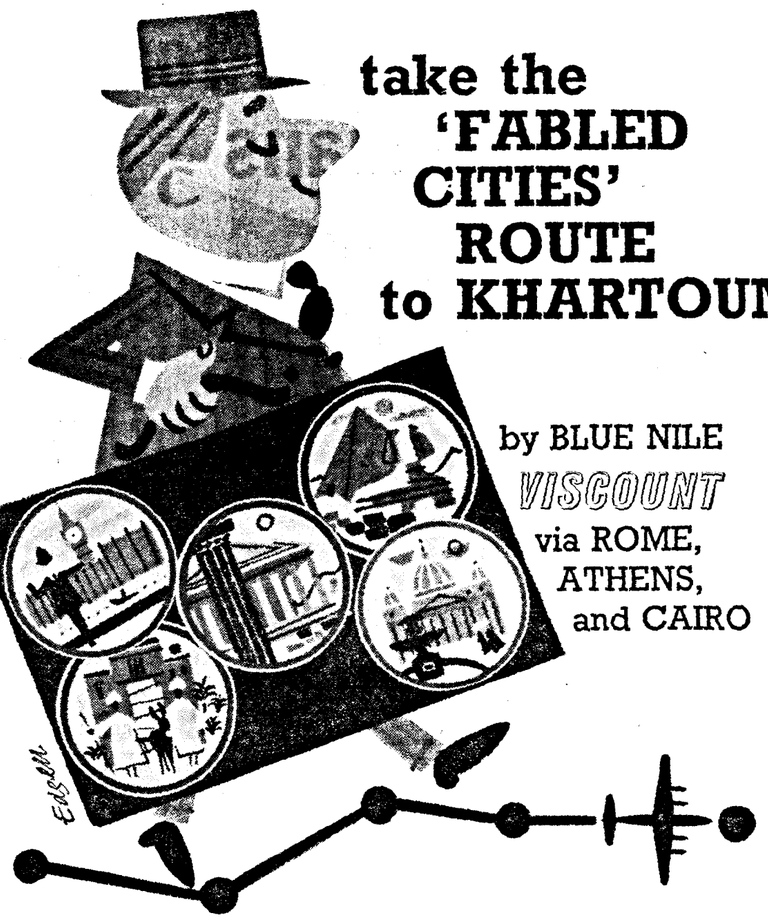
A GHANAIAN proberb says that "the woman who bears twins need never fear any pain again." At a single poll, Mother Ghana has been delivered both of a republic and of a president: but it may be that not all her problems are ended.

The mechanics of the double vote were smooth enough, even for illiterates. "Vote where you see the red" was sufficient instruction for government supporters; it covered both the white-on-red "Yes" to the Constitution and the red cockerel of Dr Nkrumah's Convention People's Party. Their United Party opponents had to seek out first a black underlined "No," and then a green cocoa tree with yellow pods, an Ashanti emblem now symbolising Dr Danquah's promise of a higher price to cocoa farmers.

There was never any doubt that the CPP would win. Nevertheless, some were disconcerted to see the *Ghana Times* on sale with the headline "Ashanti, Volta Region vote solidly for Republic" before voting had ever started. The 88 per cent "Yes" vote was less surprising than the fact that only one constituency out of 104 showed a win for the Opposition on both issues. The main "No" votes were in four areas: Accra, where many detainees have family and friends; Kumasi, with its traditional Opposition alliance of Ashanti and Muslims; Dr Danquah's home area of Akim Abuakwa; and in the Volta Region, where some Ewes of former British Togoland still resent separation from their kinsmen across the border.

Dr Nkrumah himself tended to stay above the battle; he did not campaign. But the enthusiasm of his supporters more than filled the gap. The *Ghana Times* spoke of "The Saviour, the Torch, the Teacher, the Leader, the Messiah, the Miracle of the Twentieth Century, the Great Apostle of African Unity and Independence whose personality blackens out the most blinding neon signs." The Accra *Evening News* published under the heading "Think on these things" a series of sentences including: "For your sake he was imprisoned, . . . for your sake he suffered shame and degradation, . . . for your sake he has wept twice." Such expressions were criticised in sermons but defended by the *Ghana Times*.

Dr J. B. Danquah, grave, paternal and restrained, could offer little in positive policy to match the CPP's combination of personality cult and economic dynamism. He proposed a constitutional reform commission, leading to a bicameral parliament "with real power" and perhaps a Malayan-type monarchy. He promised to repeal laws permitting detention and deportation, "restore independence" to the courts, and introduce a five-year plan to expand industrial production by 25 per cent. He proposed to align Ghana with the West, and called Dr Nkrumah's project for a union of African states "a mad hatter's dream."



Public meetings on both sides were more like rallies of the faithful than opportunities for discussion, and no questions were permitted. At a CPP rally "Lead, kindly light" was likely to be sung, while the United Party supporters chorused "J. B. Danquah is the one we love." At the CPP eve-of-poll rally in Accra, TUC members marched through the crowd with banners: "The Party is supreme," "Nkrumah, Africa's Political Messiah," and "Nkrumahism is the Philosophy of our Age."

Speakers for the CPP made little reference to the provisions of the Constitution—it was not translated into any vernacular language, and few voters seemed to have read it. Dr Danquah's attack concentrated on the extent of the president's powers, especially the power to grant loans, and on his "absolute power without check" over the judiciary, the civil service and the armed forces. He called Article 2 (permitting surrender of Ghana's sovereignty to a union of African states) a "betrayal." His arguments passed over the heads of the majority of voters, who were content simply to associate "Nkrumah" and "Yes."

The Opposition alleged substantial intimidation in rural areas, but direct evidence was hard to find. The government admittedly used the machinery of the state—district commissioners were prominent in the fight, and chiefs were warned of the consequences should they fail to get out the vote of their subjects. Radio Ghana all but ignored Opposition speeches, and Dr Danquah was refused permission to broadcast. But the ballot was not rigged, and, in spite of its handicaps, the Opposition ran a vigorous campaign. After the election, Dr Nkrumah said:

> We have set up a committee to analyse our position in those areas which did not poll high enough. With the report of this committee we shall formulate plans . . . to conduct a surgical operation in critical self-examination and map out the blueprint for Republican Ghana.

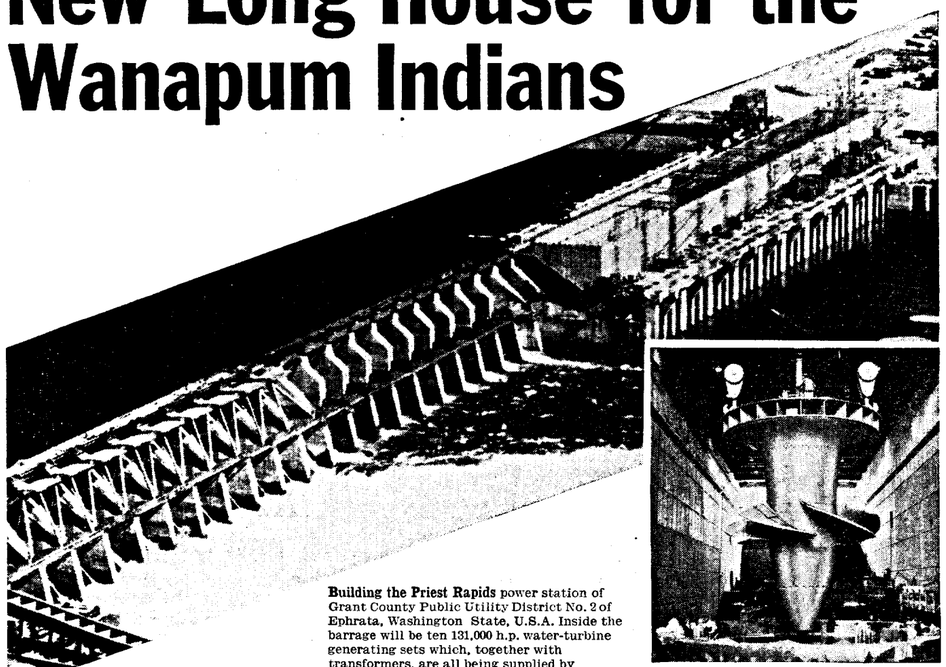
Surgery may still be needed—but if Dr Nkrumah is not satisfied with his 88 per cent, he must be a hard man to please.

The BLUE NILE Viscount, maintained and crewed by Airwork for Sudan Airways, is the only service that exists primarily to serve the Sudan. Every Monday at Noon it leaves Gatwick Airport (only 35 minutes from London by fast train) and reaches Khartoum next morning stopping at Rome, Athens, and Cairo. If, for reasons of business or pleasure, you wish to break your journey at one of these 'Fabled Cities' and complete it later on you may do so* *at no extra cost*. The same concession applies on the return journey —every Thursday evening from Khartoum.

VISCOUNT comfort—ROLLS-ROYCE speed

The VISCOUNT 831, used for the Blue Nile Service to Khartoum, is larger, faster, and even more luxurious than earlier ones. An unusual feature is the FREE INFORMATION SERVICE on board, which supplies passengers with up-to-date news of Sudanese business, political, and social events—very helpful to newcomers and to those returning after a long leave of absence.

**Athens traffic rights are subject to Government approval.*



ASK YOUR TRAVEL AGENT ABOUT THE BLUE NILE ***VISCOUNT*** SERVICE TO KHARTOUM *and about the special 'stop-over' facilities*

SUDAN AIRWAYS' *technical maintenance is provided under contract by Airwork Limited who are also the UK General Sales Agents.*

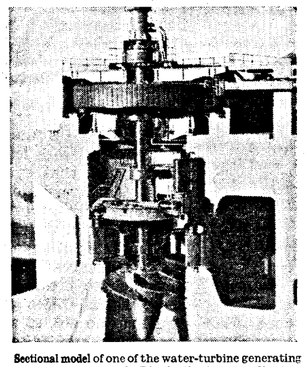
New 'Long House' for the Wanapum Indians

Building the Priest Rapids power station of Grant County Public Utility District No. 2 of Ephrata, Washington State, U.S.A. Inside the barrage will be ten 131,000 h.p. water-turbine generating sets which, together with transformers, are all being supplied by English Electric.

One of the turbine runners being lowered into position at Priest Rapids. These runners are the largest so far built in Britain and are among the biggest in the world.

When the great Priest Rapids hydro-electric project was begun in Washington State, it meant, as so often happens, disturbing many historic sites and remains of the local Indians, the Wanapums.



However, cordial co-operation with local authorities has removed most of the relics to museums and provided a new site for the Long House, which the Wanapums use for tribal feasts and religious rites. Now a very different Long House is reaching across the Columbia River, a massive barrier of steel and concrete. And the throbbing heart of this power-house will be the ten huge generating sets made in Britain by The English Electric Company.

Every six weeks another English Electric turbine and generator set, with its massive forgings machined to smooth perfection and its myriad windings, is added to the impressive rank of machines in the Priest Rapids power-house. As it goes on line, still more power pulses into the electrical system of busy Washington State. When all ten are installed, over 1,300,000 h.p. will be at work in the "Long House."

Wherever power is needed

The U.S.A. is one of the many countries where English Electric has won a high reputation and a succession of important orders. At home, too, this company, with its huge technical resources backed by long experience in many branches of engineering, is making the equipment, first to provide us with more power—from coal, oil, gas, water, the atom—and secondly to utilize it, on our railways, in our industries and our homes.

Electric power leads to prosperity, both for us in Britain and for those other countries served by English Electric whose needs are often so much greater than ours.

Sectional model of one of the water-turbine generating sets for Priest Rapids. The feathering propeller turbine is rotated by water pressure and flow, driving the generator above it. The electrical power generated is led away to transformers for distribution to industry and the home.

POWER IS THE BUSINESS OF

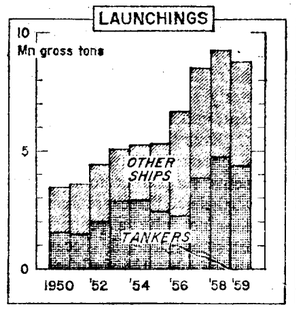
'ENGLISH ELECTRIC'

. . . BRINGING YOU BETTER LIVING

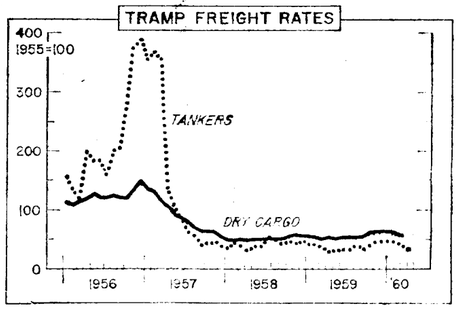
THE ENGLISH ELECTRIC COMPANY LTD., MARCONI HOUSE, STRAND, LONDON, W.C.2

THE BUSINESS WORLD

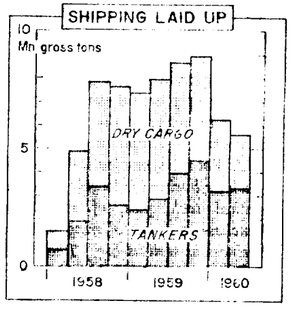
Shipping in the Shallows



For most British industries the mild recession of 1958 may be a thing of the past; shipping is still floundering in the shallows. Although a mild breeze of activity gave freight rates a little movement during the winter months, the breeze has died down again, and the tramp and tanker sections of the market, at any rate, are faced with the prospect of three seasonally quiet months. Although the rate of expansion in world trade has been resumed, following a mild setback, shipping remains a depressed industry.



Why has this apparently mild setback in world trade had such a serious and lasting effect on the international shipping industry? Firstly, one of the principal manifestations of the recession was a sharp decline in the demand for the ocean transportation of fuel (oil and coal) and of raw materials for industry, particularly the steel industry. Second, and even more aggravating, is the fact that this pause in expansion occurred at a time of unprecedented activity in the world's shipyards, which has raised the capacity of the world fleet to about 118 million tons gross, half as much again as ten years ago. And in the postwar world shipping seems to be dependent for its prosperity largely on the level of consumption of fuel and industrial raw materials.



Changes in demand for these industrial commodities appear to have a greater effect on global demand for shipping than changes in demand for foodstuffs and fertilisers, which have been less liable to fluctuate, largely as a result, it may be supposed, of the rapidly expanding population of the Eastern countries. Taking a very long-term view, one might argue that this factor should be a bull point for shipping, since these countries may always have to rely in the end on increasing imports of grain from North America and Australia. But at the same time Russia, China and India, for example, are planning rapid expansion of their merchant fleets, in order to reduce their reliance on Western shipping services. It is interesting to reflect, however, that had it not been for the intense chartering activity of the Chinese and Russians last year, which kept over 100 ships in employment, shipping depression in the West would have been much more severe.

As it was, the setback in Western seaborne trade last year coincided with a flood of new vessels from the shipyards, mainly dry-cargo tramps and tankers—and, moreover, vessels which were emphatically larger, faster and more efficient units than their predecessors, particularly the war-built standard ships. The consequence of this was to swell beyond all reason the potential carrying capacity of the world fleet; and yet the paradox arose of new and more efficient and economical vessels going straight to the laying-up buoys, while inefficient and obsolescent war-built ships were still sailing the seas. This phenomenon, again, was an accident of timing. Some of the older ships were still engaged on long-time charters, which had been fixed at highly profitable rates during the peak of shortage; others had been purchased during the weak market between Korea and Suez at prices which enabled them to operate at some sort of a profit, even at cut rates. The tonnage of ships scrapped last year amounted to only about 2½-3 million tons: roughly three times as much new tonnage was launched.

The surplus of tramp and tanker tonnage is reflected in the size of the laid-up fleet. At the beginning of November the tonnage of shipping laid up throughout the world amounted to well over 8 million tons gross. By the beginning of April this total had been reduced to 5,600,000 tons. But much of this laid-up tonnage passed, it must be noted, not into employment but into oblivion, via the shipbreakers' yards. Mean-

while new ships have been coming from the shipyards at the rate of about 8,500,000 tons gross per annum. The fact that freight rates showed some rise in the winter months, and have been falling only gradually since, in spite of this cushion of available laid-up tonnage and the influx of new ships from the builders, indicates that there must have been quite a marked revival in the volume of world trade.

This revival has been of benefit mainly to the dry-cargo tramps. So far as tankers are concerned, freight rates have shown no resilience, and the high season is now over. The tonnage of tankers laid up is now increasing (at present it amounts to about 3,300,000 tons gross of the total). This is in spite of a marked incursion of tankers into the grain trade; there are today perhaps 1,300,000 tons gross of tankers carrying grain. This has further helped to impede the return of the tramp fleet to any better balance between supply and demand. The excess of tonnage is most marked in the tanker section; it is here also that the largest increases in size and speed have occurred in new vessels coming off the stocks. Much of the decline in demand for tanker service has been a direct result of the American decision to restrict oil imports from overseas. It is among tankers, too, that the surplus seems likely to persist longest. Not only is there a large volume of tonnage on order and still to be delivered, but over the coming years, though oil consumption seems certain to rise, shifts toward the use of Sahara oil, and the commissioning of trans-European pipelines, seems likely to reduce the total amount of sea haulage required to deliver a given tonnage of petroleum to market.

Cargo liners, too, have noticed the effects of the recession, often having to maintain sailing schedules with holds only partly filled. Freight rates for parcels of bulk cargoes, such as grain, have fallen to the same low levels as competing tramp rates. The growth of exports of motor cars from Europe to North America has not benefited the liners to any great extent, since these are now being carried mainly as full cargoes in specially-fitted tramps. Conventional tramps, in many trades, have been losing traditional cargoes, such as grain, to tankers and ore to specialised ore carriers; but some of them have at least been gaining something on the swings. Port handling costs for cargo liners continue to increase; in the short-sea trades and across the North Atlantic some effort is being made to develop the use of cargo containers, in an endeavour to save handling charges, but this development is not an easy one for conservatively-minded waterfront labour to accept. The decline in cargo traffic has helped to ease congestion in ports, even in Colombo.

After a long period of stability in freight rates, increases have recently been secured in the North Atlantic and West African trades. In the latter the recent increase of 5 per cent, coupled with the noticeable increase in the time chartering of tramp vessels, indicates a marked increase in traffic. International competition, particularly on the Pacific routes and on the new St. Lawrence Seaway route, which still has its teething troubles, is as intense as ever.

IN the sphere of passenger liners international competition is complicated by government subsidies and by the growing competition from air transport, particularly on the North Atlantic. Italy, France, the Netherlands and the United States have built or are building North Atlantic passenger ships for "prestige" purposes, with state aid; and it is perhaps a sign of the times that the Scandinavians should have abandoned a plan to build a new liner, while the Cunard Line considers it cannot afford to replace the *Queens* without some measure of Government support. State subsidies to international airlines, direct or indirect, as in low airport charges and cheap capital, tend to make life impossible for private enterprise in the passenger field, as the chairman of P & O recently pointed out. "Assuming a continuation of present national policies in the air and by sea", said Sir Donald Anderson, "one can only foresee a diminishing sphere for passenger ships run as a commercial venture". Even so, his group is in the course of a massive investment in Pacific passenger services, coupled with cruising.

If shipowners were not optimists, with great faith in the future, it is doubtful whether they would risk such large investments in what must always be something of a risky business. In due course the tide will change and shipping will again prosper. But it is too early to be sure that the slight breeze which has begun to stir the sails is the wind of change which will blow shipping out of the shallows into deep water again.

How Much in Stock?

BY A CORRESPONDENT

Changes in the level of stock are one of the largest, most sharply fluctuating, and most baffling variables anyone encounters in trying to interpret statistical measurements of the behaviour of the national economy: they also present every businessman down to the microcosm of the shop round the corner with a recurrent problem of practical management. It is difficult to be fully convinced by many of the rules of thumb that are used in different businesses to supplement day-to-day judgment of what stocks to hold. Yet rules, one feels, there ought to be. Operational researchers —whose business is largely the development, with advanced mathematical techniques, of sound rules to supplement managers' hunches—are now offering some suggestions that may help small business as well as big. Their mathematics may involve recourse to a computer: but with this service now widely available on hire, the small business need find nothing daunting in that.

STOCKS of raw materials and fuel, work in progress and finished products in this country add up to about six months' national income. Manufacturing industry holds half of this, wholesale and retail distribution a quarter, and agriculture and forestry half the remainder. The total remains remarkably steady, any quarterly seasonal fluctuation being only of the order of 1 per cent, and no yearly change since 1951 has exceeded 5 per cent. Even these changes, however, have on occasion been large enough in absolute terms to swamp the balance of payments surplus or to tip internal stability into inflation. Nevertheless, there are reasons for believing that speculation does not play a proportionately important role, and that most stocks are held because they are needed for getting on with the job. If then it is possible to work effectively with smaller stocks—as a lot of businessmen have come to suspect in recent years—there should be plenty of room for savings in the present commitment of over £8,000 million.

There must be hardly a commercial or industrial organisation that does not hold stocks of some sort, but in very few cases is it the main concern of the enterprise. The demands of production usually take first place and most of managements' attention. Any attempt to re-examine traditional stock-keeping rules of thumb may be met with impatience from production managers, supported by the fact that the number of different articles usually runs to four figures and often to five, so that the task of establishing the optimum safety margins and order quantities scientifically can be a gigantic one.

Stock control is often thought of as the creation on documents of a mirror-image of the physical situation and movements of stock. Each item is coded to avoid confusion, and a separate record is kept of it, with receipts added to, and despatches or usage deducted from, a starting figure, so that the final balance represents stock in hand. This "control" is now practised by most large companies; it should perhaps be called merely "stock recording." Apart from checking that stocks are what they ought to be—and setting on foot inquiries into the inevitable discrepancies—the principal use of such stock recording is to make re-ordering a matter of routine. Whenever the balance falls below a predetermined level, an order of a predetermined quantity may be placed. This is the "two bin" system. Alternatively (by the "constant order interval" system) an order may be placed at regular intervals to make up the balance to a predetermined "maximum stock." These procedures are now followed by most large companies in the case of all run-of-the-mill stock items. But they simply raise two sixty-four dollar questions: how do you decide what the order level and what the order quantity should be? This is where operational research finds one of its most simple (though the term is relative) and satisfactory fields of application.

THE order quantity must not be too large (or the interval too long), or stocks will be too high. It must not be too low, or the "procurement" costs of repeatedly ordering, receiving, inspecting and paying for small quantities will be too high and quantity discounts may be missed. These costs of procurement fall, per unit of turnover, as the size of order rises, but against this the costs of holding a bigger stock are higher. A balance has to be struck between the two sorts of cost. How? The answer lies in a simple formula, which has come to be known as the square-root formula; this gives the optimum quantity to order and shows that, for given unit costs of procurement and stockholding, this optimum varies in proportion to the square root of turnover. (This implies, incidentally, that holdings of stock should show important economies of scale.) A simplified example, applied to a notional firm is worked out above.

The snag here is that of measuring the costs of procurement and stockholding. The difficulty is probably greater with stockholding costs, not only because whether a warehouse is full or not may make the cost of space for any given unit of stock large or nil, but also because few businessmen are clear what rate of return they want on capital locked up in stocks. If the risk of deterioration or loss of value is small, should it be only a little above the cost of borrowing—say 6 per cent—or should it be what they would require on a fixed investment project —say 15 per cent? To quote a recent article in the *Journal of Industrial Economics*:

> The emphasis of many companies on a quick rate of stockturn even at the cost of much hand-to-mouth buying can be shown to imply that they are requiring a much higher rate of return on capital invested in stocks than would seem to be warranted by the risks involved.

Certainly attention has long been concentrated on the rate of stockturn as an index of efficiency rather than on minimising total costs.

How much to order at a time is one thing; when to order it is another. Determining the optimum re-order level is a matter of balancing stockholding cost, not against procurement cost but against the cost of the risk of being out of stock. This field is clearly one for the statistician using probability theory; though even after he has worked out his answers (possibly using a computer to simulate the application of various rules to actual data), it must generally be left to management to make a subjective judgment about what the cost of becoming out of stock really is. Still, if they can be told that their present levels of stock reduce the risk of being out of stock to once in ten thousand years, they may be convinced that some savings are possible.

Pioneers in these applications were in the United States: Bell Telephone and Westinghouse, prominent among these, have reported some very large savings. In this country, ICI

THE RIGHT AMOUNT TO ORDER

The XYZ Company stock four products with greatly differing annual turnovers. They re-order every 6½ weeks. It costs them 10s. to place an order and they want a return of 16 per cent per year on the working capital they tie up in stock. So their total costs are as follows:

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
				Average	← COSTS →			
Product	Turnover p.a.	No. of orders p.a.	Standard order	Stock (ignoring carry-over or buffer)	Procurement (10s. × col. 3)	Stockholding (16% of col. 5)	Total	% of turnover
	£		£	£	£	£	£	
I	16	8	2	1	4	0·16	4·16	26
II	36	8	4½	2¼	4	0·36	4·36	12
III	400	8	50	25	4	4	8	2
IV	1,600	8	200	100	4	16	20	1¼
Total	**2,052**	**32**	**256½**	**128¼**	**16**	**20·52**	**36·52**	**1·8**

Then they apply the formula $Q = \sqrt{2AC.B}$, where

Q = the quantity they should order at a time
A = the cost of an order = (10s.)
B = the stockholding cost per annum = (16 per cent)
C = the annual turnover,

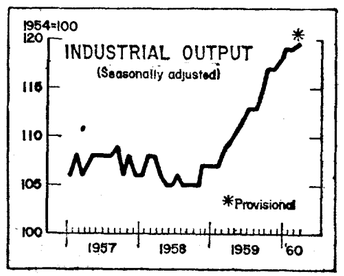
and get the following result:

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
I	16	1·6	10	5	0·8	0·8	1·6	10
II	36	2·4	15	7½	1·2	1·2	2·4	6·7
III	400	8·0	50	25	4·0	4·0	8·0	2
IV	1,600	16	100	50	8	8	16·0	1
Total	**2,052**	**28**	**175**	**87½**	**14**	**14**	**28**	**1·4**
Saving	—	***4***	—	***40¾***	***2***	***6·52***	***8·52***	—
Percentage	—	***12½***	—	***32***	***12½***	***32***	***23***	—

They reduce stocks by £40¾ or 32 per cent, orders placed by one in eight and their total costs by £8.52 or 23 per cent. The reader may care to try whether by further juggling with standard order quantities he can bring total costs still lower.

Central Purchasing Department has applied the techniques extensively, and a well known firm of management consultants is now exploring their potentialities in distribution. They require, as a precondition, an efficient system of stock recording, and they may need calculations on a computer, though this is not always necessary. Today, in any case, computer time can be readily hired in most business centres, which may help to bring them within reach of the firm of only medium size.

For really small firms, what is needed above all is a "do-it-yourself" kit, a simple explanation of the considerations behind these new "least-cost" approaches, and some principles from which an individual buyer can construct a new set of rules for his own situation, rules around which his *nous* can still come into play. Some ready reckoners, including one to tell him when it is worth stocking up to take advantage of better terms, would be extremely valuable. The Purchasing Officers Association has published some of the pioneer work in its journal, but has not yet really attempted to put these new methods over to its members. Operational research men are conscious of the need to "sell" their techniques to large-scale industry; can they not, with all reasonable statistical safeguards, popularise them in this way too for the ordinary citizen of business?



BUSINESS NOTES

THE ECONOMY

Is the Pace Moderating?

SINCE industrial output in Britain appears to have risen about 14 per cent over the last 16 months, one is naturally looking for signs that it is beginning to level out; even so, to interpret the latest statistics as a "production plateau" seems economically near-sighted. During most of last year, industrial production was rising by nearly 3 per cent in every quarter; it seems now to have risen by 2 per cent between the last quarter of 1959 and the first quarter of 1960 (as provisionally estimated). There have been apparent jerks or steps in this expansion (if only because unless output is rising at the rather fantastic rate of 12 points a year or more, there must always come some months in which the rounded index figure will not be higher than the previous month's). One cannot attach too much importance to short-term interpretation of such apparent halts and jerks in the growth of output—particularly as revision of the index is always liable to transfer them between months and iron out some of them altogether.

From the statistical record, therefore, it would be premature to infer that the inevitable levelling out, as capacity is taken up, stocks are rebuilt, or demand ceases rising as urgently, has begun. Restrictions on hire purchase may well moderate the pace of sales somewhat, as well as the increase in total debt; demand had already been slackening more than seasonally for certain kitchen appliances. New orders for machinery appear still to be gathering pace, but demand for heavy plant remains considerably more slack. On the side of output, production of the steel products most in demand must be close to capacity; the motor makers, though reporting steadily that they too are working to capacity, keep inching up their output, and may have room for quite a substantial increase in production of commercial vehicles providing that demand keeps up. There is no sign of any pick up in the rate of shipbuilding, and the National Coal Board is doggedly squeezing down its output of coal; but the boom has occurred without benefit of those industries so far, and they are hardly likely to exert much more depressing influence on the general level of production than hitherto. But there are one or two sectors of industry still relatively slack that might benefit from a shift in consumer demand away from durables—the food business, for example, has experienced some slight increase in business recently, but is by no means fully employed.

THE NEW SQUEEZE

"Deliberately Moderate"

IN banking circles and in the gilt-edged market second thoughts on the new credit measures have on the whole confirmed the initial impression, recorded in these columns last week: the principal characteristic of these restraints, in the words of the Chancellor of the Exchequer himself, is that they are "deliberately moderate." This being so, some bankers find it hard to understand why the authorities should have thought it necessary to invoke the entirely novel special-deposits type of control, which when first devised was supposed to be available to reinforce the accustomed market weapons of control and not to serve as substitute for them, implying that it would be used only when a strong effect was needed. Other bankers, even though equally disliking the principle of direct control over their liquidity, still regard this as preferable to a return to the "directive" control over advances.

Only experience of the actual operation of the new device can show whether this preference is a rational one. The greater the freedom left to the banks to sell gilt-edged—and even to do so in preference to cutting advances—the wider will be the difference between the two systems of direct control. But in fact it has been made quite clear that the target is advances; and if the possibility of making a further call for special deposits is used to coerce the banks into cutting advances rather than attempting to sell—this influence is almost bound to be present in some degree, even in the absence of any overt threat—the distinction will shrink into insignificance. The Chancellor suggested last week that the smallness of the initial calls—the 1 per cent of gross deposits for clearing banks, and ½ per cent for Scottish banks—and the length of the period for completing them up to June 15, would influence the banks "in the direction of moderating their advances rather than selling gilt-edged stocks." It is not easy to see the logic of this argument; and it is even harder to believe that in the long run what the banks do under this new system of control will be, in any real sense, "entirely up to decision by the banks concerned."

There is no doubt that all the banks will make real efforts to moderate the pace of their advances—a due slackening, rather than a halting or any rigid stabilisation, appears to be all that the authorities have in mind at present—but there is no reason to suppose that their restrictiveness must now be considerably sharpened. Doubtless the standards of "credit-worthiness" will be tightened a little for most types of borrowers; but, otherwise, the "small" customer is not likely to be significantly affected. The squeeze will most notably affect the big special projects, especially property finance, to which it has been applied for some weeks. Banks with instalment-type personal-loan schemes will presumably seek to operate them so that they conform, in principle, to the intention of the new terms for hire-purchase.

Reprieve for Gilt-edged?

THE fact that the banks may be faced with large demands by drawings on overdraft limits already granted and under special forward commitments, makes it impossible to be sure that the trend of outstanding advances will be radically altered in the near future. For that reason it is likewise impossible to be sure that the first call for special deposits, small though it is, may not involve some banks in further sales of gilt-edged. But this is a period in which seasonal factors are normally augmenting the supply of liquid assets; and there is some reason to believe, also, that the particular conditions ruling around the last make-up date caused the published statements to show an unrepresentative degree of tightness in several banks. If, however, some banks do find themselves under liquidity pressure before June 15th, it is generally assumed that the official desire for "smoothness" should ensure a readiness to stand behind the gilt-edged market. Any bank selling before that date, it is thought, would be accommodated.

These conclusions can, perhaps, reasonably be drawn from the very fact that the authorities thought it preferable to invoke the special deposits device rather than administer a further turn of the market screw, whether on the model of February 24th or by Bank rate. It is much less certain whether this same line of argument ought to be carried much further—to the point, in particular, at which the authorities are thought to have set their faces against any resumption of large-scale selling by the banks, and to have demonstrated, already, an intention to use special deposits as the means of enforcing such a wish.

NET GILT-EDGED PRICES

	Jan. 1	Feb. 25	April 28	April 29	May 4
Exchequer 3% 62/63	$96^{1}/_{8}$	$95^{3}/_{8}$	$94^{1}/_{4}$	$94^{3}/_{32}$	$94^{1}/_{4}$
Savings 3% 65/75	$75^{13}/_{16}$	$74^{1}/_{2}$	$72^{1}/_{4}$	$72^{11}/_{16}$	$73^{7}/_{32}$
Conversion 5% 1971	—	$96^{15}/_{16}$	$94^{15}/_{16}$	95	$95^{1}/_{32}$
Conversion 5½% 1974	$101^{3}/_{16}$	$98^{29}/_{32}$	$96^{1}/_{2}$	$96^{3}/_{4}$	$96^{7}/_{8}$
Br. Transport 3½% 78/88	$67^{9}/_{32}$	$65^{1}/_{8}$	$63^{1}/_{4}$	$63^{1}/_{2}$	$64^{5}/_{32}$
Treasury 5% 86/89	$96^{3}/_{16}$	$93^{3}/_{8}$	$91^{1}/_{32}$	$91^{1}/_{16}$	$91^{3}/_{32}$
War Loan 3½%	$65^{1}/_{32}$	$62^{1}/_{4}$	$61^{13}/_{32}$	$61^{29}/_{32}$	$62^{13}/_{16}$
Consols. 2½%	$49^{3}/_{4}$	$47^{3}/_{4}$	$46^{5}/_{16}$	$46^{11}/_{16}$	$49^{3}/_{32}$

The gilt-edged market, in the first four business days of the new régime, seemed to be making that larger assumption. At all events, the knowledge that the authorities had turned to this form of control and had rejected any further use of interest rates abruptly dispelled the prevailing gloom. Substantial rises have been general throughout the list. The medium dates which the banks had previously sold were quick to move, but they have since been matched by longer stocks. War Loan gained ⅜-½ point on each of three successive days—though mild disappointment over the gold figures slowed the pace down on Wednesday.

Not So Happy

EQUITY prices were marked up in immediate response to the announcement of the credit restrictions, just as many dealers had expected them to be once the feeling of uncertainty had been allayed. Hire purchase shares which took a bad knock since the beginning of the year went up; rather more surprisingly so did motor shares. One measure of the market's relief that some action had finally been taken is that on Friday the *Financial Times* ordinary index gained 5.2 points to 310.6. But in the next three days' trading all these gains were lost and on Wednesday the *Financial Times* at 298.9 was at its lowest point for the year so far. *The Economist* indicator at 335.6, compared with 341.0 a week earlier, also fell to a new low.

Clearly the malaise in the industrial market in the last few weeks was not due just to uncertainty about the actions that the Government might take. Nor is it now due simply to uncertainty about what further action the Government may be forced to take later. It is rather that the high yields on gilt-edged stocks have at last been recognised as offering positive counter attractions. The institutions, having bought equities early in the bull market, certainly have no wish to start unloading. But at present prices and with prospective new calls from industrial borrowers facing them there is no urgent reason for them to buy more. The thinness of the market, whether it is moving up or down, suggests that private investors are making the running. A good deal has been made of the fact that prices both in Wall Street and Throgmorton Street have fallen by more than 10 per cent since the beginning of the year. According to the creed of the chartists this is the bear market signal. There have been a number of gloomy prognostications that the London market still has a good way to fall before the bottom is reached and these have had so powerful an influence that prices continued to fall in London even though Wall Street rallied sharply after the Dow Jones average dipped below 600.

Not Too Irksome

FOR months past the chairmen of many leading finance houses have condemned the trend in hire purchase business towards smaller deposits and longer periods of repayments. Some of them went so far as to suggest that they would welcome some hire purchase controls, so long as they were gentle ones, and now many of them have openly admitted that the new restrictions of a 20 per cent down payment and a two-year repayment period for many consumer goods do not displease them. Many finance houses have insisted that these in fact were the normal minimum terms—especially on cars, which make up the major part of their business. They are not likely to shed many tears if some of their smaller and speculative rivals are squeezed out of business and they are less concerned about the effects of the restrictions on their business than they are about the effect that the call of special deposits will have upon their ability to borrow from the clearing banks. They do not expect their present advances to be cut.

If the Easter holiday is taken into consideration, the April figures of hire purchase business in motor vehicles show virtually no falling off from the record levels in March. Contracts for new cars were 19,668, against 20,316 in March and 15,851 a year ago. For secondhand cars contracts totalled 79,992, against 82,803 in March, and were 3,804 higher than in April, 1959. Greater business in new and used motor cycles and scooters and the large demand at this time of the year for caravans brought the total number of contracts for April up to 173,681. This was only slightly below the peak of 175,401 in March and was about 5 per cent higher than for the same period last year. Any immediate effect that the restrictions may have upon this sector of the HP business will not be seen for another month, but they may not be swingeing.

FOREIGN EXCHANGES

A Fair Gold Influx

APRIL marks the season of the year when the sterling area's earnings of foreign currencies should be at or near their peak and the gold and convertible currency reserve figure for the end of that month has duly deferred to convention by showing an increase of £18 million to £1,011 million. The usual IMF repayment of £5 million was made last month and in addition £5 million was transferred to former EPU creditors under bilateral agreements. The current trading surplus would, therefore, seem to have reached a fairly satisfactory £28 million.

The latest movement confirms the trend of sterling in the foreign exchange market and in particular its fairly persistent strength against US dollars. The first four days of last week witnessed a considerable but temporary reversal of this trend and there was some appreciable selling of sterling, reflecting apparently the uncertainties of the measures that were to be taken to restrict credit. For three days up to Thursday last week the Exchange Equalisation Account probably had to intervene in the market and give some support to sterling. By the end of the week, however, the previous tendency had re-established itself and sterling, which had dipped to $2.80\frac{3}{4}$ has since recovered to $2.80\frac{5}{8}$.

The reassuring impact on the exchanges of the introduction of special deposits and hire purchase credit controls has been reinforced this week by a further decline in the New York Treasury bill rate, which following the latest issue is now down to an average rate of just over 3 per cent. Forward rates for sterling in terms of dollars have, as usual, been extremely sluggish in adapting themselves to the margin between comparable interest rates in the two centres. As a result, there has been a differential this week of about 11/16 per cent in favour of moving funds to London and investing them in Treasury bills with the forward exchange covered. A certain amount of short money is still making its way to this market on these terms.

This movement helps to account for the weakness of the dollar not only in terms of sterling but also of most European currencies. The dollar has for some time past been at its lowest permissible range of fluctuation in Germany, the Netherlands and Italy. In France it has only been held barely above the floor by persistent intervention on the part of the Bank of France, which in the course of these operations has continued to add to its gold and convertible currency reserve. Security sterling has been somewhat weaker this week, falling to $2.76\frac{7}{8}$. This reflects American selling of sterling securities which has had to be absorbed by the London Stock Exchange and which has caused distinct weakness among some of the American favourites.

STEEL

Hedging Export Bets

IT is not at all easy to know what "the trade balance" for any single commodity is supposed to mean, to any country that trades in more than one: the British Iron and Steel Federation's calculation that exports of British steel more than pay for our marginal and specialised imports of steel and for our very large imports of steel-making materials is diverting, but its implications are not obvious. The federation, in its current *Steel Review*, adds to this figuring estimates of the value of the steel embodied in exports by Britain's metal-using exports and of the foreign steel in the vehicles, plant and machinery that we import, and concludes that "the steel industry's contribution to the country's overseas earnings has been between two and three times as great as her overseas payments." This mercantilist rhetorical flourish may suit the federation's advertising; its relevance is more doubtful in the review's sober analysis of the way in which British industry has been suiting its exports to a growing world trade in which engineering exports have shown a great relative growth in importance while those of textiles have declined. The federation notes that the same period has seen the dwindling of Britain's exports of coal. It might be reminded that in the early fifties, before it acquired larger things to worry about, the National Coal Board sometimes rationalised that decline by pointing to the vast surge of other exports which, by supplying some warmth or energy, it had made possible—though the board never got as far as calculating the "coal content of energy-using exports."

The shift in trade towards more highly processed manufactures of steel has in fact considerably reduced the relative importance of Britain's direct steel exports: these represented no more than 18 per cent of ingot production last year, whereas 30 years before they accounted for more than 40 per cent. The actual tonnages exported have not fallen much—in 1957, indeed, the "ingot equivalent" tonnage was almost as high as 1957; but the change has occasioned much questioning, during the postwar period, of future prospects for world trade in steel and Britain's share of it. In the industry's most recent "five year plan" published in 1957, it took a more optimistic view than immediately after the war, and the Iron and Steel Board guessed that there might be opportunities to increase exports to the equivalent of 5 million ingot tons by 1962.

In fact, exports fell back after the postwar peak achieved in the year that plan was published; last year's shipments, some 3.2 million tons of finished steel, were reckoned as the equivalent of 3.71 million ingot tons. The federation this week reckons that over the next five years British direct exports might achieve an increase of perhaps $5\frac{1}{2}$ per cent a year. Such a rate of increase would take these exports by 1965 to no more than the total earlier forecast for 1962; the federation seems to have a different "product mix" of exports in mind, as well as being less optimistic now than the board was two years ago.

Machine Tool Orders

Feb...	46·5	17·6	64·1	8·2

Orderbooks have been lengthening throughout British engineering: in February the index of orders on hand had risen to 96 (January, 1958 = 100) against 88 a year before. The machine tool industry, which is benefiting considerably from investment by the motor industry, has now eight months' work on its books.

Expansion—More and Less

ENGLISH STEEL this week made public a significant alteration in the order of expansion that it had planned for its steelworks at Tinsley Park, Sheffield. It intends to replace the billet mills at the River Don and Stevenson Road works, which are more than 40 years old, by a new blooming mill and two 32-inch billet mills, which will increase the mills' capacity for rolling alloy and special carbon steel billets by 250,000 tons a year; and to put in new bar rolling mills at the River Don works, to take another 60,000 tons of steel a year. It will provide the extra steel for these from three new 100-ton electric melting furnaces; this will bring the group's total melting capacity for alloy and special carbon steels to close on a million ingot tons a year.

This scheme will cost £26 million, and is planned to be in full operation by 1963. It appears to be taking the place of a £15 million scheme approved in early 1956 which was then also scheduled to be ready by 1963, for increasing steel melting capacity, casting capacity, and heavy forging capacity—the last with a new press that would have been one of the largest in Europe. The company says that these proposals have now been deferred. This decision reflects revised judgments of future demand for very heavy forgings (and castings?) over the next few years, from one of the few producers in Britain of the heaviest of metal structures by both of these processes. A few years ago the supply of super-heavy castings, in particular, was looked on as one of the possible bottlenecks in the expansion of investment in heavy plant in this country. But the shift to fabrication of steel structures, even the heaviest, and the slackening of demand from certain major customers, such as the shipbuilders, appears to have left such specialised facilities, even during an apparent increase in fixed investment as a whole, relatively lightly employed.

SHIPPING MANAGEMENT

Orient and Pacific

HAVING bought out the minority shareholdings in the Orient line, the P & O Group has wasted no time in announcing its plans to integrate management of the two shipping lines that have been offering co-ordinated services to the Orient and the Pacific for so many years. The two shipping companies will remain in being, and retain their distinctive flags and markings; the P & O company will provide various central services, mainly concerned with accounting, to operational companies in the group, but Orient will have no executive functions. Operational control, however, will be handed over to two new companies in the group—P & O-Orient Lines Passenger Services, and P & O-Orient Management.

The passenger services company will be responsible for selling all passenger space, for programming the ships of the two fleets, and for settling their employment; it will be remembered that the *Oriana* and the *Canberra*, the fleets' two newest and largest acquisitions, are being planned for shifting between different routes according to the advantages of the season. The new management company will be responsible for actually running the passenger ships, and also for all the operations of the group's tankers and cargo ships throughout the world, as well as maintenance and general administration of the combined fleets.

This integration has made redundant about 150 staff in P & O's London organisation (into which the London offices of Orient may be merged) about two-thirds of them young women "quickly able to secure similar posts in the City." Generous compensation terms have been offered and accepted. A similar integration of management and staff is taking place in Australia. Financial savings, said Sir Donald Anderson this week, should be material.

FUEL

Unseasonable Winter

THOUGH average temperatures this year have so far been almost precisely the same as in the early months of 1959, those of the last two months of 1959 were somewhat higher even than at the beginning of the "coal winter" of 1958-59—which had itself, to the despondent coal industry, seemed unseasonably warm. During this coal winter, reckoned to run from the beginning of November to end of April, Britain will probably have used about a million tons more coal—say 2 per cent more—than in the previous one. Even allowing for the higher temperatures over a third of the period, that increase in consumption is little enough for an economy turning out 5-6 per cent more goods and services and probably 10 per cent more industrial products.

Figures of oil deliveries are not available as quickly as those for coal consumption; but in the first four months of the fuel winter as defined above deliveries of petroleum products for inland fuel con-

Wind of Small Change

PERHAPS the most convincing argument for adoption of the decimal system of coinage by Britain is that everyone else is doing it: the rush to count in tens has now reached the Commonwealth, the last bastion of those who favour twelves and twenties (which are easily divisible by more factors). Other reasons advanced for the change are that monetary and accounting machines are at present held back from sterling countries by their decimal makers (because the complex adjustments would not be worth the probable sales); that money sums would be easier; and that teaching time would be saved in schools. As a result, most people want decimalisation but, to judge from the latest report* on the subject, no one wants it very badly. The report, based on fairly extensive evidence from industry and commerce, concludes that there is a strong case for the change, but admits that no one who was asked expressed any great dissatisfaction with the present system.

The scientific and commercial committees that prepared the report try, but fail, to assess the problem in monetary terms: the proportion of machine conversion and replacement costs that they have been able to work out amounts to £128 million, and the only sensible thing that can be said about the value of the long-term benefits is that they would "be spread in varying degree over the whole population, and would be perpetual."

There is a second, more serious, unresolved problem. The report agrees that there is an "overwhelming wish" to retain the pound as the main unit, but is led by the logic of decimalisation to see that if another main unit were acceptable the ten-shilling/cent system would be best. Keeping the pound would probably mean going to three places of decimals (i.e., making a thousand of the smallest units equal to the new highest unit of currency), or having fractions of cents, complications that would make the change less valuable and the small change non-decimal. Of 145 countries and territories in the world which have decimal money, 138 go down only to a hundredth of the basic unit (the other seven are in the Middle East); and of the 48 members of the International Monetary Fund only four have their highest money units worth £1 sterling and only one, Egypt, worth more.

THE second half of the report, dealing with the metric system of weights and measures, does not propose a complete change-over from pounds and inches to kilograms and metres. Such a change would be very expensive. Engineering equipment using lb-inch measures is more widely spread throughout the world than metric equipment: and this slight deterrent to easier calculation is not based on British tradition alone, but enjoys American support. Scientific equipment and measurement is almost universally metric, but Denmark, Germany, Holland, Sweden and other countries use inches and pounds in goods they want to sell to the United States, Britain, or Commonwealth countries. International air navigation has developed on inch-pound units. A complete change is something that could come only in the very long run.

But rationalisation of the Imperial system of weights and measures (desired as a second best alternative by the Hodgson Report of 1951) comprises the most practical set of proposals in the report. It is suggested that the apothecaries', troy and pennyweight systems be removed from school curricula; that the use of the cental (100 lb) and the short ton (2,000 lb) in place of the long ton (2,240 lb) and the hundredweight (112 lb) be encouraged; that the rod, pole, and perch be buried (they are already dead); that decimal fractions of the inch should be used more and vulgar fractions less. These are comparatively minor changes which could sensibly be carried out: but the fact that legislation would probably be needed to spread the use of decimals in weights and measures in a country where such use is not generally illegal is indicative of the lukewarm attitude towards any change.

* Decimal Coinage and the Metric System: Should Britain Change? British Association for the Advancement of Science and the Association of British Chambers of Commerce committees. Butterworths Scientific Publications. 7s. 6d.

sumption appear to have risen by nearly 2 million tons, or 20 per cent. An increase of say 4 million tons in the total "coal equivalent" consumed in those four months would suggest that the economy was using perhaps 6 per cent more fuel in delivering its 10 per cent or more of extra industrial output, which would not be out of line with the run of experience. But oil, clearly, is still getting the lion's share of the increase. Factors such as oil consumption in power stations, which was 130,000 tons up in January against an increase of only about 30,000 tons in their coal consumption, and in central heating, where oil consumption has more than doubled since 1956, are accounting for large shares of the extra demand.

Oil consumption at the power stations is still rising, as more of the stations equipped to take it are fully run in. There have been substantial cuts in the programme of oil supplies that was decided on in 1956 when the National Coal Board was unready to guarantee all the fuel the power stations expected to need by the mid-sixties and the electricity supply industry was denied the alternative of importing American coal.

By 1965 the total oil used annually, say 5 million tons a year, will be considerably below what was originally planned. But it will rise above that level in the meantime. These oil contracts are for the supply of specific power stations, coming in on peak load and almost round-the-clock utilisation. It is only after their first few years' work, as they are relegated to rather less continuous running by the normal process of despatching load to the newer power stations with the lowest running costs, that their station load factors, and their annual fuel consumption, will decline in the ordinary course of things. Ministers have talked again this year of further discussions about the future of these contracts—to meet which considerable investment has been carried out by the Central Electricity Generating Board and particular facilities have been installed by the oil companies; but there has been no announcement of further reductions.

ALUMINIUM

Impalco Expands

When the American Reynolds Metals Company and its partner Tube Investments won control of British Aluminium they set off a chain reaction which has not yet died down. Thwarted of a big stake in British Aluminium, Aluminum Company of America (Alcoa) afterwards teamed up with Imperial Chemical Industries to form Imperial Aluminium, which took over ICI's fabricating plant in South Wales at a value believed to be about £10 million. Then Kaiser Aluminum, the third largest producer in the United States, formed jointly with the Delta Metal Company a new £10 million concern, James Booth Aluminium, into which the British company put its aluminium and light alloy interests for about £5 million, and Kaiser contributed another £5 million for the re-equipment and expansion of the plant.

Recently Imperial Aluminium took over the Invicta Foil company and the rigid aluminium foil division of the Prestige Group, and this week ICI announced a bigger step forward—the acquisition, on Impalco's behalf, of control of Almin, the parent company of Associated Light Metal Industries. This group, said ICI, with assets of about £5 million, and covering a wide range of light metals technology, especially in aluminium, and including secondary metal and finished products makes a "notable addition" to the venture. With Aluminium Limited, the Canadian company, represented here by its fabricating subsidiary, Northern Aluminium, all four of the major North American companies have a stake in the British market. Bigness is not everything, but American capital and particularly know-how can contribute a good deal to the expansion and improvement of the British industry, and consumers ought to benefit from this competition of the giants.

TRACTORS

More Too

Ford has announced that a new tractor factory costing £10 million will be the next stage in its plans to expand in the region around its existing plant at Dagenham. The factory will be at Basildon new town, 20 miles from Ford's main plant; Ford states that the 3,500 workers needed will come from the staff of its existing tractor plant. The space freed at Dagenham will be used to provide extra capacity for machining and other operations involved in making car engines and transmissions. The move thus forms part of the Ford scheme to make Dagenham the centre for this engineering production, which will need expansion to match the increased body-building and assembly facilities on Merseyside. Some increase in the labour force at Dagenham would seem necessary if the existing tractor staff is to go to Basildon; no doubt this forms part of the bargain that Ford has made with the Board of Trade, which was originally reluctant to see additional demands for labour in the area.

The new factory at Basildon will add about 15 per cent to Ford's present capacity for tractor production, and allow space for further expansion if needed; it will also allow the company to concentrate its present scattered facilities for making tractors. Ford is now making up to 360 tractors a day, which exceeds the output of the other big British maker, Massey-Ferguson; Ford production was ahead during most of last year too. Massey-Ferguson is believed to be making about 270 completed tractors a day at present, though it also produces parts, counted as "tractor units," for assembly abroad: if these are added to its completed tractors, the gap between its production and that of Ford becomes smaller. Massey-Ferguson claims, however, that with its factories in the USA and France it remains the largest tractor maker in the world.

All British manufacturers of tractors have enjoyed boom conditions for the past year, thanks chiefly to buoyant export demand. Production last year was nearly 15 per cent higher than in 1958, while exports, which took 74 per cent of output were up 23 per cent; in the first quarter of this year exports were no less than 50 per cent higher than a year before. The United States, Australasia, and Scandinavia showed the biggest increase in demand for tractors from Britain. But west German imports are also expanding, because that country's tractor industry is not as strong as its motor industry: in the first quarter of this year its purchases from Britain were half as much again as a year before.

FILMS

A Shortage of Product

The world wide fall in cinema going has for some considerable time been bringing about a steady reduction in the number of films being made. New second features are now a good deal less common, and though many British cinemas, where double-feature programmes have remained the rule longer than in any other country, are now making up their programmes by running several "shorts" with the main film, the number of short films actually available to the British exhibitor has declined even more rapidly in the last ten years than the number of features. Just recently, this decline in film making has become an actual shortage of feature films, either good or bad. Cinemas outside the three main circuits have suffered particularly, but the dearth is general and new first features are nowadays going into general release within a week or so of their first showing in the trade's West End "shop windows."

This is primarily due to the drastic cut in production plans in Hollywood, which occurred long before the scriptwriters' and actors' strike stopped work altogether at the principal studios some weeks ago. Compared with the thirty or so big pictures a year they were each making a few years ago, the major Hollywood studios had been reckoning on making only about ten apiece this year. Independent producers, who are taking over a bigger share of American production, cannot hope to make more than a few films in a year, and in any case the growing trend towards "colossals" means concentrating expenditure on to longer films rather than upon more of them.

British feature production, on the other hand, has been keeping its end up—assisted considerably by the practice of American major companies and independents of making American films outside the United States, to cut labour costs, assist some stars'

The Statue of Liberty

Five minutes' walk

FROM THE MONUMENT

Five minutes' walk from the Monument of London could take you inside The Hongkong and Shanghai Banking Corporation . . . and, *for business purposes*, inside America. The same walk could take you inside the other territories where we are established. We can provide you with up-to-date credit information and advise you on many other aspects of business with the Far East. As the largest British bank established by the Far East for the Far East, with branches in 20 countries and a network of agencies in all other principal trading centres, we are in a unique position to help you.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

For the man who really cares

The elegant styling of the Riley 4/Sixty Eight makes it one of the most modern cars today. But it's shaped for more than looks. Driving the 4/Sixty Eight is a very satisfying motoring experience, with ample power for safe overtaking and effortless fast cruising. This fine car is designed for the motorist's delight. Polished walnut veneer fascia and door cappings—real leather upholstery—deep pile carpets, are refinements you expect to find in more expensive cars, yet you get them all in the Riley 4/Sixty Eight at a surprisingly low cost. Before you decide on that new car try the Riley 4/Sixty Eight, a car you'll be proud to own year after year.

Ask your nearest Riley Dealer for a demonstration.

Price: **£725**
plus £303.4.2 P.T.
Duotone colours extra.

Every Riley carries a Twelve Months' Warranty backed by Europe's most comprehensive Service—B.M.C.

Riley 4 SIXTY EIGHT

FOR MAGNIFICENT MOTORING

RILEY MOTORS LTD., *Sales Division*, COWLEY, OXFORD.
London Showrooms: 8-10 North Audley Street, Grosvenor Square, W.1.
Overseas Division: Nuffield Exports Ltd., Oxford and 41/46 Piccadilly, W.1.

For the motorist who wants big performance in a four seater saloon, the lively compact Riley One-Point-Five is the answer. Long stride cruising in the 80's. Sparkling acceleration. Luxurious appointments.
Price: £576 *plus £240.14.2 P.T.*

and directors' tax situations, and satisfy quota regulations. Since 1955, Board of Trade registrations of "British-made" features, of 3,000 ft. or more in length, have numbered about 120 a year, while the number of foreign films registered by the Board has declined from nearly 400 to close on 300 a year. Cinema owners have now achieved the abolition of entertainments duty; and lately the fall in average box-office takings seems, for the moment at least, to be levelling off. Their new worry, now, appears to be that of getting enough first features to fill their regular schedules.

ASSISTANCE TO INDUSTRY

Mounting Up

SHORTLY after the new Local Employment Act came into force last month, the Government issued the final score of the amount of assistance given to private firms under the Distribution of Industry (Industrial Finance) Act, 1958. This measure and the two earlier Distribution of Industry Acts are now repealed. During the twenty months in which the 1958 Act was in operation the Treasury provided just over £9 million to 165 companies in places with "high persistent unemployment": nearly all of it, apart from £78,000 in grants, was in loans. This was a much higher rate of assistance than under the 1945 and 1950 Acts, whereby about £10 million was lent during thirteen years to 84 firms in the (now defunct) development areas.

But throughout this whole period, from the passing of the 1945 Act to last March, the Government was also building factories in the development areas for letting to private firms, mostly at subsidised rents. Up to March, 1959, another £73 million was spent in this way. Under the present Act the Government will still be able to build factories, in the new "development districts." But it has now got the additional power to make capital grants to industrialists who choose to put up their own, on the argument that such grants may stimulate more construction for the same outlay of public funds. Whether this will be so remains to be discovered. Moreover, its power to make loans to firms in these development districts is not now restricted to cases where borrowers cannot obtain the money from ordinary commercial sources.

PACKET SOUPS

Not Too Many Cooks

A FEW weeks ago Heinz entered the £5 million market for packet soup by selling at large introductory discounts to retailers in Scotland. Since the Scots, with a tenth of Britain's population, buy a fifth of the soup sold, this was the logical place to start. Heinz's discounts have meant that 1s. 6d. packets are selling for 1s. 1d. and less, against 1s. 4d. paid for the established brands, like Knorr-Swiss, which has 60 per cent of the business in its hands. Anglo-Swiss Foods, who produce Knorr-Swiss soups, is not unhappy about this: its general manager, Mr H. J. Lavers, said in January that his company could not support the market alone, and that a really aggressive competitor was needed.

Heinz is not the only new competitor Knorr-Swiss has to face. Batchelor, a Unilever subsidiary, controls about a fifth of the market; Nestlé has Maggi; Eto, well known on the Continent, has recently ended its 18-months' test marketing and "gone national"; the French brand of Dulfrance is being tentatively marketed. And everybody in the trade is waiting to see what Campbells (which have a packet soup subsidiary on the Continent) will do.

For it is Campbells that indirectly has caused the emphasis in the battle for sales of packet soups to swing from a question of price to one of quality. Ordinary canned soups are not always superior to the dehydrated packet soups when they reach the plate, and the housewife must carry home several pounds of metal and liquid for a week's supply. Packet soups weigh about 3 oz, and enough for six people can be popped into the purse or pocket of the buyer. That has always been the main strength of the packet soups. But Campbells, followed by Heinz, has introduced condensed soups, and cut the advantage by half—most cans of condensed soups weigh only 8 oz, and an equal volume of water is added to them.

Five times as much soup is sold in cans as in packets, despite the convenience of the lighter package: makers are hoping that by improving the quality of the dehydrated product and using the sales strength of the bigger companies in the market they can prevent the disparity from growing any wider. They are also trying to sell much more to caterers.

TIN MARKET

Nearer to Normal

EVER since the International Tin Council first restricted exports in December, 1957, it has given the manager of the buffer stock authority to buy and sell in the middle bracket of the price range, that is between £780 and £830 a ton. That authority seemed prudent when exports were severely restricted, to avoid the possibility of a sharp rise in prices. Normally the manager cannot sell unless the price goes above £830 and cannot buy unless it falls below £780. Since the beginning of this year export control has been greatly relaxed, yet the manager has continued to operate, keeping prices artificially stable within a narrow range of £785-£795 a ton. Merchants and dealers on the London and New York markets have become increasingly critical of this interference, which was never the intention of the scheme.

At its meeting in London this week the council decided to withdraw the manager's authority on July 1st, when the new quarterly control period begins. In the first quarter the manager was disposing of the British Government's stock, and without that authority he could not have done so unless prices went above £830 a ton. There has also been the fear, which seems much exaggerated, that tin had to be kept below £800 a ton to preserve the United States "benevolent neutrality" towards the scheme. Withdrawal now is sensible, and has the added virtue of restoring normality before negotiations on a new agreement start in New York later this month. The impact on the market should not be great. While the manager was keeping prices stable consumers may have bought less metal forward than usual, and it will be interesting to see how easily any consequential increase in buying is absorbed. On Thursday morning three months' tin closed at £787 a ton, showing a slight rise on the week, with the premium for cash metal narrowing to £4.

The council decided to restrict exports in the third quarter to the current rate of 37,500 tons and, anticipating some improvement in supplies from Bolivia, it expects actual exports to be about 36,300 tons, or 1,000 tons more than it expects in the second quarter. The council also made the annual re-distribution of one-twentieth of the producers' total votes, and therefore of the individual countries' share of exports, thus helping requirements to be supplied from the most economic source. Bolivia's share was slightly reduced, and the shares of other countries increased.

URBAN MOTORWAYS

An Inner Ring for London?

WHEN the Nugent Committee on the London road system reported last year it was rather cold to the immediate idea of constructing ring roads in London for many valid reasons besides their enormous cost. But it did suggest that the possibility of building new roads over or alongside railway lines merited further study. The more modest of the two-road programmes that it suggested has since been adopted by the London County Council. But the roads lobby has not abandoned its own preference for ring roads of the urban motorway style. Indeed, the British Road Federation has now come up with the claim that it would be possible to construct a six-lane inner ring motorway over or alongside existing railway track for almost its entire length.

It has selected a 25-mile route somewhat further out from the centre of London than the line of the "A" ring road proposed earlier, but nowhere more than a mile away. For half its length this ring road would almost coincide with the north and west cross routes proposed by the Nugent Committee and only five miles, apart from the

Thames crossings, would be separated from railway lines. Provided that there are no serious technical objections to operating trains under such long stretches of road viaduct, the Federation's scheme has the immediate attractions of being somewhat less costly to build and involving possibly less extensive property redevelopment than any previous proposal for a ring road. Its sponsors claim that it would cost "some £83½ million" against the £150 million that the 11-mile "A" ring road would now cost. A further £9 million would be needed for four radial motorways (to connect with M1, A4, A12, and A40) that form an inherent part of the Federation's proposals.

More detailed studies would be necessary to test these estimates of cost and the scheme's technical feasibility. The number of interchange points, moreover, would directly affect both its cost and the amount of contiguous property that would have to be acquired, if M1 style junctions with feeder roads were used. No traffic studies exist to show whether this would in other ways be a good line for a ring road, or what economic benefit could be expected from it in comparison with the likely return from other road schemes, or whether in fact any ring road at all is the right answer. But all major road works of this kind, especially in built-up areas, are bound to represent some compromise between what is best from the point of view of traffic flow, cost of construction, and engineering. The Federation's proposal seems, at least on first inspection, to be rather more realistically framed than other schemes put up lately by the roads lobby: it certainly deserves serious study. But it hardly stands a chance of being taken up unless national investment in roads is considerably increased.

SOFTWOOD

Consumption Rising

Consumption of softwood in Britain has increased sharply this year. With the expansion of industrial and residential building—the official forecast is that well over 300,000 houses will be completed this year—apparent consumption of softwood reached 368,000 standards in the first quarter, 18 per cent more than a year ago. Anticipating good business, importers started buying exceptionally early this season, and in the six months ending March they ordered nearly 1½ million standards.

Something New in the Foundry

A foundry is about as traditional a kind of industrial establishment as one can find, largely because it was one of the first ever developed: apart from shell moulding, which only applies to small parts, basic methods of casting had until recently remained unchanged since man first began work in metal around 5000 BC. But of late the foundrymen have adopted one new trick, and an important one, which promises to make great changes in costs and efficiency. Instead of making the moulds and cores out of moist foundry sand—which has natural hard-setting properties, but which needs heating in an oven if used for large or complex castings—they have found a way of using ordinary clean, dry sand. One mixes it with a little sodium silicate—the water glass used to preserve eggs—makes the mould, and then blows carbon dioxide gas into the mould box, under a cover, to permeate the prepared sand. A chemical reaction between the gas and the sodium silicate solidifies and cements the sand, and the mould is ready for use.

This process seems to have been invented sixty years ago: it was patented indeed, by two British consulting chemical engineers named Hargreaves and Poulson in 1898. But they found so little interest in their invention that they concentrated their activities on the soap industry and abandoned their interest in casting. The technique disappeared until the nineteen-forties, when it was re-invented in Czechoslovakia by a Dr Petrzela; he took out a British patent, but allowed it to lapse in 1953. When the process finally began to be used in Britain, around 1955, attempts were made to revive this second patent. Imperial Chemical Industries bought the British rights—as supplier of chemicals that could be used in the process—and when the patent was eventually restored in 1959 it granted licences free of charge to any foundry that wished to use the process.

Advantages of the carbon dioxide process are many, both in reducing cost and improving quality; but the costing methods of the foundry industry are those of a craft industry, in which the men on the floor know best; accountants do not seem to have penetrated far into their mysteries. Despite conditions normally favouring conservatism, the use of the process has spread fast; 80 per cent of British foundries are now estimated to use it. The biggest cost saving probably comes from the elimination of baking the moulds and cores, which saves the fuel used and makes unnecessary the ovens and the cranes needed to move moulds into them. It also makes mould production far faster—an hour for a ten-ton mould compared with days before. This speeds up the tempo of production in the foundry, offering further indirect savings in cost. Moulds for small and simple parts do not need baking, so the process may not help on such work; but the cores which form the internal cavities of a casting always need baking. In foundries with a "jobbing load" of some large castings and many small moreover, tying up one's oven capacity often slowed work down: gas moulding obviates this. Casting of non-ferrous metals can also be made much cheaper by using the carbon dioxide process; it gives a better surface finish than most sand moulds and can replace the metal dies used in die-casting, cutting tooling costs, reducing the cost of changes in design and making production more flexible.

The improved surface quality of the castings produced by this process may give bigger cost advantages to users than to the founders. Greater dimensional accuracy, sometimes almost as good as that provided by shell moulding, means that less machining is needed; for this reason the British Motor Corporation has begun using the process on castings used for car engines. The moulds and cores, moreover, contain less water than conventional ones, so that there is less hydrogen released to contaminate the casting after the molten metal is poured and the water vaporises; and the sand is more permeable to escaping gases than that of normal moulds.

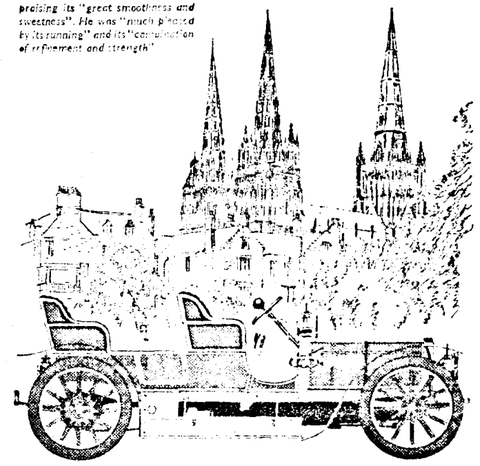
In the steel industry the process is being used to cast iron base plates and moulds into which molten steel is poured; base plates so produced have survived 350 pourings, though 75 is the normal maximum. The base plate is heavy and mounted in the floor, so changing it is an expensive operation. At the top of the ingot moulds carbon dioxide finds another application; it is used in the Swedish "Tiger Top" process to solidify feeder heads on the moulds, which reduce the wastage of steel from the casting. This process is already widely used abroad and has been successfully adopted by two British steelworks.

Some development troubles have been experienced in gas moulding in steel foundries; the most serious was the breakdown of cores caused by the expansion of the sand as the metal contracted. But recent experiments suggest that changes in the chemical composition of the sand should overcome this weakness. In general, the process seems to have produced remarkably few introductory troubles, though it has been found that different proportions of sodium silicate and carbon dioxide to sand are required for the different metals to be cast. Much of the development work needed has been done by ICI and Distillers; but the simplicity of the process has been one of its best salesmen.

Boving design and finish ensure ENDURING EFFICIENCY

This solid cast stainless steel runner for Scotland is an example of the high quality of finish to very fine limits which is a feature of Boving turbine runners of all types.

Constant research into design and production methods, backed by the latest advances in technology, maintain Boving Quality at the highest standard. High quality finish ensures high efficiency, increases reliability, and reduces costly outages.



Boving & CO LIMITED

VILLIERS HOUSE 41-47 STRAND LONDON WC2

THE 1906 25-30 h.p. AUSTIN

This finely-designed car had a good "press" on its debut, the correspondent of "The Autocar", for instance, praising its "great smoothness and sweetness". He was "much pleased by its running" and its "combination of refinement and strength"

1906 . . . a year of a General Election and the Workmen's Compensation Act . . . events that must have had their effects in peaceful Lichfield as elsewhere . . . Lichfield, where the 13th century cathedral must often have provided an apt setting for the imposing 1906 Austin . . . Lichfield, where today The Kenning Motor Group has a depot that provides a special kind of enthusiastic motoring service.

THE Kenning MOTOR GROUP

Head Office: Gladstone Buildings, Clay Cross, Derbyshire

KEN/4

DEPOTS THROUGHOUT THE COUNTRY

But shipments from northern ports have been delayed by a late winter, and stocks have fallen more sharply than usual ; at the end of March stocks of imported softwood stood at only 336,000 standards, one-fifth smaller than a year ago and the lowest level since timber control ended in 1952.

British purchases for the whole season might well reach 1.65 million standards, appreciably more than in 1958-59. Sweden, Finland and Russia have shared in the increase but Canada has not, mainly because it has a more profitable market in the United States, even though prices in the European market have gone up. When the Russians made their second offer this season they raised their prices by £3 to £7 a standard—with 7-inch unsorted redwoods costing £89 a standard cif—bringing them broadly into line with Scandinavian quotations. Since then Swedish prices have moved higher, and any further offer from Russia is expected to reflect that firmness. So far Russia has sold over 350,000 standards to Britain this year, rather more than in the whole of the 1958-59 season.

ELECTRIC LAMPS

The Cost of Light

THIS week's cut of a penny in the price of "coiled coil" electric lamp bulbs—from 1s. 9d. for a standard 100 watt bulb to 1s. 8d.—brings their prices now to the same as those of single filament bulbs ; its purpose seems to be to encourage sales of the coiled filament lamp so that they can become the chief, and eventually the only, type of lamp made. At present the older single coil lamp accounts for more than three-quarters of British output. Apart from its (up to now) lower price, it is rather more robust, and less liable to fail from blows or vibration: the coils in the coiled coil lamp's filament may touch and cause a short circuit if shaken or vibrated sharply enough, though makers claim that the modern type is now less vulnerable to such damage. A 100 watt bulb with the newer type of coil is, however, about 8 per cent more efficient as a means of transforming electricity into light, which might mean a saving of about 10d. on current in the 1,000 hours that both types of lamp are reckoned to last. The makers are now thus providing bulbs that give 8 per cent more light for the same cost.

The coiled coil lamp's increase in efficiency is not considered great enough by some makers to offset its greater robustness. Their disagreement may be a convenience to industrial users, who do not want to have to replace lamps because of premature failures ; normally bulbs are changed at regular intervals, and reliability is therefore essential. Crompton Parkinson has announced that for these reasons it is not following the lead of its chief rivals, and will continue to offer single-filament lamps below the price of coiled coil lamps—a margin which may also reflect a difference in production costs.

SHORTER NOTES

Group profit before tax of Rowntree & Company for the year ending December 31st fell from £2,882,000 to £2,720,000, after charging £1,116,000 to depreciation, against £991,000 before, but the net profit attributable to Rowntree is slightly higher at £1,368,000 (£1,317,000). Had it not been for a change in the method of stock valuation the net profit in 1959 would have been £300,000 lower. The final dividend is 10½ per cent less tax, making a total of 15 per cent compared with 13 per cent for 1958. The directors propose to capitalise £1¼ million of the reserves (totalling £10,766,000) by a three-for-five scrip issue.

★

The European Free Trade Association (Origin of Goods) Regulations, 1960 are published by the Stationery Office this week, to give as much notice as possible to importers before the reduced rates of duty for goods qualifying for EFTA treatment take effect on July 1st.

★

Political and Economic Planning (PEP) has published a study of minimum prices in European trade in agricultural and horticultural products, in the light of the use of these devices by members of the European Economic Community.

★

Prices of jute goods in Dundee have again been raised, following the further increase in raw jute. Most qualities of jute yarns have gone up by £5 a ton.

★

British Glues and Chemicals and the Agricultural Holdings Company have formed a jointly-owned company, British Impulse Proteins, to exploit the Chayen impulse protein process for extracting protein from vegetable materials and marketing the products. Agricultural Holdings controls a group of seed wholesaling companies; British Glues has developed the process which was invented by its research director, Mr I. H. Chayen, who is the chairman of the new company. A plant to operate the process will be built in Britain.

★

Total National Savings now amount to £7,000 million thanks to last year's record savings for a peacetime year of £389 million. The recent survey on Premium bonds and their holders showed that the public is fairly well satisfied with these bonds, but the Chancellor of the Exchequer had the results of the survey in mind when he recently announced the improved premium bonds with a shorter waiting period and with both more and bigger prizes.

★

A placing has been arranged by S. G. Warburg of London, Kuhn Loeb of New York, and Stockholm's Enskilda Bank of 1,083,259 shares in L. M. Ericsson, the Swedish telephone group. These shares were held by International Telephone and Telegraph and represent 23 per cent of the total capital. The 638,007 voting "A" shares have been placed in Sweden, while the 445,252 partly voting "B" shares have been placed here and in other European countries.

★

Gulf Oil Company announced at its annual meeting in Pittsburgh last week that drilling of three widely spaced wells in the South Ceuta area of Lake Maracaibo in Venezuela has proved extremely productive, indicating a pay thickness of up to 1,100 feet and indicating an oilfield that could be the largest that Gulf has discovered since Kuwait. A second major discovery has been made in Eastern Venezuela, in a concession in which Gulf has a 50 per cent interest.

★

A revaluation of the freehold properties of Flowers Breweries has thrown up a surplus of £4.8 million. The company's interim dividend has been raised from 6 per cent to 7 per cent and a 100 per cent scrip issue is proposed.

BABCOCK & WILCOX, LIMITED

MR W. LIONEL FRASER'S REVIEW

EXPRESSION OF CONFIDENCE IN THE FUTURE

"In the Atomic Energy Field . . . we are participating in a huge and costly pioneering undertaking"

The sixty-first Annual General Meeting of Babcock & Wilcox, Limited will be held on May 26, 1960, at Federation of British Industries, 21 Tothill Street, S.W.1.

The following are extracts from the circulated Statement of the Chairman, Mr W. Lionel Fraser:

FINANCIAL COMMENTS AND RECOMMENDATIONS

The profits of the Group, subject to United Kingdom taxation, but after setting aside the sum of £1,761,332 for depreciation, were £523,154. After taking into account United Kingdom taxation and other adjustments, the balance standing to the credit of the consolidated Profit and Loss Account is £573,850.

The Preference Dividends, less tax, required £58,281 and your Directors now recommend that a Final Dividend of 4½ per cent, less tax, be paid on the Ordinary Stock, requiring £259,239, making a total of 9 per cent for the year.

As they stand, and without explanation, the year's results are bad. In this Review I shall do my best frankly and fully to set out the causes of the setback, as your Directors see them, and to give reasons why we do not feel the results truly reflect the inherent strength and potentiality of the Group.

TRADING CONDITIONS

During the early months of 1959 output from our main Works at Renfrew and at Dalmuir fell short of the programme, as the result of a number of unforeseeable difficulties which were encountered of a technical nature, and also relating to labour. By the middle of the year many of these problems had been overcome, and later a substantially accelerated rate of production did much to make up for the reduced output of the early part of the year, but at a considerably higher cost than originally anticipated.

During 1959 there were more labour disputes than in any previous year in the Company's history, both at the Works and on the erection sites. As a result, management had to devote a disproportionate amount of their time in striving to arrive at reasonable settlements of these disputes. In some cases where the full concessions demanded could not be granted, the Unions concerned banned overtime or, alternatively, the groups of men in question precipitately came out on unofficial strike. We must all be alarmed at the increasing resort to these so-called "go-slow" tactics or "wildcat strikes," and it is most regrettable that in our case they have caused both a substantial loss of production and have contributed to our uneconomic results. Our factory at Dalmuir which we took over from the Ministry of Supply on January 1, 1959, has had more than its share of these disputes, but despite this, we have increased the labour force by no less than 800 and succeeded in raising output materially. Although we have still much to do, I consider it a major achievement to have adapted these Works to our productive use in so short a time.

NEW ORDERS

I am pleased to be able to state that our order book was higher at the end of the year than at the beginning, for during 1959 we obtained an improved volume of new business. Perhaps the most notable is that for the Thorpe Marsh Power Station of the Central Electricity Generating Board, where we shall be supplying a single boiler unit having a capacity of 550 Megawatts. The single boiler is for a generating set whose output of electricity exceeds that of the well-known Battersea Power Station, which is served by seventeen Babcock boilers installed over the last thirty years.

In the export field valuable orders were obtained in Sweden, Finland, Poland and Rumania, in addition to those awarded to Subsidiary Companies with their own partial manufacturing facilities, such as Australia, Africa and Mexico. The total volume of export orders lagged behind our hopes, however, due to intense world competition.

NUCLEAR POWER CONTRACTS

We are now heavily engaged in our Works and at site on the contract for Hinkley Point Nuclear Power Station. Here, we have built the largest Goliath crane in the world, and it is operating splendidly. Other nuclear contract work at present in hand are the containment vessel for the Advanced Gas-Cooled Reactor for the United Kingdom Atomic Energy Authority at Windscale and the reactor vessels and another Goliath crane for Atomic Power Constructions Ltd. at Trawsfynydd, Wales. The Company, maintaining its tradition in the field of marine propulsion, has developed nuclear propulsion plant capable of immediate application in naval and merchant vessels.

EXTENSION OF ACTIVITIES

In order to utilise to the full the excellent facilities at Dalmuir, we have made some interesting and varied arrangements which should improve our overall profitability as sales develop. We have completed agreements with the Richier Group in France for the sale and manufacture of their full range of Tower Cranes, their vibratory road rollers and certain large concrete mixing machinery.

Another new manufacture for which the plant at Dalmuir is particularly suited is the Marion Excavator. An agreement was signed last year with the Marion Power Shovel Company of USA licensing us to manufacture a range of excavating machinery, which will be marketed in this country and abroad by John Blackwood Hodge & Co. Ltd.

We have also entered into new licence agreements associated with our conventional products, of which I shall mention but two examples. One is a French development, the Ignafluid Stoker, which has had success in burning very fine low grade coals. The first installation is under construction for the Scottish Gas Board.

Another arrangement is with Waagner-Biro of Austria. This is for a waste heat boiler of particular interest in steel works. The first orders for manufacture in this country have been placed by Richard Thomas & Baldwins Ltd. and Colvilles Ltd.

TRADING DEVELOPMENTS IN EUROPE

Today one hears much of the steps contemplated by British, American and other firms to establish factories within the European Common Market area. In this connection there is no doubt the Babcock organisation is exceptionally well situated to meet the new trading conditions that are likely to arise in Europe, for your Company is directly interested through its connections with the Société Française des Constructions Babcock & Wilcox, Paris ; the Deutsche Babcock & Wilcox, Oberhausen and Babcock-Smulders, Brussels ; some of which were established with their own works more than 60 years ago. Furthermore, we have long-standing licensee arrangements with leading engineering companies in Holland, Italy, Norway, Sweden, Denmark and Finland, and are, of course, also directly interested in Sociedad Espanola de Construcciones Babcock & Wilcox, Bilbao.

"Here follows a Review of the Group Overseas and Home Subsidiaries."

GENERAL REVIEW AND PROSPECTS

I have not refrained for some years past from emphasizing that with the conditions which existed in our industry, further setbacks were to be expected and that any improvement would inevitably be slow. Nevertheless, as I mentioned earlier, your Directors regret again to have to report an adverse result. It is a fact that there is excessive capacity in the boiler industry. There have also been heavy additions to labour charges and depressing interruptions in the rhythm of production from strikes, but the major burden has resulted from the vast problems relating to the rapid emergence of atomic energy for power purposes.

By our work in this field we are participating in a huge and costly pioneering undertaking. The design, manufacture and erection of large

Power Station boilers has always demanded the highest engineering skill, but the difficulties associated with atomic power plant at this early stage of progress are even more incalculable. However, there is no doubt that in the long term the application of nuclear power is inevitable, although there will be delay in achieving a competitive basis as construction costs of conventionally fired generating plant have been lowered markedly in recent years. It is vital, therefore, that your Company should continue to play its part in the reliable development of reactor systems.

So, what of the future? We are an important entity in the industry and as such are conscious of our national responsibility. Your Company has ramifications and connections in almost every country in the world, and these sources of experience and knowledge afford strength to those who direct the affairs of the Company. We cannot alter the conditions with which the boiler industry is faced today—the fierce competition, the cripplingly low margins of profit and the present unhappy labour situation. But we do have faith that by the maintenance of highest standards of work and service we will be able to overcome this frustrating state of affairs and that fair rewards will attend our best endeavours.

Tremendous efforts have been made, and are still being made throughout the Group to meet the challenge. Your Directors have since the war authorized the expenditure of very considerable sums of money, not only to ensure that our Works, in this country and abroad, are equipped with the most up-to-date and efficient plant and machinery, but by way of investment in the construction of new factories in certain territories overseas. Naturally the results from some of this outlay, especially in the latter category, will take time to materialise, but some of our Subsidiaries are already producing substantial profits which go some way to compensate for losses on domestic orders. At the same time, I must stress forcibly that in a heavy engineering business such as ours it is absolutely essential that conditions should be such that reasonable profits are available to enable us to undertake the continuous research and technical development. This is very expensive but indispensable if we are to keep in the forefront of industry and render capable service to our customers, whether they be in private enterprise or in nationalised undertakings.

Looking back over my period as Chairman and through the eyes of a banker with experience of many industries and people, I repeat what I have said in substance before that this is a great Company. One of my main reasons for this strong statement is that the Company has not failed to give close attention to the introduction of young and competent engineers, scientists, mathematicians and other professional staff, with the result that there is, in my opinion, unrivalled skill in the organisation—a fine investment for the future.

Finally, I would just like to add that in the boiler industry where contracts take years to complete and where such huge sums are involved, precise profit assessments cannot be given over short periods, and for this Group to attempt, for instance, to provide six-monthly figures would be both inappropriate and misleading. Indeed, I sometimes think that Stockholders would be able to make a more balanced judgment of the position if we were permitted to present our results say once every three years, instead of annually.

RETIREMENT OF DIRECTOR

Sir Frederick Leith-Ross has notified his colleagues that he will not seek re-election at the forthcoming Annual General Meeting, as he wishes to reduce his commitments. In these circumstances your Directors have with much regret accepted his resignation and desire to express their gratitude to him for the valuable assistance he has rendered in all our deliberations.

CHAIRMANSHIP

I must now be forgiven for making a personal statement. This is the last occasion on which I shall have the honour of reviewing the Company's position as Chairman, as I have already announced my intention to resign from the Board immediately after the Annual General Meeting on May 26th, as from which date my colleagues have appointed in my place, Sir Kenneth Hague, at present Deputy Chairman. He comes to the Chairmanship having served all his working life in the Group in various high posts, and on the termination of two years as President of the Engineering and Allied Employers' National Federation. The Company is fortunate too in that Sir Reginald Verdon Smith will succeed to the office of Deputy Chairman.

As for myself, I shall have completed almost ten years as Chairman, which was the period which had always been envisaged, and my colleagues and I felt that the forthcoming Annual General Meeting would be the most appropriate and convenient time for me to hand over the office. I cannot pretend that I am anything but most unhappy that my resignation has coincided with a moment when current trading conditions are unfavourable. However, I have not deemed it right to defer my resignation on this score, as if Stockholders agree to the creation of the appointment of President at the Annual General Meeting, the Board intend to nominate me as the first President of the Company—at my request on an honorary basis. I shall therefore be able to maintain some association with the Group and its affairs, in which I shall continue to take especial interest.

Needless to say, I relinquish the Chairmanship with feelings of sadness, for it is a proud appointment. There can be few companies where the atmosphere on the Board is more harmonious and objective, or where a better relationship exists between the Directors and the Staff. My gratitude is unbounded for the friendship and support accorded me by everybody in the Group, from my colleagues down to individual employees.

FIAT S.p.A.

TURIN, ITALY

(Motorcar, Aircraft, etc.)

SHAREHOLDERS' MEETING

The Meeting of Fiat Shareholders, held in Turin on April 28th under the chairmanship of Professor Dr Vittorio Valletta, Chairman of the Board of Directors and Managing Director, unanimously adopted the report and balance sheet for the fiscal year 1959. The surplus assets amounted to 19,700,689,407 lire. A dividend of 85 lire per share (5 lire more than the previous dividend) was declared.

The meeting resolved to increase the Company's stock capital from 100,000 millions to 150,000 millions of lire, through the issue of 100 million preference shares of 500 lire each, with a surcharge of 500 lire ; and a bond loan of 30,000 million lire.

Valletta's report points out the big increases made by Fiat in 1959, "continual growth which is a proof of the value of private enterprise in industry." The chief figures:

— *total sales* 438,000 *millions* (65,000 millions more than in 1958).

— *motor vehicles produced :* 430,282 units, including 422,216 passenger cars (an increase of 89,030 units over 1958); 195,549 units exported ; daily average production of Fiat motor vehicles about 2,000 units.

— 20,000 *farm and industrial tractors :* about half of them exported.

— *steel production :* about one million tons.

— *total Fiat exports in* 1959 reached 140,000 million lire (27,000 million more than in 1958).

As at December 31st Fiat personnel numbered 85,117, of whom 66,872 were factory workers: an increase of 5,000 people over the previous year notwithstanding the development of automation. "This imposing mass of Fiat workers, of whom more than 71,000 are in Turin—states the report—is one of the largest labour forces employed today in Italy by any single industrial concern." A labour force endowed with a strong team spirit and a sense of co-operation. The elections held on April 7th for the Shop Stewards' Committees at Fiat again confirmed the strong majority of the representatives of the democratic Trades Unions.

The Fiat report states that from the salient economic indices in the whole of the West, beginning with the United States of America, and in the new psychological and political climate of relaxation of the international situation, strong trends are indicated towards higher consumption and therefore increased production, towards larger investments ; in short, vaster prospects for business and employment for all. With regard to relaxation towards the international situation, we all hope that it will lead to definite West-East agreements (on controlled disarmament in the first place) for a true peace; not merely "coexistence," but genuine living together bringing moral, economic and social betterment to all peoples. Confidence also in the development of the ECM, provided it is based on conditions of fiscal parity.

Fiat seeks to double its production and has therefore resolved on *new investments to the value of* 150,000 *millions of lire* to be spent within the next 2 or 3 years.

ROYAL-GLOBE INSURANCE GROUP

REVIEW OF RESULTS FOR 1959

STATEMENT BY MR T. H. NAYLOR

CHAIRMAN: ROYAL INSURANCE COMPANY LIMITED

The Annual General Meeting of the Royal Insurance Company Limited will be held on Wednesday, May 25th, in Liverpool.

A statement by the Chairman, Mr T. H. Naylor, from which the following are extracts, has been sent to stockholders with the 114th Annual Report and Accounts:

We can look back on 1959 with some satisfaction for, although the year was not without its misfortunes—such as the abnormally high level of fire damage in the United Kingdom—there were positive signs of improvement in certain areas, notably the United States, where underwriting conditions had been difficult in recent years.

After a brief pause in 1958, the upward trend in our Group premium income was resumed and the total—excluding Life Assurance—rose by over £6 million to £137 million. Out of this vast sum there remained, after paying all claims and expenses on underwriting account, £2½ million, or 1.8 per cent, rather less than one week's gross income, to be transferred to Profit & Loss Account.

Over the 5 years ending in 1958 the annual profit on our underwriting operations had fallen from more than £4 million to rather less than £¼ million, or 0.6 per cent, and, although the profit for 1959 of 1.8 per cent is no more than marginal, it is in the circumstances an encouraging improvement.

Thanks to the continued buoyancy of our investment income, now amounting to £4.3 million net, our consolidated profit of £5.3 million (after United Kingdom taxation and Pension Funds contributions) was the highest ever recorded.

DIVIDEND

The increase in our consolidated profit and the prospect of business returning to a more favourable basis have enabled your Directors to recommend an increase in the final dividend from 2s. to 2s. 6d. This, with the increased interim dividend of 2s. 2d. per 5s. unit paid last November, makes the total distribution for the year 4s. 8d., as against 3s. 11d. last year.

OVERSEAS

In the United States there has been a progressive improvement during 1959 in our underwriting experience, arising to a large extent from the steps taken both by our own Group and by the industry there to put the business on to a better footing.

It would be unwise to expect the recent pace of improvement to be maintained, and it is only fair to acknowledge that the position has been helped by the absence of severe hurricanes, but, even so, the future looks brighter than it has done for some time.

In other overseas territories, despite the many problems with which we have been confronted, particularly those of a political and economic nature, our business generally continued to flourish and made a substantial contribution to the improved results for the year.

FIRE DEPARTMENT

It will be seen that premium income in this department showed a welcome increase, and, in spite of the abnormal level of fire wastage in the United Kingdom, we were able to earn a surplus on the account of over £1 million.

	Net Premiums	Underwriting Surplus	Percentage of Premiums
	£	£	%
1959...	56,501,646	1,006,993	1·8
1958...	53,905,306	1,120,521	2·1

At home, continued competition led to a further lowering of rates, but even so, our premium income increased with the general improvement in trading conditions. Losses, however, rose substantially, but fortunately not to the same degree as the national fire wastage. Nevertheless, our ratio of profit in this department at home was the smallest we have ever earned.

ACCIDENT DEPARTMENT

	Net Premiums	Underwriting Surplus	Percentage of Premiums
	£	£	%
1959...	74,359,208	1,306,818	1·8
1958...	70,613,785	−602,005	−0·9

Accident Department income has again shown a satisfactory increase, and the outcome has been decidedly more favourable than in the previous year. Apart from the United States all major territories produced a modest profit.

Motor insurance continues to present us with many problems and unfortunately the number of road casualties in 1959—as in 1958—increased at an even faster rate than the number of vehicles on the road. Added to this social evil, there is from the purely material view point the continued rise in the cost of repairs.

Here I would like to comment on the suggestion that has been made from time to time that insurers invariably pay inflated repair charges. In fact, our own staff engineers, and qualified assessors acting for us on a fee basis, personally inspect every damaged vehicle we insure, except where the damage is of a quite minor nature and, even in those cases, a tight and careful control is maintained by scrutinising and approving every account for repairs. Whilst, therefore, the isolated case of abuse does come to light, I feel that the stockholders will appreciate that this can only be exceptional and that, generally speaking, we pay no more than a fair price for the work undertaken. I have no reason to suppose that our approach is anything but typical of Offices generally.

MARINE DEPARTMENT

	Net Premiums	Fund as at December 31	Percentage of Premiums
	£	£	%
1959...	6,431,742	14,544,271	226·1
1958...	6,237,355	14,190,170	227·5

The previous year's shipping depression continued into 1959 and it was not until the end of the year that there was any sign of an improvement in freight rates. It is satisfactory in these conditions to have recorded a slightly increased premium income in 1959.

Our transfer of £152,338 to Profit & Loss Account relates to the 1957 underwriting account which was closed at the end of 1959. Although smaller than the comparable figure a year ago, it was not an unsatisfactory outcome for a year in which the number of major casualties to first-class vessels rose above the normal level.

LIFE DEPARTMENT

	New Sums Assured	New Annuities (per annum)	New Annual and Single Premiums
	£	£	£
1959...	56,528,870	1,598,065	1,994,182
1958...	46,088,189	1,739,407	1,938,134

New sums assured in the Life Department have again exceeded those for the previous year by a substantial margin. New annuities, which consist to a large extent of deferred annuities under pension schemes, have been maintained at a satisfactory level, but have not shown the steady increase which has been a feature of the life assurance business. The volume of new annuity and pension business is particularly susceptible to changes in the law, and recently the uncertainty regarding the extension of the national pension scheme has had its effect. Following the passing of the National Insurance Act 1959, this uncertainty has to some extent been resolved, and I hope that the future will show an increased realisation of the value of insured pension schemes with a corresponding expansion in this section of our business.

INVESTMENTS

	Invested Assets General Funds	Life Funds
	£	£
1959.....	202,888,736	92,227,251
1958.....	190,908,369	86,346,243

With the resurgence of confidence and rising industrial production, the demand for capital remained firm throughout 1959 and consequently long term interest rates were sustained at a high level not only in this country, but in most parts of the world. Thus, in the main fields of our investment activities, we were able to invest in fixed interest securities at very attractive yields.

The outstanding feature of stock markets, almost throughout the world but particularly in the United Kingdom, was the rise in ordinary share prices. This provided an addition to the value of our investment portfolio more than sufficient to offset falls in fixed interest security values with the result that the total appreciation on the portfolio increased.

MANAGEMENT, STAFF AND AGENTS

It has been a matter of pride and pleasure to all in our Group and to many others in the Insurance industry that Sir Charles Trustam, our Chief General Manager, received a Knighthood in the New Year's Honours List for his services to the industry. As in all organisations, the standard which prevails is set at the top, and we are fortunate in enjoying the benefit of Sir Charles' wise and thoughtful control of our affairs.

It is a special pleasure to be able to take this opportunity of personally thanking all the Management and Staff, who so ably represent us throughout the world. To our Agents too, who form such a vital link between the Group and its Staff on the one hand, and the client on the other, I would like to extend our grateful thanks.

RIO TINTO

Accumulation of operating profits overseas

The Eighty-seventh Annual General Meeting of The Rio Tinto Company, Limited will be held on June 2nd at Barrington House, 59, Gresham Street, London, E.C.2.

The following is an extract from the statement by the chairman, Mr Gerald Coke, which has been circulated with the report and accounts for the year 1959.

ACCOUNTS

The income for the year includes an increase in the receipts from your Company's holdings of the Rhodesian Copperbelt and in Mary Kathleen Uranium, which is partly offset by lower income received from the Kern Oil Company, The Pyrites Company Inc. and the Compañia Española de Minas de Rio Tinto, S.A.

The profit figure of £3,914,000 before taxation includes the consolidated profits of Mary Kathleen Uranium which are free of tax in Australia and which would only attract British tax if remitted. Consequently the figure of £1,216,000 shown as tax on profits for the year is substantially lower than it would otherwise have been.

Although Canadian profits are not consolidated, a similar taxation problem would arise if any dividends were remitted to the United Kingdom out of uranium earnings and this position in regard to tax raises important issues of policy.

Both in Canada and Australia substantial profits will be earned over the next five or six years, which will be free of tax in their country of origin, under tax concessions granted by the Governments of the countries concerned. Briefly, these concessions, which provide that no tax is payable for certain specified periods, are intended to give the company an opportunity of amortising to a large measure the cost of its plant and equipment.

The effect of this is that, while the companies have the benefit of being able to accumulate tax funds to replace the wasting assets inherent in their operation, these moneys if remitted to this country would bear tax here, since the Double Tax Convention only permits the off-set of tax to the extent that tax has been paid in the country of origin.

The accumulation of funds in the manner described above has the advantage of enabling the company to replace its assets by other revenue-bearing investments: and your Board, in considering future dividend policy insofar as it relates to the parent company, will have to weigh up, on the one hand, the value of extending their field of profitable operations out of tax-free revenue and, on the other, the justifiable demands of shareholders for some proportion of the revenue currently derived from the investment of their existing funds.

These tax concessions are, of course, intended to benefit and encourage the operation of mining enterprises in the Commonwealth. They are a recognition by the Governments concerned of the fact that in the field of metal mining large expenditures have to be undertaken and a considerable time-lag occurs between exploration and economic operation, but their effect is frustrated in the case of any mining house based on London by British tax laws. It is hoped that the British Government will give earnest consideration to the alleviation of a situation which places a British company at a disadvantage against one operating in other countries of the Commonwealth. It is indeed urgent that they should do so if London is to retain its importance as a base for mining finance business and if engineering and other industries, which look to mining for outlets for their products, are not to lose valuable customers.

SPAIN

In last year's Chairman's Statement a warning was conveyed that the trend of sulphur prices was downwards and that this would affect the profitability of your Company's investment in Spain. This forecast was in fact borne out by events and your Company received a lower dividend from Compañia Española de Minas de Rio Tinto during the year. The declared dividend was further reduced in value in your Company's hands by a devaluation of the peseta. The happy relationship between the two companies continues and our Spanish colleagues are to be congratulated on maintaining the mine at a high level of efficiency.

AUSTRALIA

Mary Kathleen Uranium paid its first dividends during the year, amounting to A.2s. 9d. per stock unit. The mine is operating most satisfactorily and has substantially improved on the estimate of costs and profitability made when the mine was started.

The problem of adequate water supply is still proving intractable and it has been decided to construct a second dam to minimise the risk of water shortage in a dry period.

AFRICA

The opportunity to diversify functionally the Group's activities in Africa was presented by the chance to acquire the Cam and Motor Mine from the shareholders and an offer was made at 11s. per 2s. 6d. share, which was accepted by over 90 per cent of the shareholders. Steps have been taken since the end of the year to exercise the right to acquire the remainder of the shares, making the company a wholly owned subsidiary of Rio Tinto (Southern Rhodesia) Limited. This purchase has been financed in part by sales—at prices greatly in excess of those ruling currently—of some of the holding in the Copperbelt companies. The remainder of the purchase price has been found from cash or the sale of short-dated securities, leaving the holdings of the two principal producing companies virtually intact. The purchase of Cam and Motor, besides giving the advantage to the Group of a holding in gold mining to diversify our metal interests, also presents tax advantages. Until this acquisition all exploration costs in Africa had to be met from the net income of our Copperbelt investments; the possession of an active mine means that there is a source of gross income against which a certain amount of exploration expenditure can be set off. The exercise of the options on Patchway and Big Ben has added two minor gold-producing properties to the Group.

As reported in the Review of Operations, Rio Tinto also acquired an interest in the Sandawana Emerald deposit in Southern Rhodesia. The emeralds so far disclosed are of high quality and, if the deposit fulfils its early promises, this small investment could yield substantial returns.

CANADA

The Chairman then reviewed the position of the Canadian uranium industry following the announcement by their Government in November, 1959, that an agreement with the United States Atomic Energy Commission had been concluded under which the options to purchase further quantities of uranium oxide after the conclusion of the present contracts in 1962-63 would not be exercised, but stretching out the present contracts to 1966. The steps taken to meet the situation, which had already been notified to Shareholders, were outlined, and the Chairman stated: At the end of the stretched-out contract period in 1966 the Group will possess assets which have been completely amortised and which should be capable of producing uranium as cheaply as any comparable mines anywhere in the world.

OIL

Our income from the Kern Oil Company was reduced by the lower crude oil prices which ruled throughout the year and by the need to continue expenditure on the search for additional reserves.

If you are interested in obtaining a copy of the full Report and Accounts please write to: The Secretary, The Rio Tinto Company, Limited, Barrington House (Room No. 71), 59, Gresham Street, London, E.C.2.

steel construction builders' joinery

wire netting and fencing

Boulton and Paul Limited

The ANNUAL GENERAL MEETING of Boulton & Paul Ltd. was held on May 3rd, at Norwich. Mr. J. S. Murray, Managing Director, presided. The following is an excerpt from the statement of the CHAIRMAN, Mr. J. H. Trevfon, circulated with the Report and Accounts.

Another Good Year

Last year I pointed out that our group was well placed to meet the undoubted requirements of the country in the supply of new factory buildings, new houses and modernising roads and railways. The past year has seen increased activity in these fields, and we did our fair share in all of them. As a result we had another good year with profits in excess of the previous year. As far as can be judged the outlook is promising.

Developments

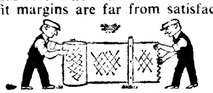
One of the most important developments was the acquisition of the structural engineering business of Moreland Hayne, with works at Silvertown on the London Docks. It has not only brought our Group into the centre of London on the manufacturing side, but has given us increased capacity at the time when we need it.

The extension of our wire products plant in the Midlands consists of a completely up-to-date continuous wire drawing, annealing and galvanising plant which should show substantial economies in production and allow a high degree of control over quality.

Structural Engineering

Notwithstanding the rather slow start our output of structural steel came to a good figure. The following are examples:—

Technical College, Corby.
New Factory for Roneo Limited, Norwich.
Power Station, Hunts Bay, Jamaica.



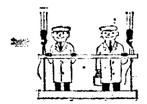
Railway transit sheds for British Railways.
Buildings for British Sugar Corporation, Ltd.
Factory extensions, General Electric Co. Ltd.
New factory for Joseph Lucas Ltd., Birmingham.
Football Stands for Fulham and Norwich F.C.
Office block, new tool room for Pressed Steel Co. Ltd.

In addition, we design and make fully automatic plants for the Steel Fabrication industry. We are unashamedly proud of our success and especially of the fact that several of these plants have been supplied and installed by us in the U.S.A.

Wire and Wire Products

Whilst our volume of business increased, competition became fiercer with the weakening of the trade association structure of the industry and profit margins are far from satisfactory.

The fencing department, which is closely allied to the wire side and uses their products, has continued to expand. Their extremely mobile erection teams are to be seen in all parts of the country working on diverse projects.



Timber Products

This has been a record year for sales of builders' joinery and our manufacturing facilities have been hard pressed to execute orders received. The prospects for future sales are good, but rising costs must be faced.

Builders' Equipment

Stephens and Carter have had another busy year. This Company benefits as the building trade expands, not only from its hire and erection of scaffolding, but also from the sale of ladders, and other equipment for builders.

Balance Sheet

The assets and liabilities include Moreland Hayne's figures and the new Midland works. The rise in Current Assets and Liabilities also reflects increased trading. We have further developments in mind, and our stocks are increasing with our increased turnover, indicating full use of our financial resources.

Group Profits

The profits of the Group before taxation amounted to £416,363. The taxation charge of £142,531 has had the benefit of over-provisions in previous years of £44,882. After deducting the minority interests, and bringing in the "carry forward," a disposable surplus is shown of £308,891. This compares with the figure of £209,187 for the previous year. In dealing with this surplus, attention has been given to the desirability of building up reserves and conserving resources for future activities. After providing for the fixed Preference return, we are recommending a final Ordinary dividend of 12½ per cent. This is on "all fours" with last year's final dividend of 10 per cent, if we add to that the special interim dividend of 2½ per cent, paid at the beginning of this year.

Summarised Results

Group Profits before taxation	100%	£416,363
Taxation	34%	£142,531
Minority Shareholders ...	1	4,334
Retained Profits	43	178,167
Distributed Profits	22	91,331
	100%	£416,363

Group Profits attributable to Ordinary Shareholders before Taxation as a return on:		
Issued Ordinary Capital	£825,000	45½%
Net Tangible Assets ...	£2,055,508	18½%
Ordinary Dividend before Taxation as a return on:		
Issued Ordinary Capital	£825,000	12½%
Net Tangible Assets ...	£2,055,508	5 %

The Report and Accounts were adopted

SNIA VISCOSA

NATIONAL COMPANY FOR VISCOSE APPLICATIONS INDUSTRY

SHARE CAPITAL—27,450 MILLION LIRE

The Meeting of Snia Viscosa took place in Milan on April 7th. The Report was read which discussed the situation in the world and in Italy of the artificial and synthetic fibre industry, a situation which in general presented much more favourable characteristics than those of the preceding year. The Snia Viscosa Group took particular advantage of this, production in 1959 being 107 million as against 96 million Kilos of fibre in 1958. Particular stress must be laid upon the fact that production of lilion, Snia's polyamide fibre, more than doubled. Because of this, the problem is being considered of a separate installation for the production of caprolattame, the raw material for the production of lilion, by more simple and rapid means than those used traditionally. Production has also been started on an industrial basis of an acrylic fibre, Krylion. Production has also been developed of plastic materials such as sniamide and dialux, as well as of the principal raw materials for the manufacture of artificial and synthetic fibres (cellulose, soda, sulphuric acid, carbonic sulphide, etc.). During the period, production was commenced of the cellulose transparent material known as cellophane as well as of a glass fibre, vitrofil.

The Report goes on to announce that an agreement has been reached with Allied Chemical for a plant of huge dimensions for production of lilion in the USA. The American company entered into this agreement, after weighing offers from the principal concerns of the world in this industry, because of the guarantees furnished by the experience of the Snia Viscosa Group in the chemical, textile and mechanical field. Snia will not only supply machinery manufactured in its establishment, but will also guarantee assistance in getting production under way.

In the course of the discussion the president of Snia, Franco Marinotti, explained various points touched upon in the Report, and especially drew the attention of the Meeting to the great importance of the agreement with Allied Chemical, as well as to those concluded with USSR, India, etc., regarding other fields of activity of Snia. This expansion across the world is not prejudicial to the future development of Snia's exports, since where friendly relations are established they will always produce positive results. The president went on to discuss the satisfactory financial position of the Group which not only permits normal business activity but also effective expansion. He then discussed the favourable situation of Italian and foreign shareholdings in the Group. Finally, in connection with the projected Bill for the safeguarding of free competition, he observed that Snia, in the face of foreign competitors, already exports a notable portion of its production, and that there exists in the home market various and important producers who sell almost exclusively in Italy, thus giving rise to an extremely competitive situation.

The president's statements were unanimously approved by the Meeting, which then noted that the year closed with a net profit of 2,960 million lire (2,138 million lire in 1958), after allocation to the Sinking Fund of 4.500 million lire (2,500 million lire in 1958). The resultant dividend therefore was of 120 lire per share, compared with 100 lire in the preceding year.

Statement by the Chairman

MR. P. G. MACDONALD, W.S., J.P.

to be presented at the Annual General Meeting of United Biscuits Limited, to be held on May 31st, 1960, at the Caledonian Hotel, Edinburgh

UNITED BISCUITS

LIMITED

AND SUBSIDIARY COMPANIES

McVitie & Price Ltd · Macfarlane, Lang & Co. Ltd · S. Henderson & Sons Ltd · McVitie & Price (Canada) Ltd

I AM GLAD to be able to report that despite increased competition in 1959 our group sales at £18,500,000 exceeded by £300,000 the record figure achieved in 1958. This is all the more gratifying in the light of the reduction in biscuit production in the United Kingdom as a whole during 1959 by some 8,500 tons, or 1.6 per cent. During the year there was an increase in the cost of some ingredients, particularly butter, which rose from an average price in 1958 of £230 per ton to £348 per ton in 1959; no increase was, however, made in the price of our biscuits. In spite of the consequent contraction of our margin of profit, it is satisfactory to record that our trading profit for the year fell only slightly short of the record figure of the previous year. This is a result of our policy of quality control, the continual introduction of more efficient and economic methods of production and improved methods of distribution.

It will be of interest to shareholders to know that our sales of cake continue to show a very healthy expansion, our group sales having exceeded £2,000,000 last year.

ACCOUNTS

The trading profit for the year ended 31st December 1959, after charging depreciation, directors' remuneration, provision for pensions and auditors' fees, amounted to £2,386,423 (1958, £2,472,963). After adding income from investments and bank and other interest amounting to £73,689 (1958, £69,312), the profit before taxation amounted to £2,460,112 (1958, £2,542,275). Having deducted taxation on profit for the year of £1,131,964 (1958, £1,302,402), the profit attributable to the group amounted to £1,328,148 (1958, £1,222,733), an increase of £105,415.

The preference dividend for the year required the net sum of £36,750. An interim ordinary dividend at the rate of 5 per cent. was paid on £4,500,000 requiring £137,812 (1958, 5 per cent. on £3,000,000, £86,250). The Directors propose that a final dividend be paid at the rate of 11 per cent., requiring £303,188, making with the interim a total for the year of 16 per cent., which compares with an effective rate of 13⅓ per cent. for 1958. The total dividends paid and proposed for the year amounted therefore to £477,750 (1958, £396,375) and the balance of unappropriated profit, £850,398 (1958, £826,358); has been transferred to revenue reserve.

Turning now to the consolidated balance sheet, it will be noted that this year for simplicity the general reserve and the balance on profit and loss account have been merged under one heading, revenue reserve, which at 31st December 1959 amounted to £3,574,934 (1958, £2,724,536). The financial strength of the group continues to grow and current assets exceeded current liabilities and future taxation by £3,929,052, an increase over last year of nearly £800,000.

EXPORT

I am also glad to be able to report to you that our export sales continue to expand and show an increase of 20 per cent. over the previous year. Our Canadian subsidiary accounts for the greater part of this increase in export sales.

THE FUTURE

With the continuation of the economic expansion of this country I feel that we can look forward in the future to a rising standard of living. Part of this increase will consist of an improvement in the national diet, and, although there will be intense competition, I feel sure that the discerning housewife will continue as in the past to favour the best quality. Consequently our group should obtain an increasing share of the available market.

The Chancellor of the Exchequer in his recent Budget has done nothing to encourage energy and enterprise. In my Statement to you with the 1956 Progress Report I referred to the 1957 Budget and stated: "By leaving the unmarried man who earns £2,000 to pay exactly the same amount of tax as he did before the Budget will do nothing to discourage him from emigrating. Neither has the Budget done anything for industry apart from shipping, nor has it eased the present crushing estate duty burden. Accordingly, we must all continue to press for further cuts in Government expenditure and so lighten taxation including estate duty." Since then the standard rate of income tax has been reduced by 9d.; the level for payment of surtax—fixed over forty years ago—and rates of surtax remain unchanged. The Chancellor has, at last, agreed to grade the liability for estate duty on gifts made within five years of death. We are grateful for this concession. It is a source of satisfaction to me as I first made this proposal ten years ago and have had it raised with successive Chancellors each year since then. But my comments in 1957 as to the necessity for cutting Government expenditure so as to lighten the burden of taxation remain vitally applicable today. It may be that the economic climate of the moment is not favourable to large-scale cuts in taxation, but the minimum the country, which returned the present government to power with such a substantial majority, was entitled to expect at this time was a reduction of 3d. in the standard rate of income tax and the raising of the surtax level to £3,000.

MANAGEMENT AND STAFF

Once again I would convey my best thanks to all members of our team who have contributed so much to another successful year, and I know that you, the shareholders, will wish to be associated with me in these remarks. The rapid expansion in the past decade has been a stimulating challenge to all of us and I am confident that we shall have the continuing support and loyalty of management and employees alike.

Copies of the Report and Accounts may be obtained from The Secretaries, United Biscuits Limited, 12 Hope Street, Edinburgh 2

TELEPHONE AND GENERAL TRUST

CONSIDERABLE OVERALL PROGRESS

MR ALASTAIR F. ROGER ON POSITION OF FINANCIAL STRENGTH

The thirty-fourth annual general meeting of the Telephone and General Trust Limited will be held on May 24th in London.

The following is an extract from the statement by the Chairman, Mr Alastair F. Roger, which has been circulated with the report and accounts:

The retirement of Sir Alexander Roger from the Board of Directors on March 22, 1960, after having served as Chairman for some thirty-four years, will already be known to Stockholders from the Press announcements.

I am sure you will approve the Board's invitation to him to become the Trust's first Honorary President, and welcome his acceptance thereof.

He is justly proud of having presided over the Trust from its modest beginning in 1926 with a capital of £75,000 to its present position as a powerful Investment Trust with general investments valued at nearly £7 million and interests of over £3,500,000 in telephone operating subsidiaries.

Your Directors have honoured me by appointing me Chairman of the Board.

ACCOUNTS

As regards the Accounts, I intend to continue the practice of dealing mainly with the Holding Company's figures rather than the consolidated figures, as I think they are of more immediate interest to Stockholders of the Trust.

The Income received by the Trust during the year, consisting almost entirely of Dividends and Interest, was £62,000 greater at £569,658, and the Net Profit after payment of all expenses, Debenture and Loan Interest and Taxation was some £51,000 greater at £249,915.

After providing for the 7 per cent Preference Stock Dividend and for the transfer of £50,000 to General Reserve, the payment of a final dividend of 10 per cent on the Ordinary Stock is recommended, making with the 5 per cent interim already paid, a total of 15 per cent for the year, and also a dividend of 15 per cent for the year on the "A" Ordinary Stock—in both cases an increase of 1 per cent compared with the previous year. The Balance carried forward on Profit and Loss Account of £235,508 compares with an adjusted figure of £192,852 brought in.

Turning to the Trust's Balance Sheet, you will see that it once again shows a strong position with Capital and Revenue Reserves of £1,535,508, and a large appreciation in market value on our general quoted investments compared with their Balance Sheet cost.

The Consolidated Balance Sheet also shows a strong position. The increase of £405,859 to £2,572,535 in the interests of minority shareholders in Subsidiary Companies reflects the successful issue of additional Ordinary Shares by the Jamaica Telephone Company during 1959.

GENERAL INVESTMENTS

Over the years we have built up a wide portfolio of general investments which stand in the Balance Sheet at £2,342,745. Of this, £2,151,085 represents quoted investments which, at December 31, 1959, had a market value of £6,683,573. These investments have contributed a steadily growing income to the Trust by way of dividends, and we believe this growth will continue.

INVESTMENTS IN TELEPHONE OPERATING COMPANIES

Barbados.—Development and expansion of the system continues satisfactorily, with an increase during 1959 of 691 stations in service, making a total of 8,910.

Although the Trust holds a majority of the Ordinary Shares of the Barbados Telephone Company, there are a considerable number of local investors in both the Preference and Ordinary Shares. The Trust welcomes the support of these local investors.

Jamaica.—In 1959 a record in new development was achieved with the addition of 3,315 stations, making a total of 33,565. Capital Expenditure during the year amounted to £744,500. A quotation was obtained for the Ordinary Shares of the Company on The Stock Exchange, London, thus increasing their marketability.

Trinidad.—I had hoped I would be able to report that a settlement had been reached with the Trinidad Government on the Company's long outstanding application for a Rates increase. I regret, however, that this is not the case, as although the Federal Supreme Court, on appeal, has given a ruling in the Company's favour on its rights under its Ordinance to obtain a revision of tariffs, the Trinidad Government has obtained leave to appeal to The Privy Council.

The existing tariff clearly does not provide the fair return to which the Company and its Shareholders are entitled, and the Ordinary dividend has been further reduced from 6 per cent to 4 per cent in respect of the past year.

As a result, expansion of the system is entirely held up, with growing inconvenience to the public in Trinidad. The Trinidad Government has recently suggested further talks. Representatives of the Company are ready to attend, and are now awaiting from the Trinidad Government full details of the proposals it wishes to discuss.

Portugal.—The Trust's close and mutually beneficial relations in the financial and technical spheres with its associated company The Anglo-Portuguese Telephone Co. Ltd. continue. During the year the Company's telephone systems in Lisbon and Oporto, where it operates under a concession granted by the Portuguese Government, have continued to expand. Nearly 23,700 telephones were connected to the systems, bringing the total to 253,500 at December 31, 1959.

GENERAL

Although the year has not been without its difficulties, I feel that this report shows a position of considerable overall progress and continuing strength. Your Directors look forward with reasonable confidence to the prospects for the current year.

TRADE INDEMNITY COMPANY LIMITED

A MORE ENCOURAGING OUTLOOK

MR H. T. SILVERSIDES' REVIEW

The forty-second ordinary general meeting of Trade Indemnity Company Limited was held on April 28th in London, Mr H. T. Silversides (the chairman) presiding.

The following is an extract from his circulated statement:

I am glad to be able to report that, on the whole, the situation is much more encouraging than it was a year ago.

The gross premiums earned in 1959 amounted to £1,666,456, a decrease of approximately 5 per cent as compared with 1958. On the other hand, the retained premium of £573,845 was only down 2 per cent.

Last year I mentioned that we had considered it expedient to cut down severely on our overseas commitments. To give you some idea of the extent of this reduction, the 1958 proportion of total premium income which related to export business, amounting to 18 per cent, had fallen in 1959 to 7 per cent.

By way of compensation for this drastic cut in export business, the turnover at home, mainly due to higher sums at risk on existing policies, increased to such an extent that in 1959 your Company again insured approximately £1,000 million of credit risks. Of that total, some £980 million was insured in the United Kingdom.

I have said that the increase in the United Kingdom is mainly due to higher cover under existing policies, and I cannot hide my disappointment that more progress has not been made in writing new policies. Every effort will be made to extend our connections at home and I hope it will prove possible, with due care and selection, to increase our support of the export market in due course.

Claims paid and other outgo, less salvages, in 1959 at £746,541 are much more in line with normal expectation of losses than was the case last year.

Turning now to the Profit and Loss Account, you will note the figure of £58,305 transferred from 1957 Underwriting Account and you will observe that Interest on Investments and other Income (gross) is £47,887. These two items total £106,192 and, after the addition of £7,669 in respect of Income Tax recoverable on the loss on 1957 Underwriting Account less tax on income in this Account and the deduction of the provision of £3,400 for Profits Tax, we are left with £110,461 which is carried to Appropriation Account.

The balance brought forward from 1958, suitably adjusted for the increased cost of the dividend for 1958 by reason of the reduction in the rate of Income Tax, was £136,166 and this, together with the £110,461 brought down, means that there is £246,627 available in the Appropriation Account. Of this, £45,938 is absorbed by the proposed dividend at the rate of 15 per cent. less Income Tax, leaving a carry-forward of £200,689.

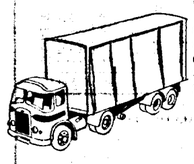
GENERAL REMARKS

In the course of his remarks on economic developments and the likely effect on their business in 1960, Mr Silversides said: From the middle of 1959 onwards, we have seen a steady improvement in business conditions. Industrial production, consumption and employment have all made noticeable progress against a background of stable prices.

At the present time the investment programmes of both the public and private sectors indicate that this expansion is likely to continue, perhaps at too great a rate. Hence the warnings issued from time to time by the Government and the application of the brakes through the increase of Bank Rate to 5 per cent in January last.

From our own point of view, we always have to bear in mind that any economic expansion must be expected to encourage the growth of a proportion of speculative enterprises which are the first to go once monetary or other measures are introduced to control the situation. It remains to be seen to what extent, if any, the authorities deem it necessary to take further action to direct and perhaps restrain current expansion and to what degree any measures introduced will react on any "mushroom" growths which the economic climate itself has fostered.

Commenting on the report of the Radcliffe Committee, Mr Silversides said: The Report serves to underline the important role of trade credit in the economy as a whole, and I trust that some part of the interest which it has aroused in the subject of trade credit will be extended to the question of insuring the credit risks themselves.



The report and accounts were adopted.

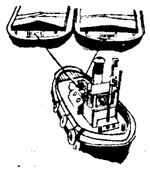
EXPANSION TO CONTINUE

Mr. P. S. Henman on a new phase in the development of the Group

Consolidated profit before tax, for the year ended 31st December, 1959, amounts to £581,014, which is £167,436 more than the corresponding figure for 1958. This increase in profit has been secured by the development and expansion of the Group's existing resources and also as a result of the purchase of additional subsidiary companies.

DEVELOPMENT

The warehouses at Dartford and Birmingham have now been completed and work has started on a new warehouse in Hull. On the cold storage side of our business, we have undertaken large-scale reconstruction work in Cardiff. In London the new garage and offices for J. Spurling Ltd. have now been built, and we have purchased a fleet of 17 barges and a tug.



NEW ACQUISITIONS

Our most important purchase was the equity capital of Bristol Industries Ltd., which is a holding company with ten trading subsidiaries. These companies engage in the familiar Group activities of road haulage, contract vehicle hire, warehousing and cold storage, but there are also subsidiaries operating petrol filling stations and dealing in private car and commercial vehicle sales, and an engineering company. All have fitted admirably into the Group pattern.

The second important acquisition was that of Connal & Co. Ltd. This is a Glasgow warehousing and road transport company, tracing its origins to the year 1722. The Company has a large subsidiary in London known as Caledonian Wharfage Co. Ltd., controlling wharves at Blackfriars and in Bermondsey.

FURTHER EXPANSION

Important though the acquisitions of 1959 may be, they mark only the beginning of a new phase in the development of the Group. Already in 1960 three public companies, Bootle Cold Storage Co. Ltd., The Sheffield Pure Ice & Cold Storage Co. Ltd., and Johnson, Cole, Brier & Cordrey Ltd., which operates a cold store and public warehouse business in London, have become Group subsidiaries. We are glad to be approached by the Boards of companies which might usefully fit into the Group structure and to discuss with them suitable terms to offer their shareholders. It is intended that development of this type shall continue; it is development planned to fit the Group's existing manner of operation and to diversify its interests, but at no time to enter completely uncharted waters. It is our experience that the introduction to new subsidiaries of Group management techniques and methods results in increased productivity and a consequent uplift in profit.

SHARE CAPITAL

At the Annual General Meeting a resolution will be proposed to increase the authorised share capital of the Company to £6,000,000 by the creation of 1,000,000 Second Preference Shares of £1 each, and 8,000,000 Ordinary Shares of 5s. each.

FUTURE PROSPECTS

The improvement in traffic which was effected in the latter half of 1959 has, to a large extent, been maintained in 1960.

	1959	1958
Group Income	£5,037,000	£3,398,000
Profit before Tax	£581,014	£413,578
Taxation	£217,793	£162,563
Net Ordinary Dividend	£162,594	£79,530
Coverage	2.08 times	2.43 times
Net Assets	£4,723,798	£2,709,800

Record Changer and Tape Deck

COMPANY'S STRUCTURE STRENGTHENED BY REORGANISATION

DR D. M. McDONALD'S REVIEW OF PLANS FOR THE FUTURE

The twenty-fourth Annual General Meeting of Birmingham Sound Reproducers Limited will be held on May 27 at the Savoy Hotel, Strand, London, W.C.2.

The following is the statement by the Chairman, Dr D. M. McDonald, BSc, MB, ChB, which has been circulated with the report and accounts for the year ended December 31, 1959:

During the first months of 1959 sales were rather difficult but in the second three months they started to improve and I am pleased to say that this trend was continued for the last half of the year, during which record production figures were achieved. Early last year the opportunity was taken to reorganise production and sales and develop new models. We were thus able to reap the full benefit of the increased sales demand which commenced in the Spring of last year.

Although the profit before tax is £1,386,013 compared with £1,538,341, which reflects the cost of this reorganisation, I am happy to report that the net profit, after tax and adjustments, is £817,286—a slight increase—against £806,061.

I would like to take this opportunity of expressing my great appreciation of the outstanding work that has been done by the Company's officials and work people in achieving this result. The Company's structure has been immeasurably strengthened by the reorganisation which took place last year and new staff engaged during this period are already contributing to the smooth working of our business.

In our range of record changers the UA.8 has continued to be one of our main models for the past year. The UA.12 has been produced in substantial quantities in the second half of the year and we have recently launched a further new record changer known as the UA.14, which has been well received.

The reception given to our tape deck has been beyond expectations and we anticipate large developments in the use of tape recorders in the next few years.

PLANS FOR THE FUTURE

The licence granted a few years ago for a new factory of 350,000 sq. ft., in Old Hill, has now been received and it is expected that this factory will be completed by the end of 1961. In addition a new site of about 12 acres, which we acquired at Stourbridge, a few miles from our Head Office, will prove advantageous. As it is not anticipated that a licence to build a new factory at Stourbridge will be granted—the Board of Trade rightly being concerned with unemployment in the depressed areas—we have repaired the existing buildings which will relieve pressure in the Old Hill factory.

We have embarked on an ambitious training and apprenticeship policy as we find that nothing is better than "growing your own wood." We are demanding a very high level of intelligence and character and also insisting that every apprentice and commercial trainee continues his academic education by attending appropriate night classes. This we hope will bear fruit over the years.

It is difficult to break away into other fields of production because of the fresh opportunities which are continually presenting themselves in the gramophone and associated markets. However, temptation in these directions will not deflect us from our intention to manufacture new products at an appropriate time.

Naturally it will be some time before all these measures are reflected in our profits, but in the meantime I am pleased to be able to say that the first three months of 1960 show an improvement over the same period for 1959. If this continues, we will not be disappointed with the current year's results.

I would like to pay a personal tribute to the work of Mr J. B. McNulty, who recently left our Board. As resident director in N. Ireland he was one of the architects of our plant in Londonderry and his counsel over the last few years has proved both wise and constructive.

An Interim Dividend of 15 per cent on £1,000,000 Ordinary Share Capital has been paid during the year to December 31, 1959. (Dividends for 1958, Interim Dividend of 15 per cent on £800,000, Final Dividend of 32½ per cent on £1,000,000 being equivalent to 44½ per cent for the year less Income Tax on the increased Share Capital of £1,000,000.)

Your Directors have decided to recommend the payment of a Final Dividend of 35 per cent less Income Tax at 7s. 9d. in the £ in respect of the year ended December 31, 1959, on the present Ordinary Share Capital of £1,000,000. You will be asked to approve this at the meeting.

BANK LEUMI LE-ISRAEL B.M.

CONTINUED EXPANSION

PROPOSED RIGHTS ISSUE

The ninth Annual General Meeting of the Bank, being the 38th since the establishment of the business, was held in Tel-Aviv on April 24, 1960.

In his address the Chairman, Dr Y. Foerder, drew attention to the Bank's growth, especially as reflected in the consolidated figures, which had increased from IL.570 million to IL.645 million.

The Bank's deposits had reached a total of IL.364 million, including IL.55 million of special Government Deposits. The Deposit savings scheme had increased steadily and the balance of over IL.30 million represented over 50 per cent of all such bank savings schemes in the country.

Advances and Loans to Customers had increased by IL.117 million to IL.135 million, Documentary Credits, Acceptances, Guarantees etc. had risen from IL.79½ million to IL.94 million.

The net profit was IL.973,911 as against IL.752,248 for 1958 after the usual provision for taxation, depreciation etc. and ample provision for contingencies.

The recent rights issue had brought the paid-up capital and open reserves to IL.8 million. This increase was important for the Bank's future expansion but the directors did not consider it quite sufficient and preparations were already in hand for a further increase by way of another rights issue on advantageous terms. In addition, the directors intended to offer the staff a small limited issue on equal terms in appreciation of their efforts and to strengthen their interest in the Bank's progress.

Amongst the important developments mentioned by the Chairman was the formation in London of the Anglo-Israel Bank Ltd., to take over the business of the London Office of the bank, and also the establishment of a full Agency in New York. This will greatly facilitate the increase of foreign business jointly with the bank's Offices in Zurich and Frankfurt.

THE ECONOMIC SPHERE

In reviewing general economic conditions in a year of satisfactory progress, the Chairman pleaded for further liberalisation and a smaller measure of direct Government interference. He did not believe, however, that the abolition of exchange control could be contemplated for the present. Under the prevailing circumstances he was in favour of the continuation of qualitative and quantitative credit control by the Bank of Israel. Finally, he dwelt on the importance of encouraging savings through bank savings schemes and by other means, especially through the Stock Exchange. He stressed the paramount importance of developing the equities market to enable investors to participate in Israel's growing economy.

The General Meeting approved a final dividend of 6½ per cent, making 12½ per cent for the year (unchanged), and noted that the directors consider that they will be able to pay the same dividend on the further increased capital after the forthcoming rights issue.

(Copies of the Annual Report for the year 1959 are available on application to the bank's London subsidiary, the Anglo-Israel Bank Ltd., 6 Gracechurch Street, E.C.3.)

ÖSTERREICHISCHE LÄNDERBANK

VIENNA, AUSTRIA

The Annual General Meeting of Österreichische Länderbank was held in Vienna on March 29th and the following are details of the report presented by the Board of Directors:

REVIEW

The success achieved by Österreichische Länderbank during the business year 1959 may be considered proof of the sound foundations on which the Bank has been built, and of its earning power. Although current earnings were affected by the exceptional conditions prevailing in the money market the Bank succeeded not only in making good this loss of earnings but also in achieving a further increase of S 8m.

This increase in income contrasted with a rise in expenditure of S 10m. The taxed net earnings of app. S 99m. thus almost equalled the record figure of some S 101m. reached in 1958.

The success achieved during 1959 is further underlined by the fact that in drawing up the balance sheet, both valuations and provisions for risks of all kinds were treated on a very conservative basis. Besides, S 1m. was put into reserve for the granting of bursaries by Österreichische Länderbank.

Issues.—The year under review was marked by an exceptionally vigorous issuing activity in the loan and mortgage bond sector. The Länderbank also managed to take over for placing amounts in excess of its quotas during 1959. This, coupled with the vigorous revival of the share market which started in May, 1959, resulted in a rise in the securities turnover to almost double the figure of the previous year.

The foreign trade boom experienced by Austria during 1959 also produced a rise in the foreign currency turnover. The Länderbank, at app. 38 per cent, secured the same share in export trade turnover as in the previous years.

Deposits.—The rise in deposits amounted to S 334m., with savings deposits alone accounting for as much as S 329m. At the end of the year under review savings deposits totalled S 1,538m. The rate of increase amounted to 27.3 per cent and thus exceeded by some 3 per cent the average attained by Austrian joint stock banks.

First-grade liquidity at the end of the year reached 19.2 per cent, (obligatory rate: 15 per cent), whilst liquidity as a whole amounted to 55.2 per cent (obligatory rate: 40 per cent). At the date of the balance sheet liquidity was far below the average of the year under review.

Out of the taxed net earnings for 1959 of app. S 99.1m., some S 79m. was appropriated to reserves. The Bank's capital resources as returned, including special reserves, accordingly reached S 763m., or app. 12.3 per cent of liabilities (11.7 per cent in the previous year). The ratio of capital resources to deposits was far above the international average.

Out of the net profit of app. S 21.5m. remaining after deduction of the appropriations to reserves, an 8 per cent dividend on the share capital is to be distributed (7 per cent in the previous year).

Personnel.—Owing to the expansion in the volume of business, and as a result of the opening of new branches and offices, the Länderbank's personnel increased by 5.4 per cent. At the end of the year under review the number of people employed by the Bank was 1,942.

HUDSON'S BAY

RECORD SALES

The two hundred and ninety-first annual general Court of The Governor and Company of Adventurers of England trading into Hudson's Bay was held on May 5th in London, Mr W. J. Keswick, the Governor, presiding.

The following is an extract from his circulated statement for the year to January 31, 1960:

The Company had another good year and sales reached the record level of £79,891,000. The trading profit before taxation was slightly higher at £4,952,000, compared with £4,896,000 in the previous year, after charging depreciation of £1,323,000 this year against £1,204,000 in the previous year. Canadian taxes were higher this year as the Canadian tax rate on corporation profits rose from 47 per cent to 50 per cent, with the result that the total charge for taxation increased from £2,259,000 to £2,457,000. The net trading profit after taxation was, therefore, lower at £2,495,000 compared with £2,637,000.

Trading dividends paid and proposed are unchanged at 24 per cent, which is approximately 4s. 9½d. per share gross and 2s. 11½d. net after deduction of United Kingdom income tax from the dividend. The proposed Land Account distribution of 5 per cent is also unchanged from last year's regular distribution.

In November, 1959, an interim trading dividend of 10 per cent and a distribution of 2½ per cent from Land Account was paid to Proprietors. Final payments proposed are 14 per cent, less tax, on trading and 2½ per cent from Land Account.

The report and accounts were adopted.

PEARL

ASSURANCE COMPANY LIMITED

Chairman: **GEOFFREY KITCHEN, T.D., M.A.**

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1959

TOTAL ASSETS £284,589,333 **GROSS INCOME £62,111,940**

INVESTMENTS

The Assets show an increase of £14,079,515. The valuation of the investments, taking Stock Exchange securities at middle market prices, showed a substantial margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £88,288,036 compared with £81,806,225 for 1958 and the total sums assured and bonuses in force (including the Capital Redemption Fund), amounted to nearly £714 millions (an increase for the year of over £45 millions). The total new annuities of all kinds amounted to £951,791 per annum.

FIRE AND ACCIDENT

In this Branch the premium income was £9,950,775.

REVERSIONARY BONUSES

ORDINARY BRANCH.—A reversionary bonus of **£2 8s. 0d.** per **£100** sum assured or annuity on United Kingdom policies entitled to participate in full profits.

INDUSTRIAL BRANCH.—A sum of £3,628,570 has been allocated to provide bonuses in the Industrial Branch making a total allocation up to date of **£37,513,391.**

Frankfurt (Main), April 1960

The Board of General Managers

THE HOFFMANN MANUFACTURING COMPANY

RECORD TURNOVER ACHIEVED

The annual general meeting of The Hoffmann Manufacturing Company Limited was held on May 4th in London, Mr J. W. Garton, JP (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

In the year 1959 which is now under review we achieved a record turnover consequent upon a marked improvement in the order position from the middle of the year onwards.

The order book at this time is in a very healthy state, but I would personally wish to see increased investment in capital equipment, and whilst there is some indication of this trend the emphasis would still appear to be mainly on consumer goods.

The profit of the Hoffmann Group for 1959, before taxation, but after all other charges, including Debenture Interest, amounts to £1,704,511 and compares with £1,206,476 for the previous year. Income Tax and Profits Tax absorb £717,340 against £581,474 in 1958. The net profit of the Group for the year 1959, after taxation is, therefore, £987,171 and compares with £625,002 for 1958.

The Directors recommend a Final Dividend of 29½ per cent less tax, which with the Interim Dividend already paid of 6½ per cent, less tax, makes a total dividend of 36 per cent, less tax, for the year.

The Group Capital Commitment for plant and machinery at December 31, 1959, amounted to £1,189,683, and the major part of this new equipment will be installed by the middle of the current year. This substantial expenditure has been made necessary by the increasing demand for our products

This capital programme will be financed from the internal resources of the Group.

SUBSIDIARY AND ASSOCIATED COMPANIES

Hoffmann Gloucester Limited has again had a very good year and continues to play an important part in the Group's activities, with its combination of special bearings and standard group products.

Hoffmann Tweedales Limited again experienced unsatisfactory trading conditions due to the reduced demand for its products by the textile machinery trade but the position may improve later this year as a result of marketing new products which have been recently developed and which are now undergoing tests

CAPITAL REORGANISATION

At December 31, 1959, the Parent Company's Fixed Assets Replacement Reserve stood at £2 million and the Directors consider that in view of the considerable amount already spent on capital equipment, it would now be prudent to capitalise part of this Reserve, the balance remaining on the Reserve Account being ample cover for that part of the outstanding capital expenditure commitment of the Parent Company at December 31, 1959, of £718,751, which relates to increased cost of replacement.

The Directors still feel that the issued share capital does not adequately reflect the capital actually employed in the Company's business and they therefore propose that the sum of £1 million, part of the amount standing to the credit of the Parent Company's Fixed Assets Replacement Reserve, be capitalised and distributed amongst the Ordinary Shareholders in the form of one new Ordinary Share for every existing Ordinary Share.

I should like to emphasise that this does not imply any intention to increase the amount distributed to the Ordinary Shareholders for 1960.

The report and accounts were adopted.

At the subsequent extraordinary general meeting the Board's capital proposals were duly sanctioned.

SUN INSURANCE OFFICE LIMITED

MR C. G. RANDOLPH'S STATEMENT

RECORD RESULTS IN 250th YEAR

FORMATION OF SUN ALLIANCE INSURANCE LIMITED

In his statement the Chairman, Mr C. G. Randolph, mentioned that 1959 was the 250th year since the foundation of the Office on April 7, 1710.

He referred to the announcement on October 1, 1959, of the formation of Sun Alliance Insurance Limited, a holding company which would acquire the whole of the capital of the Sun and of the Alliance in exchange for its own shares. By this means both Offices maintained their independence and separate identities. The Directors of both Offices considered that the proposal would be of benefit in the long term to the shareholders, the staffs, the two Offices and the insuring public.

He drew attention to the high level of fire wastage in the United Kingdom in 1959. As he had mentioned in the past, expansion in recent years had been exceptional and was unlikely to continue. The growth in 1959 was less pronounced, but the total increase in all Departments of £786,823 to a record total of £23,328,315 was substantial and evidence of the vitality of the organisation.

FIRE ACCOUNT

The increase in premiums was £313,821 and the comparative figures were:

	1958	1959
	£	£
Premiums	10,149,706	10,463,527
Claims	4,694,574	5,334,644
Profit	1,054,237	984,837
Ratio of Profit	10·39%	9·41%

This was a most satisfactory outcome in view of the exceptional level of claims at home. Overseas the year had been generally successful with an improvement in Canada and the United States. He pointed out that the very satisfactory results would not have been achieved had they not again been fortunate in escaping serious losses from windstorm or other natural catastrophe.

ACCIDENT ACCOUNT

Income had increased by £497,548 and expansion had been widespread except in the USA, where the business had been curtailed in order to improve the results.

The comparative figures were:

	1958	1959
	£	£
Premiums	11,197,576	11,695,124
Claims	6,967,958	7,100,138
Profit	−94,619	549,460
Ratio of Profit	−0·84%	4·70%

In 1959 they had been successful in reducing the loss on Motor business to a negligible figure. At home they had made a marginal profit which was an improvement on the average of the last five years.

Other classes had generally shown a profit both at home and overseas.

In Canada a useful profit had been earned and in the USA the adverse margin had been greatly reduced.

MARINE ACCOUNT

In spite of the large amount of tonnage laid up the premium income was approximately the same as for the previous year. The 1957 account had been a difficult one but overall had shown a profit, and the trend of the 1958 and 1959 years' figures showed an improvement.

Cargo business continued to be extremely competitive.

The comparative figures were:

	1958	1959
	£	£
Premiums	1,194,210	1,169,664
Fund at the end of the year	2,065,821	2,096,522

After transferring £50,000 to Profit and Loss Account the balance of the Marine Fund was equivalent to 179.24 per cent of the premiums.

PROFIT AND LOSS ACCOUNT

It was fitting that the operations in their 250th year should have resulted in the largest premium income and also the largest transfer from Revenue Accounts in the history of the Office. These transfers totalled £1,584,297 compared with £1,059,610 in 1958 and £1,341,116 in 1949, the highest previously recorded.

Income from Interest, Dividends and Rents had increased to £1,520,832 before deduction of tax. The book value of investments stood at £29,192,632, an increase of £2,886,363.

The Directors recommended a further dividend of 6s. 4d. per share, less tax, making a total of 10s. 6d. per share for the year against 7s. for the year 1958. After payment of this dividend the balance in the Profit and Loss Account would stand at £4,393,416.

The Chairman concluded by thanking the Advisory Committees, Local Directors and representatives of the Office at home and overseas for their continued support. He also paid tribute in this special year not only to the present employees but also to those who had retired, and congratulated them on the results of the year's operations.

MONTFORT (KNITTING MILLS) LIMITED

MR E. HARRY MEAKIN'S STATEMENT

The forty-sixth Annual General Meeting of Montfort (Knitting Mills) Limited was held on April 28th at Leicester, Mr E. Harry Meakin, Chairman and General Manager, presiding.

The following is an extract from his statement circulated with the accounts for 1959:

1959 was a year which, after a slow start, saw more optimism in trade conditions generally than has existed for some years, and the general impression during most of the year was that the textile trade, as a whole was experiencing almost boom conditions. Whilst it is true to say that some sections of the knitted goods trade showed considerable improvement, there were others which were not so happy. We have succeeded in penetrating the dollar market and have obtained contracts from the USA and Canada, which we are pleased to say are showing further advancement during the present year. We have also, during the past year, developed our trade and our associations with several of the largest multiple and mail order organisations, which augurs well for the future.

OUTLOOK

There have already been hints from the Chancellor and others that a brake may have to be applied, and such action can easily affect trade in the second half of the year. There are also signs of an increasing volume of imports from other countries. On the other hand, it can be said that we have made a somewhat better start to the present year.

I have already mentioned certain satisfactory and growing developments in our outlets, which already mean that our order books in all companies in the Group are in a much healthier state than they were twelve months ago.

The report was adopted.

REFUGE ASSURANCE COMPANY LIMITED

The Chairman in a statement submitted with the 1959 accounts mentioned that the annual premium income of new policies written in the year was £2,330,000, and that this, together with single premiums of £430,000 assured total benefits aggregating some £41 million. The total premium income of the year from the Life Branches exceeded £20 million, and payments to policyholders were some £13,700,000 of which £10 million were to living policyholders and £3,700,000 payments on death.

The premium income of the Company's subsidiary, which conducts most classes of insurance business other than Life, was £1,870,000. The underwriting results in the Motor Account continued to be unfavourable, and the Fire Account also had proved relatively unprofitable.

INVESTMENTS

The Company's assets of £164 million included £52 million invested with the British Government and Local Authorities, £42 million in Debentures and Preference stocks, and £22 million in Ordinary stocks. In addition there are mortgages, largely in connection with House Purchase, of £32 million, and property investments of £6 million.

BONUSES TO POLICYH OLDERS

In the Ordinary Branch surplus of £2,186,000 was allocated to policyholders to provide a bonus on with-profit policies at the increased rate of £2 4s. per cent on the sum assured in respect of each year's premium due in 1959 and paid.

In the Industrial Branch the total surplus allocated to policyholders was £2,950,000. This sum included approximately £1 million of a non-recurring nature which had been used to reduce considerably the waiting period after which reversionary bonuses are granted. The rate of bonus granted on this occasion was £1 12s. per cent on the sum assured for premium-paying policies which were in force on January 1, 1960, subject to completion of one year's premium payments. Policies effected in 1955-58 now participating for the first time had been granted additional bonuses, and the granting of paid up policies at advanced ages and certain other increases in benefits had been continued.

INSTITUTE OF CHARTERED ACCOUNTANTS

ANNUAL MEETING

The seventy-ninth annual meeting of the Institute of Chartered Accountants in England and Wales was held on May 4th in London. Mr C. U. Peat, the President, in the course of his address, said:

MEMBERSHIP AND RECRUITMENT

Our membership at the beginning of this year was over 32,500 and it has since been increased to over 33,000. During the past year the Council has done much to stimulate interest in the profession among those leaving school and the universities. We have distributed widely the introductory booklet *Why Not Become a Chartered Accountant?* and its companion which the Council issued last October under the title of *A Career for Graduates*. We seem at present to be holding our ground in recruitment and it is particularly satisfactory to know that there has been a substantial increase in the number of university graduates entering into articles, although the number is still far too small.

There can be no doubt that a person of the right outlook and ability can achieve a full and satisfying career as a chartered accountant and our aim must be to emphasise this long-term outlook if we are to avoid losing valuable recruits because of the more immediate financial gains to be obtained in other occupations.

EDUCATION AND TRAINING

Throughout the period of his articled service an articled clerk must obtain the training and education required not only to pass the Institute's examinations but also to equip him properly for his future responsibilities. For example, the independent audit is one of the vital services of our profession and it really is fundamental to the training of a would-be chartered accountant that he should have a depth of real auditing experience.

MANAGEMENT ACCOUNTING

I wish to emphasise the very great importance of further development in the field of management accounting. This is the production and presentation of accounting information which is of direct assistance to the management in the formulation of policy and the day-to-day control of the business.

This is a vital service which many members are already providing either as officers of industrial and commercial enterprises or as independent advisers, but a great many more members ought to turn their attention to it. There is a vast area of business activity carried on by small and medium-sized concerns which I believe could benefit greatly from sensible down-to-earth advice on management accounting from practising members of the Institute.

It is in the interests of our clients and ourselves that we should seize this opportunity. We must, however, do it properly. Each practising member ought to make a thorough appraisal of his knowledge and experience, the organisation of his practice and the facilities and staff at his disposal so that he can decide what services he can properly undertake for his clients.

AUDITING TECHNIQUES

Auditing techniques have changed a good deal and they will go on changing. There have been some revolutionary developments in the nature of business records and yet I feel that we have so far had only a preliminary glimpse of the impact of electronics. As auditors therefore we must concentrate our attention more and more on the fundamental objective, namely to give our professional opinion on the truth and fairness with which a financial statement is presented.

Times Furnishing

CONTINUED EXPANSION

The twelfth Ordinary General Meeting of The Times Furnishing (Holdings) Limited was held on April 28th in London, Mr Henry Jacobs (the Chairman) presiding.

The following are extracts from his circulated Statement:

With the proposed Final Dividend, the Total is equivalent to 13½ per cent less tax (11½ per cent for 1958 calculated on the same basis).

Although the profit before taxation at £647,994 is lower by £153,556 than for 1958, regard should be had to the increase of £580,165 in the unrealised profit on HP Accounts, arising from the addition of £1,463,581 to the total of HP Accounts. Virtually all the £580,165 should benefit the results for this year and next.

The Company's reputation for quality, value and straightforward Easy Terms is reflected in the vast volume of turnover with old customers and their friends.

The utmost care is taken to ensure that the merchandise handled by TIMES FURNISHING and WILLERBYS shall be of such standard as to give every possible pleasure in use and wear.

In WILLERBYS' tailoring workrooms, much has been done by improved styling and methods of production to give even higher value and satisfaction.

So far, in the current year, trading has increased over the previous year.

During the past year, five branches have been opened and new Stores at Plymouth and Bristol are under construction. Further developments for expansion are in course of negotiation.

APPOINTMENTS

COLLEGE OF ADVANCED TECHNOLOGY, BIRMINGHAM

Department of Mathematics

Applications are invited for the post of

PRINCIPAL LECTURER IN INDUSTRIAL STATISTICS

Candidates should have high academic qualifications and have had some industrial and research experience. Teaching experience is desirable.

SALARY SCALE: (Men) ... £1,750—£1,900
(Women) ... £1,400—£1,520 (Plus equal pay increment)

Further particulars and forms of application from the Bursar, College of Advanced Technology, Gosta Green, Birmingham, 4. Applications to be received within 14 days of this advertisement. Please quote "W."

K. R. PILLING, Clerk to the Governors.

BANKING EXECUTIVES

International Bank about to establish London branch invites applications from experienced and able executives. The positions offered call for men of personality and wide experience in foreign and domestic banking who can establish and maintain sympathetic contacts on all levels. Applicants wishing to be primarily considered for foreign banking section should be able to travel and have a knowledge of languages.

Initial, brief applications should be sent in strict confidence to

CASE STAND 214, GENEVA.

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN ECONOMIC HISTORY

Applications are invited for an Assistantship in Economic History. Salary scale: £700-£850 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (three copies) should be lodged, not later than May 21, 1960, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

UNIVERSITY OF GLASGOW

RESEARCH ASSISTANTSHIP IN ECONOMIC HISTORY

Applications are invited for a Research Assistantship in Economic History. Salary scale: £700-£850 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (three copies) should be lodged, not later than May 21, 1960, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

UNIVERSITY OF MALAYA

(SINGAPORE DIVISION)

Applications are invited for (i) Lectureship or (ii) Assistant Lectureship in Economics. Salary scales: (i) £1,148 x £24 — £1,292 (U.S.S. x £36 — £1,520 p.a.; (ii) £1,001 x £24 — £1,089 p.a. Thirty point according to qualifications and experience. Allowances: Expatriation pay (range £200 to £300 p.a.; cost of living (temporary) in range £210 — £450 p.a. Passages for appointee, wife and children under 12 years. Part-furnished quarters at reasonable rent. Provident Fund Scheme. Detailed applications (eight copies) naming three referees, by May 31, 1960, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

Statistical Research

An Assistant in Statistical Research required by the National Coal Board in London. The post is suitable for new graduates in statistics or in mathematics (including statistics) or those who have passed the final examinations of the Association of Incorporated Statisticians or Royal Statistical Society.

Appointment superannuable, salary depending on qualifications and experience within £750 — £895 male, £750 — £965 female. Write for application form to Staff Department (N.1639), 2 C.L., S.C.B., Hobart House, London, S.W.1, which should be returned by May 17, 1960.

For further appointments and other classified advertisements see pages 586 and 587

UNIVERSITY OF OXFORD EXETER AND KEBLE COLLEGES

JOINT LECTURESHIP IN ECONOMICS

The colleges propose to elect to a Joint Lectureship in Economics during Trinity Term. The lecturer would receive a salary of £800 per annum, together with free rooms in college. He would be eligible for appointment to due course to a University Lectureship to be held in conjunction with his college lectureship and in that event his emoluments would be increased. He would be expected to take up his duties on October 1, 1960. Further particulars may be obtained from the Rector of Exeter College, to whom applications should be sent in duplicate, together with the names of not more than three referees, by May 14, 1960.

COMPANY AFFAIRS

Shares in the Building Boom

Output in the building and construction industry last year was about 5 per cent higher than in 1958 and the tempo of production rose as the year proceeded. Deliveries of cement and bricks to the home market were as much as 11 per cent higher. Set against this background the trading results of **Associated Portland Cement** in the year to December 31st look disappointing, for consolidated trading profits rose by only 2½ per cent, from £15,069,644 to £15,465,252.

APC is the major exporter of cement from this country and a 10 per cent reduction in cement exports at a lower margin of profit must explain some of the lack of buoyancy in profits. Lower charges for tax and depreciation and a smaller appropriation for fixed assets replacement have resulted in a substantial increase in the net profit, from £4,435,567 to £5,590,098, and the directors have set the ordinary dividend at 11 per cent. This compares with the equivalent of 9.6 per cent paid for 1958 and the forecast of at least 10 per cent for 1959 made by the directors when British Portland Cement and Alpha Cement were absorbed at the end of the year. The latest dividend, covered about three times, is not especially generous and the £1 stock units were marked down from 67s. to 61s. 9d., to yield 3¾ per cent.

London Brick has benefited more directly than APC from the high level of building activity. Mr A. T. Worboys, the chairman, reports that production and deliveries in 1959 were the highest ever achieved but that demand for all products still outstripped supply despite various capital extensions during the year. Trading profit rose from £2,608,294 to £2,880,276 last year. A further increase seems assured this year as various extensions completed late in 1959 will yield an additional 100 million bricks in a full year. Shareholders will be disappointed if the dividend of 20 per cent (against 17 per cent) is not maintained for the current year on the capital as increased by the proposed 25 per cent scrip issue. London Brick is not short of money: its liquid assets (taking investments at market value) amount to £3,384,022 (against £2,984,296) and compare with capital commitments of only £120,000. At 100s. 9d. the £1 stock units yield 3.9 per cent, but the return would rise by a full point if the present rate of dividend is maintained on the enlarged capital.

The rise in trading profits of **Richard Costain**, the building contractors, from £609,761 to £677,294, is up to expectations, for in his interim statement in December Sir Richard Costain indicated that profits would be slightly higher. The dividend, as he then forecast, is left unchanged at 15 per cent. Shareholders can look forward to a higher payment this year with confidence, for Sir Richard has already promised a modest increase. This prospect is reflected in the current low return of only 3.6 per cent offered by the £1 shares at 82s. 6d. To support their view of the shares, investors can point to the fact that Costain has more work on its books than ever before, and that on the property investment side of the business a full return should be seen this year from the company's $3½ million block of offices in Toronto.

With ever increasing sums being spent on road construction in this country, road making contractors are enjoying boom conditions. Among the largest is **Limmer and Trinidad Lake Asphalt**, which for the year to December 31st reports a 17 per cent increase in trading profits, from £699,928 to £821,928. Higher charges for depreciation at £317,076 (against £281,657) and for tax at £211,373 (against £149,445) has left net profit only 10 per cent higher at £293,029, against £266,422. The additional profit is more than absorbed by the higher dividend payment of 17 per cent, against 15 per cent, which is paid on the capital as increased by a one for ten rights issue last July. On the higher payment, which is covered just over twice by earnings, the 10s. shares at 43s. 6d. yield almost 4 per cent. This year the company will have full use of the £366,000 of new capital it raised last summer and its earnings seem certain to rise.

Not one of these shares yields more than 4 per cent. There is no sign that the boom in the building and road making industries is slackening. But yields as low as this assume that the directors will be more inclined to loosen the purse strings than they have so far been.

Babcock and Wilcox

In his last statement as chairman of Babcock and Wilcox, Mr Lionel Fraser says: "As they stand, and without explanation, the year's results are bad." They certainly are, though not all that much worse than the results of other heavy engineers and boiler-makers which have concentrated much of their recent energy and development expenditure on nuclear power. Output from the company's works was at a low level early in 1959 and though it picked up as the year progressed the value of the group's sales fell from £34.9 million to £32.8 million. Profits before tax slumped from £3,097,382 to £314,644. The net profit, including investment income and a tax credit, fell from £1,761,400 to £573,850. Earnings thus barely cover the dividend of 9 per cent as reduced from the previous year's 13 per cent. Practically nothing has been ploughed back from profits into a business which, as Mr Fraser points out, continually needs a flow of capital to sustain its research and development programme and which had a bigger order book at the end of the year than it had at the beginning.

All this is bad enough. But what may worry shareholders more when they look at the yield of 5.1 per cent offered by the £1 shares at 34s. 7½d. xd. is that the gross return on sales has fallen from nine to less than one per cent and on net assets of £29¾ million from 10 to 1 per cent. At the end of 1954, when Babcock and Wilcox had just begun working on nuclear power contracts, its sales amounted to £32.7 million and its net assets to £21 million and on them it earned gross returns of 12 per cent and 19 per cent respectively. Five years later, as Mr Fraser makes clear, there is excess capacity in the boiler industry and there have been heavy additions to labour charges and interruptions to the rhythm of production from strikes. The major burden is however "the vast problems relating to the rapid emergence of atomic energy for power purposes." Having got so far in Babcock and Wilcox cannot now contract out even though "there will be delay in achieving a competitive basis as construction costs of conventionally fired generating plant have been lowered markedly in recent years." There is nothing the company can do, Mr Fraser says, to alter the conditions facing the boiler industry today—"the fierce competition, the cripplingly low margins of profit and the present unhappy labour situation."

Schweppes

Last year the soft drink manufacturers basked in the sunshine of a long, hot summer. Many of them achieved increases in sales of between 20 and 25 per cent, and sometimes more. Schweppes, which with its tonic water and bitter lemon dominates the "mixer" trade, did exceptionally well. Trading profits rose by just under 50 per cent, from £3,238,716 to £4,802,815 and net income rose by exactly 50 per cent, from £1,274,032 to £1,911,718. Almost all of that advance must have come from the soft drinks side, for Schweppes did not acquire its jam interests in Chivers, Hartley and Moorhouse, until late in the year.

At the time of the Hartley take-over, the Schweppes directors referred to a notable increase in soft drink sales and profits at home, and forecast a dividend of not less than 20 per cent. They have now declared a final of 18 per cent (for which the shares issued in connection with the three jam take-overs now rank). This makes a total payment of 23 per cent, compared with the equivalent of 10 per cent for 1958, and is covered about twice by earnings. Reflecting Schweppes' record of achievement and expansion, the yield of 3.7 per cent offered on the 5s. shares standing at 30s. 6d. is on the low side.

Soft drink manufacturers can hardly dare to budget for as large an increase in sales this year as they secured in 1959. Moreover, theirs is a competitive trade, where the small manufacturer still clings to the local market and where certain recent innovations may make some impact on sales of bottled drinks on a national scale. Deliberately it seems, Schweppes has widened its interests and has become a powerful force in the preserves industry; to secure a reasonable return on the price it paid to enter that industry, it will have to apply with vigour some of the economic lessons it has learnt in the soft drinks industry. It may therefore be difficult for Schweppes to maintain for a year or two at least its notable rate of advance of recent years.

Pressed Steel

The big rights issue announced by Pressed Steel has given its 5s. ordinary shares a severe knock. A month ago the shares stood at 42s. 6d.; they are now 32s. The new shares are offered at 30s. each, two for five to ordinary shareholders and 66 new shares for every £125 of debenture stock. The issue for about £10.7 million appears to cover something less than half of Pressed Steel's capital needs for its new expansion programme. Last year the group added nearly £4 million to its fixed assets and its liquid balances were reduced from £4½ million to £1½ million. As the chairman, Mr Alex Abel Smith, says, it will be three or four years before the full benefits of the expansion scheme can be expected to accrue. What in the meantime can shareholders expect in the way of dividend?

Profits advanced from £5.9 million to £6.8 million last year, and should go up again this year, for though Mr Abel Smith expects another reduction in orders for railway wagons and equipment he foresees another busy twelve months for the motor car body division and another record year for the Prestcold division. But it would be unrealistic, he says, to expect an increase in the sales of refrigerators of the same magnitude as occurred in 1959. The dividend has been raised from 25 to 30 per cent and there should be no difficulty in maintaining that rate on the enlarged capital. The emphasis must surely be on profit retentions in the next few years to meet the costs of the capital programme; the prospect of conservatism in dividends is reflected in the "ex rights" yield of 4¾ per cent.

Spicers and E. S. and A. Robinson

The recovery in the demand for paper last year, which has already been reflected in the higher profits recently announced by Bowater, has not made its impact on all sections of the paper industry.

The results of **Spicers** are better than the directors forecast when they announced the sale of British Waxed Wrappings to Wiggins Teape last October. For the year to December 31st last the group's trading profits rose by 11½ per cent, from £976,879 to £1,118,860, and net profits before tax at £783,920 are well in excess of the £715,000 forecast by the directors. The ordinary dividend of 10 per cent is also above the forecast of not less than 8 per cent.

Of the £3 million received from the sale of British Waxed Wrappings, £1 million has already been used or committed and it is the present intention to use the balance of the proceeds for further expansion within and outside the group. A dividend of 8 per cent has already been forecast for the current year and shareholders will look for some clearer indication than their decision to pay 10 per cent for 1959 from the directors that it is their intention to pay more than this. This depends on the ability of Spicers' remaining interests, together with the new additions it is making, to replace the sizeable contribution to profits made in the past by British Waxed Papers. At 31s. the £1 shares yield 6½ per cent, assuming that the 10 per cent dividend will in fact be maintained.

The market's reaction to the results of **E. S. and A. Robinson** was to mark the shares down by as much as 12s. to 82s. 6d. The group's trading profit for the year to the end of February fell from £6,184,333 to £6,027,382. With a sharply lower charge for depreciation at £1,481,270 (against £1,864,850) and an almost unchanged tax charge of £2,017,273, net profits have risen from £2,277,847 to £2,505,008, but the dividend has been left unchanged at 16 per cent although its earnings cover has been raised slightly from 2.1 to 2.2 times. The stock market had expected a payment of up to 20 per cent. It seems clear from the results that competition in the packaging industry, to which the chairman referred last year, has become more acute. At the current price the £1 shares still yield barely 4 per cent—a return that would not be justified unless there were a prompt improvement on the latest results. This may depend in part on recent moves to expand its interests both in the paper industry and in other fields.

Rio Tinto Makes the Best of It

It is not so long since the shares of Rio Tinto were being bought on a yield of 2 per cent. Today they yield 5¾ per cent in a dull market. The majority of the shares are held on the Continent which has become increasingly nervous about investments in Africa. About 44 per cent of Rio Tinto's income came from Africa in 1959. Another reason for the selling of the shares was the sharp blow received by the Canadian uranium industry last November, when the United States Atomic Energy Commission in agreement with the Canadian government announced that it would not take up its option to make further purchases of uranium after 1960-63 and that the present contracts would be lengthened out to 1966. Such has been the effect on the market for uranium shares that the auditors in their report draw attention to the fact that the market value of Rio Tinto's investment in Rio Tinto Mining Company of Canada was only slightly above the book value of £10½ million at the end of 1959 and in fact had fallen below it on March 31st.

On the surface the outlook is certainly depressing for shareholders in Rio Tinto but this view is not shared by the chairman, Mr Gerald Coke, and his fellow directors. Already the Canadian company has regrouped its forces to adapt itself to the new situation. A new company has been formed, Rio Algom, to amalgamate its four Canadian uranium producing companies. On June 30th this company will take over a master contract for the 27.7 million pounds of uranium concentrate remaining to be delivered. Its operations will be concentrated at the two Algom mines which have the richest deposits and which are the cheapest producers. The other mines will be closed down but they will be kept on a care and maintenance basis to take advantage of any revival in demand for uranium which may occur. Through the inclusion of Northspan and Milliken in the new group the company will obtain the benefit of substantial tax write-offs. Under the rules of the SEC in the United States, with which the new company will be registered, no forecast of future profits can be given; but the directors of the Canadian company estimate that over the "stretched out" period, earnings of Rio Algom will exceed those that would have been earned by the individual companies over the period of the present contracts. The payment of dividends by the new company will continue to be restricted until the $20 million of Northspan debentures have been repaid.

What of the future of the industry after 1966? Mr Coke says that it holds many uncertainties but he estimates that by 1975 (not 1970 as he mentioned last year) demand will have overtaken supply. Meanwhile Rio Tinto is busily exploring other fields. Last year it acquired the Cam and Motor Gold Mining Company in Southern Rhodesia. Recently it has linked up with companies in both Germany and Austria for the production of uranium and thorium fuels. In the nuclear fuel field, Rio Tinto and Dow Chemical are already partners in a Canadian venture for the extraction of thorium from uranium, and have set up Thorium Limited in this country to produce a variety of refined thorium and rare earth compounds. For the immediate future, however, shareholders' hopes must centre largely on the group's interests in the Rhodesian copper producers and in the Mary Kathleen Mine in Australia, where output has been sold in advance under contract to AEA and where profits for the next few years will be free of tax.

Consolidated Zinc

At the time of the one-for-six rights issue in March last year the directors of Consolidated Zinc took a cautious view of the outlook for 1959. Assuming a recovery in world demand for lead and zinc, they expected earnings to be "in line" with those for 1958—when net profits fell from £1,770,000 to £1,618,000. Three months later all the leading producers introduced restrictions on sales of these metals; zinc prices recovered strongly in the second half of the year and lead edged a little higher. This helps to explain why the directors' caution has proved in the event to have been excessive. The preliminary statement shows that the group's trading balance and other income for the year ending December 31st rose sharply from £4,209,000 to £5,317,000, while net profit rose by over 60 per cent to £2,663,000—£600,000 higher than in the pre-recession year 1956.

The net profit is struck after providing £1,270,000 for depreciation (against £1,392,000) and £1,210,000 (against £1,069,000) for tax. The allocation to general reserve is slightly higher at £950,000, and £280,000 is transferred to exploration reserves. With a final dividend of 2s. 9d. the total payment is raised from 3s. to 4s. per £1 ordinary share on the increased capital of £10,185,696. Despite these good results the £1 shares were still marked down by 2s. 3d. to 73s. 6d., to yield 5½ per cent.

Aircraft Profits

When **Bristol Aeroplane** merged its aircraft and guided missile interests with English Electric and Vickers and its helicopter interests with Westland, the directors said that profits in 1959 would show some improvement and that they expected to maintain the 10 per cent ordinary dividend. To the stock market's surprise, they have declared a dividend of 11 per cent and report a 40 per cent advance in profits before tax, from £1,240,000 to £1,739,000. This increase appears to reflect, first, the dividend from Bristol Siddeley Engines, in which Bristol and Hawker Siddeley each have a half interest. Secondly, it must reflect a reduction in bank interest; last year saw the conclusion of the "Britannia" programme and the formation of the non-consolidated company, Bristol Siddeley Engines, which combined to reduce Bristol Aeroplane's own bank overdraft from £14½ million to under £5 million.

Profit after tax has risen from £614,000 to £893,000, so the latest dividend is covered about 1.8 times. But this is of little more than historical significance and until investors can gain clearer ideas of how the British aircraft industry in its new and slimmer form will fare—and of the prospects of Bristol as an investment trust tied to the fortunes of the industry—they cannot be expected to show much enthusiasm for the 10s. shares, which at 14s. 10½d. yield 7.5 per cent.

The preliminary statement from de **Havilland Holdings** merely spells out the estimates of the group's results in the year to September 30th as revealed in the documents sent out to shareholders for the merger with Hawker Siddeley. There is no final dividend for 1958-59, after an interim of 5 per cent. Those who accepted the offer from Hawker Siddeley will be entitled to any dividend paid by that company for the year to July 31st next. Profits of de Havilland before tax amounted to £2,263,301 in 1958-59, compared with £383,775 in the previous year, including a special credit of £530,860. The net surplus after tax is £1,187,504, against £133,606. The sharp recovery in profits was due to a sudden concentration of work last year, including deliveries of Comet 4's and of the missile "Firestreak" and the development of "Blue Streak." But this accounting for the past offers little guidance to the future of the aircraft industry in its new groupings.

English Sewing Cotton

For five years the ordinary dividend of English Sewing Cotton was left unchanged at 12½ per cent. Earnings from the British mills were on the decline and income from the subsidiary, American Thread, became an increasingly important factor in the group's dividend policy. Last year the revival in the Lancashire cotton industry altered this picture—to the shareholders' immediate advantage. Trading profits of American Thread rose by 31½ per cent, from £1,280,698 to £1,648,177, but the advance in the trading profits of the British interests was twice as big at 63 per cent, from £1,084,071 to £1,766,585. So the British mills were again contributing over half the consolidated profit. For the group as a whole, gross profits went up from £2,364,769 to £3,414,762 and the net surplus after tax more than doubled, from £433,213 to £963,417.

Equity earnings have risen from 16 to 38 per cent and the directors have raised the ordinary dividend to 17½ per cent. The year's results, and particularly the recovery in profits at home, justify the payment of 5 per cent more. But the directors make a point of saying that they came to their decision "having regard to the improved prospects for 1960." In the short run, the outlook for the cotton industry is brighter than it has been for years and English Sewing Cotton's decision gives added strength to cotton equities. Its £1 shares at 52s. 6d. now yield 6.8 per cent. Yields on cotton shares are still 1½ to 2 points higher than those on industrial blue chips. That may possibly take rather more account of the chequered record of the industry than of the immediate prospect of better earnings and dividends from cotton companies that are staying in business.

Insurance Results

Bigger dividends declared by nearly all the composite insurance companies stem in part from their improved underwriting experience in 1959. Of these offices the largest is the **Royal**, which last year earned an underwriting profit of £1,306,818 on its accident business, compared with a loss of £602,005 in 1958. In this department, premium income rose from £70.6 million to £74.4 million and Mr. T. H. Naylor, the chairman, says that of its major territories only the United States failed to make a modest profit. He denies the suggestion that insurance companies pay inflated repair charges on damaged cars, but he admits that the cost of repairs is rising and says that if this trend continues, a revision in rates must follow.

In the fire department, premium income rose by £2.6 million to £56.5 million, but the underwriting surplus fell by £114,000 to just over £1 million. In this country continued competition led to a lowering of rates, while the exceptionally dry summer was an important factor in what Mr Naylor refers to as the "abnormal level of fire wastage" in 1959. By contrast, a modest profit was shown on fire business in America. With a further increase in investment income from £3.9 million to £4.3 million, Royal's consolidated net profit of £5.3 million was a record. At 125s. 10½d. xd the 5s. shares yield 3.7 per cent on the increased dividend of 93½ per cent, against 78⅓ per cent. The low yield partly reflects the possibility of a scrip issue.

Unlike the Royal, **General Accident** made a bigger profit on its fire account last year: it rose from £682,071 to £826,595 on a premium income of £6.6 million. In the accident department the tiny profit of £64,000 in 1958 was turned into one of over £1.1 million, better than it has been for several years. The company, with a premium income of £61.5 million in 1959 in this department underwrites a good deal of motor business, about which the chairman, Sir Stanley Norie-Miller, says that its many problems show little sign of abatement. The dividend has been raised from 27½ per cent to 45 per cent, and is still covered 1.6 times by investment income, which over the last ten years has soared from £716,264 to over £3.6 million. It is mainly on this score that the 5s. units still yield only 3 per cent at the current level of 75s. xd.

The **Pearl** has reported a further increase in the gross yield on both its life funds to £6 11s. per cent. This is due largely to higher dividends on its big equity portfolio, with a book value of over £65 million on December 31st, £7½ million more than at the end of 1958. On its non life business Pearl's underwriting loss was £960,916. On the increased tax-free dividend of 80 per cent the 5s. shares at 140s. yield 4⅓ per cent.

BICC

The full report for 1959 of British Insulated Callender Cables without a statement from its forthright chairman, Mr W. H. McFadzean, is very like Hamlet without the Prince. The chairman's statement is not being published until nearer the date of the annual meeting later in the month. Meanwhile the accounts measure the group's growth arising from the acquisition in 1959 of both Telegraph Construction and Maintenance and Scottish Cables. Total assets of the group have risen from £62.4 million to £72.3 million; net fixed assets account for £27 million against £22.5 million. In 1955 total assets amounted to £59 million and net fixed assets to under £16 million. Over this period the group's investment portfolio has more than doubled, rising from £3 million to £7.3 million at book values; its market value at December 31st was over £11½ million.

Income from these investments, which are largely in the Commonwealth but which include some interests in Portugal and Venezuela, almost doubled last year from £358,850 to £676,548; in a period of intense competition in the cable industry shareholders may be cheered to find that the present net dividend is half covered by investment income alone. The balance sheet also reflects the difficulties of last year for it reveals a net cash deficit of £1.7 million (against net liquid assets in 1958 of £1.3 million). Since capital commitments have risen from £1.6 million to £2.3 million there is a clear possibility that new capital may be needed. The £1 shares, which have weakened since the preliminary profit statement was published, yield almost 5 per cent at 54s. 6d. xd on the maintained dividend of 13½ per cent.

Birmingham Sound Reproducers

This company, which manufactures automatic record changers, gramophone units and pick-ups under the brand name "Monarch," was made public in 1957. Like other specialised firms of its kind it has been able to hold its own both in the British and American markets against the competition of the bigger electronic manufacturers that have a far wider range of interests and products. Record sales were slack until the summer of last year and in the first part of its financial year Birmingham Sound Reproducers did not find the going too easy. Later, however, sales began to improve and the company produced more than it had ever done before. That is not reflected in the trading profit, which fell from £1,659,274 to £1,534,091, but these results were affected, as the chairman, Dr D. M. McDonald, explains, by the reorganisation of production and sales.

Thanks to a reduction in tax, net profits were slightly higher at £812,856 (against £801,606) and the ordinary dividend was raised from the equivalent of 44½ per cent to 50 per cent. On that dividend, covered 2½ times by earnings, the 5s. shares at 50s. 7½d. yield 4.9 per cent. The company has successfully launched new models, including a new tape deck.

Radiation

Radiation, which makes gas and electric cookers and a wide range of other durable household equipment, had an extraordinarily successful year in 1959. Trading profits more than doubled, from £1,375,112 to £3,198,238, and net income trebled, from £483,852 to £1,424,532. The ordinary dividend was raised from 6 to 12 per cent, but this included a bonus of 2 per cent. The chairman, Mr W. Donald King, expects competition to be tougher this year and costs are rising. Though Radiation may be able to hold its share of the market, its profits may not be quite so buoyant.

Fluctuations in earnings in this industry are inevitable and so the directors have sought to establish a dividend rate that they can expect to maintain under reasonable conditions. The rate they seem to have in mind is 10 per cent; Mr King emphasises that the bonus of 2 per cent derives from the 1959 profits and he warns shareholders not to assume that it will be repeated in subsequent years. On a 12 per cent dividend the yield on the £1 shares at 37s. 6d. xd is about 6.3 per cent. On a 10 per cent payment it would be about 5 per cent but shareholders could be acutely disappointed if the dividend is so reduced this year.

Smith St. Aubyn

Like those of the other discount houses which close their financial years at the end of March, the results of Smith St. Aubyn reflect the impact of the decision to raise Bank rate to 5 per cent last January. In his statement Mr Duncan Mackinnon, the chairman, says that the increase in Bank rate resulted in an immediate loss on its bill portfolio and a considerable reduction in the unrealised profits on its bond holdings. But he adds that the company is now trading at a profit again. Despite this setback disclosed profits for the year to March 31st last were only £43,888 lower at £247,582 and the ordinary dividend has in fact been raised from 15 per cent to 17½ per cent. The company has handled a large amount of bills and its year-end holding was 20 per cent higher at £68.4 million. By contrast its portfolio of short dated bonds, which had more than doubled in the previous year, fell sharply from £27 million to £17.4 million. The larger part of the holding was held for most of the year and produced a very satisfactory profit, but it was felt necessary to reduce the holding in the period of uncertainty before the increase in Bank rate. Further sales were made after January, when in Sir Duncan's view, the authorities were maintaining the short bond market "on an unrealistic basis" and when a better return could be obtained on bills than on bonds.

London Stock Exchange

FIRST DEALINGS:	April 4	April 25	May 9
LAST DEALINGS:	April 22	May 6	May 20
ACCOUNT DAY:	May 3	May 17	May 31

The stock market's initial response to the announcement of credit restrictions sent the *Financial Times* share index up 5.2 points last Friday, its biggest rise in a single day since the Budget. The rise in prices was not supported by any volume of business and new uncertainty about the outlook under conditions of restrained credit together with the topsy-turvy behaviour of Wall Street brought prices down. Over the week to Wednesday's close *The Economist indicator* fell 5.4 points to 335.6, a new low point for the year. The broadening of investment demand for gilt-edged stocks was reflected in much firmer prices. In undated stocks 3½ per cent War Loan put on 1⅛ to 62⅞. Gains in medium-dated stocks ranged up to more than a point; exceptionally Savings 2½ per cent, 1964-67, rose by 1¼ to 83⅛. Home corporation loans have also been stronger, with 5 per cent LCC, 1980-83, gaining ½ at 92¼.

Falls in *industrial equities this week* have in almost all cases wiped out last Friday's gains, and in three days the *Financial Times* share index fell by 3¼ per cent from 310.6 to 298.9, its lowest point since November 9th last year. The market in steel shares was mixed: Colvilles fell 1s. to 67s. 6d., John Summers were unchanged at 72s. and Dorman Long gained 4½d. to 45s. 9d. Among bank shares Barclays were 3d. higher on balance at 53s. 6d. having *touched 56s. on Friday*, but Midland lost all its earlier gain and closed on Wednesday 6d. lower at 86s. 9d. In HP shares, United Dominions Trust were unchanged over the week at 145s., though on Friday they had been marked up to 152s. 6d., but Bowmaker rose from 22s. 7½d. to 24s. 3d. In the stores group United Drapery lost 1s. 6d. to 46s. 9d., but GUS "A", following favourable press comment, rose by 1s. 3d. to 46s. 4½d. Although Wall Street's sharp rise on Tuesday helped American favourites to regain some of the ground lost earlier, the gains were not sufficient to wipe out all these losses, so that Unilever Limited over the week lost 2s. 10½d. to 147s. 10½d. and the NV shares lost 1s. 6d. to 193s. Philips Lamps fell 2s. 3d. to 178s. 3d. and Ford Motor in a weak market fell by 1s. 4½d. to 103s. 1½d. Among heavy engineering shares Guest Keen were 2s. 3d. lower at 81s. 9d. Vickers lost 1s. to 29s. 6d. xd and Davy-United closed 2s. lower at 102s. 6d. Electrical shares were mixed; AEI gained a further 4½d to 52s. 7½d. and General Electric put on 7½d. to 38s. 1½d., but English Electric closed 6d. down at 38s. 10½d. Building and paper shares were particularly weak on disappointment with the results of Associate Portland, whose shares fell 3s. 4½d. to 62s. 10½d., and E. S. and A. Robinson, which lost 11s. 9d. to 84s. 3d.

Oil shares have all weakened, with Shell 2s. 9d. down at 144s. 6d. There has been a renewed interest in gold shares both in London and in the Cape.

Money and Exchanges

THE MONEY MARKET

THE new measures to restrict credit had little effect on the bill rate at last Friday's Treasury bill tender. It was only fractionally lower at £4 13s. 0.48d. The discount houses left their concerted bid for the 91 day bills offered at £98 16s. 9d. unchanged but they received only 23 per cent of their applications. The tender was split due to the incidence of the August Bank Holiday in three months' time. For the less marketable 92 day bills the market bid £98 16s. 6d. and received a full allotment so that the market's total allotment at its minimum price was about 28 per cent, against 51 per cent the previous week.

In New York the rate on three months bills fell sharply from 3.317 per cent to 3.003 per cent and on six months bills from 3.705 to 3.349 per cent.

Credit conditions became even more comfortable in Lombard Street at the end of last week and on Friday the Bank of England sold back a small amount of bills to the market. By contrast money has been in short supply this week apart from Tuesday. Despite some small official help one or two houses were forced to borrow at Bank rate a marginal amount on Monday and a small amount on Wednesday.

(1) Retained imports. (2) Owing to changes in classification 1957 and 1958 figures are not strictly comparable with later ones. (3) 1957 figures in *italics* include trade with the Channel Islands. (4) Average for fourth quarter. (5) Average for first quarter. (4) In 1959 indices for total imports and exports, but not for the commodity classes, are adjusted to include trade with the Channel Islands.

APPOINTMENTS

Ferranti

has a vacancy

at the

HEAD OFFICE IN MANCHESTER

for an

ASSISTANT ECONOMIST

The duties of the successful applicant will include the preparation of statistical information for higher management, the preparation of reports on current economic issues relevant to the Company's interests, and the analysis of published financial information.

A good degree in Economics, a sound knowledge of statistical sources and an ability to do independent work are desirable qualifications.

The Company has a Staff Pension Scheme and a Dependants Insurance Scheme.

Forms of application can be obtained from T. J. Lunt, Staff Manager, Ferranti Ltd., Hollinwood, Lancs. Please quote ref.: LJG.

COST ACCOUNTANT

MELBOURNE—AUSTRALIA

A well-known Public Company engaged in the manufacture of canned and frozen foods requires a young and competent Accountant whose ability will ensure rapid promotion to increased executive responsibility and status.

Qualifications: Fully qualified Cost Accountant under 30, with previous experience in manufacturing organisation producing a variety of products.

Duties: Supervision and preparation of weekly and monthly cost control data for management budgetary control in conjunction with monthly financial accounts. Residence in Melbourne.

Salary: To be discussed during interview in London with Managing Director. Salary will be based on past performance and future potential and will be attractive to man chosen.

Write, with full details of qualifications, to:
GILBERT J. McCAUL & CO., LTD.
Kempson House,
35/37, Camomile Street,
London, E.C.3.

CHIEF ACCOUNTANT

OVERSEAS OPERATIONS

A large manufacturing organisation with numerous subsidiary companies is expanding its activities both manufacturing and marketing within the Commonwealth and in Europe and wishes to appoint a Chief Accountant for its overseas operations. The appointment will be based on London with the parent company but some travel overseas will be necessary. There will be opportunities for advancement into wider spheres of management. The advice of professional taxation and accounting consultants will be available. Starting salary will be not less than £2,500 and commensurate with experience and proved ability; pension scheme is non-contributory and assistance will be given with house purchase if required.

Candidates should be Chartered Accountants aged 35-45 who have had practical experience of accounting and taxation overseas. Applications will be treated in the strictest confidence and should give details of appointments held, experience gained and salaries earned. They should be addressed to Box 1319.

BRITISH NYLON SPINNERS LIMITED require a woman, aged 25-45, as an Information Assistant for the Economics Library of their London Office in Knightsbridge. Candidates, preferably educated to degree standard, should have had some experience of library work, with genuine interest in Economics as applied to the textile industry. Excellent working conditions in modern offices.—Apply in writing to Personnel Manager, Pontypool, Mon.

EXPERIENCED WRITER required for London monthly publication dealing with important international trade, Economic, financial or technical background essential, languages desirable. Good salary. Pension fund.—Apply Box 1320.

ECONOMICS GRADUATE, young, with proved writing ability, required to join staff of oil magazine in London.—Apply Box 1321.

THE SCOTTISH
COLLEGE OF COMMERCE
DEPARTMENT OF ACCOUNTANCY AND COMPANY SECRETARYSHIP

SENIOR LECTURESHIP IN LAW

Applications are invited for the above post tenable in the Department of Accountancy of the College.

Applicants should hold a degree in Law of a British University and should have several years' post-qualifying experience in the profession, commerce or industry. Previous lecturing experience, although a recommendation, is not essential.

The salary scale appropriate to the post is that appropriate to Senior Lectureships, viz., £1,560 x £60 — £1,800.

Further particulars may be obtained from the undersigned, to whom applications should be sent, not later than two weeks after the appearance of this advertisement.

W. H. MASSON
Secretary-Treasurer.

Pitt Street, Glasgow, C.2.

For other appointments see page 575

An expanding organisation of

RESEARCH & MARKETING LIMITED.
54 Fetter Lane, E.C.4.

PROFESSIONAL ACCOUNTANTS. HOME CIVIL SERVICE. At least 16 pensionable posts for Chartered Accountants or for Certified Accountants who have had suitable professional experience. Age at least 25 and under 35 on May 1, 1960 (with extension for Regular Forces Service and Overseas Civil Service). Starting salary (London, men) £835 (at 25) to £1,120 (at 34). Scale maximum £1,165. Good prospects of promotion to senior posts carrying salaries up to £2,005 or higher.—Write to Secretary, Civil Service Commission, Burlington Gardens, London, W.1, for application form, quoting 57/60. Closing date June 2, 1960.

DUNLOP

EUROPEAN STUDIES

Dunlop has an immediate vacancy at their Head Office in London for a man with sales or market research experience, preferably in the automotive branch. His main task will be to study market situations and other trading problems arising from the free trade movements in Europe. He must be prepared to travel and if necessary to live abroad although this latter is not immediately envisaged. A University graduate is preferred, and a fluent knowledge of at least one European language is important. Starting salary will be according to qualifications.

Applications to Overseas Sales Executive, St. James's House, King Street, London, S.W.1.

UNIVERSITY OF AUCKLAND
NEW ZEALAND

LECTURESHIP IN ECONOMICS

Applications are invited for the above-mentioned post; candidates should have qualifications in Economic History or Economic Theory.

The salary scale is £1,250 — £1,700 per annum, and an allowance is made towards travelling and removal expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in New Zealand and London, on June 15, 1960.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above Studentships and Grants for research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University. Applications should be sent not later than July 1, 1960, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

GENERAL SECRETARY VACANCY

In June, 1961, the General Secretary of the Institution of Professional Civil Servants will retire. Applications are invited for this post. Candidates will need to have a detailed knowledge of Civil Service organisation, Whitley working and trade unionism and be able to show a capacity for representing the extremely wide range of interests of the Institution's membership. Experience of negotiation and arbitration, a capacity for presenting a case and for speaking at public meetings, ability to write for the Institution's journal, are all essential attributes.

The salary is £2,700 a year (subject to adjustment in line with Civil Service salaries at this level). There is a non-contributory superannuation scheme with a fixed retirine age of 60. Six weeks' annual leave.

Applicants will be considered together with the present senior staff of the Institution. The successful candidate will be required to take up duties a few months before the General Secretary retires. Applications, giving all relevant detail, must reach the Institution by June 30, 1960, and should be addressed to: The General Secretary, I.P.C.S., Queen Anne's Chambers, 28 Broadway, London, S.W.1.

World Politics and Business

The Economist · 22 Ryder Street · St. James's · London · S.W.1

A B

There you have it . . .

and there, very likely, is where you don't want it. Our business, which is mechanical handling, satisfies the continual needs of industry to move all sorts of things from A to B. Thinking of the shortest distance leads to thinking of conveyors and thinking of conveyors - to a great many important people we are glad to say - leads to thinking of Sutcliffes.

Maybe you have never thought of Sutcliffes, but there are a great many reasons why you should; not least is our fundamental 'straight-line' thinking which is expressed in many very large and important handling plants and in more underground coal conveyors than anyone else has made. We installed the first of these in 1905 so we were in the lead then. We still are.

Sutcliffe *Britain's Best Conveyors*

We shall be pleased to send you informative literature ref: E 73 on request.

WORLD'S SMARTEST RESORT, WORLD'S FASTEST SHIP

Sail with a gay Who's Who on s.s. "United States"

To America in five days! From the moment that deep ship's whistle fills the air, your trip on the UNITED STATES is an unforgettable experience.

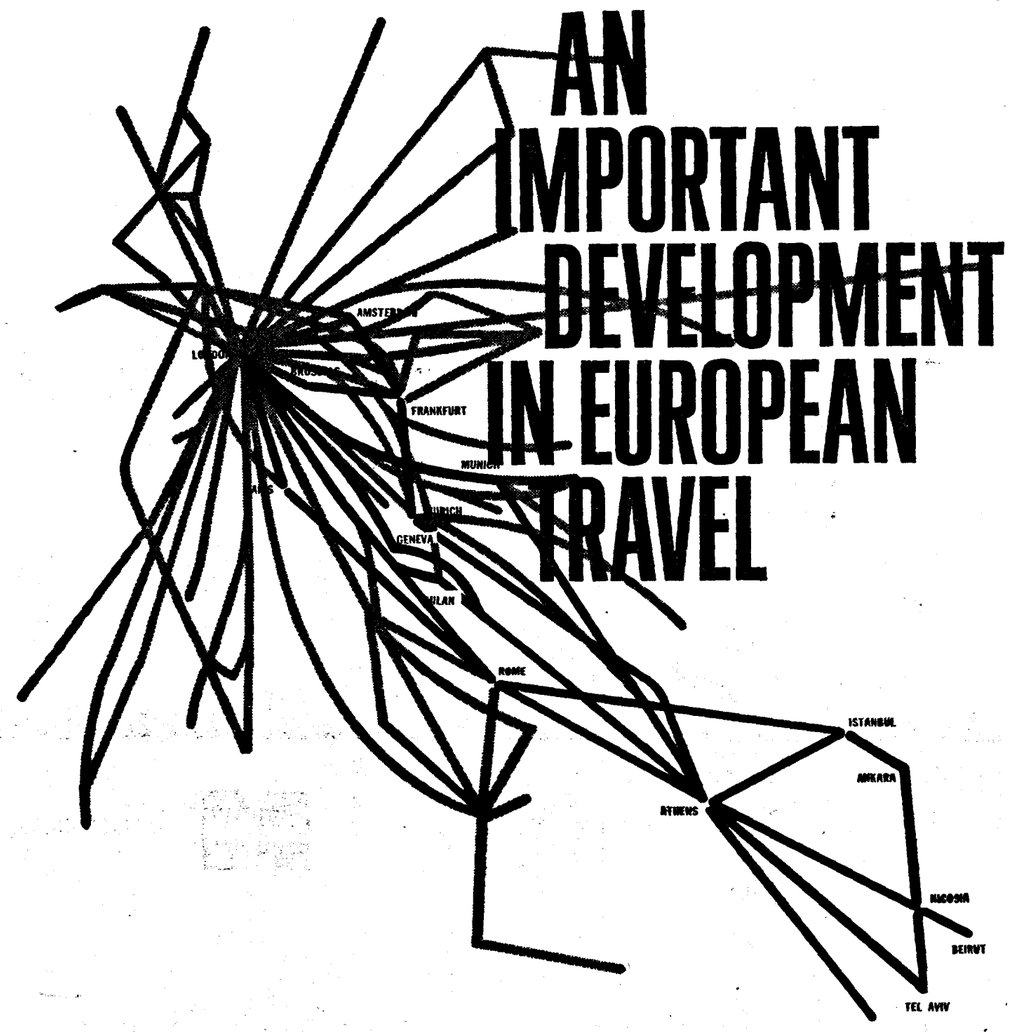
You enjoy Meyer Davis dance bands . . . gourmet meals . . . pre-release films . . . cinema horse-racing . . . a heated swimming pool.

Your fare includes acres of deck space . . . luxurious air-conditioned accommodation . . . liberal luggage allowance . . . plus 5 days of the world's most palatial resort life thrown in! There is no finer food and service anywhere than on this great ship and her charming running-mate the AMERICA.

By Presidential proclamation, 1960 is a special "Visit America Year." Your voyage can be a glorious holiday for your family too. With the lifting of restrictions on currency for travel you can get virtually unlimited dollars for expenses on board and in the United States and Canada. The luxurious Cabin and Tourist classes can meet any budget problem. And you can pay all fares to your destination and return in sterling. Also, when the low Thrift Season fares are in operation there is an additional reduction of 10% on Round Trip fares during the same period.

Consult your Travel Agent about inclusive tours based on our "in-America-when-you-step-aboard" sailings.

It's sparkling, gay, lively—but no two guests get the same impression of the Captain's Dinner. This is how Tom Keogh, the well-known illustrator and stage designer, sees it.



Since restrictions on currency for travel have been lifted, more and more wives go with their husbands on business trips to America.

NO FINER WAY TO THE U.S.A.

AN IMPORTANT DEVELOPMENT IN EUROPEAN TRAVEL

Two Great Airlines link networks

BEA and OLYMPIC have linked their networks of services across Europe. This now brings you the advantage of a greater number of flights, particularly on the important trunk route through Paris, Rome and Athens to the Eastern Mediterranean. In addition, services connecting the intermediate stops and main European centres are more conveniently scheduled. First Class and Tourist services are available on these routes. Full details of connections and fares are available from your Travel Agent or any BEA or OLYMPIC office.

Stronger than Hercules

Every day men like this in plant locations throughout the world are given the strength to exert and control tremendous power far greater than ever attributed to the mythical Hercules. Possessing complete control of their tremendous strength, these men break and join molecules of materials found in nature and produce valuable products such as petrol, plastics, rubber, fertilizers and many other chemicals. The engineers at Kellogg House have provided the technological know-how and direction—at an economic cost—to create many of the processing facilities which enable ordinary men to perform Herculean tasks necessary for industry. Kellogg invites enquiries from the men responsible for directing and managing process facilities.

SENIOR SERVICE *are Satisfied*

—THEY CHOSE TR

J. A. Pattreiouex Limited, one of the Gallaher Group of Companies, and makers of Senior Service Cigarettes, have chosen TR Internal Telephones, TR Time Recorders and TR Fire Alarm Systems for their three large factories at Hyde, Middleton and Ashton. These premises are converted cotton mills and quite naturally their size presents a problem in internal communications, and fire security—a problem solved very successfully by TR Services.

What are TR Services?

A complete service in business and industrial communications offered on a rental basis. These services which are used by over 30,000 organisations in industry and commerce, include Internal Telephones, Internal Broadcasting, Staff Location and Time Control, TR Security (watchman protection, fire detection and alarms). Full details of how TR Services can help you will be sent on request.

The Weekend is the Time

–when Grandma comes to tea

THE WEEKEND IS THE TIME when the Marsdens really are a family. Grandma comes over for the day from the village where she lives, and that's something everyone looks forward to.

THE WEEKEND IS THE TIME the Marsdens do most of their television viewing; they enjoy watching with Grandma, because it's such a treat for her. And they have so much more leisure at weekends; so they're relaxed, receptive, in the right frame of mind to take in and appreciate what they see.

THE WEEKEND IS THE TIME when the family likes to talk things over together. Grandma is particularly interested in her daughter's home, and the exciting new things she's buying nowadays for her house and family, and they discuss together the things they see on television.

THE WEEKEND IS THE TIME to reach the Marsdens—and their visitors. There are four million homes like theirs in the North and Midlands and the weekend is the time when viewing by visitors is greatest. The Marsdens are the people with money now; they can afford to spend it on better living and modern comfort for their homes and families. So if you sell what they want, tell them about it—through ABC Television.

THE WEEKEND IS THE TIME!

The Congress of Paris

THE weather planes over the summit speak of lowering skies. These are the normal atmospherics of diplomacy: they need not be unduly disconcerting. Mr Khrushchev has hurled many less justifiable thunderbolts than those he has just directed at the Central Intelligence Agency and General Twining. The righteous Jove has seemed, if anything, less menacing than the unregenerate one. Mr Khrushchev went as far as to question President Eisenhower's motives in Moscow on Wednesday, but the news blackout imposed for a time that night may mean that he then had second thoughts about courting an open break.

Even so, there is a danger. Mr Khrushchev has not been ungrateful for the opportunity given by the shooting down of an American U2 reconnaissance aircraft to chastise the Americans before a Supreme Soviet containing watchful, if silent, critics of the détente. He may even have earned himself an approving nod from Peking. But if the American pilot is now put to an unsavoury trial to satisfy the cold warriors of the communist block, President Eisenhower cannot be expected to negotiate in Moscow next month, whatever happens in Paris next week. As it is, most of the clouds above the summit have not suddenly blown up out of a clear firmament, and they will not speedily roll by. The problem of German reunification has been with us for fifteen years: the present Berlin crisis, in its more or less acute form, for a year and a half. We live in a damp climate: an umbrella is a luckless diplomatic symbol only when it stays tightly rolled.

The summit conference, and even a series of summits, will not by themselves solve the major crises of the world; they can merely alleviate them. By and large we must live with our tensions. What we can do, unceasingly, is try to make them livable with. Diplomatic solutions, when they are not imposed by force, become possible only after sensible shifts in the balance of power or changes in the internal complexions of the great powers. There have been occasions, particularly after Stalin died in 1953, when the balance of power in central and eastern Europe seemed to have shifted in the West's favour, and the reunification of Germany on western terms could appear a feasible diplomatic aspiration. This opportunity, if it ever existed, has now passed for the foreseeable future. When Mr Gromyko wished to be particularly tantalising at the foreign ministers' conference at Geneva last summer he would recall the years when Soviet policy still admitted, in principle, that Germany could be reunited through free elections.

But time jogs on and Soviet policy has a new basis. In November, 1958, Mr Khrushchev reopened the Berlin question in the belief that the advance of Soviet military technology and the consolidation of the east German regime had given him the advantage. But this summit conference still finds the powers in stubborn, and perhaps merciful, equilibrium. The Russo-American détente has produced nothing except the understanding that neither power dare strike the other down. This is something; it may even be counted the main thing. The capital lesson of diplomacy is that neither treaties nor agreements can permanently remove the danger of a great war. Only the determination of the powers themselves to avoid such a war can keep the danger in abeyance.

The object of the Paris summit and its successors should thus be twofold. It should be to compel the great powers regularly to apply their minds to the existing sources of tension that could seriously jeopardise the détente. If they

are realistic they can negotiate small, but cumulative, arrangements that can reduce the risk of their blundering into war. It should also afford them the opportunity, not of preventing new crises elsewhere—for the smaller powers cannot be deprived of their freedom of action—but of cushioning their effect, so that neither East nor West is so sharply humiliated or feels its basic interests so threatened that it is provoked into raising the dispute to a *casus belli*. This may be called a code of conduct, such as Mr Selwyn Lloyd is known to have in mind ; it is, however, unlikely that Mr Khrushchev's ideas of competitive co-existence go as far as the Metternichian inflexibility that such specific arrangements as arms embargoes in the Middle East or Africa would involve.

Even so, if they are foresighted, the powers will reflect with increasing urgency on the limitations of the present four-power system, hitherto chiefly preoccupied with European questions, in tackling disputes that are likely to arise in an ever-widening arena. This may prove to be the last summit conference for a considerable period to be primarily concerned with European issues. The next one could find itself more immediately interested in Iraq or North Africa ; the next, with South East Asia or the Caribbean. Already, the problems that China, a restless and ambitious power, poses in nuclear and general disarmament suggest that future discussions on those subjects, at any rate, cannot be profitable without its concurrence. There are, and will be, other powers with claims to be heard. All this will be better considered before the next emergency arises. Summit diplomacy can hope to have greater success in these preventive efforts than in its strictly therapeutic ones.

MR KHRUSHCHEV'S initial, sophisticated reaction to the spy plane incident suggested that the present détente might have a greater stability than had appeared likely even on the morrow of his American visit. Thus, he did not declare that these flights, each one of which confronts the ground defences with the fear of surprise nuclear attack, were necessarily a cause for war. He apparently knew enough of Mr Eisenhower from their earlier meetings to be able to dissociate him publicly from these espionage activities. There has been no question of abandoning the summit.

Yet Mr Khrushchev's own position must be considered. He has associated himself with a policy of extending the basic détente. It has not received general support within the communist block. Since last December he has seen the West engaged in an anxious attempt to rediscover the semblance of its earlier unity ; and it might not unreasonably be construed that the coherence the West now possesses comes from the tacit acceptance of the arguments of those most attached to inflexible policies. At the same time, the United States decision to persevere with the reconnaissance flights and the unilateral decision to resume underground nuclear tests—even for peaceful purposes—may increase whatever plausible suspicions Mr Khrushchev may entertain that military opinion in the West is consciously reducing the prospects for an improved détente.

The bias of Mr Khrushchev's policy in the next ten days may thus be unusually instructive. He has seized on the spy flight as an excuse to his own critics if the Paris summit ends in unmitigated deadlock. It remains to be seen what efforts he is prepared to make in Paris to escape from such a deadlock. If he judges that Mr Eisenhower's visit to Moscow would serve no useful purpose, he has a spy trial ready to prevent Mr Eisenhower's arrival. One factor in Mr Khrushchev's mind must be the type of American government that will emerge from the November elections. Even before the aircraft incident Mr Khrushchev had launched a bitter personal attack against Mr Nixon and one of his possible secretaries of state, Mr Dillon.

THERE is, however, a more hopeful moral that may also be drawn from the flight of the U2. The American counter to Mr Khrushchev's charges against foreign bases has been to revert to the idea of Mr Eisenhower's open skies proposal at the Geneva summit in 1955. The moral basis for this may now look shakier than it did ten days ago, but the scientific argument is becoming increasingly convincing. The rapid development of aerial photography techniques, to which American research has been giving much attention, is reaching the point where the Russian aversion to disarmament inspection—which Mr Khrushchev prefers to call licensed espionage—could become as antiquated as the U2 aircraft itself beside the Samos reconnaissance satellite. The United States has already got surprising, if unintentional, photographic results from its last earth satellite ; and there was no Russian protest. For Mr Khrushchev to insist on the inviolability of his air space will grow increasingly difficult with time: after all, he has his own satellites girdling the earth over everybody's heads. Ultimately, the powers will have to choose between shooting down every meteorological device, if they can, and living with the idea of being inspected. If inspection from satellites cannot be prevented, Mr Khrushchev may come to see the sense of making a proper job of it, and tying in prevention of surprise attack—General de Gaulle's present preoccupation—and general disarmament as well.

It seems probable that the U2 incident will give the disarmament question an even higher priority in Paris than it would otherwise have had—even if the full consequences of scientific development are not yet accorded full diplomatic recognition. This is the field where Mr Khrushchev himself is most likely to spring surprises ; after all, the Russian position in the ten-power talks at Geneva has not budged appreciably from Mr Khrushchev's own proposals at the United Nations in September, 1959. The summit can infuse new purpose into the flagging Geneva talks both on general disarmament and on nuclear tests. This is necessary if the détente is to be given any purposeful meaning.

The German question and Berlin, the most immediate sources of tension between East and West, remain. Since the talks at Geneva and Camp David last summer Soviet policy has been at some pains to remove the impression of a threat to sign a unilateral peace treaty with the east German regime, provided the West shows itself willing to negotiate. If Mr Khrushchev is prepared to await the outcome of the American elections, and the next west German elections in 1961, before cutting the last bridge to a compromise with the West, an interim arrangement on Berlin remains a possibility. Berlin is thus a continuing test of the great powers' determination to avoid a general war.

Mr Eisenhower has made it perfectly clear that the only way west Berlin can be protected by the West is by making it a *casus belli*. For the past twelve months Mr Khrushchev seems to have taken him at his word, that an overt move against Berlin would disrupt the détente—perhaps fatally. The issue on which the West has not been decided in its own discussions is how far it is necessary and possible to let Mr Khrushchev off the hook—for the absence of any compromise would be interpreted inside the communist block as a direct rebuff—by rewriting the Berlin statute both to continue the indispensable western rights and to deprive the Russians of any legitimate complaint there. To leave west Berlin in jeopardy would itself be a crushing blow to western unity and prestige. Everything depends on whether the argument in Paris, on both sides, is conducted in order to win or, in the last resort, to reach a compromise. The safe ground is narrow, but it can still be discerned on the lines of the final western offer at Geneva last summer.

The essential issue in Paris is whether the powers are content to settle for the sterile détente imposed by the nuclear balance, or whether they are willing, both by alleviating existing tensions and establishing the machinery of consultation that can limit the effect of new crises, to improve the quaking half-trust that has been built up on the simple avoidance of the ultimate disaster. This has to be a two-sided business. It is not enough to suppose that Mr Khrushchev and Mr Gromyko have reason to let the West down lightly this time, or that the essential enlightenment of western policy will necessarily shine through the argument. But the détente, such as it is, exists. It is not impossible for both sides to walk, circumspectly but deliberately, down the same road.

Can Gaitskell Go On?

It now seems probable that the Labour conference next autumn will pass a motion in favour of unilateral disarmament, and thereby confront the party with the greatest crisis in its history

LAST month, the self-confessed failure of the Government's defence policy threatened the collapse of the Opposition, caught Mr Gaitskell in mid-flight between the United States and Haifa, and presented Mr Macmillan with the paradoxical prospect that a few more such Tory fiascos might leave him without a major party to fight against in the country. Only a brilliant and exceedingly unlikely success by Mr Macmillan at the summit could now, it seems, rescue his political opponents from suicide by resolution at the annual conference next October: a real rapprochement with Russia on multilateral disarmament could alone create the "new situation" which would enable right wing trade union leaders to wriggle free of their neo-pacifist mandates. Otherwise, if Mr Macmillan fails, and particularly if he fails gallantly, Mr Gaitskell is in the soup. A staring match will have begun between a party conference that lacks the power to elect a leader but also the temper to work with one who is not a unilateral disarmer, and a Parliamentary Party that will not elect a unilateral disarmer as leader but has usually considered itself bound by the conference's resolutions.

The first question for Mr Gaitskell is whether this battle is to be faced immediately or very temporarily avoided. If Mr Gaitskell were a man of weaker fibre than he is, there are plenty of pressures that could incline him to acquiesce in evasion. He finds himself surrounded by a Labour tradition and an atmosphere in which "fudged" resolutions saying one thing in a tone indicating the opposite are the rule. Some of his supporters in the Parliamentary Labour Party are already saying that a unilateralist resolution will have to be passed at the conference because the unions are so mandated, but that it can be done hurriedly at the end of an afternoon ; that an executive resolution which straddles the defence issues can be given maximum publicity and then be carried as well ; and that although the conference will thereby have made an ass of itself the history of Labour party conferences shows that this will be in their best tradition.

Others claim that Mr Gaitskell can turn to his own advantage the fact that the inexorable pressure of events has forced nearly everyone to adopt a position not dissimilar to Mr Cousins's original seven points—which denounced a "first strike strategy" and hence first strike weapons like the Blue Streak and called for the removal of vulnerable weapons like the Thor. This group, or collection of individuals, of whom Mr Crossman is one of the most noticeable, favour substituting an entirely new Labour defence policy to supersede all previous controversies. Other Labour supporters say that there is no real need for Labour to have an official defence policy at all ; it would be far more sensible if individual members of the Opposition were encouraged to enhance their personal reputations by contributing their own ideas to the public pool, without committing the party to fixed positions or raising questions of a split.

NO doubt these last two suggestions are tempting. But, even if papering over the cracks were the right thing for the party to try (which it is not), these would not do the trick. Most of the new policies that are being proffered to replace the dead policy of the independent deterrent would not unite the party, but would split it even more disastrously than has the old policy. For example, there is Mr Crossman's five-point plan in the *News Chronicle* for combining loyalty to Nato with a non-nuclear Europe ; one of its indispensable features is the restoration of some form of conscription, and the mass of the party would never swallow that. Again, many people would feel that Mr George Brown's instincts were sound, when his first reaction to the cancellation of Blue Streak was to go over to the idea of some sort of west European deterrent—a policy that could signalise a reversal of Labour's supercilious treatment of the movement to unite Europe and a proud resumption of the internationalist element in its tradition. But a political party cannot back casually into a continental union

just as a device for cobbling up its own shattered unity. Mr Wilson has already begun to remove the ground from beneath Mr Brown by touching on the anti-German instincts that run through most sections of the Parliamentary Party, and alerting the watchdogs of British sovereignty on the trade union right, on whose support within the Parliamentary Party Mr Gaitskell must absolutely rely.

The second idea—of allowing a free-for-all in advocacy of defence policies from the Labour benches, and saying that there could thus be no split—falls to the ground partly because, under the watchful and cliché-ridden pen of the press, it is hard to change conventions in mid-play ; but mainly because in the Labour party there is always the hungry maw of the conference which has to be fed annually with paper resolutions, and the relentless parliamentary motions of the fifty-man unilateralist group which force the Opposition to define its position in the manner of a government. Worst of all, the capture of the trade union block votes at the annual conference by the left means that, even if Mr Gaitskell found some magic formula on defence in 1960, he would find the conference returning to the assault with a paper majority in favour of a runaway policy in some other field in 1961.

THERE is therefore only one sensible course for the leader to follow this year. If the Labour conference passes a resolution in favour of unilateral disarmament next October, Mr Gaitskell must try to persuade Labour MPs to give up their feeling of obligation even to pretend to accept the conference's fiat. He must put his own leadership at stake in the process. There are signs that Mr Gaitskell is beginning to recognise this. What is not so certain is whether Labour MPs will stand rocklike behind Mr Gaitskell if they are led into such a conflict of wills.

The one historical precedent—the forced resignation of George Lansbury as leader in 1935, even although the Parliamentary Party remained loyal to him—is not very hopeful. Moreover, Lansbury was probably the only parliamentary leader of the Labour party who was really loved by his followers. Mr Gaitskell would be no competitor for such an accolade. He might not even think it desirable for a leader ; it probably is not, and where Lansbury was concerned it did not in any case do him any good. However, if there is to be a showdown, Mr Gaitskell needs a margin of personal affection in order to win—and, to speak quite frankly, there are many strategically important places in the Parliamentary Party at which this margin is alarmingly thin.

The present Parliamentary Labour Party is no monolith, even disregarding the forty or fifty members who can be guaranteed to sign any "Victory for Socialism" motion and such special cases as Mr Shinwell and Mr Crossman. There are numerous groups which shade into each other. The right-wing intellectuals (who are right-wing in the sense of favouring the adventurous ideas of the nineteen-sixties, such as readiness to contemplate merging sovereignty in Europe, rather than the adventurous ideas of the nineteen-tens) are a very different proposition from the right-wing trade unionists (who are conservative in everything, including old-fashioned patriotism and old Labour party slogans). Among the trade unionists some, like Mr Charles Pannell, are "heart of oak" loyalists to Mr Gaitskell ; others put up with him only so long as he is a "stand-patter." He is "their intellectual," to be used against the left-wing intellectuals whom they hate the worst.

There are other Labour backbenchers, some of them influential among their colleagues, who found equally distasteful the style in which Mr Gaitskell attacked Point Four at Blackpool and the manner in which the Amalgamated Engineering Union has come out for unilateral disarmament. If it came to a showdown, which sentiment would prevail ? Moreover, there is no denying that individual backbenchers are being, and increasingly will be, subjected to heavy pressures from the left-wingers in their constituency parties and their unions. Some might be frightened that, if they followed Mr Gaitskell on the constitutional issue of defying the party conference, they would not be renominated by their local parties to fight as official Labour candidates next time ; some might wonder anxiously about their financial security if a steady drop in Labour support continued each election and they had fallen out of step with the unions which might re-employ them.

THE possibility must be faced, therefore, that the Parliamentary Party might serve notice on Mr Gaitskell that it would not stand boldly beside him at the barricades. What then ? Since Mr Gaitskell's character would rule out an undignified clinging to the slender perquisites of position on Mr Cousins's sufferance, only two alternatives would be left to him: resignation followed by retirement, or resignation followed by battle from the back benches. The time has come to consider these possible alternatives ; and to say that, if it did come to this choice, Mr Gaitskell should be backed in what appears to be his present inclination to fight on from behind.

Obviously in such circumstances he should try to induce in his colleagues of the shadow cabinet a sense of collective responsibility ; he should ask them all to resign with him. The pacifists could not take over the front bench, since applause at the conference is not enough to give them a majority among their parliamentary colleagues. Perhaps Mr James Griffiths might be accepted by all sides as head of a caretaker front bench, to go through the ritual motions of Opposition while the various factions slugged it out in his rear. Such a very desperate expedient, involving the conscious throwing of the Opposition into chaos in order that it might refind its soul, would depend for its success largely on the resolution and self-discipline of the present members of the shadow cabinet. Would Mr Harold Wilson, for instance, in these circumstances, move to the back benches alongside Mr Gaitskell, or would he make himself available as a candidate of reconciliation ? What about Mr Bevan ?

Whichever way one looks at it, the prospect is grim for anybody who believes that the continued existence of a strong Labour party is an essential element in British politics. But since no possible way out can guarantee success, Mr Gaitskell has every incentive to risk all by being bold. The best bet is the unilateral disarmament of the party conference by a moral lead from the Parliamentary Party ; at the same time, a threat to involve the party in a suicidal war if it does not back Mr Gaitskell promises to be his most effective deterrent. Between now and conference time Mr Gaitskell's aim should be to make that deterrent widely known and credible. He would be wise to begin making outspoken public speeches now.

In Black and White

An alternative exists to a total rift in the Commonwealth bond

THE plain speaking about South Africa that has developed during the Commonwealth conference is not appalling ; it is essential. Mr Louw made it clear from the start that there was no prospect that the Union government would modify its policies however tactful the other Commonwealth members were. Neither in his public statements, nor in the course of the private conversations that have led some of the premiers to speak of him in pachydermatous terms, has he hinted at any modifications or even recognised the strain that South African racialism has imposed on the Commonwealth bond. Nothing was to be gained by soft soap.

The unpleasantness at the Downing Street club has, admittedly, had its painful side. The British hate a scene ; and the continuing strength of British habits in other Commonwealth countries has been revealed by the general extent of the embarrassment. When the prime minister of Malaya first took on the role of *enfant terrible,* other heads of government felt a certain need to explain away this uncharacteristic behaviour by the normally mild and patrician Tunku in terms of "playing politics" ; and it took Mr Louw's public brandishing of an invitation to visit Ghana to provoke Dr Nkrumah into cancelling it with equal publicity. But, however great the embarrassment, one can only be grateful to the South African government for having been represented at this conference by the rocklike Mr Louw, rather than by some misleadingly conciliatory figure. The ugly realities of the Union's present policy and future prospects have been starkly presented—the phrase is unavoidable—in black and white.

In Cape Town on Tuesday, the minister for Bantu affairs, Mr de Wet Nel, disposed of any faint doubts that might have survived Mr Louw's frankness by choosing this moment to tell parliament that the pass-book system "can never be abolished." In London, on the same day, there was the unprecedented sight of a group of political refugees who had succeeded in escaping from a Commonwealth country appealing to the assembled premiers for action to salvage not only South Africa but also the unity of the club itself. The arrival here of the secretary-general of the United Nations, embodying the universality of the condemnation that has placed South Africa in its present isolation, completes the picture.

Obviously the Commonwealth cannot much longer perform its role of uniquely intimate link between western, Asian and African countries if that role is blatantly contradicted by the conduct of one member. Understandably, and indeed rightly, Britain and a majority of other members are not eager simply to cast the Union into outer darkness if any less extreme step can show promise of effective results. But Mr Louw's performance in London has left little hope that his government is to be swayed by polite pressures—except in one respect, which may yet prove crucial. Not so long ago, it might have seemed fantastic to imagine the Nationalist government asking for consent to its continued membership of the Commonwealth under a republican constitution. Mr Louw's request this week revealed how quickly Nationalist attitudes toward Commonwealth membership have been transformed. It also revealed to the other members that they had in their hands a lever—the South African fear of utter isolation—which might be used to good effect.

The suggestion that another Commonwealth conference might be convened after the unusually brief interval of one year, and that the South African government's behaviour during the intervening months might be taken as the basis on which the other governments would decide about its continued association with them, has a great deal to commend it. The idea is, of course, like most things in the Commonwealth these days, without precedent ; the system is broadening down from innovation to innovation. But it is an idea that matches the realities of the situation—and it ought to appeal to the realism that is the Commonwealth's basis.

THE AFFLUENT RECESSION—II

Newcastle in the Air

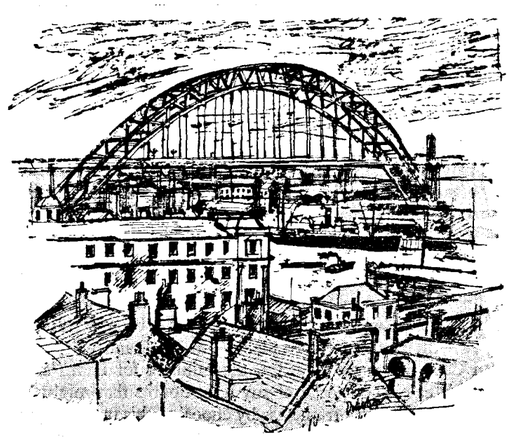
Our special correspondent has been visiting Tyneside, and found civic liveliness amid moderate economic depression

AMONG the buildings doomed by the extension of King's College, Newcastle, is the terrace in which once lived the brothers Stephenson ; while Mr Basil Spence's growing physics building affronts conservative opinion with its cantilevered lecture rooms, the locomotive works that bears the Stephensons' name is filling its last orders. Near King's, the site is ready for the new town hall, and there is talk of a brand-new city centre with raised pedestrian walks. But in Newcastle itself unemployment is 3.1 per cent (compared with the national average of 2.1), and down the river in Jarrow and Hebburn it is 8.5. The public image of the north-east is one of general decline ; the local image of Newcastle—which it is desperately anxious to transmit to the rest of the country—is of an enterprising city in which, while industry flounders, great attention is lavished on culture and civic pride. With Geordie commonsense, its leading citizens recognise that tomorrow's Newcastle will need to have changed radically if it is to be there at all.

Newcastle is the capital—actual or manqué, according to the school of thought—of the north-east region. This is a region which is geographically difficult to define, but economically easy to recognise: something more than the area between Tyne and Tees, something less than that between Edinburgh and York, an area of long-established but monotonously un-

variegated industry. Throughout the nineteenth century city and region alike boomed with careless rapture, and now they are paying for it.

Mining, shipbuilding and repairing, heavy and electrical engineering account for over 50 per cent of the region's labour force—compared with less than 30 per cent nationally. Today all these are in trouble. The National Coal Board's 1960-65 plan for Northumberland, Durham, and Cumberland may see as many as 23,000 miners paid off. Britain's output of ships has remained almost stationary since the war, while that of West Germany, for instance, has increased almost tenfold. The advent of the common market ironically emphasises Newcastle's claim to be an ideal port for exports to Europe.



Today's problem is how to start again on a scribbled slate. The basic need, every north-easterner agrees, is to attract industry. But of what sort? Here opinion divides sharply. Shipbuilders, of course, want more orders for ships; British shipbuilding (whose decline is variously ascribed to subsidised foreign competition, union opposition to new techniques, subcontractors' high prices) might be revived (by technical innovations, labour reforms, government help either to shipowners or shipbuilders). Others demand some totally new type of heavy or medium skilled industry, such as motors. But the shipbuilders and engineers are understandably less than eager for competitors for skilled labour—especially when, like the motor industry, they would pay higher rates. They speak of the dangerous influence of an alien industry's squabbling unionism on the north-east's uniquely peaceful labour situation (local boasts about which contrast oddly with the complaints of the shipbuilders in particular that one of their main handicaps is the short-sighted obstinacy of the unions). A third group agrees that the type of industry should be different: but they want the eggs to be as widely basketed as possible: "refrigerators, electronics, plastics," they say airily, "and things like that."

NEWCASTLE has inherited more than its fair share of last century's dirt and ugliness, but it has other things: libraries, theatres, 1,000 acres of parks, a university—and a sort of civic consciousness which makes it not embarrassing to belong to a Literary and Philosophical Society with a classical portico and marble busts. It has the strong local loyalty which is at once the virtue and the curse of the whole north-east. It is this which, despite the constant emigration from the region (158,000 male workers left the region between 1951 and 1958), brings many people back from good jobs in the south or midlands to second-rate or non-existent jobs at home. It partly explains the wide variations in local employment rates; there is a certain type of true Tynesider who would die sooner than move forty miles to the Tees, where unemployment is no more than the national level. But it gives the city an identity.

Newcastle has character enough to make concessions (the easy friendliness of the natives astonishes the visiting southerner) and to enforce custom (there is little welcome for the female rash enough to go into the bar of a Newcastle pub). In Newcastle workers go home for lunch—and to watch television; only the Scots are more avid lunchtime viewers. Not that they are un-British: even in Newcastle more people will watch "Wagon Train" than a BBC programme of clog-dancing. But it is far enough from London and other large cities to exist self-contained. It enjoys its own pleasures without envy. During June race-week the whole population goes to the Town Moor for the "Hoppings," (the temperance fair originally intended to distract the pitmen from gambling); on other holidays they go down to the sea at Whitley Bay or South Shields.

The problem of renovating the north-east is how to give a lead. On Tyneside alone there are seventeen local authorities. People in Newcastle have come to believe that the city council is the only one with sufficient prestige and resources to carry through a common plan. Under its present Labour government, it has in the last two years started to take an interest in the North East Industrial and Development Association, a private regional promotion body. It has also decided to give a face lift to the city itself.

The Lord Mayor has announced her intention to "change the face of Newcastle in five years." Though the legendary

Dobson and Grainger left Newcastle with a section of now-nibbled but still impressive early-Victorian town-planning, much of the centre, from the archaic and partly derelict terraces down by the quayside back up the bank into the city, is in a woeful mess. The town hall is squeezed like a toothpaste tube between narrow streets shaking with heavy traffic. Away to the north, King's College has grown up outside the city proper. Hotels are very few and of varying quality. The proposals for a new city centre provide for commerce, freer traffic flows and prestige: the projected £2½ million city hall will face the gleaming buildings of the growing university, and provide the gateway to a colossal shopping centre. The current education programme has some deliberate elements of snob value in it: while primary schools in Northumberland close down, the education committee has proposed spending at least £4½ million on higher education. Extensions to the existing Rutherford College of Technology are merely the first items in a scheme which includes a college of art and a school of music. King's College is at present part of the University of Durham, but it is scheduled to grow from its present 3,700 students to about 5,000, and will probably—and deservedly—soon become an independent university college.

But the mere word development implies new difficulties. Every scheme needs space. In Newcastle this is scarce; its population density is twice that of Bradford. Some space can be saved by replacing two-storeyed front-and-back slums with blocks of flats (though there is considerable reluctance to move from the houses traditionally clustered round the shipyard gates). But in general expansion means dealing with some other authority. This is true of the whole area. Northumberland County Council wants to see a clean break with the old creeping-octopus-spread; it proposes to "hedgehop" increased population into two brand new towns to the north-east (North Killingworth and Cramlington) with 17,000 and 30,000 inhabitants respectively. Its plan also seeks to open up the whole chaotically-developed area north of the Tyne, with a new spine road to a Tyne tunnel at the river's mouth.

Any scheme like this may concern—in terms of population, traffic and commerce—a dozen authorities. Present boundaries cause endless complications. Newcastle and Gateshead both operate a bus service both sides of the boundary, solemnly handing over receipts for tickets bought in the other's territory. The airport which serves the whole area—and whose freight traffic more than tripled between 1956 and 1958—is still Newcastle's sole responsibility. Localised views about priorities may disagree: thus Gateshead's progress with its traffic problem merely causes still greater traffic jams the Newcastle side of the bridges, where little has yet been done.

Newcastle's proposed solution to these problems is that it should swallow up some of the other local authorities. In 1937 the City Council approved a minority recommendation of the Commission on Local Government that Gateshead, Wallsend, Jarrow, Gosforth, Walker, Felling, and Hebburn, should be taken into a new county borough of "Newcastle on Tyneside." No action was taken. Last November the City Council passed almost exactly the same resolution. This is despite the fact that in such a merger it reckoned that Newcastle's present 17s. 6d. rate (producing £17.27 a head) would have to rise by about 3s. But its arguments for a greater Newcastle have little appeal for, say, any prospective mayor or councillor of Hebburn; the Newcastle council is fully aware that local pride is likely to fight to the last tricorne hat in the cause of local dignity. The Local Government Commission's decision is awaited.

It is easier to see closing mines and the empty berths in Tyneside shipyards than to keep up with the not always documented enthusiasm of planners. But at least the enthusiasm is there. It is proposed that in the spring of 1961 Newcastle will run an exhibition to demonstrate "the Tyneside of tomorrow." There are plans for a 1962 festival of Art, Music, Drama, and Recreation, to mark the centenary of Blaydon Races. There is a chance that the 1962 Royal Show will be in Newcastle. (The main difficulty in each case will presumably be to find enough hotels). If what is required for success in the 1960s is an ability to forget the past and to think comprehensively, and if there is still a place for a city with character, it ought to be possible—with luck and a little confidence from others—to forget for ever about Jarrow and the hunger-marchers, about Newcastle as the place not to take coals to, and to dispel the picture of the north-east as distant, dirty, cold and on the way out.

NOTES OF THE WEEK

EUROPE

A Question Evaded

UNHAPPILY, the conference of Commonwealth ministers has provided no evidence whatever of any change in the British Government's European policy. After their heated sessions on apartheid, the ministers contented themselves with the customary bromides about European trade—statements that all can agree on, and which mean nothing at all in terms of specific policy. The split in Europe was deplored; a bridge between Six and Seven was thought desirable: Mr Macmillan assured Commonwealth ministers that the Seven would be outward-looking; lip service was paid to the trade interests of the undeveloped countries.

But this is not what was wanted. The Commonwealth is always held up as the reason why Britain must exclude itself from European union. Is it? What does the Commonwealth think? This was the moment to try to find out.

The opportunity to sound out Commonwealth views on a possible British membership of the European communities was allowed to pass. It is a pity, for the week also brought the news from Luxemburg that the Six are preparing to press on with their acceleration plans—delayed, it is true, and preceded by a gesture to the Seven, but not modified in any way likely to prevent decisive steps on January 1st towards the creation of the common market and its differentiation from the rest of Europe.

The one new economic idea that the commonwealth conference produced was that of a programme of aid for Africa. As a vague general objective, that is an aim to which all can subscribe. But the idea of pursuing it in a separate commonwealth context raises a big doubt, closely connected with the split in Europe itself. As the African states emerge from their French and British tutelage it is becoming obvious that their economic viability and their political stability will alike depend on the formation of new groupings cutting across the frontiers inherited from the colonial past. The time, therefore, seems ripe not for new separate economic plans for the African commonwealth countries and the French community countries, but for an attempt by the European powers to promote unity in Africa by new joint aid schemes. Whether such schemes can be got going while western Europe is still divided is uncertain. But a project that released unifying forces in the same way as Marshall Aid inspired the Organisation for European Economic Co-operation would certainly be a more fitting European legacy to Africa than divisive plans.

Using the Pause

THE meeting of ministers of the Six at Luxemburg this week, to discuss the projected acceleration of the common market, has brought some much-needed clarity to the European trade problem. The meeting had to deal with five main issues: whether there should be an acceleration at all, and if so when it is to start; whether there should be talks with the Seven first; whether the projected 20 per cent cut in the community's external tariff should be unconditional or should depend on reciprocal concessions from third countries; and whether the acceleration should apply to agriculture as well as to industrial products.

The Six have indeed agreed that the speed-up shall take place, but on two matters those who retain a vision of a larger Europe have had taken successes. Practical difficulties compelled the ministers to postpone the start of the acceleration

from July 1st until January 1st, and in deference to the German and Dutch views it was agreed that there should first be talks with the Seven. These talks, however, are not to deal with the fundamental questions of associating the Seven with the Six, but merely with softening the impact of acceleration. They are to take place in the 21-nation trade committee due to meet anyway in Paris. At the same time the French contention, that the 20 per cent cut in the outer tariff should be conditional on reciprocal concessions from outside, was accepted. Only on agriculture was there a violent clash, between the Dutch who want early export opportunities and the Germans, who want to remain protected as long as possible. As *The Economist* went to press, the argument was not finished.

The Seven therefore face the clear prospect that the acceleration of the common market will go ahead. But there is seven months' grace for an attempt at talks. It is important that this time should be used well. The wrong way for the Seven to use it is to roll out stale proposals aimed at stopping the emergence of the separate tariff of the common market altogether. That is bound to be unrewarding. The right way is to accept that the common tariff will come into existence but to seek to mitigate its impact by every possible liberal means. For Britain that means offering big tariff concessions to ensure that the 20 per cent cut in the Six's outer tariff in fact takes place, and to get further far-reaching concessions on individual items. There is a strong case for the Europeans going a long way down this road together before they go to the General Agreement on Tariffs and Trade and extract what they can in return from the United States and other countries. For if the negotiations get bogged down in Gatt the acceleration will go ahead in the end without any liberal mitigations at all.

Taming the Ruhr

THE European Coal and Steel Community has celebrated the tenth anniversary of the Schuman plan (on May 9th), by blocking the latest major proposal for a merger in the Ruhr. The August Thyssen concern and the Phoenix-Rheinrohr group, the two main descendants of the prewar giant of the German steel industry, Vereinigte Stahlwerke, had planned to join up to form a group with a crude steel capacity of some five million tons a year. Last week, the plan was withdrawn after the High Authority in Luxemburg had made it clear that it was only willing to approve the merger on condition that future investment plans were submitted to it for approval. Thus a European organisation, one of whose original purposes was to make sure that the allied deconcentration of the Ruhr basic industries was not reversed, has given a belated sign of persisting life.

In practice the deconcentration has not shown much durability. The main medium-sized Ruhr firms—Klöckner, Hoesch, Mannesmann—have long since recombined, bringing coal, steel and engineering together once more. Herr Krupp von Bohlen has not sold his steel works, as the allies ordained and as he agreed; and since he has extended his engineering interests considerably, the Krupp complex too now extends once more right through the coal, steel and engineering industries. The High Authority has kept a check on this development by requiring the Krupp group to keep it informed about future investment plans, as it proposes in the case of Thyssen. But there have been loud protests from the German press over the condition attached by the Authority to the Thyssen plan.

The protests do not seem particularly well based. There is no economic objection to the sort of mild surveillance over the Thyssen group which the High Authority proposes. On the other hand, the Germans can point out fairly that the original allied attempt to break up the German steel industry into small fragments ran counter to economic needs. Though there is no single steel firm in Britain quite as large as the projected Thyssen combine there are of course firms in the United States many times larger. Whether the sheer size of Ruhr firms is a political fact of any great significance today is also an open question. The implements of power have changed.

More broadly, the political development of west Germany and its relations with its neighbours are still more crucial for its future than who owns its industry. And it is here, of course, that M. Schuman's idea has indeed borne fruit—in a rapprochement between France and Germany that has exceeded most hopes, and in the common market. All the same, the continuing weakness of the parent community at Luxemburg makes it plain that the will to political union which inspired it ten years ago burns dimmer today.

THE WEDDING

Sunshine Triumph

IN the end it was an occasion fit only for superlatives: the sort of occasion that only the pedantic, the prosaic, the heavy-gaited and the ponderous will pretend not to understand. Once again the people of Britain, and especially the women of Britain, have shown that they "care fifty times more for a marriage than a ministry." It is a matter that will madden only a few wearisome politicians that the mass of the nation obstinately but obviously treated the wedding of Princess Margaret as an occasion of much greater concern than such dull affairs as British general elections; the statistics of newspaper circulations prove it, the subject matter of every casual conversation last weekend evinced it, the crowds in the Mall on the three evenings after the wedding blazoned forth testimony of it. They were shirt-sleeved, relaxed, family crowds, one of the very rare occasions of modern mass-merrymaking without many drunks or hooliganism or even much bad-tempered jostling in evidence. It was a superb moment in the high art of gentle democratic anarchy as the crowds before the balcony good-humouredly routed the police, who wisely and judiciously let their task of traffic management slip almost entirely out of control.

The decorations and the fairy glitter from the evening floodlights, and the magic televised moments of the wedding day, will live on long after drearier political matters are forgotten, in the impressionable subconsciousness of the superficially blasé as well as in the open memories of ordinary and livelier people. A few morals stand out. Never skimp expenditure on such occasions as this; confound the politics of those who even suggest it. Preserve the details of the arrangements followed last Thursday as a model for future occasions, but next time keep the floodlighting on for two days longer. Consider whether there are not other summer occasions when the Mall and Palace could be floodlit too; accept the extra cost in litter collections and traffic jams as a small price to pay for this educational experience in the poetry of the people, in the art of long-remembered enchantment, and in the still-astonishing (but far too often latent) theatrical genius of the British.

KENYA

Dangerous Corner

THIS week Sir Patrick Renison, the Governor of Kenya, gave in unusual detail his reasons why he would not bow to African demands to release Jomo Kenyatta from detention. He adduced the findings of the Corbett report on Mau Mau, soon to be published, to support his contention that Kenyatta's release would rekindle civil strife. Although firm, Sir Patrick was not unconstructive. In effect he told Africans that the fate of Kenyatta is in their hands. After the fateful elections at the turn of the year, Africans will dominate both the legislature and council of ministers in Kenya; if they can make a success of self-government, the time will be short that will elapse before the decision to release Kenyatta or not becomes an African one.

Unfortunately, Africans do not see matters this way. Their resentment at Sir Patrick's decision is heightened by the delight with which the United Party, led by Group Captain Briggs, has hailed it. The rivalries between present African leaders are so great that, unless Kenyatta is released to take over the political organisation of the African vote, several African parties may go to the polls at the end of the year. If so, the Africans might emerge without any political steamroller such as Mr Nyerere has built up in Tanganyika; the settlers and Asians might then still manage to exert a degree of political leverage, which the Africans thought the Macleod settlement had ended. So far from admitting that Kenyatta's release would lead to bloodshed, the Africans argue that without his leadership growing frustration will erupt into disorder. The impatient campaign to resort to civil disobedience makes this likely enough, at least in Nairobi.

This threat of violence is, in itself, no good reason to release Kenyatta. What is desirable, however, is the damping down of the hero-worship now generated by Kenyatta's name, which is fostered by his detention even although he has already served his full legal sentence. He is being dressed up as a martyr and saviour by certain African politicians who need to conceal their incapacity. Perhaps the answer is to separate the precondition of keeping him out of Kikuyu land from his incarceration in the arid Northern province. Despite the risks, might it not be wise to offer Kenyatta the opportunity to make a start as a free man in London?

UNIVERSITIES

Towards 200,000 Students

LORD HAILSHAM'S offer in the debate in the Lords on Wednesday to consider a "limited" inquiry into some of the problems of the expansion of education after the age of 18 should be taken up. It fully meets the case stated by Lord Simon of Wythenshawe and would get quicker results than the Labour party's ponderous proposal for a royal commission. Lord Hailsham affirmed the Government's confidence in the type of control over universities now operated by the University Grants Committee and the committee of Vice-Chancellors and Principals; but though he rejected Lord Pakenham's suggestion that the Ministry of Education should take the universities over (a line of thought which attracts some thoughtful non-Labour people), the inquiry ought to find a better way of associating the ministry with the UGC and the Vice-Chancellors. One obvious reason is that the nine colleges of Advanced Technology, for which the ministry is responsible, ought now to be developed increasingly as full-blown technological universities on a par with the rest; so developed, and added to, they could provide 25,000 to 30,000 of the 200,000 places in universities which Lord Simon rightly thinks Britain should have in twenty years' time. Preferably, many more.

There are other problems which the UGC and the Vice-Chancellors find it hard, for various reasons, to deal with. The best size of British universities is one: Sir Douglas Logan, Principal of London University, stated last week that London was near its limit. So are some of the big provincials—Manchester, for example, may be going above the optimum, whatever that may be. But there is elbow room in the smaller ones, and we need to know how quickly new ones can be raised to the key figure of 3,000 students apiece. The relation between the schools and the universities, under heavy fire in the Crowther report, needs a mixed academic body to rationalise it—and not only in the matter of entrance qualifications.

To these and other problems of future planning must be added the question of university staff. Like the teachers, the dons are enjoying a boom. Yet they are at once fearful that the supply is too scarce and that the pay, even after the new award, is too small. To outsiders this is far from obvious; and an impartial study of the market for dons, and of their "job responsibility" (to use the business phrase), would be welcome.

NORTH VIETNAM

How the Other Half Votes

IT is as well, when deploring how far the regimes of South Korea and South Vietnam fall short of democratic ideals, to remember that the northern regimes do not even try to conform to them. The general elections held on Sunday in north Vietnam looked more democratic, on paper, than some communist elections do, in that the Lao Dong (communist) party was not alone in the field and there were nearly 100 more candidates than the 362 seats to be filled in the new assembly. But of the three "non-communist" parties, the Fatherland Front is a communist-controlled hotch-potch, the Socialist party deceives nobody, and the Democratic party, which claims to represent businessmen, also does what it is told. Close screening of candidates had further ensured their reliability.

The interest of these elections lies not in the easily foretold results, but in the fact that they are the first for more than thirteen years and the first under the new constitution. The Democratic Republic of Vietnam's first constitution was published in November, 1946, at a time when Ho Chi Minh and his followers were isolated and struggling for their existence; since they were strongly dependent on the support of various nationalist groups, the constitution was much more liberal than the communists themselves would have liked it to be. A year ago the 1946 constitution was scrapped on the ground that it no longer conformed to the "ever-developing revolutionary struggle of the Vietnamese people." The text that replaced it has eliminated many rights and guarantees which had, in any case, become a dead letter. Instead, it has included many new duties and prohibitions; for instance, under article 38: "No person is permitted to make use of democratic freedoms to infringe upon the interests of the State and people" (i.e., of the Lao Dong party).

The arrival in south Vietnam of trickles of refugees from the north—including a whole junk-load of 172 in December—shows that, in the face of many obstacles, the people of the north are still willing to risk death for the chance of life in relative freedom.

BETTING BILL

Fairly Tidy

THE Betting and Gaming Bill has now passed the Commons, with many minor changes from the original draft but no really radical ones. If the bill has a fair passage through the Lords, the gaming provisions will come into operation next autumn, the licensing of bookmakers by May, 1961. Gaming on licensed premises is no longer to be absolutely prohibited. Bar billiards, shove halfpenny, darts and other games of pure skill are free of the law; dominoes, cribbage and other fell games of chance are not, but may be indulged in subject to the 5s. maximum stake and other limitations of the Small Lotteries Act of 1956. This distinction is hardly reasonable; by the time the bill reaches the Lords the ingenuity of government draftsmen should be employed to abolish it, without naming of individual games. Gambling will now be allowed in private rooms on hotel or club premises, provided the public is excluded. A stern attempt is to be made to stop people founding clubs purely for gambling and for their own profit; the intent here is reasonable, but the provisions probably will not work. Less reasonable, but unfortunately more enforceable, is the rigid prohibition of (non-profit-making) municipal casinos in seaside towns; they could be made socially harmless and would counteract a principal attraction of continental resorts. Gambling for those under 18 is to be illegal, but the original rigid restriction has been sensibly modified to allow it to take place at home with parental consent, or elsewhere if a parent is present.

On betting the Government is still rightly going to license betting shops, and has set its face against the licensing of street betting—which, quite apart from intrinsic unenforceability, would open the way for protection rackets and a black market for licences on the streets. Penalties for non-registration of bookies' agents (e.g., in the factories) have been raised; at best, this change is academic owing to difficulties of enforcement. Advertising by bookmakers is to be unrestricted. An interesting defeated amendment would have made gaming debts recoverable at law. Logically this had much to be said for it. But established bookies are well able to defend themselves against welshers, who soon find it impossible to lay their bets with any other established bookies; and perhaps reform of the law would have encouraged some unestablished undesirables to try to come into the trade.

LOCAL ELECTIONS

Bogeys for the Boroughs

IN the first three days of local elections for the English and Welsh urban district councils, Labour seemed to be steadily losing the gains that it had made when these particular seats were last fought over in 1957. This had been expected, and Transport House could take comfort from

the fact that there was as yet no definite sign that Labour was doing worse than it had done in 1959. The Liberals were making significant advances, but there too there was as yet no sign of a landslide. As *The Economist* went to press on Thursday voting was taking place in the bigger towns —in the English and Welsh boroughs. The results of these borough elections will have been published by the time this issue is in readers' hands. In drawing any conclusions about them, it should be remembered:

(1) In May, 1957, when most of the outgoing councillors were elected, Labour won 244 more borough seats than it did in May, 1959; very broadly, therefore, any net Labour losses of below 240 or 250 this Thursday will suggest that Labour is no more unpopular now than it was a year ago.

(2) Only if Labour's net losses in the boroughs go above about 350 can one say confidently that there has been a further decline in Labour's popularity since last October's general election.

(3) The Liberals have put forward some 726 candidates in the boroughs; rather over a hundred of them are councillors who are defending existing seats. The Liberals would therefore need to mark up over 100 net gains before they could claim that their candidates were winning about a third of the seats they contested—i.e. that where they entered the contest their candidates were enjoying, on average, an equal chance of success with the other two parties. To judge from some recent local by-elections, successes on this scale are not necessarily beyond them. If they do achieve this, it will be a remarkable triumph.

It is extraordinarily difficult to tell whether the increased number of Liberal candidacies this time is a factor that should help to increase Labour losses or slightly to reduce them (by splitting the anti-Labour vote); on balance, one is still inclined to guess that it is the latter. A point to remember at these local elections is that only a determined minority of people usually bothers to vote; the deciding question between the two main parties is often whether the most determined 40 per cent or only the most determined 30 per cent of Conservative supporters feels sufficiently angry with (or frightened of) Labour councillors to bother to turn out to vote against them, or whether there is a higher pitch of anger or fear among the most determined minority of Labour supporters on the other side. At the moment, one would judge, few people on either side are very angry with, or frightened of, the other side; but the supposition must be that Labour's degree of apathy is the greater, and its turn-out, therefore, the more likely to droop.

NEW TOWNS

Brooke's No Hook

LONDON COUNTY COUNCIL'S plan to build a new town at Hook in Hampshire has been temporarily shelved. Instead, the LCC and Hampshire County Council are considering an alternative plan for expanding existing towns such as Basingstoke, Andover and Tadley. London industries would be encouraged to migrate to these places, and the LCC would build houses for the workers who went with them. In addition, it is hoped that private enterprise building would play a large part in the expansion of these towns. Frimley and Camberley in Surrey provide a good going example of a successful scheme of mixed development of this sort; it might well be repeated farther out in Hampshire.

In principle this new plan therefore seems fairly sound; what is disquieting is its background and genesis. The LCC adopted the plan for a new town at Hook after an energetic but unsuccessful exploration of the other possibilities. Much time and energy went into the selection of the site, in consultation with Government departments. Yet Hook has now been shelved only because Mr Brooke has finally insisted that the LCC and Hampshire should try to agree on an alternative plan.

Why has the Minister's intervention come so late? Is it impossible for local authorities to co-operate until one is threatened with a *fait accompli*? Or is the problem that Mr Brooke dare not say yes to Hook (and thus infuriate Conservative Hampshire), but cannot reasonably say no to the Labour-controlled London County Council (which in this case has the better social aguments on its side)? The incident is a sorry commentary on relations between local authorities and the central Government. All the facts were known five years ago and a decision should have been reached long before now. It is now up to Hampshire County Council to show that it means business over the alternative plans for town development; if good results are not reached within a year, Hook ought to be sanctioned after all.

SHIPPING BOYCOTTS

Arab Celebration—

IT was victory week in the United Arab Republic; and President Nasser was busy wringing every possible drop of triumph from it. On May 6th the American seafarers' union, through the good offices of the State Department, called off the boycott of the UAR freighter *Cleopatra*. The next day Mr Nasser journeyed to Mansoura to celebrate an Egyptian victory over France —the defeat of King Louis IX in the 13th century.

President Nasser could not, however, afford to overlook some of the implications of the *Cleopatra* affair and its settlement. The crisis was not brought about by the action of any government. Arab trade unions decided to counter-boycott American ships because the American union was boycotting one of theirs. The Arab governments were unable to do anything to control it because it involved Israel. Even in those countries where trade unions of any sort are regarded as instruments of communist infiltration, the governments had to join the outcry against the Americans. When the boycott spread from one end of the Arab world to the other, President Nasser, whatever he privately felt about its effect on aid, trade and canal revenues, could only express pleasure in public. Arab unity was making one of its rare appearances on the global stage, for once without him in the lead. For this reason, Iraq and Jordan were able to put aside their quarrels with the UAR. By supporting the boycott they were not accepting Gamal Abdal-Nasser as the leader of all Arabs everywhere.

At Mansoura and Cairo it was easy to claim that the United States government had suffered a humiliating defeat. In fact, the New York boycott had probably annoyed the State Department and the administration at Washington as much as it did the president of the UAR. To President Nasser it is possibly a little more humiliating that

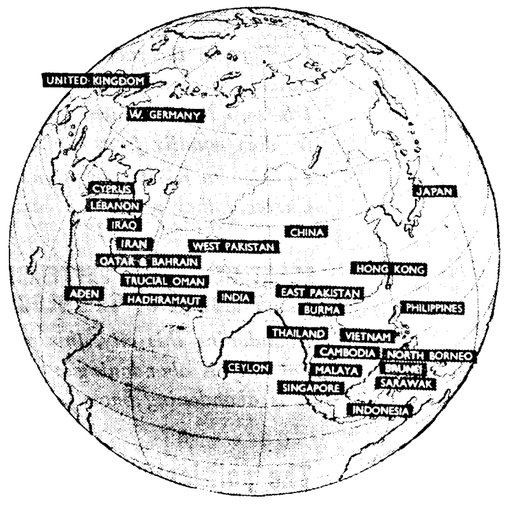
REDUCED RATES FOR FEMALE LIVES

For most kinds of life assurance the Society is prepared to grant individual policies on female lives assured at the rate applicable to male lives three years younger.

ESTABLISHED 1844

EQUITY & LAW



LIFE ASSURANCE SOCIETY LIMITED

Administration: 20, Lincoln's Inn Fields, London, W.C.2 and Amersham Road, High Wycombe, Buckinghamshire

BRANCHES THROUGHOUT THE UNITED KINGDOM

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. An effective credit information service and skilled assistance and advice are available to United Kingdom merchants and manufacturers seeking new business connexions in Asian markets.

BERLIN

WILLY BRANDT, GOVERNING MAYOR OF BERLIN:

I believe in the sacredness and dignity of the individual.

I believe that all men derive the right to freedom equally from God.

I pledge to resist aggression and tyranny wherever they appear on earth.

ERNST REUTER ON SEPTEMBER 9, 1948 IN THE THIRD MONTH OF THE BLOCKADE:

Abandoning this city, this people of Berlin, not only is abandoning a nation— it is abandoning oneself.

The political and economic future of Berlin is decisive for the future of Germany as well as for the whole of Europe

[ADVERTISEMENT]

Arabs can unite only when he is not leading them ; to Arabs everywhere the source of shame is, or should be, that the only thing they can get together on is hatred of Israel.

—*Israeli Hangover*

FROM Israel's point of view, the boycott manœuvre had become over-blown even before it collapsed. A few months ago a group of Israelis, mainly from the prime minister's office, established an anti-boycott committee, with an important branch in the United States, to fight back at the picadors of the Arab League's boycott committee. These anti-boycotters scored a bull's eye when the American dockers refused to unload the *Cleopatra ;* although there were other immediate causes, and other pressure groups at work, it would be naïve to ignore the inspiration that was wafted from Israel.

But, not for the first time, Israel's retaliatory measure was blown to such heat that it became urgent for outsiders to stamp out the flames. The American dockers' boycott was planned as a bright idea by men who were fed up with procrastination, but, from the Israeli angle, it had either not been thought out to its logical conclusion, or the State Department's response had been miscalculated. Once the Arab unions ganged up, Israel's interests were bound to rate low in the balance.

It would at least be a move in the right direction if the State Department were to follow up its promise to the Seafarers' International union to do something about the petty but harassing irritations of the Arab blacklist as it affects American ships. President Nasser is clearly anxious not to get embroiled in this sort of complication again, and it could even be that the small American freighters that ply the Middle Eastern ports will in future be the ships most able to squeeze Israeli cargoes through the Suez canal.

Even if the Egyptians remain obdurate about the canal, there can now be little excuse for anyone not to know what goes on. The publicity works two ways. It highlights Israel's difficulties ; but it also demonstrates just how easily Israel can put its spoke in the smooth running of relations between the West and the Arabs. The shipping boycott was the sort of incident to make western diplomats wish with all their hearts that the Israelis would only keep quiet. But there is not much chance of that.

PENSIONERS

No Policy for the Old

"IN this country today, although there are many services for old people, there is no policy for old age." Thus the opening sentence of Mr S. K. Ruck's article, "A Policy for Old Age," in the current *Political Quarterly*. He goes on to deplore the fragmentation of responsibility which, under the National Assistance Act of 1948, followed on the abolition of the old Poor Law Relieving Officer. In consequence of that act, it is at present no individual's and no single authority's business to look after, or even to know about, all the needs of an old person threatened with distress.

Politicians should take note of this article. Contrary to political myth, most old age pensioners today are not in penury. The National Food Survey's findings on old people's diet (which are now published quarterly) continue to be surprisingly satisfactory ; indeed, the average pensioner seems to eat more high-grade foods like butter and meat than wage-earning families in general, presumably largely because pensioners often need to (and nearly always do) spend so much less on renewing their household equipment and clothes. But many old people do have a fearfully inadequate safety net to support them in emergencies, and it is in these respects that our society sometimes verges on the Dickensian.

How readily is emergency help typically available ? How deficient are the specific services—some large, like special housing or geriatric treatment, some small, like chiropody or "meals on wheels"—and what reforms in local government organisation would help to remedy them ? Mr Ruck suggests that policy should be totally reorganised. Old people today fall into two categories. First, there are "those who on account of infirmity are incapable of living independent lives" and who are at present divided, often illogically, between welfare institutions and hospital wards; there may be a case for combining these two services. If so, probably "infirm accommodation in welfare establishments should be taken over by the hospitals rather than the reverse." Secondly, there are those old people who "are capable, with or without assistance, of continuing to live in homes of their own." Mr Ruck thinks that the single authority responsible for their welfare should be the authority that is also responsible for building council houses and is "as near to the recipient as possible, that is to say, it should be the borough, urban or rural district council"—not, as at present, mainly the distant county councils. These seem to be sensible suggestions, and worthy of wide debate.

POST OFFICE

Counter Inoffensive

BE civil, servant, is a cry that will no longer need to reverberate round our post offices, if Mr Bevins lives up to his promise and implements the recommendations of the report on service at post office counters. Curiously enough this report is not to be made generally available, because it is thought too specialised to have any public interest. Yet, next to rush hour travel, the post office is the greatest single source of irritation for city dwellers. For years the British have endured a frustration of weary queueing in their post offices, only to be greeted on arrival at the counter by a triumphant clerk displaying a notice "position closed." Some employees mysteriously absent themselves for indefinite periods from their posts ; others specialise

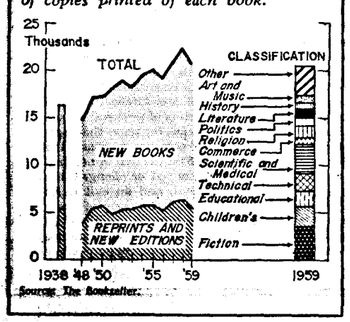
The Economist

MAY 12, 1860

ANONYMITY AND RESPONSIBILITY

Mr Horsman's exhortations to Mr Walter on Monday night, and the remarks to which they gave rise, bring before us very forcibly the class of influences for good or for evil which newspapers have begun to exert over statesmen,—the tendency, indeed, of recent English politics to diminish the sense of individual responsibility to statesmen, and to substitute in them some of the least statesmanlike qualities of ably-conducted newspapers. . . . It was a great mistake, however, to identify so completely the question of responsibility with the question of anonymous writing, and it was a still greater mistake to attempt to fix on one of the proprietors of the *Times* a detailed responsibility for all the opinions expressed by its editor or contributors. It may be conceded that the proprietors of a newspaper are responsible for the selection or dismissal of its responsible editor, but they would find no competent men for such a post at all, if all the subsequent and detailed responsibility were not left entirely in the hands of the men thus chosen. And then as *to the question of anonymousness. Few* will be found, we suppose, to acquiesce in the very marvellous paradox of the *Times*, that "opinion only becomes responsible to all intents and purposes, when it becomes anonymous" : such a statement could only have been made in order to startle. But though, no doubt, anonymousness does *lead*, often quite unconsciously, to give greater latitude to the pen than would be taken by writers who knew that they were to affix their names, yet almost all reflecting minds have *long* been *convinced* that the individual signature of every article in a newspaper is far more objectionable on other accounts than it is desirable on this. Not only would it unduly weight the scale in favour of already celebrated writers,—but it would divert the minds of readers from the neutral and impartial consideration of fact and argument to the consideration of the personal origin and antecedents of the writer's views. The discussion of political questions would become less intellectual, and more mixed up with matters of personal gossip. These evils would, no doubt, far more than outweigh the advantages of personal responsibility for newspaper articles. Still the evil of nominal irresponsibility is not removed or changed into a good. It is still an evil, and an evil to be guarded against. It is still the duty of every newspaper writer to ask himself strictly if he would object to lending the personal guarantee of his *name* to any of the assertions or innuendoes conveyed in his composition.

in glacial stares, reserved for those who request some commodity (normally a humble stamp) which these exalted functionaries are not empowered to dispense.



Now, all is to be changed. Instead of concentrating on refunding prescription charges or specialising in issuing gun licences, each clerk is to undertake every type of work. The work itself is to be reduced, which is reasonable enough: the twentieth century post office clerk has become the equivalent of the Tudor justice of the peace, loaded with "stacks of statutes" and required to act as agent for every government department too dilatory to provide its own. Stamp and postal order machines are to be introduced, and the system of direct payment for national insurance contributions extended. All this, it is hoped, will result in the average waiting time being four times reduced.

Diplomacy and good manners are now to triumph. The baleful notices, "position closed," are to be replaced by a gentler "system of traffic control"—a green light indicating the possibility of service, a red one denying it, and amber registering a warning that the position is likely to close soon. Clerical absences will be courteously explained by such soothing messages as "I am going for a cup of tea madam, and will probably be back within the hour." Mid-Victorian decor is to disappear. Colour schemes are to be bold and imaginative, "but not bizarre," lighting restful, and all equipment will "match." Clerks will wear "compatible" collars and ties. Harsh noises are to be muted by sound-absorbing panels. If, despite it all, original sin still makes itself felt, tranquillity will be instantly restored by briefly glancing at the improving and very British slogan which will be everywhere displayed: "Where lack of harmony occurs not all the faults are on one side."

Book Publishing

Last year 20,690 titles (including reprints and new editions) were issued—1,453 fewer than in 1958 owing, presumably, to last summer's printing dispute. Nevertheless, more engineering and medical books were published than in the previous year.

These figures, however, are not a measure of the output of the book trade, since they take no account of the number of copies printed of each book.

SOCIOLOGY

A Science's Plight

THE May number of the *Twentieth Century* is devoted entirely to sociology, which regards itself nowadays as discreditably cold-shouldered by the Establishment (academic and other)—as the ill-treated Cinderella of the sciences. One can much sympathise with these complaints, while refusing to put all the blame on the ugly sisters. The fact is that sociology, even less than economics, cannot yet really pass muster as a science at all. The sociologist is desperately handicapped—not only, like the economist, by the impossibility of controlled experiment, but also by a peculiar difficulty, paradoxically shared in part by his polar opposite the atomic physicist: in his field the very fact of observation alters the thing observed. What the sociologist studies in effect is not a social situation as such but that situation as modified by his own impact upon it. This is of course true of any attempt to assess any human relationship whatever; it does not prevent people from forming just and wise private judgments, and it need not prevent sociologists from producing ideas about society vastly more truthful and pragmatically useful than those thrown up by myth, prejudice and interested propaganda. But it does disqualify them from claiming for their conclusions even so much general validity as attaches to the "laws" of economics—which themselves are rocky enough.

Much of the malaise revealed by these essays may be ascribed to a reluctant half-awareness—camouflaged by a parade of methodological scruple or compensated by a defensive cocksureness—of this disqualification; and to a similar awareness, unformulated but making powerfully for mistrust, among the public. The sociology of sociology itself—its selective pull on the socially or emotionally insecure, and the exacerbating effects of low esteem on those so selected—is a part of the story, but only part. A sudden penitential change of policy by Oxbridge, or a universal doubling of sociological salaries and grants, would not solve the whole problem. In a rapidly changing society sociology does need more recruits and more resources. But it also needs—perhaps no less urgently—a calmer, more adult and less petulant assessment of its role and its limitations.

EUROPE

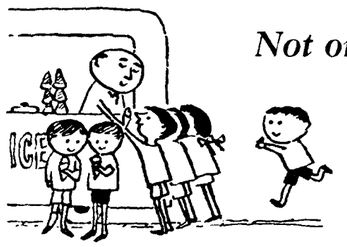
A Celtic Hostage

THOSE who know Ireland through Mr Brendan Behan's play "The Hostage" will not be altogether surprised at the first case to come before the European Court of Human Rights. An Irish builder's labourer, now aged 24, with the apt name of Lawless, who has been in and out of prison more than once for semi-political offences, was arrested by the Irish government in July, 1957, for being a member of an illegal organisation (the IRA). He was detained for five months without charge or trial in the Curragh internment camp. An appeal of Habeas Corpus was rejected by the Irish High Court. But Mr Lawless's able counsel (who, strange to say, happened to be Mr Sean MacBride, a prominent figure in the Dublin opposition) lodged a petition with the Strasbourg commission of Human Rights on the ground that the detention infringed a basic right, freedom from arrest without trial. The case comes before the new European court this month.

The case is not only a throwback to the excitements of the Irish past, but a reminder that there actually is one organ of the Council of Europe that has effective powers. An appeal to the Convention of Human Rights is an appeal to an authority that can prevail over governments. The case is also a tribute to the seriousness the Irish attach to this institution. In the early years of the Council of Europe, none provided better light relief than the Irish delegation. But in the years since they have been stalwart supporters of the convention of human rights, Ireland, together with west Germany and seven other countries, has ratified the protocol that enables individuals (like Mr Lawless) to appeal direct to the new court.

Britain, by contrast, has only applied the convention to other member states. If Mr Lawless had got into a similar pickle north of the Ulster border, his case would have had to be brought by a member state of the Council of Europe. Turkey, Greece and four other member states are in a similar position. Thus a Turkish newspaper editor who wished to appeal to the court against infringements of press freedom would have to get another signatory state to put his case. France has not ratified the convention at all, so its policies in Algeria escape scrutiny altogether.

Even in its present partial, attenuated form the convention of human rights has already had a salutary effect on members' policies. British emergency decrees in Cyprus were modified after the Greeks complained. And Mr Lawless, together with a number of other detainees, was in fact released from detention a month after his case was filed. These are significant pointers to the weight the court might have if it enjoyed the full support of all the states of western Europe.



MIGRATION

Subsidised Departures?

IN 1957, during the brief period of post-Suez disillusionment, twice the usual number of emigrants left Britain for the main Commonwealth countries. Since then the figures have returned to their normal level of about 90,000 a year (to Canada, Australia, New Zealand, South and Central Africa), plus 20,000 or so to the other Commonwealth and colonial territories. A conference of interested bodies, called together by the Commonwealth Migration Council, has now urged that the Government should do much more to encourage emigration. For a start, they would like the Government to use the full £1½ million that is allowed annually under the Commonwealth Settlement Act—not just the present average of £150,000 a year. They want to see—by publicity, assisted passages and guaranteed housing—an annual flow of at least 250,000. They support this plea with the arguments that Britain is overcrowded (it is pointed out that in 1958 immigration into this country caused a net increase in adult population), and that emigration to the Commonwealth strengthens ties of allegiance and trade.

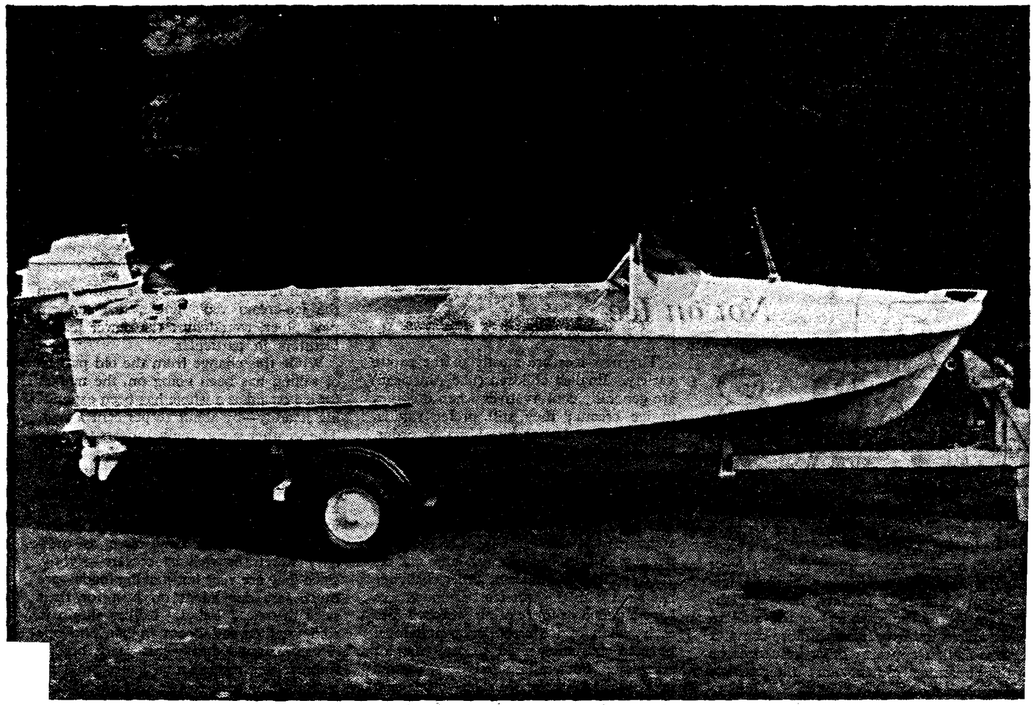
Most of the economic arguments for encouraging emigration from Britain are misguided. To say that "overcrowding" in Britain is eased by the emigration of active workers, who leave elderly relatives behind in this country, is a peculiarly muddled form of Malthusian lack of logic. Britain lost some valuable and scarce skills by the net emigration of, for example, 1,200 teachers in 1958. It has been estimated that it costs about £2,000, in housing and other public services, to settle each new emigrant. Nor can it seriously be argued that the influx of, for instance, Italians to the United States swung Britain's American trade over to Italy. However, two principles remain. Probably, Britain's ties with the Commonwealth are strengthened by maintaining the proportion of British emigrants to Commonwealth countries. Certainly, it has always been an accepted part of the standard of living of this country that Britons who want to start a new life in wide open spaces should have a peculiar imperial opportunity to do so. These are principles to be fostered, provided we are made fully aware how much they cost.

Not on Ice

THE sunny weather that Britain has been having recently has surprised everybody, but few people more pleasantly—or so it might be imagined—than the ice-cream industry. In fact, however, the influence of the weather on the modern ice cream industry is much more complex than at first appears; other influences on this booming industry are interestingly complex, too.

Still dominating the ice-cream industry are the "big four"—Walls, Lyons, Eldorado and Neilsons—who distribute their products nationally in the form of bricks, tubs, bars and lollies. Nobody is quite sure how large these firms' share of the total ice-cream market is, since this is an industry abounding in unreliable and even contradictory figures. But a good guess would be that the "big four" together make between 50 and 60 per cent of the country's ice cream, with Walls making about half this and Lyons another quarter. With total ice-cream production now running at about 100 million gallons a year, this leaves approximately 45 million gallons which are being made by the remaining 2,700 smaller manufacturers.

Until about three years ago, the trend in the industry was the familiar one of concentration of production. When competition restarted after the war, the small manufacturers—often expatriate Italians—were badly placed; raw materials were difficult for them to come by, the cleanliness of their products was suspect, and they could not afford to advertise. But recently, especially in the north of England and Scotland, local manufacture has been boosted by two new developments, the selling of new types of ices and the use of the mobile van.



The new ices are mostly of the exotic variety. English children (like American) are generally conservatives when it comes to ice cream; they still prefer vanilla, strawberry and chocolate—in that order. But chocolate peppermint, coconut milk and pineapple, for instance, are now being added to the old list in this country, and are gaining in popularity. (Dairy ices, costing 6d. for a small block instead of the standard 4d., now account for about 20 per cent of sales of small and large makers alike.) The small makers' other challenge has been with the soft ice. Branded ices have a gallon or more of air whipped into each gallon of ice cream mix, and must be sold extremely cold to stop the air escaping; but unbranded ices, which usually contain no more than 50 per cent air, can be sold much warmer, which the public appears to like.

What the small manufacturer can do with mobile vans is shown by Tonibell ices, which over the past decade must have been one of the fastest growing businesses in the country. Sales in 1948 were 5,000 gallons from one shop; today, with a fleet of several hundred vans (at £900 apiece) to boost them, they are well over a million gallons. A great advantage of vans for an expanding manufacturer is that they enable him to avoid the trade's enormously high retail margins. These run from about 25 per cent on sales price (or 33 per cent on cost) for a small shop to above 50 per cent on sale price (100 per cent on cost) for cinemas. These latter margins probably leave the manufacturers with little more than enough to cover prime costs, but are justified—rather dubiously—by the trade because cinema sales are mostly made in winter when even a small contribution towards overheads is welcome. Inevitably, the high margins allowed to shops have led the established producers to allow high margins to their tricycle ice cream sellers too; some of the latter make over £50 a week in the high summer season. So do salesmen from the new motorised vans, but they sell many more ices. The very silly attempt in a private member's Anti-Noise Bill to ban the ice-cream van's jingle, that modern pied piper, would hurt the newer manufacturers in particular.

While this change from the old pattern of selling has been going on, the market for ice cream as a whole has been expanding steadily—by about 10 per cent a year. The weather surprisingly appears to make little difference to this rate. But it does make a lot of difference to two things, the proportion of ice cream and water ices in the total and the proportion of ices sold from mobile shops. Ice creams, which are now eaten as ordinary sweets as well as coolers—rightly, since they are very hot-making foods—are much less dependent on heat for their sales than iced lollies. Lollies slump in cold weather and boom in hot, and one big store found during last year's boiling summer that though total ice-cream sales expanded by only 10 per cent on the year before, lolly sales were up 50 per cent and ice-cream sales actually down by 20 per cent. This pattern seems quite general in hot years and is reversed in cold ones.

Nor does hot weather particularly favour the mobile shop. Children buy ices even in cold weather if they are brought to the door, but if it is very hot they may be hustled off to the seaside, where they buy from the promenade kiosk. This apart, the trade, particularly where motorised, has little reason to complain. Juvenile affluence is here to stay and the fact that American and Canadian children (and allegedly also Russian ones) consume much more ice cream per head than the British—the Americans over twice as much—is a luscious indication that their market should continue to expand.

The 12½ ft. Sports runabout and launch

A new Tyglas reinforced runabout

Once again the rare qualities of glass have been employed in a product which will bring unflagging service to its owners.

In his new 12' 6" sports runabout, Mr. Peter Webster has used Fothergill & Harvey's Tyglas and Tyglas woven roving fabric as the reinforcement material for the entire plastic hull. The craft is constructed to a design by Alan H. Buchanan Ltd.

The construction incorporates longitudinal steps to increase 'grip' on the water, with a central skeg to ensure good manoeuvrability. The transom is reinforced to take outboards of up to 40 horse power. The result of this glass/resin moulding technique is a craft of immense strength and impact resistance. It has inbuilt properties to withstand any climatic conditions, resisting decay and deterioration, and reducing maintenance to a minimum. Fothergill and Harvey would be pleased to send their booklet, "Boat Building with Tyglas Products", to any interested manufacturer of boat hulls; write to The Marketing Officer, Fothergill & Harvey, Harvester House, Peter Street, Manchester 2.

More information about the craft illustrated may be had from the manufacturer, Peter Webster Limited, Fleet Street, Barnsley, Yorkshire.

Fothergill & Harvey *devise special fabrics for all industries*

LETTERS

The Channel Tunnel

SIR—In your article entitled "Real Engineering and Unreal" you list the Channel Tunnel among the expensive pipe dreams this country could ill afford at the moment; I quote your words ". . . develop a Channel Tunnel that nobody suggests would pay as a private commercial enterprise. . . ."

Granted that most developments can only be planned on estimates, those of likely traffic which have been prepared with the greatest care and caution by eminent specialised economists, viz., Economist Intelligence Unit Ltd. of London, Société d'Etudes Techniques et Economiques of Paris, and De Leuw, Cather and Company of Chicago, predict on the most conservative assumptions gross receipts of £13 million in 1965 rising to £21 million in 1980.

At the same time, eminent consulting engineers, viz., Sir William Halcrow and Partners, Messrs. Livesey and Henderson, and Messrs Rendel, Parmer and Tritton, working in collaboration with experts from British Railways, have indicated the advantages and efficiency of twin rail tunnels at a cost of £80 million; further expenditure on terminal facilities and finance and other charges bring the total cost up to some £130 million. The receipts above mentioned indicate quite clearly that such a capital outlay would be remunerative and the problem of raising this capital by private enterprise would not seem insuperable.—Yours faithfully, LEO D'ERLANGER

London, EC2

The Independent Deterrent

SIR—You are opposed to our policy of having an independent nuclear deterrent. This policy, I suggest, rests on three propositions; the last may be arguable but the first two are surely self-evident:—

(1) If you are to have an effective national defence, you must equip yourself with the latest and most powerful weapons.

(2) It would be physically and financially impossible for us to make anything like a similar contribution to the Alliance with conventional arms only.

(3) We enjoy an immense political advantage from our possession of the nuclear weapon. We ought to make sure of keeping that advantage.

You advocate, rather, a collective Western deterrent. Since the United States are bound to remain independent in this respect, you must mean a collective Western European deterrent. But what in fact would this force be? Today and tomorrow and for years to come it would simply be the British deterrent, because that is the only one available. The most likely result of such a change would be that its control, at present clear-cut, would degenerate into the same sort of muddle which afflicts Western Europe's air defence.

As to future dependence on the United States for the supply of part of our weapons system, remember that the Americans are themselves dependent on the use of bases in other peoples' territory. It is the ultimate operational control which is the vital factor. Finally, let us dismiss the idea that our present deterrent is a feeble one just because it is smaller than that of the United States or of Russia. The sober truth is that we have, poised and ready, a nuclear striking force of terrific power. To suggest otherwise can do no service either to the nation or to the cause of peace.—Yours faithfully, RICHARD COLLARD

House of Commons

Labour and the Bomb

SIR—In your article "Shopping Labour?" you comment on the unilateralist delegates to the Shopworkers' union (USDAW) conference: "If these chance groups even approximately mirrored the views of a majority of the twelve million Labour voters in the country, there would be a democratic justification for this strange system; but everybody knows that they do not."

How does everybody know this? The most recent public-opinion poll on the subject reveals that 30 per cent of Labour supporters were broadly unilateralist, 23 per cent favoured the maintenance of a separate British nuclear deterrent, 17 per cent supported some form of integrated deterrent or relying on American weapons, and no less than 30 per cent were "undecided." These figures were arrived at before the decision to abandon Blue Streak had been taken, before the Aldermaston March, before the USDAW and Co-operative Party Conferences and before George Brown threw Labour's defence policy into the melting pot. It is reasonable to suppose that the unilateralists have gained ground in the meantime.

At the time the poll was taken, the Labour supporters who favoured any kind of deterrent outnumbered the unilateralists by only four to three, and were themselves outnumbered by three to two by the unilateralists and the "don't knows" combined. It is surely reasonable to suppose that a fair proportion of the "don't knows" abstained from voting for fear of embarrassing the leadership of the party, rather than from lack of conviction.

In view of these figures, and in the light of subsequent events, I should have thought that a reasonably cautious commentator would have refrained from expressing any certainty one way or the other.—Yours faithfully, TERENCE HEELAS

Lustleigh, Devon

Restrictive Practices

SIR—Your article and the letter from Mr Adelman both take the view that agreements for the exchange of information should be made registrable and subject to some control by the Registrar with "wider discretion."

In considering the validity of these arguments the first essential is to understand clearly the present legal position in the UK:

(a) If an agreement *or arrangement* is restrictive, it is already registrable. Consequently, arrangements of the type referred to by Mr Adelman, "which provide a schedule of prices and a tacit assurance so that each seller knows that he can wait for ever, if need be, before being embarrassed by another seller's price cut," as well as being "held illegal" in the US would be registrable here. The Registrar has ample powers to obtain information under sections 14, 15, and 18 of the Act. For example, under section 14, if he has reasonable cause to believe that someone is carrying on a restrictive agreement the Registrar can give notice requiring that person to tell the Registrar whether he is party to a restrictive agreement or not and if so to provide details.

(b) If an agreement is not restrictive, "does not permit any understading on price" to use Mr Adelman's words, it is not registrable in the UK under the Restrictive Trade Practices Act. I think it ought to be borne in mind that such arrangements may, however, be liable to investigation by the Monopolies Commission.

It will be seen that restrictive agreements are already covered. On analysis, therefore, your proposals must concern only those *bona fide* exchange of information agreements which are not covered by the 1956 Act. Why should the law be changed? Why should traders be prevented from disclosing information? The level of his competitors' prices is one of the factors to which the seller must have regard in fixing his own prices—one of the desiderata of perfect competition is knowledge of competing prices. Moreover, buyers are also free to exchange information between themselves as to the prices they pay.

Purely on a point of fact, circularisation of prices is not a feature of all price exchange agreements. In some cases they only entitle a party to ask another party what his price is and it is made quite clear that once having given the answer the second party is perfectly free to change his price immediately. If a seller finds that his sales are declining the natural conclusion may be that he is losing trade to his competitors and his first inclination would be to lower prices. A moment's reflection will show that this conclusion may not be correct; the total market may have declined, so that his

reduced sales may represent roughly the same share of the smaller market, or perhaps even a larger share of the smaller market. Consequently, some schemes provide for parties to receive regular information as to the percentage which their trade represents of the total. This, again, cannot be objectionable.

I venture to suggest that there is a fundamental misapprehension in the first paragraph of your article—that one of the "implicit goals of the Act" was "lower prices." Not so—the object of Part I of the Act was to ensure that buyers and sellers should be free from restrictions. It should not be overlooked that in a competitive situation prices *may* fall to the level of the lowest-priced seller, but equally he, when he discovers what others are charging, may decide to raise his prices. An equilibrium will tend to be produced, and one cannot say *a priori* whether it will be nearer the upper or lower end of the scale. If there is an organised exchange of information as to prices, the same process will go on but probably more quickly—an equilibrium will be reached just the same. Provided each party is free from restriction and acts independently, there can be no objection—this is precisely what a market is for.—Yours faithfully,

J. P. CUNNINGHAM

London, SE12

Tax

SIR—In your article on avoidance and evasion you make your point of view very clear by advancing the two propositions that "a man is either taxed under the law or he is not; it is no part of his duty to pay a penny more than he need" and "because a hundred highly skilled avoiders have been making rings round the revenue for several years, the general body of taxpayers has been paying somewhat more than it otherwise would, but that, too, raises no moral issue." While many people, including myself, would not agree with the second proposition this moral issue need not arise if the law referred to in the first is made reasonably watertight.

The main difficulties you envisage in the equitable administration of the new Finance Bill seem to stem from the somewhat timorous definitions embodied in it; for example the reference to transactions having "as their main object, or one of their main objects" the obtaining of tax advantage. Australia appears to have avoided these pitfalls for several years; contrast the clean-cut terms of section 260 again embodied in their 1959 Act:

> "Every contract, agreement, or arrangement made or entered into, orally or in writing, whether before or after the commencement of this Act, shall so far as it has or purports to have the purpose or effect of in any way, directly or indirectly: (a) altering the incidence of any income tax; (b) relieving any person from liability to pay any income tax or make any return; (c) defeating, evading, or avoiding any duty or liability on any person by this Act; or (d) preventing the operation of this Act in any respect; be absolutely void, as against the Commissioner, or in regard to any proceeding under this Act, but without prejudice to such validity as it may have in any other respect or for any other purpose."

It seems obvious that border line cases are far less likely to arise under this (more effective) definition than they will under the qualified definitions in the English Bill. I have no particulars of "Newton's case," which I understand eventually went to the Privy Council, on the interpretation of this section as embodied in a previous year's Finance Act. However, the fact that the section is retained in the above form in the current year's Finance Act suggests that it made no major change to the initial Australian approach.—Yours faithfully,

Dublin E. J. CARROLL

Special Deposits

SIR—I am glad that in your business note on May 7th you question the logic behind the decision to call for special deposits from the clearing banks. These deposits will only be useful to the extent that they prevent an increase in the liquid assets of the banks which would otherwise serve as the basis for a further expansion of overdrafts. If the authorities themselves purchase the securities which may be sold to finance the special deposits, the banks will simply have exchanged one illiquid asset (Government securities) for another (special deposits) and the effect on their liquidity will be negligible. In fact the new squeeze is beginning to look very like the old one.—Yours faithfully,

O. N. DAWSON

London, EC3

Africa in London

SIR—Your article on this subject touches on some very pertinent points. Politics is undoubtedly the number one topic of conversation for the majority of African students anywhere, and it is both natural and healthy that this is so. What seems such a shameful waste is the way these political discussions are mostly confined to exclusive groups. How often, I wonder, does one see a group of Africans, Asians and Europeans from Kenya or Tanganyika discussing the future of their home territory together? And yet it is hoped that East Africa will have a multiracial future.

What, if anything, is the British Government doing to encourage the 10,000 African students studying in British universities and other institutions to take a wider interest in the views of students from Britain and other corners of the former empire instead of confining themselves to what they could do just as well and far more cheaply, back home? The British Council does a useful, but limited, job in getting the student settled, as do the various territorial student bureaus under the Colonial Office. And that, from what I was able to discover after considerable investigation recently, is about as far as official assistance goes. Far more expertly run clubs, residential hostels and vacation centres are urgently required and Government should be prepared to spend a lot of money on them.—Yours faithfully,

W. A. P. REILLY

Geita, Tanganyika

The Railways

SIR—We have been reading, with a great deal of interest, your concern about the British Railways and their deficit. Particularly in the "Agenda for the Railways" you seem to look at the problem largely in the light of the income to the corporation, although you do mention in the second section the possible social policy. However, at no place do you spell out what the social policy is nor how it can be measured.

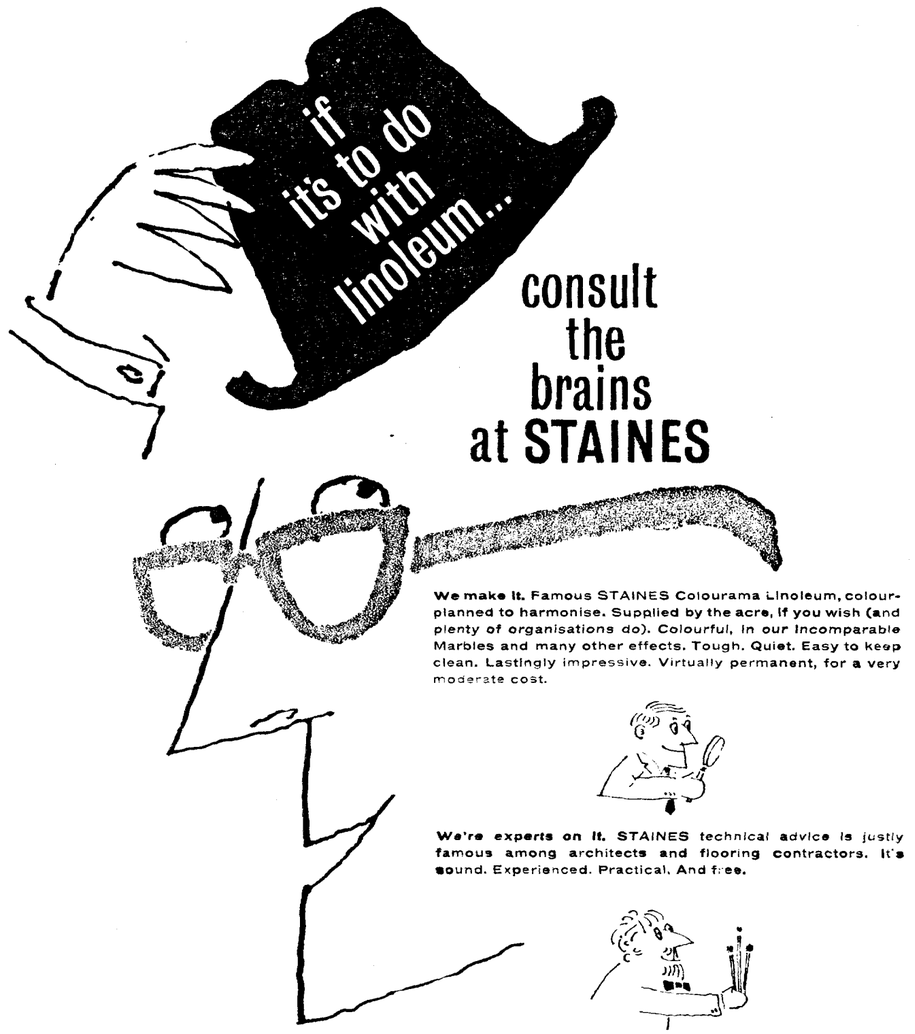
In the Philadelphia region, we have reached the conclusion that the commuter railroad lines which tie the suburbs to the core of the city must be maintained even though the income might bring in little more than half the cost. To us, the desirable social policy of value to the suburbs, as well as the city, is to have a system that provides movement within the entire region, and particularly to the dense central core, even though the fares which riders are willing to pay do not provide the full cost of service.

Our rationale is simple: that even though this looks like a very low percentage of the total cost, that the driver of an automobile to the core at peak hours pays an even smaller percentage than half of the cost of his facilities and that the local subsidy out of our city's general taxes to the person coming to the core at the peak will be less by rail than by automobile.—Yours faithfully,

JOHN A. BAILEY

Urban Traffic and Transportation Board, Philadelphia

Dentists



SIR—Your article on the country's dental problems overlooks the Government's main failing. There are not enough places in dental schools to provide sufficient trained practitioners. No new dental school has been built since before the war; but a competition is being organised for architectural designs for a school which some day will no doubt come into being.

The Government has fallen for the temptation of a quick two-year course for girls to deal with children's teeth. The New Cross school for these ancillaries does not open until October, but from then on 60 girls will be turned out every two years. The General Dental Practitioners' Association, for whom we publish *The Probe*, has no doubts that in due course the Government will proclaim these girls to be fully qualified dentists.

That school at New Cross could, of course, be used to give full dental courses. Why isn't it?—Yours faithfully,

S. C. CHANDLER

Vintage Publications London, EC4

We make it. Famous STAINES Colourama Linoleum, colour-planned to harmonise. Supplied by the acre. If you wish (and plenty of organisations do). Colourful, in our incomparable Marbles and many other effects. Tough. Quiet. Easy to keep clean. Lastingly impressive. Virtually permanent, for a very moderate cost.

We're experts on it. STAINES technical advice is justly famous among architects and flooring contractors. It's sound. Experienced. Practical. And free.

We're artists in it. The STAINES Colourama team is young, keen. Humming with fresh, imaginative ideas. Ideas as bright, and as subtle, as the Colourama range itself (and that's the widest there is). Ideas right for today's decorating trends.

Contact us here: STAINES Contract Division of the Linoleum Manufacturing Company Limited, 6 Old Bailey, London E.C.4. CITy 2471.

THREE STAR . CORDON BLEU

The most effective method of power transmission is Fenner the V-belt drive

- Separate V-Belts have a resiliency far superior to any form of flat belting.
- The wedge action of the V-Belts in the grooves actually improves with length of service.
- Neither tension nor alignment have to be maintained precisely to get good working results.
- If a V-Belt should break, the remainder will keep the drive working until replacement is convenient.
- ALL your drives using the same belt size are covered for spares by a stock of no more than are used for one drive.

Fenner

Remember that all V-Belts give long loyal service, but more Fenner belts reach pension age than any others. Catalogue 100/19 lists thousands of recommended standard drives. Send for it today.

BOOKS

The Hardest Nut

A New Deal in Central Africa

Edited by Colin Leys and Cranford Pratt. *Heinemann.* 240 pages. 21s.

THIS book is intended to be a constructive contribution to the problems that will face the British Government and the federal and territorial governments of Rhodesia and Nyasaland when they convene round the conference table with the Monckton commission report (or reports) before them—either late this year or early next. It is a very useful compendium of the main facts about the way in which federation has worked. Although no doubt the Monckton commission's report will say much of it again, perhaps at greater length, the commission will be expected to provide, from its interviews with African witnesses, chapter and verse for many of the assertions about African views that are baldly stated in this book. Dr Chidzero may be right in saying that "the one clear African challenge in matters of race is the demand for abolition of racial discrimination and the emergence of government by majority consent"; but white Rhodesians will challenge it on a score of points on the major premise, and the minor could mean a very great deal—what is "consent" and what is "government" in this context?

The authors who have contributed to the book (which is based partly on discussions at an Oxford weekend conference) bring to it a uniform point of view: that federation has worked unfavourably to the African majority; and that, on both the Southern Rhodesian record in the past fifty years and the Federation government's record in the past five, it would be unthinkable to transfer more power over the Africans to the white settlers. No matter what safeguards for the majority might be devised, it is argued, these would be nullified (like the African Affairs Board) and any pledges on implementing "partnership" would be dishonoured. But it is now clear that it would be politically impracticable to give the white Rhodesians independence on any such terms, however much they may have thought they could obtain it before the Nyasaland riots and the Devlin report transformed the outlook. The chapters on the events of the past five years (and especially Mr Guy Clutton Brock's exposé of the emergency in Southern Rhodesia in 1959) may provide African leaders at the constitutional review with plenty of ammunition if they lack any; what is of greater interest is the proposals that are made by the authors for a federation that could continue.

They believe that no safeguards for the majority can work except by means of the ballot box. They therefore propose that the Federal franchise should again be amended in such a way as to give the Africans as many votes as the Europeans have. This would be far from giving Africans the universal franchise that Nationalist leaders demand and is of course a complicated matter because of the present system of reserved seats; but it would be only for a transitional period, after which Africans would outnumber European voters. Since such concessions would give Africans full control of the government, it would be necessary to provide, shortly afterwards, minority safeguards for the whites, and these are briefly discussed; but exactly the same objections—indeed more—can be raised to these as to majority safeguards. In any event Mr Leys is frankly doubtful if the Africans would accept initial parity with the Europeans as adequate; while his expression of doubt about European willingness to concede the Africans even as much as parity is a masterly understatement. As a formal demonstration that no accommodation between the parties is politically possible, his final chapter could hardly be bettered.

Yet it is not an otiose exercise. The Europeans will certainly have to choose between some such surrender of power in the federation—in other words, a frank acceptance of a West Indian solution—and the break-up of the federation in a way that would almost immediately put the whites in the protectorates in the hands of African governments and yet without ensuring by such a sacrifice that the white Southern Rhodesians would escape a similar fate for more than a few years.

The outsider can of course see that the sensible thing is for the white minority to accept the inevitable now. Unfortunately the book offers no persuasive arguments to the white electorate to make this leap in the dark; on the contrary, its tone throughout is coldly hostile to them. Britain is warned that it must be ready to intervene to prevent them trying to seize power; they are shown up as almost incapable of acting from any motives but fear and greed; and there is scant reference to any services, as opposed to disservices, they may have done to the Africans in the past sixty years. Temperately written as the book is, settlers will feel that it puts them in the pillory. Settlers certainly need to see the other side of the case. But total lack of sympathy for their own will not persuade them to make the constructive abdication of political power to which this book calls them—or encourage the African leaders who would then take power to treat them better thereafter than the authors seem to think they deserve.

Sicily and Its Past

The Leopard

By Giuseppe di Lampedusa.

Translated by Archibald Colquhoun. *Collins and Harvill Press.* 255 pages. 16s.

A CERTAIN fascination attends the passing of an order of things. Just now there is a special interest in the fate that overtook the Kingdom of the Two Sicilies; Garibaldi's landing at Marsala was a hundred years ago, and its centenary comes just when Italian opinion, or a part of it, has begun to awaken to the unsatisfactory, one-sided and incomplete nature of the union of north and south that was then consummated. The union destroyed the existing order in the south without creating a new one, and the southerners were left to sit in a picturesque slum watching the north grow rich and modern. The present vogue for good works in Sicily is a tardy and partial recognition of these facts.

Thus a possibly transient interest—already there are signs of attention turning to the problems of central Italy—partly accounts for the remarkable success that *Il Gattopardo* has enjoyed with its Italian readers since its publication in 1958. The book could have been written at any time in the last hundred years; the late Prince Giuseppe of Lampedusa was one of a very few men surviving into modern times able to reconstruct the feelings, actions and way of life of a great Sicilian noble confronted with the collapse of the Bourbon kingdom. Something about the condition of the Kingdom of the Two Sicilies qualified it, just a century ago, to be overthrown by a mere push from Garibaldi and his handful of irregulars. What was it? A popular clamour for freedom? A surge of national pride? A resolve to catch up with the times? So the schoolbooks tell us; but neither subsequent history, nor this book, suggests that it was really so. Lampedusa's Prince Fabrizio does not resist the change, because he sees it as inevitable; he does not join in it; he expects nothing from it. At most he patronises the revolution through an energetic favourite nephew, while himself holding aloof. His family survives, a little less grand and a good deal less potent, looking quaint and out of date where before it had looked awesome and more than representative. But, it must be remembered, Sicily and its families could look back on a long history of take-overs and an endless sequence of foreign dynasties, of which the Bourbons of Naples, antediluvian as they appeared to the world at large, were only the most modern. The Sicilian character, inured to change, remained largely as it had been: proud, withdrawn, pent-up, negative, as unintelligible to Lombards and Romans as to the World Health Organisation or the World Bank.

Prince Lampedusa's book has great charm. It is imaginative and sensitive; it combines tenderness and humour with a strong sense of reality. It is not the great

book that many readers will expect; for that the structure is too weak, the absence of drama, conflict or consequence too complete. It is evocative of a place, an age and a society recaptured just in time, before hearsay and family tradition had become distorted or extinct.

Bridge to the East?

Trade with Communist Countries

By Alec Nove and Desmond Donnelly.
Hutchinson for *Institute of Economic Affairs*. 183 pages. 30s.

Soviet Economic Warfare

By Robert L. Allen.
Public Affairs Press, Washington. 303 pages. $5.

THE foreign trade of communist countries is a by-product of their home investment and production plans, which are the main motor of their economic life. Planning, with all its administrative complications, gives the system an inherent tendency to autarky—national, regional and local. In a world where prices are fixed by decree and the concept of comparative advantage hardly exists, imports from the outside world are inevitably concentrated largely on those which cannot be produced at home at all. Administrative convenience encourages a tendence to bilateralism; and the need for certainty in planning means that such trade as is conducted tends to be trade with the other planned economies instead of with the unpredictable capitalist world.

These considerations, quite as much as the strategic search for self-sufficiency, are responsible for the limited nature of communist trade with the outside world in the eyes of Mr Nove, who contributes the first essay in his and Mr Donnelly's little book. His economist's eye looks at Russian foreign trading policies in an equally helpful way. "It is a fiction," he points out, "which businessmen who deal with Russia know to be a fiction, that the corporations engage in conscious dumping, in the sense that they sell cheaper than they need." Officials of the trade corporations are rewarded if they earn more foreign currency and reprimanded if they sell too cheaply. Lacking the yardstick of comparative costs, it is true, they may sometimes sell below cost abroad. And the aim of their aid programmes, like the west's, is of course political. All the same it is his theme that Russian trading practices are motivated far more by economic and administrative considerations than is generally held in the west. And his conclusion is that east-west trade, though limited by the nature of the system, contains some possibilities of expansion if the world political climate improves and the west as well as the east does some rethinking on the differences of technique and approach that inhibit multilateral trade between the two. This little essay is one of the most penetrating analyses of the Soviet economic system in relation to the outside world to appear. Forty pages of simple information about the economic administrative regions of Russia, together with some short statistics, complete the contribution of this modest but outstanding expert on Soviet economic life.

The picture he paints is rather different from that of Mr Desmond Donnelly, MP, whose contribution forms the second half of their book. Mr Donnelly draws useful thumbnail sketches of each of the communist countries and outlines some of the practical problems that face the trader. But his starting-point is the political purpose that is the avowed aim of Soviet policy, not the economic and social framework which is a less publicised determinant. His contribution has not the same intellectual stature as Mr Nove's, but he comes to the same conclusion. Even if the period of co-existence is a period of disguised political warfare, as he suggests, east-west trade is a form of dialogue that the west must engage in as vigorously as it can.

Although this book seems something of a ragbag in form, it provides a stimulating and indeed invaluable introduction to both the business practice of east-west trade and the deeper issues behind it. Its approach is in striking contrast with Mr Allen's synthetic work on "Soviet Economic Warfare." Here a great deal of information about Soviet trade practices is put together in manageable form. Useful statistics are combined with detailed anecdotes of Russian practices. But the attempt to see all Soviet foreign trade practices in terms of political conflict is pushed so far that it becomes a grave weakness. Mr Nove's calmer analysis is a salutary antidote that makes for a better understanding of the Soviet challenge itself.

Size and Wealth

Economic Consequences of the Size of Nations

Edited by E. A. G. Robinson.
Macmillan. 469 pages. 50s.

THE fifth of the International Economic Association's symposia, held in Lisbon in 1957, concerns itself with a series of questions that have gained rather than lost in topicality since then: those relating to the size of nations as it affects—by way of the size of their enterprises, their markets, and the probability of variety in resources—their wealth and dynamic efficiency. The nineteen papers discussed by the conference covered methodology (what is "a nation"? and, more elusively, what is "size"?); case studies of individual efficient nations, large and small; the relation between size and efficiency in plants, enterprises, and industries—including the relation between scale and competitiveness; size and dynamic adjustment—including both development and the maintenance of stability; size and cost of administration; and the role of international trade as an "escape from smallness"—including the further step from trade to varying degrees of integration.

Supplemented by a summary of oral discussions considerably fuller, and correspondingly more valuable, than has been provided in previous volumes, these papers are an immensely rich mine of ideas and of facts. Anyone looking for a confident, cut-and-dried answer to the question "How much does size matter?" or indeed to any of its subdivisions is however likely to be disappointed. Indeed, one of the achievements of the conference was to lay waste quite a number of confidently held generalities. Thus, it is not at all necessary, though it may in some circumstances be helpful, to have a large home market as a "springboard" for an export trade. There are only a very few industries in which optimum size of plant or enterprise (in the loose sense of a size achieving almost all the possible economies of scale) is large enough to rule out their establishment and efficient operation in a small country. It is doubtful whether the large size of the American internal market is of more than minor importance—compared with, say, America's wealth of natural resources and American attitudes to work—to the efficiency of American production. More generally, the advantages to be expected from integration between nations (as in the common market) are more political than economic; the line of economic advance is far more clearly indicated through the General Agreement on Tariffs and Trade.

As Professor Robinson makes clear in his preface, the whole question of size deserves a great deal more attention than it has hitherto had. The participants in the Lisbon symposium are well placed to mount an advance in this long-dormant sector of the economic frontier.

Views of America

The Character of American History

By W. R. Brock.
Macmillan. 306 pages. 25s.

As Others See Us: *The United States Through Foreign Eyes*

Edited by Franz M. Joseph.
Princeton University Press.
London: *Oxford University Press*. 368 pages. 48s.

The United States to 1865

By Michael Kraus. 553 pages.

The United States Since 1865

By Foster Rhea Dulles. 575 pages.
University of Michigan Press.
London: *Mayflower*. £3 each.

THE time has gone by when British ignorance of American history could be excused by a shortage of books designed for the insular reader. Mr Brock, wisely realising that Cambridge, Eng., now has as ready access as Cambridge, Mass., to introductory narratives that tell the plain facts separating the *Mayflower* from the Polaris, has essayed something different. The main outlines of the story he takes for granted; from there he goes on to explain why American history took such an un-British, indeed often un-European, course. Some years ago another Cambridge historian, Mr Frank Thistlethwaite, offered an analysis on a somewhat comparable scale, but the emphasis of his explanation fell on economic and social factors. Mr Brock has not neglected the social either, but it is politics that fills the centre of his picture. He is frank in his expression of distaste for certain of the most distinctive features of American democracy; there is a Godley-an flavour about his remarks on "the tone of public life," and a cisatlantic reluctance to respond to the emotional pull of isolationism. But he is equally frank in recognising the power of the egalitarian and the directly representative elements in the system and he is especially perceptive of the modes and stages by which eighteenth century and ante-bellum America evolved its own variety of Anglo-Saxon policy. He writes with clarity and pungency and reinforces his analysis with a wealth of happily chosen historical instances. The level of accuracy is high save that a number of unimportant but surprising errors of transcription occur in the numerous quotations that enliven the text.

In Mr Joseph's contrived—though, on the whole, well contrived—volume, it is Professor Brogan who, unsurprisingly, speaks for Britain. He may be thought to argue a little too exclusively in terms of what the growing impact of the American colossus has been on his main critic, the British left-wing intellectual, but as always there is meat in every sentence of his perceptive prose. M. Raymond Aron, as so often at his best in a symposium of this kind, articulates the French concern over the American menace in a form that carefully sifts the anxieties of the *hommes de bonne volunté* from the panic fears of the ignorant and the mandarins. In a very freshly observed, sensibly argued contribution, Jacques Freymond relates some of the same considerations to the special case of Switzerland. And so it goes on, around twenty (alas all extra-iron curtain) countries. Hardly one contributor fails to make at least one or two points of interest, but inevitably a certain flatness creeps in, a certain social survey pallor falls over the pages. The questionnaire, for all its merits, is still, on the whole, an inferior literary instrument to the pen.

And how do Americans see themselves? For an answer, the British reader might do worse than turn to the two latest volumes of the University of Michigan's "History of the Modern World." Despite their seeming bulk and indisputable weight, these are readable narratives that well exemplify the solid merits of the modern American historian—his liberal, critical spirit, his scrupulous regard for accuracy, his awareness of the inter-connection of all aspects of the past, political, social, economic, cultural and even physical.

Golden Syrup

A Nursery in the Nineties

By Eleanor Farjeon.
Oxford University Press. 534 pages. 30s.

NOT long ago Miss Farjeon wrote an interesting but rather uncomfortable book about Edward Thomas—uncomfortable because she wore her heart so openly on her sleeve. She has further volumes of memoirs in preparation, and as part of the series she has republished her memories of childhood, which first appeared twenty-five years ago. She was one of an exceptionally happy and united family, all talented, who were perfect examples of the English tradition of respectable Bohemia. Her father, Ben Farjeon, was a novelist who was well-known in his lifetime though now forgotten; her mother was a member of a famous family of American actors; they lived in and around the theatre; and they were entirely respectable, happily married, and good members of society.

Miss Farjeon is convinced, and convinces the reader, that no one could have had a better or more stimulating upbringing; unfortunately, the reader's conviction is purely intellectual, since nothing is brought alive at all. This is essentially a private book, written, as she says, for the family; and had it not already had a great success among the sentimental, one would say that it should never have been given to the public at all. The family feeling, and Miss Farjeon's recollection of it, are so strong and so uncritical that reality is only seen at second or third hand. This is the world once seen by a united set of children, and remembered long after by a middle-aged woman without doubts or inhibitions. All the characters emerge as creatures of her affection rather than as real people, and one must have a remarkably sweet tooth to cope with the glutinous sentiment. Like golden syrup, it is a compound where taste is sacrificed to sweetness and uniform consistency. The only contrast is provided by endless documents of juvenilia, which most adults would think better forgotten. But it had its audience before and may have again.

The Enlightenment and After

In Search of Humanity

By Alfred Cobban.
Cape. 254 pages. 32s.

BY far the major part of this interesting book is a lucid, fair and stimulating account of the development of the Enlightenment in Europe during the seventeenth and eighteenth centuries. It is introduced and completed by a discussion of the bankruptcy of contemporary political thinking and by a spirited and welcome defence of rational inquiry as a means of revitalising political science in the present age and of rescuing it from the gloomy embraces of pessimists and religious revivalists. As his title suggests, Professor Cobban regards this second part of his book as containing its serious purpose; his account of the Enlightenment is not, he assures us, "history for its own sake." Nevertheless, whatever his motives or his purposes, all who are interested in the history of Western Europe in the eighteenth century will be grateful for his work. Political historians, especially (though probably not convinced that their researches are only "on a fairly superficial level") will be in his debt for his summary of the development of political ideas in the period.

Professor Cobban shows how the essence of the scientific movement from which the Enlightenment sprang was its combination of theory and experiment. This combination, a merging of the methods of Descartes and Locke, was developed in the realm of political thought by Montesquieu and transmuted subsequently by the genius of Rousseau to include emotion. These men, and others of comparable intellectual stature such as Bayle and Voltaire, shared, besides their love of reason, a hatred of cruelty and a fundamental respect for the individual. This respect perished with the wars of the French Revolution and the rise of the idea of popular sovereignty; as Professor Cobban says, "before this new theory of sovereignty" the individual's rights "faded away like snow in summer." Thereafter the field was cleared for the rise of nationalism, the growth of pessimism and the decline of reason.

But in his treatment of the political thought of the nineteenth century Professor Cobban is, perhaps, guilty of something of the pessimism which he sees as its leading characteristic. He recognises the triumph of Jeremy Bentham's ideas in England but seems not to allow the prevalence of optimism among practical politicians in England, of whom Mr Gladstone was the outstanding example. Yet his final conclusion is not pessimistic; it is hopeful and it is salutary—that reason and tolerance can lead us back to sense and humanity.

OTHER BOOKS

WORLD INSURANCE TRENDS. Edited by D. W. Gregg and D. M. McGill. *Pennsylvania University Press*. London: *Oxford University Press*. 700 pages. 80s.

This is a summary of the proceedings at an insurance conference held at the University of Pennsylvania in 1957. The papers on individual countries provide some kind of reference work on different insurance habits; but it is surprising to see so little mention of the role of London in the world insurance market.

REPORT OF THE DIRECTOR GENERAL ON THE ACTIVITIES OF THE ORGANIZATION IN 1959. Unesco. *Her Majesty's Stationery Office*. 284 pages. 30s.

THE CHURCH TODAY. By J. W. C. Wand. *Penguin*. 192 pages. 3s. 6d.

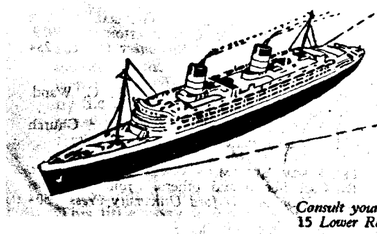
A brief description of the Christian Church in its external variety and its inner unity.

THE FISCAL SYSTEM OF VENEZUELA: *A Report*. By Carl Shoup and others. *Johns Hopkins Press*. London: *Oxford University Press*. 514 pages. 70s.

Travel in a big way...

When you cross the Atlantic by Cunard, the price of your fare covers so much that is *beyond* price. For several days you will have the holiday of your life . . . superbly fed, faultlessly served, royally entertained. You will live in spacious luxury and enjoy endless opportunities for rest and recreation. If you are travelling on business, the voyage is an ideal prelude to the strenuous days ahead. Should you need to mix a little business with your pleasure, you will find the ship's secretarial service most helpful and efficient.

FULLY STABILISED



R.M.S. Queen Elizabeth and R.M.S. Queen Mary together with many other ships of the Cunard fleet, are fitted with anti-roll stabilisers to smooth your way across the Atlantic, thus adding still further to your comfort and carefree enjoyment.

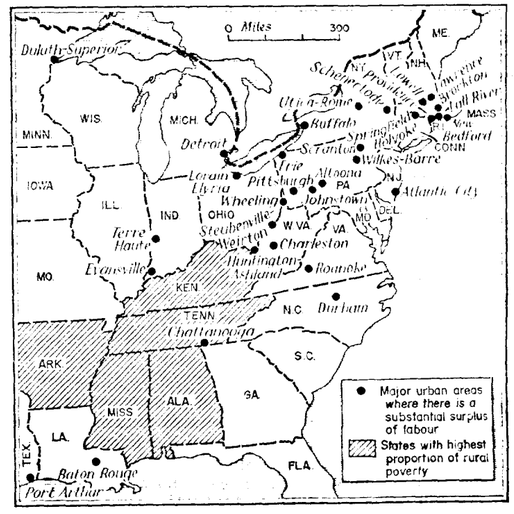
AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect: all others are the work of the editorial staff in London

Where Depression's Chronic

WASHINGTON, DC



IN a week in which George Washington has been turning in his grave because the Administration waited until its axe had been found quivering in the cherry tree before announcing that it could not tell a lie, the depressed areas about which Congress has been talking might be taken to refer to the Central Intelligence Agency and the State Department. But in fact the Legislature has been bending its attention to a humbler but more humane theme: this is the problem of bringing new life to those pockets of poverty and industrial decay which dot the map of the United States like dead skin on an otherwise healthy face. Congress has just approved a comparatively modest Bill providing $251 million in loans and grants to attract new industries to these areas. Even this required much parliamentary ingenuity: first the House of Representatives had to invoke a dustily obscure procedure known as "calendar Wednesday," last used ten years ago, to prise open the grip in which the conservative Rules Committee—through whose hands all legislation normally has to pass—has held the Bill for the past year; and then the Senate, which had approved a more generous measure earlier, decided to settle for the House's version rather than struggle over a compromise.

The Bill now goes to President Eisenhower's well-oiled guillotine. If he vetoes it, as he vetoed the rather larger Bill which Congress passed in 1958, last week's votes make it clear that in neither house do its backers have the two-thirds majority required to override the veto. But the President may be deterred by the memory of the damage which his last veto did to Republican candidates in depressed areas in the congressional election of 1958. This year American voters, their eyes drawn to the troubles of West Virginia by Tuesday's election in the state, are showing a sharpened sympathy for those areas which have been left with a heavy burden of unemployment by dying industries, the advance of automation or the retreat of factories to more profitable parts of the country.

The region which the Bill is chiefly designed to help stretches in a broad crescent from New England to the lower Mississippi. The latest figures issued by the Department of Labour give thirty major districts on the mainland of the United States, and over a hundred smaller ones, as areas of "substantial labour surplus." Half of these were reckoned, in a study prepared by the department last year, to be chronically depressed; the proportion of their working population which was unemployed, in a country where the nation-wide figure is still over five per cent, had been well above the national average for four out of the five previous years. The causes are not hard to find. Over half of these places are towns where the industries mainly responsible for the trouble are coal mining or textiles. Thus Massachusetts and Rhode Island, many of whose textile mills have been lured away by the cheap wages in the South, contain five of the Labour Department's list of 17 major chronic sufferers; the coal regions of Pennsylvania and West Virginia, plagued by the contraction which has cost three miners out of five their jobs in the last decade, account for four more.

Most of these towns lie in the older industrial regions of the north-east. But Congress has attached to them, for reasons that are as much political as economic, a block of poverty-stricken rural areas concentrated mainly in the region south and west of the Appalachians. The Bill, in addition to providing loans (and, where necessary, outright grants) designed to draw factories back into decaying cities, would also try to attract industry to the most decrepit parts of the countryside. A list of these tobacco roads, drawn up by the Department of Agriculture, suggests why the Democratic leaders thought that this double objective might for once unite the southern and northern halves of their party. Of the 300-odd counties which constitute the poorest tenth of rural America, almost two-thirds lie within the five neighbouring states of Alabama, Mississippi, Arkansas, Tennessee and Kentucky. The device was only partly successful; of the thirty-five Democrats from these states in the House of Representatives, fifteen steadfastly put their dislike of federal intervention before their desire to get assistance for their constituents.

There can be little doubt that the federal government will have to broaden the help it gives to depressed areas. Hitherto federal aid has been confined to a few minor measures. The government has given preference to these areas in placing orders for the goods it buys, and in making loans to small businessmen; and until recently it offered special tax depreciation allowances to defence industries moving into hard-hit districts. A tiny office in the Department of Commerce dispenses good advice and pamphlets to local authorities struggling to keep their towns alive. But the continued decline of the problem industries, and the stubborn reluctance of the unemployed to disperse themselves around America at the behest of the law of supply and demand, suggest that other measures are needed. In so luxurious a society it is painful to learn that four million people, a high proportion of

them in the regions which Congress is trying to help, are hungry enough to need the miserable rations of surplus foods distributed by the Department of Agriculture.

Nevertheless, it would be a foolhardy liberal who claimed that this year's Bill was a flawless answer to the problem. This is not, as its critics have argued, because it impedes the natural redeployment of labour which the free market, left to itself, would eventually bring about. The free market, which finds it difficult enough to inveigle workers down the road from Glasgow to Birmingham, faces an altogether harder task in persuading Pennsylvanians to make the trans-continental migration to Texas or California. In any case, the federal government has to reckon with the fact that many state and local authorities in depressed areas are trying to pull themselves up by their bootstraps by offering financial help to companies from other parts of the country and even putting up factories for them. If their efforts convince out-of-work miners in the black holes of Scranton and Wilkes-Barre —where the unemployment rate has been above ten per cent of the labour force for years—that it is worth staying where they are, it is pointless to invoke the holy name of labour mobility.

But the new measure, even if it becomes law, will give its administrator a hard time. It makes forty large industrial areas and a hundred smaller ones, in addition to several hundred rural counties, eligible for the funds at his disposal. Since he would have only $35 million to distribute in direct grants, and $200 million in loans which would not be available for re-use for some time, he would either have to spread his resources so thinly that they would be useless or else turn down many applicants (and thus offend their patrons in Congress). There is also some doubt about the number of new jobs which the Bill would create. Its opponents claim that it takes an investment of over $12,000 to employ one worker ; they say that, even counting the contributions which the Bill requires from state funds and private industry, it would give work to no more than about 70,000 men. This is an exaggeration, since the light industries which the Bill is chiefly designed to encourage need a much smaller investment than $12,000 a job, and each man back at work will in turn create employment for others ; but the money can, at best, provide only a partial cure.

The other danger is that the depressed areas will simply gain new industries by drawing them away from other districts. Last week Congress decided that the administrator of the programme must refuse a loan if he thinks that it would do no more than shift the unemployment. This is much sterner than the original provision, which merely required him to avoid " substantial detriment " to other areas ; it puts him under an obligation, the limits of which will almost certainly have to be decided by the courts.

These difficulties suggest that Congress has not yet found an entirely satisfactory way of getting the blood moving again through the withered extremities of the economy. But the plight of the depressed areas has plainly proved too severe for the traditional remedies available to the free enterprise system. If the lower levels of government have been unable to raise the funds needed to make these areas attractive, the federal government is the next source from which help should logically be sought ; this year's Bill would be a useful test of how effective it can be.

I Spy

ONCE official Washington had time to collect its wits, the State Department and the President between them made the best of the bad business of the bringing down, just before the summit conference, of an American aerial spy. Mr Khrushchev now has it within his power to blame the United States if the summit conference fails and to make it impossible for Mr Eisenhower to carry out his visit to the Soviet Union; and it seems certain that it will become much harder for the United States to use bases in friendly countries that have been unnerved by Mr Khrushchev's threats. But Mr Herter and Mr Eisenhower should have convinced even unsophisticated Americans, shocked to find the American government dabbling in the same dirty business as the Russians, that not only is this nothing to be ashamed of, but a necessity if a nuclear Pearl Harbour is to be avoided. In more knowledgeable Washington, the reaction to the revelation that the United States had been sending photographers across the Soviet Union for four years was much more one of relief and satisfaction; in the past it has been more usual to accuse the Central Intelligence Agency of falling down on its job than of doing it superlatively well. Moreover, now that there is reasonable doubt whether Mr Powers was actually shot down—a mechanical failure is thought more likely—the legendary Russian air defences do not seem so impressive.

Neither the President nor Mr Herter has succeeded, however, in clearing up the points which are causing real anxiety in Washington and for which the Administration itself is to blame. That the government " lied " at first is not surprising; governments seldom take responsibility for spies who are caught and the Soviet government certainly has not. What is universally thought to be deplorable, however, is the timing of the flight. So is the unfortunate contention in the State Department's first announcement that " in so far as the authorities in Washington are concerned there was no authorisation for any such flight." The intention, no doubt, was to free the President of an embarrassing technical responsibility. But it lent colour to communist insinuations that military groups in the United States are at liberty to defy and frustrate the civil government. And few people in Washington believed the announcement.

Later statements have made it clear that, even if specific flights are not authorised individually, the collection of military information by every possible means has been authorised by the President. In his press conference Mr Eisenhower contended that, although intelligence departments cannot be run in the ordinary way, there was responsible supervision. It does not appear, however, to have been responsible enough. There is also cause for regret in the suspicion which has been thrown on the valuable and peaceful work of the civilian space agency. All these matters worry many members of Congress, particularly Democrats who have long been contending that the Central Intelligence Agency is not adequately controlled. Next year, when the summit conference and the President's visit to Russia (or his failure to go) are history, it seems certain that they will be explored thoroughly.

No Stopping Kennedy?

SENATOR KENNEDY'S unexpected triumph in West Virginia is a triple one. The Democratic voters who, in a proportion of three to two, preferred him to Senator Humphrey—Mr Kennedy had expected, in public at least, to be beaten by this amount—proved that his Roman Catholicism does not count against him in an overwhelmingly Protestant state and one hitherto regarded as prejudiced in religious matters. The voters also proved that his wealth does not count against him in one of the most poverty-stricken regions of the country. And thirdly, Mr Kennedy himself proved that he can survive the combined attack of all his rivals for the Democratic presidential nomination. For in Tuesday's ballot Mr Humphrey had the active backing of the influential party leaders in West Virginia, and of many outside it, not because they favoured his candidacy but because they thought that Mr Kennedy must be stopped now if there was to be any chance at the con-

vention for the various candidates they do favour—Senator Lyndon Johnson, Senator Symington or Mr Stevenson.

Senator Kennedy owes his success to the ability with which he turned to his advantage all the reasons which were supposedly going to defeat him. Forced to discuss his religion, he did so boldly, arguing that it was his own affair but that his alleged allegiance to the Pope had never prevented him from serving his country loyally in the past and certainly would not do so if he were asked to serve it in the highest office of all. Those who suggested that he took orders from his church were in his view bigots, a condemnation which West Virginians were evidently determined not to deserve. Mr Kennedy's wealth contributed to his victory by enabling him to cover the state with personal appearances and an intensive television and press campaign which Senator Humphrey could not afford to match. But Mr Humphrey's attempt to appeal to the voters as a poor underdog was countered by Mr Kennedy's claim that in fact it was he who was the underdog with everyone in his party ganging up against him. And in this competition for sympathy he seems to have won.

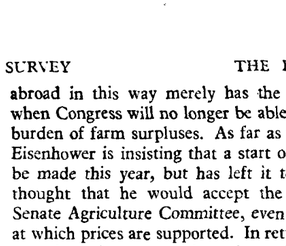
Mr Kennedy's opponents cannot be expected to come over to his side in a body, or to retire from the campaign completely, but his success deprives them of the arguments which they have been using against him so far, in particular of the contention that Protestants would not vote for a Roman Catholic. It also deprives them of Mr Humphrey as a stalking horse, since he has now given up his brave struggle for the Presidency and will devote himself to securing re-election to the Senate and a liberal platform for his party. The West Virginian battle was a simple popularity contest and did not give Mr Kennedy a block of delegates to the nominating convention. But it will be surprising if delegates from other states do not now rush to get on his bandwagon. What matters most to Mr Kennedy, however, is that there should be enough of them to enable him to arrive in Los Angeles in July assured of the clear majority of 761 votes needed for the nomination.

Wheat: Shared and Stored

LAST week's imaginative grain deal with India, involving nearly 600 million bushels of wheat and 22 million bags of rice, is the largest ever made under Public Law 480, through which surplus American farm commodities are exchanged for foreign currencies; it is also the longest, being spread over four years; and it is the first to enable the recipient country to build up reserves for emergency use. This insurance against crop failures, and against the inflationary speculation which results from chronic shortages of grain, is most important from India's point of view, since it enables that country to concentrate on its long-term project, backed by the American Ford Foundation, for achieving agricultural self-sufficiency without having to worry about current supplies of essential foods. The American negotiators insisted that India must continue to buy 15 million bushels of wheat a year on the world market at commercial prices for the sake of Canadian and Australian exporters. India is, however, being allowed to use for its own development schemes an even higher proportion than under past agreements of the $1,276 million in rupees which it is paying to the United States; all but $200 million, reserved for the American government to spend abroad, is being returned to India, half in loans, half in grants.

Even before the latest deal India had been the chief beneficiary of Public Law 480, and wheat the chief commodity to be delivered under it. But the amount involved now is about half of both an average American wheat crop and of the present surplus stock, and more than Americans consume as food during a year. Nevertheless there are people who feel that to ship America's abundance abroad in this way merely has the effect of postponing the day when Congress will no longer be able to avoid easing the taxpayer's burden of farm surpluses. As far as wheat is concerned, President Eisenhower is insisting that a start on lightening the surplus must be made this year, but has left it to Congress to say how. It is thought that he would accept the solution worked out by the Senate Agriculture Committee, even though it would lift the level at which prices are supported. In return farmers would be required to reduce the acreage they plant with wheat by 20 per cent but would be allowed to make up half the loss of output by drawing grain from the government's stock.

Meanwhile in the House of Representatives a completely new approach is being advocated with the Family Farm Income Bill. Price supports and government purchases would be abandoned and producers of each commodity would be allowed to establish their own production quotas in order to balance supply and demand. There is no doubt that if Congress passes the Bill the President will veto it, but it is backed by Democratic leaders because they feel that the party must have an energetic new approach to agriculture to offer to voters in the farm states next November. On the Republican side Vice President Nixon feels the same and has let it be known that once he is nominated for the Presidency he, too, will have something sensational to offer.



Doctor in Spite of Himself

LARGELY to satisfy Mr Nixon, a reluctant President has at last produced his own Republican answer to Democratic plans for helping old people, through the existing federal social security system, to pay their medical bills. Except as a shield for Republican candidates against the charge that their party is indifferent to the struggles of the elderly, this elaborate scheme has had a poor reception. It has been pounced upon by the right-wing

MANUFACTURERS' CHANGING PAYROLLS

EMPLOYEES IN MANUFACTURING

THEIR ANNUAL EARNINGS

Source: — Survey of Current Business, December, 1959, US Dept of Commerce.

While the total number of people employed in manufacturing in America has been decreasing, the drop has been entirely among wage earners—that is, factory employees below the rank of working foreman who are engaged in making or handling products or in plant maintenance work. The number of salaried employees—executives, technicians, salesmen, office staff—has been rising steadily. This is mainly because of the increased demand in post-war industry for professional workers, such as engineers and chemists, as a result of new and more complicated products, new methods of producing and distributing them and expanded research programmes.

By 1959 salary payments accounted for almost one-third of the total manufacturing payroll of about $85 billion a year, compared with only one-quarter of the $42.5 billion paid out to factory workers in 1947. Yet the average annual wage has gone up proportionately more over the period than has the average annual salary. This is partly because within the wage-earning group there has been a movement into better-paid occupations and away from unskilled jobs.

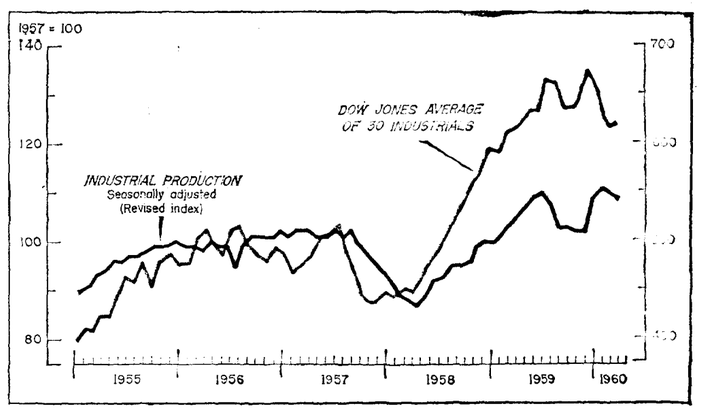
Wall Street's Crystal Ball

NEW YORK

AT the present time, when all available statistics are being sifted carefully to find indications of where the economy is going, considerable interest is focused on the performance of the stock market. Many people are asking themselves whether Wall Street, in staging a retreat of 13 per cent in share prices in the first six weeks of the year, was giving a timely warning of trouble ahead or whether it was simply revising sharply downward the somewhat heady expectations held by both investors and businessmen at the end of last year. The subsequent performance of the market—with no real recovery and no continuation of the downturn—has simply begged the question.

A great deal of work has been done on the part played by the stock market (as measured by the popular industrial averages) as a forecaster of business trends. According to those who have delved in this field, share prices have a fairly consistent record of anticipating turning points in business activity; the averages have usually turned down before the economy has reached a high point in the trade cycle and have turned up again before business has reached its low. But although the market has often been "right" as a general forecaster, its value as a guide to the future is subject to some major qualifications.

In the first place, share prices follow such a jagged course that peaks and troughs can be pin-pointed with any accuracy only in retrospect. The market rarely moves in a straight line and when it is undergoing a basic change in direction it is particularly liable to short run swings which make it difficult to determine, as at the present time, if a given peak is in fact the main one. Secondly, while the market cycle usually precedes the business cycle, the lead time has been subject to very wide variations in the past. And finally, any detailed correlation of market movements and business trends runs into the considerable snag that different statistical measures of market performance give different results; the popular Dow Jones average of 30 industrial shares and the more comprehensive Standard and Poor's index of 500 shares may tell very different stories. And even when it comes to picking out the high and low points in the business cycle it is hardly reassuring to find that they are not the same on the old and the recently revised versions of the Federal Reserve Board's index of industrial production.



THE National Bureau of Economic Research has been the chief student of the stock market as a business forecaster. Its studies show that, in the thirteen trade cycles which have occurred since 1897, market peaks (using the Dow Jones average) have preceded those in business activity on ten occasions, have coincided with them once, and have lagged behind the downturn in business twice. Similarly, low points on the stock market have occurred before those in business eleven times, have coincided with them once and have lagged behind once. But the interval has varied between a lead of thirty months and a lag of three months for business peaks, and a lead of eighteen months and a lag of one month for troughs.

In judging the reliability of the stock market as a forecaster of business trends, it is only fair to emphasise that these are not precisely what investors are trying to foresee. It is the outlook for profits, rather than the prospective volume of business, that investors are trying to assess. And while these two phenomena are clearly related, they do not reach their peaks at the same time. Corporate profits are usually largest in the early stages of a boom, before they are squeezed by rising costs of production. Similarly in a recession, profits hit their lowest point well before the economy reaches its bottom. In the latest upsurge of business, for example, both corporate profits and profit margins were at their highest in the second quarter of last year. It is this preoccupation with the trend of profits, rather than any occupational facility for gazing into crystal balls, that tends to keep the stock market at least one step ahead of business in general.

The stock market is not the only economic indicator which gives some hint of the shape of things to come. The National Bureau has selected eight statistical series (including share prices) which it considers to be peculiarly sensitive to the expectations of businessmen. Fluctuations in the length of the average work week, awards for residential building and new orders for durable goods share with the stock market a tendency to anticipate fluctuations in business activity. Taken individually, none of these "leading" indicators is a particularly reliable forecaster, but when they all act in unison—turning up together or down together—the record shows that it is reasonably certain that the level of business activity will shortly follow suit. Among its leading indicators, the National Bureau considers the stock market to be one of the more helpful ones; it is usually the first to call the turns, although since the war contracts for new residential housing have proved themselves to be a sensitive and prompt reflection of what lies ahead.

THE stock market can of course make "mistakes"—as a business forecaster, that is. A notable example came shortly after the end of the war. The stock market turned down in the middle of 1946 while business continued to climb for another two and a-half years. While many claim that investors were anticipating a postwar recession that took a very long time to materialise, others argue that the market was simply reacting to the financial stringency of the period. But for those who look to the stock market for light on business trends a lead of thirty months is not much help.

According to some students of the stock market, the powerful role of the institutional investor—with factors other than the swings of the market to consider—has made the stock market less reliable as a business forecaster than it was before the war. For instance, the reluctance of share prices to turn downward decisively in the course of the business boom in 1956-57 is attributed by some to the persistence of institutional buying even after the market had put out its "bear" signals. Conversely, the sharp drop in share prices this year has been attributed in part to the fact that institutional investors, with their portfolios now well-padded with equities, were happy to pause for breath. The stock market can point to its rather neat performance in pronouncing that the 1957-1958 recession had ended; prices of shares turned round in November, 1957, and started a determined climb even though the economy ran downhill for another five months. But only in the perspective of history will it be possible to judge the stock market's 1960 performance.

Continued from page 634

Republicans as "socialised medicine" and denounced by the American Medical Association as unnecessary, by the trade unions for its "means test" and by many Governors of the states which would be required to provide nearly half the money—and do not know where they would find it. Yet it is a step forward that both parties now recognise—if only under election pressures—that there is a problem to be solved.

In its tortuous effort to avoid involving the federal government in direct new responsibilities, the plan recalls the Administration's scheme for funnelling some federal aid to education. But now that Mr Nixon, as the prospective Republican presidential candidate, is more and more calling the tune, there is less emphasis upon saving money and more upon substance. Indeed, as far as coverage of catastrophic illness goes, the Administration's plan is far more generous and comprehensive than its Democratic rivals' and it is not cheap; it would cost about $1.3 billion a year, of which the federal government would supply about $700 million.

There are three main differences between the Republican and the Democratic approaches. The Eisenhower scheme would be administered by the states, with the aid of federal subsidies, instead of by the federal social security agency. Secondly, to avoid any element of "compulsion" (Mr Eisenhower's bugbear), old people could choose between paying premiums to a private health insurance organisation, which the government would subsidise, or paying $24 a year to enrol in the state health scheme, christened "Medicare." In theory this leaves room for private enterprise, though insurance companies would be hard put to it to rival the benefits offered by Medicare, which would include, in any year, 180 days in hospital, 365 in a nursing-home, drugs, surgery, and dentists' and doctors' services. Finally, only those with incomes under $2,500 a year ($3,800 for couples) would be eligible; this covers about three-quarters of the old. And except for those on public assistance, who would pay nothing, everyone would have to pay the first $25 of his medical bills; the government would pay 80 per cent of the rest. All these provisions would impose a heavy burden on states whose resources, both administrative and financial, vary widely. Luckily there may be time for calmer second thoughts on both sides if, as seems probable, Congress passes a Bill which the President feels that he must veto and the whole matter goes over to the next session.

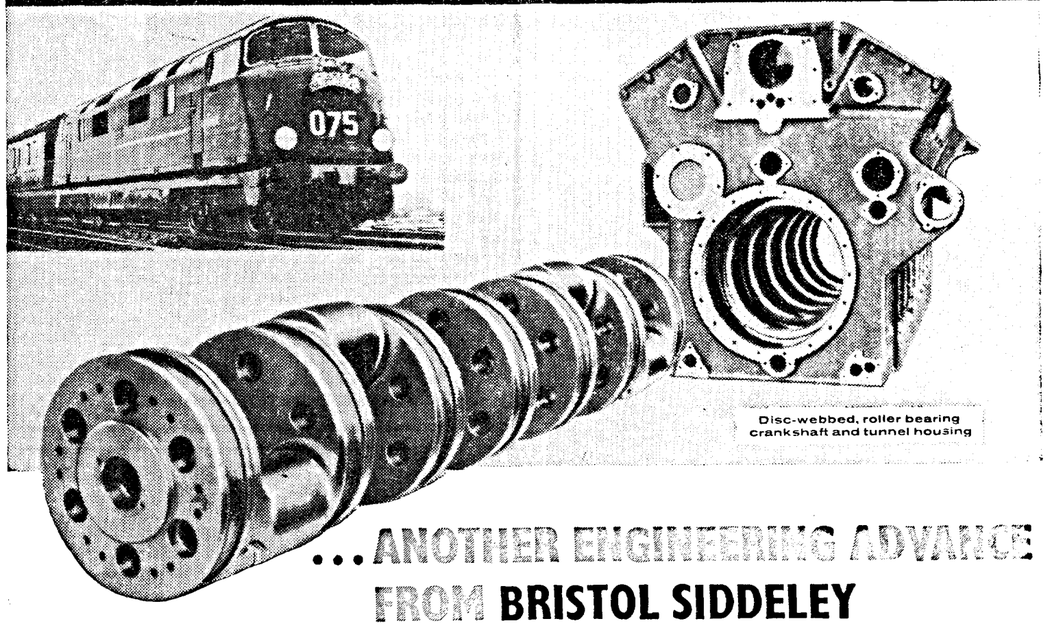
Segregation in Church

FROM A CORRESPONDENT IN COLORADO

At its quadrennial conference in Denver last month the Methodist Episcopal Church, the largest Protestant denomination in the country, with ten million communicants, decided not to try to eliminate racial segregation in its churches at this time. Almost all its members, except the southern diehards, regard segregation as a distressing affront to the spirit of Christian brotherhood and believe that integration is the only Christian solution. But after a week of emotional debate they voted overwhelmingly to uphold the report of a special commission which in effect advocates the utmost gradualism and the greatest care so that racial questions shall not again divide the church.

To understand why, it is necessary to remember that treatment of the Negro was the rock which split the American Methodists apart for almost a hundred years. Most of the early American Methodists seem to have accepted slavery, but by the early eighteen-forties a majority had embraced abolition and in 1844 the Southerners seceded, and organised the Methodist Episcopal Church South. The schism lasted for ninety-five years and was healed only in 1939 (a few groups still remain outside) and then only because the Church bowed to the southern demand for continued *apartheid*. The awkward administrative arrangements of the church today reflect the terms of this agreement. Five of its jurisdictions are geographical but the sixth, the Central one, is not. It is for Negro congregations only, and its members include about 367,000 of the 397,000 Negro communicants, who in turn comprise only about 4 per cent of the whole membership. Thus only about 30,000 Negroes, or less than one-tenth of the church's Negro communicants, have been accepted into non-segregated congregations. Little progress toward increasing this number, either individually or by congregations, has been made since 1939.

These church jurisdictions have an unusual degree of independence; although the last two General Conferences limited this slightly to open the way to eventual integration, the agreement of two-thirds of a white congregation is still required before an invitation to merge may be extended to a Negro one, and two-thirds of the Negro members must also vote to accept it. There have been very few such inter-racial amalgamations. One reason may be that, so far as church affairs go, the jurisdictions are co-equal, and this gives the Central jurisdiction a one-sixth voice, although it contains only one-twenty-fifth of all communicants. Some Negro clergymen and laymen enjoy this privileged position. On the other hand southern opposition to integration is apparently almost as swollen and angry as it was on the occasion of the original schism. It has led at least two southern states to pass laws which permit local congregations to withdraw from denominational groups if two-thirds of their members approve. Bills to the same effect are pending in other southern Legislatures.



Aid for Aid

Observers of the American scene have learned long ago the difference between an authorisation for the mutual security programme, which merely fixes a ceiling on spending, and an appropriation, which provides the actual cash. So has President Eisenhower, who launched last week an unusually vigorous and forehanded campaign to "save" foreign aid just as the Senate and House of Representatives were about to authorise almost as much as he had asked. Congress fixed a total of just under $4.1 billion—the President requested $4.2 billion—although Mr Fulbright, introducing the Bill in the Senate, spoke for many when he complained that the programme was like a "plate of warmed-over grits," lacking initiative, originality and long-term provisions.

The President himself found little that was not familiar to say in his appeal to the country although, in a new variation on the theme of mutual aid, he is believed to be entrusting much of the fight over the appropriations Bill to Mr Nixon who, as the probable Republican presidential candidate, needs more limelight than he has been getting. Even Mr Eisenhower's hint that he might call a special session of Congress if Mr Passman, an old enemy of foreign aid, persuades Congress to cut a billion dollars out of the appropriation is an echo of a threat made last year—and never carried out. Mr Passman, on the other hand, will benefit from the painful contrast between the President's willingness to veto Bills for spending at home and his determination to maintain spending abroad, from a series of scandals in the administration of foreign aid, and from the deficit in the American balance of payments.

Mr Eisenhower's argument that the way to right the balance of *international payments is by increasing exports, not by cutting* foreign aid, has been strengthened, luckily, by the export figures for the first quarter, which are 20 per cent higher, on a seasonally adjusted annual basis, than they were a year ago, largely because of the expected upsurge in shipments of cotton and because of the end of the steel strike. Imports, though still high, are only 10 per cent more than they were in 1959, encouraging hopes that

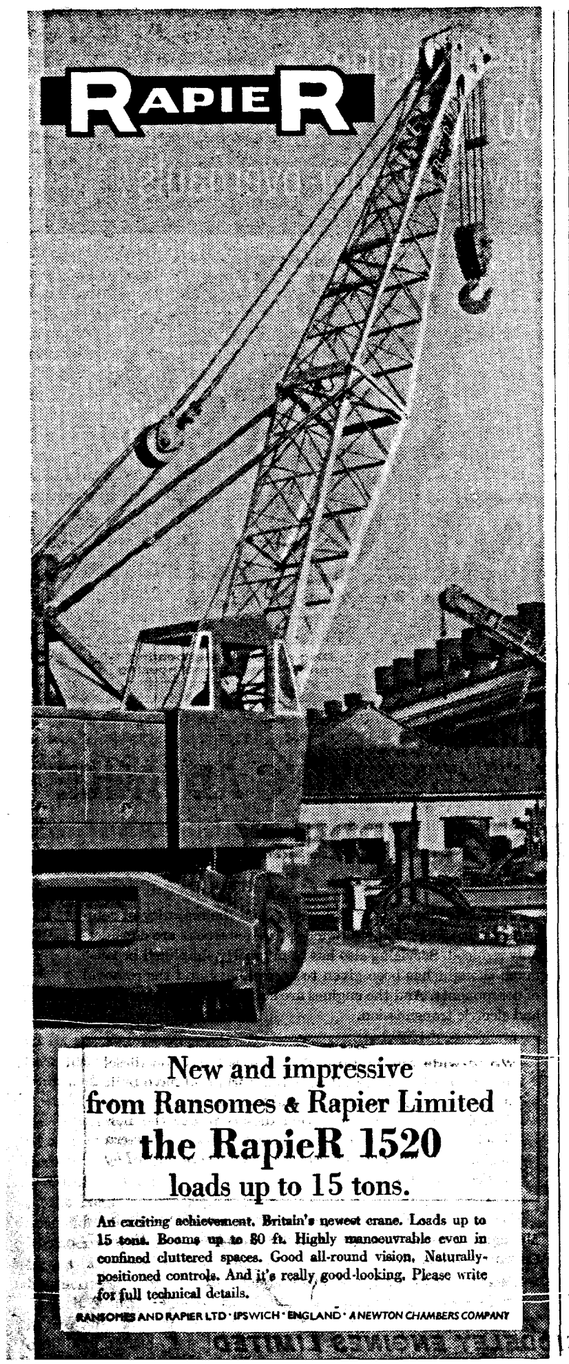
Maybach rail traction diesel engines—
from 400 to 2,000 hp—
can achieve 16,000 hours between major overhauls...

...ANOTHER ENGINEERING ADVANCE FROM BRISTOL SIDDELEY

Bristol Siddeley Engines Limited produce Maybach* rail traction diesel engines. Covering a power range from 400 to 2,000 hp, these diesels are amazingly reliable and have shown that they can achieve major overhaul lives of 12,000 to 16,000 hours!

The *proven* basic design features of the whole range (straight 4 to 16-cylinder V) are the same, and each unit can be turbo-charged, or turbo-charged and intercooled. The range operates between 1,200 and 1,600 rpm and *combines the best performance and design qualities of high, medium and low-speed diesel engines:* light weight and compactness, excellent thermal efficiency and extremely long life.

Advanced design features. The pistons are pressure-oil cooled. This gives very efficient heat dissipation and reduces liner and gas ring wear to a minimum. The roller bearing, disc-webbed crankshaft is exceptionally rigid within its tunnel housing, and in practice withdrawal is not normally necessary before 12,000 hours running. So low is big end bearing wear that in some cases the protective lead flash has been found to be intact when examined after 15,000 hours running!



Since the cylinder bore and stroke, and the majority of components, are identical in all models, spares stocks are considerably reduced. Servicing also has been greatly simplified because much thought has been given to accessibility and the removal of components. And the engines are suitable for both hydraulic and electric transmission.

World-wide application. Maybach rail traction diesel engines are in service all over the world and have built up an unsurpassed record for reliable and economic operation. Bristol Siddeley Maybach diesels power the new diesel hydraulic locomotives of British Railways Western Region and *over 200 engines have already been ordered by British Railways alone.*

For further information please write to: Maybach Sales Manager, Bristol Siddeley Engines Limited, PO Box 17, Coventry, England.

the deficit in the balance of payments will recede from $3.7 billion last year to about $2.5 billion in 1960. Even this is a disturbingly big figure and ample justification for the export drive which is getting under way. It also helps to explain why the United States, in spite of protests from the "outer Seven," has backed so unequivocally the speeded-up time-table for tariff reductions by the European common market. The Administration believes that "acceleration-reduction," as it is called, is the most hopeful way of enlarging international trade for all—and markets for American coal, cars and tobacco in particular.

New England's Midlands

FROM A CORRESPONDENT IN CONNECTICUT

THE enduring quality of Connecticut's characteristics is, to its older residents, one of this shrewd and crotchety state's endearing charms. The older it grows—and its Fundamental Orders were adopted more than three centuries ago—the more solidly chiselled seem its virtues and its faults. But this aura of immutability tends to hide the fact that the state is undergoing modern changes which threaten to destroy some of the elements that are most cherished. The flood of exurbanites which followed the second world war and swelled after the Korean outbreak brought Connecticut a swarm of new residents who invaded old towns, widened their borders, raised their gossip potential, and demanded public services that increased their taxes. The decentralisation of industry which has been made possible by the bulldozer, the super-highway and the huge trailer-lorry is bringing an industrial revolution far more sweeping than the earlier ones to the open country rather than to the older centres, to the delight of the State Development Commission and the horror of lovers of what was once green rural peace.

The resulting tensions play themselves out in local feuds in which those who came early quarrel with those who came late. The town of Fairfield has just refused to vote money for converting a small school into a $1.5 million high school because, in the words of the Italian strategist who led the attack, "the town is pricing itself out for the working man." At the other extreme, the wealthy New York dormitory town of New Canaan refuses to allow manufacturing within its leafy borders, and insists that new houses on unoccupied land must each be set in no less than four empty acres. Westport, squeezed between two sprawling industrial neighbours, plans its future growth along balanced lines that residents prefer.

Before the present age of the bulldozer the nutmeg state's economic and political structure was defined by its geography. Only ninety-five miles long and seventy-five miles wide, divided into eight counties and 169 towns, Connecticut boasted of being a "nation in miniature," with a diversified industry balancing a diversified agriculture. For decades it divided its efforts between growing tobacco and manufacturing arms and other metal objects in factories dating from the Civil War. Ports along its sea coast and a narrow coastal plain through which ran trade between New York and Boston gave it a third important source of income. Those balances have been completely upset by the new expansion. Manufacturing now provides 31.5 per cent of personal income in the state, while only 1.2 per cent comes from farms. The State Development Commission says gleefully that Connecticut may now be described as "New England's Midlands"; the phrase sends shivers down the backs of the ageing natives, immigrants who still love the soil, and exurbanites who resent the city's treading on their tails.

The changes show in statistics as well as in the night-long roar of diesel lorries down the roads and the swarming traffic in small towns that once were peaceful. Connecticut's estimated population has gone up nearly 23 per cent since 1950. The number of dwelling units increased by 30 per cent between 1950 and 1958, most of them sprouting children in need of schools. The resulting suburban sprawl affects nearly all the towns but the small ones most spectacularly. Bridgeport has spread into surrounding farm land; so has Danbury of hatter fame. The city of Hartford has added 4.6 per cent to its population since 1950, and New Haven 2.5 per cent; but the rural hamlet of Trumbull has taken 84 per cent more people within its boundaries.

The industrial shift has covered acres of farmland with modern factory floors during the past decade. Where old industrial buildings were of red brick, several storeys high, set beside waterfalls that provided power, the new ones lie flat on valley floors, close to rail and road transport, bringing electricity in from central generating stations. Individually they tend to be trim and neat, choosing pastel colours that are meant to blend with the countryside, emitting little smoke. Their desire to be considered good neighbours is somewhat marred by the fact that their workers attract a frenetic fringe of giant posters, hot dog stands, supermarkets and bowling alleys which afflict the eye and challenge town regulations.

A third great change now threatens the exurbanites. Connecticut has one major railway which long had a monopoly of freight and passenger business between New York and Boston. The New Haven Railroad, as temperamental as it is essential, loves freight and detests passengers, particularly commuting passengers who must be carried to and from the city in long trains that lie idle most of the day. Claiming to have lost $11 million last year, it threatens to stop its commuting services altogether unless they are subsidised in some way. The Interstate Commerce Commission is now investigating the situation; meanwhile, commuters fume at the inefficient service.

The state's expansion has been reflected in Connecticut politics. The Republican tradition which seems to go with agriculture has been upset by the growing importance of the manufacturing regions which nurture Democrats. Six Representatives and the usual two Senators go to Washington; one Senator is Republican, the other a Democrat; all the Representatives and the Governor are Democrats. So is the State Legislature, though by a narrow margin. This break in political tradition has resulted in some administrative progress. Governor Ribicoff has given new impetus to the drive for improvements in state government which, begun by Governor Bowles in 1950, was left languishing by his Republican successor. The need for reform of the judicial system at the grass-roots level has finally been accepted, and amateur justice is at last being superseded. County governments, mostly moribund, have given up functions that were duplicated by the municipalities and the profitable inertia of county office-holders has been swept out by new Democratic brooms.

Two major questions now confront the Governor. In the first place, will he carry reform to the point of attacking the old "rotten borough" basis on which the State Legislature is elected? Secondly, how long can the state continue to expand without having to impose an income tax? Its absence has been a powerful lure to new residents and new industries but, if they add to the state's income, they also add to the demands made upon it.

Correction: In a map on page 334 of *The Economist* of April 23, 1960, the names of Wisconsin and Michigan were transposed.

THE WORLD OVERSEAS

Italy a Hundred Years Later—I

FROM OUR ROME CORRESPONDENT

On May 11, 1860, Garibaldi and his Thousand landed at Marsala. Sicilian pride, patriotism and love of show have been devoted to commemorating the event. Not malice but the grandeur of their island tradition inspires Sicilians with the desire to remind their countrymen on the mainland that no region contributed more passionately to the cause of unification or staked its future more confidently on the advent of the "Piedmontese."

In Turin preparations are on foot for the great exhibition next year to mark a century of Italian unity. Pier Luigi Nervi is building the pavilion which promises to be one of the most spectacular and audacious achievements of contemporary Italian architecture. The exhibition theme is Labour in Industry. A hundred years after unification the old northern capital wishes to celebrate Italy's conquest of modern technology. The last of the great western nations to become an important industrial power, Italy is aware of its original contribution to the "civilisation of the machine." It is setting new standards of style and industrial design. In the engineering industries, Fiat, Piaggio, Innocenti, Olivetti, Necchi, Borletti, have become familiar names in five continents; in textiles, the new Italian fibres are putting European and American producers on the alert; in the chemical industry Montecatini and ENI have developed research centres of international fame; in the field of nuclear energy Italian initiative and foresight is making Italy the most important market in Europe for nuclear power stations. Milan justly advances its candidature as the capital of Little Europe. Under the stimulus of expansion even the static monopolistic structure of Italian industry is changing. The great financial holdings, Bastogi, Edison, Montecatini, Snia, and the state-owned ENI are launching out as competitors in the new fields of petrochemical industries, the man-made fibres, and nuclear electric power. The great ones are fighting each other, a new development in Italy where competition is all too often between the lion and the mouse.

Giuseppe di Lampedusa's posthumous novel *Il Gattopardo* (reviewed on page 627) has shaken Italian complacency more rudely than the dry official documents which demonstrate that national unity in the economic and social sense is as far off today as it was when Garibaldi set foot in Sicily. Lampedusa describes how the Piedmontese thought they could tidy up the Bourbon kingdom and teach the Southerners efficiency and how they failed to understand the enervating historic environment of the South. The documents—a report on economic progress in relation to the Vanoni Plan, published by Professor Saraceno last summer (*The Economist*, September 12, 1959), and a report on ten years' activity in the South, prepared for the Ministry of State Participation—show that a policy of financial incentives and public works in the South has failed to alter the historic relationship between the northern and southern economies; at best it has only prevented the gap between northern and southern living standards from widening as much as it would do if things were left to themselves.

Cavour was the first statesman to perceive that unification entailed a southern problem, but he had no time to deal with it and it is in any case unlikely that he could have done much to alter the main lines of the country's economic development. Those lines, from the unification to the outbreak of the second world war, are now fairly well known. What is new and unexpected is the way things have developed since Italians started to legislate consciously for their depressed areas. No one foresaw how in this postwar period the North would develop very rapidly, thanks partly to world market conditions but thanks also to the demand stimulated by public works in the South. No one foresaw that the South would develop at a much slower pace, in jerks and patches, producing two or three industrial zones where growth has been much slower than the swift change in labour patterns which has followed the breakdown of a traditional environment; new trends of internal migration have thus been set up and unemployment increases side by side with employment.

No one foresaw that the Centre, sandwiched between an economically self-propelling North and a privileged South, would decline as populations migrated northward and industry moved South across the borders of the "Cassa." In many places the line of demarcation which marks the territory in which the Cassa per il Mezzogiorno works runs along the old frontier between the Bourbon kingdom and the papal states. This odd revival of a historic frontier accentuates the fact that the three different types of development which have set in in north, central and southern Italy, correspond to three quite different agrarian economies upon which political unification was grafted. Two of these economies, the medieval share-cropping system of central Italy and the ancient latifundia of the South, were already in decline a hundred years ago. But total breakdown is slow and laborious. Disruption is accelerated by the special measures for the South and at the same time impedes these measures from giving healthy fruit.

Italian school children are told today that, after unification, taxes were levied in the South—it was the Southerners' first lesson in "Piedmontese" efficiency—but that the money raised was mainly spent on building roads and schools and public works in the North; and that, to protect its growing northern industry, the Kingdom of Italy raised tariffs which killed the wine trade of the South and ruined the few nascent industries that Bourbon paternalism had encouraged. The next generation of school children will probably have to learn how, in spite of the Republic's well-meaning efforts to redress the balance by creating social capital and giving credit incentives to industry in the South, the money spent there has short-circuited back to the North because most of the industries engaged in public works are located there, and because only the big northern firms are strong enough to supply the banks—national and international—with the guarantees required to obtain the special credits. It is calculated that in the course of a few years the South has contracted a deficit to the North of eight hundred billion lire (£480 million).

Thus, thanks partly to favourable world trade conditions, but thanks in no small measure also to this government-created market in the South, northern Italy has got well beyond Rostowian "take-off" and is now in the phase of automatic expansion. But what will happen to the South and Centre? Will northern expansion be wide enough and swift enough to carry the rest of the country along with it? Or will the different rates of progress in the South and the partial regression in the Centre operate in such a way as to accentuate the differences between the three economies, pulling them further and further apart until the strain begin to tear the political tissue of the Italian state? These are the questions that will dominate Italian development and Italian politics in the next ten years.

(To be concluded)

Cleaning-up in Korea

FROM OUR SPECIAL CORRESPONDENT

Square black jeeps, that from a distance look remarkably like London taxis, are neatly parked in rows outside the National Assembly in Seoul. The jeeps belong to the assemblymen, and presently will carry them off to lunch when they adjourn their deliberations on a new Constitution for Korea. Meanwhile, the broad street is empty and seems somnolent—until one realises that it is cordoned off at either end by short, sturdy, khaki-clad figures armed with rifles and fixed bayonets. The contrast between the peaceful jeeps and the vigilant soldiers symbolises the tug-of-war in Korea between normality and emergency. On the whole, normality appears to be winning. The curfew has been shifted from seven in the evening back to midnight, and as soon as the light begins to fade the Korean girls in their black-market evening-gowns come out on the streets and wheedle likely-looking Americans to escort them into the American Army's Chosun Hotel, that haven of soft lights, loud jazz, thick steaks, martinis and slot-machines.

On a street corner near the American Embassy where not many days ago police snipers kneeled to take aim and presently were overwhelmed and beaten to death by an infuriated crowd, the hawkers of goldfish and neckties now display their wares. The goldfish swim languidly in square glass tanks, and are much admired. The neckties sell briskly at 500 *hwan* apiece, for though the *hwan* official rate is 650 to the dollar, everyone knows that in reality a dollar will buy almost 1,500 of them, so the neckties are bargains. Small boys offer shoe-shines and copies of the *Stars and Stripes*. The British Embassy, near the National Assembly, is holding a garden fete. In the pleasant spring sunshine the revolution already seems remote. Stories, however, are beginning to trickle into the capital of villagers taking belated vengeance on the now powerless policemen; and newspapers can still report the arrests, on the same day, of a former national police director and the "king" of all Seoul gangsters. The gangster chief will be charged with squeezing small shopkeepers, the fallen police chief with having fake communist pamphlets printed and leaving them in the pockets of people he had had beaten or shot to death.

There is, understandably, an air of uncertainty about the future. Everyone seems to feel that for twelve years he was fooled by someone, and so everyone's chief fear is of being taken advantage of once again. Thus the students still hold demonstrations, warning people to "watch out for politicians who may take advantage of the current situation for their own ends," while General Song, although insisting that he is still the students' friend, regretfully warns them that he will be compelled to take "strong and stern measures to break up further demonstrations, which might be taken advantage of by the North Korean Communists." (But nobody, if General Song can help it, is going to be shot: he seems to be a strong believer in the efficacy of various sorts of non-lethal gas.)

Some ageing and half-forgotten politicians, who had quite despaired of ever becoming active again, have emerged from their caverns of obscure retirement, blinking like heavy-lidded political dinosaurs in the unaccustomed sunshine. General Lee Bum Suk, who was Korea's first prime minister and co-founder with Dr Rhee of the Liberal party—and who would have been Dr Rhee's vice-president had he not had the ill-luck to incur the old man's spite by displaying ambition as well as ability—says generously that the revolution was achieved by youth, but adds that should youth wish him to, he is ready to serve it. Mr Chang Taik Sang, another former prime minister, is pointing out that he would have challenged Dr Rhee for the presidency last month had the police only let him register. Both General Lee Bum Suk and Mr Chang Taik Sang are as convinced today as they always have been that what Korea needs is a strong man, someone rather like Syngman Rhee but even more like Lee Bum Suk or Chang Taik Sang.

A political comeback for either of them seems improbable, for all the talk at the moment is about democracy rather than strong men. The old men and the strong men are tarred with the Rhee brush. The young men, including army colonels and "Katusas," the Koreans attached to the US Army who are mostly students and who comprise a high percentage of the American combat divisions, want a real clean-up. Young college professors, some of whom led their students in the demonstrations, have been telling the National Assembly to rewrite the Constitution so as to guarantee, without qualification, freedom of speech, the press, association, and other "basic rights." There is also a strong disgust with graft and corruption and many avowals to root them completely out of Korean business and political life. It is difficult to say just how far this will really be possible in a country where *per capita* income is believed to be under £30 a year, but an ordinary assemblyman is paid over £160 a month, while a cabinet minister gets £130 a month—it being explained that a cabinet minister "naturally" draws less than an ordinary assemblyman because he has much greater opportunities to get rich more quickly than an assemblyman can hope to do.

The former vice-president who was also Dr Rhee's staunchest opponent, Dr John Myun Chang, has moved out of the vice-presidential residence, where for four years he was virtually a prisoner, into his own private house. There are no longer uniformed guards at his gate but, inside his gate, he keeps large dogs. Political assassination is another habit Korea will have to try to overcome if it is to qualify as a genuine democracy. Dr Chang has been criticised in some quarters for giving up the vice-presidency in the last days of the Rhee regime—had he held on to the post, he would now be president. He says he resigned to give Dr Rhee a shove in the right direction and that he is not sorry, for he believes Dr Rhee would never have resigned, no matter what the consequences for Korea, if he knew that John Myun Chang would then automatically step into his shoes. Many Koreans who know Dr Rhee accept this reasoning.

As leader of the Opposition, Dr Chang should stand a good chance of becoming Korea's prime minister when the Constitution is rewritten and the discredited Liberals lose the summer elections, provided the Koreans have not by then found that after all they prefer another traditional strong man, of either the Right or the Left. No Left has as yet emerged, but hardly anyone doubts that it exists. Its leader would have been Cho Bong Am, but Dr Rhee had him executed last summer. On the whole, surveying the corpses, one realises that Dr Chang has really been remarkably lucky—so far.

Mr Khrushchev's Game

Mr Khrushchev is a masterly stage-manager. On May 5th, before the Supreme Soviet, he startled the world with his announcement about the American spy plane. He paused for a day, letting the State Department get entangled in fancy explanations, and then revealed that the pilot was alive and in Soviet hands. The meeting is bound to go on record as the Soviet of surprises. Yet, it would be wrong to treat Mr Khrushchev's successful performance and its consequences for foreign policy in

isolation. The week also witnessed a major reshuffle in the leadership, while the Supreme Soviet itself endorsed important economic measures which show that, in home affairs at least, there is continuity in Russian policy.

Economic Measures. Mr Khrushchev seems determined to go on improving the standard of living. The Supreme Soviet enacted a plan to reduce working hours. It is claimed that 16 million out of the 57 million Soviet workers and employees already have a seven-hour day (six hours a day in heavy jobs like mining) and a working week of 42 hours. By the end of this year it should be the rule for all. A 40-hour week is to be the rule by 1962 and a 35-hour week should begin to be introduced two years later (30-hours in hard jobs). The scheme is not new—it was announced in the current plan—but its endorsement by the Supreme Soviet shows official confidence that higher productivity—helped, possibly, by releases of manpower from the armed forces—will prove sufficient to reach the ambitious industrial targets laid down in the plan, despite the reduction in working hours.

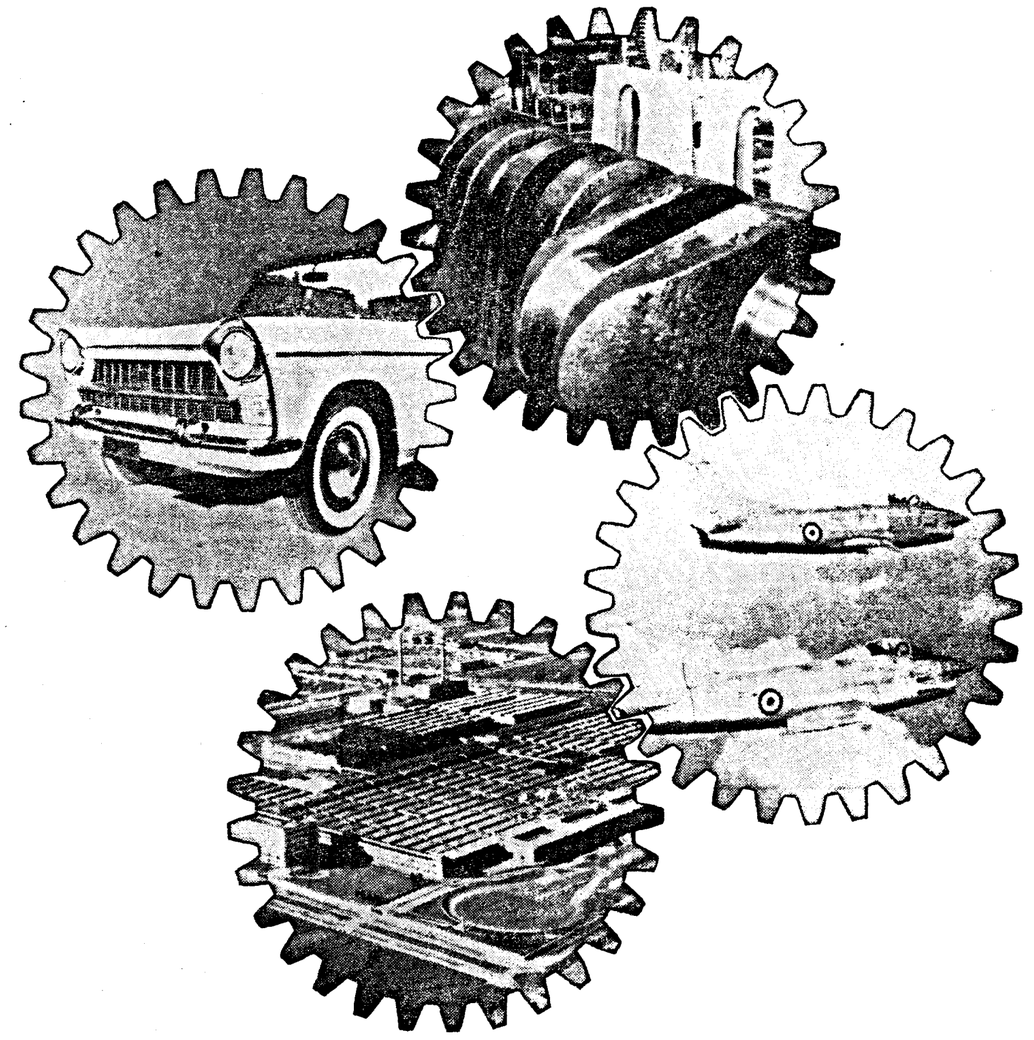
Second in importance is the proposed progressive abolition of income tax, though its significance does not lie in the rather silly boast that Russians will no longer pay taxes. When planners determine the level of wages, an income tax is really superfluous ; there are other means of getting revenue, including a turnover tax levied mainly on consumer goods. Income tax is not very progressive in the Soviet Union and not a major source of revenue. This year it was scheduled to bring in 57 billion roubles or 7.4 per cent of the budgetary revenue. But the abolition of this tax within the next five years will in itself mean a substantial increase in pay-packets, particularly for the lower-income groups. Incomes below 500 old roubles a month will be totally exempted from tax this year and below 600 roubles partly exempted. Each year the exemption will be extended to a higher bracket by 100 roubles. By 1965 the reform should be completed. For people earning less than 1,000 roubles the gain will be a net one ; between 1,000 and 2,000 the relief will be partly offset by a cut in wages ; for the privileged few (0.6 per cent of all incomes) who earn more than 2,000 a month the cut in tax will be balanced by an equal cut in salary. Mr Krushchev protests that he has not been converted to the heresy of "soulless egalitarianism," but admits that the range of incomes is too wide and will have to be narrowed.

The revaluation of the rouble—10 old ones to one new—is the least interesting measure. Since the two currencies will co-exist in the first three months of next year, the change will not be used, like the previous currency reform, to penalise illicit earnings and syphon surplus purchasing power. A nought will simply be taken off in all transactions, home and foreign. The apparent reasons for the reform are simpler accounting, and considerations of pride and prestige, though the crossing out of noughts does not, on its own, produce hard currencies.

Reshuffle in the Leadership. The session ended with the resignation of Marshal Voroshilov from the presidency of the Soviet Union. Klim, as he was popularly called, a veteran of the civil war, was one of the last figures of the stalinist old guard. At 79, his retirement is natural, yet rumour has it that it is not unconnected with his lack of support for Mr Khrushchev in the crisis of 1957. In any case, the president is rather a figurehead in the Soviet leadership. The successor, Leonid I. Brezhnev, is a metallurgist by profession who reached the top through various party jobs in the provinces (he worked with Mr Khrushchev in the Ukraine). Twenty-five years younger than Marshal Voroshilov, he should stand up better to Mr Khrushchev's travelling diplomacy.

Bigger changes in both party and government were revealed by the central committee on the eve of the parliamentary session. The main beneficiary seems to be Mr Kosygin, who moves up to full membership of the party presidium and also becomes first deputy prime minister. Aleksiey N. Kosygin was born in 1904 in St Petersburg. A specialist in textiles and light industry in general, he had a long ministerial experience in Stalin's time. Temporarily downgraded in the party hierarchy at the beginning of the new regime, he has made a steady come-back. Last year he became chief Soviet planner (he leaves his post in the Gosplan to Mr Novikov), and should now be Mr Khrushchev's main assistant in the government in economic matters, with Mr Mikoyan concentrating more on foreign affairs. The two other new full members of the presidium are Nikolai V. Podgorny, head of the party in the Ukraine, and Dimitri S. Polyansky who, at 43, belongs to the youngest generation in the Soviet leadership.

These were not the only promotions. The dismissal of N. I. Byelayev and A. I. Kirichenko was no surprise, since their disgrace was known. But other people have now been removed from key posts in the party secretariat: A. B. Aristov and P. N. Pospelov to deal with Russian affairs; N. G. Ignatov to a vice-premiership and Ekaterina Furtseva, the only woman in the top leadership, to the ministry of culture. Frol R. Kozlov has left his job in the government to Mr Kosygin, but has joined the party secretariat. This body is now apparently reduced to five and, next to Mr Khrushchev, Mr Kozlov and Mr Suslov may be its most influential members.



Several changes have also taken place recently in the military command. Marshal Zakharov has succeeded Marshal Sokolovsky as chief of general staff. Marshal Chuikov has been relieved of the command of the Kiev region. Further moves are expected as a result of the reduction and reorganisation of the armed forces. There are rumours that Marshal Koniev, commander of the Warsaw Pact, may go. Finally, Mr Khrushchev disclosed that a special command for missiles had been created, headed by the marshal of artillery, I. Nedelin.

Providential Plane? It is possible to argue from all these moves that Mr Khrushchev is now reshuffling at leisure the pack he had to bring together in a hurry after the defeat of the "anti-party" group. There are, however, signs that his foreign and military policies are meeting with opposition. In his own version of the American spy plane incident, he mentioned that another American aircraft had flown over Soviet territory last month, and that it was on his own intervention that his government decided not to make a fuss about it. Is his present display of anger partly the result of hints of dissatisfaction with his policy from some of his colleagues? At the Czech embassy on Monday, Mr Khrushchev jokingly told a Soviet general not to worry, that there was not going to be a new reduction of troops. It seems to follow that some officers do worry. There are other examples.

The incident with the U2 aircraft allowed Mr Khrushchev to

IN GEAR IN EXPORT MARKETS

This is Fiat. Prof. I. V. VALLETTA is the man behind this Italian industrial group which makes motor cars, aircraft, engines of all kinds for land, sea and air; and sells them throughout the world.

Such diversity of manufacture and market poses the big problem of maintaining a single image for the whole group—an image that *sells* Fiat transport engineering excellence as well as the individual products.

Prof. VALLETTA solves this problem by projecting the corporate personality of Fiat to men of influence around the globe through international advertising in TIME.

TIME, The Weekly Newsmagazine, New Bond Street, London W.1.

Five separate weekly editions putting sales in top gear in export markets everywhere.

ITALIAN ENGINEERING EXCELLENCE ... SOLD AROUND THE WORLD ... *advertised in* TIME

He doesn't know we exist

The keen owner of a car has night driving in mind. The garage mechanic slips a spot lamp from the box and fits it in no time at all. He doesn't think about the packaging—why should he? But the protective qualities of "Thames Board" have helped to keep the lamp in good condition. Leading manufacturers and boxmakers, however, know that "Thames Board" supplies the answer to a large variety and diversity of packaging problems. This is why more cartons and cardboard boxes are made from "Thames Board" than from any other British board.

He does

This expert package designer knows that he will get exactly what he wants from "Thames Board". Thames Board Mills have all the expertise and knowledge to solve his difficulties, and the research department is always pioneering new ways to help him.

Good packaging starts with **'THAMES BOARD'**

THAMES BOARD MILLS LTD., PURFLEET, ESSEX & WARRINGTON, LANCS

achieve many things with one stroke. At home, he could steal the thunder of his critics, show off the rockets as the main Soviet weapon, and listen to praise from as far off as Peking. Abroad, he not only scored a point in propaganda. He could now revive the issue of foreign bases, ram home the urgency of disarmament, and set about convincing the western leaders that he is in earnest about Berlin and is not going to Paris for a polite tea-party. The way in which he continues to play this trump card dealt him by the Americans will show whether he is still going on with the game, or whether, because of foreign disappointment or internal pressure, he has decided to play a new and harder one.

Bonn's Political Warfare

FROM OUR BONN CORRESPONDENT

THE communist principalities and powers launched their pre-summit propaganda barrage against Federal Germany a shade too early for it to have been as crippling as it was meant to have been. Recovered from their initial disarray, the west Germans are shooting briskly back. Allied artillery has responded to the call for supporting fire; at their conference in Istanbul last week the Nato foreign ministers singled out Russia's vilification of the west German regime as a particularly noxious poisoning of the international atmosphere. Even some of the neutrals are peering sympathetically through the smoke. The sight of Herr Willy Brandt, West Berlin's chief Burgomaster, arriving as Mr Nehru's guest at an intimate luncheon in London ten days before the opening of the Paris conference must have caused at least a blink or two at the Moscow observation post.

It was at the turn of the year that the federal government, shaken by the damaging conclusions widely drawn from the furtive anti-Jewish demonstrations in Cologne and elsewhere, decided that vigorous action must be taken to present west Germany's character and *raison d'être* more engagingly to a questioning world. It is denied in official circles that a special brains trust has since been directing the counter-propaganda effort. Yet there remains a lingering suspicion that a political warfare executive may exist, roughing it perhaps "somewhere in the Seven Mountains," prolifically hatching sibs, slogans and schemes likely to discomfit the enemy.

One resourceful ideas-man must have been warmly patted on the back for having unearthed the quotations with which the federal government's Press and Information Office appraised the nineteenth anniversary of Lenin's birth on April 22nd. Among the specimens of Lenin's thinking proffered by the *Bulletin* were such pre-summit beauties as: "The world revolution will have triumphed when the red flag flies in Berlin and Peking"; and "When the revolution has triumphed in Germany, the centre of world revolution will move from Moscow to Berlin." Had Mr Khrushchev distanced himself from Lenin, as he had from Stalin? No. And the anonymous commentator wound up with the prayer that "all the signposts at the foot of the summit" would display Lenin's dictum: "Whoever has Germany has Europe."

Wherever and however it may have been manufactured, the ammunition of west Germany's counter-propaganda has been handed out unstintingly to all and sundry. (The issue would have been of heavier calibre, one gathers, had not the federal Foreign Office feared that too fierce a fire might obstruct the repatriation of Germans from the Soviet Union, which is still continuing at an average rate of 400 a month.) British television has lately shown a film dealing with the Berlin problem—a film naturally made with official help—that must have revived much sympathy for the uneasy west Berliners. On May 2nd a proclamation headed, "A message from Berlin on the eve of the summit conference," was published as a whole-page advertisement in over one hundred newspapers and magazines in the United States. Publication in a large number of British papers has followed since. Signed by 43 prominent Germans, the manifesto stated that more than a million Germans in east Berlin were living under communist tyranny, and more than sixteen million in east Germany; the object of the communist move against west Berlin was not only to gain control of the whole of the former German capital but also to sever still further the ties between the east and the west Germans.

Whoever first coined it, the slogan that has most caught everybody's fancy, from Dr Adenauer downwards, is "Self-determination for all Germans": or—what Mr Khrushchev says should hold good for Asia and Africa should hold good for Germany. It has been taken up with especial gusto by the non-party, largely state-subsidised movement known as Indivisible Germany, which launched its "Operation Self-Determination" at a public rally in Bonn on May 5th, with Herr Brandt as the star speaker. This ambitious undertaking is being staged until June 17th, the anniversary of the 1953 rising in east Germany. It provides for innumerable public gatherings up and down the country, for the ubiquitous display in and out of doors of a black-red-gold poster demanding "Self-determination for all Germans," for relay races to the east German border, for a mass meeting near the border on June 17th which is to be addressed by President Lübke, and so on. Operation Self-Determination is being widely reported by the press and radio.

The first fruits of the counter-propaganda campaign, and of the thorough spadework carried out unobtrusively in the summit preparatory committees in Washington, Paris, London and Bonn, have allayed at any rate some of the anxiety that beset the federal government a few months ago—the fear of an international deal at Berlin's and Germany's expense. Dr Adenauer will himself be in Paris this week-end to press home his well-known views until the last moment. When he returns to Bonn, he will leave behind Herr von Brentano as the unofficial watcher over German interests, supported by Professor Wilhelm Grewe, the German ambassador in Washington, and by Professor Karl Carstens and Herr Georg von Duckwitz, directors respectively of the European and eastern departments of the federal Foreign Office. It is not yet certain whether there will be any east Germans at Mr Khrushchev's beck and call. Bonn frankly hopes that they will not get their visas. (There was disappointment in the Koblenzerstrasse when the members of an east German trade unionist delegation received visas recently to visit Scotland.) There is no expectation in federal Germany of an easing of the international tension. The fear of the Soviet Union signing a separate treaty with the east German Democratic Republic remains lively.

Lebanon's Fragile Peace

FROM OUR MIDDLE EAST CORRESPONDENT

FEW tears were shed in Lebanon when the Chamber of Deputies was dissolved last week. It would be charitable to say that its record lacks distinction. Throughout most of its three years existence, it had difficulty in mustering a quorum; and such was its moral authority that during the five months of national crisis in 1958 it met exactly once. From the outset, the composition of the chamber was attacked on the ground that the general elections which produced it were rigged by ex-President Camille Chamoun; and the oddity of some of the voting results lent support to the allegations. In a sense, the electoral irregularities led straight to the 1958 disturbances, for by excluding too many of his enemies from the chamber, President Chamoun drove them on the street.

The new chamber will certainly have a new look. Among the last actions taken by the old one was the passing of a new electoral

law which is supposed to prevent deputies from engaging in business with the government and to guarantee secret ballots for the voters. The new law also increases the number of deputies from 66 to 99; local cynics feel this only means that the spoils will be parcelled out less generously among the larger number. The new law retains the awkward communal arrangements based on a census made in 1944. There will be 56 Christian and 43 Muslim deputies. No government has dared to tamper with these proportions, though almost everyone admits that there have been important changes in the population—in growth and movement—during the past sixteen years. Nevertheless, the men of all creeds who started the "national revolution" almost exactly two years ago will be more strongly represented if only for the fact that they were under-represented before. There is good reason to believe that although there will be much bargaining and manoeuvring by individual candidates and by parties, the elections will not be rigged by the government. Too many critical eyes will be on the polling booths. Indeed, much support has been won for the idea of a caretaker government of non-political experts to preside over the voting. Mr Ali Bazzi has said that he would not care to campaign while holding his portfolio as minister of the interior, for fear that his opponents might accuse him of influencing the authorities in his favour. On this subject, Mr Rashid Karami, the prime minister, has so far remained silent.

The elections are being held, district by district, on four successive Sundays beginning on June 12th. This procedure is adopted so as to permit a greater concentration of Lebanon's small security forces in the voting areas. The first district to vote will be Mount Lebanon, traditionally a Christian—Chamounist and Phalangist—stronghold. But the pattern of the future chamber should become clear on the second Sunday, when Beirut and South Lebanon go to the polls. It is here that the former "national revolutionaries" hope to make substantial gains, and probably will. The final results will not be known until July 31st.

Ever since the troubles of 1958, the mere mention of elections has been enough to arouse tremors of apprehension. But for the fear of disorders the present chamber would have been dissolved long ago. Although the two Karami governments that have ruled Lebanon since the "national reconciliation" have gone far towards healing the wounds of civil war, the quantity of arms that have been recovered from the civilian population is negligible; if there is a will to make trouble, there is certainly a way.

These apprehensions were aroused anew by an incident that has gone down in Lebanese history as the "tragedy of Ashrafiyeh." On May 1st, Mgr Meouchy, the Maronite patriarch, was celebrating mass in the church of the Sisters of Charity in Ashrafiyeh, a district of Beirut inhabited largely by Christians. Several members of the government were present. A large crowd gathered outside the church, including many women and children. Suddenly, a hand-grenade exploded, causing two deaths and some dozens of casualties.

Some tried to read a political meaning into the tragedy. It was recalled that, just before, ex-President Chamoun had visited the patriarch for the first time since the 1958 troubles, during which President and patriarch were on opposite sides of the fence. The crowd, it was said, had been chanting Chamounist slogans. It seems just as likely, however, that the police lost their heads, or that their instructions were misunderstood. It is even possible that the responsibility lies elsewhere, in an individual with a grievance or in a lunatic. The inquiry is proceeding, and a vigorous effort is being made to sift a mass of conflicting evidence.

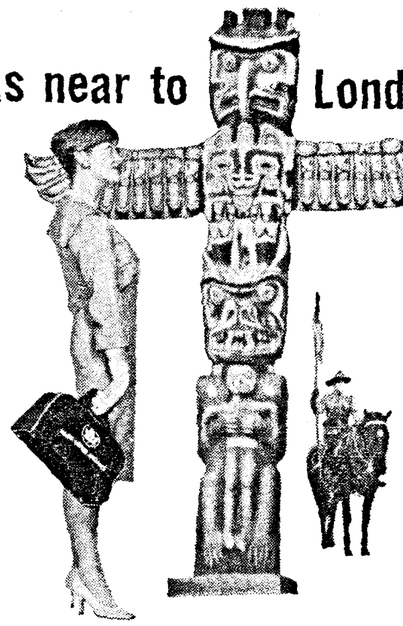
Luckily, it seems probable that the "tragedy of Ashrafiyeh" will prove to be one of a series of isolated incidents. The former "national revolutionaries" have no interest in courting trouble; they are confident that they will strengthen their position by constitutional means. Their opponents have vivid memories of the cost of the 1958 disturbances, in terms of good Lebanese pounds and piastres as well as of human life. It is even possible that the Ashrafiyeh affair may be a blessing in disguise. In some circumstances, such incidents inflame passions; in others, they bring hotheads down to earth with a salutary thud.

Greeks and Turks at Odds

FROM OUR ATHENS CORRESPONDENT

TENSION between Greece and Turkey recurs at intervals. It stems from the mutual antipathy which has existed between Greek and Turk since, perhaps, the siege of Constantinople in 1453. Greek-Turkish relations are now, once again, under some strain, and this is creating an uninviting climate for the visit to Athens of Mr Menderes, the Turkish prime minister, now finally fixed for May 26th to 30th.

The recent cycle of unpleasantness was marked by sharp public reactions in Greece against what was regarded as Turkey's opportunistic new line in foreign affairs. First came the announcement that Mr Menderes would be visiting the Kremlin in July. This was followed by reports of a proposed rapprochement between President Nasser and the Turkish leaders. Then some remarks were reported from Ankara suggesting that Turkey would favour a revival of the Balkan pact with Jugoslavia. The irritation of the Greek public, deftly fanned by the opposition newspapers, could no longer be smothered by diplomatic discretion. A spokesman declared: ". . . Greece does not view with sympathy such abrupt manœuvres in foreign affairs. . . ."

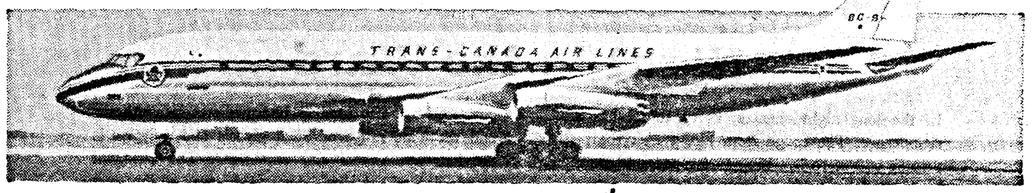


What the Greeks found especially maddening was that Turkey, hitherto extolled for its exemplary loyalty to the West, had had no qualms about taking prompt advantage of the new world climate to emerge as the champion of détente in this region. Unlike Greece, Turkey had readily accepted missile-launching sites on its soil and had, in consequence, been lavishly pampered by Washington's aid-givers. Nevertheless, this docility did not seem to disconcert Moscow in the least. Ankara lost no time in assuming bold initiatives in foreign affairs—initiatives which, it was thought here, tended to overshadow Greece's unlucrative allegiance to the West, or, conversely, its coolness about missile bases.

The government's rivals have been raking up these ruffled feelings to convince people that Greece's present leaders, by adopting a totally negative attitude towards détente, have missed the chance of stealing a march on Turkey. The internal disturbances in Turkey and the fresh exacerbation in east-west telations after the episode of the American U2 aircraft, have largely vindicated the government's attitude. The view in Athens today is that so long as Mr Menderes does not have complete mastery of his domestic affairs, he can hardly appear on the international scene as a "medium-size power" or even pretend in Moscow that he can be the arbiter of affairs in the Balkans and the Middle East.

THERE has, however, been a widespread anti-Turkish campaign in the press, which was intensified after the recent Turkish disorders. The atmosphere in Athens is, to say the least, unfavourable for a successful visit by Mr Menderes, whose name is mentioned in editorials in the same breath as Dr Syngman Rhee's. Mr Karamanlis, the prime minister, who was given a crowded and enthusiastic welcome in Ankara and Istanbul exactly a year ago, will not be able to provide a similar courtesy for Mr Menderes in Athens. Perhaps it is a consolation that, in view of Mr Menderes's coming pilgrimage to the communist Mecca, the Greek Communists are not likely to stage any hostile demonstrations. Yet the Turkish government's recent undemocratic practices will give every Greek critic of the Turkish government the feeling of being on the side of the democratic angels.

Canada is as near to London as Land's End



. . . from June

How long would it take you by Rolls-Royce to Land's End? Eight hours at least. But in June you can fly London-Montreal by Rolls-Royce in only 7 hours 5 minutes! You relax in comfort, while four Rolls-Royce jet engines speed you over 9 miles a minute. For June is when TCA's new DC-8 Giant Jet almost halves flying time from Britain to Canada.

It's swift and smooth and quiet. And you enjoy all the advantages of DC-8 travel to Canada either First or Economy Class (from £17 down Economy return London-Montreal, under TCA's Pay Later Plan). This summer TCA, in association with BOAC, offers up to three jet flights a day, as well as other services, to Canada.

Daily by Rolls-Royce powered DC-8 to Canada

TRANS-CANADA AIR LINES

21 PALL MALL, LONDON SW1 WHITEHALL 0851 AND AT GLASGOW, SHANNON, BIRMINGHAM & MANCHESTER

Night in the Ward

In the long night silences, every sound has added significance. The cough from No. 3 . . . the restless turning of No. 10 . . . the rustling pages of the record book . . . the quiet movement of feet as rounds are made . . . the whispered instructions of routine and emergency . . .

The fight against sickness and disease knows no hours. Today, to the human skills of doctor and nurse, new and vital drugs are added, and the making of many of these depends on chemicals from Shell.

High purity ketones, alcohols and other solvents are used in extraction and purification; these and other chemicals are also used as intermediates in synthesis, and the wide range of Shell glycols and polyglycols provides humectants and emollients. The stringent standards of quality demanded are easily met by Shell's high and consistent standards of manufacture.

Shell chemicals serve all industries. If you have any problem concerning the use of chemicals — pharmaceutical, industrial or agricultural — Shell can probably provide a good answer for a better result.

Write to the Advertising Manager, Shell Chemical Company Limited, 170 Piccadilly, London, W.1.

YOU CAN BE SURE OF SHELL CHEMICALS

SHELL

Apart from the psychological factor, the visit will raise serious technical difficulties. The government's opponents have actively encouraged the preposterous impression that Mr Menderes's Athens visit, "deliberately timed before his trip to Moscow," will give him the right of speaking to Mr Khrushchev on behalf of Greece, its smaller partner, or "satellite," as has been said here. The Greek government has tried to distinguish its position from that of the Turkish government, chiefly on matters of detente, and regional problems. The differences between them might, however, now become obstacles even to devising the platitudes about agreements and unity of purpose that are expected in joint communiqués.

The Greek leaders' disapproval of Mr Menderes's plan to visit Moscow does not mean that they fear an actual change in Turkey's general policy, what they feel is that for the sake of unity, individual western nations should not make approaches to Russia separately. This view was sympathetically received at last week's Nato meeting in Istanbul. Later, when Mr Herter briefly visited Athens, he made a point of emphasising that "Greece and the United States interpret in the same way the complex problems facing the world." The Greeks will want a definite commitment from Mr Menderes that he will not embark on any discussions with the Russians that might affect the Balkan *status quo*—such as, for instance, eventually consenting to the communist-sponsored plan for a Balkan "summit" conference. This would leave Greece in the embarrassing position of being the only opponent of such discussions.

Mr Menderes's visit to Athens has already been postponed at least four times since last September on account of his evident preoccupation with internal affairs. When the announcement of his intended visit to Moscow was made, it would have appeared at least tactless not to have set the date for his return visit to Mr Karamanlis. This was duly announced, but developments since then leave the wisdom of this action open to question. A fresh postponement would seem absurd, although less so in view of Turkey's internal troubles. Many people here, however, feel that a postponement would be less harmful than the risk of causing any more permanent damage to Greek-Turkish relations.

Ceylon's Return Match

FROM OUR CORRESPONDENT IN COLOMBO

THE no-contest agreements between the Freedom party, now led by Mr Bandaranaike's widow, the Trotskyists led by Dr Perera, and the orthodox Communists indicate that in the July elections, the second in four months, the United National party will face the same sort of left-centre front against it that carried Mr Bandaranaike to power in 1956. Nomination day, May 20th, should give the UNP prime minister, Mr Dudley Senanayake, a clearer idea of his chances; but he must already have mixed feelings about the elections.

He had recommended a dissolution only a few hours after his minority government was decisively defeated on April 22nd in the first vote taken since its formation after the March elections. The governor-general, Sir Oliver Goonetilleke, took even less time to make up his mind on the contentious constitutional issue: should the Queen's representative take such advice from a man who had never enjoyed the confidence of parliament? British legal opinion was freely quoted and Commonwealth precedents cited. The most intriguing aspect of the exchange was the Marxists' concern for parliamentary propriety. If recent disturbing events have led people to fear that democracy in Ceylon is doomed, such people would have been reassured by the new idiom of the Left. A few years ago nobody would have believed that a communist leader would quote King George V with reverence, or march to the parliamentary barricades in the delightfully incongruous company of Sir Harold Nicolson.

Some preferred to see this new concern for constitutional correctness, coming after the inclination of recent years to dictatorial forms, as a freakish expression of Ceylon's ambivalent love-hate attitude to British tradition. The prime minister himself seemed to accept the popular belief that when you scratch a local Marxist all you find is the London School of Economics. Defending his right to advise a dissolution, he impishly tossed back at Dr Perera a quotation from Harold Laski, the latter's old guru.

The truth, however, is much less colourful or complex. Nervous about having to face once again an electorate which had not treated them well in March, the Trotskyists and Communists pledged their support to the Freedom party in the hope that it in turn would be called to form a minority government. Mr Philip Gunawardena's People's Front, equally unhappy about immediate elections, worked out a different formula; but its plea for a "national government" found no buyers. Meanwhile, the uncertainty about the governor-general's decision kept the loose-knit Freedom party together. Mr Senanayake had counted on desertions from its ranks, particularly when its leaders found themselves named by the parliamentary bribery commission the week before the debate. (The coincidence incidentally led to embarrassing speculations.) But the prospect of office rallied the party.

There was a procession of opposition leaders to Queen's House on the morning after the debate, but, according to informed circles, the governor-general's mind was already made up. Although the opposition parties, including the Tamil Federalists, signed a joint protest at the dissolution, Sir Oliver acted in the country's best interests. The opposition's unity was artificial. Sir Oliver could not have had better evidence than the debate itself.

The six opposition parties could not even agree on any single issue on which to challenge the UNP policy statement; their successful common amendment merely recorded their lack of confidence in the minority government. A minority Freedom party government, dependent on such mutually opposed groups as the Tamil Federalists and the splinter Sinhalese extremists, the Marxists and the ultra-right Ceylon Democratic party, could have been still more chaotic.

The Freedom party and the Trotskyists have been re-examining their respective programmes in order to accommodate each other better. But the Trotskyists have had to expel one of their leaders, Mr Robert Gunawardena, who opposed their electoral pact with the Freedom party. He has since joined the People's Front led by his brother, Mr Philip Gunawardena, who, isolated and embittered, is going it alone in the hope that he will be able to offer a clear left-wing alternative to Mr Senanayake, if not in July, perhaps later.

The Gunawardena brothers will be a powerful disruptive force against the new left-centre alliance. They will attack it for trying to do a deal with the Tamil Federalists, whose behaviour last month and present boasts of holding the balance of power between the Sinhalese parties have already begun to disturb Sinhalese opinion. The United National party, on the other hand, can exploit the fact that it did not make concessions to Federalist demands to stay in power. It may also succeed in embarrassing the moderate Freedom party over its Marxist alliance. And Mr Senanayake, who resigned office in 1953 after the food riots then caused by an increase in the price of rice, has now reduced the price. Much will depend on whether this is taken at its face value or seen as no more than a vote-catching gesture. Rice is politics in Ceylon.

Correction. In an article on page 431 of *The Economist* of April 30th it was erroneously stated that Harrison and Sons, Ltd., started printing postage stamps only in 1928. In fact, we are informed that this firm's production of postage stamps before 1928 amounted to 75,000 million.

Authority is a fact of LIFE

To the task of reporting the world to the world, LIFE International's staff brings unusual ability, experience, and editorial resources including a world-wide network of correspondents and photographers. And, when special insights are needed, editors call upon experts from many fields including in 1959 these world-known authorities: Paul Henri Spaak, Hubert Humphrey, Romain Gary, Minoo Masani, Gamal Abdel Nasser, A. P. Herbert, Pablo Casals, Arthur Larson, Averell Harriman, Ludwig Erhard, Michael Heilperin, Alistair Cooke, Charles J. V. Murphy, Edward Crankshaw, R.L. Bruckberger, Sam Snead, Maria Meneghini Callas, Nigel Dennis, John Masters, Han Suyin, Charles Goren, Samuel Chamberlain. In more than 120 countries around the world, business and professional leaders and their families know that authority is a fact of LIFE. If you have a product or service to offer — for firms or families — you couldn't ask for a better setting for selling. To promote your business overseas, advertise in

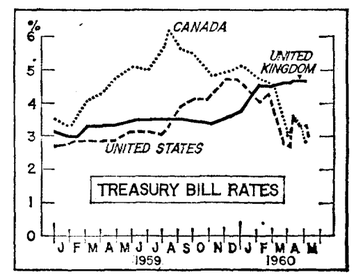
THE BUSINESS WORLD

Sterling's Light and Shade



FRENCH gold francs, German marks, Italian lire—there was a conspicuous omission from the assorted valuables that the Central Intelligence Agency apparently thought Captain Powers might find useful in strange parts. But in the more mundane world of business and finance, sterling is still in good regard. The reconnaissance incident itself has contributed to some weakening in the exchange markets this week, but no general distrust of sterling is in evidence.

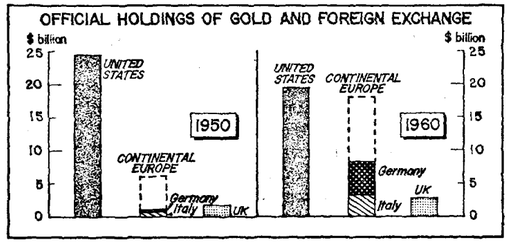
Clouds of quite another kind have also reappeared on the horizon, and the authorities are no doubt congratulating themselves for having ignored expansive pleas made after the Conservative victory last October for a dash to full exchange freedom. Britain's external balance is once again causing concern. But there is a significant difference from earlier periods of overstrain. For the first time, official measures have been taken before the weakening of sterling in the markets. Generally, indeed, the authorities have, in their restraining measures, kept ahead of outside opinion ; and this calculated initiative could be quite important in fending off psychological speculation. Mr Heathcoat Amory has so far persuaded the London stock exchange that, whatever inflationary influences appear, he will act sufficiently firmly to put them down ; that is why equities no longer get a boost from symptoms of inflation. The same reasoning has so far been good for sterling.

Confidence, that is to say, has been holding firm. Nevertheless, the weakness in the current balance of payments has to be corrected. Last year's surplus of £145 million was much too small to cover long-term investment outlays, and so the ratio of gold reserves to short-term liabilities, which it is so important to strengthen, deteriorated. Every effort must be made to prevent a further deterioration this year. Figures for the first quarter are not yet available, but there have been hints that the outcome may have been rather better than in the last quarter of 1959, which showed a current deficit.

Not all the portents this year are unfavourable. First, thanks to the stability of world food prices, Britain's terms of trade are no worse than a year ago—and 10 per cent better than at the beginning of 1957. But prices of imported industrial materials have risen by 8 per cent in the past year, and if they were to go further the building up of stocks for speculative ends might be encouraged. Secondly, markets in primary producing countries should improve this year; Australia in particular has already eased its import restrictions very considerably. So Britain's payments surplus with overseas sterling countries might improve, following its sharp contraction in 1959. On the other hand, the balance with non-sterling countries, which has a closer impact on the central reserves, may not repeat its good performance in 1959. Britain's biggest overseas market, the United States, has already become more competitive—and selling is unlikely to become easier for Britain in the common market countries. But this year the special danger for Britain is that the buoyant home market could lengthen delivery dates or otherwise divert exports to domestic use, and of wage increases leading to higher prices. There have already been reports of increases in prices of important engineering export products.

IN view of these possible if by no means certain signs of weakness in the current balance of payments, why have the exchange markets thus far remained calm ? Is it an unnatural calm, the prelude to autumn storm ? Since the increase in Bank rate from 4 to 5 per cent in January, sterling has again been enjoying support from an inflow of short-term funds. As short-term money rates in New York have moved in the reverse direction, the margin in favour of the London Treasury bill rate has been more than 1½ per cent, and even after providing for the cost of covering the exchange forward (which some operators no longer consider necessary) there has been a clear margin of either side of ¾ per cent. The resulting transfers to London have accounted for a significant, though probably not for a major, part of the modest rise of $146 million in the gold reserves in the three months to end-April. The recent tightening of credit restrictions should also help sterling by curbing overseas borrowing in Britain, which increased considerably while credit was easy to obtain in London and very tight

in New York. Credit has also been tightened considerably in Germany, where the central bank has recently decreed a further stiff increase in its calls of minimum reserves from the commercial banks (which unlike special deposits in Britain are not re-lent to the government and earn no interest for the banks). This tightening of the German money market has led to the repatriation by German banks of large funds which they had placed in foreign centres. As Germany's current payments surplus, against some expectations, has continued its relentless increase, and there has been a fall in official (though not in private) exports of long-term capital, this has led to a resumption of the increase in German gold and exchange reserves, which is as embarrassing to the Bundesbank as it is to the countries losing gold. The Bundesbank's total reserves rose by the equivalent of about $400 million in March and April, though the increase since the autumn has still not offset the whole of the decline in the first three quarters of 1959. Now that the outflow of gold and dollars from the United States has been reduced, new accumulations by Germany are less desirable than ever.



AFTER the experience of earlier postwar years, and especially of 1957, it is natural that financial and economic observers should keep an eagle eye for speculative movements of funds. The fact is that there have been very few signs of such movements in recent years, particularly since the establishment of external convertibility of the main European currencies at the end of 1958. Even the much emphasised distrust of the dollar finds little substantiation in actual movements of money. Zurich (and London) may have talked condescendingly enough, but foreign dollar balances in New York continued to rise whenever interest rates there were attractive. In the present reflux of funds to Germany there have been few signs of speculative elements, or indeed of any large participation by non-Germans, since the German money market offers limited opportunities for outsiders. Swiss banks, too, have in the past few days been withdrawing funds from London as their own market has tightened; but they have withdrawn more from New York, for the simple reason that interest rates are lower there.

It may turn out—though it is still precariously early to make a firm prediction—that speculation, psychology and nerves in general have become altogether less important influences in the exchange markets, and interest rates and strictly commercial considerations correspondingly more important. Certainly that has happened in the past few years. In some ways this experience may have a lasting influence. One can think of four main reasons why sterling may be less vulnerable today than in earlier years to a sudden speculative crisis—which is very far from saying that it is immune.

In the first place, the bestowal of the formal right of convertibility to non-residents has in the event had an important effect. Although convertibility through the market was available at very little cost before, the undertaking of the formal obligation by European central banks has given the whole exchange structure a greater stability: a speculative crisis, if one were to come, might build up a little more quickly now that the official door is open, but the more important point is that operators now see less reason for speculation. Secondly, the leading world currencies today are generally considered to be nearer in strength than they were three years ago. In one respect, if only in one, the talk against the dollar has helped sterling: it will not quickly be said again that sterling must always suffer from a general preference for the dollar and the mark as reserve currencies. Even the mark has at times lost some of its glamour, notably when Mr Khrushchev raised his Berlin crisis late in 1958 and more recently when prominence has been given to the threat of large wage increases in Germany this year. Measured by its reserve backing and its very small short-term liabilities, the D-mark may still rate as the strongest currency in the world (followed probably by the Italian lira). But no one now gives any serious thought to a formal upvaluation of the mark, which even at the most favourable opportunity in 1957 was far from a practical proposition.

Thirdly, the position of sterling has been strengthened not only by the minor lapses from favour of other leading currencies but also by its own positive demonstration in 1957. In every postwar sterling crisis up to that time, a major element in hastening the speculative scramble was the belief that the British authorities would lack the will or the courage to take sufficiently firm measures to save the internal value of the pound. It was a belief shared by many domestic observers. The significance of the 7 per cent Bank rate was to explode this debilitating assumption. Britain may still have, as has been said, the smoothest machinery in the world for the finance of inflation; but there is now on record a precedent to show that Whitehall and Threadneedle Street can, when it comes to the pinch, put sterling first.

None of these considerations allows the authorities to lean back. Sterling as an international currency remains uniquely vulnerable. The staggering burden with which it emerged from the war, an accumulation of short-term liabilities three times as large as its gold reserves, has on balance remained unchanged. (In the United States, by contrast, short-term dollar liabilities are even now not as large as the still massive gold reserves.) In recent years, moreover, there has been a big increase in privately owned overseas holdings of sterling, which are apt to be run down more quickly than official holdings. It is vital therefore that the British authorities maintain, and be seen to maintain, a determination to preserve the value of the currency and to pursue domestic policies that leave room for a permanent improvement in the current surplus,

to meet the large commitments that have been undertaken for overseas aid and investment and to improve the ratio between monetary reserves and monetary liabilities. There is no quick single way to such an improvement; but the ability of Germany to meet many of the problems of full employment and still outpace Britain in many export markets shows what resolute monetary and economic policies can do.

Roads in Summer

Road congestion, and accidents, are at a peak in summer, the time of motoring for pleasure. Can anything be done?

IT is not so very long since a Member of Parliament for a certain seaside resort made a passionate appeal for a new trunk road to ease the holiday congestion in his constituency. He described how "every Saturday, between four and nine in the evening, from the middle of July until the end of August, there is a solid queue of cars moving at only a snail's pace with holidaymakers intent on reaching their hotels and boarding houses." All he wanted was twenty miles of modern trunk road to be laid down, at a cost of £100,000 to £200,000 a mile, to cater for the traffic of about 30 congested hours out of the total of 8,760 in the year. This kind of road congestion problem, Sir Reginald Wilson of the Transport Commission commented afterwards, is "hopeless, but not serious."

Hopeless, indeed, it largely is from the point of view of road investment, now or for a long time. The example may be an extreme one. But in a country that has strictly limited resources to devote to bettering its capital facilities, investment in roads or anything else that come into significant use only at a few peak periods is bound to show a very small rate of economic return, and must inevitably come low in any sensible list of priorities. The present broad pattern of priorities in road investment—as they were again stated by Mr Marples this week in his reply to the report of the Select Committee on Estimates on trunk roads—is to concentrate upon the country's principal industrial arterial routes between the main centres of population; secondly, on the even more congested roads this traffic has to use when it reaches those cities; and thirdly, on the more notorious accident "black-spots" that may be found elsewhere. This is obviously right and sensible. It is fair to say that the very notional costing that is sometimes applied to assess returns on any given piece of road investment has built-in oddities: what is our time worth when we are not going to work? One can also doubt whether the total being spent on new roads is yet large enough, in competition with other candidates for large, new capital outlays. But given the amount of arrears in Britain's road expenditure, it is hard to deny that for a long time there will be many, much more profitable schemes of road investment than those that provide for seasonal activities.

Yet seasonal road congestion is becoming more and more serious. There are now well over 8 million vehicles on British roads; ten years ago there were 4½ million. In ten or so years' time, the number might approach 12-15 million. The prospect of millions more motorists coming out on fine summer week-ends all bent on getting to the same places of pleasure as fast as they reasonably can, is daunting enough. The prospect of the accompanying steep rise in the toll of accidents is even more frightening.

But all the year round week-day traffic from industry and week-end pleasure motoring in the summer are not geographically wholly separate activities in this crowded island. The present pattern of road works should accordingly be of some benefit to both—and, equally, will impose additional marginal frustration on both while it is actually being undertaken. Similarly, week-end motoring now can still enjoy the useful, though diminishing, legacy of some of the few good new roads, like the one from London to Southend, that were put down in the thirties. But, basically, the week-end rush to the coast sets the same familiar problem of "peaks and surges" that afflicts the city commuter. It would be more manageable if the traffic, instead of being bunched into a few hours, could be spread over a longer period. As with driving to work, the natural forces of what may be called "ecology" do already encourage many drivers to stay off crowded roads over bank holiday week-ends. But why, most motorists will understandably ask, have a car at all if one cannot take the family out for a spin at the best time for everybody?

LAST year, 6,520 people were killed in road accidents in Britain and another 326,933 are known to have been injured. The toll is heaviest in the summer, particularly at the bank holiday week-ends: there is another, shorter peak in accidents, with comparable publicity, about Christmas time. But it seems that reported accidents in relation to traffic, that is accidents per vehicle mile, are lower in the summer months than in the shorter, more inclement days of winter—as might be expected. Moreover, the yearly growth in road accidents since petrol came off the ration ten or so years ago has been lower than the rate of increase in traffic.

Some margin of accidents is inevitable in any community that wants personal motorised transport and refuses to apply as rigid rules of prevention as it enforces, say, for rail transport, factories, or domestic oil heaters. But the broad trend of road accidents masks two more sinister developments. First, casualties among motor vehicle drivers and their passengers have been rising at a much faster rate than among pedestrians. Secondly, the proportion of accidents, and even more the proportion of fatalities, occurring on country roads is steadily rising. Both, presumably, are associated with the growing habit of pleasure motoring.

Many opinions about road safety are dispensed with much eloquence but with a singular lack of reliable supporting evidence. In the last fourteen years the Road Research Laboratory has accomplished a certain amount in analysing the various causes of accidents and suggesting ways of reducing them. Zebra crossings, which cut pedestrian casualties appreciably when they were introduced in 1951, the second tail light for vehicles, and the motor cyclists' crash helmet, for example owe a lot to the laboratory: ideas can also be got from research abroad. Though a multiplicity of factors cause road accidents, it is clear that one of the greatest single ways of limiting the toll is by informed design and construction of the roads themselves, from building a new motorway with limited access and for vehicles only to a simple, cheap job of roughing up the surface of a short stretch of existing road to lessen the chances of skidding.

Given the present pattern of priorities in road investment

it will be a very long time before many of the purely tourist, seasonally used roads are brought up to modern standards of design. There are, after all, more than 130,000 miles of country roads in Britain, most of them little more than re-surfaced versions of the old highways and byways first carved out by the carriage and pack horse. But that does not mean that nothing meanwhile can be done, by experiment and analysis, to improve the flow of motor traffic along them and make them a little less dangerous. As would be expected, more accidents occur at junctions, cross-roads, hill-crests, and bends than on straight stretches of rural roads. While plans for major re-alignment await their turn in the queue of priorities, a little study may suggest ways of reducing the accident rate of dangerous points by the simple use of paint and bollards, warning signs, and where appropriate perhaps light controls as well. "No passing" stretches—marked, for example, by two centre white lines instead of one—are cheap to instal, but well worth having if they are properly enforced.

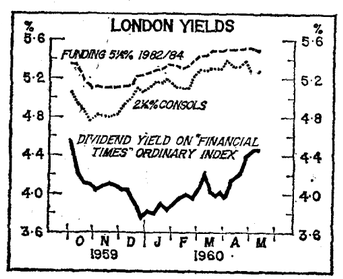
Similarly, attention can profitably be directed to the vehicle. From studies on the spot it has been found that toughened glass is safer, in the event of a major accident, than laminated glass: it breaks, but is hence less likely to break one's head. Properly-designed seat belts, if used, can also limit the seriousness of accidents when they do occur. The much delayed law for the inspection of older vehicles will help by tightening up customary standards of braking, steering, and lighting. It may also reduce delays and accidents induced by less experienced drivers trundling their decrepit chariots on to crowded roads at the occasional week-end. American experience suggests that states adopting regular vehicle tests have a significantly lower accident rate than those that do not.

Always, however, the ultimate factor is the driving habits of the motorist. Driving techniques cannot stay still as traffic steadily gets worse: manœuvres that may have been safe enough twenty, or even ten, years ago are liable to be dangerous today. The average car, too, is more powerful: there has been a noticeable increase in accidents caused by skidding or loss of control. As more experience is acquired in this country of driving on motorways with lane segregation so self-discipline on other roads may also get better.

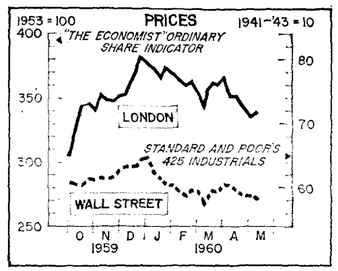
But whenever traffic movement increases, so grows the need for a sense of order to be imposed by wise regulation and enforcement. The efficacy of road safety propaganda has never yet been worked out: it would seem, however, that the need for it, and its timeliness, is greatest on the roads themselves. The episode of the "black widow" posters some years ago suggests that the British public shocks easily: "Honour your code," this summer, may seem at first sight rather unctuous. But nothing is more sobering, for example, than driving along a seemingly innocuous and empty road in Arizona or Alabama and suddenly coming upon a row of white crosses by the road-side marking the toll of deaths which that point of the road has already claimed.

The rise in accidents may soon force this country out of its more complacent attitude to that kind of propaganda and to revision of driving regulations. More use, for instance, may have to be made of suspension, the severest penalty that can be imposed upon any bad driver. Drink, too, is a factor that has been found, by study, to be present in far more road accidents than the police reports are able to show: it is perhaps the one factor that can be guaranteed to make any driver, however good he is in comparison with others, worse than usual. And, before long, the British motorist may have to surrender his fondness for freedom from speed limits everywhere but in towns.

Over the four days of Whitsun, Mr Marples will be trying out a 50 mph upper limit on 150 miles of ten heavily-used trunk roads. Universal speed limits, because they are bound to be disrespected, are perhaps as bad as no limit at all. But judiciously applied, after suitable study and with adequate enforcement (including radar), speed limits on certain congested or dangerous stretches, as other countries have found, can do immense good. They can actually improve flow as well as increase safety, by encouraging the slower drivers to keep up and the faster ones to slow down: fostering, in short, a higher and more uniform average speed of traffic. But with wider speed limits, as with all other kinds of traffic regulation, the governing rule must be to demonstrate to the motorist that the rules are meant not to nag, but to help him and other drivers to get safely to their destinations.



BUSINESS NOTES



IN THE MARKETS

Yields Talk Back

On Wednesday the London Stock Exchange enjoyed its brightest day since the budget. Buyers, including some institutions, returned to the market and lifted the *Financial Times* ordinary index by 6.1 points to 302.1. Gilt-edged, which in the beginning of the week were inactive, enjoyed renewed demand mainly for medium dated stocks, which rose by up to ⅞ on the day. This set a good tone for the small £3,380,000 Jamaica issue on Thursday, the first colonial loan in London for more than a year. The terms—coupon of 6¼ per cent, redemption dates 1977-80 and price of 99½—were attractive and the issue was over-subscribed. On Thursday the stock markets were again buoyant, and the index put on another 3.8 points.

Just as there were sound reasons for feeling at the end of last year that the surge of equity prices had gone too far, so there have been respectable reasons this week, with the indices down 13 per cent from their peak, for doubting whether prices will be pushed much lower for any length of time. The weakness of the equity market after the post-election upsurge was in its attenuated yields in comparison with the yields available on

gilt-edged. At the end of December the average yield on the *Financial Times* index was only 3¾ per cent—1½ per cent less than was offered by a twenty-five year gilt-edged security—and on some market favourites yields were 2 per cent and even less. Now, as a combination of the fall in prices and rise in dividends (the former influence having been twice as important as the latter), leading equities give an average yield of more than 4½ per cent, and the margin below long-dated bond yields has narrowed to 1 per cent. A "reverse gap" of this size may not be unreasonable, especially as further dividend increases are sure to be paid on the basis of last year's excellent profits.

In a stockbrokers' letter that had considerable influence on the timing of Wednesday's upturn, Professor Victor Morgan says that dividends should continue to show a rise of at least 20 to 25 per cent for the rest of this year, which would bring the yield on the *Financial Times* index a year from now to 5½ per cent on the basis of present prices. Thus even if the climate for equities remains unexciting—and it is part of the Chancellor's task to keep it so—the fruits of last year's company prosperity provide an important cushion. It can be calculated, for example, that without the dividend increases that have taken place since the beginning of the year, the *Financial Times* index would have to be twenty points lower to show its current dividend yield. Institutional investors are likely to take note of such considerations—though some of them have only recently caught up with the calculations pointing to the attractions of fixed interest securities. The general public is evidently already disillusioned that the great rise in the stock markets in 1958 and 1959 did not prove to be a perpetual movement. In April a small amount, £135,365, was withdrawn from unit trusts—though the number of unit holders continued to grow, by 2,730 to 620,380.

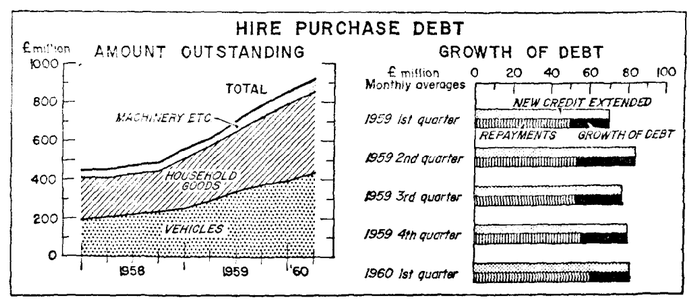
Wall Street Contrasts

A correspondent cables:

The stock market has shown little visible response this week to the "unhappy landing" which did, however, bring a modest strengthening of defence and aircraft issues. The Dow Jones average of industrials, which had fallen ten days ago to within a point of the March 8th low for the year of 599, closed on Wednesday at 606. The market like the economy appears to be moving sideways for the time being while potential investors in both equities and bonds cast around for some firmer indication of where business activity and interest rates are headed. Although the business picture has plenty of bright spots the market has refused so far to be encouraged. Retail sales in April bounded upward to an all time monthly record if seasonal factors are allowed for and the volume of car sales last month was encouraging if not spectacular. Business men are far from demoralised; dividends are being maintained or improved despite narrower profit margins and capital spending promises to be at a high level.

Investors continue to be highly selective in their buying. Electronics issues have gained an all round ten per cent since the end of last year; foodstuffs, soft drinks and tobacco stocks are up between two and five per cent; and drugs and department stores have largely resisted the general decline. The principal victims have been steel, automobile and chemical stocks; as a group these issues have dropped nearly twenty per cent in value since the turn of the year and many individual issues have dropped by around forty per cent. The uneven performance of the market is underlined by the fact that each trading day continues to bring a fairly rich crop of new 1960 highs despite the substantial general decline.

HIRE PURCHASE



Rise or Fall?

In the first quarter of this year the volume of hire purchase debt rose by still more than in the first quarter of 1959, and at the end of March it amounted to £920 million, half as much again as a year before and almost double the total in March, 1958. For some time it has been widely assumed that the accumulating burden of repayments would check the growth in net debt outstanding this year. Repayments have indeed continued to rise—they are estimated at a monthly average of £61 million in the first quarter compared with £51 million a year before—but new hire purchase credit has risen still more, by an average of £82 million a month compared with £70 million. One need not look very far for the reason. Hire purchase business in new cars—and in commercial vehicles—was more than 50 per cent up on the year in March, corresponding almost exactly with the rise in car output. For many months sales of the more popular small cars introduced last year have been limited by supply rather than demand; and buyers have evidently not been deterred by existing hire purchase commitments. Consumers have, after all, record-size personal savings to fall back on.

The question now is whether a check will be exerted by the official tightening of hire purchase terms. Opinion in the car trade is mixed. Some dealers point to the waiting lists for popular models and say that so far the tightening has had no effect. Others expect waiting periods to fall away and some sales to be held up by the increased monthly repayments needed. As the table shows, these are by no means negligible—even if buyers have another car to trade in and are therefore hardly affected by the higher minimum deposit now required.

	£500 car		£1,000 car	
	Deposit	Monthly repayment	Deposit	Monthly repayment
10% down, 4 years to pay	£50	£12	£100	£24
20% down, 2 years to pay	£100	£19	£200	£38

Outside the motor trade, the growth in hire purchase has already fallen off: credit extended by household goods shops rose by an average of £11 million in the first quarter, compared with £15 million a year before. Moreover, the steep increase of £31 million in total hire purchase debt in March may possibly have been abnormally swollen by some buyers getting in ahead of the official controls. Certainly it is too early to be sure that the official expectation of a slackening in hire purchase demand this year will prove wrong.

RAILWAYS

Development—and Handicap

THIS week's report from the Transport Commission on the state of progress in railway modernisation five years after it got under way makes, by itself, impressive reading. Many of the gains in passenger traffic following the introduction of diesel and electric services on the shorter local and inter-city routes continue to be spectacular. Compared with the last days of steam, business on some lines has doubled, even trebled: on one, the new diesel service between Leeds and Barnsley, receipts in the first full year actually rose more than fourfold. Freight traffic, of all kinds, is still steadily rising too, though it remains unclear whether this vastly more moderate, yet much more crucial, improvement betokens the winning back of custom from road haulage as well as from the general revival in industrial activity.

Naturally the commission so far has most to boast about in the quicker-yielding categories of new investment. Over half of all passenger trains are now diesel or electric. About a third of its freight wagons are now fitted with continuous brakes; and nearly a thousand express freight trains are now being run daily. The benefits of the lengthier projects of modernisation, such as main-line electrification, the radical reorganisation and modernisation of marshalling yards and goods depots, and major improvements to track and signalling, have yet to be witnessed—and precisely measured. And what difference the schemes that have already been completed are making to the railways' running costs, as distinct from their revenue, is presumably left for the commission's next annual report to elucidate.

The refusal of the Government a few days earlier to allow the commission to proceed with its original plan for a tall office block at Waterloo highlights one major handicap impeding another type of worthwhile development the commission could, if allowed, also undertake. The present plan for this new building was turned down on the particular grounds that it offended the planning rules about how much office development could be allowed there: it required a higher plot ratio than is permitted. Faulty drafting of the 1947 Act of nationalisation, however, prevents the commission from developing its sites for letting to other firms as well as for its own needs in the way that any other nationalised or private firm can. It has unsold property outside cities that has little or no alternative use, for itself or anybody else: at places like Waterloo, however, it could earn a tidy sum by developing sites alongside or over operational land and letting off at the rack rent the parts of the new buildings it does not need itself. Instead it has to let these profitable opportunities pass to other developers, getting no more than an ordinary ground rent in return. At Waterloo, for instance, this handicap resulted in the ludicrous arrangement whereby part of the new structure would be put up by the commission for its own use and another integral part would be developed for commercial letting by a private firm. The Stedeford committee, please, take note.

STEEL

Stocks Begin to Rise

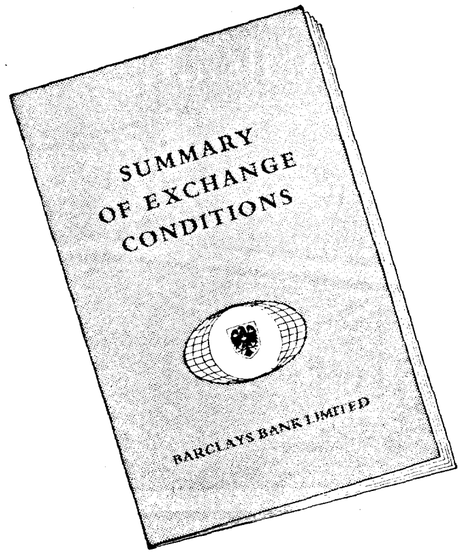
DURING the first quarter of this year, the Iron and Steel Board thinks, stocks of steel held by consumers and merchants may have risen by the equivalent of about 225,000 ingot tons, which means something of the order of 160,000 tons of actual finished steel products. This suggests that the level of stocks in the hands of consumers has now passed bottom, as well as those held by merchants, which already showed a rise in the last quarter of last year. And since the indications are that nationalised industries such as the railways and the coal mines have continued to keep their stocks down, the rise must be more significant within private industry. Ordering both at home and abroad by the motor industry, for example, certainly seems to be gathering more steel than even its current vastly increased output can eat up from day to day.

The first quarter of 1959 saw the trough of recession for steel; a year later, consumption was about a quarter higher, and instead of running down their stocks consumers were building them again. So output in the first quarter of this year was nearly 40 per cent higher, and imports, primarily of sheet, trebled. Output in April, which was affected by the Easter holidays, continued at roughly the first quarter average—it was 310,600 tons of pig iron and 478,100 ingot tons of steel a week.

STEEL DEMAND AND SUPPLY
(million ingot tons)

	1st qtr., 1959	1st qtr., 1960
Demand :—		
Home consumption	4·3	5·3
Stock build	−0·3	0·2
Exports	0·8	1·1
Total demand	4·8	6·6
Supply :—		
Production (plus re-usable steel)	4·7	6·3
Imports	0·1	0·3
Total supply	4·8	6·6

The board says that during the course of the year steel output will go up further, though the introduction of new capacity will be partly offset by the seasonal effect of holidays. It expects that exports—also this year nearly 40 per cent up—may show some reduction in coming months. Deliveries of plates, rails, colliery arches and steel forgings and castings are still below the previous peaks of home sales reached in late 1957; all other products have passed those records, even heavy sections (these mainly as a result of larger exports).



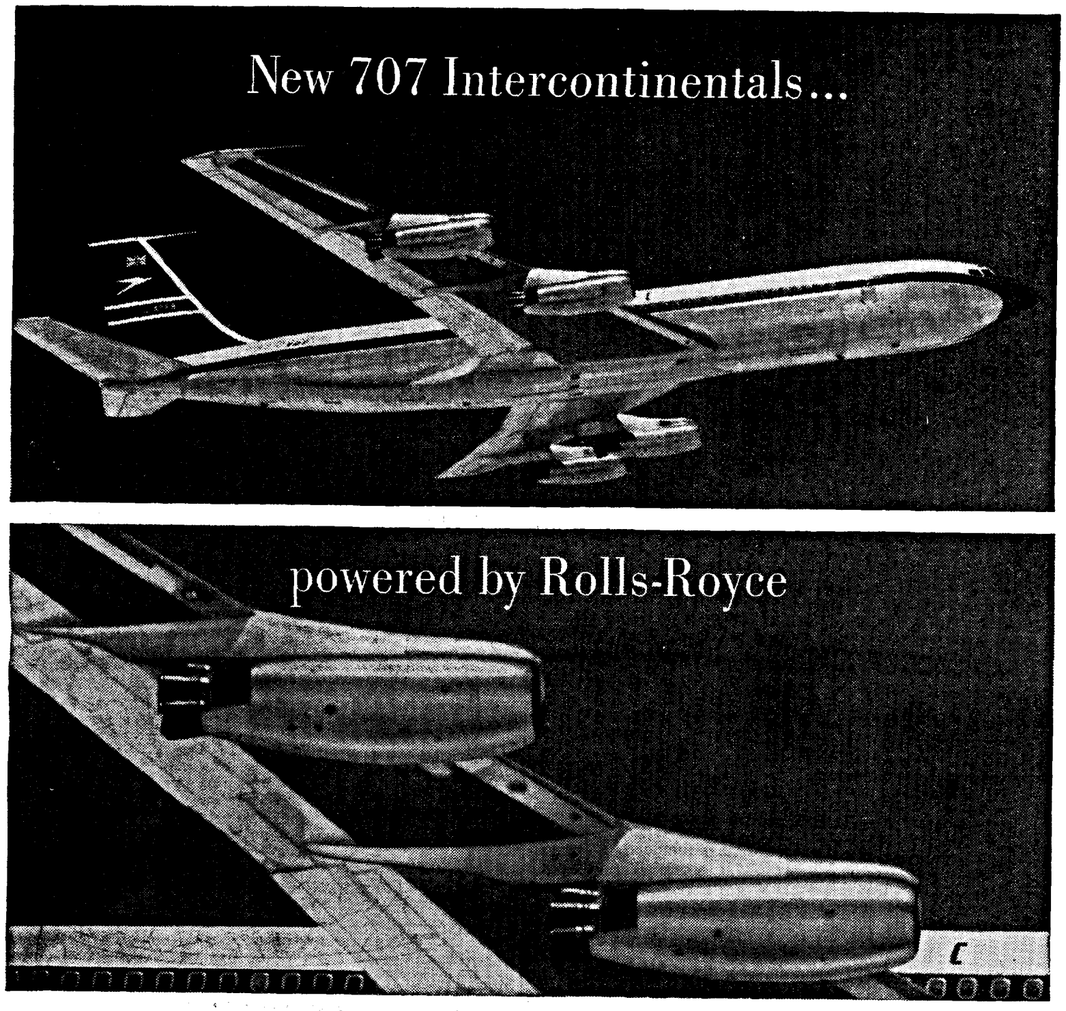
BUILDING SOCIETY NEWS

Halifax, The Bill, and Lloyds Permanent

IN the first quarter of its new financial year, the three months to end-April, the assets of the **Halifax Building Society** reached a new peak of £450 million. In these first three months of its financial year it lent a further £24.1 million on advances, over £3 million more than in the previous quarter and some £6 million more than in the same quarter last year. To do so however has meant a reduction in its liquidity ratio from 18.6 per cent at the end of January to 17.4 per cent at the end of April. Even the Halifax has now begun to feel the strain of uncompetitive interest rates. While its net receipt of funds at £8.7 million for the April quarter was above the £5 million received a year ago, the net monthly inflow of £2.9 million compares with an average of £3.7 million for the previous six months. It will now be surprising if the Building Societies Association, of which the Halifax is not a member, does not recommend an increase in rates at its next meeting.

The **Building Societies Bill** has now reached the committee stage in the House of Lords, and the Government has introduced an amendment to give the Chief Registrar power to vary the limit of £5,000 imposed in the bill for so-called "special" advances. These include advances of any amount to a corporate body and advances of over £5,000 to any person (or of an amount which will bring a personal debt to over £5,000). While Lord Hailsham thought this limit was adequate at the present time, he conceded that it was wrong to write this figure definitively into the Act. Under the amendment an order by the Registrar to vary the limit would be made with the consent of the Treasury; it would therefore be subject to parliamentary criticism and control. Lord Hailsham also said that his mind was not closed to all proposals for the introduction into the bill of a right of special appeal against decisions taken by the Chief Registrar. He thought however that a recent case showed that the provision for some kind of review by the court already existed and would exist under the bill.

On Thursday the Court of Appeal dismissed the appeal of the hitherto unnamed **Lloyds Permanent Building Society** against the imposition by the Chief Registrar of a "stop" order on the society. Treasury consent to this order was given on April 6th. Mr Neil Mckinnon, counsel for the Society, asked for leave to appeal to the House of Lords, but this was refused. The Court directed that the monies which had been lodged in the court since early in April should be paid back to the depositors. The auditors in their report on the accounts of the society for the year drew attention to certain features of the society's cash position as at December 31, 1959.



A new guide to foreign exchange

Our 'Summary of Exchange Conditions', which has just been re-issued, gives in convenient form an outline of financial conditions in seventy countries as they affect United Kingdom exporters. The booklet can be obtained through any of our 2,200 branches or direct from our Intelligence Department.

soon will serve you on the routes of B.O.A.C.

B·O·A·C
BRITISH OVERSEAS AIRWAYS CORPORATION

On June 6th, British Overseas Airways Corporation will begin flying a non-stop service to New York with new 707 Intercontinental jetliners.

BOAC's luxurious new Intercontinentals are the fastest, longest-range jetliners in the world. A distinguished product of transatlantic teamwork, they are built by Boeing and powered by world-famous Rolls-Royce Conway engines. Intercontinentals will bring you the advantages of unprecedented speed and comfort—and non-stop travel over BOAC's longest routes. You'll find your flight a restful, relaxing, yet exhilarating experience. And throughout your trip, you'll enjoy the superlative service that makes a flight with BOAC a truly memorable experience.

See your travel agent, or BOAC, for reservations for *your* flight aboard a superb BOAC 707 Intercontinental.

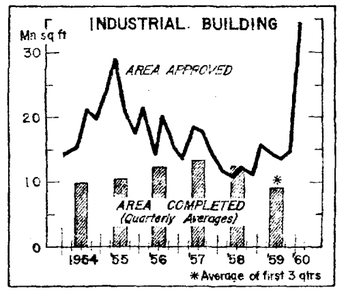
RULES FOR BIDS

A Good Draft Code

THE Board of Trade's existing rules governing the conduct of licensed dealers in securities date back to 1939; they cover offers to dispose of securities but not to acquire them, and they do not control activities in connection with take-over bids. These latter will be considered by the Jenkins Committee, which is reviewing the Companies Act and the Prevention of Fraud (Investments) Act, from which stems the Board of Trade's power to issue dealing rules. The Board has now published a draft of new rules which will cover offers to acquire securities and take-over bids. They appear on first examination to be well designed to secure that the fullest relevant information is in the possession of shareholders in good time before they are asked to decide whether to accept an offer.



There is now a month's interval for detailed study of the draft and for making representations. For take-overs, the proposed rules lay down a minimum period for consideration of 21 days, while for a conditional offer a latest date must be named on which the offerer can declare it unconditional, with a further period between seven and 21 days for acceptance. A partial offer must be open to acceptance by all shareholders and if over-accepted must be scaled down rateably. The licensed dealer must state among other things what steps he has taken to assure himself that the offerer can find the full amount; what payments for loss of office are proposed for directors of the company to be taken over; and what agreements exists between the bidding company and directors of the offerer company. The draft rules also provide for the disclosure of "any material change" in the financial position of the offerer company since the latest publicised accounts and for the disclosure by an accepting board of directors of their individual interests and expectations following the take over. It may be possible to improve some of the detail in the draft rules; but their general acceptability cannot be gainsaid and their writ runs not only among licensed dealers but also among all exempted dealers such as brokers of recognised stock exchanges, merchant banks and other bodies dealing in securities.

CONSTRUCTION

Lopsided Boom

PLANS for new construction showed a great leap forward during the first quarter of this year, but it was the leap of a one-legged man: the total area of new building schemes approved was swollen very largely by the motor industry's intention to put out more cars, while the Federation of Civil Engineering Contractors was complaining that its members have too little work to do. The 992 industrial building schemes approved by the Board of Trade during the quarter covered 34.4 million square feet, more than twice the area covered by the 526 schemes approved during the first quarter of 1959. The gap between approval, starting construction, and finishing the job is, however, notoriously arbitrary.

A third of the area covered by these new intentions is in the north western region, where the new Merseyside motor plants are to be established. Scotland and Wales, similarly affected (though not enough to satisfy Scottish MPs), account for another

4.6 million square feet between them. The policy of the Board of Trade, following the purpose of the Local Employment Bill, is to approve schemes in development districts freely. But in the Midlands, the eastern region, and the London and south-eastern regions, where the board says its line will be "tough" (because of full employment), 428 schemes, covering nearly as large an area as in the north-west, were approved in the first quarter of 1960.

In such areas the policy is to approve projects involving a low labour content—storage space, a ramped car park, a highly mechanised plant—or other "special cases," like service industries, or firms needing space as a counterpart to their factories in a development district. A third kind of area is distinguished, "where there is no particular need for positive encouragement of new industry, but no reason to discourage moderate expansion."

While construction plans in general have increased phenomenally, civil engineers are complaining of a lack of work. They blame higher interest rates and the fact that local authorities must now get most of their capital on the open market; the tendency for local authorities to use their own labourers rather than outsiders; the run-down in the opencast coal programme; increasing mechanisation in their own industry; and insufficient expansion of the road programme. All this adds up, the Federation of Civil Engineering Contractors says, to enough spare capacity to double the present road programme—but it is not clear how many of the unused machines are nearing obsolescence.

SHIPPING

Cunard in the Meantime

REPLACEMENT of the Cunard Steam-Ship Company's most important operating assets is a question of investment policy at present not mainly within the discretion of its board; last year, in effect, the company put this before the Minister of Transport and asked whether the Government could help. The re-elected government had indeed committed itself to assistance of some kind in its election programme, and since September a committee under Lord Chandos has been discussing what kind of assistance—and indeed what kind of replacement—would be most suitable. This committee is expected to give its advice to the Government very shortly; whether its report will be published, before or after the Cabinet's decision, remains to be seen. But Cunard's annual report, published this week, demonstrates that it has found reason, since the late Colonel Denis Bates laid down a year ago the broad specification of Atlantic liner that it had in mind, to re-examine a wide variety of alternative types.

Sir John Brocklebank, who has succeeded Colonel Bates as chairman of Cunard, said in his statement this week that this re-examination had not greatly changed Cunard's mind about what ships are best for the North Atlantic route, potentially the most lucrative ocean crossing in the world. The board and management, he said, were still

> firmly convinced that two ships of about 75,000 gross registered tons with a service speed of 30 knots would be the best and most profitable units with which to maintain our weekly express services, which has shown itself to be the most efficient method of carrying passengers across the North Atlantic by sea.

Suggestions that smaller ships, which could on occasion shift to different routes, might be as efficient have clearly not commended themselves to Cunard. It does appear, however, that the 75,000-tonners they now have in mind might be a little cheaper in terms of passenger capacity—say £27 million apiece for 2,400 passengers, against nearly £30 million for 2,000 on last year's figuring—and a little less luxurious, with rather smaller public rooms. The advantage of light alloys in the superstructure of the two new liners now being fitted out for the P & O group seems also to have been noted.

On the North Atlantic, Sir John was able to tell shareholders that the outlook was appreciably better, both in freight and for cruising; tourist attractions such as the royal wedding, the Olympic games, and the Passion Play at Oberammergau all play some part in the economic forecasting of a luxury passenger service. Cunard's dividend was covered last year only through the tax relief in respect of investment allowances. But the adverse financial result was largely attributable to the ill fortune of the group's Brocklebank line on the India, Pakistan, and Ceylon trades. Whatever vessels

it may in future build to serve the North Atlantic, Cunard did last year manage slightly to improve its share—27 per cent—of Atlantic passenger business.

RUBBER MARKET

The Price Perverse

COMMODITIES can be perverse. Everything points to a surplus of natural rubber this year—everything but the market, that is. Prices have been rising, especially for the top grade of sheet rubber, and especially for spot and nearby deliveries. This week the top grade shot ahead, the spot price in London closing on Thursday at 42¼d. a lb., nearly 4d. up on the week. While few people were looking for a fall in prices just yet, this sudden burst of strength has surprised everyone, and puzzled most. The advance in Singapore has occurred despite the reported rise in stocks, and it remains to be seen how genuine the shortage in that market is. In London, where prices on the terminal market now command a premium over replacement cost (and are far above parity with New York), the shortage is believed to be largely technical—the result of buying by people who had sold short. Buying by consumers who are short of butyl synthetic rubber for making inner tubes, and need more top grade natural rubber instead, is apparently of minor importance.

Adding piquancy to events in the market, the International Rubber Study Group has just published estimates suggesting that supplies of natural rubber this year could exceed consumption by nearly 200,000 tons. World consumption of natural rubber in 1960 is estimated at 2,110,000 tons, and consumption of synthetic rubber (leaving out the Communist countries) at 1,750,000 tons. The group does not reveal how much natural rubber it expects the Communist countries to "consume" (that is, import) this year. World production of natural rubber is put at about 2,135,000 tons, and the group points out that up to the end of last month about 95,000 tons of natural rubber had been sold from government stocks for delivery this year. If prices remain above the point at which the American and British governments restrict sales, it considers that another 75,000 tons could be delivered this year. Thus the total supply of natural rubber could exceed 2.3 million tons. The group adds, however, that a considerable part of the surplus will be needed if commercial stocks are rebuilt to a more normal level.

ATOMIC ENERGY AUTHORITY

Fair's Fair

THE Comptroller and Auditor General had some harsh comments to make about an arrangement reached between the Atomic Energy Authority and an unnamed chemical manufacturer for the supply of a chemical for which the company was the only supplier and the AEA the only customer. Sympathy is, however, likely to be all on the side of the supplier. It had been making this chemical for the atomic energy programme since 1951 on a ten-year contract and seemed to have been heartily fed up with it. When the AEA asked it in 1958 to increase capacity, the company disliked the idea and told the Authority so. It could find far better use for the funds at its disposal, and suggested that if the AEA wanted capacity expanded, it, and not the company, should put up the capital. The AEA refused and then followed "lengthy negotiations" in which the company "was not a willing collaborator" and "accepted the contract reluctantly." The only terms on which it would do so were those which would give it the same return on capital as it would have earned if the funds had been used in the way that the directors would in fact have liked to use them. This gave it a return of 17 per cent on capital employed in the first year, increasing to 45 per cent return in the fifth and last year of the new five-year contract.

Sir Edmund Compton was shocked, but had he in fact any reason to be? Industry can now provide a fine variety of case histories where companies have invested large sums in producing esoteric materials required by one or other specialised government department, but with no normal commercial future that anyone can see. A change in government policy, frequently taking place between the time that work is started on the new plant and the time that it goes into commission, suddenly leaves the company with a costly investment and a market to build from the ground up for a very expensive commodity. Why should directors agree to supply the government with a commodity that only the government want on terms any less favourable than it could earn elsewhere? In ordinary life, people who demand non-standard products such as bespoke shoes, portraits in oils, or custom-built cars, expect to pay a premium for them, and there is no logical reason why the Atomic Energy Authority should be treated in any different fashion. Nor is there any reason why the company should have been expected to accept any lower return on its capital than it could have earned elsewhere.

PHOTOGRAPHY

Freedom Regained

THE abolition of import restrictions on cameras last autumn, except on those from Japan, has meant that for the first time in 20 years the British photographer can spend as much as he likes on the tools of his hobby. Cameras costing over £7 10s. cif—which sell for more than three times as much in the shops—were the most expensive that could previously be imported freely. The result of freedom has been a sharp rise in imports, which were valued at 65 per cent more in the first quarter of this year than a year before. The average value of each camera imported also has gone up by 40 per cent, to £4 15s. cif—which means around £17 10s. retail. The majority of imports is thus still within the limits set by the defunct regulations; the bulk of imported cameras sell for £10-£25 retail. But much of the rise in the average value of imports seems to have resulted from dealers stocking up with the expensive cameras that they were previously unable to obtain freely or legally to meet the pent-up demand for them. The desire for cameras that are easier to use, with automatic settings, is a factor making for a rise in the average value of cameras sold; one big seller that could not have previously been imported freely is the Agfa Optima. Agfa reports that its sales are up a third this year, with a swing from cheaper to more expensive cameras of this kind. The Leica Retina and Rolleiflex account for most of the increase in imports of the highest quality cameras costing over £75 retail.

These most expensive sales are limited to specialist dealers; the largest number of cameras are sold through chemists to people with less exacting requirements. Among the most popular cameras are cheap 35 mm. cameras such as the Ilford Sportsman, which is imported from Germany, and the Kodak Colorsnap, which is made in Britain. This, at £10 9s., is the most expensive British-made camera to sell in large numbers; home production fell 8 per cent last year while imports were rising. Cameras made in Britain formed only 40 per cent of total deliveries by value, but 60 per cent in number. This year it seems likely that they will take an even smaller share of the market in terms of value, though the numbers sold are rising. The desire at least to appear to be a fully-equipped member of an affluent society, with leather cases dangling proudly, militates against the sales of the modest camera that just takes pictures.

CABLES

BICC's New Rod Mill

BRITISH INSULATED CALLENDER'S CABLES, the biggest cable maker in Britain, and as a group probably the largest in the world, has in the last decade carried out a substantial programme of modernisation and regrouping of its cable making plants, partly in anticipation of the end of price-fixing in this industry which, it has claimed, it saw coming. Its new £1½ million copper rod rolling mill at Prescot in Lancashire, which was officially opened this week, should be another major reinforcement to its competitive position.

The process of rolling a ton of copper wire bars into rod costs at most about £15, as against, say, £250 for the metal itself—

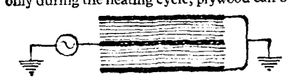
Electrical Aids in Industry *Data Sheet* **No. 12**

Dielectric Heating-3

Some further details of the uses to which dielectric heating can be put are given in this data sheet, being continued from data sheet No. 11.

The Woodworking Industry

A most important development in recent years in the woodworking industry has been the introduction of synthetic resin adhesives of the thermosetting type for the bonding of wooden components.

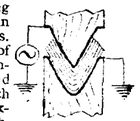


Setting of these resin adhesives proceeds at a rate largely determined by temperature. For instance, urea formaldehyde sets as follows:

TEMPERATURE	SETTING TIME
65°F	9 hours
80°F	1 hour
150°F	3 minutes
190°F	1 minute

The resultant bonded joint is equally satisfactory in each case. Most of the power supplied when dielectric heating is used is absorbed by the resin, the heat thus being concentrated where required.

Plywood



With dielectric heating consuming power only during the heating cycle, plywood can be produced with considerable savings in heating times and costs.

For example, in a press holding 100 3-ply ⅛" thick assemblies, the resin glue is set in 20-30 minutes, depending upon the dryness of the wood.

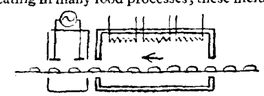
Curved Laminated Sections

Curved laminated sections are being increasingly used in contemporary furniture, and with dielectric heating rapid production can be achieved using wooden shaping blocks in single daylight presses. An alternative method of providing heat by conduction from heated metal strips is much slower as the total thickness rises above 0.05 inch.

Furniture Assembly

Because of the savings in glueing processes already instanced, dielectric heating is being extensively used in the furniture trade. It leads also to reductions in labour and floor space, with the elimination of assembly jigs. The heating equipment is such that it can be placed directly in the production line, thus cutting handling to a minimum.

Blockboard



Blockboard, having large areas of glue line, provides an excellent use for dielectric heating, which gives considerable savings in time and labour.

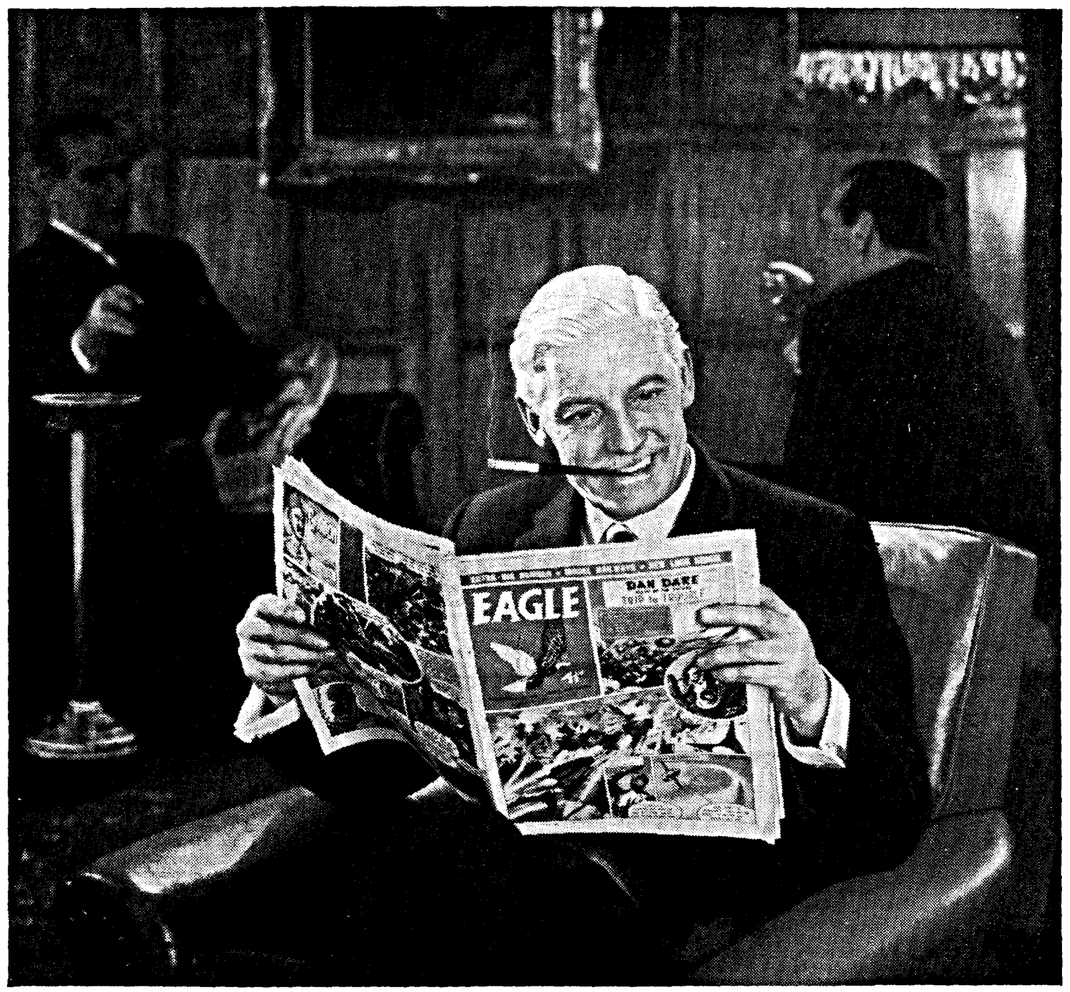
Other Resin-bonded Products

Dielectric heating is also used in the manufacture of other resin-bonded or impregnated products such as grinding wheels, fabrics, felts, and similar products.

Foodstuffs

Increased use is being made of dielectric heating in many food processes; these include

defreezing and melting, sterilisation and disinfestation, drying of breakfast cereals, dog biscuits, etc., and similar applications. Some cooking processes, such as bread baking, are technically possible, but dielectric heating gives an 'unbrowned' product. In the biscuit trade, however, dielectric heating is combined with conventional baking to produce normal biscuits in ⅓ to ½ the usual baking time and thus increase production.



The examples given here cover only a part of the field open to dielectric heating.

For further information, get in touch with your Electricity Board or write direct to the Electrical Development Association, 2 Savoy Hill, London, W.C.2. Telephone: TEMple Bar 9434.

Excellent reference books on electricity and productivity 18 6 each, or 9/- post free) are available—"Induction and Dielectric Heating" is an example.

E.D.A. also have available on free loan in the United Kingdom a series of films on the industrial uses of electricity. Ask for a catalogue.

7548 B

People who can
buy Player's No.3—
by the hundred

Player's No. 3 are the rather expensive cigarettes for people who do what they like . . . with insouciance. Their reading taste may be catholic. But their smoking taste—never. Rather firmly, they insist on Player's No. 3. The tobacco, they find, is unequalled. 4/6 for 20.

and the further wire drawing and insulating processes bring the finished cable to, say, £450-£750 a ton. This almost wholly automatic rolling mill, therefore, cannot make much difference to final prices; but its operating cost will be a great deal lower than the ageing plants it replaces. With an initial normal capacity of 100,000 tons of rod of better quality a year, as against about 65,000 tons from the older mills, it will also enable the group to cater more readily for the needs of the cable making businesses which it has bought up in the last few years, as well as to sell more to other cable makers.

FCI

Money Back

THE Finance Corporation for Industry has had a quiet year, but its most profitable one. In the twelve months to March 31st it entered into no new loan commitments at all—nor is there any reason why it should have done at a time when commercial institutions in the market were falling over themselves to lend. The fact is that FCI has never really found its niche simply because the capital market has been doing its job. Lord Piercy's Industrial Commercial Finance Corporation, set up at the same time after the war, has trouble enough finding outlets among smaller companies. Catering for the bigger fish, FCI has tended to get embroiled in a few large and "public duty" ventures.

Not all have been without profit in the end. In the past year, FCI shows a surplus of £3.2 million on realisation of investments, against a mere £120,000 the previous year. This coup is due mainly to the exercise of an option to take up (and sell) two million South Durham Steel & Iron ordinary shares, acquired under the terms of a loan agreement at 20s; after the election the shares reached a peak of 61s.

As a result, FCI is paying its shareholders, who include insurance companies, investment trusts and the Bank of England, their first divided for three years, of 6 per cent. But this absorbs only £18,375, and the great bulk of this year's profit available for appropriation, of £1,290,591, is being put into reserves, "bearing in mind the purpose for which the Bank of England last year paid £3 million in advance of calls" to shore up the corporation's losses.

DC 3 REPLACEMENT

A Ridiculous Tariff

HOLLAND'S Fokker aircraft company has been demonstrating its Friendship aircraft this week to the smaller British airlines, knowing only too well that this is a labour of love so long as the aircraft attracts a 17 per cent tariff. The British Overseas Airways Corporation does not pay this tariff on its imported American aircraft; when BOAC bought its first Constellations, arrangements were made to allow them and their successors, the Stratocruisers, Seven Seas and Boeing 707s, to enter the country duty free on the simple argument that similar types were not available in this country. The Friendship, however, attracts the full rate of duty. What began as an expedient has now ended as an infuriating regulation that provides no protection of any value to the British aircraft industry and a good deal of irritation to potential customers abroad.

The Friendship falls into the class of aircraft loosely described as "Dakota replacements"; that is, it is medium-sized (40 passengers), relatively short-ranged (600 miles) and able to operate off rough airfields under difficult conditions. Thus it competes directly with Handley Page's Herald transport, Hawker Siddeley's Avro 748 and Vickers-Armstrongs' abortive effort to market a "local service" Viscount. It differs from them commercially in having been markedly more successful. The first foreign-built aircraft designed to use Rolls-Royce's Dart turbo-prop engines, the Friendship has been licensed by Fairchild in America and Fokker and Fairchild have between them firm orders for 162 aircraft, of which more than 100 are already in service. Nothing succeeds in aviation like success; the more Friendships are sold, the more are likely to be bought on the argument that this is now a proven aircraft.

It is certainly a small airline's aircraft: the first customer was Aer Lingus, which took delivery late in 1958, and the order book shows that most customers buy from one to seven aircraft and rarely more. Since about 40 per cent of its cost represents the price of British-built components — engines, undercarriage and the like—the Dutch are understandably irritated at meeting tariff barriers when they try to sell the aircraft in this country. The British industry might retort that it sees no reason to open its home market to so dangerous a competitor, but it might pause to think whether this attitude has not contributed a good deal to the growing hostility to its own products being encountered abroad. The success of the Friendship and the Caravelle has removed much of the postwar inferiority complex of European aircraft manufacturers and the European industry, now tooling up for production of Lockheed's 104 fighter, for French-designed reconnaissance aircraft and Italian-designed fighters, is closing its ranks and itself preparing to repel borders.

THE MOTORWAY

First Lessons

APART from the need for a sense of "lane discipline," which most drivers appear by now to have acquired, the first principal conclusion generally drawn from actual experience of using the London to Birmingham motorway has been that the "hard" shoulders on the near-side of each carriageway should be really hard. Heavy lorries that have pulled over for an "emergency" stop finally got away only with the help of a tow. At the symposium on the motorway, held by The Institution of Civil Engineers just six months after it was officially opened, the chief engineer of the Ministry of Transport, Mr John Baker, thought it "possible" that these shoulders would have a paved surface on a stronger base in future in place of the finish of grass or small chippings on a stone base that was used originally so as to "preserve the traditional verge appearance in this country." The contractors who built the motorway suggested that the concrete base of the carriageways should be extended to the outer edge of the hard shoulders.

Although it is too early for all the lessons of Britain's first venture into this type of motor road to emerge fully, it is at least clear that the design and construction of future motorways should allow for the difficulties that contractors face in getting access to, and working completely within, a site that stretches like a very narrow thread across miles of open country, interrupted by road, rail and river crossings where bridges take some time to build. On the design side proper, Mr Baker considered there should be more room in future between the hard shoulder and the edge of the slope of embankments or cuttings; that all slip-roads may need dual carriageways; and that there is a clear need for restaurant and service areas since some night lorry traffic has already gone back to the A.5 while the motorway's cafés remain as yet uncompleted. The more important lessons will have to await the completion of the extensive traffic engineering studies that are now going on. The first study of actual speeds on the motorway, conducted before traffic had settled down, suggested that this ingredient of the calculation that investment in the motorway would produce a net economic return of 10-14 per cent this year, rising to 18-25 per cent by 1965 with the expected growth of traffic, may have been about right.

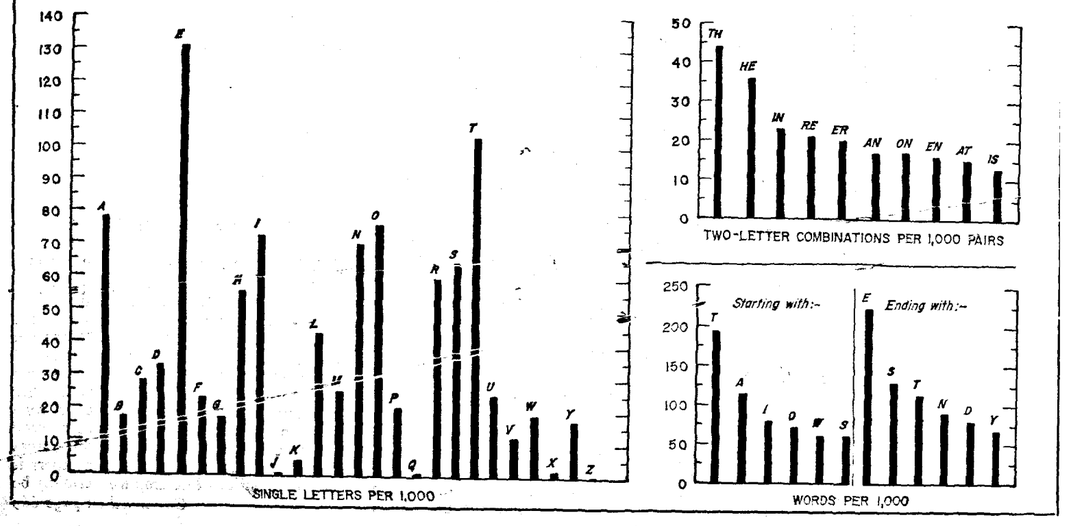
JUTE & JUTE GOODS

Steep Rise in Prices

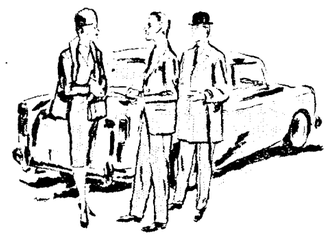
WHEN most of the world's jute comes from one small part of it, East Pakistan and West Bengal, and weather plays a big part in the size of the crop, prices can fluctuate sharply. With world consumption rising and a small crop in the principal exporting country, Pakistan, supplies this season were already tight. Now the weather has turned traitor, and prices have gone through the roof. Sowing of the new crop has been delayed by drought; in some areas germination has been poor and in others it may have failed. The crop will certainly be

Continued on page 669

Top Letters



PART of the Post Office's plans for mechanising Britain's mails depends on inducing the public to use address codes on the lines of London telephone numbers instead of laboriously spelling out the names of houses, streets, towns and counties. Codes of this kind could be translated into a language machines can read and so make possible mechanical and electronic sorting of the mails. But to be successful, a code must be easy to remember; to be easy to remember it must bear some relation to common speech. And to design a code of this kind it is necessary to have some definition of what common speech is. How many times do letters recur in "ordinary" English and in what combinations do they most frequently appear?

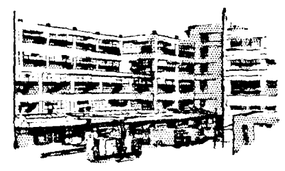


Although the intelligence services must know a good deal about this, they keep their information to themselves. They say that only two detailed analyses of the letter structure of the English language appear to have been published, one based on the King James version of the Bible (which may not meet the definition of "ordinary" English but has perhaps contributed more to common usage than almost any other single source) and the other on an unspecified source. The ordinary person may find this surprising: how were the keyboards of typewriters, linotypes, and the like originally designed, and is not the Morse code said to have been designed with some pattern of letter frequency, at least, in mind?

However, to help the Post Office in this job two members of the Medical Research Council's Applied Psychology Research Unit at Cambridge, Drs A. D. Baddeley and R. Conrad, and Mr W. E. Thomson of the Post Office Research Station decided to carry out their own analysis using the Post Office computer. Without a computer they could not in fact have comleted the task they set themselves. As source material they took all the leaders in *The Times* for five successive days—as an example of "typical" written English—and the text of one week's broadcasts of Mrs Dale's Diary (as "typical" spoken English, a choice that suggests psychologists think poorly of the English gift of the gab); and then counted the number of times that different letters of the alphabet were used, and the number of times that different two- and three-letter combinations occurred. Some of their findings were published in the scientific journal, *Nature*, at the end of last month; a selection of results obtained from analysing *The Times* is shown in the charts.

CERTAIN marked differences emerge between Mrs Dale's and *The Time's* versions of the English language. Spoken words seem to average only four to five letters apiece, as against five to six letters for written English, but more surprising is the frequent occurrence in spoken English of the vowel sound "ou" which crops up 1,443 times in a sample of just over 17,000 words and is passed only by "th" and "he" (1,600 times apiece). Yet "ou" is not even placed, as the chart shows, among the ten most popular two-letter combinations in written English, where "o" is much more likely to be followed by "n." Other differences of this kind are a preference for "de" in written as against "do" in spoken English, "ge" as against "go," "st" as against "se," and at the bottom end of the scale, "ze" as against "zy." If "e" is Top Letter, turning up more frequently than any other, then "z" is certainly Bottom Letter. Mrs Dale uses it only three times in 66,000 words. Names and places were excluded, which seems slightly odd given the object of the exercise.

By looking at these two- and especially at the three-letter combinations, it should be possible to invent word-like codes that are much easier to remember than combinations of letters thrown up by random selection. But because this is the only modern analysis of its kind, it could have an importance beyond the Post Office's own mechanisation plans. It provides basic data about the structure of two samples of English, formal and informal, that could be of assistance to typewriter, teleprinter and linotype makers in checking on the validity of their keyboard patterns and to all methods of communication that depend on the transmission of codes. Whether it has a bearing on the design of computers for language translation is something that only computer makers can decide, but the tables with such forbidding titles as "Digram frequency of written and spoken English" should be a lasting source of inspiration to all small boys tempted by recent events to play at being secret agents, as well as to those adult small boys who write (and read) thrillers.



Conducted Tour of the Motor Market

There is much to be said for every car on the British market. How can a man decide when the moment comes for a new car? It is never any good plunging into a purchase—especially one involving hundreds of pounds—without first studying the market. The current issue of *The Motor*, Britain's most influential motoring journal, is a British Cars, Components and Accessories Number. It is a complete Buyers' Guide to British Motor Cars, containing excellent articles on accessories and design, as well as the usual road test and reports on current events. Here are some of the contents:

Complete buyers' guide to British motor cars.
3-page feature on accessories to improve the convenience of the car.
Article by Laurence Pomeroy on design of British cars to sell to the overseas market.
Review of the outside suppliers used by the industry.
Road test on a Lotus Elite.
6-page illustrated report of the Tulip Rally.
Silverstone B.R.D.C. International preview.

The Motor is only one of fourteen opinion-shaping journals published by Temple Press Limited. Every one of these publications is a leader in its field. And they are not leaders in the home market alone; altogether 2½ million copies go abroad every year to inform the world. The technical journals of Temple Press are good reading, well presented, informative, good to advertise in.

A MAN IS KNOWN BY THE COMPANY HE KEEPS

A host is known by the brandy he serves

To serve your guests an indifferent brandy is more insult than compliment. The correct thing to serve after meals is a cognac of liqueur quality. This is why the perfect host gladly pays that little bit more for a really fine liqueur brandy like Remy Martin. A genuine Fine Champagne V.S.O.P. Cognac. A brandy defined by French law as *Fine Champagne* because it is made exclusively from grapes grown in the two finest districts of Cognac. And it is reassuring to remember that Remy Martin make *nothing* less good.

MAYFAIR, dignified building of 6,000 sq. ft. with permanent Town Planning consent for office use to be let or sold with vacant possessions of 3,200 sq. ft. on basement, ground, and superb first floors. Remainder let to produce £4,000 p.a. to two tenants on full repairing and insuring leases. Passenger lift and central heating.

APPOINTMENTS

OXFORD UNIVERSITY
INSTITUTE OF STATISTICS

Applications are invited for junior research posts in applied economics in general, and the economics of underdeveloped countries in particular. Candidates should have a good degree in economics or statistics. The salary will be in the range £700–£1,100 (but this is under review). Posts are superannuable and an allowance of £50 per child is paid. Application forms may be obtained from the Secretary of the Institute, St. Cross Road, Oxford. Closing date June 6, 1960.

THE UNIVERSITY OF LEEDS
DEPARTMENT OF ECONOMICS AND COMMERCE

The Council invites applications for appointment to the Montague Burton Chair of Industrial Relations within the Department of Economics and Commerce at a salary in the range £2,400 to £3,000 a year. The appointment will take effect from a date to be arranged with the successful candidate. Applications (sixteen copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds 2 (from whom further particulars may be obtained) not later than June 20, 1960; candidates overseas may apply in the first instance by cable, naming three referees in the United Kingdom.

UNIVERSITY OF BIRMINGHAM
FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited for an ASSISTANT LECTURESHIP (£700 x £50 to £850) or LECTURESHIP (£900 x £50 to £1,350 x £75 to £1,650) in ECONOMICS, preferably from graduates who have specialised in Mathematical Economics. Salary scales are under review and are likely shortly to be increased. Duties to begin on October 1, 1960, or as soon thereafter as possible.

Applications (two copies), with the names of three referees, should be sent by May 20, 1960, to the Registrar, The University, Birmingham, 15, from whom further particulars can be obtained.

OXFORD UNIVERSITY
COMMITTEE FOR COMMONWEALTH STUDIES

Applications are invited for the post of RESEARCH OFFICER at the Institute of Commonwealth Studies. The appointment will normally be for two years, with a possibility of extension to four years. The holder will be required to undertake approved research, under statutory conditions of residence, and will be expected to work within one of two fields:

(a) the history, economic, social or political, of European dependencies in the nineteenth and early twentieth centuries, with special reference to tropical dependencies; or

(b) Studies in Commonwealth Government, not excluding the comparative study of politics and government in Commonwealth and other tropical countries.

He may be expected to work, in association with a Professor Reader, on some aspect or members of the Unit, on a project lead to publication within a limited and take account of his special interests.

An initial [illegible] of teaching will be allowed and may [illegible]. The salary will be within the scale £700 by £50 to £1,250 per annum. According to age and qualifications, the commencing point of the F.S.S.U. and child allowances.

Applications, stating the names of two referees, should reach the Secretary, Institute of Commonwealth Studies, 21 Beaumont Road, Oxford, not later than August 31, 1960.

AUSTRALIAN NATIONAL UNIVERSITY
Research School of Pacific Studies
READER IN INTERNATIONAL RELATIONS

Applications are invited for appointment to a Readership in International Relations in the Department of International Relations.

The Reader in International Relations will be expected to engage in and to assist in supervising research into the political, legal or economic relationships between nations. In its empirical work the Department pays considerable attention to the Asian and Pacific regions.

The salary range for Readers is £A2,763–£A3,213 but is at present under review and may be increased substantially. A Reader is appointed to the permanent staff; retiring age is 65, with the option of retiring after the age of 60. Study leave entitlement is one year on full pay in every six years, plus contribution of up to £A1,342 towards travel and other expenses.

Superannuation is on the Federated Superannuation System for Universities pattern but with provision for supplementary benefits. Reasonable removal expenses are paid and assistance with housing is provided.

Further details are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close on July 17, 1960.

UNIVERSITY OF GLASGOW
SIR JOHN MACTAGGART FELLOWSHIP IN ECONOMICS OF HOUSING

Applications are invited for the above Research Fellowship—stipend £1,450 per annum—tenable for a period of three years in the Department of Social and Economic Research. Applicants, who should be qualified in economics or a related subject, will be expected to pursue research into some selected aspect of the housing problem in Scotland under the general direction of the Head of the Department.

Applications should be made before June 4, 1960, to the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON, Secretary of University Court.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for the post of ASSISTANT LECTURER in ECONOMICS in the Department of Economics and Social Science from October 1, 1960. Further particulars may be obtained from the Registrar, University College, Cathays Park, Cardiff, to whom six copies of applications containing the names of three referees should be sent not later than June 8, 1960.

UNIVERSITY OF CAMBRIDGE
SCHOOL OF AGRICULTURE

Mathematical graduate required to work in Agricultural Research Council Statistics Group; previous statistical experience not essential. Appointments will be in Assistant Experimental Officer grade, starting salary from £510 p.a. at age 21 to £696 p.a. at age 26 or over. Application in writing stating age and qualifications and giving names of two persons to whom reference may be made should be sent to the Secretary, School of Agriculture, Downing Street, Cambridge, not later than May 31, 1960.

UNIVERSITY OF GLASGOW
LECTURESHIP IN ACCOUNTANCY

Applications are invited for a Lectureship in Accountancy (full-time). The appointment will be made on a salary range of £1,600 per annum, initial salary to be fixed after consideration of the successful candidate's qualifications and experience. F.S.S.U. and family allowance benefits.

Applications (eight copies) should be lodged, not later than June 4, 1960, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON, Secretary of University Court.

For further appointments and other classified advertisements see pages 696, 708, 709, 710 and 711.

CANBERRA UNIVERSITY COLLEGE
AUSTRALIA
CHAIR OF ECONOMIC HISTORY

Applications are invited for appointment to the Chair of Economic History.

In 1960 the College will become part of the Australian National University and its present function will be continued. Further details of the association are given in the information sheets for applicants.

Salary ranges are now under review. At present the salary of a Professor is £A3,552 p.a.

Further information and the summary forms which must accompany an application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, with whom two copies of each application must also be lodged.

Applications close, in Australia and London, on June 30, 1960.

THE UNIVERSITY OF MANCHESTER

Applications are invited for two posts at the grade of ASSISTANT LECTURER in ECONOMICS in the Faculty of Economic and Social Studies. Salary scales (at present under review) £700 x £50 to £850 per annum; membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than May 31, 1960, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of ASSISTANT LECTURER in GOVERNMENT (with special reference to Political and Social Theory). Salary scale (at present under review) £700–£850 per annum. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than May 28, 1960, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER in ECONOMIC HISTORY. The salary will be on a scale (at present under review) £900 to £1,650 per annum with membership of the Children's Allowance Scheme and F.S.S.U. Duties to commence October 1, 1960, or as soon as possible thereafter. Applications should be sent not later than June 4, 1960 to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

Continued from page 665

a month or more late, and how much it will suffer is anybody's guess. In the meantime jute mills have to live off their stocks and what remains of the current crop. In these circumstances shippers in Pakistan are not exactly falling over themselves to sell, consumers are hesitant and the range of prices is wide. Firsts have shot up to roughly £145 a ton cif for prompt shipment, the highest point reached since the Korean war ; they are about £37 dearer than a month ago and nearly £45 dearer than two months ago. Last week new crop firsts were bought forward for about £106 a ton ; now sellers are asking about £130 a ton.

Prices of jute goods in Dundee were twice raised by £5 a ton last week, and another increase cannot be far off. All but the short-sighted in India and Pakistan will be dismayed by this turn of events. High prices will in time encourage substitution, and once people have switched to cotton and paper it is difficult to win them back to jute.

AERIAL PHOTOGRAPHY

How Far-Sighted?

RECONNAISSANCE experts are beginning to pour cold water on some of the more highly coloured claims made for their cameras since Mr Khrushchev decided the time had come to make an example of an American U.2 caught on a tip-and-run photographic foray behind the Iron Curtain. A good camera mounted on a bomber flying ten to twelve miles up can take pictures at a range of 100 miles. But at this height it is not easy to find the camera, the lens and the fine grain film capable of giving a usefully detailed picture when it is mounted on an unsteady and fast moving platform like a Canberra, a Valiant—or a U.2. All kind of techniques are being used to correct the inevitable fuzziness of a picture taken under these conditions, many with remarkable success ; but since the standard military reconnaissance picture is taken on a scale of six inches to the mile, any idea of counting the rivets on an aircraft wing can be thrown out of court. Cameras could be built to give this fantastic definition if the military budget was big enough to pay for them ; and they probably would be built if the services could prove that there was any value in being able to see the whites of the enemy's eyes. But at the moment there is not.

Cameras are accurate enough, however, to have done away with any conventional idea of camouflage ; nothing short of systematic landscaping can trick a camera into thinking that a missile launching pad is anything but what it is. Their main deficiency is that they do not work either in cloud or at night without the aid of flares—obviously ruled out in sneak peacetime reconnaissance flights. Radar and possibly infra-red techniques, which can be used to a limited extent to supplement the cameras, work both through cloud and in the dark. A wide radar beam throws up a fair picture, and a narrow one can trace faithfully the outline of a building or an obstacle on the ground. But in general it is nothing like as detailed or as accurate as the high altitude camera.

Most of the intensive development work now is going into equipment, cameras, shutters, and fast film, which will work in the RAF's new TRS 2 low level bomber (the R stands for reconnaissance). This will not do what the high flying aircraft have been attempting, i.e., make a survey of Soviet territory accurate enough to provide co-ordinates for setting missiles on course to their targets. It is intended to give a commander notice of troop movements after the war has started, and is probably the only vehicle able to penetrate enemy defences under these conditions, because it will fly under the radar and missile screens. Pride of place in the RAF's reconnaissance library goes at the moment to pictures taken at high speed from heights at little as 150 to 200 feet. A good deal of interest is being taken in the American reconnaissance satellites ; the first pictures transmitted so far are of no military use at all but it seems only a matter of time before the technique improves.

SHORTER NOTES

The Kariba hydro-electric scheme, which is to be officially opened by HM Queen Elizabeth the Queen Mother next week, is already partly in operation. The first generator and substations began to supply power to the Northern Rhodesian Copperbelt at the end of December ; the second came into operation this week. It was originally planned to bring in the six generators (supplied by the AEI group) at the rate of two a year ; this has now been accelerated, with three coming in this year, two in 1961 and one in 1962.

★

On Monday morning the first ingot to go through the 42-inch blooming mill at the Durgapur steelworks in West Bengal, built by the British consortium ISCON, was successfully rolled and sheared ; during the day 250 tons were rolled. This marks the beginning of steel production from Durgapur ; the mill was built by Davy-United, of Sheffield, which is the main contractor on the plant's rolling mills, wheel and axle plant, central engineering maintenance shops and foundry.

★

The limit of £2,000 hitherto imposed by the Inland Revenue on contributory pension schemes approved under Section 379 of the Income Tax Act, 1952 is to be raised to £3,000. This is an important decision, which is capable of expanding the pension possibilities for the increasing number of people whose earnings range above £3,000. Like so many Revenue decisions, however, it rests on the administrative discretion of the Board, whose wisdom about the amount (which has long been held at £2,000) and the timing has to be accepted.

★

As a result of a substantial rise in quotation fees, the gross profits of the Stock Exchange for the year to March 24th rose from £946,858 to £1,169,512. In such an active year however expenses were heavy and a special provision of £65,000 was made for alteration of buildings and the replacement of plant and re-wiring. The final surplus for the year amounted to £22,522 against £11,574. The new subscription rates for members announced last January did not apply until the current year.

★

Associated Biscuit Manufacturers, which owns Huntley and Palmers and Peek Frean, has made a bid for the shares of another leading biscuit manufacturer, W. and R. Jacob (Liverpool). The offer is on the basis of one £1 share for every four 5s. "A" shares in W. and R. Jacob and one non-voting £1 "A" share for every four non-voting 5s. "B" shares. The directors of W. and R. Jacob, who, with their families, hold 70 per cent of the "A" shares, recommend acceptance of the offer.

★

Two shipping companies have announced plans to raise new capital. Coast Lines is to make a rights issue of two £1 ordinary shares at par for every five held, which will raise about £1 million. The rights issue by London and Overseas Freighters will raise £4½ million on the basis of one 5s. share at 9s. for every two held. It also plans a reorganisation of its capital.

COMPANY MEETINGS

THE BURMAH OIL COMPANY LIMITED

INCREASED DEMAND FOR PETROLEUM PRODUCTS OVERSEAS

EXTENSIVE PROSPECTING PROGRAMME CONTINUED

MR W. E. EADIE'S SPEECH

The fifty-eighth Annual General Meeting of The Burmah Oil Company Limited will be held on Thursday, June 2, 1960, in the Merchant's Hall, 30 George Square, Glasgow.

The following statement by the Chairman, Mr W. E. Eadie, has been circulated with the directors' report and accounts for the year ended December 31, 1959:

DIRECTORS

It is with regret I have to report the retirement from the Board of Mr W. A. Gray, in July last year, for health reasons. Mr Gray's service with the Company covered a period just short of 50 years, of which 22 years were as a Director. We wish him a return to good health and many years of happy retirement.

Mr Richard E. Fleming accepted the Board's invitation to fill the vacancy created. Mr Fleming is well known in the City of London and we are fortunate in having his advice and counsel at our disposal.

Following the Resolution passed in July last year providing for an increase in the number of Directors, Lord Inchcape has been elected to the Board. His knowledge and experience of Eastern affairs will be extremely valuable.

ACCOUNTS

Trade in petroleum products in the countries in which the Group operates continued to expand throughout 1959. We obtained a satisfactory share of this expansion but, with smaller profit margins, the Group Profit on Trading, after charging the cost of exploration programmes, was only slightly higher at £6,880,434 compared with £6,778,505 for 1958.

Depreciation and amounts set aside at £1,983,817 show an increase of £793,013 over the charge for 1958, due mainly to the inclusion of our share of depreciation in Oil India Private Limited and the setting aside of our share of that company's net income to which I refer later.

As a partial offset to the lower Profit on Trading, after charging depreciation and amounts set aside, Dividends from Trade Investments, which are brought into account as and when they are received, at £2,833,798 are £354,853 higher than in 1958.

Other Dividends and Interest received during 1959, amounting to £9,887,672 are substantially greater than in 1958 due in the main to increased dividends received on our holdings in The British Petroleum Company Limited.

No dividend was received in 1959 from The Tinplate Company of India Private Limited and I refer you in this connection to Note 5 on the Accounts. The loss incurred by that company is the result of the low prices allowed for tinplates by the Government of India for the years 1957 and 1958. These prices have been fixed for 1959 and 1960 also. The company has appealed for a revision for the four years. The Tinplate Company of India started up some 40 years ago and was the pioneer of the tinplate manufacturing industry and is still the main supplier of tinplate in India.

The profit for the year after charging taxation is £8,899,947 compared with £7,506,141 in 1958, an increase of £1,393,806. Including the balance of £838,384 brought forward from 1958, reduced by £215,569 being the cost of increasing the capital last year, there is available for appropriation £9,522,762 from which has to be deducted the Preference Stock dividends for the year and the Ordinary Stock interim dividend of 6d. per £1 unit of Ordinary Stock free of income tax which was paid on December 18, 1959. From £7,272,910 remaining for disposal, your Board has appropriated £1,537,980 to General Reserve and recommends that an Ordinary Stock final dividend of 1s. 3d. free of income tax should be paid on June 10, 1960. This, if approved, will absorb £5,151,192 and leave a balance of unappropriated profit of £583,738 to be carried forward to 1960.

Turning to the Parent Company's Balance Sheet, the increase in Shares in Subsidiary Companies of approximately £11 million includes £5,989,583 being your Company's share of the equity capital issued by Oil India Private Limited during the year and £5,250,000 being the writing up of the issued capital of The BOC British Petroleum Share Trust Limited following the decision last year to write up that company's holding of Ordinary Stock of The British Petroleum Company Limited.

The reduction in net Advances to Subsidiary Companies is due mainly to the repayment to Assam Oil Company Limited of expenditure incurred by it on development of the oilfields before the incorporation of Oil India Private Limited.

The increase in Other Investments follows the writing up of the Company's direct holding of Ordinary Stock of The British Petroleum Company Limited. The elimination of the Capital Reserve and the reduction of the General Reserve are in accordance with Resolutions passed at the Extraordinary General Meeting of the Company held last July whereby the Share Capital of the Company was increased by the issue of £41,209,540 Stock to Ordinary Stockholders.

The item Unsecured Loan, appearing for the first time, is the amount advanced by the Company's Bankers for the pipeline being constructed for Oil India Private Limited in Assam. The corresponding item in the Consolidated Balance Sheet, Unsecured Loans, includes in addition your Company's share of disbursements by the Government of India out of the loan provided by Her Majesty's Government towards the construction of this pipe line. Reference to these loans is made later in this statement.

The consolidation of your Company's share of the assets and liabilities of Oil India Private Limited in the Consolidated Balance Sheet has been based on the draft accounts of that company. It is considered by your Board that, in view of the extent of this investment and in order to show its effect on the position of the Group, it is preferable to consolidate these accounts so far as they concern The Burmah Oil Company Limited. Until the treatment of past and current expenditure is clarified it has been deemed prudent to set aside our share of the net income of Oil India Private Limited for 1959 arising from sales of crude oil to Assam Oil Company.

THE BURMA OIL COMPANY (1954) LIMITED

This company was formed in 1954 with a capital of the kyat equivalent of £15 million to acquire as a going concern the exploring, producing and refining interests in Burma of the Burmah Oil Group, Indo-Burma Petroleum Company Limited and The British Burmah Petroleum Company Limited.

Under the formation Agreement the Government of Burma acquired a 33⅓ per cent shareholding by a cash down payment for half this interest (£2⅓ million) and the other half by an interest-free loan from the Oil Companies to be paid off by annual instalments or at any time at Government's wish. The Government had been liquidating this obligation by annual instalments and at December 31, 1959 the balance still due to your Company was £1,353,758. In exercise of its option under the Agreement, Government paid up this balance in January, 1960.

OIL INDIA PRIVATE LIMITED

As mentioned in my statement last year this company was incorporated on February 18, 1959. The authorised capital is Rs 50 crores (£37.5 million) in 500,000 shares of Rs 1,000 (£75) each.

Shareholders will recall that this company's function is to develop oil concessions in Assam in the Nahorkatiya, Hugrijan and Moran areas and to arrange for the transport of the crude oil for sale to the Government refineries at Gauhati and Barauni. Your Company holds two-thirds and the Government of India one-third of the equity capital. The first issue of capital was made immediately after incorporation. The amount was Rs 12 crores and, out of this, Rs 10.33 crores were paid to Assam Oil Company against development expenditure incurred pre-incorporation.

Agreement was reached with the Government of India during the year under which The Burmah Oil Company (Pipe Lines) Limited, a wholly owned subsidiary of your Company, was commissioned to design and superintend the construction of the pipeline from the oilfields to the Government refineries. Pipe for the first stage of the line, to Gauhati, was ordered in the United Kingdom during the year and is in the course of delivery to the site.

Under the Agreement concluded with the Government of India regarding the formation of this company, your Company undertook to arrange to provide a loan of £10 million against the foreign exchange requirements for the construction of the pipeline. During the year Her Majesty's Government agreed to lend £3 million to the Government of India also for this purpose provided this sum was spent in the United Kingdom. When this offer was accepted your Company agreed to furnish a further loan of up to £10 million against foreign exchange requirements. These requirements are now likely to be substantially less than originally expected as in the meantime the Government of India has arranged to erect a tube mill which is expected to fabricate a large part of the pipe required for the second stage of the line from Gauhati to Barauni. The total cost of the line is estimated at £33.5 million

TRADING

Burma.—The country was under the military "caretaker" Government of General Ne Win for the whole of 1959 and the year saw a great improvement in the rule of law and order in almost every part of the country.

In these more stable conditions an expansion in general development throughout the country has taken place. Production of rice, Burma's main crop, reached a record of almost 6.5 million tons, due mainly to more intensive cultivation. Exports of rice and rice products were 1.8 million tons and these together with a rigid import policy were the main factors contributing to an improvement of almost £10 million in the country's foreign exchange reserves over the year.

With the improvement in security conditions there has been an overall increase in the demand for petroleum products and our share of the trade rose by 11 per cent over that in 1958.

Pakistan.—Here also the country was under military administration throughout 1959. This has done much to restore public confidence.

Over recent years economic development in Pakistan has been to some extent concentrated in the industrial sector but in order to assist in providing the country's food requirements the emphasis of concentration is being directed to expanding the agricultural sector which should help considerably in easing the drain on foreign exchange reserves.

Our sales of petroleum products were 9 per cent higher than in 1958. At the Annual General Meeting last year I mentioned that the Government of Pakistan had then just announced a measure of restriction on consumption of petroleum products in order to conserve foreign exchange. Happily this restriction was short lived. While there have been occasional crises over import licences, there has been no serious physical shortage of major products supplies in the market.

A welcome improvement on the distribution side in East Pakistan has resulted from the chartering of a coastal tanker, the delivery of new tank wagons and a more liberal supply of tinplate.

Towards the end of 1959 a new price formula for petroleum products was agreed with the Government of Pakistan but selling prices have not been reduced since Government has announced its intention of levying additional duties to absorb any price reductions which would otherwise result.

At the Sui Gas Field sales of gas during 1959 for the Sui-Karachi and the Sui-Multan lines were 16,078 million cu. ft. (the equivalent of 388,000 tons of fuel oil) an increase of approximately 20 per cent on 1958 sales. Sales through the Sui-Multan line did not reach the expectation hoped for last year because of delay in completion of the Multan power station but a substantial increase in offtake along this northern line is expected during 1960. Proposals likely to lead to additional utilization of natural gas are under examination in conjuction with the Government of Pakistan.

India.—With the second five-year plan entering its final year, signs of progress in many sectors of the economy are now being seen, particularly in the heavy industrial and allied sectors which have mainly benefited from the large sums expended under the first and second plans. While there has been marked progress in these sectors, to expand industrially is not enough. The problem ahead is the feeding of India's vast and growing population and the cost of this to the economy. Government's planning policies are directed to raising living standards and as the populations grows and as the standard of living rises there will be an increasing demand for food so, rightly, emphasis is now being concentrated more on the expansion of the agricultural sector.

The overall development of the country's economy brings with it an ever increasing requirement for energy and 1959 saw a further expansion in demand for petroleum products. Sales through our Subsidiary and Associated Companies were 8 per cent higher than in 1958.

The excess of production over consumption of motor spirit in India still continues; demand for this product remained stationary in 1959 while there was a further considerable expansion in auto-diesel oil sales.

A new price formula for petroleum products under which reduced margins are being allowed to the Oil Companies, was negotiated with the Government at the end of October, 1959, effective to March 31, 1961. Prices to the public, however, have not been reduced; the reduction in margins is being absorbed by the Government in the form of additional duties.

OILFIELD OPERATIONS

Burma.—In the Chauk-Lanywa field development drilling operations of The Burma Oil Company (1954) Limited were increased in order to meet additional crude oil requirements of the two refineries at Chauk and Syriam. During the year a deep well was drilled in the search for new reserves in this complicated structure but without success and towards the end of the year preparations were being made for the drilling of a second deep test well.

Stockholders may remember that in 1949, as the result of disturbed conditions then prevailing, the personnel establishment working in the Yenangyaung field was reduced to a caretaker basis. Conditions there have been steadily improving over recent years and arrangements are now being made to undertake limited development operations and to drill a deep test in 1960.

Pakistan.—In West Pakistan the Balkassar field produced jointly by our subsidiary, Pakistan Petroleum Limited, and Attock Oil Company continued to maintain its small but steady production of oil.

The third well at Karsal, drilled by Pakistan Petroleum Limited in a joint operation with Pakistan Oilfields Limited (a subsidiary of Attock Oil Company), found some satisfactory production in a deep limestone bed. A study is being made to improve the rate of flow by acidization and preparations are also in hand to drill a fourth well in this area.

In preparation for further anticipated increases in gas offtake some additional drilling in the Sui Gas Field will be required and additional purification units are being erected for Sui Gas Transmission Company which operates the Sui-Karachi gas pipeline.

Agreement between the Sui Gas Transmission Company and the US Development Loan Fund Authorities for a $2 million loan for this extension to the purification plant has now been signed. When the work has been completed the capacity of the plant will be increased from the present 52 million cubic feet per day to about 120 million cubic feet per day.

In East Pakistan preparations were made during the year for the start of production at Sylhet to provide the gas requirements of a fertiliser factory being erected by the Pakistan Industrial Development Corporation at Fenchuganj; this plant is expected to become fully operational in mid-1961.

Following the discovery of gas pools in the first well drilled at Chhatak, arrangements were put in train to pipe gas a distance of 12 miles to a cement works operating in this area. Production from the well should be started in mid-1960.

India.—Further drilling during the year failed to prove any additional oilpools in the Assam Oil Company's Digboi field and development drilling has now been completed.

In Oil India Private Limited's Nahorkatiya, Hugrijan and Moran areas extension and development drilling has continued successfully. Fifteen wells were completed during the year, twelve of them as oil wells, one as a gas well and two dry holes. These results have added to the proved reserves and it is considered that the potential of the field is now about 2½ million tons of crude oil per year.

This has been another year of improved drilling speeds and operations were intensified in order to build up production capacity for the supply to the Government refineries when they come on stream.

PROSPECTING

Burma.—The extensive prospecting programme of The Burma Oil Company (1954) Limited was continued. In the Irrawaddy Delta testing of the Kyaiklat well was completed without success. A deep well at Dedaye gave a small uneconomic flow of gas only, and a third deep well at Payagon was drilled and awaited testing at the end of the year, having also given some indications of gas.

Plans to drill at two other sites in the Delta, at Tharrawaddy, and near Bogale, have been held up by delays in the grant of Prospecting Licences.

In Upper Burma the second test well at Ondwe was tested at the beginning of the year but yielded only minor shows of gas. It was intended to drill a test on an important structure near Yedwet, east of Yenangyaung, but plans were held up, again by delay in the grant of a Prospecting Licence.

Pakistan.—Active exploration drilling by Pakistan Petroleum Limited continued during the year.

In West Pakistan a sizeable gas field was proved at Kandhkot, south-east of the Sui field, which will provide a useful addition to the Sui reserves.

In East Pakistan the Chhatak well referred to elsewhere was successfully completed as the discovery well of a new gas field. At the end of the year preparations were being made to drill test wells, one at Fenchuganj and a second at Lalmai.

One seismic party worked during a large part of the year in various alluvial areas in East Pakistan.

In addition Pakistan Petroleum Limited carried out exploration drilling with other oil companies.

Near Karachi a second deep test was completed without success in a joint operation with Tidewater Oil Company, and jointly with Hunt Oil Company two wells were drilled, one at Badhra which was unsuccessful and the other at Mazarani where a small accumulation of gas was found. At the end of the year Pakistan Petroleum Limited was drilling a well at Domanda in a joint operation, with Attock Oil Company subsidiary, Pakistan Oilfields Limited.

India.—Towards the end of 1959 the Government of India invited foreign oil companies to join in the quest for oil in India subject to mutually acceptable terms to be agreed by Government with each individual company and in accordance with the Petroleum and Natural Gas Rules, 1959.

This change of Government policy (since early 1956 no new concessions for oil exploration have been granted to private enterprise) would seem to be dictated by the urgent need for large scale oil exploration programmes, involving large amounts of foreign exchange, if Government's production target of 14 million tons of crude oil annually by 1966 is to be realised.

Government asked for an expression of interest in exploration from the oil companies before March 31, 1960, and Assam Oil Company Limited has informed Government of its interest. It will of course depend on the terms under which any such new concessions will be offered as to whether or not further exploration by the Group will be undertaken.

USA.—An Agreement was reached last August with Murphy Corporation of El Dorado, Arkansas, for joint exploration and oil development operations in Louisiana and Texas offshore areas. These operations will be conducted by a subsidiary of Murphy Corporation, Ocean Drilling and Exploration Company, in conjunction with a new Burmah wholly owned subsidiary, Burmah Oil Western Company, which has been registered in Delaware with a small organisation in New Orleans.

At the end of the year drilling had commenced at the first well under this new venture and plans were also being made to acquire interests in oil concessions and for the drilling of a number of wells.

Canada.—Agreement was also reached with Murphy Corporation for joint operations in certain concessions in north western areas held by Murphy-Canada Oil Company. A Burmah wholly owned subsidiary, BOC of Canada Limited, has been registered in Canada in order to participate in these operations.

In December following the winter freeze-up seismic work has been undertaken in one area, and core drilling in another.

These ventures in the Western Hemisphere mark a significant milestone in the history of the Group and we are hopeful that they will in time make a contribution to the fortunes of your Company.

This is the second occasion on which the Group's activities have spread beyond the boundaries of its traditional areas of operation—Burma, India and Pakistan. The first occasion was over half a century ago, when your Company acquired an interest in the concessions in Persia then held by Mr W. K. D'Arcy, the first step towards the birth of The British Petroleum Company Limited.

REFINERIES

Burma.—The refineries of The Burma Oil Company (1954) Limited at Syriam, near Rangoon, and at Chauk, Upper Burma, worked to capacity and operated successfully throughout the year.

Pakistan.—Negotiations were carried on during the year with the Government of Pakistan for the setting up of a refinery at Karachi to be owned jointly by your Company, Shell, Standard-Vacuum, Caltex and the public of Pakistan.

An Agreement was signed at the end of November, 1959, under which 60 per cent of the equity share capital of the refining company will be subscribed by the Oil Companies and 40 per cent will be offered to the public. This refinery, which will have a processing capacity initially of 1½ million tons of crude oil per year, is designed to meet the requirements of West Pakistan and should be in operation at the end of 1962.

India.—The Assam Oil Company's refinery at Digboi was again fully employed and operation was free from any major interruption.

At Bombay, the Burmah-Shell refinery processed 2.3 million tons, an increase of 10 per cent on 1958.

TANKERS

Our small fleet continued to operate satisfactorily and without incident throughout the year.

PUBLIC SECTOR DEVELOPMENTS

Through its Oil and Natural Gas Commission the Government of India continues prospecting in various parts of the country.

The Government owned refinery company has arranged to acquire the plant for the refinery at Gauhati from Rumania, and that for the Barauni refinery from Russia. It is understood that the former will be completed by December, 1961, and the latter in 1963.

A company wholly owned by Government has been incorporated to distribute and market products from the Government owned refineries. It has also been announced recently that this company may import Russian oil for sale in India.

STAFF AND LABOUR

Personnel Training.—Both in this country and in the East the training of Asian staff continues and the benefits of this become increasingly apparent as more men complete their training and take up their duties.

In addition to our own trainees in the United Kingdom at the end of the year there were forty-four scholars supported by funds provided by us.

We again record our indebtedness to all in this country who have provided facilities for this training.

Labour.—I am glad to be able to report that 1959 proved to be another year of good relations with Labour generally throughout the Group, and there were no vital stoppages. Those concerned on both sides are to be congratulated on their patience, commonsense and hard work, without which such a satisfactory state of affairs could not be achieved or maintained.

Staff.—The Group's policy of replacing expatriate staff with qualified Asians as and when suitable men become available, progresses satisfactorily, although difficulties are encountered in certain cases where we are expected to accelerate matters to an extent which would prove detrimental to efficiency.

All our staff have during the year borne ungrudgingly and efficiently the additional responsibilities laid upon them as a result of the many and varied difficulties of administration and operation these days. It is with pleasure, therefore, that I express the Board's appreciation of the good work carried out during the year by the management and staff of all Group companies at home, overseas and afloat.

I. GRIEW & CO.

SUBSTANTIALLY IMPROVED RESULTS

The Twenty-fourth Annual General Meeting of I. Griew & Co Limited was held on May 11th at Baltic Wharf, Wallasea Island, Essex, Mr H. D. Griew (the chairman) presiding.

The following is an extract from his circulated statement:

The Trading Profits for 1959 were just over double those for 1958, when the figures were adversely affected by a fall in Softwood prices. These were fairly stable during the year and consequently the profit margin has been restored to a more normal level. Demand for Softwoods was at a higher level throughout the year and the sales of Wall Boards by Davey & Armitage, Limited, increased considerably, making a substantial contribution to the increase in revenue.

The contribution by our new Subsidiary, the Stamford Trading Co Ltd., to the Trading Profit during the year and included in the total figure of £71,907, amounted to £12,853. The Consolidated Net Profit for the year, after Taxation, amounts to £28,746 as compared with £8,569 for 1958.

Turning to the future, it is significant to note that, once again, there has been a steep rise in Softwood prices, possibly beyond an economic level. It is doubtful whether the full increase can be passed on, so that profits from this source may again be adversely affected during the latter part of 1960. However, Sales for the first three months of the year show a substantial increase.

There is an increasing use of particle board, popularly known as man-made timber, and our policy of expanding sales in this direction is having a most gratifying result. The Wharf and Storage facilities at Baltic Wharf are particularly suitable for this type of business and I have no doubt we can look forward to further expansion during the year. Subject, therefore, to a deterioration in the general economic situation, I anticipate that the Trading Profit for 1960 should be at least as high as that for 1959.

The report was adopted and the total dividend of 15 per cent approved.

MR CHARLES CLORE'S REVIEW

The Annual General Meeting of Sears Holdings Limited will be held on June 3rd at The Dorchester Hotel, London, W.1.

The following is an abridged version of the statement by the Chairman, Mr. Charles Clore, circulated with the report and accounts for the year ended December 31, 1959:

DEVELOPMENTS DURING 1959

The Sears group has expanded considerably during 1959. In June we acquired the remainder of the capital of The Scottish Motor Traction Company Limited, at a total cost of over £1,700,000. In August, following the purchase of a controlling interest, we made an offer for the Ordinary and "A" Ordinary capitals of Mappin & Webb Limited, resulting in our now owning about 98 per cent of the equity, at a total cost of nearly £3 million. In October an offer was made by Mappin & Webb Limited for the Ordinary capital of Garrard & Co. Limited and we now own the entire Ordinary capital of that Company, the cost being nearly £1 million.

Thus the total expansion by purchase of shares has been over £5,500,000. Besides this, however, by the end of the year our various previously owned subsidiary companies had invested an additional £4,300,000 compared with a year earlier, in expanding their existing businesses. A partial offset to the foregoing outlays has been the proceeds of properties sold and leased back, which has produced approximately £2,500,000.

In the past, I have made no secret of the fact that, whilst we are well satisfied with the main groups of companies which comprise Sears Holdings, we would welcome the opportunity to add still further to our interests by the acquisition at a reasonable price, of other major interests capable of development over a period of years. Our hopes in this respect have, however, been frustrated by the values attributed to the more progressive businesses which would form suitable additions to our family. In our view these values have reached levels which fully anticipate the improvements expected over the next few years and, as I have stated previously, we are not prepared to pay prices which discount the future too fully. Doubtless many of the amalgamations, take-overs, mergers, or by whatever name they may be called, during the past twelve months have been inspired by the advantages which will arise from the integration of associated businesses and the favourable terms which have been offered to existing shareholders can be justified for this reason. These, however, are different considerations from those which arise in our case when seeking to expand the Sears group into new industries.

TRADING RESULTS FOR 1959

1959 has been prosperous for all sections of the Sears group and total trading profits increased by £1,772,000. Excluding the Mappin & Webb group the increase becomes £1,512,000, or over 21 per cent.

The analysis which I normally provide of our trading profits is arranged differently from that given in previous years but the 1958 profits have been similarly rearranged and are shown hereunder alongside the 1959 figures.

	1959 £	Percentage of Total	1958 £	Percentage of Total
British Shoe Corporation	4,436,000	50	3,208,000	45
Engineering	3,790,000	42	3,672,000	52
Motor Distribution	410,000	5	244,000	3
Mappin & Webb Group	260,000	3	—	—
	£8,896,000	100%	£7,124,000	100%

The grouping of our businesses indicated by the above analysis represents the present pattern of Sears; viz. the large footwear group, the large engineering group, the motor sales and service group and, lastly, the Mappin & Webb group which is still in the early redevelopment stage. Your Directors feel that the time has now come to recognise these main sub-divisions of our businesses in the financial and administrative structure of Sears and we are, therefore, proposing to segregate all our subsidiaries into the four sections indicated.

Sears will, of course, remain the parent holding company, but beneath Sears will be four more or less self-contained subsidiary holding companies, each co-ordinating the activities of the businesses within its own sphere. In order to assist the subsidiary group managements and to remove existing restrictions from the financial policies of each, we propose that most of the publicly held preference capitals of the subsidiaries shall be reorganised and replaced by preference shares of the subsidiary holding companies. For the most part, therefore, these subsidiary holding companies will control and co-ordinate the activities of wholly owned and related businesses. Whilst the shareholders of Sears Holdings Limited, itself, will not be in any way directly affected by these changes, we believe they will benefit from the improved co-ordination which will result and we hope that they will find it easier to follow the fortunes of the Sears group once it is rearranged into these relatively few groups of closely related companies. A further announcement with an explanatory memorandum will be issued later this year when our plans have matured.

APPROPRIATION OF PROFITS AND DIVIDEND

After deducting pre-acquisition profits, interest, taxation and minority interests we are left with net profits attributable to Sears shareholders of £3,987,000, compared with £3,046,000 in 1958. Preference dividends amount to £137,000, leaving £3,850,000 available for the ordinary shareholders.

The total issued Ordinary and "A" Ordinary Capital has increased since last year by £2,137,805 following the capitalisation, in June, 1959, of this amount out of the Share Premium Account and its application to a fully paid scrip issue of 1 in 4. On this increased capital your Directors recommend a dividend of 25 per cent less tax. Thus, if we ignore (as we said we would) the "special interim" dividend paid a year ago and regard it for this purpose as being attributable to the year 1958, we are recommending the same actual rate of dividend as a year ago, but the effective rate of dividend is equivalent to an increase of 5 per cent, when allowance is made for the increased capital. This dividend absorbs a total of £1,637,000 and is covered 2.4 times by net earnings excluding the pre-acquisition profits of Mappin & Webb. We are thus preserving the balance between distributed profits and profits retained for growth purposes in accordance with the policy explained in previous years.

PROPOSED SCRIP ISSUE

With retained profits of over £7½ million, and Capital Reserves of nearly £7 million we feel justified in making a scrip issue to the ordinary and "A" ordinary shareholders, so that the issued capital is increased reasonably as the capital actually employed in the business also increases. Your Directors, therefore, recommend that £2,137,805 of the Share Premium Account shall be used to pay up in full 8,551,219 "A" Ordinary Shares of 5s. each, to be allotted to ordinary and "A" ordinary shareholders in the ratio of one new "A" Ordinary Share for each five Ordinary or "A" Ordinary shares held at the close of business on April 22, 1960.

I must repeat what I said last year in the same context. It is the policy of your Directors to recommend a dividend equivalent to a fair proportion of the profits earned each year, so that the amount of the dividend can be decided only when those profits are known, but having regard to the prospects for the current year, I may add that if nothing unforeseen occurs during the remainder of the present year, we shall hope at least to maintain the rate of dividend now recommended, i.e., 25 per cent on the capital as increased. After taking into account the effect of the pre-acquisition profits of the Mappin & Webb group and the previous minority interests in SMT, as well as the higher rate of Profits Tax imposed by the 1960 Budget, a dividend of this amount out of the 1959 profits would be twice covered.

THE BRITISH SHOE CORPORATION

The past year has been another prosperous one for our large footwear interests. This was due to four factors, which I assess in order of importance as: (1) the further progress of our own improvements and rationalisation of our business; (2) the general prosperity of our customers; (3) the increasing fashion-consciousness of the footwear trade; and (4) the exceptionally good summer which we all enjoyed last year.

In consequence our trading profits increased by £1,228,000, equivalent to over 38 per cent. This is a remarkable achievement in an industry which remains as competitive as ours and in which the national expansion in sales was, according to Board of Trade statistics, restricted to an overall increase of 5 per cent.

We retain our confidence in the future. The year 1960 has begun with sales well in excess of previous years and once again I am able to forecast that unless national economic conditions turn against us, we shall show a further increase in profits in the present year.

ENGINEERING

(a) *The Bentley Group*

The Bentley Engineering Company Limited and its associates (the largest contributors to our engineering profits) have maintained their steady progress in 1959, with record sales and profits. The technical developments in knitting machinery, to which I referred a year ago, have fulfilled the promise then shown, with the result that our order book is fuller than ever before. In one section outstanding orders will ensure full production well into 1961 and so our foremost problem is to increase the rate of production whilst maintaining our standards of quality, finish and user-service.

We are fully conscious of the need to remain in the forefront of technical development if we are to retain our lead in the knitting machinery world and we are, therefore, spending increasing sums on research, whilst also ensuring that our works and plants are maintained at the highest standards of efficiency. We can confidently state that, as a result of this policy, Bentley knitting machines are ahead of those made by any other hosiery machine builder.

The outlook in this section of our engineering enterprise is such that there is every indication that 1960 will break all previous records.

(b) *Pegson*

In common with other producers of capital goods of the heavier kind, Pegson Limited have felt the effect of the credit squeeze for longer than industries nearer to the ultimate consumer, but economical production methods and an energetic drive for orders have produced slightly increased profits.

Latterly inquiries have increased and, despite severe competition, on the present trend 1960 should be less difficult than 1959, although Pegson will be amongst the first to be affected if Government policy should again tend to restrict capital expenditure.

(c) *Alexander Findlay*

Alexander Findlay & Co. Limited also serve the capital goods market. They have had a satisfactory year, but the outlook is uncertain and competition extremely severe. With their specialised skill and exceptional facilities, however, Findlays can secure orders for large-scale work entrusted only to engineers in their class and they have obtained recently some satisfactory business to keep them occupied for a considerable period. During 1959 a large extension to the Company's premises was completed in order to maintain their facilities and retain their leading position in the industry.

(d) *Furness Shipbuilding*

Like others in the shipbuilding trade, during 1959 Furness Shipbuilding Company Limited have been fully occupied on orders placed previously and so have earned satisfactory profits. No new orders have been booked during the year, because we do not feel justified in tendering at prices which would show a loss —as appears necessary in the case of some yards. Whilst orders would be welcome, we have work for another two years, and recently shipowners have taken a more optimistic view of the future. We hope inquiries will develop into orders and that Furness will not encounter a period when the yard is insufficiently occupied. A relatively quiet period may, however, prove a blessing in disguise if it enables us to proceed more smoothly with plans for further modernisation of the shipyard, including facilities for larger vessels.

(e) *Pipework*

The iron and non-ferrous pipe foundries and fabricators—Shaw & McInnes Limited and Peter Johnston & Company (South Shields) Limited, are both members of the consortium company, Sears Pipework Installations Limited. As producers of capital goods, Shaw & McInnes have had a difficult year, but recently conditions have changed and 1960 should see some improvement. Peter Johnston remains fully occupied, much of their work being for land installations as opposed to their traditional shipbuilding connections.

(f) *Parmeko*

Parmeko Limited still experience severe competition in marketing their principal product, transformers, but further progress has taken place in the sale of magnetic amplifiers. We also have confidence that developments in the automatic control of industrial equipment will prove important activities in future years.

(g) *General*

Throughout the engineering group as a whole, we consider that only a major change in economic conditions can preclude increasing progress in 1960. Looking further ahead, it would be prudent to anticipate some decline in shipbuilding activities, but in view of the extensive engineering interests of the Sears group, earnings as a whole should continue to increase.

MOTOR SALES AND SERVICE

The Scottish Motor Traction Company Limited, the parent of our motor distribution and service group, has shared in the prosperity of the motor trade during 1959 and the profits improved by about 68 per cent compared with 1958.

Turnover reached record figures and the present ranges of Vauxhall cars and Bedford commercial vehicles continue to enjoy increasing popularity.

During the year we carried further the programme for modernising our depots, including extensions and improvements to the facilities available at them. We shall continue to spend money for these purposes in 1960 and the years to come.

The present year has begun well and there is good reason to hope that 1960 will be another prosperous year for the SMT group, though, with the gradual improvement in the supply of the new models of all makers (particularly the smaller models with which Vauxhall do not compete), the problems created by the disposal of an increasing volume of used vehicles will become more acute.

MAPPIN & WEBB

I have already mentioned that the total outlay incurred on the acquisition of the Mappin & Webb group and the retail jewellery business of Garrards, was nearly £4 million. Against this, however, the surplus cash holdings of the Mappin group amounted to about £600,000, whilst properties held within that group for investment purposes (or surplus to trading requirements) have been valued by Messrs. Healey & Baker at a total of over £1 million. As it is not part of the normal policy of the Sears group to hold properties for investment purposes only, these properties are now in course of being sold and are expected to realise at least the valuation figure.

Besides sales of properties, we have (with effect from the end of January this year) sold the shareholdings in two smaller Mappin group subsidiaries, the net sum realised for these two holdings being over £300,000.

Thus, when the sales of surplus properties have been completed, our investment will be reduced to less than £2 million and this figure will be still further reduced if we receive satisfactory offers for certain other small businesses still in the Mappin group, but having no association with its main activities.

Our investment will then be represented primarily by the Sheffield factories and the retail shops at home and overseas of the old-established world-famous silver, silver plate and jewellery business of Mappin & Webb, together with the equally renowned business of Garrard & Co. Limited, Crown Jewellers. Secondly, it will be represented by the general store and linen business of Robinson & Cleaver Limited, centred on Belfast, where they were first established nearly 100 years ago, but now also trading in valuable premises in London and elsewhere.

In recent years the Mappin & Webb business has not prospered financially, but, nevertheless, it has lost none of its great reputation as the premier supplier of the goods for which it is best known. I believe that in the course of the next few years, in association with the continuously successful business of Garrards, we shall succeed in developing a new Sears subsidiary group which we shall regard as a worthy member of our family.

GENERAL OUTLOOK

That completes my review of the individual sections of our large group. As to the future, I repeat the forecast of continued improvement which I gave a year ago, but this time with even more confidence and without having to take heed of the uncertainties created by the early prospect of a parliamentary general election.

STAFF

Though by tradition acknowledgements to the staff are mentioned last in the Chairman's Statement, my colleagues and I fully appreciate that the success of 1959 and previous years are at least as much the result of the energy, enterprise and enthusiasm of our large staffs as the result of skilful management. Once again we thank them.

HAMBROS BANK LIMITED

DIVIDEND INCREASE AND "RIGHTS" ISSUE

The Forty-Eighth Annual General Meeting of Hambros Bank Limited will be held on June 2nd at the Head Office of the Bank, 41 Bishopsgate, London, E.C.2.

The following are extracts from the statement by the Chairman, Mr R. Olaf Hambro, circulated with the Report and Accounts for the year to March 31st, 1960:

The results of the election and the optimism it generated against a buoyant economic background inevitably started a wave of borrowing from the banks and the newly encouraged hire purchase companies. This, just as inevitably, was overdone. The first flush of enthusiasm has now been cooled off by a rise in the Bank Rate and other steps which the authorities have taken to discourage excessive personal spending in order to keep our export trade and our balance of payments situation in a healthy condition.

We who have worked in the City of London for many years have become accustomed and inured to these ups-and-downs in economic policy but they do not make the job of running an institution like ours any easier. All the same, these events have not prevented us from having an active and successful year as the figures in our Balance Sheet demonstrate.

For the first time in the history of this Bank, our Balance Sheet total is more than £100 million, which compares very favourably with the total of £53 million only 10 years ago.

INVESTMENT TRUST ISSUE

One of the outstanding events during the year from our point of view was the issue of shares in Hambros Investment Trust. The capital was raised to £4 million and £2 million of the shares were offered to the Bank's shareholders at 25s. The shares stood, at the date of our Balance Sheet, at a middle quotation of 41s. in the Market.

SCANDINAVIAN SERVICE

At the time of the "Outer-Seven" Treaty we introduced our Scandinavian Service. Its principal object is to facilitate the financing of exports and imports between this country and Denmark, Finland, Norway and Sweden. This new service has given us more opportunities of using our intimate knowledge of these countries and has, we hope, still further cemented our very close friendship with them.

The Scandinavian Service has also broadened our contacts with industry. Many British companies of all kinds have made use of it. We deliberately designed the scheme so that it would be as simple as possible to use. We have felt for a long time that there are many lively medium-sized and smaller firms, particularly in the Midlands and North, which could make greater use of the know-how and specialised services available from a merchant bank.

THE DIVIDEND

Turning to the figures, the Deposits are up by £7,523,828 (to £73,268,171) and the Acceptances by £5,471,664 (to £27,103,344). The ratio of Loans to Deposits is 24.56. The liquidity is again high being in Cash and Bills of Exchange 72.5 per cent of the Deposits.

The available profit of the Bank and its subsidiaries stands at £690,931, and after transferring the same amount as last year to the Contingency Reserve and paying the interim dividends a balance of £420,993 remains; the Directors have decided to recommend final dividends of 17½ per cent on the £10 and £1 shares and of 3 per cent on the "A" shares, which will leave £134,649 to be carried forward.

"RIGHTS" ISSUE

The Directors have also decided that it is now appropriate to increase the Bank's working capital by using the 500,000 authorised, but as yet unissued, shares of £1 each. These shares will be offered on a "rights" basis to the holders of £10 shares and £1 shares; a circular letter giving preliminary details of the issue has been despatched to shareholders.

MOTOR BUSINESS

Hambro Automotive Corporation, our associate company, which is engaged in selling British Motor Corporation cars in the United States, continues to set up new records. In the last financial year its sales have exceeded £30 million.

DEFINITION OF A "BANK"

The competition which comes from the other Banks and Merchant Bankers of the City of London is always welcome and is indeed the strength of the London money market. There is, however, another side to the question which, in my view, requires the attention of those responsible and that is the definition of the names "Banker" and "Merchant Banker" which can be, and in fact are, used by all and sundry in London when applying for deposits from abroad. This makes it very difficult for foreigners to differentiate between what are regarded here as Banks and Merchant Banks and others who do not belong either to the British Bankers Association or the Accepting Houses Committee.

STATEMENT OF ACCOUNTS AT 31st MARCH, 1960

LIABILITIES

	£
Current, Deposit and other Accounts	73,941,631
Acceptances	27,103,344
Paid up Capital	3,500,000
Reserve	3,500,000
	£108,044,975

ASSETS

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

A WELL DIVERSIFIED ORGANISATION

SUBSIDISED COMPETITION AND UNREALISTIC FREIGHT RATES RUN COUNTER TO PRINCIPLES OF FREE ENTERPRISE

UNREASONABLE LEVEL OF TAXES OR WAGES IMPERILS ECONOMIC GROWTH AND STABILITY

MR N. R. CRUMP'S CONFIDENCE IN THE LONG-TERM OUTLOOK

The Annual General Meeting of the Canadian Pacific Railway Company was held on May 4th in Montreal, Mr W. A. Mather, the chairman, presiding.

The President, Mr N. R. Crump, addressing the meeting, said:

At the outset, it is with deep regret that I report the recent loss by death of Mr James Muir. Mr Muir was first elected to the Board of Directors in 1950, and he served the interests of your Company with the same distinction that marked his career in the field of banking and his efforts in a wide range of other business and community activities.

TWO IMPORTANT MATTERS

We are now well into 1960, and it is not my intention to deal at any length with the past year; the Annual Report of your Directors, which was distributed early last month, contains an account of the results and developments of 1959. I would like, however, to refer briefly to the current status of two important matters mentioned in the Report.

The first of these is the non-operating wage case. The Board of Conciliation established by the Minister of Labour to investigate the dispute between Canadian railways and the Unions representing non-operating railway employees has arranged to begin hearings on May 9th. The Unions are asking for an increase in wage rates of 7 per cent plus 12½ cents per hour and for additional vacations with pay, while the railways are seeking renewal of the existing contract.

The second matter is the Royal Commission on transportation. Hearings are continuing before the Commission and are scheduled to carry on for some months. Action to relieve the burden on the railways of the statutory rates on grain and grain products will of necessity be delayed. Meanwhile, the level of freight rates on non-statutory traffic remains frozen as a result of the decision taken by the Government a year ago, and no announcement has yet been made regarding future Government policy. As I pointed out to you at the last Annual Meeting your rail enterprise is in the unique and unfair position of being the only private enterprise in Canada subject to a "freeze" on the pricing of its services, and without any ceiling on its costs.

UNITED STATES SUBSIDIARIES

As a result of studies begun some time ago, a plan has been developed for merging your three US subsidiaries, The Minneapolis, St. Paul and Sault Ste. Marie Railroad Company, The Wisconsin Central Railroad Company and The Duluth, South Shore and Atlantic Railroad Company. This plan was approved by the Boards of Directors of those Companies in March, and it will be submitted to the Shareholders of the Companies later this month. Upon approval by them it will be submitted to the Interstate Commerce Commission. The merger proposal contemplates the unification of the three lines into a stronger single carrier to be known as the Soo Line Railroad Company. Studies have indicated that this unification will generate desirable savings, enhance financial and competitive strength and permit improved administrative and operating effectiveness for the benefit of security holders, shippers and the public.

RESULTS OF FIRST QUARTER

Net rail earnings of $6.7 million for the first quarter of 1960 compare with a net of $6.2 million in the same period of 1959. Railway Revenue showed a decrease of $2.4 million, or 2 per cent, reflecting a decline of 1.5 per cent in freight revenue and a drop of 5.5 per cent in passenger and other revenue. The small increase in net earnings in the first quarter was therefore possible only through stringent control of expenses. An expected upturn in freight traffic has not yet materialised and freight earnings throughout April continued to be disappointing. While your traffic officers believe that this trend will not continue, it is probable that net rail earnings this year will not be far different from last.

Other income is subject to a wide variety of influences, and it is as yet too early to see a clear pattern. However, steamship earnings will probably not show any great improvement, since cargo rates continue to be depressed and cargo volume light, and steamship passenger traffic is adversely affected by lack of immigrant traffic. On the other hand, your hotels are expected to do considerably better and an increase in communications earnings also seems likely. Dividend income is affected primarily by the outlook for the Consolidated Mining and Smelting Company, which does not appear greatly different this year.

I regret to report that 1960 will be a difficult year for your Air Lines. The introduction of Canadian Pacific Air Service to Rome will be of material assistance on the Mexico-Canada-Southern Europe Route.

Fundamental disabilities persist, however, particularly the restricted frequencies imposed by Government order on the Transcontinental Route, and the inability to secure proper utilisation of aircraft, together with increased competition from jet aircraft on certain routes. All these problems are receiving the close attention of Air Lines Management, but results of contemplated action are not expected in 1960 to solve these fundamental problems.

The development of your petroleum resources is continuing, but you realise that your Company is now in the investment phase of this programme. Accordingly, petroleum earnings available for net income are not expected to increase this year.

In summary, 1958 and 1959 have not been good years for your Company and 1960 does not hold promise of much improvement, if any. However, I am optimistic for the long term and a number of factors encourage the view that substantial improvement may be expected in the next few years providing steps are taken to correct injustices I shall mention later.

DIVERSIFICATION

In these times when many Companies are turning to diversification, I think it well to remind you that your Company is already well diversified. In the transportation field you have substantial interests in water transport, truck transport, and air transport, as well as in rail transport. You also have major interests in hotels and communications. Further diversification is provided by the interests you have in resource development arising from your petroleum and timber rights and the mining rights represented by the controlling interest of your Company in Smelters.

PASSENGER SERVICES

The major portion of your Company's investment, however, is in its railway. One of your Company's objectives has been, and continues to be, the elimination of all losses from the operation of railway passenger services. Aggressive action has been taken over a number of years to reduce passenger service in relation to the demand. Reduction in the volume of passenger business, brought about by the changing travel habits of Canadians, will necessitate still further reductions in passenger train service. Your Company has the second largest fleet of any railroad of modern self-propelled rail diesel cars. Modern stainless steel passenger train coaches, including scenic dome cars, are available for runs that will support volume movement of passengers with conventional trains.

Your Air Lines' present fleet of Turbo-prop Britannias and the Super DC-8 Jetliners on order will meet the most demanding requirements of the travelling public for speed and comfort, while the DC-6B's remain dependable work horses of the air.

At sea, two new passenger-cargo liners are now in service and a third, the "Empress of Canada," which will complete the modernisation of this part of your ocean fleet, will be launched next week at Newcastle-on-Tyne. By next summer's travel season a service with as fine accommodation as there is afloat will be available for steamship passengers between Canada and the United Kingdom, and these excellent ships are also available for winter cruise service.

The passenger-carrying equipment owned by your Company and to which I have referred enables Canadian Pacific to offer service of the highest order by land, by sea and by air. It is generally recognised that there is no finer passenger service anywhere than that provided by Canadian Pacific and never before has your Company had more to offer travellers to meet their various needs.

Your hotel system rounds out this range of services, supplying holiday facilities in some of Canada's most notable resort areas as well as distinctive accommodation in major cities throughout the Country. The Royal York, located in Toronto at the hub of Ontario's rich and rapidly growing industrial area, is the largest hotel in the British Commonwealth. The convention facilities and the modern, air-conditioned rooms provided by the recent extension to that hotel are unsurpassed and are being well received by the public.

FREIGHT SERVICES

In air freight services your airliners provide cargo capacity between all points served, and the development of this type of transportation is being closely watched.

Steamship freight service is provided on the North Atlantic and your Company is the prime carrier in the Canada-London trade. To take advantage of cargo offering between Great Lakes ports and overseas via the new St. Lawrence Seaway, four cargo vessels were chartered to provide a regular service. The recent sale of two of your Company's older freighters and their replacement by two chartered ships to supplement the remaining five "Beavers" in meeting the demands of tonnage has introduced desirable flexibility and provided an opportunity to assess fully the changing pattern of cargo movements between Canada and Europe.

Your Company is the largest highway freight carrier in Canada. Through your controlling interest in Smith Transport and your wholly owned subsidiaries, Canadian Pacific Transport and Canadian Pacific Express, Canadian Pacific highway truck services are available from coast to coast.

One of the advantages of these connections is that integration of services is made possible. Last year the first fully integrated merchandise service was introduced in British Columbia. This has been extended this month so that integrated merchandise services are now provided by Canadian Pacific between Vancouver and Vancouver Island, the Okanagan Valley and the Kootenay. The integration of merchandise services under one management enables your Company to move less-than-carload, less-than-truckload and express traffic in the most economical manner which best meets the service requirements of shippers. The ability to provide better service and to reduce costs through integration will greatly strengthen your Company's competitive position and, I am confident, will result in profitable handling of certain traffic which previously had been marginal.

Your highway interests also enable your Company to provide a substitute service on thin density branch lines and enable express service to be provided when passenger trains are discontinued.

Finally, your interests in highway services enable shippers, through piggyback, to have the flexibility of terminal truck service with the dependability and economy of point-to-point rail service. Piggyback services of your Company are available between major points on your rail system throughout Canada. This service is provided by Canadian Pacific not only for its own vehicles and those of its highway transport subsidiaries, but also for all common carriers. The increase in piggyback traffic has been marked. Improvements in both the rail cars that handle the trailers and in the trailers themselves continue to be introduced and these may be expected to produce an increase in this business and in its profitability.

I do not have to tell you that the rail carload business has been and, in my opinion, will continue for some time to be the backbone of your rail enterprise. Although rail movement no longer has a monopoly on any traffic, the economic advantage of rail transportation for mass overland movement of goods is still very great.

FREIGHT PRICING

The pricing of your rail freight transportation is under constant study by your traffic officers and the economic and service requirements of shippers are receiving careful study by your Company's Operating Department as well as by the Department of Research, augmented by a market research section of your Traffic Department which was set up last year.

The only real disability of your Company in the pricing of freight transportation is the statutory rates on grain moving to export positions in Western Canada. This question is one of the major questions now being considered by the Royal Commission on transportation. Your Company has presented a great deal of evidence to the Commission on the Western grain rate problem, including the most intensive analysis of railway costs that has ever been made. Further evidence is still to be submitted, but I am hopeful that before our next Annual Meeting a favourable recommendation from the Royal Commission on this longstanding inequity will have been made.

PROBLEM OF REDUCING UNIT COSTS

Specialised demands of shippers are being met by specialised cars. Expedited freight services have been made possible through the greater efficiency of diesels. Before the end of this year motive power will be supplied wholly by diesels, except for peak periods. Technological advances are being applied in yards and in signalling. The officers and employees of your Railway are constantly striving to improve efficiency and your management recognises that the problem of reducing unit costs for rail transportation, which has occupied so much of your officers' attention in the past, must continue to be pursued with equal vigour.

As you know, your Company led the North American Continent in the removal of firemen from diesels in freight and yard service where they were no longer required. The savings from this will grow as firemen move into gainful work as engiemen. The operation of freight and yard diesels without firemen on Canadian Pacific has been completely satisfactory from every standpoint. Operations have proceeded normally without adverse experience in respect to safety, mechanical performance, carrying out switching operations or any other aspect.

Mechanisation of road maintenance has helped to reduce costs. Reductions have also been brought about by a major change in railway supervision, when eight operating districts were eliminated and one regional administration was added. This re-organisation of the territorial supervision of your railway operations has been most successful, has improved control and at the same time has reduced costs.

The possibilities of recent developments in high-speed electronic computers and related concepts of integrated data processing were quickly grasped by your Company, and it has pioneered in applying them to the railway field. Gratifying as the progress has been thus far in using these vital new aids, it is considered that even wider areas of greater usefulness remain to be explored and mastered.

Your Company, with efficient, modern equipment and good facilities in each of its diversified transportation interests can meet the demands of the shipping and travelling public. Canadian Pacific will do so, will make a profit, and will continue to carry its share of the tax burden.

TAX BURDEN AND PRIVATE ENTERPRISE

I know you must often wonder why greater recognition is not given to the fact that your Company is the only major transportation undertaking in Canada that is fully selfsupporting as well as meeting its share of the tax burden through payment of income tax.

Taxes accrued in 1959 to meet income, property and other tax liabilities—excluding sales and excise taxes—were $39 million. This compared with the net income of $31 million of the year. It is, of course, significant that of the total taxes more than $30 million is attributable to the railway. In addition, your subsidiaries also pay income and property and other taxes amounting to very large sums, which are not included in the figures I have just given you. As an example, in 1959 income and other tax provisions of the Consolidated Mining and Smelting Company exceeded $10 million.

I cannot do better than borrow another immortal quotation from that great Freeman of the World, Sir Winston Churchill, when he said at Woodford on September 29, 1959, "some socialists regard private enterprise as a predatory tiger to be shot; others look upon it as a cow to be milked; only a handful see it for what it really is—the strong and willing horse that pulls the cart along." The fact that your Company, notwithstanding large amounts of free capital made available to its competitors, is able to pay taxes and dividends shows what can be done under private enterprise.

However, the existence of subsidised competition and unfair and unrealistic rates on the movement of the Western grain crop runs counter to the principles of free enterprise and prevents a fair return on investment in your railway undertaking. To rectify these inequities it is necessary that public funds made available to your Company's competitors be advanced only on a business basis, that your competitors by land and in the air be made to stand on their own feet without being given special advantages, and that the problem of Western Canadian grain rates be met and faced squarely. Under these conditions a more realistic return will be earned on your railway investment and added impetus will be provided to the continued efforts on the part of your Company to achieve greater efficiency and reductions in unit costs of transportation.

THE OUTLOOK

The future looks bright over the next number of years. As well as a more realistic return from railway operations, you may also look forward to the prospects of long term benefits from the investment programme being carried out in connection with the natural resources of your Company. I also believe that long term benefits will accrue from the diversification now under way by Smelters. Canada is singularly fortunate in having abundant resources, stable Government, a hard-working and skilful population; but Government and people alike must recognise

that demands on industry for taxes or wages beyond a reasonable level seriously affect investors, large and small, who contribute their savings to the development of our industries and this in turn imperils the growth and stability of the economy as a whole.

The report and accounts were adopted.

BROWN BAYLEY LIMITED

HIGHER DIVIDEND DISTRIBUTION

MR J. W. GARTON'S REVIEW OF SUBSIDIARIES' ACTIVITIES

The 4th annual general meeting of Brown Bayley Limited was held on May 6th at Attercliffe, Sheffield, Mr J. W. Garton, JP (the Chairman), presiding.

The following is the statement by the Chairman which had been circulated with the report and accounts:

As you will have seen from the Directors' Report, Mr. R. Barnaby, the Managing Director of Brown Bayley Steels Limited, was appointed a Director of the Company during the year.

We are losing the services of Mr E. L. N. Tuck who has been a director for a number of years, and our best thanks and wishes go to him on his retirement.

The Accounts now presented cover the twelve months ended December 31, 1959.

The Profit and Loss Account shows a balance, after tax, of £189,118, compared with £160,264 in 1958. The increase is accounted for by the increased dividend recommended by Brown Bayley Steels Limited.

The Interim Dividends already paid by the two Subsidiaries and the Final Dividends recommended by them are included in this Account, and it is on this basis that your Directors have pleasure in recommending a Final Dividend of 9¼ per cent, less tax. This, together with the Interim Dividend of 2¼ per cent, less tax, already paid, makes a total for the year of 12 per cent, less tax, which compares with a total of 11 per cent, less tax, for 1958.

SUBSIDIARY COMPANIES

The Hoffmann Manufacturing Company Limited. This Company achieved a record turnover in 1959, consequent upon a marked improvement in the order position from the middle of the year onwards.

As this Company's trade is broadly based its prosperity is a reflection of the level of activity of the country's engineering trade as a whole.

The order book at this time is in a very healthy state, but I would wish to see increased investment by industry in capital equipment, and whilst there is some indication of this trend the emphasis would still appear to be mainly on consumer goods.

The Accounts of this Company for the year ended December 31, 1959, are published as part of the Directors' Report, and show a profit before tax, after all other charges, of £1,704,511, and compares with £1,206,476 for the previous year. Income Tax and Profits Tax absorb £717,340 against £581,474 in 1958. The net profit of the Group for the year 1959 after taxation is, therefore, £987,171 and compares with £625,002 for 1958.

The Final Dividend recommended is 29½ per cent, less tax, which with the Interim Dividend already paid of 6¾ per cent, less tax, makes a total for the year of 36 per cent, less tax.

It is intended to capitalise £1 million of this Company's Fixed Assets Replacement Reserve and to make a Scrip Issue to the Ordinary Shareholders in the form of one new Ordinary Share for every existing Ordinary Share.

BROWN BAYLEY STEELS LIMITED

This Company started the year with a scarcity of orders associated with the recession in the general engineering industry, and certain departments were therefore unable to work to capacity.

During the later part of the year the position improved substantially and by the end of the year the order book was in a healthy position, although demand from the railway engineering industry and certain capital goods trades was still below average. In view of the improvement in the order load it is reasonable to anticipate a satisfactory level of production in most departments during 1960.

The accounts are also published as part of the Directors' Report and show a gross profit, after all charges, of £672,408, compared with £557,624 for 1958. The profit available for appropriation is £387,935, of which £101,062 is being distributed by way of dividend. The rate of the Final Dividend recommended for 1959 is 10¾ per cent, less tax, which together with 3 per cent Interim already paid makes a total for the year of 13¾ per cent, less tax.

The Farnley Housing Association Limited. The Association have again reduced the interest free loan by £200 and the balance now outstanding of this loan to them is £4,200.

The report and accounts were adopted.

UNION FINANCIÈRE BELGE DES TABACS

"TABACOFINA"

Société Anonyme

ANTWERP, BELGIUM

The Annual General Meeting of TABACOFINA was held in Antwerp on April 7th.

The report presented by the Board of Directors gives a summary of the market situation in the various countries in which TABACOFINA is active, i.e. Belgium, the Belgian Congo, the Netherlands, Switzerland, Indonesia, Brazil, Venezuela and Canada.

Net profit for the period under review which exceptionally covered 18 months amounted to BF124,164,559.83 which, together with the balance of BF9,351,935.17 brought forward from the previous year, provided a total of BF133,516,495 available for distribution. It was accordingly proposed to transfer BF15 million to the liquid reserve, to distribute BF108 million in the form of a dividend of BF150 per share, including an interim dividend of BF75, and, after sundry provisions, to carry forward the resulting balance of BF1,125,195.

The report, the accounts, and the proposals put forward by the Board were adopted.

BOARD OF DIRECTORS

Jacques van Zuylen, Chairman; Frans Vander Elst, Deputy Chairman; Pierre Vander Elst-de Gruyter; Paul Vander Elst; Edmond Wouters; Jean Vander Elst; Jean Mertens; Jean Borin; Ernest Sadzawka; Willy Tombeur.

THE EVER READY TRUST COMPANY LIMITED

The following are the comments by the Chairman, Mr A. V. Perry, on the Report and Accounts for the year ended March 31, 1960, circulated to stockholders:

GENERAL

The market value of our investments is up by nearly £1 million against last year's figure. After allowing for £168,000 received from the "Rights" issue of last May this conforms to the general pattern of the rise in equity share values, in which we hold the bulk of our portfolio. As I have stressed before, in an investment trust, consistent income is the most important point, and the ultimate importance of these fortuitous rises and falls in capital market value should not be unduly exaggerated.

CAPITAL

Your Directors took the view that opportunities might well arise in the present year for profitable investment and they took the occasion (on the terms which are shown in the Report and Accounts) of raising further capital by way of debenture, when lending rates were slightly lower than they are at the present time. This money was received almost at the end of the financial year, and except for temporary employment remains to a considerable extent as yet uninvested.

At the time we extended our Debenture our Debenture Holders asked us to agree that we would not hold more than 10 per cent of the Book Value of our portfolio in any one investment. This we were only too ready to do—because in point of fact our holding in any one security is very considerably below this figure, and it will be our policy to maintain that position.

The Balance Sheet of the Company at March 31, 1960, discloses an Issued Share Capital of £600,000 and debentures of £600,000 and Capital Reserves of some £415,000. It is proposed that the powers of the Directors to borrow money on behalf of the Company should in future be limited by reference to the aggregate of the Company's Issued Share Capital and Capital Reserves instead of only the Issued Share Capital under the existing Articles of Association.

With the Report and Accounts there is enclosed a letter and Notice of Meeting referring to this proposal.

INCOME

The consistent policy of your Board over many years now has been to distribute to Stockholders the income the Company receives, reserving a prudent margin to insure a continuity of the dividend rate. In pursuance of this policy they recommend a final dividend of 11 per cent making 18 per cent for the year. This maintains the same cover, viz. 1.12 times as last year and we trust that Stockholders will consider this as satisfactory. At the time of the rights issue we stated that we anticipated being able to recommend a dividend of 16 per cent on the increased capital.

There is every indication that, after allowing for the interest on the extended debenture, the net income for the current year should show an increase.

Our thanks are due to the Manager and his staff for the hard work they have put in during the year.

LOW & BONAR LIMITED

IMPROVEMENT IN PRACTICALLY ALL SECTORS

CONFIDENCE IN ENGINEERING SIDE JUSTIFIED

CAPITALISATION OF RESERVES

MR H. V. BONAR ON THE OUTLOOK

The forty-eighth annual general meeting of Low & Bonar Limited will be held on June 1st at Dundee.

The following is the statement by the chairman, Mr H. V. Bonar, which has been circulated with the report and accounts:

I should like to commence my remarks to you on this occasion by referring to the retirement from business on November 30th last of Mr Stephen Gillanders. He had been with the Company for over 50 years and had been a member of the Board for 41 years—an outstanding record of service and achievement. I am sure you would all wish to join me in wishing him all health and happiness in his well-earned rest.

FORM OF ACCOUNTS

This year we have altered the form in which the Accounts are presented to you. We have made the change both so as to fall into line with more up-to-date accounting practice and because we feel that in the new form they throw up to stockholders the basic information which they require in a clearer and more easily readable form. The layman can now get his broad picture of the Group's progress more quickly, while the expert—by delving into the notes—can get every bit as much information as has in the past been available to him. We trust that this change will be well received by the general body of our stockholders.

CAPITALISATION OF RESERVES

You will see from my letter and the proposed resolutions to be considered at an Extraordinary General Meeting which have accompanied the Accounts, that it is recommended that the issued ordinary capital of the Company be increased by £800,000 by way of capitalisation of reserves, through the issue to ordinary stockholders, free of payment, of 1,600,000 shares of 10s. each. This step is proposed because of the wide disparity between the issued ordinary capital of the Company and the capital employed in the Group. I wish to emphasise again, however, that this step will not increase the earning capacity of that capital and that future dividends must depend upon future profits.

RETIREMENT BENEFIT AND LIFE ASSURANCE SCHEME FOR WORKS EMPLOYEES

Reference is made in the Directors' Report to provisions set aside to cover the past service cost of a Retirement Benefit and Life Assurance Scheme. While for many years past there has been in existence a contributory Pension Scheme for staff, including foremen and assistant foremen, the Board feels that the time has now come when the great body of Works Employees should also be catered for in some way. Accordingly, as from June 1st, a new Scheme is being brought into operation for Works Employees who are not eligible for the Staff Pension Scheme. This new Scheme will be non-contributory and is intended to be complementary to the revised National Scheme when that comes into force next April.

Producing as it will lump sum figures on retirement, dependent on length of service, of up to £400 in the case of men, and £280 in the case of women, and giving during service a life assurance cover of whatever would be granted on retirement, this Scheme should be some help towards easing the problems which the average worker's household has to face, either when the time comes to adjust itself to living on State pensions plus past savings instead of full wages, or when the breadwinner has suddenly been taken from it. This new Scheme will also, through its operations, provide in the fullness of time some assistance for those employees who, through lack of demand or change of business trends—should these unhappy circumstances ever arise, which I trust they will not—have to be paid off because of lack of work. Full details of this Scheme have just been notified to all the employees concerned and have been well received by them. Schemes of this nature are, of course, not inexpensive. At their inception, indeed, the cost is relatively heavy because of the sharp incidence of past service. Your Board have accordingly decided to set aside such sums now out of Taxed Profits as will take care of the great part of that past service cost, leaving in the main only current and future service to be met, as a year-to-year charge on the Group's Accounts.

REVIEW OF 1959

The year to November 30th last, was a good one and showed an improvement in practically all sectors of the Group's operations. At home, on the engineering side, Bonar Long & Co. Ltd. showed increased profits despite keener margins. This important and ever-expanding sector of the Group's operations thus has fully justified the past confidence that has been shown in it and the capital expenditure which has been, and still is being, incurred in developing its full potential.

Our jute interests in the UK, partly thanks to improved demand particularly from the Floor Covering Industries, and partly thanks to a successful buying policy in raw materials, did markedly better than in the previous year.

In our flax interests a sharp turn for the better took place in the last four months of the year, and with increased demand and rising raw material prices, results for 1959 were better than anticipated and returned to the 1957 level.

The Transparent Packaging Division broke through at last and for the first time made a contribution towards the over-all results.

Meantime, overseas, the Group's Dominion-wide organisation in Canada improved upon the previous year's already excellent showing, while in South and Central Africa the further contraction of profits which I forecast last year, was avoided—an excellent result in all the circumstances.

PROSPECTS FOR THE FUTURE

The early months of the current year have not been without their alarms and excursions. In the case of textiles, there was the Board of Trade announcement in the middle of January reducing the level of protection afforded to the Dundee and District Jute Spinning and Weaving Industry on certain standard widths and weights of cloth. Fortunately, as we announced in a press statement at the time, the effects of this action on the Group's operations should be of a relatively minor nature. More serious, however, is the long-term implication of this action and the doubts which it must raise as to future Government policy towards the industry.

Another current worry on the jute side of the Group's activities has been the movement of raw material prices over the last two months. Prices have advanced at first steadily and latterly excitedly, and it seems clear that there is going to be barely enough jute to satisfy all world demands, until the new crop is harvested and becomes available on the market. With world demand expanding, particularly from the underdeveloped Eastern countries, it is clear that a very much larger crop is going to be required in the coming year, if jute prices are not going to rule for a long time to come at a level which cannot but do harm, both to the interests of the industry itself and to the interests of its customers. At the moment, as a result of unfavourable weather conditions for sowing, considerable doubts must be entertained as to whether this larger crop is going to be forthcoming.

Still in the field of textiles, I must again make reference to the Restrictive Trade Practices Act. I mentioned some years ago when this Act was passed, that it might in due course affect our operations. I had in mind our textile operations within the UK both in flax and in jute. In the course of the last year, such agreements as have existed in these two industries have either come under scrutiny or are shortly to do so. In the case of flax, having read the pleadings and decisions in other cases such as cotton, the industry decided that, in the main, they would not fight their case. These past practices, therefore, logical and desirable though in my view they were—and would have continued to be—have had, perforce, to be abandoned.

Fortunately the upsweep in raw material prices and the present high level of demand has, for the moment, postponed the inevitable effects which I fear will result in the long run from a return to uncontrolled and cut-throat competition. The case for jute, however, is in many ways different. The Government have long admitted the necessity of giving a considerable measure of protection to the Dundee and District Spinning and Weaving Industry against the imports of low-priced Asiatic goods. It is the industry's contention that the various price agreements operated by it are the necessary

lubricating oil which makes the unusual and somewhat involved form of protection work smoothly and efficiently, and with the maximum fairness to all parties concerned. The industry accordingly proposes to fight for the maintenance of the various arrangements which have stood the test of time so well and been of considerable benefit to consumers as well as manufacturers.

ENGINEERING POSITION

In engineering, we have had to face, as many of you will have read in the press, a temporary set-back in this rapidly expanding sector of the Group. The dismissal, and may I say the very necessary dismissal, of a Shop Steward resulted in a strike of the greater part of the labour force of Bonar Long & Co. Ltd. which endured for fully six weeks. The tragedy to my mind of this strike was that, in the final upshot, labour returned to work on exactly the same terms as were offered by Management the day after the stoppage commenced. Thus, employees lost six weeks' wages and the Company six weeks' production, not to mention some cancellations of existing orders and loss of fresh business—all quite unnecessarily.

The present widespread strike of engineering apprentices affects Bonar Long & Co. Ltd. in common with most other engineering concerns in Scotland. At the moment, regrettable though it is, being in direct breach of agreement, it is not causing any major disruption of production.

These various difficulties, however, are either, in the case of textiles, warning signals for the distant rather than the immediate future, or, in the case of Bonar Long & Co. Ltd. a temporary upset in a business whose future remains bright.

OUTLOOK REASONABLY GOOD

Despite these difficulties, prospects for the current year, if one excepts South Africa, remain at the moment reasonably good, although as far as operations in the UK are concerned and principally on the textile side, it is too early to assess whether they may suffer from the tightening by the Government of the screws on credit.

In Canada, while it may be too optimistic to expect a repetition in full of last year's excellent figures, trading nonetheless continues at the moment at a very satisfactory level and the Group's accounts this year will benefit from a 33⅓ per cent increase in dividend from the Subsidiary Not Consolidated.

In jute spinning and weaving, capacity at the moment is fully as well booked as it was this time last year, and the Group is well covered in a strong raw material market.

In flax, demand remains active and unless raw materials fall sharply with a consequent write-down in stock values at the end of the year, a further improvement in results is to be expected.

BONAR LONG & CO.

Bonar Long & Co. Ltd., despite the loss of production and orders resulting from the strike, has still plenty of work in hand and in prospect, and should gradually benefit from the big new extension which has just been completed, provided that our efforts, at no small capital cost, to give increased employment in the Dundee area, do not receive further set-backs from labour of the kind experienced in the last few months. This new extension, in the long run, should not only mean a gradual increase in turnover, but also lead to further economies in the process of manufacture.

The Transparent Packing Division, now that it has broken through the profitability barrier should, as things stand at the moment, show some further increase in its contribution to Group earnings.

OPERATIONS IN AFRICA

This only leaves our operations in Africa for me still to touch upon. In the present circumstances of that confused, and in many ways tragic, continent, I do not believe that any of you would really expect me to try and assess what this year's fortunes of this part of the Group may be. That the recent developments in the Union of South Africa are bound to have done, and be doing, damage to the economy of that country, as a whole, must I think be undeniable and at the moment that is all that I can say. The Central African Federation has also got major political difficulties ahead of it, as has indeed East Africa, where nonetheless, the overturn of the Company's Branch has been surprisingly well maintained over these last few months. To put, however, this African situation in its proper perspective, I should perhaps add that the Group's African Companies and Branches provided last year roughly 11 per cent of total Group earnings.

Before closing, I should like, as ever, to express my sincere appreciation of the efforts and the loyalty throughout the past year of every member of the Group, whatever capacity or country they are serving the Group in. Once again, they have given of their best to further your interests and earned your hearty thanks.

LOW & BONAR LIMITED

Operates in its own name and through various Subsidiary and Associated Companies.

MANUFACTURERS AND MERCHANTS OF

In the UK
- Jute Yarn, Cloth and Bags.
- Flax and Hemp Yarns and Cloths.
- Electrical Transformers, Switchgear and Capacitors.
- Transparent Packages.

In Canada
- Jute, Cotton and Paper Bags
- Cartons and Transparent Packages.

In South Africa and the Central African Federation
- Tents, Tarpaulins, Filter Cloths, Oilskins, Rubber and Plastic Suits, etc., etc.

BUTTERWORTH & CO. (PUBLISHERS) LIMITED

A SATISFACTORY YEAR

The Forty-sixth Annual General Meeting of Butterworth & Co. (Publishers) Limited will be held on May 30th at the Connaught Rooms, Great Queen Street, London, WC2.

The following is a summary of the statement by the chairman, the Earl of Rothes, which has been circulated with the Annual Report and Accounts for 1959:

In spite of the printing strike which lasted for seven weeks and dislocated our publishing programme for the last half of 1959, the results for the year under review are satisfactory.

In last year's Statement I explained that 1958 (£386,000) was an exceptionally good year. We might well have equalled it had it not been for the strike. In any event the latest results show an improvement over those of 1957 (£308,000) which was a more normal year. The actual figures for 1959 before providing £167,329 for taxation amount to £357,733. The sum of £80,000 has been allocated to General Reserve, bringing it up to £413,000, and £6,409 to Staff Contingency Reserve, raising that total to £47,622. The balance carried forward on Profit and Loss Account is £153,886 as against £135,652 brought in from the previous year.

The Directors recommend a final dividend of 20 per cent, making 35 per cent for the year, which is twice covered and a modest increase on the previous year (32½ per cent).

The general pattern of progress continues, but, in order to maintain our expanding business, expenditure of large sums of money is essential and therefore a substantial part of the profit must be ploughed back.

Legal publishing is once again a record, as is also Scientific, but in the latter case margin of profit is less due to rising costs. Medical publishing is not so good but up to expectations. Our various Journals did well and we have purchased "The Police Journal."

The new series of "West Indian Law Reports" have made a promising start in the Federation.

The transfer of the main store and packing department from Barking to Chichester was completed and it is now working well and economically. All Subsidiaries overseas had a good year. A new Company, Butterworth & Co. (New Zealand) Limited, has been formed to deal with our business in the Dominion formerly carried out by Butterworth & Co. (Australia) Limited.

More and more does it become apparent that if we are to meet the challenge of local competition we must augment our local publishing in the Commonwealth, as compared with mainly exporting books from this country.

After careful consideration it has been decided to form a wholly-owned Subsidiary Company in the USA, where there appears to be considerable scope for the publication and sale of Medical and Scientific books. This Company will be started on a modest scale and will be expensive in the initial stages, but in the long run, we hope, profitable. It should be in operation before the end of the current year.

In general the outlook for the Group is set fair, the main trading for 1960 so far is up to expectations and although it is foolhardy in an uncertain world to forecast the current year's results, I regard the future with confidence.

EAGLE STAR INSURANCE

A NOTABLE AND EVENTFUL YEAR

The Annual General Meeting of Eagle Star Insurance Company, Ltd., will be held on June 2 at Wimborne House, 22 Arlington Street, London, S.W.1.

In the course of his Statement circulated with the 1959 Report and Accounts the Chairman, Sir Brian Mountain, Bart., said:

General trading conditions were better in 1959 than for some years past, though the rise in manufacturing activity and stock valuations takes several months to seep through into our figures.

LIFE

The strong rise in personal savings continued throughout the year in spite of buoyant consumer spending, and we got our share of LIFE business to continue the remarkable run of record new production since the War. The 1959 achievement was indeed remarkable in the special sense that quite a lot of our effort was devoted to helping clients and others make up their minds about the National Insurance Act 1959 and the problem of "contracting out." Quite recently we have prepared a little booklet to help employers over this difficult stile, and if any shareholder or, in fact, anyone who may read this, wants a copy, do please ask us to send one. It is called "The Eagle Star presents . . . " and we are rather proud of it because, so far as we know, it is the only thing of its kind that tells you not only how to decide but how to go about it once you have done so.

FIRE

The FIRE Account took an unusual number of hard knocks last year as a result of the serious fires which have multiplied so noticeably in the past eighteen months. Dry conditions and water shortage caused fire waste well above average in agricultural districts at home but there is little doubt that modern factory planning, with its emphasis on large open spaces and conveyor methods of assembly, constitutes a fundamental increase of hazard in manufacturing risks in all countries. We have reaped a steady reward in new proposals under our various "ALL-IN" schemes for Homes, Shops, Offices, Hotels and Schools—the Shopkeepers' policy, which we recently revised and improved, being a special favourite.

MOTOR

The home MOTOR Account once more showed only a small margin. Our regional reorganisation has resulted in a welcome reduction in expense ratio, but on present indications we shall be lucky to do more than break even in 1960. I suppose we all have our own theories about the causes of road accidents; but the plain fact seems to be that density of modern traffic and the power of modern vehicles will go on producing more and more costly accidents by sheer weight of numbers. Insurers naturally take their full share in the work of accident prevention, but our immediate problem is to collect enough premiums in the aggregate from the motoring public with really effective differential charges between the good and the recognisably not-so-good driver.

ACCIDENT

Our ACCIDENT Account is much expanded by inclusion of "Midland" results, which are largely Employers' Liability and running quite well. Amongst the miscellany of risks this department undertakes, its chief preoccupation in 1959 has been the marked increase in crimes against property, in which the criminal has all too often literally a flying start. Armoured security escorts recall the days of the highwayman, whilst siren alarm attachments for despatch cases and unattended vehicles give a faintly humorous idea of the conditions under which we manage to squeeze a small profit out of these types of insurance last year.

ENGINEERING

Our ENGINEERING department, which has had its difficult moments in the past, has now settled down under its new organisation and is making steady and profitable progress. Shareholders will, I am sure, be interested to know that the United Kingdom Atomic Energy Authority has marked its confidence in our inspection and consultant service in the most practical manner by renewing its contracts with us for another term.

PLUVIUS

Once again our lively PLUVIUS department gave us some good publicity, a rising income and a small profit. I have said before that this account is not by any means confined to the United Kingdom, and our leadership in a highly specialised class of business is unchallenged. Enquiries come daily from all sorts of places, with all sorts of climates, such as the Belgian Congo, Fiji and Hawaii to name but three. Oddly enough, our Holiday policy has sold very well throughout the exceptionally fine summer, but the Continental policy got off to a slow start. Apparently English people don't trust their own weather even when it is set fair, which is wise of them, but think the sun shines continuously abroad, which is not quite true. We expect realisation of the hard truth and growth of the Continental holiday habit to sell many of these policies for us in future.

MARINE

It is so long since I was able to speak cheerfully about our MARINE Account that I hesitate to record a distinct improvement in the opening of 1959 account and some sign that 1957 and 1958 settlements will be less costly than we had feared. We maintained our income fairly well in a year of low values and high laid-up tonnage and, except in the United States, competitive tendering resulted in some saving in repair costs. There is some sign of improvement in market conditions but we have decided to make no transfer from the Fund for the time being.

AVIATION

Advent of the jet age is presenting AVIATION underwriters with a challenge which I am glad to say is being faced with unexpected discipline. The capacity and value of these aircraft expose very high individual loss possibilities and their small numbers are exceedingly hard to accommodate in accounts already affected by the fall in renewal values of piston aircraft. Nonetheless, a determined effort has been made to provide capacity and sustain a sensible rating pattern which shows every sign of surviving until jets come forward in sufficient numbers to make a book. Our attitude in the market is one of cautious optimism and we take more than our full share of responsibility.

* * *

The dividend recommended in respect of 1959 is 2s. 3d. per Ordinary Share against a comparable total distribution for 1958 of 1s. 10½d. per Share. The balance carried forward in the Profit and Loss Account is £2,077,850.

Total resources exceed £169 million. Total premium income exceeds £24 million.

TAYLOR WOODROW LIMITED

A RECORD YEAR

The Twenty-fifth Annual General Meeting of Taylor Woodrow Limited will be held in London on June 2nd. The following is an extract from the statement by the Chairman, Mr Frank Taylor, which has been circulated with the Report and Accounts for the year ended December 31, 1959:

Your Company celebrated its Twenty-fifth Anniversary as a Public Company on February 1, 1960. I am happy to report that the progress of your Company during the year under review has been not unsatisfactory and the accounts show record profits.

Conditions affecting the Building and Civil Engineering Industry generally towards the end of 1959 were not unfavourable but the recent rise in the Bank Rate and the possibility of restrictions of credit facilities in the future may lead to a reduction in the volume of Building and Civil Engineering work available and consequently contracts of the right type may be more difficult to obtain. Apart from this, together with other Contractors we are finding in the United Kingdom competition is extremely severe.

ACCOUNTS

The profits for the year, after taxation, are shown at £702,812 which compares with £573,761 for 1958. I am pleased to report this increase in profits and also that the turnover of the Group for the year (not including Associated Companies) was £29½ million compared with £27 million for 1958. I should, however, again mention that the fact that many of our contracts extend over several years makes it appropriate that results should be judged over a number of years rather than on one year.

The Directors are recommending that for 1959 a final dividend be paid of 7½d. per share (less tax) on the present Issued Capital of 11,250,000 Ordinary shares.

AT HOME

Building and Civil Engineering.—Another busy year on building and civil engineering work in the United Kingdom has produced good results.

At Hinkley Point we are working in association with English Electric and Babcock and Wilcox in the construction of a 500,000 Kw. Atomic Power Station. This Team of three has also just tendered for another such station at Dungeness and is now working upon designs for the one at Sizewell.

Our civil engineering work at Northfleet and High Marnham Power Stations is now well advanced and at Cwm Rheidol we have just started a hydro-electric project comprising a dam, power station, shafts and tunnels.

After commenting on the progress of various other projects, the Chairman stated:

During the past year your Subsidiary Company, Myton Limited, has commenced work on further contracts in the London Area. Several important contracts have been completed during the year and continuing progress and expansion is being maintained.

SUN ALLIANCE INSURANCE LIMITED

ADVANTAGES OF THE MERGER

A MUTUAL STRENGTHENING AND PROTECTION OF BOTH

MR T. D. BARCLAY'S STATEMENT

The First Annual General Meeting of Sun Alliance Insurance Limited will be held on June 15th at Bartholomew Lane, London, E.C.

The following is the statement of the chairman, Mr T. D. Barclay, in regard to the accounts for 1959:

In presenting to the Members the first Accounts of Sun Alliance Insurance Limited I would like to record the satisfaction with which the Directors learned of the response of the Members of the Sun Insurance Office Limited and the Alliance Assurance Company Limited to the offer made on behalf of Sun Alliance by Baring Brothers & Co., Limited. We felt sure that the merger to which this scheme gave effect offered very great advantages to the Shareholders of both Companies and we learnt with much gratification that this was overwhelmingly endorsed by the majority of the members as over 90 per cent accepted the offer within the allotted time.

Sun Alliance, however, only came effectively into being on November 4th, though we have the benefit of a full year's results of our two constituent Companies. In the circumstances it would be inappropriate to offer anything in the way of a detailed survey of the affairs of the new Group, and I propose to confine myself to a few brief comments and a word or two on our plans for the future. In order that the Shareholders may be fully in the picture we have thought it well on this occasion to send to each a copy of the detailed Statements by the Chairmen of the two operating Companies. Sun Alliance is a Holding Company only, and therefore the Profit and Loss Account, and Balance Sheet at December 31st last are in a very simple form, detailed results and figures of both Sun and Alliance being shown in the Accounts of those Companies which are also circulated. The Group Accounts are perhaps rather more bulky than one would wish, but I am anxious that the Shareholders should have full information about the affairs of our Companies.

COMBINED PREMIUMS AND UNDERWRITING RESULTS

In this Statement we have confined ourselves to setting out in a convenient form the essential figures of premiums and underwriting results of our two Companies combined. These are as follows:

	Premiums	Claims	Transfer to Profit and Loss Account
	£	£	£
Fire Dept.....	18,791,081	8,677,220	1,814,080
Accident Dept..	21,629,186	12,107,728	1,245,399
Marine Dept...	3,654,309	2,882,890	—1,645

It will be noted from these figures that the total premium income in the Fire, Accident and Marine Departments amounted to £44,074,576 and the transfers from the Departments to £3,057,834. I might add that the Capital, Reserves and Insurance Funds of the two Companies are now £50,411,027, and it will be seen, therefore, that Members now participate in one of the largest Insurance Groups in this country. In addition there is the Alliance Life Department which transacted new business last year totalling £18,632,138; the Life and Annuity Funds now amount to £40,929,398.

SUN'S 250TH ANNIVERSARY

The Consolidated Profit of the Sun for the year is most gratifying. The figure of £1,481,216 is a record in all the long history of that very old Company and it is especially appropriate that this should be achieved to mark the occasion of the Sun's 250th anniversary in 1960.

The Directors have given considerable thought to the form in which the Accounts should appear and it has been decided that, at any rate for the time being, they should be in the form of Group Accounts. They have also had under consideration the value at which the shares held in the Sun and Alliance should be brought into the Balance Sheet of the Holding Company. It was decided that they should be treated as being equal to the nominal value of the fully paid shares of the Holding Company issued by way of exchange. The requirements of the Companies Act on this point are not entirely clear and we have adopted this basis for the time being as we believe that it is in the interests of the Members and keeps the position as flexible as possible pending clarification.

At this stage the Accounts merely record the receipt of the distribution by Sun and Alliance which is passed on to Shareholders in the form of dividend. Expenses of Management, which are small, and the Directors' fees have been provided by means of separate payments by the Operating Companies. It will be noted that no attempt has been made to write off the item appearing in the Balance Sheet under the heading of "Preliminary Expenses." It is the intention of the Board to deal with this at the first convenient opportunity.

DIVIDEND FORECAST JUSTIFIED

In the Offer to the Members of Sun and Alliance dated October 14, 1959, it was indicated that the Directors hoped to be able to declare a dividend of 1s. 6d. per share, representing a substantial increase in so far as concerns former Sun and Alliance Shareholders. On reviewing the results of these two Companies the Directors have felt justified in declaring this dividend which will be payable on July 12th. For the time being it has been decided to leave any balance of net profits in the Accounts of the two Operating Companies where, of course, it is readily available for transfer to the Holding Company as and when may seem desirable.

I have been elected Chairman of this Company and am pleased to have Mr Randolph, Chairman of the Sun, as Deputy Chairman, with Lord Rennell and Mr Keswick as Vice-Chairmen.

The Board consists of all the Directors of both operating Companies and I believe that the Members must be gratified to know that they will continue to have the benefit of the advice of such a very experienced and influential team.

Mr A. P. Cameron, who has been a Director of the Alliance since 1947, has decided not to offer himself for re-election to the Alliance Board or to the Sun Alliance Board. We shall miss him, but he goes with our best wishes for a long and happy retirement.

In this Statement which accompanies the first Accounts of Sun Alliance I should like to place on record the Directors' appreciation of the great help they have received from Baring Brothers & Co., Limited, in connection with the arrangements for the merger of the Sun and Alliance and to the Solicitors and Auditors for their help and advice.

SEPARATE IDENTITY OF BOTH COMPANIES PRESERVED

It was clear from the terms of the original offer to Shareholders of both Sun and Alliance that we chose the method of a Holding Company in order to preserve the separate identity of both Companies. The conception is a partnership of two old established and most respected Insurance Companies both having great traditions and a high quality business. I would wish to emphasise again that there was no question of one Company taking over or absorbing the other. The aim was rather the mutual strengthening and protection of both at a time when other large groupings were taking place in the Insurance industry. Sun and Alliance have been old friends in the past; now this friendship is blossoming into a closer relationship. At this stage there is little more than a plan as it were on the drawing board, but it is our intention to take every opportunity of integrating the two businesses with the object of widening the scope of our joint enterprise and of saving expense. Shareholders will, I feel sure, understand that this plan cannot mature immediately. Both Sun and Alliance operate in different ways and in many different countries; much must be done before a start can be made in bringing the two together and machinery has already been set up with this in view. It is the clear intention of the Board that in achieving integration the two separate insurance entities should be maintained.

The negotiations which led up to the merger were prolonged and intricate. The fact that they were brought to a successful conclusion reflects much credit on the senior officials of both Sun and Alliance who have spared no effort in achieving this goal. I should like to pay a tribute to them and to the Staffs of both Operating Companies who have done so much to bring about the satisfactory results now being considered.

18 35 BAYERISCHE HYPOTHEKEN-U. WECHSEL-BANK

Bayerische Hypotheken-und Wechsel-Bank

MUNICH

Theatinerstrasse 9-15 Kardinal-Faulhaber-Strasse 10

260 Branch Offices in Bavaria, the Palatinate, and Baden-Württemberg

Offices of the Mortgage Department
at Augsburg, Berlin, Düsseldorf, Frankfürt/Main, Hamburg, Hannover, Ludwigshafen a.Rh'., Nürnberg, Regensburg, Würzburg.

At the General Meeting held on April 7, 1960, it was agreed to distribute **a dividend of 14 per cent and a bonus of 4 per cent on nominal DM 90,000,000.— common stock** for the business year 1959.

Payment is effected starting April 8, 1960, through any branch office of our bank and the other pay offices that have been publicly announced, against presentation of Coupon No. 8 and less 25 per cent capital revenue tax, 10 per cent of which can be recuperated upon request, in accordance with the English-German agreement on double taxation.

Following are some figures from the Balance Sheet as per December 31, 1959:

Capital (capital stock and reserves)	DM 231,320,000.—
Deposits with the Banking Department	about DM 2,102,358,000.—
Savings Deposits included therein	about DM 822,562,000.—
Pension Fund	about DM 68,551,000.—
Debtors	about DM 1,035,960,000.—
Long-term Loans of the Mortgage Department	about DM 1,567,809,000.—
Outstanding Bonds and Borrowings of the Mortgage Department	about DM 1,604,366,000.—
Net Profit	about DM 16,374,000.—

Munich, April, 1960. THE BOARD OF DIRECTORS.

THE BRISTOL AEROPLANE COMPANY LIMITED

GROUP'S DIVERSIFIED INTERESTS IN AIRCRAFT FIELD

CHANGES IN INDUSTRY'S CORPORATE STRUCTURE AND FUTURE PROSPECTS

SIR REGINALD VERDON SMITH ON NEW CHAPTER IN COMPANY'S HISTORY

The annual general meeting of The Bristol Aeroplane Company Limited will be held on June 2nd at Filton, Bristol.

The following are extracts from the Statement by the Chairman, *Sir Reginald* Verdon Smith, which has been circulated with the Report and Accounts for the year ended December 31, 1959:

The net profit for the year as shown in the Consolidated Accounts is £1,739,000, an improvement compared with 1958 of £449,000. Taxation of £846,000 shows a substantial increase over 1958 (£626,000).

Out of the *net profit, after taxation, of* £893,000 (1958, £614,000) it has been decided to transfer £150,000 to General Reserve (1958 £150,000), and to transfer £75,000 to Contingencies Reserve bringing this Reserve up to a total of £1m. The net dividend on the cumulative preference stock required £38,000, the 3½ per cent Interim Ordinary Dividend, already paid, has absorbed £149,000, and a final dividend of 7½ per cent, requiring £318,000, is now recommended, leaving £163,000 to be added to profit and loss account, making the balance on that account £535,000.

In summary, the results for 1959 were considerably better than for the previous year and this improvement was due to several causes. Greater stability was achieved in the aircraft sales position; production of Bloodhound missiles reached a steady flow; a high level of turnover was maintained by Bristol Siddeley Engines and the Canadian Company had a successful year's operations.

ACTIVITIES OF THE OPERATING COMPANIES

BRISTOL AIRCRAFT LIMITED

Britannia.—During 1959 19 Britannias were delivered. These fine aircraft are now of course widely known on the long distance routes throughout the world. The introduction of the wide fare differentials which two years and more ago we were recommending for turboprop aircraft will undoubtedly result in high load factors for existing Britannia fleets, but unfortunately for us and for other manufacturers of turboprop aircraft the airlines had already committed themselves and their available resources to their new turbojet fleets—in consequence, during 1959 in the light of market conditions the Board decided not to lay down any further Britannias beyond the total of 83 to which Bristol Aircraft was already committed.

The total sales value of the programme of 83 aircraft and their spare parts has amounted to approximately £100 million. This is no small achievement. The Britannia has provided civil operators with a remarkably flexible aircraft for a great variety of operations and has enabled the carrying capacity of RAF Transport Command to be increased several times over.

The load carrying capabilities of the long range turboprop aircraft have been demonstrated to the world and derivatives of the Britannia are being developed both by Short Brothers & Harland—the "Britannic" freighter—and by Canadair—the CL-28 "Argus" maritime reconnaissance aircraft in service with the Royal Canadian Air Force—and the CL-44 swing-tail freighter which, in company with the Britannic, promises to achieve a real break-through in low cost air freight operations.

But for stockholders the matter must be measured not in these imponderables of aviation development but in money. As has been mentioned in the Reports of previous years, there has been an annual call on the profits earned by the Company on other work to meet unrecovered outlays on aircraft and development. Instead therefore of achieving a reasonable profit on a large turnover it has been necessary to write off these costs and also the interest charges incurred in financing the large investment in stocks and work in progress. We can now look forward to a modest profit on the sale of spare parts and to income from licences.

It has to be acknowledged that in terms of capital employed and of human and industrial effort there are easier ways of earning profit, especially during a period of general prosperity. But this surely should not mean that engineering projects of this scale and difficulty, the success of which means so much to the preservation of our prosperity, ought to be neglected merely because other activities are financially more attractive and make smaller demands upon economic resources. It is because problems of this sort have to be overcome that the aircraft industry in each country of the western world is going through a phase of major change both in corporate structure and in its relations with Government. We believe that the basis of Government participation in research and development which has been outlined by the Minister of Aviation recently, together with the consolidation of the industry, will go a long way towards securing a much sounder position.

High Speed Research Aircraft.—Work continued steadily upon the all-steel research aircraft being developed under Government contract. It is hoped to have the first aircraft ready for flight at the end of this year.

Supersonic Transport Aircraft.—There can be little doubt that in due course the experience of supersonic flight already gained with military aircraft will be applied in the transport field. We hope that the Company's pioneering work in this field will be rewarded by the opportunity of designing and manufacturing the world's first long range supersonic airliner.

MISSILES

During the year good progress was made in the introduction into Royal Air Force service of the Bloodhound ground to air missile, and the development of longer range and greater defensive power proceeded according to plan.

HELICOPTERS

Having arranged the transfer of our helicopter interests to our West country neighbour, Westland Aircraft Limited, we now look forward to the benefits of participating in that Company's future growth and progress.

BRISTOL SIDDELEY ENGINES LIMITED

The Bristol aero-engine business was transferred to Bristol Siddeley Engines early in 1959, together with Armstrong Siddeley Motors Limited and Bristol Cars Limited.

The aero-engine products of Bristol Siddeley, including liquid-fuelled rockets, ramjets, turbojets, prop-jets and, even today, a few more piston engines, were supplied during the year to the British Government, to the armed forces of many other countries, and to airlines. Bristol Siddeley was also active in a number of power projects not connected with aviation but in several instances deriving from aero-engine development. Subject always to the familiar hazards of the aircraft industry, we believe that there are encouraging prospects for Bristol Siddeley Engines both in the current year and in the longer term.

The Chairman then referred to Bristol Aerojet Limited and Short Brothers and Harland Limited and after reviewing the Group's activities overseas, continued:

CHANGES IN CORPORATE STRUCTURE AND FUTURE PROSPECTS

Widespread publicity has naturally been accorded to the recent changes of corporate structure in the British aircraft industry. In our case the process of integration had already proceeded some way, and the policy urged upon the industry by the Minister of Aviation was so very much in line with our own thinking that we needed neither persuasion nor pressure to carry it further. It seemed to us timely and sensible to combine our helicopter activities with those of Westlands, and then to link the destinies of our long-established aircraft business with those of English Electric Aviation Limited and Vickers-Armstrongs (Aircraft) Limited by the transfer of all three to the British Aircraft Corporation. The early stages of this partnership have been most encouraging, and, whilst no sensible person would predict an easy way of life for any undertaking concerned with aviation, we believe that the new Company can look forward to an illustrious and successful future.

Finally, what do all these changes mean for the Company's stockholders? Prophecy is notoriously dangerous: where defence production is concerned so much depends on considerations of policy outside our control: the development and supply of civil aircraft, for all the inevitability and importance of air transport throughout the world, is evidently a very vexed problem for aircraft manufacturers everywhere. The new British Aircraft Corporation has yet to take formal shape and demonstrate its capabilities in practical achievement. Much depends on the profitability of our large investment in Bristol Siddeley Engines. Even so, I am reasonably optimistic. The risks with which in recent years the Britannia project endangered the rest of the Group's long and profitable record and overshadowed its varied activities have been dispelled. The picture in Canada is one of steady growth. Our interests are of course concentrated almost entirely in aviation, the business which we know best and in which we have confidence in our competitive abilities. Within the field of aviation there can hardly be another company in this country with more diversified interests. We believe that this new chapter for your Company, so different from the early days, will prove no less successful than the past.

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa)

THE FOLLOWING IS EXTRACTED FROM THE REPORT OF THE DIRECTORS FOR 1959

CAPITAL.—In accordance with the Resolution passed at the Extraordinary General Meeting of Members of the Corporation held on May 26, 1959, 700,000 ordinary shares of 2s. 6d. each were issued by the Corporation to a subsidiary in The British South Africa Company Group and, in return, a wholly-owned subsidiary of the Corporation acquired 455,000 ordinary shares of 15s. each in The British South Africa Company.

The issued capital of the Corporation is accordingly now £1,250,000 in 10,000,000 ordinary shares of 2s. 6d. each.

A further £1,000,000 of 6½ per cent Registered Unsecured Notes 1974/83 were issued (being the balance of the Note Issue referred to in last year's Annual Report).

RESULTS FOR THE YEAR.—The Consolidated Profit for the year was £2,856,915 and appropriations have been made from it as indicated below.

1958 £		1959 £	£
1,903,957	CONSOLIDATED PROFIT FOR THE YEAR attributable to the Corporation (after providing for taxation)		2,856,915
	DEDUCT:—		
32,802	Expenses of Note and New Share Issues ...	3,232	
865,450*	Dividends declared	1,148,437	
898,252			1,151,669
1,005,705	RETAINED BALANCE OF CONSOLIDATED PROFIT FOR THE YEAR		1,705,246
845,888	Balance brought forward from 1958	1,291,593	
—	*Less*: Attributable to a former subsidiary Company	145,523	
			1,146,070
1,851,593			2,851,316
	DEDUCT:—		
350,000	Transfer to Reserves of Union Corporation— Exploration Reserve Account	150,000	
—	General Reserve Account	300,000	
	Transfers to Reserves of Subsidiary Companies—		
60,000	Exploration Reserve Accounts	—	
150,000	General Reserve Accounts	1,200,000	
560,000			1,650,000
£1,291,593	Balance carried forward to 1960		£1,201,316

* Excluding £70,362 dividends payable within the Group.

The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price to allow for the wasting nature of a substantial part of the portfolio. To this end they have charged the Profit and Loss Account with £150,000 of which £50,000 has been charged in the accounts of a subsidiary company.

In view of the active prospecting being undertaken in a number of fields the Directors have appropriated a further £150,000 to the Exploration Reserve Account in spite of the fact that the large recoupments of exploration expenditure during the year exceeded the cost of exploration by some £163,000.

The major event of the year was the flotation of two further mines in the Kinross area, namely Bracken Mines, Limited and Leslie Gold Mines, Limited. Members of the Corporation were invited to subscribe at par for shares in these two companies in the proportion of one share in each company for every ten Union Corporation shares held.

The Corporation itself has a large stake in these Companies, which is mainly held through wholly-owned subsidiaries. In order that Members can more fully appreciate the value of these holdings the Directors have decided upon a new method of presenting the Accounts which now segregate the Corporation's interest in quoted subsidiary mining companies from the Corporation's other interests in the Consolidated Balance Sheet.

The Corporation has commitments to subsidiary mining companies amounting to £8,800,000, which sum it is anticipated will be required over the next two or three years. In the absence of unforeseen circumstances, the Directors are confident that the necessary finance will be available from existing resources, if need be supplemented to some extent by short-term borrowing.

When considering the dividend for the year the Directors had to take these commitments into account. Nevertheless, they felt justified in increasing the final dividend to 2s. 9d. making the total dividend for the year 3s. 9d. per share less United Kingdom Income Tax.

THE UNION CORPORATION GROUP OF COMPANIES

During the year Bay Hall Trust Limited, an investment trust incorporated in the United Kingdom, which since its inception has been a subsidiary of the Corporation, reorganised its capital structure. As part of this reorganisation an issue of new shares was made for cash at par. Whilst the Corporation has retained its investment in the Company, it did not itself participate in this issue, but Members of the Corporation were offered shares in the proportion of one new Bay Hall share for every five Union Corporation shares held. As a consequence Bay Hall Trust ceased to be a subsidiary of the Corporation which, however, continues to act as Managers.

Attention has already been drawn to the flotation of two new mines (Bracken Mines, Limited and Leslie Gold Mines, Limited) in the Kinross area under the Corporation's auspices. Work has begun on the sinking of shafts on both mines. Winkelhaak Mines, Limited, the first, and hitherto only, mine in the Kinross area has now been declaring monthly profits for more than a year, during which time the grade and profits have steadily improved. In the Orange Free State, St. Helena Gold Mines, Limited further increased the tonnage milled, grade, reserves, profits and dividends, whilst continuing to carry on a substantial capital expenditure programme designed to open up more of its lease area and further expand operations. The older mines of the Eastern Rand are still earning handsome profits which have been well maintained during the year even though in some cases mining operations are becoming more difficult and ore reserves are declining.

On the base metal side, San Francisco Mines of Mexico, Limited has been forced to pass its dividend for the second year in succession as a result of the poor market for its products and the low metal prices ruling, coupled with the continuing very heavy burden of Mexican taxation.

Both the production and the profits of South African Pulp and Paper Industries, Limited have been at a record level. Work is continuing on the construction of a newsprint plant at the company's Enstra mill.

EXPLORATION

Further exploratory drilling was carried out in the Kinross field outside the three lease areas and the Corporation continued to be active in other parts of Southern Africa and elsewhere.

BOARD OF DIRECTORS

During the year Colonel The Lord Robins, KBE, DSO, President of The British South Africa Company, was appointed a Director of the Corporation.

The full Report and Accounts (copies of which can be obtained on application at the London Office, 95 Gresham Street, London, E.C.2) include further details of the progress of the companies under the administration of the Corporation, brief particulars of the progress of other companies in which the Corporation is interested, sections dealing with the South African Gold Mining Industry and statistics of World Gold Production, Consumption, Distribution and Reserves and the Corporation's Trade Cycles Chart, revised to date.

COMMERCIAL UNION ASSURANCE

RECORD FIGURES

The Annual General Meeting of the Commercial Union Assurance Company Limited will be held on May 30th in London.

The following are extracts from the review by the chairman, Mr Ronald C. Brooks, OBE, MC, of the report and accounts for the year 1959:

Before commenting in a general way upon our results for 1959 I should refer to the acquisition last year by your Company of the share capital of the North British & Mercantile Insurance Company Limited. Shareholders were given an outline of the reasons which led your Directors to take this step.

With the inclusion of the business of the North British & Mercantile Insurance Company Limited and its associated Offices, our net premium income from the Fire, Accident and Marine Accounts now comfortably exceeds £100 million—a figure which truly reflects our position as one of the foremost groups of insurance companies in the world today. In the Life Department, also, record levels were achieved in 1959, new sums assured exceeding £57 million.

Although we have made an underwriting profit from our Fire and Accident business, it is again smaller than we would wish. Several factors have contributed towards this but there are two important ones. Firstly, world trade last year was generally buoyant and in those conditions our business expanded quite considerably; this increase in premium income is naturally welcome but it does entail a greater provision being created for unexpired risks, which in turn reduces the underwriting surplus. Secondly, our operations in the United States of America—where much of the expansion took place—again resulted in an underwriting loss, which, although smaller than for 1958, was nevertheless of such proportions as to reduce considerably our profit from the remainder of the territories in which we are working. Much is still being done to improve the results of our American portfolio and I am hopeful that before long the tide will again turn in our favour. In the Marine Department we have now closed our account for the year 1957 and the balance has been transferred to Profit and Loss Account.

I will now deal with the departmental accounts and I should mention that where comparisons are made between 1959 and 1958 the figures for both years include those of the North British & Mercantile Group.

FIRE DEPARTMENT

Net Premium Income 1959	£47,001,988
Net Premium Income 1958	44,782,380
Increase	£2,219,608

The ratio of claims paid and outstanding was 52.18 per cent., commission absorbed 22.23 per cent, and expenses of management accounted for 22.01 per cent. After adjustment of the provision for unexpired risks there was an underwriting profit of £563,324 (1.20 per cent), which has been transferred to Profit and Loss Account.

At home the income has increased, but the outstanding feature of 1959, which has already received some publicity, was the high total of national fire wastage.

In the oversea field the expansion of our premium income has been resumed and most of the territories in which we operate contributed to the forward movement.

ACCIDENT DEPARTMENT

Net Premium Income 1959	£55,439,027
Net Premium Income 1958	52,267,269
Increase	£3,171,758

The ratio of claims paid and outstanding was 60.55 per cent, commission 16.44 per cent, and expenses of management 20.77 per cent. After adjustment of the provision for unexpired risks there remained an underwriting profit of £53,037 (.10 per cent of the premium income), which has been transferred to Profit and Loss Account. The additional reserve has been increased to £8,750,000, making the total Accident Fund (including provision for unexpired risks) £30,925,611, or 55.78 per cent of the premium income.

At home business again increased and this expansion generally applied throughout all classes of Accident insurance.

The miscellaneous classes of Accident insurance again expanded.

MARINE DEPARTMENT

Net premium Income 1959	£4,984,798
Net Premium Income 1958	4,929,296
Increase	£55,502

The claims paid, after deduction of reinsurance and salvage, amounted to £3,761,381, and, out of the surplus of the 1957 underwriting year and previous years now closed, the sum of £603,452 has been transferred to Profit and Loss Account. The Marine fund now stands at £7,327,135, which is 146.99 per cent of the premium income.

The more optimistic forecast of the results of 1957 given to you last year has been borne out by the final figures and we have been able to increase our transfer to Profit and Loss Account. The year 1958 appears to be showing a progressive improvement on the preceding years.

On balance I feel that we are now seeing a general improvement in our Marine results.

LIFE DEPARTMENT

New sums assured £57,200,766 (1958, £47,300,521): New Annuities £2,712,566 per annum (£2,941,366); Claims by Death £2,185,949 (£2,344,484); Matured Endowment Assurances £4,426,932 (£4,640,316).

These results are the aggregate of the figures of the Commercial Union and North British & Mercantile Life Funds, both of which are open for the transaction of new business. Both companies have produced record new business figures, the North British & Mercantile reaching £20 million for the first time.

APPROPRIATION ACCOUNT

As a result of the year's operations we are able to transfer £4,350,315 to the Appropriation Account, a figure greatly in excess of the combined figure for 1958.

The Directors recommend a final ordinary dividend of 1s. 3d. per 5s. share, making, with the interim dividend of 1s. paid in November last, a total of 2s. 3d. per 5s. Ordinary share.

RICHARD CRITTALL

HEATING, VENTILATING, AIR CONDITIONING, ELECTRICAL AND MARINE ENGINEERS

Main points from the Directors' Report and Statement by the Chairman, Mr. GEOFFREY C. R. ELEY, C.B.E., to the Annual General Meeting on 6th May, 1960.

	1959 £	1958 £
Issued Capital	525,000	525,000
Group Profit before Tax ...	252,154	222,829
Taxation	111,099	82,422
Dividends (net)	72,352	52,828
Net Current Assets	967,527	929,846

NEW ACQUISITION. A new subsidiary company, Maddock & Wright Ltd., an established heating and ventilating business in Leicester, was purchased. A new branch office of the Parent Company was opened in Cardiff.

INCREASED TURNOVER. The enlargement of the works of our subsidiary, Thomas McDowell Ltd., has made possible a substantial increase in our output of Deflecto Grilles and other ventilating fittings. We believe that there are increasing opportunities for the use of our design of strip heating known as Sunztrip, a form of radiant heating particularly suitable for factories. We are collaborating with Wm. Beardmore & Co. Ltd. in the development of the Beardmore-Crittall radiant acoustic ceiling for installation in hospitals, schools, offices and showrooms.

PROSPECTS. The full effects of the increasing tempo in the building industry have still to be felt in our own field as specialist sub-contractors. Indeed, intense competition continues in our industry and 1960 promises to be a strenuous—and possibly a more difficult—year but we enter it with a considerably higher forward order book than at the same date last year. We view the longer-term future with confidence and are constantly studying possibilities for further expansion.

Copies of the full Report and Accounts may be obtained from The Secretary, Richard Crittall & Co. Ltd., 151, Great Portland Street, London, W.1.

VENESTA LIMITED

ANOTHER MAJOR CHANGE IN COMPANY'S STRUCTURE

The Sixty-first Annual General Meeting of Venesta Limited will be held on May 30th in London. The following is an extract from the circulated statement of the Chairman, Mr S. A. Field:

The past year has marked another maior change in the history of the Company. Venesta is no longer a diversified manufacturing company, but a holding company, and by the recent sale of the aluminium foil business, its present main interest is again in plywood and related products.

The sale of the company's foil business in the UK, India and Ceylon to Reynolds T. I Aluminium Limited became effective on March 25, 1960.

The accounts cover the eighteen-month period to December 31, 1959. During the second half of 1959 the Net Profit, before tax, for the Group, excluding the foil business, was running at the rate of £500,000 per annum.

In November, 1959, the company purchased Midland Veneers Service Co. Ltd., specialising in the manufacture of ornamentally veneered and moulded plywood.

Products manufactured at the Erith and Clayton factories continued at the same rate as before, with the exception of Plymax, the metal-faced plywood which rose steadily.

Restrictions imposed by the Finnish industry kept production of O Y Faner AB, the Finnish subsidiary, below maximum during the first six months. During the last twelve months increased demand and quota enabled production to be raised. In the current year, much will depend upon political and economic factors, though the climate at present is fairly good.

The French subsidiary, Luterma SA, experienced difficult trading during the first part of the period. The Company's policy of increasing the manufacture of specialised products, which yield a better profit margin than plain plywood, proved a good standby. In the Spring of 1959 the situation improved and the final results were good.

Venesta and Acme Tea Chest Companies have been affected by Japanese competition, but it is hoped to offset this by reducing selling prices and *increasing volume.*

Venesta Metal Containers has increased its sales and output by the equivalent of an annual rate of 8 per cent by the more effective utilisation of existing plant. At present the order book is stronger than at any previous time. It is proposed to continue expansion and orders for new equipment have been placed.

The profitability of the Group's existing operations is largely governed by the general state of the British and French economies. For the immediate future, a continuance of the present high level of economic activity seems assured, but in the United Kingdom the latter months of the year could begin to feel the cumulative effect of measures to restrict credit. In both Britain and France profit margins are likely to remain under pressure, but unless there is a major setback in either or both countries, profits should show a further modest improvement during 1960.

GLENFIELD & KENNEDY HOLDINGS LIMITED

CHAIRMAN'S STATEMENT—MAY 27TH, 1960

The Sixty-first Annual General Meeting of Glenfield & Kennedy Holdings Limited will be held at Kilmarnock on May 27, 1960. The following is an extract from the statement by the Chairman, Mr Hugh Cowan-Douglas, which was circulated with the Report and Accounts for the year ended December 31, 1959:

The results which are now submitted to you are broadly in accordance with expectations. The gross and the net profits of the group, while well below the level of the years 1952-1957, nevertheless show an improvement on the figures for 1958, which, of course, were adversely affected by the serious loss sustained by our Polmadie company in that year. That company again made a loss but a much reduced one. The Worcester company, which is largely dependent on the oil industry, again produced a disappointing result. The other main companies in the group all made quite satisfactory profits in spite of difficult trading conditions.

Group sales for the year fell slightly below the record levels of the two previous years.

The group profit after charging £333,191 for depreciation and £92,000 for interest on the Convertible Loan Stock amounted to £558,885 (1958—£438,999). Tax, after credits for adjustments in respect of previous years, took £232,112 and the net profit comes out at £326,773 (£229,838).

A total of £25,121 has been retained by subsidiary companies. The directors recommend the allocation of £100,000 to General Reserve and the payment of dividends at the same rate as for the past few years. This involves a small reduction to £205,303 in the amount carried forward to 1960.

Outstanding orders of the group, which at the beginning of 1958 stood at approximately £9 million and £7 million a year later, had by the beginning of 1960, fallen to just under £6 million. The value of new business booked so far during 1960 shows an improvement in comparison with the corresponding period in 1959, and with industrial recovery now becoming more evident in the capital goods sector there are grounds for hope that the position will continue to improve during the remainder of this year. There are, however, as yet few signs of renewed large-scale activity on the part of the oil companies in regard to expansion of refining capacity or placing of orders for new oil tankers.

During 1959 we encountered increasingly severe price competition stimulated to a great extent by shortage of work in our own and other sections of the engineering industry both at home and overseas. In this connection we are concerned at the not inconsiderable increase in manufacturing costs which will arise from the recent reduction in the standard working week from 44 to 42 hours.

The year 1960 will be one of difficulty, although it may well provide in certain directions opportunities for rapid recovery and advancement of our prospects.

GLENFIELD & KENNEDY LTD., KILMARNOCK

While orders have been generally scarce for our heavier range of manufactures, some notable contracts have been received. Considerable design and tendering work has been done for turbines and gates for hydro-electric projects, part of which have been ordered and part are now under active consideration.

1959 was an outstanding year in regard to orders received for micro-straining equipment. The activities of our American associate, Glenfield & Kennedy Inc., in this field have been of particular significance. Orders for four installations of one machine each were received during 1959, and early this year, as part of a major waterworks development, a contract valued at $500,000 was received from the Board of Water Commissioners, Denver, Colorado. This notable achievement should pave the way for further successes in what is potentially a very large market for this specialised equipment.

Towards the end of the year an agreement was concluded with Messrs Schmitz & Schulte of Germany, which secured for us the manufacturing and selling rights in the British Commonwealth, and certain other territories, of that company's range of S & S rubber diaphragm valves.

J. BLAKEBOROUGH & SONS LTD., BRIGHOUSE

This company made a most gratifying contribution to the group profits and the prospects for 1960 are quite good.

Activities have been fully maintained in equipment for nuclear power. Valves operating at Calder Hall and Chapelcross continue to give complete satisfaction in service. Valves of many types and sizes are being installed in all the nuclear power stations under construction in this country. Reactor valves of the latest and most up-to-date design have been developed to meet the exacting demands of atomic energy and are to be installed in the new advanced gas reactor at Windscale.

To meet more exacting conditions on oil tankers, a cargo valve with flexi-ring, which ensures a complete seal under all conditions, has been marketed and has found favour with the leading oil companies.

The demand for Hammel-Dahl control valves continues at a satisfactory level.

J. BLAKEBOROUGH & SONS (SOUTH AFRICA) (PTY.) LTD., BENONI

Satisfactory results have been achieved at Benoni where our subsidiary is meeting the demands from the goldfields and the waterworks undertakings, both in the Union and in the Rhodesias. Future prospects are promising, and it has been decided to improve the iron foundry still further by installing new cupolas and sand conditioning plant.

ALLEY & MACLELLAN LTD., WORCESTER

It was pointed out a year ago that the demand from the oil companies was not good. Unfortunately this position continued throughout

1959 and has shown little improvement so far in the current year.

ALLEY & MACLELLAN (POLMADIE) LTD., GLASGOW

During the year a considerable number of changes have been made at Polmadie. Completely new management has been introduced and they have had to deal with a variety of tasks. Reorganisation within a number of departments was overdue and, in the main, this is nearing completion. Further stock reductions have been achieved and, with a substantial extra charge for depreciation this year, the management are satisfied that our fixed and trading assets are now valued on a sound basis. Short-time working was necessary during part of this year but, with a reduced labour force, it has been possible to return to a five-day week. It is not likely that the company will earn a profit during the current year.

BLACKETT, HUTTON & CO., LTD., GUISBOROUGH

The erection of the new fettling shop and modernisation of the light foundry is still proceeding.

Orders increased towards the end of 1959, and this improvement has been maintained to date.

THE BRITISH PITOMETER CO., LTD., PARK ROYAL, LONDON

A high level of output was achieved during 1959, but this was largely the outcome of orders placed during the previous year and current orders have declined.

STAFF

The year under review has not been an easy one and has called for considerable effort and hard work on the part of the management, staffs and workpeople employed by our various companies, and on behalf of the stockholders I would like to express to them our sincere thanks and appreciation.

THE CUNARD STEAM-SHIP COMPANY LIMITED

1960 OUTLOOK MORE PROMISING

Sir John M. Brocklebank, Bart, Chairman of the Company, *in a statement to* stockholders for submission at the eighty-third Annual Meeting to be held on June 1st, says:

I would first like to say a word about the great loss which the Company suffered by the death of Colonel Denis Bates last September. His wisdom, example and leadership endeared him to his colleagues at all levels and he was never too busy to pass on his knowledge and experience. He will be sadly missed by us all.

Last year my predecessor did not venture a forecast for 1959, but in general the situation for shipping has been worse rather than better. Broadly there are still too many ships looking for too few cargoes. The reasons for this situation have been given so often that there is no need to elaborate. In short the industry, and by industry I mean the international rather than the national shipping industry, has built and still is building more ships than the world's trade requires. To produce an improvement in the freight side of our business one of two things must happen. The total volume of world trade must increase or more ships must be scrapped. It is reasonable to hope that one or even both must happen before long, but unfortunately it is not possible to forecast the date.

Bearing in mind the foregoing I feel that the managements of the Group have no need to be ashamed of the 1959 results which show a reduction in gross operating surplus to £5,039,666 from the £5,670,919 of 1958. Surplus for the year at £900,560 is down by £492,319; balance carried forward is £1,267,641. Although the Port Line profits were very slightly down on last year the Cunard Company figures are better by more than that amount and the overall drop in the Group's surplus is almost entirely attributable to Brocklebanks who have had a most unhappy year.

The outlook for the Group in 1960 is decidedly more promising. The Brocklebank management took steps last year which are already reflecting some improvement and although it is too early to forecast the outlook for Port Line this is, if anything, better than at this time last year. The outlook in our main North Atlantic passenger business, in freight and in cruising is in all three cases appreciably better. In view of this your Board recommends a dividend of 8 per cent for the year.

WEEKLY EXPRESS SERVICE

This statement has to be in the printers' hands before April 20th so you must forgive me if more has been made public on the subject of replacement tonnage for the weekly express service before you receive the report and accounts on May 9th. In September last year the Minister of Transport invited a committee under the chairmanship of Lord Chandos to investigate and report on this problem. At the present time the committee has not completed its report so it would not be proper for me to comment on their activities. I can, however, say without embarrassment to anybody that as far as has been shown by their contacts with this Company the Chandos Committee have carried out their investigations with patience and in the most thorough manner. Needless to say we have co-operated to the very best of our ability.

Since my predecessor's statement at the annual meeting a year ago our design team have put in a great deal of excellent work examining a wide variety of ships which might suit our requirements, but although their studies have produced a few minor improvements in design which collectively would reduce cost and improve the profit we are still firmly convinced that two ships of about 75,000 gross tons with a service speed of 30 knots would be the best and most profitable units to maintain our weekly express service which has shown itself to be the most efficient method of carrying passengers across the North Atlantic by sea. The Committee's report is likely to be in the hands of the Minister shortly and I can say no more until after the report has been made and the Minister has had time to study it.

CUNARD AND THE AIR

I would now refer to the entry of our Company into the air. We are in process of acquiring Eagle Airways Limited and associated Companies who are one of the leading private aircraft operators in the United Kingdom. The Companies, founded some eleven years ago, have developed an extensive international network of scheduled services in Europe and are operating an extensive route network in the Western Hemisphere. Recent Government approvals of outstanding applications have authorised Eagle to operate on the route London-Bermuda-Nassau and to provide capacity for First, Economy and Coach Class passengers with effect from October 1st, thus linking the European pattern of scheduled services with their route network in the Western Hemisphere. Cunard offices in the United States (17) Canada (9) and Europe (23) will augment Eagle's existing sales organisation and we hope by this means to assist our own overheads and increase ticket sales on the Eagle route pattern. We are also having discussions with BOAC and other transatlantic carriers to investigate the possibilities of air/sea exchange arising from a recently announced agreement whereby it will be possible for people to travel one way by sea and one way by air and qualify for the return ticket discount. We believe that both the sea and the air can benefit from such arrangements and that we can augment our own revenue and make use of our existing sales structure.

As to the outlook, there is no doubt that the advent of the Boeing 707 and the Comet 4 on the North Atlantic has made a measurable improvement in comfort, time and above all convenience to the passengers who use these pure jet aircraft. This was in fact mentioned as a mild warning by our New York office in their annual report to us in January and we must not forget that 70 per cent of our passengers emanate from the USA and Canada. The international air lines are catering for an enormous increase in total traffic between the two continents. Notwithstanding, our own North Atlantic carryings to date, particularly in First Class, show healthy prospects for this year and together with the cruising we can hope for a better passenger year than in 1959.

Developments in the air come so fast that it is at times hard to keep up with them, but I am now even more convinced that the sea should be complementary to rather than competitive with the air so nothing would give me more pleasure than to see a forecast made in "Flight" of April 1st come true: "So here we have (1) Cunard and Eagle working with rather than against BOAC, and (2) a tripartite British air corporation—independent—shipping partnership which will obviously be of great advantage to Britain on what is after all the world's most important route."

SHIPPING'S PROBLEMS

So much has been written and said about building and operating subsidies and about flags of convenience that there is no need for me to comment further except to say that the British shipping industry can be protected by our Government if the Government consider protection desirable and necessary. The policy of flag discrimination on the other hand is a menace which it is hard for our Government effectively to counter. Retaliation in kind would achieve nothing and would result in ships travelling full one way and empty the other. It may well be that the Board of Trade in conjunction with the

Ministry of Transport would have more strings to its bow in negotiations with foreign governments and that their chance of success in countering this policy of discrimination would be better than that of the Ministry of Transport alone. India, which is a terminus of practically all the Brocklebank operations, is one of the leading nations to make use of this device to help build up their shipping industry.

With the new "Andania" now delivered and the "Alaunia" to be completed later in the summer, together with two ships on loan from Brocklebanks and partly with chartered tonnage, we plan to expand our cargo service from this country to and from the US Gulf ports. The prospects are distinctly promising.

It has been realised for some time that the Company's office arrangements in Montreal have been inadequate, and the building we at present own there is not readily capable of enlargement. Therefore it was decided to negotiate with the Prudential Assurance Company for the purchase of their building which adjoins our own. Not only will the new building provide up-to-date working conditions for our principal office in Canada but will also prove a profitable investment.

In conclusion I express our warmest thanks to all who work for the Companies of the Cunard Group, ashore, afloat and now in the air, also to our agents all over the world.

THE EQUITABLE LIFE ASSURANCE SOCIETY

EXPANSION OF REVENUE

The 198th annual general meeting of The Equitable Life Assurance Society was held on May 11th in London.

The following are extracts from the speech of The President, Mr John H. Bevan:

From the Accounts, you will see that there has been an increase in the total funds of nearly £2½ million. Revenue from premiums continues to grow and it is now approaching £3 million.

Perhaps the most important function of a life office is to cover the risk of early death of a man at a time when his children are young and his potential liabilities are, therefore, heaviest; one of the results of the improvement in mortality at the younger ages is that we have been able to reduce very materially the premiums to cover such liabilities.

Our low ratio of expense, and the freedom from commission which has always been a feature of the Society, mean that we are able to offer competitive terms for all classes of life assurance.

The Balance Sheet shows a few changes, the most significant of which are increases in mortgages, debentures, ordinary shares and freehold and leasehold property.

New business written during 1959, in terms of new sums assured, amounted to just under £7 million and was, therefore, rather below the figure for the previous year. Whilst I naturally regret the recession, it is to some extent explained by the fact that new business in 1958 was exceptional; the figure for 1959 was about the same as that for 1957.

Our thoughts are now beginning to turn to the 200th anniversary of the foundation of the Society, which we shall celebrate in 1962. This is an event which I can fairly say will be unique, because it will not only be the bi-centenary of our own society but the bi-centenary of the foundation of scientific life assurance itself.

The report and accounts were adopted.

G. & J. WEIR HOLDINGS

YEAR'S TRADING RESULTS FAVOURABLE

VISCOUNT WEIR'S CONFIDENCE

The Annual General Meeting of G. & J. Weir Holdings Limited will be held on June 1st at Cathcart, Glasgow.

The following are extracts from the circulated statement by the chairman, Viscount Weir, CBE:

During 1959 the Government relaxed the restrictions imposed on credit and borrowing, and this produced an upsurge in demand in which the main beneficiaries were the manufacturers of consumer and consumer durable goods. Unfortunately, the position was markedly less favourable in the field of capital goods, where new demand remained at a low level, both at home and abroad, although there were signs of improvement towards the end of the year. In particular, recession conditions continued in the shipbuilding industry; although United Kingdom yards maintained output at the level of recent years, there were virtually no additions to the country's order book over the period, so that outstanding orders contracted by the amount of tonnage launched.

Against this general background of the national economy, your Companies experienced a favourable year's trading results which can be considered satisfactory both in respect of output and earnings.

The Trading Surplus of £2,476,387 was generated from a Group output in excess of £21 million, and this I consider to be satisfactory under the conditions prevailing.

The charge for taxation, after crediting £103,907 in respect of over-provisions in previous years, amounts to £1,218,956 compared with £1,398.449, leaving a profit of £1,256,143 compared with £1,123,173 for the preceding year. Your Board now feel justified in recommending a final distribution of 12 per cent to Stockholders, making a total of 18 per cent compared with 17 per cent for 1958.

DEVELOPMENTS

This year was notable for a number of interesting developments in the growth and expansion of your Group. These can be regarded as logical extensions of current activities, and should be helpful in expanding the range of our products and improving our competitive position.

The most important was the acquisition of Lobnitz & Co. Limited. Stockholders will recall our purchase two years ago of the business of Wm. Simons & Company Limited. Its neighbour is the Shipyard and Engine Works of Lobnitz & Co. Limited. Both firms have been for many years the leading builders in the United Kingdom of dredgers and other harbour craft, and both enjoy the highest reputation in this very specialised branch of shipbuilding. It became increasingly clear to your Board that considerable advantages would be secured if the two Companies were operated as a single unit. We therefore entered into negotiations with the Proprietors of Lobnitz, with the result that the Company became a wholly-owned subsidiary of your Group. At the end of the year the two businesses were integrated into one Company under the name Simons-Lobnitz Limited. Substantial progress has already been made in the rationalisation of the departmental activities of the two firms, but it will be some time before the full benefits of integration are experienced As an immediate advantage, however, our competitive position in the dredging industry has been much improved through the pooling of their joint wealth of experience and know-how.

During the year, G. & J. Weir Limited concluded an agreement to manufacture under licence the complete range of reciprocating and centrifugal compressors designed by Clark Brothers of Olean, NY, USA, a well-known member of the Dresser Industries Group of Companies. Through this arrangement we will be able to manufacture Clark products in the United Kingdom, and these will be available for sale throughout the sterling bloc through the Clark Bros. Co. Division of Dresser (Great Britain) Limited.

A third new development also concerns an association with an American Company. G. & J. Weir Limited have entered into an agreement with the Chicago Bridge & Iron Co. of Chicago, Ill., to form a joint company known as "Weir-Chicago Bridge Inc." for the manufacture and sale of Weir distillation plants in the United States

After reviewing the performances of the individual companies of the Group, the statement continues:

PROSPECTS

For 1960 our results will now be affected by the low level of Orders in 1958 and 1959 which the two major trading companies have experienced. These predicate a reduction in their joint output as compared with 1959. The orders from which this output is derived comprise contracts secured under very competitive market conditions, and it will be subject to increased wage costs as a result of the recent hours/wages award to the Engineering Trade Unions. The other members of the Group should fare better.

Reviewing the effect of these factors as a whole, we must expect a reduction in our gross earnings when we compare them with the results of 1958 and 1959. On the basis of our current estimates, this reduction could be material, but I would not expect our level of distribution to be significantly affected; indeed, I believe it may well be possible for us to maintain our current level of distribution in 1960—although of course I cannot be bound to any specific undertaking in this regard.

The prospects in the shipbuilding industry, in the opinion of those best qualified to judge, remain depressing; but in other ways we are finding grounds for encouragement. Already the intake of orders has slightly improved; there are encouraging expectations of potential business on the land side, and in particular a high level of interest and enquiries for our sea water distillation plants. We have a solid foundation of technical strength within the Group, and the progress in design which has taken place within the last three years has been satisfactory. During this time we have accomplished much useful work throughout the Group in the improvement of our existing products and will therefore be in a very favourable position when demand improves. Your Group's financial position is clearly one of substantial strength and I am confident that we shall continue to give a good account of ourselves.

ALLIANCE ASSURANCE COMPANY LIMITED

Extract from the Review of the Report and Accounts for the year 1959 by the Chairman, Mr T. D. Barclay

The year 1959 has been one of outstanding importance in the history of the Company having regard to the merger with the Sun Insurance Office Limited. Pursuant to the Offer dated October 14, 1959, conveyed to the Shareholders of Alliance and Sun by Baring Bros. & Co. Limited on behalf of Sun Alliance Insurance Limited the whole of the capital of both Companies was acquired by Sun Alliance in exchange for Sun Alliance Shares.

Underwriting profits showed a reduction but the investment income increased and after allowing for lower tax charges the final figures show a net profit for the Group of £1,535,517 as compared with £1,453,693 in 1958.

The premium income in the Fire, Accident and Marine Departments continued to expand and amounted to £20,746,261 as compared with £19,531,269 in 1958.

LIFE DEPARTMENT

The net new sums assured completed during the year amounted to £18,632,138 compared with £15,367,184 in the previous year.

The purchase money for immediate annuities was £741,544 as compared with £223,466 and deferred annuities were issued for £316,979 as compared with £316,236.

FIRE DEPARTMENT

In this Department the net premiums rose from £7,921,047 to £8,327,554 and the claims rose from £3,006,323 to £3,342,576. The result for the year was a surplus of £829,243 as compared with £859,358 in 1958.

MARINE DEPARTMENT

The net premium income was £2,484,645, which shows an increase of £187,277 compared with last year's premium income.

The Underwriting Account for 1957 has now been closed with a balance of £177,588. Settlements arising from previous years' Accounts, however, amounted to £229,233 and a transfer from Profit and Loss of £51,645 was necessary.

ACCIDENT DEPARTMENT

The net premiums in the Accident Department amounted to £9,934,062 as compared with £9,312,854 in 1958. The claims rose from £4,603,349 to £5,007,590 and the surplus, after providing for unexpired risks, increased from £654,998 to £695,939.

The Engineering business of the National Boiler & General Insurance Co., Ltd., whose figures are included in the Consolidated Accounts, resulted in a record surplus.

TRUSTEE DEPARTMENT

This Department continues to provide a useful service to many friends and connections of the Company. The total fees received during 1959 amounted to £31,531.

INVESTMENT DEPARTMENT

The substantial rise in the equity price level naturally involved the acceptance of a relatively lower initial yield on new equity purchases in 1959, but this factor was more than offset by the steadily rising dividends on the whole equity portfolio and the relatively high yields still available on new fixed interest investments. As a result the over-all gross Income Yield on the whole fund increased further from £5 7s. 8d. per cent in 1958 to £5 12s. 6d. per cent in 1959.

In the case of the Shareholders' Funds also the favourable margin between Book and Market Values increased to a record figure and the gross investment income rose further to £1,308,018, an increase of some £87,000 on the year.

PROFIT AND LOSS ACCOUNT

The Consolidated Profit after provision for taxation and other outgoings amounted to £1,535,517 as against £1,453,693 in 1958.

As a result of the merger the Alliance has now only one proprietor and the new Holding Company, Sun Alliance, might be described as being in the position of guardian or trustee for our old Stockholders. The latter received their last dividend direct from the Alliance at the rate of 2s. per Alliance share paid in January, 1960. We now propose a further 3s., which will make a total of 5s. per share paid by the Company in respect of 1959, representing an increase of 9d. per share on the distribution of 4s. 3d. which was paid for 1958. The cost of this increased distribution is £880,470, after allowing for income tax. The final dividend, costing £578,282 after allowing for income tax, will be paid to Sun Alliance and together with the appropriate distribution from the Sun will enable the Holding Company to declare a dividend of 1s. 6d. This is the amount forecast in the original form of Offer. The balance of our profits will be carried forward.

RAND MINES, LIMITED

PROVINCIAL INSURANCE COMPANY LIMITED

The Annual General Meeting of the Provincial Insurance Company Limited will take place at Kendal at noon on May 27, 1960. The following is the statement of the Chairman, Mr Peter F. Scott:

Before I review the year's results, I wish to announce two important changes in the Board, Sir Bernhard Binder retired in November last after thirty-one years as a director. His wisdom, experience and keen interest have been a source of great strength ever since he joined us when we were newcomers to the City with assets of less than one million pounds. My father, Mr F. C. Scott, also decided to retire last autumn, having given me invaluable help during the three years since he handed over the chairmanship. He had completed fifty-six years with the Company and forty-four years as a director, during which time he held the offices, first of Secretary, then Managing Director, Chairman and latterly President.

I shall ask you to approve the election to the Board of Mr Harold Wincott and Mr J. O. Blair-Cunynghame, OBE. Mr Wincott is well known in financial circles and we have had the benefit of his advice for the past year. Mr Blair-Cunynghame will put at our disposal his wide experience acquired in the course of a distinguished career at Cambridge as well as in industry and commerce.

I have also to report that, as already announced in the press, Mr J. G. Henderson relinquished his appointment as General Manager on March 31, 1960, and leaves with every good wish for the future. He is succeeded by Mr W. H. Gee, who joined us in 1947, and has been Deputy General Manager since 1958.

The following table sets out the main features of this year's accounts, with the corresponding figures for 1958:

	1959	1958
	£	£
Premium income	9,214,737	8,705,334
Underwriting profit	99,097	−84,101
Percentage of profit	1·1	−1·0
Interest, dividends and rents	685,263	621,421
Sundry charges, less credits	113,169	166,604
Surplus before taxation	671,191	370,716
Taxation	307,044	180,721
Dividends (net)	282,049	246,938

Premium income increased by rather more than £500,000 and this takes account of the rigorous pruning of our Canadian business which will be further reduced in the coming year. This remedial action of our Canadian managers has contributed to rather better results in Canada, and I am glad to have this opportunity of thanking Independent Insurance Managers Limited for their loyal co-operation in carrying out a continuing task of great difficulty.

The home account, still the larger part of our business, produced a moderate profit in all departments. Overseas we were not so fortunate but the process of consolidation to which I referred last year goes on. Our large account in Southern Africa still gives us cause for concern, but progress has been made in Australia, Nigeria, the Far East and East Africa. We have made a satisfactory start in Ghana, where the Ghana General Insurance Company Limited was incorporated during the year in concert with the Ghana Insurance Company Limited. A relatively small account in Venezuela is, however, causing anxiety.

In a year of virtually stable prices, the increase in premiums is a real gain and, what is even more important in this context, expenses have been held at approximately last year's level.

FIRE DEPARTMENT

	Premiums	Underwriting profit	Percentage of premiums
1959	£1,569,711	£35,454	2·3
1958	£1,497,364	−£14,873	−1·0

Home fire losses in 1959, of which we had our share, have received considerable publicity. These disastrous fires, involving exceptionally large concentrations of value, are evidence of a trend which is causing anxiety to underwriters. Under stress of competition there appears to be a general lowering of the underwriting standards on which the reputation of the British insurance market was established. Symptoms of this are a tendency towards wider cover without adequate rate increases, failure to insist on higher standards of fire protection, and widespread under-insurance.

ACCIDENT DEPARTMENT (INCLUDING MOTOR)

	Premiums	Underwriting profit	Percentage of premiums
1959	£6,287,160	£63,643	1·0
1958	£5,907,673	−£69,228	−1·2

Nearly all sections shared in the advance of premiums to which the largest contributor is the home motor account. Here the cost per claim continues to creep upwards year by year, and in 1960 the rise will be the steeper because of the increase in legal charges now in force. If, in addition, the incidence of claims continues to rise, fresh losses on motor business must inevitably lead to further increases in premium rates.

MARINE DEPARTMENT (INCLUDING AVIATION)

	Premiums	Marine Fund	Percentage of premiums
1959	£1,357,866	£1,662,700	122
1958	£1,300,297	£1,636,117	126

There are grounds for believing that the hull account is now more soundly based than it has been for some years, but cargo underwriting, which has to meet considerable international competition, is causing anxiety. Premium income shows a small increase, due largely to the efforts made in the market to improve aviation rates, and to the introduction of high-valued jet aircraft.

In the consolidated balance sheet, where total assets are approximately £14 million, there are no significant alterations. Investments of about £10 million are shown at or under cost, and the capital appreciation of holdings of ordinary shares, which have a book value of over £3 million, adds to the financial strength of the Company. The fall in the proportion of freehold and leasehold properties reflects the sale of a property-owning subsidiary company.

I referred last year to an arrangement whereby our staff would be able to acquire ordinary shares of the Company on favourable terms. The scheme was received with enthusiasm, and in its first year has met with considerable success, 43,020 shares having been taken up.

Our gross interest earnings having increased to £685,263, the directors recommend a dividend of 2s. 1½d. on the ordinary shares, an increase of 3d., which, less income tax, amounts to £263,112.

In closing, I should like to express thanks, on behalf of the shareholders and directors, to staff at home and overseas for their loyalty and enthusiasm, to managers on whose energy and enterprise we depend, and finally to all friends, local directors, and agents, at home and overseas, for their support.

MELBOURNE AND GENERAL INVESTMENT TRUST LIMITED

SIR DENYS LOWSON'S REVIEW

At the Annual General Meeting of the Melbourne and General Investment Trust Limited held on May 4th at Estates House, Gresham Street, London, E.C., Sir Denys Lowson, Bart (the Chairman), who presided, said:

The gross revenue for the year to February 28, 1960, amounted to £80,069; thus showing an increase of 17.5 per cent over the total revenue of £68,138 for 1959. This revenue represents a further record in the history of the company, and we are not unhopeful that the results for the current year will show some further improvement.

The proposed final dividend on the Ordinary shares of 14 per cent, makes a total distribution for the year of 24 per cent and compares with 21 per cent for 1959. This distribution is paid out of net earnings on the Ordinary capital of 31.5 per cent and entails a priority distribution of 28.8 per cent—83.0 per cent out of the total net revenue for the year after all expenses.

From a capital angle we also have a satisfactory picture to present. The appreciation of the investments over book value amounted at February 28th last to 99.2 per cent, as compared with 44.00 per cent at the same date in 1959.

CARLTON AND UNITED BREWERIES

As shareholders are aware, we have a substantial investment in Carlton & United Breweries of Melbourne, which constitutes our only unquoted investment. This is one of the leading brewery companies in Australia; and through sound and enterprising management has shown notable progress for many years past. Notwithstanding the fact that they again made an increased distribution on their Ordinary shares, the total dividend only represented 43.95 per cent of the actual cash earnings of that company; and left no less than £A1,552,000 to be ploughed back into the business and on which increased earnings may reasonably be anticipated in the future.

Beer can rightly be described as one of the growth industries in Australia at the present time. During the last 20 years, the annual production has risen from 89 million gallons to 228 million gallons of beer, an increase of no less than 156 per cent. Furthermore, during that period the consumption of beer per head has increased by 79 per cent. Bearing in mind the probable further increase in the Australian population, the low rate of unemployment as well as the past record of Carlton & United

Breweries, I think we can continue to expect this company at least to maintain its rate of growth during the next few years.

AUSTRALIA'S REMARKABLE EXPANSION

The expansion of Australia as a whole over the last 20 years has been remarkable. The Gross National Product has increased from £A949 million in 1939 to £A6,197 million in 1959, and even if one makes allowances for the rise in the cost of living over that period and the fall in the purchasing power of money, the increase in real terms works out at approximately 118 per cent.

It may reasonably be anticipated that the population in Australia will double over the next 30 to 35 years; the current rate of increase being about 2½ per cent per annum. In spite of this achievement and the growth of its secondary industries, Australia has not yet reached the stage in her economic development where she can meet all her own capital requirements; so that the maintenance of the past rate of expansion must to some extent be dependent on further capital investment coming into Australia from overseas.

Apart from this investment, we have a well-spread general portfolio and your directors look forward with confidence to the future of this company.

The resolution for the adoption of the report and accounts was seconded by Sir Keith Officer and carried unanimously; and the proceedings closed with a hearty vote of thanks to the chairman, directors and staff.

CRUSADER INSURANCE COMPANY LIMITED

In his annual statement, the Chairman of the Crusader Insurance Company Limited, Mr Harvey Bowring, observes that in 1959, the Company's Diamond Jubilee Year, the overall net premium income showed an increase of £343,699 over 1958.

Since 1954 (when he became Chairman) the assets have doubled, from over £5 million to more than £10 million, new Life Sums Assured, other than Group, have increased 2½ times to £6,487,655, net Fire Premium income 2½ times to £245,315, and Sickness and Accident and Miscellaneous net Premium income from £556,389 to £905,322.

The yield on the assets of the Life Assurance Fund was £5 11s. 7d. per cent, £1 1s. 10d. per cent more than in 1954.

There are now over 1,100 Group Schemes in operation, and although the National Insurance Act, 1959, introduced a graded pension element, this innovation may well have an effect on Pension Scheme business similar to the impetus on Sickness and Accident Insurance provided by the National Health Service Act, 1948.

Overseas operations, particularly in Africa, have been a promising feature and there should be ample scope for development.

In referring to the future, the Chairman expresses the opinion that, in a free enterprise community, there is surely room for concerns of all sizes provided they are imbued with a spirit of initiative. The Company looks forward to growing bigger—but by its own efforts—with ever increasing opportunities for those who merit them.

In his conclusion, the Chairman says: The extent to which the future of the Company will depend on the staff is fully realised and I find it increasingly difficult adequately to pay tribute for the notable part they have played.

ABERDARE HOLDINGS LIMITED

The twenty-fourth ordinary general meeting of Aberdare Holdings Limited was held on May 10th in London, Sir John Pascoe (the chairman) presiding. In his circulated review, the Chairman, commenting on the financial results, said: We have now maintained our dividend at 17½ per cent, less tax, for six years, but clearly your Directors could not even contemplate an increase whilst the very low price levels obtain in the Cable Industry.

Aberdare Cables Limited.—Sales for the year were considerably lower than that for the previous year. Furthermore, very severe competition developed among the cable manufacturers with consequent lowering of the price level. Although there has been a slight improvement recently, the price level is still unremunerative.

South Wales Switchgear Limited.—Our turnover is still increasing with a very satisfactory amount for export.

Aberdare Engineering Limited.—The total contribution to the profits of the Group fell, but not to any very serious extent.

Treforest Electrical Services Limited.—Although your Company held a considerable interest, control was only obtained shortly before the end of the year, and we have since made an offer for all the Minority Shares. We anticipate the extension and expansion of this business.

South Wales Electric (Pty) Limited and Aberdare Electric Africa Limited.—These wholly owned Subsidiary Companies will, we expect, render increasing assistance to South Wales Switchgear Limited and to the profit of the Holding Company in future years. The report was adopted.

HEVEA INVESTMENT COMPANY

The annual general meeting of the Hevea Investment Company Limited was held on May 5th in London, Mr C. C. Loveday (the Chairman) presiding.

The following is the chairman's statement to members circulated with the report and accounts for the year ended December 31, 1959.

I am pleased to report that the profit of the Company for the year under review after providing for all expenses amounts to £22,716, as against £13,851 for the previous year. This result may be considered satisfactory, bearing in mind that the new money raised by the rights issue was only available during the last few months of the year, but we must remember that the broadening of our interests by the purchase of shares in Industrial undertakings must result in an initially lower yield than was previously received from our holdings in Rubber Companies.

An interim dividend of 10 per cent less tax was paid in June, and it is now recommended that a final dividend of 12½ per cent less tax be paid on the increased capital of £66,000.

Your Directors propose that £6,600 of our reserves be capitalised by the issue to Members of one new share for every 10 held at the close of business on May 4, 1960, and we feel confident that for the current year we shall at least be able to maintain our present rate of dividend (22½ per cent) on the Capital as increased by this issue.

You will also be asked to sanction the increase of our Authorised Capital to £400,000 to enable us to carry on our expansion policy as opportunities offer.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION LIMITED

The seventy-fourth Annual General Meeting will be held on May 25th at Perth. The following is an extract from the circulated address of the Chairman, Sir Stanley Norie-Miller, Bt, MC, DL, JP:—

The Group again showed considerable expansion though the rate of progress was not quite so marked as in 1958. Income from all sources advanced by over £7,000,000 to reach a total of £78,733,610.

Trading was more profitable and the revenue balance for the year was the record one of £3,201,720 — compared with £1,891,991 in the previous year. Adding the amount brought forward there is available for appropriation the sum of £4,380,504.

Allocations totalling £950,000 have been made to Departmental Funds and £500,000 to General Reserve. It has been decided to dispense with the Contingency Reserve, transferring the amount of £500,000 therein to General Reserve, which is consequently increased by £1,000,000 to £4,000,000.

Your Directors recommend a Final Dividend of 1s. 6d. per unit on the increased capital, namely £5,400,000 of Ordinary Stock. If the recommendation is approved the net cost of dividends on the Preference and Ordinary Stock after deduction of tax will amount to £1,413,344. Net interest earnings and dividends on investments for the year amounted to £2,325,577.

The total new sums assured of £23,179,734 represented the combined business of The General Life Assurance Company and The English Insurance Company Limited. Premium income—new and renewal—in the Life Account was £4,487,946, an increase of £714,934, while Consideration for Annuities granted amounted to £831,203 compared with £133,339 the previous year. The ratio of Expenses and Commission at 12.31 per cent showed a further improvement, being 1.95 per cent lower than in 1958.

The problems inseparable from our substantial portfolio of Motor business show little sign of abatement. Accident frequency continues to increase and the average cost of each claim rises steadily. The maintenance of a high standard of underwriting based on many years of experience, coupled with economy in working expenses, has served to ameliorate the situation, but the Motor Account is still unprofitable. Fortunately other classes of Accident and General business continue to yield a satisfactory profit, and this was especially true of the 1959 results.

In the decade just ended we handled no less than £419,000,000 of Accident and General premium income and on it we earned a profit of no more than 1.67 per cent.

Once again our Fire Account demonstrated its superlative quality and produced the highest profit we have ever recorded.

SELANGOR RIVER RUBBER ESTATES

The twenty-eighth annual general meeting of Selangor River Rubber Estates, Limited was held on May 11th in London, Mr G. D. Wreford-Brown, OBE (the Chairman), presiding.

The following is an extract from his circulated statement:

I am very pleased that, in my first year of office as Chairman, we are able to recommend a Final Dividend of 17½ per cent, less tax, making the total distribution 30 per cent. This equals the best ever distribution for 1957 but, in that year, you may remember, the dividend contained an element of once for all from taxation relief arising out of transmission of the Company to the status of an Overseas Trade Corporation. The profit for 1959, in fact, was our highest ever; our crop was up by 171,000 lbs., our net sale price improved by 5¾d. per lb. and, despite substantial increases in production costs and export duty, our profit from Estate operations came out better at £60,642 as against £38,432 for 1958. Our investment income, too, was up by £7,898, thanks to a 60 per cent distribution by our Subsidiary Company as against 40 per cent for 1958. The improvement in the market price of rubber, of course, is primarily responsible and, I am glad to say, continues to maintain its improvement.

We have sold a small part of next year's crop up to June at 32d. per lb. cif, a happy augury for the near future. But, what must be far more gratifying to Shareholders, is the resurgence of interest in the rubber share market and the consequent improvement in the value of their holdings. The report was adopted.

LONDON AND RHODESIAN MINING AND LAND COMPANY

The Fifty-first Annual General Meeting of the Company was held on May 4th in London. In the absence of the chairman, Brigadier S. K. Thorburn, due to indisposition, Mr A. H. Ball, the Managing Director, read the Chairman's statement, from which the following are extracts:

The accounts cover a fifteen-month period following upon our decision to change the Company's financial year-end from June 30th to September 30th.

Total net revenues at £181,536 compare very favourably with the total for the twelve months ended June 30, 1958, of £128,000.

The profit before taxation at £124,973 was over 50 per cent higher than in the previous twelve months and of this amount taxation absorbed £40,855. The net profit amounted to £82,372 (as compared with £43,397).

In view of the necessity to maintain the group's liquid resources, the Board has been conservative in providing for a total dividend of 7½ per cent less tax, absorbing £45,938 (as against 5 per cent absorbing £28,750 in the previous year).

The Consolidated Balance Sheet discloses what I regard as a strong position.

Looking towards the future of your Company, the figures that I hope to put before you in a year's time should be satisfactory and the profits at least as good as for 1959.

The report and accounts were adopted.

THE MANGANESE BRONZE AND BRASS COMPANY

REDUCED VOLUME OF MARINE WORK

EXPANSION OF OTHER INTERESTS

MR J. C. COLQUHOUN ON SCOPE FOR CONSIDERABLE IMPROVEMENT

The sixty-first ordinary annual general meeting of The Manganese Bronze and Brass Company Limited was held on May 10th at 2 London Wall Buildings, London, E.C.2, Mr J. C. Colquhoun, MBE (the chairman), presiding.

The following is an extract from the Chairman's circulated statement:

In my Statement a year ago I mentioned that some reduction in the volume of work must be expected in 1959. That has been so as regards the products which we sell to shipyards at home and abroad, including propellers. In other directions, however, sales have increased, although not sufficiently in the year under review to offset the drop in earnings on marine products. Consequently, for the first time for six years I am unable to report that earnings have risen to a new record level. The reduction in taxation and the increase in capital allowances introduced in the 1959 Budget, however, makes it possible to repeat the same gross rate of dividend distributions as in the previous year and still show an increase in the surplus for the year after making all provisions for taxation and dividends.

The Group Accounts for the year ended December 31, 1959, show a profit before taxation of £610,225 (against £673,722 for the year 1958). This was after charging for depreciation £125,965 (£111,688). Provision for taxation requires £266,097 (£344,904) leaving a net profit for the year of £344,128 (£328,818).

Your Directors recommend that a final dividend for the year of 8d. per share be paid on the Ordinary Shares, making 1s. 0½d. per share for the year (same). If approved the surplus remaining will amount to £200,382 (£193,873).

NEW ACQUISITION

As announced on September 30th last, we have still further widened our range of products by the acquisition, for cash, of Redro Limited and its subsidiaries, Deans & Son (Yorkshire) Limited and Beverley Fibre Glass Limited, all situated at Beverley, Yorkshire. This Group specialises in manually- and power-operated doors and door systems, seats and aluminium castings, fittings and fixtures for road and rail passenger transport vehicles.

WORKS REPORTS

Birkenhead Works.—The output of marine propellers from your Birkenhead Works was somewhat lower than the record figure achieved in 1958 and reflects the diminishing activity in shipbuilding.

The performance required from marine propellers continues to become more exacting. This has resulted in a greater proportion being produced in NIKALIUM than in any previous period. The trend of development by our design staff has been in the direction of more complex designs and more complicated blade sections and calling for still greater accuracy in manufacture. For the time being, at any rate, this has led to increased production problems and costs.

The design and manufacture of propellers for major passenger liners has long been a feature of our work and during the year we supplied propellers for the "ORIANA" and "WINDSOR CASTLE," due to go into service in 1960, and towards the end of the year working propellers for the new P. & O. liner "CANBERRA," all of which are SCIMITAR/NIKALIUM propellers.

The controllable pitch propeller supplied during the previous year has proved extremely successful for deep sea trawling and additional equipment of this nature will be supplied at an early date.

Although there was a substantial reduction in our commitment for propellers by the end of the year, it is still at a high figure and a full casting programme is already available for 1960.

Handford Works.—The first of the modifications to the extruding plant at Handford Works has been completed and thanks to the use of a new process it has been possible to substantially increase the size of billet that can be extruded on existing plant.

During 1960 a second scheme will be introduced to increase our production of wrought metals.

Sales increased steadily throughout the year, and whereas in my previous report I had to advise a substantial reduction in the order book, I am now pleased to state that the forward position is satisfactory.

Elton Park Works.—Tests on new types of presses proved them to be faster and more efficient than existing equipment and further orders have been placed in order to expand our production.

STEVEN & STRUTHERS LIMITED, GLASGOW

Considerable improvements and modifications have been carried out at the Works and during the year the assembly of aluminium cab ends for diesel locomotives was undertaken on behalf of Lightalloys Limited, but it was not until towards the end of the year that a final decision was made as to further expansion and shops are now being prepared for the production of special marine products and for the manufacture of rigid foam doors that are at present made at Willesden.

CAPLIN ENGINEERING COMPANY, LIMITED

During the year the plant was transferred to the Willesden factory of Lightalloys Limited, and the Caplin site sold.

There has been considerable interest in the quartz cutting and lapping machines and many orders have been obtained, not only at home but in Europe and America, with the result that the sales for the year are very satisfactory and there is a substantial order book for the future.

It is proposed to erect shops on our Elton Park site at Ipswich for the transfer of the whole of the plant during 1960.

LIGHTALLOYS LIMITED

The Works, which depend markedly upon the British Railways programme were affected by the delays in the Modernisation Scheme earlier in the year, but with the placing of the contracts rapid progress was made and sales more than maintained. The development of rigid foam products and the making of doors for marine purposes progressed and finally resulted in a substantial order for doors to be installed in the "Canberra" and "Oriana."

Orders for aluminium castings continued at a high level but prices for this work are extremely keen.

DEANS & SON (YORKSHIRE) LIMITED

With the purchase of the Beverley Group of Companies at the end of September, attention had to be turned to the transfer of production to that site and this has called for considerable thought and co-operation between the respective executives, whilst at the same time the sales and production programmes have to be carefully synchronised to minimise the loss of output during the transfer period.

In regard to the future, plans have been completed and work started on a considerable extension to the factory at Beverley. When completed it is our intention to transfer a large part of the production of Lightalloys Limited to Beverley with the economic advantage of having one large unit for similar products. Other products will be transferred to Glasgow and Ipswich, so that the Willesden site of Lightalloys Limited can be sold. Lightalloys Limited will continue to trade under that name with sales and design offices in London.

GENERAL

The outlook for our marine products of course depends on shipbuilding prospects which, to quote from the information office of The British Shipbuilding Conference, cannot be said to be measurably brighter, even with the improvement in new work placed in December. The Company's interests in other products have been extended in the past three years and here there is scope for considerable improvement although we do not expect to get the full advantage in 1960.

The report and accounts were adopted and the dividends, as recommended, were approved.

THE PYRENE COMPANY

NET PROFIT UP

CAR BUMPER PROJECT

MR FRANCIS A. J. HARRISON'S STATEMENT

The forty-sixth Annual General Meeting of The Pyrene Company Limited will be held on May 31st in London.

The following is an extract from the statement by the Chairman and Managing Director, Mr Francis A. J. Harrison, circulated with the report and accounts for the year ended December 31, 1959:

The Group profit of £381,976 after tax is £13,567 higher than the record established in 1958. Without the exceptional expenditure necessarily incurred in the launching of the "Pyrene" Home Fire Extinguisher, the Group profit, before tax, would have been slightly higher than that of 1958. The directors recommend a final ordinary dividend of 16¼ per cent, less tax, making a total dividend for the year of 27½ per cent.

Due to the irregular receipt of airfield crash truck contracts, the overall sales of the Parent Company did not quite reach the 1958 record, the difference being 1.6 per cent. General Sales Division sales, which do not include vehicles, were in fact up by over 10 per cent.

This includes, of course, sales of the "Pyrene" Home Fire Extinguisher. The cost of launching it was not recoverable in the first year. Having launched it, however, steady sales continue. Meanwhile, overseas sales are being developed.

The Motor Car Bumper Division's sales achieved a gain of nearly 10 per cent, but the margin of profit was not maintained, due chiefly to the introduction of new models and of methods to improve corrosion resistant finishes. The Metal Finishing Division scored an all-time record with an increase in sales of 18 per cent.

The total value of orders outstanding at the end of 1959 was some 12 per cent higher than at December, 1958.

The combined direct and indirect exports of the Parent Company amounted to 48 per cent of the year's total turnover. With the exception of crash trucks the value of direct exports was again higher.

LOOKING FORWARD

Operating profit of the Parent Company for the first quarter of 1960 is comparable with that of the first three months of 1959, and the rate of incoming orders is being well maintained.

The main new development derives from the increased number of bumpers that will be required to keep pace with the growth of our Motor Car Manufacturer customers' production.

To achieve the required output we have planned large plant developments in two main stages involving investment, including working capital of a sum approaching £1 million during the period up to the end of 1962.

Negotiations with one of the Ministries for the lease or purchase of a factory in South Wales are already at an advanced stage. This factory, complete with canteen and other services, has a floor space of some 90,000 square feet. Plant to the value of £362,000 has been sanctioned for production there. The delivery and installation of this plant will complete phase one of the project. We expect to employ some 300 people at this factory.

To deal with more immediate increase in production, auxiliary finishing plant is being extended at another site and the new "flow" line layout at Great West Road will be completed by August next.

It will be realised that the outlook, particularly in Bumper production, is one of expansion but the expense necessarily incurred, in order to achieve it, is likely to retard profits of the Division during the current year.

APPOINTMENTS

REPUBLIC OF THE SUDAN

Applications are invited from those suitably qualified to fill vacancies in the Khartoum Technical Institute, Ministry of Education, Sudan, as Senior Lecturers and Lecturers in Accountancy. Candidates should be professionally qualified Accountants and should hold the A.C.C.A. Teaching experience in a similar appointment will be an advantage. Minimum age 25 years.

DUTIES:

Those appointed will be required to prepare students for the Intermediate Examination of the Association of Chartered and Corporate Accountants.

TERMS OF SERVICE:

Appointment will be on contract, with bonus, for a period of up to five years. Salary scale ranges from £S.1,075 to £S.1,975 for Senior Lecturers and £S.1,075 to £S.1,675 for Lecturers. Point of entry into scale will be determined according to age qualifications and experience. A cost of living allowance, which is reviewed every two months, is payable. An outfit allowance of £S.50 is payable on appointment.

Full particulars and application forms are available from the Appointments Section, Sudan Embassy, 3 Cleveland Row, St. James's, London, S.W.1. When applying, please quote reference 4/1027.

Closing date June 30, 1960.

For further appointments and other classified advertisements see pages 648, 708, 709, 710 and 711

UNIVERSITY OF EDINBURGH

LECTURESHIP IN THE DEPARTMENT OF ACCOUNTING AND BUSINESS METHOD

Applications are invited for the post of Lecturer in the Department of Accounting and Business Method. A practical knowledge of costing and management is desirable. Salary scale, £900 by £50 to £1,100; Bar; £1,150 by £50 to £1,350 by £75 to £1,650 per annum, with placement according to qualifications and experience, and with superannuation benefit and family allowance where applicable.

The successful candidate will be expected to take up duty on October 1, 1960.

Further particulars may be obtained from the undersigned, with whom applications (six copies), giving the names of two referees, should be lodged not later than June 4, 1960.

CHARLES H. STEWART,
Secretary to the University.

BUSINESS AND PERSONAL

CLIENT willing pay five times profits, plus surplus assets at par, for limited number sound manufacturing businesses. Ideas Marketing Pool, Ltd., 6-8 Old Bond Street, London, W.1.

GERMAN BANKER

in Frankfurt/Main and West Berlin with excellent connections among financial institutions, industry and trade is willing to act as representative for British and American financial or industrial organisations, also for investments in German enterprises. Write Box KL 274 Ernst W. Bohle, Advt. Agency, Klockmannhaus VI, Hamburg, Germany.

FOUND new interest in Photography since Zeiss, Leica, Rollei, Bessamatic, Retina are available NEW from Wallace Heaton, Ltd., The Camera Specialists, 127 New Bond Street, London, W.1.

THE CUNARD STEAM-SHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the Eighty-third Annual General Meeting of The Cunard Steam-Ship Company Limited will be held in Cunard Building (Fifth Floor), Pier Head, Liverpool, on Wednesday, June 1, 1960, at 11 a.m.

(1) To receive and consider the Statement of Accounts for the year ended December 31, 1959, with the Reports of the Directors and Auditors.
(2) To sanction the declaration of dividend for the year 1959.
(3) To elect Directors in place of those retiring but who, being eligible, offer themselves for re-election.
(4) To fix the remuneration of the Auditors.

By Order of the Board,
H. M. GOULDEN,
Secretary.

Offices: Cunard Building, Liverpool.
May 7, 1960.

Note to Members. A member entitled to attend and vote is entitled to appoint one or more proxies to attend and vote instead of him. A proxy need not also be a member.

COMPANY AFFAIRS

Boots Pure Drug

THE shares of Boots Pure Drug have often been ranked in the vigorous growth category of Marks and Spencer, and this rating is well justified by the results to March 31st. Group profits before tax soared by over 50 per cent from £4,997,839 to £7,560,697 and the ordinary dividend is set at 21 per cent, against 16 per cent last year and the market's expectation of 18 per cent. Moreover, the increased dividend is still almost twice covered.

The results certainly bear out the brave forecast made by the chairman last July, when he expressed considerable optimism about the company's prospects. It is clear however that Boots does not intend to rest content. The company is spending some £15 million in the next five years in refitting and rebuilding many of its 1,300 shops to double the total sales area of its shops within ten years. So, even on this excellent dividend, the 5s. ordinary units at 33s. 3d. still yield only 3.1 per cent, which presumes further benefits to come.

Sears Holdings

WHILE Watney Mann makes its second takeover bid within a week, Mr Charles Clore, the chairman of Sears Holdings, refers in his statement with the full accounts to its own abortive bid for Watney Mann last May. The bid of 60s. was certainly a shrewd one, as is proved by Watney's present trading position, but Mr Clore says that when the shares shot up by 50 per cent to 75s. he did not consider it right to raise the bid to a figure not justified by the asset backing. (It may be noted that the shares now stand at 82s., ex the hired-off property company whose shares stand at 108.)

Mr Clore is still intent on adding to Sears' interests but he repeats that he does not intend to pay prices that discount the future too fully. There was further expansion in the group last year with the acquisition of the minority holdings in Scottish Motor Traction as well as the purchase of Mappin and Webb and Garrard the jewellers for some £4 million. In typical fashion, however, the cost of this investment has been almost halved by the sale of certain properties and small businesses in the Mappin and Webb group. Nevertheless the group's liquid assets have fallen from £8 million to £5½ million largely as a result of the increase in working capital from £22 million to £27 million.

The table shows that the new acquisitions have played a small part in total profits; but the other businesses in the group continued to expand so that net profits rose from £3,323,773 to £4,228,404. The ordinary dividend was maintained at 25 per cent on the capital as increased by a one-for-four scrip issue—an effective increase of 5 per cent. A further one-for-four scrip issue is now proposed, after which it is hoped at least to maintain the present rate of dividend.

Sales of the British Shoe Corporation, which contributed 50 per cent of Sears' total profits, again reached a new peak and trading profits advanced by 38 per cent. Mr Clore expects a further increase in profits from this group in the current year.

Gross profits:—	1958 £	1959 £
British Shoe Corporation...	3,208,000	4,436,000
Engineering	3,672,000	3,790,000
Motor distribution.....	244,000	410,000
Mappin and Webb Group...	...	260,000
Total	7,124,000	8,896,000

In the engineering section profits showed only a small increase and its proportion of profits fell from 52 per cent to 42 per cent. Bentley Engineering achieved record sales and record profits from the sales of knitting machinery and with its order book fuller than ever before Mr Clore forecasts still better results in 1960. The Furness group received no orders for new ships, but shipbuilding contributes a small proportion to total profits and Mr Clore would expect earnings from the engineering section to continue to rise even if there were no profits from shipbuilding.

During the year it is proposed to reorganise the many subsidiaries into the four sections indicated in the table with a self-contained subsidiary holding company in each section. Shareholders in Sears will not be affected by this change but Mr Clore believes that they will benefit from the improved co-ordination which will result. At 31s. 3d. the 5s. "A" shares yield 4.8 per cent on the indicated dividend, equivalent to 30 per cent on the present capital.

High Hopes for Breweries

THE lull in brewery take overs has been short lived. **Watney Mann,** with its acquisition of Phipps Northampton scarcely completed, has started talks with Wilson and Walker Breweries of Manchester on an amalgamation of the companies and has made a share exchange offer worth just over £3¾ million for Ushers Wiltshire Brewery, with which it made a mutual trading agreement last July. For every £100 stock in Ushers, Watney Mann offers 87 of its £1 ordinary shares and for each 6 per cent preference one new 6¾ per cent preference share. With Watney at 82s. the offer is worth 71s. 4½d., while Ushers now stand at 69s. 3d. compared with a price of 67s. before the bid.

For Watney the main attraction is that it will be able to use Ushers' spare brewing capacity at Trowbridge to meet its own heavy demand in the west country. The great attraction for Watney shareholders is the indication of sharply increased profits and the possibility of a good increase in income. Mr Simon Combe, the chairman, reveals that in the six months to the end of March the group's trading profits (excluding those of Phipps) rose by over 50 per cent, mainly as a result of the strong demand for its beers. Thus the interim dividend, which had been forecast at 5 per cent when the Phipps offer was made, is now stepped up to 6 per cent against an equivalent 3¾ per cent. Despite this increase the directors will not commit themselves beyond the forecast of a total distribution of 17 per cent already indicated. Even a normal English summer, however, ought to produce a higher total payment. On this conservative basis the £1 shares at 82s. yield just under 4¼ per cent.

If the offers are accepted, as is strongly recommended by the directors of Ushers, Watney Mann will become the largest brewing group in the country with over 5,500 houses (which will be increased by another 1,000 houses if terms are agreed with Wilson and Walker) compared with the 5,360 owned by **Ind Coope.** The latter has also announced an increase in its interim dividend, from 4 per cent to 5 per cent. For the year to August 31st, 1959, a total of 15½ per cent was paid and on this basis the 5s. shares at 19s. 6d. xd yield almost 4 per cent.

For **Whitbread** shareholders the 1959 results were a great disappointment; despite 2d off the pint and a glorious summer, group profits fell and the ordinary dividend was unchanged. While they await the full report and some explanation for the poor results, shareholders may be more pleased by the prospect of participating in a brewery investment trust, Whitbread Investment, which is to buy almost all of Whitbread's trade investments, and whose shares are to be offered on a rights basis to "A" and "B" stockholders of Whitbread. The scheme would be subject to the approval of the holders of the £1 million of 5¼ per cent debentures in the trust, for which there is already a stock exchange quotation.

The cash value of Whitbread's trade investments, which stem mainly from the many trade agreements made with other breweries, was £2,211,221 at the end of 1958. Of this £1,425,000 represented the holdings of the investment company, which was set up in 1956. At the end of last year, the trust's holdings totalled £1,533,000 with a book value of £3,330,000. Thus the actual amount of investments involved in the present scheme is the parent's own holding of £786,806 at the end of 1958 and further shares which have been acquired subsequently through trading agreements with such breweries as Flowers, Brickwoods and Bentleys.

Marks and Spencer

IN a year of very good results from department and multiple stores, Marks and Spencer's figures stand out so prominently as to give some justification for the yield basis in past months of just over 2 per cent on the shares. After further price cuts, the company has substantially increased its sales, its profits and, most significant of all, its profit margins. In the 53 weeks to March 31st sales rose by £14 million to £148 million, an increase of 10.4 per cent or 8½ per cent allowing for the extra week. Gross profits jumped from £17,053,107 to £20,116,229 and the margin of profit increased from 12.7 per cent to 13.6 per cent. Shareholders participate fully in these excellent results with an ordinary dividend of 40 per cent against an equivalent payment of 31¼ per cent, and the non-voting 5s. "A" units now yield just under 3 per cent at 72s. 3d.

From this year's profits, tax takes £8,725,000 against £7,350,000 and depreciation, repairs and maintenance take £2,309,974 against £1,994,392, so that net profits have risen from £7,708,715 to £9,081,255. The higher dividend absorbs £5,319,626 and is covered about 1¾ times. The major increase in sales occurred in the latter six months of the year to March 31st, including the prosperous Christmas period; but business has been very good since then, and investors can probably look for a further dividend increase in the current year, as they have without disappointment for some years past.

Guest, Keen and Nettlefolds

IN his statement last year Mr K. S. Peacock, the chairman of Guest, Keen and Nettlefolds, pointed out that the trading results for 1959 might show some decline unless there was some marked improvement in general conditions. After an improvement in the latter part of the year to January 2nd, trading profits of the GKN group in fact rose impressively by 9 per cent from £31,019,363 to £33,848,726. A fall in investment income was more than offset by a further drop in interest disbursements and with tax almost unchanged at £12,775,769 because of a substantial investment allowance relief of £822,757, net profits showed a smart rise from £11,243,342 to £13,012,074.

The ordinary dividend has been raised from 13 per cent to 15 per cent and is covered 3¾ times by earnings. Big profit retentions are still needed, not least for the £6½ million expansion programme in South Wales, which is to raise GKN's production of iron and steel there by one-third. This is to be financed from retained profits, but with a cash flow for 1959 of £17.2 million Guest, Keen and Nettlefolds should have little worry on that score. At 84s. 3d. xd the £1 units yield 3½ per cent.

Paper Prospers

"Expanding range of production at UK mills"
"A year of outstanding progress in packaging"
"Bridgehead in the European common market"
"Increasing productivity at Bowater's Canada mills"
"Tennessee mills in top gear"

IF it is true that only a small percentage of shareholders read their annual reports, even the most indifferent shareholder in **Bowater Paper** can flick through the 66 pages of the 1959 report and pick up these five headings, gaining a good impression of the company's performance and of its major activities. Further exploration will reveal that in a year which ended with all Bowater mills working at full capacity, trading profits advanced from £18.1 million to £20.1 million, while sales rose by £10 million to a new peak of £117 million. The record level of profits of the North American subsidiaries, which account for some 70 per cent of Bowater's total sales, had much to do with this increase. The North American corporation received a maiden dividend from Bowater Southern Tennessee during 1959, in which its fourth newsprint machine was fully used.

Sir Eric Bowater reports further expansion in the field of packaging products. With the growing trend towards self service both in shops and by vending machines, the demand for all forms of protective wrappings and cartons has soared, and

extra capacity is being installed in various parts of Britain, though with the growth in demand has come fierce competition and lower profit margins. Bowater-Eburite, however, in which the Bowater group's packaging interests are concentrated, increased its profits from £1,672,000 to £1,850,000. With the acquisition of the large minority holdings in Bowater-Eburite earlier this year, this company will shortly become a wholly owned subsidiary.

In the packaging field, Bowater Paper set up last year as an active manufacturer of these products in Belgium, France and Italy, where demand for modern methods of packaging and pre-packaging is not yet as high as in this country and the United States. These developments, together with others in Belgium and Italy for the production and marketing of household tissue products, may be no more than a beginning to Bowater's European story, in Sir Eric's view.

The balance sheet shows an increase of £5 million to £137½ million in net fixed assets, a much smaller rise than in past years. Depreciation claimed an additional £1 million of Bowater's available profits at £6.3 million—more than 30 per cent of the trading surplus. Following the conversion last July of £8.5 million of the 5¾ per cent loan stock, loan capital is down to £67.9 million. The further opportunity of conversion this year gives stockholders who subscribed to the original issue an equivalent conversion price of 50s per share compared with the present price of 66s. 1½d., though this is still some 12s. below the 1960 peak. The £1 shares yield 4½ per cent on the increased dividend of 15 per cent, on which shareholders are already looking for a further advance this year in view of the proposed one for five scrip issue. The directors consider prospects more favourable than in recent years.

The results of **Wiggins Teape** seem to bear out an optimistic view. The directors gave a forecast of appreciably higher profits when the rights issue was made last December, and consolidated trading profits in fact rose from £3,346,589 to £4,475,485 of which the larger part (£2,488,069) came in the improving second half of the year. These profits include only some £232,337 from the various companies acquired during the year. The profits of British Waxed Wrappings (taken over from Spicers a year ago) and two other subsidiaries were not included, but amounted, before tax, to £345,362. With results so well up to expectations, the dividend is set at 18½ per cent against a forecast 17½ per cent. In addition the directors propose to make a 50 per cent scrip issue. Shareholders will infer from this the prospect of a further increase in dividend; profits in the current year are running substantially higher than a year ago.

For shareholders in **John Dickinson**, the paper makers, there is the prospect of a large capital repayment. At December 31st, liquid assets had reached £12,588,795 against capital commitments of some £3½ million, to increase the group's capacity by 25 per cent. This development programme which, the chairman suggests, is largely to meet the challenge of the Outer Seven free trade area, will be financed from the group's gilt-edged holdings, which totalled £2,523,905 at the end of December and from retained profits. Of the remainder, largely Treasury bills, £5,417,264 will be absorbed in the repayment of the debenture and preference stocks and of 12s 6d on each £1 unit. A scrip issue will restore these to £1 units, on which it is hoped to maintain the dividend at 20 per cent.

Schweppes

THE report of Schweppes and the statement of the chairman, Mr R. Hanning Philipps, shows a substantial increase of 50 per cent in trading profits last year, to which the newly acquired jam interests in Chivers, Hartley and Moorhouse contributed only £50,187 of post acquisition net profits to the group total of £2,038,743. Profits from jam will show an appreciable advance in a full year, but they will be ploughed back for long term development and will not be available for distribution by the parent company.

Schweppes will be relying on its soft drinks interests for any further advance in profits in the current year. In 1959 results were helped by the exceptional summer and by last year's low prices for fruit and sugar. Raw material prices have already risen this year and such a fine summer would be surprising. The main trade of Schweppes is in "mixer drinks," however, for which the demand is fairly stable throughout the year. In the first quarter of the current year, sales of mineral waters were 18 per cent higher than a year ago but sales of fruit squashes have so far been less buoyant. While the chairman feels that it will be a struggle to equal the record profits of 1959, he sees no reason why Schweppes should not come near to doing so. On this statement the 5s. shares gained 1s. 1½d. to 30s. 1½d. to yield 3¾ per cent.

Rolls-Royce

FEW shares recently have been marked up sharply on the publication of their results, however good. But on news of the 1959 results Rolls-Royce £1 shares put on 1s. 9d. to 43s. 9d. to yield 4.6 per cent on an unchanged dividend of 10 per cent. No one had hoped for an increased payment and the interim statement last October had indicated a fall in sales; in fact they were slightly up at £97½ million.

Although depreciation takes an extra £278,000, research and development expenditure is down from £5,836,724 to £5,660,333. Profits before tax, which have been adjusted for a new method of stock valuation, are some 2 per cent higher at £4,876,469. After a lower tax charge net profits are 18 per cent higher at £2,634,854 and the 10 per cent dividend is covered 2.2 times. Despite the improved results the profit margin before tax is still no higher than 5 per cent, reflecting the enormous burden of research and development expenditure which Rolls-Royce must carry to maintain its dominant position.

Burmah Oil

BURMAH OIL, like BP and Shell was forced to operate on shorter margins in 1959 so that higher sales brought only a fractional increase in trading profits from £6,778,505 to £6,880,434. Turnover rose in India by 8 per cent and in Pakistan by 9 per cent. More settled conditions in Burma were responsible for a rise of 11 per cent in sales there. Agreements recently negotiated with the Indian and Pakistan governments seem likely to lead to a further shaving of margins, but any fall in trading profits should be offset by a further increase in Burmah Oil's investment income, which last year rose from £10.9 million to £12.7 million; the higher final dividends from both BP and Shell come into Burmah Oil's account this year.

Mr W. E. Eadie, the chairman, indicates that the amount which Burmah Oil will have to provide towards the cost of a new pipe line is likely to be substantially less than the £20 million which had been agreed with the Indian government. The government has now arranged to build a tube factory which is expected to make a large part of the pipe for the second stage of the line linking the oilfields of Oil India Private to the government refineries. Burmah's own capital requirements of £4 million this year should not present much difficulty, for last year's cash flow came close to that figure, while cash and investments totalled £13½ million. At 46s. the £1 shares yield 6¼ per cent.

Hambros Bank

AFTER keeping the ordinary dividend at 20 per cent for the last three years, the directors of Hambros Bank have now raised it to 22½ per cent. A rights issue is also to be made (as on the last occasion when the dividend was increased) of one new £1 share at 80s. per share for every five £1 shares or every two £10 shares (£2 10s. paid), to raise in all £2 million. This increase in capital is designed to march with the increased business now being undertaken by Hambros. Mr R. Olaf Hambro, the chairman, describes the year to March 31st last as active and successful.

Deposits rose by £7½ million to £73¼ million and acceptances from £21.6 million to £27.1 million—this largely reflecting the introduction of its Scandinavian service at the time of the signing of the "Outer Seven" treaty. The main business of the bank is in that area; but the group's agency in the United States for the sale of BMC cars had a record year with sales of over £30 million, and this no doubt played its part in the increase in the bank's disclosed profits from £513,602 to £564,890.

The other major change in the balance sheet stems from the public issue of shares in Hambros Investment Trust, made to Hambros Bank shareholders last November. The bank then retained a 50 per cent interest in the Trust (with members of the Hambro family holding a further 17 per cent), and this now ranks as a trade investment rather than as a subsidiary company. The trust holds 50,000 of the bank's partly paid £10 shares and is expected to exercise its rights to the new shares. On an "ex all" basis the £10 shares £2 10s. paid yield just under 5 per cent and the £1 shares 4½ per cent.

W. H. Smith

AS expected, W. H. Smith was hit hard by last summer's printing strike and Mr D. J. Smith, the chairman, estimates the total cost to the company at about £200,000. Nevertheless the trading profits for the ten months to the end of January of £1,795,763 against £2,279,199 for the previous twelve months are not up to best expectations and Mr Smith points to the burden of rising costs, and increased competition. This underlines the importance of the £3 million programme of modernisation and expansion of the business, as well as the new schemes for staff training. In this connection capital commitments outstanding at the end of January amounted to £476,000, but the latest balance sheet shows that the company is well able to meet the demands of this programme, for its net liquid assets then amounted to £3.9 million.

Meanwhile the chairman seems quietly confident for the current year; the recent development of introducing gramophone record departments to certain stores continues to meet with success and a few stores are now selling cameras. At 58s. 3d. the ordinary shares yield 4 per cent on a 12 per cent dividend. For the ten month period, resulting from the change in the company's financial year, an actual dividend of 10 per cent was paid.

Rhodesian Selection Trust

THE risks facing investors in the Rhodesian copper companies are starkly illustrated by present events. Output is high, so are copper prices, and profits and dividends are up. Yet current yields are also high, with Roan Antelope, to take one example, offering a return of 7½ per cent. The market is affected by three uncertainties, not all operating in the same direction. Left to itself, world production of copper is likely to exceed consumption this year; hence prices are expected to fall. In fact a small part of Chilean output has recently been shut down by a stoppage that could spread to the other mines. And now, following the riots in South Africa that at once depressed Rhodesian copper shares, come the disorders in some copperbelt towns this week. Production may not be affected, but the market is understandably nervous. Potential buyers must look at the recent impressive statements of the Rhodesian Selection Trust group against this backcloth.

In the third quarter ended March, Roan Antelope produced and sold about as much copper as in the previous quarter, costs were a little higher at £162 a ton, and estimated profits before tax went up by 22 per cent, from £1,564,000 to £1,911,000. Comparing the first nine months of 1959-60 with 1958-59 (when production at all mines suffered

from a strike), profits before tax show a still sharper rise of 45 per cent, from £3,267,000 to £4,746,000. Mufulira, in which Rhodesian Selection Trust itself has a 64 per cent interest, produced considerably more copper in the March quarter than in the previous one, and costs fell by nearly £3½ to £157.6 a ton. Sales were slightly higher, and the estimated profit before tax rose by over one-quarter, from £2,008,000 to £2,536,000. Profits for the first nine months at £6.4 million, show a rise of 40 per cent on the figure of £4,545,000 a year ago. Rhodesian Selection Trust, which also has a 64 per cent interest in Chibuluma, a small mine, reports an even better result in the first nine months, its estimated profits before tax rising by a half, from £3,252,000 to £4,870,000. Confident expectations of higher dividends were confirmed on Thursday, when all three companies put up their interim dividend by 50 per cent. Roan Antelope's was raised to 4½d. a share (before deduction of Rhodesian and UK taxes) from 3d. a year ago. Mufulira declared an interim of 2s. 7½d. a share, against 1s. 9d. before, and Rhodesian Selection Trust's went up from 4d. to 6d. a share (all less tax).

Union Corporation

THE major event for Union Corporation in 1959 was the flotation of the new Bracken and Leslie mines in the Kinross area, and it is presumably to these subsidiary mining companies that Union Corporation has commitments amounting to £8.8 million over the next two or three years. The corporation is confident that this sum can be supplied from existing resources with possibly some short term borrowing.

Net income rose sharply last year from £1,903,957 to £2,856,915 but with investment income almost unchanged, this rise was due mainly to an increase in profit from the sale of investments, which in turn stemmed largely from the flotation of the new mines. In the present disturbed state of the Kaffir market, profits from investment seem certain to fall far short of the 1959 figure of £1.5 million, and while an increase in dividend income can be expected, it can scarcely be sufficient to keep profits at the 1959 level. In view of this and the company's heavy commitments a further increase in the dividend, which has been raised from 3s. 6d. to 3s. 9d. per share, seems unlikely in the near future. At 50s. the 2s. 6d. shares yield almost 7½ per cent.

Profits from Insurance

INCREASED dividends across the board reflect a material improvement in the world wide underwriting experience of the composite insurance companies, as well as further expansion of the non-life interest income that traditionally provides the wherewithal for dividends. Last year brought a welcome reduction in underwriting losses in North America. The tide seems to have turned in the vitally important United States market; British insurers (with some notable exceptions including the Royal/Globe) still incurred underwriting losses in 1959, but the aggregate loss was much smaller than in the previous year, which itself showed a considerable reduction on 1957. In Canada, where an improvement also started in 1958, there was a small underwriting balance on the right side last year.

This week's insurance reports include that of the Commercial Union group, now second only to the Royal in the size of its non-life premium income, and of the Alliance, which shares with its new partner, the Sun Fire, a reputation for achieving underwriting results consistently above average. The combined fire and accident premium income of the Commercial Union and the North British and Mercantile rose from £97 million in 1958 to £102½ million last year, and an underwriting loss of £169,000 in 1958 for the two offices together was turned into a profit of £616,000. After bringing in transfers from marine, life, annuity and capital redemption accounts and charging overhead expenses and taxes, but excluding interest on the non-life assets, there was a loss in 1959 of £449,000, compared with a loss of £1,594,000 by the two offices in the previous year. Net interest earnings on the non-life assets rose by £541,000 to £4.7 million, and covered the increased Commercial Union dividend of 2s. 3d. per share (2s. per share before the amalgamation) with £1.1 million to spare.

* From all classes of insurance.

The Sun-Alliance group achieved an underwriting profit totalling £1,025,000 in 1959; details are shown in the table. These offices continue to trade independently. A maiden dividend of 1s. 6d. per share has been declared by the holding company, as forecast when the merger terms were announced last October.

London Stock Exchange

FIRST DEALINGS:	April 25	May 9	May 23
LAST DEALINGS:	May 6	May 20	June 10
ACCOUNT DAY:	May 17	May 31	June 21

AT the beginning of the week equities continued to see-saw within fairly narrow limits, with business comparatively restricted; markets were sensitive, with sellers predominating and prices weakened. The start of the new account on Monday did not bring about any improvement, but a better tone began to develop as the week progressed, and on Wednesday prices rose sharply: the *Financial Times* index gained 6.1 points. In the gilt-edged market medium dated securities enjoyed the biggest rises. Three per cent Savings Bonds 1965-75 gained 7/16 to 74 7/16, while both 5½ per cent Exchequer Bonds 1966 and 3½ per cent Conversion 1969 gained ½ to 101 1/16 and 86⅛ respectively. 5½ per cent Funding 1982-84 gained ⅛ at 101⅝; but over the week 3½ per cent War Loan at 62 9/16 xd and old Consols at 47½ remained unchanged.

On Monday, the *Financial Times* index fell to 295.8, a new low point for the year, but in the week to Wednesday *The Economist* indicator rose by 3.7 points to 339.3. In that week, Turner & Newall fell from 100s. 7½d. to a low of 97s. 6d. but regained 2s. to 99s. 6d. ICI gained 2s. to 56s. 3d., Unilever 3s. 9d. to 148s. 6d., and Associated Portland Cement 3s. 6d. to 65s. 3d. In the engineering group Babcock & Wilcox, which had been depressed by their results, regained 3s. 6d. to 38s. 1½d., Vickers rose 1½d. to 29s. 7½d. and Tube Investments 9d. to 76s. 3d.

Bank shares did not join in the general improvement. Over the week the Midland lost 2s. 3d. to 84s. 3d., Barclays 1s. to 52s. 6d., and National Provincial 2s. to 74s. 9d.; though Lloyds was 6d. better at 58s. 9d. United Dominions Trust was unchanged at 148s. 9d. Pearl Assurance gained 3s. 9d. at 136s. 3d., but Prudential "A" lost 1/8 at 16 5/8.

Steel shares were mainly better; United Steel gained 1s. over the week to 76s. 3d. British Oxygen was very firm, at 84s. 6d. against 81s. 3d. Channel Tunnel was very weak, falling from 26s. to 15s. 9d., though it regained 1s. 3d. to 17s. in the rally on Wednesday. Shipping shares continued to be depressed, British & Commonwealth falling by 2s. 6d. to 39s. 9d., P & O by 9d. to 39s. and London & Oversea Freighters on the news of the rights issue by 9d. to 16s. 9d. Among store shares, Marks & Spencer rose 2s. 3d. to 72s. 3d. on the interim results, and Montague Burton 3d. to 48s.

The gold mining market experienced considerable falls over the week, both Free State Geduld and Western Holdings losing 11s. 3d. to 116s. 3d. Troubles in the Copperbelt affected the shares of the mining companies; Chartered lost 5s. to 63s. 9d., RST 1s. 3d. to 11s. 4½d. and "Tanks" 2s. to 29s. 6d., against the year's high point of 48s. 3d.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended May 6, 1960, there was an "above-line" surplus (after allowing for sinking funds) of £52,230,000 compared with a deficit of £52,998,000 in the previous week and a credit of £62,615,000 in the corresponding period of last year. There was a net expenditure "below-line" of £16,662,000 leaving a total cumulative deficit to date of £99,886,000 compared with a surplus of £3,279,000 in 1959–60.

THE MONEY MARKET

THE London Treasury bill rate edged up a little at last week's tender. The discount houses cut their common bid by 2d. to £98 16s. 7d., equivalent to a rise of 8d. per annum in the discount rate. But the average rate on the whole £250 million of bills allotted rose by only just over 4d., to £4 13s. 4.70d. per cent. Outside tenderers again took a large share of the allotment; total applications rose to £447 million, and applications at the discount market's syndicated price were allotted only 23 per cent.

In New York bill rates have risen more steeply. The three months' rate rose from 3 per cent to 3¼ per cent at the tender, and six months' maturities from 3⅜ to 3½ per cent.

The London clearing banks have this week begun their transfer of special deposits: Wednesday's Bank return shows these at £3.5 million. Credit has been generally short in Lombard Street, except on Tuesday this week when some funds were unlent. This followed extreme stringency on Monday, relieved for the most part by very large official purchases of bills. The prevalent rate on bills sold in the market has been 4⅜ per cent.

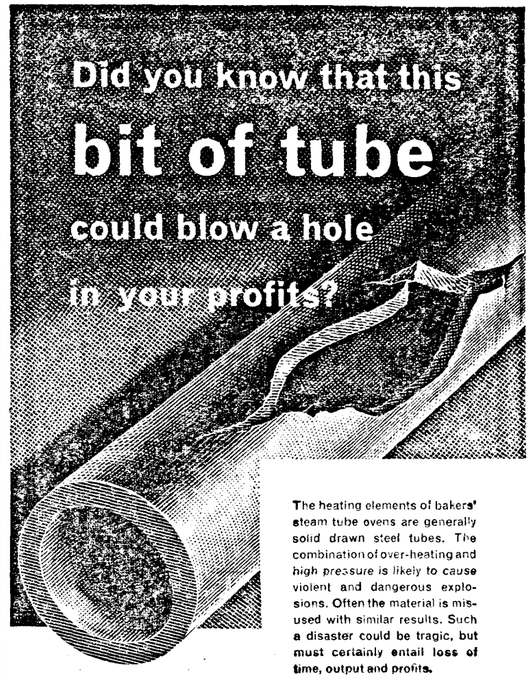
EAGLE STAR...

presents

A GUIDE TO THE NATIONAL INSURANCE ACT 1959

This Guide explains in simple terms the background to the problem which every employer faces today, and brings together in one booklet the salient points otherwise only available from detailed study of the regulations, memoranda, etc., issued from time to time by various Government Departments.

The Booklet will be of particular value to those employers who are considering instituting a new Scheme in order to be able to contract out of the Graduated State Scheme. We shall be happy to send you a copy, free of charge, on application to our nearest Branch Office (see telephone directory), or to Life Department



EAGLE STAR INSURANCE COMPANY LIMITED

Wimborne House, 22, Arlington St., London, S.W.1

THE DAI-ICHI BANK, LTD.

Head Office: TOKYO JAPAN
New York Agency: NEW YORK
Overseas Representative Office: LONDON, CHICAGO

The heating elements of bakers' steam tube ovens are generally solid drawn steel tubes. The combination of over-heating and high pressure is likely to cause violent and dangerous explosions. Often the material is misused with similar results. Such a disaster could be tragic, but must certainly entail loss of time, output and profits.

Vulcan know

Overheating is one of many factors to cause explosions in ovens. The expert who knows them all, and just where to look for potential faults and danger spots—and not only in ovens—is the Vulcan Engineer Surveyor.

Industrial accidents need never happen if he regularly inspects machinery—your machinery. The inspection *and* protection of boilers and cranes, lifts and hoists is what Vulcan provide. It is a specialist's job. Vulcan are the specialists. That's why insurance brokers know that safety first is Vulcan first.

Vulcan are specialists

May we send you FREE 'Vulcan'—a journal for all users of plant and machinery with *reports of accidents and safety hints.* Write to Dept. 17.

NATIONAL PENSIONS and OCCUPATIONAL SCHEMES ? Contract out —or not ?

Recognising that in view of its leading position in the pensions world the Society had a clear responsibility to express its own considered views on the problems presented to Employers by the National Insurance Act, 1959, the Legal & General has provided a comprehensive booklet on this subject for all its Pension and Life Assurance Scheme and Endowment Pension Scheme Policyholders.

The booklet gives in one single document the whole background to the question of whether to contract out or not, **and is a clear guide to a decision by an Employer.**

COPIES OF THIS BOOKLET *will be furnished with pleasure to any Employer who is not already numbered among the thousands the Society is privileged to serve.*

LEGAL & GENERAL

ASSURANCE SOCIETY LIMITED

CHIEF ADMINISTRATION: 188 FLEET STREET, LONDON EC4

MSL *have been retained to advise on the appointment of an*

AGRICULTURAL DIRECTOR

for the largest broiler chicken production and marketing company in Europe, which is British and has its H.Q. in Sussex. The company's turnover during the next twelve months will be about £5,000,000. The broiler industry has grown rapidly in the last five years and is expected to have expanded threefold in the next five years.

After an acclimatising period of about a year, during which he will make a visit to the U.S.A. and will not be on the board, he will take over responsibility for all the livestock production activities of the company. These include two large modern hatcheries and experimental farms, and advisory services to growers, covering plant, equipment, foodstuffs, and livestock; they will later extend to the management of the company's own farms which are being increased in number.

Candidates between 35 and 45, preferably with an agricultural degree, will already have reached a senior managerial position with both technical and commercial responsibilities and are most likely to come from the following; the agricultural services division of a company growing livestock or crops for further processing i.e. freezing or canning, or producing animal foods; estates management, including advisory services to farmers, planters, or growers.

Starting salary not less than £3,000 and more will be paid for a particularly suitable man; car provided; pension scheme.

Please send brief details in confidence, quoting reference S.2372, to D. M. Sidney. In no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED, 17, Stratton Street, London, W.1.

ABBOTT require a senior accountant

to act as deputy to the Secretary and Treasurer. The successful candidate will be responsible to the Secretary for the maintenance of all financial records and will be expected to be a keen student of costing and budgetary control methods. Applicants should be chartered accountants with broad commercial experience, aged about 35. A University degree is desirable but not essential. The location will be initially in the North East but subsequently in North Kent where the Company is carrying out a rapid and large expansion programme offering excellent prospects for the successful candidate whose current remuneration is probably not less than £1500 per annum. Apply in own handwriting stating age, experience and present remuneration to the Secretary, Abbott Laboratories Limited, Bede Trading Estate, Co. Durham.

ABBOTT... fine pharmaceuticals

NATIONAL COMMERCIAL BANK OF SCOTLAND LIMITED

INVESTMENT DEPARTMENT

A vacancy exists in the Research Section for an additional specialist in Company Analysis. Applicants—aged 25 to 35—must have experience, preferably with stockbrokers, in assessing the investment merits of companies.

Applications, which should be accompanied by particulars of qualifications and experience, should be addressed to:—

The Investment Manager,
National Commercial Bank of Scotland Limited,
14 George Street,
Edinburgh, 2.

MARKET RESEARCH

We are seeking a new Departmental Head for our Market Research Department. This vacancy, of which our Staff are aware, will be filled by a man aged 28/35, who possesses a B.Sc. in Economics, Psychology or Sociology, and has held a post which has afforded *him ample experience* in research involving full responsibility in the design, execution and analysis of field surveys. A minimum of four years' commercial experience in the Market Research field is expected, and a knowledge of the operation of the Attwood and Nielsen surveys is preferable. Duties will include:

(a) Analysis of marketing problems in relation to research requirements.

(b) Design and control of surveys—both for departmental and outside execution.

(c) Liaison with associated companies, marketing personnel and advertising agencies.

(d) Budgetary control.

(e) Control and supervision of departmental personnel both male and female.

This post is permanent, progressive and pensionable, and will be remunerated accordingly. Applications are invited only from those who can conform closely to the aforementioned requirements. Please write in strict confidence, giving details of age, previous experience and present salary to the Personnel Manager, The Nestlé Company Limited, St. George's House, Wood Street, London, E.C.2. A recent passport-size photograph will be an advantage.

ACCOUNTANT and Office Manager required by Devon Department Store. Especially suitable for newly qualified young man. Salary £900-£1,300 according to experience. State age, education and qualifications.—Apply Box No. 1324.

ASSISTANT ECONOMIST

The person appointed to this position will be engaged in obtaining and interpreting information on economic conditions, the construction industry and the demand for building and civil engineering structures in the U.K. and Overseas. Apart from publications, it will be necessary to obtain data by means of surveys and personal interviews which could involve a certain amount of travel in the U.K.

Applications are invited from women aged 24-30 with at least a 2nd Class Honours Degree in Economics and a minimum of three years' experience since graduating. Please address applications to:

PERSONNEL OFFICER,
RICHARD COSTAIN LIMITED,
111, WESTMINSTER BRIDGE ROAD,
LONDON, S.E.1.

SURREY EDUCATION COMMITTEE

BROOKLANDS COUNTY TECHNICAL COLLEGE, HEATH ROAD, WEYBRIDGE.

Required September or January, 1961, Assistant Lecturer, Grade B, for residential courses in Management. Subjects to be covered, APPLIED ECONOMICS, INDUSTRIAL ORGANISATION or SOCIAL STUDIES (ability to present for admission by mature and experienced executives essential). Working knowledge of Industrial Statistics useful additional or alternative qualification.

Application form obtainable from Principal to be returned by June 11, 1960.

STATISTICS AND MARKET SURVEYS

Economics Graduates with a knowledge of statistics are offered a post in the Components Group Commercial Department. This is an excellent opportunity for a man aged about 30, who has had experience in the collection and preparation of statistical data and industrial market surveys. Some knowledge of electronics would be an advantage.

Undergraduates who complete their courses this summer will be considered as trainees.

Attractive salary offered, together with a generous non-contributory Pension and Sickness Benefit plan.

Apply in confidence by sending a personal history to:

W. J. Yeomans, Personnel Manager,
Standard Telephones and Cables, Limited,
Footscray, Sidcup, Kent.

NORTHAMPTON COLLEGE OF ADVANCED TECHNOLOGY

St. John Street,
LONDON, E.C.1.

Applications are invited for the following posts:—

I. SENIOR LECTURER in Industrial Relations and Social Psychology. Experience in industry is necessary. Experience in the conduct of industrial courses at senior level will be a special recommendation.

Salary: £1,550 per annum increasing by annual increments of £50 to a maximum of £1,750 per annum plus a "London" allowance of £38, increasing to £51 p.a. at the age of 37 or after 16 years' teaching service.

II. LECTURER in Logic and Scientific Method. The emphasis in lectures will be on applied logic, with particular regard to problems involved in discussion on research or other committees and in the presentation of technical information. The lecturer will assist in the development of intensive communication courses.

Salary: £1,370 per annum increasing by annual increments of £35 to one final increment of £40 to a maximum of £1,550 p.a., plus a "London" allowance of £38, increasing to £51 p.a. at the age of 37 or after 16 years' teaching service.

The appointments will be within the Liberal Studies organisation of the College and the persons appointed will be required to participate in both undergraduate and post-graduate courses. Further particulars and form of application may be obtained from the Secretary, Northampton College of Advanced Technology, St. John Street, London, E.C.1.

THE PATENT GLAZING CONFERENCE

TECHNICAL OFFICER

The Patent Glazing Conference, which is an old-established trade association representing the interests of specialist sub-contractors engaged in the manufacture, design and installation of Patent Glazing for the daylighting of industrial and other buildings, is considering the appointment of a full-time Technical Officer.

The duties would be generally to keep the Conference in touch with current developments in design and construction in the building industry as a whole, and to consider and advise on their implications for the Patent Glazing trade. He would be expected to pay particular attention to problems on the behaviour of traditional and new materials, insulation, lighting, safety, maintenance and economics and to advise on any research which the Conference might sponsor.

The ideal candidate would be in his late 20's or in his 30's, enthusiastic, have an enquiring mind and be capable of expressing himself clearly both orally and in writing. He should have scientific or *technical experience* preferably in research or in architecture. The salary would be according to his general qualifications but a starting salary of not less than £1,500 p.a., provisionally on a three-year engagement, is envisaged. The proposed appointment is a new one and prospects would depend entirely on how the work and the officer himself developed.

Applications, marked Strictly Personal, should be submitted by May 31, 1960, to the Director, The Patent Glazing Conference, Burwood House, Caxton Street, S.W.1.

OPERATIONAL RESEARCH

Production Planning and Control

The Operational Research Department of The Steel Company of Wales Limited, is participating in a company-wide study of the future development of production planning and control. The size of the Operational Research team working on this project is now being increased, and applications are invited for several positions as *Research Officers*, one of whom will act as team leader.

Preference will be given to applicants with *Honours* Degrees and experience of systems analysis or computer programming.

The *Operational Research Department, of which* this team forms a section, at present consists of some two dozen research staff, plus juniors working on a wide variety of problems, and possesses its own Pegasus Computer.

The *working environment* is a very large and modern integrated iron and steel works, situated on the pleasant coastal plain of South Wales.

Please write giving full details of age, experience, qualifications and any further information considered relevant to:

SUPERINTENDENT, PERSONNEL SERVICES,
THE STEEL COMPANY OF WALES LIMITED
(Steel Division),
ABBEY WORKS, PORT TALBOT, GLAM.

BRITISH INSTITUTE OF MANAGEMENT require a Marketing Management Adviser.

The Adviser is responsible for all the Institute's activities in the sphere of marketing in the broadest sense, including the provision of information and advice to enquirers, the gathering of information from published sources, the formation and running of Study groups, the preparation of material for publication and the organisation and running of courses, conferences and seminars. Experience in one or more aspects of marketing is essential. The Adviser will have the assistance of an advisory committee, an Information Officer and a library.

This post would be suitable for a young man planning to return to industry in three to four years' time or for an older man as a permanency.

Starting salary: £1,050-£1,200. Pension Scheme.

Applications to Mr. N. S. Gallagher, Head of Management Services Department, British Institute of Management, 80 Fetter Lane, London E.C.4.

For further appointments and other classified advertisements see pages 668, 696, 708, 710 and 711

PORTSMOUTH COLLEGE OF TECHNOLOGY

MARINE RESOURCES RESEARCH UNIT

The College offers a number of grants for full-time post-graduate research work in the Unit on the economic development of marine resources, a field of growing world importance. Research projects are directed towards the obtaining of Ph.D., M.Sc., or M.A. degrees, and are in the following groups: basic resources, catching techniques, processing techniques, and marketing. *Graduates in economics*, biology, chemistry, engineering and geography are eligible. Students taking Final Degree examinations this summer may apply now for provisional consideration.

Application forms and further particulars may be obtained from the Registrar, College of Technology, Portsmouth.

FORD

require

A qualified accountant aged 25 or over, to join a small Control Audit Team. The successful candidate will assist in the critical examination appraisal of Manufacturing and Commercial operations and related systems and management controls. Previous experience preferable but not essential.

Please apply giving details of age, experience and qualifications to

MR. H. C. CRAWFORD,
TRAINING AND RECRUITMENT DEPARTMENT
FORD MOTOR COMPANY LIMITED
DAGENHAM · ESSEX
quoting reference CCA.

A B

There you have it . . .

and there, very likely, is where you don't want it. Our business, which is mechanical handling, satisfies the continual needs of industry to move all sorts of things from A to B. Thinking of the shortest distance leads to thinking of conveyors and thinking of conveyors - to a great many important people we are glad to say - leads to thinking of Sutcliffes.

Maybe you have never thought of Sutcliffes, but there are a great many reasons why you should; not least is our fundamental 'straight-line' thinking which is expressed in many very large and important handling plants and in more underground coal conveyors than anyone else has made. We installed the first of these in 1905 s we were in the lead then. We still are.

Sutcliffe *Britain's Best Conveyors*

We shall be pleased to send you informatit literature ref: E 73 on request

Such antics are antique

Getting entangled with a welter of competing firms all plugging separate pieces of product finishing equipment is a frustrating, staff-consuming trial of strength—a trial in which the overall view of a complete finishing system can easily be lost. That is why so many front-line manufacturers have long since pensioned off the old, piecemeal approach to product finishing and now delegate the whole responsibility to a single, specialist organisation—Lysaght-DeVilbiss.

With no narrow interests to serve, Lysaght-DeVilbiss have the broad view and dedicated skill born of more than fifty years' specialisation. They design, manufacture and install complete finishing systems, from metal pre-treatment to final stoving. For a sound, unbiased opinion on the surface coating system best suited to your product, speak to Lysaght-DeVilbiss without delay. No obligation, of course.

AN IMPORTANT DEVELOPMENT IN EUROPEAN TRAVEL

Two Great Airlines link networks

BEA and OLYMPIC have linked their networks of services across Europe. This now brings you the advantage of a greater number of flights, particularly on the important trunk route through Paris, Rome and Athens to the Eastern Mediterranean. In addition, services connecting the intermediate stops and main European centres are more conveniently scheduled. First Class and Tourist services are available on these routes. Full details of connections and fares are available from your Travel Agent or any BEA or OLYMPIC office.

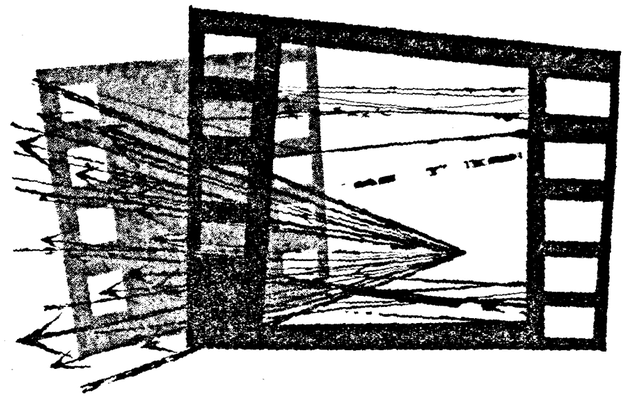
MALTA ... a hive for industry ... new or expanding

Malta is no longer slumbering quietly in the Mediterranean. Malta is planning an industrial revolution—giving top priority to new enterprises and programmes of expansion. The accent is on incentives. Here in Malta, ambitious development is not beset by chronic shortage of space, labour and capital aid. All three are ready and waiting for those who can put them to good purpose.



The more capital aid you want, the more scope you want, the more space you want, the more you must think of Malta.

For a full account of the opportunities in Malta, send for the official Brochure

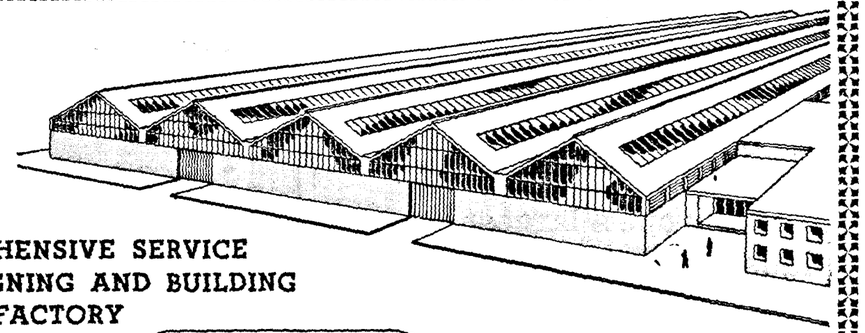
PENCIL AND COW BEYOND THE SPEED OF SOUND!



What have a pencil point in flowing water and a little toy cow that walks down a slope to do with supersonic flight? The answer to that is in 'Beyond the Speed of Sound', the last of a series of three Shell films which deal with problems of high speed flight.

These films, and others made by Shell, may be used for training and informing in many different contexts. Organizations may borrow the films free of charge. The Shell film catalogue lists over 175 films which may help your training scheme. Please write and ask for a copy.

Supported wholly by voluntary contributions.

who

took the steel pressing industry where it was needed?

The Pressed Steel Company. Since 1947 they have, in close co-operation with H.M. Government, established new factories at Linwood, Swindon and Swansea. Results: for the areas—some seven thousand very welcome jobs; for Pressed Steel—a remarkable lift in production.

TO BRITAIN'S 92 MOST ENTERPRISING MANAGING DIRECTORS

Burnley, Nelson and Colne are names famous in the world of textiles. Now, however, as a result of the Cotton Act of 1959,

THERE ARE 92 FORMER COTTON MILLS FOR SALE OR LEASE IN THIS AREA

These buildings offer the go-ahead man in light industry major advantages in terms of solid construction, adaptability, and space.

Local workers are extremely adaptable and nimble-fingered. Communications are soundly based—and provide close contact with the nerve centres of British industry in the north and midlands.

The industrial pattern of north-east Lancashire is changing fast—Burnley's special £5 million re-development plan is already well under way with the recent completion of the luxurious Keirby Hotel, an eight storey hotel specially designed to the needs of businessmen. Men of foresight in light industries will want to know more about 92 opportunities like these.

Full particulars of these properties are available from

The Hon. Secretary, North-East Lancashire Development Committee,
The Town Hall, Burnley, Lancashire.

who

makes railway coaching stock in Scotland?

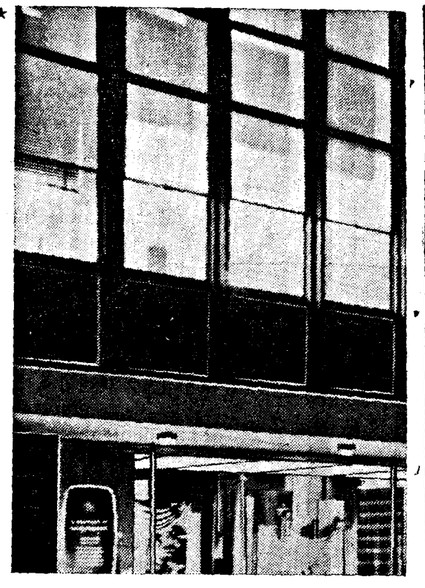
The Pressed Steel Company. In 1956 they reintroduced the building of railway coaching stock to Scotland. The idea worked so well they've already made 1,000 units for British Railways.

PS means Pressed Steel, and the Pressed Steel Company means business, expanding business.

To take advantage of the leading place in world trade occupied by British steel and engineering — and to maintain this lead despite increasing competition in overseas markets — G.E.S.O., the Export Services Organisation of the GKN Group, was brought into being.

G.E.S.O. does not replace the direct overseas selling arrangements of individual GKN companies, it augments them. It investigates and it researches. It uncovers facts, discovers figures and interprets both. It helps to get more things done more quickly. The operations of G.E.S.O., like the distribution of GKN goods and the location of GKN companies, are worldwide.

To live, we must export. To live better, we must export more. G.E.S.O. is one of the ways in which the GKN Group is going about it.



There are over 80 independent companies in the GKN Group. They are concerned mainly with steel in all its forms and all its aspects, and there is virtually nothing in steel that is outside their scope. What one GKN company cannot do, another can; and what all can do is to provide a service in steel as complete as you will find anywhere.

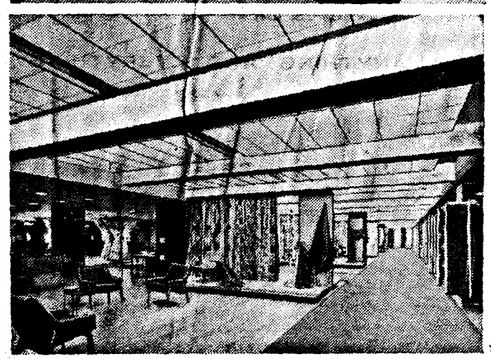
Interior decor and displays designed by Beverley Pick Associates.
Lighting installation by Duncan Watson Ltd.



The world's most fabulous showrooms devoted to interior decoration

G.E.C. lighting triumph

This is the new world headquarters of Sanderson's, a palace of design and colour, devoted solely to the display of wallpapers, fabrics and paints. In such a building lighting plays an important and exciting role, for lighting is, itself, a part of modern decor. Yet it must never be allowed to steal the show. It must never be the star.

So, throughout the showrooms, lighting to the design of Beverley Pick, F.S.I.A., has been used, sometimes dramatically as in the fabulous two-storey exhibition area, often discreetly for small intimate fabric display features like the rondelles.

Dominating the reception hall is an already famous stained glass mural. Brilliantly symbolising the house of Sanderson living by design and colour, it is apparently flooded by natural daylight, an effect G.E.C. has achieved by carefully positioned cold cathode tubes.

Geographical surgery for Europe's new artery

The seven mile road tunnel being driven through Mont Blanc, Europe's highest mountain, will shorten the motorist's journey from Paris to Rome by 124 miles. It will be the world's longest road tunnel, providing an Alpine link—open all the year round—

between France and Italy. No longer will the snow-bound roads of the mountain passes be a barrier to European communications and trade.

The Mont Blanc tunnel will take three years to complete and will cost an estimated £11,700,000. About four miles of the tunnel are being driven from the Italian side and the contractors, Società Italiana per Condotte d'Acqua, are using Atlas Copco equipment exclusively. Atlas Copco compressors, rock drills and Sandvik Coromant drill steels have been chosen for this project, regarded as a major contribution towards the unity of Western Europe.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

The Descent

FOR ten days now the great powers have sustained the illusion that, for each individually, the summit was a vindication and a triumph. The United States has hailed Mr Eisenhower for the patient resolution that brought about the unmasking of the true Khrushchev in Paris; the blundering over the flight of the U2 has been presented as nothing alongside the enormity of Soviet behaviour. In Mr Macmillan the Commons (and the Gallup poll) have instantly recognised the great, if unsuccessful, mediator; the national sense of diplomatic maturity and responsibility, bruised by the Suez adventure, is now assuaged.

For General de Gaulle the claim has been made out (first by M. Fontaine of *Le Monde* and later by Messrs Cook and Alsop in the *New York Herald Tribune*) that he was not only loyal to the Americans but right about the Russians from the beginning. And in Moscow Mr Khrushchev has had the public reception that is thought to befit the strong and the righteous. The descent from the summit has been as easy as that for all concerned. But where does the journey towards perdition end, and what diplomatic labour will be needed for the return?

If Mr Khrushchev had made a different speech from the one he did make in east Berlin on his way home on May 20th, the mood might be very different. The self-deception in some quarters might indeed be all the more energetically maintained: but the criticism of the western part in the Paris breakdown would possibly be heard with more attention and urgency by the western public. That Mr Khrushchev did not provoke an immediate crisis over Berlin was not out of regard for Mr Eisenhower's resolution, Mr Macmillan's supplication or General de Gaulle's inflexibility. Curious as it may seem, both sides emerged from Paris claiming to have secured the moral advantage, if nothing else—which is, after all, the last refuge of baffled statesmanship. Had Mr Khrushchev followed his press conference at the Palais de Chaillot with the immediate imposition of a blockade of west Berlin he could never have hoped (as he clearly still does) to receive the approbation of the uncommitted third of the globe. What he had to avoid in Berlin was giving the moral game to the Americans by default.

Even if Soviet policy requires the eventual signature of a separate peace treaty with the German Democratic Republic this will need a period of assiduous preparation which may well occupy six or eight months. Mr Khrushchev may seriously believe that he can bring another American president to the summit after that time, or he may not. But for his separate peace to possess any international standing, let alone legality, it must be signed by more states than the communist block and its clients. At least three uncommitted nations—Finland, India and Jugoslavia—have the right to a say in any German peace treaty; they were, in fact, specifically mentioned in a Soviet note to the West on January 10, 1959. Mr Khrushchev will miss his trick if he cannot, by cajolery, pressure or the mien of moral rectitude, persuade two of the three to move closer to his position in the coming months.

The primary danger before the West now is that its own policies, formulated in the heat and clamour of the American electoral conflict, may present Mr Khrushchev with the exact opportunity he could be counting on. It may be natural that the United States should rally to Mr Eisenhower in the immediate shock of disillusionment and bewilderment that this month has brought upon the American nation. Yet the style of electoral campaign which (as our Washington

correspondent reports on page 863) Mr Nixon and the Republican party now seem to envisage has a disturbing ring. At such a time the American people may be no more patient than others are with the advice gratuitously offered by its allies. Yet it must be said that every voice of sanity and reason emerging from the United States (and some have been heard already) serves to strengthen the trust that is still placed in the future of American leadership.

It must also be said with all clarity that, despite Mr Eisenhower's explanations on Wednesday, the United States has not much to be proud of in its government's reaction to the U2 affair. From now on every attempt merely to brazen it out or, worse, to reduce the admittedly slim chances that remain of reaching limited arrangements with the Soviet Union on disarmament and the suspension of nuclear tests can be counted an American defeat. Fortunately, Mr Eisenhower himself is anxious to see the Geneva talks continue. Through ineluctable pressure or personal miscalculation, Mr Khrushchev contrived to put Russia in the wrong in Paris: this was the one major service that he, or his associates, have ever done for the West's reputation. It is no wish of America's friends now to see the United States in needless difficulties in the coming months for the same failings that put Mr Eisenhower's policy in jeopardy in the last days before the summit.

The initiatives that are left to British diplomacy at this time are limited; but they need not be altogether ineffective. First and foremost, by every means consistent with the fundamental needs of the alliance, British policy must encourage the United States to see the Paris breakdown in wider terms than the exacerbation of the Russo-American rivalry and distrust brought about there. The Soviet Union has not shifted from its ultimate design to outflank the immobile West through Africa, Asia and Latin America. For the West's own advantage the present opportunity to secure the ear of the Afro-Asian powers must not be dismissed in favour of the easy demonstrations of proud inflexibility that spring to the military, or diplomatically closed, mind. The Security Council debate this week has demonstrated the concern of the smaller powers. The greatest shock the summit gave to the peoples of south and south-east Asia was to hear in Mr Khrushchev's voice the authentic tones of Peking. But, after the flight of the U2, western rectitude cannot be taken to be self-evident; it has to be demonstrated.

This means that the second task of British diplomacy is to save what remains of east-west negotiation and contact. Mr Khrushchev did not hold out much hope in Paris for the disarmament talks; the chances of a useful discussion on preventing surprise attack have vanished for the immediate future. But the suspension of nuclear tests remains an object of Soviet policy that it is equally in the western interest to pursue. The present atmosphere of suspicion and recrimination does not improve the prospect of securing even the severely limited system of monitoring and inspection that Mr Khrushchev had previously been ready to entertain. But the talks must be persevered with, for their ending would certainly unleash far greater dangers.

For the one power that has decisively profited from the Paris failure is China. Mr Mao has seen at a stroke the fulfilment of his pre-summit wish that, after the U2 affair, "those people who described Mr Eisenhower as a man of peace would now be awakened by the facts." Peking has became shrill in its denunciations of the "trick peace": the Chinese arguments for priority in the distribution of Soviet economic aid and for revolutionary activity among the neutral powers may be listened to with all the more respect by some quarters in Moscow. The greatest danger is that the failure in Paris, if it were followed by a breakdown in the nuclear talks at Geneva, might finally prompt a favourable Soviet answer to Chinese demands for a nuclear armoury. Of all the major powers, China alone professes a philosophy of atomic war, and it has the cause—in Formosa—to start one. The risk is evident that Peking may use its first bomb to paralyse the Nationalist regime, in the belief that the United States would hesitate to start a general nuclear conflict.

It is not in Mr Khrushchev's visible interest to give his Chinese allies this blank cheque for oblivion. But his resistance to pressure is bound to be weakened if there is no prospect of a workable arrangement on nuclear weapons with the West. The third responsibility of British policy at this time is thus to ensure that there are no miscalculations, on either side, in the Far East that could lead to a nuclear war. This will involve convincing Peking that the Americans would mean business in a new crisis in the Formosa Strait, just as Mr Macmillan impressed on Mr Khrushchev in March last year the risk he would run by any unilateral step in Berlin. It is too much to suppose that American opinion would stomach any attempt to bring China into the next round of international discussions, at least before the November elections are over. Mr Macmillan would get no thanks from anyone for a direct intervention in Peking at this stage (although the idea of an eventual visit ought to be in the back of his mind).

For the moment, the chief responsibility is Mr Khrushchev's. What his future dealings with Mr Mao are likely to be is a matter he may be anxious about himself. It is something that, at the height of Peking's anti-American demonstrations on May 20th, Mr Khrushchev's ambassador managed to inject the double-edged thought that the Americans would come to recognise "that peaceful co-existence of the two systems of capitalism and socialism is the only way out." On the western side, the Seato conference in Washington next week could afford the opportunity for taking a long-term view of policy towards China.

Without a sustained effort by both sides the failure at the summit will inevitably induce a marked deterioration of relations along the entire perimeter of east-west contact. Should this deterioration become cumulative, either by accident or deliberate policy, the ability and determination of the great powers to avoid a major war in the future, whatever their inner revulsion from it, must be fatally diminished. The full extent of the dangers inherent in the Paris breakdown is only beginning to penetrate the public consciousness. After all, the sky has not fallen. It can only be said that the best way to remove the danger is not to pretend that it does not exist, and not to imagine that the posture of military readiness is the sole preventive of war that the wit of man can devise. In the West we need to be frank with ourselves, besides being true to our obligations to each other.

Living with Europe

Political life in a Europe that contains the community of the Six is going to be different

BRITISH policy, in its dealings with the western European powers during the years in which they have been searching for a union, has almost always been worrying about what the consequences of going into such a union might be. Because those consequences looked incalculable and unpredictable the British, whenever a decision had to be taken, hung back. Times have changed. True, the union of the Six is not yet by any means total; but it has gone far enough to force the British to turn their attention to the consequences of staying out. Serious enough commercially, these are still more portentous politically. It is not surprising that the Government should now be giving signs of a reconsideration of its course.

The British are not alone in their worry. The European Free Trade Association is a club of those who were unable, or have hesitated, to join but yet are uncomfortable at being left out. There are others, just as uncomfortable, who cannot even join the Seven: Finland will probably turn out to be one of these, Jugoslavia certainly is, and the Soviet sphere of eastern Europe contains others that feel their exclusion just as keenly, but cannot even say so. What all have in common is that life in a Europe which contains an integrated western European continental block is not going to be the same for them as it was in the old Europe. This is all the more true because the common market possesses, in a fairly limited area within its borders (the north of France, the Low Countries, the Rhine basin, and the industrial north-west of Italy), the greatest concentrations of economic power, the greatest accumulations of wealth and the richest sources of technology and capital on the European continent.

To do it justice, the British Government did grasp the economic implications of this and sought to insure against them; its chosen form of insurance was the free trade area plan which the French threw out of the window at the end of 1958. What the British had not grasped were the political implications. When accusations began to fly that their purpose in putting forward the free trade area was to undermine or disrupt the common market, they were genuinely taken aback. They had, indeed, intended no such thing. No doubt they had committed a psychological error in deciding to handle the new European union as if it were a purely commercial affair, but that by itself would not have been fatal without the other factor which the British had failed to foresee—that the first tendency of a new union would be to assert its separateness; and those who had chosen not to come in would be liable to be told, rather demonstratively, to keep out.

As it happened, France at that moment had a government of a new kind, more self-assertive, quicker and crisper in its decisions than its predecessors, which decided to couple its entry into the common market with a forcing bid for diplomatic leadership of the western part of the continent. General de Gaulle has made the pill harder for Britain to swallow; even without him, however, it is probable that Britain would soon have found itself being treated as an outsider. A long tradition on the Continent associates efforts to unite Europe with efforts to exclude British influence. By deciding to join, the British might have succeeded in breaking the tradition; by staying aloof, they strengthened the hand of those who had never been able to conceive of European union except in terms of shutting the British out.

That attitude is not, of course, wholly irrational. Because of Europe's divisions, Britain has at various times enjoyed more influence on events in Europe than the numbers, wealth and talents of the British people would have justified by themselves. Whenever a strong power has sought to organise Europe, Britain has set about organising a counter-coalition. The British and their friends may see this traditional role as the protection of freedom and the defence of small nations, but there have always been those in Europe who look at it less charitably; and it is they who are on top nowadays in the Christian Democratic parties, the ministries of foreign affairs and finance, the editorial boards, the inter-parliamentary commissions and the new European executives.

It is unfortunate for Britain that this hostile view of its role in Europe has prevailed just when it has become quite baseless. The preponderance of Soviet power, and the Soviet control of eastern and most of central Europe, virtually impose unity (if not actual union) on those European countries that remain free. A balance-of-power game within free Europe is thereby rendered pointless, as well as inexcusably reckless.

To be fair, British governments since the war have realised this, and their attitude towards the western European moves for union has in fact been benevolent, if somewhat vacuous. What they did not realise was that their motives would be treated as suspect; that the Carolingians have never loved Britain and do not love or trust Britain today; and that the British would get no credit for their benevolence unless they actually proved it by doing their best to join. Since they did not, they were easily outmanœuvred over the free trade area and driven on the defensive; and the course they then adopted, the formation of the association of the Seven, could easily be, and is being, represented as just another example of the British at their old game of organising counter-coalitions.

If this is really the frame of mind in which the Little Europeans look at Britain, it may fairly be asked, what would be the good of the British Government changing its course and seeking to join the common market? Would not this move, too, be received with distrust and misrepresented as just another cunning British divisive manœuvre? Or if it did succeed, what kind of political company would Britain then find itself in? The Carolingians seem not unhappy with their narrow horizon; they give the impression of being content that their Europe should be little so long as it is homogeneous—predominantly bourgeois, predominantly Catholic, averse to social change, intransigent in its dealings with the East, its concept of government a mixture of the technocratic

and the authoritarian, its vestiges of democratic political life exposed to the atrophy of disuse. Would Britain be in place in such a world ?

The answer to this last question is that a country cannot choose the world it will live in, but can only seek to shape it. British interests and influence will be powerfully affected by the existence of such a Europe whether Britain goes in or stays out. If the choice is to stay out, then the possibility of influencing the trend of affairs in that region of Europe is lost ; but the region is still too near, the ties with it too close and organic, for the British to be able to disinterest themselves. If the British were to go in, they would take their view of politics and society with them, to reinforce those bodies of opinion in the region that think broadly as they do.

The people who have most cause to complain of British neglect of Europe are not the opponents of British influence there—they could hardly have been better served than they have been by the postwar British governments of both parties —but its supporters and sympathisers. It is they who, while Britain plays dummy, are losing the rubber. They are also, of course, the people who would most actively support a British entry into the European Community if a British government could bring itself to make the attempt. If the attempt had been made as late as the beginning of 1959, it would almost certainly have succeeded. As time goes by the odds worsen ; even now, however, it has still not quite become respectable in western Europe to urge the exclusion of Britain openly as an end of policy.

CLEARLY, the problems associated with a change of course are becoming complex ; thus, an American vested interest has appeared in keeping to as small an area as possible a customs union which discriminates against American trade. To the question what to do about the Commonwealth is now added the question what to do about the Seven. A simple decision to join the common market tomorrow is evidently not now on the cards. This does not make a British reassessment of European policy any less necessary ; what is wanted is that the Government should know in its own mind, and make clear to its friends, what its purpose is—the objective it is trying to achieve, and the evils it is seeking to avoid.

The choice is really between full participation and an active estrangement. Tact and goodwill can postpone and alleviate the estrangement, they cannot prevent it altogether. (The closest and most pressing case, the British relationship with France, is discussed in the following article.) As is inevitable at this stage of a reappraisal, some attractive half-measures are being thought about in London: joining Euratom, or the Coal and Steel Community, or both, while leaving the question of joining the common market till later. The signs of thought are welcome, but the truth probably is that it will be no use attempting the first two steps without first having formed a definite intention to go all the way.

Particular efforts at co-operation with individual members of the Six, or with all of them together, will be aired and tried out from time to time. This is inevitable as the attributes of great-power status and great nationhood become more elusive and more burdensome. European partnerships for the development of aircraft, space vehicles, missiles, radar systems, even armoured vehicles, impose themselves by the mere scale of the demands they make. So does a European effort to concert aid to, say, Africa. But, as things are, these remain for the British mere brainwaves to be played with and discarded: how can they be turned into projects, let alone policies, if no one knows whether the partners who would have to undertake them are going to be friends or opponents? If British policy can get clear the direction it wants to take, then only will some awkward pieces in the puzzle of European policy begin to fall into place.

King Edward is Dead

Franco-British relations need a modern formulation and need it soon

BUFFETED by the summit storms, the western powers drew momentarily closer together in Paris last week: this psychological tightening of the alliance is something for which Nato is habitually indebted to Soviet policy. The consequences of the summit for the relations of the United States with its allies are discussed in an earlier article, but the state of the Franco-British relationship is equally worth attention now. If Britain and France, rightly or wrongly, have attempted to play a semi-independent part in the world, their independent manœuvres have seemed, willy-nilly, to be turned chiefly against each other.

Thus, in Paris, the two lesser great powers might have united in an attempt to mediate between the Russians and Americans: not an unworthy responsibility. As it happened it was Mr Macmillan, a member, in General de Gaulle's eyes, of the Anglo-Saxon block, who appeared as the harassed go-between ; while it was the general, the progenitor of the European third force, who stood, in French opinion, staunchly in the American corner. This was the outcome of an honest difference over the prospects for negotiation. But, in the result, it has not done General de Gaulle's, or the European Economic Community's, reputation any harm with American opinion. So most events nowadays seem to conspire to harden Franco-British divisions.

It is a truism that since the war, and the almost-forgotten treaty of Dunkirk in 1947, the Entente Cordiale has been weakening, less by contrivance than by circumstance. The historical conditions that summoned the entente into existence in 1904 and preserved it through the nineteen-thirties have been eclipsed by a new balance of power. The French explanation has usually been that collective arrangements have replaced whatever guarantee Britain could give against France's Continental neighbours. But this needs qualification. In western Europe the Franco-British alliance was necessarily submerged by the Brussels treaty of 1948 and by Nato itself ; even so, these arrangements did not produce an observable effect on what was still Paris's sense of dependence on London. As late as the collapse of the European Defence Community and the signing of the Paris agreements in 1954, French policy

insisted on the British connection as a reinsurance against the revival of German power.

THUS the real factors in the supersession of the entente have been the very recent development of the European political and economic community from which Britain excluded itself, and the progress of west German rearmament that has made the German Federal Republic into France's chief European guarantee against the Soviet Union. These changes have coincided with the psychologically-occasioned reassertion of French interests by General de Gaulle, an assertiveness directed against Britain and the United States, but never yet against Germany. In the British view, gaullism's diplomatic ambitions have restricted the possibility of a frank exchange on the realities of the entente.

Whatever the difficulties, this exchange ought not to be delayed much longer. General de Gaulle's state visit to London was a genuinely sentimental occasion that drew much of the sting from the past. But what reliance can be placed on the professions, on both sides of the Channel, of desire to breathe new life into the entente itself ? The ties still have a meaning, even if sometimes only a negative one. Thus, *The Economist* has been informed by French officials that M. Debré takes singular exception to a statement by one of our correspondents (" Channel Crosscurrents " in the issue of April 9th) that he had said on television: " The Entente Cordiale is dead." *The Economist* is glad to record this denial of the report, and withdraws the statement with pleasure. It also considers it significant that there should be a body of opinion in France, including gaullist opinion, that believes it is not entirely in French interests to push Britain into compulsory emigration from the European continent.

But there are two Franco-British decisions that have to be taken if this emigration is to be prevented. British opinion must finally appreciate that the days of, in Sir Winston Churchill's phrase, choosing the open sea are, in fact, ended. And on General de Gaulle's part there must equally be a revision of his ideas of European leadership, without Britain, in favour of a collective European arrangement that would be in the long-term interest of all the partners concerned. Without these changes in fundamental policy, incidental co-operation—such as Mr Watkinson's and M. Messmer's talks on Franco-British missile development for space exploration—will not do much to narrow the widening gulf.

There is a great deal that Britain and France can usefully do, and ought to do, together, in the modern world. They have a responsibility to co-ordinate their policies to assist the new states and associations in west and central Africa. They alone can now prevent a European trade division which, whatever its direct effects, already adds to the cold war arguments of the old-fashioned Leninists in Moscow and Peking. And if they put their heads together in time they can still ensure that western Europe develops a balanced defensive system in place of their own economically ruinous, and largely ineffective, separate nuclear deterrents.

M. Mendès-France, in the current issue of *L'Express*, goes as far as to argue that after the failure of the summit Britain and France should take the initiative in proposing a peace plan of their own, ranging from the cessation of nuclear tests to a ban on arms deliveries in areas like the Middle East. This seems an ideal of Franco-British action that is unlikely to materialise from the present policies of London and Paris. General de Gaulle is reported, in fact, to have drawn the conclusion from the summit that France is justified in going ahead with its independent deterrent. If this is so, the chances for cross-Channel co-operation may be all the more limited. The decayed Edwardian entente appears an antiquated instrument in the developing world. But we need not lament its passing if we face up to the realities of what Franco-British relations still mean, and can still become.

Defence Bargains in Washington?

Paradoxically, the failure at the summit may be giving the Government an excuse to accelerate its defence policy in the wrong direction

BRITISH defence policy, too, will need a reappraisal after the summit conference's collapse. There is unfortunately a danger that the emphasis will be wrongly placed, partly because of the British Government's political timidity and partly because of American over-politeness.

Mr Watkinson and the eminences of the Ministry of Defence are going shopping in Washington, with the metaphysical formula of " an independent (and inexpensive) British contribution to the western deterrent " inscribed on their indents—at just the right time for buyers. The Americans, anxious to strengthen their alliances in response to Mr Khrushchev, are in a mood to make promises that Skybolt will be supplied without strings, correctly designed to fit Vulcan bombers and British-made nuclear warheads. They may even offer a bargain-line of Polaris missiles to fit British submarines as well ; and Mr Watkinson's anxiety to secure mobility in deterrents will make him a receptive customer.

But should ironmongery dominate the discussions in the Pentagon ? Mr Watkinson is shopping for deterrents that will not be needed, or available, till 1965 or later ; the present " independent " British deterrent is assumed to be valid until then. In the meantime, it would be a good thing if the American generals, in the name of collective western defence, asked some probing questions about British conventional forces. Mr Watkinson has confirmed that national service is to end ; he has not undertaken that even the contingent liability to serve should be kept on the statute book, for use in case of emergencies. Yet the recruiting figures for the regular professional army are at present declining dangerously. There is now no prospect of an army of 180,000 by 1962 ; indeed, the army will be exceedingly lucky to attain the Sandys target of only 165,000, even if Sir Frederic Hooper's researches can find new ways to stimulate recruitment. The Government is now busy saying that, what with mobility and reduced commitments, 165,000 is plenty. It knows quite well that it is not. This idea of a coming net reduction in com-

mitments was a wishful thought in the days when it was hoped that the summit conference might lead on to disarmament; to rely on it now is a flat contradiction of the other things that Mr Watkinson will be saying about "strengthening our defences" when he is shopping in Washington.

THE army is already overstrained, and morale in its ranks is being buffeted. An understrength, overstrained, overworked regular army, relying on volunteers, is just as much a self-destroying organism as the mixed conscript and short-service regular force was said to be. It is also more perilous. Under national service, taps regulating the flow of conscripts could be turned on and off; volunteers cannot be. This is the most serious defence issue before the country, far more immediately serious than the question of what vehicles should carry British H-bombs after 1965. There is unhappily only one obvious remedy: compulsory selective service, the retention of the power to conscript some young men into the forces if they are unlucky in some form of ballot. The Americans still operate a system of compulsory selective service, and so do some of our other Nato allies. Yet both British political parties have made it a matter of honour to refuse to countenance any such "unfair system."

Nobody denies that the introduction of selective service in Britain would require considerable political courage. Yet if ever the step is to be taken, the next six months will provide by far the best opportunity. One reason for this is the mood of renewed resolve—or perhaps resignation—about defence matters among the public after the summit. Another is that the Labour party (see page 848) is at present searching for a defence policy that would put "greater emphasis on conventional forces"; if the Government introduced selective service, the Opposition would be much less well-placed than ever before to smite the Government really furiously. Some of Labour's bolder backbenchers might even support the move. Unless the decision is taken the result could be that when the British are wanted—by Nato, Cento, Seato or anybody else—the British won't be there. If our allies think that the Russians are now liable to probe for soft spots, they should speak up.

On the Bottle

The British are at last becoming wine-drinkers

"LET us have wine and women, mirth and laughter, sermons and soda-water the day after." Nearly one hundred and forty years after his death Byron's words seem to be being accepted—in the case of the wine at least—even by the notoriously phlegmatic British public. Until the nineteen-fifties wine, with almost the sole exception of low grade port for a few confirmed bibbers, was the carefully guarded retreat of the upper classes. Now, perhaps for the first time, foreign wines are beginning to find a mass British market.

Not that British wine consumption per head is yet anything but derisory by comparison with that of most Continental countries. The French, before the recent high prices and the anti-alcohol campaign began to reduce drinking somewhat, easily headed the league with an average of over 30 gallons of wine a year for every man, woman and child; Italy came next by drinking 24 gallons per head, though of rather lighter wine. Britain still drinks only one-third of a gallon (no more than 2½ bottles) per head. But this total has been rising sharply; in 1949 total withdrawals from bond were little more than half what they are now, while the consumption of light table wines—which have borne duty of 13s. per gallon ever since the 1949 Budget—has risen by nearly 500 per cent since then. British wine consumption as a whole is still only just about back to prewar levels; but the people who are drinking wine, and the types of wine that are being drunk, have undergone a sea change.

The postwar growth of British wine consumption has in fact been concentrated on two fairly narrow sections of the trade. The first is cheap table wine which—at 7s. to 9s. 6d. a bottle—provides quite keen price competition with beer, considering the amounts of each that are normally drunk at a sitting. The spread of the wine habit has not been solely due to the spread of the expense-account business dinner; even more, it is a result of the increased willingness of pubs and restaurants of all types to sell wine by the glass. Middle-class women, who have never taken kindly to beer, provide a principal market for it; they are said to have shied away from the gin and orange which was their standard order in the thirties.

The other wine to have profited from recent social trends is Spanish—though not South African—sherry. Consumption of Spanish sherry in Britain has risen steadily, by about 8 per cent a year for the last decade; with the latest reduction in duty of 2s. a bottle, this rate should accelerate. From the marketing point of view, sherry has an advantage over other wines in that it is blended into a standard product and can thus be heavily advertised. The practice of drinking an aperitif before a meal and of washing up—instead of drinking a heavy wine—afterwards has also been sherry's gain and port's loss.

Port is the depressed class among postwar wines. Consumption of port is now no more than a third of its level in 1938. The statistics show that the chief sufferer has been not so much Portugal as Australia, whose cheap "port-style" wines were a favourite of three vanishing social groups: women in the public bar, craftsmen in the front parlour, and misguided teetotallers. Withdrawals of Australian port from bond, which were 2.9 million gallons in 1938, were as low as 290,000 gallons two years ago. Portugal has also felt the pinch, but for a different reason; its better ports were drunk not by a disappearing proletariat but by a much impoverished upper crust. Port is sweet when public tastes are shifting to drier wines; and it still has an image of male exclusiveness. Thus good port now tends to be drunk mostly in incorrigibly male backwaters—in clubs, Oxford and Cambridge colleges, army messes and banqueting halls. Not even British wines, production of which (at 5½ million gallons yearly) has heartenингly not gone up since 1955, have fared so badly.

With these changes in taste has come a complete reversal of the wine trade's attitude towards its public. Before the war wines were said to have finesse or pretensions; today they are just pleasant or unpleasant to drink. Ports used traditionally to be stored for years in a cellar and then to be served at bloodheat; today, the lighter and younger varieties at least are served chilled. Neither businessmen at dinners nor well-paid working people in pubs have much time for sophistry; the old smoke-screen of vinous adjectives has gone as surely as the clientele that demanded them. Champagne, though it has regained some of the ground lost during the period of sky-high prices in the early fifties, still sells no more than it did before the war; the recent spate of American-backed take-over bids for the champagne houses is viewed with alarm in the trade. It is the low-priced wine which gives value for money that is most popular today.

THIS change in British tastes has had a sharp impact on the various wine-producing areas. First, it has favoured the cheaper Spanish table wines as against the dearer French ones. High quality French wines remain unchallenged, but total imports of table wines from France have risen only 13 per cent in volume since 1954, while imports from Spain have much more than doubled. Imports of other cheap varieties like Jugoslav riesling and Chilean hock have also done well. The ending of duty discrimination against estate-bottled wines in the last budget may help to shift the balance towards France a little, but the bull market for cheap "imitation" wines does not seem to be a quickly passing phase.

UK WINE CONSUMPTION

	1938/39	1958/59
Withdrawals from bond:—	(Thousand gallons)	
Table wine	3,062	7,034
Champagne	482	462
Port	3,838	1,393
Sherry	3,031	3,292
Others (including port and sherry type)	4,809	2,482
	15,222	14,663
British wines	6,471	5,578

CONSUMPTION PER HEAD, 1957

(gallons)

United Kingdom	0·38	West Germany	2·0
France	30·0	USA	0·8
Italy	24·0	Holland	0·16

A second impact has been within the French wine industry itself. Britain has traditionally been a claret-drinking country; it was from the Bordeaux chateaux rather than the Burgundian merchants that the prewar Briton with a cellar traditionally drew the bulk of his supplies. But since the Burgundians are sharp businessmen—they have for many years sold three times as much Burgundy as is ever grown in the Burgundy area by the simple means of mixing their wine with *ordinaire* from the south and topping it up with stiff Algerian—they have begun to tailor their methods to the new market in a way that the Bordeaux growers have not. By introducing less and less tannin from the pips and skins into the new wine, the merchants have cut their maturing period—the period until the tannin is aged out—quite markedly. They have thus cut their costs sharply, too. Even a fine Burgundy can now be drunk in good condition after three years, while the sun-baked 1959s may well be ready this Christmas. Last year's fine clarets, however, will not reach their peak until 1968 and, although the ageing will make them better wines, it will also make them dearer. This will not matter to the very top chateau wines, since advance publicity has enabled them to be sold off already to wealthy Europeans and Americans; but in the middle price ranges it could in the future give the Burgundies an important edge.

The trend to regard wine more as a business and less as a connoisseur's hobby was shown up dramatically—and perhaps irrevocably—by the history of the 1959 vintage. The hot summer greatly favoured the northern Rhine and Moselle wines, champagnes and those that often lack enough sun; but it tended to burn up some of the Burgundies and many of the Bordeaux. However, the word got—and was spread—around that for all fine French wines this was the year of a lifetime, and the huge demand this publicity caused took the established merchants by surprise. A few fought against it, but the speculative buying of others doubled and even trebled the prices of fine claret within six months. Fortunes were made and now the best 1959s are almost impossible to buy, even though only some are of outstanding quality; the best will eventually cost at least £4 or £5 a bottle. Such happenings are anathema in this staid industry, where recommendations have always been made in a discreet whisper rather than a vulgar shout. But if the expansion of wine drinking continues at its present pace, this commercialism will be the shape of things to come.

The Economist

MAY 26, 1860

ROBERT OWEN

"There is a class of persons whose conduct and character offer an almost inscrutable problem to the curiosity of those whom accident, or personal interest, or the study of some peculiar subject with which these erratic beings have connected their names, may lead to think or to inquire concerning them. . . . Of such men was *Robert Owen; the skilful manager of cotton mills at twenty; the educational philanthropist and friend of statesmen and princes at forty-five; the apostle of a socialist Utopia at sixty; in early youth and mature manhood the outspoken, offensive, aggressive atheist; in old age the victim of the silliest superstition that has degraded this educated century.* Throughout all his changing phases of opinion and activity he was the same man as when he began: narrow-minded, ignorant, dogmatic, and conceited as few men are, and as few or still are allowed to show themselves; earnest, benevolent, and good-tempered enough to win—despite such faults—courtesy from the world, and warm affection from a large circle of friends and disciples. With little or no knowledge of theology, and with a mind wholly incapable of weighing theological evidence, he had arrived in early youth at a settled contempt for all religious creeds—*apparently on the score of their number and diversity*, and was wont to thrust his unbelief down the throats of his religious friends, in a manner certainly likely to peril friendship. Yet he was allowed to marry the daughter of a sincere and orthodox Quaker; and the severest rebuke which he ever seems to have drawn down by the opinions he was wont to force upon his father-in-law was the observation—very well deserved, but quite too delicate for Owen's appreciation—"Thou needest be very right, for thou art very positive." The *redeeming feature of his character*—the quality by which he achieved all the good he did accomplish among the men with whom he dealt, and which won pardon for the nonsense he talked and for the mischief he wrought even from those whom he most grievously misled and injured—seems to have been that marvellous sweetness of temper and amiability of manner which is dwelt on by his panegyrists to the exclusion of all discussion of his intellectual capacity. He had that which Mrs Browning ascribes to Napoleon—"the genius to be loved"—a gift wholly apart; not unfrequently, from any qualities that should command esteem or confidence from sober thinkers.

NOTES OF THE WEEK

LABOUR AND DEFENCE

K Saves G?

While a dreary deadlock at Paris would have increased the itch of trade union delegates to see Britain breaking loose from nuclear armaments with a great moral gesture, the planned fiasco by Mr Khrushchev has had the opposite immediate effect. Mr Gaitskell saw the opening provided for him by the general disgust at Mr Khrushchev's offensive melodramatics and took it brilliantly. This week he and Sir Tom Williamson harangued the Great Yarmouth conference of the General and Municipal Workers on the need to stand by Nato; the mental confusion or electoral death wish of the unilateralists; and the folly of binding the parliamentary party by conference resolutions to detailed defence policy. He left with the union's 670,000 votes at next October's Labour conference in his pocket.

He then returned to London to collect his reward for Mr George Brown's display of parliamentary skill in the debate on Blue Streak. By turning the Government's concession of error into an honourable means of altering his own course away from independent British deterrence, Mr Brown made possible a new and fruitful alliance between himself and Mr Wilson. Leaving Mr Strachey stranded, still hugging the all-British bomb, these two have lined up practically the whole parliamentary Labour party behind a new outline of defence principles, which Mr Gaitskell has approved.

The foundations of the new approach are reliance on American nuclear weapons and no replacement for Britain's own V-bombers when they wear out after 1965. This increased dependence on the United States is wishfully squared with the Labour party's instinct for more forceful assertion of the British viewpoint by the suggestion that Nato generals be somehow made more subject to Nato politicians. (This hopeful idea of a political junta in Nato so far has little content in it, although one suggestion mentioned by Mr Gaitskell—that there might be resident cabinet ministers of high standing at Nato headquarters—is worth thinking about; certainly it is a constitutional device which ought to appeal to Mr Macmillan as a former resident cabinet minister in the Mediterranean.) Mr Gaitskell made one other point clear when questioned on the BBC's "At Home and Abroad" by Mr Robin Day. Mr Mulley's notion of a Western European deterrent, separate from that of the American, with which Mr Brown bravely flirted, has been turned down. Mr Gaitskell wants, not two buttons in the west, but one and, not two fingers on it, but some intermediate number between 2 and 14.

Counting the Block Votes

Logically, the new Labour policy ought not to satisfy a single genuine unilateral disarmer. But behind the scenes verbal ladders are being provided for any muddleheads and waverers who want to climb back down into the party fold. And since the brainiest craftsman of verbal ladders is Mr Richard Crossman, he is enjoying the exquisite triumph of a return to grace as one of the four wise men, who are to transform the outline into a document. The new outline policy implicitly assumes that tactical atomic weapons will continue to be stationed in Europe; but for the benefit of doubters it is being whispered that they can possibly be done away with later if conventional forces in Nato are built up—not of course by selective service or anything as unpopular as that, but by combing our garrisons in places like Cyprus. Similarly, silence in Mr Brown's latest policy about American bases is being accompanied by the suggestion that perhaps they will fade away in a few years as technological change makes them useless to the Americans. The extent to which such delicate details will be made explicit presumably depends on Mr Crossman's bargain with the other three, not to mention Mr Crossman's bargain with himself. However, the important fact on which comment has rightly concentrated is that Mr Gaitskell has made the brave and sound decision to take a basically unequivocal stand on the three principles of British need for defence, British membership of Nato, and Nato's need for a nuclear deterrent.

He has thus cleared the deck for battles ahead. The battle at the October conference itself cannot yet be counted won by a long chalk. The mineworkers and railwaymen will not decide until July how they will vote; by that time the flight of the U2, which the unilateralists will doubtless play up for all they are worth, may have outlasted Mr Khrushchev's spectacular unpleasantness in the activist memory. Even if Mr Gaitskell did secure the block votes of both these big unions the arithmetic gives no ground for premature celebrations. Mr Gaitskell will be really safe only if Mr Carron "does a Tom Williamson" by reconvening the National Committee of the Amalgamated Engineering Union and inviting its members to eat their unilateralist vote, or if Mr Carron himself finds some way of privately re-interpreting that vote out of existence, or if Mr Cousins's transport workers' union can be weaned away from Mr Cousins's personal anti-nuclear predilections.

If the conference vote still does go the wrong way, Mr Gaitskell is now in a stronger position to lead the parliamentary party in repudiation of it. He has been preparing the ground for this—albeit a little uncertainly—in the past week. In his Great Yarmouth speech he asserted that the party conference should not bind the parliamentary party on technical details of defence policy but only on matters of principle (an unhappy distinction which invites the retort that unilateral disarmament is a matter of principle). He is reported to have spoken much more strongly to the parliamentary party about their being representatives of the aims of Labour voters, not delegates of the keen minorities who turn up at conferences. Moreover, Sir Tom Williamson was apparently trying out the ground for a constitutional amendment when he referred to the anomaly of the party conference alternating between an advisory role when the party was in office and a binding and vote-losing one when it was not. If Mr Gaitskell gets away with it at the conference on defence this year, he will make a great mistake if he sits back, breathes easily and lets the constitutional issue lapse—until the leftwingers at the conference put him over another barrel on some other aspect of policy next year. Mr Khrushchev may kill him by kindness yet.

EUROPE

Reflection in Lisbon

The meeting of ministers of the Seven (the European Free Trade Association) in Lisbon on May 19th and 20th was the first occasion on which they have seriously begun to consider the changes in policy which they will have to make if they are to reach terms with the Six. No radical decisions were taken. The Seven, for instance, are still holding out for the view that there must be an association between themselves as a group and the Six. But, face to face with the prospect of an accelerating common market, the Seven did show a little more flexibility than hitherto; they recognised, for instance, that the Six preferred the formula of a customs union to a free trade area. This is a welcome change from the chest-beating that has sometimes done duty for serious discussion of these matters in the past.

The Lisbon discussions, however, do suggest a danger as well as a hope. The Six have offered to talk with the Seven but not on the subject of a loose European association. They are only prepared to talk about ways of modifying the impact of their accelerated common tariff through reductions on a most-favoured nation basis. In the absence yet of a basic change in Britain's political approach, the attempt to get tariffs down on a world-wide basis did in fact look like the one field where there is an immediate opportunity to do some good, and before the Lisbon meeting this seemed to be substantially accepted in London. At Lisbon, however, the general anxiety for a deal in Europe drove the Seven to answer the Six with an offer to discuss both a short-term solution on these lines, and a long-term European association. These intentions are unexceptionable; the danger is that the group's ideas of a European solution have not yet evolved enough to offer much hope of practical results. It would be a pity if another abortive encounter on this front were to inhibit the Europeans collectively from taking the initiative for world-wide tariff reductions, both in the group of 21 and in the General Agreement on Tariffs and Trade.

A Champion for OEEC

The anxiety of the smaller European countries not to lose what has been achieved in the way of general European integration has been brought into the open by the Swiss counter-proposals on the future of the Organisation for European Economic Co-operation. The four wise men—from Britain, France, the United States and Greece—who reported last month on the organisation's future suggested enlarging it to include the United States and Canada and giving it new powers in the field of aid to the developing countries; but they left its competence in matters of trade somewhat in the air. Now the Swiss have countered with proposals to give the new body greater powers, especially in the field of trade.

It is not surprising that smaller countries, which set much store by the OEEC principle of one country, one vote, should do their best to keep it alive, and several of the Swiss proposals deserve sympathy. The idea for instance, that the OEEC decisions should be preserved unless it is expressly decided to the contrary (the wise men had proposed a completely fresh start) seems right. Equally the Swiss suggestion that if some countries (like the United States) want to move slowly, others may undertake more extended co-operation among themselves if they wish. The idea of a joint policy to liberalise imports from the undeveloped countries is excellent, both in its own right and as a useful prelude to a broader European agreement.

It is true that in many ways there is as yet no substitute for OEEC. Whether the Swiss are right to rely on solving the European political and economic problem within this context is another question. Too much politics stand in the way. And it is not fortunate that the Swiss have accompanied their championship of the OEEC idea with a somewhat ostentatious neglect of the demand, in which the Americans are deeply interested, for a concerted effort of aid to the undeveloped world.

TURKEY

Turning Back the Clock

Although Mr Menderes announced last week that the whole of Turkey "is in peace and tranquillity," he has decided, because of the domestic situation, to postpone his already much-postponed visit to Athens, which should have started on Thursday. In fact, the crisis that erupted a month ago with student demonstrations against the Menderes regime has been simmering ever since. Last week there were again violent clashes between students and police, and on May 21st about 800 military cadets, accompanied by a number of regular army officers, marched through Ankara in orderly protest against the government's policies and actions.

Although the government has tried to explain away the cadets' march as merely a protest about their weekend leave, it has clearly taken very seriously this first open demonstration that the army might be tempted to abandon its traditional neutral stand in politics. Martial law in Ankara was at once made more rigorous and the curfew was extended (it has since been relaxed again). A censorship of letters and telegrams was imposed, telephone tapping authorised, gatherings of more than five persons forbidden, and the threat made that the security forces would use fire-arms. In addition, all universities and colleges throughout Turkey have been closed down until the end of the period of martial law at the end of July—unless it is extended.

Such drastic medicine is unlikely to cure Turkey's ills. Mr Menderes claims quite rightly that Turkey's fate cannot be settled by street rioting. Nor, however, can it be settled while the country's principal cities are under martial law, the universities closed down, the press stifled, and all political activity (outside parliament) forbidden—although in practice nothing prevents Mr Menderes from addressing large gatherings of his supporters, wherever and whenever he pleases.

Mr Menderes says that he wants to hold elections as soon as possible. This presupposes a return to normal conditions; elections that were suspected of being neither completely free nor completely fair would only make matters much worse. But the fundamental cause of the feeling against Mr Menderes in Turkey today is the belief that he is determined to turn the clock back and deny the Turks the democratic freedoms which were triumphantly demonstrated in the country's first free elections ten years ago. Mr Menderes claimed the other day that the People's Republican party only held those elections because they were "forced to do so by the Turkish nation whose patience had been exhausted." Has it not occurred to him that history might repeat itself?

BY-ELECTIONS

North Edinburgh

The parliamentary by-election at North Edinburgh last week confirmed some of the impressions that arose from the recent local council elections. There is no great sense of political excitement in the country. It is mainly in the factory areas that Labour has lost further support since October; in the residential areas former Tory supporters are staying away from the polls to about the same extent as former Labour supporters are. Liberal candidacies are apparently still likely to draw more votes away from the Tories than from Labour, perhaps even generally in the old "standard" proportion of two to one. There is a convincing ring of truth in one Tory's analysis that "when a working class voter breaks away from Labour he now feels no barrier against coming right over to us, but a Tory who feels dissatisfied with the Government is much more likely to desert us to go Liberal than to go Socialist." At residential North Edinburgh last week the Liberal picked up 15.5 per cent of the vote (which was between 1.3 and 2.5 per cent better than Liberals did in neighbouring Edinburgh constituencies last October). To make way for this the Tory share of the vote dropped by 9.8 per cent and Labour's by 5.7 per cent. The total turnout was only just over 53 per cent, compared with nearly 74 per cent last October. So the Tory's Lord Dalkeith was returned to Parliament with a majority of 5,334, compared with his predecessor's 8,756.

PICCADILLY

Plan Wanted

In rejecting the contentious scheme for the Monico site in Piccadilly Circus, Mr Brooke has done the easy thing politically: he has pleased the aesthetes, opposed brash commercialism, and made something of a monkey out of the Labour-controlled London County Council. His decision will have been the right one only if he proves also to have struck a blow for positive planning of our cities. Although the perceptive sketch at Mr Cotton's press conference last October was most ineptly presented, the vetoed building would

not in fact have been quite so revolting aesthetically as journalists and critics in search of lusty epitaphs have contended. But it would undeniably have blocked any really imaginative scheme for the whole Circus. The delay imposed by Mr Brooke will be worthwhile if such a scheme is now produced and executed. This will not be nearly so easy as saying no to what was admittedly second-rate.

Two sorts of "compulsive redevelopment" projects are practicable. The method which is easiest technically—and (as a rule) most fruitful aesthetically—is for a single large developer, public or private, to handle the entire project. But nobody is likely to handle Piccadilly in this way. The LCC has other heavy commitments for its investment funds; in any case, it is not the right body to undertake such a vast commercial project. Equally, no private developer in Britain has yet shown a tenth of the vision that produced Rockefeller Centre in New York. London badly needs some equivalent venture, although Piccadilly is probably not the best place for it.

It follows therefore that the redevelopment of the Circus will need to be a "group project," under which several developers and the local authority work closely to a single overall design. This is not an easy concept to execute; no legal powers exist to compel co-operation, but only to reject unsuitable designs. The essential next step is that the LCC should draw up an imaginative plan, give it wide publicity, and invite private developers to submit only such schemes as will fit in with it.

EDUCATION

Transatlantic Teaching

MR PHILIP GOODHART, in a new Bow Group pamphlet*, has obtained an interesting and convincing comparison of British and American educational methods—by collecting the comments of the teachers of each country who, under the exchange scheme, visit the other. The teachers confirm the general view that American methods leave the bright pupil bored and underworked, while the British approach leaves the lower quartile neglected and obstreperous. (The fact that the British teachers tended to go to the better American schools, while the Americans were generally shrewdly used to help out in the worse British primary and secondary moderns leaves this comparison unaffected. It is noteworthy that while British teachers were impressed by the breadth of subjects studied by young Americans, the American teachers were not impressed by the scholarship of the little British swots. On discipline—contrary to popular myth—the American schools came off better; but the American relation of parent to teacher and school simply horrified the British professionals, who regard education as something clinical done to children by experts in secret.

The most important difference highlighted by Mr Goodhart's labours is the vast difference in books and equipment in British and American schools. There is occasionally some excuse for inferior equipment here (the Americans were quite happy with the newer British schools they taught in), but there is no excuse for the paucity and the old-fashioned inefficiency of textbooks in British schools. The Americans' point here is certainly valid, and it is humiliating to learn how the English teachers envied the Americans the books that they brought with them. This fault can be traced to the conservatism of many British teachers, the myopia of British educational publishers and, above all, the parsimony and neglect of many local education authorities. It may be too much to expect the British parent to complain (as the American parent would), but why have Her Majesty's Inspectors not made more noise about it? Armed with this questionnaire, Mr Goodhart and his fellow Conservative backbenchers should make some.

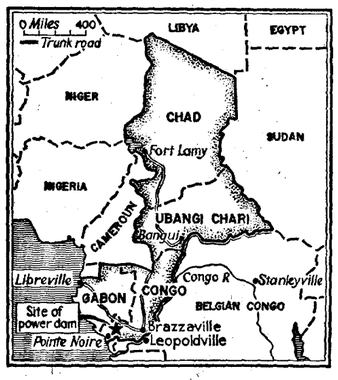
* Exchange Teacher, by Philip Goodhart, MP. The Bow Group, 2s.

EASTERN EUROPE

Hot Water

SOME dismay and disarray were only natural in eastern Europe at the first shock of the summit failure; after all, a return to the cold war could have a very direct personal impact on the lives of the peoples of these countries in terms of shortages of consumer goods, closer attention from the secret police, and renewed isolation from the outside world. Whether these fears will come true is yet to be seen; meanwhile the communist governments have fallen into line with statements and speeches supporting Mr Khrushchev and condemning the American imperialists.

The Jugoslavs, on the other hand, are maintaining a stoutly critical attitude towards both the Russians and the Americans. On May 17th, before the summit had actually disintegrated, Marshal Tito was quickly off the mark with a statement which, while condemning the flight of the U2, pleaded strongly that the incident should not be allowed to upset the conference. Since then Jugoslav comment has been concerned to express, not blame of one side or the other, but doubt of the determination of the great powers (all of them) to solve international problems, and with calling for an end to "block disputes and rivalries" and a greater recourse to the United Nations.



The Jugoslavs' attitude has got them into hot water, not only with the Albanians and the Chinese (never much at a loss for something to abuse the Jugoslavs about), but also with Moscow. An article in the Soviet ideological journal, *Kommunist*, treats both Jugoslavia's domestic policies and its international attitudes with severity. Jugoslavia, it maintains, by its neutral "non-block position" and its refusal to recognise the need for communist solidarity, is actually helping the imperialists; in the struggle against imperialism no socialist country can remain neutral without harming both itself and the socialist movement. In plain terms, what the Russians really cannot stomach about Marshal Tito is his determination to treat both themselves and the West as equally prone to international misbehaviour.

Although the article in *Kommunist* contains references to the U2 incident, it may well have been prepared before the summit collapse. It may, in fact, be yet another sign of the growing ascendancy in the Kremlin of those forces that are equally opposed to an accommodation with the West and to putting up with President Tito's individualism. At the congress of the Jugoslav Socialist Alliance last month, the Jugoslav president was clearly concerned to speak well of Soviet policies and attitudes, and anxious to re-establish closer contacts with other communist parties. Now he has had a rebuff—though he has not this week been denied birthday greetings from Mr Khrushchev. But in so far as the rebuff is due to his stand over the summit failure, he is most unlikely to make the slightest change in his attitude.

EQUATORIAL AFRICA

Post-Colonial Reunion

THE decision of the African leaders of former French Equatorial Africa to reunite as an independent territory within the French Community is wise, and seems to justify the hopes of French officials that the Africans would learn to work together once they had had a taste of living apart.

The weakness of the new Union of Central African Republics is that, so far, Gabon has declined to become a full member, though Gabon is the richest part of the former French colonial federation. But the timetable has probably been geared to the independence of Mali, which is due on June 20th, and of the Belgian Congo, due on

International BTD-20

wins International acclaim!

Throughout the world, cost-conscious contractors acclaim the BTD-20—the only crawler of its size with six-speed, *full-reverse* transmission. The BTD-20 'dozes with 28,300 pounds of push, in first gear, or with 21,000 pounds in second gear, and backs out as fast as 8.4 m.p.h.—moving hundreds more yards daily! With its full range of job-matched equipment, the BTD-20 is providing the BIG power that gets BIGGER profits *from the BIGGEST projects*. Your International Construction Equipment Dealer will give you full details of the mighty BTD-20.

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED · HARVESTER HOUSE · 259 CITY ROAD · LONDON EC1

June 30th. The Republic of the Congo, in particular, cannot afford to lag too far behind because it has been giving a lead to the Bakongo people in their demand for the resuscitation of their lower Congo kingdom.

The new links of the Republic of the Congo with Chad and the former territory of Ubangi Chari would seem to postpone the hopes of the Abbé Youlou Fulbert, the premier of the Congo Republic, for such a reunion; it is another indication of the curious strength of the purely adventitious frontiers created by European colonialisation. But it may be that the Abbé, who is a far-seeing man, envisages a much wider federation, taking in both Gabon and parts of the Belgian Congo later on, perhaps on the lines of the late M. Opangault's vision of a United States of Latin Africa. But in any case he needs his hands free of colonial status to deal with the leaders of an independent Congolese state.

The fact remains that the three states of the new union have always been dependent on French financial subventions, and for the development of their resources (of which the projected Kouilou hydro-electric scheme is the most notable) need a great deal of external capital. If they wish to obtain this aid they will have to offer investors a certain minimum of political stability.

PROFESSIONAL DISCIPLINE

Compulsory Witness?

THE report of the Simonds Committee on Powers of Subpœna of Disciplinary Tribunals is based on what must have seemed to the committee to be a simple argument. Since parliament has entrusted jurisdiction to these professional disciplinary bodies—such as the General Medical Council and the Bar Council—logically it should be prepared to give them the powers necessary for the adequate discharge of their functions. The committee therefore recommends—among other things—that all professional disciplinary bodies set up by statute should be given full powers to obtain the issue of writs of subpœna, and that these writs should extend to the production of any evidence obtained by police officers, whether in the course of criminal investigations or otherwise. This recommendation has caused a stir of indignant protest.

Why? Part of the explanation lies in the public repugnance aroused by two recent cases, where the police handed on transcripts of intercepted telephone conversations to private courts that subsequently ended a barrister's and a doctor's professional career. But the telephone tapping incidents are not the only sources of the public's objection. The fact is that a general reaction against private courts—first against manufacturers' price maintenance bodies, then against trade union courts in industries that suffer a closed shop, and against some agricultural marketing boards—now seems to be lapping against these once highly respected professional disciplinary councils as well. There is widespread uneasiness about the proliferation of these tribunals. Professions from solicitors to midwives now possess them, and there is the grisly but by no means remote prospect of these privileges being extended to chiropodists, dieticians, and even remedial gymnasts.

The Simonds proposal to extend subpœna powers gives this new uneasiness a special edge; the ordinary man feels instinctively that he might be less willing to co-operate with the police if he knew that his evidence might be used in professional proceedings about morals as well as in police proceedings against crime. The appropriate remedy for this, however, is not necessarily to withhold subpœna powers, which can sometimes help defendants rather than the disciplinary authority. The right course may be to do some new thinking about whether (and in which cases and with how absolute a freedom from outside supervision) established practitioners are necessarily the right and only people to lay down and enforce a code of ethics or practice for their own profession or trade.

HOMICIDE

Malice and Murder

ALTHOUGH the doctrine of constructive malice—that any death caused in the course of a felony is murder—was abolished by the Homicide Act of 1957, that of implied malice was retained. Accordingly if a thief assaults a householder with intent to do him grievous bodily harm and the householder dies, the thief will be held guilty of murder. This was the exact situation in the Vickers case of three years ago and Vickers was executed. Last week, by substituting a verdict of manslaughter for murder in the Smith case, the Court of Criminal Appeal showed that malice in murder cases is not to be implied lightly.

Smith, it will be recalled, shook off a policeman from his car; the constable fell in front of an oncoming vehicle and was killed. It was never alleged that Smith intended to kill the constable; the issue for the jury was whether he intended to cause him grievous bodily harm. The trial judge simply directed the jury that a man must be taken to intend the natural consequences of his acts, and the jury accordingly found Smith guilty of murder.

The Court of Criminal Appeal, in substituting a verdict of manslaughter, has now ruled that the trial judge's direction was inadequate. What the judge should have told the jury is that in every murder case a subjective intention either to kill or to cause bodily harm must be shown, and established by external evidence. Since intention in law means foresight of consequences, even if there is no desire that they should take place, a persuasive piece of evidence is that a man intends the natural consequences of his actions. But it is no more than persuasive; it is a presumption of fact not of law, and hence can be rebutted by evidence of contrary intent. The standard of the reasonable man is the appropriate rule for tort cases where the standard is one of average care; it is not the appropriate rule for crime, where personal responsibility must be established. The evidence for a proposition ought not to be confused with the proposition proved by that evidence. The Court of Criminal Appeal's categorical reassertion of this distinction should be warmly welcomed.

MOROCCO

A King's Freedom

KING MOHAMMED V of Morocco has dismissed his government and appointed himself prime minister; on Sunday, the Moroccans will vote in their first country-wide elections, and if these are successful the end of the king's freedom to hire or fire governments may be in sight. In pre-protectorate days, the Sultan's power was absolute, in religious as well as secular matters. When the French and Spanish handed back their powers four years ago, the Sultan's authority, in law, was as extensive as it had been forty-five years earlier.

As was to be expected, this situation displeased many of the nationalist intellectuals who had fought or agitated for independence. Two factors, however, prevented them from expressing their displeasure too openly: the major part that the Sultan had played in achieving independence, and his personal qualities of political acumen and relative liberalism. They could not, therefore, hope—at least in the short term—to emulate M. Bourguiba's deposition of the Bey of Tunis. Sultan Mohammed ben Yussef, moreover, made it clear that he intended his rule—and his line—to continue, by turning himself into a king and, against tradition, naming his son Moulay Hassan as his heir. Now Moulay Hassan is to be the king's deputy prime minister.

The course that remained open to the intellectuals was to encourage the king in the direction of constitutional evolution. In this they may have been more successful than would appear at first glance from the king's singular choice of a prime minister; for the king has also pledged himself to transform Morocco into a constitutional monarchy by 1962. Sunday's elections, although they are only for municipal councils, are a step in that direction. If the electoral experiment is successful, it is likely to be followed by general elections for Morocco's first constituent assembly.

The leftish government of Mr Abdullah Ibrahim had been at loggerheads with the palace for some months. Its dismissal came as no surprise, and the traditionalist Istiqlal party had been clamouring for it on the ground that fair elections would be impossible if it remained in power until polling day.

UNITED ARAB REPUBLIC

Freedom is Boredom

ON Tuesday, President Nasser gathered in the remnants of the once-great Egyptian press. *Al-Ahram, Al-Akhbar, Rose al-Yousseff* and ten other newspapers and magazines are to be given to the National Union, the catch-all government political organisation. The able owners and directors of all the publishing houses are to be replaced by deserving henchmen of the republican regime. According to the official statement, public ownership of the press is the only safeguard against deviation from the aims of the revolution and, in fact, the only firm guarantee of genuine freedom of the press.

Among the few pleasures enjoyed in the past by the Egyptian public was that of reading between the lines of these independent newspapers and magazines. In face of the most stringent censorship, the editors made bold to criticise or, what was more effective, make fun of their rulers. They printed what they were told to print; but an officially inspired story denying the existence of a kerosene shortage might well be illustrated by a cartoon showing a man marrying an ugly woman because she owned a tin of kerosene. Now there will be less jollity in coffee-houses all over the country where the literate few used to read aloud to the illiterate many the tales of wondrous scandal in the pages of *Rose-el-Youssef* and *Al-Akhbar*. Now the ears of the Egyptians will be filled with the kind of dreary news about co-operatives, social uplift and ministerial pronouncements that, once heard, hardly seems worth repeating in the bazaars.

The great newspapers of Cairo were founded late in the nineteenth century by Lebanese who went there to escape the repressive censorship imposed on them by Sultan Abdul Hamid II. Recently, however, the Egyptians have been doing the censoring. Even foreign correspondents have found it necessary to abandon Cairo, once the fountainhead of Middle East news, and to seek the freedom of personal movement and the (relatively) uncensored mail and cable services offered by Lebanon.

In New York, the congress of the International Federation of Newspaper Publishers promptly denounced President Nasser's takeover as an intolerable and unbearable violation of the freedom of the press; and the International Press Institute will surely do the same. It will not bother the Egyptians that the world regards their press as less free than it used to be. Except for a few weeks in the spring of 1954, they have not had a free press for years. They will, however, resent it very much if President Nasser intends to substitute lessons in good citizenship for the blood and thunder they relish.

ART FINANCE

The American Advantage

THE two big art galleries in this country are a good deal better off than they used to be. The annual purchase grant of the National Gallery was increased in January 1959 from £12,500 to £100,000, and a further £25,000 has since been added; the Tate Gallery's grant has gone up from £7,500 a year to £40,000 a year. But these galleries are now seriously concerned about the need to augment the representation of French paintings of the nineteenth and early twentieth centuries which they share. This collection was never large and is now being much depleted—first, because a considerable part of it has been removed to the Courtauld galleries at the University of London and, secondly, by the sharing of the Lane collection with Dublin which is imminent.

The dizzy prices fetched in the saleroom by impressionist and post-impressionist paintings make even the new purchase grants look small. In their latest report published last week, the trustees of the National Gallery therefore return to an old bone of contention—the lack in this country of special tax inducements to encourage private patronage such as those offered in the United States and described by our New York correspondent on page 869. In Britain, the value of notable works of art accepted by British galleries in lieu of estate duties is excluded from the estate for purposes of aggregation, but no such concession applies to a bequest of money to a gallery. A benefactor who in his lifetime makes a gift of a sum of money to a gallery by means of a deed of covenant obtains no surtax relief (as he did before 1946); in the case of a lump sum payment or a gift of a work of art, the donor receives no tax relief whatever.

Hardly surprisingly, the Standing Commission on Museums and Galleries favours the adoption of tax inducements. But the Waverley Committee, which examined the question in 1952, considered that it would be anomalous to allow a transfer of capital to be set off in the assessment of taxable income. The Royal Commission on the Taxation of Profits and Income, under the chairmanship of Lord Radcliffe, likewise reported against it in 1955. More recently, Lord Radcliffe described the extensive American tax inducements as "bad neighbourliness." Certainly they encourage American taxpayers to raid the world's art markets.

CHRISTIAN STEWARDSHIP

A Voluntary Tithe?

A REVOLUTION is taking place in the fund raising methods of the Church of England. English churchgoers have never been noted for the generosity with which they have supported the Church. In 1956 the total expenditure of parochial church councils was divided by the number of Easter communicants, and it was found that the average contribution for each practising Anglican for Church needs was 2s. 7d. per week, less than 4d. in the £ of net income after tax. The figure for direct giving was presumably less than half of this, since 53 per cent of the money was raised by special efforts such as bazaars, fêtes, and sales of work.

The Christian Stewardship campaign, started some years ago, is seeking to inculcate the idea that at least one tenth of disposable income after tax should be devoted to Church and philanthropic needs. To achieve this startling end various methods are employed. The simplest is the envelope scheme, parish members being invited to give a fixed sum each week and provided with envelopes in which to place contributions. A more ambitious method, "the every member canvass," is a planned visitation of all members of the parish, who are asked to pledge themselves, by signing an appropriate card, to give a regular sum to the Church. Christian Stewardship has not lacked its critics, many of them objecting to the Church's use of professional fund raising bodies, which has shocked some of the devout and taken aback even more of them. Yet there seems no reason why the Church should not take advantage of contemporary techniques of business efficiency. One point needs to be made. In some parishes, the campaign has been too successful, so that the Church councils have been left with a surplus of funds which they are not suited to administer. This situation could be met by distinguishing clearly between "dues", money needed for necessary parish expenses, and "alms" for general charitable purposes. The alms could and should be paid into a fund separately administered.

Business machines that meet your changing needs

When you select a new Burroughs adding, accounting or computing machine, you make an investment which pays off immediately and continues to pay off in increased profits through many years of dependable service. Why? Because the multi-job versatility and many advanced efficiency features built into all Burroughs machines allow a growing business to handle its increasing flow of paperwork with speed, ease and accuracy.

A continuing research programme and world-wide manufacturing facilities make it possible for Burroughs to meet the individual requirements of every business—as it is now and as it will be several years from now!

Diplomacy and Paranoia

SIR—The Paris explosion has shown that the diplomacy of the West has come to a standstill. In 1945-1950 the United States could have forced Stalin's armies back by nuclear threats, if the western publics had actively wished it. Now Mr Khrushchev can drive the allies out of Berlin, if he chooses to risk a general war. Possibly he will put on pressure in less dangerous places. In any case peace has become so precarious that large areas of the historical civilised world may soon have to be content with a mention in the school text-books of Melanesia and Tierra del Fuego. It is one thing to risk annihilation in the planned defence of freedom; it is another to risk it in a game of nuclear strip-poker.

The leadership of the West seems, above all, to lack modern psychological knowledge. For several decades psychological concepts have been available which are relevant to the problems of power-politics. Yet few people invoke them to interpret what is actually going on. It seems certain that the East-West problem is essentially one of paranoia (or the sense of being persecuted). Not only the Soviet Union but also the United States suffer from deep feelings of insecurity. In the American instance this is partly due to racial ferment, in the Russian one to the survival of a regime unconsciously recognised as base and inferior; in both cases to that lack of a settled life which has been described as "industrial nomadism."

Clearly, paranoia is still to be found in those European nations which have exhibited so much of it in the past. (Hitler still easily holds the world record.) France is speaking rather too much of its *mission civilisatrice;* British minds engrossed with colonial problems find it hard yet to accept Africans as real humans who can live and have their being except by courtesy of the British administration. But beside the supercharged paranoia of the Pentagon and the Presidium, Europe's leaders have almost the equanimity of the early nineteenth century.

It will be objected that America is right to uphold freedom and Russia wrong to seek to extend its tyranny. This consideration has no place in an argument advocating a "psychological" diplomacy, which indeed in no way invalidates existing alliances for defence. What is essential is mediation by someone (ideally perhaps by neutrals) which will reduce the fear and hatred of the giants and thus the negative projections which their leaders make upon one another.

Fortunately American-Russian hatred is recent and superficial. In the early years after the Russian revolution, the Soviet Government often invoked America as a model with such slogans as: "We want the pulse of America beating within Russian socialism." In Soviet eyes the United States remains the promised land of know-how and ubiquitous plenty. Before the Paris explosion Mr Khrushchev himself had done much to renew the old Soviet-American contacts. Moreover, both giants share a traditional dislike of Western Europe which they regard, at least officially, as pompous, decadent and obsessed with its historical grandeur. The basic Soviet-American entente extends in the same vein to the colonial question.

The therapeutic role of the European mediators should, then, be to urge clinical conceptions of public behaviour on the two greatest powers. The Presidium and the Pentagon may be stuck with Pavlov. But Freud, Adler and Jung are not altogether unknown in the rest of Russia. It remains to apply them to political relationships. If it could be understood that war is, in essence, the re-establishment of relations between communities isolated from one another by negative feelings; that this kind of renewal of contact is now outdated and that in any event only positive feelings towards other nations will help reduce a sense of insecurity and inferiority at home, then humanity will survive and flourish.

Khrushchev appears as a fluctuating and dangerous demagogue. But he cannot be feared; so, to continue to lead, he must make himself personally loved. At present his interlocutors oscillate between attitudes of contempt and fear. These feelings must be replaced by a clinical gravity and a more robust humour, which the western leadership should actively invite the western public to share. Only when the West withdraws its own negative projections will the Soviet Government feel even an inclination to haul down the skull and crossbones and turn itself into a legitimate institution.—Yours faithfully,

*London, S.W.*3 CHARLES JANSON

Cyprus

SIR—In your Note in *The Economist* of May 21st, referring to the deadlocked negotiations on the bases in Cyprus, it is suggested that the differences are small. Viewed from a British standpoint these differences may be small, for indeed the whole problem is small to Britain, but from a Cypriot viewpoint they are obviously important. They refer to the ultimate fate of parts of Cyprus so closely interconnected with the rest of the island that they would necessarily affect the whole life stream of the emerging republic.

The Greek Cypriot position is that when Britain no longer requires the bases for its military purposes, sovereignty over the respective areas should revert to the republic of Cyprus. This is surely most reasonable. These areas form an integral part of Cyprus and should in the ordinary way be under the same sovereignty as the rest of the island. The only reason for placing them under British sovereignty is security of tenure of Britain's military bases. It follows as a necessary implication that if at any time such bases are no longer required for military use, British sovereignty over them would be purposeless. But to the Cypriots it means more than that; to them it is essential to know that the base areas in such a case will, as is natural and logical, come under the sovereignty of Cyprus. An undertaking to this effect by the British Government would create an atmosphere of confidence and mutual trust which more than anything else would ensure the effective use of the bases.

Besides other details, the question of civil administration in the base areas is also significant, particularly as there can be no frontiers between the base areas and the republic. Agreed arrangements for such civil administration should be given a binding form in order that they should have the required validity. The people of Cyprus cannot understand why the British Government refuses to concede points so obviously reasonable and in accordance with the spirit and aims of the London agreement, particularly as it should be far easier for those to whom the differences involved appear small to make the necessary concessions than for those to whom such differences are by the very nature of things so vital.—Yours faithfully,

ZENON ROSSIDES

Nicosia, Cyprus

Diplomats in Africa

SIR—As one who has spent some time in trying to understand the new scene in Africa, I should like to add a few words in support of some of the sentiments in your article last week.

British policy has undergone a great and salutary revision in its general approach to African aspirations to self-government and independence. We seem at last to have realised that the principal danger to British interests in Africa—as, indeed, to African interests—lies not in "going too fast" with the development and encouragement of African politics, but in "going too slow." We seem also to have decided to resolve the striking contradictions that have existed between policy in West Africa and policy in other parts of Africa.

All this is greatly to the good. Unfortunately, as you point out, this significant and fruitful transition in policy has yet to be accompanied by any sign of comparable transition in the administrative faculties whose task it is to watch over the workings of policy, collect the information required to improve these workings, and conserve and reinforce the large fund of goodwill that Britain now has in many African countries, including some that were never part of the British Empire.

At the same time, one may doubt whether any such transition in administrative organisation was feasible until now. Are

you not misjudging the real possibilities when you write that "it is very late in the day" to make the change? One could argue, rather, that the administrative change could not be expected before the policy change. What the emergent situation undoubtedly requires in the next year or so—and the sooner the better—is a high-level re-examination of the proper functions and responsibilities of the Foreign Office, the Commonwealth Relations Office, and a Colonial Office whose area of authority will shortly become very small indeed. As things stand today, the Foreign Office may well be equipped to provide senior diplomatic staff. It is almost entirely unequipped to provide experience and information. The Commonwealth Relations Office is certainly in an even worse case—is little more, so far as one can tell, than an amiable post office. Meanwhile, the Colonial Office is allowing brains and experience to filter away into private employment. Cannot something be done—and done now—to recast and revise all this in the light of actual and potential needs? One great transition, surely, deserves another.—Yours faithfully, BASIL DAVIDSON
London, SW13

Czechoslovakia

SIR—Your note on the proposed new constitution for Czechoslovakia includes the remark that the proposed constitution "explicitly states that the Communist party is the leading force in society and the state" and that "there is no similar statement in the constitution of the Soviet Union." May I remind any readers misled by this assertion that Article 126 of the Soviet Constitution of 1936 says of the Communist party that it "is the vanguard of the working people in their struggle to strengthen and develop the specialist system and is *the leading core of all organisations of the working people both public and state*"?

I venture to do this not simply because of a pedantic concern for the accuracy of *The Economist* but because I believe that much of the flimsiness of public comment on Soviet affairs arises from a neglect of this key provision of the Soviet constitution.—Yours faithfully, MAX BELOFF
Oxford

Moral Rearmament

SIR—You call for honest inquiry. Let us have it. Your colleagues in the responsible journals of Zurich, Frankfurt and Paris have presented the facts to their readers.

Let us have in true perspective the part played by the ideology of Moral Rearmament in the reconciliation of France and Germany and of Greeks and Turks in Cyprus and in providing leaders in Japan with a sound basis for their national life and leaders in Kerala with fresh hope. Let us have the news from Nigeria, too, and from the Ruhr.

In the free world we seek the inspiration to bring unity of purpose to NATO, to guide the constructive developments of the British and French Commonwealths, to enable the industry of Europe and America to serve the needs of the underdeveloped countries and to make our society a pattern of responsible men bringing the answer to the divisions of class and race.

To find that inspiration we have first to accept that "men must choose to be governed by God or they condemn themselves to be ruled by tyrants." Selfish comfort would persuade us to evade the choice. The Communists lull us with the pretence it need not be made or divert our attention. You, Sir, can greatly help us choose aright and find our true part in constructive world strategy.—Yours faithfully,
Glasgow J. H. JOUGHIN, RN (Ret.)

SIR—As a regular reader of *The Economist*, who has always welcomed its informed coverage on world affairs, I frankly am appalled at the bias of your article on Moral Rearmament.

Any "honest inquirer" will soon discover that men like Kishi of Japan, Makarios and Kutchuk of Cyprus, Azikiwe of Nigeria, and Adenauer and Schuman, have testified to the effectiveness of this work in their countries. It gives real hope, at a time when summit conferences fail, to find a force at work that is bringing a solution to some of the difficult problems of our time.

This is news that should be proclaimed, not suppressed under the guise of "Christian humility." Surely these facts deserve more serious appraisal than you appear to have given them.—Yours faithfully, A. S. KIAER
London, SW1

Liberals

SIR—You assert in your issue last week that the Tories made "unprecedented gains" in the council elections at West Ham. Last December "a Liberal sensationally broke into Labour's monopoly of the local council" (your comment, December 12th) at West Ham. On May 12th there were three further Liberal gains. The present composition of the Council is: Labour 60, Liberal 4, Conservative nil. Unprecedented gains indeed!—Yours faithfully,
P. C. CHITNIS

London, SW1

[Sorry. We listed West Ham as one of the sixteen boroughs in which Labour lost seats that it had held ever since the war. It is quite true that in West Ham (but not in the others) the losses were made only to Liberals.]

Postal Codes

SIR—Your interesting article on "Top Letters" suggested that the use of postal address codes by the public would eliminate the need to write the "names of houses, streets, towns and counties" on letters sent by post. I am afraid this is not correct. The postal code will be an addition to the full postal address.

So far as we can see at the moment, the full postal address will be needed for sorting letters at the smaller offices where the use of coding/sorting machinery could not be justified, and at all offices for sorting items of mail, e.g. packets and parcels, which cannot be dealt with under the coding/sorting process. What is perhaps even more important, it is most unlikely that we shall ever devise a machine that can walk up the garden path and put the letters through the letter box: a postal address will always be needed by the delivery postman.

I might add that we should have liked to have been able to shorten the postal addresses used on letters but at the present stage of our development we can see no way of doing it.—Yours faithfully,
General Post Office, T. A. O'BRIEN
London, EC1

Roads in Summer

SIR—I spent two months last year driving a rented car around and about in England. This proved to be a thrilling and nerve-testing experience in contrast to the driving I do in Canada and the United States.

The cause of the thrills and excitement stemmed from what I judge to be a game generally played by Englishmen. My wife and I call the game "do 'im in"—its main rules, we judge, are few. Among them are the following: each car owner pretends that there are few or no other cars in existence; positions are taken by parking just around the corners from oncoming traffic, or just over the tops of hills, or by driving about on dark and stormy evenings without lights before some officially published "lighting-up" time; points are accumulated only by causing *others* to have accidents; grand scores are made when, having caused a head on crash between other cars by waving-on a following car over the crest of a hill or around a bend, one can lay a charge against the wrecked cars for having failed to signal or for injuring your own passengers by the flying wreckage.

My wife and I also concluded that the only way in which the traffic in Southern England would ever get itself sorted out was by adopting a policy either of paving the area, London-Windsor-Portsmouth-Brighton-Canterbury (so you could drive without roads) or by directing all traffic at all intersections by some sort of master electric computer which would—at some additional mileage driven—direct everyone to his destination without stopping.

In the first case, one would see the elimination of pedestrian traffic more quickly than they can be run down in the lanes, as at present. In the second case, the lack of traffic jams would convince everyone that they were making progress in their trip, though the journey from Croydon to Brighton might take one by way of the West Riding lanes.—Yours faithfully,
Ontario, Canada GEORGE F. BAIN

BOOKS

The Lawgiver Returns

The Law and the Profits

By C. Northcote Parkinson.
Murray. 185 pages. 15s.

FOUR and a half years ago a letter appeared at *The Economist* from an unknown correspondent who intimated that he was some sort of professor at Singapore; it accompanied an article which, the correspondent explained, enunciated a new law of government that he proposed to name after himself. The article was almost twice as long as any that *The Economist* would normally publish. It was read here with a rejection slip already poised for the pinning. A few minutes later it was being passed round the office instead, with decreasing tentativeness. "Is it just my peculiar sense of humour that is tickled by this or . . .?" On November 19, 1955, the week in which the report of the royal commission on the civil service also appeared, "Parkinson's Law" was published in *The Economist*. Within a short while it had attracted far greater fame than that royal commission ever did. MPs rallied the Government about the law's discovery at question time in the House. Earnest Germans wrote to *The Economist* pointing out that the mathematical formulae underlying the law did not add up. Foreign civil servants wrote to government departments seriously complaining that their copy of the "royal commission report did not contain the appendix which I understand is called Parkinson's Law." Requests for reprinting poured in to *The Economist*, and the article was later republished by the author as the leading piece in his best-selling book.

Parkinson's Second Law, which now appears directly in book form, is one to which *The Economist* can claim no similar privilege of godparenthood. It does not recapture quite the full careful rapture of the first law; there is a tendency in a book to carry on the joke just a little too long; we prefer the egg that this cuckoo laid in our own nest. But the elusive and devastating style remains, and so does the straight-faced satire. Where the first law had proclaimed that "work expands so as to fill the time available for its completion," this second law explains that "expenditure rises to meet income." Individuals learn the truth of this whenever they get a rise in salary, and have to cut their coats accordingly. But governments rarely pause to consider it. This is because most taxes are burdens imposed by some people on others, not on themselves. ("The taxes decreed by ancient monarchs were all of this type and so are the graduated taxes of today at all levels above the average, being voted by those to whom the heaviest rates will not apply.") The limit of government expenditure is therefore reached only after a long dreary process of social and imperial decay. During this period enterprise flounders, because the most profitable study of the ablest is how to avoid tax, and the highest aim of the majority is to "be living in a small suburban house with a small suburban garden, drawing a small suburban income and supporting a small suburban wife."

The only way to escape this decay, says Professor Parkinson, is for some government to undertake a fiscal revolution: by applying the methods of individual finance to public expenditure. The Cabinet should decide what proportion of national income should be taken in tax, and what should be its distribution between departments. Government income should then be regarded as fixed. "No department under this system would be asked to submit an estimate. It would be told, instead, to keep within a total." No compromise approach to this reform is likely to succeed, nor is it in practice ever seriously attempted. The present British system of nominal parliamentary checks on estimates was "introduced during the Second Dutch War in 1666, [when] their primary object was to prevent money from the Navy Vote being spent by Charles II on the aptly entitled Duchess of Portsmouth. Even for this strictly limited purpose the method chosen was no startling success." Nor were great improvements made when the system was changed to "its present form in 1689, from which year it more or less prevented William III from spending the money on his friends—who were not even girls." No other system but the Parkinson revolution can advance the day when officials come "to realise that a knighthood is more readily to be won by saving money than by spending it."

Here and there, as he warms to his subject, Professor Parkinson bares undoubtedly reactionary teeth; in some of his comments on bureaucracy there is a relapse into snarkiness—which is a mistake, for the efficacy of the attack depends on the style being that of a boojum, you see. But much can be forgiven in a book that throws itself with such generally devastating wit upon Whitehall strongholds that have been impregnable since the days of Gladstone. "Among the entanglements which surround their position," says the author, "are the graves of their former assailants." He joins himself engagingly to their company. On the anniversary of the publication of this book, as he says already happens on the anniversary of the death of one of his predecessors in assault, leading bureaucrats should exchange a barbed wire.

Political Communication

The Weapon on the Wall

By Murray Dyer.
Johns Hopkins. London: *Oxford University Press.* 290 pages, 48s.

AMERICAN experts have built up a body of studies on propaganda, which is taken much more seriously than in Britain—too seriously, perhaps. The subject is being turned into a branch of sociology and psychology, taught in a jargon that leaves one-time practitioners baffled. Mr Dyer's work is an exception. It is repetitive, but very clear.

The author, who is a member of the Operations Research Office at the Johns Hopkins University, rightly condemns the term "political warfare"; for it does not take into account the fact that propaganda has its place in time of peace, and is addressed to friends as well as to enemies. Although the idea of "propaganda" for home consumption is rejected in America (as in Britain), it is not possible, or at any rate not desirable, for a western country to put out material that cannot or should not be heard locally. This is a point often forgotten by too zealous propagandists. Mr Dyer has coined the term "political communication" to avoid these difficulties and the bad odour surrounding the word "propaganda." His choice is accurate and "pure," but somewhat clumsy.

Mr Dyer begins by recalling the difference between American and Soviet behaviour in two historic events: one, the dropping of the bomb on Hiroshima, and, two, the launching of the first sputnik. No arrangements had been made to influence public opinion about the first atom bomb, whereas the Russians marshalled their case for world leadership "with malice, forethought, integrated governmental action and skill." The contrast should never be possible again if Mr Dyer's far-reaching claims to an equal share for propaganda planners in top-level councils, and his well thought out operating principles, were achieved.

There are, however, weaknesses in his case. Can it be imagined, for instance, that propagandists could have been informed before the American secret service sent spy planes over Russia? The fact of the matter is that too much should not be expected of propaganda, and too complicated an organisation defeats its purpose. It is the basic action itself that makes the "political communication" good or bad. Anyone could have thought out the right propaganda for the sputnik in a twinkling, given a functioning apparatus for dissemination. No amount of previous planning could do more about Hiroshima than give the stark lesson of Allied power. Soviet propaganda is as subject to this law as western practitioners. Admirers, such as Mr Dyer, should bear in mind its failures. Mr

Khrushchev's speech of May 5th on the spy plane incident was excellent propaganda, because he took a comparatively rational and restrained line, pointing, *inter alia*, the lesson that one must not allow the military (in Russia as well?) to have too much power. But if his decision to go to Paris and smash the summit before the world's journalists was intended to be another master stroke of propaganda, then it failed; the action itself was not acceptable.

Mr Dyer's ideal organisation is intended to operate in time of war as well as peace, but he must surely have in mind more wars of the Korea type. One cannot help wondering what would happen to political communication if H-bombs were falling; even in the last war it was impossible to maintain complete control of the man at the microphone or the leaflet-writer at the front.

Unthanked Statesman

Haldane of Cloan: *His Life and Times*
By Dudley Sommer.
Allen and Unwin. 448 pages. 42s.

INTELLECTUALLY, Haldane was one of the greatest Scotsmen of his age. He was the leading figure at the English Chancery Bar; the reorganiser of the British army and father of the force that tilted the scales against Germany in 1914-18; almost the founder of the modern university system in England; a philosopher who moved freely in that rare atmosphere which metaphysicians alone can breathe; and (above all, perhaps) a character that could bear without complaint the wickedest campaign of calumny to which any public man in this country has been subjected in the last hundred and fifty years.

Fortunate enough to be born in a religious Scottish family and to be educated at a Scottish university, Haldane moved on to Göttingen, where he indulged and cultivated his taste for metaphysical discussion. If he had wanted an academic career he could no doubt have been a Scottish professor, but he chose instead the English Bar. That was not an obviously safe move, for he had few English connections and none of those great advantages that Wykehamists and fellows of All Souls bring with them when they are called. But he had enough luck to give his abilities a chance, and his early struggles in the profession were not severe. In his first year of practice he broke his duck and made more than £30. In his third year he made £160 and in his fourth about £1,100. After six years he was prosperous enough to look round for a seat in Parliament and lucky enough to be elected first time. He took silk at 33 and never had a setback in his practice.

In fact, it was only the squabbles between the Lib-Imps and the Radicals that prevented Haldane from reaching the Woolsack in 1906. And it was a stroke of luck for Britain that he missed the appointment. For he went, instead, to the War Office, and turned out to be the one man capable of reorganising the army and giving it a modern shape, and his work was completed with very little time to spare. In 1912 he became Lord Chancellor, but was kicked off the Woolsack by the mudslinging of Northcliffe and the rancour of Bonar Law.

Next only to his services to the army comes his work for English education. Thanks largely to his efforts, London was established as a teaching university and became the largest in the country. Haldane helped as much as anyone to kill the old notion that Oxford and Cambridge were the only towns in England where undergraduates could decently be taught, and but for his campaigning English education would be in a poor plight today.

Mr Sommer has brought to the writing of this book a splendid enthusiasm and a most admirable energy. It is a performance of which he may well be proud. The general reader may perhaps find himself a little wearied by over-much quotation. A certain amount of quoting is essential, but too much of it blunts the narrative. Not many readers have concentration enough to digest three pages running of quotation printed in small type.

Mixed Bag for Eggheads

THE two latest salvoes in the battle of the egghead paperbacks indicate how diverse the market is expected to be. Any lingering doubt that a market exists at all should be dispelled by the current international exhibition of paperbacks at Bowater House; by the issue by Whitakers of the first comprehensive British catalogue of paperbacks, which is to appear next month; and by the entry of Pan Books, hitherto mainly associated with station bookstalls, into the same field.

The first five titles in Collins's new *Fontana Library* are all classics, in the sense of being well-established works that sell steadily but slowly. The series is to consist of uniform, completely reset editions of previous titles from various publishers. Prices are reasonably low and fairly closely related to size. Both in appearance and in content they are satisfactory: good sound stuff—books one always *meant* to buy but *never did*.

The Cambridge University Press series, of which this is the second batch, is slightly more exotic (though it must be distinguished from the Cambridge "Students' Editions," which are paperback versions of strictly academic textbooks). Selected from the Cambridge back-list, they are mostly reprints, either from the existing plates or by a photographic process, and their format varies according to the original editions. They are comparatively lush in appearance; prices are to match, and are apparently related more to expected sales than to size. The series is to be jointly produced and distributed with Cambridge's New York office; and the American prices on the jackets are independently estimated in New York according to expected American sales. Hence the discrepancy between two titles, which in America both cost $1.25 but over here 7s. 6d. and 8s. 6d.

Where is the Oxford University Press in all this? In fact, Oxford has had fourteen titles in its American series, *Galaxy Books*, on the English market since February, selling at strict conversions of the American prices, plus carriage costs. An English series is to appear in the autumn. It will be selected from Oxford's lists on virtually the same principles as Cambridge has used, and will consist of general and academic works that have sold steadily as hardbacks, with perhaps some new titles later. The format will be uniform, which will mean complete resetting in some cases.

At the moment, the most striking thing about the Cambridge and Fontana lists, and about many paperbacks already available, is what an extraordinarily assorted selection they seem to be. Religion, economics, literature are all jumbled *together. But these are merely the first* attempts on the mass market that is thought to exist just below the threshold of purchases of hardbacks; what they have in common is the hope of their publishers that at least five to ten thousand people will be stirred to buy any of them as soon as their new low price is revealed. For instance, the buyer of the Fontana edition of Fisher's History of Europe will save 31s. on the two-volume hardback edition published by Eyre and Spottiswoode, and the buyer of Acton 10s. In some cases—for instance, A. S. Turberville's "English Men and Manners in the Eighteenth Century," which is appearing as a *Galaxy* book—the hardbacked edition is out of print.

The selection looks less odd if it is compared with American lists; a close eye is being kept on tendencies in the American market, where theology and philosophy paperbacks (not to mention Trotsky's three-volume history of the Russian revolution) have had vast sales. (The eye is very close in some cases: thus the *Fontana Library*'s next batch is to include Edmund Wilson's "To the Finland Station," which Mayflower has been distributing here in a Doubleday Anchor edition for years.) It is true that a price which seems reasonable in America is two or three times less reasonable here: page for page, many of these books are less good value than Everyman or the World's Classics. But what the contemporary paperback has over the older cheap series is its content: comparatively esoteric or up-to-date material (sometimes so up-to-date as to be published simultaneously with the hard cover edition—e.g. Professor Rostow's book) that in hardback costs far more. If the American experience is any guide, it is comforting to think that Britain is on the verge of admitting that even the new or the difficult can be cheap without being disreputable.

Lowe's Last Chance

The Last Years of Napoleon

By Ralph Korngold.
Gollancz. 444 pages. 25s.

"SIR HUDSON LOWE'S Last Chance" would be a good sub-title for this lively record of island discords. For that unsuccessful and deservedly unpopular officer, nearly court-martialled for surrendering Capri in 1808, was never given another. We see more of him than Napoleon. After a stormy interview on August 18, 1816, they were not on meeting terms. Both were to blame. Napoleon's dislike of Lowe's manners and methods is excusable; it was shared by all (including Lady Lowe) who had to deal with him. Wellington had found him "stupid, ill-educated, jealous, suspicious." Admiral Malcolm complained that he wrote in a style which was "repugnant." Count Balmaine's epithet "repulsive" is justified by Mr Korngold's description of his appearance. Yet the ex-Emperor, whose dynastic hopes depended on contacts with Europe, should have realised that self-isolation from the Governor meant isolation from the Allied Commissioners, one of whom, the Russian Balmaine, might have been helpful.

Lowe's determination to smell out and crush any Bonapartist conspiracy was not, as the author seems to think, due merely to an anxiety-neurosis; for an escape by the man who believed that "impossible is a word only found in the dictionaries of fools" could not be ruled out. Precautions (though Lowe's were sometimes silly or malicious) were not unnecessary. Nor were Lowe's fears of Bonapartist propaganda—even if its unsuspecting agents were simple British sailors, soldiers, or visitors to the island. He sensed, though he did not understand, the genesis of the legend that later carried Napoleon III to power. Lowe behaved churlishly over gifts of books and china stamped with the Imperial "N"; and childishly about beans from Napoleon's garden whose colours seemed to him politically symbolic. But Bonapartist bric-á-brac was to play a major part in nourishing the legend; Mr Korngold should reread Guérard's "Reflections" on it.

Sir Hudson had no wish to shorten his prisoner's life: his meddling in medical matters was partly due to his wish to preserve his own lucrative position by prolonging it; and so was his hostility to any suggestion that life on the island was unhealthy. Mr Korngold over-emphasises the prevalence of a form of "hepatitis" and the possibility that it was a contributory factor in Napoleon's final illness: cancer research supports Sir Hudson on this point. The author is happier in dealing with the quarrels of the temperamental individuals cooped up with the Emperor.

Among these, fortunately, was Count Bertrand. His journals, deciphered forty years after Rosebery had favourably compared his silence with the literary loquacity of his companions, have enabled Mr Korngold to revise some long-accepted opinions: but the evidence used lacks explanatory footnotes; and some small sacrifice of gossip to make room for a few of the penetrating military criticisms made by Napoleon not long before his death, and concisely recorded by Bertrand, the experienced staff officer, would have increased this book's historical usefulness without lessening its entertainment value. General Gourgaud had a good military record; but his possessive devotion so bored Napoleon, and so infuriated the others, that no one was sorry when he got permission to leave. They did not know (nor did Rosebery) that neurotic discontent had driven him to ease his passage to England by giving information to the Governor, and to try to insure his future by giving more to the British Government. Las Cases's curious disappearance is also explained: his literary facility, his fairly fluent English and his consequent usefulness to Napoleon aroused an envious hostility that drove him to get himself deported by posing as a plotter. The ci-devant Marquis de Montholon was a toady whose influence at Longwood is thought by Mr Korngold to have been the result of his wife becoming Napoleon's mistress—a position for which her experiences would not have disqualified her.

The war between O'Meara, the ship's surgeon who attached himself to Napoleon's household, and Sir Hudson is fully described. It led to O'Meara's deportation from the island; and his dismissal from the navy in 1818 after he had accused the Governor of plotting Napoleon's death. But O'Meara had the last word when he published his "Voice from St Helena" twelve months after Napoleon's death: the voice was untruthful; but it was unanswered even by those who might have been expected, at least officially, to defend the Governor. O'Meara profitably exploited his dubious record, reinforced the Bonapartist cause, and ruined Sir Hudson Lowe, who died, socially ostracised, unpensioned and poor, not long before his "anxiety-neurosis" was justified by the advent of Louis Napoleon.

OTHER BOOKS

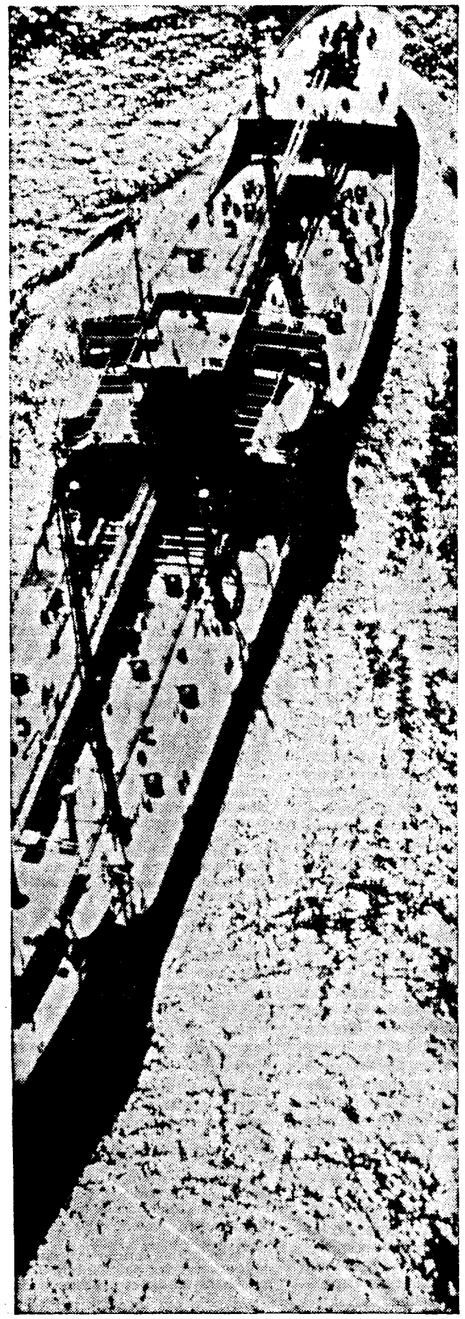
THE REBELS. By Brian Crozier. *Chatto & Windus.* 256 pages. 21s.

This book analyses the rebellions that have broken out all over the world since the end of the second world war: from Cuba to Indonesia, from Kenya to Cyprus, from Hungary to Tibet. It describes the personalities and background of some of the rebel leaders, and the policies of the various governments concerned in dealing with them. As the author is a member of the staff of *The Economist*, it is against our policy to review the book.

EUROPEAN ASSEMBLIES. By Kenneth Lindsay. *Stevens.* 289 pages. 35s.

Soaked in day-to-day experience of the Council of Europe and the Assemblies of the Six, Mr Kenneth Lindsay is the outstanding British expert on the parliamentary aspect of the European groupings. The main body of this book, describing the development and problems of the European assemblies, and the long appendix—a series of papers contributed to a Round Table Conference on them—provide a fund of useful background information on their working. They carry a stage farther the useful exposition of the subject which Mr Lindsay provided in his earlier work "Towards a European Parliament." Mr Lindsay's advice on how to solve the assemblies' difficulties is less helpful. No amount of technical alterations—merging one assembly with another, linking this organisation and that as he suggests—can produce useful results until the political difficulties that divide the governments of western Europe are resolved.

LOCAL GOVERNMENT AREAS. By J. Herwald Morris. *Shaw and Sons.* 264 pages. 37s. 6d.



A legal guide to methods of local government reorganisation in England and Wales.

TRADE AND ECONOMIC STRUCTURE. By Richard E. Caves. Harvard Economic Studies, Vol. cxv. *Harvard University Press.* London: *Oxford University Press.* 325 pages. 48s.

This is a scrupulously comprehensive critical survey of the theories of international trade and its relation to internal economic structure; more particularly of the skeletal structure of those theories—the "models and methods" of Dr Caves's sub-title. Its object is accurately described as that of "co-ordinating the work of current researchers on the 'frontiers of knowledge' with that of their contemporaries and predecessors." To specialists and would-be specialists in the field of international trade theory it will immediately become indispensable. The unqualified reader is warned off.

MANAGEMENT SURVEY. By Frederic Hooper. *Penguin Books.* 218 pages. 3s. 6d.

The increasing interest in management since this book was first published by Pitman in 1948 justifies its reissue as a Pelican. For the new edition Sir Frederic Hooper has added a few footnotes, but has not felt that any appreciable alteration of the original text was called for.

What are they carrying... petrol or gasoline?

Differences in language and customs, however small or subtle, can be important to people in Britain doing business with America.

As a U.S. bank with branches in London, Chase Manhattan knows the differences and similarities, can do much to make your dealings with the States more pleasant and more profitable. Chase Manhattan knows, too, the differences in customs and trade practices *within* the states... for its network of correspondent banks is the largest in America.

In fact, almost anywhere you do business, Chase Manhattan's network of more than 51,000 correspondent banks and branches around the world can get up-to-the-minute information for you, and provide you with every type of modern banking service—promptly, efficiently, and on a personal, *localized* basis that practically puts you on-the-scene yourself.

Why don't you talk to the people at Chase Manhattan... in either of the London branches.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

What President for Mr Khrushchev?

WASHINGTON, DC

THE macabre air which marked President Eisenhower's triumphant return to Washington last Friday was heightened when the bells of the church opposite the White House rang out the tune of "America the Beautiful," inviting him to "crown thy good with brotherhood from sea to shining sea." For there is likely to be remarkably little brotherhood in the United States between now and next November's election. Mr Adlai Stevenson, having suggested that the United States was partly responsible for the collapse of the summit meeting, has been sternly told by Vice President Nixon that this was a shocking thing to say; Mr Stevenson in turn has been blamed by a Republican Senator for the failure in Paris on the grounds that Mr Khrushchev thinks he is "soft on communism" and is waiting for him to become President.

The Democrats are divided three ways. Some of them, such as Mr Lyndon Johnson, the majority leader in the Senate, want to hold only the discreetest inquiry into what went wrong in Paris because they believe that Americans should present a united (if speechless) front and also because they suspect that there is little political gold to be mined from the summit. Others, like Senator Symington and the Democratic Advisory Council, have briskly demanded a whole new foreign policy without making it entirely clear whether they prefer a renewed attempt to talk to Mr Khrushchev or a return to the barricades of the cold war. Only Mr Stevenson and a platoon of liberals in the House of Representatives have made it plain that they want to go on negotiating but want it done better.

The scene is now set for a major debate on foreign policy before the election; in spite of the attempt by the managers to ring down the curtain, fighting has already broken out on the stage. There is reason to think, however, that the debate will have less effect on the nomination of the candidates in July than it will have on the subsequent struggle between them. Mr Nixon has so firm a grip on the affections of his party's organisers, and has done so well in the primary elections in which the rank-and-file in a few states express their preferences, that he would have to be extraordinarily butter-fingered to lose the Republican nomination now.

It is true that Mr Nelson Rockefeller, his only potential rival, stood aside ostentatiously from the Administration's climb to the summit while Mr Nixon was tagging along dutifully, three paces behind the President. But Mr Nixon is now making up for this by catching spies, promising to be firm with the Russians, and glaring at faint-hearts. He will probably suffer less from his association with an Administration which tripped over its own feet at the summit than he will gain from his association with a President who, as last Friday's cheering crowds showed, is still almost immune from criticism.

In the Democratic race Senator Kennedy's lead over his competitors is nearly, though not quite, as substantial. His astonishing success in last Friday's primary in Oregon—the seventh victory in the seven primaries in which he has chosen to take part—has hammered the final rivet into the bandwagon which he will now parade temptingly in front of his rivals' supporters. He has already collected about 360 of the 761 delegates whom he will need to win the nomination at the Los Angeles convention, and has high hopes of about 150 more. But the sceptics recall that in 1952 Senator Kefauver won every primary that he entered except one and yet lost the nomination to Mr Stevenson. They claim that this month's events in Paris have widened slightly the gap which still lies between the cup and Mr Kennedy's expectant lips.

WHETHER or not this is so depends on which of the candidates judges the country's reaction to the collapse of the summit most accurately. There are shrewd observers in Washington who believe that Mr Stevenson, by speaking out bravely and early, may yet succeed in rallying a majority of Americans to his view; this is that the conference would at least have taken place if the United States had been less clumsy, and that it is too soon to conclude that there is no point in talking to Mr Khrushchev. But many more people see signs that public opinion is lurching in the opposite direction. The word "appeasement" was heard on Capitol Hill this week; Senator Dodd, who speaks for those Roman Catholics who look at the Soviet Union through the spectacles of moral absolutism, wants to have Mr Cyrus Eaton arrested for talking to Mr Khrushchev at the airport in Paris; Mr David Lawrence, the columnist, has called for the withdrawal of the American Ambassador from Moscow. If these undulations mark the beginning of a wave that will carry American foreign policy back to its own brand of Stalinism, Mr Stevenson will go under with hardly a gurgle.

In theory, such a wave might help either Senator Johnson or Senator Symington. They are older men who might hope to benefit from a public suspicion that Mr Khrushchev, if he met Mr Kennedy, would simply pat him on the head. Each of them, however, goes to the convention under a powerful handicap—Mr Johnson that of his unpopularity among voters in the North, Mr Symington that of his simple lack of delegates. The evidence is that Senator Kennedy can ride the wave of public opinion skilfully enough to stay in the lead. On Wednesday night he was still communing with his muse and his poll-takers, but reports suggest that, while dissociating himself from the Advisory Council's apparent belief that Mr Eisenhower should not have gone to the summit at all, he will take care not to expose himself to the charges that are already being levelled against Mr Stevenson. And unless he misjudges the situation hopelessly, he will go to the convention with so many delegates—perhaps 600 or more by then—that his opponents will have to combine very early in the proceedings to defeat him. Since this implies an alliance between Mr Stevenson and Mr Johnson, who differ radically in their attitude towards Russia, it can be argued that the disaster in Paris has made such an alliance less likely than before.

Thus the odds are still in favour of a Nixon-Kennedy contest. The way in which such a contest would be affected by recent events depends on the extent to which these events have altered the public's image of the kind of President it wants in the next four years. This, in turn, depends largely on what Mr Khrushchev does between now and next November. If he precipitates a major crisis by blockading West Berlin, or simply keeps on sticking pins into the vulnerable expanse which the State Department now presents to him, he will probably make Americans fighting mad.

The fragile tolerance which they extended towards Mr Khrushchev last September will finally crack; and there will re-emerge that element in the American temper which believes that in every quarrel there comes a point at which the good man has no choice but to strap on his guns and wait outside the saloon for the villain. Mr Nixon, in these terms, is undoubtedly the fastest gun in Washington. He showed his dexterity last week when he insinuated that to ask for an inquiry into the Paris failure was tantamount to demanding that Mr Eisenhower apologise to Mr Khrushchev. In a contest to decide who could go gunning after communism best, it is very unlikely that Mr Kennedy could compete (or would want to) with Mr Nixon.

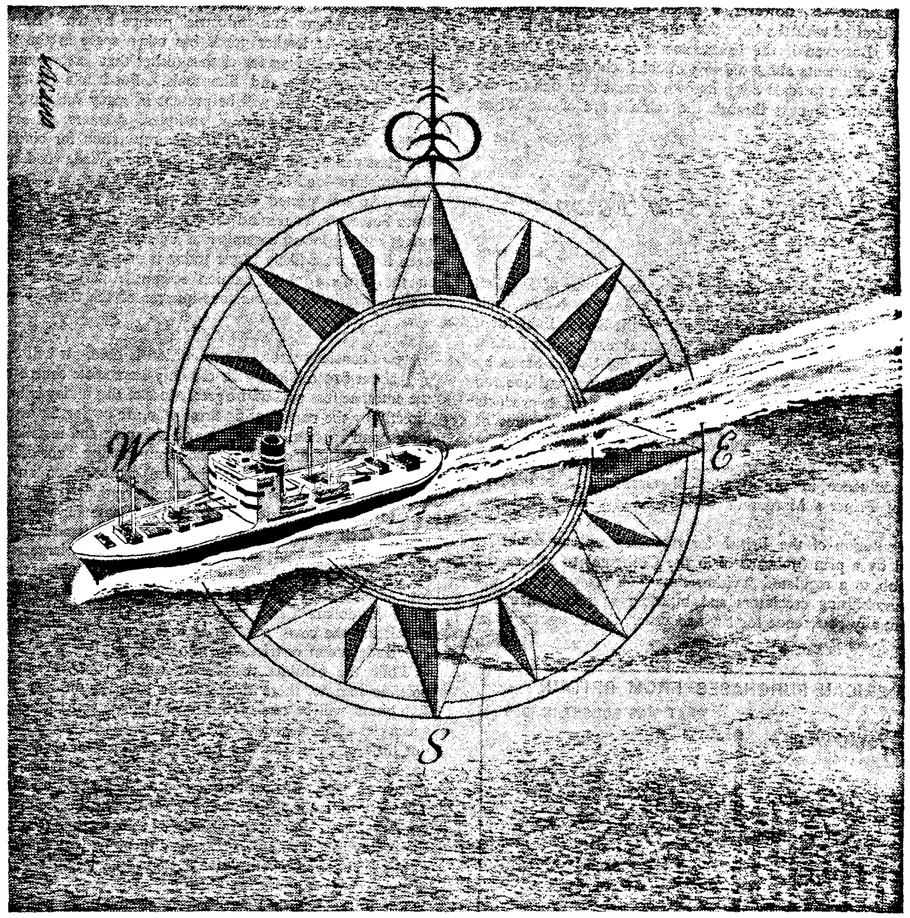
But if the situation gets no worse, Senator Kennedy will have some distinct advantages. In these circumstances the country will probably seek a President who, while promising to be firm with the Russians, will keep open the door to conciliation. This is exactly the middle-of-the-road position on which Mr Kennedy is likely to take his stand. He will be helped by his ability to criticise the Administration's fumbling over the U2 episode which has undoubtedly irritated even those Americans who do not believe that it affected the outcome of the summit. In this context the Vice President's claim that he already has his fingers on the strings of government (as far as anyone can claim that in the Administration's present unravelled state) is likely to be more of a handicap than a help. Nor should Mr Kennedy suffer because of his youth, since Mr Nixon is only four years older.

Above all, there is one quality in Mr Nixon's character that may make the public uneasy about his ability to handle a world poised between war and peace. He gives the impression of being impetuous, of sometimes sacrificing cool judgment for quick action. This is the quality which he showed when he decided, against the counsel of his advisers, to brave the mob in Caraças in 1958. The same instinct, in political debate, makes him leap for an opponent's throat—as he did once again last week—when another man might judge it wiser to be more restrained. This might be very dangerous at a time when resolution has to be tempered with calm deliberation. If the voters come to this conclusion, Mr Nixon's hopes of the Presidency may also be in danger.

First Witness

THE inquiry which the Senate Foreign Relations Committee is to begin this week into the degree of the Administration's responsibility for the President's humiliating rebuff in Paris is to hear first the Secretary of State, Mr Herter. But the President himself has already given his own account of the events and drawn his own moral from them in a broadcast to the whole country. Mr Eisenhower did not make any concessions to his domestic critics. He defended the timing of the reconnaissance flight over the Soviet Union, implied that it had been weighed carefully and that there had been no failure of co-ordination inside the government and even took direct responsibility for the world-wide alert of American defence forces, just as the conference was breaking down, which has also provoked much criticism.

What is more important, the President declared that American policy would not be altered by the noisy collapse of a meeting from which he insisted that much was not expected. The United States will still try to reach understandings, on a business-like basis with the Soviet Union on specific problems, particularly in the negotiations over nuclear tests and disarmament (though the President must realise that recent events have hardly improved the already doubtful prospect of the Senate approving a treaty banning atomic testing). The United States will continue to try to improve contacts between the Russian and the American people. And finally, it remains ready to conclude the "open skies" agreement, under the aegis of the United Nations, which the Soviet Union turned down five years ago. At the same time the President promised that the United States would remain strong and, if he had wished, might have pointed to two bits of evidence: the first firing, over its full range, of an Atlas missile and the first experimental launching of the Midas reconnaissance satellite, which eventually will make the U2 obsolete.



The President's defence of past policy will hardly satisfy the liberal Democrats who recently sent a series of eight far-reaching questions to the White House or even Mr Rockefeller, the only possible (though most improbable) Republican alternative to Mr Nixon as a Republican presidential candidate, who has joined in the call for a searching, but non-partisan, inquiry. But it seems probable that Mr Fulbright, the chairman of the Senate Foreign Relations Committee, and Mr Lyndon Johnson, the Democratic leader in the Senate, who thinks that a savage attack on the Administration at this time would damage both the country and his own party, will be able to keep the inquiry both short and quiet. Witnesses will be heard in closed session and censored transcripts of their testimony released later. To another congressional body the case of the U2 appears simply as a timely case study; this is Senator Jackson's subcommittee which for many months has been taking testimony on the inadequacy of the government for forming and carrying out national policies.

Still Distressed

NO one expected that the Senate would be able to over-ride the President's veto of the $251 million Bill to aid depressed areas and it did not; the vote this week was 49 to 35, well short of the required two-thirds. The time was, however, well spent from the point of view of Democrats who want to draw the attention of voters to the veto as one more piece of evidence that the President and his party are indifferent to human needs. In 1958, another election year, when the President vetoed a similar Bill, a number of Republican Congressmen and Senators whose constituencies included distressed areas were defeated. To avoid a melancholy repetition, alarmed Republicans who must stand for election this year have persuaded the Administration to offer a more generous compromise than the puny $53 million programme which the President has been sponsoring.

A new Bill proposing aid of $180 million has been introduced by a Republican from Pennsylvania, a politically important state with many miners who have been left high and dry by the closing of marginal coal mines. All of the help, however, would consist of loans and the biggest share would go, not in industrial re-equipment, but on public facilities—roads, sewers, water mains, and so on; the Democratic Bill had offered some of this aid in grants on the ground that local governments in many of such impoverished areas cannot afford to borrow any more. The Republican measure takes account of other points made in the President's veto message by restricting federal participation in any project to 35 per cent in order to encourage local initiative and by omitting entirely any aid to rural areas. But whatever help such a belated change of heart may be to distressed Republican candidates, it is almost certainly too late in the session for it to be passed in time to be of assistance to their distressed constituents.

Federal aid to education is another field in which the President is sharply at variance with the liberal Democrats; if Congress were to adopt the generous Senate Bill, which provides grants to assist both the construction of schools and the payment of teachers' salaries, a veto would be certain. The Bill which the House was to debate this week—after dragging it out of the Black Hole of the

WESTWARD THE COURSE OF EUROPEAN ENTERPRISE!

More and more of today's alert European businessmen are going West to trade . . . and the United States marketplace abounds with the products of the economically renascent countries of western Europe.

Yes, the United States market of the '60's is full of promise . . . for those who know how to cultivate it.

Banks abroad desiring to obtain a favorable position for their customers in U. S. markets are invited to use the facilities of Manufacturers Trust Company. Through our complete branch coverage in New York City and our thousands of correspondent banks throughout the United States, we are exceptionally well equipped to obtain data on local market conditions in the United States and to handle all types of banking transactions.

Rules Committee—is, however, a much more modest measure which was drafted with the hope that the President might be able to sign it. But even if the House passes it—resisting that old red herring, arguments about aid to parochial schools—the Senate may not be willing to scale down its own demands enough for the resulting measure to pass through the camel's eye of the White House.

Britain Comes to Town

NEW YORK

FOR two weeks, starting on June 10th, the chimes of Big Ben will toll the quarter hours in the Coliseum, New York's largest exposition hall. The occasion will be the British Exhibition, the biggest and best trade show ever staged abroad by the British, and the most ambitious one ever brought to the United States by a foreign country. Here, spread out over four floors and 400,000 square feet, visitors with enough stamina will see British products ranging from custom-made precision tubes to the sculptures of Henry Moore; they will be able to find a pint of bitter in "The Red Lion," a laugh in the Anglo-American humour section, sentimental indulgence in the "Churchill Corner" or before the pictures of Princess Margaret's wedding, and a great deal else besides.

The reputation of the British for queueing will no doubt be reinforced by a plan (unheard of in the Coliseum) to subject the unruly mob to a regulated "visitor flow"—a project which has meant immobilising escalators and building a special staircase. Apart from any preference for law and order, there appears to be

an element of compulsory indoctrination in the scheme: wherever he is bound, the visitor will be propelled first through the giant government exhibit which is designed to remove any remaining doubts about the British, all things considered, being a pretty remarkable race.

Firms participating in the exhibition will be broadly representative of those selling British goods to the United States. In line with the trade statistics, the largest single exhibit will be the British Motor Show. To Americans who think of Britain in terms of whisky, cashmere sweaters and bone china, the marked predominance of industrial machinery and other capital goods may come as a surprise. Indeed, when compared with the enthusiasm of engineering firms, the response from exporters of consumers' goods has been somewhat disappointing and, while their displays promise to be of high quality, their quantity will be rather lower than the organisers would have wished.

Thus, engines of one sort or another will be shown by some twenty-seven firms and industrial pumps by ten. But only one manufacturer of leather goods has taken space in the show, and female visitors looking for clothes (other than jerseys) must choose between Burberry's and Simpson's. Foodstuffs (biscuits, jams, chocolates) and drink will be present in many varieties, and there will be a good showing of antiques, sweaters, silverware and cutlery. But Britain's considerable reputation for china, pottery and glass will be upheld by only two firms—Wedgwood and Crown Staffordshire—and displays of dress fabrics will be disappointingly thin. An unexpected exhibit in this vast market place will be from Sotheby's, to remind the Americans that the highest auction prices and the lowest commissions are still found across the Atlantic even if the most likely buyer today is another American. Indeed, in the firm's 1958-59 auction season, American-owned articles realised nearly $4 million, one-quarter of the total.

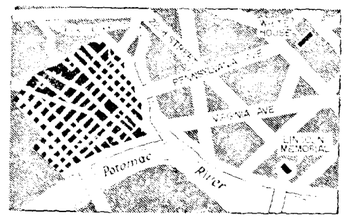
As a financial venture the exhibition is bold. It will cost, in all, about $10 million, with the only immediate source of income the entrance fees paid at the gate. Most of this outlay is being borne directly by the participating firms who are paying $4 a square foot for ground space and all their own shipping and installation costs. Even so the organisers, a non-profit-making subsidiary of the Federation of British Industries, are gambling on an unusually large attendance, some 400,000, to balance their books. The actual cost to exhibitors varies enormously. Those for whom a square foot of shelf space in the "Grocery Shop" is adequate may get by with an outlay of $150, while a few of the largest exhibitors are running up bills to the tune of $300,000. The greatest problem for the organisers has been to persuade potential participants "to think in dollars" and to refrain from the painful exercise of translating the costs, swollen as they are by American wage rates and trade union restrictions, into sterling.

While the exhibits themselves will not arrive until the last possible minute, there seems to be little doubt that the British Exhibition will be one of the most elegant and carefully planned spectacles ever staged in the Coliseum. American trade shows put little emphasis on *décor* or on comprehensive design. They are confined as a rule to a single industry and are thought of strictly as a place to do business and fraternise with competitors. The very different all-purpose exposition has, however, been gaining popularity. Sponsored usually by local chambers of commerce, the object is to boost a particular city or region, and the general public is attracted by extensive displays of consumer wares—many of them of very indifferent quality.

But if the British Exhibition is aiming high in the aesthetic scale for trade shows, the exhibitors are taking part in it to sell their goods. A few of the larger exhibits—those of Imperial Chemical Industries, the British Iron and Steel Federation, the Shipbuilding Conference—are geared more to general prestige than to immediate entries in the order books, but in general the show is being presented as the British version of the "hard sell." The motor industry, for instance, which had thought at first in terms of a fairly nominal presentation, is in fact bringing over fleets of commercial vehicles in an attempt to break into that import market, which is now dominated by Germany.

The Duke of Edinburgh's presence on the opening day will be an invaluable asset; he will be headline news from coast to coast, and a great drawing card to many who, in their ordinary way, take no interest in Britain. Meanwhile, posters went up this week in all railway stations within 200 miles of New York; shops throughout the country have been supplied with "Salute to Britain kits" to display in their windows; and a memorandum to New York's restaurants has suggested—perhaps a trifle ill-advisedly for a New York June—that Yorkshire pudding and steak and kidney pie be added to menus for the duration.

District within a District



FROM A CORRESPONDENT IN WASHINGTON

THERE are more than twenty towns and villages called Georgetown scattered about the United States and Canada but only one, Georgetown on the Potomac River, is internationally fashionable (it is claimed that it has more inhabitants listed in "Who's Who" than has any other place so small). As Chelsea and Mayfair (Georgetown has the character of both) are celebrated far beyond London, so Georgetown is well known beyond the District of Columbia, of which for 88 years it has been a part. Shops and restaurants, good book sellers, a fortnightly newspaper, a Catholic university and twenty-four churches make this district within the District nearly self-sufficient and the most desirable in the national capital.

Probably Georgetown is now at the peak of the restoration which began during the first war, was accelerated during the depression, and culminated nearly ten years ago when Congress passed the Old Georgetown Act. This defines the often-disputed boundaries of Georgetown and states that

> In order to preserve and protect the places and areas of historic interest, exterior architectural features and examples of the type of architecture used in the National Capital in its initial years the Commissioners of the District of Columbia before issuing any permit for the construction, alteration, reconstruction, or razing of any building . . . shall refer the plans to the National Commission of Fine Arts for a report as to the exterior architectural features, height, appearance, colour and texture of the materials of exterior construction which is subject to public view from a public highway.

In all it has taken three Acts of Congress to bring Georgetown to its present status as a residential area of "historic interest." The first two, in 1871 and 1884, were concerned with swallowing the independent town in Maryland which had been a prosperous tobacco shipping centre in the eighteenth century (the customs house, standing today on a residential street, is still the clearing house for all foreign consignments entering the capital by air or rail) and adding it to the politically peculiar District of Columbia. This meant altering the street names to conform with the alphabetical and numerical system of Washington. Recently, at private expense, the original names have been attached, in nostalgic old italics below the official ones, to the sign posts. Guides bringing tourists through the area are happy to point them out, along with the homes of famous Secretaries of State on P Street, formerly West Street. For the most part, however, tourism is kept within genteel bounds. There are no picture postcards, and sightseers gravitate to Georgetown principally on four days in the spring when a number of interesting and attractive houses and gardens are opened for the benefit of local charity—although this is not needed as

much as it used to be. Most of the poor, both coloured and white, have now vacated their ramshackle and often tiny homes, leaving them to be remodelled by the affluent and artistic.

Since Georgetown has been the home of the urban as well as the urbane off and on for more than 150 years serious students of architecture discover interesting overlapping in design as the styles of town houses of one period slide into fashions of the next. Though only one pre-revolutionary structure is standing at present, many tall, well-proportioned houses of the Federal period (1780-1830) and larger detached Victorian mansions set among trees are to be seen. A few graceful wooden buildings have survived and—a matter of less pride—there are terraces built early in this century. Two houses of contemporary design were completed just before the old Georgetown Act was passed, and their owners, a former ambassador and a well-known newspaper columnist, may be remembered more for their picture windows than for their careers. No matter what the period of a house, television and air conditioning equipment is usually present, discreetly placed on a mansard roof or in an inconspicuous window, to remind the visitor that the addition of the new is an uninterrupted process in spite of the difficulties put in its way by the Old Georgetown Act.

The District of Columbia has no elected officials to initiate reforms and improvements and as a result all its five areas have active organisations of citizens which concern themselves with local problems. But Georgetown is the only section where community interest runs high enough to support two such organisations. It is chiefly due to them that the population of some 15,000 is constantly reminded that vigorous vigilance is the price if their shady oasis (one mile square) and the considerably inflated values of their properties are to remain secure. Both groups are guided by enthusiasm for the special qualities of Georgetown and a desire, sentimental as well as sensible, that they should be preserved even though certain restrictions may be irksome. One surprising freedom remains, however; no permit is required simply to paint the outside of a house, and the rebellious or frustrated property owner who may have been prevented from altering a window pane or putting up a fancy fence can, if he chooses, paint his walls blue and pink.

Several years ago more than a hundred persons concerned about the preservation of Georgetown formed Historic Georgetown Incorporated to buy four dilapidated eighteenth-century buildings, on a shabby corner of shop-lined M Street, which were apparently in danger of being torn down. Nearly $200,000 was raised, common and preferred stock was issued, and today the restored buildings are profitably leased as business premises, while the value of neighbouring property also seems to have risen. But an understandable conflict exists between the owners of valuable industrial property along the Baltimore and Ohio Railway's lines south of M Street and the preservationists. Business concerns, more interested in the practical uses of buildings than in architectural delights, are being accused of allowing their properties to fall into such disrepair that they qualify for demolition under laws regulating safety and sanitation.

Supporters of efforts to amend the Old Georgetown Act would like to sharpen its teeth to correct this situation—if it exists—and they also favour changing the troublesome clause which permits the District Commissioners to take action which they think is "right and proper in the circumstances" but does not require them to follow the recommendations of the architects who advise the Commission of Fine Arts on proposals for building or altering Georgetown houses.

As a result of the Act and because new building sites, scarce as hens' teeth, are very expensive, there is considerably more reconstruction than new construction under way in Georgetown today. But last year the largest single development in seven years was completed with the building of eighteen new brick houses. The design is more typical of the pre-revolutionary period than of Georgetown, but in order, presumably, to attract admirers of the architectural style of both centuries, the builder has lined the slate roofs with gold-tinted snow-guards in the form of the Federalist eagle; that this proud and lonely bird should be depicted behaving like a pigeon apparently disturbs only the bird fanciers. Customers have not been deterred by this or by prices ranging from $65,000 to $90,000; these are considered high since the houses are neither large nor luxurious, and smaller houses nearby have better garden space. House hunters in Georgetown would often prefer to remodel a Victorian house, but even these are seldom available.

What opportunities for your business are opened up by the European Common Market? Hanover's Foreign Department—through its London and Paris offices and a world-wide network of foreign correspondents—can help you find the answer.

Justice on the Move

TEN days after the President signed the new Civil Rights Act the Department of Justice called for the voting records of four counties in four different states of the deep South: Alabama, South Carolina, Georgia and Louisiana. These are four of the so-called "cipher" counties where not a single Negro is registered to vote although the adult Negroes in them outnumber the whites. One of them, in South Carolina, seems to have responded by registering 49 Negroes and then declaring registration closed until after the crucial election in which the Democratic nominees are chosen. Presumably this was to protect itself against a possible finding by the courts of a "pattern of discrimination" which could lead, under the new law, to the appointment of federal referees who have power to register any Negro who is qualified. This week the Attorney General called for the voting records of four more counties.

The Department of Justice is also suing Biloxi, a coastal city in Mississippi, the fifth state of the deep South, to force it to allow Negroes to use the public bathing beach. Last month there was violence when Negroes tried to do so, as part of their general campaign to gain access to public beaches which they help, through their taxes, to maintain. The only reason, however, that the federal government can intervene at Biloxi is because it contributed over $1 million some years ago to restore the beach after a hurricane, with the requirement that it should be for the use of the public. All this election year activity on behalf of Negro rights is the department's answer to critics who maintain that it has dragged its feet in the past and who suspect that it will take about two years of litigation to enfranchise any Negroes in the South.

Although it is six years this month since the Supreme Court ruled that racial segregation in tax-supported schools is illegal, none of the five states of the deep South has given an inch. Now, however, a federal judge has ruled that New Orleans, in Louisiana, must make a start by next September. It may thus become the first big city to have to choose—or to have the State Legislature choose for it—between racial integration and shutting its schools. Atlanta, in Georgia, has been given a postponement until September, 1961, in the hope that the State Legislature may amend the state law to give local authorities freedom of choice. But the largest segregated school system in the country is outside the deep South at

Artful Giving

It has frequently been recommended—most recently by the Trustees of the National Gallery—that in order to encourage private gifts to museums and art galleries, in spite of today's heavy taxation, the British Government should offer tax inducements similar to those available to would-be benefactors in the United States. What these are is explained below by our New York correspondent.

AMERICAN museums and art galleries do not receive direct grants from federal funds; the only exceptions to this rule are bodies like the Smithsonian Institute in Washington which are considered to be agencies of the federal government. The majority of museums draw all their funds from private sources, although there are many which get some assistance from municipal revenues. But even where there is a measure of public support, museums still depend heavily on wealthy patrons. Luckily they are able to remind potential donors that not only is it more blessed to give than to pay taxes but that it may even be profitable. New York's Museum of Modern Art, for instance, has issued a lengthy memorandum—"Gifts to the Museum and Greater Tax Savings"—which suggests various ways of enriching the museum at a minimum of real expense to the patron; the alternatives range from instalment giving to the bequest of undeveloped mineral deposits.

Largely because of the strong national preference for private philanthropy over public grants, the Internal Revenue Service has always looked kindly upon those who give to the wide range of causes that for tax purposes are regarded as worthy. Donations to any of these bodies are tax free up to the equivalent of 20 per cent of an individual's income each year, and in certain cases (mainly those of educational and religious institutions) the tax-free limit is 30 per cent. In 1957 over $5 billion escaped the Treasury's net through the loophole of gifts to charity.

In claiming a tax deduction a donor is not limited to cash contributions. On the credit side of his tax account he can set the full current value of any gift in kind—a work of art, a piece of land, some securities or (in theory at least) a mink coat or any other item of personal property. For anyone well endowed with worldly possessions this opens up considerable opportunities for exchanging family heirlooms for lower taxes. If, for example, a man with an otherwise taxable income of $25,000 takes a picture worth $5,000 from his wall and gives it to a museum, his income for tax purposes is reduced in that year to $20,000. If his rate of income tax is high and his appreciation of art low he may regard the transaction as a gain.

There is another important advantage in making gifts in kind rather than in cash. If a person gives a hundred shares in the General Motors Corporation to a museum it receives, and the donor can deduct from his income, the full market value of these shares; if he had tried to realise these assets in the ordinary way he would have had to pay—if they had appreciated in value—a capital gains tax.

IN the last few years the provisions of the tax law have been further refined to suit the varying tax situations and tastes of donors. Since the outright gift of a valuable work of art may carry an individual's charitable contributions in that year beyond the 20 per cent that can be deducted for tax purposes, he is now allowed to spread his gift over a longer period. He may, for instance, give to a museum a one-fifth interest in a work of art in each of five years. By this device he can make full use of the inherent tax advantages of his gift and at the end of the period the museum will be in full possession of the painting.

In the second place, the tax law now allows a donor to get current tax relief from the gift of a work of art, although it will only become the property of the museum at his death, by giving away the "remainder interest" as determined by actuaries. The sum that can be used as a tax deduction will, of course, be considerably less than in the case of an outright gift, but the donor does not have to part with the object in question.

It is widely believed that the American tax law allows a donor to have his cake and eat it—to "deduct" his picture and *keep it hanging on the wall*. When the donor has deducted only the remainder interest on his tax returns he is of course entitled to keep the picture, but if he is giving it over a period of years he must share its use with the beneficiary in proportion to their respective interests in any year. Thus, if he has donated a one-fifth share to the museum, he can keep the work of art for only four-fifths of that year. If, on the other hand, a person makes an outright gift, and claims the full tax deduction for doing so, he is defrauding the Internal Revenue if he then borrows it back again. A certain amount of illegal "lend-lease" may go on but it is not the responsibility of the museum to see that its arrangements with benefactors tally with the latter's tax returns.

Houston, Texas. Early in June voters there will have a chance to say whether the integration which a federal court has ordered has their approval. Under Texas law state funds are cut off from any school system which pulls down the colour bar without the consent of local voters.

Under TWA's Wing?

THERE are obvious advantages in the merger which Trans World Airlines and Northeast Airlines announced last week that they may conclude. Northeast, the smallest of the twelve domestic trunk lines, cannot seem to make money, even though, besides serving New England, it has a temporary certificate, which expires in November next year, to fly on the rich New York-Washington-Florida route. But this run, which is busiest in the winter, would fit in well with TWA's transcontinental and trans-atlantic services, on which the summer is the peak period. By joining forces, the best use could be made of the expensive new jet aircraft which are causing the industry so many headaches. TWA and Northeast already have certain links and are on a friendly footing, with TWA leasing a jet to Northeast to help it to keep up with its rivals.

If the relation is to become closer, the consent of various creditors and shareholders will have to be obtained, as well as that of the Securities and Exchange Commission and of the Civil Aeronautics Board; Northeast's competitors on the Florida route will fight hard to have the merger turned down. But, if it goes through, it may lead other airlines, which have been hard-pressed this year, to follow suit. Most of the smaller ones are suffering from the same troubles which are leading Northeast to take shelter under TWA's wing and which helped to land Capital Airlines in its present difficulties: the sharpening of competition with the arrival of the big jets and with the duplication of services permitted in recent years by the CAB. The traffic has not grown fast enough to make profits for every one and the return on investment in the airlines has fallen from nearly 12 per cent in 1955 to just over 7 per cent last year.

Recently the CAB announced that it was in agreement with one of its examiners that the rate of return over the industry as a whole should be 10.5 per cent. But if the airlines believe that they are about to be bailed out of their present difficulties by a big rise in fares they may be disappointed. The airlines have applied for increases, but it is far from clear how the new rule will work or that it will do much more than justify the interim increases which the industry won in 1958 and 1959. Capital Airlines, which has just appointed a new chairman who is said to be skilled in arranging mergers, seems to have the right idea; but he realises that Capital, now facing possible foreclosure by its creditors, will have to be put into better order before it can hope to attract a partner.

Jews Apart

FROM A CORRESPONDENT IN COLORADO

ALTHOUGH the 5 million or so Jews in the United States provide most of the outside money which is collected for Israel, a small but very vocal minority still opposes strenuously the whole idea of a national Jewish state. The American Council for Judaism, which has only about 20,000 members but seems to have plenty of money, has just held its 1960 convention at Denver. Its contention is that Jews in America, and elsewhere, should try to be assimilated into their communities in all matters save religion.

The council was organised in 1943, specifically to resist Zionism, and scandalous charges against that movement were made at Denver. The council's chairman, Mr Lessing Rosenwald, declared that funds raised through the United Jewish Appeal, ostensibly for charitable purposes, have been diverted to other activities; that about $18 million of this money was used by political parties in Israel in 1951; that about $15 million has come back to the United States to pay for Israeli propaganda; and that much more has been spent to promote the "ingathering" by Israel of Jews from all over the world. Rabbi Elmer Berger, the council's vice-chairman, alleged that Zionists put pressure on dissenting Jews to conform, and one resolution called upon non-Zionist organisations to withdraw from the President's Conference of national Jewish groups on the ground that this is just a Zionist front. Another demanded that the United Jewish Appeal should devote itself to pure philanthropy.

Dr Mezvinsky of Harvard University even argued that Zionism, as well as continued anti-Semitism, is responsible for the fact that Jews who have made enough money to escape from the city ghettos have established "gilded" ones in the suburbs in which they continue to be insulated from their neighbours in self-sufficient Jewish communities. He said that Jewish parochial schools have been revived, that 400,000 children now attend them in New York City alone, and that two-thirds of American Jews remain clustered in and about the country's ten largest cities: like the other speakers he appealed to Jews to enter wholeheartedly into American life. Officials of the council claim that they are beginning to make some impression on American public opinion, against the Zionists, and that they are also beginning to receive some cautious political recognition. At the Denver conference a message was read from President Eisenhower praising the council's "fine record"; and similar messages of good will were received from the Vice President, Mr Nixon, from the Secretary of State, and from several Senators and other leading politicians of both parties. This is the American phase of the world-wide duel between the Zionists—whose strength is that they have created Israel—and the Jews who, as local patriots, oppose them.

SHORTER NOTES

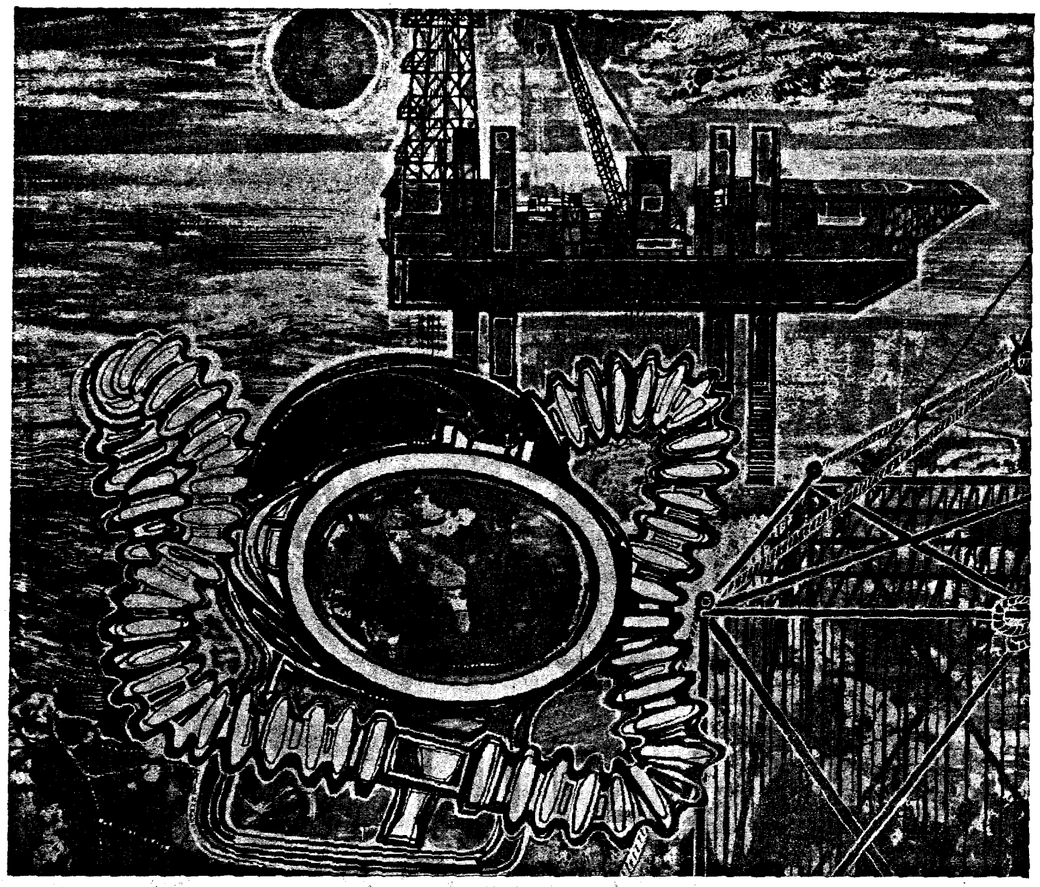
The sixty-three-year-old president of the Carpenters' Union, Mr Maurice Hutcheson, has been sentenced to six months in gaol for contempt of Congress in refusing to answer questions from the Senate Committee which was enquiring into corruption in trade unions. The questions dealt with the use Mr Hutcheson had made of union funds, but he felt that his replies might help the prosecution in a case being brought against him in connection with a highway scandal; he also argued that the questions dealt with personal matters which were outside the committee's authority.

* * *

John D. Rockefeller, Jr., who died recently at 86, devoted the last fifty years of his life to giving to worthy causes much of the money inherited from his father, the creator of Standard Oil. Mr Rockefeller gave away over $470 million during his life, including about $80 million each to educational, charitable and religious causes, both at home and abroad. Individual gifts which testify to the width of his interests were the $8.5 million site for the United Nations building, $52 million for the restoration of colonial Williamsburg, $2 million to save the Californian redwoods and $5 million for the Museum of Modern Art—though Mr Rockefeller did not care for the modernists. As a result of this philanthropy, and because he had set up trust funds for his descendants long ago, Mr Rockefeller left only $150 million.

NOW JUST A DAY AWAY BY BOAC JET SERVICES!

BOAC and the Bank of London & South America together offer a unique service to businessmen visiting Latin America. This rich area, today only a day away from London by BOAC jetliners, contains rapidly developing countries of great potential. More and more businessmen are being attracted by markets which show increasing promise of expansion, particularly in the capital goods field.



The Bank of London & South America—the only British Bank in South America—will be pleased to advise you on economic and trade conditions. The Bank will also give you the latest information on exchange regulations, Customs tariffs and import controls. With branches throughout the area, the Bank can also help you to make contact with local buyers, agents and distributors.

BOAC offers you far and away the best air travel on the route. Superb *Comet* jetliner services from London fly to Recife, Rio, Sao Paulo, Montevideo, Buenos Aires and Santiago in a matter of hours. There are also fast jet-prop *Britannia* flights to the Caribbean, Caracas and Bogota. Whether you travel First Class or low-fare Tourist, you enjoy BOAC service—utterly competent, friendly, considerate.

We welcome your inquiries. For free booklet "Take a closer look at Latin America" and detailed travel literature write to Information Officer, B.O.A.C. Airways Terminal, Victoria, London, S.W.1. For detailed market information write to the Bank of London & South America Limited, Head Office, 40-66 Queen Victoria Street, London, E.C.4.

Divers helmets, a reflection of

THIS YEAR THE WORLD WILL USE over 1,000 million tons of oil. In 1970, international petroleum economists reckon at least 1,800 million tons will be needed.

To meet such a demand it is necessary to find new sources of crude oil. To meet such a demand, in full and in time, it was necessary to start looking for these sources long before 1960. It was also considered prudent to look beyond the limits of the land.

This is why, since February, 1954, a British Petroleum team, in association with French interests, has been probing the oil-bearing potentialities of the rock beneath the waters of the Persian Gulf – first by underwater survey and later from the mobile drilling barge "ADMA Enterprise".

In 1958 their first test well struck oil. Since then two further wells have been completed and BP is preparing to produce crude oil commercially from the new field.

This means that, when a 20 mile submarine pipeline to a tanker loading jetty on Das Island has been completed, BP will have, for the world, a new source of oil.

This submarine operation is indeed a visible symbol of the fact that BP believes in 'hats off to tomorrow'.

THE WORLD OVERSEAS

Caudillo Among the Catalans

FROM A CORRESPONDENT IN BARCELONA

GENERAL FRANCO'S visit to Barcelona, which ended this week, has confounded the sensationalists. Before his arrival at least three different stories had reached here from Madrid, all purporting to come from the usual well-placed sources. One was that General Franco was to meet General de Gaulle somewhere off the Catalan coast. There has been no evidence of this meeting, and it is difficult to see when it could have been fitted in. Another was that General Franco was suffering from a severe illness and had gone to undergo treatment by a Barcelona specialist. Whatever the truth about the Caudillo's health, he carried out a full programme and he looked tanned and fit. The story that caused most interest was that he would announce his retirement and a decision about his successor. He made no such announcement, and, in a fighting speech to the people of Gerona, declared that he would continue on his present course and that the opposition abroad could hope for no changes.

More cautious forecasts of the visit said that it would be a great gesture of friendship to Catalonia ; and these proved right. The Caudillo stayed three weeks, with an interval of two days in Mallorca and Minorca, and the whole plan of the arrangements was a compliment on a grand scale to Barcelona and the Catalans. The government moved to Barcelona in a body, and cabinet meetings were held there. It was the scene of the annual Victory Parade of May 8th, always hitherto held in Madrid, as also of the mass display of athletics and folk-dancing organised by the Falange "Education and Rest" organisation, at which General Franco presided and during which the 9,000 participants danced the Catalan "sardana" in the Barcelona football stadium.

Apart from visiting some factories and inaugurating a centre for workers' technical training, the Caudillo devoted most of his programme to ceremonies calculated to appeal to the Catalans' pride in their traditions and culture. He visited the monastery of Montserrat and was received by the abbot ; he presided at a meeting in the Barcelona central library in homage to Maragall, the Catalan poet and champion of the Catalan language ; he attended the handing over by the army to Barcelona city of the castle of Montjuich, to be used as a museum and park. To appreciate the significance of these gestures one must remember that the abbot of Montserrat is an independent prelate and a local hero, who has more than once clashed with the state authorities ; that during the years that followed the Civil War, even to talk Catalan in public places was discouraged, and that even now no daily newspapers are published in the language ; and that the castle of Montjuich was once a notorious political prison. During the visit the government announced the granting of a new charter to Barcelona municipality, together with greater financial freedom. Various schemes for public works and improvements in the city were approved. Announcements were also made of special interest to Catalan industrialists at the present time—approval of the cotton industry's reorganisation scheme, an increase in long-term credits to industry, and plans to revive activity in the building trade by means of credits and public spending.

All this may seem rather prosaic after the sensational forecasts ; but General Franco's wooing of Catalan opinion is significant when viewed in connection with the present state of the country as a result of Spain's new economic policy. In July last year the Spanish government, with the assistance of large credits from abroad and under the supervision of advisers from the Organisation for European Economic Co-operation and the World Bank, embarked on the present stabilisation policy. The purpose was to halt the inflation at home and to restore Spain's international solvency. The peseta was devalued, foreign exchange policy was liberalised, and there was a considerable easing of controls on industry and foreign trade. Government spending was cut down and credit restricted. From a financial point of view the operation was remarkably successful. Before it was launched Spain had great difficulty in meeting its international obligations—the state was, in fact, practically bankrupt. In the following August and September, however, Spain had a favourable balance of payments of more than $81 million, compared with a deficit in the same period of 1958 of $21 million. By the end of the year the fiduciary circulation showed an increase of only 2 per cent for the twelve months, compared with 10 per cent in 1958. By May this year, the reserves of the Institute of Foreign Exchange exceeded $300 million.

BUT the deflation hit business and the workers hard. This was due, not so much to restriction of credit, which was mild from the beginning, as to the cutting down of government expenditure and the knowledge that the inflationary period, with rising prices and shortage of goods and labour, was at an end. The individual consumer stopped spending and traders bought only from hand to mouth. Trade was paralysed and many of the smaller firms closed down. Unemployment rose steadily ; it is estimated to be now somewhere between 150,000 and 200,000. This comparatively low figure (less than 1 per cent of the population) is explained partly by the laws against dismissal of regular employees. The real hardship lies in concealed unemployment (workers not covered by the laws, and the small workshop with two or three hands) and, above all, in the loss of bonuses and overtime, which were the means by which the workers were able to meet the rise in the cost of living. The cost of living, though largely stabilised since the new policy, is now about 492 by the official index, compared with 350 when the last rise in wages was decreed, in 1956.

By February things had reached a stage when both the Church and the Falange felt called upon to issue public protests. A collective declaration by the Metropolitan Bishops of Spain and a statement by the heads of the Falange syndicates demanded reactivation of industry and measures to protect the worker's employment and purchasing power. But "reactivation" may be a slow process. The first sign of any renewal of confidence was a slight increase in the credits ("personal credits and credits against securities") in the Bank of Spain statement for April.

The stabilisation policy is not popular with any section of the country ; yet it may prove a turning point in Spain's history. General Franco and the ministers responsible for it are holding firmly on their course. The object of General Franco's visit to Catalonia was probably first to rally public opinion in this important, notoriously dissident area of Spain and, secondly, to win the confidence of the Catalan industrialists, who will be the backbone of the future struggle for a more efficient industry and a more

competitive export trade. His speeches outside Barcelona dwelt on national unity and the dangers of subversion. But those delivered in Barcelona stressed the importance of a sound economy and included, in his speech to the workers' training centre, a complete apologia of the government's economic policy, before and after stabilisation.

Germany's Importunate Creditor

FROM OUR BONN CORRESPONDENT

THE two wicked Germans whom Mr Khrushchev apostrophised by name in east Berlin on his homeward journey put their heads together on Tuesday in Bonn. To the Russian, the federal chancellor and the governing burgomaster of west Berlin must appear to be men much of the same kidney: they personify the two main blocks of national resistance to Soviet plans for Germany. To the Germans themselves, it need scarcely be said, the 83-year-old Dr Konrad Adenauer and the 45-year-old Willy Brandt (a firebrand, Mr Khrushchev called him) have hitherto seemed about as unlike as the two figures in Cranach's painting "The Ill-matched Pair," in the Karlsruhe gallery.

Age, background, and temperament apart, the Christian Democrat and the Social Democrat have clashed often and bitterly in the political arena ; and there have been signs recently that the older man, who frankly claims to be indispensable, resents the prospect of having to fight it out with the younger for the chancellorship in next year's Bundestag elections. But Mr Khrushchev's fulminations brought the two more or less amicably together in the Palais Schaumburg on Tuesday, and the Bonn air is loud with diminishingly harmonious talk of the need for reconciliation.

Although one or another of its members may have occasionally dropped a sizeable brick—such as Herr Strauss's eager reconnaissance in Spain—the Bonn government has tried consistently over the years to make a convincing show of knowing the proper station of the German Federal Republic as a probationer in post-war western society. Dr Adenauer's initial reserve over the hubbub in Paris was in keeping with this unwritten code. He must have been strongly tempted to say at once "I told you so." Yet he let four days pass, and others talk, before remarking at a party gathering in Cologne that his policy had been proved "so shatteringly right" that those who now wanted to make common cause with the Christian Democratic Union would have to subscribe unequivocally to its foreign policy. In the Bundestag on Tuesday, Dr Adenauer stuck to his guns ; and he gave no hint of an inkling that, in all the sad story of the summit conference, anyone but Mr Khrushchev might at any stage have made a false move.

It is obvious to the Chancellor and his colleagues that this is not the time to be smug. Naturally, they are relieved to hear from Mr Khrushchev that at least during the remainder of the year the communist powers will not carry out their threat of signing a separate peace treaty with the east German regime. But the nagging, enervating insecurity is still there, and, short of unspeakable surgery, looks just as incurable as ever. It is doubtful whether Herr Ulbricht and his team are as disappointed as some commentators have conjectured by Mr Khrushchev's refusal to move precipitately in Berlin. Herr Ulbricht can be counted upon to use every hour of the pause to continue to separate eastern from western Germany as irrevocably as possible, and to promote at the same time conditions in which the former's institutions would oust the latter's in the event of unification. As for west Berlin, can it be nourished artificially for ever ?

On Wednesday the Chancellor set off from Bonn to brood for three or four weeks, with the stimulus of teleprinters, in northern Italy. His present reserve is due probably as much to perplexity as to propriety and concern. Germany's official and unofficial seers and pundits are bowed as intently over their crystal balls as their counterparts in other western countries. Until more is known about the reasons for Mr Khrushchev's behaviour at Paris, and its consequences to the policies of both the Soviet Union and the United States, the Germans must share in the universal suspense, The anxious policy-makers of Bonn appreciate more clearly than ever before the extent of their political, economic, and military dependence on their western allies. Bonn must wait patiently for decisions from its partners, and, if it is to survive, concert its policies with theirs. Should these entail unpalatable concessions they would still have to be stomached.

Dr Adenauer cryptically reminded his fellow-countrymen some time ago that they had not yet paid the whole bill for having started and lost the war. If they still doubted the existence of an importunate creditor, the millions of Germans comfortably watching Eurovision's reproduction of Mr Khrushchev's press conference must have been rudely jerked out of their illusion. The search continues on sickeningly familiar tracks for an alternative to what seems to be the now more gravely threatening fate of perpetual partition or complete bolshevisation. It is chiefly the Social Democrats who, apparently despairing of fashioning a partisan policy that will both ease the deadlock and satisfy the electorate, are talking of the necessity of bipartisanship. The left-wing Herr Wehner, who pushed his way forward to the vice-chairmanship with the demand for lustier opposition to the chancellor's inflexible ideas, has sadly declared that the primary objective of foreign policy must now be simply "to hold the German people together as a nation."

His fellow vice-chairman, Herr von Knoeringen, has added that "The men engaged in the manual labour of foreign policy must now talk openly with each other. I think that will happen." These were the Social Democrats' very first reactions ; Herr Ollenhauer showed himself on Tuesday more inclined to be censorious. Dr Adenauer, for his part, made it quite clear that he was not ready "to meet the Social Democrats half way," as Herr von Knoeringen proposed—or, indeed, an inch of the way. He is more likely to be preoccupied in the coming weeks with thoughts of saving what can be saved through closer political and economic co-operation in free Europe—including, perhaps, a newly interested Britain ? It should be instructive to hear what more the Chancellor has to say when he returns from Cadenabbia.

—"*You Too, Mr Kishi?*"

FROM OUR CORRESPONDENT IN TOKYO

"ET tu, Kishi!" President Eisenhower may mournfully murmur if, as a result of the U2 affair, he has to cancel his trip to Japan as well as to Russia. The president may be advised from Tokyo that the proposed date of June 19th will not do, because on that day the streets of the Japanese capital, through which the president is supposed to pass in the company of the Emperor, are more likely to be filled with snake-dancing demonstrators denouncing Mr Kishi and the new America-Japan security treaty than with pro-American loyal subjects. Mr Kishi got the treaty through the Lower House of the Diet in the first few minutes of May 20th, so that it automatically becomes law on June 19th, even if the Upper House dislikes it. But this bit of smart-alec timing has proved so unpopular that cries for Mr Kishi's resignation or dismissal have been rending the air ever since.

Leaving the Diet after two o'clock in the morning of Friday, May 20th, Mr Kishi hurried home to his private residence in Shibuya, six or seven miles away. His official residence, adjoining the Diet, was attacked that night by members of *Zengakuren*, the students' organisation controlled by the most violent faction of

aluminium

the Communist party. The following night, Saturday, the students switched their attention to his Shibuya home, but fortunately Mr Kishi had decided to spend that night in his official residence. The students now say they will henceforth demonstrate against him outside both his houses, and will keep this up until he resigns; and Socialist Dietmen likewise threaten to visit the prime minister and talk with him every day, until he agrees either to resign or to dissolve the Diet and hold elections. For June 19th, the day the security treaty becomes effective in Japan, students, Socialists and members of the trades union federation *Sohyo*, promise token strikes and street demonstrations on the largest possible scale.

The students have naturally found the temptation irresistible to call Mr Kishi "Japan's Syngman Rhee." In fact, hardly any resemblances exist between Korea and Japan at this stage of the anti-Kishi agitation. In dealing with demonstrators, the Japanese police have drawn their batons, but not their guns. Thousands of policemen have been deployed against tens of thousands of demonstrators; but hardly any heads have been broken. The tactics of the police are to form themselves into a rather passive living wall, against which the demonstrators lean or shove, usually with no score ensuing. The recent scenes have been occurring amid constant downpours of soaking rain, with both sides wearing raincoats and rubber boots. The demonstrators carry umbrellas, as well as flags and placards; the policemen carry, on bamboo poles, lanterns with tasteful Japanese designs. While these impedimenta can of course be used as weapons, they usually just impede.

Much has been said and written in Japan and abroad about the violence of the *Zengakuren* students. It is true that they have used violent language about both Mr Khrushchev and Mr Kishi, thus showing a rather fine impartiality; but their physical violence so far has not, except in the case last year of a rather disgusting mass urination on the Diet steps, gone much beyond the "rag" stage. The wildest and woolliest aspects of *Zengakuren* are their verbal onslaughts and the length of their hair, and much more ominous for Mr Kishi is the growing participation in the demonstrations of bourgeois housewives and lower middle class shopkeepers. The significance of such straws has not been lost on the anti-Kishi factions within the prime minister's own Liberal-Democrat party; and the current betting is now a shade more in favour of when Mr Kishi resigns, rather than if he will. But Mr Kishi seems loth to go, and most unlikely to before June 19th: in which case the demonstrations will probably continue, and Tokyo in consequence may not, after all, see President Eisenhower.

In his verbal exchanges with students and Socialists, the exasperated prime minister has asked them to explain what they mean by accusing him of "tyrannising over the country with his

A Polemic in Russian Verse

PREOCCUPATION with the summit and with the resurgence of international tension has distracted attention from a Soviet literary event full of political significance. On April 29th *Pravda* devoted a page to extracts from a poem by A. Tvardovsky. Mr Tvardovsky, a recent visitor to London, is no obscure rebel, but a Stalin-prize winner and a major figure in the Soviet literary establishment. *Pravda* is not in the habit of devoting so much space to verse. What is striking is that parts of the poem to which it has opened its columns read like a literary equivalent of Mr Khrushchev's "secret" indictment of Stalin. And this time the indictment is combined with a cry of conscience, the sad confession of a generation which did not dare to speak out so long as the "cult of personality" had not been officially condemned.

The most striking passages are contained in the part entitled "So It Was." Stalin dominates the stage from the very first:

> When alive, yet from life separated
> By the Kremlin walls,
> He was above us like a terrible ghost
> We did not know any other names. . . .

The author then addresses a childhood friend, a man of his own generation, whom he warns that "we cannot hide anything from our adult memory. . . . Days gone by are not strangers, We know these and previous years, And belong to them equally." The complaint continues:

> So it was: for quarter of a century
> The name of a man
> Resounded together with the name of our country
> As a call to struggle and work.
> And *it* seemed a natural thing
> That through the smoke of his pipe
> He saw personally everything in the world
> And ruled over all, like God;
> That these hands reached out
> To all most important matters in the world
> To all productions, to all sciences
> To sea depths and celestial bodies . . .
> And even his posthumous glory
> A hero owed to him. . .

Mr Tvardovsky turns his attention to the purges, to Stalin's vanished companions:

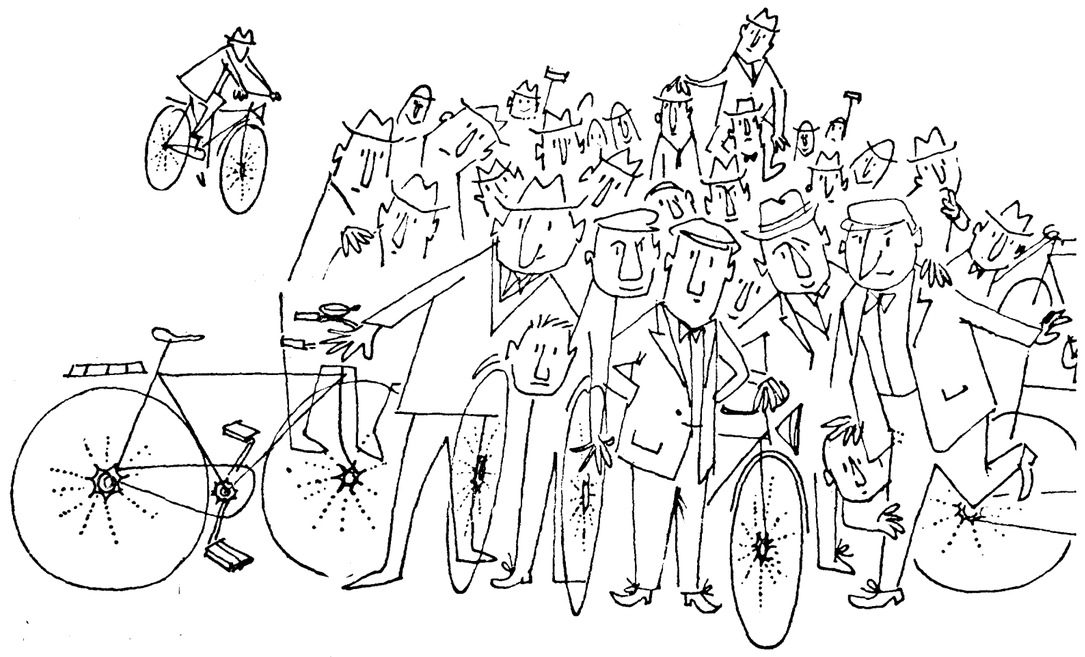
> Those who had been with him from the beginning,
> Who knew the underground and prisons . . .
> They went back into shadow, one after another.
> Some into shadow and some into sleep—
> the list is long . . .
> And those completely banned,
> They have gone long ago;
> For centuries in advance it was decided
> Which portraits are to hang and where.

The poet shows sympathy for Stalin's companions who, like Mr Khrushchev, have survived. It was not easy to stand in Stalin's way:

> Thus in the world he lived and ruled,
> Keeping the helm in his tough hand,
> And he who standing by his side would not praise him,
> Would not glorify him—find me one like that . . .

The guilt is collective: "Who among us is fit for the part of a judge, to decide who is guilty or not guilty. We are talking about men and don't men create gods?" Indeed, who can claim innocence? Certainly not the writers of panegyrics, who can merely reveal "that he himself put into our mouths poems about his own person." Nor

> Those who in official halls
> Before he even had time to open his mouth
> Already would stand up and shout:
> Hurrah! He will be right again. . . .



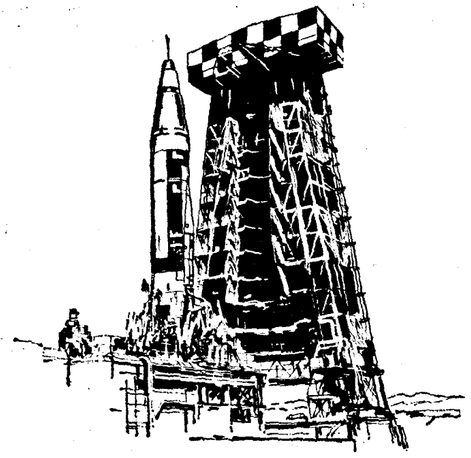
For the collective guilt the author tries to find an explanation in Stalin's complex figure:

> A son of the East, not for nothing,
> Until the very end he showed signs
> Of his violent
> Unreason
> And reason.

The confession is later followed by a justification. It was under Stalin's banner that great economic achievements were carried out; Soviet soldiers *fought* heroically in the war; and so on. Finally, things are brighter now that the day of truth has come: "Men, and not gods, will decide in future."

For all this balancing note, the poem created a tremendous stir in Soviet intellectual circles. It should not be forgotten that Mr Khrushchev's posthumous attack on Stalin before the party congress, though it was made more than four years ago, has still not been published in Russia; and that criticism of the "cult of personality" has in recent years been toned down. To Russian readers, therefore, this piece of iconoclasm *in verse* is something of an event. It may not have been a pure coincidence that *Pravda* should have published the poem at the close of April, during those tense days when Soviet leaders were probably arguing about their country's relationship with the outside world, and by implication about the future of their society.

You'll find the most inquisitive people in the world in Amsterdam



Who are these inquisitive burghers staring at? You, most probably. Not that there's anything wrong with your tie. It's just that they'll take to their bicycles at the drop of a hat to satisfy their lively curiosity.

You'll find curiosity even more rampant in the Shell research hives on the outskirts of Amsterdam. They make a virtue of it there. Whys and hows fly thick and fast as bumble-bees. Shell research people take nothing for granted, almost nothing for proved. They believe that, given the time, they could make almost anything from oil.

This inspired curiosity has done a lot for you since the war. It put the I.C.A. into your petrol which has virtually taken the sting out of the deposits in your car. It helped to make the silent polyethylene dustbin your wife is so proud of. It also gave her new super-detergents. People remind us that overmuch curiosity killed the cat. Never a lively Amsterdamer cat—take it from us.

GATEWAY TO THE WESTERN U.S.A.

Many of the world's leading shipping lines and their shipper customers *now use the modern,* economical facilities of the Port of Long Beach. Tonnage and ship arrivals are at the highest point in our history. A continuous expansion program is providing new piers, berths and transit sheds which will be available in the near future. We invite inquiries from shipping lines, importers and exporters regarding present facilities and those under construction.

SHIPPING LINES, IMPORTERS, EXPORTERS:
Please write (on your letterhead) for complete details and for "Harbor Highlights," the Port's free, quarterly news magazine.

THE PORT OF LONG BEACH OFFERS:
1. Fast access by truck via non-stop "freeways" to Los Angeles and other Western U.S.A. cities.
2. Modern piers, transit sheds and warehouses.
3. Excellent stevedoring services for all general and bulk cargoes, grain and steel scrap.
4. 10 to 20 minute run from berth to open sea.
5. Dockside rail trackage connecting with major transcontinental railroads.
6. Radar-radio ship pilotage.

majority." He has pointed out that his majority in the Diet correctly mirrors majority support at the polls, and that if the Socialists boycott debate because they know they cannot vote down measures they dislike, it is they, not he, who are wrecking parliamentary procedures. While this, of course, is true, it is also correct that the government has repeatedly insisted that the basis of the new security treaty is trust in the intentions of the United States, and that Japan's faith in the American word was much shaken by the U2 affair. It was, therefore, not unreasonable for both the Socialist parties as well as a segment of the Liberal-Democrats to call for extended debate on the treaty after the U2 sensation. Leading Liberal-Democrats not belonging to Mr Kishi's own faction had no interest, rather the reverse, in getting the pact approved in time for Mr Kishi to receive President Eisenhower's congratulations in Tokyo. They did not, therefore, support Mr Kishi's rush tactics, or even take part in the final voting on the treaty, which was passed by a Liberal-Democrat rump. This is what Mr Kishi's critics mean by "tyranny of the majority."

But the matter goes still deeper. Japan is a country where a court trial may continue for ten years, so the treaty would perhaps have been better not rushed through the Diet. Would, however, even another two months' debate have made much difference? The Japanese have made it rather plain that what they really want are the Americans' dollars without the Americans, and security provided by America without any corresponding obligation. The treaty, though full of American concessions to Japanese fears of involvement, still leaves primary decisions up to the United States: Japan, in a word, *can* be involved before being consulted, as the U2 affair shows. Mr Kishi and Mr Fujiyama, despite having made ambiguous genuflections towards the Japanese voters, probably would not be dismayed by this conclusion. But what the Japanese people would have preferred all along is a leisurely debate without end, on the merits and demerits of a treaty to be ratified at some time in an ever-receding future. Mr Kishi's real crime is to have opposed this never-never philosophy.

THE ALGERIAN WAR—II.

Under the Harrow

FROM A CORRESPONDENT LATELY IN ALGERIA

WHEN we turn from the military and administrative to the political sphere we pass from clarity to obscurity. It is true that the opposing theses are clear enough. The Front of National Liberation stands for an independent Algerian state which will include not only Muslims but also as many European Algerians as care to take Algerian citizenship. As proof of its representative character, the FLN can adduce the 150,000 of its members who have died fighting the French army, and the fact that every Muslim "*interlocuteur valable*" belongs to it. It has accepted the principle of self-determination and is ready to discuss a cease-fire, provided that conditions for a free consultation of the Algerian people can be discussed and agreed. The other protagonist is less the French government than the French army, or at least the French officer corps. The officers are against any possibility of independence for Algeria, or for any portion of it. (The idea of partition is dismissed out of hand by French and Muslims alike.) "Autodetermination," they will tell you, "is useful for foreign relations; but it is no good inside Algeria."

Disapproving in some respects of the attitude of the *colons* towards the Muslims, the officers agree with them in holding that the Muslims can only be trusted to vote for remaining with France, if it has first been made quite clear to them that there is no alternative. The government attitude, on the other hand, implies that the suppression of the rising, the granting of the vote, the development of industry, education, and health services can be trusted in the long run to produce a genuine preference for an associated Algerian state, permanently within the French orbit. The fact that the government is nevertheless unwilling to discuss or announce the conditions for a free expression of Algerian opinion suggests either that it is not sure of its own thesis, or that it dare not face the combined opposition of army and settlers. Its refusal to discuss conditions is sometimes explained on the ground that the GPRA (rebel government in exile) denies the right of other Algerian bodies to be consulted. This is not true; the GPRA does not deny the right of the French government to discuss the future of Algeria with whomever it likes. It is in the matter of the cease-fire which, it argues, concerns only itself, that the GPRA sees no reason to bring in a third party.

It is much harder to ascertain the opinions and probable course of action of the so-called "uncommitted masses," for whom the French administration is looking for leaders who would persuade them to support an associated state. Circumstances do not allow them to express their feelings freely. They are cut off from their Muslim neighbours on the east, and on the west, by double fences which are electrified, lit by searchlights, targeted by artillery, with a "prohibited area" between them thickly patrolled by armoured cars and tanks. The 1,250,000 who have been "regrouped," voluntarily or compulsorily, in 1,100 centres under army control, need a permit to go out; a permit to work in their own fields (if they have any; otherwise their European employers send for them in the morning); a permit to visit, or be visited by, their relatives. Even in the towns, supervision or control, as it is called, is strict. Hardly a family has not had one or more members killed in the fighting or in the counter-actions, arrested, imprisoned, deported, sometimes tortured. Lawyers have long lists of relatives who have disappeared and never been heard of again. The sea coast is so closely patrolled that any unauthorised exit or entrance of arms or of persons is claimed to be virtually impossible. The desert to the south is under constant observation from the air.

IN such circumstances the foreign visitor cannot expect a free expression of opinion; he must rely on chance indications. He may notice the distinction made by Muslims between the "good" French of France and the "bad" French of Algeria, the former being transformed into the latter by length of residence. This may seem less a moral judgment than an attempt to exploit the divisions in the European front. He may notice that no Muslim Algerian ever speaks of the Europeans and himself as "we." More commonly he says "they." "If only they would leave us in peace," burst out one taxi-driver, chance circumstances suddenly loosening his tongue. "My son—they sentenced him to eight years imprisonment, and he wasn't guilty; he's been in prison four years now. And when they want to see your identity card: some are polite, very polite: but others shout and abuse you like a savage. And then the tortures, the electricity, the water, the burnings—it's horrible. Vote? I don't want a vote: I only want to be left alone. Morocco? Tunisia? Of course it's better there."

The "uncommitted" masses are waiting. They are intelligent enough to know that the increased health services, education, and the granting of the vote are the direct result of the rising and an attempt to counter the appeal of national sentiment and Muslim solidarity. Meanwhile they will probably continue to temporise. If the authorities, on whose whim their existence depends, give them a choice, which it seems safe to exercise, then they will choose the burden which seems lightest, the whips rather than the scorpions—de Gaulle rather than Soustelle; association rather than integration; if it were really believable, independence. Where no choice seems to be given, they will vote as it is indicated to them.

And yet much has changed, and the effect will be cumulative.

It is probable that the army and the settlers were right in thinking that the vote, the offer of self-determination, however qualified, put the key to the door of independence into the hands of the separatists. Not necessarily this year; perhaps not next, but one day. Most of the outside world is inclined to think so, and in their heart of hearts some French officers also.

NEW GUINEA—II.

Australia Plays Out Time

FROM OUR CORRESPONDENT IN CANBERRA

IF West New Guinea achieves self-government in the next ten or fifteen years it will probably be the feeblest little coconut republic the world has yet seen; and it will present its Australian neighbours with some mighty problems. Whatever the Dutch do in their ten-year development programme, the territory seems unlikely, on its own, ever to be self-supporting—except at a primitive, subsistence level. The Netherlands, presumably, would be willing to continue its financial support for a time, but that would leave West New Guinea weak and precarious and it might seek to attach itself to another country or group: not to Indonesia, to judge by present feeling in the territory—and certainly the present state of the Indonesian nation is not such as to tempt anyone to join it. A better solution would be to unite with the Australian half of the island, which is peopled by the same race, and economically far more developed. But such a union would be possible only if Papua and New Guinea were self-governing also. If they were still in tutelage, political agitators would filter across the border from West New Guinea.

This would make Australian New Guinea difficult to administer, and a flare-up is not as remote a possibility as visitors to the now peaceful territory might suppose. The sight of the white man's wealth has bred some envy and resentment among the natives. It has even led to the curious "cargo cult"—which centres on the belief that a ship sent by one's ancestors, is about to arrive laden with all the good things seen in white men's homes. There is resentment against the remaining forms of racial discrimination—the prohibition of liquor for natives, the segregation that occurs in practice if not in principle, the contempt and aversion of individual settlers, the basic wage of 25s. a month, plus food and board. There are some explosive sentiments there. But there is no national consciousness. Most Papuans do not know what a nation is, and as there are some two or three hundred languages in use in the territory, their sophisticated brothers could not easily tell them, even if they could reach them through the jungle. But the politically conscious minority could make life very difficult for administrators and settlers.

They could also alarm those responsible for Australia's defence policy. The territory has always been regarded as vital to Australian security, even now, when all distances have so shrunk that, for example, Indonesia is almost as much on Australia's doorstep as New Guinea. A West New Guinea that could fall under communist influence, and spread the rot to the eastern half, would cause great despondency in Canberra.

Such anxieties might be avoided if the Netherlands and Australia were to work together to bring their respective parts of the island to the point of self-determination at the same time, giving them a common language (it would have to be English) which would make possible a nation of united New Guinea or a Melanesian federation to include some of the outlying islands. The Dutch want this kind of co-operation; but although by an agreement of 1957 the Netherlands and Australian governments declared that in advancing the peoples of their territories towards self-determination, they would recognise their "ethnological and geographical affinity," the Australian government has in practice refused to co-operate in political matters, and has restricted the agenda to questions of health, agriculture, airlines and limited matters of administration.

There are several reasons for this Australian stand. One is that although the two colonial powers have the same nominal aim of bringing their territories to self-determination, their underlying aims are different. The Dutch aim is to get out as fast as honour will allow. The Australian aim is slowly to build a stable democratic society in which the 20,000 white settlers can remain on terms of partnership with the Papuans. This does not mean Australian New Guinea has been run for the benefit of the settlers. On the contrary, the settlers have been firmly kept in their place. They may lease but not buy land, which is regarded as belonging to the indigenous inhabitants, and only about 2½ per cent of which has been alienated. Their demand for self-government (by the whites) has been resisted and they are told that the next step towards self-government must be greater representation for the native people. And lately, to their horror and fury, they have been required to pay income tax. Their presence in the territory hastens its economic development, but they undoubtedly slow down and complicate political advancement.

Refusal to co-operate with the Dutch in political matters seems to rest also on the personal view of Mr Paul Hasluck, the minister for territories, who thinks that it is no use making a blueprint for a society; it must build itself, and Australia's care must be to see that the principles on which it is built are the right ones. Mr Hasluck has also set his face against the education of the élite on the Dutch model. In Hollandia and other towns of West New Guinea secondary schools take pupils to the age of seventeen, while inland there are very few schools at all. In Australian New Guinea the educational effort is widely spread in primary schools over the whole area (most of them run by missions, with unqualified teachers and an unsuitable curriculum); there are only four secondary schools. There is no university in either part of New Guinea. The minister thinks that it would be nonsense to educate the coastal natives to govern and represent the tribesmen inland, who share neither their language nor their outlook, and who are far better understood by the officers of the administration.

Above all, non-co-operation with the Dutch is due to reluctance to offend Indonesia, which is too near Australia on one side and too near Singapore on the other. Although Australia has publicly recognised Dutch sovereignty in West New Guinea, it has steadfastly refused to say what it would do if that sovereignty were violated, although a military guarantee would enable the Dutch to move more slowly. It has been very tolerant of arms shipments to Indonesia by Americans and British, although these raise Indonesian strength far above that of the Dutch in the area, and although the claim that all these can be used only for internal security, as distinct from external aggression, is quite unreal. Then too, Australian and Indonesian leaders have exchanged visits; and the Indonesian ambassador to Australia recently toured Papua-New Guinea as the guest of the Commonwealth government (using the occasion to score off the Dutch by contrasting their efforts unfavourably with those of Australia). All this fragile goodwill would be shattered if Australia joined with the Dutch in a plan which would certainly baulk Indonesia's claims. Nor would a secret political plan, or a secret military guarantee, be any better: the Dutch are looking for a deterrent (in the archaic, non-nuclear usage) and it is in their interest if not to shout the news from the housetops, as they did with the despatch of the aircraft carrier *Karel Doorman* and the two destroyers, at least to let it filter out.

Yet if the alternative is a temptingly weak state created across the jungle border, Australia's interests may be no better served than if it had shown Indonesia a bolder front. But surely there is a third possibility: namely, that without agreeing on a timetable, there could at least be such co-operation in the political sphere—particularly over language, speed of advancement and training for leadership—that when the time comes for self-determination, a united New Guinea will not be impossible. One must hope that the minister for territories, who has been visiting The Hague this week, will not allow his preconceived ideas to exclude such an accommodation.

The "Armenian Wizard" in Eclipse?

OF the ten full members of the party presidium announced on March 5, 1953, immediately after Stalin's death, only three are still in their posts. Mr Khrushchev is, naturally, one of them. A figurehead, the aged marshal Voroshilov, who earlier this month was removed from his job as Soviet President, is the second. Last, but not least, is that "Armenian wizard," Anastas Mikoyan, possibly the most intelligent and experienced member of the Soviet leadership. Mr Mikoyan's position now seems threatened.

The first sign was rather cryptic. The issue of *Partyina Zhizn*, which went to press on May 3rd, contained an article on Soviet Azerbaidjan which did not mention Mr Mikoyan at all. This was in sharp contrast with, say, the entry on this subject in the recently published Small Soviet Encyclopedia, in which Mr Mikoyan figures prominently. A further clue was Mr Mikoyan's absence from among the Soviet leaders who came to greet the returning Mr Khrushchev last Saturday. (A Soviet official said he was on holiday on the Black Sea coast.) More significant, probably, is the fact that a Soviet delegation now visiting Argentina is headed by Mr Kosygin, Mr Mikoyan's new fellow first deputy prime minister. Hitherto, Latin America has seemed to be Mr Mikoyan's particular province; he visited both Mexico and Cuba fairly recently. The eclipse of Mr Khrushchev's chief partner in the policy of co-existence would be a not unnatural sequel to a setback to that policy.

Anastas Ivanovitch Mikoyan was born in 1895 in the neighbourhood of Tiflis. He is thus a year younger than Mr Khrushchev, but has a much longer party career behind him. Like his fellow Caucasian, Stalin, the Armenian Mikoyan went first to a Church seminary in Tiflis, from whence he rapidly graduated into politics. He can claim to be an old bolshevik, since he joined the party in 1915. Three years later he is reported to have escaped miraculously the fate of the "Baku commissars" executed at the time of the British intervention. After the victory of the revolution, he rose rapidly in the party hierarchy, and not merely in the Caucasus. By 1923 he was a member of the party's central committee. Three years later, when Mr Khrushchev was still completely unknown, Anastas Mikoyan was already a candidate for the powerful *Politburo* (though he became a full member only in 1935).

Mr Mikoyan climbed on to the Stalinist bandwagon. He advanced fast because the elimination of Stalin's rivals left room at the top for newcomers. Naturally, like all the Stalinists, he paid tribute to his master and carried out his orders. But he was not essentially a manipulator of the party machine and he avoided the thick of the personal struggle. He was more a technician, a manager, the chief "red merchant." From 1926 onwards, he was successively commissar for trade, supplies, light industry and foreign trade. At party congresses he would set himself not to appeal to the bloodthirsty instincts of his listeners, but to whet their appetite with visions of all the good things which would soon be provided for the Soviet citizen.

Astute and cautious, a hard bargainer but a flexible politician, Mr Mikoyan managed to survive Stalin's reign. Directly after Stalin's death he does not seem to have been included in the inner leadership. But this setback did not last. During the short Malenkov era, Mr Mikoyan—a specialist in light industry—was the natural co-author and propagandist of plans for a "rapid expansion of consumer goods." He did not, however, share Mr. Malenkov's disgrace. On the contrary, he played a key part in the memorable 20th congress in 1956. It was Mr Mikoyan who delivered the first open speech at that congress attacking Stalin both for ideological errors and personal injustices. The speech created a tremendous stir and may well have precipitated Mr Khrushchev's more famous "secret" indictment.

When, in March, 1958, Mr Khrushchev replaced Marshal Bulganin as prime minister, Mr Mikoyan became his first deputy. All observers are agreed that he was not, like the fallen marshal, Mr Khrushchev's stooge. Many have been witnesses of occasions when the cautious Mr Mikoyan tried to keep his extrovert partner under control. Some even believe that he was the real prompter of the policy of détente. The transition from home to foreign affairs would have been easy for him. As Russia's chief foreign trader for years, he had better contacts with, and more knowledge of, the outside world than any other Soviet leader. During Mr Khrushchev's period of travelling diplomacy, he was the perfect partner. His visits have not been limited to Latin America; he also preceded Mr Khrushchev in the United States. His last trip was to Iraq in April. There, at a press conference, he tried to explain why it would be unwise for Moscow to recognise the Algerian government-in-exile. His views were sharply criticised in the Chinese press. Without mentioning him by name, the Chinese have, in fact, been gunning for him for quite a time.

Has the luck of the "Armenian wizard" run out? Does Mr Khrushchev intend to sacrifice a partner in order to preserve his position? There is no official indication of this; there are merely straws in the wind. But the fate of Mr Mikoyan is worth watching. One of the very few remaining old bolsheviks, he was probably never a real contender for his fellow Caucasian's succession. He has, however, been associated with all the three major trends in the post-Stalinist phase: the attack on the "cult of personality," the emphasis on the needs of the consumer, and the policy of co-existence. The length and extent of his eclipse may, therefore, serve as a guide to the confusing struggle over policy now going on in Moscow.

Round-the-clock defence
intercepts aircraft hundreds of miles out—

far up into the stratosphere...

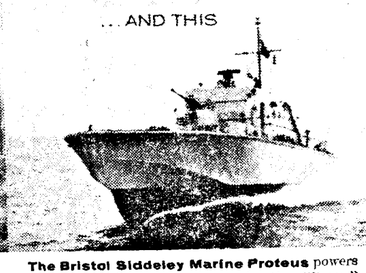
...AND BRISTOL SIDDELEY SUPPLY THE POWER

Bristol Siddeley Engines power the whole of the RAF's round-the-clock defence which shields Britain from possible air attack.

The defence system is made up of Bristol/Ferranti Bloodhound ground-to-air guided missiles, powered by two Bristol Siddeley Thor ramjets, and Gloster Javelin all-weather weapon carriers, powered by two Bristol Siddeley Sapphire turbojets.

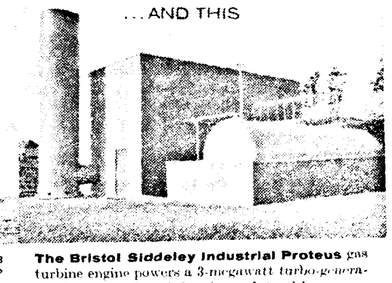
These two types of weapon carrier complement each other, and their radii of action form a series of interlocking defensive cones which extend out from the coastline to an effective range of several hundred miles and far up into the stratosphere.

No known manned aircraft in service has a performance which would enable it to outclass or evade this round-the-clock defence.



BRISTOL SIDDELEY ENGINES LIMITED

POWER FOR THIS

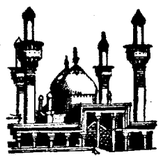


Bristol Siddeley Maybach diesel engines power Britain's fastest express train—the British Railways "Bristolian". Two Type MD 650 engines, developing a total of 2,300 hp, give the "Bristolian" a top speed of over 90 mph. Over 200 Maybach diesels have been ordered by British Railways alone.

...AND THIS

The Bristol Siddeley Marine Proteus powers the world's fastest naval vessels, the "Brave" class Royal Navy patrol boats, built by Vosper Ltd. Three Proteus deliver a total of 10,500 hp—propel these 96-ft boats at over 50 knots. The Marine Proteus is quick-starting, flexible and reliable.

...AND THIS



The Bristol Siddeley Industrial Proteus gas turbine engine powers a 3-megawatt turbo-generator. Designed for peak-lopping and stand-by generation, this new pocket power station will deliver full power within 2 minutes of a cold start for a lower capital cost than any other type of installation.

A tale of Twenty-two Cities

From Tunisia to India, from Aden to Iraq are the Cities, twenty-two of them—in fifteen states. They all have this in common: every one is in an area where a dramatic transformation is taking place, a transformation from a traditional past to modern statehood. Every one, too, contains a branch of The British Bank of the Middle East, a Bank

dating back to 1889 and closely associated with the rapid development taking place today. Tunisia, Libya, Lebanon, The United Arab Republic, Syrian Region, Abu Dhabi, Iraq, Jordan, Saudi Arabia, Kuwait, Bahrain, Qatar, Muscat and Oman, Dubai and Sharjah, Aden and India: these are the territories where The British Bank of the Middle East operates. It has intimate knowledge and experience of their political, economic and financial affairs. If you are interested in new markets and the limitless possibilities of development in this vast area, The British Bank of the Middle East can give you the reliable help and advice you need.

THE BUSINESS WORLD

Old and New in Merchant Banking

MERCHANT banking, which has always been the inner citadel and core of the City of London, has been peculiarly resistant to fundamental change. The bank parlours have remained bank parlours. Partners of leading houses have the same names as a hundred years ago. No doubt, their power and influence are not what they were in the old days, when the Rothschilds maintained their own intelligence services and Baring Brothers was the sixth great power of Europe. But the merchant bankers of today are still to be found at the hub of an impressive range of positions of influence. By any count it is a remarkable feat of survival. It has been made possible only because, traditional as they may be, these banking families have been willing and able, when pressed to it, to move with the times, even if this has meant a shift in the character of their business.

One such shift is visible today, and possibly it is the most far-reaching of all. The veil of privacy is being lifted. Public opinion—which was not very impressed by the bits about merchant bankers that emerged incidentally from the Bank rate tribunal or by the high-handed way in which some (but not all) of the old-established City houses conducted themselves in the British Aluminium affair—is now being treated with much more consideration ; public relations officers have made their appearance in Bishopsgate. Some of the newer houses, moreover, combining fresh vigour with the old sagacity, now attach less importance to the established and comfortable ways ; and at times it is they who have made the running. Yet—and this is the prime proof of adaptability—the old houses have not, in the last resort, lined up against the new ; some have, in fact, thrown in their lot with them in mergers, producing juxtapositions such as Philip Hill, Higginson, Erlangers and S. G. Warburg (incorporating Seligman Bros.).

In merchant banking, as in much of industry, there is in any case a trend towards bigger units. This year it has already produced two more link-ups, between Lazards and de Stein and, as announced last week, between Schroder and Helbert, Wagg—in these cases making formal an association that was already fairly close. And at the same time—still more revolutionary—the old merchant banking families are now beginning to open the door to the public investor. Immediately after the war only one of the members of the Accepting Houses Committee (Hambros Bank) was open to the general investor ; today six are. On Thursday Philip Hill announced a one-for-four rights issue, its second within the year, of 4,375,000 shares at 22s. 6d.—compared with a market price of 37s. 6d. Other houses are expected to market their shares before long ; only two houses, N. M. Rothschild and Guinness, Mahon, are still unincorporated.

These private partnerships, and many of the private companies, still publish no accounts. So it remains impossible to group the houses in order of profitability and size. But each house that comes to the market has to open its books ; aggregate figures have been made available by the Radcliffe committee ; and in due course these will presumably be published in a regular series. The accompanying table shows the figures for the latest available date, February of last year. They show total deposits of £220 million, the majority on overseas account ; acceptances of £122 million, mostly for United Kingdom residents, but the bulk probably on account of overseas trade ; and " main assets " totalling £268 million. Of the individual houses, the new Schroder-Helbert, Wagg group has a balance-sheet total of £106 million (including acceptances of £16 million) and Hambros Bank £108 million (including acceptances of £27 million). Baring Brothers, a non-quoted company that publishes its balance-sheet, has a total of £33 million (including £8 million of acceptances).

THE seventeen members of the Accepting Houses Committee constitute the recognised " establishment " of the London merchant banks, and the entrée is not easy. The qualification is not only that a " substantial part " of business must consist of accepting bills to finance the trade of others ; but the acceptances must also command the finest rates in the discount market and be taken by the Bank of England—a qualification which implies " long experience, and a standard of means, liquidity and standing satisfactory to the Bank " (as the Committee put it to the Radcliffe enquiry).

As the tabulation overleaf shows, only two of the present members, Warburg and the Philip Hill group, began business in the twentieth century ; and each has now merged with an old-established business. The Issuing Houses Association is a much wider association of merchant banks, which includes some members of the Accepting Houses Committee, and some

houses, such as Rea Brothers and Ullmann, whose acceptances up to a certain volume command good rates at some discount houses. Other issuing houses do no banking business. It is the marriage of international banking and acceptance credits with issuing business and company finance that is the particular hallmark of the London merchant bank.

Many of these firms had their roots in commerce. They were merchants first, and they became bankers afterwards. This was true, for example, of Barings, who dealt in wool before they transacted any banking; of the Schröder brothers who came here from Hamburg as merchants in grains and tallow; of the original William Brown, the founder of the firm that was to become Brown, Shipley, who exchanged cotton and tobacco from America against textiles and other manufactures from Europe. As they prospered, these merchants found themselves called upon in the normal course of business to guarantee, and sometimes to finance, the transactions of smaller firms. In time they deemed it more lucrative to finance other people's trade than engage in trade themselves.

Some of these houses, however, retain to this day an important merchanting business, among them Antony Gibbs and Arbuthnot, Latham; these, however, are the exception rather than the rule. Others had their origins in finance and moneylending unsullied from the start by commerce; this was true of the house of Rothschild, one of several firms in which family tradition has remained strong and consistent.

During the nineteenth century, the period of their most rapid growth, these firms were always outward-looking. They transacted little domestic business. Their acceptances were the bill on London which became the most widely used instrument for financing international trade. In the course of this acceptance business, they acquired trading connections and a knowledge of foreign countries which made them the obvious agents for handling issues of bonds for foreign borrowers in the London market. The Macmillan report of 1931 drew attention to the highly developed and efficient capital market for foreign issues in London; it suggested that "the British financial organisations concentrated in the City of London might with advantage be more closely co-ordinated with British industry."

THAT advice, reinforced by the wave of defaults and standstill agreements that swamped so much of the foreign debt which had been issued previously through the merchant banks, fell on good ground. During the thirty years since, there has been a shifting tide of interest towards domestic industrial banking by the merchant banks. Close links have been established with industry; two examples, among many, are the links between Lazards and English Electric, and Schroder and Pressed Steel. These do not involve direct permanent holdings by the banks in the companies with which they are associated, as they do in Continental *banques d'affaires*. But the connections are frequently closer than between industry and the clearing banks; in a number of cases merchant bankers sit on the boards of their industrial clients.

The merchant banks' new issue business is no monopoly. Two-fifths of the issues of public companies in the ten years after the war, it was revealed in evidence to the Radcliffe committee, was raised through brokers rather than through members of the Issuing Houses Association. In any case, the great bulk of the issue is sub-underwritten by many institutions—the insurance companies, pension funds and merchant banks that together form the sub-underwriting "club." This business, too, may at times engage the merchant banks in substantial commitments.

The business of the merchant banks is highly personal. To any really large industrial group these banks are relatively modest institutions. Such a customer when dealing with his banker may well feel he can talk only to the people at the top. So, as this company finance business develops, the maintenance of personal contacts calls for a large number of partners or executive directors; and this has been one contributory impulse in the trend towards larger units.

In the best of firms, moreover, the need arises to reinforce as well as simply to multiply the personnel at the top. The essence of successful merchant banking lies in the virtues of adaptability, quickness of reaction to opportunities, and foresight. It is not likely that these talents will indefinitely be found within one family. New blood has to be brought in. The comparative growth and decline of some of these firms can often be related directly to the readiness with which the heirs of the founding fathers have been prepared to share with others, and occasionally to cede to them, responsibility and power.

The recent combinations among merchant banks have brought a greater spread of interests, bringing issue business to banking and banking to an issuing house. The broader the basis of its activities the easier will it be for a merchant bank to take the shock of fluctuations in certain specialised types of business. The magnitude that these shocks may reach was starkly revealed to the public by the proceedings before the Bank rate tribunal; at the height of the 1957 exchange crisis, Lazards lost one-quarter of its total deposits in only three weeks.

Many merchant banks have become directly involved in medium-term credits for financing the export of capital goods. Their experience fits them well to head the banking syndicates which, with the help of the Export Credits Guarantee Department, are financing large overseas projects. Most of the credit may be, in fact, found by the clearing banks; but this type of finance does involve some immobilisation of merchant banks' resources, thus adding to the arguments for greater size.

Investment management is another growing activity. Merchant banks have always managed the substantial fortunes of their partners and families: for the older firms this is now an important part of their basic business. It was a natural step to use this experience in advising clients—individuals, pension funds, college endowments—on their own investment portfolios. Many merchant banks have gone further. They have formed investment trusts, some with a public quotation; and, most recently, some of them have launched new unit trusts, providing management services. Some merchant banks have also been active in international investment business, for which their extensive overseas connections make them a natural channel. Some houses now make more money on the stock exchanges than from acceptance commissions.

Taxation, inevitably, has exerted much pressure on family concerns. In a number of cases the marketing of shares in merchant banks has sprung from the necessity to make provision for death duties; this has probably played a part in some of the mergers; and, even if resources are available to provide for these commitments, a quoted security is preferable as a basis for estate valuation. It remains to be seen whether the essentially personal business of merchant banking will now remain unaffected by the growth in the size of its units, or by the intrusion of outside shareholders into the preserves of some of the most tightly-knit families in Europe.

Members of the Accepting Houses Committee

(Houses marked with an asterisk are quoted companies or controlled by quoted companies)

Arbuthnot, Latham (1833). Active merchanting business; good acceptance business.

Baring Brothers (1763). Long connections with overseas business, particularly in South America. Important acceptance business and domestic industrial issuing business.

Wm. Brandt's (1805). Has interests in marketing timber and grain through subsidiaries in UK and Commonwealth.

Brown, Shipley* (1810). Largest dealers in London market in foreign notes; good acceptance business. Links in USA through Brown Brothers Harriman.

Antony Gibbs (1808). Widespread overseas interests in North and South America, Australia and Africa; direct merchanting. Has insurance subsidiaries in UK and abroad.

Guinness, Mahon (1836). International banking and acceptance business; investment and new issues. Subsidiary in Ireland. With Samuel Montagu has hire purchase interest.

Hambros Bank* (1839). Large Scandinavian business; owns Mocatta and Goldsmid, the bullion brokers; runs an agency for BMC cars in the USA and has interests in Africa. Hire purchase subsidiary. Big acceptance and new issue business.

Philip Hill, Higginson, Erlangers* (1907, Erlangers 1870). Controlled by Philip Hill Investment Trust. Merged with Erlangers last summer and now forms one of the largest issuing houses; also runs a unit trust. Its American associate is Harriman Ripley.

S. Japhet* (1896). Controlled by Charterhouse Group and in turn controls an investment trust and hire purchase company. Acceptance and foreign exchange business.

Kleinwort (Cuba 1792, London 1830). Important acceptance business, and increasing investment management. Important contacts in Africa and USA.

Lazard Brothers (1877). S. Pearson, representing Lord Cowdray, has controlling interest. Large acceptance business. Active in arranging medium-term export credits, in investment banking and industrial issues, and, through de Stein, investment and property trust management. Connections in Paris and New York through Lazard Freres.

Samuel Montagu (1853). Pre-eminent in London foreign exchange market and bullion market. Subsidiary in Zurich. Important domestic acceptance business. Through recent link with Wood Hall Trust has acquired Hart, Son and Company.

Morgan Grenfell (1838). Traditional links with United States and France. Has now developed close contacts with British industry and has large investment and industrial issue business. Connections, now mainly informal, with Morgan group in USA.

N. M. Rothschild (1804). Together with traditional acceptance and foreign exchange business, has large investment and issuing side and acts with National group of unit trusts. A leading firm in bullion market. Direct interests in insurance.

M. Samuel (1831). Active in domestic acceptance business, foreign exchange, shipbuilding finance, new issues and investment trusts. Close link with Shell group.

J. Henry Schroder* (1804). Active foreign exchange and acceptance business. New issue and investment business will now be reinforced by majority interest in Helbert, Wagg. Subsidiary in USA.

S. G. Warburg* (1934). Controlled by Mercury Securities; merged with Seligman Brothers in 1957. Through Kuhn Loeb has an active American connection. Large business in industrial issues and investment management. Hire purchase link.

TABLE II
THE QUOTED COMPANIES

All figures except dividends, prices and yields in Lonsdale and Philip Hill relate to banking subsidiaries; but for Mercury, only the figure for deposits relates entirely to the banking subsidiary. Figures for Philip Hill do not include Erlangers.

	Deposits £'000s	Capital & reserves £'000s	Disclosed net profit £000	Div. per cent	Price	Yield per cent

* For 3½ months to December 31, 1959. † Does not include recent rights issue. ‡ Before tax and contingencies. § Ex rights. * Includes shares recently offered for sale. (ǁ) Profit figure is for year to February, 1960, but balance sheet figures are at February, 1959.

Foods of Convenience

IN season, towards the end of the summer, ten ounces of fresh peas—in the saucepan, which means about a pound and a half in the shopping basket—might cost the housewife anything from 3d. to 1s. 6d. in cash, plus the time it takes to shell and wash them. In or out of season, all the year round, she can get the same amount "fresh-frozen" for 1s. 11d.; canned freshly after picking, as "garden" peas, for 11d. to 1s. 2d.; dried, for 10d. to 11d. plus the time it takes to soak them; and "processed" (i.e. picked, dried, and later soaked and canned when it suits the canner's convenience) for 6d. to 7½d. She can store canned or dried peas as long as she likes; frozen peas (until British refrigerator manufacturers put in larger and colder ice compartments) not more than a day or two.

That crude comparison of prices sets out roughly what the housewife has to pay for convenience in buying peas—plus, probably, some loss of flavour, but only individual tastes can assess that. How much convenience she is prepared to buy can be seen from the fact that less than a third of the green peas harvested each year are sold fresh. Peas are particularly suited to commercial preparation—and preservation; the season is short, and one throws away more than half of the weight with the pod. They still make up probably 22 per cent of all the canned food produced in Britain, and nearly 35 per cent of the frozen food sold; dried peas, again, are one of the few dehydrated foods sold in substantial quantities. If one adds in canned beans (which, homely as they may seem, add the extra convenience of coming from abroad—largely from the United States and Hungary), about 480,000 tons are accounted for out of the 1,354,000-odd tons of canned and frozen "foods of convenience" now produced in Britain—though their proportion by value is much lower, as they are among the few relatively cheap staples into which these packaged foods have achieved real inroads.

It is upon this substantial core of pease pudding that food processors in Britain, following the American example, have

launched a constantly expanding series of ventures in foods of convenience. What these foods have in common is what the industry calls the "convenience factor": all the shelling, selection, stirring, scraping, cleaning, cutting, measuring and gentle feminine swearing is done, rather more harshly, in factories and by the time the food reaches the kitchen it is ready to cook (indeed, usually only to warm up, though the self-heating cans devised in wartime never seem to have appeared on civilian markets). The housewife pays more for the meal—the difference being the price of the service. Manufacturers are confident that housewives will continue to buy more of this convenience—not least because the number of wives who go out to work has doubled (to one in three households) over the past generation and spare money has replaced spare time.

IN 1938 just under 30 per cent of all consumer expenditure went on food. The proportion fell to around 23 per cent immediately after the war, soon rose to above 31 per cent, and has since declined very slightly, in spite of sharply increasing incomes. Most of the rise was due to the end of rationing after 1953, and the return with much relief to a more comfortable diet between 1953 and 1957. Between 1953 and 1958 expenditure on food rose by a quarter, but prices increased by only 18 per cent. Since 1957 this increase in "real" spending on food has slowed down. In terms of calories, people are probably eating about as much as they are likely to want. Variety and convenience, however, may be as potent as quality in competing for the marginal shilling: food processors, not surprisingly, would argue that they go together. Certainly the sales of packaged foods have been rising much more sharply than total spending on food.

The average person in this country to-day eats five times as many canned vegetables, three times as much canned meat, fourteen times as much canned soup as he did before the war—and 80 per cent more canned fruits. Present consumption averages about 70 lb. a head each year, which is still only half as much as the average American eats out of a can. In money terms, spending on canned foods has risen from £42 to £68 a head over the past five years. Most of the fruit and much of the other canned food is imported, but there are nearly 350 firms in Britain doing the canning. Most of the cans are made by the Metal Box Company; and all of them together use 300,000 tons of steel a year.

The pattern, as with most food production in Britain, is of large markets for single products dominated by the biggest firms, with the more exotic and varied foods coming from foreign or small local firms. Of 563,000 tons of vegetables canned in Britain in 1959, nearly 200,000 tons were processed peas, and another 178,000 tons were beans in tomato sauce, largely produced by Heinz. Batchelors, Smedleys, Lin-Can, Benedict and Hartleys dominate the canned pea market, but there are many large regional canners. Although only about half as many "garden" as processed peas are sold, the trend towards better quality in food is shown by an increased sale of garden peas, and a sharp increase in sales of the more expensive frozen peas.

Canners are experimenting with more complete dishes—putting pork into the baked beans is an old example of this—and their newer products include cooked curries and stews. Large specialised markets, whose obvious basis is convenience, have arisen in canned pet foods and canned strained baby foods (a £5 million market dominated by Heinz). Condensed soups, to which housewives must add a volume of water or milk equal to the volume of the can, have increased the food value one can get out of a given can.

SALES of frozen food in Britain doubled between 1957 and 1959, to about £36 million a year. Nearly three-quarters of these are attributable to Birds Eye, who have announced their intention of investing £7 million in the industry in the next three years. Most of the frozen food sales are of peas (accounting for 34 per cent of all frozen food sales in 1959) and of "fish fingers." The decline in consumption of fish in Britain since the war has been partially arrested by the introduction of frozen fish, and the pre-cooked or partially pre-cooked "fingers." The biggest sellers after Birds Eye are the Swedish firm, Findus, and Associated Fisheries' Eskimo account for about 5 per cent of the frozen fish business.

Because the development of a big market in frozen foods depends on the possession of large cold stores and a refrigerated distribution system, with access to refrigerator space in the shops, it is unlikely that any but a large new firm will enter the industry in the near future. But many small firms are producing specialised products in small areas, and the bigger companies (Birds Eye, Eskimo, Frood, Fropax, Mudd, Ross, Smedley and Findus) are generally content to leave this to them. The accent on convenience has gone up in the newer frozen foods: complete meals are offered by most firms.

However, these meals have encountered consumer resistance to the price which frozen foods appear to demand for their convenience. Frozen peas have been successively reduced in price: by comparison, some of the complete meals look costly. As in the case of some of the complete dehydrated meals introduced by Batchelors, the difference in price between the "convenience pack" and the same dinner cooked from fresh foods is still too big to enable a mass market—like that for "TV dinners" in the United States—to be built up. Batchelors have introduced dehydrated vegetables along with their complete meals, and it is possible to buy dried mashed potatoes, which offer an obvious convenience in preparation (add milk and stir) while raising memories of revolting wartime chow.

Wrapped and washed fresh meats and vegetables, sliced bread and sliced cheese are all gaining sales because they save work in the kitchen. Prepared sweets—jellies, custard, blancmange and the newer instant puddings—form a £12 million a year market, although the "instants" have been gaining sales at the expense of the others. One food of convenience that seems to have failed is the cake mix. These were introduced to Britain in 1954; the market expanded in 1955 but has declined ever since. In this way and others, British manufacturers have discovered that the American trend is not always repeated here. Other manufacturers are now waiting, for example, to see how Nestlés does with Nestea before trying to imitate this product: no one knows whether or not it has been an instant success. The British housewife, clearly, likes convenience and is prepared to pay something for it; but that something is still limited, and her taste buds are not yet quite as indifferent to fresh flavours as the food packer would wish.

Unfree As the Air

TWICE in six weeks a delegation from the Ministry of Aviation has crossed the North Atlantic to discuss the revision of the 14-year-old agreement that regulates air services between this country and America; twice it has returned empty handed. Let it be said at once that this failure is no reflection on the goodwill or the ability of the negotiators on either side; but they found themselves victims of the pernicious species of bindweed that is quietly strangling commercial air transport. No airline can fly into a foreign country without the full paraphernalia of a treaty providing for air services between the two countries, and the fun only really gets under way after the treaty is signed. For then comes the business of deciding periodically to what cities, with what airlines and how often the new services shall run; this second stage of negotiation is carried out in an atmosphere of hard horse trading with each "concession" being balanced by a *quid pro quo* from the other side—which itself is a sad comment on the growing illiberality of governments towards anything that savours of competition in the air.

In this bargaining the American airlines find themselves in a peculiar situation. As the only carriers with modern equipment, they alone were capable of keeping the world air routes open in the years after the war; countries actively welcomed American air services to their territories. Only recently have other national airlines expanded and re-equipped to a point where they expect—and need—the same comprehensive route network that the American international airlines already enjoy by virtue of squatters' rights. Since the United States sits geographically athwart some of the trunk air routes, more and more foreign airlines are asking for leave to fly to more and more points inside the United States. But to American airlines, possessing the rights they already do, such requests look like all give and no take. The stiffer that competition becomes, the greater the pressure the American lines apply at home to get these foreign requests turned down. As the attitude of the United States grows stiffer, so the temper of foreign airlines grows shorter. They in turn ask their governments to be beastly to the Americans. And they are.

TO their credit, both the British and American governments dislike the "get tough" policy that has led to a humiliating and childish series of incidents in which British and American airlines have been shut out, and even booted out, of each other's airports because of some imaginary breach of existing agreements. The State Department, which negotiates on behalf of the American airlines, and the Ministry of Aviation, which acts for the British carriers, arranged the latest, abortive meeting specifically to see if they could not come to some general arrangement about air services that would leave their respective airlines some freedom of manœuvre and put an end to the horse trading. They did in fact negotiate a package deal, which fell some way short of this ideal but would have been an improvement on existing arrangements.

Because it was an improvement, the deal exposed airlines in both countries to more competition. The Ministry of Aviation can call its own airlines to order and tell them that more elbow room for them can be obtained only at the price of more elbow room for their competitors. The State Department cannot do the same in the United States. It can sign agreements *ad nauseam*; but the body that has to stamp the precious document allowing an airline to enter America is the Civil Aeronautics Board. And the CAB cannot be made to toe the State Department line if it does not want to do so.

WHAT appears to have happened in the recent talks is that American airlines brought pressure to bear on the CAB, which marshalled its statisticians (and it has many) to prove that foreign airlines would gain more from the package deal than American airlines. Recondite figuring produced the required answer; and so the CAB turned the agreement down. When the meetings were adjourned, it was in order to see whether the CAB could be talked out of its attitude; but there is more than a hint that the American airlines carried enough influence with the President to stop him from putting pressure on the Board to come to terms.

It may be quite true that the package deal broke some of the rules of sound horse trading, and that airline X may have gained more by flying to Y than airline A would make from being allowed to fly to B; but this was not the object of the exercise. The talks were intended to free air traffic, not to tie it, knot for knot, more tightly than ever. It is time it was realised that no airline—British, American or of any other nationality—can operate commercially unless it gets proper use out of its aircraft; and that to do this it must have some flexibility in the way it plans its routes, the number of times a day or a week it serves any city and how many seats it offers for sale. One big jet flying from New York can carry traffic destined for London and Paris in its huge cabin, and if it can do this, the airline saves making a separate flight to each capital. But will it be allowed to? Not without weeks of negotiation at the highest government level, and a 50-50 chance that the application will be rejected.

The countries which take the most liberal view are those with the least to lose by putting their principles into practice—Holland and the Scandinavian countries, for example, with big efficient tramp airlines and little home traffic for foreign competitors to filch. But even these countries are not above threatening to impose import restrictions on foreign goods if their airlines do not get the traffic rights they want. In spite of the failure of the recent talks, Britain and America remain the most liberal-minded of the big powers in air transport. Their standards may have slipped in recent months, but not to the levels of European countries like France and Italy, still less to those of India, Australia or Japan. The basic trouble remains that the world has too many airlines, most of them inefficient, under-capitalised and unprofitable. And the granting or withholding of traffic rights is used without scruple as a means of protecting them against competition that would—and certainly should—drive them out of business.

BUSINESS NOTES

THE ECONOMY

The Labour Market Tightens

UNEMPLOYMENT seems to have declined in the month to May by about 25,000 more than would be expected for the time of year, and the number of unfilled vacancies notified to labour exchanges, to have risen by 23,000 more than seasonally. The total number of vacancies, 327,000, is now not far short of the total out of work, 341,000. The labour market seems to be tightening now in the less prosperous areas as well as in the boom towns of the Midlands, where the unemployment percentage is down to 0.7; Scotland's figure has come down to 3.5, and Wales now has only 2.8 per cent of its employees out of work. Although industries still seem by no means evenly busy, the pressure is evidently becoming more general. At the meeting of the National Production Advisory Council on Industry last week, the Chancellor was still confident that the "recent shift in emphasis was about right in both timing and in scale"; but he was beginning to express greater anxiety about the level of exports. He emphasised that one condition of achieving a reasonable balance between exports and imports—which he did not think was yet right—was "not having our industrial system so loaded with home demands that it cannot take on new export orders or can take them only with unacceptable delivery dates."

Plainly, further measures of restraint this summer cannot be ruled out. True, action already taken has not been ineffective. The rise in bank advances has slackened, and credit generally is nothing like so easy to obtain as it was last year. But, predictably, the trifling call to special deposits and modest hire purchase restrictions imposed a month ago, do not themselves appear to have had any great weight. In the money market indeed special deposits have had the ironic technical effect of inducing the discount market to reduce the bill rate, a movement that is not normally associated with credit restriction. Understandably, therefore, the Bank of England has been putting on pressure in its day to day operations by making funds available only at penal Bank rate terms. Last Friday, nonetheless, bill rate was unchanged, at £4 11s. per cent; the rate would doubtless be jacked up quickly enough if the market had any reason to fear an early rise in Bank rate. Nor have special deposits and the present hire purchase controls many terrors for the equity markets: share prices have risen fairly sharply this week. The authorities would find it simpler and more effective to make their next move of restraint, when they judge it necessary, either a rise in Bank rate or tougher open market operations.

BANK ADVANCES

The Pace Slackens

ADVANCES by the London clearing banks at their make-up on May 18th show a rise on the month of £26 million, following a rise of £98 million in April. The pace of growth has plainly slackened, but nothing like so sharply as this crude comparison suggests. First, the May period was four weeks and the April period five. Secondly, the April figure was swollen by large internal transit items immediately after Easter, exaggerating the true increase in April by £10 million and correspondingly understating the increase in May. The "clean" May figure will not be known until the week-end, when the clearing banks publish their annotated combined statement (why the banks should take three to four days to print this statement remains one of the banking mysteries). Thirdly, State boards repaid £2½ million in May, while in April their advances rose by £5 million. Fourthly, advances at the National Provincial and the Westminster were swollen by special influences on the April make-up day, and both these banks show reductions in May. Finally, seasonal influences themselves make for a slackening at this time of year. Thus while the banks' conscious efforts to restrain the rise in advances—which really began after the drop in official support prices for gilt-edged on February 24th—appear to have borne fruit, the latest figures do not suggest any dramatic effects. The Bank of England may be satisfied with these figures so far as they go: the aim of the credit restrictions imposed at the end of April was stated to be to slow down the growth in advances, not to stop it altogether or force a reduction.

The authorities have succeeded in preventing an increase in the supply of liquid assets to the banks, and the increase in bank advances had to be financed by further sales of investments. These totalled £34 million, and most of the sales were probably made before announcement of the credit restrictions on April 28th. The three main sellers were the Midland (£15 million), the National Provincial (£10 million), and the District (£5½ million). The NP and the District thereby succeeded in raising their liquidity ratios from the bare 30.0 per cent to 31.4 and 32.6 per cent respectively. But the Midland's ratio rose only by 0.1 to 30.7 per cent; while Lloyds, which transferred £5½ million to special deposits before the May make-up, shows a fall in its ratio from 30.9 to 30.1 per cent. The only other transfer by a clearing bank was by the National, of £300,000; though in the past week the Bank return shows a further increase of £8.6 million in the total, to £15 million. Thus a further £60 million or so has to be transferred in the next two and a half weeks.

IN THE MARKETS

Equities Rise

ON the stock exchange the bank figures were taken as an indication that further bank selling of gilt-edged was less likely, and the gilt-edged market, which the summit break-down robbed of its recent poise, recovered ground in mid-week. In equities, while Wall Street this week has quietened down after its flurry in "defence" stocks on the news of the summit breakdown, London prices have risen strongly following last week's see-saw. The market is still thin and the shortage of stock has contributed to the rise. This shortage has been a constant refrain in the market for many months now and what it really indicates is that there are not many big sellers about. That should not surprise anyone. The buying has been well spread throughout the market though it has been concentrated just a little more on capital goods issues than on consumer goods shares. It was sufficient in the week to Wednesday's close to lift *The Economist* indicator 9.5 points to 357.2 and the *Financial Times* index 9.3 points to 320.4. Prices are now about 6½ per cent higher than they were at their low point at the beginning of this month—and the same amount below their new year peak. Summit or no summit the industrial market has shown a strong resistance to predictions of a bear market. Kaffirs, too, have become firmer.

THE PRICE OF OIL

Britain's Insulated Market

WITH 90-95 per cent of its 35,000-odd filling stations sewn up in exclusive dealing agreements, and virtually 100 per cent of the petroleum, crude or refined, imported through the major international companies, Britain has remained during a period of softening petrol prices elsewhere about the firmest market for "dealer gasolines" in Western Europe. Mr Getty of Tidewater Oil has some land at Holyhead where he could put an oil terminal if he cared to; Signor Mattei has appeared in London once or twice, talking of petrol stations-cum-motels, Total Oil Products, owned by the French *Compagnie Francaise des Petroles*, is often tipped as the first big outsider likely to attempt a large-scale entry into this best-disciplined of markets. But so far these threats of new competition have remained potential. A substantial investment would be involved in setting up full-scale marketing, and not merely are most of the pumps under contract, but the majority of existing storage capacity and the best sites for bringing oil into Britain have been pre-empted by the majors operating here already. But during this year and next, certainly some of the 5-year exclusive dealing contracts come up for renewal; there may be some new bidders.

On a much tinier scale of competition, Jet brand motor spirits, which came on to the market a few weeks ago, are being sold at more filling stations than any of the other cut-price petrols that have occasionally been reported in the last few months. Rather more than 30 stations "north of the Thames and south of the Humber" are selling its super, premium, and standard grades, with some of them selling no other brands, and others are being signed up. Jet Petroleum's "100-octane super" is being sold for 4s. 5½d. a gallon, against 4s. 11½d. for the major companies' super grades in this "outer zone." (The majors argue that the effective difference here is less than 6d., quoting an Automobile Association test which rated the super Jet grade at 98 octane rating, with 2.38 c.c. of tetra-ethyl-lead per gallon; their own super grades are all advertised as 100-octane or more.) Its 90-octane grade, comparing roughly with mixture grades, and selling at 4s. 0½d. against 4s. 5½d., was rated by the AA as 91-octane; this would compete in price also with the majors' regular grades of 82 to 83-octane, which sell at 4s. 3½d.

A Drop in the Ocean

THE Jet Petroleum company, which owns storage at Keadby in Lincolnshire and Felixstowe in Suffolk, has been supplying motor spirit and a range of most other oil products apart from solvents in the commercial market for bulk supplies for several years, particularly to municipalities and public utilities. In those markets petroleum products are sold by specification and price rather than by brand, and the majors by no means disdain price competition. Jet's management, indeed, say that the majors have been prepared to shade their wholesale prices for bulk commercial supplies of motor spirit by rebates of 4d. a gallon or more; its own venture into the retail market is in part merely to reach a sector of the market where the prices it is being forced to quote to get or retain bulk business can give it a bigger advantage to woo the consumer. But these prices also represent the very low prices at which products are available from many refineries in Europe, processed from Venezuelan and Middle East crudes. Jet says that it bought some Russian gas oil last year, while import licences were to be had, but has had no petrol from there or refined from the Russian crude. (The Russians are not, in any case, prepared to sell products quite as cheaply as many independents in the West will.)

This latest trickle of cheap petrol has gained much more publicity than the earlier ones; for the moment the majors have no need to take it any more seriously. Mr Roberts of Jet Petroleum says that in 1939—"when there were 80 independents in this market; I'm the only real one left"—his firm had more than one per cent of oil sales in Britain; he does not pretend to have nearly that percentage today. But with total sales of motor spirit expanding by some 12 per cent a year (the 1959 figure), and still about 7 per cent of the country's filling stations untied, he claims there should be enough room to give him a sizeable expansion without hurting anybody—except, perhaps, some retailers near the stations that sell his petrols. Jet petrols are priced too far below the majors' recommended prices for any retailers to match while wholesale prices remain steady; indeed, the retailer seldom gets more than 7d. a gallon including his rebate. Nobody—least of all Mr Roberts—imagines that the majors would find him important enough to slash their own prices to his levels. But the majors are sensitive and proudly jealous of their public image; and in a market that has remained so conspicuously insulated from the price cuts that the independents have forced in Germany and Italy, his presence and activities can hardly help causing some slight embarrassment.

Price Structure for Europe?

WHETHER the complex realities of product pricing on this side of the Atlantic—and on both sides of the Channel—are adequately reflected in the new "cargo price indexes" that Platt's Oilgram has now tentatively proposed for United Kingdom and Channel ports seems open to considerable doubt. Platt's price reporting services for crude oil and for petroleum products at the US Gulf are accepted throughout the world industry as a guide to the pricing of many transactions: no such prices have ever been published for Europe though, as the Oilgram says, "many traders in Europe (refer) from long habit to Gulf Coast or Caribbean prices as a yardstick in their dealings." The new ranges of prices that it is proposing for this side of the Atlantic take as their "highs" the Caribbean product prices posted by major companies plus the current "average freight rate assessment" (calculated quarterly for current tanker business) from the Netherlands West Indies to the United Kingdom. As their "lows" they take the discounted prices at which Platt's reckons these products can in fact be obtained in the Caribbean plus spot tanker rates to Britain. The width of the ranges thus obtained vary; for 90-octane gasoline the "low" is 20 per cent below the "high," and for Bunker "C" fuel oil 27½ per cent below.

Few of the major companies operating in Britain are prepared to comment upon the value of publishing such indexes or the validity of the formula adopted. There is little doubt that the discounts Platt's quotes—2 cents a gallon on gasoline, 0.75 cents a gallon on kerosine, one cent a gallon on gas oil, and 35 cents a barrel on fuel oil—are those obtained by certain customers for Caribbean products. But to European eyes the whole basis of the formula seems odd: does the "market" upon which its low figures are set really exist? Statistics show that a certain volume of products does move from the Caribbean to Western Europe, but mostly in transactions within or between the major international companies as a matter of convenience; there is probably a fringe of "distress selling" of Caribbean products as well, but these are probably at markedly bigger discounts than those these "indexes" show.

Can one really purport to report price levels for Europe without reference to the fact that practically all the products that Europe consumes are refined from Middle East crudes? Some tenuous link, certainly, would exist between the prices at which products refined from Middle East crudes are available from European refiners and the prices that would need to be quoted for really competitive products in the Caribbean; but to take the one as the measure of the other appears at first like putting a clouded mirror up to a vague reflection to try to see the man beside you. The difficulties of constructing a formula that would reflect reliable "lows" in price for the market in products in Western Europe, certainly, would be formidable indeed; how much distress selling, at the moment, ought one for example to include? Platt's are to be congratulated for facing a problem which nobody else has been quite prepared to tackle, that of the growing independence of the European price structure from that in the Western Hemisphere; but it seems doubtful whether this particular approach is a very satisfactory one.

FINANCE BILL

Appeal on Clause 26

ON the committee stage of the Finance Bill this week the Government made a small concession to the critics of clause 26, which gives the Revenue a general power to tax stock exchange operations whose object is deemed to have been avoidance of tax in certain designated ways. Besides giving a guarded promise to "look again" at the wording of the clause, the Treasury proposed an improvement, but a limited one, in the procedure of appeal. Appeals on questions of fact remain limited to the

Special Commissioners in the first place and a special Tribunal of Referees, appointed by the Lord Chancellor, in the second place; appeal to the high court is possible only on points of law. The new proposal is that the tribunal should first consider, on the basis only of written statements from the Revenue and the taxpayer, whether there is a *prima facie* case. If it decides there is not, the Revenue will be able to proceed no further. If it decides there is, this will not prejudice the position of the tribunal in its full hearing of the appeal at a later stage. This, broadly, is the procedure that has been used for appeals by taxpayers against surtax assessments, which are heard by a special tribunal also headed by the Chairman of the Board of Referees but with two members chosen for their business experience, rather than for the special financial knowledge that the members of the clause 26 tribunal, very understandably, will need to have.

There is no way of making administration of a general taxing power fully acceptable, and the Treasury may feel that it has done its best. But one further step might make a lot of difference in the way the Inland Revenue comes to use its power. Decisions of the special tribunal should be made public, at the first stage as well as the second. That would be the best protection against over-zealous administration of what is inevitably bad law.

ROADS

Paying by Tolls?

FACED with demands for greatly increased roadbuilding, and with a reluctance on the part of the Treasury to authorise more than the £65 million which will be spent on new roads this year, the Ministry of Transport is reported to be giving serious consideration to the building of toll roads as an alternative means of highway financing. The idea of charging tolls on major roads in Britain has been mooted before; in the past, when total expenditure on roads was relatively insignificant, it received little support. Toll roads have usually been strongly opposed by the road lobby headed by the British Road Federation, among whose supporters is the motor industry. Recently, however, Mr Brian Rootes argued that the extra burden on the road user would be more than repaid by the conditions of safer (and of course increased) travel resulting from new roads. In addition, charging tolls seems politically more feasible, as well as decidedly more equitable, than raising the tax on petrol.

It is impossible to assess the practicability of toll roads until more is known of their economics; no estimates have yet been released of the level of charges necessary to make a given road pay for itself on this basis (over, say, fifty years including maintenance and interest). A maximum charge of 1d. a mile has been suggested; but at this rate the trip from London to Birmingham on the M.1 motorway would cost about 6s., which would seem rather more than most motorists would pay to enjoy the convenience, such as it now is, of a high-speed, limited-access road. It is planned to charge tolls on the new Dartford-Purfleet tunnel, and on the proposed Severn and Forth bridges; charges have not yet been decided, but they should be easier to compute for a tunnel or bridge than for a road.

In addition, toll roads pose some technical problems that might be difficult to overcome. Not all of the five major road projects now planned—the Great North Road, the London-Yorkshire motorway, the Birmingham-South Wales route, the South Wales radial road, and the Channel Ports road—have either been designed or are being built as limited access motorways. Experience with toll roads in the United States has been generally satisfactory, though not uniformly so: but the longest motorway now planned for Britain will be less than half the length of the Pennsylvania Turnpike. Unless the cost of collecting tolls is not to become uneconomic, the number of access points must be limited; at present there is about one access point for every eight miles on the London-Birmingham motorway.

AIRCRAFT INDUSTRY

BAC Takes Shape

THE merger of the aircraft interests of English Electric, Vickers-Armstrongs and the Bristol Aeroplane Company was announced in January; it has taken the best part of five months to shape the board of the new British Aircraft Corporation, formed out of the merger, and to find a chairman. With Vickers and English Electric providing a deputy chairman apiece, as well as the two executive directors responsible for the aircraft and missile sections respectively, the new company needed not so much a strong policy-making chairman as a co-ordinating figure acceptable to all three parent companies. This week it was announced that Lord Portal, late of British Aluminium, had accepted the job.

At the same time it was announced that the new company was acquiring a controlling interest (well over two-thirds) in Hunting Aircraft, as had been foreshadowed at the time of the merger. The Hunting Group, a family business based mainly on oil and shipping, has thus pulled out of the air. Earlier this year, the Hunting Clan airline merged with Airwork, and the Hunting holding in the new airline now being formed is an extremely small one. Now the firm is disposing of most of its aircraft manufacturing interests too and BAC is acquiring a stake in light aircraft production plus a management with experience in this field. (Hunting Aircraft makes the RAF's basic jet trainer and has an interesting small civil jet on the drawing board.) The family is not believed to have asked a particularly high price, but equally it could be argued that it has found—under considerable pressure from Mr Sandys—a neat solution to the company's future; there is a strong likelihood that the British Aircraft Corporation will in fact put Hunting's little jet airliner into production, in which case the family will still have a minority interest in the company manufacturing it.

What happens to Hunting's interest in the de Havilland 121 remains, however, something of a mystery. The aircraft industry's first experiment in mergers was the formation by de Havilland, Fairey and Hunting of Airco Ltd., specially to finance and build the medium range jet airliner for British European Airways. Hunting is responsible for building the outer wing sections. And although Airco is as good as dead, and de Havilland has been bought by the Hawker Siddeley group, the contract still remains in force—or so it seemed when Fairey Aviation tentatively tried to dissociate itself a short while ago.

BUILDING SOCIETIES

Higher Rates

As had been expected, the recommended rates of the Building Societies Association have been raised: from 3¼ to 3½ per cent, net, on shares and from 5½ to 6 per cent on mortgages. Some of the London societies will have to offer and to charge more than this but the majority of the societies will follow the Association's recommendations. Up to the moment of decision some societies continued to urge that while the rate to old borrowers should go up to 6 per cent new borrowers should be charged 6¼ per cent. These arguments were pressed by those that are concerned about the small margin available for appropriation to reserve. The prospective rise in the composite rate of income tax paid by the societies on behalf of investors added weight to their case. With the composite rate at 5s. 1½d. the margin available for reserve under the old recommended rate was 5s. 11d. per cent. If mangement expenses remain unchanged and if the composite rate goes up by 3d.—and there are some who believe that by the time the Inland Revenue has completed its survey in August it will go up by more than this—the reserve margin under the new recommended rate will be only slightly higher at 6s. 6d. per cent. The increase in profits tax has also added to the burden of tax borne by the societies. To encourage a bigger inflow of money it was suggested that the rate paid on deposits should go up from 3 to 3¼ per cent, net; it was, however, finally decided to leave that rate unchanged at 3 per cent, net, as it has been since the middle of 1956.

Tax was a subsidiary reason for putting rates up; the principal one was expressed bluntly by the Association when it said that 3¼ per cent, net, was "no longer sufficiently attractive to encourage new investments or even to retain existing funds." The higher

rate on mortgages will eventually be charged to almost all old borrowers as well as to all new ones, though, as is usual, this will be largely effected by lengthening the period of the mortgage rather than by increasing the monthly payment. It was on the eve of this decision on rates and on the threshold of a new and better law for building societies that Mr John Millican, the general manager of the Cheltenham and Gloucester, came to his two years' office as chairman of the Association. He succeeded Mr Alexander Meikle of the Woolwich, to whom he was deputy in two of the most eventful years in the history of building societies. Both in that period served the movement well. Mr Millican's deputy will be Mr John Dunham, the president of the Co-operative—a man and a society whose views are less rigidly orthodox than those of some others in the movement.

IMF AND BRAZIL

Loans and Politics

THE International Monetary Fund has announced two new credits. Syria, or rather the United Arab Republic (Syrian region), is to make its first drawing on the Fund, of $7½ *million*, to meet difficulties arising from a prolonged drought and a sharp drop in agricultural output. Secondly, and far more contentiously, the Fund is giving further facilities to Brazil. For the past year and more the Brazilian government has declined to implement the monetary reforms that Dr Jacobsson, reasonably, insisted were necessary if Brazil was to qualify for further exchange assistance from the Fund. Unlike other Latin American countries, Brazil has yet to break from the dreary cycle of inflation; its bank deposits and its cost of living continue to increase by several percentage points month by month. Brazil has now given no commitment on anti-inflationary measures beyond expressing the pious hope that the budget deficit may be reduced from 30

The Problem of Wheat

ONE of the differences between the present International Wheat Agreement and its predecessors is that the council is required annually to review national production, stocks, prices and trade, including disposal of surpluses and special transactions, and to inform exporting and importing countries of the effects on international trade in wheat of any of the facts that emerge. The hope—held by members with varying degrees of piety—is that this exercise will in time persuade governments to mend their ways, or at least to stop them from making things worse. As wheat farmers are politically sacred, the council has no power of sanction: members still reserve "complete liberty in the determination and administration of internal agricultural and price policies." The first review was published this week. Its conclusions are hardly novel; home truths never are.

Looking back over the last twenty years, the council sees three major and interrelated developments:

Increasing government intervention, especially in production and trade;

Increasing yields brought by technical and scientific advances; and

Divergent trends in consumption in different parts of the world.

After the war governments introduced policies to encourage wheat production and protect farm incomes, and they have been loth to modify them since. World output has risen from a prewar average of about 140 million tons to about 200 million tons. The artificial profitability of wheat growing has stimulated the application of measures to increase yields, so frustrating such efforts as have been made—notably in the United States—to curtail output by reducing support prices and restricting acreage. The council sees "little sign of any halt to the upward trend in production, let alone any stabilising at lower levels."

In rich countries consumers have been switching from bread to high protein foods; in less developed countries rising incomes and changes in food habits have encouraged consumption of wheat, though not fast enough. But on balance world exports of wheat and flour have been growing, especially in the last five years, when they reached an average of 29½ million tons a year compared with 18¼ million tons before the war. The recent rapid expansion owes much to sales to under-developed countries on concessional terms, mainly by the United States—at the expense, it is often claimed, of other exporters (Australia particularly is upset by the latest sale of 600 million bushels of American wheat to India, a natural market for its own wheat).

Yet despite the expansion of world exports, stocks among the four major exporters have now grown to a massive 53 million tons, sufficient to supply world imports for almost two years, and ". . . the situation giving rise to these surpluses must now be regarded as a deep-seated and persistent problem." The council softly concludes that while

> the harmonisation of national policies with the demands of the international problem of wheat depends on the action of governments, the process of reviewing the international effects of these policies can scarcely fail to be a constructive exercise. It should enable governments, in any re-examination of their policies which they consider desirable, to consider whether the measures involved are sufficiently flexible to allow for the balanced development of the world wheat economy and the gradual solution of the serious problems that beset it.

It ought to indeed, but experience suggests that hopes should not be pitched high.

billion cruzeiros to 6 billion, largely as a result of a decline in the subsidised coffee crop. Yet the new IMF credit, of $47.7 million in US dollars, sterling, marks and French francs, does not appear to represent a surrender by the Fund. The arrangement provides for repayment not later than six months after the transaction is completed; and the official announcement states specifically that the transaction "is of a short-term character and not part of a general stabilisation programme."

Evidently diplomatic considerations have played an important part. The credit appears to be a good will gesture by Dr Jacobsson, either urged by the State Department or with its support, with an eye on the Brazilian elections later this year. Officially the Fund may be accepting the Brazilian explanation that no major economic reform is possible before these elections; unofficially it and the State Department no doubt reckon that this support will help the government candidate. These tactics are not to everyone's approval. The British, German, Dutch and Belgian directors of the Fund abstained in the vote.

HENRY SIMON AND SIMON-CARVES

Terms of the Merger

It is never easy to work out the terms of a merger between two concerns that are fair to both sets of shareholders. The task in the case of Henry Simon (Holdings) and Simon-Carves was not made any easier by the intervening bid by EMI for Henry Simon (which was later withdrawn) nor by the cross-shareholdings between the two companies. Not merely does Henry Simon own 765,926 of the 5s. ordinary shares in Simon-Carves (equivalent to nearly 13 per cent of the equity) and Simon-Carves 257,775 preference shares and 360,506 of the 5s. ordinary shares in Henry Simon (equivalent to 7 per cent of the equity) but the directors, largely through the family links between the two companies, also have big cross-shareholdings. Lazard Brothers, following an investigation by Peat Marwick, Mitchell and Company, has sorted the difficulties out and produced an equitable scheme which eliminates the cross-shareholdings between the companies and returns some cash to shareholders.

Its details are necessarily complicated. Henry Simon will change its name to Simon Engineering and will hold all the issued share capital of both Simon-Carves and Henry Simon. The outside ordinary shareholders in Henry Simon (that is, shareholders other than Simon-Carves) will become shareholders in Simon Engineering. Outside ordinary shareholders in Simon-Carves (other than Henry Simon) will receive ordinary shares in Simon Engineering on a one-for-one basis. On earnings Simon-Carves contributes 52.5 per cent and on net assets 53.4 per cent to the new group; its slightly bigger contribution in assets is recognised in the proposal to give outside ordinary shareholders in Simon-Carves one 6 per cent preference share in Simon Engineering for every 15 Simon-Carves ordinary shares they hold in addition to the ordinary shares they will receive. They and outside ordinary shareholders in Henry Simon will receive a tax free cash distribution of 5s. per share out of the cash surplus to the requirements of the new group. Outside preference shareholders in Henry Simon will receive one new preference share for every four they own, so that they will hold 125 6 per cent preference shares in Simon Engineering for every 100 preference shares they held in Henry Simon. Finally, Simon Engineering will make a 50 per cent scrip issue to outside ordinary shareholders in both concerns.

The Expected Gains

As a result, outside shareholders in Simon-Carves will hold 52.3 per cent and outside shareholders in Henry Simon 47.7 per cent of the equity of Simon Engineering. That is almost exactly in line with the contributions that the two concerns make in earnings to the new group. The directors expect the 1960 income of Simon Engineering at least to equal the aggregate earnings of Simon-Carves and Henry Simon of £2.6 million in 1959 and they hope to pay a dividend of 26¼ on the ordinary shares. As far as outside ordinary shareholders are concerned that is equivalent to 40 per cent on their present holdings in the separate concerns and compares with the dividend of 35 per cent paid by both companies for 1959. Thus the dividend will be more liberal. This puts the shares on a yield basis of 4½ per cent, covered just over twice by earnings.

Beyond the immediate gain in income, shareholders have to look to the long-term advantages that may accrue from the merger of these two sister companies. Simon-Carves has not many manufacturing interests of its own and its strength has lain in its design and supervisory team of engineers. Henry Simon, too, has had experience in planning and supervising large scale engineering contracts, but it has been more closely concerned than Simon-Carves with actual manufacture, especially of mill-

SYNTHETIC RUBBER

Expansion Ahead

Manufacturers of synthetic rubber in the free world are planning to raise their capacity by about one million tons, or more than 40 per cent, to a total of about 3.1 million tons. The Rubber Growers' Association, pardonably curious to know what its competitors are up to, has collected estimates showing that the bulk of this increase is taking place, not in the United States where consumption of synthetic rubber already accounts for over two-thirds of total consumption, but in western Europe and elsewhere. American manufacturers are not expanding capacity for the production of styrene-butadiene rubber, the general purpose article which in the United States has largely replaced natural rubber in passenger car tyres and is claiming a larger share in Europe. The main increase will be in butyl rubber, used for inner tubes, and in the new polydienes—polyisoprene and polybutadiene rubber—which the makers hope will prove suitable for heavy-duty tyres, and thus break natural rubber's hold on this market.

In western Europe the main increase will be in styrene-butadiene rubber, the demand for which far exceeds supply now that natural rubber costs 1s. a lb more than the synthetic product, selling at a fixed price of 1s. 10½d. a lb. More neoprene rubber, a flame- and oil-resistant material used for belting and fuel hose, will be available, and more nitrile (*n*-type) rubbers, used for oil-sealing rings and gaskets. And three European countries—Britain, Germany and Holland—are going to produce polyisoprene and polybutadiene. The whole of the increase in Japanese capacity will be in general purpose rubber, and six other countries—Argentina, Australia, Brazil, India, Israel and Mexico—are to have plants with a total capacity of 180,000 tons of general purpose rubber a year.

SMALL EXPORTERS

With an export turnover of under £2,000, a company making building components launched out into the world markets—their payments guaranteed by ECGD. In five years their export turnover was £468,000.

LARGE EXPORTERS

Within six years of taking ECGD cover, a maker of internal combustion engines raised his annual export turnover from £93,000 to £4,380,000, adding 50 new markets to his original 23.

ECGD credit insurance has helped many of our smaller exporters to grow big. And by underwriting the sort of credit terms new buyers need, ECGD is enabling big exporters to expand in overseas markets *in spite* of stiffening competition. Eighteen established exporters, each with annual turnovers topping the million-pound mark, took out ECGD cover last year for the first time. *Big or small, have a talk with your ECGD man.*

EXPORT AND EXPAND THROUGH E·C·G·D

ECGD is a Government Department set up to help exporters. Its services are fully explained in the booklet "Payment Secured". Write for a free copy.

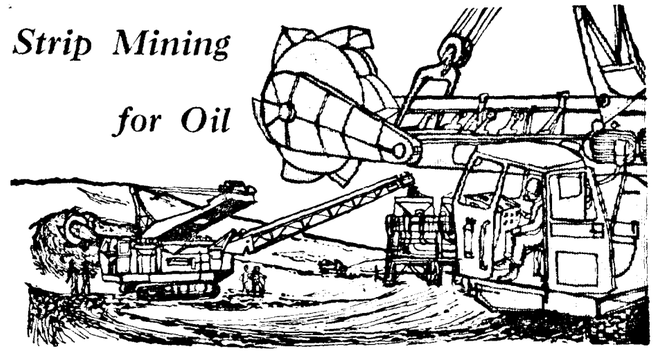
ing and handling equipment. The directors believe that benefits will flow from the pooling of research and technical experience; that the merger will lead to a rationalisation of the two companies' organisations overseas; and that the ability to draw upon the manufacturing facilities and technical knowledge of Henry Simon in such fields as heavy reduction gears and mechanical handling equipment will be of advantage to Simon-Carves and should lead in turn to an expansion of Henry Simon's business. A long established alliance, in fact, has been given a permanent and formal form.

MOTORS



Squeezing Them Out

CAR and commercial vehicle production fell less in April than could have been expected from the effects of the Easter holiday. Production was at a rate of 30,173 cars a week, compared with 32,000 a week in March; but for Easter, it would probably have been at a new record rate of over 33,000 a week. Clearly firms that seemed to be working to capacity have been able to wring more cars from their plants, though Ford for one reports that it was unable to increase its output. Its workers have been maintaining an average of ten hours overtime a week for some time, and until new production facilities become available at Dagenham production has reached its limit. The British Motor Corporation seems to have been able to step up its output, despite a continuation of its chronic labour troubles. Standard-Triumph International increased its daily rate of production in April also. Rootes and Vauxhall report that they were producing cars at much the same daily rate as in March.

Commercial vehicle production was at a rate of 8,605 a week in April, little below the 9,273 reached in March; as with cars, the weekly rate would have been higher but for Easter, and reached a new record level of around 9,700 a week. So the boom in commercial vehicles was reaching a new peak before the hire purchase restrictions were imposed. Exports were nearly 10 per cent higher than in March at 12,921, with larger shipments to most of the important European markets.

Car exports were slightly lower in April than in March; 63,321 were shipped abroad compared with 65,626. Exports to the USA were 18 per cent lower, suggesting that the fall in sales and rise in stocks has begun to affect orders—despite the favourable seasonal factors, sales of British cars in the USA were only 13 per cent higher in March than in February. Exports to Canada were also slightly lower, and those to Sweden fell by 600, or 25 per cent. These are both big markets, and ones in which stocks have been accumulating; exports to them are therefore liable to fall if sales fail to come up to expectations. Increased exports to Australia and

Strip Mining for Oil

THE Athabasca tar sands, in north-eastern Alberta, Canada, contain possibly the world's largest single reserve of oil, but in one of its least accessible forms: at least 300,000 million barrels, in the form of bitumen stickily mixed with sand, are thought to exist there. So far no economically feasible way of developing the field has been found, though many have been suggested including an underground nuclear explosion to free the oil; to the several major oil companies who hold leases there they provide large proven reserves at virtually no exploration cost but apparently prohibitive production cost—in the context of present oil costs and prices. The Great Canadian Oil Sands Company is the latest to venture into the area: it has announced a plan to produce 31,500 barrels of synthetic crude oil a day from the sands by 1963, providing it can gain approval of its project from the Alberta Conservation Board. Great Canadian has completed marketing arrangements to sell 75 per cent of its output to Sun Oil, with the rest going to Canadian companies.

Another group, comprising Imperial Oil, Richfield Oil, Cities Service Athabasca and Royalite Oil, has been operating a pilot extraction and processing plant in the area since last August, producing about 3,000 barrels a day. Royalite was among the first to begin large-scale development of the sands, and through a subsidiary has applied to build a 300-mile pipeline from the field to Edmonton, where oil could be shipped to markets through the Inter-provincial Pipeline system; Great Canadian's scheme, estimated to cost $100 million, would also include a pipeline.

The layers of sand are generally about 150-200 feet thick (though as much as 1,000 feet thick in some places), and lie for the most part beneath deepish overburden. A limited proportion of the sands, however, is accessible to surface mining; and Great Canadian, like the Richfield group, plans to extract the bitumen-sand mixture by strip mining in this area, using tractor-mounted excavators that scoop the sands up with bucket-wheels mounted on 20-foot booms. In addition experiments have been carried out using *in situ* heating methods developed for extracting shale oil; and the nuclear explosion, which is being financed by Richfield, may still be tried. Extracting the material, where the overburden is shallow, is less of a problem, however, than processing it to obtain oil. The Richfield pilot plant separates the bitumen from sand by a water flotation process using a diluent produced from bitumen, and it is reported that Great Canadian plans to use a similar scheme; Royalite has experimented with centrifugal separation. The bitumen would then be hydrogenated to a product described as a blend of naphtha and gas-oil.

EVEN if the companies succeed in setting up and making their plants work on a production scale, it remains to be seen how much Athabasca oil they can sell. There is a good deal of oil without any sand in it in other parts of Alberta, which would seem always to be cheaper to produce; and far cheaper oil than that is abundant elsewhere in the world. One geologist has suggested that it might be more economical to gasify the tar sands with hydrogen, producing natural gas and ethane instead of crude oil. Sales of by-products—Athabasca synthetic crudes would contain a large amount of sulphur—may make the operation more feasible. But Canadian oil—even free flowing—has always found it difficult to compete with imported crudes, especially with supplies as plentiful as they are now. Canadian petroleum supplies, certainly, are exempt from US import restrictions: this preferential position may eventually help, though relatively little Canadian oil is now being exported to the United States.

other Commonwealth markets have offset most of the fall in exports to the USA; the future level of the industry's exports depends on their ability to continue to do so.

STATE PENSIONS

Contracting In and Out

In advance of a conference on the state pension scheme, the British Institute of Management conducted a survey among its member firms on their attitude towards contracting in or out. Just over three-quarters of the 276 companies which filled in the BIM questionnaire had not made up their minds what to do; that proportion did not vary significantly between the differing kinds of schemes they ran. Of the 790 schemes, 510 were provided for salaried staff and 280 for hourly paid employees; 563 were insured and 227 privately funded; and 661 were contributory and 129 non-contributory.

Of those that had already come to a decision, 77 schemes will be contracted out, 70 contracted in and 30 will be split. But while in this comparatively small sample more schemes will be contracted out than in, the survey also made it clear that more employees will be brought into the state scheme than will be left out of it. This was not due simply to the fact that schemes run for the lower paid workers were more likely to be contracted in, but rather to the decision by a number of big companies to participate in the state scheme. Where the companies had not come to any final decision, they indicated that 211 of their schemes were likely to be contracted in, 131 contracted out and 145 split. At the conference itself a wide difference of opinion was revealed. Mr S. R. Plant, who drew up Ind Coope's own pension plan which is the first to be issued with a certificate of non-participation, set down the reasons why Ind Coope decided to stay out. Mr Arthur Seldon, speaking in his capacity of editorial adviser to the Institute of Economic Affairs, urged employers to contract out. Mr E. B. Patrick of ICI said that he was opposed in general to Mr Seldon's views and added that his company had in principle decided to participate in the state scheme.

LONDON OFFICES

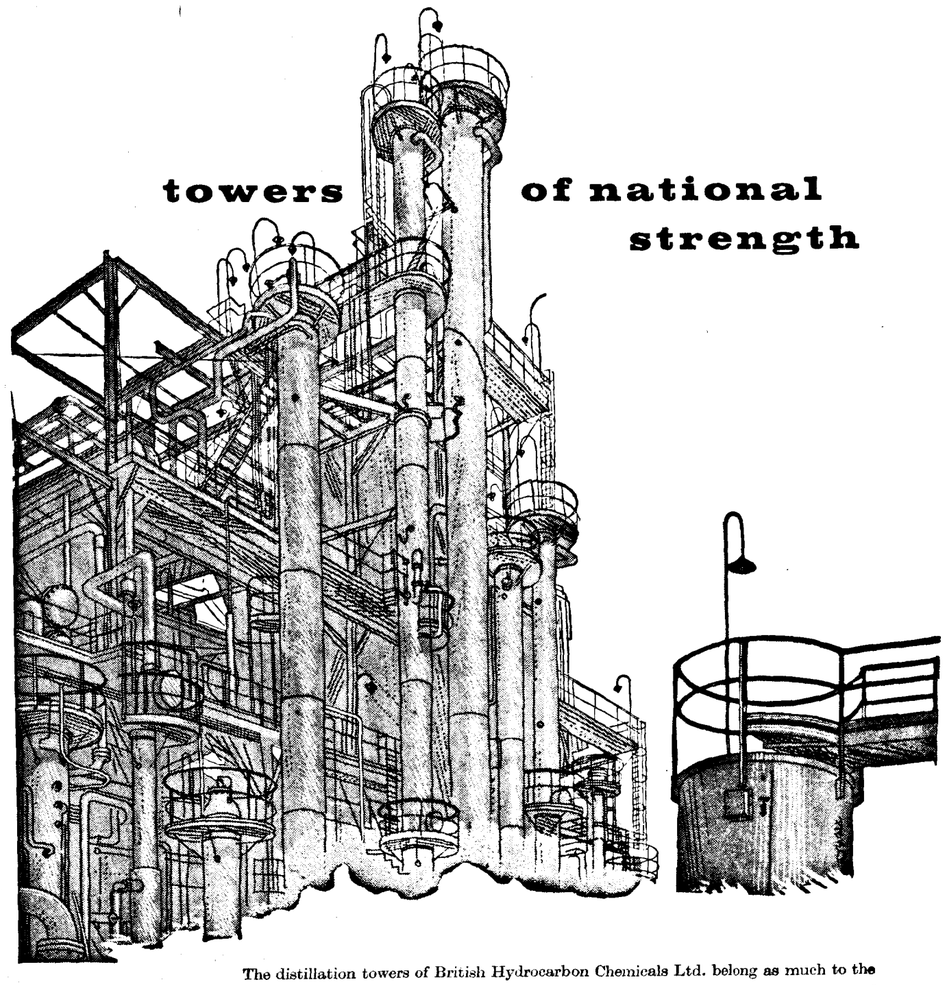
Tenants Grow Choosy

Demand for office space in central London is at present generally firm, but there are signs that tenants are becoming more selective. The level of office rents has not fallen appreciably for new buildings in good locations in the West End or City: in the West End the best accommodation now costs about 30-35s. a square foot, and in the City the range is from 32s. 6d. to 40s., though some buildings have fetched as much as 45s. a square foot and in some cases rents have fallen as low as 20s. New office buildings in the West End are practically non-existent; and most of the new buildings in the City which were without tenants six months ago are now being filled, albeit slowly and at lower rents than those originally asked.

In the third major location for offices in central London—the Holborn area—vacancies are more common. Though there has been a good deal of speculative building in Holborn in recent years, the area, situated roughly between the centres of the West End and City, does not seem yet to have become as desirable as either one in the eyes of prospective tenants. The result has been that rents have fallen to well under 30s. a square foot in some cases, and one new 15-storey building in Holborn, on the market for about 18 months, is still standing empty and is now being offered by floors instead of as a single large unit. Other more marginal areas—such as Marylebone Road and the South Bank—now command even lower rents, but have not been as heavily built up yet and hence have fewer vacancies. Another indication (and consequence) of the discrimination which tenants are now displaying is the large amount of office space available (at correspondingly lower rents) in older buildings, especially in the West End.

Large companies still have considerable, if not unlimited, choice among first-class new buildings. But there are few new buildings available for smaller companies wanting 10,000 square feet of office space or less. With large office blocks—such as the one mentioned above—the common practice is to let the entire building to one tenant, who may then sublet any space which he does not need to smaller companies, usually at a higher rent to cover the maintenance and provision of services which he is responsible for. With few exceptions—Bucklersbury House in the City is one—most postwar buildings have been designed for one tenant only: smaller firms are thus faced with a choice of a more expensive subletting or second-class accommodation in older buildings, at a lower rent but often at a much lower standard of amenity.

SHAVING



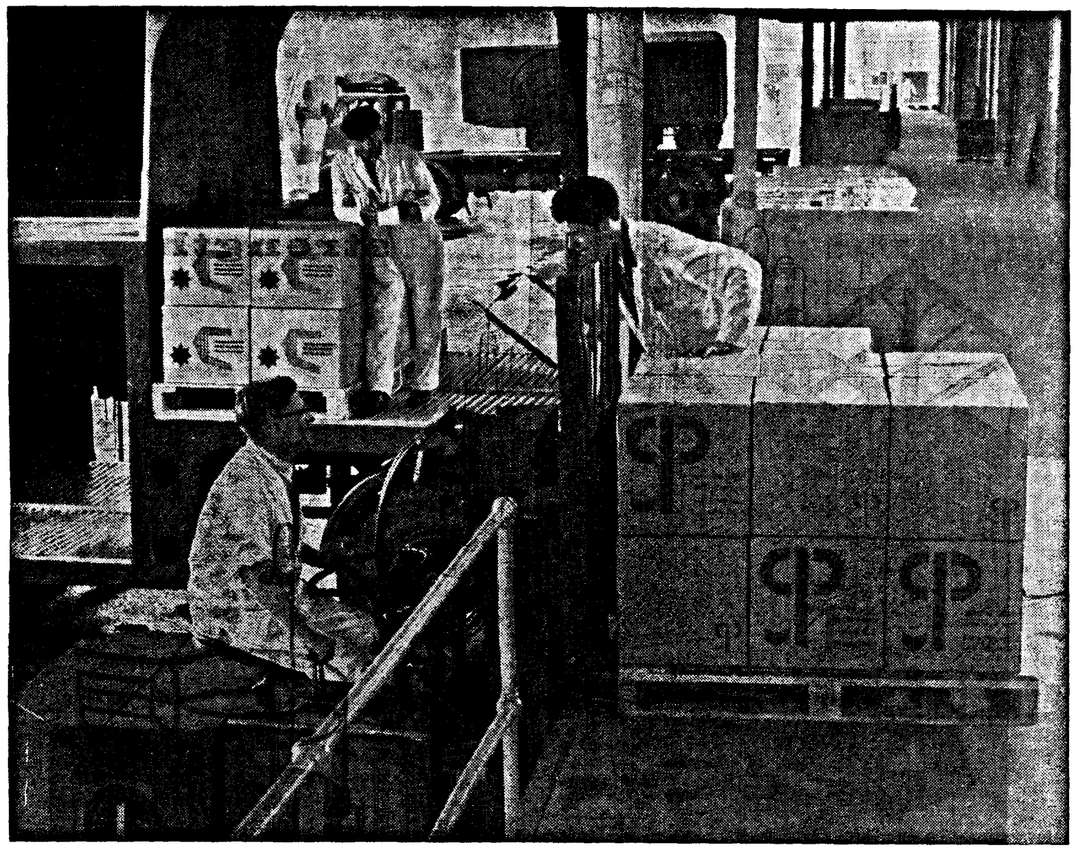
The Fight for the Stubble

Competition over the English beard between dry and wet shaving has received added impetus from Gillette's introduction last week of a new razor blade, after, it says, five years' research; Morphy-Richards introduced a cheap electric razor earlier this year. The appeal of the new Gillette blade is based on superior performance, which the company says comes from a new (and, until the patents are accepted, secret) method of sharpening the edge of the blade, giving quicker and more comfortable shaving. Gillette explains, for those with a clinical approach to their chins, that the new blade is so sharp that it cuts off the hairs without bending them, and so does not pull the nerves. The cost of the new blades, 2s. for five, is nearly 1d. a blade more than Blue Gillette and 2d. more than 7 O'clock, the cheapest blade that Gillette sells here—and one which is produced by the same processes as all the other blades Gillette has marketed up to now. These three types gave Gillette 75 per cent of the razor blade market a few months ago. The appeal of the Morphy-Richards electric razor, on the other hand, goes the opposite way in price; it appears to work as well as most of those already marketed, for less than half the price—£3 10s. Opinion in the industry is divided on its effect; some believe that the existing electric razor makers will lose sales to it, others that it will find its market among the wet shavers and expand the total market for electric razors as the Model T did for cars.

The sales of electric razors have remained static at around 1 million a year for the last four years, after rapid expansion from 1953 to 1956. Remington, at first alone but for small companies, has about 40 per cent of the market; Phillips, which entered the market in 1949, now has a 30 per cent share, and Ronson, which began production in 1954, holds about 16 per cent. Roughly a quarter of the shaving population—which means about 4½ million men—are said now to be dry shavers; the figure had shown signs of stabilising before the Morphy-Richards razor appeared, and Gillette market surveys indeed showed a 1½ per cent fall in its size between March and October last year. A Ronson market survey made this spring suggests, however, that 30 per cent of men have now been converted to dry shaving.

The Cost of a Smooth Chin

One intriguing aspect of the fight between the two types of shaving is that many men try dry shaving and abandon it—but their number and the fate of their shavers is unknown. A Gillette market survey found that 30 per cent of the men interviewed who had had their last shave with a wet razor claimed that they had tried but abandoned an electric razor—though it does not mean they had all bought one. This could mean that as many men as use a dry razor had abandoned one; as only about 2½ million more dry razors have ever been sold in Britain than are believed still to be in use, there must be a heavy turnover in the secondhand machines. One reason for the number of "failed dry shavers" is that more than a third of the machines are given as presents; and a shaver ought to be chosen to suit the beard it has to cut. Improved retailing methods seem as important as price cuts to popularise dry shaving; Herrmans, which runs a specialised advice service for buyers of electric razors in London, now plans to extend this by appointing agents in the provinces.



The distillation towers of British Hydrocarbon Chemicals Ltd. belong as much to the British industrial scene as to Grangemouth. From these symbols of a new age of prosperity there flows a continuous stream of chemical products that are revolutionising our way of life. Distributed to industry as raw materials, they include ethyl and isopropyl alcohols, phenol and acetone, butadiene and polyethylene . . . chemicals that have become essential constituents of such diverse products as drugs and detergents, meths and make-up, textiles and toys, plastics and paints, shoe soles and solvents. In eight years of operations British Hydrocarbon Chemicals Ltd. has taken its place among the major producers of the world and become a tower of strength in British industry today.

THEY'RE OFF!

First produced fifty years ago, but as modern as modern methods can make them, "Fiberite" cases show that only by attention to detail can fibreboard packing become "Fiberite" packing.

Significant places—loading bays. Where your product leaves your care but not your thoughts. For whether the journey is long and arduous, or just to the next town, you want your customers to receive what you make in the very same condition as when you made it.

That's why so many manufacturers and producers see to it that their products are entrusted to the best care available—the reliable care of "Fiberite" packing cases.

For behind every "Fiberite" case lies the same degree of skill and know-how that produced your product. The skill, know-how and vast experience of Thames Board Mills Ltd., so long the pioneers of modern packaging. See *your* products get off to a good start too—in "Fiberite" packing cases.

REGISTERED FIBERITE TRADE MARK PACKING CASES

Are made only by **THAMES BOARD MILLS LTD.,** *Purfleet, Essex & Warrington, Lancs*

The word "Fiberite" is a registered trade mark

TBF 23-0084-60

The relative cost of the two types of shaving is hard to determine: it all depends on the reliability of the electric razor, which can cost £1 or so a year for repairs, plus another £1 or so in depreciation—the average life is 5 years, though they will last longer if their owners choose to keep them. The average British shaver seems to use about 80 blades a year, costing £1 or more—depending on the importance he places on the consistency of the quality of the blades he uses. Add soap or shaving cream, and he may spend as much as a dry shaver, though the economical can obviously spend less.

Makers of both types of apparatus avoid stressing the cost angle. Makers of electric razors tend to stress that their product is a symbol of status and modernity, while the makers of wet razors emphasise the closer shave their product can give—urging men to buy their better but most expensive blades, and more often, so that they can always present an immaculate chin to the world. Big business, especially for the advertising agencies, is involved; sales of razor blades last year were worth £15-20 million, and sales of electric razors over £7 million. With any luck shaving may become cheaper as well as easier.

ANGLO-POLISH TRADE

Bringing Home the Bacon

AFTER taking five months off for second thoughts, Britain and Poland resumed trade talks in London last week and quickly settled details of a new three-year agreement beginning on July 1st. Import quotas will continue to be negotiated annually, and those for the first year provide for an increase in British exports to about £20 million from £16½ million in 1959, while Polish exports are expected to increase from £32½ million to about £35 million. Tossing obscurantism aside at long last, the Board of Trade is now publishing details of quotas in these bilateral trade agreements. The principal quotas for British goods are:

Vehicles and parts, £445,000; construction plant, £450,000; electrical goods (mainly radio and television equipment), £440,000; machine tools, £320,000; agricultural and horticultural machinery, compressors, pumps and printing machinery, £210,000; tools, gauges, other industrial and scientific instruments, £295,000; synthetic fibres, £1 million; rayon yarn, £400,000; cotton yarn, wool piece goods and other textiles, £180,000; clothing and footwear, £45,000; rubber manufactures, £200,000; periodicals and books, £150,000.

For Polish goods the principal quotas are:

Bacon, 48,500 tons; butter, 20,000 tons; canned meat, £3.8 million; onions, £500,000; bilberries, £350,000; vegetables, £100,000; chemicals and pharmaceuticals, £800,000; machine tools, £220,000; wooden furniture, £320,000; and footwear and toys, £100,000 each.

The main increases are in foodstuffs, except bacon and butter, for which the quotas are the same as in 1959. The talks broke down in December over a dispute on bacon; Britain then opened a quota of only 20,000 tons for bacon in the first half of this year, and made no promises about the second half.

TRACTORS

Competition Can Hurt

THE boom that the British tractor industry has been enjoying seems to have passed Massey-Ferguson by. While Ford and other makers are reporting record production, its output has been falling, and a further contraction now planned may cause some short-time working at its Coventry factory. A fall in demand for sets of tractor parts from Massey-Ferguson's Detroit factory and from Yugoslavia—which is partly seasonal—seems to be the chief reason for the company's misfortunes, though poor home sales are also blamed. And, as so often happens if a foreign-controlled company runs into difficulties, the owners have taken over management: Mr Thornbrough, president of Massey-Ferguson International in Toronto, has become acting managing director of the British company. Perhaps as a consequence of a drive to improve sales, especially in Britain, three executives resigned in April: the marketing director, the general sales manager and the home sales manager.

Mr Thornbrough has stated that Massey-Ferguson made 38,500 tractors in the six months to the end of April, more than any other British maker; there is intensive competition with Ford to prove most convincingly which is the larger producer. He gives current output as 340 tractors or equivalent sets of parts a day, of which 274 are complete or completely knocked down tractors (Ford is making up to 360 a day). Next month Massey-Ferguson's total output will be cut to 324 a day, though the production of complete tractors will rise to meet improving demand at home. These figures compare with the peak of 410 tractors a day that was reached in 1959.

Competition has become stronger for Massey-Ferguson since Ford introduced its Dexta tractor in 1958, which brought it into the same power class. Ford reports that home sales have risen this year, which suggests that the Dexta is now becoming established in the farmer's esteem and taking sales away from Massey-Ferguson. The Canadian-controlled group may now feel it necessary to introduce a new model to meet the Fordson competition; though any tractor model normally enjoys a very long production run, its current 35-hp tractor, competing with the Dexta, has been available since 1956.

SHORTER NOTES

Hambros Bank has placed 360,000 5s. shares in Buxted Chicken company, a leading concern in the broiler chicken industry. The placing represents 20 per cent of the equity and at a price of 14s. 3d. the shares yield 4.4 per cent. Founded only in 1955, the company's profits have jumped from £2,775 in 1955-56 to £166,711 in 1958-59. The group is at present selling 200,000 birds a week, or 10 million a year.

★

More new companies were registered in Britain last year than at any time since the Board of Trade began to compile records in 1862. The number of 29,198 companies registered was 30 per cent more than in 1958 and 55 per cent more than the average in the previous five years. At the end of 1959 the total number of companies on the register was 367,959 (against 345,674 at end-1958); of these 351,480 (against 329,314) were private companies and 16,479 (against 16,360) were public companies.

★

A coin-operated, automatic ticket issuing machine, claimed to be capable of replacing up to twenty parking meters of the type now in use in London, is to be produced by the National Time Recorder Company. On inserting a coin, the motorist receives a ticket showing the time of issue or of expiry, which he places inside the windscreen of his car. Since with this system it would not be necessary to mark out maximum size parking spaces, a greater number of cars could be parked in a given kerbside space. The machine is expected to cost about £100-£125, against £25 for conventional parking meters, and will be on the market in about two months.

★

The rights issue by Metal Industries is to be on a one for four basis at 54s. per share and will raise £3.8 million. British Ropes is to raise almost £2 million by its one for eight issue at 9s. 6d. Crittall Manufacturing will raise £745,000 by a three for ten issue at 10s. per share.

COMPANY MEETINGS

LONDON AND MANCHESTER ASSURANCE COMPANY LIMITED

THE YEAR'S BONUS HIGHEST EVER PAID

PREMIUM INCOME INCREASED

LIFE ASSURANCE'S ATTRACTIONS AS FORM OF SAVING

CAPITALISATION AND SCRIP ISSUE APPROVED

LORD GRANTCHESTER ON GOVERNMENT SPENDING

The Ninety-first Annual General Meeting of London and Manchester Assurance Company Limited was held on May 25th in London.

The Right Honourable Lord Grantchester, OBE, MA, FCII, the chairman, who presided, said:

TYPES OF POLICY

I should like to begin my remarks today by a reference to the goods we have for sale.

In the ordinary branch for many years our most popular policy has been our endowment assurance with-profits policy. The rates are good and, looking to the future, bonus prospects have been considered particularly attractive, quite apart from the special distribution provided for in this year's accounts. This year's ordinary branch reversionary bonus at 48s. per cent is the highest ever paid by the company.

We have encouraged the taking out of larger policies to secure maximum cover at minimum cost through our special non-profit rates, which are among the best in the market.

Under the more stable monetary conditions prevailing today we can with confidence stress the merits of whole life policies, which for a given premium provide the greatest insurance protection.

ANNUITIES AND PENSIONS

We have developed a sizeable annuity account in immediate and deferred annuities of the conventional type. For the self-employed our single premium policies, in respect of which considerable tax advantages are allowed by Section 22 of the Finance Act, 1956, are issued at rates which place the London and Manchester among the premier group of offices for this class of business and our scheme for Investment Trust Retirement Annuities, under which the premiums and annuity payments are made in terms of the current prices of Investment-Trust-Units, provides a unique opportunity of participation in benefits which may be expected to accrue to shareholders from general industrial expansion.

We have not sought group pension business, in which a number of offices specialise, though we are always pleased to consider proposals from employers who wish to help their staff to provide for old age by assisting them in the payment of premiums during their service. In the case of smaller firms, at any rate, we believe members of the staff prefer this more personal and individual method of dealing with the problem of old age than under a group scheme. We are not as an office, therefore, specially affected by the Government's new State pension scheme. We regret that the Government should have departed from the principle of a basic minimum flat rate pension and should have introduced a variable element which, with its contracting-in or contracting-out options, is giving a lot of work to all those who arrange or have to administer private pension schemes.

ENDOWMENT SHARE PURCHASE PLAN

Last year we extended our loan service, previously restricted to loans on properties, to those who wish to purchase stocks and shares as an investment, provided the investment is spread over a fairly wide field of industry as it is through cautiously conducted Investment Trusts and Unit Trusts. Repayment of these loans is provided for by means of endowment assurance policies, which are held by the company as collateral security for the loans made. This particular method is offered only by the London and Manchester. It gives an incentive to acquire an investment portfolio to those who hold responsible positions, but who, in these days of high taxation, have been unable to accumulate the necessary capital. It has the advantage also that the investor is covered by the terms of the policy against the risk of leaving a liability in respect of his purchase in the event of his premature death.

NEW BUSINESS

The new sums assured of £7,790,000 in the ordinary branch and £7,280,000 in the industrial branch show increases this year over last year of £1,600,000 and £400,000 respectively. The higher ordinary branch expense ratio, calculated on the conventional basis, is chiefly due to the increase in new business in this department.

SAVING WITH LIFE ASSURANCE

We are in competition with many other forms of saving, but there is no other form of saving which at the same time provides the additional protection which the breadwinner needs to provide for his family or other dependants should an untimely death bring to an end his ability to continue to do so through his earnings. I believe the increase in our premium income which we are happy to be able to report today would be even greater if there were a more general realization of the necessity that we cannot be sure of life, a reminder which I think is forcibly brought home to us with the increasing deaths caused by accidents on our roads.

Although the State now provides a subsistence pension, it is more than ever necessary in a time of increasing prosperity for all to set aside sufficient adequately to supplement the State pension, so that the gap between earnings prior to retirement and pension after retirement is not too great. Those who have made adequate provision can then live as long as may be without undue anxiety.

In these days everyone is tempted through the widely developed system of hire purchase to seek the enjoyment of more possessions and pay for them later. Within limits this system has its conveniences, but in many cases those who think ahead find it more conducive to their peace of mind and happiness to use our method of saving by instalments in advance of making their purchases, particularly for the replacement and the renovation of their homes, rather than to incur debts which, in the event of illness or other unforeseen expenses, can become an embarrassment.

There was a time in the lifetime of many of us when a choice had to be made between enjoying the present and saving for the future. Today it is possible for the majority with their increased earnings both to enjoy and to save. It may be hard to forgo some present enjoyment, but a sense of security cannot be built upon a foundation which is not buttressed by saving.

DISTRIBUTION OF SURPLUS

For many years we have been moving, with your approval, towards a pattern in the annual distribution of surplus as between policyholders and shareholders which, without diminishing the amount available to shareholders, has given an increasingly greater proportion of the surplus to policyholders. While we do not consider too great rigidity in any pattern to be in the interests of the company, however attractive it may appear, we think we may together justifiably take pride in the achievement of our target of a distribution of 90 per cent of the surplus to policyholders in both life branches. Under normal conditions this is the percentage of the annual surplus available for distribution which we should wish to see maintained.

The competitive element in a free society is sometimes decried but I think no one can doubt that the results in the business of insurance of competition has been creditable to the business and profitable to customers.

INVESTMENTS

The relatively attractive yield obtainable recently on loans on rates is the reason for the substantial increase under this item in this year's balance-sheet. Otherwise there is no significant change in the disposition of our assets or in investment policy, which I hope you will feel has yielded most satisfactory results.

The results of the 1959 Election enabled your directors to discard for some time, perhaps for a long time, their preoccupation with the threat of nationalisation.

The menace of further inflation was checked, if not very firmly held. Industrial companies have been adjusting themselves to current asset values and their earnings have been increasing so as to show a reasonable return on current values. It was natural that, following this process of adaptation and consolidation, share prices should rise reflecting the changed values. It was against this background that your directors had to consider what recommendations should be made to you.

Last year I commented upon the substantial difference which then existed between the balance sheet value of our stock exchange securities and their market value and, as you would expect, this difference had increased substantially by December 31, 1959. It has been customary to point out that too much attention should not be given to the year-to-year changes in the market value of investments but rather to the long-term growth and preservation of both income and capital. Our present policyholders reap benefit from the past during which there has been a steady build-up of strength of the company. Just as the present is built upon the past so the present has to make its contribution to the build-up for the future, but there may be times when, having fulfilled every reasonable obligation to the future, considerations of equity not only justify but call for an exceptional distribution. Your directors believe that the present is such a time.

SPECIAL BONUS

I should draw your attention to the note attached to the balance sheet explaining an apparent increase in the sum invested in Ordinary stocks and shares. Had it not been for the transfer from inner reserve to the life funds mentioned in the first sentence of this note, the balance sheet would have shown a reduction, as a result of sales which have been made, in the amount now invested in Ordinary stocks and shares. Out of the inner reserve built up from realised appreciation a sum of £3 million has been transferred to the life funds, divided proportionately to the funds of each branch. The special bonus thus made possible takes the form of a 25 per cent addition to the bonus additions already credited up to December 31, 1958. It is gratifying to us, as we are sure it is to you, that it has been possible so to supplement the benefits accruing to our policyholders.

The cost of the special bonus as calculated by the actuary is £2,353,590.

SCRIP ISSUE

I must refer now to the capitalisation proposed in the resolutions to be submitted for your approval today. A sum of £261,500 is included in the transfers to profit and loss account from the same source as the special bonus just mentioned. This will enable your directors to submit to you, after the proposed increase of capital from £250,000 to £500,000, the resolution to capitalise £246,996 and for the issue of one new share for every share now held. In the event of the resolutions being passed letters of allotment will be posted to shareholders tomorrow.

You will notice that there is credited directly to the profit and loss account this year for the first time the proportion of interest earned on the existing capital of the company plus the balance standing to the credit of profit and loss account. Having allocated this year 90 per cent of the year's surplus to the policyholders we thought it proper to bring this item into the shareholders' account. In future accounts we shall be able to credit the profit and loss account with the interest earned on the increased capital. This will, therefore, be available in future years for dividend in addition to any amount which is transferred from the revenue accounts in respect of surplus. So far as 1960 is concerned, with the concurrence of the Actuary, I can say that, in the absence of unforeseen developments, we anticipate that there will be available for transfer to the profit and loss account out of surplus an amount at least equal to the transfer this year, namely £213,100, which is the total of the sums transferred this year from the revenue accounts after deducting the sum of £261,500 derived from realised appreciation.

GOVERNMENT SPENDING

Whatever the immediate outcome of the meetings and conferences in session, in suspense or in prospect, there is no doubt that we are living in a time of very rapid change. Machines and processes are obsolescent as quickly as they can be brought into use. Rapid adaptation to technical advance as well as to new political alignments is necessary, involving new problems of industrial adjustment. It is to be regretted in such circumstances that there should be increases in Government spending and lending rather than an expansion of private initiative. It is even more regrettable that the continued high level of Government expenditure delays overdue changes in our taxation structure and a revision of general depreciation allowances by which alone initiative can be stimulated and modernisation in our industries kept achieved. It is still necessary to emphasise that any Government which does not treat the prevention of renewed inflation as a cardinal feature of its policy is failing in one of its primary duties. Some of the present methods of finding money for increasing Government expenditure are open to objection as incompatible with this duty.

I cannot but believe that these matters will occupy the very serious attention of the Government in the coming months. If they do, I think we may be reasonably confident that British skill and British initiative will enable this country to retain a fair share of prosperity in a less restricted and developing world, but one in which, if stagnation is to be avoided, competition has to be faced as a necessary ingredient of progress.

The report and accounts were adopted and the board's capitalisation proposals, as mentioned, were approved.

THE FRIARS INVESTMENT TRUST LIMITED

LARGER INCOME AND DIVIDEND

The Thirty-third Annual General Meeting of The Friars Investment Trust Limited was held on 23rd May at 33 Cornhill, London, E.C., Mr J. N. Buchanan, DSO, MC, the chairman, presiding.

The following is his statement which has been circulated with the report and accounts for the year ended 15th February, 1960:

During the year under review Gross Income has risen from £279,732 to £303,119. Dividends received are £27,000 higher than in the previous year but Refunds of Tax under Double Tax Conventions are down by £4,500. After payment of all Expenses, Tax and Interest on Borrowed Money there remains a balance of £152,916 for the Stockholders, against £139,369 a year ago. We have transferred £30,000 of this to General Reserve Fund, which now stands at £105,000. An Interim Dividend of 3 per cent has already been paid and a Final payment of 7 per cent is now recommended, making 10 per cent for the year, against 9 per cent paid for the previous year.

The value of our investments at the date of the Balance Sheet amounted to £7,250,000, against £5,450,000 a year ago, and the appreciation over book cost at that date was 131 per cent. There is included in the Report for the first time a classification of the Investments showing how our investments are spread, which we think will be of interest to Stockholders.

EXTENSION OF BORROWING POWERS

In the Notice calling the Meeting you will see that the Meeting will be asked, as special business, to approve a Special Resolution extending the Directors' borrowing powers under the Articles of Association. At the present time the Directors may (in addition to certain borrowings for temporary purposes) borrow up to the nominal amount of the paid up share capital, excluding any share capital which has been paid up by way of capitalisation of reserves or undistributed profits since 22nd July, 1957. This exclusion of "bonus" shares was imposed at the time of the capitalisation issue of 1,000,000 shares of £1 each made in July, 1957, since the Directors saw no reason to make that issue the occasion for an increase of the Directors' borrowing powers. In the light of the growth in value of the Company's portfolio since then the Directors consider that the time has come for these borrowing powers to be extended and the proposed Resolution will permit borrowings up to the full amount of the paid up share capital for the time being including any bonus shares comprised therein. The present amount of the paid up share capital is £2,000,000. The Board have no immediate intention of exercising these additional borrowing powers but think it is in the interests of the Stockholders that they should be available. A Proxy card is enclosed for use as you may direct.

Since the Company's year ended the Board have applied to the Stock Exchange to have the Stock quoted in units of 5s. each. In addition it has been decided to abolish the charge for registering transfers and other documents. The object of these measures is to broaden the market in the Company's shares and make them available to a wider range of investors.

The report and accounts were adopted, the payment of a final dividend, as recommended, was approved, and the Special Resolution regarding the increase in Directors' borrowing powers approved.

PRESSED STEEL COMPANY LIMITED

EXTENSIVE CAPITAL EXPENDITURE PROGRAMME

STEADILY INCREASING PRODUCTION OF CAR BODIES

PRESTCOLD DIVISION'S RECORD SALES

MR ALEX. ABEL SMITH'S STATEMENT

The Thirty-third Annual General Meeting of the Pressed Steel Company Limited was held on May 25th at Queen's Room, Baltic Exchange Chambers, 14-20 St Mary Axe, London, E.C., Mr Alex. Abel Smith, TD, JP, the chairman, presiding.

Mr J. S. Kean, CA, the secretary, read the notice convening the meeting and the Report of the Auditors was read by Mr T. Howarth of Price, Waterhouse and Co.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1959:

Ladies and Gentlemen,—Before reporting to you on the year's results, I must tell you of the honour done to your Company by His Royal Highness the Duke of Edinburgh who, on February 12th last, spent the greater part of the day visiting our Cowley and Swindon factories. In the course of the visit many members of the Management, Trades Union Officials and a number of Shop Stewards were presented to His Royal Highness, who was enthusiastically received by our employees at both factories.

PROFIT AND APPROPRIATIONS

The accounts show a profit for the year, after charging debenture interest, depreciation and all taxes, of £2,461,506. Taxation, which included a charge of £125,000 for tax equalisation, the reason for which I explained in my statement last year, was higher by £24,800 while the charge for depreciation and obsolescence of buildings, plant, machinery and equipment rose by £296,008, reflecting a further increase in the Company's fixed assets.

From the profit of £2,461,506 there must be deducted the amount of the regular dividends on the two classes of Preference Shares and the interim dividend of 9 per cent paid last November, on the Ordinary Stock, which, together, less income tax, total £283,906. This leaves £2,177,600 to be added to the balance of £2,073,348 carried forward from 1958 and gives a figure of £4,250,948 to be considered.

Your Board recommends a transfer to General Reserve of £1,500,000 and the payment of a final dividend on the Ordinary Stock of 21 per cent less income tax which absorbs £561,220. This leaves £2,189,728 to be carried forward on profit and loss account.

BALANCE SHEET

On the asset side you will note that there has been a substantial increase in fixed assets amounting to £3,949,557 mainly accounted for by new plant, machinery and equipment at all our factories and by capital works in progress at Swindon and at Cowley where the rebuilding and enlarging of the paint and trim shop, which you will recall suffered serious damage from fire, is well under way.

Long term liabilities are lower by £1,211,875, reflecting the conversion last June of this amount of the 5½ per cent Convertible Debenture Stock 1977-82; as a result of this conversion the amount of Ordinary Stock units of 5s. issued rose by £412,037 to £4,363,222.

Revenue Reserves and Amounts set aside for Future Taxation now include a sum of £375,000 for tax equalisation.

Outstanding commitments for capital expenditure at the end of the year amounted to approximately £4 million but as at today's date this figure is substantially higher as a result of further commitments into which the Company has entered in connection with its expansion programme to which I refer below.

MOTOR CAR BODY DIVISION

The year under review was one of steadily increasing production, in particular at our Swindon factory where the benefits of past expenditure on multi-welding and other automation equipment were increasingly evident. During the last full working weeks of December our production of car bodies and body components was at a rate which broke all previous records.

Sheet steel again presented a major problem, and as the volume of our production rose we were forced to place increasingly large orders abroad. The halt in supplies from the United States in the latter months of the year as a result of the steel strike, caused us great concern; we were, however, able to maintain the tempo of our production by a combination of running down stocks and combing the Continent for additional supplies. The domestic steel companies are engaged on another large expansion programme, but until the new capacity comes into production it will be necessary for us to continue to supplement home supplies by purchases from abroad, unfortunately at a considerable premium.

The manufacture of press tools has become an increasingly important part of our business. We are now probably the largest manufacturers of this type of tool in the world, and are supplying a steadily increasing number of customers at home as well as on the Continent. We have recently received inquiries from the USA and are hopeful that we may develop business there.

RAILWAY CARRIAGE AND WAGON DIVISION

Production of railway utility vans and 3-car trains for the Glasgow Electrification Scheme continued, and during the year the first deliveries of 3-car diesel units were made as well as of various miscellaneous types of railway equipment and of mine cars. However, orders placed during the year by our main customer, the British Transport Commission, showed a further decline and, although we obtained our share of such orders as there were, there was not sufficient business to keep our Linwood factory working to capacity.

PRESTCOLD DIVISION

Our sales, both of domestic refrigerators and of commercial equipment, reached a record; our problem in fact was to meet the soaring demand.

A noteworthy event during the year was the award of the Duke of Edinburgh's Prize for Elegant Design to our three cubic foot "Packaway" domestic refrigerator which continues to be a best seller.

THE OUTLOOK

As regards the **Motor Car Body Division** you will have read in the press of the big expansion plans of the motor industry. Our customers have indicated that they will require greatly increased quantities of bodies from us, and as a result another large scale addition to our productive capacity is called for. Information was recently sent to shareholders outlining our plans for expansion. It will of course be three to four years before the full benefits of this expansion are felt.

Noteworthy features of our programme are the introduction of body-making on a large scale to our Linwood factory and the acquisition of a site for the erection of a factory for toolmaking on the Simonside Trading Estate at Jarrow. These developments, which in due course will provide substantial employment in both places, conform with the desire of Her Majesty's Government to see the introduction of more industry to both areas concerned. We are glad to be able to make our contribution in this way.

Reviewing the workings of the first three months of the current year and looking at our order book, I can say that, barring unforeseen developments, this division of our business seems assured of another busy twelve months.

Turning now to our **Railway Carriage & Wagon Division,** from the experience gained in the first three months of the current year, orders for railway equipment appear likely to be once again on a reduced scale. It is satisfactory however to be able to report the encouraging progress we are making with one of our new projects known as the "Roadrailer." Prototypes of this composite vehicle which has two sets of wheels enabling it to run either on the road or on rails, are at present being tested by the British Transport Commission. Other potential customers are also showing interest.

We believe that in the "Roadrailer" we have a new form of transport that could help to ease the traffic problem on our roads.

Turning finally to the **Prestcold Division** we are anticipating another record year but it would be unrealistic to expect an increase in sales of the magnitude that we experienced in 1959. We are planning a steady build-up in production at our new Swansea factory where the first Prestcold came off the line in March. By this time next year this highly automated plant will, we hope, be turning out all our Prestcold products and in due course, the other household appliances on which we are working.

I would like specially to mention the recent formation in conjunction with our bankers, J. Henry Schroder & Co. Ltd., of Prestcold Finance Ltd. As its name implies, the purpose of this company is to finance instalment purchases of our Prestcold products. Its function is complementary to the acquisition of distributors and its activities will, we believe, help to stimulate sales.

The market, particularly for domestic refrigerators, is highly competitive; but the fact remains that less than 18 per cent of the estimated 16 million electrically wired houses in this country are equipped with domestic refrigerators. This gives an indication of the sales potential, and I am confident that our Prestcold models will continue to command a satisfactory share of the market. We continue to do a substantial export business.

In any assessment of the outlook the trend of manufacturing costs is a vital factor; export markets can only be won, held and expanded provided the goods this country is offering are competitive with similar goods produced on the Continent and elsewhere. The recent reduction in the working hours of industry, while from many points of view welcome, will raise production costs at home. It is of the utmost importance that all who play their part in the world of manufacture in this country are aware of the consequences that will result if, due to rising costs, our products become uncompetitive in world markets.

MANAGEMENT TRAINING

In view of the demands that our new expansion programme will make on all levels of management, it is, I think, appropriate to refer to our Management Training Scheme which we have been developing over a number of years. The scheme is now producing a number of first class potential managers which enables us to face the future with confidence.

TRIBUTE TO COMPANY'S EMPLOYEES

The past year was another busy and exacting one for management, staff and employees alike. All contributed their share to the successful results attained and I am sure you would wish me, on your behalf, to express your appreciation and thanks to them all.

The report and accounts were adopted and the payment of a final dividend of 21 per cent, less tax, making a total of 30 per cent for the year, was approved.

Mr R. T. Pemberton, MIMechE, MIChemE, and Colonel F. T. Davies, who retired by rotation, were re-elected. Since the last Annual General Meeting Mr R. N. Davies has been appointed a Local Director; Mr H. R. Barber, AMIMechE, Mr D. A. Field, Mr S. C. E. Lewis, Mr J. L. Lutyens, MA, AMIMechE, and Mr C. F. Tracy, MC, BSc(Eng), have been appointed Divisional Directors.

The other formal business of the meeting having been duly transacted, the proceedings terminated.

THE FERROGRAPH COMPANY LIMITED

(MAGNETIC TAPE RECORDERS, ELECTRONIC COMPONENTS AND SMALL MARINE INSTRUMENTS).

The following are salient features of the Accounts for the year ended 31st December, 1959, and the Report of the Chairman, MR R. W. MERRICK *to the 40th Annual General Meeting on 25th May, 1960.*

THE YEAR AT A GLANCE

	1959	1958
	£	£
Capital Authorised, issued and fully paid	150,000	100,000
Assets *less* current liabilities...	285,430	251,096
Trading Profit	111,552	106,464
Profit available for distribution	57,050	52,189
Dividend for year ended 31st December	27½%	25%

TRADING

The year has once again produced a successful trading result with a small increase in sales and an increase of 5% in net profit. These results represent another landmark in the history of the Company and point to continued unspectacular but steady progress. In the two major fields of operation, viz. Tape Recorders and Marine Echo Sounders, the Company has expanded its sales, increased its influence and enhanced its reputation. In the sphere of Marine activity developments of an interesting nature are planned.

EXPORTS

Overseas Sales were at much the same level as the previous year but the pattern of distribution has changed. Dollar earnings were singularly deficient due mainly to the confusion existing in North America by reason of the projected introduction of new recording systems, causing the purchasers to hold off for many months, whereas the Commonwealth provided a more healthy contribution and the recent return of Australia and New Zealand to sterling purchasing should further extend this trend.

SUBSIDIARY

In August, 1959, the Company purchased the whole of the issued share capital of Rendar Instruments Ltd., a small company manufacturing *inter alia* radio components and precision mechanical assemblies. A considerable part of Rendar's output has been attributable to Ferrograph for a number of years and its acquisition consolidates what has been a valuable attachment over a great number of years.

FUTURE PROSPECTS

The state of the present order books of all within the Group is satisfactory and the prospects are encouraging. With the continuance of fair trading conditions at home, the possibility of expansion overseas, and the ready co-operation of all employees, there is no reason to be other than optimistic for the future.

RENDAR INSTRUMENTS LIMITED.

NORTH BRITISH AND MERCANTILE INSURANCE

UNDERWRITING RESULTS AGAIN SHOW IMPROVEMENT

NEW LIFE BUSINESS EXCEEDED £20 MILLION

MR CYRIL H. KLEINWORT'S STATEMENT

The Annual General Meeting of the North British and Mercantile Insurance Company Limited was held on May 19, 1960, in Edinburgh. In the absence of Mr Cyril H. Kleinwort, due to indisposition, Lieutenant Colonel John Leslie, DSO, MC, DL, presided.

The following statement was issued to the Shareholders by Mr Kleinwort in connection with the Accounts for the year ended December 31, 1959:

Before dealing with the Accounts for last year there are several matters in connection with our General Court of Directors to which I should make reference.

In accordance with the terms of our merger with the "Commercial Union," Mr R. C. Brooks, Sir Mark Turner and Lieutenant Colonel John Leslie, three of the Directors of the "Commercial Union," together with Mr F. E. P. Sandilands, the General Manager, joined the General Court.

Earl Grey, who had been a Director since 1938, resigned in July, 1959, for reasons of health and we wish to record our appreciation of his services to the Company.

We were also sorry to lose during the year the services of another of our colleagues on the General Court as Mr G. E. Beharrell intimated his wish to retire in order to reduce his commitments.

Lieutenant Colonel John Leslie has been appointed a Deputy Chairman of the General Court in succession to Mr H. S. Milligan who retires from our Directorate this year by rotation. He had decided not to stand for re-election as he feels that he cannot undertake a further term of office. We are very sorry to lose him after an association with the Company extending over 46 years and we should like to take this opportunity to place on record our sincere thanks for the long and valuable service he has given to the Company both in an Executive capacity and as a Director.

Turning now to an examination of our affairs, I would mention that we have taken in recent years a fixed rate of exchange of $2.80 to the £ in converting our Canadian figures. In 1959 the rate has been taken at $2.70 to the £ as this approximates more closely to the current rate.

We have also decided this year to increase the Reserve for Unexpired Risks in the Fire Account from 40 per cent to 50 per cent of premium income. The additional 10 per cent required has been taken from the Additional Provision and Reserve in that Account.

It will be seen that the Reserves brought forward in the Accounts have been adjusted, where necessary, to cover these items.

I am pleased to say that our underwriting results again show an improvement and this year we are able to report a profit in each main department. The figures are materially influenced, of course, by conditions in the United States where the experience was once more unfavourable but considerably better than it has been in recent years. The position there, although one must be cautious about the immediate future, is much more encouraging than it has been for some time. Unfortunately fire losses in the United Kingdom reached new heights and the 1959 total of £44 million is the highest of which there is any record. So far there has not been any improvement this year and the toll of loss by fire has continued to rise. Although these heavy losses are covered by insurance and the individual sufferers are protected financially the damage to property and loss of valuable stocks has to be made good and this means diverting efforts which could be used to far better purpose.

In Canada there was a welcome improvement in the experience in both the Fire and Accident departments.

FIRE DEPARTMENT

The total premiums of our Fire business vary only slightly from those for 1958, but the pruning of our income in the United States continued and the reduction recorded there of over £200,000 has been almost offset by increased premiums in the Home and General Foreign fields. Losses, I am pleased to say, are lower by £259,368 and expenses are down by £75,661.

After adjustment of the Unexpired Risks Reserve on the 50 per cent basis in place of the 40 per cent used previously, I am pleased to report a profit of £137,323 on the year's working which compares favourably with the loss of £25,821 last year.

We have brought back from Profit and Loss Account this year a sum of £24,523 to round off the Additional Reserve in the Fire Account to £2,250,000 as the adjustment required in providing a 50 per cent Reserve left an odd figure.

CASUALTY DEPARTMENT

Total Casualty premiums were £12,002,908, representing an increase of £107,566, the corresponding figure for 1958 being £11,895,342. Total claims incurred were lower at £6,871,284 against £7,063,859, the percentage of claims to premiums being 57.2 per cent compared with 59.4 per cent for 1958.

After adjusting the Reserve for Unexpired Risks on the usual basis there is an underwriting profit of £123,129, 1.0 per cent of premiums, compared with an underwriting loss of £683,203, 5.7 per cent of premiums for 1958.

Generally our Home and Overseas business showed modest development and a satisfactory profit with the important exception of the United States of America where we again incurred an underwriting loss.

MARINE DEPARTMENT

The premium was slightly lower than last year, this being brought about by a fall in the hull premium owing to the large number of ships being laid up.

Both the hull and cargo markets remain very competitive, but fortunately there seems to have been a levelling off in the cost of ship repairs which should be of some benefit to us. This easing of repair costs certainly does not apply to North America, however, where they are still increasing and cause some concern to both shipowners and underwriters.

We have transferred the sum of £382,900 from the Marine Fund to Profit and Loss Account.

LIFE DEPARTMENT

I am pleased to be able to report another record year's new business in the Life Department. For the first time in our history the net new sums assured exceeded £20 million. The contribution towards this total represented by individual assurances showed a particularly gratifying increase over 1958.

A growing premium income is an essential feature of a healthily expanding Life Fund and it is encouraging to note that our new Life premiums in 1959 at £447,505 were 13 per cent higher than the corresponding figure for the previous year.

With the close of the year we came to the end of another Quinquennial Valuation period. The rate of bonus—which is the highest declared by the Company in normal time—is 52s. per cent per annum and is repayable in respect of each of the five years 1955-59. I make no apology for stressing that this is a compound bonus calculated on the sum assured and existing bonuses. Over a period of twenty years a compound bonus at the rate which we have just declared would produce the same result as a simple bonus of 63s. per cent per annum. The strength of the Life Fund (as revealed by the investigation carried out by the Actuary) is such that we have felt fully justified in announcing that until further notice interim bonus on current claims will be payable at the same rate as that just declared.

The Actuary's Valuation has been based on the most up-to-date Assurance Mortality tables and we have increased the Additional Reserve from £750,000 to £1 million. Further, the substantial sum of over £500,000 has been carried forward.

There is an increasing tendency amongst our contemporaries towards more frequent valuations and distributions of surplus and we propose to come into line with this trend. The intention is to carry out the next valuation at the end of 1963 and to value triennially after that.

The gross rate of interest earned on our Life Fund—an important factor in the production of surplus—increased to £5 9s. 0d. per cent in 1959. The figure for 1958 was £5 7s. 2d. per cent. The Life expense ratio in 1959 was 12.4 per cent against 12.1 per cent in 1958.

Our Annuity Account, which is largely concerned with Pension Schemes business, continues to grow in importance, and the separate Fund supporting this branch of the Life Department's business now exceeds £32 million.

The Sinking Fund Account is small and calls for no comment. The sum of £25,000 has been transferred to Profit and Loss Account.

INVESTMENTS

There was no really material change in the long term interest rates on fixed interest securities during 1959. Our investments in Equities showed further appreciation with the result that the margin between the market values and book values of our portfolio has materially improved.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The results of our operations for the year are summarised in this Account. Gross Interest, Dividends and Rents amount to £2,183,240, an increase of £187,469 over 1958. Arising from the valuation of the Life branch at December 31, 1959, referred to earlier, credit has been taken for the shareholders' portion of the profit which has been spread over four years instead of five years to bring the transfers into line with the change in date of the next valuation. The results of the operations of the Fire, Accident and Marine Departments for the year produce a total profit of £643,352, a great improvement on the net loss of £350,389 in 1958.

It is proposed that a dividend of 2s. 6d. per share be paid, of which 1s. 3d. has been paid as an interim dividend. The total dividend of 2s. 6d. per share, with the dividend on the Preference Stock, will take £885,062.

After charges for taxation amounting to £884,030 and transfers to the Staff and Widows' Pension Funds which have been maintained at £360,500, there is a final balance on Profit and Loss Account of £13,598,951, compared with the sum of £12,795,975 brought in.

Finally, I wish to express our sincere thanks to all those connected with the Company for their loyal and efficient help in the past year—the officers and staff at Head Offices and home branches, the directors, officers and staff of our Associated Companies, our local directors at home and abroad, the managers and staffs at all our branches overseas and our agents throughout the world.

The report and accounts were adopted.

HARLAND AND WOLFF, LIMITED

FACTORS AFFECTING RESULTS

NEED FOR SUBSTANTIAL INFLOW OF NEW ORDERS

SIR FREDERICK E. REBBECK ON CURRENT BUILDING PROGRAMME

The seventy-fifth Annual General Meeting of Harland and Wolff, Limited was held on May 18th at the Registered Office of the Company, Queen's Island, Belfast. Sir Frederick E. Rebbeck, KBE, DSc, DL, JP, Chairman and Managing Director, presided.

The Secretary read the Notice convening the meeting and the Report of the Auditors.

The Chairman said:

As the Statement of Accounts and Directors' Report have been in your hands for some time, may I presume to take them as read. (Agreed.)

It will be recalled that in my remarks at the Annual General Meeting last year I drew attention to the delay in our building programme, due to labour troubles in 1958, and emphasised that the financial consequences would certainly be reflected in the results for 1959. You will note that the profit on trading now reported has indeed fallen compared with the figure for the previous year. I must add that the continuing depression in shipping during the year has also had its inevitable effect on our shiprepairing activities and the falling off in voyage repairs and maintenance work has been acutely felt.

Work has commenced on the reorganisation and improvement of certain of the larger slipways in the Belfast shipyard. This scheme will increase the capacity of the cranes and will further extend existing welding facilities with a material improvement in capacity and efficiency. It has not been possible to commence this work earlier as our heavy shipbuilding programme has necessitated the uninterrupted use of these particular slipways. In this connection I would draw attention to the increase in our commitments for capital expenditure, which now stand at £796,000.

NEW ACQUISITION

During the year, advantage was taken of an opportunity to acquire, in association with a consortium of British shipbuilders, the whole of the ordinary share capital of Brown Bros. & Co. Ltd., the well-known manufacturers of the Denny-Brown stabilisers and of ship's steering gear, and this now appears as an addition to our Trade Investments.

Out of the surplus available this year for distribution the Directors propose to pay again a dividend of 10 per cent to the Ordinary Stockholders. This leaves an amount of £161,931 of which they propose to allocate £150,000 to Fixed Asset Replacement and carry forward the balance of £11,931 in the accounts of the parent Company.

THE YEAR'S WORKING

As mentioned in the Directors' Report, twelve merchant vessels, a frigate and a number of small craft, totalling in all 163,115 tons gross, were launched from the Company's shipbuilding yards during the year. This substantial output included the 20,000-ton Passenger and Cargo Liner AMAZON for Royal Mail Lines, Limited, which Her Royal Highness The Princess Margaret graciously named and launched in July.

This fine ship, which was completed before the end of the year, has recently been joined in service by her sister ship ARAGON, while the third of the trio, ARLANZA, named and launched last month by Lady Dorothy Macmillan, is at present fitting out and will be delivered later this year. Apart from AMAZON, eleven other merchant vessels comprising oil tankers, cargo and refrigerated cargo liners for British owners and two coastal minesweepers MOSSELBAAI and WALVISBAAI for the South African Navy were delivered.

Our current building programme includes the 45,000-ton Passenger Liner CANBERRA for the Peninsular and Oriental Steam Navigation Company, which was named and launched in March of this year by Dame Pattie Menzies, wife of the Prime Minister of Australia. This remarkable ship, the design and construction of which have aroused world-wide interest, is the largest merchant vessel launched from a British yard since 1938. Other vessels building or on order include large oil tankers, bulk carriers, cargo and refrigerated cargo liners for British and foreign owners.

Naval construction work continues to constitute an important element of our programme. The Frigate TRISHUL was handed over to the Indian Navy early in 1960 while work continues on the Light Fleet Carrier HERCULES, also for the Indian Navy. Contracts for HM Navy include the Frigate BERWICK, at present fitting out, the Frigate WEYMOUTH and the Guided Missile Destroyer KENT, which are in the early stages of construction.

DIVISIONAL ACTIVITIES

The Marine Engineering Division operated throughout the year at a high level of capacity. Apart from the construction and installation of main and auxiliary machinery for merchant and naval vessels building in the Company's shipyards, a number of important main machinery installations were completed for hulls under construction in the yards of other shipbuilders. The output of main propelling units during the year amounted to 221,660 IHP.

Despite some recession in demand, the output of the Industrial Engine and Electrical Divisions has been satisfactorily maintained, and I am pleased to be able to record an increase in our output of H. & W./Cooper-Bessemer gas compressors.

Our Steel Constructional Division continues to make an important contribution to the Company's economy.

As I have already mentioned, the present world conditions have led to a substantial reduction in the volume of work handled by the Company's Repair Establishments at London, Liverpool and Southampton and there is, unfortunately, as yet no appreciable sign of recovery in the shiprepairing industry.

The high rate of launchings and completions which we have maintained for the past three years has naturally reduced our order book. Unless we succeed in obtaining a substantial inflow of new work in the near future our position is bound to be affected.

THE OUTLOOK

Prominent shipowners have emphasised in recent months that trading conditions in general have shown little sign of improvement in the course of the past year and there seems to be little prospect of any material change in the immediate future.

It may well be that some time will elapse before the stage is reached at which current world shipbuilding capacity is matched by demand. Nevertheless, even in times of depression ships are required for specialised service and whilst the current market prices for vessels of this type are far from remunerative, we are making every endeavour to obtain a sufficient volume of work to enable the resources of the Company to be employed to the best possible advantage.

In conclusion, I would like to take the opportunity of thanking all members of our organisation for their loyal co-operation and service throughout the year.

The Report and Accounts were adopted; the proposed dividend was approved; the retiring Directors, namely, Sir Andrew McCance, Mr C. C. Pounder, Dr Denis Rebbeck and Mr W. T. Underwood were re-elected. Messrs Price Waterhouse & Company were re-appointed Auditors and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the Chair.

DUNLOP

RUBBER COMPANY LIMITED

Turnover Reaches £261,000,000

"The year 1959 has been a year of good progress for the Group and it is a matter of considerable satisfaction that we were able to show record figures."

The 61st Annual General Meeting of Dunlop Rubber Company Limited was held on May 23rd at the Piccadilly Hotel, London, W.1. Mr G. E. Beharrell, The Chairman, who presided, said :—

Results for 1959—Increased Sales

The volume of goods sold increased by about 8 per cent compared with 1958, and turnover by 7 per cent—or £18 million—to a total of £261 million. The turnover in the second half of the year was particularly satisfactory. This increased volume, together with new equipment and refinements in method, resulted in a substantial increase in our efficiency and in lower conversion cost.

Certain other factors, however, have operated in the reverse direction. Of these factors—the increase in natural rubber prices, higher wages and keen competition—the most important was the additional cost of natural rubber during the year.

Cost of Rubber.

The Directors' Report refers to the fact that the price of natural rubber increased from 24¼d. to 36¼d. per lb., and although our increased proportion of synthetic rubber makes us less vulnerable to price fluctuations the tonnage involved in our consumption of natural rubber, 61 per cent of our total usage, is still considerable. Our Plantations only supply a small part of the Group's requirements and so there was a substantial increase in our raw material costs in 1959.

Nevertheless, we have been able to anticipate or meet competition and improve our profit margin in relation to turnover. The profit margin (before tax) has been restored to the 1957 level of 5.4 per cent after the dip to 5 per cent in 1958. Although this improvement is gratifying, the rate is still modest; but our business is highly competitive. The ability to operate satisfactorily on low margins depends on the extent of turnover in relation to capital employed.

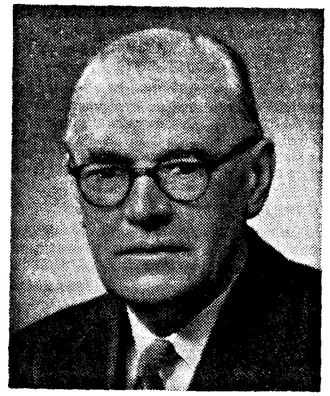
Return on Capital.

In my speech last year I told you that we did not consider our return on capital employed to be high enough and that our efforts were being directed towards producing a better result. Our return this year has increased from 11.4 per cent to 12.5 per cent, which is the best since 1954. This is still lower than we would like to see but the improvement represents real progress.

Growth.

Our activities in the United Kingdom continue to represent about 40 per cent of the Group's business and although our turnover increased in 1959 much of this increase reflected the higher level of activity of the Motor Industry. The profit from our United Kingdom activities was, therefore, only slightly higher than in the previous year.

Having regard to what I have said about the importance of volume to us, we are expanding our production facilities to cater for the new plans of the Motor Industry. Our tyre producing factories in the United Kingdom are located not only in the Midlands but also on Clydeside and Merseyside and so are well sited for the new locations recently announced by vehicle manufacturers. You will have noticed from the Review of Divisions and Subsidiary Companies the several forms of growth in which the Group is engaged—expansion in established markets, the establishment of plantations and factories in new places, the development of new products and our substantial shareholding in the International Synthetic Rubber Company. In this particular regard, I am pleased to say that our investment is now showing a return, that Company having paid its first dividend in 1959. This is a successful venture and we can confidently expect an increasing return on our investment.



Overseas Affairs

The final part of what I have to say today will, with your permission, be devoted to one aspect of our overseas business. With 60 per cent of the Group's assets and 70 per cent of the profit abroad, it is one of your Board's main concerns to formulate policy towards the several developing areas of the world. Inevitably with interests so widespread there must be ups and downs in the trading experience and results of individual companies; but overall the 1959 results from our overseas operations and exports from the United Kingdom have been highly satisfactory. The profit increased considerably both absolutely and as a proportion of the Group profit.

There is no fine division between the work of the Group at home and its work abroad. Indeed, there is a unity of purpose that gives the Company much of its inspiration and strength. But it is salutary to remember how international Dunlop has become over the years with rubber plantations and more than one hundred factories in twenty countries. Our interests are well spread across the five continents but Africa is an area that calls for special thought as we enter the nineteen sixties. How do we weigh the opportunities of growth against the risks of unforeseen change in that potentially rich area?

Africa.

An understandable feature of many of the developing countries in Africa, as elsewhere, is the intense and widespread desire to raise living standards. Equally understandable is the way that these countries look to the richer nations of the world to help them achieve this end. There are indications that in the next few years programmes of global aid will be enlarged and extended. But there will remain a central role for private industry to play, and, as an international company, we have recognised and do

G. E. BEHARRELL, Chairman.

recognise the needs of developing countries, and our opportunities and responsibilities.

One of our more recent ventures is the rubber estate which is being prepared in Nigeria. Over half of the 21,000 acre site has been cleared and almost all the cleared area has already been planted. When it is completed it will be the largest single plantation in Nigeria.

The Nigerian Governments urgently wish to develop plantation industries, for which much of the land in the Eastern and Western Regions of the country is eminently suited. Our project will make a substantial contribution to the Nigerian economy, both as a source of natural rubber and as a revenue earner. It will also be of considerable value to the Group.

Factory in Rhodesia.

The Group's newest factory, in Bulawayo, Southern Rhodesia, was opened in July, 1959, and is designed to serve the Federation. When I visited the factory at the beginning of this year I was impressed, as so many others have been, at the speed with which a fine factory could arise on what, not many months previously, had been bush land.

The Government of the Federation is well aware of the need for industrialisation. One problem which it has in common with other developing countries, and also with many other countries for that matter, is the probability that over the next decade there will be a shortage of capital for investment and that there will be many competing claims for the available resources. Inevitably, it must recognise the compelling need to create a climate in which industry can flourish.

This goes beyond such measures as guaranteeing the safety of the original investment and of freedom to repatriate capital and dividends, although these things are important. In my view it extends to a reasonable expectation that immigrant industries, with all the advantages which they can bring to a country, should be given time and positive encouragement to establish themselves securely. That means being able to generate within themselves the ability steadily to re-equip and expand.

On our results so far, I should explain that the first few months of the year are not as a rule our best period; but I can say that the provisional Group trading figures for the first quarter show an advance on the results for the corresponding period of 1959. Much can happen yet, but 1960 has made an encouraging start.

ALUMINIUM-INDUSTRIE-AKTIENGESELLSCHAFT CHIPPIS

ZURICH, SWITZERLAND

SWISS ALUMINIUM PRICES STABLE

NEW POWER STATIONS IN SWITZERLAND

FRIA ALUMINA PLANT ABOUT TO ENTER SERVICE

The Seventy-first Annual General Meeting of ALUMINIUM - INDUSTRIE - AKTIEN-GESELLSCHAFT CHIPPIS was held in Zurich on April 29th, and the following is a summary of the report presented by the Board:

REVIEW

During the year under review conditions in the aluminium business varied from country to country. In North America in particular the unused production capacity of the large plants exerted pressure on markets for some considerable time. In Europe employment was better and more even. Towards the end of the year, however, satisfactory conditions obtained in almost all countries where aluminium was produced or processed.

World production made further progress and rose from 3.55 million tons to 4.07 million tons. The United States led as it had done for a long time with a total of 1,772,000 tons, followed by the Eastern bloc with an estimated output of 840,000 tons, Europe with 726,000 tons, and Canada with 543,000 tons. French production rose to 173,000 tons. Norway has developed into an important export country for virgin aluminium and in 1959 reached a production of 145,000 tons. Japan registered an output of 100,000 tons.

Wage increases in the United States led to a rise in selling prices from 24.7 to 26 cents per pound of virgin metal after the Canadians had slightly increased their prices a little earlier. Compared with conditions in North America prices in Europe remained stable once again last year. There was merely an adjustment in the United Kingdom to overseas prices, and in January, 1960, a slight rise in Italy. Swiss prices of virgin aluminium have now remained stable for more than three and a half years. The same goes for the prices of semi-finished goods and foils.

Efforts made by overseas producers to sell aluminium in Europe are significant. Practically all the large American producers entered the market recently and offered the metal in all European countries at the prevailing home market prices of the country concerned. Since they also bear freight charges, duty, commission, turnover tax, etc., their profit margin is considerably smaller than the national one. The German market in particular has been the scene of a struggle and has been importing increasing quantities for a number of years. The same process can also be seen in the case of European firms trying to sell their excess production in the United States.

The output of the Company's four plants rose by some 5 per cent, excluding its share in *Mosjöen Aluminium A/S*. Semi-finished products and foils also showed an increase in output, but although all the Company's subsidiaries showed a satisfactory level of employment, in certain countries inadequate prices had to be accepted until the summer. In Switzerland, too, the situation for virgin metal, semi-finished products and foils showed a favourable development during the second half of the year. Sales of Raffinal, SAP—a metal made of sinter aluminium powder—and of Gallium were also satisfactory.

In Canton Wallis the Company is going ahead with its plans for the erection of new power stations, which will produce additional power for the plant to be built at Steg, as well as with the project for the erection of a large new rolling mill, most probably at Siders, which will in part replace existing obsolescent installations.

PARTICIPATIONS

SA des Bauxites de France at Marseilles showed an increase in production and a slight improvement in its general position.

Società Alluminio Veneto pA at Porto Marghera continues to exploit its bauxite deposits in Apulia and the Abruzzi. Its main supplies, however, come from other countries, in particular from Yugoslavia.

Martinswerk GmbH obtains its bauxite supplies from half a dozen different countries.

The Company's three alumina plants once again worked at full stretch. The large new power plant of *Martinswerk GmbH*, Bergheim-Cologne, was completed. *Società Alluminio Veneto pA*, Porto Marghera, increased its output, as did *Martinswerk*. *Société Française pour l'Industrie de l'Aluminium* at Marseilles, after an interval of many years, for the first time once again operated at a profit thanks to the devaluation of the French Franc. Its future profitability will depend on whether production costs can be kept at approximately the present level.

Work on the alumina plant of *FRIA, Cie Internationale pour la Production de l'Alumine* at Kimbo (Guinea) continued according to plan. Machinery and installations are being tested at present and the first export shipments are planned for the month of April. The plant has a capacity of 480,000 tons, 10 per cent of which represents the Company's share.

Over the whole year the power output of *Rhonewerke AG*, Ernen, was not unfavourable. At the Mörel and Ernen plants output totalled 426 m. kWh, an increase of 5 m. kWh compared with the previous year. At the plants of *Illsee-Turtmann AG*, Oberems, output reached 108 m. kWh compared with 106 m. kWh in the previous year. At *Rheinkraftwerk Neuhausen AG* (AIAG participation 80 per cent) output at 39 m. kWh showed a slight drop. *Elektrizitätswerk Rheinau AG* (AIAG participation 41.8 per cent), however, succeeded in raising output from 218 m. kWh to 245 m. kWh, with 102.2 m. kWh representing the Company's share.

Work on the *Kraftwerke Gougra AG* power station (AIAG participation 30 per cent) was completed. Supplies for the Company from the Gougra plant totalled 110 m. kWh during the year.

Water conditions at the Company's Italian power stations were satisfactory most of the year, in contrast with Austria where the situation was less favourable. Power output in the Company's plants, together with its share in other power stations, totalled almost 2,000 m. kWh.

The encouraging output of AIAG smelting plants was due to the satisfactory water position and to good market conditions. For the first time it was possible to maintain output at the Chippis and Porto Marghera plants almost at the normal level during the winter months. Both plants registered a record output. Power consumption for the production of metal was further reduced by the reconstruction of furnaces. The Mosjöen plant, in which the Company has a holding, developed satisfactorily and work on raising its annual capacity to 32,000 tons was completed recently.

The *RV Neher AG*, Kreuzlinger, foil plant reported a considerable increase in output. *Lavorazione Leghe Leggere* at Porto Marghera also registered an improvement in business in terms of both turnover and prices during the second half of 1959. The situation of *Aluminium-Walzwerke Singen GmbH*, Singen, was again encouraging as was that of the *Star Aluminium Company Ltd.* of Wolverhampton. *Laminal Rusconi Fraschini* also increased its production, as did the Jackson Plant of *Aluminum Foils, Inc.*, where there was also an improvement in quality. The Raffinal installation is being enlarged.

The first stage of the expansion of the *Aluminium Belge SA* plant at Liège has been completed. Some of the new rolling mills are already in service and some are still being tested.

In Brazil the extrusion plant of *Aluminio Industria SA*, at Pindamonhangaba, was taken into service on schedule in December.

Allega AG Zurich, which sells semi-finished products from stock, registered record turnover figures.

The *Anglo-Swiss Aluminium Co. Ltd.*, Sheffield, looks after sales of virgin metal in the United Kingdom and increased its sales.

PROFIT

The profit and loss account showed a net profit of Sfrs. 17,499,968 which, together with the balance of Sfrs. 1,812,791.26 brought forward from the previous year, produced a total of Sfrs. 19,312,759.26 available for distribution. It was proposed to allocate this sum as follows:

- to distribute a gross dividend of Sfrs. 120 to each Sfrs. 1,000 share;
- to allocate Sfrs. 1.5 m. to the special reserve fund;
- to allocate Sfrs. 2 m. to depreciation reserves;
- to transfer Sfrs. 1 m. to the provident fund;
- to carry forward the resulting balance of Sfrs. 2,062,761.26.

The report, the accounts, and the proposals put forward by the Board were adopted.

BOARD OF DIRECTORS

(Verwaltungsrat)

Dr Ernst Wetter, Zurich, resigned as Chairman, but remains on the Board; Mr Fritz Schnorf, Meilen, formerly General Manager, has been elected new Chairman.

The members of the Board are: Fritz Schnorf, Meilen, Chairman; Robert Naville, Cham, Deputy Chairman; Dr h.c. Carl J. Abegg, Zurich; Dr Anton Bettschart, Rolle; Dr Robert Bühler, Winterthur; Heinrich Hürlimann, Zurich; Frédéric Maurice, Geneva; Cyrille Pitteloud, Sitten; Dr Rudolf Speich, Basle; Dr Ernst Wetter, Zurich.

CADBURY BROTHERS LIMITED

GROUP SALES EXCEED £85 MILLION

PROGRESS OF OVERSEAS INTERESTS

MR PAUL S. CADBURY ON THE YEAR'S DEVELOPMENTS

The sixty-first annual general meeting of Cadbury Brothers Limited will be held on June 13, 1960, at Bournville, Birmingham.

The following is a statement by the Chairman, Mr Paul S. Cadbury, which has been circulated with the report and accounts.

RETIREMENTS

Since the last annual general meeting Mr Laurence Cadbury who had been Chairman from 1944 to 1959 has retired after forty years as a Managing Director. As a Director of the Holding Company he continues as Chairman of its Finance Committee. Mr Arthur Whittaker who served the firm first as solicitor and for the last eleven years as a Managing Director also retired last year. Mr Charles Cadbury, Mr C. Raeburn and Mr R. N. Wadsworth have been appointed Managing Directors.

RAW COCOA

During the 1958-59 season there was a good crop of cocoa in West Africa; 255,000 tons in Ghana as compared with 207,000 tons in the previous season. The spot price fell from about 300s. per hundredweight earlier in the year to 235s. on December 31st. In accordance with our usual practice we wrote down our stocks to the market price. The firm continues to encourage the growth of cocoa in the tropics. Although the price fluctuates, it is significant that the average world price of cocoa for the last five years has been about 280s. c.i.f. UK. This offers a very good return to the growing countries as compared with other tropical crops. In December I was glad to see the Firm's plantation at Ikiliwindi in the British Cameroons. This large cocoa farm was started four years ago and is developing very satisfactorily. The first cocoa was harvested this year. Our relationships with the various governments in West Africa continue to be excellent. Mr W. R. Feaver, our General Manager, was invited by the Prime Minister of Ghana to serve on the Industrial Development Corporation and at his request a report was made by the head of our Education Department at Bournville on the training for management which is so essential if industry in Ghana is to be developed successfully.

TRADING CONDITIONS

In 1959 the demand for chocolate and sweets in this country dropped from the high 1958 level of 8.3 ounces per head per week, to 7.8 ounces per head per week. On the home market our sales have reflected this fall and in 1959 our revenue from Cadbury proprietary lines was slightly down compared with the all time record in 1958. This was in part due to the exceptionally hot summer which undoubtedly affected the demand for chocolate. To some extent the value we could offer was also affected by the high price of raw cocoa. I am glad to say that we have been able in 1960 to decrease the price of some of our moulded chocolate lines and increase the weight of others.

In the export market sales have increased especially in the dollar markets. Our overseas factories have also had a good year, particularly in Australia, New Zealand and Ireland. The combined turnover of all our overseas manufacture now stands at over £17 million, an increase of over £1 million compared with 1958. We started manufacturing overseas after the 1914-18 war. In the early days most of the Managing Directors and technicians of the companies we formed came from this country. Increasingly over the years the overseas companies are recruiting their own nationals to the Boards and higher Management. Whereas in the past the flow of ideas was from the home factory to the overseas factories this is now a two way traffic. During the year our colleagues in Australia have built a new modern milk condensing factory which is likely to prove a model for our factories in the rest of the world. This is an example of Anglo-Australian co-operation to which the technical experts in both countries have contributed equally. The original research was started in this country ten years ago by our Research Engineers and Chemists at Bournville. Its translation into a production unit owes much to the Engineering Director of our Australian company who visits this country regularly.

Our group sales at home and overseas have risen from £84,200,000 to £85,100,000.

FACTORY SPACE

Further developments have taken place at our factory at Moreton on the Wirral peninsula and by the end of 1959 work had started on a very large building to which we expect to transfer a further section of our assortment production. This section employs a larger amount of labour per ton manufactured than the average. At Bournville itself we are hoping over the next three years to replace some of the seventy- and eighty-year-old buildings which, although structurally sound, fall short of modern standards. Before we could pull anything down we had to build during 1959 a large new block to house some of our offices. This is completed and the plans to pull down the first of the old buildings are now approved. Although we hope to replace much of the original factory with modern buildings, it is not expected that the total numbers employed at Bournville will rise above the present level. The introduction of a shorter working week in the near future, which has now been agreed in principle at the Joint Industrial Council for the industry, must have an effect on the numbers employed and on the availability of factory space. We accept the need for spreading the industrial load to other parts of the country and have during the year transferred some of our chocolate making and moulding to Moreton. The new Block to which I have already referred as under construction, will house an increased proportion of our chocolate assortment manufacture. Though we have been very successful in moving large units of established production to the factory at Moreton we still find it essential to develop new ideas and new lines at Bournville. The development of new processes involves much more than the development of the product. Sometimes years must elapse before all the problems of entirely new production are solved. During this period it is essential that the full team of experts is available at headquarters if serious mistakes are to be avoided. New lines are subject to unpredictable fluctuations in sales and our industry is in any case subject to considerable seasonality. For these reasons we like to develop most of our new ideas at Bournville. We have introduced automation into many of our processes during the past year. At Moreton where there is plenty of space many of the major processes are now automatically controlled and increasingly raw materials are supplied in bulk. It will not be possible to apply some of the latest technical developments at Bournville until the new buildings are erected in two or three years time. We are finding that the provision of wider roadways for road delivery is necessary, and we are giving a great deal of thought to the need for additional space for car parks in the vicinity of our factories.

PERSONAL RELATIONS

No field of industry is so important at the present time as that of personal relations. We have always believed that in this field a great deal depends on good communications. At Bournville and in our other factories this matter has always received close attention. We have good and close relationships with the Trades Unions. The first Works Councils (which are internal organisations comprising both management and workers) were started as long ago as 1918 and their most important feature is the work of the Shop Committees. At Bournville alone there are 104 Shop Committees which meet regularly.

One of the most significant changes in industry since the war has been the increased employment of married women. At Bournville we now have over 3,000 married women on our books, the majority working part time. It has been more difficult to integrate this section of our workers into the community than others. Nevertheless many who started at Bournville in their early teens and then returned after their children were old enough to go to school, have long service with the company. I am very glad to be able to report that for those married women who work full time the facilities of our pension fund are now available on the same terms as for single women.

Another feature of good communications is our house magazine, the Bournville Works Magazine, of which 17,500 copies are published monthly. While this reports those things that are of interest and importance to our employees, such as social and sporting events, it is increasingly a medium for letting those who work in one department of the factory know about other departments and about matters of general interest and importance to our industry. Directors regularly make statements to the Works Councils and members of Shop Committees, which are fully reported. Not only has the Magazine a large circulation, but it also has a very wide readership. The latest development in this field is a new magazine at Moreton. This consists of a few articles of general interest which are reproduced from the Bournville Works Magazine, and a section dealing with news of the internal affairs of the Moreton factory.

During 1959 the National Insurance Act was passed providing for the payment by the Government of improved retiring pensions. The Trustees of our Men's and Women's Pension Funds are giving careful thought to the implications of the new legislation.

RESULTS

The writing down of the value of our stocks of cocoa has resulted in a substantial fall in the group net profits for 1959 to 2.4 millions. I have every confidence that we shall be able to recover a large part of this writing down in 1960.

It may be thought from the accounts that the ordinary shareholders in the British Cocoa and Chocolate Company Limited received a very substantial increase in dividends. This, in fact, was not so. In order that the Company's Profit Tax Liability should not be unnecessarily increased the Directors did not recommend payment of ordinary dividends in March and April, 1959, out of the profits of 1958, which is our usual practice, but out of the profits of 1959. If these interim dividends paid in March and April, 1959, were excluded from the dividends for 1959 and added to those of 1958, the total dividend paid and proposed for 1959 is only a little more than that for the previous year.

There is little doubt that our industry is meeting stiff competition. The shortages of materials caused by the war and its aftermath have been removed. Although there is more spending money available than ever before this is heavily committed on hire purchase. Competition is, however, good for all of us and I have every confidence that we shall be able successfully to meet the problems of the sixties as we met those of the twenties and thirties.

TOZER KEMSLEY & MILLBOURN (HOLDINGS) LIMITED

The twelfth annual general meeting of Tozer Kemsley & Millbourn (Holdings) Ltd., will be held on June 15th in London.

The following is an extract from the circulated statement of the chairman, Mr Joseph R. Millbourn:

The Trading profit of the Group, at £436,034, is £226,302 less than last year. Net profit, after taxation, at £274,658, is only £72,521 less than last year. The reason for the relatively smaller reduction in Net Profit is that the charges for Overseas and United Kingdom Taxation are reduced by reliefs claimable this year in respect of certain provisions set up in previous years for doubtful debts which can now be established for taxation purposes.

The falling off of turnover in the first quarter of the year, to which I referred last year, continued throughout most of the year. This reduction in business was common to most of our principal markets. Conditions generally were highly competitive, resulting in narrower margins of profit for our customers and ourselves. In these circumstances, it is almost inevitable that our experience of the collection of payments due to us should deteriorate.

The current year has started well; our turnover for the first quarter of the year is well ahead of the same quarter last year and this is spread over most of the countries we serve.

BICC

Mr W. H. McFadzean on conditions in Cable Industry, strength of Group and expanding opportunities

In reviewing the world-wide activities of the British Insulated Callender's Cables Group for the year to 31st December, 1959, the Chairman, Mr W. H. McFadzean, stated:

★

Group sales totalled £128,000,000 as compared with £110,000,000 for 1958 reflecting not only the addition of new subsidiaries but a higher level of activity. Of this total £38,000,000 or some 30% represented exports from the United Kingdom and sales of Overseas Companies—a contribution to the vital overseas income of the country which we are constantly striving to increase.

★

We in BICC, as the largest Group—by a considerable margin—of cable manufacturers in this country, and indeed we believe in the World, have given a lead to the industry by raising prices to some extent, although these have by no means brought us back to overall economic levels. The achievement of the latter must remain one of our objectives and there are encouraging signs that other Companies are thinking on similar lines to ourselves.

★

The overall results for 1959 emphasise the underlying strength of the BICC Group which stems from the broad base of our activities and the wide geographical disposition. In the Group itself we operate thirty-two factories at home and eleven overseas, supported by a network of selling organisations and construction establishments throughout the World.

★

The installation of the new automatic Copper Rod Rolling Mill, to which I referred in my Statement last year, was completed as planned. We deeply appreciate the honour paid to us by the President of the Board of Trade, the Rt. Hon. Reginald Maudling, M.P., in performing the official opening ceremony. All indications are that this Mill, the most up to date of its kind in the World with a normal production of 100,000 tons of rod per annum, will fulfill our high anticipations.

★

In assessing the outlook for the BICC Group account must be taken of the international scene in view of our numerous interests overseas. Although as always there are plenty of problems around, all indications point to there being a further expansion in word trade in 1960 and the challenge to all of us in Britain is surely that we should obtain a greater proportion of it. We shall only succeed, in my opinion, if we still further broaden and intensify our selling effort overseas and if we are successful in controlling inflation and thereby in keeping our costs and prices competitive.

★

I believe there will be plenty of business available during 1960 and we in BICC shall certainly endeavour to take our full share. Our main problem will be the price at which our goods are sold, particularly in that disturbed part of our business, low-voltage mains and wiring and general cables. To my mind, however, the most important single factor here is whether the self-discipline which several companies have imposed will be sustained. If it is, then 1960 whilst not producing satisfactory results in this range of our products may prove to be a very important year in that it may witness stability being reintroduced into the cablemaking industry on which a more economic future can be built.

★

As regards our other wide and important activities, I feel we can look forward to a satisfactory year. Competition will be keen but with the broad base of our products and their geographical spread we can meet any reasonable competition.

1960 is likely to be a difficult year, but I am quietly confident that we shall meet the challenge successfully and I see the future as one of expanding opportunities and prospects.

RECKITT & COLMAN HOLDINGS LIMITED

CONTINUED EXPANSION OF WORLD-WIDE SALES

IMPROVED TRADING PROFIT

MR J. B. UPTON'S STATEMENT

The seventh Annual General Meeting of Reckitt & Colman Holdings Limited will be held in the Connaught Rooms, 15, Great Queen Street, London, W.C.2, on Friday, June 17, 1960, at 11.30 a.m.

The following is an extract from the Chairman's Statement in respect of the year 1959:

SALES

Group sales throughout the world, excluding inter-company sales, rose in 1959 by approximately 6 per cent—a rate of progress very similar to that recorded in the previous year. In both cases, new businesses acquired during the year contributed a modest quota to the improvement.

Trading profit rose by 16 per cent from £8,589,000 to £9,992,000 and much of this improvement is attributable to our operations overseas where, on this occasion, after allowing for last year's provision of £160,000, exchange losses amounted to only £32,000 as against £426,000 in the previous year; it has not been thought necessary to make a provision this year. South America is the principal area in which these losses regularly seem to arise. The amount allocated to the employees' profit-sharing scheme rises from £430,000 to £500,000.

The consolidated profit for the year, after taxation, is £5,371,000 (£4,481,000 in 1958), and out of this sum £517,000 (£511,000 in 1958) has been transferred to the reserve for replacement of fixed assets.

DIVIDEND

When sanction was given a year ago at an Extraordinary General Meeting for a scrip issue of two new shares for every three then held, the Directors forecast that they would be able, in respect of 1959, to recommend ordinary dividends totalling not less than 9 per cent on the increased capital. As the year progressed, it became apparent that our results would justify a higher figure and the 9 per cent was raised to a promise of 10 per cent when the interim dividend was announced in November, 1959. The accounts for 1959 and your Directors' belief in the prospects for 1960 are such that they can recommend a final dividend of 7 per cent, making 12 per cent in total in respect of 1959, while still retaining a sufficient margin of safety to take care of such uncertainties as may lie ahead. So far our 1960 returns are in accord with your Directors' expectations.

The increase in the rate of Profits Tax (from 10 per cent to 12½ per cent) is a proposal in the current Finance Bill which directly affects your Company. In a full year, at our 1959 rate of earning, it would increase our liability to taxation by about £125,000, after allowing for such double taxation relief as may be obtainable. It is regrettable that the "touch of the brake" which Her Majesty's Chancellor of the Exchequer has found it necessary to apply should divert to the Treasury money which would otherwise be reinvested in our business.

TRADE

As I have said the Group's sales in 1959 were satisfactorily greater than they were in 1958 which was itself a record year. Very few price adjustments were made in this period of comparative economic stability and progress abroad was fractionally better than it was at home.

Some of the sales growth, at home and abroad, is due to businesses acquired during 1959 or the latter part of 1958, but the largest part results from the development of our existing lines, old and new.

Reckitt & Sons Limited had a good year; household goods, toiletries and pharmaceuticals all contributing to the increase in total sales. Windolene, which I mentioned as a growing household line last year, again did very well, as did Steradent and Nulon amongst the toiletries, whilst Dettol enjoyed record sales to the general public.

Reckitt's Chemical Subsidiaries again faced intense foreign competition for their specialties in export markets but in general held their own well; while Reckitt's (Colours) Ltd. recorded a satisfactory increase in sales and profits.

The share capital of D. R. Collins Ltd. has also been acquired recently. This leading perfumery group, whose best known mark is "Goya," has its headquarters and factories at Amersham in Buckinghamshire. Its business will continue to be conducted from there by the excellent existing organisation.

The control of Vitax Ltd. has also passed into Reckitt hands. Vitax is the agricultural and horticultural fertilizer firm with an exceedingly good reputation which has been giving technical advice and service to Reckitt's in the latter's experimental entry into the gardening products field.

J. & J. Colman Limited also recorded an increase in sales and profits. The exceptionally fine summer in 1959 encouraged the consumption of soft drinks and the Robinson brand benefited thereby. Competition in this field is growing in its intensity but Colman's are well equipped to hold their own, though a cold summer could mean that the consumption of even Robinson's Lemon Barley Water might decline for the time being.

Colman's subsidiaries also had a more profitable year though, as I suggested in my last statement might be the case, the total sales of Joseph Farrow & Co. Ltd. did not reach so high a level as they did in 1958.

Chiswick Products Limited.—The sales and the profits of the Chiswick group in 1959 were an improvement on those in 1958 but, in face of rising costs, it was not possible to keep all consumer prices as low as had been customary. A small price increase for some lines thus became necessary towards the end of 1959, but this scarcely affected the results for that year.

The Floor and Furniture Polish market is also highly competitive with increasing interest in those products formulated with the addition of silicones. Mansion and Min are of the highest quality and made good progress.

The integration of the Meltonian and Wren businesses, to which I referred last year, has proved highly successful. Meltonian-Wren Ltd. with Properts Ltd. handle most of the specialties for the shoe trade and both had a good year.

The share capital of Floor Treatments Ltd. of High Wycombe, Bucks, has been acquired since the end of 1959. The business of this company is the supplying of semi-permanent finishes for wood and other hard floor surfaces and the maintenance of those finishes, and it is thus directly complementary to some of the normal Chiswick trade. The rights outside the USA in Ovenstick, a safe and handy cleaner for the insides of domestic cookers, has also been acquired, as has the share capital of Kay Brothers Ltd. of Stockport, one of whose products is an excellent firelighter called Zip.

Sissons Brothers & Co. Limited.—Competition in the paint industry continued to be keen during 1959 but Sissons' total sales were well maintained; their export trade showed a satisfactory increase and profits improved.

During 1959 Sissons acquired the whole of the equity capital of Porter Paints Ltd. with factories in London and South Wales. Porter caters almost exclusively for the industrial paint market and will add to our technical and commercial ability to handle this class of trade, at home and abroad, while Porterfleck—a new multi-colour paint—should also interest the decorating trade.

The R.T. French Co. in USA again beat its previous sales record, in face of very severe competition to one of its major developing lines —French's Instant Potato. Very heavy advertising is needed in the market and the overall increase in profit was slight. A line of pickles has been added to the R.T. French range by the purchase of L. C. Forman & Sons Inc. of Pittsford, NY.

Reckitt, Colman, Chiswick (Overseas) Limited is responsible for the Group's trade outside the UK and the USA. The increase in overseas sales was somewhat greater in 1959 than it was in 1958, which was itself a year of good progress. Natural population increases, higher purchasing power and the introduction of new lines have in many countries started to strain our production facilities which are being increased in consequence.

The statement reviewed the progress made by the overseas companies and concluded with a tribute to the Staff and Employees.

Dresdner Bank's Successful Year

Total Assets DM 7,600,000,000 – Reserves Exceed Authorised Capital – High Earnings

During 1959 the Dresdner Bank was able to extend its business connexions at home and abroad still further. The number of customers rose to nearly 800,000. It co-operates with 3,000 correspondent banks throughout the world in the field of foreign trade financing and in money market and securities operations.

The Bank's total assets increased in 1959 by 16% to DM 7,600,000,000. Deposits rose by 19% to a total of DM 6,700,000,000. The total volume of credit, made up predominantly of short-term advances and bills, including guarantees, passed the DM 5,000,000,000 mark for the first time; this increase was, however, lower than the rise in deposits. At the same time, the Bank increased its liquid reserves considerably. It deposited substantial sums from its liquid resources with foreign banks, and invested in foreign Treasury Bills and Treasury Bonds, its holdings of these increasing by nearly DM 400,000,000 to DM 520,000,000.

Since the currencies of all important industrial countries became freely convertible, the Dresdner Bank has been able to intensify its stock exchange dealings on security markets abroad. It has played a leading part in the listing of shares of important foreign companies on German stock exchanges and also participated in the issue of World Bank Loans.

Foreign securities have recently been added in increased measure to the portfolios of the Funds of the German Investment Trust (DIT), which was founded by the Dresdner Bank in 1956. With the launching in January of this year of the TRANSATLANTA Fund, which includes leading shares from eight European and overseas countries, the German Investment Trust now manages four investment funds, of which more than 8,000,000 certificates valued at DM 800,000,000 are in circulation at present. The expansion of business in practically all fields has prompted the bank once more to increase its capital. Of the 1959 earnings, DM 40,000,000 have been added to published reserves; unpublished reserves have also been strengthened. The Annual General Meeting held in Frankfurt am Main on the 29th April decided, apart from declaring a dividend of 16% (compared with 14% for the previous year), to increase the capital by DM 40,000,000. When this capital increase has been effected, the Dresdner Bank will have a share capital of DM 220,000,000 and published reserves of at least the same amount.

In order to meet its customers' requirements, the Dresdner Bank, which maintains regional head offices in Düsseldorf, Frankfurt am Main and Hamburg, has further enlarged its network of offices in the German Federal Republic. Forty-five new branches were opened between January, 1959 and April, 1960. Altogether, the Bank has at the present time over 290 branches and offices in 180 cities and towns. It is represented in West Berlin by its subsidiary, the Bank für Handel und Industrie AG, with a further 35 branch offices. The Dresdner Bank maintains representative offices abroad in Istanbul, Cairo, Madrid and Paris. In collaboration with the Deutsch-Südamerikanische Bank AG, its affiliate, joint agencies are maintained in important centres in Central and South America.

Main Items of the 1959 Balance Sheet as compared with 1958 (Millions of DM)

ASSETS	1959	1958
Cash and due from Central Bank	848.94	799.07
Due from Banks and Cheques	465.77	221.37
Bills, Treasury Bills and Medium-Term Notes	2,536.57	2,037.47

Düsseldorf • Frankfurt am Main • Hamburg

FRANCIS SHAW & CO. LTD.

The fifty-first annual general meeting of Francis Shaw & Company Limited was held on May 24th in Manchester. The following are extracts from the statement of the Chairman, Dr J. G. Mackay, as circulated with the Report and Accounts for the year ended December 31, 1959:

The increase in the group trading profit from £370,004 to £539,588 arises solely from an increase of over 47 per cent in sales, which reached a new record. The planned level of increased production mentioned in last year's Report was maintained throughout the year and is continuing. The value of new orders booked during 1959 has exceeded the value of machines shipped but competition both at home and overseas is keener and margins are narrowing.

It is recommended that the Company should raise additional £450,000 of new money to finance:

1—Additional expenditure on the provision of further manufacturing space and Plant and Machinery at the Works of the Parent Company.

2—Expansion of the manufacturing facilities of our Canadian subsidiary.

3—The subscription for controlling interests in the new selling subsidiaries in Australia, in the Netherlands and in Italy.

4—The purchase consideration for Joseph Robinson and Company (Holdings) Limited, and expenditure on Plant and Machinery for the Works of this subsidiary.

5—Additional Working Capital.

The method proposed is that Ordinary Shareholders on the Register at the close of business on May 9, 1960, shall be offered as Rights 300,000 new Ordinary Shares of 4s. each and £300,000 6½ per cent Convertible Unsecured Loan Stock 1975-80 in the proportion of One Unit comprising one Ordinary Share and £1 Loan Stock in respect of every 10 Ordinary Shares held on that date, the price to be 30s. per combined unit payable in full on acceptance.

VALUABLE EXPORT ORDERS

In spite of keener competition, we have improved our position in many overseas markets. We have largely completed delivery of our share of the contract secured by Rustyfa Limited in 1957-58 for all the plant and machinery for a large tyre factory now being erected at Dnepropetrovsk, USSR. Early in 1959 we booked valuable orders from Poland, Bulgaria and Yugoslavia, against which we are now delivering. In June, 1959, Rustyfa Limited signed a contract worth £7,500,000 with Masinimport, a department of the Rumanian Ministry of Foreign Trade, to supply the complete equipment for a tyre factory to be erected near Bucharest. We, in consequence, have secured large orders for rubber machinery to be delivered in 1960-61.

Our successes have not been limited to Eastern Europe. During the year we won substantial orders for delivery to Morocco, Iran, Israel, Canada, Argentina, Western Germany, Holland and Spain, and in our current order book 26 different countries are represented.

The expansion plans recently announced by the British Motor Industry have produced a welcome revival in the Home market. Substantial orders for tyre and other rubber machinery have been placed with us in the past five months.

The report and accounts were adopted.

LONDON BRICK COMPANY LIMITED

RECORD LEVEL OF PRODUCTION AND DELIVERIES

OUTPUT FACILITIES AGAIN EXPANDED

POLICY OF PRICE STABILISATION THREATENED BY RISING COSTS

MR A. T. WORBOYS ON THE YEAR'S ACHIEVEMENTS

The sixtieth annual general meeting of London Brick Company Limited was held on May 24th in London.

Mr A. T. Worboys, CBE (the chairman) presided and, in the course of his speech, said:

The Profit on Trading and Sundry Income for the year amounted to £2,855,468 and compares with £2,589,311 for 1958. After deducting depreciation, £475,000, and the Directors' remuneration, the net profit for the year amounts to £2,315,598 compared with £2,130,575 for the previous year. Taxation amounts to £1,150,533 and the net profit after taxation is £1,165,065, an increase of £204,328. After adding the unappropriated balance on Profit and Loss Account brought forward at the beginning of the year amounting to £384,639 and the taxation adjustment in respect of the previous year amounting to £100,533, the balance available amounts to £1,650,237.

Pursuing our usual conservative policy, we have transferred to General Reserve the sum of £600,000 out of the available balance and after deducting the net dividends on the 8 per cent Cumulative Preference Stock and the net interim dividends of 20 per cent on the Ordinary Stock, there remains a balance carried forward of £393,637. The Directors do not recommend any further dividend for 1959.

In the Directors' opinion it is necessary and desirable to bring the Issued Capital of the Company more into line with the book value of the assets of the business. At an Extraordinary General Meeting proposals will be submitted to capitalise £1,300,000 from General Reserve and to make a bonus issue to Ordinary Stockholders, thereby raising the Issued Capital of the Company to £6,900,000 comprising £400,000 8 per cent Cumulative Preference Stock and £6,500,000 Ordinary Stock.

Dealing now with our two Subsidiary Companies, Stewartby Housing Association Limited continues in full operation.

As regards Transformers (Watford) Limited, our manufacturing Subsidiary, the factory output during the year reached a record level but, despite lower profit margins which have persisted in the heavy electrical plant manufacturing industry for the past few years, the trading profit shows an upward trend which, under prevailing conditions, can be regarded as satisfactory.

The value of orders on hand at the close of the year was not unsatisfactory, despite severe competition both in the home and export markets.

THE PARENT COMPANY

Production and deliveries were the highest achieved. In the early months of the year it became apparent that the demand for our products would be very heavy and would tax our resources to the utmost. Our attention therefore had to be directed to the quickest means and methods by which increased output could be attained and all our energies have been devoted to this end.

You will remember that at our Calvert Works a new kiln was in course of construction and work had been started on the extension at our Bletchley establishment. The kiln was completed and brought into operation in the late summer and the work at Bletchley was completed by November. Despite the additional production obtained from these and other general improvements, however, it was decided that further extensions were necessary. The decision to build another kiln at Calvert was taken and, following planning, we were able to start the work in the early autumn. This kiln is now nearly completed and by July of this year will yield a useful contribution to the Company's output.

Naturally, as these improvements and extensions are completed, it is not surprising to find that each week brings a new all time Company record in some section, but perhaps the highlight of the year was Tuesday, November 3rd, when the day's make exceeded the 10 million mark. Efficient as our plant is, it is still possible, through careful study, to find ways in which a few more million bricks or a few more thousand tons of hollow clay blocks can be made available and, in the aggregate, these additions become really significant.

With production at our present level, the securing of adequate supplies of raw materials is vital. Constant attention is devoted to this matter and much careful planning is necessary.

Careful survey must be made of the requirements for the various types of bricks and, in particular, we always have well in mind the necessity of producing additional quantities of our now well known and established range of facing bricks.

Full and complete mechanisation of all stages of our brickmaking processes continues to be our objective. Modern scientific tools and electronics have been enlisted in our studies of automatic handling of our products during production and give hope that the day may not be far distant when the ideal of complete mechanisation will be realised.

Although much of our research during the past year has been concerned with specific works problems, longer term investigations and some of a more fundamental nature have not been allowed to lapse.

Our customers' requirements, both now and in the future, have been given due place in our research programme. Our studies of thermal transmission through walls have been carried on and the results continue to be of great interest, not only to architects and builders, but also to the farming industry, particularly those sections concerned with the intensive rearing of pigs and poultry.

THE BRICK SHORTAGE

During 1959 bricks were in the news. There was much comment, both in the national and provincial press, on the apparent shortage of bricks and the effect this was having on building programmes. Many reasons were put forward for the difficult supply position and, in some instances, quite unjustified criticism was made of the brick industry generally and of our Company in particular as the largest producer of bricks in the country.

It has often been said that if the building industry in this country is to operate efficiently, it must be geared over a period of years to a steady and well defined building programme. The best results cannot be expected in an industry so dependent on long term planning if the tap of investment available for building is turned on and off. This, of course, is what successive governments have done since the war, either by use of building controls or by the operation of monetary restrictions. No section of the building industry is more sensitive to these fluctuations than the brick trade.

The chairman then outlined the situation that developed in 1959, the reasons for it and the steps taken to alleviate the difficulties caused to the building industry and continued:

Whilst this was a year when demand for our bricks broke all previous records, the increased level of building did provide a ready market for all types of hollow clay blocks, production and deliveries of these products being well maintained throughout the year. The demand for our field drain pipes was also very satisfactory and deliveries in the year were substantially higher than ever before.

PRICE STABILITY

A contributory factor to the volume of our order book was the long term effect of our policy on prices which has further concentrated the heavy demand on ourselves, particularly in view of this year's rash of price increases by the smaller brickmakers.

Only by increased production and efficiency has it been possible for us to hold our prices steady since 1957 but whether, in face of mounting costs and increased wages, this position can be maintained is a matter of great concern as we wish to avoid price increases in a time of heavy demand.

THE CURRENT YEAR

Up to date our trading compares very favourably with the same period of last year. We are very busy in every section of the business and face a very heavy demand for all our products. Subject to the warning I have already given in regard to increasing costs and providing nothing of an exceptional nature crosses our path, I look forward with confidence to the results that I shall place before you when we meet again next year.

The report was adopted and at the subsequent extraordinary general meeting the proposed scrip issue was approved.

MONTECATINI

SOCIETÀ GENERALE PER L'INDUSTRIA MINERARIA E CHIMICA

RESULTS FOR THE YEAR 1959

On April 29th the Ordinary Annual General Meeting of the Società Montecatini was held in Milan, under the Chairmanship of Dr Carlo Faina, Chairman and Managing Director of the Company.

Dr Faina stated that in 1959 the Montecatini Group achieved its normal turnover increase although the volume of its productions was increased to an even greater extent than usual. The market changes, as well as developments deriving from previous investments, have resulted in bringing about a noticeable change in the activities of the Group. But in 1959, as in previous years, the Group made a powerful contribution to the Italian economic expansion. In Sicily in particular, one of the most important industrial achievements in Europe since the war took place in the San Cataldo/Campofranco/Porto Empedocle triangle, in connection with the mining and processing of potassium ores and the production of potassium and compound fertilisers.

As far as the various branches of the Group's activities are concerned, during 1959 mining production has developed steadily. Pyrite mining remained at last year's very high level, while Montecatini's bauxite production amounted to 232,000 tons, slightly more than in the previous year. Equally stabilised were the productions of blende, galena and marble in blocks. Prospecting and drilling for liquid or gaseous hydrocarbons has resulted in substantial natural gas discoveries in Abruzzo. After the conclusion of the first stage in the vast programme for the development of potassium salts deposits, the San Cataldo mine will soon be found to be one of the best productive units of Europe.

On the whole the progress of the Group's chemical activity was satisfactory. Sulphuric acid production was slightly increased and the plants for the production of superphosphate have been kept in perfect efficiency. Satisfactory results were also achieved in the field of fungicides and insecticides for agricultural use. The expansion in the production of nitrogen has unavoidably affected the level of market prices, but the technological progress achieved by the Group in this branch of activity is still far ahead, a fact not to be underestimated when considering its bearing on the situation in this sector.

During 1959 the Campofranco plants for the production of potassium fertilisers were completed. Thus the problem of the Italian potash supply can be considered as solved. As regards complex fertilisers, the Montecatini Group has been able promptly to follow the changing market trends. Progress has also been reported in the production of phosphorous, fluorine derivatives, and special metals such as titanium, zirconium etc.

In the plastics field, the Natta-Montecatini techniques in the olefins polymerisation processes have opened new avenues for chemical production. Plant for the production of polypropylene is now in operation, being built or in the designing stage in various parts of the world. In Italy production of "Moplen" (which is the trade name for polypropylene) will soon reach 30,000 tons per annum. Other polyolefins are in an advanced stage of development and some of these appear to be very promising. The Montecatini Group now produces the entire range of plastic materials at present existing on the market; this being a record which does not apply to Europe only.

In the field of man-made fibres, decisive progress has been achieved in developing the polypropylene fibre "Meraklon," which is now successfully competing with other fibres, both man-made and natural, and a wide market has been secured for this product. The processing of "Nailon," "Terital" and "Movil" is proceeding in a manner which can be said to be more than satisfactory.

In so far as the remaining chemical productions are concerned outstanding results have been achieved through the processing and marketing of paints and intermediate products. Explosives for use in the mines and for fireworks are being marketed satisfactorily.

The same may be said as regards dyestuffs (ACNA) and Pharmaceuticals (Farmitalia).

The activity of the associated companies in foreign countries has also given cause for satisfaction. With regard to research, the grant during 1959 of over 1,200 patents in more than 40 countries is a sign of the Group's achievements also in the field.

The plants built in many parts of the world provide sufficient evidence that the technical achievements of the Montecatini Group are asserting themselves not only in the fields of nitrogen and polyolefins, but also in organic and inorganic chemical production in general.

The production of electric power by the Group in 1959 was 2,800 million kWh, and the activity of the Group as industrial consultants is continuing with great success.

The production of aluminium increased by 23 per cent as compared with that in 1958, and, as consumption is expected to rise still further, the Company has completed the technical design for a new large plant.

To the long list of research institutes operated by the Montecatini Group, the Chairman has now added a new centre for paints and intermediates. Other institutes will start operation shortly.

The draft balance sheet of the Montecatini Company as at December 31, 1959, closes with a net profit of Lit. 12,412,199,497 as against Lit. 10,847,738,689 for the previous trading year. The allocation for the Sinking Fund has been fixed at Lit. 14,500,000,000 as compared with Lit. 13,000,000,000 for the previous year.

The Balance Sheet shows on the Assets side assets amounting to Lit. 313,640,384,673; under the heading "Holdings," there is a total of Lit. 54,567,021,207; the Debtors' Accounts amount to Lit. 103,211,193,984. On the Liabilities side of the Balance Sheet, the reserves are found to be decreased by Lit. 457,613,066; the Long-term Loans, on the other hand, show an increase of Lit. 5,709,580,456; the Creditors' Accounts amount to Lit. 63,234,241,114.

The Profit and Loss Account shows an increase of Lit. 12,283,919,653 in purchases, a slight increase in sundry operating costs, an increase in financing costs and the fixing of an allocation for the Sinking Fund which represents the total amount of ordinary writing-off possible with exemption from taxation. Labour and accessory costs remained almost unchanged. On the other hand, to an increase of Lit. 12,855,842,328 in proceeds from sales, increases in Income from Real Estate, in Financial Income and in Miscellaneous Receipts must be added.

The dividend for the Trading Year 1959 was fixed at Lit. 115 per share.

REICHHOLD CHEMICALS LIMITED

(Incorporating the following subsidiary companies: Beck, Koller & Co. (England) Limited, James Beadel & Co., Limited, Vinyl Products Limited and Vinatex Limited).

SUBSTANTIAL EXPANSION OF SALES

MR WALTER H. BREUER'S STATEMENT

The Eighth Annual General Meeting of Reichhold Chemicals Limited will be held on June 14th at Winchester House, Old Broad Street, London, EC2.

The following is the statement by Mr Walter Hugo Breuer, Chairman and Joint Managing Director, which has been circulated with the report and accounts for the year ended December 31, 1959:

The Annual Accounts for the Eighth year are presented in established form and reflect the year's operations of our Group of Companies and their position at the close of the year.

Profit margins are again considered satisfactory and the substantial expansion of sales has enabled your Directors to present a result showing continued progress.

DIVIDEND DISTRIBUTION

An Interim Dividend of 7½ per cent less Income Tax on the Ordinary Share Capital of the Company was paid in October, 1959. On February 9, 1960, Shareholders were allotted, by way of a scrip issue, one new Ordinary Share of 5s. fully paid for every eight Ordinary Shares of 5s. fully paid held at that date, which issue ranks for the Final Dividend now recommended in respect of the year ended December 31, 1959, of 15 per cent less Income Tax at the Standard Rate ruling on date of payment. The total of the two scrip issues which have taken place since the formation of your Company is an increase in the Issued Ordinary Share Capital of 50 per cent on which appropriate dividend increases have taken place.

In continuance of our policy of an adequate "plough-back" it is proposed both to place a further £131,467 to General Reserve and to appropriate the £78,233 10s. 0d. required for the scrip issue, out of the year's undivided profits.

In comparing the Dividend Distribution with the amount of Profit retained, I would draw the attention of Shareholders to the substantial Capital Expenditure programme to which your Group is at present committed, and to which I refer in some detail in the following paragraphs.

The Phthalic Anhydride Plant extension commenced working in December, 1959, and provides a welcome addition to the supply of this essential raw material particularly in view of the prevailing World-wide shortage with consequent substantial price increases.

In spite of this increased production the Beck, Koller Company have been obliged to purchase Phthalic Anhydride to take care of their ever-growing need.

There has been a sustained increase in the demand for Polyester resins and in order to meet the volume of requirements in this direction it was essential to plan a substantial increase in Resin production.

In other industrial fields additional productivity of resins is imperative; therefore, new plant is to be installed and should be on stream by December, 1960. This will have the effect of doubling the output of Resins at Speke with an expected reduction in overhead costs.

EXTENSIONS AND IMPROVEMENTS

During the year a new block of Research Laboratories was completed and occupied by the Research Department which is under the able direction of Dr Swann and in the same building much needed accommodation was provided for the Engineering Draughtsmen.

Other extensions and improvements such as roads, canteen facilities for work-people and staff are proceeding. A new Constructional Resin Department has been completed and will contribute to the increasing diversification in the industrial fields based on new materials.

The Vinyl and Vinatex Companies continue to expand.

In order to meet the substantial increased demand for PVC Compounds, etc., a new factory for Vinatex is being built at Havant.

New Plant is being installed and from the end of July, 1960, a welcome increase in production will meet the increased demand for Vinatex products. This could not have been met from the restricted production at Carshalton.

Vinyl Products Ltd., are developing and marketing a number of new products which will necessitate a substantial increase of production capacity over the next few years.

The large Capital Expenditure programme of the operating Companies makes it essential for us to "plough-back" money each year, in addition to the provision we make for depreciation.

CLOSE CONTACT WITH AFFILIATE COMPANIES

We continue to enjoy close technical contact with our Affiliate Companies, Reichhold Chemicals Inc., and other Reichhold Companies throughout the World and recently an arrangement was concluded between Beck, Koller & Co. (England) Ltd., and the well-known American Company, Spencer Kellog & Sons Inc., to promote selected surface coating vehicles in the United Kingdom including stable one-can polyurethanes.

You will observe that in the Notice of Annual General Meeting there are particulars of a Resolution which is being submitted to the Meeting to alter Article 13 of the Articles of Association which is being revised so as to allow the Director's signature to be mechanically applied to Share Certificates.

Once again you will doubtless wish to associate yourselves with the tribute I am happy to pay on behalf of the Board of Directors to all our Factory Employees, Technical and Administrative Staffs and Directors of Operating Companies for their continued loyalty and enthusiastic support.

BANCO DI ROMA

Capital:	Lire	12,500,000,000
Paid up Capital:	„	6,750,000,000
Reserve:	„	5,400,000,000

The Annual General Meeting of the Banco di Roma was held in Rome on April 21, 1960, at which the Balance Sheet at December 31, 1959, as well as the Profit and Loss Account, which showed a profit of Lire 814 million, were approved.

The Meeting decided—after the Board of Directors' Report had been presented—to appropriate Lire 400 million to the reserve, making it Lire 5,400 million; to distribute a dividend of 10 per cent, and pro rata for shares not fully paid up. It further provided for the election of the Board of Auditors, reconfirming in their previous offices the members, whose triennial appointments had expired.

During the meeting of the Board of Directors, which followed the Annual General Meeting, the following appointments were reconfirmed: Cav. del Lavoro Ugo Foscolo—Chairman; the Baron Professor Doctor Francesco Mario Oddasso and Doctor Massimo Spada—Deputy Chairmen.

BEYER, PEACOCK & CO. LTD.

(Locomotive Builders and General Engineers)

PERIOD OF REORGANISATION

The annual general meeting of Beyer, Peacock & Co. Ltd., was held on May 25th in London, Mr Harold Wilmot, CBE (Chairman and Managing Director), presiding.

The following is an extract from his circulated review:

The locomotive factory at Gorton entered the period I mentioned in my last review. In the long-term interests of the shareholders it was imperative to seize the right moment to embark on a major reorganisation of the factory which, in addition to retaining a Beyer-Garratt potential, would ensure conditions for the economic production of locomotive types other than steam. This reorganisation started in July 1959 and will be complete in the next few months. Your Board are convinced that the Manchester locomotive factory will then be entirely suitable for the large scale production of main line locomotives of all modern types. The prospect of keeping these facilities reasonably occupied for the next few years would appear promising. By our next Annual General Meeting I hope to be able to report a steady flow of diesel-powered locomotives from the reorganised works. Our latest estimates indicate that the capital costs involved will be reasonable and well within the financing capabilities of the Company.

Your Board have been occupied in the task of consolidating the Group and turning it into a Holding Company type of structure as indicated in my last review. The Holding Company exercise is now complete in all its major aspects and the accounts are presented in the appropriate form. The Holding Company Board is already conscious of benefits which will flow from the new organisation. I have personally relinquished a number of appointments in Subsidiary Companies—only retaining those with immediate problems or special temporary difficulties. Younger executives have been appointed to a number of key positions, and I have every confidence that this general move is in the best interests of the proprietors.

ANTI-ATTRITION METAL COMPANY

The only Subsidiary which proved more intractable than I anticipated a year ago is Anti-Attrition Metal Company Ltd., which made a large loss in 1959 (£95,686). This loss has been taken up in the consolidated accounts. I believe, however, that the reorganisation of management at Maidenhead and of the production equipment of that factory will help towards a more effective selling effort and better financial results. Modest profits are already being made, and our weekly and monthly figures encourage us to hope for steady improvement.

As there is an outside interest in Anti-Attrition Metal Co. Ltd. amounting to 12½ per cent of the equity of that Subsidiary your Board have decided that a subvention payment is inappropriate as that would be in effect a subsidy by the shareholders of the Holding Company to the minority shareholders of that Subsidiary. The result from an accounting point of view is that taxation chargeable for 1959 is greater than it would otherwise have been, but a tax loss is carried forward and will mean tax free profits in Anti-Attrition Metal Co. Ltd. for future accounts. To this extent and for those reasons the results of the Holding Company after tax appear to be less favourable than they are in reality.

All the other main producing Subsidiaries made profits to an extent we consider not unreasonable in a year of considerable recession for our types of product. In every case our forecasts for 1960 show improvements both in turnover and in total profits.

I would refer shareholders to the paragraph on dividends and dividend policy in my last review. The conditions there outlined have in the view of your Board been met. In the first place the figures for 1959 are somewhat better than forecast a year ago. To undertake a change-over from Steam to other forms of main line rail traction and to avoid during such a period a major loss on working may reasonably be regarded as exceptional in the locomotive industry. In the second place our forecasts for 1960, made on our usual lines, lead us to the expectation that the condition outlined last year—a profit of at least 10 per cent in 1960—will be achieved. Your Board is, therefore, proposing the promised final dividend for 1959 of 12 per cent.

Mr James Hadfield, MBE, has recently been appointed Deputy Managing Director. Mr Hadfield has served Beyer, Peacock & Co. Ltd. in various capacities over a period of 36 years, and in addition has held a number of appointments in the Subsidiary Companies. I know of no one better fitted for the wider responsibilities he has assumed.

The report and accounts were adopted.

These Notes have not been and are not being offered to the public. This advertisement appears only as a matter of record.

NEW ISSUE May 19, 1960

$6,000,000

Synthetics and Chemicals Limited

Term Notes

Synthetics and Chemicals Limited has been formed by The Firestone Tire & Rubber Company, of Akron, Ohio and Kilachand, Devchand & Company, Private Limited, of Bombay, India for the purpose of constructing and operating a plant in India to produce synthetic rubber.

The undersigned participated in negotiations relating to a Credit Agreement under which commitments to purchase the Term Notes have been made by several United States commercial banks.

NEW YORK BOSTON PITTSBURG CHICAGO
PHILADELPHIA SAN FRANCISCO CLEVELAND

BANK OF WEST AFRICA LIMITED

A DECADE OF PROGRESS AND EXPANSION

MR SYLVESTER GATES ON IMPORTANT DEVELOPMENTS

The sixty-sixth annual general meeting of the Bank of West Africa Limited will be held on June 16th in London.

The following are extracts from the circulated statement of the Chairman, Mr Sylvester Gates, CBE:

The balance sheet reflects the changes in the Bank's share capital approved at last year's extraordinary general meeting. The issued capital is now £4 million and the published reserve after the appropriations made in this year's accounts now stands at £2,700,000. Our current, deposit and other accounts show a decrease of some £7,500,000. This is due in part to the transfer of further Government accounts to the new Central Banks in Nigeria and Ghana, in part to last year's transfer from inner reserves to reserve fund but principally to the slower return of funds following upon this season's exceptionally heavy purchases of cocoa.

On the other side of the balance sheet our cash holdings were at our normal ratio of some 10 per cent of deposits. Money at call and at short notice, together with Treasury Bills, again are at about the same proportion to deposits as a year ago. These items together give us a liquidity ratio of some 49 per cent. Our loans, advances and other accounts show a reduction of £1,200,000 mainly attributable to the lower level of finance required for the year's smaller groundnut crop.

The profit and loss account shows that we have had a satisfactory experience during the year and are having some success in meeting constantly rising costs. The amount recommended to be distributed by way of dividend is slightly increased.

NEW BRANCHES

During the year new branches have been opened at Agege, Gashua, Lagos (Obun Eko), Kaduna South, Ogbomosho and Oyo in Nigeria, and at Akropong, Axim, Kpong, Manhyia (Kumasi) in Ghana. In Sierra Leone a sub-branch has been opened at Fourah Bay College.

In West Africa every opportunity is taken to extend our services to developing areas and our network of branches has more than trebled during the last decade as has the amount of business we have handled. Our modernisation programme including premises, mechanisation of accounting and new methods makes good progress.

The Africanisation of our service overseas proceeds. Already, I am pleased to say, twenty-six of our branches are in charge of African managers.

Having reviewed developments in the four West African countries in which the Bank is primarily interested, i.e. Nigeria, Ghana, Sierra Leone and Gambia, the Chairman continued:

GENERAL

This is Nigeria's year of achievement and we look forward with pleasure to her becoming a sovereign State and a full member of the Commonwealth. Ghana has decided to become a Republic, within the Commonwealth; Sierra Leone will become independent next year.

Independence, however, far from solving existing economic problems, creates some fresh ones of its own. A British Colony is sheltered by the credit standing of the mother country in the world capital market; a new sovereign State stands alone. It is natural, therefore, that Nigeria, no longer eligible in the future for assistance from the Colonial Development Corporation, should have expressed concern about the prospect of attracting a continuing flow of investment capital—all the more so since Nigeria as well as Ghana is moving from the stage where development was limited by shortage of materials and skills to one where the limiting factor is finance.

On his return from Africa Mr Macmillan recently said that Great Britain and the other countries of Western Europe must accept the challenge of providing capital for the new countries of Africa. Much indeed is already being done to satisfy their needs. In 1958 (the latest complete year for which published figures are available) private overseas investment in Nigeria amounted to £20 million—four times what it was in 1953. During the year under review the UK has agreed to lend £15 million to help Nigeria finance current development plans—and this is in addition to an unspent balance of several million pounds from outstanding Colonial and welfare grants. The promise of assistance totalling £7.5 million to Sierra Leone has already been referred to above. At the same time Ghana has been successful in arranging a "Credit Guarantee" of 200 million D.M. (£17½ million) with the West German Government. In Ghana and Nigeria allocations have been received from the United Nations Special Fund for Economic Development to carry out large-scale investigations and geological surveys.

To provide capital for small and medium-sized industrial ventures a number of new agencies have recently been created. In Lagos the Commonwealth Development Finance Company has established the Investment Company of Nigeria Limited with a share capital of £1 million, in which our Bank has taken a participation. In Kaduna the Northern Development (Nigeria) Limited has been formed jointly by the Colonial Development Corporation and the Northern Regional Development Corporation. In Enugu the Industrial and Agricultural Company Limited has been formed jointly by the Government of the Eastern Region and the Colonial Development Corporation. Finally, the Colonial Development Corporation is also to participate in the Southern Cameroons Development Corporation to the extent of £3 million.

Notwithstanding all that is being done to help the countries of West Africa, over-reliance on foreign aid and foreign investment would be bound to lead to disappointment. In the long term it is upon the better mobilisation of the now considerable resources of their own citizens that the economic growth of these countries must depend. An encouraging sign has been the striking growth in savings during the last few years—particularly of Savings Accounts in Banks—and West African Governments are beginning to recognise the importance of fostering this development which serves the double purpose of releasing domestic resources for use and checking one of the chief deterrents to foreign capital—the danger of inflation.

As the nineteen-sixties open West Africa stands on the threshold of what may well be its period of greatest development. For over 66 years our Bank has served the financial needs of all sections of the community. We look forward to making a yet greater contribution in the future.

INNS & COMPANY

(Public Works Contractors, Asphalters, Sand and Gravel Pit and Quarry Owners)

RECORD PROFITS IN ANNIVERSARY YEAR

The twenty-fifth annual general meeting of Inns & Company Limited was held on May 20th in London, Mr Walter Wallace (Joint Managing Director) presiding.

The Chairman, in the course of his speech, said:

This is the twenty-fifth anniversary of your Company since it was made Public in 1935. It is, therefore, both fitting to the occasion and pleasing to your Directors that we should be presenting Accounts which record the highest profits in the history of the Company.

We propose to mark the event by raising the dividend distributions on the Ordinary Shares to a total of 30 per cent for the year and to capitalise £189,000 of Reserves by the issue, credited as fully paid, of one new Ordinary Share for each five Shares held.

The Accounts to December 31, 1959, are also the first to reflect a full year's results of your main subsidiary Company, W. & R. Wallace Industries Limited. Out of a total profit of £750,384 before Tax, this latter Company and its own subsidiaries provided £188,774, so that I can once more say that all sections of our business have, by their greater activity, contributed to the improved results.

We are satisfied with our progress so far this year and if this state of affairs continues for the remainder of the year I see no reason why we should not be in the comfortable position of maintaining the rate of distributions on our Ordinary Share Capital as increased by the proposed capitalisation of Reserves.

The Consolidated Trading Profit amounts to the record figure of £982,162, which, after various charges, leaves, as stated earlier, a Profit balance of £750,384 before Tax. After providing for all taxation and adding the balance brought forward from last year, there is a total of £515,103 available for the appropriations and Carry Forward to 1960 set out in the Report of the Directors.

Revenue Reserves have increased by £166,715 and Capital Reserves by £9,470. After the proposed capitalisation Issue the former will still stand at £703,711 and the latter at £609,404.

Our financial position remains very healthy. Current Assets exceed liabilities by £1,053,228 as compared with £908,119 last year.

The report and accounts were adopted and at the subsequent Extraordinary General Meeting the Board's capitalisation proposals were approved.

BANCO DI SANTO SPIRITO

ROME

Established 1605

THE ANNUAL GENERAL SHAREHOLDERS MEETING was held in Rome on April 9, 1960, the Marchese Giovanni Battista Sacchetti being in the chair. In the course of the meeting the following Balance Sheet was approved:

BALANCE SHEET AT DECEMBER 31, 1959

LIABILITIES		ASSETS	
Capital	Lit. 3,000,000,000	Cash and Balances with other Banks	Lit. 28,903,791,457
Reserves	„ 1,500,000,000	Bills and Government Bonds	„ 50,981,123,335
Deposits	„ 68,228,604,591	Securities:	
Current Accounts (Creditors)	„ 91,087,054,386	Real estate securities	„ 6,862,727,681
Banker's Drafts	„ 4,076,850,973	Miscellaneous shares	„ 808,989,706
Creditors (Bills Endorsed)	„ 2,427,982,900	Holdings	„ 485,584,398
Miscellaneous Creditors	„ 8,812,217,770	Stock Exchange Transactions	„ 9,728,346,065
Staff Retirement Fund	„ 4,350,000,000	Bills on hand	„ 31,797,024,539

	Lit.275,743,589,461		Lit.275,743,589,461

It was further resolved to transfer Lit.350,000,000.– to reserves and to distribute a 10 per cent dividend per share

---

ROYAL MAIL LINES LIMITED

The Annual General Meeting of Royal Mail Lines Limited will be held on June 17th in London. The following is an extract from the circulated statement of the Chairman, Mr Walter C. Warwick:

The trading conditions in 1959, which have followed the same pattern as those of 1958 with generally low freight rates prevailing and with expenses continuing to rise, have made it difficult to operate the ships with any substantial margin of profit. The virtue of prudent procedure followed during the more profitable years is again evident and it is only the restraint of the past which makes it possible to recommend a dividend for the year under review.

During 1959 *Highland Brigade*, *Highland Chieftain*, *Highland Princess* and *Tweed* were sold, and since the end of the year *Highland Monarch* and *Loch Ryan* have been disposed of. The proceeds of the sale of these ships is of small significance, however, in comparison with the very large sums required to meet the building costs of *Amazon*, *Aragon* and *Arlanza*.

Commenting on the increase in flag discrimination, the Chairman said: British Companies are prepared to meet any competition in a fair field, but if restrictive practices become widespread the fleets of the traditional maritime nations face an impossible task.

Referring to the outlook, Mr Warwick said: Until freer trade and increased cargoes materialise we cannot look for any substantial betterment in our trading results, but I do think we have passed the lowest point of the depression and that, unless any unforeseen setback occurs, we may expect to see a gradual improvement as time goes on.

YORKSHIRE INSURANCE COMPANY

LORD MIDDLETON'S REVIEW

The Annual General Meeting of The Yorkshire Insurance Company, Limited, was held on May 24th at York.

The Right Honourable Lord Middleton, KG, MC, LLD, the chairman, in the course of his speech, said:

The rapid growth of our Life Department during recent years has continued during 1959. We achieved a total of over £45 million in net new Life business transacted. Both the amount of new business transacted and the rate of increase over the previous year were records. Our Life Fund rose to £51¼ million.

Our net Fire premium income rose by some 10 per cent. After charging overseas taxation there remains a surplus of £133,884 and the fund carried forward represents a little over 50 per cent of the year's premiums.

The Accident and General account has shown a marked improvement. The premium income has continued to expand at a satisfactory rate, both at Home and Overseas. In total our Accident operations resulted in a surplus of £293,588 representing 3.44 per cent of premiums.

The total premiums in the Marine account in 1959 amounted to £2¼ million compared with £2,134,983. Our Marine Fund stands at £3,215,407—143 per cent of premiums. We are left with a balance of £589,000 carried to Appropriation Account compared with £166,000.

We recommend a final dividend of 2s., making a total of 3s. 8d. for the year.

The report and accounts were adopted.

THE MERCHANTS MARINE INSURANCE CO.

The Annual General Meeting of The Merchants Marine Insurance Company Limited will be held on June 15th in London.

The following is an extract from the circulated statement of the chairman, Viscount Knollys:

I am glad, once again, to report a further growth in all sections of our marine business. Our premium in 1959 amounted to £577,892, an increase of £27,133 over 1958. Bearing in mind the continuing downward trend in cargo rates and the amount of world tonnage laid up, this increase though comparatively small, represents further development in our world marine business.

The premium on our fire, accident and general business amounted to £389,063, a decrease of £109,595 on the 1958 premium income. As a result of reducing our commitments in the accident and general account, I am glad to tell you that we are able to show a small overall profit of £4,315.

We consider it prudent to retain the whole of the profit of the marine accounts in the marine fund, which amounts to £630,273, or 109.1 per cent of the premium income, and is, in our view, adequate to meet all calls upon it.

After bringing in interest on our investments, and the profits from our fire, accident and general accounts, the net surplus for the year is £52,408. From these profits we provide £22,641 for taxation, which leaves a balance of £29,767. The directors recommend a dividend of 15 per cent, less income tax, for the year. This would leave a carry forward of £201,594, an increase of £20,579 on the year.

BRITISH ROPES LIMITED

INCREASED TURNOVER

The 38th Annual General Meeting of British Ropes, Ltd., was held on May 25th in London.

Mr Harry Smith, chairman and joint managing director, in the course of his speech said:

Group profit before taxation amounts to £2,543,000 compared with £2,015,000 for the previous year. Taxation absorbs nearly half of the Group profit, and after the deduction of the proportion of profits of Subsidiary Companies attributable to outside shareholders, the profit applicable to British Ropes Limited amounts to £1,311,000 compared with £912,000 for the previous year. Your Directors recommend a final dividend of 14 per cent on the Ordinary stock, making a total of 20 per cent for the year, compared with 18 per cent for the previous year.

Since my last report to you trading conditions in this country have shown a modest improvement and the turnover of your Company's products manufactured in this country for both export and home consumption has increased by 7 per cent. Some products have achieved a greater increase but, as regards rope, many of our important customers in the Mining and Shipping Industries are still operating well below their peak. The prices of our products have remained relatively stable in spite of increases in raw material and other costs.

EXPORT MARKETS

We have continued to devote unremitting effort to our export markets. The percentage of our export sales to total sales in 1959 has exceeded 25 per cent for the first time.

A number of steps have been taken to expand your Company's overseas interests in Mexico, Belgium and Nigeria.

It has always been your Company's policy to foster the development of its interests in the Commonwealth, and we were therefore particularly glad to be able to announce in April this year that negotiations had been concluded with the New Zealand Government for your Company to establish a Wire Rope Plant in New Zealand.

The considerable capital expenditure and re-equipment which we have carried out in recent years has provided the Group with adequate capacity for most of its products, but the demand for high carbon wire of which your Company is already the largest manufacturer in the United Kingdom is increasing more rapidly than could have been anticipated. Plans have therefore been made for a substantial increase in capacity for wire production.

With these major increases in our overseas investments and the need to expand wire production, it has become evident that our financial resources are insufficient, particularly as further opportunities for overseas development may well occur. Your Directors, therefore have decided to raise approximately £2 million of further Capital by means of a rights issue to Ordinary Stockholders on the basis of one new share for every 8 stock units of 2s. 6d. each held by stockholders on the register at the close of business on May 2, 1960, and the price at which the new shares are to be offered is 9s. 6d.

We manufacture a wide range of products serving many industries and with our productive capacity, the strength of our technical resources and our widespread overseas interests, I feel we can face the future with confidence.

The report was adopted and the Board's capitalisation proposals were approved.

CITY DEEP, LIMITED

(Incorporated in the Union of South Africa)

MR P. H. ANDERSON'S STATEMENT

The Fifty-ninth Ordinary General Meeting of shareholders was held on May 23, 1960. The following is an extract from the circulated Statement by the Chairman, Mr P. H. Anderson, dated April 22, 1960.

The reorganisation of the mine about the middle of 1958 embraced a reduction in the milling rate which resulted in the ore milled during 1959 decreasing to 1,353,000 tons from 1,511,000 tons in the previous year. The yield, however, at 4.170 dwt. per ton was higher by 0.198 dwt. but this was not sufficient to prevent a fall in the gold recovery of 17,994 oz. to 282,108 oz. fine. This factor, together with a reduction of 9d. per ounce in the average amount received for gold, resulted in the working revenue for the year at £3,528,946 being lower by £237,050 than in 1958.

Working costs at £3,420,821 were less by £205,986 and in consequence of these changes in revenue and expenditure, the working profit for 1959 was £31,064 lower than that for the previous year.

To the working profit of £108,125 was added a credit adjustment of £41,975 in respect of pneumoconiosis charges, interest received amounting to £31,208 and £6,162 being the difference between the other items of income and expenditure, giving a total profit for the year of £187,470. Taxation and dividends absorbed £13,011 and £126,677 respectively, leaving £60,065 to be added to the unappropriated balance of £839,130 at December 31, 1958, thereby increasing it to £899,195 at the year-end.

OPERATIONS AT THE MINE

In contrast to the decline in the previous year, the footage developed during 1959 at 41,750 ft. was greater by 15,500 ft. than in 1958. Of this increase, 6,273 ft. were in respect of reef development, mainly on South Reef, while of the balance, 1,035 ft. related to sub-incline shaft sinking, the rate of which was accelerated with a view to improving the ore reserve position. There was a corresponding increase in the footage sampled and although the results on the South and Main Reefs caused the average percentage payability to decline, the value rose from 317 inch dwt. to 335 inch dwt. On Main Reef Leader, the main ore carrier in the mine, payable disclosures fell from 56.9 per cent to 50.2 per cent but in turn the value was higher rising from 339 inch dwt. to 372 inch dwt.

The ore developed during the year increased by 150,700 tons but the value was lower by 0.8 dwt. per ton. The total ore reserves increased by 97,000 tons at the year-end and for the first time included reserves below the Vierfontein dyke. The value of the available ore reserve, however, declined by 0.3 dwt. owing to the inclusion of certain ore of border-line value in the long wall faces at depth.

I cannot let this occasion pass without referring to City Deep's proud achievement on January 1, 1960, in winning the Industry's "Millionaire Shield" for working a million fatality-free shifts. This is a remarkable record for any mine and particularly so in the case of an ultra-deep mine such as City Deep.

UNITED PREMIER OIL AND CAKE COMPANY

SIR ERIC MIÉVILLE ON SUBSTANTIALLY IMPROVED RESULTS

The forty-first annual general meeting of United Premier Oil and Cake Company Limited was held on May 25th in London, Sir Eric Miéville, GCIE, KCVO, CSI, CMG (the Chairman), presiding.

The following is an extract from his circulated statement:

In my Review last year I mentioned that, at the end of 1958, there was an improvement in the crushing side of our business. This feature continued throughout the year and is revealed in our 1959 profits. Premier Oil & Cake Mills Limited are a major subsidiary of our Group, but have to contend with the violent fluctuations that take place, from time to time, in the prices of the raw materials with which they are concerned. They have also to compete with the importation of Cakes, Meals and Oils manufactured in the Commonwealth and other countries at a labour cost, in many cases, below the recognised standard of this country.

The other companies which form part of our Group enjoy a more stable existence and their returns continue to show satisfactory and progressive results.

The gross trading profits of the Group amounted to £503,001, which is more than double the comparable figure for the previous year. After all charges, including taxation, there remains a balance of £167,425. From this amount we have paid the dividend on the 7 per cent Preference Stock and have allocated £75,000 to the General Reserve, leaving a net amount available for the ordinary dividend of £60,269.

An interim ordinary dividend of 2d. per ordinary stock unit (less income tax) has already been paid and we now recommend a final payment of 10d. (less income tax) making a total of 1s. per stock unit for the year. We have thus restored the dividend rate paid since 1954 except last year when, owing to the poor trading results, the ordinary dividend payment was halved. After payment of the final ordinary dividend, £11,269 will be retained in the business and added to the amount carried forward in the Company's Profit and Loss Account which now stands at £330,593.

During the year we were fortunate in being able to bring within our Group the business of George Hunter Ltd., for which we paid £90,000 in cash. George Hunter's profits, excluding pre-acquisition profits, have made a contribution before tax of £25,000 to our Group in the present year.

It will be seen from the Consolidated Accounts that current assets, less current liabilities, that is to say our working capital, now amount to £1,403,078 as compared with £1,172,793 a year ago. Reserves now amount to £1,260,000.

During the last 10 years we have retained in the business (including depreciation) £1,932,883 and we have paid out in taxation £1,803,185. We have paid out as net dividends £667,029.

As to the general outlook, I can fairly say that the immediate prospects are encouraging, and under the wise and enthusiastic guidance of our Managing Director Mr W. E. Waterhouse, there are grounds for confidence in the future of the Group.

The report and accounts were adopted.

HIGHLANDS & LOWLANDS PARA RUBBER COMPANY LIMITED

POLICY MORE THAN JUSTIFIED

The Annual General Meeting of Highlands & Lowlands Para Rubber Company Limited will be held on June 21st in London.

The following is an extract from the circulated statement by Mr Thomas B. Barlow, the Chairman:

The report and accounts for 1959 are of greater interest than before because they record greater success on a large scale. The result of a rubber crop of over 23,200,000 lbs. and palm oil and kernels of 9,600 tons was a profit of £1,415,000. While the palm oil and kernels crop remained the same, rubber increased by 10 per cent and profits increased by 55 per cent.

The Issued Capital has increased from £1,213,000 to £2,169,000; this is accounted for by £594,000 stock issued to Scottish Malayan shareholders and in December all stockholders received a bonus issue of 1 for 5 which amounted to £362,000. Thus for the year 1959 members have received 10d. per 2s. stock unit, less tax, by way of income and a 20 per cent bonus issue by way of capital.

Two years ago we began our policy of grouping, since when our nominal Issued Capital has increased from £469,000 to £2,169,000 and our market valuation from £700,000 to over £8½ million and our members now include a large number of institutional investors. The statement made last year that Highlands was a growth stock with considerable scope seems amply justified and because the immature acreage untapped is more than 25 per cent of the total, a steady rise in output can be expected in the coming years.

ESTATES

The estates are generally in good and improving order. The overall average yield per acre tapped is now 724 lbs. as compared with 660 lbs. last year. We adopt a conservative system of tapping on newly opened rubber and because Estate Managers love to harvest more than their estimate, the modest increase of 350,000 lbs. this year is well within our hopes.

Yields of oil palms on the coastal estates are very good and with improved stock we expect to average 1½-2 tons of oil per acre, or double our present yield. It is significant that the profit on rubber rose from £16 per mature acre in 1958 to £30 in 1959 and the profit on oil palms rose from £35 to £36 per mature acre.

With the continued progress in the 12-year-old war against Communist terrorism in Malaya, the Government has decided to end the State of Emergency. The successful conclusion of this long struggle will enable an increasing part of the energies and resources of the country to be devoted to peaceful progress and development.

I would like to thank all the staff on the estates, the Labour Force, the Eastern Agents and the Secretaries who have all contributed to a very successful year, and let us rejoice that things are going well, that our policy has been more than justified and that unless anything unforeseen occurs we can look forward to an even better year in 1960.

EDWARDS HIGH VACUUM

Specialists in high vacuum equipment for:

INDUSTRY · RESEARCH · ATOMIC ENERGY · MEDICINE · EDUCATION

The 20th annual general meeting of Edwards High Vacuum Limited was held on May 25 in London, the Rt. Hon. Lord Wilmot of Selmeston, P.C., J.P., presiding.

The following is an extract from his circulated statement:

We have achieved yet another year of record turnover and the degree of increase reflects the effect of the extension to premises completed in 1956 which has given its full benefit in research and production facilities. In brief, the Trading Profit after charging taxation leaves available for appropriation £148,000 as compared with £113,000 for 1958.

The Directors now recommend a Final Dividend of 14 per cent on the Ordinary Shares making a total of 20 per cent for the year as compared with 16 per cent for 1958.

OVERSEAS ACTIVITIES

Commenting on the world-wide spread of the use of the company's products, Lord Wilmot said: We now export to more than 50 countries. With the relaxation of most of the embargoes in the Eastern Bloc and China, sales have quickly followed the technical appreciation of our equipment.

An important part is played by our own subsidiary and associated companies in Canada, Italy, Germany and, more recently, America. Edwards High Vacuum Inc. commenced trading at Niagara Falls in July, 1959, as a wholly-owned subsidiary of the Canadian company and has already secured valuable orders within the USA market.

Your Directors are expanding all activities within the Edwards Group and as a part of this programme plans were made in 1959 for expansions within the Italian company.

CONTRACTS

There have been further Atomic Energy developments within the Commonwealth during the year to which our company has made its contribution.

After referring to other contracts in the chemical field and in the sphere of high vacuum metallising, the chairman said: Many of these contracts have been secured in the export market where our sales are maintained at a high level.

NEW PREMISES AND TREND

It is necessary to look well ahead in providing adequate facilities for research and production activities, so vital to the future of the company. We have, therefore, arranged for extensions to the research, administrative and production premises at Crawley, which we hope will be completed during the early part of 1961.

The trend of progress during the last five years would appear to indicate continuing success for your company and we look forward to the future with confidence.

The report was adopted.

Head Office: Manor Royal, Crawley, Sussex.

CANADA · ITALY · GERMANY · U.S.A.

BARTON & SONS

HIGHER TURNOVER AND PROFIT

The ordinary general meeting of Barton & Sons Limited was held on May 25th in Birmingham.

The following is an extract from the statement by the Chairman, Mr H. Prichards, circulated with the Report and Accounts:

Our net profit before taxation is £1,044,315 against £862,415, an increase of 21 per cent. The past year has seen an accelerating demand for nearly all the Group's products and the increased turnover enabled us to earn a higher total profit than that achieved a year ago.

All three companies engaged in the production of steel tubes and fittings had a very successful year, and the two companies engaged in the fabrication and erection of structural steelwork both achieved very satisfactory results.

The varied products of the remaining Subsidiary Companies are principally supplied to the motor trade and the general engineering industry. Demand was at a reasonably high level.

During the year we acquired the whole of the Issued Share Capital of Bilston Shot & Grit Co. Ltd., and shortly after the end of the year we disposed of our holding in West Midland Refining Co. Ltd.

The first three months trading of 1960 show that the improvement which began in the latter half of 1959 is being maintained. Should the volume of work continue on this high level then I am confident that the results for 1960 will again give cause for satisfaction.

The report was adopted and a total distribution of 17½ per cent approved.

ASSOCIATED FISHERIES

The annual general meeting of Associated Fisheries Limited was held on May 19th in London.

Mr Stewart Cole, FCA (the Chairman), in his statement, said that because of the continued reduction in productivity of the Distant Water fishing ground, the total quantity landed by their fleet was less than the previous year, but a slight increase in the average price realised, coupled with a reduction in catching costs, produced an improvement on last year's contribution to Group Net Profit by their trawling fleet.

Total sales of our "ESKIMO" Brand of Frozen Foods increased and we are pursuing the planned extension programme envisaged for producing and marketing these products in growing volume to meet increasing public demand.

The total turnover of the Group rose to a record total in excess of £13 million. After covering all costs and depreciation the profit remaining out of every 20s. of turnover is 9.9d., of which Taxation will absorb 4.6d. Of the remaining 5.3d. the net dividend recommended for the year will account for just over 3d., leaving 2¼d. retained to assist in financing the development of the Group undertakings.

To date Group profits have been running at a slightly higher level than for the comparable period of last year. You should, however, bear in mind the unresolved political problems associated with Iceland and the European Free Trade Association confronting our Industry over which we have virtually no control. The Board feel confident that the Group will continue to progress on sound lines.

The report was adopted.

BLOCK & ANDERSON, LIMITED

ANOTHER YEAR OF EXPANSION

SCRIP ISSUE APPROVED

MR W. E. BLOCK'S STATEMENT

The 29th annual general meeting of Block & Anderson, Ltd., was held on May 24th at the registered office of the company, Banda House, Cambridge Grove, Hammersmith, London, W., Mr W. E. Block, Chairman and Joint Managing Director, presiding.

The secretary (Mr R. W. Finnemore) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year ended November 30, 1959:

This year has again been one of expansion for your Company. Sales have increased, and the results are very satisfactory.

The group profit before taxation is £242,043 as against last year's figure of £188,187. You will remember that in November of last year the issued Ordinary Capital was increased from £215,000 to £236,500 by a rights issue and the issued Preference Capital was increased from £80,000 to £100,000. At that time your Directors stated that, in addition to the 10 per cent interim dividend declared in October, 1959, they expected to be able to recommend a final dividend of 25 per cent on the increased capital. I am pleased to say that, in view of the results, your Directors recommend a final dividend of 30 per cent.

After allowing for this distribution and the dividend on the Preference Shares, the balance of undistributed profit remaining to be carried forward in the Consolidated Balance Sheet amounts to £391,498 as against £324,977 brought in.

CAPITALISATION OF RESERVES

In view of the amount at present showing as reserves, your Directors consider it appropriate to bring the Issued Capital of the Company in line with that actually employed. You will, therefore, be asked to pass resolutions that the Authorised Capital be increased from £400,000 to £750,000 and that £236,500 being as to £152,201 standing to the credit of the Share Premium Account and as to £84,299 part of the amount of Unappropriated Profit standing to the credit of Revenue Reserves be capitalised by the creation of 4,730,000 1s. Ordinary Shares to be distributed to the Ordinary Shareholders in the proportion of one new share for every share held.

Whilst I have every confidence in the future of your Company, the issue of these shares should not be taken to forecast an increase in the total amount to be distributed as dividends.

After allowing for the suggested issue and the estimated costs, the balance of Unappropriated Profit will be £307,199 less the costs of the issue, which will be approximately £2,800. The balance of unissued capital will be £177,000, but your Directors have no present intention of issuing any or all of it.

PROGRESS AND EXPANSION

Continuing our policy of progress and expansion, our Development activities are being pursued vigorously, and further important additions are being made to our range of products. We have opened two new Branches, one in Croydon and the other in Wolverhampton.

Both Home and Export sales were satisfactory, and I am happy to say that the results of the year to date have been encouraging. Our South African subsidiary has established a new Branch in Durban and our Canadian subsidiary continues to expand.

In January of this year a friend and colleague, Mr W. H. Bennett, died. He had served on the Board since our formation as a public company and rendered valuable service with wise counsel. In order to strengthen the Board and at the same time to give recognition for responsibilities already being carried, Mr W. C. Riehle, MBE, and Mr W. Crosskey, FCWA, were appointed to the Board as Executive Directors. Mr W. C. Riehle has been Commercial Manager for a number of years and joins the Board as Sales Director, and Mr W. Crosskey relinquishes his post as Company Secretary to become Financial Director. During the meeting you will be asked to confirm their appointments.

A NEW DEPARTMENT

During the year we have formed a Department for distribution through Dealers in Great Britain of our full range of adding machines, the Odhner Calculators and the Facit Typewriters. We are pleased with the progress made, and I would like to thank all our Dealer friends for their co-operation.

I wish to express, on behalf of my co-Directors and myself, our appreciation and thanks to all the Management and Staff both at home and abroad, and to our Agents and Suppliers for their valuable services and co-operation.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr L. E. Brougham, who retired by rotation, and Mr W. C. Riehle, MBE, and Mr W. Crosskey, FCWA, who had been appointed during the year, were re-elected; the remuneration of the auditors, Messrs Peat, Marwick, Mitchell & Co. was fixed and resolutions were passed approving the proposed increase of capital and capitalisation of reserves.

DARWINS GROUP LIMITED

ENCOURAGING PROSPECTS

The thirty-first annual meeting of Darwins Group Limited was held on May 24th in Sheffield, Mr F. Thompson-Schwab, the Chairman, presiding.

The following is an extract from his circulated review:

At our last Annual General Meeting held in May, 1959, I reported that at that time business was not at a satisfactory level. I expressed the opinion, however, that some gradual recovery could be expected. I am pleased to say that that forecast proved correct, and, although it was late in the year before any real improvement was manifest, we were ready to meet the demands arising from the changed circumstances.

All the Companies in the Group are at the present time fully employed. Heavy demands, however, bring problems and there is intense competition for the available supplies of raw materials, particularly steel scrap which is a vital part of our needs.

The value of our Sales for 1959, £5,348,000 was £179,000 in excess of those in 1958, but was less than our capacity was capable of producing. This additional turnover, together with the effect of the economies which were introduced earlier in the year, had the effect of increasing the trading profits from £350,565 to £444,217. In view of the improved results your Board recommend a final dividend of 8¼ per cent actual (less tax) which compares with a rate of 6 per cent paid last year.

It is interesting to reflect that ten years ago in 1949 when the present Management took over, the Company's Ordinary Share Capital was £500,000 with a market value of less than that figure, whereas today it is £1 million with a market value of more than £2 million. Ten years ago the accumulated Reserves were less than £20,000, today they are more than £1 million.

The financial results for the first quarter of the current year show a very satisfactory improvement on the corresponding results for 1959 and the prospects for the remainder of the year are most encouraging in view of the very substantially higher Order Book we now have, as compared with last year.

I see no reason why, given stable economic conditions, we should not look forward to increased demand for the Group's products.

The report was adopted.

E. POLLARD & CO., LTD.

The forty-eighth annual general meeting of E. Pollard & Co. Ltd. was held on May 24th in London.

Mr H. Edward Pollard (chairman and managing director) presided and, in the course of his speech, said:

The net profit of the Group after providing for taxation is £8,000 less at £176,000 as although the gross profit decreased by £97,000 the amount required for taxation was about £89,000 less. We are proposing a similar dividend to last year, that is 17½ per cent. I mentioned last year that the last few weeks of 1958 were disappointing and that shopfitting was still suffering from its recent setback. Unfortunately this situation continued and, indeed, became rather worse towards the end of 1959, and although the engineering and shop display business increased, this did not compensate for the shop-fitting difficulties.

The lift subsidiary, Hammond and Champness Ltd., have completed arrangements with a leading American Group to work in conjunction with them to introduce a new oil hydraulic system.

The steel doors and shutters under Haskins are now being made in part at the new Kingsland factory and we look forward to efficient and rapid production in this modern factory.

The Morris Singer subsidiary obtained a number of orders for their new developed curtain wall systems as well as a large contract for a stainless steel installation for the Millbank skyscraper.

As regards the future, Engineering and Shop Display are likely to continue satisfactorily, but the main Shopfitting section is very slow to improve and this improvement must come quickly if we are to show better results at the end of 1960.

The report was adopted.

COMPANY AFFAIRS

Current Results

HAVING risen last year, profits seem likely to go up again this year. This is one of the assumptions that British investors are making in looking forward to further increases in dividend payments. It is a well-founded one and recently has found some confirmation in the statements made by the spokesmen of British industry about trading results in the first few months of this year. At the annual general meeting of **"Shell" Transport,** for example, Lord Godber said that the volume of sales achieved by the Royal Dutch/Shell was in the first three months of this year 5 per cent higher than in the comparative period in 1959 and that the group's net earnings would probably show a similar increase. He also announced that the directors intend to reduce the disparity between the interim and final dividends.

Like Lord Godber, the chairman of **British Petroleum,** Sir Neville Gass, referred to the current surplus of oil but he was able to point to a growth of 15 per cent in BP's volume of sales in the first quarter of this year. Prices have remained depressed but Sir Neville added that income from trading has also benefited. He emphasised that not too much should be made of results for three months only but he regarded them as making a good start to the year.

In another field of activity Mr G. E. Beharrell, the chairman of **Dunlop Rubber,** also speaks of an encouraging start being made to the year. The first three months are not, he said, as a rule Dunlop's best period but trading results in this period were better than in the same period last year.

Anglo American Corporation

ECONOMICALLY Anglo American is as well balanced as it ever was and it is probably stronger than it has ever been before. But because its vast interests are concentrated in Southern Africa its shares have in the minds of investors a political risk that at the moment outweighs any economic advantages. This is a risk that has been attached to all South African securities and not specifically to Anglo American alone; indeed, its African employees, made up largely of migrant labour, have gone on working undisturbed by the riots and the political crisis. Earlier this year its £1 shares stood at 232s. 6d. They now stand at 158s. 9d., to yield 5.6 per cent on the dividend as increased from 80 to 90 per cent. They would stand higher than this if investors were prepared to take the political risk of investing more capital in South Africa.

From its many mining interests Anglo American, as the accompanying table shows, did well last year. Because of the growth in output from the newer mines, income from gold-mining was rising. It should go on rising and the finance houses, though there is some development to complete, are faced with a much smaller prospective strain on the capital resources than they have had to bear in the past. Uranium is earning a small steady profit and should continue to do so in the next two years or so. The future of uranium production in the Union will however come into question by the middle of this decade. The diamond industry has done well and this year Anglo American will take into its accounts the bigger dividends that have already been declared. Last year's recovery in copper and in base metals contributed to the advance in Anglo American's income and bigger dividends seem likely to come again from this source this year. Coal, on the other hand, may not contribute so much as the copper belt will be making smaller demands on the Wankie Colliery. In a rising Kaffir market, Anglo American made a slightly bigger profit from share-dealing than it did in 1958. Much of the buying, the directors say, appeared to be American and on balance Britain and Continent were net sellers of South African mining securities. This year, the Kaffir market is not likely to be one in which the finance houses will make much of a profit.

J. & P. Coats

IN the past the dividend policy of the directors of J. & P. Coats, the sewing thread manufacturers, has been conservative. Admittedly, the ordinary dividend was raised from 8½ to 10 per cent in 1958 through the payment of a special interim but the stock market was completely taken by surprise when the directors declared a dividend of 15 per cent for 1959. Before that announcement, the £1 stock units stood at 37s. 9d. They are now quoted at 44s. 6d. xd., to yield 6¾ per cent. This dividend and the results backing it have given added strength to cotton shares.

The higher dividend is certainly justified by the year's outturn. Before tax, the consolidated profit has risen from £6,157,925 to £10,628,966 and after tax from £2,736,581 to £5,612,966. The group, manufacturing and trading throughout much of the free world, has obviously benefited not simply from the recovery in the Lancashire cotton industry but also from the greater stability in cotton prices and in foreign exchange rates. In 1959 it did not have to write its stocks down, as it had to do, to the tune of £1,196,000, in 1958 and it had to provide only £518,000, compared with £1,310,000 in 1958, for exchange losses.

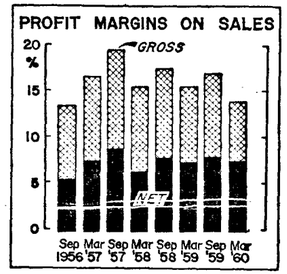
English Sewing Cotton

LIKE those of J. & P. Coats, the preliminary results of English Sewing Cotton published at the beginning of the month gave added strength to the market in cotton shares. English Sewing Cotton's profits were much higher, particularly those earned by its British interests, and again like J. & P. Coats the group was not faced with big losses on stocks. The ordinary dividend, having been left unchanged for five years at 12½ per cent, was raised to 17½ per cent, so that at 52s. 9d. the £1 shares yield 6½ per cent. In his statement with the full accounts the chairman, Mr Leslie Shaw, makes it clear that the recovery in trade did not really get under way until late in the year. That fact and Mr Shaw's comment that the order book is good and that profits in the first quarter show a "pleasing advance" over those of the first quarter of 1959 suggest that the immediate prospect is a bright one.

Re-equipment and expansion in this country and, through the subsidiary American Thread, in the United States has added to the group's short term debts. The bank overdraft now amounts to over £3 million and the directors are considering plans to replace it with longer term finance. They hope to put their proposals before shareholders in the next few months. It has been a long time since an old-established company in the cotton textile industry has appealed for new money, but the trading prospects and the market in cotton shares itself are such that it would be surprising if such an appeal were not successful.

John Thompson

IT could have been worse. That was the stock market's reaction to the results of John Thompson, the boilermaking company that is linked with AEI in an atomic power consortium. The interim dividend had already been cut from 10 per cent to 7½ per cent and shareholders must have been relieved that the final payment has been cut by only a similar amount. Thus the



total dividend has been set at 20 per cent, against 25 per cent. This reduced payment is barely covered by earnings for the group's trading profit fell last year by 23 per cent, from £1,742,336 to £1,331,642, and its net profit by 35 per cent, from £501,055 to £342,311. Of this amount probably about a third stems from Thompson Brothers (Bilston). This company was acquired in September, 1958, and John Thompson's latest accounts include 16 months' profits from this source.

Last August the chairman reported that the company was extremely busy on work connected with the motor trade, but that this was not the case in other sectors of the company's business. At that time however the recovery in the heavy engineering and capital goods industries was barely perceptible. What is not clear is whether any improvement in profits from these spheres will be sufficient to offset the losses that the company will have to bear in connection with the Berkeley Nuclear Power Station. No charge against profits has been made in John Thompson's latest accounts for the loss but in the balance sheet £500,000 has been set aside from general reserve to cover the company's share of the total loss. Yielding 5½ per cent the £1 shares now stand at 18s. 3d. That compares with a price of 37s. at the peak of the boom in atomic energy shares in 1957.

Beecham Group

THE rise in the net profits of the Beecham Group from £3,196,223 to £3,790,325 in the year to March 31st was sufficient to enable the directors to raise the ordinary dividend from 24 to 27 per cent and still to leave the payment covered about twice by earnings. The 5s. shares were marked down quite sharply after the dividend announcement and now yield 3½ per cent at 38s. 6d.xd. Throughout the stock exchange boom, the Beecham shares were counted among the growth stocks even though, as the chart shows, the expansion in sales of Beecham's heavily advertised products was being achieved to some extent at the expense of profit margins. This time the stock market was disturbed by the fact that in the six months to March 31st sales at £25,434,000 were not much bigger than sales of £24,525,000 in the six months to September 30th and that gross profits at £3,482,000 (against £3,943,000) and net profits at £1,864,000 (against £1,926,000) were actually lower. Over the financial year Thomas and Evans contributed a full year's profit, compared with seven months in 1958-59, and James Pascall contributed profits for 11½ months.

The decline in the gross margin was sharp and at 13.7 per cent it is lower than it has been since the six months ending on September 30, 1956. There may be seasonal influences affecting these margins now that Beecham through its control of Thomas and Evans has a big stake in the soft drinks industry and it may be that the slight recovery in margins reported in the six months to September 30th last reflected the fillip given to soft drink sales by the hot summer. But investors will not continue to

remain as confident about the prospect of growth as they were until there are definite indications that the decline in margins has been arrested.

BICC

IN his statement Mr W. H. McFadzean, the chairman of British Insulated Callender Cables, warns shareholders that 1960 is likely to be a difficult year. Under the leadership of BICC prices of low voltage mains cables and wiring and general cables have risen to some extent from the unprofitable levels to which they fell after the breaking up of price agreements in the cable industry. The ending of these agreements coincided with a period of excess capacity, which resulted in part from such technical changes as that from rubber to thermoplastic insulation and in part from the development of local manufacture overseas. In spite of recent price increases, Mr McFadzean emphasises that cable prices in general are still not back to economic levels, and he adds that as a large proportion of BICC's mains cables is sold under annual contracts it will be some months before the company benefits from the new prices. Mr McFadzean's highest hopes for 1960 are for a return of stability to the industry, which rests on "whether the self-discipline which several companies have imposed will be sustained." It seems clear, however, that BICC's first essays into price leadership have been successful.

United Drapery Stores

IN his first statement as chairman of United Drapery Stores Mr Joseph Collier anticipates further expansion for the group. Last year UDS acquired Mackross of Cardiff and the Irish credit business of Alexander Sloan (Dublin) and since the close of the company's financial year at the end of January it has acquired department stores in Portsmouth and Aberdeen. All these businesses were bought for cash, but following last year's rights issue UDS has ample liquid resources. On January 31st they amounted to £3.3 million. Last year the group achieved a new record in sales and its profits advanced from £7,912,797 to £9,024,834. The provision for unearned profit on hire purchase contracts charged against these profits went up from £503,832 to £685,954. New acquisitions contributed £425,015 and existing interests £686,892 to the advance in gross profits. Bigger sales are reflected in the rise from £9,027,018 to £10,399,897 in debtors, shown after deducting the provision for unearned profits which has risen from £2,484,753 to £3,498,756.

The first three months of the current year show a further improvement in turnover compared with the first quarter of 1959. The new hire purchase restrictions may bring some slowing down in HP sales, but these do not form an unduly significant proportion of total sales. On a 37½ per cent dividend covered twice by earnings the 5s. shares at 49s. 6d. yield 3.8 per cent.

Land Securities Investment Trust

MR HAROLD SAMUEL'S forecast last year of a modest increase in dividend for shareholders in Land Securities Investment Trust has been fulfilled with a total payment of 8 per cent, against 6½ per cent. The trust's rental income in the year to March 31st last rose from £2,708,725 to £3,188,121, reflecting in part a full year's revenue from Bowater House, which was completed in August, 1958, and from Queen Anne's Mansions, a very large office building acquired just over a year ago. The advance in rental income, however, was more than offset by increases of £382,690 to £1,195,567 in ground rents and of £192,878 to £1,539,341 in interest and depreciation. But a rise of £129,471 in other credits, including investment income, together with a reduction in tax from £387,888 to £282,868, left the trust's net income 30 per cent higher at £557,733. As in past years almost all the earnings of the trust has been distributed in dividends and ordinary earnings amount to only 8¼ per cent.

The book value of the trust's properties has risen from £41.9 million to £44.7 million and this has been financed by an increase in secured liabilities from £26 million to £30 million. It is not clear as yet how this figure is broken down, but during the year the company was lent £6 million by Legal and General Assurance on the security of a partly convertible debenture. Legal and General's option to convert can first be exercised in 1961 at a price of 22s. 6d. That right already looks attractive in relation to the market price of 28s. on the 10s. ordinary shares. Earlier this year the shares stood at 32s. 4½d. and even now they yield only 2.8 per cent.

Highlands and Lowlands

THE policy of Highlands and Lowlands Para Rubber Company, in the van of the movement toward larger groups of Malayan estates, has rapidly borne fruit.

The issued capital has risen from £469,000 to £2,169,000 in the past two years and the market valuation from £700,000 to over £8½ million. Group profits before tax in the year ending December 31st jumped from £573,000 to £1,415,000, and after deducting £630,000 (against £343,000) for tax and other charges the profit available for appropriation is £785,000, against £230,000. Because Scottish Malayan Rubber was acquired halfway through the year this bald comparison exaggerates the real improvement in the company's fortunes, which is summarised in the accompanying table.

	1958§	1959
	£	£
Profit	906,000	1,414,922
Depreciation	105,000	105,037
Pre-acquisition profit		90,242
Available for appropriation	*757,000*	*1,320,973*
Taxation	310,000	535,739
Replanting reserve	120,000	243,130
Ordinary dividend	167,500	525,836
Ordinary dividends (per cent)	*31 1/3*	*41 2/3**
Rubber crop (million lb)	21·1	23·2
Selling price, per lb	21·8d.	28·5d.
All-in cost, per lb†	16·0d.	18·5d.
Profit, per lb	5·8d.	10·0d.
Yield per mature acre	660 lb	724 lb
Profit per mature acre	£16	£30

* 39 7/12 per cent on capital of £2,168,863. † Excludes amortisation of mature areas. § Including Scottish Malayan for full 12 months.

The improvement is wholly due to rubber, earnings from palm oil and palm kernels remaining unchanged. The rubber crop was 10 per cent larger than in 1958, the gross price rose by over 6½d. to 28½d. a lb, and though costs were higher because wages and export duty went up, the profit rose by 70 per cent to 10d. a lb. The final dividend is 7d., making with the interim of 3d. a total of 10d., or 41⅔ per cent, on the 2s. ordinary shares, but as the interim was paid before the one for five bonus issue the rate on the present capital is equivalent to 39 7/12 per cent.

In his review the chairman, Mr T. B. Barlow, points out that a steady rise in output of rubber can be expected because the immature acreage untapped is more than 25 per cent of the total. The total replanting reserve now stands at £663,000, and it is planned to plant or replant about 5,700 acres each of rubber and oil palms over the next four years. The group's average cif price for rubber in the first four months of this year was 34d. a lb, and though Mr Barlow does not expect, and does not want, rubber prices to remain so high as at present, he considers the outlook encouraging.

Interunie

WHEN Mr G. Vrint, one of the managing directors of Interunie, visited the United States about twelve months ago he did not find American investors especially interested in acquiring shares in this, the second largest of the open-ended investment trusts in Holland. In Britain, where the Continental trusts are less well known to investors, he may deservedly have had rather more success. Shares in Interunie provide an entry into a wide-ranging and forward-looking investment portfolio in shares in the international companies of Holland, in local Dutch stocks, in other Continental securities and in American stocks. Though it is an investment trust and not a unit trust in the British sense it is managed very much as if it were a mutual fund.

The shares are dealt in on the Amsterdam exchange, with the price being determined by the break-up value of the underlying securities plus stamp duties and commissions. There is no loading charge, managerial expenses being charged against income and capital gains (which cannot be distributed in Holland without attracting tax at the full rate). New shares are issued at the market price. Most, though not all, the investment income is distributed and last year Interunie paid a dividend of 18 per cent. On that dividend the shares at Fl 194 offer a gross yield of 4½ per cent. Under the double tax agreements British investors can claim back the 15 per cent Dutch withholding tax so that this is a true gross yield to them. That is higher than current yields obtainable on many individual Continental securities—a reflection of the fact that the portfolio has been built up over a good number of years. The market for this kind of security in Britain cannot be big and clearly for any market to be established at all Interunie will require the active support of a merchant bank as well as a firm of stockbrokers in the City.

Head Wrightson

THE shares of Head Wrightson have in the past rightly earned the tag of "growth." From 1953 to 1959 the group's trading profits advanced year by year. In the year to March 31st last they suffered a check, falling by 10 per cent from £1,815,173 to £1,648,515. This has not prevented the directors from raising the dividend for the ninth successive year. It has been increased from the equivalent of 13½ per cent to 14 per cent, as forecast when the 50 per cent scrip issue was made. As in past years the dividend is strongly covered 3½ times by earnings.

The setback in profits was not wholly unexpected, for shareholders were warned a year ago that the volume of orders being received had fallen and that the group's exceptional progress might not be maintained in the short term. The operations of this constructional engineering group are spread throughout the capital goods industries and presumably Head Wrightson experienced the effects of the recession in this sector of the economy for the greater part of its financial year. As producers of plant for the iron and steel industry Head Wrightson stands to benefit from the industry's programme of capital expenditure. It has already received this year orders from both Consett Iron and Steel Company of Wales. Its profits seem likely to recover this year, but the 5s. shares at 22s. 4½d. yield only 3.1 per cent.

London Stock Exchange

FIRST DEALINGS:	May 9	May 23	June 13
LAST DEALINGS:	May 20	June 10	June 24
ACCOUNT DAY:	May 31	June 21	July 5

THE beginning of the three week Whitsun account has seen stock markets at their brightest for some weeks. While there has been some improvement in turnover it has still remained at a low level, and in a market short of stock gains in prices have often been out of proportion to the amount of actual buying. In the gilt-edged market prices continued their downward drift at first but gains of up to ⅛ were recorded on Wednesday following the slowing down in the rate of the rise of bank advances. Over the week 3½ per cent War Loan was unchanged at 62¼ and old Consols lost ¼ to 46⅝. Short dated stocks were little changed on balance but the near "short" 3 per cent Savings Bonds 1955-65 gained ⅛ to 91. Among medium dated stocks 5½ per cent Exchequer Bonds 1966 gained ⅛ to 101⅝, 3 per cent Savings Bonds 1965-75 were unchanged at 74⅛. 5½ per cent Funding 1982-84 lost ⅛ to 101¼ and 3½ per cent Funding 1999-2004 lost 5/16 to 68⅛.

The Economist Indicator gained a further 9½ points over the week to 357.2 and now shows a rise of 6½ per cent from its 1960 low recorded earlier this month. Steel shares have shown good rises on hopes of higher interim dividends. Colvilles and United Steel gained 3s. 6d. and 1s. 6d. respectively to 80s. Stewarts and Lloyds rose by 3s. 9d. to 52s. 6d. and Lancashire Steel rose by 3s. to the same price. In the engineering group Vickers rose a further 2s. 3d. to 35s. and Tube Investments rose by 2s. 9d. to 79s. 3d. In anticipation of the proposed merger Davy-United gained 12s. to 116s. 6d. and Power Gas 15s. to 99s.

Among Continental and American favourites Philips Lamps reflected persistent demand with a rise of 14s. 6d. to 193s. Unilever NV gained 6s. to 194s. and Unilever Limited 2s. 6d. to 151s. Fisons rose by 1s. 7½d. to 52s. 1½d. and Ford Motor after falling to 109s. rose over the week by 1s. 10½d. to 114s. 4½d.

While bank shares generally have shown little change Schroders rose by 10s. to 515. on the merger with Helbert Wagg and Hambros Bank new shares which opened on Monday at 15s. 6d. premium rose 3s. 3d. to 18s. 9d. premium. Insurance shares have been in good demand and typically Legal and General gained ½ to £17⅞ xd and Britannic 11s. 3d. to 188s. 9d.

Textile shares have made good gains following the good results from J. and P. Coats which rose 6s. 6d. to 44s. 3d.; Lancashire Cotton rose 6s. 3d. to 68s. 6d. and English Sewing Cotton 2s. 6d. to 52s. 3d. Gains were not limited only to cotton shares for Courtaulds rose 2s. 4½d. ahead of next week's results and Patons and Baldwins 7s. to 65s. 3d. Oil shares have remained dull but Shell Transport gained 3s. 6d. to 146s. 3d. There has been a good market in Kaffirs; Free State Geduld rose 6s. 3d. to 128s. 9d. and Western Holdings 5s. to 128s. 1½d.

THE MONEY MARKET

THE Bank of England has kept money extremely short in Lombard Street in the past week. On Thursday last week the Bank gave only a small amount of official help and five or six houses were having to borrow a fairly large amount from the Bank. This week the authorities have not attempted to help the market in its difficulties and two or three houses on Wednesday were forced to borrow at Bank rate. The Bank return shows a rise in discounts and advances of £8 million to £37½ million—and further special deposits of £8½ million in the week to Wednesday. The ruling rate for overnight funds has been 4½ per cent but 4⅝ has been readily conceded at times. Bill business has been small but August maturities have been sold at 4¼ per cent.

Keeping its bid unchanged at £98 17s. 3d., the discount market secured another good quota of Treasury bills at last Friday's tender. Although the number of bills on offer had risen by £10 million to £260 million, applications fell by £27 million to £417 million and the market's allotment rose from 58 per cent to 61 per cent. The average rate of discount was virtually unchanged at £4 11s. 1.69d.

(1) For a rough conversion to basis of June, 1947, multiply throughout by 1·534. (2) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the *London and Cambridge Economic Service*. (3) For a rough conversion to basis of June, 1947, multiply throughout by 1·561. (4) Surveys made twice a year; annual figures relate to October survey. (5) October. (6) In general males under 21 and females under 18 years of age. (7) Certain changes have been made in the classification and coverage of the Board of Trade's index numbers in this section. (8) The series for "*all items*" and "*other items*" have been revised throughout; quotations for Middle East and Venezuelan crude oil now replace the previous quotation for gasoline.

Suddenly I thought

"One day his cake will have thirteen candles"

"And then," I thought, "he'll be going to a public school. *Or will he?* I know which school I'd like him to go to. What I don't know is where the money will come from."

So I did the sensible thing . . .

I started to pay those school bills *now*—by easy instalments, you might say—through a London Assurance Education Policy.

For roughly £3 a month spread over these less expensive years, I'll get £100 a year coming in for five years from the time the boy's thirteen—just when the school bills really get a bit much.

And if I should die, my wife would get the money from The London Assurance, either as cash down or as income. That's another reason why I'm glad . . .

I wrote to

THE LONDON ASSURANCE

"Very good people to deal with"

Head Office: 1 KING WILLIAM STREET, LONDON, E.C.4.

To get our leaflet about THE EDUCATION POLICY simply write and ask for it. If you would also like information about Life Assurance generally, or Fire or Accident Insurance, just say so. *Address your letter to:* Personal Advice Bureau (Room 16).

APPOINTMENTS

REED PAPER GROUP

ECONOMIC and MARKET RESEARCH

The Reed Paper Group, which has extensive interests in paper production, packaging, and other converted paper products, invites applications for a number of new appointments in both its Economics Unit and its Market Research Unit. The activities of these Units are wide and varied, offering considerable scope for original thought and initiative. The work includes:—

(i) the evaluation of broad economic data;
(ii) the assessment of short and long term market prospects and raw material trends;
(iii) the analysis of new projects;
(iv) the study of the structure of U.K. and overseas industries; and
(v) the study of developments in international trade of importance to the Group's interests.

Appointments will be made at various levels. Applicants should have a first or second class honours degree in Economics or related subjects, and for the more senior appointments they should also have appropriate research experience. Applications will also be considered from candidates who are about to graduate this year.

Excellent conditions of service include a non-contributory pension scheme and provision for assistance with house purchase.

Applications, which will be treated in strict confidence, should set out full details of qualifications and experience and should be addressed to:—

The Group Personnel Officer, Albert E. Reed & Co. Ltd.,
Larkfield, Nr. Maidstone, Kent quoting reference ER/MR 12.

MARKETING RESEARCH

A London Agency in the top ten offers a progressive position as Research Officer on a group of national accounts.

Practical research experience is necessary for this post and the successful applicant should have progressed beyond the trainee stage. Salary bracket is £1,200 — £1,500.— Box 1332.

THE DURHAM COLLEGES IN THE UNIVERSITY OF DURHAM

Applications are invited for the post of DIRECTOR OF THE BUSINESS RESEARCH UNIT in the Department of Social Studies for a period of five years from October 1, 1960. Applicants should have academic qualifications in economics and experience of research in industrial organisation. Salary range £1,850 — £2,000 a year.

Applications (three copies), together with the names of three referees, should be sent not later than June 7, 1960, to the Secretary, 38 North Bailey, Durham, from whom further particulars may be obtained.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF MATHEMATICS

Applications are invited for appointment as Lecturer or Assistant Lecturer in Applied Mathematics at a salary on the scale £1,050 x £50 — £1,400 x £75 — £1,850 (efficiency bar probably at £1,550) a year for a Lecturer, or within the range £800 x £50 — £950 a year for an Assistant Lecturer, according to age, qualifications and experience. Applications (three copies) stating date of birth, qualifications and experience, together with the names of two or three referees, should reach The Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than June 24, 1960.

ACCOUNTANT IN NIGERIA

An expanding Structural and General Engineering Company in Lagos requires

A QUALIFIED ACCOUNTANT

Age 25-35 years. Free first-class passages; 15-18 month tours followed by generous leave. Good salary with free fully furnished accommodation and free medical attention.

Applications, in writing, to:

CHIEF ACCOUNTANT,
DORMAN LONG & CO., LTD.,
G.P.O. Box 2,
Dock Street, Middlesbrough, Yorks.

P E P

requires two research assistants for three-year enquiry on present pattern, future trends and policy of Mental Health Services with special reference to community care. Applicants should have research experience and interest in this field. Salary according to age and experience.—DIRECTOR, P E P, 16 Queen Anne's Gate, London, S.W.1.

O and M

J. & P. COATS Ltd., Thread Manufacturers, wish to appoint to their systems staff in Glasgow a fully trained O and M man aged about 25 to 30. Permanent appointment, superannuated with prospects of advancement. Initial salary commensurate with qualifications and experience. Applications in writing to the Personnel Manager, 155 St. Vincent Street, Glasgow, C.2, should give all relevant particulars. Full details of the appointment will be given to those called for interview.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for the post of Assistant Lecturer in the department of Social Science and Administration, mainly for teaching on the Mental Health and Applied Social Studies Courses. Applicants, preferably graduates, must have taken a professional casework training with supervised fieldwork experience, and in addition have experience in employment as a social worker. Family casework, or psychiatric social work in a local authority Mental Welfare Department or in an adult psychiatric setting, would be of particular value. Salary scale £800 x £50 — £950 a year plus £60 a year London Allowance: with superannuation benefits and family allowances. In assessing the starting salary consideration will be given to age and experience.

Applications, with the names of three referees, should be received not later than June 25, 1960, by the Secretary, The London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF AGRICULTURE

Applications are invited from graduates in Economics, Agricultural Economics, Horticulture or Agriculture for a vacancy as Horticultural Liaison Officer at the Assistant Lecturer level in the Provincial Agricultural Economics Service. The successful candidate will be required to deal with management problems in Horticulture and to establish liaison in this subject between the University and the N.A.A.S. in Yorkshire. Salary within the range £800 — £950 a year, according to age, qualifications and experience, with child allowance. Applications (three copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than June 18, 1960.

ROAD RESEARCH LABORATORY (D.S.I.R.), Harmondsworth, Middlesex, requires Civil Engineers, Physicists, Mathematicians, Statisticians in the Senior Scientific/Scientific Officer grades, for work in Tropical Section of R.R.L., as follows: (a) Civil Engineers and Physicists for work on problems of soil mechanics, road construction and maintenance in overseas territories; (b) Civil Engineers, Mathematicians and Statisticians for work on road traffic and transport, and on road safety problems of overseas territories. Work based at Road Research Laboratory at Harmondsworth, and in other regular visits to overseas territories, with, in some cases, postings to overseas territories for periods of 1-2 years on specific projects. Qualifications: 1st or 2nd Class Hons. degree. At least 3 years' post graduate experience required for S.S.O. Starting salaries with range S.S.O. (minimum age) £1,231-£1,460; S.O. £858-£1,150. Normal prospects of promotion to Principal Scientific Officer in mid-thirties (range up to £2,126) with possibilities of higher posts. Five-day week. Applications from overseas candidates will be considered. Forms from Ministry of Labour, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting S.459/59A.

ASSISTANT ECONOMIST

The person appointed to this position will be engaged in obtaining and interpreting information on economic conditions, the construction industry and the demand for building and civil engineering structures in the U.K. and Overseas. Apart from publications, it will be necessary to obtain data by means of surveys and personal interviews which could involve a certain amount of travel in the U.K.

Applications are invited from women aged 24-30 with at least a 2nd Class Honours Degree in Economics and a minimum of three years' experience since graduating. Please address applications to:

PERSONNEL OFFICER,
RICHARD COSTAIN LIMITED,
111 WESTMINSTER BRIDGE ROAD,
LONDON, S.E.1.

JOINT GENERAL MANAGER required by established Hire Purchase Finance House to assume responsibility for administration, Accountancy of legal qualification and administrative experience in larger organisations more important than Hire Purchase knowledge. Age about 40. Salary about £3,000 p.a. commensurate with age and experience.—Apply Managing Director (Appointments), Western Credit Ltd., Austin House, Derry's Cross, Plymouth.

STATISTICIAN

An opening has occurred for a man to take charge of our newly formed Statistical Section. Applicants must have had experience of market research or statistical accounts work and be fully capable of providing sales statistics for senior management. This position will be of particular interest to a man capable of working on his own initiative and interested in the modern conception of marketing.

A first class salary, fully commensurate with ability, will be paid to the right man, and applications are invited, giving full details of career and experience to date, to:

The Personnel Manager,
FABLON LTD.,
75 Grosvenor Street, London, W.1.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Lecturer in Statistics. Salary in the scale £1,050 x £50 — £1,400 x £75 — £1,850 p.a. with F.S.S.U. and children's allowances. Applications should reach the Registrar, The College, Keele, Staffs, from whom further particulars and application forms may be obtained, not later than June 30, 1960.

RENAULT LIMITED

as part of their expansion programme require an

EXPERIENCED STATISTICIAN

to take charge of a department dealing with market research sales returns and the compilation of graphs and charts. Applicants should have a degree in economics or a qualification in statistics and should have had good experience in this type of work. A good starting salary will be paid in accordance with experience and qualifications. There is a staff bonus and pension scheme and the annual holiday entitlement is three weeks.—Please write, giving full details including present salary, to the Personnel Manager, Renault Limited, Western Avenue, Acton, W.3.

RUSSIAN TRANSLATORS WANTED. Technical and legal. Typewriter essential.—Box 1333.

NIGERIAN INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH

UNIVERSITY COLLEGE, IBADAN

THE EDINBURGH JUNIOR RESEARCH FELLOWSHIP

Applications are invited from graduates in Economics for a Junior Research Fellowship tenable at the Institute in connexion with a study of the factors affecting the demand for various foodstuffs in Nigeria, which is being conducted jointly with the Department of Political Economy of the University of Edinburgh. Tenure two years, commencing on or after July 1st. Salary Scale £800 x £50 — £900 p.a. (under review). Passages paid for appointee, wife and five children under 11 years, on appointment, overseas leave, and termination. Children's car and outfit allowances. F.S.S.U. Part furnished accommodation. Detailed applications (six copies), naming three referees, by June 25, 1960, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

COMPANY SECRETARY

BOMBAY

A privately owned British Company, in the Building Material Industry situated a few miles outside Bombay, requires a Company Secretary.

A young practising Solicitor would probably best meet the requirements as a great deal of the work is on legal problems in connection with the large Indian labour force. However, a qualified Solicitor or law graduate with suitable industrial experience would certainly be considered.

Age about 30, preferably married. Minimum salary £3,250. Furnished house available in Company Compound. Medical attention and reasonable transport provided. Provident fund. Three and a half months' leave every 18½ months' service.

Apply in writing in the first instance, stating age, qualifications and experience, to Box 1334.

CITY AND GUILDS OF LONDON INSTITUTE

ADMINISTRATIVE OFFICERS

Owing to expansion, the City and Guilds of London Institute invites applications for responsible posts as Administrative Officers to be concerned with the Institute's work for the advancement of technical education and training.

Candidates should normally be within the age range 25 to 35 years, but a limited number of posts will be available for older persons with good experience up to the age of 55. Successful candidates will be appointed on salary scales within the range £750 to £1,250, with excellent opportunities for advancement to higher appointments.

Applicants men or women) should possess a degree or qualifications (experience regarded as equivalent). Administrative experience ability and an interest in technical education are essential.

Those wishing to apply should write for further particulars to the Deputy Director, City and Guilds of London Institute, 76 Portland Place, London, W.1, marking their envelopes "A.O.I."

COUNTY BOROUGH OF SOUTHEND-ON-SEA

COMPUTER OFFICER

BOROUGH TREASURER'S DEPARTMENT

A.P.T., GRADE IV, £1,065 £1,220

Applications are invited for the appointment as Computer Officer to be engaged in the planning, programming and installation of an I.C.T. Hec. 4120 Computer (delivery due in December next). Applicants should be either Qualified Accountants with wide experience of local Government administration or Engineers with experience of a computer installation. Commencing salary will be fixed according to experience of successful applicant.

Applications, quoting the names of two referees, to Borough Treasurer, Municipal Buildings, Southend-on-Sea, by Tuesday, June 7, 1960.

Consideration will be given to the provision of housing accommodation if required.

ARCHIBALD GLEN, Town Clerk.

VICTORIA UNIVERSITY OF WELLINGTON

NEW ZEALAND

SENIOR LECTURER AND LECTURER IN ECONOMICS

Applications are invited for the above-mentioned posts. The salary scale for a Senior Lecturer is £1,750 per annum, rising by two annual increments of £100 and one increment of £50 to £2,000 per annum, and for a Lecturer £1,250 per annum, rising by annual increments of £75 to £1,700 per annum. The initial salary in each case will be determined according to the qualifications and experience of the appointee.

Approved fares to Wellington will be allowed for each appointee, his wife and his dependent children.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in New Zealand and London, on July 15, 1960.

VICTORIA UNIVERSITY OF WELLINGTON

NEW ZEALAND

SENIOR LECTURER IN ACCOUNTANCY

Applications are invited from suitably qualified persons for the above-mentioned post. Applicants should have had practical experience of accounting and audit. Membership of a public accounting would be an advantage. University training and teaching experience is desirable but not essential.

The salary range is from £1,750 to £2,000 (the intermediate steps being 2 x £100 and 1 x £50); the initial salary will be determined according to the qualifications and experience of the appointee.

Approved fares to Wellington will be allowed for the appointee, his wife and his dependent children.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in New Zealand and London, on July 15, 1960.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER in PSYCHIATRIC HISTORY. The salary will be on a scale for present under review) going to £1,850 per annum with membership of the Children's Allowance Scheme and F.S.S.U. Duties to commence on either 1 July or 1 October as may be agreed thereafter. Applications should be sent not later than June 4, 1960, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF CAMBRIDGE

UNIVERSITY LECTURESHIP AND UNIVERSITY ASSISTANT LECTURESHIP IN SOCIOLOGY

The Appointments Committee of the Faculty of Economics and Politics have recently to be in a position to make appointments to a Lectureship in Sociology and a University Assistant Lectureship in Sociology in the Faculty. The persons appointed will be expected to teach mainly for the newly instituted Tripos in Sociology, to be established in the Economics Tripos, and they may also be required to co-operate in the teaching of sociology in other Triposes. It is hoped that the persons appointed will take office on October 1, 1960, but the Appointments Committee may be prepared to consider appointments to a date not later than October 1, 1961. The appointments will be subject to the Statutes and Ordinances of the University.

Further particulars may be obtained from the Secretary of the Appointments Committee of the Faculty of Economics and Politics, The Marshall Library, Downing Street, Cambridge, to whom applications should be sent as soon as possible and in any case not later than July 1, 1960. Candidates should specify whether they wish to be considered for a University Lectureship a University Assistant Lectureship or for either of these appointments. Eight copies of each application should be sent and, if not already sent, four copies of any published work or unpublished writings. Testimonials are not required, but a candidate should give the names of two persons to whom reference can be made.

FORD

and a

NEW APPROACH TO FINANCE

In the last few months FORD of DAGENHAM have been seeking staff to augment and broaden their finance service to management. A new and imaginative approach is being developed with the object of providing constructive advice on the financial implications of policies covering the whole range of the Company's activities from iron-making to the sale of the completed car. Training in economics, statistics, mathematics or accounting is desirable; a penetrating analytical mind is essential. Applications from men between the ages of 25 and 30 are now invited. Salary and prospects will be most attractive, but the standards set are uncompromising and it is unlikely that men without a good honours degree or professional qualification will be accepted.

Selected candidates will be interviewed during the next few weeks when they will be given the opportunity of learning more about the work and of meeting some of the present staff.

Replies should be addressed to

Mr H. G. Pearman, Training and Recruitment Department,
Ford Motor Company Limited, Dagenham, Essex,
quoting on the envelope "reference CRM."

THE ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION PARIS

SEEKS

ECONOMISTS

for work in its Economics Division concerned in analysing the anti-cyclical and development policies of governments and the relation of developments in Member countries to the world economy.

The qualifications required are an Honours degree in economics; advanced training or research experience in economics; versatility and imagination in dealing with the wide range of problems which arise; ability to express ideas lucidly and fluently in either English or French.

Headquarters in Paris with occasional travel within the area of Member and Associated countries.

Salary tax free. Disturbance grant, expatriation, cost of living and family allowances and Provident Fund.

Fuller details and application forms from Personnel Division, O.E.E.C., 2 rue André Pascal, Paris 16, before June 11, 1960.

ENGINEER FOR INTERNATIONAL INVESTMENT INSTITUTION

WASHINGTON, D.C., U.S.A.

The basic requirements for this position are a degree in engineering from a university or professional institution; some years in industry; and a successful record in engineering or industrial consultancy.

The work involves the technical analysis of a wide variety of industrial projects in all parts of the world either from written presentations or by on-the-spot investigations. An appreciation of marketing and the ability to make market analyses are also essential.

Applicants (aged about 35-45) should have a broad outlook and experience; assistance from specialists in any particular field outside the competency of the engineering staff is available as required. A critical and analytical approach with the ability to write clear and concise reports are essential requirements. Fluent English is essential, and other languages desirable.

The successful applicant will be stationed in Washington, but will be expected to make short visits overseas from time to time. All removal expenses for the applicant and his family will be paid and there are generous home leave privileges. The position is permanent and offers a most interesting variety of work; salary will be commensurate with qualifications and experience.

Applicants should send, in confidence, and in English, a short but comprehensive statement about their careers and background to Box 1331.

SALES PROMOTION MANAGER

An expanding marketing organisation distributing the products to wholesale, multiple, co-operative and retail gro... outlets throughout the United Kingdom require the serv... of a gentleman experienced in marketing methods and w... a sound connection with the large groups and multipl... particularly in the London area and preferably throughout ... country. To the right man, this is ... excellent opportunity to achieve unusual progress. Applicatio... (in strict confidence) must give full details of past experienc... age and salary required.—Box 1330.

MULLARD LIMITED

invite applications to fill a vacancy in their Accountancy Department dealing with Sales Costs, Budgetary Control, Financial Forecasts and Reporting for Management.

Factory costing and accounting is not involved but previous experience of this would be an advantage.

Applicants should be within the age range of 23-33 years. These posts are pensionable.

Written application should be sent to the
PERSONNEL OFFICER,
TORRINGTON PLACE, LONDON, W.C.1.

BRITISH OVERSEAS AIRWAYS CORPORATION have vacancies for Assistant Methods Officers at London Airport, salary range £860 to £1,120. They will form part of a team responsible for reviewing and improving methods of work, administrative and clerical procedures and related equipment. Degree or professional qualification required. Previous experience of the work desirable but not essential. A successful candidate will have a lively and enquiring mind with ability to think logically and objectively. He will be encouraged to apply these characteristics to a variety of interesting tasks.

Contributory pension scheme, attractive insurance and holiday arrangements.—Write, giving full details of experience and qualifications, to Recruitment Manager, B.O.A.C., London Airport, Hounslow, Middlesex.

ECONOMIST

Or Statistician with Economic qualifications is required for industrial market research work in the London Office of Tube Investments Limited. He will be required to report on any and all aspects of the Company's business.

Candidates should be between 26 and 30 years, with a good Honours degree and at least three years' practical experience in economic analysis and/or market research. A knowledge of sales forecasting techniques and statistical methods would be an added advantage. Preference will be given to candidates who have experience of engineering industry.

Salary commensurate with age and experience. This is a permanent, pensionable position.

Applications in writing to:
ECONOMICS & STATISTICS OFFICE,
T.I (GROUP SERVICES) LTD.,
THE ADELPHI,
LONDON, W.C.2.

TECHNICAL PLANNING LIMITED are expanding their operations and would require experienced Executives to handle Consumer work. Men and women between the ages of 25 and 35 are invited to apply. Candidates should have good knowledge of market research techniques. Salary according to age and experience.—Please apply in full confidence to:
THE MANAGING DIRECTOR,
TECHNICAL PLANNING LIMITED,
73 ELGIN AVENUE,
LONDON, W.9.

THE BEECHAM GROUP

has a vacancy for

a MARKET RESEARCH MANAGER. Sound market research background (including consumer research) and understanding of statistical methods essential. Commercial experience desirable. Duties will include the collation and interpretation of market research data (including television data) and the preparation of reports and forecasts. Age, 35 years or under.

Appropriate salary will be paid. Profit participation and non-contributory pension schemes are in operation.

Application, in writing only, giving details of age, qualifications and experience, and quoting reference MRM 72, to be forwarded to The Personnel Controller, Beecham Group Limited, Beecham House, Great West Road, Brentford, Middlesex.

JAMAICA COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY, KINGSTON

(Principal: H. Falkner, M.Sc.(Wales), B.Sc.(Lond.), A.Inst.P.)

Applications are invited for appointment as HEAD OF THE DEPARTMENT OF COMMERCE.

Salary scales: £1,600 x £50 — £2,000 p.a., but likely to be revised to £1,800 x £75 — £2,250 p.a.

Entry point according to qualifications and experience.

Appointment may be either permanent or on contract. Possible housing assistance. The College is a rapidly developing one.

Further information obtainable from Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W.C.2, to whom applications (six copies), giving age, qualifications, experience and names of three referees should be sent by June 21, 1960.

HATFIELD TECHNICAL COLLEGE

MANAGEMENT DEVELOPMENT PROGRAMME

A programme continuing the development of managerial ability which has begun inside the firms.

THE FIFTH COURSE WILL BEGIN ON OCTOBER 3, 1960.

After a week in residence the course continues one day per week for nine weeks and concludes with a further week in residence.

INDUSTRIAL FIRMS ARE INVITED TO OBTAIN INFORMATION FROM THE DIRECTOR OF STUDIES AT HATFIELD TECHNICAL COLLEGE, HATFIELD, HERTS.

FINANCIAL NOTICE

ROYAL DUTCH PETROLEUM COMPANY

N. M. Rothschild & Sons announce that the General Meeting of Shareholders of Royal Dutch Petroleum Company on May 19, 1960, have decided to declare a final dividend in cash of fls. 5.25 per share in respect of the financial year 1959 to be paid on each of the 72,301,575 ordinary shares outstanding at December 31, 1959. The amount of fls. 5.25 includes the interim dividend of fls. 1.50 which was made payable in October, 1959.

Furthermore it was decided that from the Share Premium Reserve on each of the 72,301,575 ordinary Shares outstanding on December 31, 1959, a 2 per cent distribution be made in ordinary shares of the Company, which will participate for the first time in the profit for the financial year 1959.

2. THE CASH DIVIDEND now becoming payable amounts to fls. 5.25 for the shares and fls. [illegible] for registered share respectively.

A. *On the bearer shares:*

This cash dividend will be payable against surrender of Coupon No. 119 on or after May 24, 1960, at the office of N. M. Rothschild & Sons on business days, Saturdays excepted, between the hours of 11 a.m. and 2 p.m.

Payment will be made in sterling at the buying rate of exchange on Amsterdam current [illegible] in view of the fact which the coupons are so specified, in view of the fact that guilder funds are being provided by the Company for that guilder funds are being provided by the Company for payment of this dividend the [illegible] foreign exchange commission will be deducted from the sterling proceeds.

In the case of shareholders not resident in the Scheduled territories, the Paying Agents may, at the request of the authorised Depositary presenting the coupons, pay the dividend in a different currency. Information on this aspect will be supplied by the Paying Agent upon request.

Coupons must be accompanied by a declaration in triplicate signed by an Authorised Depositary reading:

"We declare under our responsibility that sufficient evidence has been submitted to us that the shares from which the coupons enumerated below have been detached

(a) do not belong to residents of the Netherlands;

(b) are provided with [illegible] issued by the Nederlandsche Bank."

From the gross dividend the Netherlands dividend tax of 15 per cent is to be deducted except in the case of coupons presented on behalf of: (1) residents in the United Kingdom, provided they hold a Netherlands declaration — Inkomstenbelasting No. 92 V.K. — in duplicate; (II) residents in the Netherlands Antilles, Surinam or Curaçao, provided they hold a Netherlands declaration — Inkomstenbelasting No. 92 NA — in duplicate; (III) residents in Sweden, provided they lodge a Netherlands declaration — Inkomstenbelasting No. 92 ZW — in duplicate, duly completed by the Swedish tax authorities; (IV) residents in Finland, provided they lodge a Netherlands declaration — Inkomstenbelasting No. 92 FIN — duly completed by the Finnish tax authorities; (V) residents in Denmark, provided they lodge a Netherlands declaration — Inkomstenbelasting No. 92 DEN — duly stamped by the Danish tax authorities; and (VI) residents in France, in which case either with the declaration, sealed and signed by the shareholder [illegible] certificate of the local duly competent by the appropriate [illegible] Inspector of Taxes or a French declaration model B in duplicate duly completed and signed by the authorised French bank must be provided.

As regards holders residing in [illegible] attention is drawn to the fact that the remittance [illegible] provides the model A Netherlands Tax Consent [illegible] to abuse is looked when or model B declaration [illegible] tax will be deducted and dividends are collected [illegible] there will be no possibility whatever of reclaiming this tax.

In case (III), (IV), (V) and (VI) above the usual affidavit certifying non-residence in the United Kingdom will also be required in payment is to be made without deduction of United Kingdom income tax.

Coupons must be left for an appropriate period for examination and be handed in personally. Coupons examined paid through the post.

Coupons must be listed in triplicate on special forms, enclosing the declaration referred to above, which can be obtained on application.

B. *On the registered shares:*

As to the shares registered in the United Kingdom section of the Amsterdam register, the following arrangements have been made for the payment of the dividend amounting to fls. 5.25 per registered share (nominal value fls. 20).

May 19, 1960, is the date for the fixing of the Sterling amount of the dividend on the basis of the Sterling Guilder rate of exchange current in Amsterdam on that date.

May 20, 1960, will be the record date. Shareholders registered at the close of business on that date will be entitled to receive the dividend.

On or before June 21, 1960, dividend warrants will be posted by the Transfer Agent, Nederlandsche Handel-Maatschappij, N.V., Amsterdam, to shareholders registered in their books on the record date.

A further announcement will be made as soon as possible giving the rate of exchange, the amount of the dividend in Sterling per share and the amount of the 15 per cent Netherlands dividend tax in Sterling per share.

2. DISTRIBUTION OF 2 PER CENT IN SHARES on the ordinary shares in issue on December 31, 1959, in new bearer and registered shares.

A. *On the bearer ...*

Coupon No. 120 from the bearer shares ... the 2 per cent to the share distribution.

B. *On the registered shares:*

Holders of shares registered in the Amsterdam register (including the United Kingdom section thereof) and in the register at the London office of Lloyds Bank, who hold share certificates are in addition to those already issued of the manner in which they may claim the distribution. After the record date they will receive direct from the Transfer Agent, or from the Company as the case may be, dividend coupons Series "B" which will be found in the following denominations:

B 1 representing the right to the distribution on one share;
B 5 representing the right to the distribution on five shares;
B 50 representing the right to the distribution on 50 shares.

The Series "B" coupons will enable the holding of registered shares to be built up to any New York round lot. The holder of bearer shares [illegible] five B 1 coupons or five B 5 coupon will have the same value as one coupon B 50 detached from a bearer certificate for 50 shares, and so on.

Authorised Depositaries [illegible] coupons No. 120 and/or Series "B" coupons may present them at the office of N. M. Rothschild & Sons for exchange for new shares in bearer certificates for one and 50 shares. Coupons may also be exchanged for shares registered in the U.K. section of the Netherlands register or in the New York register in which case they should be sent to Nederlandsche Handel-Maatschappij, N.V., Amsterdam, or to The Chase Manhattan Bank, New York, as appropriate. In the former case presentation to Nederlandsche Handel-Maatschappij, N.V., Amsterdam, may be made through the intermediary of N. M. Rothschild & Sons.

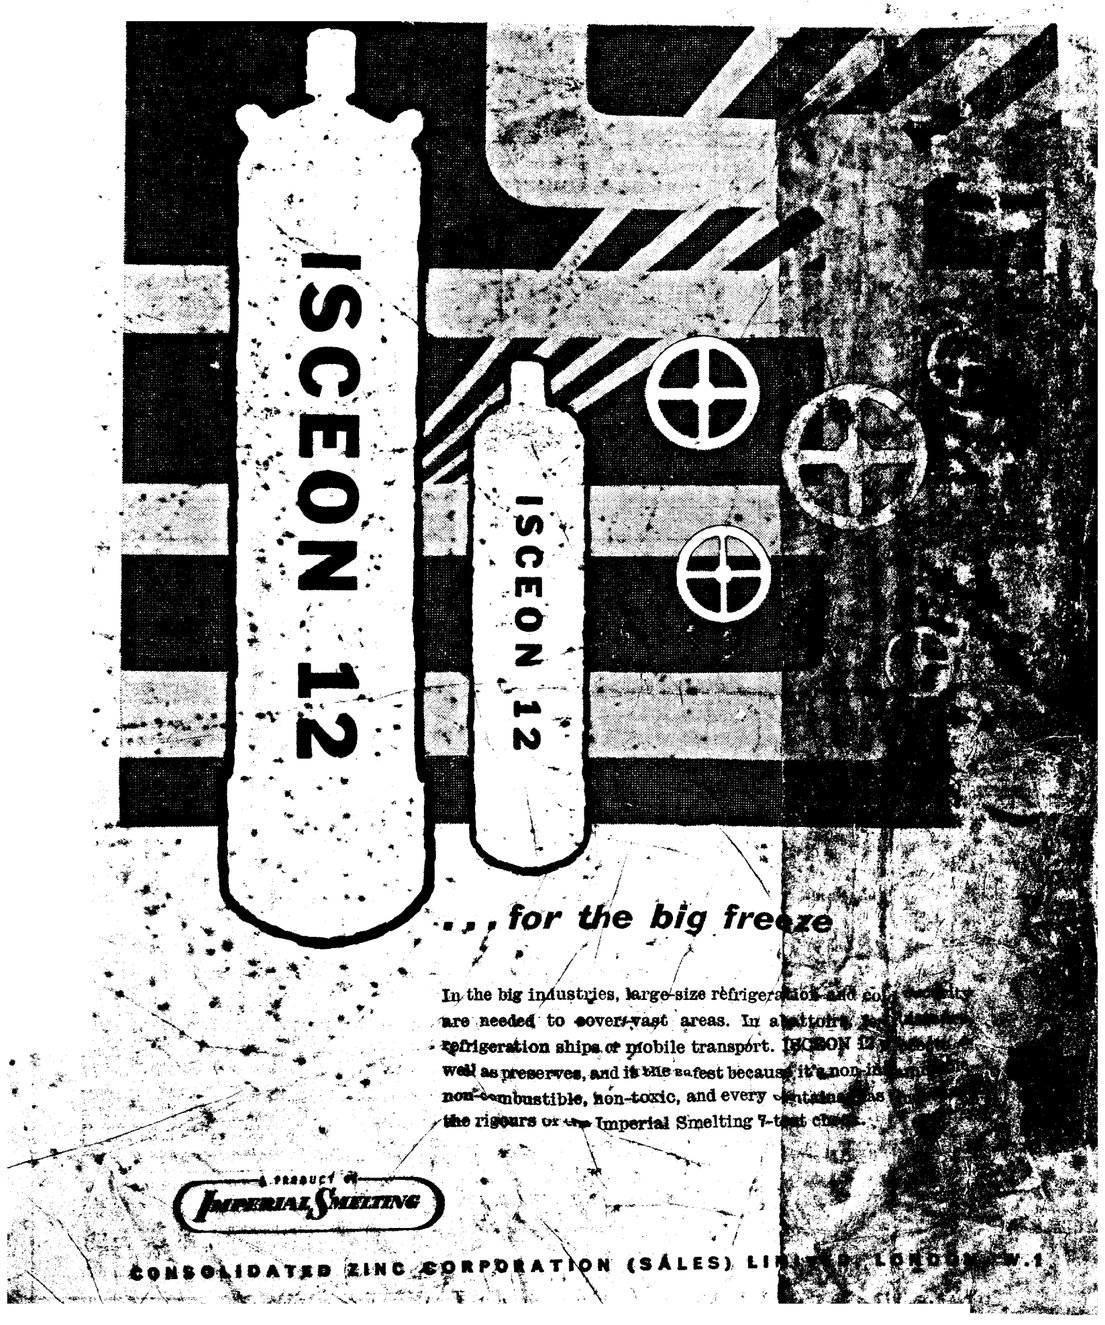
Residents of the Netherlands are not eligible to be registered as the holders of shares registered in the United Kingdom section of the Amsterdam register or in the New York register.

Coupons from a minimum of 250 shares or a multiple thereof must be lodged if new bearer shares are required and from a minimum of 50 shares or a multiple thereof if registered shares are required.

Series "B" coupons may be amalgamated with coupons No. 120 in order to make up the appropriate number required for presentation, but fractions of a share will not be issued.

Coupons must be listed in triplicate [illegible] will not be issued, are available from N. M. Rothschild & Sons, special forms which are available from N. M. Rothschild & Sons and must be left for an appropriate period for examination and must be left for an appropriate period for examination and must be

Further information is obtainable from N. M. Rothschild & Sons, New Court, St. Swithin's Lane, London, E.C.4.



May 20, 1960.

With reference to their announcement dated May 20, 1960, regarding the FINAL DIVIDEND for the year 1959 on the shares of fls. 20 registered in the United Kingdom section of the Amsterdam Register, N. M. Rothschild & Sons are authorised by Royal Dutch Petroleum Company and by Nederlandsche Handel-Maatschappij, N.V., Amsterdam, the Transfer Agent, to announce that the rate of exchange fixed for the payment of the dividend is fls. 10.581=£1. The gross amount of the dividend will be 10.5s. United Kingdom and the amount of the 15 per cent Netherlands Dividend Tax 1.6s. 0.7574d. per share.

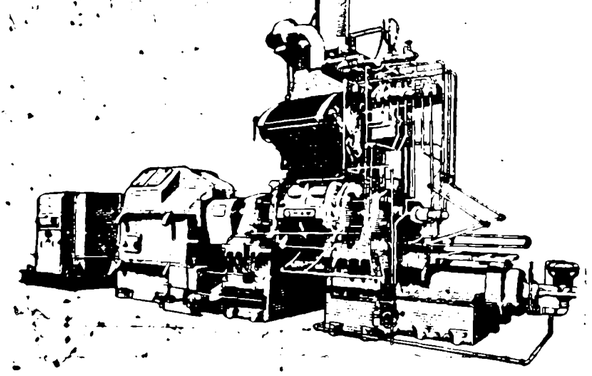
The way you take.

...leads through the snow
...through floodwater
...through muddy fields
...way trodden in safety, in comfort



Rubber boots are among the minor modern conveniences of life—particularly dramatic or exciting, but part of the daily contribution made by industry to make comfortable living. Man-made rubber is a contribution on scale, supplementing natural rubber both in properties and in economic value.

Synthetic rubbers, originating in laboratories rather than plantations, are the result of research and experiment. Their compounding needs careful and thorough control of raw materials, and processing under accurately controllable conditions. Plant and machinery derive from long co-operation with synthetic rubber makers. Constant research and development, leading to advanced design and skilled manufacture from selected materials.

Features of the Francis Shaw Intermix include:

- ★ Compounding with thorough dispersion
- ★ Effective control of temperature
- ★ Low wear rate and easy maintenance
- ★ High or low speeds

Take the way to better production—with Francis Shaw machinery for synthetic rubber manufacture

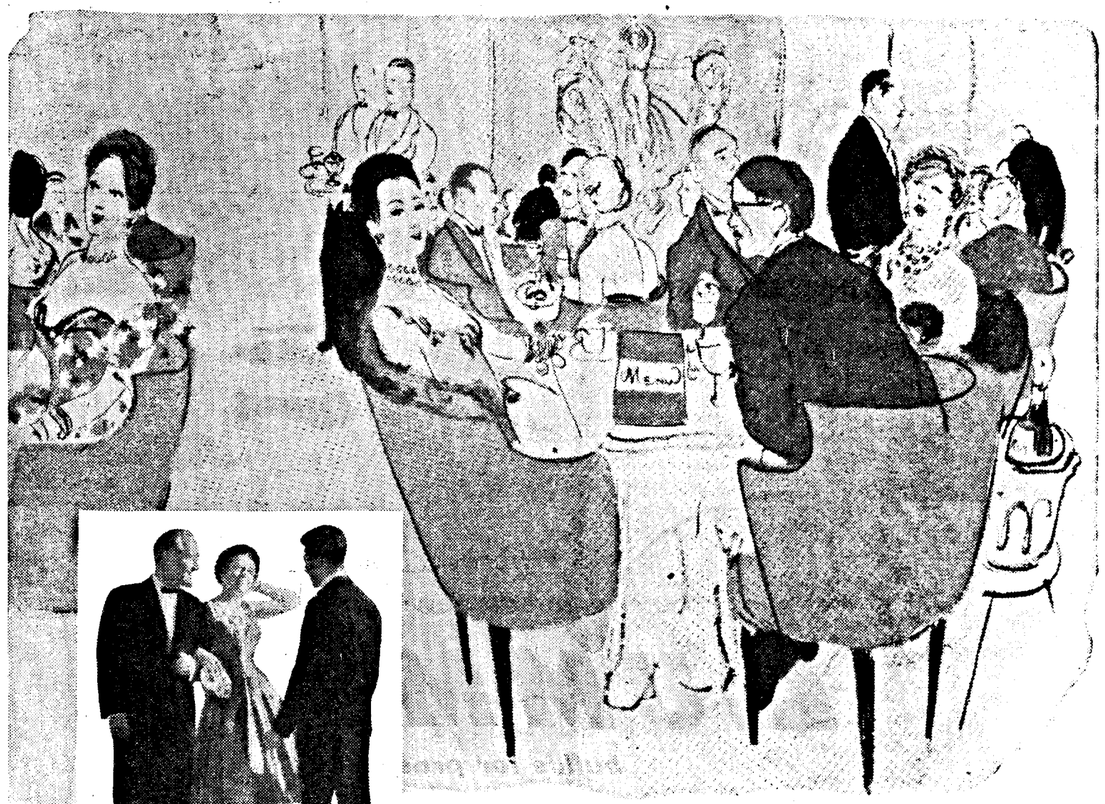
WORLD'S SMARTEST RESORT, WORLD'S FASTEST SHIP

Sail with a gay Who's Who on s.s. "United States"

To America in five days! From the moment that deep ship's whistle fills the air, your trip on the UNITED STATES is an unforgettable experience.

You enjoy Meyer Davis dance bands . . . gourmet meals . . . pre-release films . . . cinema horse-racing . . . a heated swimming pool.

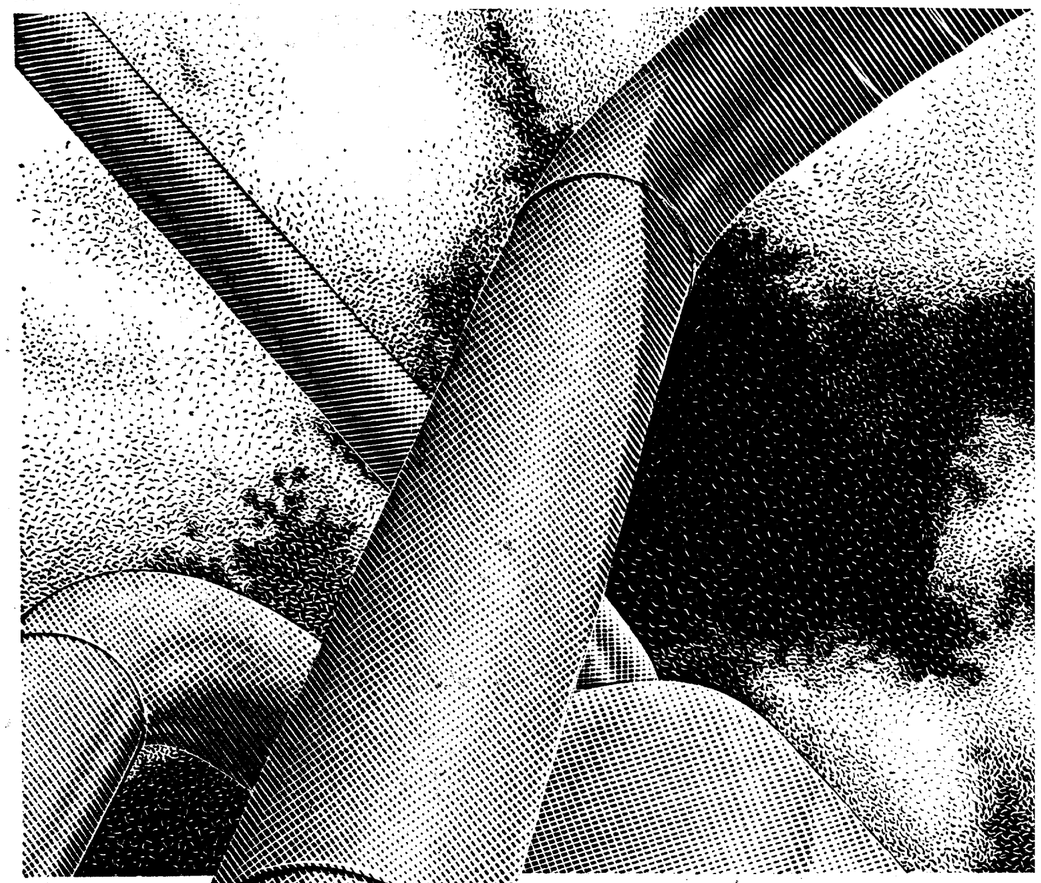


Your fare includes acres of deck space . . . luxurious air-conditioned accommodation . . . liberal luggage allowance . . . plus 5 days of the world's most palatial resort life thrown in! There is no finer food and service anywhere than on this great ship and her charming running-mate the AMERICA.

By Presidential proclamation, 1960 is a special "Visit America Year." Your voyage can be a glorious holiday for your family too. With the lifting of restrictions on currency for travel you can get virtually unlimited dollars for expenses on board and in the United States and Canada. The luxurious Cabin and Tourist classes can meet any budget problem. And you can pay all fares to your destination and return in sterling. Also, when the low Thrift Season fares are in operation there is an additional reduction of 10% on Round Trip fares during the same period.

Consult your Travel Agent about inclusive tours based on our "in-America-when-you-step-aboard" sailings.

It's sparkling, gay, lively—but no two guests get the same impression of the Captain's Dinner. This is how Tom Keogh, the well-known illustrator and stage designer, sees it.



Since restrictions on currency for travel have been lifted, more and more wives go with their husbands on business trips to America.

AEI

Transmuting Matter. Here is the twentieth century 'philosopher's stone', transmuting the materials exposed to it. It is high energy electron irradiation, and it can toughen a silicon rubber shoe sole, preserve food, sterilize surgical dressings, develop new plastics. An AEI laboratory to irradiate samples quickly and cheaply was recently built and can be hired for £50 a day. AEI were the first in the world to develop the *linear accelerator* (heart of this apparatus) for medical uses.

WORLD ELECTRICAL NEWS IN PICTURES-4

Slim Vision. When AEI introduced the Siemens Ediswan 100 17" tube, it opened the door to the new slim sets—less bulk and better looks. The trick is done by a new 'cylinder' lens, which needs a much shorter focus than the conventional type. Many big manufacturers now fit a slim tube from AEI, who make in all over a million tubes a year. They will be ready with the 'slim' 21" tube too, when the manufacturers are ready to make the sets.

Breaking Russian Ice. This ship can sail through ice up to 10 feet thick. She is powered by de Schelde—AEI diesel-electric machinery that develops 7,000 s.h.p. She is one of six built for Russia and carries cargo and passengers to and from the Northern Baltic ports. She is shown here in the Antarctic where she was the flagship for the Russian expedition during the Geophysical Year. Thus British know-how plays its part in literally smashing a way through one of the toughest of all barriers to trade.

AEI

Associated Electrical Industries Limited

—a single manufacturing company uniting the people, traditions and knowledge of such world-famous names in electricity as Metrovick, BTH, Siemens, Ediswan, Henley's, Birlec and Hotpoint. *With its 100,000 employees, 60 factories, 94,500 stockholders, £133,000,000 capital and £208,000,000 sales last year, AEI is helping Britain to compete in the electrical markets of the world.* AEI resources are increasing the world's supply of electrical power; AEI research is finding new ways for people to benefit from it. Every working day of the year, AEI delivers on average £800,000 worth of electrical equipment to its customers.

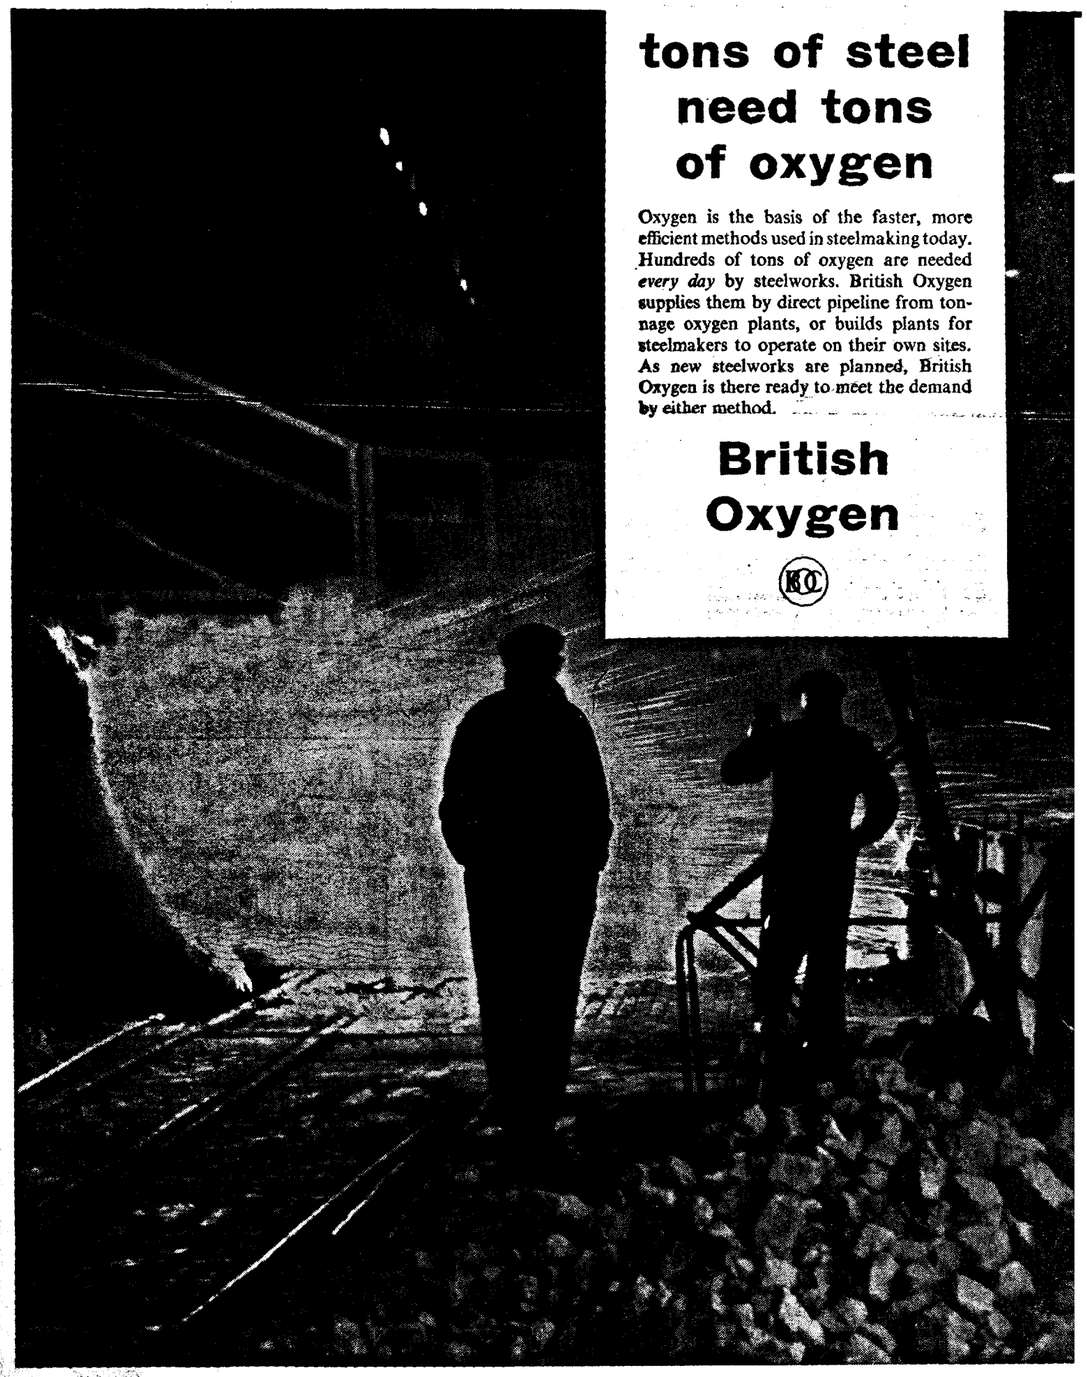
Stopping corrosion in tankers

In certain circumstances, oil can itself cause corrosion of metal. So oil's chemists evolve a paint to safeguard the tankers.



If the oil products carried in tankers are not kept at the correct temperature, they can free bacteria which eat into the metal of the tanks. Until recently constant repainting and the replacement of costly heating systems was the only answer to this problem of corrosion.

SHELL Chemists, exploring the special properties of epoxy resins, have now formulated a new paint with exceptional adhesive and anti-corrosive properties. This reduces the cost of tanker maintenance by avoiding the replacement of heating coils and bottom plates. Chemists can solve such problems, and test their solutions, only in laboratories where modern equipment simulates industrial conditions of operation.

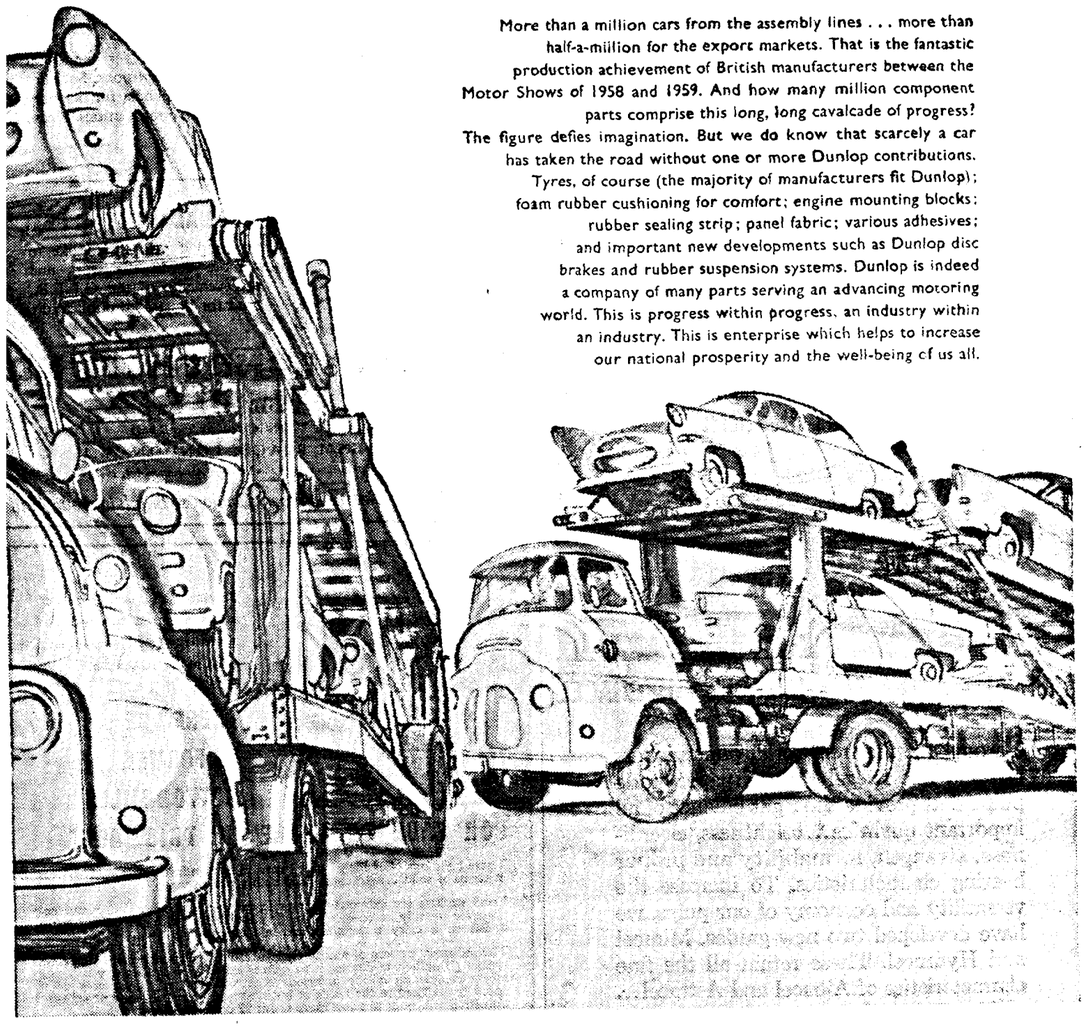
SHELL INTERNATIONAL PETROLEUM COMPANY LIMITED · ST. HELEN'S COURT · LONDON EC3



tons of steel need tons of oxygen

Oxygen is the basis of the faster, more efficient methods used in steelmaking today. Hundreds of tons of oxygen are needed *every day* by steelworks. British Oxygen supplies them by direct pipeline from tonnage oxygen plants, or builds plants for steelmakers to operate on their own sites. As new steelworks are planned, British Oxygen is there ready to meet the demand by either method.

British Oxygen

BOC

COMPONENTS OF PROGRESS...

More than a million cars from the assembly lines . . . more than half-a-million for the export markets. That is the fantastic production achievement of British manufacturers between the Motor Shows of 1958 and 1959. And how many million component parts comprise this long, long cavalcade of progress? The figure defies imagination. But we do know that scarcely a car has taken the road without one or more Dunlop contributions. Tyres, of course (the majority of manufacturers fit Dunlop); foam rubber cushioning for comfort; engine mounting blocks; rubber sealing strip; panel fabric; various adhesives; and important new developments such as Dunlop disc brakes and rubber suspension systems. Dunlop is indeed a company of many parts serving an advancing motoring world. This is progress within progress, an industry within an industry. This is enterprise which helps to increase our national prosperity and the well-being of us all.

TO BRITAIN'S 92 MOST ENTERPRISING MANAGING DIRECTORS

Burnley, Nelson and Colne are names famous in the world of textiles. Now, however, as a result of the Cotton Act of 1959,

THERE ARE 92 FORMER COTTON MILLS

FOR SALE OR LEASE IN THIS AREA

These buildings offer the go-ahead man in light industry major advantages in terms of solid construction, adaptability, and space.

Local workers are extremely adaptable and nimble-fingered. Communications are soundly based—and provide close contact with the nerve centres of British industry in the north and midlands.

The industrial pattern of north-east Lancashire is changing fast—Burnley's special £5 million re-development plan is already well under way with the recent completion of the luxurious Keirby Hotel, an eight storey hotel specially designed to the needs of businessmen. Men of foresight in figh industries will want to know more about 92 opportunities like these.

Full particulars of these properties are available from

The Hon. Secretary, North-East Lancashire Development Committee, The Town Hall, Burnley, Lancashire.
