From this first principle springs a further basic thought: methods used in economic and social development cannot be divorced from the overriding social objective without destroying the objective itself. It means that neither sound economic development nor real social progress can be achieved by the imposition of a particular way of life, by herding people into regimented units, collective farms or communes, by depriving them, even temporarily, of their liberties, or by disregarding their human dignity. These methods are not only destructive of personality, but even the social results are not worth the sacrifices involved. They do not meet the people's need for an early improvement in their levels of living. Real wages in the Soviet Union, not to speak of Communist China, remain far below those paid in the free economies of the West. In spite of remarkable technical developments, longer hours of

work are required of the Soviet worker before he can earn enough to buy the basic necessities. This is a rather startling fact after forty years of Soviet Communism, even when one takes into account the late start of the Soviet Union in large-scale industrialization, and the ravages of the Second World War. There continues to prevail a painful shortage of consumer goods, a severely limited choice for the individual as to how to use his limited purchasing power. And there are continuing restrictions on mobility, and limitations on other prerogatives of the individual. What is more, there is no indication that "the State will wither away," to use the famous dictum of Karl Marx; that there will ever be real social fulfillment and true freedom for the individual.

THE NEED FOR PLANNING

The social approach to free world assistance in the development of the underdeveloped countries calls for careful planning. There are some in this country to whom the word "planning" is a dirty word. It smacks of Socialism and Communism. Yet, private companies plan and could not survive otherwise. Similarly, over-all development has to be planned, to husband scarce resources and to give purpose and perspective to economic and social development.

There are fundamental differences between "planning" as here understood and totalitarian planning. Viewed in free world perspective, the less-developed countries with their vast human resources must be encouraged to stress "human investment," the human element in the development process, the importance of human qualities and attitudes, intangible most of them, which encourage economic growth and efficiency. These include organizational capacity, initiative and self-reliance,

energy and hard work, honesty, confidence in the future, skills and knowledge, inventiveness, ambition and drive, and several others. Many of these qualities, essential to growth, fall into the category of "variables" which plague the mathematical economist. They call for value judgments which cannot be quantified and fed into the computing machine, however useful such computers may be in the planning of certain aspects of economic and social development.

To bring such qualities as initiative, self-reliance, and the will to improvement to the fore, and to achieve voluntary commitment in the less-developed countries, individually and as peoples, to the development effort, it is essential that they be given a share in its planning. Considering the complexities, national planning has to be largely left to the expert, subject to final approval by parliaments or other representative bodies. However, broad participation in planning can be achieved on the local level, which gives special significance to the various community-development programs which are dealt with elsewhere in this volume.

By contrast, the totalitarian approach, rather than taking into account the human element in planning, the more intangible variables, tries to minimize or even eliminate them. In order to have its econometric conclusions come true, this approach bends human nature, it regiments the individual, it deprives him of his liberties, it tells him where to go and what to do. In one word, it tends to turn the individual himself into a machine, to reduce him to the stature of a robot. Whole generations are sacrificed to future targets. Totalitarian planning of this type loses sight of the central purpose of economic development, which is the freeing of the individual, not only from poverty and disease, but from ruthless encroach-

ments on his basic rights by bureaucrats and the ever present State.

The recognition of individual advance and social development as the ultimate objective of all economic development, has a direct bearing on the establishment of concrete development plans which, while flexible and always open to needed adjustments, can give direction and perspective to national development efforts. It is not suggested that "social" programs should be given priority over "economic" programs. The two are interrelated.

BALANCED ECONOMIC AND SOCIAL DEVELOPMENT

There has been much discussion in the United Nations, and particularly in its Economic Commission for Asia and the Far East, of "balanced economic and social development," aimed at a better understanding of the relative importance of economic and social programs in the over-all development of the less-developed countries, their relationships and "complementarity," the allocation of scarce resources for social as contrasted with economic purposes, and the co-ordination of programs to achieve maximum results in both fields.

In the light of these discussions and of acquired experience, it has become possible to advance certain tentative conclusions. There is growing agreement that priority should be given to economic programs with an early social impact, and to social programs designed to advance economic development.

Within the economic category, early emphasis should be placed on the development of labor-intensive enterprises, such as the development of power and transportation facilities, on food production and the encouragement, in the private and the public sector, of industries designed to meet basic consumer needs. This emphasis on achieving high levels of employment and on the early

satisfaction of consumer needs and the raising of levels of living creates incentives to hard work and strengthens the commitment of the people to local and national development efforts. Needless to say, there is a danger point beyond which it would be unwise to stress the early satisfaction of consumer needs lest, due to insufficient savings, capital resources should not grow sufficiently to permit investments necessary to the acceleration of economic growth²—such growth to include the establishment of capital industries at a reasonable rate.

Inversely, social programs need to be developed which have an immediate or early impact on economic development. This includes programs of education and of health, the development of improved labor relations and organization, and the establishment of minimum wages where possible. The elaboration and application of such programs may involve very difficult choices. It may mean, for instance, that in terms of short-range planning, limited resources have initially to be concentrated deliberately on primary education for only part of the children of school age, in order to preserve resources for secondary and higher education, particularly of the vocational and technical types necessary to meet pressing requirements for trained personnel. Similarly, in the area of health, efforts may have to be concentrated on certain regions within a country, where improved health conditions are most likely to increase production and create new capital. Such temporary imbalances, while difficult to defend on purely moral grounds, may

² While every effort has to be made to encourage domestic savings, such savings in the less-developed countries cannot be expected for some time to meet essential investment needs. To assure a sufficiently rapid growth of development, financial aid from abroad has to be provided in the form of private investment and public aid through loans and grants.

be necessary in order to provide manpower where it can make the maximum contribution and create new resources for a comprehensive development of the entire country. They can be defended on the ground that they will advance rather than retard social development.

At a recent Working Party on Economic Development and Planning in Bangkok, the Philippine Representative addressed herself in some detail to shifts in emphasis within social programs to accelerate economic development, and discussed recent shifts of emphasis in broad social programs which had taken place in the Philippines. Like the advertisements of reducing medicines, she used the "before" and "after" methods. In the field of education, for instance, emphasis in the Philippines used to be on literacy, while it had now shifted to vocational training, including the field of agriculture. The accent on training for government jobs had been replaced by a recognition of the need for skilled labor and management personnel. In the field of health the earlier emphasis on the building of expensive hospitals had yielded to health campaigns for control of malaria, particularly in newly opened parts of the Philippines, and of tuberculosis, particularly in the industrial labor force. Accent was now placed on rural health centers and on nutrition. In the field of labor, where the emphasis had in the past been on direct benefits and on the setting of standards, greater emphasis was now placed on apprenticeship, on unionism and collective bargaining, and on labor-management relations. In the field of social welfare, a preoccupation with public assistance had yielded to a new emphasis on self-help. The accent on family welfare services had yielded place to efforts to foster community-wide services, frequently in the form of co-operatives. A drive for community development

had outgrown an earlier emphasis on casework.

Needless to say, the observations made here are not to be taken as an attempt to produce the blueprint of a master plan. In keeping with the various stages of development reached by the less-developed countries, and in line with their traditions and special needs, each country has to establish its own plans and guide posts. What counts is the recognition that those who are responsible, in the more highly developed free countries, for the development of foreign policy will do well to give full weight to the importance of those types of assistance most likely to further social development in the less-developed regions of the world in the form of higher levels of living shared in by the largest possible number of people.

"SOCIAL WORK, LTD."

In a democracy, foreign policy is a concern of all the people. Each group in the population—engineers, agronomists, economists, doctors, educators, social workers—have their own contribution to make to the formulation and attainment of foreign policy objectives. In an age when the raising of levels of living has become a major objective of both domestic and foreign policy, all of those working in the social field have an exceptionally important role to play.

If the word "social" is taken in its widest sense, it is evident that in some social areas, such as the improvement of health and nutrition, remarkable progress has been achieved through national and international efforts in the less-developed countries. Much has been done, also, by such agencies as the International Labour Organisation to create a greater awareness of the need for better labor conditions or, through the United Nations Children's Fund, for improved care for mothers

and children. Community-development programs in Asia and in Africa owe much to foreign assistance, including a number of dedicated social workers from the West. Progress in education, while remarkable in some places, has on the whole been slow, too slow in view of existing needs.

At best there is no cause for complacency. The number of teachers or social workers serving in foreign lands either under bilateral aid programs or under international auspices, such as the United Nations Expanded Program of Technical Assistance, is surprisingly small. Even more striking is the fact that social work experts play a very minor role in the policy-making bodies of most of the less-developed countries or among those who are responsible for bilateral and international aid programs. The situation in this respect is so unsatisfactory that the Economic and Social Council of the United Nations, at its 28th Session in the summer of 1959, felt compelled to request "the Secretary General, in cooperation with the specialized agencies concerned, to give special attention to the inclusion of social experts at appropriate stages, especially the initial stage, in the planning and implementation of economic development projects in order to insure adequate consideration of the social implications."

Without attempting an analysis in depth, it might be suggested that one of the major reasons for this situation is inherent in the aspirations and attitudes of many of those who have made the promotion of social welfare their life work. There is no lack of interest in foreign relations or of willingness to serve. But there is frequently an excessive preoccupation with methodology, requiring ever more advanced forms of specialist training and an over-emphasis on degrees and "professional" standards.

This preoccupation and emphasis is undoubtedly important, but unless it is balanced by training in the broad issues of economic and social development which confront two thirds of the people of the world, it tends to isolate the social work expert from the broad stream of historical change. It may even result in a form of parochialism which may prevent the great social work profession in such a country as the United States from making the contribution it should to social development throughout the world.

The "Ltd." has to be taken out of

"social work," to permit the free world countries, and chief among them the United States, to provide to the less-developed countries expert assistance which will lift social planning and activities to the high policy level, and to train social workers, in and for these countries, whose specialization will be given meaning by their grasp of the problems of balanced economic and social development. The new perspective thus gained will give new direction and strength to social development in the world as a major objective of enlightened foreign policy.

INTERNATIONAL RELATIONS

FRANZ M. JOSEPH (Ed.). *As Others See Us: The United States Through Foreign Eyes*. Pp. viii, 360. Princeton, N. J.: Princeton University Press, 1959. \$6.00.

The short and not so sweet tenure of American world power is slipping away without giving Americans a chance to enjoy the sensations of undeserved superiority. This is at least one distinction that differentiates us from the Greeks, Romans, Spaniards, and Englishmen whose days in the sun lasted so much longer and were generally so much more profitable. Few Americans tread land abroad as masters; even our soldiers and airmen huddle on their bases, fenced off from a world largely out of bounds. Despite all the talk of ugliness, most of our official civilians are engaged in earnestly trying to help a variety of querulous people spend American money for their own benefit. Meanwhile, in the United States, the effort to achieve an intelligently hardheaded view of American problems in a changing world is bogging down in swamps of worry over what these querulous people think of us, our foreign policy, our national and individual behavior, our culture, our characters, our mortal souls. Instead of understanding the simple proposition that no-

body likes the powerful—and the Russians have acquired this status, and the Chinese are fast approaching—we are supposed to be bothered by the spite we earn regardless of how often we shine our shoes, pare our nails, wipe our noses, use the right kind of soap, and spend so much money.

These perverse sounding remarks are inspired by this book *As Others See Us*, a collection of essays by foreign authors including no Chinese, Japanese, or Russian authors, but many others, ranging from well-known and knowing skywriters like Denis Brogan and Raymond Aron and the urbane A. D. Gorwala of India to much less well-known and less knowing generalizers such as: Julian Marias of Spain who writes, "When the American and Spaniard meet there is usually comprehension and frequently a lively congeniality," and Peter von Zahn of Germany stating that, "(The Occupation and the Nuremberg trials) strengthened the German in his conviction that the American's conceptions about right and wrong were simple, sometimes primitive, that he did not know political compromise, the nuance, the shades; but that he attempted, with the greatest determination and complete disregard for precedents, to make his views prevail." Yugoslavia is represented by a diplomat's wife who manages to sound exactly like

Ninotchka in the early scenes of that play: "My views, feelings, and judgments arising from my experience in the United States have never been entirely personal. . . ." The Egyptian author, who "obtained permission of his government to write this essay," informs us that "recent international happenings have shown U. S. policy to be guided by forced alliances and by gain and expediency rather than by right and justice."

Seldom do these authors have anything fresh to say about America—most of their remarks are friendly, superficial, and only occasionally shrewd. Only a few seemed to realize that it was not their portraits of America but of themselves that are significant, and most of these profit from being unintentionally drawn. And, only a few deliberately saw the essay as a means of communicating about themselves. From these, notably the Ghanaian K. A. B. Jones-Quartey and most perceptive of all, the Italian journalist, Luigi Barzini Jr., we do get memorable vignettes of encounters with America. In general, however, one looks in vain through these essays for evidence that there is some higher and more perceptive grace in any of their motes than in any of our beams, or that in the protected sanctuary of greater weakness of the lesser power or the ex-power there is some secret source of greater wisdom from which it would help to drink deeply.

Technology

WILBUR SCHRAMM (Ed.). *One Day in the World's Press: Fourteen Great Newspapers on a Day of Crisis, November 2, 1956*. Pp. 138. Stanford, Calif.: Stanford University Press, 1959. \$6.95.

This can be called, in a special sense of the word, a textbook. It gives the text, in English and, by a most ingenious use of typography and make-up, the appearance and texture of fourteen newspapers ranging from *Pravda* to *La Prensa*, from Cairo to Frankfurt. In all but a few cases, the entire issue is reproduced. The day chosen is the one on which the banner headline

of *The New York Times* began with "British and French Fleets Close on Suez" and *Pravda* said "Hands off Egypt," but in Stockholm, the readers of *Dagens Nyheter* found "Fleets sail toward Suez" in a secondary position, the banner reading "700,000 Russians Invade Hungary."

It is odd to find in this book, devoted in essence to the reproduction of the actual, a sort of heroic figure. "Why," asks the editor, "were these events and their meaning so much clearer to *Dagens Nyheter* . . . than to most of the other papers . . . ?" He suggests a number of reasons, including differences in time to press, and then: "Or was it that *Dagens Nyheter*, unlike most of the other papers, had not been shell-shocked by Suez and was simply making more effort to cover Hungary?"

"Clearer" and "shell-shocked" are "loaded" words here. It would be equally just to ask why the meaning of Suez did not become clear to the editors in Stockholm, why they could not take their fascinated eyes off Hungary in the tenth day of rioting and revolution there to observe the overwhelming totally new circumstance—the display of force by Britain and France. One might attribute this to the fact that the paper had a special correspondent in Budapest but relied on the news agencies for direct reports from the Mediterranean. And add that the subhead on the news story from Budapest ends with "and our newspaper urges the Hungarian people to rise against the invading Russians" which may be taken as merely an index to the editorial page, but has also overtones of the tendentious news headlines of *Pravda*.

Apart from this single lapse from objectivity, the book is admirable. It is about the size of a tabloid, but the reproduction in size of the large newspapers involves no loss except in a few photographs. Once the reader has considered the handling of the major events, he will discover many fascinating secondary points of interest: that *Pravda* actually publishes those fatuous letters from workers which appear in comic excerpts in our press; that a whole page of *Jen-Min Jin-Pao*, the Peking newspaper, is given over to a trans-

lation of an ancient Chinese classic although "the materialistic point of view lacks thoroughness" and to a report by the Institute of Philosophy on the nature of class contradiction; that *La Prensa* is as devoted to sport as any North American newspaper; and that however the press reflects the political and cultural character of its own country, one universal remains—the trivia in each of the newspapers.

The information given about the communications, radio, television, film, and books, as well as newspapers, in each country is invaluable, and the questions and summations are admirable.

ALEC NOVE. *Communist Economic Strategy: Soviet Growth and Capabilities*. Pp. xi, 82. Washington, D. C.: National Planning Association, 1959. \$2.25.

Behind its clumsy title, this well-written monograph contains a magnificent review of Russia's current economic situation. The author is one of those literate and perceptive analysts whose balanced and sophisticated judgments have most advanced our understanding of the Soviet Union. His essay can be unreservedly recommended as a thoughtful, up-to-date introduction to its subject, complete with cautions and hardheaded policy judgments.

This study of Soviet economic strength is one of several National Planning Association monographs that analyze "the economics of competitive coexistence." The separate studies investigate specific aspects of the efforts of members of the Soviet bloc, led by the Soviet Union, to win friends and influence people, especially among the uncommitted nations of the underdeveloped world, and to advance Soviet objectives through economic channels. Nove's discussion centers on the Soviet Union, with attention where appropriate to the Eastern European members of the bloc and to China, together with a series of reflections on their trade and aid relationships with the outside world.

After a short introduction and brief dis-

cussion of political forces at work in the Soviet Union, Nove presents a compact survey of the human and material resources the Soviet Union is bringing to bear on its economic challenge of the West. Next he considers the significance of important trends in the effectiveness with which Soviet economic activity is organized. In chapter four he turns to the record and prospects for Soviet economic growth and considers its possible impact on the outside world. Finally, there are four pages of conclusions, nine pages of useful statistical material, and five pages of Notes. The whole is sensibly organized and judiciously presented.

Among the many suggestive observations that mark Nove's conclusions, perhaps three can be singled out and paraphrased here. It is suggested that the Soviet example of rapid growth may prove to have a most powerful influence in Asia and Africa, quite apart from the presence or absence of a Soviet bloc trade and aid program. It is also made clear that, since the trade and aid program so far has involved only a very small fraction of overall Soviet economic activity and since substantial continued growth in the Soviet gross national product can supply easy increments for trade and aid, the Soviets' capability for a massive drive is clearly always going to be present.

The most intriguing conclusion emerging from this study is that the Soviet leadership's focus on internal domestic objectives has so far placed a narrow limit on their willingness to make heavy outward commitments. The self-imposed restraints of economic autarchy have only been relaxed here and there, not wholeheartedly abandoned. It appears to this reviewer that the Soviet Union is likely to get involved in really large trade and aid activities with underdeveloped areas only if Kremlin attitudes are substantially altered. Yet this very change in attitudes might mean, paradoxically, that we would have less need to feel concern over the dangers a Soviet drive would pose for the independence of other nations.

Associate Professor of Economics
Haverford College

RAYMOND L. GARTHOFF. *The Soviet Image of Future War*. Pp. xii, 137. Washington, D. C.: Public Affairs Press, 1959. \$3.25.

Dr. Raymond L. Garthoff is among the few top students of Soviet military strategy in the West. His two previous books, *Soviet Military Doctrine* and *Soviet Strategy in the Nuclear Age*, are classics on Soviet strategy. He is presently with the Department of Defense.

Soviet strategists in recent years have rejected the view, accepted so unquestioningly prior to Stalin's death, that the traditional "principles of war"—security of the rear, trading space for time, the devices of attrition, and so forth—are by themselves sufficient operational precepts for victory in the nuclear age. Since 1953, Soviet strategists have realized that modern military technology is no respecter of ideologies and that, unless the Soviet Union is able to achieve a position of technological-military superiority, the Soviet homeland will be in great danger in the event of war. This book has many implications for defense policy, for it casts considerable light on issues which have provoked one of the most searching debates on military policy yet witnessed in the Western world. The debate has centered largely on whether United States-Western military posture is adequate to meet the full range of Communist military threats.

The problem is primarily one of estimating Soviet intentions and capabilities. While national security policy should be based more on the latter, every effort should be made to analyze Soviet intentions. It is in this light that Dr. Garthoff's book is particularly useful. At issue in the Western military debate has been the question of whether the United States has not overemphasized its capacity for waging general war to the detriment of its limited war capability, although limited conflicts represent the more probable future threats. Dr. Garthoff's study supports those who contend that limited war is much more in keeping with classic Soviet strategic doctrine than strategies for general war. "The Soviets tend in their published writings to discount or deny the possibility of local

and limited wars, particularly limited nuclear war. But there are good reasons to doubt that such statements foreshadow future Soviet behavior. . . . In seeking to maneuver the U.S. into positions of choice between massive but mutual devastation, or no effective response at all, they strive to deprive us of confidence that we have the alternative of limited nuclear reaction. . . . Limited wars, indeed, represent the classic form of Communist limited military action, for limited objectives, and at limited risk. . . ." (p. 15).

Perhaps the author's most interesting point concerns the importance of surprise attack in Soviet strategy.

While Dr. Garthoff concedes that surprise is now recognized by Soviet military thinkers as a critical factor in modern war, he concludes that the revolution in Soviet strategy on this issue is not complete. Dr. Garthoff does not completely reject the thesis advanced by Herbert S. Dinstein in his study, *War and the Soviet Union*, that the Soviets have fully incorporated the concept of the complete pre-emptive strike into their strategic doctrine. But his analysis clearly supports the view shared by not a few Western military experts that a pre-emptive nuclear strike against the centers of Western power is the least likely of Soviet threats. "Every tenet of Soviet military doctrine is opposed to the conclusion that such a venture would lead to quick victory" (p. 83). More probably the new Soviet missile-nuclear capabilities will be used to underwrite an increasingly bolder strategy of limited challenges designed to demonstrate to America's Allies that American power is no longer adequate to provide for their security. The Soviets will launch a pre-emptive strike against the United States only if "the United States were ever to let its whole military strength so decline that the Soviets believed they could win at acceptable cost . . ." (p. 85).

This excellent study should be read by everyone concerned with the formulation of Western defense policies. Its message for Western policy-makers is clear. No single strategy will be sufficient to deal with the military tasks confronting the United States and its Allies. The West

must have a flexible military posture adequate to cope with the full spectrum of conflict.

University of Pennsylvania

LESTER B. PEARSON. *Diplomacy in the Nuclear Age*. Pp. vi, 114. Cambridge, Mass.: Harvard University Press, 1959. \$2.75.

This little book comprises the author's four Clayton Lectures, delivered at the Fletcher School of Law and Diplomacy in 1958, and the Nobel Peace Prize Lecture of 1957. They present the views of an articulate and wise public official with long diplomatic experience in the service of the Canadian government. Since Mr. Pearson's intelligence and authority have always been bywords at the numerous international conferences at which he has participated, students of diplomacy and international relations are bound to find his views interesting, and the reading of them is pleasant and not very time-consuming.

They should not, however, expect anything particularly novel. This reviewer has seen or heard elsewhere practically every idea expressed in this book. Words of wisdom and experience are, after all, not usually arresting for their originality. But it is useful to have them repeated conveniently, especially if they are well stated, and there are always new students to whom a book such as this will have freshness along with its other virtues.

In the first chapter, entitled "Diplomacy New and Old," the author discusses the effects on diplomacy of the acceleration of communications and the transformations of political society in many parts of the world. Nuclear weapons have made the consequences of failure far more disastrous than formerly but have not, he thinks, affected the conduct of diplomacy as such. Communications have reduced the decision-making functions of the professional diplomat, but the observing and reportorial functions remain. The glare of modern publicity has made a profound change in his environment, yet the qualifications that

made a good ambassador two or three centuries ago would also serve well today.

In the very brief second chapter, "On Coalition Diplomacy," the author becomes less general and concerns himself primarily with the North Atlantic Treaty Organization (NATO). He feels that the NATO Council should have more decision-making authority in both the foreign and defense policies of the member states. The third chapter, on "Negotiation and Diplomacy," reiterates some well-known but significant truths about negotiations, such as the importance of knowing one's own objectives and of having agreements recorded accurately in writing. The fourth chapter, "Power and Diplomacy," comes to grips with some of the special problems posed by nuclear weapons, in which the author shows himself quite up to date. He is aware, for example, as many of his colleagues are not, that under some circumstances, which are not at all hard to imagine even between the two super-powers, the aggressor could hope to launch a surprise attack so overwhelming to the victim's retaliatory power that it could escape any serious counterblow.

The final chapter, "The Four Faces of Peace," discusses the relevance to peace of international trade, power, national policies, and human emotions and motivations. It is a suitable summation for a man whose forte is in seeing things clearly and seeing them as a whole. One may miss the exhilarating shock of a new thought, but there is much to be said for a book where every thought expressed is worthy of respect and, almost invariably, concurrence.

BERNARD BRODIE

Senior Staff Member
The RAND Corporation
Santa Monica, Calif.

LLOYD A. FREE. *Six Allies and a Neutral: A Study of the International Outlooks of Political Leaders in the United States, Britain, France, West Germany, Italy, Japan and India*. Pp. xiii, 210. Glencoe, Ill.: Free Press, 1959. \$5.00.

This study emerges from a project of the Institute of International Research at Princeton developed in co-operation with local opinion research organizations in the

several countries surveyed. Cross sections of parliamentarians were systematically interviewed, and these inquiries were supplemented between 1955 and 1958 by intensive interviews, conducted directly by the Institute "in governmental, official, parliamentary and elite circles in all of the countries concerned except the United States . . ." (vii). The aim was to uncover the "reality worlds" of these individuals and provide "a picture of the psychological dynamics influencing not only the foreign policy as such, but the international posture of seven major nations at a given point in history" (ix).

India's internal divisions and antagonisms and her quest for social democracy are her primary concerns. Her convictions against war and her interests as a militarily weak state lead her to a policy of nonalignment in the cold war between communism and the West. She supports the principles and objectives of the United Nations and aspires to moral leadership in the search for world peace.

Japan's redundant population and sparse resources make her dependent upon the outside world for stable trade. International peace is vital to her; communism and the cold war, a threat. Should a nuclear war break out she is fearful of becoming a battlefield and feels constrained to be as neutral as possible. Most of the Liberal-Democrats desire, for the present, to preserve the ties that bind Japan to the United States but prefer greater freedom of action in the partnership. The goal of the Socialists is complete independence.

Pragmatic, and "power-oriented," the Conservatives of Great Britain would maintain, as far as possible, Britain's military strength and prestige. Confronted with the threat of international communism, they would supplement the United Kingdom's power with that of the Commonwealth and the United States and rely upon a policy of containment and deterrence. The Labourites consider the domestic well-being of the British people their primary concern, and would chiefly rely upon the United Nations to preserve peace.

France, with neither the military power nor the resources to play a great role in world affairs, is reluctant to take a lesser

part. She insists that she should be formally recognized as a member of the Big Four on a basis of juridical equality with the United States, Great Britain, and Russia.

Italian leaders have no "great power" aspirations for Italy. They have had to concentrate on vast problems of internal rehabilitation and reconstruction. Unable to face the Soviet menace alone they follow American leadership in foreign policy though at times it has been irksome. They regard the North Atlantic Treaty Organization (NATO) as the main pillar of their policy. The secondary pillar is the unification of Europe with Italy an integral part.

The Germans likewise have no desire to achieve great power status. Their chief aspiration is for reunification of their divided country. Most of the Christian Democrats believe that to reach this goal they should have a close relationship with the United States and the NATO alliance. The Socialists reject the Adenauer policies of deterrence, containment, and collective defense and advocate progressive disarmament, accommodation between communism and the West, and peaceful coexistence. American legislators express strong aspirations for peace and freedom and fear that both are threatened by communism. Although emphasizing mutual understanding and accommodation in the relationships of nations of the free world toward one another, they tend to follow the power approach when dealing with the Communist bloc.

FRANK M. RUSSELL

Professor of Political Science,
Emeritus
University of California
Berkeley

NORMAN HARPER and DAVID SISSONS. *Australia and the United Nations*. Pp. xiii, 423. New York: Manhattan Publishing Company, 1959. \$3.00.

At the San Francisco Conference of 1945 on the United Nations Charter, Dr. H. V. Evatt, chief of the Australian delegation, became prominent for his enthusiastic support of the United Nations and his aggressive championship of the rights

of the "Middle Powers." He agitated for some reduction of big power influence in the new organization and the liberalization and broadening of its economic and social functions. Australia failed in limiting the veto in the Security Council. But she was responsible for enlarging the powers of the General Assembly, making full employment a United Nations goal, and increasing the obligations of the colonial powers toward their colonies and the United Nations—to name only the more important successes. On the other hand, Australia jealously guarded preservation of national sovereignty and protection of national interests against encroachments by international agencies. Even the enthusiastic Dr. Evatt doubted the United Nations' ability to guarantee Australia's security, and he, as well as succeeding Australian governments, preferred to rely for that upon the Commonwealth, the United States, and regional organizations.

The Australian public did not share Dr. Evatt's enthusiasm. The feeling of the majority was, at best, cautious optimism about the future of the United Nations.

Once the United Nations began functioning, Australian interest waned. It never played any sizable role in Australia's security nor has it basically affected Australia's foreign policy. On trusteeship questions Australian governments sided with the colonial powers more than with the colonial peoples. In the economic sphere Australia acted according to selfish considerations, and her participation in the International Labor Organization was not impressive, largely due to her federal structure and constitutional system which make ratification of international agreements in this field difficult.

Australia contributed to the general trend of nations transacting more and more international business outside of the United Nations. This further weakened public interest in the organization. Only occasionally, during such events as the Korean conflict or the Suez crisis, was any appreciable—usually hopeful—attention paid to the work of the United Nations. There is, consequently, a conviction among interested Australian circles that under present world conditions any substantial revision

of the Charter is impossible and that only an improvement of technical and procedural weaknesses might be possible.

In essence, this is the story of this book, which provides sufficient details to substantiate it. The authors set Australia's relations with the organization into the context of Australian policies and attitudes generally. This makes the book, written with scholarly care and discrimination, interesting and valuable.

WERNER LEVI

HENRY BLUMENTHAL. *A Reappraisal of Franco-American Relations 1830-1871*. Pp. xiv, 225. Chapel Hill: University of North Carolina Press, 1959. \$6.00.

This analysis of diplomatic relationships between France and the United States in the middle third of the nineteenth century is based on impressively thorough research in French and American archives and on the published materials. Its general thesis is the falseness of the popular impression of abiding Franco-American friendship since the American Revolution; indeed, Professor Blumenthal's volume is a kind of catalogue of frictions and even of crises between France and the United States. Relations between the two countries were in fact marked by frequent distrust and hostility, particularly after Louis Napoleon established the Second Empire in December, 1851.

In his study, Professor Blumenthal adopted a topical approach, which has a number of disadvantages. This organization of his material not only led to a considerable amount of duplication, but it also blurred the significance of the February Revolution and the coup d'état in 1851. The chapter on incidents between 1800 and 1860 was also transformed by this approach into a rag-bag collection of miscellaneous conflicts or frictions.

The volume suffers also from an overemphasis upon developments within each of the two countries and between France and the United States and by some neglect of the general European diplomatic scene. The Crimean War, for example, receives less attention than it deserves.

Indeed, there is no description or analysis of Napoleon III's policies with regard to Europe and the rest of the world; such an analysis would have thrown much illumination upon Franco-American relations during the Civil War. Moreover, the various internal problems and upheavals which occurred in France during these years are not given the attention and explanation they deserve; they did, after all, profoundly affect Franco-American relations.

The style is reasonably clear, with the exception of one or two gross slips, such as one intervention which did not "come off." In addition, the book has a marked nationalistic tone, rather remarkable for a study which deals with the diplomacy of another century.

ROBERT F. BYRNES

Professor and Chairman,
Department of History
Indiana University

RAYMOND W. BIXLER. *The Open Door on the Old Barbary Coast*. Pp. 204. New York: Pageant Press, 1959. \$3.50.

This short but quite penetrating book recalls the wartime appearance of Louis B. Wright's *The First Americans in North Africa* (1945). That volume, issued at a critical time, described America's earliest involvements on the African continent. Even before the days of Jefferson's determined resistance to the Barbary corsairs, North Africa has been of sporadic interest to Americans. Bixler's book is a history of United States economic and political relations in the nineteenth and twentieth centuries with the countries along the Mediterranean's African coastline.

The author has shown real diligence in consulting primary sources, including the consular and diplomatic archives of the United States Department of State, as well as foreign correspondence and documentation concerning American involvement in North Africa. His book is both descriptive and analytical. The lay reader might wish for a bit more color and evidence of literary style in such a book as this. As with so many similar works, Bixler's book is written primarily for the specialist. De-

spite its lack of stylistic finesse, one can have little quarrel with the conceptualization of the book, with its informativeness, or with its thoroughness.

Bixler points out how, too often in our national history, North Africa has, like other diplomatically marginal areas, been ignored or rated as of little importance to United States foreign policy. This neglect has tended to color the attitude of colonial peoples and to facilitate the penetration of Africa by the Soviet Union. This phenomenon occurred in Egypt, where a combination of diplomatic bungling and misunderstanding severely damaged the American power position during and after the Suez crisis.

This book makes the point that an era of revolution has arrived in an awakened, socially sensitive Africa. Now that the old imperialism of the nineteenth century is passing, it behooves us to show special care in the development of alternative policies to suit the future. To quote Bixler: "Zealous new national states are coming into being. As they become members of the United Nations, they will join the Afro-Asian bloc and participate in the struggle between East and West." In an age when the Mediterranean has become a vital link in America's world-wide defense posture we need more books which help define, historically and for today, the role which a democracy should play in regional strategy.

AMERICAN GOVERNMENT AND HISTORY

JAMES ROOSEVELT and SIDNEY SHALETT. *Affectionately, F. D. R.: A Son's Story of a Lonely Man*. Pp. xii, 394. New York: Harcourt, Brace & Company, 1959. \$5.75.

This is, as Congressman Roosevelt says, a testament of love to Franklin Delano Roosevelt—not as President of the United States but as father of a numerous and rambunctious brood of children and as consort to Eleanor, his "dearest Babs," to

whom the British in wartime gave the not inappropriate code name of "Rover." It is a "document of love" also to Granny, his mother, that austere dowager of Hyde Park under whose benign rule Roosevelt and his family lived for nearly sixty years. Granny was generous to a fault and spoiled the children by showering them with gifts and surreptitious supplemental cash. But she was equally generous with Franklin and Eleanor, to whom Granny's gifts of hospitality at Hyde Park, a town house in New York, and the now legendary summer mansion at Campobello were but a few items on a large list of benefactions. For it was his mother, Sara Delano Roosevelt, who during most of Roosevelt's life controlled the family fortune.

What effect all this had upon the character and conduct of the Roosevelt family, one can only surmise. That it was an important factor in the education of Eleanor Roosevelt there can be no doubt. It is hard now to believe that this gallant woman lived for many years as a timid, shy, and complacent girl under the shadow of her gracious, generous, but domineering mother-in-law.

Important as Granny is, the center of this fascinating chronicle is James Roosevelt's father, Franklin Roosevelt. It is, in fact, a book about three fathers—the robust, part-time playmate, part-time politician of the prepoly days before August 10, 1921; the affectionate, indomitable, and infectiously cheerful "Pa" of the long recovery period until the gubernatorial campaign of 1928; and the final lonely father, still called "Pa," of the Presidential years.

It may be that "no man can be a hero to his valet" and that "one must not inquire into the mystery that surrounds a King or a President" lest charisma be dissolved by familiarity. But none of these clichés would seem to apply to Roosevelt. The more one learns of the intimate details of his life, both before and after the polio attack, the more does his stature grow. The more, too, does Franklin Roosevelt, the man, the politician, and the President, seem to stand apart from Franklin Roosevelt, the son, husband, father, and friend. He was not only "hail fellow well met,"

equally at home with Louis Howe and Gus Gennerich, Winston Churchill, and the British Royal family, but always, too, fairly alone and aloof.

This book is a massive refutation of Jim Farley's statement that "Franklin finds it hard to relax with people who aren't his social equals." This remark, attributed to Mrs. Roosevelt, was no doubt inspired by her husband's early cruises on Vincent Astor's "Nourmahal" with a covey of millionaires, mostly Republican in politics and patrician in parentage and tradition. Flatly denying having made the statement, Mrs. Roosevelt went on to say, "I couldn't even have thought to say such a thing because it was not true. If I were going to say anything at all on the subject, it would have been that I never understood how Franklin could have gone on those cruises and relaxed with those people." That he could do so in the midst of the bitter battles of the early New Deal is part of the Roosevelt mystique that not even his children could quite fathom. For, as Congressman Roosevelt says, "Nowhere in the world really was there anyone for him with whom he could unlock his mind and his thoughts. Politics, domestic economy, war strategy, postwar planning: he could talk over with dozens of persons. Of what was inside him, of what really drove him, Father talked to no one." It is this quality that justified the subtitle of this book—*A Son's Story of a Lonely Man*.

James Roosevelt and his collaborator, Sidney Shalett, both obviously write under the influence of the "FDR myth." The Father and the President is clearly a hero to them as he was to millions of others around the world. And not all of the intriguing and fascinating tales of his personal follies and foibles, of the *sturm und drang* of a turbulent and often incorrigible family, of his often ambiguous posture toward personal and political associates and public policies, seem to dim in any degree the love of those who knew him best or the luster of his name among the great Presidents of this country.

PETER H. ODEGARD

Professor of Political Science
University of California
Berkeley

THE BASIC BOOK ON

PARTIES AND POLITICS IN AMERICA

By CLINTON ROSSITER, *Cornell University*

A distinguished political scientist provides a forthright and objective account of American party politics in this concise and invaluable guide. In vigorous and lively language, he examines the two major parties—"the peace-makers of the American community"—describing their historic functions and the way they have helped to achieve national unity.

He discusses their make-up, their achievements and failures, the images each has established of itself and of the opposition party. The demographic forces influencing the American voter and the complex question of how the parties actually differ receive thought-provoking treatment.

This is a superb analysis of the hard facts of American political life, written with critical affection and admiration.

216 pages. Cloth, \$2.85; paper, \$1.65

CONTENTS. I. The Pattern of American Politics. II. The Functions of American Parties. III. Democrats and Republicans: Who Are They? IV. Democrats or Republicans: What Difference Does It Make? V. The Future of American Politics. Notes. Index.

CORNELL STUDIES IN CIVIL LIBERTY

BILL OF RIGHTS READER

Leading Constitutional Cases

SECOND EDITION

By MILTON R. KONVITZ, *Cornell University*

Twenty-four new cases have been added to this outstanding collection of about one hundred of the leading constitutional opinions on the rights guaranteed by the first ten Amendments. Revised and enlarged, the new edition includes the most important cases decided by the Supreme Court through 1959. Each case, carefully selected and edited, is preceded by an introduction, and many concurring and dissenting opinions are included.

THE AMERICAN VOTER

By ANGUS CAMPBELL, PHILIP E. CONVERSE, WARREN E. MILLER, and DONALD E. STOKES, *all of the Survey Research Center, University of Michigan*. Drawing its data from rigorously conducted nationwide surveys, this book offers a theoretical analysis of the influence of political, psychological, social, and economic factors on voting behavior. The authors first examine the act of voting itself and the immediate political attitudes involved in this act. They then proceed to show how the election-day decision is linked to, and partially determined by, such factors as education, age, socio-economic status, individual personality traits, and geographical and social mobility. Of particular importance is the last section of the book in which a broad classification of presidential elections is proposed, and the effects of American electoral behavior on the over-all political system are examined. *The American Voter* uses a completely new approach to many problems—and thus is able to offer several new and highly significant explanatory principles for understanding voting behavior. 1960. 573 pages. \$8.50.

PRESIDENTIAL POWER

The Politics of Leadership

By RICHARD E. NEUSTADT, *Columbia University*. This is a book which breaks new ground. It is not about the Presidency as an institution, or about its legal powers; rather, it treats the politics involved in holding the office. It deals with the man inside the office and with the most important problem which that man must face—how to obtain and preserve personal influence and political power. As the author writes, "This is the classic problem of the man on top in any political system: how to be on top in fact as well as name." The book combines penetrating analysis with a wealth of illustrative material drawn from the Roosevelt, Truman, and Eisenhower administrations. The reader will find in this work enlightening discussion of such important events as the campaign for the Marshall Plan in 1947, the shift in Korean war aims in 1950, the dismissal of General MacArthur, Truman's seizure of the steel mills, Eisenhower's use of troops in Little Rock, and the emergence of a "new" Eisenhower in 1959. An expertise in politics is often said to be essential for a President. This book provides a scholarly explanation of the reasons why. 1960. 224 pages. \$5.95.

HERBERT HOOVER. *An American Epic*, Volume I, *The Relief of Belgium and Northern France, 1914-1930*. Pp. xxiii, 477. Chicago: Henry Regnery Company, 1959. \$6.50.

In 1914 a man who had made a worldwide reputation as mining engineer and reorganizer-manager was called upon to undertake a herculean task—the feeding of ten million people in German-occupied Belgium and Northern France. This was a redirection of his major life efforts at the age of forty, a redirection that opened the way for a second meteoric career, culminating in the Presidency of the United States.

Herbert Hoover has now undertaken a detailed, authoritatively documented history of relief during both World Wars and in the postwar periods. The present volume covers only relief in Belgium and Northern France from 1915 to 1919, though the story is continued to the final "closing of the books" in 1927 and "re-unions" of the directing commissions in 1938 and 1958. Two more volumes are promised.

In preparation for this history, "the number of documents, books, articles, diaries, records, and reports that had to be examined . . . exceeded 3,500,000." Mr. Hoover himself inspected about 400,000 items, his "homework over the years." This is an impressive piece of writing and editing, but the story itself is far more impressive.

Beginning with nothing—no organization, no money, no precedent, only the ideals of humanity and the determination that the job had to be done—Mr. Hoover and his American Commission for Relief in Belgium (CRB) had to overcome opposition in military circles, on both sides, and caution and suspicion at the diplomatic level. They had to organize, at community and national levels in Belgium and France, orderly distribution of food and other supplies. Money had to be raised—a total of nearly a billion dollars, in the form of subsidies from governments of the United States, France, and Great Britain and as charitable contributions by people in several countries. They had to arrange for the purchase, shipment, and distribution of

over five million tons of commodities, chiefly foodstuffs.

The CRB organization and its performance were remarkable in many respects. Almost all of the American members and the leading Belgian members served as volunteers, for periods of a few months to four and a half years, almost all of the Americans even paying their own traveling expenses. Most of the Americans were engineers. Goods worth \$1,400,000,000 were distributed at a total expense of about \$4,000,000—an expense ratio less than one-third of one per cent. The war began in August 1914; Mr. Hoover accepted the chairmanship of the Commission in mid-October; relief supplies began to arrive in November.

The story is primarily one of high-level diplomacy against great odds. Through quoted documents, correspondence, and memoranda, and through direct comments by Mr. Hoover, one feels the awful pressure of the race against starvation and the frustration attending negotiations with military commanders and ministries. The reader gains insight into the personalities of well-known wartime leaders—Ambassadors Walter Hines Page and James W. Gerard, Hugh Gibson, Lord Grey, Lord Percy, General von Bissing, and many others whose names are not so familiar.

Occasionally the author permits himself a pithy comment on a personage or a situation. One such sentence reflects a great deal of Mr. Hoover and of his appraisal of the diplomatic maneuvering: "Stupidity is an essential concomitant of war."

HOWARD M. TEAF, JR.

Professor of Economics
Haverford College

BENJAMIN FRANKLIN. *The Papers of Benjamin Franklin*. Edited by Leonard W. Labaree and Whitfield J. Bell, Jr. Vol. I: Jan. 6, 1706 to Dec. 31, 1734. Pp. lxxxviii, 400. New Haven, Conn.: Yale University Press, 1959. \$7.50.

This attractive, scholarly volume is the first of a new and comprehensive edition of *The Papers of Benjamin Franklin*. Sponsored by the American Philosophical Society and Yale University, the project

was formally announced on the anniversary of Franklin's birthday, January 17, 1954. In order to make the edition as comprehensive as possible, the editors promptly started a world-wide search for Franklin papers which brought to light literally thousands of new or hitherto unavailable papers. At the time the present volume went to press, 27,800 Franklin papers belonging to 375 owners had been located and photostated for inclusion in this edition which will have three times as many Franklin papers as the latest previous edition (1906) of his writings by Smyth.

This initial volume serves a twofold purpose, first as an introduction to the edition in general, and second, the printing with editorial notes of all Franklin papers of the period from 1722 to December 31, 1734. The long, scholarly Introduction reflects the results of the latest research on virtually every aspect of Franklin's papers—Franklin's literary heritage, genealogies, earlier editions, editorial policies on questions of selection ("any paper whose contents are in any sense the product of his mind"), arrangement (chronological sequence), form and method of presentation. In addition, there are a number of other noteworthy features of the volume that are especially germane to the edition as a whole, such as the fine frontispiece in color of the portrait of Franklin painted in 1778 by the great court portraitist J. S. Duplessis. Pieces like this of the Passy period help to create that larger atmosphere of Franklin's life not yet present in the early Boston-Philadelphia years.

Nevertheless the papers of this early period hold a surprisingly high place in the canon of Franklin's writings. It is doubtful whether any of the succeeding volumes will have as great an appeal to the average reader. Here are the satirical "Silence Dogood" secretly published in the *New England Courant*; the "Busy Body" papers; the "Plan for Conduct"; "Articles of Belief and Acts of Religion," a sort of personal liturgy; "Proposals and Queries To Be Asked the Junto"; "Agreements of the Directors of the Library Company;" Papers on Conversation, Cold, Reading of History, and Literary Style; "Providence

of God in the Government of the World;" the "Epitaph;" and the first two *Poor Richard's Almanacks*.

The photoduplication (28 pages) of the first impression of *Poor Richard's Almanack* for 1733 is a bold departure from the conventional and an effective stroke to introduce the reader realistically not only to Franklin's most popular publication, but also to Franklin as printer, publisher, and businessman. More than ten thousand of the *Almanacks* were sold annually, from 1733 to 1756, the year in which the more acceptable maxims and other features of the *Almanacks* were gathered into one final *Poor Richard*, known as the *Way to Wealth*. More than any of his writings *Poor Richard's Almanack* created an image of Franklin in the popular mind before even the first part of the Autobiography was written.

In the facsimile reproduction of the "Epitaph" (1728), there is more than just another well-chosen illustration. By implication the editors draw attention to Franklin's remarkable penmanship which, like his mental powers, retained its clarity and edge to the end.

"The Plan of Conduct" (p. 99) adopted toward the end of his long voyage in 1726 is an interesting example of several self-imposed disciplines Franklin adopted as a young man. Writing about it in his Autobiography, he described the plan: "more remarkable as being form'd when I was so young, and being pretty faithfully adhered to quite thro' to old age." While Franklin speaks of it as included in the *Journal* of the voyage, it does not appear there. Indeed, no original has been found. The near loss of this important document gives emphasis to the total loss of the large body of Franklin papers entrusted to his friend Galloway before leaving for France in 1775.

Like the content, paper, printing, and binding of the volume are in keeping with the standards established by Benjamin Franklin himself, still America's ranking printer and publisher. The 12-point type for the text was especially designed and cut for this edition. A working Index for each volume is welcome in anticipation of the more detailed Index promised for the

entire work after the last volume appears some fifteen years hence.

In every respect this initial volume of *The Papers of Benjamin Franklin* has in it the promise of a superb addition to the great project of American historiography inaugurated by the American Historical Association, and now in full stride, for the publication of the papers of the great men of the nation.

WILLIAM E. LINGELBACH

Professor of History, Emeritus
University of Pennsylvania
Librarian, Emeritus
American Philosophical Society

DAVID B. TRUMAN. *The Congressional Party: A Case Study*. Pp. xii, 336. New York: John Wiley & Sons, 1959. \$7.50.

For better or worse Congress is one of the great institutions in the world and the subject of many intriguing volumes. Allen Drury, through the novel *Advise and Consent*, has given us a stirring, if fictionalized, account of how the Senate works. Journalist William S. White in descriptive prose has taken us behind the *Citadel*. Many political scientists and members of Congress have likewise turned their hand to provide insights about the United States national legislature. Professor David Truman, one of political science's best scholars, has resorted to roll call votes to study the relationship between political parties and the legislature. In a general way he is trying to find out the influence of the political party and the President's program on voting behavior of majority and minority members.

At the outset, the layman who is unsophisticated in statistics and with such terms as "high cohesion" and "cleavages" and "multi-nuclear types" will find many pages difficult to follow. He will hardly be able to judge the efficacy of the author's methodology nor his conclusions. Nevertheless, if he will discipline himself to read the prose and the summaries, he will learn a considerable amount about the leadership systems in Congress and the degree of cohesion on notes between "elective" leaders such as the floor leader and whips and the "seniority" leaders who are the

standing committee chairmen and ranking minority members. Truman brings in the voting behavior of state delegations and some fine insights about Presidential leadership.

The scholar is likely to be as fascinated with the method of analyzing vote clusters as with the substantive observations and conclusions. Although the book concentrates on the clusters of voting blocs in the Eighty-first Congress (1949-51), it makes some generalizations which, to this reviewer, are valid for most Congresses. At the same time, Truman is cautious about applying his conclusions to all Congresses. Each Congress is different as each set of leaders is different. For example, this reviewer, using impressions and interviews, came to quite different conclusions about Senate policy committees in 1955 than did Truman through statistical analysis of their behavior in 1949. This is what makes Congress an exciting subject!

For the reader who believes the congressman ignores party when voting there is a challenge in this book. Truman's analysis finds "Congressional parties" a reality, and he has provided additional documentation of the interdependence between the President and the elective party leaders in Congress. Although a majority of the American voters seem unworried about a President and Congress of opposite party faith, the author believes that this results in limiting the significance of the Congressional parties and their leaders.

HUGH A. BONE

Professor of Political Science
University of Washington

HAROLD M. HYMAN. *To Try Men's Souls: Loyalty Tests in American History*. Pp. ix, 414. Berkeley and Los Angeles: University of California Press, 1959. \$6.00.

In this episodic history of loyalty testing in America, Professor Hyman presents a most stimulating account of efforts to uncover the disloyal from the days of the early colonies to the present. Emphasizing the record of oaths of allegiance in the Revolution and the Civil War and of the amateur and extralegal "spycatching" operations of World War I, he amasses im-

pressive evidence documenting his contention that loyalty testing has proved generally ineffective and in support of his concluding plea that, "Until the past history of the inutility of loyalty tests . . . is recognized, American unity and American rights will suffer." The book offers both revealing insights into the antecedents of present-day loyalty-security measures and valuable contributions to the understanding of the times which the author treats.

The chapters on the colonial and Revolutionary periods, in which Hyman convincingly argues that loyalty tests "played a primary role in structuring the Revolution," provide a rich background for the analysis of current controversy over the merits of loyalty measures. Both critics and defenders of today's loyalty programs will find that many of their arguments were stated long ago—by a Lafayette counseling General Washington not to equate nonjurancy with disloyalty or a Tom Paine urging the use of stern loyalty tests to determine "who are in real allegiance with the United Independent States, and who are not."

In his discussion of the complex of laws, edicts, and local understandings concerning loyalty during the Civil War and Reconstruction, Professor Hyman enlarges on a field explored in his earlier book, *Era of the Oath: Northern Loyalty Tests During the Civil War and Reconstruction* (University of Pennsylvania Press, 1954). He depicts, with considerable writing skill, the meaning of loyalty tests in the daily lives of millions of citizens in both the North and the South. Of particular interest is his account of the antidisloyalty campaign of Republican Representative John Fox Potter and his investigating committee established in mid-1861, and of Potter's tactics, which bear a striking resemblance to those of his fellow Wisconsin legislator some ninety years later.

Hyman presents only a sketchy, though provocative, treatment of loyalty measures since World War I. With regard to legislative loyalty testing in the 1950's, he observes that modern techniques of mass communication have added "to its exploitative potentialities, but not, unfortunately, to its efficiency or objectivity."

Hyman is far from happy with the recent record of loyalty testing in the hands of the executive but concludes that, "Executive, national management of loyalty testing emerges from history as the proper pattern" and "is far more correctable than congressional control."

No one genuinely concerned over the loyalty-security issue should pass this book by.

WILLIAM D. CARMICHAEL

Assistant Professor of Economics
Woodrow Wilson School of Public
and International Affairs
Princeton University

JAMES MORTON SMITH (Ed.). *Seventeenth-Century America: Essays in Colonial History*. Pp. xv, 238. Chapel Hill: University of North Carolina Press for the Institute of Early American History and Culture, 1959. \$5.00.

This interesting collection of essays on the English colonies in the seventeenth century is the fruit of a symposium in honor of the 350th anniversary of the founding of Jamestown sponsored by the Williamsburg Institute. Its program was, as the editor puts it, "to examine some of the more important manifestations of the American colonial experience." The volume makes no claim to be a comprehensive history of seventeenth-century English colonization, but a certain unity has been achieved by the editor's Introduction and Oscar Handlin's essay on the significance of the century. The other essays center on four chief aspects, relations with the Indians, the social structure, church and state, and the character of the transplanting of the peoples as seen through the eyes of contemporary historians. Information on these subjects has in some of the essays been assembled more from the scholarly monographs of other writers than from direct contact with the primary sources, and the impress of the symposium discussions is apparent from the many points of view expressed.

Wilcomb E. Washburn, in his "The Moral and Legal Justifications for Dispossessing the Indians," states that the European powers made little or no attempt to justify such dispossessing, being inter-

ested chiefly in safeguarding their own claims against their European rivals. While this may be true in general, there was at least one English king who did make a conspicuous public attempt to justify pre-empting Indian lands. James I, recognizing the occupational right of the Indians in the northern coast region, stated in his charter to the New England Council in 1620 that because of a "wonderful Plague" which had depopulated the area he believed God "in his goodness" had determined that the country should be "possessed and enjoyed" by Englishmen going there. Winthrop later made a similar statement, after a smallpox epidemic, that God had silenced the Indian claims in the area.

Nancy Oestreich Lurie deals with the impact of the white man's culture on that of the Indians. Mildred Campbell's interesting essay on social origins of the immigrants points out two basic aspects of seventeenth-century philosophy affecting everyone; the general acceptance of the idea of grades of society and the belief that differences in status were "not unalterable." The reviewer is reminded of an almost unbelievable example of the latter in the life story of William Phips of Boston, a rough, uncultured ship carpenter and sea captain who was knighted by James II for discovering a sunken treasure ship in the waters off the Bahamas and then was made the first royal governor of Massachusetts under the new charter. In contrast, Bernard Bailyn found status in Virginia more fixed, for by the end of the century a colonial aristocracy had emerged whose members were distinguished from other people by their wealth, importance, and political influence. There are interesting essays on new patterns of church and state in the colonies by William H. Seiler, Emil Oberholzer, and Philip Haffenden, and Richard Dunn's analysis of histories of English colonization indicates that the colonial authors better understood the significance of the transplanting than did authors in England.

The question might be raised as to whether it is possible to evaluate the influence of the new world on the emerging cultural patterns without taking into ac-

count the promoters of colonizing projects, the trading companies and the feudal proprietors, along with the people they sent over and whose government they controlled. Also the development of a more centralized national control in the royal provinces and over the colonial empire as a whole, supported by increasing numbers of colonists, was certainly a major aspect of the colonial experience. The Restoration experiment with a "dominion" in New England, with the intention if successful of following it with regional groupings elsewhere, was something far more than a doctrinaire gesture, with the emphasis on national control of defense as well as trade and on greater uniformity in province laws and their conformity with the national ones.

Taken as a whole this collection of essays, while covering subjects long well known and understood, presents new and heretofore undiscovered aspects of social patterns in a transplanted English society and of characteristics indelibly impressed on a people ultimately forming a new nation.

VIOLA F. BARNES

Professor of History, Emeritus
Mount Holyoke College

OSKAR MORGENSTERN. *The Question of National Defense*. Pp. xii, 306. New York: Random House, 1959. \$3.95.

Professor Morgenstern has made a major addition to the growing literature on strategic problems. He explains in his Preface that he does not intend to be original, but to find the truth. Therefore, he warns, the reader may feel his conclusions to be obvious. Indeed much of what Professor Morgenstern says is familiar, but the whole has a clarity, consistency, and logic which make the book an original and significant contribution.

The argument of the book rests on the principle that "in order to preserve a nuclear stalemate under conditions of nuclear plenty it is necessary for both sides to possess invulnerable retaliatory forces." If retaliatory forces are vulnerable and can only strike if they get warning and respond quickly, an unstable international situation exists. But if each side knows

that the other side, because its retaliatory force is relatively invulnerable, is under no pressure to strike quickly, worry about error is largely eliminated. This is particularly important when weapons systems are based on ballistic missiles which cannot be recalled as aircraft can.

Fixed sites for missile bases do not meet the requirement for such a retaliatory invulnerable force, the book argues, because in the race between hardening such sites and developing weapons which can destroy them, the defender always loses. Furthermore, it is against American interest to attract ever larger nuclear weapons to our own territory. Since our Allies have similar objections to sites on their territory, the United States needs mobile missile launching platforms in places under the surface of the water. This is Morgenstern's "Oceanic System." He recognized that bases in space would meet the same requirements, but he excludes them from consideration because he thinks they are too far off in time to warrant consideration in his recommendations for what should be done in the immediate future. The "Oceanic System" is not restricted to submarines which can launch missiles from underwater; it includes nuclear powered seaplanes. He advocates seaplanes because they could be serviced from mobile submarine bases rather than from fixed sites on land. Jet aircraft, Morgenstern feels, should be put on permanent air alert as a stop gap until superior systems become available. In addition, Morgenstern advocates improved limited war forces and insists that we should arm them with nuclear weapons of low caliber if that be to our military advantage.

Morgenstern makes very serious criticisms of American defense policy; his own recommendations are carefully considered and deserving of serious attention.

HERBERT S. DINERSTEIN

The RAND Corporation
Santa Monica, California

JAY LUYAAS. *The Military Legacy of the Civil War: The European Inheritance*. Pp. xi, 252. Chicago: University of Chicago Press, 1959. \$5.95.

This reviewer found unusual interest in this book, since from her study of foreigners in the Union and Confederacy she encountered many old acquaintances, such as Colonel Wolsey, Colonel Freemantle of the Coldstream Guards, Colonel Fletcher of the Scots Fusilier Guards, the Prince de Joinville and the Bourbon Princes, Heros von Borcke, the picturesque Prussian with Stuart's Cavalry, and Scheibert, official observer for Prussia, to name just a few.

The author followed a simple and logical organization. In his first chapter he states his problem: to determine the military influence of our Civil War on subsequent warfare and on European military theorists. To find the answer, the author then devotes a chapter to each of the British, German, and French observers, official and unofficial. Next he explores the military writings of French, English, and German military men since the close of the Civil War. Here the author has done a prodigious amount of research. So important did he regard the writings of G. F. R. Henderson that Luyaaas devotes an entire chapter to "The Henderson Legacy." When World War I revealed that our war with its use of trenches and railroads was a forerunner of modern warfare, there followed a revival of interest in that war and reappraisal of the war leaders. Writers like Captain Lepoitier saw that it resembled World War I in that sea-power was the decisive factor. In England the Civil War continued to be studied at the staff college. With new standards from the recent war Jackson shared the stage with Lee, praised for his use of trenches, Sherman for his remarkable strategy and mobility, and Grant for his policy of attrition, understood finally.

Luyaaas concludes that our Civil War never exerted a direct influence upon military doctrines in Europe. Each of the major armies found some part of the American experience of special significance as the British, considering creation of a volunteer force, found the volunteer army. Available information was ignored in favor of a study of recent European wars; yet England could have profited in her Boer

War from our cavalry lessons, and the Allies from the use of trenches. The lesson to be drawn from rifled artillery had to await universal introduction of rifled artillery in about 1870. American developments in technology were noted but not tactical lessons.

The reviewer must deplore the omission of a Bibliography. Attention must also be called to careless proofreading (p. 103), where obviously some lines have been omitted. On page 56 occurs an error of fact: Borcke is presented as serving from May, 1862, to the "following" June whereas he was wounded June 19, 1863.

ELLA LONN

FREDRICK B. PIKE (Ed.). *Freedom and Reform in Latin America*. Pp. ix, 308. Notre Dame, Ind.: University of Notre Dame Press, 1959. \$6.00.

A curious creation indeed would be a *divertimento* in six movements, one each contributed by Corelli, Moussorgsky, Beethoven, Wagner, Stravinsky, and Berg. The editors of symposia should not lightly assume that ten area experts representing almost as many disciplines will produce a more grateful pastiche than our beastly *divertimento*, especially when it is plain that the authors are not in agreement as to the subject on which they are writing. The editor's introduction makes it clear that he considers freedom and reform as mutually opposed—or at least opposable—tendencies. Dr. Pike states, "For Latin Americans, the query as it emerges today is, can we reform in the midst of the freedom we prize? . . . It is not accidental that in the United States the liveliest concern over the disappearance of freedom has come in an age of reform. . . ." Some of his authors are either unaware of this point of view or tacitly in disagreement with it. Professor Charles C. Cumberland, for example, takes the usual view that freedom and reform are handmaidens, basing his entire essay on that premise. Yet another author, Professor Richard N. Adams, restricts his definition of freedom

to religious and political matters, offers a sophisticated statement of the relationship between freedom and reform, and then concludes with an inferentially negative definition of freedom by saying, ". . . one could hardly extend them [aboriginal cultures] more freedom than they have now." Had this collection been organized as a philosophical debate on the social ethics of the political dynamics of Latin America, it would have gained enormously and served as a most unusual contribution. But such frank confrontation never occurs. The result is a bad symposium, although the book is a collection of good articles.

The several authors are among the most able to be found in their respective fields: W. Rex Crawford writes on the concept of freedom as such in Latin America; C. S. Cumberland relates politics and cultural homogeneity to derive a fresh hypothesis of more than passing research interest; F. A. Hermens addresses himself to the constitutional aspects of the matter, while W. S. Stokes contributes a piquing portion of his recently published book, *Latin American Politics*. P. A. Cebollero presents a quite detailed survey of attempts at educational reform, W. C. Gordon discusses economic well-being and social progress, and R. H. Fitzgibbon, A. Karasz, and Alceu Amoroso Lima consider the special cases of Uruguay, Bolivia, and Brazil respectively. The editor himself contributes a broadly impressionistic piece on the sources of revolution in Latin America. These essays are, by and large, fresh and informative. Poor co-ordination, unhappily, does not permit them to gain depth and perspective through their mutual association, so the articles must stand or fall one by one.

So far as symposia on Latin America are concerned, the honors will continue to go to the *American Political Science Review's* now classical "Pathology of Democracy in Latin America," March, 1950, in which Professors Crawford and Fitzgibbon also participated to greater advantage than here.

EUROPEAN GOVERNMENT AND HISTORY

BRIAN CHAPMAN. *The Profession of Government: The Public Service in Europe*. Pp. 352. New York: The Macmillan Company, 1959. \$6.50.

C. H. SISSON. *The Spirit of British Administration and Some European Comparisons*. Pp. 159. London: Faber & Faber, 1959. 21 s. net.

Brian Chapman is Senior Lecturer in Government at the University of Manchester. He has lived often in France and Italy and, among British political scientists, is a leading student of continental government. C. H. Sisson is an assistant secretary in the Ministry of Labour and National Service who, after twenty years in Whitehall, profited by a Simon Senior Research Fellowship to observe administration in France, Germany, Austria, Sweden, and Spain. They have produced complementary books, different in organization, but both illuminated by urbanity, perspicacity, wit, shrewd insight, and appreciation of ways in which "they order this matter better in France."

Mr. Chapman deliberately eschews systematic comparisons with the British system. Mr. Sisson's essays are suffused with the calm assurance that matters are ordered pretty sensibly in Britain, yet he tantalizes the reader by a manner that suggests that he is posing in his tweediest suit, clutching his oldest briar pipe, for a portrait of the typical Briton, like Commander Whitehead and his Schweppesmanship.

Mr. Chapman's book is a magisterial treatise that traverses the experience, literature, official documents, and reports of eleven countries, from Denmark and Sweden to Spain and Portugal. He characterizes his volume as an "attempt to write a textbook for a subject that does not yet exist," for the good reason that there are few writers with sufficient scope to encompass it. He first outlines the historic roots, from Roman times, of the public service in Europe; he discusses its composition, extent, recruitment, and training; the conditions of service—rights, duties, security of tenure, discipline, and promo-

tion. The central concerns of his treatise are the controls of the public servant and the interplay between him, the politicians, and the public. His is a beautiful book.

Mr. Sisson's records of his observations and reflections are less tightly-knit, provocative essays, from which the temptation is to quote at large. Like Chapman, and like Fritz Morstein Marx in *The Administrative State*, Sisson knows that only the strong interplay of opposing parties can provide the political leadership and control that enables the civil servant to play his proper role: "without the dialogue between the two sides of the House, the administration could not show even as much life as it does." Without it, too, the higher civil service, as a professional elite, will dominate the government.

Both authors are thoroughly British in their view of juridical controls, as exercised by continental councils of state. Chapman gives the postwar French national school of administration higher marks than Sisson, who thinks the apprentice year closer than the academic year to the "Anglo-Saxon conception of an institution designed to train people to perform tricks rather than one designed to inculcate learning." In a sideswipe, Sisson dismisses "the fantasy of some American case-studies," footnoted to Stein's famous volume, "as a sort of administrative science-fiction."

Climb steadily to the top of Mount Blanc with Chapman as expert guide to the most extended view of the public service in Europe. Sit over pipes and ale with Sisson on your descent to chuckle over wise saws.

EDGAR S. FURNESS, JR. *France, Troubled Ally: De Gaulle's Heritage and Prospects*. Pp. 512. New York: Harper & Brothers for the Council on Foreign Relations, 1959. \$5.75.

One of General de Gaulle's accomplishments is that he has succeeded in focusing world attention on his determination to restore France to the status of a truly great power. Professor Furness, a politi-

cal scientist at Princeton, correctly believes that the prospects of the Fifth French Republic are inseparable from the conditions which led to the destruction of the Fourth Republic. He devotes, therefore, the major portion of his book to an analysis of France's domestic and foreign policies from 1944 to 1958.

The author attributes the final bankruptcy of the Fourth Republic to the system of "immobilisme" which, "reflecting contradictory aspirations of the French people, . . . concentrated on 'resolving' conflicts by tactical means without taking strategic or long-range action." In spite of large infusions of foreign aid, protectionist policies, increased production, and high taxes, since 1945 no French government had been able to balance the budget or to satisfy the desire of the great mass of the French people for higher living standards. The Fourth Republic lost the loyalty of many Frenchmen because they were dissatisfied with the system of inequitable taxes, deplorable housing conditions, and inadequate educational opportunities. Crucially important, moreover, was the growing discontent of the French army which felt betrayed by the politicians and let down by the existing political system.

While the author's comments about France's domestic affairs are informative and enlightening, his analysis of foreign political questions is penetrating and thought provoking as he traces the many shifts in French policy since the end of World War II. Prominent among them was the original desire to dismember Germany, which gave way to the acceptance of Germany as a member of the North Atlantic Treaty Organization (NATO) and the Common Market. Confronted with the East-West conflict, France moved from the original position of intending to rely for its security on the prewar system of alliances—including the Soviet Union—to the support of the Western defense system and the European unification movement. The author analyzes, furthermore, the new relationship between France and its overseas territories, the costly war in Indochina, the Suez fiasco, and the Algerian dilemma.

Although aware of the tremendous complexities of the Algerian problem, Professor Furness regards De Gaulle's inability to end the war as his "most evident failure." As far as French possessions in Africa are concerned, he expresses the realistic view that, although their "loss would be a calamity for France, . . . a policy whose only political alternatives for Africa are maintenance of its connection with France or complete alienation from the West would face diplomatic bankruptcy." This warning is meant for the United States as well as France.

After the Second World War the United States was so anxious to restore France to a dynamic role in world affairs that it encouraged France to think of itself as a great power. The author criticizes the United States for having persistently underestimated the limitations of France's power. Indeed, he is concerned lest Washington continue to do so. This reviewer agrees with the author's conclusion that a power unable to cope with internal weaknesses should resign itself to a limited role in world affairs. Expecting De Gaulle to run into domestic opposition to policies beyond the resources of France, Furness believes that "in the end De Gaulle will not succeed in restoring France to its past grandeur." He suggests that France would do well to recognize its decline as a world power and to chart a new course, taking cognizance of the fact that, fundamentally, it is a continental European power. These critical and controversial observations merit widespread discussion.

HENRY BLUMENTHAL
Associate Professor of History
Rutgers, The State University

JOHN T. MARCUS. *Neutralism and Nationalism in France: A Case Study*. Pp. 207. New York: Bookman Associates, 1958. \$4.50.

Sir Eyre Crowe's famous memorandum concerning British foreign policy in 1907 argued that coalitions of jealous rivals against the eminence and wealth of Britain were only obviated by Britain's manifest concern for the ultimate interest of every nation, its independence. This concern permitted Britain to protect herself from

the threat of a power aspiring to general dominance by forming an alliance of those states seeking protection from the same threat.

In attempting to contain the expansionist designs of the Soviet Union, American policy-makers looked with some assurance to receive the support of other nations. It has not always been forthcoming. Some states and some parties within states have opted for various forms of neutrality in the Cold War. This neutralism, principally as manifested in France, is the subject of Marcus' book. It is "primarily a mood, an attitude of values, and only secondarily a policy, or set of policies" (p. 107). But its significance was demonstrated in the defeat of the European Defense Community.

This was a considerable achievement for the "mood" and views originally expressed by some left-wing politicians and notably intellectuals, including the *Mouvement Républicain Populaire* (MRP) senator and philosopher, Étienne Gilson. The neutralism of the earlier period from 1949 to 1951 was often pro-American in some respects, but it was argued that since the United States could not provide any tolerable security for France, neutrality would be in the interests of France and ultimately of the United States. If France were not an American ally, the Soviet Union was unlikely to attack her, and she could concentrate on domestic reconstruction and reform. American leadership in resisting the North Korean aggression and in urging the rearming of Western Europe and Germany provoked a more anti-American temper and a more forceful neutralism. Moreover, the disintegration of De Gaulle's *Rassemblement du Peuple Français* (RPF) as a political movement—many of his supporters found Pinay's rightist government congenial—restored the purity of a *mystique* to De Gaulle's movement and permitted his followers to work with others on political issues, for example, on Vietnam and the European Defense Community. Thus, neutralism was temporarily effective because it marked the convergence of "the social ideology of the left and the nationalism of the right" (p. 20). A somewhat similar convergence provides some of the

support for De Gaulle today. In a brief chapter Marcus notes the play of leftist neutralism and nationalism in Bevanism and among the German Socialists.

The volume is distinguished by judiciousness, careful analysis, and wide research.

M. A. FRITZSIMONS

Professor of History
University of Notre Dame

WILLIAM A. JENKS. *Vienna and the Young Hitler*. Pp. viii, 252. New York: Columbia University Press, 1960. \$5.00.

Adolf Hitler called the time he spent in Vienna "the hardest, but also the most thorough school of my life." A number of books have already been published by the companions of his early years, which have shed some light on the darkness in which Hitler wished to preserve his youth. Professor Jenks does not attempt to add to the biographical information thus far assembled. Rather it is his intention to "re-create the Vienna in which Hitler spent six aimless but important years." Like most students of the Führer, he has gathered the impression from reading *Mein Kampf* that practically all the future dictator's ideas were conceived or stimulated during his sojourn in the Hapsburg capital. His book is, therefore, a background study designed to explain the convulsed and ideological processes which crystallized in the doctrine of national socialism after 1919.

An introductory chapter presents a view of the Vienna of 1906, with its magnificent opera, its courts and parades, under which seethed the turmoil of its racial mixtures and nationalistic tensions. Mr. Jenks concludes: "If Vienna did . . . not inspire Hitler's hatred for 'inferior races' . . . it at least fixed and intensified his unholy complexes."

The book gives a graphic description, drawn from authentic material, of the welfare institutions to which Hitler was obliged to appeal for his actual survival in Vienna. Apparently some were models of cleanliness, where food and shelter might be secured for a token fee. Even so, Hitler was not always able to pay the small amount that was asked, and con-

OXFORD books of exceptional interest

German Electoral Politics

A Study of the 1957 Campaign

By UWE KITZINGER. The West German election of 1957, the first in which a German democratic party polled an absolute majority, is the subject of this study. The author analyzes the ideological background, the social basis, the policy aims and propaganda techniques of each party, the role played by the Catholic Church, organizations of former National Socialists, trade unions, refuge associations, undercover activities of communists, and pressure group tactics of business. 4 plates. \$7.20

African Nationalism

By NDABANINGI SITHOLE. Mr. Sithole discusses, from the African point of view, the racial situation in southern Africa—African reactions to the West and to Russia, African reactions to white domination, Communism in Africa, etc. \$3.25

Five Elections in Africa

A Group of Electoral Studies

Edited by W. J. M. MACKENZIE and KENNETH ROBINSON. This is a comparative study of elections in five African territories that were, or are, administered by the British and French governments. The elections, all studied by qualified observers are: The Western Region of Nigeria, May 1956; The Eastern Region of Nigeria, March 1957; The Sierra Leone Election of May 1957; Senegal: The Elections to the Territorial Assembly, March 1957; and African Elections in Kenya, March 1957.

OXFORD UNIVERSITY PRESS

The Soviet Design for a World State

by Elliot R. Goodman

Soviet intentions and expectations concerning their world-wide mission are usually described in clichés: "the Kremlin wants world domination" or "seeks world revolution." This book probes behind these phrases and expresses their meaning clearly and concretely. Professor Goodman has drawn on a broad sampling of significant Communist writings to show what the Communist world order would be like if the Kremlin achieved its long-range goals. \$6.75

Current Soviet Policies—III

THE DOCUMENTARY RECORD OF THE EXTRAORDINARY 21ST CONGRESS OF THE COMMUNIST PARTY OF THE SOVIET UNION

Edited by Leo Gruliov and the staff of the "Current Digest of the Soviet Press," this book is the third in a series designed to meet the needs of both scholars and journalists who wish to obtain authoritative documents regarding recent developments in the Soviet Union. It brings together in one volume the record of the Extraordinary 21st Congress of the Communist Party as revealed in the government-controlled Soviet publications. \$6.00

Defeated Leaders

THE POLITICAL FATE OF CAILLAUX, JOUVENEL, AND TARDIEU

by Rudolph Binion

The history of the Third French Republic told in the form of comparative biography. From its inception in the 1870's the Third Republic was the object of criticism by every political party. In studying the careers of three political reformers, Dr. Binion examines the complexities of French politics and analyzes the failure of these men to reform the regime. \$7.50

COLUMBIA UNIVERSITY PRESS
2960 BROADWAY, NEW YORK 27

Kindly mention THE ANNALS when writing to advertisers

sequently spent many a night in the Prater. Such experiences did not turn him into a park-bench philosopher. On the contrary, the self-induced hardships of these early years increased the venom of a mind that was born poisoned.

The most fruitful parts of Mr. Jenks' study are those devoted to the two crucial figures who influenced the political thought of young Hitler: Karl Lueger and Georg von Schönerer. Lueger in particular attracted Hitler's attention, not only because he was a master demagogue and a crafty politician but also because his "rehabilitation of Vienna" showed the political possibilities inherent in an anticapitalistic program. Schönerer, on the other hand, confirmed Hitler's belief that the Hapsburg empire was doomed and that from its ruin a pan-Germanic empire would rise. The chapter in which Mr. Jenks deals with the Austrian Social-democrats is also enlightening. It explains the contradictions in which this party became involved in its hopeless effort to steer a course between the internationalism of Marxian doctrine and the claims of oppressed ethnical groups such as the Czechs and the Southern Slavs. Hitler's contempt, both for the Social-democrats and the Slavic races, was based on the impressions he received in imperial Vienna. It is, of course, important to note that he remained entirely ignorant of the European West.

The pages devoted to the culture of prewar Vienna are less conclusive. Hitler found Viennese culture decadent and "Jew-ridden," and there is a grain of truth in his observations. However, there is no proof that he was in any position to appreciate the Viennese mind. We have no evidence that he ever read a page by Hofmannsthal, Rilke, Schnitzler, or Freud, nor that he ever listened to the music of Mahler or Bruckner. Hitler's taste was for the bombastic and the chaotic; it was natural that he liked Wagner.

This picture of prewar Vienna will, without doubt, help a future biographer to draw the early years of Hitler with firmer strokes. There remain, however, two questions on which Mr. Jenks has not touched—deliberately, I would judge. One is the origin of the pseudoscientific information

that Hitler absorbed prior to 1914 and which he displayed in *Mein Kampf* as an ideological screen for the burning resentment which inspired most of his assertions. The other problem concerns his psychological make-up. Very little progress has been made in this direction since Heiden's work on the subject. Admittedly the task is a formidable one, but only a psychological study of Hitler could fully explain why the lessons he learned in Vienna became the inflammable material that set a continent on fire. Mr. Jenks' book will facilitate research of this kind; it is fully documented and reveals a familiarity with the intricate Austrian problem that comes only from long and sympathetic investigation.

GERHARD MASUR

Professor of History
Sweet Briar College

L. G. JOHNSON. *The Social Evolution of Industrial Britain: A Study in the Growth of our Industrial Society*. Pp. viii, 178. Liverpool: Liverpool University Press, 1959. 25s net.

Although this volume covers much of the same ground as standard works on British social history written by Clapham and the Webbs, it emphasizes, to a greater extent than in previous publications, the loyalties, habits, and aims of the British people. It is less concerned with the expansion of manufacturing techniques and industrial skills. The search for intellectual maturity, through formal and informal education, and the conflict of ideas because of the advancement of knowledge are outlined in great detail.

Tracing the transformation of the British economy from farm-centered to manufacturing-centered, the author, who is a senior lecturer in economics in the University of Leeds, discusses the new skills developed by Britons, the social implications of industrial progress, and the rise of organized labor. Finally, he indicates the significance for social evolution of important economic, political, and intellectual developments of the last fifty years. Moreover, some of the tasks of creative adjustment now facing Great Britain are emphasized. Completion of these tasks,

in a modern technological period, must be assured if that nation is to sustain its evolution as a democratic industrial society.

To the reviewer, one of the most baffling aspects of the book is the stress of the labor movement with little or no reference to management's role in British progress. Although the part the Productivity Teams played in Britain's recovery after the war receives some attention, it appears that the author does not envisage these Teams as making the significant contribution to productivity and to management education which the reviewer feels was the final result. Johnson writes that the years immediately following the Second World War represented a period when, for the first time in British experience, "serious attempts were made by the government and the Press to instruct the general public in matters directly concerned with the nation's economic prosperity." More attention in this area might be devoted to the rise of the statistician as a key figure in British governmental and business circles.

The book ends on the note that, at least as far as inventiveness is concerned, "there seems to be no limit to the expansion of the British economy. The community's most difficult problem is that of human relations within industry." Wage policies have assumed ever greater importance in British affairs. Johnson believes that his country will be asked, eventually, to decide whether the system of collective bargaining should retain its current form. Perhaps, instead, in order to achieve effective co-operation among the government, unions, and nationalized industries, the system should be altered. The hope is expressed that, in spite of drastic change, "the British people will derive inspiration from the knowledge that, during the earlier phases of industrial growth, they manifested a creative capacity for the development of democratic institutions and that they will not permit their community-sense to be weakened by their efforts to live becomingly in the future."

MARY E. MURPHY
Professor of Business Administration
Los Angeles State College of Applied
Arts and Sciences

ABDURAKHMAN AVTORKHANOV. *Stalin and the Soviet Communist Party: A Study in the Technology of Power.* Pp. 379. New York: Frederick A. Praeger for the Institute for the Study of the USSR, 1959. \$6.00.

Mr. Avtorkhanov was born in the Caucasus in 1908, apparently of Muslim origin. His first name, translated from the Arabic, means "servant of the Merciful (God)." In the volume under review, he has attempted the ambitious task of studying in detail the means by which a fellow Caucasian, Stalin, succeeded in dominating the Communist party of Soviet Russia. The narrative—a mixture of personal reminiscence and historical chronicle—concentrates mainly upon the decade 1928–1938. It is successful not only in making the drama, intrigues, and the squalor of the inner-party power struggles at the topmost levels come to life but also in its skillful sketches of some of the more prominent Soviet figures of that time: Stalin himself, Bukharin, Tomsky, Madame Krupskaya, and Pokrovsky. Events subsequent to 1938, including the Khrushchev regime with its revelations of the Stalin system, are also analyzed, but the earlier period is really the heart of the study.

The author—now a leading figure in the Munich Institute for the Study of the Soviet Union—was a member of the Institute of Red Professors in Russia and later worked in the Agitation and Propaganda Department of the party's Central Committee. He suffered for his sympathy toward Bukharin's views and so-called "right deviationism" and spent several years in prison after 1937, the year of the Great Purge.

Mr. Avtorkhanov is shrewd indeed in his estimation of Stalin and his methods. Unlike many of Stalin's foes, he recognizes just how formidable the Georgian Bolshevik was. The discussion of Stalin's position in the party subsequent to the titanic struggle with and victory over Trotsky, but before the triumph over Bukharin and the "Rights," is masterly in its analysis of Stalin's grasp of "unlimited tactical flexibility"—otherwise known as "Leninist dialectics." Mr. Avtorkhanov concludes

that "Stalin will go down in history not only as a tyrant and Grand Inquisitor but also as a phenomenal tactician, strategist, and master of the science of power. The essence of Stalinism, as practiced by himself and his pupil Khrushchev, is the technology of power."

Stalin and the Soviet Communist Party makes a fascinating and significant contribution to our understanding of the mentality of the Stalinist period of Russian history. Much of the historical value of Mr. Avtorkhanov's book will rest, however, upon the extent to which we can lend credence to the author's "Tacitan" historical approach. For example, a rumor is repeated which pictures Lenin's widow, Madame Krupskaya, as wailing in the home of either Rykov or Bukharin that "This Asiatic monster [Stalin] will end by throwing me into the Lubyanka. . . ." It is possible to visualize such a scene. At another point, the author, in discussing Lenin's demise, goes beyond even Trotsky in practically accusing Stalin of poisoning the ailing Lenin. In this reviewer's opinion, accusations of this kind need more than even the strongest circumstantial evidence to convince the historian of their truth.

DAVID HECHT

Associate Editor, *Collier's Encyclopedia*

TAMAS ACZEL and TIBOR MERAY. *The Revolt of the Mind: A Case History of Intellectual Resistance Behind the Iron Curtain.* Pp. xiv, 449. New York: Frederick A. Praeger, 1959. \$5.00.

Aczel, one of the most celebrated young Hungarian Communist novelists and winner of both the Stalin and Kossuth Prizes, joined the Communist movement during World War II; he played an active role in the events leading up to the Hungarian Revolt, fled Hungary after its collapse, and is now living in London. Meray, an equally outstanding Hungarian journalist, novelist, and Kossuth Prize winner, was also forced to flee Hungary following the events described in this book. Incidentally, he is the author of the recently published account of Imre Nagy and the Hungarian

Revolution, *Thirteen Days that Shook the Kremlin.*

With convincing candor, which is quite impressive at times, the authors describe how they swam with the Communist current for several years, accepting the falsehoods with which Matyas Rákosi tried to justify his domestic as well as the Kremlin's foreign policy while slavishly copying the Soviet Union's economic program, although it completely unsuited Hungary and brought the country to the brink of bankruptcy. Aczel and Meray describe vividly the organized mass arrests and trials with predetermined capital sentences and how this unleashed terror induced them to doubt the dictator's claims. They eventually realized that the members of the ruling clique "lived in an air-tight, isolated world, in a glittering glass sphere into which no sound from the outside could penetrate. They lived according to their own rules, and they answered their own questions in the way they wanted to answer them. Life was an endless succession of victories, and they were the conquerors. . ." (p. 309).

The authors end their story on the eve of the October, 1956, events. Their last chapter is a valuable "Who's Who" of the most important personalities covered in their book. All in all, theirs is an eminently readable, and factually dependable, introduction to the operation of the police state in the European Soviet orbit.

JOSEPH S. ROUCER

Chairman and Professor
Departments of Political Science
and Sociology
University of Bridgeport

JOSEF KOVAGO. *You Are All Alone.* Pp. 295. New York: Frederick A. Praeger, 1959. \$6.00.

The title of this book may refer either to the author, who was the mayor of Budapest between 1945 and 1947 and again during the revolution of 1956, or to his country. Its real value is in the description of a nation's suffering under Communist rule. The author recounts his own day-to-day experiences, imprisonment in 1950 by the tyrannical Rákosi regime and

release shortly before the 1956 Revolution when the policy of de-Stalinization ushered in a period of thaw resulting in a rising spirit of criticism. The book does not represent a penetrating insight into the Communist mystery, and no attempt is made to discuss the ideological character and the genesis of the Revolution. Nowhere does one get a clear picture of how much the Revolution was anti-Communist, anti-Russian, and prodemocratic; there is no discussion of the elements and groups of Hungarian society that led the Revolution. In fairness to the author, however, his book was not intended to be more than a personal account of the crucial events of these years.

What the author does, and does well, is to present his personal experiences accurately and as dispassionately as possible. It might be noted, however, that the prominence given to some leaders of the Revolution and the superficial treatment accorded to others leave an erroneous impression of the relative importance of the roles that individual persons played in the Revolution. Yet the author is essentially kind to his political rivals. He refers to Anna Kethly, the Social Democrat leader, who might have been his political adversary in a free election, with the utmost respect. But Imre Nagy, about whom he has very little to say, is praised faintly as "the patriot Communist who became disgusted with Communist and Soviet terror." Kovago fully acknowledges that Nagy's government received "a unique mandate from the people" and "a vote of confidence which was virtually unanimous" (pp. 249 and 251).

The Revolution tested Kovago's political integrity and convictions, and he apparently survived unscathed. He was steadfast in his demand for the revival of the political parties, free elections, and the withdrawal of Hungary from the Warsaw Pact. As to whether the position he took was politically astute and realistic, future historians will be in a better position to judge. As he saw it in 1956 the only alternative to Communist Hungary was a free and neutral Hungary, and he was convinced that the people of Hungary had rejected both the Tito and Gomulka

types of national communism. He urged his anti-Communist friends to take over the leadership of the Revolution to avoid being "swept by the storm" (p. 172).

One does not obtain a clear picture of what Kovago expected from the West during the Revolution and whether or not the disappointment over western failure to help or the gratitude over western sympathy dominated his feelings. When Vice-President Nixon explained the "moral dilemma" that faced the United States: that is, if the United States "gave special help to the Hungarian refugees, then more and more people would leave Hungary," which would mean "a very serious loss" to that country, but if the United States did not "give the refugees their support," then it would find itself in "an impossible moral position" (p. 280), Kovago could only say that he "never saw the facts in this light." It would seem, therefore, that the author himself is at a loss to know just what course the United States government should have taken. All in all, Mr. Kovago's book is well written and informative, and it helps the reader to understand Hungary's tragedy.

Stanford University

ALBERT N. TARULIS. *Soviet Policy Toward the Baltic States, 1918-1940*. Pp. viii, 276. Notre Dame, Ind.: University of Notre Dame Press, 1959. \$5.50.

Here is another one of those books that is so dully written that one can only say the author would have been wise to present a straightforward and unadorned calendar of events, rather than to try to string his thoughts together in a narrative, as he has done here. What we have is a calendar of events anyway, and the strung together paragraphs only obscure a clear-cut view of events that a sober calendar would have furnished. The impact of a calendar would have been the more powerful, also, as then we should have been able to see in stark and bitter outline the inevitable *descensus Averni* which is the theme of Mr. Tarulis' story in this volume.

The book had to be written, that we recognize and concede, if only to record

in one place the steps by which the Soviet Union took over and began to absorb the three Baltic republics of Estonia, Latvia, and Lithuania. In the year 1918, within the space of ten months, from February 16 to November 18, the three achieved independence. In the summer of 1940, in the space of three days, August 3, 5, and 6, the three lost that independence and became the 14th, 15th, and 16th republics, respectively, of the Soviet Union. In the book under review we have the record, compiled in detail and largely based on primary sources, of just how the drama implicit in this took place. Unfortunately, in this portrayal, there is no drama, just a record of cynical and low-minded political maneuvering and ultimately a forcing of three once independent states into the Soviet orbit without resistance.

The Baltic has always been some Power's lake: for instance, Denmark's and Sweden's, and there was a time the British would have contemplated its acquisition; at one moment in the period 1930-32, there was hope that it might even become the lake of the mid-zone states, with Sweden as a benign patron. Signs pointing in this direction were, among others, the conference of the Agricultural Countries which was held in Warsaw in 1930, and again the celebrations in Tallinn and Tartu in 1932 of the 300th anniversary of the Estonian University of Tartu. We have tangible evidence of what was then happening in the file of that excellent organ of the small Baltic nations, *Baltic Countries*, published in Poland. But since Peter the Great, there has never been a moment's relaxation of the Russian will to make the Baltic a Russian lake, and it is the realization of this that we see in Tarulis' book.

It is clear that if the Baltic peoples had been one, they might have been able to learn to live with a giant, as Poland, with her unique culture, has been able to do. But with three different peoples, varying greatly in historical experience among themselves and with a population ratio of one to thirty with the Soviet Union, there was never any hope. The sad record is here, fully set down.

Scholars reading this book will certainly

miss a Bibliography. And desirable also would be an informative "who's who," so that men such as the United States Minister to Latvia (p. 169) could be properly identified and so that one could recognize in the man, Kreve, who played so great a role in the final handing over of Lithuania to the Soviet Union the professor, Kreve, who had been a great spiritual force in Lithuanian life and who reached the end of his career at the University of Pennsylvania.

STANLEY W. PAGE. *The Formation of the Baltic States: A Study of the Effects of Great Power Politics upon the Emergence of Lithuania, Latvia, and Estonia*. (Harvard Historical Monographs XXXIX.) Pp. ix, 193. Cambridge, Mass.: Harvard University Press, 1959. \$4.50.

Professor Page's book is concerned with one of the most exciting and complex episodes of the political history of World War I. In a way, it may be viewed as a case study of the double conflict between national aspirations and big powers' politics and between the latter's mutually exclusive political goals. This pattern had been in existence in several areas during the closing days of World War I and reappeared in several instances some twenty-five years later.

The Baltic States became a pawn in the power politics of the big powers. It was only at the beginning of 1917 when Germany faced the necessity of contemplating a negotiated peace that some of her political leaders took cognizance of a national movement in Lithuania which demanded independence. Even though this policy was calculated as a matter of temporary expediency the military leaders of Germany combatted it by other designs which equaled outright annexation. Latvia and Estonia remained part of Russia and their national aspirations continued on the whole to be ignored even by her provisional government. Then, the October Revolution and the Brest-Litovsk Treaty threw the whole area into a maelstrom of chaotic

events in which nationalism, imperialism, and Bolshevism crossed swords in a drama of manifold conflicts. Self-determination became the slogan of the day, whether carried on the banners of the advancing German annexationists or on the lips of the Bolshevik interventionists. The Allies who accepted the principle of self-determination as one of the guiding lights of their peace aims ironically were most reluctant to implement it toward the Baltic States.

The chaos reached its peak when after the armistice the ill-fated Iron Division of General von der Goltz was supposed to hold its position on behalf of the Allies. More out of chaotic circumstances than as a result of a planned policy emerged the independent Lithuania, Latvia, and Estonia, and the only elements that shone in the darkness of power politics were the national sentiments and goals of their people.

Professor Page succeeded in collecting pertinent information from many scattered sources and in presenting an integrated picture of an extremely complex story. It is a pity, indeed, as he himself recognizes, that lack of language knowledge of the Baltic nations prevented him from tapping an important part of historical materials. Nor did he make use of the archives of the Imperial German Ministry of Foreign Affairs, the microfilms of which are deposited in the National Archives, Washington, D. C. and which would have thrown an additional light on the somber scene of the German politics in the Baltics. Nevertheless, his volume deserves careful study for its informative value and clarity of presentation.

FRIEZ RÖRIG. *Wirtschaftskräfte im Mittelalter: Abhandlungen zur Stadt- und Hansegeschichte*. Pp. xi, 707. Köln and Graz: Böhlau Verlag, 1959. No price.

This book is a posthumous collection of essays written over a period of some thirty years by our generation's most outstanding historian of the German Hansa and the cities of northern Germany. A complete

list of Rörig's publications covers dozens of pages. From these papers the editor has selected a score which deal primarily with the history of the Hansa, the Hansa towns, and medieval cities in Germany. The first half of the book contains a set of articles which already had appeared during the lifetime of their author, at that time under the title *Hansische Beiträge zur deutschen Wirtschaftsgeschichte*.

Whereas the first half of the book contains essays which deal with strictly circumscribed problems of medieval economic, and especially commercial and urban history, the papers in the second part deal with somewhat more general questions. One paper, for example, is entitled "Medieval World Economy: Flowering and End of an Economic Epoch." Another is entitled "The Sea and the European Middle Ages;" and a third "The City in German History." Though many of the illustrations in these articles are taken from the history of the Hansa, and, in particular that of Lübeck, their scope is much wider and their historical depth greater than the earlier papers which explicitly deal with the history of Lübeck or the political and commercial struggles of the Hansa in the Baltic Sea.

The significance of these chapters is threefold. First, they contain some interesting and well-presented aspects of European economic history. For example, in one essay on "The Origin of Magdeburg and the Earlier History of Commerce," Rörig presents a penetrating analysis of the gradual expansion of commerce in the ninth and tenth centuries into the area between Rhine and Elbe, and in the essay "Symbolism of the Reich in Gotland," he describes the manner in which the expansion of German commercial interests in the Baltic gradually brought this area into the network of European trade in the twelfth and thirteenth centuries.

Secondly, Rörig's essays are important because several provide a synthesis in the field of urban and commercial history; they form a capstone to the more monographic and specialized presentations in the first part. This is true, in particular, of the last two papers on the role of sea trade in European economic history and

the economic function of the cities of Germany in their historical development. A third essay, "The Origin of the Hansa and the Baltic," is primarily historical in conception. It had not been published before, but was intended as a first chapter in a larger book on the history of the Hansa, in general.

Thirdly, Rörig's essays, notably the crucial essay on medieval world economy, contain a lengthy exposition of and argument for a particular thesis on the role of medieval cities and medieval trade, in general. Among European economic historians two extreme positions had become elaborated, one represented by Bücher and Sombart, and the other by Pirenne, H. Bechtel, and Rörig. Whereas the former thought of the economy of the typical medieval town as limited in scope, extent, and variety of customers, the second group emphasized the essential international interdependence of urban economies. Whereas Bücher saw a historical development from a "town economy" to a "national economy," Rörig replies: "The real economy of medieval towns was at the same time always a world economy; only when national economies began to develop, the world economy had come, for the time being, to an end" (p. 391).

Much of the content of the essays collected in this book is an elaboration of this thesis. It is not possible to enter here into the dispute between Bücher and Sombart, on the one hand, and Rörig, Pirenne, and those siding with them, on the other. In part, this dispute is clouded by semantic problems. For example, such concepts as "town economy" or "world economy" are employed with different meanings. Moreover, whereas Bücher has in mind primarily the typical small town of the German plains, with some 1,500 to 2,000 inhabitants, Rörig is inclined to think of the great emporia like Venice, Florence, Bruges, or Lübeck. But the conflict goes deeper than this, and though it cannot be said to be fully resolved—especially since the quantitative relations of medieval commerce are as yet too little explored—Rörig presents in the book under review a mass of ammunition for the "modernizers," as they have sometimes been called.

Surely in view of his arguments the Bücher-Sombart thesis cannot be maintained in its primary intransigent form.

In the course of developing his thesis of the oecumenical network of medieval trade, especially as it was carried on from and through the commercial centers in Northern Germany, Rörig presents a mass of valuable, challenging data and insights. His book is a pleasure to read, and anyone interested in the Hansa or medieval commerce will find it an indispensable companion. And last but not least, some of the essays contained in this work, such as the long essay on "The Market of Lübeck: A Topographical-Statistical Investigation of an Aspect of German Social and Economic History," are rare masterpieces of social-historical analysis which will long remain models for historians and students of society.

BERT F. HOSELITZ
Professor of Social Science
University of Chicago

MOSES HADAS. *Hellenistic Culture: Fusion and Diffusion*. Pp. vi, 324. New York: Columbia University Press, 1959. \$6.00.

The author has previously published the following important books: *A History of Greek Literature*, *A History of Latin Literature*, and *Ancilla to Classical Reading*. He is Jay Professor of Greek and chairman of the Department of Greek and Latin at Columbia University. In the present work he clearly indicates how Greek civilization after the career of Alexander the Great became strongly affected by Oriental civilizations, while at the same time it exerted a powerful influence in Syria, Mesopotamia, and northwestern India. This is naturally a most fascinating subject, and we are grateful to the writer for his scholarly treatment. He maintains with much justice that western civilization is greatly indebted to the process which he has described. The Christian church in particular drew heavily upon the culture of the Hellenistic world in which it originated and developed. It should be noted especially that the influence of Hebrew literature, chiefly the Old Testament, seems to have expedited the spread of Christianity in the eastern half of the Roman Empire.

Professor Hadas makes this significant statement on p. 264: "For the shaping of European civilization the emergence of unified conceptions of law and authority is the most meaningful consequence of interaction between east and west in the hellenistic age." In his opinion Virgil borrowed from the Jews the widely accepted idea that the Romans were an elect people. He was probably correct in making this remarkable conclusion.

There are altogether twenty chapters, which present somewhat scattered bits of information, leaving the reader in a state of mind in which he is still anxious to view the whole aspect in a more closely knit scene. The Books of the Maccabees, for example, receive more than the proper share of attention, chiefly because the author had published a great deal on this portion of Hebrew-Aramaic literature. We might also wonder why Mr. Hadas expresses this strange thought: "In Greek tragedy there are no villains: Clytemnestra and Aegisthus may not have sufficient justification for compassing the death of Agamemnon, but they have some" (p. 56). No doubt all villains have some justification for their peculiar actions, and yet we hesitate to magnify the extenuating circumstances. In general it may be said that the ancient Greeks were a bit lacking in personal virtue and have received more credit for sound ethics than they deserved.

Professor of History
University of Michigan

ASIA

SIR MORTIMER WHEELER, C.I.E. *Early India and Pakistan to Ashoka*. Pp. 241. New York: Frederick A. Praeger, 1959. No price.

While Sir Mortimer Wheeler was the Director General of Archaeology in India, he initiated, on a scientific basis, a regular survey and excavation of prehistoric sites in India and utilized in it the most up-to-date scientific method evolved in Europe and America. It is, therefore, suitable that he should have presented to the learned

world the state of knowledge of prehistoric India in the form of this nicely printed and well-illustrated handbook. A comparison of it with Stuart Piggott's *Prehistoric India*, published in 1949, would give a fair measure of the progress and precision of knowledge achieved during the last ten years.

The author begins with a discussion of the chronology of the three types of wares which are of special importance in any study of Indian prehistory during the first millennium B.C. The "Painted Grey Ware," associated with the Bronze Age, is the earliest ceramic specimen yet found that belongs to a date posterior to the Indus Civilization. The beginning of this "earliest reputable pottery known to us from a number of town-sites, mentioned as already established before the Mahabharata war," is attributed by the author to the eighth century B.C., though Indian archaeologists, who excavated Hastinapura, would prefer to take it back to 1100 B.C. The initial date of the "Northern Black Polished Ware," which immediately succeeded the "Painted Grey Ware," is placed somewhere in the fifth century B.C. The third, the "Rouletted Ware," is placed, on more sure grounds, approximately at the beginning of the Christian era. With an initial gap of five hundred years—more or less—after the end of the Indus Civilization about 1500 B.C., the three types of wares mentioned above bring us through successive stages to the historic period.

The book also deals with the beginnings of the prehistoric age and gives a good account of the Stone Ages and the Indus Civilization, but its special feature is a clear exposition of the prehistoric culture of the period that immediately followed, and particularly its extension to the Ganges Valley and Central India of which very little has so far appeared in the form of a popular handbook. Sir Mortimer Wheeler writes in an easy and lucid style, and his book will surely be read with interest and profit by anyone who wants to possess general but authentic information about prehistoric India. The only blemish in the book is its last chapter dealing with the great Maurya Emperor Asoka, and the author would have been well advised to

omit it altogether. Its relevancy with the preceding chapters is not quite apparent, and the treatment of the subject is open to serious criticism.

R. C. MAJUMDAR

Honorary Head, Department of
History
Bharatiya Vidya Bhavan
Bombay

A. DOAK BARNETT. *Communist China and Asia: Challenge to American Policy*. Pp. xi, 575. New York: Harper & Brothers for the Council on Foreign Relations, 1960. \$6.95.

Officials, scholars, newspapermen, and debaters will find this book a blessing. Accurate and up to date, it summarizes the accomplishments of the Peking regime within China, outlines Peking's strategic capacities, describes Communist China's foreign policies segment by segment, and concludes with a discussion of Nationalist China and of American foreign policy.

The author is an outstanding China expert. Reared in China, he has the additional advantage of recent service in Hong Kong with the American Universities Field Service. He has also written many of the background studies which go into this book. He knows the country so well and so deeply that he is able to marshal immense numbers of facts without becoming complicated or tedious.

The present work does not have the "fact-crammed" impact of Rostow's 1954 book, *The Prospects for Communist China*. This book is never too detailed. There are few tables of figures, no tables of organization, and very little reference to materials not available in the English language. The approach is always gentlemanly and never pedantic. Sometimes this reviewer has wished that Barnett had been more specific in things which he obviously knew but did not include. The Council on Foreign Relations has an admirable reputation for keeping problems at an understandable, reasonable level; this book continues that tradition.

No other recent book has the sheer geographic and functional sweep of this one. The author portrays Chinese Communist behavior under medium-heavy magnifica-

tion. He does not go into the passionate detail of Robert North's *Moscow and Chinese Communists* or the fact-laden heaviness of Peter S. H. Tang's more recent *Communist China Today*. He desires to keep the subject understandable; this he accomplishes.

In his policy conclusions Mr. Barnett cogently summarizes four major alternatives of the United States in dealing with mainland China—accommodation, limited pressure, complete countermeasures, and a "two-Chinas" approach. He shows that the limited pressure has not been very successful, that accommodation is useless, that real countermeasures would not be accepted in this country or anywhere else, except Formosa, and that the "two-Chinas" policy would meet violent resistance from both the Chinese regimes, Nationalist and Communist. He concludes that the problem is indeed perplexing and that China should be considered in the light of a broader, more inclusive Asia policy.

One may add that the book is handsomely printed, the Bibliographical Note an excellent survey, and the Notes full. The publisher has not keyed the Notes to the text in their running heads, but they are serviceable nonetheless.

PAUL M. A. LINEBARGER

School of Advanced International
Studies
Johns Hopkins University

PEDRO CARRASCO. *Land and Polity in Tibet*. Pp. vii, 547. Seattle: University of Washington Press, 1959. \$5.75.

Dr. Carrasco has combed the literature on Tibet, principally in Western languages, to produce a useful composite of data contained in the works of explorers, other travelers, officials, diplomats, and other direct observers of the Tibetan scene. This course was prescribed for Dr. Carrasco because of the inadequacy of existing documentary materials and also because the area is generally closed to firsthand field research. He candidly offers his work "as a provisional analysis, giving only tentative answers to a wide variety of questions" (p. iii) until such time as a work of definitive scholarship can be undertaken. Accepted with these reservations, Dr. Car-

rasco's work incorporates a typological guide to the subject and a body of useful substantive conclusions on the relations between the system of land tenure and the political-social organization of Tibet in the "modern" as distinguished from the "contemporary" period—that is, "before the disruption effected by modern civilization" (p. 229).

The basic conclusion of the study is: "There is no class of private landowners not engaged in government, and there is no group of officials that does not also have a privileged economic position. That is, there is no separation between economic power and political power. The same people who control the land also control the state; in fact, they are the state; and the state, that is, its personnel as a group, owns the land" (p. 216). It is equally clear, however, that the system operates differently in detail in the different parts of the country, that landlord-tenant relations are not identical, and that there are variations in the status of regional chiefs, lamas, landlords, peasants, traders, and other social elements. Particular attention, however, is paid to those parts of the country then under the rule of the Dalai Lama, although with respect to the status of the latter Dr. Carrasco asserts: "Since the Dalai Lama is the successor to the rule of the once unified Tibetan nation, he is in the position both religiously and politically to claim some sort of sovereignty over all Tibetan areas" (p. 79). But considering that "in Lhasan Tibet, the upper class clearly rules and owns the land as a body," the corporate or collective rule of the upper class "also finds its political expression in the absolute power of the Dalai Lama, his personal ownership of all the land, and the subordination of all the people as his subjects." But from the traditional seclusion of the Dalai Lama and the fact that only the thirteenth of the Dalai Lamas of the period in question "ever exercised his theoretical power," Dr. Carrasco concludes that "the absolute power of the Dalai Lama . . . is simply a fiction of Tibetan political theory" (p. 217). Certainly these conclusions are not unrelated to the policies and actions of the Chinese Communist regime since the

establishment of its authority in Tibet after 1951.

H. ARTHUR STEINER

Professor of Political Science
University of California
Los Angeles

DAVID J. STEINBERG and others. *Cambodia: Its People, Its Society, Its Culture*. Pp. 350. Revised for 1959 by Herbert H. Vreeland. New Haven, Conn.: Human Relations Area Files Press, 1959. \$7.00.

Cambodia is the fifth in the Human Relations Area Files (HRAF) series of publications which is designed to provide insight into the total functioning of contemporary societies. In view of the paucity of English-language publications on any facet of present-day Cambodia, this volume is a truly welcome addition to the series.

In keeping with the spirit of the series, *Cambodia* endeavors to provide comprehensive coverage of Cambodian life. The contents of its twenty-two chapters may be summarized into the following categories: religion, economics, government and politics, foreign policy, education, health and welfare, family, values and attitudes, and patterns of living. Of these areas economics and politics receive the greatest amount of consideration, while the least attention is devoted to values, attitudes, and patterns of living.

The book has many merits, particularly with regard to its description of the difficulties attendant upon economic and social reform; but certain shortcomings stand out. Among the most notable of these are the absence of evaluative material and the gross generalizations which the writers often permit themselves to make on the basis of meager facts.

For example, in chapter 8 (pp. 96-97) it is implied that Cambodia's policy of neutrality makes it possible for Communists to use the country as a base for propaganda and infiltration, both within Cambodia and into Thailand and South Vietnam. Except for noting that Prince Sihanouk has stated his concern about Communist activity, no evidence is given

to support this conclusion. Nor is it mentioned that Prince Sihanouk also expressed his concern, on the same occasion, about similar Western activity in Cambodia.

It is unfortunate that an unbalanced concern with issues in the cold war, often confused, beclouds what otherwise one would expect to be careful evaluation. No evidence is offered, for example, to support the assertion that the neutral attitude of the Cambodian government lowers its resistance to communism (p. 113). Nor is any evidence adduced to demonstrate that the Chinese in Cambodia will necessarily serve the aims of Peking (*ibid.*).

The authors betray a lack of understanding of Cambodian politics. To say that "the framers [of the Cambodian Constitution] were satisfied with merely adapting the French constitution" (p. 262), shows a serious lack of appreciation of the shrewdness and foresight of Prince Sihanouk. While it may be true that the Constitution is in part derived from the draft constitution which was rejected by the French electorate in 1946, it would be more pertinent to note that, in setting up a system of parliamentary democracy combined with a measure of autocracy, Prince Sihanouk, then King, liberalized the regime but also provided for a check on the diversity, bred by democracy, which he felt would hinder political and economic progress. As far as Cambodia is concerned, he has been proven correct.

A glance at the Bibliography leads one to question whether all the important material on Cambodia has been consulted by the authors. Conspicuously absent in the Bibliography are the important historical writings of Aymonier, Leclere, Groslier, and Briggs.

These inadequacies, as well as the inconsistencies, often in a single chapter, in the factual material presented, while in part due to poor editing, are perhaps also the inevitable by-products of the particular method used in the compilation of material. This book and the others in the HRAF series have grown out of a request of the Army's office of psychological warfare for information. The original collation of materials on Cambodia was carried

out in 1955 under the editorship of Mitchell G. Zadrozny of the University of Chicago. This monograph was then combined with certain classified information and rewritten by another team as a handbook for the Army's use. In the meantime, HRAF decided to make the original monograph available to the general public. Perhaps it was inevitable that when still another group of persons rewrote the original synthesis in 1957 and revised it in 1959 a certain unevenness of quality and disjointedness in organization would result.

In their statement of purpose, the authors say that they seek to describe the presence and impact of forces for change and to emphasize the constants of attitude and behavior in Cambodia. The flaws in editing, some of which have been noted, detract from the success which they might have achieved in this undertaking. However, many of the guidelines for future research on Cambodia have been laid down in this book.

ROGER M. SMITH

Southeast Asia Program
Cornell University

The Indonesian Town: Studies in Urban Sociology. (Selected Studies on Indonesia, Vol. IV.) Pp. xxxiv, 379. The Hague: W. van Hoeve for the Royal Tropical Institute under a grant from The Netherlands Organization for the Advancement of Pure Research, 1959. Distributed by the Institute of Pacific Relations. \$6.00.

This is another volume in the series of English translations of Selected Studies on Indonesia by Dutch scholars, selected and edited by a Committee of the Royal Tropical Institute of Amsterdam. In the Foreword, the editors remark that while the Dutch knowledge of the Indonesia rural scene is widely recognized, relatively few people outside The Netherlands are aware of the Dutch research in urban sociology. This work was executed mainly between the wars as Netherlands East Indies officials became increasingly aware of "bad Kampongs."

The book has four Parts. Part I consists of four chapters and a conclusion

from the *Explanatory Memorandum* on the Town Planning Ordinance for Municipalities in Java (Batavia, 1938), written by architect-planner, Thomas Karsten. Part II presents in five chapters and a summary a Netherlands East Indies Central Bureau of Statistics Report, *An Investigation of the Living Conditions of Municipal Coolies in Batavia in 1957*. Part III contains three chapters by W. Brand, "Differential Mortality in the Town of Bandung," and Part IV comprises two chapters by H. J. van Mook comparing Kuta Gede before and after the reorganization.

These studies document the editors' statement that the painstakingly detailed Dutch scholarship which we have come to respect was applied to the urban as well as to the rural scene in Indonesia. The book would also lead to the conclusion that Dutch social scientists and officials came no closer to providing a satisfactory theory of underdevelopment when they studied urban problems than they did in describing village society.

The first chapter of Part I presents some interesting figures of urban growth from 1905 to 1930. These figures show that considerable growth took place in this period but that it was largely confined to large and middle-sized cities. Chapter Two provides evidence that urban conditions had become highly unsatisfactory by the 1930's. Karsten is rather critical of the efforts made to deal with them. He stresses, as causes of urban squalor and congestion, lack of knowledge; inadequate, inefficient, and western-oriented planning; the welter of land laws; and the uninhibited and ill-conceived acquisition of land by westerners. In Chapter Three, he shows that sociological dualism and pluralism existed in cities as well as in the country, leading to social conflict. The final chapter calls for better planned urban development and improved technical training to that end.

Part II provides a wealth of statistics on budgets of Batavia (Djakarta) coolies. One interesting fact is that the number of children increases with income, indicating either the presence of family planning or very high infant mortality rates among the very poor. The average number of

children per married couple was not particularly high, 2.6, but only some 11 per cent of these went to school.

Part III shows that Europeans were as healthy in Bandung as in Amsterdam, infant mortality being somewhat lower. The Chinese were less healthy than the Europeans, however, and Indonesians had still higher mortality rates than the Chinese.

Part IV derives particular interest from having been written by the last of the Dutch Governors-General in Indonesia and providing clues to this high-ranking official's attitudes. Through the screen of minutely detailed description, one can sense the enthusiasm which van Mook felt for his job and his optimism regarding the potential for Indonesian evolution within a framework of Dutch guidance. It was this latter attitude which eventually made enemies for him in both camps during the Indonesian Revolution.

BENJAMIN HIGGINS

Department of Economics
University of Texas

J. E. KIDDER, JR. *Japan Before Buddhism*. (Ancient Peoples and Places, Vol. 10.) Pp. 282. New York: Frederick A. Praeger, 1959. \$5.50.

This detailed, well-referenced, attractively illustrated book is by far the best survey of Japanese prehistory in a Western language. To find a comparable work one must look back half a century to N. G. Munro's *Prehistoric Japan* (1911). Munro's excellence was in attempting to interpret the past coherently, not merely to survey the existing finds. Most of his successors, failing to revise his concepts or ask really new questions, let Japanese prehistory appear to fall in the doldrums. In welcome contrast, Kidder's new survey draws on a vastly larger store of data, heeds current Japanese thinking, and incorporates fresh concepts to give insight into the past. He summarizes very briefly (pp. 86-89) the few positive results from race-preoccupied attempts to sort out prehistoric "Ainu" sites from "Japanese" sites; race played a negligible role in the successive transformations of culture and society, and Kidder properly emphasizes

diffusion and social contact, instead, as the forces that brought Japan abreast of continental Far Eastern civilization.

The culture directly ancestral to historic Japanese civilization cannot be traced earlier than the Bronze-Iron Age, the third of four main cultural divisions described in the four central chapters of the book. The earliest periods, Paleolithic and Mesolithic (pp. 27-33), first discovered barely a decade ago, are known from stone implements that suggest a sparse population of hunters and gatherers existing with minor changes for several thousand years. The same sort of primitive life was led by people of the following period, the Neolithic, even though they had new skills, as evidenced by the myriad varieties of pottery produced in the Jomon style during their span of several millennia (pp. 60-68). Following Japanese precedent, Kidder reviews the abundant Neolithic materials in five subperiods. These had by no means run their course when rice agriculture began about 250 B.C. in Western Japan, but continued in the north. However, rice growing by newcomers, presumably from the continent, began a new era of population increase and cultural enrichment in historic Japanese civilization. In the first phase of this era, bronze and iron were used by settled villagers making pottery in the Yayoi style. Social stratification became a feature of this Bronze-Iron Age and was intensified when great earth tombs were built in the succeeding Proto-historic period, from the fourth to eighth century A.D. Kidder, reviewing the historic sequence of Yamato emperors (p. 209), shows that the earliest must have lived near the first century B.C., that is, during the Bronze-Iron Age when Yayoi culture prevailed.

Kidder's account, in the main, follows majority opinion among Japanese prehistorians. Points that call for criticism, in fact, often are not Kidder's, but his too faithful reflection of the inconsistencies and blind spots that persist in Japanese interpretation. While questions of interpretation are by no means inconsequential, the very fact that they rise to mind shows the extent to which Kidder has given coherence and order to the hitherto disor-

ganized and complex details of Japanese archaeology.

RICHARD K. BEARDSLEY

Department of Anthropology
University of Michigan

ALTEMUR KILIÇ. *Turkey and the World*. Pp. 224. Washington, D. C.: Public Affairs Press, 1959. \$4.50.

This is an excellent review and exposition of the foreign relations of the Republic of Turkey, with sufficient background on earlier years, and particular attention to the present. The author, with due attention to the facts, admittedly sets forth the Turkish viewpoint, including the reasons why Turkey, although a small country, regards itself as both a Western power and a political, military, and cultural bridge between West and East. The penultimate chapter, on Turkey in the Middle East, is of special value not only because it reveals Turkish opinion but also because Kiliç is one of the Turkish officials who understands Americans quite well, and because the Foreign Office in Ankara often has, or could have, anticipated American policy formation. The final chapter on Turkey and the World, which is unlisted in the Table of Contents, should be read by all persons interested in Turkey even if they do not have time to complete the rest of the book.

The international relations philosophy of the author, and presumably of his government, is barely if at all distinguishable from that of the late John Foster Dulles. While Kiliç's partiality to the current regime makes him more critical of its predecessor, his characterization of the former President İnönü as "cautious" would find few dissenters.

Unfortunately, the book is written by a journalist for the type of reader who is satisfied by newspaper coverage of events and problems. Although the author quotes widely, the impedimenta of scholarship are conspicuously absent. Counting memoirs as primary, the Bibliography lists mainly secondary sources. This is the more regrettable as Mr. Kiliç has the intellectual capacity and the necessary access to official sources to have written a book equally interesting if designed also for reference

use, with documentation and citations. Even in the spelling of proper nouns, standard rendition in the official, latinized alphabet has been ignored, and transliterations lack uniformity. The publisher has let pass numerous typographical errors.

The author, press attaché of the Embassy of Turkey in Washington from 1955 to 1959, last year, at the age of thirty-five, became Director-General of Press, Radio, and Tourism, a position little short of Cabinet rank and significance in the government of Turkey. Son of the most renowned raconteur in the entourage of the great Atatürk, he tells his story well. He deserves continuing success and an increasing audience as Turkey's spokesman.

ZIYA GÖKALP. *Turkish Nationalism and Western Civilization: Selected Essays of Ziya Gökalp*. Translated and edited by Niyazi Berkes. Pp. 336. New York: Columbia University Press, 1959. \$5.00.

Ziya Gökalp (1876-1924), Turkey's first professor of sociology (1915), was the most quoted theoretician during the demise of Ottoman power and the birth of modern Turkey. Thanks to Professor Berkes, who provides not only the translation but also an illuminating introductory article, his principal writings are now available to readers of English almost as soon as the works of the fourteenth century Arab social historian, Ibn Khaldūn. Gökalp, who, unlike the Berber of Tunis, never traveled abroad, except as a British exile to Malta in 1920 to 1921, distilled the best of European sociology, in the retort of Turkish history and experience, to produce an elixir of reform ideology.

Turkey's salvation, he thought, lay in westernization, nationalism, and Islam. Distinguishing between civilization and culture—material things and techniques versus matters of the spirit—he taught and preached that Turks, proud of their folk culture and inspired by the faith, could so effectively adopt the West's methods of production, commerce, and government that Turkey—as a nation, not an imperial

state—might merit and achieve membership in the Society of Nations. While his most mature writings recognized weaknesses of theocracy and religious establishment, he never abandoned his conviction that enlightened practice of Islam was essential to Turkish behavior. That Atatürk found it necessary to abolish the Kalifat to avoid domestic and foreign political complications does not invalidate the Gökalp viewpoint: in fact, revival of religious activity, especially since 1950, may increase the pertinence of Gökalp's passages on this subject.

That this leader of thought died before his ideas could be tested adds interest to his works: he could not alter his ideas opportunistically. His philosophy for a nationalist program is almost required reading for students of Turkish affairs, and of the role of ideas in action, particularly in nascent nationalism.

Berkes has brought to his task both a wealth of research and academic experience in his own country and the advantages of American graduate education. The translation into English is excellent for not only its literary quality but also its competent rendition in current sociological terminology without excessive employment of parochial lingo. More biographic data on Gökalp would have been appropriate. The book, printed in England, is superbly edited and produced, despite hazards of trilingualism; it is worthy of Gökalp's inspired life and Berkes' painstaking, excelsior interpretation.

SOCIOLOGY

KURT H. WOLFF (Ed.). *Georg Simmel, 1858-1918: A Collection of Essays, with Translations and a Bibliography*. Pp. xv, 396. Columbus: Ohio State University Press, 1959. \$7.50.

Current interest in Simmel's work, as well as his place in the history of sociology, is well served by this book. It

contains the most substantial analysis in English of the reasons for Simmel's continuing importance to sociology since the appearance of Spykman's *Social Theory of Georg Simmel*. I especially recommend F. H. Tenbruck's chapter on "Formal Sociology," Donald N. Levine's "Structure of Simmel's Social Thought," and Heinz Maus' article on "Simmel in German Sociology" for presenting a definitive evaluation of Simmel's contribution.

Tenbruck presents a brilliant analysis of Simmel's concept of "forms-of-sociation" which successfully resolves criticisms directed against it and clarifies Simmel's intention. The other two authors present a detailed analysis of Simmel's influence on ideas in the past, as well as on contemporary theoretical writing. In addition to these articles the book contains comment on Simmel's contribution to the "Sociology of Power" by E. V. Walter. H. D. Duncan and M. Lipman discuss Simmel's "Image of Society" and "Conception of the Individual," respectively.

The value of the book is greatly enhanced by new translations of some of Simmel's works. These include a translation by Howard Becker of the Table of Contents of Simmel's *Philosophy of Money* which I hope will prompt someone to make the book available in English. One also welcomes the translation of the first fifty pages of Simmel's *Soziologie* which deals with the problem of sociology and Simmel's answer to the Kantian question: "How is Society Possible?"

The Appendix contains a detailed Bibliography of writings about Georg Simmel and of Simmel's own works that are available in German and in English.

Professor of Sociology
Hunter College

MARGARET CLARK. *Health in the Mexican-American Culture: A Community Study*. Pp. xii, 253. Berkeley and Los Angeles: University of California Press, 1959. \$5.00.

This is a problem-oriented study of a Mexican-American neighborhood of less than five hundred residents in San Jose, California. It is an abridged and some-

what popularized version of a doctoral dissertation in anthropology. The treatment almost never transcends routine description and assertion. Yet it tells a true story straightforwardly, and even if none of the facts are surprising, they still deserve to be recorded. Readers unfamiliar with Mexican Americans may enjoy the book because it is liberally salted with human interest anecdotes. Those who know something about the minority will be glad for an addition to the small stock of words on an important but ignored part of the American population.

The author is a humane social scientist who desires to protect a weak minority that is the object of misunderstanding and discrimination. Her conceptual perspective chiefly derives from the idea of conflict between cultures. Although much of the book is composed of standard background information about the community, rather little of it is brought to bear directly on the problem of health.

The conclusions and recommendations ask for understanding, patience, and adaptability on the part of medical and public health personnel. These recommendations are unexceptionable, but they are predicated on the assumption that medical practitioners can adapt more readily than their Mexican-American patients. It would be well indeed if physicians and public health nurses were better grounded in the social sciences and better informed about the social and cultural backgrounds of their patients, whoever they may be. But it is unrealistic to expect individuals of categorically superior status working in positions of authority and responsibility, the Anglian physicians, to be compliant and adaptive toward categorically vulnerable and dependent individuals, the Mexican patients. It is hoped that a few key points, for example, the importance of the extended family in decision making, will be taken into account by medical practitioners who deal with Mexicans.

The author and others concerned with such problems are more likely to influence medical practice among minorities if they turn their recommendations around. That is, they should instruct the minority how to adjust to and make the most of the

realities—often strange and cold—of medical care in the United States. For populations, such as Mexico's, that are likely to persist as minorities for some time, the best long-term approach is to accelerate the higher education, medical and otherwise, of members of their community.

University of Texas

PAUL ZUCKER. *Town and Square: From the Agora to the Village Green*. Pp. xxiii, 287. New York: Columbia University Press, 1959. \$15.00.

Dr. Zucker has a long career as historian and critic of architecture in Germany and the United States. He received the Brunner Award of the American Institute of Architects in 1953 for this book, now issued sumptuously with 96 beautiful pages of illustrations, 55 line cuts, and tender loving care. The author claims as his fresh *parti pris* the view historically and aesthetically of "space as a three-dimensional void," rather than as "three-dimensional mass, . . . volume," finding "its most outspoken and characteristic form in the square, the plaza, the focal point in the organization of the town."

Dr. Zucker allows his publisher to claim that "this book is the first publication in English which gives a general survey of . . . the function of the square in the life of the community and . . . of its conception in purely aesthetic terms." Such a book would be of great interest to the urbanist. Dr. Zucker, in his first five pages, starts bravely to deal with "the psychological function of the square: . . . a gathering place for the people, humanizing them by mutual contact . . . freeing them from the tension of rushing through the web of traffic."

But, in good Germanic tradition, he adopts a "structural" classification of "archetypes" that are "spatially, and not functionally defined." Squares, forsooth, change their functions across the ages. With this basic model, Dr. Zucker has written a systematic and rather pedestrian account of the European town and square in antiquity, in the Middle Ages, the

Renaissance, to the nineteenth century—with brief excursions to Asia and the Americas. From the Far East he brings back Lao-tse's pregnant statement that "the true reality of a room is not its walls but the emptiness they contain." From Latin America, he brings the perplexity whether the gridiron town plan with a central square reflects native traditions or the Conquistadores' Laws of the Indies. Indeed, he concludes that "founded cities always adhered to the gridiron scheme through all centuries and in all regions: . . . there must exist an inner urge for order," which, "in the conception of Thomas Aquinas . . . mirrors the heavenly order of the other world."

Dr. Zucker's side glances at the social and cultural meaning of the square are tantalizingly few. The climate of France and Italy led to "a form of public life—and life in public—which made street and square the natural locale for community activities and representation." Spain, with similar climate, never developed a public life. And in England and Holland not only the climate but "the strong emphasis on domestic life . . . mostly prevented any desire for public spatial expression."

The student of cities not concerned with technical architectural analysis will enjoy greatly the beautiful and evocative illustrations that Dr. Zucker has brought together. But for vivid and imaginative depiction of "the function of the square in the life of the community" he will turn to *The Heart of the City*, edited by Tyrwhitt, Sert, and Rogers for the International Congresses for Modern Architecture (1952), mentioned in Zucker's Bibliography; and even more to the perceptive and human pages on "Cities and Squares" in G. E. Kidder-Smith's *Italy Builds* (1955), not noted by Zucker.

G. FRANKLIN EDWARDS. *The Negro Professional Class*. Pp. 224. Glencoe, Ill.: Free Press, 1959. \$4.00.

G. Franklin Edwards in *The Negro Professional Class* has analyzed occupa-

tional mobility among Negroes in a selected group of professions in the District of Columbia. Despite the fact that Washington offers certain special inducements for the development of Negro professional and other white collar workers—Howard University, Freedmen's Hospital, a concentration of federal agencies, a long tradition of professional associations, and good public school education available to Negroes—the findings in Edwards' study offer insights and interpretations which have applicability to most American cities.

Starting with the observation that there has been a conspicuous absence of large-sized business enterprises among Negroes, the author notes that the professional occupations were and are the ones "in the Negro community which could be identified with the American middle class." Edwards has selected four professions for study. They included (1) male college teachers, (2) physicians and surgeons, (3) dentists, and (4) lawyers. A sample of 300 persons forms the basis for conclusions.

Many of Dr. Edwards' findings will not surprise those who are familiar with the general literature on occupational mobility in the United States and know its Negro communities. Most professional Negroes in the District of Columbia come from families in which the fathers were white collar workers. There are, however, two striking differences between Negroes and whites in this regard since among the latter there is a much heavier concentration of fathers in the proprietary group and among Negro professionals there is a greater concentration of fathers in semiskilled or service work. "It is observed that the respondents of the present study come from families in which the occupational level of their fathers was superior to their [the parents'] . . . contemporaries." And this is not a single generation phenomenon: "over a period of time those [Negro] persons entering the professions come from increasingly higher occupational origins."

With a low incidence of business employment, among both Negro professionals and their sons, and this has progressively declined over three generations, "the concentration of . . . [Negro professionals]

resembles the occupational orientation of other minority groups and provides an insight into the areas in the occupational structure where minorities may earn a decent living and secure status."

Dr. Edwards' book reflects and documents the observable fact that medicine is probably the profession which has the highest prestige in Negro society. It also suggests that the improved status of Negroes and growing national concern for civil rights have contributed greatly to the rise in the number and quality of Negro lawyers. This reviewer was delighted to note that the role of the late Charles Houston in the development of the legal profession among Negroes is delineated.

Although restricted in scope, *The Negro Professional Class* is a significant contribution to the literature on occupational mobility and the Negro in America.

ROBERT C. WEAVER

Consultant
Ford Foundation

MAXWELL R. BROOKS. *The Negro Press Re-examined: Political Content of Leading Negro Newspapers*. Pp. 125. Boston: Christopher Publishing House, 1959. \$2.75.

Given the history of race relations in the United States, one might expect to learn from this small volume that the Negro press is generally radical in its weekly view of America as a civilization. That such is not the case is the major conclusion of Professor Brooks' empirical study of five Negro newspapers with a combined circulation of approximately 800,000 copies, namely the *Afro-American*, the *Amsterdam News*, the *Chicago Defender*, the *Journal and Guide* of Norfolk, and the *Pittsburgh Courier*.

To determine the extent to which the Negro press is radical, the author used one of the techniques of content analysis developed by H. D. Laswell. A sample of editions was selected randomly from the entire output in 1948, a concept of the "American Creed" was operationalized in terms of twenty favorable and twenty-two unfavorable symbols, and a count of positive, negative, and neutral frequencies was

accumulated. The careful analysis yielded some five thousand symbols in various editorials, personal columns, and news items. Unfortunately, the author failed to include a single example of an article from which he had selected and scored some of the symbols, thereby limiting the possibility of any independent comparison based on a set of recent editions.

The overwhelming drift of editorial and personal comment in 1948 was favorable to the "American Creed," particularly in relation to the ideal patterns concerning civil liberties, equality, the franchise, democracy, the Supreme Court, and the Constitution. At the same time, the five newspapers were "uncompromising" in their rejection of social practices which perpetuate the status of second-class citizenship. Thus, "their criticism is directed against barriers that tend to restrict the Negro's participation in the social order, rather than against the nature of the social order itself."

The book provides the social scientist with a good example of the research advantage which can be gained from a rigorous application of content analysis. However, quantification alone is not altogether satisfying to the reader who wants to understand the several ways in which an issue is articulated in the Negro press. Even a small amount of case material would have added immeasurably to the value of the book.

OSCAR GLANTZ
Assistant Professor of Social Science
Michigan State University

OSCAR HANDLIN. *The Newcomers: Negroes and Puerto Ricans in a Changing Metropolis*. Pp. xiii, 171. Cambridge, Mass.: Harvard University Press, 1959. \$4.00.

Under the aegis of the New York Metropolitan Region Study, Oscar Handlin has apparently directed his writing toward the "educated layman," and toward the "practitioner." Human relations specialists and others who are biased positively toward "minority groups" will probably find *The Newcomers* an excellent resource. Persons who are active in programs for the amelioration of social problems associated with

"Negroes and Puerto Ricans in a Changing Metropolis" will find a readable summary of population trends, an insightful analysis of the problems of Negroes and Puerto Ricans in New York City, and predilections which imply that future inter-ethnic-racial relationships in Metropolitan New York are fraught with considerable potential tension.

From another point of view, however, Handlin's treatment of "Patterns of Adjustment" is rich in analysis but poor in citations which support his statements. I could find no direct reference to Clyde Kiser, Louise Kennedy, or Ira Reid, all of whom made studies of native-born or foreign-born Negro migrants. The discussion of "Forms of Social Action" is even less well supported. Here the task is to assess the organizational pattern which has developed so that Negroes and Puerto Ricans may "act freely and as equals" within the region. It is a difficult task, but I believe that the literature is more informative than Handlin indicates.

Some of this criticism is vitiated if *The Newcomers* is considered as an extension of the author's earlier works. The sweeping statements about high population density, immigrant slums, and immigrant social organization as an adjustment process gain considerable credence from the scholarly *Boston's Immigrants* and the poetic *The Uprooted*.

However, his neglect of materials from other disciplines and his concentration on New York dull the edge of Handlin's possible justifiable criticism of Hawley and Grodzins for their lack of historical depth about metropolitan expansion and suburbanism. A more explicit recognition that knowledge may be generalized and that the adjustment processes and the adaptive social organization for in-migrants have been studied before, for example, Killian's Ph.D. study of the "hillbillies" in Chicago and Ostafin's study of the Polish in Detroit and upper Michigan as well as the better known students of Park, Burgess, and Thomas would have given greater depth to the book. Parenthetical remarks about the similarity between the New York Negro in 1950 and the Boston Irish in 1850 do not seem sufficient "to break down the pa-

rochial boundaries between the various social sciences."

LEONARD BLUMBERG

Associate Professor
Department of Sociology and
Anthropology
Temple University

GUNNAR MYRDAL. *Value in Social Theory: A Selection of Essays on Methodology*. Edited by Paul Streeten. Pp. xlvii, 269. New York: Harper & Brothers, 1959. \$5.00.

More than half of this work is a reprint of parts of *An American Dilemma*, written with the assistance of Richard Sterner and Arnold M. Rose. Of the rest, only Streeten's thoughtful Introduction and a Myrdal article previously published in German had not been available in English. Streeten offers as a "justification for collecting these scattered reflections . . . that the reader interested in the relation between values and analysis of facts in social theory might not look for its treatment in the sources on which this volume draws." Thus we may see in one volume Myrdal's greatest weakness.

This review reacts to the book and not to the prestige of an unusual, intelligent, and decent person who commands high position in the political and economic councils of his own country and in those of the United Nations. Too often Myrdal's virtues in public affairs and his advocacy of constructive programs lead writers to overlook his naïveté and prejudice in psychological, sociological, and methodological matters and his failure to understand the efforts of social scientists.

Myrdal concerns himself here with conflicts among the objective, the practical, and the idealistic. He appears to have wondered a lot about the relations between curiosity concerning society and desire to change society. Like many practical men of large affairs, he found himself annoyed by the pettifoggery, the impracticality, and the objectivity of those devoted more exclusively to curiosity about society. He has also listened to condensed and biased summaries of theory and evidence—in the

manner of so-called "practical men"—for lack of time to dig deeply and to see accurately at first hand.

Built into social science and "common to all social sciences in the entire Western world" Myrdal sees an attachment to a "do-nothing (*laissez-faire*) bias" and to a "naturalistic and, therefore, fatalistic philosophy." He contends that social scientists exhibit "a systematic tendency to ignore practically all possibilities of modifying—by conscious effort—the social effects of the natural forces." He objects to the findings of social scientists that culture characteristically resists social change, that culture controls to a degree the nature of law, and that the midwives of social change are frequently crises and catastrophes. He regards such views as conservative and as perversions of scientific ideals which are inherent in social science. He therefore asserts that a "disinterested social science" is . . . pure nonsense. It never existed, and never will exist. We can make our thinking strictly rational in spite of this, but only by facing the valuations, not by evading them." Thus we should turn away from a dependence on observation and from an ideal of objectivity. We should develop a social philosophy with political action objectives.

Myrdal's position is actually far more conservative than that of those he attacks as conservative. He would lead us back to a position in which the thinker about society is more clearly an instrument of political interest groups.

Despite the hidden value premises common among social scientists, they respect the few novel facts that do "beat their way" into consideration. Such facts are novel in that they were theretofore unanticipated and unexplained. These facts provide us with what leverage we possess with which to modify or destroy the "strictly rational" theories and plans of action inherited from another day and put forward by special interest groups.

ALFRED MCCLUNG LEE
Professor of Sociology and
Anthropology
Graduate School
Brooklyn College

FRANCIS P. WEISENBURGER. *Ordeal of Faith: The Crisis of Church-Going America, 1865-1900*. Pp. 380. New York: Philosophical Library, 1959. \$6.00.

Organized religion in America was subjected to many stresses and strains between the end of the Civil War and the turn of the century. Biblical criticism, Darwinism, widespread acceptance of the scientific method, urban growth, and the decay of the Puritan ethic were some of the threats to religious orthodoxy. *Ordeal of Faith* recounts, in a simple, factual manner, many of the events that were part of this conflict. Dr. Weisenburger, long Professor of History at the Ohio State University, has brought together in barely 300 pages of text a wide assortment of interesting historical detail.

The scope of the book is broad. The author begins by discussing the roots of anticlerical individualism in America and suggests reasons for a decline in church loyalties from 1865 to 1900. Each issue is then treated separately: the impact of evolution, of higher criticism, of interest in comparative religion, of the new sociology and the social gospel, of rationalism and of pragmatism, and of developing psychological emphases. The ideas of a host of familiar and less familiar religious leaders are examined, ranging from George D. Herron and Walter Rauschenbusch to John A. Barrows and Laurens P. Hickok.

Most attention is focused upon Protestantism. Each of the major denominations is given separate coverage. Perhaps too much effort is made to cover "left-wing" and bizarre groups as well, beginning with Unitarianism and Ethical Culture and including Swedenborgianism, Spiritualism, Theosophy, and Christian Science. Some of the most significant material is included in the discussion of Roman Catholicism. Dr. Weisenburger points to many controversies that raged within the American hierarchy still unknown to many both within and without the Church of Rome. The four-page chapter on Judaism might better have been omitted altogether.

Ordeal of Faith is commendable as a conscientious effort to summarize briefly the major religious trends of the thirty-

five years under study. Its very conciseness, however, is costly. Superficial treatment is accorded many subjects that demand more complete and profound analysis. An even more serious weakness is that the author seems to have done an insufficient amount of original research. He has depended too much upon secondary sources instead of delving into the masses of primary material, notably periodicals, that are available.

In spite of these shortcomings, *Ordeal of Faith* is a useful reference book. It provides teachers and students interesting bits of information that can aid in understanding the period examined. For the laymen, Dr. Weisenburger has written a satisfactory introduction to main events that helped shape the current religious scene.

RALPH LORD ROY

New York City

The World's Metropolitan Areas. International Urban Research, Institute of International Studies. Pp. vii, 115. Berkeley and Los Angeles: University of California Press, 1959. \$3.00.

The main, and an important, contribution of this little book may be stated in the language employed in its first chapter. It lies in "the delimitation of metropolitan areas throughout the world according to an approximately standardized method, and the provision of a table listing these areas, their principal cities, and their populations as of two recent dates" (p. 4). This purpose has been accomplished. The volume thus makes available, for the first time, reasonably comparable data on the total population of the world's great clumpings of peoples into an objectively defined ecological unit—the metropolitan area.

Consideration was given to the use of the "urbanized area" as defined in the United States Census as the unit of observation. Although the concept was regarded as theoretically preferable, the "metropolitan area" concept was used because of its greater feasibility and practicability.

For purposes of international comparability the metropolitan area is defined as

follows: "An area with 100,000 or more inhabitants, containing at least one city (or continuous urban area) with 50,000 or more inhabitants and those administrative divisions contiguous to the city (or to the continuous urban area) which meet certain requirements as to metropolitan character."

It is to be noted that this definition differs from that of "Standard Metropolitan Area" as employed in the United States in several respects. The variations are described in detail and presented together with their rationale which is composed largely of considerations of feasibility and practicability. The procedures employed are carefully described. The text of this volume comprises 35 pages, the Table with the basic data 27 pages, and the Appendix giving component areas of the metropolitan areas and sources of the data, 50 pages.

The study entailed investigation of 202 countries and territories. Of these, 105 had at least one metropolitan area before 1954. Of the total of 1,046 metropolitan areas for the years before 1954, Davis and his colleagues were able to delineate the boundaries of 720 or 69 per cent. Of the 326 cases where only the population of the central city could be shown, 266 were in Communist countries, and 230 of these were in the Soviet Union and China.

Both the geographical and statistical results of this investigation are necessarily subject to error. The authors are quite aware of this. They provide an evaluation of their own work with which the reviewer is entirely in agreement. "Although the results are necessarily tentative, they at least afford one more tool in comparative research on urbanization, internal migration, economic location, and population redistribution."

PHILIP M. HAUSER

Professor and Chairman, Department
of Sociology
University of Chicago
Director, Population Research
and Training Center

H. WARREN DUNHAM. *Sociological Theory & Mental Disorder*. Pp. xii, 298. Detroit, Mich.: Wayne University Press, 1959. \$5.50.

H. Warren Dunham is well known to social scientists as the coauthor, with R. E. L. Faris, of the notable study of the ecology of the functional psychoses in Chicago, published in 1939 under the title *Mental Disorders in Urban Areas*. The present volume consists largely of reprints of Dunham's individual papers on subjects related to mental illness, including an early presentation of the Chicago data, originally published as a paper in the *American Sociological Review* in 1937. In addition to reprinted journal articles, however, this collection contains a special Introduction and three hitherto unpublished papers. One of these is a statistical study, "Trends in Mental Disease for the United States and Selected States, 1910-1950," which generally supports Goldhamer and Marshall's thesis that, at least in recent years in the United States, the psychoses have not increased in frequency with the march of civilization. A second is an analysis of the paranoid schizophrenic as a social type. And a third is an evaluation of psychoanalysis as "ideology or science."

The contributions range from the descriptive ecological studies for which the author is justly famous to considerations of methodology, analyses of mental illness as social type, and philosophical reflections on the state of knowledge in social psychiatry.

Of major interest are Dunham's mature reflections on the state of social psychiatry today as a research area, some twenty years after his pioneering studies in Chicago established the existence of sociological differentials in the incidence of mental disorders. The existence of such differentials has been repeatedly confirmed, most recently by Hollingshead and Redlich in their careful investigation of social class and mental illness in New Haven. But, although the ecological studies seemed at first to be an avenue which would lead directly to etiological knowledge, this avenue has so far led only into a jungle of speculations: the drift hypothesis, the social isolation hypothesis, the migration theory, conflicting claims about the nature and effects of various family patterns, and so on.

To add to these already formidable com-

plexities, Dunham observes, the increasingly promising biochemical investigations raise the possibility that an unknown proportion of schizophrenia is organic rather than functional in its etiology. Thus Dunham suggests the possibility that only "pseudo" schizophrenia can be explained sociologically, that the "real" disease is biologically based. Although this may appear to represent something of a retreat from earlier enthusiasms, it would seem actually to be an inevitable withdrawal from an indefensible position. The prospect of a sufficient sociological explanation, not merely of sociological differentials in incidence, but of the etiology of the individual case as well, is remote, to say the least, and the quest for it imposes an unnecessary burden on the pursuit of whatever etiological factors—social, cultural, psychological, or biochemical—may be responsible for statistically significant differences in incidence. Dunham's implied caution to sociological investigators to eschew exclusively sociological theories is an augury of a less narrowly sociological orientation on the part of social scientists interested in the causes of mental illness.

JACK GREENBERG. *Race Relations and American Law*. Pp. viii, 481. New York: Columbia University Press, 1959. \$10.00.

Despite the continuing furor over the details of race relations and the accommodations which must be and are being made in patterns of segregation, the law has become rather clear. Legislatures continue to pass new statutes, and the decisions pour from the judicial spigots; but the main legal guidelines have been established. What remains is the particular application of known principles in specific factual situations which result from activities of members of the white citizenry desperately trying to find acceptable loopholes. Each new variation on the basic

theme of attempted evasion of the constitutional mandate finds, sooner or later, challenge from members of nonwhite groups and some religious organizations. The time thus had come for someone to draw the diverse threads of legal doctrine together into a cohesive whole. This is what Jack Greenberg has done in *Race Relations and American Law*.

Granting the obvious preferences of the author—he is Assistant Counsel to the National Association for the Advancement of Colored People (NAACP) Legal Defense Fund—the book is remarkably free from emotion and polemic. Mr. Greenberg succeeds in the task he undertook: describing and discussing race relations and American law "essentially as they exist today and in a manner that will remain useful in the future." In relatively brief but nevertheless complete form he has set out a useful statement of the law relating to public accommodations and services, travel, elections, earning a living, education, housing and real property, criminal law, domestic relations law, and the armed forces. The material is so presented that anyone, of whatever persuasion, can find considerable enlightenment and help in threading his way through the legal mazes involved in those subjects.

Of a more controversial and debatable nature are Mr. Greenberg's first two chapters, dealing with the capacity of law to change patterns of racial relations and a legal overview and his thesis that, William Graham Sumner to the contrary notwithstanding, "stateways" can change "folkways." But here again are discussions which will enable any reader to profit and to learn, if not to agree.

Lawyers will find this book of most use, but any person who deals with race relations will find it invaluable, although perhaps somewhat difficult. By legal standards, Mr. Greenberg writes with clarity and a welcome simplicity; but the matters he discusses are complex, and his exposition will demand the close attention of the reader.

Several Appendices, collecting legislative and judicial materials, enhance the value of the volume for reference purposes, as

do a good Bibliography and a Table of cases.

EDUCATION

OSCAR HANDLIN. *John Dewey's Challenge to Education: Historical Perspectives on the Cultural Contest*. Pp. 59. New York: Harper & Brothers, 1959. \$2.50.

Any book, however thin, that helps to correct the appalling distortions that continue to prevail concerning John Dewey's educational philosophy is to be welcomed, and especially at a time when attacks upon it have become more virulent than ever before. Professor Handlin serves this purpose, for he demonstrates how Dewey entered the American scene at a time when education was much in need of criticism and improvement. Between 1870 and 1910, the years to which the book pays primary attention, rapid changes were occurring that rendered much of the typical program, especially on the high school level, obsolete. Vocational courses, education for citizenship, and so-called "cultural" training in the refinements of society—all of these were largely separated from the actualities of a young nation growing swiftly toward maturity.

Dewey's great purpose was to bring the schools back into the mainstream. The experimental school which he and his wife developed at the University of Chicago in the 1890's dramatized not only how it was possible to do so, but how, when it was done, the experience of learning could be exciting and rewarding to children. Handlin makes the important observation, not often enough recognized, that Dewey, though a trained philosopher, developed many of his seminal ideas in the laboratories of his own school and in the communities where he was an active citizen.

To appreciate the public service performed by this lecture, the second of an annual series presented by the John Dewey Society, is not, however, a sufficient reason

to approve of it on more critical grounds. Although the author has unearthed a number of interesting historical details that may hitherto have been missed, the central thesis is threadbare—namely, that the schools of the period in many ways fell short of their responsibilities. The subtitle of his lecture—"historical perspectives on the cultural context"—is scarcely borne out: one finds too little either in the way of perspectives or of context to tell us anything freshly insightful about the weaknesses as well as strengths of the American culture, a culture of which Dewey's democratic philosophy has been and remains one of the most sensitive barometers.

It is a little surprising, moreover, that a historian of Professor Handlin's stature should resort to such journalistic oversimplifications as the following: "The culture communicated by the schools had thus become entirely detached from experience" and "The realm of the classroom in the 1890's was totally set off from the experience of the child who inhabited it." Granting the shortcomings of the educational system of that period, the words "entirely" and "totally" are almost if not just as false as they would be today when, despite Dewey's towering influence, we are unfortunately still able to make comparable judgments about education.

THEODORE BRAMELD

Professor of Educational Philosophy
Boston University

CHARLES V. KIDD. *American Universities and Federal Research*. Pp. xii, 272. Cambridge, Mass.: Belknap Press of Harvard University Press, 1959. \$6.00.

The post-World War II federal research explosion has had shattering and bewildering impact upon government, industry, and academic institutions. Washington has witnessed the disconcertingly fast growth of new agencies and new programs, the availability of additional billions of dollars, and the rise of a new breed of bureaucrats: scientist-administrators. Concomitantly there have arisen new problems of budgeting, new devices for co-ordination, new mechanisms for advice and liaison with the scientific community, and inter-

minable committees for review and evaluation. In fact, it would seem that not science, but committee reports and recommendations about science have become the endless frontier.

On campuses, and especially in graduate schools, new problems of contract and grant relationships have had to be faced. Searching questions have been asked regarding the basic mission of the university, the public responsibilities of institutions of higher learning, and the relative priority of administrative, academic, and fiscal considerations in the newly developing complex of relationships among business office, dean's office, departments, and the individual scholar and scientist. Policies have had to be quickly formulated regarding indirect costs, payment of summer and academic-year salaries, and the fixing of responsibilities for accepting and administering government grants and contracts.

With increasing recognition of the pursuit of scientific knowledge as an essential requirement for national survival and well-being, intricate interrelationships have been established between university science and the federal government. Dr. Kidd's volume is a penetrating and comprehensive analysis of these indissoluble relationships.

Dr. Kidd defines his central thesis as follows: "Large scale federal financing of research has set in motion irreversible forces that are affecting the nature of universities, altering their capacity to teach, changing their financial status, modifying the character of parts of the federal administrative structure, establishing new political relations, and changing the way research itself is organized." He systematically reviews the research goals and activities of the federal agencies and relates them to the basic missions of the university. He courageously identifies the many difficulties created by the differences in perspectives and objectives of government officials, on the one hand, and academic administrators and faculty, on the other.

In general, little exception can be taken to Dr. Kidd's personal recommendations and conclusions. Unfortunately, he tends, at several points, to equate "non-federal" with "private," thus overlooking the sig-

nificant role of public agencies at the state and local levels. Also, his timidity and pessimism regarding federal support of the social sciences and humanities seem scarcely warranted in the light of encouraging developments in the past year or so.

Dr. Kidd's concern for the preservation of the essential role of the university is admirable. "The university at its best," he writes, "is a key institution through which the right of man to know and to seek knowledge freely is safeguarded. It is through remaining free to criticize our culture, our economy and our political system that universities can best serve the nation as a world power." Dr. Paul E. Klopsteg's wise Foreword reiterates this theme. Especially noteworthy is Dr. Klopsteg's insistence that we not overlook the important position of the undergraduate liberal arts college in the educational process.

HARRY ALPERT

University of Oregon

CHARLES FRANKEL, (Ed.). *Issues in University Education: Essays by Ten American Scholars*. Pp. xiv, 175. New York: Harper & Brothers, 1959. \$3.95.

It is a matter of educational history that American universities are grounded upon colleges of liberal arts or make instruction in this area their prime reason for being. This dedication is shared to a large degree by denominational colleges and, except for certain teachers' colleges and schools of technology, other private or state controlled institutions of higher learning. By definition, the liberal arts cannot but be associated with that process which, ideally, sets the mind at liberty or, through an inherent emancipative action, breeds the man or woman, catholic and humanist, whose concern is mankind; properly, whose country is the world.

A continuing theme of *Issues in University Education* points to the general abrogation of this unique sanction in American agencies of higher education. For, says the editor Frankel—at least on the undergraduate level—"The American college has one primary meaning. It is

the great social escalator of contemporary American society. . . . Young Americans come to college to learn how to behave and how to dress; they come to college to meet—and marry—the right people; they come so that they can leave labeled 'college graduate'" (p. 157).

Even so, the ten specialists who offer this unusually good symposium devoted to a clarification of higher education's contemporary problems see expressive values in the American people's drive to mass education. As an indigenous development, this must be evaluated in terms of the American culture—as opposed to the application of preconceived standards from abroad. Not least in this evaluation is the fact that the United States chose higher education. Belief in the efficacy of a college education is marvelous.

The volume is one outgrowth of a series of international conferences sponsored first by the Hazen Foundation and later by the Department of State. Although the contributions range from higher education philosophy to town and gown relationships, and from the "Making of the Scholar" to the "Democratization of Educational Opportunity," the result is far from the frequent overlapping or pied points of view sometimes characteristic of such undertakings. Yet, unfortunately, no Index has been provided.

Furthermore, one may ask why anthropology was not called to aid; or why the present challenge to American ideology—and that of the free world—was not dealt with more decisively. Professors Ulich and Franklin come closest although their remarks on pages 44-45 and 76-77 only cite the problem. Chapter VII, "In Loco Parentis," offers a weird close-up of educational babysitting that prompts recourse to Abraham Flexner's famous dictum: "To my thinking, for us Americans, education ought at this moment to emphasize scholarship and the capacity for severe intellectual effort, for nothing else needs emphasizing." The prospect of an advanced enrollment within the next decade along with Robert Oppenheimer's comment that knowledge doubles every ten years places Flexner's thrust squarely in the plexus.

Jacksonianism in American higher education remains unresolved.

KENNETH V. LOTTICH

Associate Professor of Education
Montana State University

JOHN A. GARRATY and WALTER ADAMS. *From Main Street to the Left Bank: Students and Scholars Abroad*. Pp. x, 216. East Lansing: Michigan State University, 1959. \$4.00.

Beginning with John and Ruth Useem's study of *The Western Educated Man in India*, a substantial technical literature has accumulated over the last few years on educational and cultural exchange. This literature is largely the product of three major research and publishing ventures: the eight volumes on universities and world affairs published by the American Council on Education; the five volumes on cross-cultural education sponsored by the Social Science Research Council and published by the University of Minnesota Press; and now the projected ten-volume study—the volume under review is the second of this series—which the Institute of Research Overseas at Michigan State University is conducting on the international programs of American universities.

After nine months of observation in Europe and 400 interviews, Professors Garraty and Adams set out in their book to describe the activities of a large sampling of American students and professors in Western Europe and to estimate their effectiveness. There are separate chapters on the motivations for foreign study, differences between European and American educational systems, orientation activities, organized programs, cross-cultural relationships, professor exchanges, and the impact of the European university and the American student on each other.

Since the first six chapters of the book are largely descriptive, they can be skimmed or skipped by the readers familiar with educational exchange activities. This is not true, however, of the latter part of the book which contains many valuable insights and significant findings. Some of the findings confirm what is al-

ready well known from other studies or what has long been apparent to persons engaged in the operation of exchange programs—in fact, much of the book is based upon interviews with program administrators—but many of the authors' conclusions are quite novel or develop basic principles which have been only dimly perceived by others.

Some of the points made by the authors which seem to this reviewer to be especially well founded and which if more widely appreciated would greatly benefit current educational exchange programs are the following: the main impact of educational exchange will almost always be upon the visiting scholars and not upon the host culture, and this should be kept in mind in planning and evaluating programs; from the American standpoint, large-scale programs of educational exchange would be justified, if for no other reason than the urgent need of Americans to know a great deal more about other peoples and their culture; educational exchanges to be worthy of the name and the large expenditures involved should have at the center a hard core of intellectual effort; from an academic standpoint, although perhaps not from all others, the benefits of educational exchanges increase and the difficulties decrease as the student gains in intellectual maturity and the ability to work independently; and at the professor level it would be better to cultivate and promote exchanges developing naturally among scholars, and for which candidates are already available, than to plan on the basis of political or other considerations more ambitious programs that are less related to academic needs and opportunities and require an extensive and perhaps in the end an only partially successful recruitment campaign.

The authors should be complimented on the evident zest with which the study was conducted and on their lively reporting style.

Research Councils

JAMES BRYANT CONANT. *The Child, the Parent, and the State*. Pp. vi, 211. Cambridge, Mass.: Harvard University Press, 1959. \$3.50.

In these addresses directed to the interested citizen, Dr. Conant explores the broader aspects of his constructive study of *The American High School Today*, published in 1958. His sober analysis of changes in secondary school organization needed to meet the Russian challenge to our scientific achievement provides a welcome contrast to the strident outpourings of those who attribute our deficiencies mainly to progressivist and adjustment to life conceptions of the educational process.

American educational ideas and practices, Dr. Conant makes clear, are inextricably related to complex social factors—to our tradition of decentralized control, to our predominantly industrial economy, to our national tendency to prize practical effectiveness, to our impelling belief in equality of opportunity. Despite its defects, which are in part the obverse side of its virtues, he regards the American high school as a distinctive achievement. Far from advocating a return to the European system, he points out that the trend of world thought is in the direction of the American concern for the educational needs of all the youth, not alone, or primarily, for the academically talented of the upper classes. In concluding, Dr. Conant expresses the conviction that the American high school will be recognized in due time as "one of the finest products of democracy . . . as a continuing insurance for the preservation of the vitality of a society of free men."

In *The American High School Today*, Dr. Conant presents detailed recommendations for pedagogical improvement. Here he reiterates his belief that no radical change is needed in the basic pattern, that is, the comprehensive high school which provides a common core of studies for all and offers electives to meet the abilities and goals of various groups of students. For the common core he suggests as a minimum: 4 years of English, 3 years of social studies, 1 year each of mathematics and natural science. For the academically talented he would require,

besides the core of English and social studies, a sequence of 4 years of mathematics, 4 years of sustained study of a single foreign language, and intensive work in physics.

The difficulties of introducing the program would not come primarily from the educators or school administrators—although some of them no doubt differ with Dr. Conant on the merits of the particular curriculum he proposes. The real difficulties arise from economic factors, from parents' ambitions for their children, and from community attitudes generally. The chief problem is connected with the decentralized character of our school system which has led to the multiplication of relatively small schools. Only 4,000 out of the 21,000 high schools have a sufficiently large student body to permit economic organization of special classes or can maintain a teaching staff and provide facilities necessary for a high standard of work in the sciences and in foreign languages. If the work in our smaller schools could be raised to the level of our best schools, the quality of our secondary school achievement would be enormously improved. A prerequisite for any needed educational reform is an extensive movement of consolidation. This vast task in reorganization would require federal direction and support, modification of taxation policies, and not least, a radical change in public attitudes from local and regional loyalties to a national outlook.

Half of the book is comprised of documents, extensive notes, and concise factual material. The approach throughout is practical: no attempt is made to discuss educational theory; for example, the cultivation of intellectual attitudes or the development of the personality as a whole. Dr. Conant's presentation may not appeal to humanists, perhaps, either of the elitist brahmin persuasion or of the liberal progressive party. But it offers an excellent introduction to the complexities of the American educational problem and is of great value for the educator as well as for the layman to whom it is addressed.

I. B. BERKSON

Professor of Education
The City College

OLIVER C. CARMICHAEL. *Universities: Commonwealth and American*. Pp. xx, 390. New York: Harper & Brothers, 1959. \$6.00.

The universities Dr. Carmichael has studied are appropriately considered together. They have common roots in the institutions for higher education early established in England and in Scotland. Except for a few in Africa and Canada, they have a common language of instruction. Sharing certain basic ideas and ideals regarding higher education, they have developed in many respects along similar lines.

The book is more than a record of impressions gained from visits to more than fifty universities in the English-speaking world and from wide knowledge of universities in America. It contains a great store of precise and illuminating information about the history of these institutions, about numbers of students, about kinds of degrees, and about educational programs.

The chief value of the book is not, however, in the information it contains about these matters, but rather in its analysis of current problems in the institutions of higher education in Commonwealth countries and in the United States. The concluding chapter on "Problems and Prospects of Higher Education" is an impressive analysis of common problems and major issues: the expanding demand for higher education and the consequent problem of handling increasing numbers of students; the proliferation of courses and educational programs to meet the variety of needs of students and the consequent need for a clarification of the objectives of institutions of higher education; the pressure of society to develop our human resources to the full and the consequent need of more adequate provision for the gifted student; the importance of education for women and the need to develop not only equal treatment, but improved curricula for them. The second of these points deserves special attention. As Dr. Carmichael makes clear, "the clarification of objectives and realistic revision of our curricula and methods are long overdue."

Dr. Carmichael cannot be accused of exhibiting prejudices in favor of the prac-

tices of higher education in America. Indeed, while paying tribute to "American zeal for higher education," he confesses that "a paramount need in American higher education is an emphasis upon quality." But if he does not overpraise American education, he does perhaps deal too gently with some of its gravest faults: the corrupting influence of athletics in American higher education, and of the fraternity system, for example, and of the evils of academic bookkeeping under the American course-credit system.

Perhaps these are some of the things Dr. Carmichael has in mind when he indicates in his conclusion "that drastic reforms will be required to achieve maximum results by way of educational and scientific advances." It is to be hoped that American readers will not only be reassured to discover that our basic problems are not unique but spurred to the drastic reforms this book calls for.

CLARENCE FAUST

President
Fund for the Advancement of
Education

RICHARD N. SWIFT. *World Affairs and the College Curriculum*. Pp. xi, 194. Washington, D. C.: American Council on Education, 1959. \$3.50.

This is one of a series of eight studies on the role of American universities in world affairs, prepared for the Carnegie Endowment for International Peace as the outcome of a long-range inquiry conducted under the general direction of Howard E. Wilson. Mr. Swift, Associate Professor of Government at New York University, has closely examined the undergraduate curricula at more than seventy institutions from the standpoint of their effectiveness in preparing students—as citizens or potential statesmen—to cope with the awesome problems of maintaining man's cultural heritage and ultimate values in a world which, as he puts it, is "superbly equipped for mass suicide." His audit is not reassuring.

Typically, the college curriculum is parochial, traditionalist, and compartmental. Parochialism denies to most students

even rudimentary acquaintance with non-Western cultures. It permits a great many to escape with a liberal education no more universal than the limits of American or Anglo-American history, literature, and social problems. Mr. Swift also joins his voice to the hue and cry over the linguistic illiteracy characteristic of the American college graduate.

Traditionalism in the curriculum has tended to block awareness of the progress of knowledge and appreciation of fresh insights, especially in the study of human behavior. Students do not come to grips with implications for contemporary society in many branches of learning. The outdated intellectual perspective they often acquire distorts their assessment of current realities.

The compartmental or departmental division of the curriculum may interfere with what Mr. Swift conceives as an adequate approach to education in world affairs. It accents specialization at the cost of a broad grasp of the interrelatedness of modern life. The author is particularly impatient with those who haggle over whether political science has a proprietary claim to the field of international relations. World affairs, he insists, are properly the concern of every department, at least in developing the student's general education. Even for undergraduates majoring in world affairs, Mr. Swift prefers a far-ranging combination of subjects, rather than concentration in a single discipline.

The author has a confidence, which to this reviewer seems exaggerated, that the introduction of new courses, the revision of old ones, and the reorientation of curricular requirements will make quite a difference in the influence of the colleges on their students' fitness for world responsibility. He hopes that proposals of a 1953 Modern Languages Association Interdisciplinary Seminar, for instance, might revolutionize the teaching of language so that students would grasp much more intimately than they usually have the cultural traditions of the country whose language they study. American history courses should give emphasis to the context of world events in which the United States functions. More colleges

should route all their students through something like Columbia University's renowned Contemporary Civilization sequence or basic courses in the analysis of problems of international relations and American foreign policy. Above all, non-Western studies should be encouraged.

The most telling conclusion is that to learn about world affairs students "need an atmosphere where they can begin to see the wholeness of knowledge" whether or not they intend to become specialists. Mr. Swift persuasively maintains that "effective teaching in world affairs occurs where the curriculum and the faculty spirit are truly liberal; where faculty members teach students and not just subject matter; where they try to develop minds and not merely drill automatons; where world affairs permeates the curriculum and appears to some extent in all required courses; and where the college deliberately helps the student relate all his studies to world affairs. In short, if a college or university regards itself as veritably a community of scholars, it can undoubtedly create an effective undergraduate program in world affairs."

PHILIP E. JACOB

Professor of Political Science
University of Pennsylvania

STANLEY M. ELKINS. *Slavery: A Problem in American Institutional and Intellectual Life*. Pp. viii, 247. Chicago: University of Chicago Press, 1959. \$4.50.

The author has aptly stated that his study "does not pretend to be a history" of slavery in any sense but an analysis of certain factors neglected in previous studies of the institution.

In the development of this novel approach, the writer analyzes some interesting angles. In comparing the institution of slavery in North America and Latin America, he concludes that, under the beneficent influence of the crown and church, the institution was less rigid in legal character and hence in its practical operations in Latin America. Thus in the latter region the "Sambo" type, the existence of which is attributed to the submerging of personality, did not appear as

it did in North America. The slavery system in the United States and the concentration camps in Germany are represented as analogous in portraying "the infantilizing tendencies of absolute power."

The British crusade against bondage is compared with that in the United States. The English, operating through institutions national in character, had created a mind favorable to abolition; whereas in America there were no national churches, universities, or business organizations to facilitate a calm, intellectual climate for discussion of gradual means of abolishing slavery. Instead, at a time when economic conditions in the South were ripe for defense of its institution, abolitionists, dedicated to the "guilt and sin" formula, accentuated that defense.

On two points, in particular, the reviewer disagrees with the author. Neither Phillips nor Stampff is definitive on slavery, and both have merits and defects, respectively. To disparage the former and praise lavishly the latter, as the author does, is to overlook the fact that Stampff's approach and bias are as truly subject to criticism as are Phillips'. The other point is in respect to slave insurrections. Since no such phenomena of consequence occurred after 1831, the author concludes that all fears of such were absurd and designed largely to cement antiabolition feeling. Doubtless, such fears were exaggerated, yet when abolition literature was being sent into the South some years after the Nat Turner Insurrection, scores of people, from the North and South, declared that literature to be of an inflammatory and insurrectionary character. Many of these people were probably as honest in their convictions as Duff Green, whose contrary views are given as proof of the author's view. Perhaps, therefore, the eternal vigilance of future years is not as simply explained as suggested in this study.

HENRY H. SIMMS

Professor of History
Ohio State University

MABEL NEWCOMER. *A Century of Higher Education for American Women*. Pp. xii, 266. New York: Harper & Brothers, 1959. \$5.00.

The author does not attempt to present a detailed historical development of the higher education of American women but highlights significant trends in a pertinent discourse. The real value of this book on a subject that already has extensive documentation is that it gives an excellent perspective on what women of this country have chosen to study, what they have done with their education, and what particular contributions college women have made to society. With the marked changes in what women have been doing with their lives in the past few decades, the author not only raises questions as to how a college education can best assist women to meet the varied demands of multiple responsibilities, but is courageous enough to make sound recommendations on controversial issues relating to their education. A scholarly author with a long and distinguished career teaching social sciences and in government service, Newcomer is well qualified to write on this subject.

The writer discusses objectively the educational aims of the women's colleges and of the women students themselves, comparing and contrasting curriculum, student activities, and motivations in these colleges with coeducational programs. She has given well-documented and carefully evaluated analyses about women after college who have jobs as scholars, artists, homemakers, and civic workers. The author's concern is not whether women will ever use their college education, for there is ample proof that they do, but whether women will acquire the education they need before they marry, and then when the youngest child has entered school be able to establish themselves in some profession without too long a period of training. While the proportion of American women of college age who enter higher education is increasing, approximately 52 per cent do not complete their first degrees, and the proportion continuing with master's and doctoral programs is declining. If the present trend continues, it is to be expected that "women will contribute a decreasing share to the advancement of knowledge in this country." The chief problem, Newcomer believes, is the lack of motivation.

Women themselves are not convinced that higher education is as important for them as for men.

The author contends that educational systems have taken little cognizance of the fact that girls mature earlier than boys and because of early marriage more imaginative programs should be developed to assist them in the completion of undergraduate courses. She makes exceedingly important suggestions to meet this problem. This is a book which should be read by all concerned with women's education.

ALTHEA K. HOTTEL

Dean of Women (Ret.)
University of Pennsylvania

POLITICAL THEORY

PITIRIM A. SOROKIN and WALTER A. LUNDEN. *Power and Morality: Who Shall Guard the Guardians*. Pp. 204. Boston, Mass.: Porter Sargeant Publisher (An Extending Horizons Book), 1959. \$3.50.

Moved by the frightening specter of a divided world in possession of weapons whose potential for annihilation can scarcely be contained, the authors review with great industry the causes of the corruption of power. Then they proceed to disengage it from the instruments of destruction and place it at the service of an emerging order of values which will unite and lead mankind into a new era of creative civilization.

Of the 193 pages of the text, 110 are devoted to a historical and statistical disclosure that authority corrupts through the possession of coercive forces, that individuals and groups invested with power over fellow men have been more ruthless, immoral, and destructive than those without such power, that those who have wielded political power have a worse historical record than those who have exercised nonpolitical power. Further, the incidence of insanity has had a higher ratio among political rulers than the nonpolitical, and the latter higher than individuals who exercise no power whatsoever upon their fellow men. A hierarchical ratio of criminality and insanity is found, with historical

reference, in descending scale from despotic, political rulers to democratic and republican rulers, to captains of finance, industry, labor leaders, and so on. The underlying argument is that moral integrity and sanity are in inverse proportion to the possession of power further aggravated by instruments of coercive force and destruction.

After this bleak, pessimistic picture of human nature in the exercise of power, the authors hopefully envision for mankind a bright new horizon. First, there must be total disarmament by all and the complete elimination of any military resources by a process of scientific and moral persuasion. The coercive power of each state must be reduced and restricted solely to the policing of civil order. This will allow the growth and promotion of the new integral order of values and institutions while the sensate form of culture, which has been dominant in the Western world during the last five centuries, is disintegrating.

The presently emerging integral culture order is an intermediary between the medieval ideational culture which did not take adequate account of sensory phenomenon and the ancient and modern sensate culture which exaggerated it. The ultimate principle of the integral culture proclaims that the true reality-value is an "infinite manifold" in which the supersensory, rational, and sensory forms are inseparable from one another and promises a unification of religion, philosophy, science, ethics, and fine arts into an integrated system of supreme values of truth, goodness, and beauty. This conception of the authors is not unlike the Toynbean latitudinarian and comprehensive integration of values. To ensure the triumph of the new integral order, government, the authors contend, must be entrusted to scientists, sages, and saints who will be guided by universal and perennial moral principles in order to serve only the good and not the evil purpose.

The serious, high-minded intention of the authors is unquestionably clear and admirable, but the premises of their arguments and the means they propose do serious violence to the realities of human

nature. The imbalance of excessive scientism in the first and greater part of the book, in which a most discouraging picture of men in the exercise of power is delineated, contrasts stridently with the idyllic innocence ultimately achieved in the new order. The human capacity for evil will not be eradicated or rendered impotent by the complete removal of the instruments of force and destruction. There will always remain instruments of violence about us. A more realistic admission of perverse and obstinate wills and intellects which will ever remain impervious to the idealism the authors envision as well as to the intellectual and moral discipline they propose might have allowed, on the one hand, the ever-present necessity for coercive power and, on the other, seriously modified the Platonic view of the infallibility of the wise and good in government. The authors have made a strong and admirable case for the potential of human goodness, and the present reviewer prayerfully joins them in the triumph of virtue. But in the vision of a complete triumph on earth of truth, goodness, and beauty over their contraries the authors have overextended their horizons.

JOSEPH COSTANZO

Professor of Political Philosophy
Fordham University

HORACE M. KALLEN. *A Study of Liberty*. Pp. xv, 151. Yellow Springs, Ohio: Antioch Press, 1959. \$3.00.

Written by a philosopher with a scholarly vocabulary, this study of the basic impulses to freedom is arduous for the average reader of the literature of liberty. As a somewhat more than average reader I had to consult the dictionary with unembarrassed frequency. Despite the difficulties of a scholar's language, the book is rewarding in its insights and its frequent eloquence.

The main thesis enshrines liberty as the driving force of progress in "man's perennial war of liberation," treating reason and science as its major instruments. Life is a constant "becoming"; there are no absolute rules, creeds, or goals. Liberty as "experience, idea and ideal" is examined under two main headings, "Freedom as the

Human Condition" and "the Actual and Ideal in Pursuit of Liberty," with such diverse topics as "Liberty as the Price of Security," "the Conscious Self as Value System," "Freedom as the Making and Working of Ideals," and "Living, Actual and Hypostatic."

A fair quotation of the underlying thesis reads: "The upshot of all the foregoing observations would be that pursuit of liberty and struggle for self-preservation are alternative expressions for the human condition. . . . By first intention, liberty in sum signalizes those altering interorganic relations whereby an organism stays a live organism as it carries on, its give-and-take being the on-going transaction of the self's inner concords and conflicts with the like relations between the diverse and diversifying surroundings outside."

Dr. Kallen illustrates his thesis with both historical and contemporary conflicts, but his major search is in the realm of ideas. None of the great mass movements for liberation is cited, as might be expected in a study of liberty. The nature of the force and its relevance to the individual and to his social relations are the philosopher's own world, in this case warmed and heightened by evident but restrained passion for freedom against all its adversaries.

ROGER N. BALDWIN

Chairman
International League for the Rights
of Man

KENNETH N. WALTZ. *Man, the State and War: A Theoretical Analysis*. Pp. viii, 263. New York: Columbia University Press, 1959. \$5.50.

This closely reasoned book finds three "images" of war in the writings of social philosophers. The first group sees wars resulting from "the nature and behavior of man . . . from selfishness, from misdirected aggressive impulses, from stupidity. . . . The elimination of war must come through uplifting and enlightening men or securing their psychic-social readjustment." The second group sees war as the result of the internal structure of certain states. A state "plagued by internal strife [arises] by the contradictions which Marx thought inherent in capitalism" may

. . . seek the war that will bring internal peace. Though the interest of the people is in peace, their governors make war." The third group blames our anarchic system of states. "With no system of law enforceable among them . . . conflict, sometimes leading to war, is bound to occur." The ultimate solution must be world government, but this will be unsuccessful unless it deals with the psychic and political forces analyzed in the first two "images."

Like all good books, this one provokes further thought. It deals with the political and social philosophers. Yet some soldiers have thought about war. Other professionals are more likely to have read them than the social philosophers. Clausewitz's works are not analyzed; the only other professionals mentioned are Skoblov, Tirpitz, and Eisenhower. To adopt Dr. Waltz's terminology, the professionals' image of war has often had a demonstrable influence on policy. To take another possible image, where do politicians get their ideas about war? From military or political thinkers or from distorted versions of both? *Geopolitik* is not mentioned; misinterpreted Rousseau, Clausewitz, Marx, and Darwin have also influenced policy. This superb study deals with one set of images about war; others must still be examined.

As always, it is possible to question details. Norman Angell is correctly described as the leading modern "publicist for the classical economists' conviction that war is an uneconomic venture." But Jean de Bloch is not mentioned, though Merle Curti thinks that he "inaugurated a new and more positive [and publicly more influential] phase of pacifism," and quotes another authority as saying that *The Future of War* . . . [is] exceeded in importance only by the work of Grotius."

THEODORE ROPP

Professor of History
Duke University

LEO STRAUSS. *What Is Political Philosophy? And Other Studies*. Pp. 315. Glencoe, Ill.: Free Press, 1959. \$6.00.

This book is a collection of learned lectures and essays by a scholar who holds

the chair of political philosophy at the University of Chicago. It is a volume by an expert who adheres throughout to his professional subject matter.

There is a considerable diversity of material in the work. There are a number of chapters devoted to broad and general themes, such as "What Is Political Philosophy?" "Political Philosophy and History," "On Classical Political Philosophy," and "On a Forgotten Kind of Writing." The latter is a suggestive essay on how really to understand many political philosophers of the past.

Then there are excellent chapters on important phases of the political thought of leading political philosophers of modern and contemporary times, such as "The Basis of Hobbes's Political Philosophy," "Locke's Doctrine of Natural Law," and the political and social philosophy of the recent German publicist and philosopher, Kurt Riezler.

More esoteric are the chapters on "Restatement of Xenophon's *Hiero*," "How Fārābī Read Plato's *Laws*," and "Maimonides' Statement on Political Science." The volume concludes with some sixteen reviews of important books on political philosophy and the history of political theory, chiefly drawn from the period between 1939 and 1951. Some of the best are those of R. H. S. Crossman's *Plato Today*, which attempts to interpret Plato in terms of present political situations; of C. E. Vaughan's classic *Studies in the History of Political Philosophy*; of C. H. McIlwain's *Constitutionalism, Ancient and Modern*; of John Dewey's rather archaic and discredited, even in revised form, *German Philosophy and Politics*; of Leonardo Olschki's *Machiavelli the Scientist*; and Yves R. Simon's *Philosophy of Democratic Governments*.

Perhaps the most interesting chapter is Chapter IX which can be regarded as a somewhat original contribution to the sociology of knowledge and the art of interpreting some political philosophers. Professor Strauss contends that political philosophy seeks the truth, while political society rests on commonly accepted values and myths known as public opinions or convictions. The latter may fail to coin-

cide with philosophical truth or the findings of social science. Hence, there is often a clash between political and social truths and the accepted principles of society. Truth may upset public convictions and lead to disastrous social tensions. Conscientious and conservative political philosophers may, therefore, feel compelled to write with their tongues in their cheek, so to speak: "Philosophers or scientists who hold this view about the relation of philosophy or science and society are driven to employ a peculiar manner of writing which would enable them to reveal what they regard as the truth to the few, without endangering the unqualified commitment of the many to the opinions on which society rests."

Professor Strauss suggests that a more lucid and intelligible history of political philosophy might be provided by applying this hypothesis to the writings of the great political philosophers of the past. He deals with certain criticisms of his hypothesis by Professor George H. Sabine and Yvon Belaval, especially as related to the thinking and writing of Spinoza, Leibnitz, and Kant.

It would be interesting to see how Professor Strauss would deal with George Orwell's mechanism or device of "double-thinking," which seems to be the key to much of the political thought and practice of our day. It surely serves to support the politicians and to deceive the public—and it may amuse the political philosophers when it does not alarm them as they view the disastrous consequences.

All in all this is a learned book of, by, and for scholars. It will not excite the rabble, but it will instruct the elect.

HARRY ELMER BARNES

Malibu, California

PAUL WEISS. *Our Public Life*. Pp. 256. Bloomington: Indiana University Press, 1959. \$4.50.

Dr. Weiss deals with social theory. He expressly sets his book in the tradition of Aristotle, Hobbes, and Hegel, "the three great philosophical theorists of the Western World." He has many references to Plato, but Locke and Rousseau are mentioned only twice and Marx once. The

author does not discuss the social sciences or their contribution to the understanding of man in society. Dr. Weiss obviously considers the social sciences irrelevant to his argument, for he deals with ideal models rather than with actual societies. Only twice does he violate his own self-denying ordinance to mention an actual social situation—the mid-twentieth century controversy in the United States over civil rights and the League of Nations. "I asked myself," he says of his book, "not only how it is that men come to be part of public groups, but what ought to occur, if they are to move out of inferior into better states of affairs, from conventional traditionalized societies to state, to cultures, and then to civilization." The terms "state," "culture," and "civilization" must be understood in terms of specific definitions given by the author in this adventure in speculation. Dr. Weiss says: "... we live not in that Civilization [characterized by peace and prosperity and which can be achieved only through world government] but in a fragmentary realization of this—in a unit of civilization or *Culture*."

The author makes an exhaustive, and exhausting, dialectical analysis of man's "native" rights—"essential demands." "The answer here given to the vexatious problem of unalienable rights . . . agrees that native rights are absolutely unalienable, but only as constituent elements in a single constructed unalienable right. . . ." Dr. Weiss begins his discussion of law with "social" law, William Graham Sumner's folkways and mores though Sumner is not mentioned. The author advances to "positive" law and then to "natural" law. Putting aside the discussion through the centuries of the concept of natural law, Dr. Weiss uses a definition that fits into the development of his argument. "Natural Law" is compounded of our understanding of "the social good, of values that now prevail, of laws of nature that connect the one with the other, and of the fact that the social good makes the operation of some laws more desirable than the operation of others." "Natural Law stands in between positive law and a more comprehensive law, a Law of Civilization. . . ." Natural law "needs a society or state, but no

society or state could exist with it alone." The Law of Civilization "is pertinent to men regardless of what society they occupy or what their states demand. That more comprehensive law demands the achievement of perpetual peace and prosperity for mankind."

This essay contributes two new concepts to social theory, "native rights" and the "Law of Civilization." Its chief distinction is an ordered analysis at the level of the ideal "of a sequence of more and more comprehensive ways [a series of enlarging concentric circles] in which men could exist together" if they would succeed in achieving the good life and be able to look "beyond Civilization" to the ultimate "Absolute Good."

ECONOMICS

SIMON KUZNETS. *Six Lectures on Economic Growth*. Pp. 122. Glencoe, Ill.: Free Press, 1959. \$3.50.

The six lectures that comprise this volume were presented by Professor Kuznets at the Centro de Estudios Monetarios Latinamericanos (CEMLA) in Mexico City during July, 1958. The lectures cover, in an admirably clear and concise manner, the following areas: The meaning and measurement of economic growth and the high rates of modern economic growth; the necessary conditions for growth and the time patterns of growth; findings on industrial structure and the labor force and national product; capital formation with particular attention to long-term problems; the problems and trends in foreign trade ratios; and the tasks of theory.

The materials frequently wander into the realm of analytical postulation, but the author states in his Preface that the "... lectures deal briefly with findings and hypotheses that warrant more detailed evidence and more rigorously formulated analysis. But I preferred to cover a wider scope rather than encumber the discussion with detailed data or with mathematical

formulae, more appropriate to publications designed for reference."

The language is generally clear. A straightforward definition of growth is presented—a sustained increase in the output of goods. It is refreshing to find such a clear-cut statement of what is growth, instead of being couched in a number of ifs, ands, and conditions. Two characteristics of this sustained growth, one found in all cases—rise in per capita product—and one found in almost all cases—a sustained and substantial increase in population—are set forth as features of economic growth. In spite of the author's lament that the supply of empirical data relating to rates of growth is meager, he does well in presenting several very useful tabulations depicting growth factors in a number of countries.

Particular attention is given to the role of innovations in facilitating economic growth. Likewise, he notes a close association between the nature of the industrial structure of the labor force and national income. One of the more elucidating lectures is concerned with capital formation. The reader is given a clear definition of 'capital, something that is missing in so many treatments of capital formation in development.

As a series of lectures, the discussions are at times brief and a little disjointed. But the whole is tied together extremely well in the last lecture that discusses the role of theory. The first task of theory is to formulate a model, and the second is to "... analyze and formulate the effects of different initial structures of nation-states upon the patterns of economic growth that ensued, and upon characteristics of the mature economies in which modern development has been maintained. The emphasis here is on the differences in the patterns of modern economic growth and in the resulting structures, rather than upon their common characteristics."

In terms of what the author proposed—a series of lectures outlining the subject—he accomplishes his objective well. Quantitative aspects of economic growth are intermingled with analytical propositions in good balance. Data from a wide range

of countries are used to support the assertions. The experience of developed areas is used as a backdrop for discussing the problems of developing nations.

REUBEN E. SLESINGER

Professor of Economics
University of Pittsburgh

Depreciation and Taxes. Symposium conducted by the Tax Institute, Nov. 20–21, 1958. Pp. viii, 248. Princeton, N. J.: Tax Institute, 1959. \$6.00.

This is another of the annual symposia "conducted by the Tax Institute to focus attention on a major problem of taxation by affording an opportunity for discussion by informed participants representing different points of view."

In this case the principal participants were tax accountants, attorneys, university and business economists, business managers, and tax administrators, including present and former high officials of the United States Internal Revenue Service.

The four half-day sessions were devoted to: 1) Fundamentals of Depreciation Policy; 2) Depreciation and Changing Price Level; 3) Specific Aspects of Tax Policy and Management Decisions; and 4) Considerations in Depreciation Reform.

There is no doubt that depreciation is one of the most important and difficult problems of business management and tax administration. Following are some of the more important aspects of this problem which were discussed: "The deficiency of historical cost accruals by reason of inflation is the main problem of tax depreciation today," said one participant. Apparently all present agreed that inflation affects usual depreciation policies disastrously, but some considered failure to make proper allowance for technological obsolescence as more important in dynamic modern industry.

Minor attention was given to the new depreciation methods of the Internal Revenue Code of 1954, the last in first out concept (LIFO), and wartime and other accelerated depreciation methods. Also discussed were the interrelations of depreciation policies and: 1) capital gains; 2) capitalization versus expensing; 3) treatment

of salvage; 4) incentive taxation; and 5) other phases of fiscal and business policies.

The Director of the Canadian Tax Foundation summarized briefly the reformed depreciation policies of Canada, the United Kingdom, Sweden, and West Germany, barely mentioning Japan. The net effect in all of these countries has been to increase depreciation allowances very substantially, obviously as an incentive to increase industrial production and general economic prosperity.

Several of the participants were very critical of accountants and business managers and of their respective organizations for not being more courageous in taking the lead in reforming depreciation policies and practices. The chief difficulties were shown very emphatically to be the widespread web of long-standing, conflicting special interests, both economic and political.

As would be expected, most of the discussions were from the point of view of management and its representatives. It was admitted, however, that, in the long run, realistic depreciation accounting and practice, which conforms with the economic facts, would be to the best interest of business, government, and the public generally, even though it might be to the short-run disadvantage of some special interests and politicians.

These valuable symposia on basic problems might be more effective, "and not just talk," if they and the reviews thereof were published twelve or even six months earlier.

ROY G. BLAKEY

Professor of Economics, Emeritus
University of Minnesota

The American Economic Impact on Canada. (Publication Number 12, Duke University Commonwealth-Studies Center.) Pp. xviii, 176. New York: Cambridge University Press for the Duke University Commonwealth-Studies Center, 1959. \$4.50.

The Commonwealth-Studies Center was established at Duke University in 1955 with financial assistance from the Carnegie Corporation to encourage research in Com-

monwealth affairs. One part of its program is the Summer Seminar and Research Group which annually brings together a group of scholars from various Commonwealth countries to pursue their studies in contact with each other and with members of the faculty and graduates of Duke University. The group of visitors which assembled in the summer of 1958 presented seven papers on the economic impact of the United States on Canada, and these studies have been embodied in this volume for public circulation because of the widespread interest in the general topic. The volume is Number 12 in the publications of the Center and the second one on Canada, an earlier one having dealt with problems of Canadian federal development.

Although collectively the essays in this volume are broad enough to touch on the whole field of Canadian-American problems which "have as long a history as the Canadian economy itself" (p. 100), the range of special interest is narrower both in time and topic. The emphasis is on the present and, among many possible areas of special concern, three are selected in which the rays of Canadian discontent have in recent years been brought to focus sufficiently to generate what might appropriately be called a slow burn. These are the nature and significance of American policy relating respectively to foreign investments, agriculture, and labor organization. Canadians devoted a good deal of energy in the 1950's to discussing and exploring the apparently rapid absorption of the Canadian nonagricultural economy by American capital and management, the presumably destructive impact of the agricultural policy of the United States on the Canadian farmer, and the alleged domination of Canadian labor unionism by gargantuan labor organizations with head offices in the neighboring republic. The Commonwealth-Studies Center could scarcely have chosen a more timely group of topics for investigation in the summer seminar of 1958.

The papers in this volume examine excellently Canadian complaints in the light of the best available knowledge. It is difficult to assess dynamic processes in mid-course, but the effort in these studies

is well directed. As might be anticipated, none of the situations turns out to be wholly black or white. American investment presents opportunities for great mutual advantage but is not without potential danger. American agricultural policy does not bear full responsibility for the difficulties of the Canadian farmer but creates hazards in special areas. International unions are "the dominant force in Canadian organized labor" (p. 130), but, in fact, limitations on the autonomy of Canadian unionism are relatively slight. The merits of the individual studies lie, of course, not in summary conclusions such as these but in the careful elaboration of the many relevant circumstances. A paper dealing with the American economic impact on Quebec does not appear to fit readily into the main approach of the book but contains a striking number of homespun truths about a province and a people who are far from living the homespun lives commonly attributed to them.

An Appendix provides some two dozen useful statistical series of particular relevance.

V. C. FOWKE

Professor of Economics
University of Saskatchewan

FRANK A. HANNA. *State Income Differentials, 1919-1954*. Pp. xix, 268. Durham, N. C.: Duke University Press, 1959. \$7.50.

This is the final report of a five-year study of Differences in State Per Capita Incomes, which Professor Hanna has lead on the Duke University campus and which was supported jointly by Duke and by the Rockefeller Foundation. The volume is a mine of statistical information for ready reference. It is difficult to find any single result which might be labeled spectacular, but numerous hypotheses are examined and few obvious ones forgotten. It is not a book that he who runs may read, although the initial chapter summarizes some of the principal results for the impatient.

Hanna's personal income figures show a secular leveling of state per capita incomes. That is to say, the percentile range

separating average per capita incomes in New York and Arkansas has tended to contract over the period of the study. The contraction of the income range is marked during periods of prosperity and reversed in periods of depression. Low income states seem differentially sensitive to nation-wide economic changes; Hanna calls this an "accordion effect." Except for the disturbing effects of random fluctuations in farm income, it is possible to compute each state's per capita income figure for any year from the figure for the previous year, the national per capita income change during the given year, and Hanna's indexes of sensitivity and of differential secular trend.

At the same time, differences in state per capita incomes have persisted, and the rank order of the forty-eight states has changed but slightly. To explain the persistence of the differentials, Hanna considers differences in occupational distributions, wage rates, the importance of property incomes, and so on. All of these have their effects, but neither singly nor in additive combination do they explain the entire difference in state per capita incomes. The unexplained residual is apparently due to the existence of positive correlation and covariance among these several factors.

A number of demographic features are also considered in the same way as these economic features have been, notably the age composition and the labor force participation rate. Urbanization is however rejected as an explanatory variable. Hanna finds that cities of given size differ so drastically among themselves that "city size" is an inferior proxy or surrogate for the other economic and demographic variables he has isolated.

Emphasis throughout is on the forty-eight states as such. Little reference is made to metropolitan areas or to regional groups such as "New England" or "the cotton South." Neither is great attention paid to racial composition on the demographic side—the proportion of nonwhites in state populations. These features seem somewhat anomalous in the product of a leading economic statistician in a leading

southern university, while not detracting from the value of the book as a whole.

Formulation of American Foreign Policy

By ROBERT R. BOWIE

FOREWORD

The papers in this volume, with the exception of the article by Charlotte and George Dyer, are the addresses presented at the annual meeting of this Academy, held in Philadelphia on April 8 and 9, 1960.

Upon looking at the title of this volume, some members of the Academy may ask, "Why are most of the Academy meetings devoted to foreign affairs? Why can we not leave the elucidation of American foreign policy and related questions to organizations and journals which specialize in foreign affairs, and turn our attention to other important issues, like 1) the future of the capitalistic system, 2) the decay of American cities, 3) the reorganization of our state and federal governments, 4) the care of the aging, 5) the repression of crime, 6) the disintegration of the family, 7) the decline in economic competition and the inflationary effects of administered prices, 8) social medicine, 9) the progressive abandonment of railroads and waterways and our consequent enslavement to the internal combustion engine, and 10) the denial of higher education to talented but poor youths?"

These topics are all good ones, and hence are covered in the regular volumes of *THE ANNALS*, but the officers of the Academy have learned from years of experience that the members and delegates who attend our meetings are less interested in our domestic problems than they are in the troubles of peoples beyond the seas. The poverty of the fellaheen is more absorbing than the rescripts of the Federal Reserve Board. This interest in far-away conditions is not mere exoticism; it bears closely on our modern role as leader of the Western world and our responsibilities to undeveloped and wavering nations. Consequently our officers have shown no hesitation in selecting topics which attract a sustained interest and which also have a solid substantive content. (Comments from our members on this point are sincerely solicited.)

In the Foreword of the 1959 volume, I made the statement that the attendance at that meeting had been the largest in my experience with the Academy. I am gratified to say that this attendance was sustained at the 1960 conference. Approximately 800 attended, including delegates from 341 embassies, missions to the United Nations, United States governmental agencies, universities, and civic and scientific organizations of this country and many foreign countries.

The program was carried out as planned, except that Senator Joseph S. Clark was detained by the crucial civil rights vote of 8 April, and the ambassador of the Union of South Africa to the United States, His Excellency Wentzel C. du Plessis, withdrew from making a public statement because of the adverse American public opinion brought about by the current racial convulsions in his country. Senator Clark's paper was read by a member of his staff, and is published in the pages following; Ambassador du Plessis expressed his regret that the submittal of a paper was precluded by the turn of events.

JAMES C. CHARLESWORTH

ABSTRACT: American foreign relations are determined through a series of complex policy-making decisions. In the analysis preliminary to a policy decision the external environment, the broad objectives of our foreign policy, and the means available for its implementation must be evaluated, interrelated, and appraised. This analysis is but one of the stages leading to the final conduct of foreign affairs. Enlisting the support and resources for a specific policy and the operation or execution of that policy are two further distinguishable stages. Though in the normal order they would follow the policy decision, they too must be predicted and appraised in the original analysis and thus also affect the outcome of the actual policy. To cope with the difficult task of formulating foreign policy, several government organizations were created after World War II: The Department of Defense, the National Security Council, the Central Intelligence Agency, and the Policy Planning Staff of the Department of State. This policy-making machinery has greatly enhanced United States capacity for coping with the complex process of foreign affairs, but its operation can and should be further improved.—Ed.

*Robert R. Bowie, LL.B., Cambridge, Massachusetts, is Director of the Center for International Affairs and Dillon Professor of International Relations at Harvard University. Formerly, he was Assistant Secretary of State; Director of the Policy Planning Staff of the Department of State; and the Department's representative on the Planning Board of the National Security Council. A graduate of Princeton University and the Law School of Harvard University, Mr. Bowie has also been a Professor at the Harvard Law School and General Counsel and Special Adviser to the High Commissioner in Germany. He is co-author of *Studies in Federalism* and a contributor to *Federalism, Mature and Emergent*.*

ANY treatment of the formulation of American foreign policy in a limited space must inevitably be highly selective. This article will focus on the complexity of policy-making, especially under modern conditions, and comment briefly on certain of the institutions and procedures now involved in making American foreign policy.

ELEMENTS OF POLICY-MAKING

The foreign policy of a state is what it actually does in its relations with other states. That end product, however, is shaped by various factors. There is the initial task of deciding what to do and how to do it. The analysis and judgment required for this purpose are considered below. Then there is the job of marshaling the necessary support and resources to carry out the selected course. The proposed policy may require appropriations, legislation, or other action by Congress. It may depend on Allied approval or co-operation. Finally, there is the stage of executing the policy, often abroad. In its own way, each of these phases has a part in shaping the eventual policy. The proposals as initially framed will take into account the anticipated response of Congress, public opinion, or Allied nations, but they may have to be modified in the course of obtaining the requisite support and co-operation. Similarly, practical problems in the field may change the ultimate emphasis or impact of the policy. A complete discussion of the making of policy would have to consider the influence of each of these stages on the actual conduct of foreign relations. Since all factors cannot be covered in this article, it will concentrate mainly on the first stage of the process: the decision on what policy to adopt and how to carry it out.

Inherent complexity

Before commenting on American procedures, it is well to remind ourselves of the reasons which make the formulation of foreign policy such a difficult and complex task. The fundamental one is that it must deal primarily with external conditions which will prevail in an uncertain future, and over which, at best, any one nation has limited control or influence. The basic task of any nation is to decide how to use its resources and influence to modify and shape this environment. The process of analysis—of deciding what to do and how to do it—involves at least three difficult factors which influence and act upon each other.

The first of these is the appraisal of the present external situation, and the likely course of its development: this is the environment in which foreign policy must be conducted. In large part, this estimation involves both the effort to predict the interests, purposes, and actions of other states and the impact on them and on each other of their differing motivations and actions.

The second factor relates to the objectives which should guide our policy. In its broadest sense the aim of our foreign policy is to create and maintain external conditions congenial to our way of life and values. To provide a basis for action, however, this general purpose must be made more specific in terms of security, economic activities, and so on. Also, relative priorities must be established among these interests.

Finally, there is the choice of means. There are many instruments which a nation can conceivably use to influence the outside world: military force, political activities, economic measures, propaganda, and various other ways. It must decide which of these are most suitable for attaining a specific purpose

and how they can best be used; resources are seldom large enough to allow the use of all possible means in an indiscriminate way.

The analysis is more difficult than this listing would imply. These factors cannot be treated separately; they are all interrelated and influence each other. It is not feasible to study them one at a time. For example, consider the question of appraising the external situation. To be useful the assessment must be objective, but it cannot be passive. The policy-maker is not looking at conditions as a bystander, but as one of the actors. His purpose is not merely to anticipate history but to assess how future forces and events may affect the interests and purposes of his own nation. Consequently, in assessing the environment he must start with some conceptions of national interests and purposes in order to consider how they may be threatened or impeded. Similarly, the appraisal must seek to determine the ways in which the situation is subject to influence both by national actions and by the actions of friendly or hostile powers.

The effort to determine the basic direction of policy involves a comparable analysis. The broadest aims of policy, like security and prosperity, may be treated as given. But practical objectives must be chosen in the light of external conditions and the means available to the nation. The policy-maker must be concerned both with what is necessary and what is feasible. The situation is similar with respect to means. In deciding what instruments to create and utilize, the policy-maker must take into account both what objectives he wishes to accomplish and what methods he deems most likely to be effective in influencing the external environment.

Thus, his task is to solve an equation with three variables, which affect each

other. Moreover, none of these factors are neat or precise: they all involve large elements of prediction, appraisal, judgment, and choice. Anyone who has been charged with trying to cope with such analysis cannot fail to be impressed with the uncertainty inherent in the process. In evaluating future policies, the decisions regarding conditions, purposes, and means pose many baffling dilemmas and alternatives. As historians and columnists have discovered, second-guessing on foreign policy is much easier and less risky than its initial formulation. Time and events remove most of the uncertainties and foreclose many of the alternatives which the policy-maker had to face and choose between.

The contemporary world

Thus the making of foreign policy is inherently difficult in any period. The conditions of the modern world, however, add greatly to the complexity. The reasons are varied.

In the first place, there are far more actors on the international stage. Until World War I, and even later, international affairs were largely dominated by a small number of European nations. The Western Hemisphere, including the United States, played only a small role. Asia and Africa were still within the European empires or, like China, too disorganized to be significant. Despite differences, European statesmen were familiar with the history and thinking processes of the nations playing important roles. Today all that is changed. Now over ninety countries are conducting their own foreign affairs, and another score will begin to do so within a relatively short time. These countries differ widely in culture, history, and attitudes. In living conditions and experience the newer nations are separated by a wide gulf from the developed countries of Europe and North

America. Many of them have weak governments that are facing staggering problems. With very limited background, they must decide how to relate themselves to the outside world and must determine their interests and priorities. The very number of actors, and especially of new actors, adds enormously to the task of conducting foreign policy for every nation.

An added complication is that the relations between nations are far more intimate today than ever before. Further, the domestic affairs of most countries are now closely entwined with international affairs. Each nation must be concerned in some degree with the internal life of other countries. The progress of growth and change within the newer nations is bound to have profound effects in international relations. Inevitably, other nations have a deep interest in the social, economic, and political evolution of these newer nations. But the same fact is also true among the developed countries. The prospects for Europe largely depend on the likely evolution of the political and social order in Germany, or France, or Britain. The events in Algeria, or the possible successor to Adenauer or De Gaulle, can directly affect a wide range of other countries.

The third complicating factor is the Sino-Soviet threat. The existence of expansionist powers has often been a feature of international life, but the Communist powers have developed to a high degree the techniques of pressure, infiltration, and subversion. They show unusual skill in exploiting conditions of instability.

Finally, our times are marked by a pace of change unparalleled in history. The international environment is not only complicated but is changing with tremendous rapidity. This is the hallmark of our era. Under the pressure

of nationalism and the urge for better living conditions, newer countries are actively seeking to modernize their economies as rapidly as possible. They are undergoing social revolution which will undoubtedly transform the structure of their social order and the attitudes of their people over a relatively short period. Meanwhile, the efforts of Western Europe to transcend ancient rivalries and to draw together in regional groupings seems likely to have a major impact on international relations. The Soviet Union too is not immune to the force of change; one obvious question is how social evolution may affect its external purposes and policies. Last, but not least, is the revolution occurring in the whole field of military technology, in the form of nuclear weapons, missiles, and now space. The result is to raise wholly novel questions about the role of force in international affairs.

Under the impact of all these forces, international life has become an intricate web of relationships constantly undergoing extreme and rapid change. As a consequence, the effort to appraise this unfolding situation, to disentangle the various forces and to foresee how they will interact, to determine what our interests are, what our goals should be in a world of flux, is far harder than in the past. Our knowledge is very limited about many of these areas of change. Very little is really known about the whole process of accelerated social and economic change or about the effects it may have on institutions and attitudes. Even those best qualified are only beginning to grasp the significance of the revolution in military force and strategy. No one can be very confident about foreseeing the prospects of change in the Soviet Union. These are all new phenomena, facing the policy-maker with even more uncertainty than usual.

UNITED STATES POLICY MACHINERY

In assessing our foreign policy machinery one should keep in mind how little time our country has had to master its present role. We emerged from World War II ill-equipped for the task. The nation and its leaders misjudged the kind of world which lay ahead and labored under serious illusions about our position and our interests, and the dangers menacing them. Our nation has had to develop an understanding of foreign affairs and the techniques for conducting them in a far shorter period than most great powers. The fifteen years it has had to evolve a framework for policy-making have been times of unprecedented change and turmoil. In many ways what has been achieved in so short a time is remarkable. Yet most would agree that the machinery still needs to be strengthened and improved if the United States is to meet the challenge of the period ahead.

Our present machinery for making foreign policy dates mainly from 1947. By that time Soviet conduct in occupied Germany, in Eastern Europe, and in the Conferences of Foreign Ministers had dashed the earlier hopes for postwar co-operation. The experience of that period had also shown the serious inadequacy of our instruments for policy formulation. To remedy the defects and fill the gaps, new agencies were created and old ones remodeled. The Defense Department was established to unify—but not to merge—the three military services under the direction of the Secretary of Defense. The Central Intelligence Agency was formed to correlate and evaluate intelligence relating to national security. And the National Security Council was organized to advise the President on the integration of domestic, foreign, and military policies, relat-

ing to National Security, and to facilitate co-operation among the interested Departments. At the same time, General Marshall set up the Policy Planning Staff in the State Department to undertake longer-range analysis.

In the intervening years, these various agencies, and certain related ones, have been modified or strengthened in the light of experience, without changing the basic conceptions underlying their foundation. In particular the National Security Council is now assisted by a Planning Board and by an Operations Co-ordinating Board (OCB). On the Planning Board are Assistant Secretaries or officials of similar rank from each of the departments primarily interested in national security affairs. This group prepares, for the consideration of the National Security Council, policy papers designed to pose basic issues of policy and to analyze alternatives for dealing with them. All the members of this group may agree upon the substance of the papers or, if they disagree, the points of disagreement will be indicated, and alternative proposals will be submitted to the Council. In its deliberations the Council also has available the National Intelligence Estimates which indicate the consensus of the several agencies regarding the situation in the area or region under discussion. The Operations Co-ordinating Board was created in 1953 to improve the execution of the policy decisions. It is composed of senior officials from the operating agencies engaged in foreign affairs. This Board, assisted by working parties, develops detailed plans for the various countries and regions. These are intended to co-ordinate the activities of different American operating agencies and to ensure that they reinforce each other. This Board submits regular reports to the National Security Council regard-

ing the progress and problems in each area.

Operation of machinery

How well does this machinery work in practice? Speaking generally, it has certainly improved our policy-making and facilitated the performance of the novel tasks involved in our postwar role. Most observers would probably agree on that point. The present system has, however, been criticized from various points of view. It is obviously not feasible here to review or appraise its operation in any detail. There is only space to comment briefly on certain of the issues which have prompted discussion.

One common criticism is that the policy papers of the National Security Council are too general. Sometimes this defect is attributed to the tendency of committees to seek the least common denominator as a basis for agreement. This view tends to misconceive the nature of the Council. The National Security Council does not reach any decisions. It is solely an advisory group for the President. It discusses issues before him and makes recommendations, but the only one who can decide is the President. The members of the Council may espouse divergent views without resolving the issue. Thus the President has the chance to hear frank expressions of opinion by his principal advisers before deciding on policy issues.

It is true, however, that the National Security Council papers are often quite general. They seldom prescribe the specific means for handling crises which may arise in some area over the next two years. That is not the purpose of the Council. Its function is to consider the general direction or basic strategy of our policy. It enables the responsible officers—the Secretaries of State, De-

fense, and the Treasury, the Chairman of the Joint Chiefs of Staff, and the Director of Central Intelligence—to discuss the critical issues and to examine the alternatives for dealing with them. On the basis of such discussion and analysis the President can then determine the guidelines to govern the departments in their operations overseas. Then, as has been said, the Operations Co-ordinating Board offers a forum for working out more detailed plans.

The machinery does not, of course, always produce the right solutions. Entrenched preconceptions may impede or prevent realistic appraisal of some situations. Thus, repugnance of the Soviet regime made it hard for some to credit promptly the evidence of rapid Soviet economic and scientific progress. Similarly, some have been slow to comprehend the full scope of the Soviet threat, partly at least because its techniques and objectives are so alien to our own. And some did not grasp the force and significance of the new nationalisms as quickly as should have been done. But it is very doubtful whether any machinery can safeguard entirely against such intellectual lags in a period of radical change.

Political-military co-ordination

A valid criticism is that the existing mechanism has not been fully effective in integrating the political and military aspects of policy. The urgent need for better co-ordination in this field was one of the major reasons underlying the creation of the National Security Council in 1947. The initial concept was valid but too simple. In essence, the notion was that foreign policy, military capability, and economic resources must be kept in step. Thus the National Security Council was expected to keep in balance political com-

mitments, military means, and economic requirements. This, of course, is necessary and useful. But in reality today the relation between these factors is much more complex, much more subtle, than that concept suggests. For instance, foreign policy requires many other instruments which compete with the military for resources. Again, collective defense depends on stationing of forces overseas, allocating military assistance, and many other things which require the integration of political, military, economic, and psychological factors. Indeed, deterrence itself, which is the underlying premise of our entire defense policy, is a very complex concept; in deciding on strategies, weapons, and forces within this context it is essential to take account of the political and psychological, as well as the military factors. Finally, in the field of arms control, all these factors must be combined in preparing or analyzing any proposals. The requisite integration cannot be achieved merely by discussion at the level of the Planning Board, or the National Security Council. To get proper results the staffs of the various departments will have to work together intimately at much lower levels in order to mesh thinking and analysis. These officials do consult with each other to some extent but not nearly enough has been done along this line. Top officers in the Pentagon have sometimes been reluctant to see too much co-operation of this kind and the State Department has not been active enough in this field. One handicap, of course, is the shortage of people on both sides able to carry on integrated analysis of this kind. The military services have probably done better in training such people, as in the war colleges. While Foreign Service officers attend these courses, there is still a serious lack of officials with the necessary competence for this kind of work.

Allocation of resources

The present machinery is also deficient in another regard. It tends to be too much divorced from the budget procedures. The basic decisions on national strategy inevitably involve allocation of resources at least in broad terms. The Budget Bureau has insisted on its prerogatives in this area; the National Security Council and the Planning Board have either stayed out of this field or been kept out. The National Security Council should obviously not attempt to make the budget. It could not. But it could exercise more influence on the broad allocation of resources between types of military forces, between military and economic purposes, and so on. Under present procedures, however, these kinds of decisions tend to be made in the framework of the budget procedure.

In the case of decisions regarding the size and type of military forces, which are closely related to the National Security Council functions, another obstacle arises from the Pentagon procedures. The form of the military budget, based on the three services, makes it almost impossible to determine how various budget levels or allocations would affect military capabilities for specific tasks relevant to foreign policy. The result is to impede or block efforts to relate military means to political requirements.

Long-term planning

The Policy Planning Staff was established in 1947 in order to broaden the perspective of the thinking and policy-making in the Department both by transcending the regional approach and also by seeking to look a little further ahead in time. One of the common criticisms is that the Policy Planning Staff has too often become involved in current actions. While this criticism

is partly valid, much of it reflects a misconception of what is useful and possible. There is in the concept of long-term thinking and planning a basic dilemma. It is perfectly possible to put a group of people into an ivory tower to think about the future and write learned and interesting papers. The objection is that it is probably fruitless. Their efforts may result in a magnificent library, but will have little effect on the shaping of policy. The purpose of a policy planning staff, however, is not merely to produce literature. It is presumably to produce results which will affect the determination of policy for different situations. Foreign policy for better or worse is made in current decisions. The decisions made this week or this month relating to the Middle East, or disarmament, or economic assistance often determine the course of policy over a period of years. Unless insights and thinking on long-term factors can be brought to bear on such decisions as they are made they will have little effect. On the other hand, if this planning group becomes too immersed in current activities, it will be unable to contribute views that differ from those produced by others engaged in similar activities. The staff must try to devote its time not only to long-range analysis but also to selected decisions likely to have future significance. There is a constant tendency to draw this staff into operations to a degree beyond the requirement described. This must always be resisted. But many critics who could legitimately object to that tendency ignore the question of how to mesh the thinking with action.

What kind of a contribution should such a staff try to make? Some have suggested that it should be mainly engaged in contingency planning of the sort that many military staffs do. To my mind this is misguided. It would

not be fruitful for such a staff to spend its time trying to develop drawers full of solutions for possible crises that might arise in the next period of years. In the first place, it is very doubtful whether the way such crises are likely to arise can be foreseen concretely enough to make the planning of much help. In addition, the potential number would be too vast to manage.

The purpose of the staff, it seems to me, should be quite different. Its major concern should be to identify the long-range or basic forces at work in the world and determine the implications for the premises of American policy and for the analysis of our interests and purposes.

There are many instruments of policy which tend to be neglected because their effects are slow, or long-term, or not immediate. The tendency of officials charged with day-to-day operations is to look for means which have immediate impact. Therefore, another function of such a planning staff is to direct attention to instruments of policy, or kinds of actions, that may not seem profitable in the short run, but which may be quite vital in shaping the long-run environment.

Furthermore, the staff should constantly criticize existing policies whenever they appear outmoded or no longer suitable to changed conditions. In a world such as has been described, this function is vitally important.

CONCLUSION

This discussion can be concluded with three comments.

First, we can and should constantly seek to improve the methods and machinery for making policy. Improvement is likely to come from a wide range of small actions rather than from any panaceas.

Second, machinery, while important,

is no substitute for able individuals and informed leadership.

Third, the best possible policy will not succeed in giving us an orderly world in our time. We must not let

crises, instabilities, and failures discourage or frustrate us. If we do, we will fruitlessly waste energy which should be devoted to playing a constructive role.

QUESTIONS AND ANSWERS

Q: In the light of what Professor Sohn said about the need for understanding abroad, I would like to have you explain what part foreign information, conventionally known as propaganda, plays in foreign policy.

very important element in the whole series of instruments.

Q: In this turbulent world of social, political, and economic change in which the United States is destined to play a leading part, is there a "grand design," an "American grand design," to affect the shape of things to come? If there is not such a "grand design," are there indications that such a "grand design" will be evolved some time in the future, or is it not desirable, or is it not possible in planning and thinking about world affairs on a universal scale? Should we consider that this is strictly the province of the totalitarians?

A: I understand the question to mean the use of propaganda as an instrument of foreign policy. Well, as you know, this is the business of the United States Information Agency, and a rather large-scale activity. I do not know what the current budget is, but it runs into quite a substantial sum of money going into broadcasting, into facilitating the publication of books and other materials, and into implementing various forms of exchanges. All of this is designed to try to do what I think Professor Sohn was suggesting, namely, to relate the purposes and aspirations of other countries to the foreign policy of the United States; to make them realize the ways in which our purposes and theirs coincide; and to try to convey the fact that what they need and what they seek are things which we recognize and wish to support. This is certainly an important instrument in the conduct of foreign policy today. Of course, people differ on how effectively it is being used, partly at least because it is so hard to evaluate the impact of effort to influence attitudes. Doubtless there are ways in which it could be made more effective, but I think it is certainly recognized as one

A: That is a big subject, but I will try to comment. Let me say, first, that to understand the course of American foreign policy you have to think of it a little bit in historical terms. It seems to me that in 1945 we entered a world quite unprepared for what we had to face. We were unprepared because we misjudged what the world was like: we did not understand at all the nature of the Soviet Union's purposes; we were not prepared for the decline and fall of the empires as rapidly as it occurred; we really had not visualized the meaning of nuclear weapons, and so on. Second, I do not think we understood the process of international politics very well. We were rather naive on that. Third, I really do not think we understood our role in the world. Now

that was quite a large series of handicaps with which to start, and it seems to me that you have to visualize the last fifteen years as a process of learning, a process of growing to understand better each of these factors. If you look at it in these terms, there is reason, I think, to feel that we, as a nation, and our leaders, have learned a great deal about each of these topics. I think we understand much better what the world is like. I think we understand much better the demands of our role. However, the way a nation like ours, or any democratic nation, learns is to be confronted with hard facts which tends to mean a series of reactions to crises. I do not think we are at the end of the process. But there are signs we are now beginning to recognize as a nation that a reactive policy, a policy of trying merely to contain communism, is simply inadequate and that our policy must have a positive dimension, a purpose of its own which, I think, is what you are talking about. You speak of it as a "grand design." Maybe that is a little more elegant than how I would refer to it, still it seems to me we must have a conception of the kind of world which we want to live in, the kind of world which will be congenial or compatible with our values and our way of life. This means a distinctively positive approach to the job to be done. I think myself this is coming to be realized as an absolutely essential component of an adequate foreign policy. Now this is not a substitute for the negative element; we still have to recognize the fact that we are in a contest with the Soviet Union.

They are going to use whatever means are available to them, and we have got to be able to counter this as best we can. Therefore, I do not think it is an "either" "or," one or the other, proposition. It seems to me that adequate policy must contain both elements, both the recognition of struggle and the recognition of the necessity for positive purposes of our own for building a kind of world which will fit our needs and the needs of other countries which want to live their own lives not dominated by an alien philosophy. It is going to take a little while to put it into concrete terms, but I think it is happening. Fields like trade relations with other parts of the world, the question of economic assistance to other parts of the world, are beginning to be seen by us not as just negative reactions but also as positive purposes of our own. But, it does take a while for the thinking of leaders and of the electorate to see it in these terms. If you look back over the past fifteen years and how far we have come in that time, then I think you can take hope that in the decade of the 60's we really will add to and round out an adequate program on the positive side. Unless we do, I do not believe that we will be able to carry through in a period of relaxation all the necessary measures, which are going to be slow and costly in time and energy and resources, with the persistence and patience needed to make them work. So I think it absolutely vital for the free nations to develop the bases for making common cause for the purpose of creating a kind of world which is congenial with their values.

Creating a Favorable World Opinion of American Foreign Policy

By LOUIS B. SOHN

ABSTRACT: The United States has for a long time treated its foreign relations as a series of crises and has concentrated too much on counteracting Soviet moves. The United States must instead try to develop a positive, independent policy, the aim of which should be to create a world order in which all nations would be able to live in peace, freedom, and justice. Such a policy cannot be improvised; it must be as thoroughly prepared as that which resulted in the creation of the United Nations. A large research effort, comparable perhaps to the Manhattan Project in the field of nuclear energy, would be necessary. To the extent that the United States should be able to formulate a foreign policy which would be favorable to the survival of the American people and to the survival of the human race, it would not have to worry about creating a favorable world opinion. An effective plan for world peace would create such a wave of enthusiasm around the world that even the Soviet Union would not find it advisable to be opposed.

Louis B. Sohn, LL.B., M.Dipl.Sc., LL.M., S.J.D., Cambridge, Massachusetts, is Professor of Law at Harvard University. Previously, he was legal officer in the Secretariat of the United Nations, as well as a member of the World Court delegation to the San Francisco Conference. He is a member of and has been officer of several law associations; presently, he is on the board of editors for the American Journal of International Law. A graduate of John Casimir University, Lwów, Poland and Harvard University, Professor Sohn is the author of Cases on World Law (1950), Cases on United Nations Law (1956), and co-author of World Peace Through World Law (1958).

THE basic condition for the creation of a more favorable world opinion concerning American foreign policy is for the United States to have a foreign policy in the first place. The second requirement is that the American policy be a policy which would appeal not only to Americans but also to the largest possible number of other nations. Finally, proper means must be devised to persuade other nations that we have an effective foreign policy and that this policy is a good one from their point of view.

FOREIGN POLICY CRITICS

Many books have been written since the Second World War condemning American foreign policy.¹ Some authors have even alleged that the United States does not really have a consistent foreign policy, and that it does not know how to formulate one. Many be-

¹ See, for example, C. Bowles, *Ideas, People and Peace* (New York, 1958); T. I. Cook and M. Moos, *Power through Purpose: The Realism of Idealism as a Basis for Foreign Policy* (Baltimore, 1954); T. K. Finletter, *Foreign Policy: The Next Phase* (New York, 1958); L. J. Halle, *Civilization and Foreign Policy* (New York, 1955); J. H. Herz, *International Politics in the Atomic Age* (New York, 1959); E. Hughes, *America the Vindictive* (New York, 1959); G. F. Kennan, *American Diplomacy, 1900-1950* (Chicago, 1951), and *Realities of American Foreign Policy* (Princeton, 1954); H. A. Kissinger, *Nuclear Weapons and Foreign Policy* (New York, 1957); C. O. Lerche, Jr., *Foreign Policy of the American People* (Englewood Cliffs, N. J., 1958); J. J. McCloy, *The Challenge to American Foreign Policy* (Cambridge, Mass., 1953); J. H. Morgenthau, *In Defense of the National Interest* (New York, 1951); R. E. Osgood, *Ideals and Self-Interest in America's Foreign Relations* (Chicago, 1953), and *Limited War* (Chicago, 1957); H. L. Roberts, *Russia and America: Dangers and Prospects* (New York, 1956); F. Tannenbaum, *The American Tradition in Foreign Policy* (Norman, Okla., 1955); J. P. Warburg, *The West in Crisis* (Garden City, New York, 1959).

lieve that our foreign policy is merely negative and passive, and that, in particular, it is so preoccupied with finding an adequate response to each Soviet or Communist Chinese step that no effort is made to establish an independent policy. Others complain that American foreign policy is inflexible, that it is based on the utopian idea of forcing the Communist powers into an unconditional surrender and on the conviction that anything short of such a surrender must be dismissed as appeasement. The view has also been expressed that the American people do not believe in either the traditional or the new means for conducting foreign policy; that they do not trust diplomats, have no confidence in international law, and are afraid that the United Nations is going to deprive them of sovereignty.

Some of these criticisms are, of course, exaggerated. There can be no doubt, for instance, that in the 1950's the United States accomplished its primary aim—to stop the territorial expansion of the Soviet bloc. But any impartial observer would agree with the statements made in a recent study by the Council on Foreign Relations that “the tendency of the United States up to now has been to treat foreign relations as a series of crises, of moves and countermoves in the cold war,” and that “the United States has failed to cast its policies adequately for the long term.”²

LONG-RANGE OBJECTIVES

The first step in our search for a generally acceptable American foreign policy must be, therefore, to discover

² Council on Foreign Relations, *Basic Aims of United States Foreign Policy* (Senate Committee on Foreign Relations, United States Foreign Policy, Study No. 7; Washington, 1959), p. 8. This is one of fifteen excellent studies prepared for the Senate Committee on Foreign Relations in 1959-1960.

its long-range objectives. It has been suggested that they may be traced back to the preamble to the United States Constitution which proclaims as its goals “to form a more perfect Union, establish Justice, insure domestic Tranquillity, provide for the common defense, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity”; and that, in modern terms, this means that the object of our foreign policy should be “to promote and secure conditions in the world under which a nation, with such purposes as ours, can live and prosper” and to create “some form of world order compatible with our values and interests.”³

If we should accept this approach, it need not lead us to a constant emphasis on United States interests and United States security. In fact, such an emphasis would be rather undesirable, if we should want other nations to endorse our policy. While it may often be true that what is good for the United States is good for the world, our foreign policy will have a much greater appeal to the nations of the world if it is presented in the alternative form that what is good for the world is good for the United States. While this might sound simple in theory, it is not so easy in practice. Too frequently we have been engaged in two inconsistent selling jobs in situations in which we have presented different interpretations of the same idea at home and abroad. One might recall, for instance, the crucial negotiations for the creation of the North Atlantic Treaty Organization (NATO). While our Secretary of State was traveling abroad trying to persuade

the Scandinavian nations to join an organization which would increase their security, other spokesmen for our government were busily explaining to the Senate that there would be no real legal commitment to come to the aid of an attacked nation.⁴ More recently, practically every appropriation for foreign economic assistance has been defended in Congress as a contribution to our defense against communism, while we have insisted abroad that we have no intention of interfering in domestic affairs of the assisted nations.

Realism and idealism

This emphasis on our national self-interest, narrowly understood, has led to a misunderstanding about the role played in United States foreign policy by realism and idealism. Some critics of that policy maintain that the United States does not pay enough attention to the realities of power politics, and that it sacrifices political advantages because of moral or idealistic scruples. A recent study has pointed out, however, that whenever “the United States has tried to act without moral conviction, or in ways that went counter to its basic beliefs, it has found itself inhibited and has ultimately had to re-chart its course.”⁵ Whether the issue involved was domination of the Philippines, assistance to French colonialism in Indochina, or support to dictatorial regimes in Latin-American countries, the policies contrary to the basic American ideal of democracy have usually been abandoned. In other situations, the United States has accepted deep commitments and onerous responsibilities which were not necessarily dictated

⁴ See, for example, the debate in the Senate on February 14, 1949. 95 Congressional Record (1949), pp. 1188-93.

by self-interest. Both lines of action have contributed to a positive image of America in other countries.

Words and deeds

Another closely connected problem is the relationship between words and deeds. On frequent occasions, big words have not been accompanied by action, thus leading to a "let-down" of hopes and expectations. New policies have sometimes been announced which seemed to imply our willingness to accomplish a change in an undesirable situation, but when a chance arose to fulfil our promise, we hid behind some qualifications which were allegedly embodied in our policy statement. There was, for instance, a tragic link between the so-called "liberation" policy and the purely verbal condemnation of the Soviet suppression of the Hungarian revolt.

Nevertheless, there is room in foreign policy for general declarations of moral principles and for their slow transformation into rules of international law. But such declarations should not be unilateral; they should embody the consensus of as many nations as would be willing to subscribe to them and should be adopted, if possible, by appropriate organs of the United Nations or of other international organizations. Despite some misgivings in certain United States circles, the Universal Declaration of Human Rights, approved unanimously by the General Assembly of the United Nations in 1948, has had an important impact on developments in many nations.*

MAIN GOAL: PRESERVATION OF PEACE

Coming back to a definition of American objectives in more positive terms,

* United Nations Secretariat, *The Impact of the Universal Declaration of Human Rights* (1953), pp. 12-49, and *The Universal Declaration of Human Rights: A Standard of Achievement* (1958), pp. 16-30.

there are many aspects which could be discussed. Even if the Soviet Union should disappear tomorrow, there would be still the problem of China, the growth of political and economic nationalism in Asia, Africa, and Latin America, the interrelated questions of race conflict and colonialism, and the problems of economic development and international trade. But the crucial problem is the preservation of peace. If all humanity should be destroyed in a nuclear war, all other values would lose their meaning. The basic objective of American foreign policy must be, therefore, to find a satisfactory solution to the problem of peace and war and to have it accepted by other nations. As in other areas, this policy should not be limited to a monotonous rejection of Soviet proposals, nor should it consist of a series of unrelated, half-baked suggestions which do not even have the approval of the legislative branch of our own government. It is difficult to rally support in this country and abroad for a policy which is presented to the general public in bits and pieces which do not appear to fit into any previously announced larger scheme. The seriousness of each proposal has to be judged also by the amount of consultations which preceded it, both with the leaders of Congress and with our allies. If a new proposal is accompanied by disparaging remarks in Congress and by shouts of dismay in allied capitals, one cannot expect that other nations will embrace it with enthusiasm.

To illustrate, I would like to discuss two concrete cases: the establishment of the United Nations and the recent disarmament proposals made by Secretary Herter and Mr. Eaton.

Planning the United Nations

In the midst of a great conflict, when all the resources of the nation had to be geared to winning the war, the Sec-

retary of State had the foresight to direct the preparation of comprehensive plans for an effective world order to be established after the war. A group of dedicated persons was assigned to this task, and a wide network of consultations was established with private groups working in this area. Many ideas were considered, some of which were quite radical; and through constant discussion a cohesive plan was hammered out. After consultations with Congressional leaders and other influential citizens, the plans were revised and presented unofficially to our closest allies. Further revisions followed and the general outlines were presented to other nations for their comment.⁷ At the Moscow Conference at the end of 1943, an agreement was reached with the Soviet Union on a few basic principles,⁸ and a way was opened for the preparation of a detailed draft. A technical conference of experts from the United States, United Kingdom, the Soviet Union, and later China, was held at Dumbarton Oaks and a set of proposals was agreed upon. These proposals were immediately published and widely discussed. A few points unresolved by the experts were settled at the summit meeting at Yalta. The support of the Latin-American Republics was obtained at a special conference at Chapultepec, and finally a conference was held at San Francisco of all the nations concerned. The United States delegation to the Conference included a group of important Senators and Congressmen, and some fifty national organizations were consulted daily about the developments at the Conference. A

⁷ For a history of this patient effort, see Department of State, *Postwar Foreign Policy Preparation, 1939-1945* (Washington, D. C., 1950); R. B. Russell, *A History of the United Nations Charter* (Washington, D. C., 1958).

⁸ 9 Department of State Bull. (1943), pp. 308-9.

concerted effort was made to explain the crucial issues to the general public, and wholehearted support by most of the influential newspapers was enlisted. Consequently, no strong opposition was encountered in the Senate and the Charter of the United Nations was approved by a Senate vote of 89 to 2.⁹ Only four months after its signature the Charter came into force, and a new era thus began.

Disarmament proposals

Compare with that our recent disarmament proposals. Except for a brief effort in 1946 which culminated in the Baruch plan, we have shown very little imagination in the area for a long time. Over the years we have insisted on discussing minute issues, each of them in isolation from others; for a while, we even refused to discuss the reduction of conventional armaments together with the nuclear ones despite the fact that it was in our interest to have conventional armaments reduced simultaneously with the nuclear ones. In the last five years, we have made so many separate proposals, some of them quite contradictory, that not even a specialist in the Department of State can tell what our over-all plan is, and how these pieces fit together. In addition, nobody seems to know which of these proposals were seriously discussed by the various branches of our government before their presentation, which have received the approval of the Senate Committee on Foreign Relations, and which have the support of our allies.

Since September 1959, when the Soviet proposals for total disarmament galvanized us into action, a new approach to the problem of disarmament seems to have developed in our government. It was first indicated by some questions asked by Mr. Lodge at the

⁹ 91 Congressional Record (1945), p. 8190.

United Nations;¹⁰ it was spelled out by Secretary Herter in his speech before the National Press Club;¹¹ and was implemented by Mr. Eaton in his introductory statement at the Ten-Nation Disarmament Conference in Geneva.¹² For the first time, we seem to have recognized the fact that disarmament is not an end in itself, and that the security of the United States in a disarmed world would require the strengthening of various international institutions—the establishment of a strong international police force, the development of better methods for solving international disputes, and the creation of new rules of international law which would protect nations against injuries to their vital interests by means short of war, such as subversive activities, economic boycotts, dumping, and so on. After preaching for many years about the need for the rule of law in international affairs, we have finally outlined some concrete steps in that direction.

Publicity fiasco

Has this important action received proper recognition at home and abroad? Has it made clear to other nations that we are more peace-loving than the Russians and that we really want to establish the rule of law in the world? There can be no doubt that the answer is "no."

Why did it happen that way? In the first place, the new ideas were buried in long statements dealing with technical details of our new disarmament proposals. Secondly, these disarmament proposals seemed to put stress not on the great principles of an effective peace plan, but on a variety of studies which must be conducted before these principles can be elabo-

rated. In reading our proposals, most people—including the newsmen—never advanced beyond the complicated first paragraphs, and as a result there was practically no reaction to the exciting new idea of a comprehensive peace plan; and even the newspapers which noticed it paid little attention to the idea. Thirdly, there was no indication of the seriousness of our proposals, as measured by prior consultations with Congress and our allies. Fourthly, there was no further action, no attempt to stimulate a debate in the Senate on the subject, no television address bringing the matter more directly before the American people, no Presidential endorsement, no indication that the matter will be brought up at the next summit meeting, no concerted action by our diplomatic missions abroad to bring the new ideas to the attention of foreign governments and foreign newspapers. A great opportunity has thus been missed to create a favorable climate abroad for our foreign policy in an area where other nations are instinctively receptive to our proposals.

New approach

The remedy would seem to be to duplicate the original United Nations approach. There we developed a great idea which was shepherded carefully to a successful conclusion. Now we have a new idea which is a logical sequel to the other one. By a determined effort over perhaps a three-year period we might be able to advance from the present tentative concept to a generally acceptable plan. To the extent that studies are needed, we can conduct them ourselves and present the results to the other nations, as we have done at Dumbarton Oaks. If we can do the job well, and I do not doubt that we can, we should have no difficulty in creating such a wave of enthusiasm around the world that even the Soviet Union would

not find it advisable to be opposed. If, however, the Soviet Union should reject a proposal recognized by all as the only safe way towards peace, then we would accomplish at least the other aim of our foreign policy—to show to the peoples of the world who is the true lover of peace. We have really nothing to lose, and we can gain a tremendous amount. In any case, the risk of exploring the road to peace is much smaller than the risk of a continuing arms race and the prospect that nuclear weapons may soon come into the hands of persons who will have less inhibitions in using them than the present possessors.

NEEDED: A NEW MANHATTAN PROJECT

In conclusion, it seems clear that before the United States can create a more favorable world opinion for its foreign policy, it must reformulate this policy in positive and concrete terms, both in the general area of peace-planning and with respect to the more specialized problems of our relationship to the Soviet bloc, Western Europe, the Commonwealth, Asia, Africa, and, last but not least, Latin America. The Senate Committee on Foreign Relations is now engaged in this task and it has enlisted the support of all the important centers around the country; the studies already published have developed a number of important new ideas which deserve wide public discussion. But the main burden of formulating the policy, of explaining it to the country and of selling it abroad rests on the executive branch of the government, and in particular on the President. If he should lead courageously, the nation would follow, and other countries would also rally behind us. This cannot be improvised, however. A tremendous effort will be necessary to enable the next President to establish a meaningful foreign policy.

As a minimum this effort should be similar in scope, size, and importance to the great research program which culminated in the establishment of the United Nations. Perhaps we should set our sights even higher and start a research effort comparable to the Manhattan Project in the field of nuclear energy.

Suggestions have been made recently for a separate National Peace Agency¹³ and for an Arms Control Research Institute.¹⁴ But these projects are still too limited in scope, both with respect to their subject-matter and the resources to be drawn upon. It might be desirable to establish in addition a truly international research project in this field, in which men from many nations would join in an objective study of the problem of peace. Such a project might be under the direction of an international peace commission, composed of fifty private individuals—ten lawyers, ten political scientists, ten specialists in arms technology, ten economists and ten persons with experience in the work of the United Nations—with a staff of full-time research associates and part-time consultants. The commission should be empowered to prepare detailed proposals not only for disarmament, but also for an international police force, settlement of international disputes and peaceful change, and development of underdeveloped countries. It should be required to finish its work in three years. If the plan proposed by this commission is deemed by most nations to be impartial and adequate, it would create such a wave of enthusiasm around the world that no nation would dare to be opposed.

If such a world-wide project is deemed too ambitious, it might be tried on a smaller scale, for example, within

¹³ 106 Congressional Record 4559 (8 March 1960).

¹² *Ibid.*, p. 513, at 515.

the framework of the Atlantic Community. At least, a commission with similar composition and object might be established in the United States, to guide our own study of the problem. It should be entitled to call upon the best men in the country and its research studies should be given the highest priority. To finance the commission's projects, one tenth of 1 per cent of the amount spent on armaments should be sufficient. Planning for peace is less expensive than planning for war, but the peace planners still require much more than has been spent on their work during the last fifteen years.

With patience and perseverance, our commission should be able to formulate interrelated statements of our goals and to outline the concrete steps which we should take to reach these goals. If the President accepts these statements and uses all the power of his office to

ensure the support of the Congress and of the people of the United States, then the moment will come to present this new formulation to other nations for approval. If we do this job right, there can be but little doubt that our new foreign policy will be of the kind that will appeal to other nations and will receive their support.

The United States has no ambition to rule the world in an authoritarian manner; its goal is instead to create a world order in which all nations will be able to live in peace, freedom, and justice. Should we find a way to accomplish that goal, we can fully expect that all the nations of the world will accept it without any hesitation. If we succeed in developing a foreign policy which will be favorable to our own survival and to the survival of the human race, we will not have to worry about creating a favorable world opinion.

* * *

QUESTIONS AND ANSWERS

Q: Is there not a certain basic flaw in your proposal, namely, that you are actually describing what the Soviet Union does effectively carry out and proposing it for a society which is open? Therefore, is not this proposal, in all its approaches, against the things we positively desire and rather value? Now here is the fundamental question: Are you not proposing something which is not available to a divergent free society?

A: I agree with you that the Soviet Union has a very definite plan for a world order dominated by Communists. The question is what is going to be our reply to it: is our reply to it going to be to do nothing; or is our reply going to be something that everybody knows is entirely ineffective; or shall we try to

find a solution for the problem of peace and war in the world that would be run on a democratic basis rather than on the Communist basis? I think those are the clear alternatives before us. Are we going to have a Communist-dominated world, or a world in which a democratic system would prevail at least on the international level even if there would be some Communist system in some member nations. I think this is something that the nations of the West can devise, and with some imagination, it can be done. I am encouraged, for instance, that in Europe when it came to the several functional problems of the economic life in which until very recently an extreme nationalism persisted, even France and Germany were able to unite in a European

Economic Community, which constitutes a great encroachment on what used to be called economic sovereignty. They have done it as a matter of survival in the world and for more efficient division of their resources. I think we need to do the same in the world at large, and it can be done by the same method, namely, trying to devise some functional way of dealing with problems of peace and war by a specialized organization like the United Nations, perhaps revised to some extent, and with the necessary powers for the purpose. It seems to me that we can devise one, or, at least, propose one and have before the nations of the world an alternative to a Communist-dominated world.

Q: I would like to ask about this large-scale research program of an international scope that you propose for hammering out a genuine proposal for a world under law. You did not feel that the persons engaged in this should be solely government representatives with which I heartily agree. What is your idea, Professor Sohn, of the kind of personnel who should be engaged in this; how should they be recruited; and what should the scope of the research be?

A: The question is to what extent there should be an international group trying to work out a peace plan, and how it should be composed. It seems to me that this group should be, as I mentioned, primarily a private group. I have no objection to public officials taking part in such a group, provided they are, at that point, no longer public officials. I think what I am against is having in that group delegates instructed by their governments and simply transferring to a new forum all the

present difficulties we have in our current forum. I have something more in mind, like the international staff of the North Atlantic Treaty Organization or the international staff of the United Nations where people try to think in terms of a group of nations rather than in terms of instructions given them by their governments. Now as far as membership of the group is concerned, it should be composed of political scientists, economists, lawyers, and other ordinary scientists. We have discovered over the last few years that the problem of peace enforcement or disarmament enforcement is a very complicated technical problem. It requires tremendous amount of studies, it requires devising new technical instruments for detecting, for instance, tests. Just to try to give you an idea of it, at this point, there is a project going on in our government trying to devise a new machinery for testing, and this by itself would cost in the neighborhood of one hundred million dollars. Very interestingly at this point, this is provided by the Department of Defense budget, rather than the budget for peace planning that normally would be under the State Department. In general, I think a properly equipped group, not organization, is needed. I think Professor Bowie is right. If you make a big organization with all its bureaucracy you are going to run into trouble. This could be avoided if the group could be limited to say fifty or one hundred men coming from all the principal nations of the West which are willing to co-operate with the project. The purpose would be to put them together and enable them to think through problems that have arisen. Professor Bowie, I think, said in the very beginning, how complicated it is for us simply to adjust to the facts of present life to get all the necessary data, economic, political, social, geographical, historical that

would come into such an appraisal, and those various devices of government and law that are necessary to control the big problems ahead of us. I think a group of that type working together in the kind of atmosphere that you have at Princeton in the Institute for Advanced Study or at the new Behavioral Science Institute in California could after a while probably arrive at certain things that would be of extreme use in trying to plan what you can do. But I would repeat again that I think as far as the United States is concerned, probably a much bigger effort is necessary, an effort much of the scale that was undertaken when we were trying to draft the Charter of the United Nations. The problem I would think is even bigger than was involved in the drafting of the Charter of the United Nations, and as far as I can tell we devote to it about one hundredth of the effort that we have devoted to the United Nations. The minimum required is to devote as much effort to the problem of how to solve the present issues of foreign policy, in such a way that it would be acceptable not only to us but also to all our Allies, as was devoted in the period 1942 to 1945 to preparing for the United Nations.

Q: How can we reconcile our position, for example, domestically, where the chief executive of the nation takes a rather equivocal position on the burning question of race in America while Henry Cabot Lodge takes rather a good position in the United Nations? This is on the executive side. On the legislative side, hypothesizing for a moment, could we envision, for example, the next President of the United States taking a trip to Africa and, in line with the lesson we learned since Woodrow Wilson, taking the chairman of the Senate Foreign Relations Committee, Senator Ful-

bright of Arkansas, along with him? The question is simply, how do we reconcile this problem of our equivocal position in the executive branch right now and our ability to address ourselves openly, forcefully, frankly, and honestly to the world of color which is going through so much turmoil and struggle right now?

A: Not being connected with the government either previously or at present, it probably would be easier for me to answer. I think the basic problem here is that, of course, our picture abroad depends very much on what we do at home, and the better we do at home the better we will do abroad. I think that the matter is as simple as that. Of course, this involves, on the other hand, the old complicated issue, how do you solve those problems domestically, and that I think is not the problem for our forum today. It is quite clear, as I mentioned before, that we have been having some difficulties abroad because of the fact that we were saying different things elsewhere and different things at home—the NATO example I gave you. I think the same applies also to the question of color. As long as our principal Allies are nations which are connected in the minds of Asians and Africans with big empires, it is very difficult for us to take a consistent stand when issues of color arise. Sometimes we support France on problems of Algeria, sometimes we abstain, sometimes we hesitantly vote against. In the question of South Africa, we have the same dilemmas, although I think we have resolved it to our satisfaction at this point—we are persistently voting against South Africa, forgetting about the complications it might cause domestically in the United States. I think Mr. Lodge explained it very well when he said you have to distinguish between nations in the world who are trying to

do something about the color problem like the United States and nations in the world who are strongly opposed to solving the color problem except by *apartheid*. I think we have to take a stand on that issue and we should make clear that we are willing to help those European nations which are trying to solve the problems of color in an effective manner, or are trying to find a solution for it, or, at least, show willingness to find a solution for it. On the other hand, we should become more and more opposed to those nations which do maintain the color line without hesitation and try to enforce it in a ruthless manner. I think this is a very good line to take, and I am glad we have taken it.

Are American Foreign Service Officers Adequate?

By HAROLD B. HOSKINS

ABSTRACT: The Foreign Service Institute was organized in 1946 to train Foreign Service officers so that they will be able to carry out foreign policy more effectively. One of the recognized deficiencies in the Foreign Service, the insufficient knowledge of foreign languages, has received much attention at the Institute. Because of the accelerated language program, the language competency of the officers has increased very considerably. In addition, the testing for language ability is now formalized and all persons who come through the Institute are given an examination. Officers receive training at various times in their career. The structure of the Institute's training program is in the form of a pyramid: Training is given at the base to all officers entering the Service; at the mid-point to about one third of the mid-career officers; and at the top to a few senior officers. The success of the training program and the future of the Institute depend largely on the support of the various agencies of the government, the President, the Congress, and the general public. Great strides have indeed been made in the training wing of the State Department. Continued efforts by the Institute as well as greater external support will increase the professional capacity needed to carry out our foreign policy.—Ed.

Harold B. Hoskins, Washington, D. C., is Director of the Foreign Service Institute of the Department of State. He has been a staff member of several diplomatic legations in the Middle East and has served with the Department in various capacities in Washington. A graduate of Princeton University, Mr. Hoskins previously was a business executive in the textile industry.

MY part in this symposium is a relatively simple one when I compare it with the task of those members who have undertaken to discuss the complications inherent in the formulation of foreign policy and the creation of a positive climate in the rest of the world for the interpretation and the understanding of our foreign policy. I hope it is so specific that I can make clear the facts with which we are dealing.

As a missionary's son, I am always very glad to discuss the Foreign Service Institute, the training arm of the State Department, because it is one of the weapons, one of the best, in my opinion, for making foreign policy effective. The type of training and organization we are building is designed to prepare a better Foreign Service Institute for whoever is in the White House. Our job, we believe, is a bipartisan or nonpartisan one, that I hope can appeal, particularly in a political year such as this one, to a great many people on both sides of the aisle.

ADEQUACIES OF TRAINING

In considering the responsibilities of the Foreign Service and the adequacies of training, it must be remembered that the training must be good because we have a very thin front line of Foreign Service officers. There are approximately 4,000 spread all over the world and in Washington. Many of them are of recent vintage, because American world responsibilities date primarily or to a very considerable degree since World War I. Fortunately, better language programs are one of the elements in the training now given at the universities. Months ago, I went to Vassar to assist in the inauguration of a new language building called Chicago Hall, interestingly enough, which is going to be devoted entirely to the teaching of languages. I might mention that

the German cultural attaché who was there told the following story. When he was in Munich last summer, he saw a small group of American girls standing over in the corner; he watched this affair and then went over to speak to them. He thought the joke was rather amusing. When he went over looking at them rather poignantly, he said, "Vaaasarr?" There was a moment of silence, and then the little girl said, "Nein, Smith College."

It is indeed important that we are getting more people trained in languages. As I previously stated, our objective in the Institute is primarily to train officers and achieve a better Foreign Service for whoever may be in the White House. An adequate training is, in my opinion, one of the means by which we can make our foreign policy effective. It is a relatively simpler proposition when compared to the formulation and implementation of foreign policy. So it is important, I believe, that the American public and the Congress should know more about our training and what we are doing. Primarily, we have increased our training program. We did a very considerable amount of training, I might add, before *The Ugly American* came on to the scene. At this point, I might ask, what is the answer to this "ugly American problem" about better representation abroad and the adequacy of our people abroad? As far as the government civilian representation is concerned, which is my segment, I believe that a Foreign Service Institute can do and can help do a better job of training our officers whether from the State Department, the Department of Commerce, Agriculture, the Central Intelligence Agency, International Co-operation Administration, or the United States Information Agency. But I would like to stress the fact that, for instance, under our authority which originates in

the Foreign Service Act of 1946, we are training people today from twenty-five different agencies in the government. Primarily, of course, we are training Foreign Service officers, but we are also training people from the military services and from the civilian services.

Foreign language program

The Foreign Service Institute, which was organized during 1946, was hurt during the McCarthy period; it was at a low ebb financially and in prestige particularly between 1950 and 1954. Furthermore, the United States was handicapped in its operations during World War II and since then by a recognized weakness, the insufficient knowledge of foreign languages. I do not mean to imply that the knowledge of a foreign language is the only thing that is required of a Foreign Service officer or anyone else to make him effective. But, like the alphabet and multiplication table, we are increasingly of the opinion that a foreign language, at least one and preferably two, helps our people understand the problems they are dealing with. In June 1954, the Secretary's Committee on Personnel, which is better known as the Wriston Committee, in their report urged a reorganization and an expansion of our training program. This has, I would say, in great part been accomplished, despite attacks from some people in the Congress. Some of those attacks have been justified and others have not. Our clientele today in the Foreign Service Institute is being trained primarily to meet the needs, as I said, of the Foreign Service and the government of the United States in relation to foreign affairs. Can we make this small group of people more effective and more adequate in their handling of our foreign policy? I mentioned the fact that we are now training people from twenty-five government agencies whereas a few years ago we

were training people from three or four. That is not in itself the whole story, but it shows the direction in which our work has gone.

We also, I am glad to say, are training an increasing number of wives and dependents on the basis of the space available and pending full authority to do a complete job. Nevertheless, we are doing it, and we have already trained several hundred wives of Foreign Service officers, military attachés, and people who have gone abroad in the past year.

A PYRAMID STRUCTURE

Our structure is rather simple, but for the next generation it may be very important indeed. A pyramid is used for our training, and we train everyone at the base. Everyone who comes into the Foreign Service today gets three to seven months of basic training before he goes into his job. We train about 35 per cent of our officers at mid-career—in other words, those who have been in the Service about seven to twelve years. We now have a very small number—this is only the second year of the senior officer course—of the highest ranking officers in the Service who are destined, so far as can be analyzed, to go into the highest posts in the Service. We also teach language. We are teaching twenty-six languages full-time at the Foreign Service Institute, and forty-nine languages abroad—part-time for the most part—at 170 posts. Therefore, we feel that we are progressing in this problem to a greater degree than in the past.

We have little difficulties, however, every once in a while because under the regulations, for instance, a man and wife cannot both be career Foreign Service officers and serve at the same post together. Recently, I talked to one of the young groups of our Foreign Service officers, and said I was glad

to see that 8 per cent of those coming into the Foreign Service today were women. And, I said, even if they do not stay for their whole career, we are glad to have them because there are certain things that women can do that men cannot do in the Foreign Service. They can go into harems in the Middle East, they can talk to women's groups in a more effective way, perhaps, than men. But I said, remember, that you cannot have a husband and wife both as career Foreign Service officers at the same time. Unfortunately, three months later when I again talked to them, I found that one of the boys in the class had married one of the girls in the class. So we lost a Foreign Service officer before we even started, but we did not lose her entirely, because we are going to have the benefit, we hope, of two for the price of one when they go abroad to their post.

I shall not dwell on statistics, but we have trained, and more are *en train*, close to 1,000 Foreign Service officers, grade 8 (FSO-8). FSO-8's are approximately equivalent to second lieutenants in the military. These officers have been trained in both languages and in the career—the metier of the Foreign Service. We have had eighteen classes of mid-career officers who have come in, had their brains stretched, we hope, with suggestions and ideas from the academic world as well as from the Department and other agencies of the government. We now are running our second senior officer course which is organized on a nine-month basis along the same lines as the National War College and other military service colleges.

Formalized testing

Another important point is that since the first of July 1958 we are testing for language skill. It used to be that a man or a woman in the

Service said, well I think I can speak French fairly well or German or whatever the language might be. We now have a rather formalized system of testing which we think is fair. We are improving our system. We now take the responsibility of testing every Foreign Service officer who comes through our Institute in the same manner as a medical examination is given before he goes abroad.

THE INSTITUTE'S PROSPECTS

What is the future of this training? I would like to stress the fact that we are receiving strong and growing support within the State Department, within the executive branch, from the President himself, who came over to talk to the first graduation of the senior officers' course last June. We had nineteen officers in this course, eleven from the State Department, seven from other agencies in the government, including four from the Defense Department. I regret that there is not more understanding in the Congress and the general public about what is being accomplished in the Foreign Service Institute. We are very eager to make a better Foreign Service with the best means at our disposal.

In our foreign language program, for instance, we have a system developed by the military during the war, a guided imitation system of learning languages that we think allows us to teach the Foreign Service officer to speak, not just to read, a language more rapidly than would otherwise be the case. Of course, there is no substitute for time, and we do not think that you can teach Arabic or Chinese or Hindi in a few months. To teach those languages twenty-seven months may be necessary, but we believe that we can teach French, German, Spanish, Italian, Portuguese from three to six months. I realize there exists a difference of

opinion here. Those in the academic world, especially, may think this achievement impossible. The fact is that we stress the speaking ability more than the reading ability of a language, and we have been rather successful so that we now have in the Foreign Service a speaking ability in over fifty languages and dialects.

As far as the Academy of Diplomacy is concerned, we recognize it as one of our problems, a very difficult one. We have studied it at considerable length. I might add that the opinion of the State Department at the present time is still against an undergraduate academy.

A small budget

I would like to stress finally the cost of the Foreign Service Institute because that is always a factor. The problems that arise in connection with the Bureau of the Budget and the National Security Council are similar to those encountered by the Foreign Service Institute, and even the State Department as a whole. We certainly need private educational institutions for research and for the preparation of more teachers. We also need commercial schools such as Berlitz, Vox, and others which I think in many instances do a very good job in fulfilling the needs of people who travel abroad. But the government, including the Foreign Service, is in need of

certain special requirements which cannot be procured at the present time outside of the government. At the same time, I would like to emphasize that our budget is relatively very small. Our budget for administration and teaching is less than two million dollars. We certainly have no objection to the needs of the military services for thirty-four billion or whatever it will require, but I would like to point out that, as a private citizen and a taxpayer myself, I do not think there is any waste in our relatively small training operation. The financial rewards of the Foreign Service are certainly not enormous, but you no longer need a private income to survive—except possibly in three or four major posts. Of course, there are dangers and complications in this sort of life, living abroad most of the time. But, I suggest, there is considerable amount of psychic income in this job of helping to do a better foreign policy job abroad. The Foreign Service has been criticized so often that I am glad as a noncareer Foreign Service officer to stress the wide scope of the training job that is already being done. I think this is one reason why an increasing number of our ablest younger people are coming into the Foreign Service. They are a fine group—both men and women—patriotic, able, and worthy of the public's support, and I hope it will be forthcoming.

* * *

QUESTIONS AND ANSWERS

Q: I gleaned from recent newspaper criticism that the Foreign Service Institute is doing an excellent training job, but the trouble seems to be the co-ordination of the assignment of the people trained by the State Department. Would you kindly comment on that?

A: We are doing a training job, and we are working more closely with the assignment problem, but frankly the assignment problem apparently was a very difficult one for the State Department to mesh completely or very rapidly as a result of the "Wristonization." The "Wristonization," as you know,

brought several thousand people into the Service who had not been there before, and the problem of assigning them to the posts where their languages could be used was something that was not possible to do effectively and completely, right away. Furthermore, you have, I think, one other academic question which has never been resolved. Some of us believe that a man or a woman in the Foreign Service should know something about French, or German, or Spanish, or Russian even if he is not immediately assigned to that country because he is ultimately likely to use it elsewhere. Now a day or two ago you saw the joking reference to the fact that there was a Foreign Service officer who had been trained in Chinese who was in London. Unfortunately, it was not made clear that the reason why that gentleman was there was to act as an interpreter with the Chinese in Poland, a very good reason for having him there, but that did not come out in the published hearings. I would like, therefore, to point out one other thing in connection with this language problem which I did not point out before—just one figure I hope you will keep in mind. Two years ago an investigation showed that about 50 per cent of the Foreign Service did not know any language other than English. That has been reduced from 50 per cent to 15 per cent. Fifteen per cent today of our Foreign Service officers do not have a working knowledge of any foreign language; even this figure is being reduced rapidly.

graduate work. Shortly before he arrived at his post, his position was abolished. His criticism was that there were far too many people available to do the job that needed to be done; that the Foreign Service officers, in general, were doing work which could be done much better by the staff officers; that there was a tendency of the Foreign Service officers to usurp or, because of oversupply, to take on duties which were normally done by the staff officers. I would like, therefore, to ask you, what is your appraisal of the morale of the young Foreign Service officers who have been in the Service for a period of two or three years? To what extent is there a turnover or what is the rate of turnover among these younger officers? And to what extent is this young man's limited observations of the oversupply of Foreign Service officers and the tendency to usurp or to do jobs that the staff might better do, an accurate picture throughout the Service?

A: I think the answer to your question is that these conditions that your friend outlined did exist in certain places and under certain conditions. I do not think it is a general situation, but I think it does apply in certain situations. I believe also that as the expansion has taken place in the Foreign Service and in the number of posts abroad, a shortage has been created of officers capable of performing other than these clerical jobs. The need for them has grown, so that today, I would say, the morale of the younger officers in the Service is good. I think again it varies with the individual, but, by and large, Foreign Service officers today are being given a training which makes them realize that three months after they get into the Service, in their first posts abroad, they are not going to be dealing with Mr. Khrushchev on

Q: One of my very good students of a few years ago passed a foreign service examination successfully in his junior year. He was subsequently appointed to the Foreign Service and after eleven months resigned or at least came back completely disillusioned and frustrated. He is now back resuming

the problems of Berlin. They have got to realize that they start lower down the level and work up to it gradually. I think you have to have patience, you have to have an ideal toward which you are working, and I believe that you have to go into it with a zeal, a missionary zeal, that determines that you are going to work this thing out even if it takes a number of years. That quality is what I see in these younger people coming in. I find an outstanding good group now entering. We had applications to take the examination for the Foreign Service from over 10,000 people in December, and they came from every state in the Union. Now those are points which are

not always clearly brought out. I think there are complications, and I do not mean to deny that there are unhappy individual situations, but, by and large, I would say the situation is much better. Also, I would like to point out the fact that there is a realization as I have said that even if people are coming in and going out, they have a knowledge of our problem and the complexity of foreign affairs which they did not have before. Now that applies to women as much as to the men. There is no excessive turnover, as far as I know, in personnel, and there is, as I have already indicated, a realization on the part of these younger officers that it is a long, slow process to the top.

America and the Future of the Maghreb

By EL-MEHDI BEN ABOUD

ABSTRACT: In the world today nations are interrelated to a greater and greater extent. There is a trend towards more uniform political, technical, and economic progress. The Arab Maghreb does not escape this trend. The prosperity desired by the peoples of North Africa is in large part dependent on the formation of the Maghreb. The foundations for such a regional group rest on various physical similarities, on necessity, and on a common will and purpose. Unity will be an effective instrument to strengthen the area. The development of economic well-being is also dependent on peace in the environment and international co-operation. But there is neither peace in this area nor the possibility for unified action among independent nations. The revolution in Algeria persists. Peace must first be achieved, for only then will the Maghreb come into real existence and reconstruction begin.—Ed.

His Excellency, El-Mehdi Ben Aboud, M.D., Washington, D. C., has been Ambassador to the United States from Morocco since September 1956, when the Embassy of Morocco was first opened. In April 1960, he was also appointed by his government to be Ambassador to Cuba, El Salvador, the Dominican Republic, and Nicaragua. After receiving his medical degree at the Medical Faculty of the University of Paris, His Excellency was the official representative of the Independence Movement of Morocco (Istiqlal) in the United States. Upon his return to Morocco, he practiced medicine until he was appointed Ambassador to the United States. He was also the first Moroccan to address the United Nations in official capacity as representative to the Conference for the Establishment of the Statute for the Atomic Energy Agency.

THE theme of this paper, "America and the Future of the Maghreb," is of the highest interest to all of us. But a discussion of this subject imposes a difficult task. It is not within man's realm to know or foresee the future. What is within his reach is to believe in theory and practice, in a code of morals and human law, to listen to his conscience, and then to expect success or failure on the basis of compliance with or transgression of this set of principles. In the world today, there are many philosophies, many creeds or commandments, many constitutions, many charters, many codes of international law, all of them reflecting the light of human conscience. Their purpose is to bring peace and avoid violence. Their implementation seems to be in conformity with the spiritual nature of man and the apparent laws of social stability. Their disregard leads to conflicts such as the events of violence in Africa. If we really believe in the teachings of our long-standing culture, we can say that the future of international relations, based on the principles of universality and unity of man, is necessarily a future of peace and prosperity among co-operating nations. If, on the contrary, these moral obligations remain unfulfilled and the old rapports of slaves and masters are not broken, there is certainly no doubt that the ultimate course of future events will include a series of conflicts and perhaps chaos.

That is all one can say about the future. The American University of Beyrouth, to take just one of two examples, has guaranteed to the United States the friendliest of relationships with the peoples of the Middle East. The partition of Palestine in favor of a political movement called *zionism* has created a feeling that injustices were visited upon the Palestinian Arab, injustices which have ruined the old relationships in that neutral area.

The United States' reluctance to rec-

ognize the French Protectorate over Morocco, keeping an American legation accredited to the King of Morocco, has won the hearts of our people over to friendliness with the American people. The Franco-American negotiations, at the time of the Protectorate regime, to establish air and naval bases in Morocco that were concluded without consulting the local government were not well received and were not recognized by Moroccans. The recent agreement between Morocco and the United States to evacuate these military installations was a new demonstration of the American sense of justice, of friendship, and of respect towards small nations. In short, to prophesy the future is a hazardous adventure.

A HISTORICAL TREND

In spite of the hazards, however, man's desire to know the future relationships and respective roles of nations in world affairs is a highly significant feature of our times. It derives from several observations.

There is today a deep awareness that the world is one: our planet is shrinking to a greater and greater extent. The unity of men stems, according to our belief, from the eternal unity of mind. Therefore, the principles of universality of values are bound sooner or later to be implemented either through violence or by peaceful means. Freedom, knowledge, security, prosperity, and so on must be opportunities equally shared, with no political or economic obstacles or strings attached. To define precisely the rewards and sanctions contained in an immanent code of justice written in the hearts of men is the duty of every individual anxious to observe the laws of the world order.

Nations are interrelated through the process of mutual influence. This interrelationship works in favor of the development and/or the transfer of civilizations. Imitations and contributions

are usual processes of social life. If a nation like Algeria is held down by obstructive measures and by force of arms, this regressive attitude disturbs the normal course of history. As a result, to swim against the stream is impossible in the long run. But the future prospects sink as long as such an attempt is continued. On the other hand, nations are interdependent. They work together without great awareness of it, mainly in the field of economic activity. As in a given country a carpenter is in need of a mason, tailor, or a peasant; likewise, physical geographic conditions create a similar need in international affairs. This observation should encourage men to replace the old system of domination—the unhealthy exploitation of the majority by the minority—by a new order of co-operation. Nations should complement each other. The United Nations, in this respect, is a window of hope opened on the future.

A third observation reflects the trend of contemporary history. There is a tendency toward the standardization of patterns of living and toward an equal distribution of the political, technical, and economic fruits of material progress. This does not mean a homogenization of humanity currently separated by a diversity of cultures. Rather, it reveals a general quest for political independence, regional groupings, active industrialization, modernization of agriculture, generalization of social security, and so forth. In brief, each nation's struggle for freedom and prosperity.

This phase of history may be considered as an imperative, if transitory, period and it is oriented in the right direction.

THE ARAB MAGHREB

The Arab Maghreb does not escape this trend of history. On the contrary, it is a significant example illustrating the orientation of historical events.

The goal of national independence is the development of men as individual entities. Past history has brought an irrefutable proof that this goal is impossible to attain without national freedom. Present history shows that even with national independence, prosperity is not an easy task without peace in the neighborhood, that is in Algeria, and without international understanding. Besides, the moral conscience of the peoples of Morocco and Tunisia reminds them that they are duty-bound to consider Algerian independence as a categorical imperative without which moral existence is unjustifiable in the near or distant future. Furthermore, colonialism entered North Africa through Algeria. The consolidation of Moroccan and Tunisian independence is not possible if history does not reverse itself. Finally, political or economic strength can grow on firm ground only if it is cemented, assisted, and guaranteed by a unified Arab Maghreb. The large quantity of natural resources that are needed requires not only unified efforts among the various parts of the Arab Maghreb but judicious co-operation in the international domain.

Foundations

The foundations of the Arab Maghreb and the urgent demand for its formation rest on the following historical and geopolitical factors:

(1) The similarities in geographic conditions, ethnographic traits, cultural and psychological complexions have denominators common to each country; moreover, each country's level of progress is equal and each is in the same phase or period of history.

(2) The common will to build a future together is a binding factor.

(3) The empire of necessity makes unity the only shelter against neocolonialism and hidden interference in internal affairs. Otherwise, the temptation to divide and rule will grow stronger and stronger.

(4) The law of action and reaction between nations imposes unity as a means to accelerate progress. As an instrument applied by regional groupings or regroupings, unity can strengthen the moral and material health of the area.

(5) The colonization of North Africa and the war in Algeria with all its complications show that the loss or the recovery of freedom is simultaneous in neighboring areas and that unity will guarantee the future against the perpetuation of weakness and decay inherent in the artificial balkanization of areas.

The Arab Maghreb, then, is a projected regrouping to form a new regional entity which would fulfill the aspirations of the peoples of North Africa in accordance with the demands of intellectual freedom as well as the law of historical and economic necessity. It would also conform to the trend of history. Aspirations for political regional regroupings for regional common markets or for the formation of great federations are not an exclusive privilege of one area of the world. American, Italian, German, and Soviet territorial unifications are or should always be kept in mind as large and early examples of the historical trend toward beneficial and important group formation. It is observed as well in the Middle East and Africa.

Obstructions

Such a unification is obstructed only by the vestiges of colonial domination. This colonial domination was imposed and maintained by:

- (1) a military occupation and economic domination;
- (2) a policy of depersonalization;
- (3) and a sort of expropriation of the minds by a war launched against local language and cultures. When colonialism leaves by the front door, it attempts to return by the windows, which are:

- (a) interference, through a huge apparatus, in internal affairs of the liberated country;
- (b) economic pressures of all sorts—local and international;
- (c) support of some subversive forces;
- (d) and the perpetuation of the policy of divide and rule. For the Arab Maghreb, the war in Algeria can be explained, among other factors, by the colonial desire to keep a foothold in Africa.

It is clear then that as long as there is such a state of affairs, the law of action and reaction will maintain North Africa in a triple difficulty. The retardation of Algerian independence hurts international relations, and this in turn has a deep impact on North African affairs as well as on the position of the United States. The accelerated progress we plan to pursue cannot follow the rapid rate of development necessary. Many nations observed the beneficial effect of the rapid European economic recovery. A rapid North African economic reconstruction will benefit even more of the nations of Africa, who are in such urgent need of prosperity and peace. Conversely, to antagonize Algerian independence will retard this work of unification and reconstruction and result in the development of an atmosphere of generalized revolt.

Objectives

The Arab Maghreb is African by geography, Oriental by culture, and both Mediterranean and Atlantic by neighborhood. Two main deductions can be derived from the characteristics of the Arab Maghreb. Its policy must always evidence good neighborliness and rapprochement between nations. Furthermore, the development of events in that area will have a direct impact on countries in the vicinity.

The problems of the Arab Maghreb occur in the climate of a post revolu-

tionary period. They are, therefore, numerous and are of equal importance. Underlying these problems are certain primary objectives:

(1) A search for peace, prerequisite to an effective political unity and to the economic reconstruction of the Maghreb.

(2) The institution of a real democracy without obstacles from outside. Real democracy is in the interest of all.

(3) The normalization of international relations, readjusting the old situations to fit in the frame of new situations and requirements of sovereignty and economic emancipation.

REVOLUTION: PAST AND PRESENT

America's own history places her in a good position to study and understand the recent course of events in young nations. Although history does not repeat itself, there are some broad lines of similarity.

The national movement starts with an intellectual revolution and continues with an armed revolution. After independence, priority is given to internal over external affairs. Territorial unification and integrity occupy also a central place in political affairs. Then, many problems of equal importance and sense of urgency are raised simultaneously. At this time, also, foreign intrigues and local impatience lead to complications, and it is under conditions such as these that the aftermath of a revolution takes place. But the task of reconstruction presents itself as an imperative and only after a certain lapse of time can an increasing role in world affairs be played.

We should bear in mind that roughly the same rhythm of history develops in

our times. However, we must add the following corrections and amendments:

(1) In the Arab Maghreb, the armed revolution persists in Algeria. Peace is, therefore, still an element which is absent from the North African scene. Only after Algeria is liberated and reorganized by an Algerian government will the Maghreb come into real existence.

(2) Political colonialism should disappear and not be replaced by economic neo-colonialism.

(3) Big powers must understand the views of small nations or new federations who are presently in a position of self-defense.

(4) Territorial integrity is a legitimate claim and a guarantee against international frictions.

(5) Continued co-operation, consultations, and contacts are already inscribed in the normal course of events and are regular practice among the African states.

(6) A deep reconversion of ideas must occur in order that the European powers and the new nations can make an adequate readjustment to the new order of our times.

Mistakes can certainly be avoided. Co-operation has today a clear and concrete meaning in the field of economic and cultural understanding. Obstacles in the road have no *raison d'être*. The war in Algeria is really absurd, although every nation in the United Nations feels that it has its share of responsibility in the conflict.

It is comforting sometimes to open the window of hope on the future and speak about the coming phases of history. But the burning problems of the present remind us of the acute pressure to find a quick solution to the major difficulties.

* * *

QUESTIONS AND ANSWERS

Q: Mr. Ambassador, what would you consider to be the state of relations or rapport, if you will, between the western part of the Arab world and Mr. Nasser's United Arab Republic?

A: This is an up-to-date question. When we say the Arab Maghreb we automatically link it to the Arab Orient or Middle East, since Maghreb means the west. If you speak about Mr. Nasser, he is the Chief of State, and I cannot answer, but if you mean by pronouncing his name, how events in the Middle East will affect future rapport with the Middle Eastern countries, I can answer this question, and will answer it in this line. The Arab Maghreb and the Arab Middle East are one and the same people, with the same background in history and culture. The territorial location from the Atlantic Sea to the Persian Gulf—this is a sentence very dear to the Arabs—is one continuous piece of land with only a little fissure called the Suez Canal. Today we are also in the same level of technical progress, we have the same amount of needs, and hopes, and aspirations. Therefore there is an adequate similarity between every part of the Arab world and we consider the Arab world as one. Our future relations have already been announced by our adherence to the Arab league. We are members of the Arab league. We also have a common culture, which is the identity card of every grouping on the earth. This Arab culture has to be understood and used—the term linguistically is to be used in comparison with the term say Latin culture or Germanic culture. It does not mean that the blood is Arab or Latin or Germanic, but it means that the way of thinking, the influence, and the education are received in the framework of the Arab culture. We belong to this. A third observation is that today there is a trend of regroupings or groupings as we just said, and it is always hopeful to encourage human beings to unity instead of division. If there are common grounds and common denominators to meet together and unite, I believe that unity is one of the

best attributes of every absolute ideal that man can dream of. If there is any encouragement to division, you have to reflect why there is an encouragement to division since division is already repulsive to the heart and mind of men. Therefore, the Arab world and Maghreb have all common reasons and all common grounds to unite. The form, the concrete form, of this unity belongs to the future which no one can prophesy, but when Americans say that we are united as Americans, under the same flag, with the same language, with the same culture, and the same background, there is an aesthetic sense, an aesthetic feeling of happiness inside the heart of every man who feels he is fulfilling his duty towards his fellow man, and especially the nearest ones among these fellow men. It is also with the same pleasure and also the same sense of duty that Arabs want to unite and I believe that unity is also in the trend of history. Even though they do not want to unite, the law of necessity will orient them to unity and then God will open their eyes for a moral observation and a moral understanding of the value of that unity.

Q: I would like to ask His Excellency, how much the exploitation of the oil in the Algerian Sahara is complicating the question of Algerian independence? How steps might be taken in view of France's long desire and hope to make itself self-sufficient in petroleum, and what steps could be made to adjust this situation?

A: This question is even more up-to-date. It is a very difficult question, it requires experts to study, but we can make the following observation: There is a huge amount—I have referred to this in my notes—of natural resources in North Africa and mainly in Algeria.

Oil in Algeria is flourishing and it is also of a good quality. The question has an apparent shape of material economy but if you really open this question you find that it strikes the heart of the world idealism. The eighteenth and nineteenth centuries presented a doctrine called "The Colonial Pact Policy." The major European powers agreed to have colonies to divide the territories of Africa, the Middle East, and Asia between them to exploit them in the following way: To take the raw materials from the colony, transport it in the metropolitan land, transform it into manufactured goods, and then resell it as manufactured goods to the colony. So the colony was an area for an open market, a source of cheap or free of charge raw material, a source of cheap or free of charge labor or forced labor, and also a strategic area in the economic competition between colonial powers. Today, oil was found and exploited in an era of crisis. Those, in Europe, who need the use of this oil have legitimate claims, but they will have no legitimate claims if they take a country like Algeria, attempt to perpetuate the law of colonial domination in it, because there is some oil. France should understand that she has to live and let live. If she does so, no complication will arise in the solution of the present conflict in Algeria. The amount of natural resources in North Africa and Algeria is so great that it needs Tunisia, Algeria, Morocco and, I hope, Libya, to unite in order to be able to exploit all at once oil, gas, phosphate and some other raw materials like manganese, lead, zinc, cobalt, and so on and provide for the transformation of these raw materials through local industries into manufactured goods. But the vestiges, the rest of the colonial pact philosophy, are still laboring in the minds of some European powers today. That is why they put obstacles in the way and try to present

them as a justification for a military occupation. For example, the oil in Algeria, they say, should be a link of co-operation and harmony between nations and will also justify the progress that we are speaking about. There exists a great amount of natural resources, and there is a conflict. The conflict is for freedom. The amount of natural resources can strengthen this freedom and at the same time provide the necessary amount of oil for the use of European powers. I believe without the European market, this oil will be useless; it is too much for the use of North Africa. So the problem has to be put in the right way—are we ready to understand that in Algeria with its wealth, we can co-operate in freedom or exploit in slavery? This is the real problem.

Q: Mr. Ambassador, most consideration of problems of Africa tends to divide the continent into the Arabic part and the Sub-Sahara part. I wonder whether you care to comment on the relations between these two and to make my question more up-to-date, would you care to speculate on the future and the possibility of a stronger Pan-African agreement among the Arabs and emergent nations of the Sub-Sahara?

A: This is a question anticipating the African conference in Addis Ababa in two months from now. The Sahara desert used to be presented as a separation between Africa north, and Africa south, of the Sahara. Today—I was in Liberia twice last year and I heard this—the Sahara is the bridge linking North Africa to Africa, south of the Sahara. And it is a true assertion, to answer the first part of your question, historically speaking, that because of the deeply religious moral education, the peoples of Africa used to exchange visits between North and South. If you go to Khartoum or to Guinea, you will

find vestiges of Moroccan society, you will find some people who originally came from Morocco, you will find the culture the same, and you will find families now having certain desires to go back to see either their former town or their former family. Commerce used to be very frequent between North and South Africa, but mainly with the neighboring countries which is quite normal in geography.

The second part of the question is about the future. In other words, what do the Africans on the one side, the Arabs on the other side, and the bridge between the two which is North Africa, want? Here we enter the doorway of human freedom, human choice. We have said that today if we really want to read between the lines, we will find that a trend of history is the unification of areas. These areas will unify themselves in the following way: First, beginning with original groupings, North Africa will form the Maghreb; Ghana, Guinea, and Liberia for the last two years have been talking about a form of federation; Sudan and Senegal are already federated in the Mali federation. This is a concrete, obvious, objective observation. It is based on the awareness that the world is progressively being unified. Theoretically speaking we are already one. If there is war in the United States there will be war all over the world; if there is war in the Suez Canal there will be war all over the world; if there is war in Berlin, for instance, there will be war all over the world. There is an awareness now that the world is shrinking and that there is a moral obligation to follow the laws of nature. I believe that Bacon said something to the effect that "to dominate nature you have to follow its laws." This idea is to be applied today. The Arabs are already six nations in Africa: Libya, the Sudan, United

Arab Republic, Tunisia, Morocco, and Algeria. In Algeria, there are about eighteen million Muslims speaking Arabic and therefore the Arabs as representatives of a culture feel that they are brothers of the other Africans and that the Middle East as compared to the huge continent of Africa is relatively small. They will have all the reasons to orient their minds towards unification with Africa, and vice-a-versa, Africa will have all the reasons, moral reasons, to unite or come closer to the Middle East because these original groupings, if we really think in term of man and man, began under the definition given by the will of God. Thus, this unity of humanity is being developed progressively first through general groupings, some happened already as the Federation of the United States, some will happen, some are in the process of happening right now. This will again cause some continents to unify, either economically, under an economic organization like the Common Market in Europe, for instance, or under the political loose groupings like the Arab League or under an organization like the Secretariat of Independent African States. The central idea is clear: the brotherhood of man is more and more imperative, it has to be implemented on earth, it may take centuries and centuries, or less than that. Yet we see today and read in the trend of history that the Arabs will have no difficulty to unite with other Africans and that the union of the Arab states and the union of African states instead of being conflicting and antagonizing will appear in the near future. They are already appearing right now as harmonized elements to give to the world an illustration that the meaning of history is not an illusion and that human beings want to unite, want to live in peace. It is only ignorance that brings confusion.

Our Role in the Quickening Pace Towards Independence in Africa

By JOSEPH C. SATTERTHWAITE

ABSTRACT: Our belief in the self-determination, self-government, and independence of peoples has persisted throughout American history. The rapid political and social changes that are occurring in the countries of tropical Africa have drawn our sympathy and, in a more active way, have drawn our support through material and technical assistance granted to them directly or through the organization of the United Nations. It is of fairly recent date that the United States has officially co-operated in this area, an area that was previously a sphere in which European interests were predominant. While we have begun to offer assistance to the African states, we are hopeful, at the same time, that the long-established ties with the European countries can continue in another form, advantageous to both. The needs, we recognize, of the African states are of such magnitude that they cannot be fulfilled by any one country. We have, therefore, co-operated in efforts to promote economic development initiated by the United Nations and its specialized agencies. We are being called upon more and more to share our material benefits with the less-developed parts of the world. The African states form one of these areas, indeed a very important one, and we are ready to play our role in responding to their needs.—Ed.

Joseph C. Satterthwaite, A.M., LL.D., Washington, D. C., has been Assistant-Secretary of State for African Affairs since 1958 when the post was created. He entered the Foreign Service in 1926 and his varied career has been spent in Germany, Mexico, Argentina, Iraq, Turkey, Syria, Nepal, and Morocco. Mr. Satterthwaite has also been Ambassador to Ceylon and Burma, Director of the Office of Near Eastern and African Affairs, and Director-General of the Foreign Service. He is a graduate of the University of Michigan.

IT is my intention to discuss briefly why and how we, as Americans, are involved in the nationalist ferment in Africa and what the future may hold for our relations with the independent states. Major attention has already been given to the northern and southern areas of the continent. The northern area is the focus for another paper in this volume. And the position of the United States toward recent developments in the Union of South Africa has been made known both in Washington and at the recent meeting of the Security Council. My remarks are accordingly directed in general to the great belt of tropical Africa where at present social and political changes are moving at a rapid pace.

OUR MORAL AND HISTORIC ROLE

I think it may be held that since the American Revolution, the American people have been involved in the movement of any peoples anywhere in the world toward self-determination, self-government, and independence. The founders of our nation and our great statesmen have fully realized and articulated this fact, knowing that the principles on which our independence was based would have effect far beyond their time and beyond our shores. Abraham Lincoln called for the blessings of liberty for all mankind believing that neither his country nor the world could long survive half free and half slave. In the rush of modern events, I think we sometimes forget the strong and enduring currents which our example set in motion. We do not, of course, have a monopoly on these ideals for they have been given impetus by the great liberal societies of Europe and have been jointly enunciated in such historic documents as the Atlantic Charter.

The events of the twentieth century

have brought to the surface a new wave of change which has carried hundreds of millions of people to independence in Asia, in the Arab world, and now in tropical Africa. Here "freedom" in various languages is the catchword. The old slogans and declarations of our independence struggle have been revived with undiminished force and meaning. These phenomena stir a spontaneous response and welcome in the American people because they spring from the same soil in which our own past is rooted.

America also has ties with Africa of a more tangible kind. About one tenth of our population has its origin in tropical Africa. We have, therefore, a special interest in events in Africa, an interest, however, which is by no means confined to those of our population who had their origin on that continent and who have contributed so much to our culture and its expression. I might also observe that our own problems of assimilating Americans of African descent into our free society, an issue involved in our Civil War, should make us view with some humility the present problems of the European populations which now control the "multiracial" states in Africa.

Again on the very tangible side, we helped to establish over one-hundred years ago the free state of Liberia as a home for freed slaves and as an example of the principle of self-government which remained unique in tropical Africa until the twentieth century. Its name, "Liberia," proclaims its status, and its capital, Monrovia, commemorates the President under whose administration it was founded. Our government has always had close and friendly relations with Liberia, and American investment and free enterprise continue to have an important influence on the development of its economy.

Our governmental and cultural rela-

tionships with Africa by no means exhaust our long-term historic association. American missionaries in large numbers have had an important influence quite apart from their evangelical mission. Their mission schools have provided primary and secondary education to promising students who had nowhere else to turn. These men and women now form part of the leadership group who will have to cope at various levels with the independence which their people have achieved or may achieve. Some few of them have gone on to universities in the parent country or in the United States. I think it significant that from this number have emerged such leaders as Prime Minister Nkrumah of Ghana, Julius Nyerere of Tanganyika, and Dr. Asikiwe of Nigeria. Viewed especially in the light of present conditions, the educational service performed over a long period of years by American and other Christian missionaries in Africa will have an abiding beneficial influence on the new societies now being formed.

American private enterprise, private foundations, and education have had a significant influence in Africa. The preponderance of investment has been in the industrialized Union of South Africa, in Liberia, and the Rhodesias, but it is increasing in those newly independent countries which have established a friendly climate for foreign capital. The foundations are conducting research and consultative and educational programs in many countries which have achieved or are on the way to achieving independence. The metropolitan and local governments generally have welcomed these efforts, and their work and training will be of great assistance not only to new governments when they emerge, but also to the United States government and private enterprise in planning future aid and investment programs.

OUR PROPER CONTEMPORARY ROLE

Now I would like to turn to our proper contemporary role in Africa. I shall confine my remarks largely to the role of government. I use the word "proper" advisedly because we are admonished by some to "keep hands off" and urged by others to champion the growing nationalist movement in Africa. We are charged on the one hand with interference, on the other with irresponsible indifference. We likewise face the accusation that our sympathies are entirely with African aspirations and that we are prepared to abandon European and other minority groups who have made their permanent home in Africa. We do not, of course, subscribe to the belief that any race or individual in Africa is expendable. Each can play an important role in the future development of Africa. Between these extremes we must pursue a course best calculated to serve the long-term interests of the peoples of the United States, of Africa, and of the free world in general. I say "proper," also, because we did not play a major role in Africa during the last century, whereas our European allies have major interests of long standing on that continent. The drama now unfolding is one, therefore, in which the Africans and Europeans play the major parts. Our course, in view of our varied and sometimes conflicting interests, is often difficult to chart. However, we shall not go astray if we continue to be guided by our firm belief in the evolution of peoples to self-government and independence by peaceful means, our traditional willingness to offer moral and material assistance to peoples striving to maintain stable representative governments, and our readiness as a member of the United Nations to help defend duly constituted governments and their peoples against aggression.

In tropical Africa the evolution to-

wards independence has been and continues to be remarkable for the speed and nonviolence of the transition. This has required statesmanship, tolerance, and goodwill of a high order on all sides—by the Africans who are imbued with ardent nationalism and are impatient of delay, and by the European powers who are faced with major political, economic, and psychological decisions and adjustments. Our proper role as a government is to play the role of a friend contributing to orderly transition while hoping that new, strong, and voluntary ties will be established between the new countries and the former administering states. Certainly both stand to gain from such a relationship.

I do not mean to indicate from the foregoing that the United States has no official presence in African countries while these changes are going on or until they become independent. On the contrary, we have one or more Foreign Service establishments in most of the political subdivisions of the continent, twenty-nine United States Information Service establishments, as well as International Co-operation Administration representatives, and programs in Overseas Territories. We have embassies in eleven independent countries. Significant, if modest, educational exchanges are taking place, and the President's Cultural Presentation Program is bringing American artists, musicians, and athletes before African audiences. In 1958 and 1959, Prime Minister Nkrumah and President Touré of Ghana and Guinea, respectively, paid visits to the United States at the invitation of President Eisenhower. Such visits express the profound interest and respect of the American people and government for these new nations and their leaders as they embark on the difficult course of liberty.

I should like to comment here on the frequently expressed doubts or fears as

to whether the people of Africa are yet ready to run their own affairs, whether they have sufficient experience with self-government to assume its responsibilities, whether they will not fall victims of governments of the extreme right or left. I believe history has shown that "readiness" is almost an academic question. Peoples tend to acquire independence, whether they are ready or not, according to a timetable more or less of their own making. The degree of experience with self-government varies with the type of tutelage received from the mother country. In tropical Africa, for example, we are witnessing the imaginative evolution of the French community. Its members have moved in a short period of time from typical colonial status towards self-government or independence. Nigeria, a British colony, has benefited in an exemplary manner from education and civic training and guidance provided by Great Britain in preparation for independence in October 1960. We have the dramatic instance of the Belgian Congo where six months ago neither the people of that area nor the Belgian government would have predicted the independence which will come on June 30 of this year. Yet the colonial government with outstanding statesmanship has negotiated with Congolese leaders for the transfer of power under the optimum conditions time will allow.

Turning to the character the new governments will have, I believe, on the basis of past and present experience, we have reason to be optimistic. Elections, both in still dependent and in independent areas, have been generally peaceful, impressive, and marked by a very large turnout of voters. The new governments are responsive to the will of the people and have the support of the majority of the populace. In some cases there is not the same respect for the minority opposition that is custom-

ary in Western democracies. However, we cannot expect Africa to follow entirely Western patterns in developing democracy. Ancient African local governmental processes accept as binding the consensus of the majority. And in African societies where the tribal and chieftain system prevailed those who opposed this consensus had to be silent or leave the group; a system which we might consider autocratic. What we can hope for with considerable confidence is the steady growth of democratic principles based on respect for human rights, justice, and law. We must expect a certain instability and trial and error. These are, after all, the normal problems of democracies which we experienced in full measure during the first decades of our independence. What would be most helpful at this time, it seems to me, is continuing evidence of America's understanding, confidence, and willingness to assist during the years of growth and adjustment ahead.

AMERICA'S ECONOMIC INVOLVEMENT

Both African and outside observers agree that for a long time to come the principal assistance required by the emerging states of tropical Africa is, first, education and training—using those terms in their broadest sense—and second, development assistance, which includes private investment and public financing. President Sekou Touré of Guinea when he was in the United States made the pointed observation that to Africans the world is divided into two parts: not free and communist, but developed and undeveloped, and that they would seek development assistance from wherever they could receive it, without regard to political considerations.

It is perfectly clear that Africa's needs are great, so great that they cannot be provided by any one country. The metropolitan powers have, during

the period of dependence, provided major economic assistance both for development and in the form of administrative expenditures. In general, it seems that substantial assistance from the metropolitan powers will continue during and after the transition period to independence. The value of this type of support for last year is estimated at over \$500,000,000. But independence shifts certain burdens and the metropolitan powers are unlikely to continue to provide all the costs of an administration which they have relinquished.

The United States has but lately become involved in providing a share of the educational, technical, and development assistance so urgently needed in tropical Africa. Interest of American private investment in West Africa is strong and, given a continued receptive climate, should increase. The government, the private foundations, and our universities are making a significant beginning by provision of educational and training assistance for the future leadership. There are now over 1,700 African students in the United States. But by contrast, there are some 10,000 in the United Kingdom, a similar number in France, and an undetermined number in Communist-bloc countries. Next year our government hopes to finance 500 educational exchanges, 400 of them to bring Africans to this country, 100 for American teachers, professors and specialists to work on the African continent.

Now, these are good beginnings but they are not good enough. The facts are that countries are approaching political independence without sufficiently trained leadership and technical and managerial skills and without firmly established economic and social institutions and systems which provide the foundations for secure, confident, African-governed nations. Present United

States foreign assistance programs are not adequate in scope or size to be responsive to the dramatic changes taking place. As the most materially favored nation in the free world community, we must accept a larger responsibility in meeting this challenge. The executive branch has, therefore, proposed to the Congress a special program for tropical Africa with an initial appropriation of \$20,000,000 under the Special Assistance category. We have a fresh situation; we are attempting to meet it in a fresh manner. President Eisenhower in presenting this proposal to Congress said: "It is my belief that this initial effort must be increased significantly in the immediate years ahead and complement similar efforts on the part of other free world nations so that the capacity of the new and other developing nations in Africa to manage and direct their development can be strengthened and increased rapidly and effectively."

The essential character of the special program for tropical Africa lies in its intensive concentration on key education and training problems and on regional activities. It would not replace our bilateral technical co-operation under the International Co-operation Administration, but it would be closely related to it. It is not intended that it should become a competitor to or substitute for assistance from other free world sources. It is our hope, rather, that it may serve to encourage an increase in assistance from other free world countries and international and national organizations.

Development Advisory Group

I mentioned earlier that no single country could possibly provide the economic and technical assistance required by Africa in the coming years—a continent of over 220,000,000 people, over three times the area of the United States, and undeveloped in the mid-

twentieth-century sense of the term. Recognizing this, and also the fact that a number of our allies are providing bilateral assistance to a number of undeveloped countries, Under-Secretary of State Douglas Dillon suggested to the European countries in January that the principal capital exporting countries meet to discuss various aspects of co-operation in their assistance efforts. The suggestion was accepted and last month the group held its first meeting in Washington. Known as the Development Advisory Group the members are: Belgium, Canada, France, the Federal Republic of Germany, Italy, Japan, Portugal, the United Kingdom, the United States, and the Commission of the European Economic Community.

At this meeting primary attention was directed towards methods and means of improving the flow of bilateral aid. Members reported on their experience and problems in extending, financing, and promoting economic development in the less-developed areas. They heard reports from the International Bank and the International Monetary Fund. Significantly, I think, the Group agreed that its efforts should not involve discussion of amounts of financing for particular regions, countries, or projects. In other words, it is not another operating agency but a facilitating, ways and means body. This should allay the fears expressed by some undeveloped countries that the capital exporting states plan to "gang up" on them, make decisions affecting them without consultation, and keep them in a position of suppliers of raw materials to the industrialized economies. Nothing could be farther from the truth. The Group plans to continue its activities through meetings at regular intervals, the next to be in about three months in Bonn, Germany.

A somewhat detailed discussion of the Development Advisory Group has

been given because it could be a very important step towards reconciling our own and other free world countries' sometimes disparate approach to the joint problems of furnishing economic aid. It is a step away from "going it alone" and towards co-operative efforts. As one commentator expressed it, "the Conference well might become a beacon of hope in a vast economic wasteland." As one of the largest underdeveloped areas of the world Africa could be a principal beneficiary of its work.

In considering the whole area of economic, technical, and educational assistance, we are too often inclined to act, I think, as though all motivation rests with us, "us" meaning the developed countries. This is not a healthy or natural situation. Important initiatives are also required of the countries and territories to be assisted. We may take the area under discussion this afternoon as an example. As states in tropical Africa move toward independence, we need to know with some preciseness their own estimate of their needs. It is not sufficient to say, "we need everything." We cannot plan or budget on that basis, and "shotgun" aid is likely to have a worse effect than none. New states must put their own economic and fiscal houses in order so that aid can be efficiently channeled. There must be an understanding of the processes through which assistance funds are appropriated in democratic countries. Our Congress has an inescapable accountability to the taxpayer for the use of his money, and I would hope that recipient countries would understand this and not regard certain strictures on the use of grant or loan funds or technical assistance as evidence of "political strings" on the part of the United States. While we must cut the red tape that sometimes binds our aid programs, some controls over them are a mark

of responsibility. In the field of free enterprise, new governments must create conditions that will make capital investment and development attractive or it will go elsewhere.

THE REGIONAL APPROACH

Particularly in Africa there would seem to be advantages in a regional approach to assistance. The boundaries of the present political divisions of the continent were in many instances arbitrarily drawn and often prevent the undertaking of economically or socially viable projects.

It is encouraging that African leaders are aware of this problem and are giving some consideration to area planning from the development point of view. We can, I think, do much to encourage such regional and co-operative approaches to the many common developmental problems which confront all the African countries. For example, in planning the special program for tropical Africa which I mentioned earlier, we are proposing to use a portion of the funds requested to support and sponsor multi-country conferences, workshops, and seminars as training programs in themselves and as a means of stimulating co-operative approaches to special development problems, such as the tsetse fly which closes large parts of the continent to livestock raising. In the field of education we will propose a training grant program which will permit Africans from several countries to attend various African schools and colleges.

I would make one further remark on the subject of economic assistance. Aimless benevolence is not the objective of our foreign assistance programs. Our objective is to strengthen the economies of underdeveloped states and enrich the lives of their people so that democracy will be satisfying and meaningful to them. We believe that such objectives

are in our mutual interest. To accomplish them efficiently, there must be responsive initiatives from the co-operating countries.

We must recognize, of course, that the whole question of regionalism in Africa is a complex and difficult subject with far-reaching political overtones. While I believe that closer associations of African countries will develop, it will be a long process and it is a matter which the peoples themselves will have to effect.

In this connection it is pertinent to quote from the speech made by Secretary of State Herter earlier this week in Chicago at the 38th Annual Convention of the National Association of Broadcasters. Referring to efforts which the United States is making to build closer relations with the new African nations and the concern which we have for their welfare and security as they assume the responsibilities of independence, he said: "It is our hope that they can devise regional arrangements to insure the peaceful settlement of disputes and to avoid a wasteful and dangerous arms race. This would indeed be a forward step toward insuring peaceful change."

COMMUNISM AND AFRICA

It is not the purpose of this discussion to study communist influence and involvement in Africa but I believe I should mention it if for no other reason than to avoid misunderstanding. The forces of international communism are fully aware of the opportunities present to exploit the nationalist movement in Africa for their own political ends. They have been doing so at an increasing rate, covertly through their usual methods and overtly through rather massive economic and technical assistance in chosen areas. I think it is testimony to the stability and good sense of the African people that commu-

nism has not gained a significant foothold on the continent. The policy of "positive neutrality" enunciated by some African leaders sometimes leads us to the view, erroneously I think, that the new African states are "soft" on communism. There is more evidence, I believe, that Africans who have but recently freed themselves of foreign control will not, except by force, permit themselves to come under a new domination alien to them in every sense of the word.

I would not be honest if I did not admit that we are concerned over the impressive assistance offers that the Communist bloc have made in Africa in the last year or so. If these programs were only what they seem on the surface, aid to the economy and technology of underdeveloped societies, there would be little cause for concern. It is not reasonable to assume that new governments in dire need of the assistance of technically developed peoples would refuse to accept such aid. The legitimate concern, it seems to me, stems from the fact that communism uses all means to attain the political objective of communization and control. Economic "co-operation" is only one means, but it could be an effective one when applied to peoples who lack an established political and economic order of their own. However, there are many indications that the African peoples and leaders will be vigilant and uncompromising in rejection of all political subversion masquerading as friendship and assistance.

Our own expanding programs of cultural, technical, and economic collaboration with Africa stem from the traditional character of our society which has demonstrated time and again our conviction that to help others help themselves is the path of enlightened self-interest. Our motives are, and must remain, positive and not negative—for a better way of life for

Africans, not against a communist initiative here and there. We have no desire to see Africa become a "cold war" battleground. Such a development would be as distasteful and unproductive for Africans as for the rest of the free world. We believe that the maturing "African personality," while unique, has already cast its lot with free men.

THE UNITED NATIONS AND AFRICA

No discussion of America's relationship to Africa would be complete without mention of the United Nations. Additional contact with Africa comes about through our participation in the United Nations and its specialized agencies. For example, as members of the Trusteeship Council we have had a voice in the future of the trust territories in Africa, although all seven of them are or were administered by various European powers. I think it is fine testimony to their administration and to the effectiveness of the United Nations system that three of these trust territories, Cameroun, Togo, and Somalia, have been or will be granted independence in 1960, and that one other, British Cameroons, may determine its future status within the year. The British Cameroons elected to postpone the decision in a plebiscite held under United Nations auspices last fall. The United Nations has so far been unsuccessful, I regret to say, in its efforts to have Southwest Africa put under trusteeship or under some other form of international supervision. It remains under mandate to the Union of South Africa where it was placed by the now defunct League of Nations.

The United States is a strong supporter of the United Nations technical assistance programs and of the specialized agencies working in the fields of health, agriculture, and education. We are also the largest contributor of funds to these agencies and to the United

Nations Expanded Technical Assistance Program. I think it is sometimes forgotten that the United States assessment represents about a third of the total budgets of the various specialized agencies, and its voluntary contributions amount to 40 per cent of the total funds available to the Expanded Technical Assistance Program and to the United Nations Special Fund. By formula we agree to maintain this ratio as other countries increase their contributions. In other words, the amount of our assistance is tied to the confidence which other members indicate by their support of the specialized agencies and United Nations technical assistance.

In this connection, we have noted the strong preference which some leaders of independent African nations have expressed for assistance through the United Nations rather than through bilateral assistance. Some of them may fear that bilateral assistance will involve excessive dependence upon other nations, or that such assistance would entail conditions which might detract from their sovereignty. While there are certain conditions attached to virtually all forms of aid, multilateral as well as bilateral, we believe the record of the United States and other free nations in supplying economic aid and technical assistance clearly demonstrates that such aid will not be used to impair the freedom or independence of any nation. At the same time, there are sometimes definite advantages connected with aid through the United Nations, and we believe that both United Nations sources and other sources will be needed. As I have noted, our government is the heaviest investor in the United Nations' programs. As more African countries attain independence, I foresee their sharing to an increasing extent in the benefits of these programs. I also believe that the dynamic develop-

ments on the continent increase both the obligation and the opportunity for the United Nations to expand its work. The Economic Commission for Africa, established with headquarters in Addis Ababa in 1958, should give new impetus to the planning of effective programs to meet the social, economic, and technical needs of the African people. The United States has observer status on this Commission and is following its progress with keen interest.

Through the United Nations our government also becomes involved in Africa's political and social problems; and, conversely, the increasing representation of African states in the world organization is having a growing impact. The one-nation one-vote system in the General Assembly means that Africa may, before very long, be able to influence strongly the resolutions of that body which tend to reflect world opinion. In the past we have frequently found ourselves at variance with the African states on issues which, we think, they tend to view from a local or continental vantage point. It is understandable that these new countries should, at the outset, be primarily concerned with African problems and attempt to avoid entanglement in wider issues which, they may feel, they had no part in creating. But it is our hope and expectation that time and experience and the full acceptance of African

countries into world councils will bring us closer together on positions which the United Nations can take to advance peace, security, and international amity.

CONCLUSION

The question posed in that part of this symposium dealing with Africa is whether America is involved in the nationalist ferment in Africa. I believe it is now evident that the United States and the American people do have a significant involvement in African affairs and, inevitably, in the nationalist ferment now taking place on that continent. In the past, this involvement has been important but limited and sporadic. However, with a dramatic new era dawning over Africa, we are called upon to play a new and, I think, a more positive role in responding to the needs of these countries and in sharing with them our human and material resources. We shall not play it alone but in concert with others and with the United Nations. The United States has strong historic, cultural, economic, and linguistic ties with tropical Africa. They are invaluable assets with which to develop new bonds with the peoples of Africa who are looking to the United States to see what response to their needs and problems will be forthcoming. I am sure we shall not be found wanting.

* * *

QUESTIONS AND ANSWERS

Q: Some of us in the University Extension Association feel that most of the efforts toward educating the adults in world affairs in the past ten years have been considerably less than effective. Secondly, we feel that part of the reason for this is that the universities have not played so large a role in educating

American adults about world affairs as they should have. Africa especially has been one of the neglected areas in this adult curriculum. What might we as academics, as scholars, as people interested in world affairs do to offer the American public some greater education, not simply awareness, not simply propa-

ganda, but genuine education about Africa and its problems and the relation of those problems to our own national welfare?

A: As Ambassador Ben Aboud would have said, that is a very timely question and very difficult perhaps for me to answer since my main responsibility is to deal with African affairs rather than American. But that does not mean that we in the State Department do not have a very keen interest indeed in the problem which you have posed. I think that it is answering itself to a large degree. When I had the responsibility of recruiting an African research division in 1946, we had the greatest difficulty in finding any scholars who had taken a doctorate or even a master's in an African subject. I am glad to say that the two or three we did find have since distinguished themselves in African affairs, and as I am sure you know there are about 200 Ph.D.'s who have taken their doctorates in African studies. That in itself is not the answer to educate the American people, but naturally the universities are the seat of learning, for us the highest seat, and little by little, more and more the great universities and some of the smaller are specializing and bringing in experts on African affairs, and of course that is the most important way. But there are other media and you only have to see the number of interesting and really vital programs on Africa which the nation's three great television chains have produced and the number of special articles in our magazines, I think, to realize that the American people are taking an interest and are thereby getting an education in the problems of Africa.

Q: I recently visited the Republic of Guinea as a private citizen, and found

that the country is full of Russians and East Germans. The Soviet Union has given very large financial assistance to Guinea and not only are they accepting it but they are contemplating the establishment of a technical school founded by Russians and presumably administered by Russians. I also found in the interior of the Republic of Guinea that those people who have some slight education are strictly communistic in their viewpoint. By communistic I do not mean communism as we now interpret it among us intelligently, but they are pro-Russian in their viewpoint. They welcome Russians, the East Germans, technical people, who are visiting them and who are teaching them in the ways that the Russians usually adopt in undeveloped countries. I want to ask how the United States proposes to, let us say, counter such advances by the Russians and the East Germans?

A: I think you will find there the situation which I mentioned in my speech. I mentioned President Sekou Touré by name stating of course they would accept aid from any place they could get it. It is perfectly true there are a great number of East Germans and Polish, Hungarian, and especially Czech technicians and a number of Soviet technicians there and in very important areas, and they are throughout the country. I think it is equally true that the few Americans who do travel out in the country are also very cordially received. There is one feature, of course, about the government of Guinea which may apply to some other areas of Africa. It does have a form of a politburo government but this, it seems to me, is deceptive since it fits in precisely with their own African tribal system. Also there is quite a degree of democracy even in Guinea itself. While there have been no national elections, the members

of the party, the governing group, have all come up through elections in the local communities. Now, as to what we are doing, this has been a most frustrating experience. At a very early date we did send in some assistance in the form of rice and flour which was most welcome, and when President Touré was here we made an offer to give 150 scholarships and to furnish an English teaching program. We hope this will be implemented in the very near future, but we have run into great difficulties which only illustrate the problems for these new countries. Our Congress, I think understandably, puts a great many limitations on the use of our funds and how they are accounted for and this leads to rather difficult negotiations which often are not understood by these new governments. I am confident we have found a way now of implementing those two programs and we hope that we can increase our assistance in effective ways. We are convinced though the Communist technicians are there in great numbers that certainly the President himself and the members of the government do not consider themselves as being under Soviet or East-bloc pressure, that they do dominate the situation. It is therefore all the more important that we get more assistance on our side of a kind that can be really effective in helping them with the very great needs they have. I think as an engineer you probably failed to mention one other significant fact—one of the largest private investments in all of Africa is to be found in this country and is progressing satisfactorily. I refer to the great aluminum project which is 48 per cent American owned, and while this country may have some real difficulties it certainly at no time has had the impression that the Guinean government would not co-operate with it fully. The company is moving ahead with its great project and we hope that the next project, or one of

the two or three next projects, will also go forward, one of which you no doubt know about, the Konkouré Dam.

Q: I wonder if you would like to comment upon the role that arms shipments might play at the present time in stirring up cold-war tensions in Africa, and also what the feasibility might be of controlling these shipments?

A: I am very glad that a member of the government is bold enough to get upon his feet and ask a question of that kind, but I should point out that he is a servant of Congress and not of the executive branch, which makes it easier for him, perhaps. As you will recall, the question of arms control, raised by the questioner, was mentioned by the Secretary of State last Monday. Our hope naturally is that there will not be an arms race but let me say that so far there has not been. The only shipment of arms of any significance, and this is completely insignificant in terms of the West, were the few thousand arms which the Czechs sent in to the security forces of Guinea when these forces were left with no arms at all. My personal feeling is, and I think it may reflect the attitude of the government—it is a problem now being studied very vigorously—that perhaps the surest way to assure an arms race would be for the Western powers to tell the new governments that they could not have arms. They themselves, and I speak particularly of the states of Western Africa, have only very small forces at the moment. Ghana and Nigeria have the names of some famous regiments and war experience, but certainly considering the size of these countries and the important security problems they have, the forces which they have, though they may be called armies, are essentially

nal security forces and could not be effective offensively. Liberia, old friend, has an extremely small force which certainly has no alternative possibilities. Nevertheless they have to and will insist on getting and, needless to say, if the Western powers refuse them these arms they will be a very approachable and readily available source, which would be un-

fortunate. I am confident that in their meetings these African powers themselves will find a solution to this problem. We all know that modern armaments are so fantastically expensive that if they got involved in a race of this kind they would not have the means left in their limited economies to improve the standards of living which is their most important consideration.

An American Policy Toward Communist China

By JOSEPH S. CLARK

ABSTRACT: Security—the containment of Communist China—is one of the basic ingredients of the official United States policy in east and southeast Asia. At the same time we are attempting, with near-success, to conclude a nuclear test ban treaty that will eventually, it is hoped, become one part of a more general disarmament agreement. But is there any hope for a lasting disarmament agreement that excludes Communist China? Moreover, can a nuclear test ban treaty be effective whose control system requires inspection sites on the China mainland and yet denies the possibility to Communist China to participate in its formulation? Furthermore, how advanced is Communist China in the scientific realm? Is it not probable that she too will join the nuclear club in the foreseeable future? When the answers to these questions are faced squarely, they will of necessity indicate the unrealistic nature of the policy we are taking towards Communist China. Hopefully, before even this door is closed, we will begin to explore those contacts with Communist China which are now available to the United States to discover whether or not there is a basis on which a disarmament agreement that includes the Chinese Communists can be concluded.—Ed.

Joseph S. Clark, LL.B., LL.D., Washington, D. C., is United States senior senator from Pennsylvania. He practiced law in Philadelphia from 1926 to 1951, became city controller in 1949, and later mayor of this city in 1952. Mr. Clark graduated from Harvard University and the University of Pennsylvania and has been a member of the Board of Overseers, Harvard University.

BEFORE President Eisenhower leaves office next January, the present United States policy of refusing to deal with Communist China will have run its course. In all likelihood the State Department will be urgently seeking ways to open direct communications with Peking at the highest levels of government. Mao Tse-tung's active co-operation and participation in a joint undertaking with the United States will probably be sought. Such communications and negotiations will not only be consonant with our national security interest but essential to it. Another major aggressive move by the Chinese is the only eventuality which would delay this drastic change in policy.

A year ago, six months ago, such predictions would have been shrugged off as ludicrous, possibly subversive. Today they are accepted as inevitable by those who have been following closely developments at the nuclear test ban talks in Geneva. As the test ban negotiations near agreement between the United States, Great Britain, and the Soviet Union, our so-called "China policy" becomes as obsolete as George Washington's stand against "entangling alliances."

A political lag between established policies and the needs and events of the day is always dangerous. When there is a clear challenge in a field affecting national safety and survival and there are literally no government policies to meet that challenge, it is frightening. This presentation suggests that the urgent need to obtain Chinese participation in nuclear test ban and disarmament control measures requires rethinking of our attitude toward Communist China. Let us ask ourselves a few questions.

What is our current China policy? Why will a nuclear test ban agreement require a new United States attitude toward Peking in the immediate future?

What new approaches to the Chinese should be attempted to obtain their co-operation in disarmament matters?

OUR CHINA POLICY TODAY

Since the death of Secretary Dulles and the retirement of Walter S. Robertson, his principal adviser on Sino-American relations, J. Graham Parsons, Assistant Secretary for Far Eastern Affairs, has been speaking for the Administration on China. Mr. Parsons, a firm adherent to the Dulles-Robertson views, restated recently the main objectives of the Administration's policy of containment of Communist China in a major address on "The American Role in Pacific-Asian Affairs."

Our first task . . . is to assist the survival of [the free countries of east and southeast Asia]. That is why there is emphasis on military aspects in our aid programs and posture in the area. Security is the basic essential. First, as a necessary deterrent to the Communist attacks, we maintain bases and sea power in the region. . . . Also to promote security we render assistance to local forces through our military assistance program. . . . In addition we have concluded bilateral mutual defense treaties with some of these countries, including Japan, Korea, the Philippines, and the Republic of China. Finally, . . . we have joined with seven other countries to form the Southeast Asia Treaty organization.

* * *

As our second major objective, we seek to promote self-sustaining economies to enable the free countries to achieve the rate of progress they desire without sacrificing human values as do the Communists.

There can be no quarrel with any of these statements standing by themselves. The trouble is, they ignore the principal problem which confronts us. The methods of implementing these objectives are well known to all Ameri-

cans. They include (1) nonrecognition of the Chinese Communist regime; (2) opposition to the admission of the Peking government to the United Nations; (3) a negative attitude toward person-to-person contacts between United States citizens and the people of Communist China; (4) no trade with the China mainland; (5) support of Chiang Kai-shek as the only "legitimate" representative of China; and (6) maintenance of strong naval and air forces based on Formosa to hold the offshore islands and deter Chinese Communist aggression anywhere in Southeast Asia.

Two inclusions in and one omission from Mr. Parsons' statement should be noticed.

The two most-discussed aspects of this policy, nonrecognition and opposition to United Nations admission, miss the real point. The critical questions are elsewhere. No political leader of stature in the United States today favors the recognition or seating of Communist China unless, first, satisfactory agreements can be reached with Peking on some of our major outstanding differences. Yet a review of the United Nations votes in the last few sessions on the perennial question of seating Mao's government shows that the margin of votes in opposition to seating has steadily dwindled. The admission of Communist China may well be voted in one of the next few sessions in spite of continued United States opposition.

Omitted entirely from Mr. Parsons' address is any mention of the problem termed "the most important one facing the world today" by President Eisenhower and Premier Khrushchev—disarmament. This omission is most startling in view of the imminence of an East-West nuclear test ban agreement calling for Chinese participation.

A NUCLEAR TEST BAN TREATY

With the United States-United Kingdom acceptance, following Mr. Macmillan's recent mission to Washington, of the Russian proposal for a limited moratorium on low intensity underground nuclear explosions, conditioned upon Soviet agreement on a number of unresolved issues, including a joint detection research program, a test ban agreement in the foreseeable future became for the first time a real possibility.

The progress of the three-power talks which started in October of 1958 has been so slow and sporadic that the wide area of agreement which has already been reached has not received adequate public consideration.

After a year and a half of negotiations and some 200 meetings the United States, the United Kingdom and the Soviet Union have agreed on the following points:

1. Purpose and Duration of Agreement. There shall be a treaty whose purpose it will be to ban all aerial nuclear weapons tests within monitorable distance from the earth's surface, all underwater tests, and all underground tests, if the explosions underground are of a magnitude to register 4.75 on seismic instruments at agreed locations. The agreement shall run for an unlimited time period, but violation of key provisions will be cause for abrogation.

2. Duties and Obligations. The United States, the United Kingdom and the Soviet Union have already agreed that Article I of the treaty will include a section obligating them "to refrain from causing, encouraging or in any way participating in the carrying out of" nuclear explosions in other countries.

They have also agreed to assign aircraft and weather or exploration ves-

sels to routine checking duty, to provide aircraft for special air-sampling tests, and to give inspectors access to sites of possible explosions whenever the treaty authorizes inspections.

3. Control Conference. The negotiators have agreed that there will be a conference consisting of representatives of each of the three signatory countries and representatives of other countries which accede to the terms of the treaty. The conference will be convened in Vienna once a year or at any time at the request of a majority of the parties to the agreement. At such conference each country will have one vote and most actions will be taken by simple majority decision. The purpose of the conference will be to assess the operation of the control system and make recommendations for any needed treaty amendments. The conference will also have budgetary authority for the control system.

4. Control Commission. It has been agreed that a Control Commission will be established to supervise the detection and identification system. The Commission will consist of representatives of the United States, the United Kingdom, the Soviet Union and four or six other countries to be elected by the conference for staggered two-year terms. Under the latest Russian proposal the Commission would be made up of three Communist, one neutral, and three Western members. The United States has indicated that this is unacceptable because it would place too much pressure on the single neutral member. Our latest proposal is for three Western, two Communist, and two neutral members. Not surprisingly the Soviets have rejected this proposal, and there now appears to be increasing sentiment for a nine-member Commission with three members from the West, three from the Communist bloc, and three from neutral countries.

The Commission will be a permanent one set up to meet in Vienna on twenty-four-hour notice given by any party to the agreement. Voting will be by simple majority rule, unless otherwise specifically provided.

5. Control Posts. The control system will consist of 180 control posts. Each post will be fully instrumented to detect sizable explosions of all types, and manned by 30 technicians, only ten of whom would be nationals of the country where the post was located. The number and general location of the posts were agreed upon by a panel of experts of the three nuclear powers which met in Geneva in the summer of 1958.

Twenty-four of the inspection posts will be located in North America, six in Europe, thirty-seven in Asia, sixteen in South America, sixteen in Africa, four in Australia, seven in Antarctica, and sixty on islands. In addition there will be ten detection ships and planes with roving assignments, and laboratories and a headquarters control structure in Vienna.

Unilateral ban

6. Moratorium on Small Underground Tests. The Western powers will agree to a limited moratorium on small underground nuclear tests, although this will not be written into the treaty and will therefore not directly face the hurdle of Senate ratification. The President has made it clear that he will recommend to his successor continuation of this unilateral ban conditioned on satisfactory Russian performance in a joint detection research project to be undertaken by the three nuclear powers and Soviet acceptance of some of the important issues not yet resolved. Senators Kennedy, Humphrey, Symington, Johnson, and the Vice-President have all indicated assent to this arrangement within the last few days, and indicated

that they would be inclined to continue in effect the President's declared ban on small tests in the event of Russian good faith in compliance with the treaty. Governor Stevenson's backing for this approach can be assumed from his many pleas for a mutual test ban, first voiced in 1956 and reiterated many times since then. Tass has already indicated that an unwritten United States guarantee against low threshold underground tests will satisfy the Soviet Union.

A section providing for nuclear explosions of a peaceful nature has almost been agreed upon in Geneva but is not yet fully settled.

Unresolved issues

The following points, however, have not yet been resolved: the number of times inspection teams will be permitted to investigate on-site evidence of explosions; the identity of the other nations to be represented on the Control Commission in addition to the three signatory powers and the creation and staffing of control posts in countries not parties to the original agreement between the three nuclear powers.

There is evidence that the most important of the unresolved questions—the number of on-site inspections—will be on the agenda at the forthcoming summit conference in May. Settlement of this key question would remove the final major obstacle to agreement.

When the ink is dry on the test ban agreement the question of the participation of nonnuclear countries will come forward. By common consent this large and knotty problem has been postponed until agreement has been reached among the negotiators for the three original members of the nuclear club. The wisdom of this understanding and the desirability of signing a treaty which defers this problem appear highly questionable.

French participation in the test ban

control system is already necessary. The plutonium explosions in the Sahara on February 13 and April 1 are uncomfortable reminders that nuclear know-how cannot be contained within national borders. Although the co-operation of the Fifth Republic cannot be taken for granted, ultimate French co-operation will surely be achieved. The United States and the United Kingdom favor France as the third western country on the Control Commission. France is already participating in the general disarmament talks now in process in Geneva. De Gaulle's joint statement with Khrushchev on April 2 acknowledged that "disarmament is the most important and the most urgent problem of our age," and yesterday in London President de Gaulle told Parliament that France will forego further testing and co-operate in general disarmament measures if adequate controls over nuclear weapons production and tests are established.

Red China's participation

In the light of the preceding points, China's participation in the control system becomes essential.

Almost half of the thirty-seven control posts to be located in Asia would be located on the China mainland to provide adequate inspection and control. If the Soviets agree to United States-United Kingdom preliminary draft provisions, a start on the establishment of control posts in countries such as China which are "adjacent or contiguous" to the territory of the signatory powers will be required within two years of the signing of the treaty. The completion of all 180 control posts will be required within four years of the signing of the treaty. A failure to comply with either requirement will be cause for abrogation of the treaty. Thus, our Far Eastern policy planners will be confronted with the necessity

of obtaining China's initial participation in the control system within two years of the completion of the nuclear test ban agreement.

There is general agreement that this co-operation and participation will have to be effected. Secretary of State Christian Herter told the Senate Foreign Relations Committee on January 21, 1960, that Communist China's participation is "inevitable" if a disarmament agreement between East and West is to be effective. President Eisenhower indicated a concurrence in this view at his March 16 press conference when he stated that the Chinese "will have to be taken into account" when disarmament agreements "come into the realm of practical negotiation and enforcement." All Western disarmament experts who have voiced opinions on the question share these views.

GENERAL DISARMAMENT AGREEMENT

It must be remembered that a nuclear test ban is just the first step in any general disarmament program designed to end the present arms race. If agreement is eventually reached at the ten-nation East-West general disarmament talks now in process in Geneva, a broad array of disarmament measures and international controls requiring the co-operation of all major powers, including China, will be required. Many of the main features of the Western proposal outlined by our chief delegate, Mr. Frederick M. Eaton, at the ten-nation talks would necessitate the presence of inspection teams on the China mainland.

The Western proposals put forward up to the present time include the following: Observers at the launching of missiles capable of carrying nuclear weapons; supervision of the reduction of armed forces to agreed levels; inspection of facilities designed to manufacture fissionable materials; aerial and

mobile ground inspection teams to guard against surprise attacks; and, ultimately, co-operation in setting up an "international organization to preserve world peace" in the event that nations do not lay down their arms and submit to controls.

One proposal advanced by Mr. Eaton bearing on the co-operation of countries such as China which are not taking part in the present talks is as follows:

A disarmament conference with other States having significant military capabilities, [should be] called to consider their accession to the disarmament agreement, including their acceptance of appropriate reductions or limitations of their respective force levels and armaments.

Are these proposals and others being made by the United States and our allies at Geneva just attempts to counter the propaganda success of Khrushchev's total disarmament proposals at the United Nations last September? Does not history "prove" that all disarmament efforts are futile? Is not the best mankind can hope for in the foreseeable future a continuation and acceleration of the nuclear arms race in which we will strive to maintain a rough balance?

I submit that the answer to all these questions is a resounding "no!" I submit that those leaders in our public life today who are most concerned with the future are the ones most conscious of the need—indeed the dire necessity—of making the present test ban and general disarmament talks succeed and of taking actions to strengthen the authority of the United Nations to maintain the peace and to resolve peacefully and equitably the disputes between nations.

Plainly the establishment of the 180 control posts, including those on the China mainland, would be an essential first step of inestimable value to all further disarmament controls which must

follow if World War III is to be averted.

Something of the difficulty involved in obtaining Peking's co-operation in international disarmament agreements was indicated earlier this year by Communist China's Foreign Minister Chen Yi. Chen is reported to have stated that "any international disarmament agreement which is arrived at without formal participation of the Chinese People's Republic, or signature of its delegates, cannot, of course, have any binding effect on China." Last October after Khrushchev's visit to the United States, Chinese Premier Chou En-lai gave notice that China "must have the right to participate in any important international issue which concerns her own interest or the interest of world peace."

Time is clearly of the essence if the effort to effectuate an international accord banning nuclear weapons tests is to be successful. The nuclear club, whose membership increased to four in 1960, may double or triple by 1970, according to a recent forecast by the National Planning Association (NPA). By 1970 NPA asserts "most countries with appreciable military strength will have in their arsenals nuclear weapons—strategic, tactical, or both."

Even those who view with equanimity the resumption of tests by the United States in order to "perfect small tactical weapons and fission-free thermonuclear explosives" have no assurances to offer when reminded of published reports that the Chinese will explode their first atomic device in 1962.

SCIENTIFIC DEVELOPMENTS IN CHINA

United States knowledge of scientific developments in China is hopelessly inadequate. We must rely entirely upon second-hand reports and the accounts of journalists from other nations permitted entry by the Peking regime for

all knowledge concerning China's great "leap forward" in science and in other fields.

When Chiang retreated from the mainland in the fall of 1949 the Communists were left virtually without physicists or technicians of any sort in the fifth year of the atomic age. It is now common knowledge that Communist China obtained its first nuclear reactor in June of 1958. The installation, which is of medium size, is located near Peking and is said to have the capacity to produce enough plutonium in a three-year period to permit an atomic explosion. The center of the Chinese nuclear program is reported to be at Urumchi, the capital of Sinkiang province, 1500 miles west northwest of Peking. There, it is said, the Chinese are operating a factory to refine uranium ores from Tibet and Sinkiang for shipment to Soviet central Asia for processing into a rich uranium. Another large reactor is being built, according to reports reaching Hong Kong, in Northern Manchuria where the natural resources necessary for large-scale production of plutonium are abundant. Other reactors are reported to be in various stages of construction at Sian, on the Yellow River in central China, and at Chungking on the Yangtze River.

There is little to indicate that the Soviet Union is anxious to have its Communist partner join the nuclear club. True, in 1955, the Soviets signed an agreement with the Chinese on scientific and technical co-operation, but it is now established that the Russians have refused recent Chinese requests for advanced reactors and other nuclear materials necessary to speed the Chinese nuclear development program.

Extraordinarily enough, the Chinese atomic bomb and related delivery system programs have received invaluable aid from the United States. The Chi-

com rocket research program is headed by Dr. Chien Hsueh-shen, Chairman of the All-China Automation Society. Dr. Hsueh-shen was a professor at the California Institute of Technology and headed an American delegation of scientists that examined the German rocket program after World War II. He returned to Communist China from the United States in 1955, after the rescinding of a court order forbidding him to leave this country following arrest in a deportation proceeding brought by the United States Immigration and Naturalization Service.

Because of the virtual nonexistence of direct reliable news sources on the China mainland, it is almost impossible to assess the priorities being given to various programs by Mao's regime. Clearly immense stress is being placed on basic public works, heavy industry development, and new means of transportation—China's traditional bottleneck. New methods of cultivation and agricultural research, described in some detail by Morton H. Fried in the March 19 issue of the *Saturday Review*, indicate great strides in the field of agriculture. Scientists and scholars in all fields of human learning from Western countries would clearly have much to impart and much to learn from developments during the last ten years, but no such exchange program is being considered.

The peculiarly intensive xenophobia exhibited by Communist China in its adventures in Korea, in Vietnam, in Tibet, along the Indian border, and more recently in Nepal, and in all monitored propaganda broadcasts from Peking clearly indicate one thing. China will not be content to lag behind the United States or other countries of the West or of the Communist bloc in any sphere of human endeavor—including nuclear capability and general weaponry.

Will public opinion in the United States be as rudely jolted when news of an atomic explosion on Communist China's soil emanates from Urumchi, Sian, Peking, or Chungking as it was when our newspapers contained the first word of Sputnik? It seems inevitable. Because once again, our government has done virtually nothing to prepare for the inevitable. The plain writing on the wall is being disregarded.

The State Department has advised my office that in the ninety-seven meetings held in Warsaw between our Ambassador, Jacob D. Beam, and Chicom Ambassador Wong Ping Nan since August 1, 1955—the most recent meeting was on March 22 and the next meeting is scheduled for May—China's participation in a nuclear test ban control system or in general disarmament accords has never been discussed.

POLICY CONCLUSIONS

If the first Chinese atomic explosion can be expected within the next two years and during that same time period Peking's participation in a nuclear test ban control system will be required to prevent a breakdown of the treaty soon to be signed at Geneva, certain United States policy changes are clearly indicated.

First, our one available line of communications with the Chinese Communists through our Ambassadors to Warsaw should be utilized to indicate at that level, or preferably at higher governmental levels on both sides, our own bona fide intention to achieve a universal, controlled nuclear test ban agreement and ultimate general disarmament and to sound out Chinese intentions in the entire arms control field.

Second, we should initiate "informed, private discussions," as suggested in the studies prepared last fall by Conlon Associates for the Senate Foreign Relations Committee, "between the United

States and our European allies, Japan, and some of the leading 'neutrals,' particularly India, Burma and Indonesia, to solicit ideas and some cooperative thinking about the problem of China;" and, I would add, in particular, about the problem of Chinese participation in test ban and general disarmament control systems.

Third, China's place in the test ban control system might well be placed on the agenda of the summit meeting in May. Soviet views should be elicited on a problem we both know will be confronting us in the immediate future, and in which United States long-range interests may be the same as the Soviets', as Harrison Salisbury has suggested in his new book, *To Moscow—And Beyond*.

None of these approaches or any others designed to gain Chinese co-operation in test ban and other disarmament control measures may work. If so, Napoleon Bonaparte's musing may well be a prophecy: "China—a sleeping giant—when he wakes he shall shake the world." If so, the sooner we

establish that dismal fact the better, because the military effort we will have to make to keep the arms race in balance in the next forty years as well as the risks of failure will be stupendous. We might as well get at the task free of any illusions about achieving disarmament or developing the rule of law in the world society. But if Peking's understanding of the ultimate folly of nuclear warfare is increasing as Chinese scientists have grown in numbers and in learning and China's physical plant and rudimentary comforts have increased, we should know that too. Let us spare no effort or talent to prevent Communist China from shaking our world—or that of our children.

American Alliances with Asian Countries

By AZIZ AHMED

ABSTRACT: Geopolitical considerations necessitate alliances with Pakistan. Pakistan borders on Russia and China, lies astride the Indo-Pakistan subcontinent, and constitutes a bridge, geographically and otherwise, between the Middle East and Southeast Asia. The alliances rest on a firm foundation of common objectives and values that are shared by Pakistan and the United States. The charge that alliances and grant of military aid have generated tension in the areas concerned lacks foundation. To wit, tension in the Middle East has not subsided despite Iraq's withdrawal from the Baghdad Pact; relations between India and Pakistan have lately improved vastly despite continuance of alliances and military aid. The basic cause of Indo-Pakistan tension is the continuance of the Kashmir dispute. Recent developments on India's northern borders underline the urgency of Indo-Pakistan co-operation to meet a common danger. Pakistan has offered to join with India in defense of the subcontinent. This can be possible only if the Kashmir dispute is settled. Economic progress of new Asian countries is not possible without the assurance of continued security. And alliances provide this assurance. They constitute a shield behind which the standard of living of the peoples of Asian allies can be raised.

Aziz Ahmed, Washington, D. C., is Ambassador of Pakistan to the United States. He has held various posts in the Pakistan government, including Chief Secretary, government of East Pakistan; Secretary to the Cabinet, central government of Pakistan; and Secretary-General to the government of Pakistan. He has, in addition, represented his country at conferences in London, New Delhi, Colombo, Ankara, Bandung, and Teheran. He has been a delegate to the United Nations and has led a trade delegation to the Soviet Union, Poland, Czechoslovakia, and Yugoslavia. Ambassador Ahmed was educated at Lahore and Cambridge and joined the Indian Civil Service in 1930.

A CRITICAL appreciation of American foreign policy and objectives would be valuable at any time; it is particularly necessary at the present time. The particular subject with which this article deals assumes special significance against the background of recent developments in Asia, and since Pakistan is, if I may so describe it, the most allied of America's Asian allies in that it is signatory to more mutual assistance arrangements with which the United States is associated than any other Asian country, it is perhaps appropriate that a representative of my country should attempt to examine the various facets of this subject.

STRATEGIC FACTORS IN ALLIANCES

It may be useful at the outset to state a few basic facts about Pakistan which have a bearing on the question why American alliances with Asian countries should have included Pakistan. Although Pakistan is a small country, compared to, say, India, it is not without considerable importance to the security of the free world. In terms of population—85 million—it is the fifth largest country in the world. In area, it is equal to the combined areas of France, Italy, Belgium, and Holland. Strategically, it occupies a position of unusual interest. It lies astride the Indo-Pakistan subcontinent; each of its two parts abuts upon a separate geographical region. West Pakistan borders on the Middle East; East Pakistan borders on Southeast Asia. Together, the two parts of Pakistan constitute, in more than a merely geographical sense, a bridge between the Middle East and Southeast Asia. West Pakistan, furthermore, has a common border with China and is very close to the Soviet Union's southern frontier. Pakistan thus occupies a position of special significance to the Indo-Pakistan subcontinent. West Pakistan stands guard at

the entrance to the mountain passes through which all recorded land invasions of the Indo-Pakistan subcontinent have taken place. In effect, Pakistan constitutes virtually the protective shield of the Indo-Pakistan subcontinent on its northwestern border and forms a gateway to south Asia. Its strength and stability must therefore be a matter of some interest and concern to all well-wishers of peace and stability in that region.

It was in view of such considerations and the international situation at that time, that, some six years ago, the United States offered to enter into a mutual defense assistance agreement with Pakistan. We too felt that the development of the international situation, at that time, warranted a decision to either accept a firm alliance with the United States or a position of uncertain neutrality. We decided to sign an agreement with the United States and cast our lot unequivocally on the side of the free world, principally, because we share the same values.

PAKISTAN AND DEFENSE PACTS

Politically, it was not a simple decision. There were influential elements in our country which advocated that Pakistan steer a neutral course in her international relations. We rejected such a policy because it was shortsighted. We chose instead, by subscribing to that agreement, to share with America the responsibility, insofar as it lay within our limited power, of strengthening the fabric of world peace. It was a decisive moment. Our course was finally set. And since then we have neither faltered nor deviated from that course.

In accordance with this policy and because of our evident interest, by virtue of our geographical situation, in the security and peaceful development both of the Middle East and Southeast Asia, we later joined the Baghdad Pact and

the Southeast Asia Treaty Organization (SEATO). Again, last year in March, it was in pursuance of this same policy that we signed a Bilateral Agreement of Co-operation with the United States who simultaneously signed similar agreements with Turkey and Iran. The purpose of these agreements is to help reinforce the defensive potential of the Baghdad Pact, now called the Central Treaty Organization.

All these alliances are of a purely defensive character. They are fully in accord with the peaceful principles of the United Nations Charter. They are not aimed against any country whatever. In spite of this obvious fact, our membership in these alliances has made us the target of the hostility of certain nations, although those nations too subscribe to the Charter. In recent years, this hostility has found expression in a variety of anti-Pakistan moves, as, for instance, in the Soviet Union's exercise in the Security Council of the veto to block progress towards a settlement of the Kashmir dispute as well as her open incitement of Afghanistan to lay claim to Pakistan territory. Nevertheless, we have throughout stood firmly by our allies. The fact that we signed the Bilateral Agreement of Co-operation with the United States last year, despite the existent hostility, was proof of our intention not to be deflected from our policy, however great the pressure might be.

It is perhaps natural under the circumstances that, in return, we should expect steadfastness from our allies as well. Our people are, therefore, dismayed when, for instance, they hear influential opinion in this country advocate "massive aid" to neutralist India, not to Pakistan or to any of America's other Asian allies. In fact a considerable body of opinion in America now not only condones but openly approves of and even advocates a policy of neu-

trality for Asian countries situated along the communist perimeter. Public opinion not only in Pakistan but throughout United States' Asian allies is perplexed that influential and knowledgeable elements in this country should be advocating a policy which would seem to put a premium on neutrality.

Latterly, there has been a welcome shift in this attitude to some extent. So far as Pakistan is concerned, there is a growing consensus that not India alone but both India and Pakistan constitute the "critical area" in Asia and that both need concentration of economic aid. But the reason for giving this aid is not because Pakistan needs to be strengthened as an ally. The general thesis of these advocates of "flexibility" still seems to be that the supreme objective of American policy should be to woo in every manner the uncommitted world, and the unfortunate impression exists that American allies are taken for granted.

MISCONCEPTIONS OF MILITARY AID

In line with this thinking is the criticism one meets in certain quarters of the wisdom or value of these alliances. It is contended that these alliances and the grant of military aid to their Asian members have created tension in the area. The Baghdad Pact, it is claimed, was responsible for creating tension and division in the Arab world; Pakistan's membership in the Baghdad Pact and SEATO led to the worsening of American relations with India and to the creation of tension between Pakistan and India, and, farther east, Thailand's membership in SEATO caused tension between that country and Cambodia.

Even the value of these alliances to the free world is sometimes openly questioned. There is a disposition to question the ability of Asian allies, no matter how well equipped, to contribute to the defense of the free world. There

is a disposition even to discount the importance these regions have in the context of free-world interests and security. Some of these critics go so far as to suggest that under certain circumstances it might be preferable to shed America's Asian allies and encourage them to follow a policy of neutrality.

Advocating such a course, a distinguished journalist contributing to the *Washington Post* and *Times Herald* last December, for instance, considered Iran "a secondary theatre in the power politics of the globe" and went on to forecast that with the discovery of oil in French Africa and in Libya the oil of the Middle East was no longer a matter of life and death for Europe and that this discovery would be bound to affect European concern about the Middle East. Another critic of these alliances, writing in the January issue of *Foreign Affairs*, expresses a similar view. He considers it doubtful whether the United States needs as military allies any of the Asian states that have joined the Southeast Asia Treaty Organization. "Any great war in which we became involved," he writes, "would be fought principally in other theaters than South and Southeast Asia and for purposes to which the nations there would probably make only peripheral contributions, given the lightning speed of nuclear operations."

It is difficult to contend with a philosophy which is in the nature of a counsel of despair, which already appears half reconciled to the possible loss to the free world of the Middle East and, by implication, of South and Southeast Asia also. The view that any great war involving the United States would be fought principally in theaters other than South and Southeast Asia would seem to ignore the fact that new centers of power and, with it, of likely major conflict zones, are rising in the East.

Another argument sometimes advanced is that it is futile to give military aid to Turkey, Iran, and Pakistan, the Central Treaty Organization's Asian members—which constitute what is known as the Northern Tier—because none of them could withstand a Soviet attack or contribute materially to the defense of the region. This would be true of some of the North Atlantic Treaty Organization members also; yet no one would suggest on that ground that steps should not be taken to strengthen the North Atlantic Treaty Organization defense posture. Indeed it would seem to be an argument for placing more, not less, military and economic strength in the Northern Tier. It is precisely the weaker points along the free-world defenses that would need special attention.

THE SINGLE COUNTRY VERSUS REGIONAL APPROACH

I turn now to the main criticism against these alliances, namely, that they have caused tension in the regions concerned. In this connection it is the American alliance with Pakistan that is often singled out for adverse notice. The argument runs something like this: It is suggested that it is a matter of supreme importance for the future of Asia that the Indian democratic experiment should succeed. For that purpose it is necessary that the West give India massive aid so that she may attain, with a speed broadly comparable to that of Communist China's, a self-sustaining, prosperous economy. If that was achieved, the success of India's democratic institutions would have been demonstrated and, in consequence, free institutions everywhere in Asia would survive. In contrast with the recognized imperative need to help India massively, the United States has, it is contended, by giving military aid to Pakistan helped create tension between India

and Pakistan and thereby compelled India to divert her resources from desperately needed economic development to strengthening her military establishment. Some of these critics also cite, with evident approval, the Indian claim that Pakistan's membership in these alliances has encouraged her to be intransigent in the Kashmir dispute, compelling her to match Pakistan's intransigence with her own. Let us briefly examine these contentions.

Consider first the premises. While it may be true that a failure in India's democratic experiment may have a far-reaching effect on the future of free institutions elsewhere in Asia, it would, I venture to suggest, be an oversimplification to conclude that free institutions everywhere in Asia would survive if only the Indian democratic experiment succeeded. What is in fact needed is that not only India but all underdeveloped countries should receive the maximum assistance possible in raising the living standards of their peoples. It would be unrealistic to imagine that the mere spectacle of a successful, prosperous democracy in India would prevent other countries in Asia, battling ineffectively with their own problems of poverty, ignorance, and disease, from turning in despair to totalitarian methods for a solution. One can see the lack of wisdom in even entertaining such a hope by looking at the Western Hemisphere. Here, the United States is the example of the most prosperous democracy in the world. There could be no greater monument to individual freedom and private enterprise. And yet this has not prevented the emergence of totalitarianism in parts of nearby Latin America.

THE KASHMIR DISPUTE

Nor would it be correct to say that American military aid to Pakistan created tension between India and Paki-

stan. There was tension between these two countries long before Pakistan started receiving military aid from the United States; it has existed since the very birth of the two nations. It did not originate with the supply of American arms to Pakistan. It arises primarily because of the dispute over Kashmir. On the Pakistan side, it is fed by bitter indignation that India, having pledged herself in the Security Council to allow the people of Kashmir to decide whether their state should join India or Pakistan by means of a free plebiscite, should nevertheless continue, on one ground or another, to deny them that right. On the Indian side, this tension arises perhaps from a fear that since India continues to bar Pakistan from obtaining redress through peaceful means, either through the machinery of the United Nations or the International Court of Justice, Pakistan might one day in desperation attempt to seize Kashmir which India intends to retain, if necessary, by force. It is only on some such assumption that one can understand India's past objections to the grant of military aid to Pakistan, for India knows fully that there is no likelihood whatsoever of Pakistan launching an aggressive venture against her. Under the terms of the Mutual Defence Assistance Agreement Pakistan is committed to use assistance received under that agreement exclusively for purposes of self-defense. India, further, has the assurance from the United States, repeatedly given at the highest level, that should Pakistan decide, despite that commitment, to use American military assistance in an aggressive war against India, the United States would take action both inside and outside the United Nations to thwart that aggression.

Obviously, therefore, if tension between India and Pakistan is to be removed, we should have to remove its

root cause. It cannot be removed by dissolving American alliances with Pakistan or by denying military aid to that country. It can be removed only by helping to bring about a just solution of the Kashmir dispute.

It is only by a Machiavellian disregard of logic or historical fact that it can be maintained that the grant of military aid to Pakistan has made Pakistan intransigent on the Kashmir issue. Both before and after the receipt of military aid, Pakistan has accepted every proposal put forward by United Nations mediators for a solution of this dispute. India has rejected every one of these proposals. As an alternative, Pakistan has repeatedly proposed that the issues in dispute be submitted to international arbitration. India has been rejecting even this offer. It is under the circumstances scarcely permissible to charge that a solution of the Kashmir dispute is being balked by Pakistan's "intransigence."

INDO-PAKISTAN RELATIONS BETTER

That American alliances with Asian countries are not the basic or even the major cause of regional tensions is proved further by developments that have taken place in those regions during the last two years. Iraq is no longer a member of the Central Treaty Organization; yet one sees little evidence of relaxation of tension in the Arab world, as a result. Pakistan continues to be a member of both the Central Treaty Organization and the Southeast Asia Treaty Organization and a recipient of military aid, yet during recent months Indo-Pakistan tension has greatly abated and the relations between India and Pakistan are today better perhaps than they have ever been in the past.

The reason for this latter trend is that recent developments along the subcontinent's northern borders are happily compelling both India and Pakistan to

take a more realistic view of their relations. We consider that it is in Pakistan's interest to have in India a strong and stable neighbor. Perhaps India also is beginning to realize, in light of her geographical location, that it is in her interest that Pakistan too should be strong and stable.

JOINT DEFENSE OFFER

President Ayub has shown both courage and statesmanship by offering to join with India in arrangements for the defense of the Indo-Pakistan subcontinent. Only thus, in his judgment, can the subcontinent be properly defended; acting separately, neither India nor Pakistan can adequately defend it against what is clearly a developing common threat.

While India has not found herself in a position to accept President Ayub's offer, she is at least beginning to realize that the danger to her security comes not, as she previously imagined, from Pakistan but from another source. Largely for this same reason, despite continued American military alliance with Pakistan, American-Indian relations have also greatly improved.

Similarly, farther east, it is difficult to see why Thailand's membership in the Southeast Asia Treaty Organization should be the cause of tension between her and Cambodia, because Cambodia is herself eligible for military aid from the United States and, under a Southeast Asia Treaty Organization Protocol, enjoys the same protection as do the members of the pact.

KEY TO ASIAN STABILITY

The key to peace and stability in Asia does not lie in the dissolution of free-world ties with Asian countries. Rather it lies in the resolution of the basic causes of tension. More particularly, it is to be found in a reconciliation between India and Pakistan on the

Kashmir issue. For so long as Indian and Pakistan troops continue to stand facing each other along the cease-fire line in Kashmir and along the Indo-Pakistan border, instead of facing outwards, for that length of time Indo-Pakistan tension will remain, and the two countries not able to co-operate in the vital field of defense will leave the security of the entire region in jeopardy. Mr. Chester Bowles put his finger unerringly on this crucial issue when, speaking at a conference in Washington in May last year, he said:

Nothing is more important for the future stability of South Asia than that such a reconciliation succeed. If the mutual fears and animosities between India and Pakistan continue unabated, . . . the effectiveness of American and other outside aid to either country will be dissipated in mutually wasteful armament expenditures. Working together . . . India and Pakistan combined can constitute the central source of military and political stability in Asia and provide a new gravitational influence for economic and social betterment on the whole Asian continent.

ALLIANCES ESSENTIAL

A word about the value of these alliances. If these alliances were in fact of such little consequence as some critics aver, it would perhaps be reasonable to expect that countries opposed to them would not continue to denounce them so violently or work so sedulously for their undoing. Consider, for instance, the intense pressure to which Iran has been subjected by the Soviet Union for being a member of what is after all only a purely defensive alliance. Similarly, one cannot help ponder the fact that the Chinese should not attempt to seize a small island like Formosa but should quietly bite off a sizeable portion of Ladakh and take forcible possession

of Longju, despite the nonaggression treaty and friendship which bound them to India. Was it perhaps because India, although a far bigger and stronger country than Formosa, was militarily alone?

There is a tendency perhaps to over-stress the purely military aspect of these alliances. It is often forgotten that the object of these alliances is not only to enable America's Asian allies to stand up to military pressure but to create conditions under which these countries can undertake the urgent task of building up their economies in an atmosphere of security and freedom. The withdrawal of British and French power from Asia left a power vacuum in the area. It also synchronized with the emergence of an insidious international threat to the area, a threat that could take the form not merely of an armed attack from without but of subversion from within. The new states needed to build up their political stability and economic strength. For this purpose they needed above all, and still need, an assurance of continued security. Without this they could not undertake any long-range economic and social development. These alliances provide that vital assurance. They are primarily an instrument for deterring attack; they constitute a protective shield for the Asian allies, behind which their economic development plans can go forward and the standard of living of their peoples can be raised.

A time may come when such alliances no longer would be necessary. Any premature termination of these alliances could however cause a serious loss of confidence among Asians in American policies and assurances, impair American prestige among her allies as well as neutrals, and imperil the stability of Asia.

QUESTIONS AND ANSWERS

Q: Mr. Ambassador, what effect, do you think, President Eisenhower's goodwill trip had on Southeast Asia?

A: I think it has had a very good effect. For one thing, apart from the fact that the President has the secret, given to few people, of making friends, radiating friendship, and goodwill, which in itself is a very great gain, this visit gave him firsthand knowledge of what was happening in that part of the world. Those of you who saw his State of the Union Message and subsequently read about what has allegedly been decided by his administration can already see

the results of that visit. These reflect the urgency that he has felt of backing the economic development, of not only all the undeveloped countries, but in particular of Pakistan and India as well as Taiwan.

Q: Mr. Ambassador, would you comment on Pakistan's view of the United States' attitude towards Mainland China, such as Senator Clark's paper suggested?

A: I will give the answer in one sentence. We have diplomatic relations with China.

New Trends in United States Economic Foreign Policy

By EDWIN M. MARTIN

ABSTRACT: United States economic foreign policy has two major functions: to protect and advance public and private economic interests and to promote American political interests abroad. A complex decision-making process is necessary to formulate economic foreign policy. To decide any specific issue, the government must consider the multitude of varied interests involved. The final policy decision will necessarily be a compromise, rarely satisfying all the interested parties. Recent developments in two areas of economic foreign policy—foreign trade and foreign aid programs—have required, in order to continue the policy objectives in these fields, the formulation and execution of new measures. One important change is the deficit in the United States balance of payments. Measures have been taken by the government to counteract this deficit. The rapid rate by which countries are becoming independent poses a new problem for foreign aid programs. The government will continue its share of technical and material assistance to these countries and, in addition, will co-operatively seek to augment the assistance offered by the other industrialized countries.—Ed.

Edwin M. Martin, Washington, D. C., is Deputy-Assistant Secretary of State for Economic Affairs. Prior to this appointment, he was Minister-Counselor for Economic Affairs at the American Embassy in London. Mr. Martin has also served as Deputy Chief of the United States Mission to the North Atlantic Treaty Organization and European Regional Organization (USRO), alternate United States member of the NATO Council in Paris, Special Assistant for Mutual Security Affairs to the Secretary of State, Director of the Office of European Regional Affairs and Deputy Director of International Trade Policy. He entered government service in 1935 and has been with the State Department since 1945.

ALTHOUGH I chose this title myself there is, of course, no such thing as "economic foreign policy." There is only "United States foreign policy." It has economic aspects, though always intermingled with other considerations, and, of course, economic tools are often used to execute policy. But though the phrase is in this sense an abstraction, and it is important that this be understood, it is a useful one and I shall continue to use it.

While it is a commonplace that the art of government is the art of compromise, in my experience, which has covered both domestic as well as foreign governmental activities, I think I have found no area of policy in which the necessity for compromise is so incessant or the conflicting interests so many as in the field of economic foreign policy.

ECONOMIC INTERESTS

In dealing with what we may call the economic aspects of foreign policy, our objective is the apparently simple one of promoting the economic interests of the United States and its citizens. But when we turn to address a specific problem, we find ourselves faced with numerous conflicting pressures, all reflections of the legitimate interests of an important segment of the United States economy. To determine what is "the United States economic interest" becomes a major exercise in politics and economics. An acceptable compromise answer must be found before one can turn to the "foreign policy" issue of how to secure a favorable reception of the United States position by other governments.

For example, when reaching a decision as to whether or not to establish oil import quotas one must take into account not only the views of United States oil companies who are primarily engaged in producing oil in the United

States but also of other companies who are largely dependent on imported oil. One must consider the effect such an action will have on consumers of petroleum products. One will certainly also hear from competing fuel interests like the coal industry and the gas industry. Beyond the multitude of facts presented by these various people in an effort to describe the current impact of a proposed course of action on their livelihood, one must also view the long-term national interest in a natural resource so important to our national life and security.

Having done all this, one then must consider the impact of alternative decisions on our foreign relations, an impact which can in no sense be avoided. If we establish quotas, what will be the direct effect on the economic position of foreign producers of oil who have been shipping to the United States market? Further, what effect will the economic impact have on their political stability and on their attitude toward the United States and on United States leadership in the wider political arena which is so important in the world today? But one cannot stop here. Apart from the possibility of direct retaliation, a decision of this kind will be taken in other countries as indicative of whether the United States is moving toward a protectionist or liberal trading attitude and provide, justifiably or not, precedents and encouragement to one group or the other, with important effects on other United States trading interests.

In some sense, this case is perhaps unusually complicated by the multitude of conflicting interests whose pressures converge on the decision-making center, but I cannot think of any decisions, of any consequence, in which some of these elements are not involved. Often the pressures reach the State Department directly from the interests affected; often the issues are sufficiently related

to national interest that other departments of the government and legislators from the Congress are properly concerned and must have a fair opportunity to make clear in what way the national purposes for which they are responsible will be affected by alternate courses of action. I am sometimes surprised that any decisions at all get made, but an astonishing number of them do in fact, even though sometimes the parties at interest are impatient at the time it takes, and some of them miserably unhappy with the outcome.

POLITICAL INTERESTS

In the other major area of economic foreign policy, that of economic actions designed primarily to assist in promoting political objectives, there is a similar range of considerations forcing compromise decisions. To a large extent this element of our foreign policy is performed through various economic and technical assistance programs. Such programs must often in the short-run be more or less specifically related to our political problems and objectives, country by country. This is a delicate task requiring great diplomatic skill and restraint. Their most important political impact is long-run and indirect, acting through their success in accomplishing their economic purposes of creating sound economic institutions, an understanding of how to make an economy function effectively, and of raising living standards. Countries do not become worth-while friends through purchase any more than do people. We must hope that by our assistance we are making it more possible for each of the less-developed countries to choose freely its own path of political and economic development and that the society which results may be proud to be a friend of the United States, but in any case will wish to and be able to reject the external controls and the internal slavery

implicit in dependence on Soviet leadership and assistance.

In addition to the reconciliation of political aims with economic goals, aid programs call for other types of compromise. First and foremost is the need to adjust the programs we try to pursue to the available resources that the United States people feel capable of sparing for these purposes. In a very real sense the most limited resource is not the taxpayers' money but people who are not only experts in their field and willing to live under unusual and difficult conditions but have the kind of creative imagination and personal touch necessary to apply their knowledge, gained in a highly mechanized, complex, and relatively rich society, to the problems and condition of less fortunate and often newly independent and proud people with great ambitions and hopes but limited material resources.

It is also essential to encompass in our programs not only what our experts think is desirable but also what the recipient countries would like to do, in the light of their own backgrounds, their own understanding of the world, and their resultant aspirations. In other words, to consider what path these countries prefer to take toward the goal of economic well-being and political sufficiency which they all seek. I assure you this is never easy.

Even in the aid field there are also legitimate domestic economic interests which must be given due attention. In the interest of our own business community but also in the interest of our economic and political objectives in the recipient countries, we are anxious that our public aid and lending activities do not inhibit but promote the opportunities for private business enterprise, whether local or foreign. Nor does it make much sense to use United States public funds to develop capabilities to produce items for sale in world markets

which will increase the problems of disposing of commodities which we produce in surplus.

With this brief introduction to the kinds of compromise necessary to formulate United States economic foreign policy, I should like to describe briefly what we are doing in two major areas where recent developments in the world have called for new measures to enable us to succeed in carrying out old policies.

FOREIGN TRADE PATTERNS

In the trade field the last two or three years have seen the end of the period of postwar economic reconstruction and thereby the achievement of the objectives of the Marshall Plan. European countries, Japan and, to a major extent, the Soviet Union have repaired their war damage and restored their disrupted trade patterns. As a result, the United States is no longer the sole source of supply for quick deliveries of many types of manufactured goods and raw materials which in large part it was in the immediate postwar era. The other industrial nations can now meet a large share of their own needs, are able to compete vigorously and effectively with us in third country markets, and by vigorous selling and inspired designing have made the most of their competitive advantages, invading the United States market in an unprecedented way.

The end of the old era and the beginning of a new, yet unnamed period in world economic history has been most dramatically signaled by the change in the balance of payments position of the United States on the one hand and the rest of the world on the other. Between 1955 and 1959, we lost 10 per cent of our gold stores; over the same period other free world countries increased their gold and dollar holdings by 40 per cent. Italy, for example, now

has the third largest gold and dollar reserve in the Western world but her \$3 billion plus is roughly doubled by West Germany.

Protected somewhat by the effects of the Suez crisis in 1957 the United States balance of payments in 1958 and 1959 showed a deficit averaging over \$3.5 billion. During the past ten years, we have acquired a number of large international payments obligations to cover the cost of our military forces stationed abroad in the interest of free world security, to pay for the rapidly increasing volume of United States private investment all over the world, to meet tourist expenditures satisfying the wanderlust and curiosity of the average American, and to pay for that portion of our foreign aid which is spent abroad.

But the changed world trading picture which I have described has whittled away the surplus of exports over imports we formerly had and still need to balance these obligations. While we are a rich country, with very large gold reserves remaining, deficits of the magnitude of 1958 and 1959 cannot be accepted as a regular charge for the indefinite future. The stability and soundness of the dollar must continue, not only in the interests of the United States world economic and political position but also in the interests of the many countries for whom it is the principal reserve currency and whose economic health is therefore dependent on the dollar's health.

The basic decision has been taken that a vigorous effort should be undertaken to move us toward a "reasonable equilibrium" in our balance of payments over the coming years, and that the one path through which a major improvement of the sort required is possible is in expansion of our exports. Thus the liberal United States trade policy of the past twenty-five years, under which we have prospered greatly, still seems to us

the appropriate guideline for actions to deal with these new developments. Restrictions on imports would only invite retaliation, start a downward trend in the volume of world trade, and thus have a retarding effect on economic growth and prosperity of the Western world, so important to us both politically and economically.

We are attacking our problem in this spirit on five major fronts.

Anti-inflationary measures

First and of prime importance has been the Administration's drive to curb inflation and hold the price level steady. Its success in securing a balanced budget this year, with a prospective surplus next year, represents a major contribution by the government to this goal. Ultimate success, of course, depends on actions by others as well. If we can achieve our purpose, the competitive position of United States exports will be improved. For while we are holding prices relatively steady, inflationary pressures have developed in the economies of some of our principal competitors, pressures which will tend to reduce or eliminate such price advantages as they may now have.

Discriminatory practices

Secondly, we have over the past eighteen months pressed a vigorous campaign to secure the abandonment of those discriminations against imports from the dollar area which we tolerated so long as dollars were a scarce currency but which few countries can still justify on this basis. It is not, of course, easy for countries, which have so long been starved for dollars, to adjust their thinking to the new situation in which they find themselves. Moreover, it was inevitable that industries should be built up behind the quota restrictions which are now reluctant to expose themselves to United States competition. However,

it is hard to deny the justice of our case. There is also in most of these countries a real appreciation for the help which we gave and the understanding which we showed during their lean postwar years. As a result all major countries have made substantial reductions in their discrimination against the dollar area and in most cases those remaining are confined to a hard core of agricultural products. It is clearly as difficult abroad as here to find solutions for agricultural problems within the limits of general applicable principles.

Increase sales abroad

With the prices for United States exports more competitive and with new markets opened by the removal of dollar discriminations, it has seemed worth while to institute a major program for promoting increased United States sales abroad. The President announced such a program about two weeks ago. It is most important to underline that the major effort must be made by American business, for only the manufacturer can really sell his product. There are ways, however, in which the government can assist. We are trying to do all we can by providing better service to American business concerns abroad, more information here about opportunities in other countries, and better credit insurance arrangements on export sales. But our main reliance must be on the traditional energy, ingenuity, and skill for which the American private enterprise system is so famous. This is another great opportunity to demonstrate its superiority.

Tariff reductions

Having made substantial progress in eliminating quota discrimination, the Administration is now addressing itself to reducing tariffs against United States goods. When it appeared possible that the Common Market and the Outer

Seven might try to solve their differences by arrangements which, while mutually satisfactory, discriminated against trade from non-European areas, we reversed our previous position and asked to be included in a new group which would grapple with the differences between the Six and the Seven. From this inside position we will be better able, not only to protect ourselves against agreements which will be adverse to our interests, but also to press the Six and the Seven to accompany the preferential position, which the members are giving each other under each arrangement, with lower tariffs to the outside world. We wish to ensure that they will not become closed trading areas but will contribute to a general expansion of world trade.

It is with this end in view that we have welcomed the Hallstein proposal that an acceleration towards a common external tariff among the Common Market countries be accompanied by a 20 per cent reduction in the tariff scale.

It is also to enable us to negotiate for reductions in their tariffs that we asked for and secured from the Congress the most extensive authority yet granted for negotiating on tariffs in the meetings of the General Agreement on Tariffs and Trade (GATT). This coming fall and winter will see a series of such negotiations in which we will use our bargaining power to secure tariff concessions from other countries and organizations like the Common Market which will facilitate the expansion of our exports. It must be clear, however, that we can only succeed in securing concessions desired by United States exporters if we are willing to open up some opportunities to others.

Low-cost imports

Lastly, we have addressed ourselves more formally than heretofore to the problems created for United States in-

dustries by the increasing volume of imports into the United States from such low-cost areas as Japan and Hong Kong. Some temporary relief has been found in voluntary arrangements to restrict exports of particular items whose price and volume tended to swamp our industries. In addition we are pressing our European allies, now that they are in a sound financial position, to open their doors wider to imports from these areas, thus sharing the advantages and disadvantages of these low-cost imports rather than having them sent primarily, as they now are, to the United States and Canada.

But these are temporary arrangements and not satisfactory solutions to the long-run problems of the very low-cost producers. As time goes on, we shall find more and more of the now less-developed countries with a desire to earn more of their way and a need to repay the large volume of loans now being made to them. We can hardly expect that they will be able to do so solely by the export of raw materials and tropical foodstuffs which are not competitive with our own industries. A middle way must be found which will give them a market for the industrial products which their economic development will permit them to produce without enabling them to seriously disrupt important parts of the industrialized countries' economies. The United States proposed, therefore, at the GATT meeting in Tokyo last fall that a special group be established to recommend possible solutions. It is now at work. The problem is inherently complex, politically and economically, and I cannot predict that a solution is in sight. But a vigorous and rational attack on it has been launched.

These efforts combined with other special factors have permitted us to start 1960 with a substantial increase in our exports over 1959 levels, with-

out a corresponding rise in imports. This is an excellent beginning and seems to prove that the problem is not insoluble and that the means to combat it have been well chosen. But a few swallows do not make a spring. There are still no grounds for relaxation and much hard work and thought will still be required before we reach the necessary "reasonable equilibrium" in our balance of payments.

FOREIGN AID PATTERNS

The second major area of new developments in our foreign policy is the increased intensity and complexity of the problems to which our foreign aid effort must address itself. This results from two factors. First is the ability of the Soviet bloc, as a result of their considerably improved economic position, to which I have referred earlier, to undertake fairly substantial aid commitments. Any pleasure that we might have at the willingness of the Soviet Union to share the burden of providing badly needed development capital to the less-developed countries of the world is seriously diluted by the Soviet Union's utilization of the position which such assistance gives her to promote the adoption of Communist ideology and Communist methods.

The existence of this alternative source of aid also presents a tempting opportunity to the recipient countries to manipulate their demands between the West and the Soviet bloc in an effort to secure more funds from both. This is an opportunity of which advantage will only be taken by countries which are either inexperienced and uninformed about the political elements of Soviet economic assistance or are completely confident that they can defeat Soviet attempts at political infiltration. It is vital to the future of such countries that they understand the dangers of overconfidence in this regard.

In order that the less-developed countries be able to make a free choice and improve their chances of staying free, they must be offered by the West a sound but attractive package of technical and economic assistance designed to enable them to make real and noticeable progress toward higher living standards for their peoples. Our policy must be conceived to provide such an adequate alternative rather than merely to match Soviet offers. It must also recognize that assistance is in the United States interest whether or not there is Soviet competition. The legitimate ambitions of the less-developed countries must be given an opportunity to find fruition in a reasonable rate of economic development. This cannot take place without the kind of economic assistance from both public and private external sources that we benefited from in the early portion of the last century.

Newly independent countries

Our foreign aid program is also faced with new problems because 1960 will apparently give birth to at least eight new countries, perhaps more, in contrast with an average of two a year over the last ten years. These countries add new demands to the other urgent ones with which we have already been dealing. With independence their peoples expect a major upsurge in economic well-being which, if disappointed too seriously, might become a cause of political instability and economic deterioration, developments no one in the West can desire. Many of them start with great difficulty in finding the trained personnel to plan a development program, not to mention the problem of its execution and later of the efficient functioning of the more complicated economy which results.

We are doing what we can to meet these new needs, but we are also ex-

pecting that added resources will become available as a result of the new found prosperity of our European allies and Japan. Currently, we are providing around \$2 billion a year and they are contributing approximately \$1 billion in various forms of direct public assistance. Their share has been increasing each year for the past several years and there seems every reason to hope that it can continue to grow. The added urgency of the need, to which reference has been made, will not only render a reduction in the United States contribution impossible but will also require a more nearly adequate execution of the responsibilities of the industrialized countries.

It is important not to minimize the problem they have in expanding their present aid levels. Several of them have very large gold and dollar reserves but it is not simple to convert these assets into aid for less-developed countries that will provide projects of a long-term character, which is the main requirement. One can raise taxes, sell government bonds in the market, reduce expenditures on other programs, or sell bonds to the central bank. None of these is easy and some of them are fiscally risky for the countries which are most prosperous. Certainly we have found that securing the funds for an adequate program of public assistance is not easy and cannot be done without sacrifice.

Our friends have only recently achieved their present state of prosperity, and they are relatively inexperienced in the problems of developing an adequate foreign aid program. In order to help them to learn from our mistakes and difficulties, as well as to permit a better co-ordination of the activities of the increasing number of agencies engaged in making assistance available, there has been organized a Development Assistance Group. It had its first meeting

early in March and made real progress toward these objectives. This is an official level organization, engaged essentially in the technical problems of economic assistance and not concerned in any way with dividing spheres of influence, discussing individual country programs, or individual projects. It deals only with principles, broad policies, general means, and methods. It is as interested in expanding aid through the United Nations and other multilateral channels as well as bilaterally. But I think by means of this organization we can make real progress to improve the quantity and quality of assistance made available.

In granting effective assistance, it is necessary also to have the help and advice of the less-developed areas. It is particularly important, for example, that they be able to exercise a co-ordinating role to ensure that the several types of aid received from various sources are integrated into a sensible plan and a well-designed set of priorities. They are in the best position to control the flows of assistance.

It is equally important that they resist the temptation to secure quickly large amounts of credits to finance capital equipment for development projects from commercial sources on short-terms—three to five years—only to find that they have seriously overburdened their payment capacity and face bankruptcy. It has happened. It is in their interest as well as ours that they exercise restraint and finance their development programs by loans and other forms of assistance which create a burden reasonably related to the growth of their capacity to liquidate their debts. If we in the industrialized countries are tempted to inflate our exports by pressing short-term credit on them, the less-developed countries must warn us that we are placing them in an unsound position and insist on the more gener-

ous repayment terms their situation requires.

There are, of course, many other subjects with which economic foreign policy must deal. I have discussed two broad areas in which new problems have compelled us to seek new lines of action and new arrangements. The flexibility which we have managed to achieve in these situations is something to be proud of and reflects the maturity which has

been acquired over the past two decades by the American people in the field of foreign policy. If we can maintain this spirit in our approach to world problems, we need have no fear about our ability to support the responsibilities of our leading position and continue successfully the fight to maintain the ideals for which this country stands, and thus make clear to others the benefits of our way of life.

* * *

QUESTIONS AND ANSWERS

Q: I have been very much interested in the administration of the tariff. All during the year, I have been very much in favor of low tariff, that is a tariff for revenue only which would not protect the big industries and would serve the general consumer, that is, serve the mass of the people. I would like to know how the administration of the tariff could work out in regard to the public opinion and the general interest of the people. I want some ideas on how a high tariff would work and also how a low tariff would work?

A: I must confess that I am not sure which point of the question to address myself to. It seems to me that we are dealing in this field, as in most others of human endeavor, with an imperfect world, and one in which, as I indicated in my speech, compromises are the only way one gets ahead. In general, we feel that the United States interests will be best served by continuing ourselves and encouraging others to lower tariffs. On the other hand, if one does this overnight, one disrupts the existing patterns of economic activity in a way which is not to the net advantage of ourselves or others. Consequently, what we have been doing for the last twenty-five years represents gradual but very substantial progress in lowering our

tariff. Other countries have to a lesser extent done the same. I hope we can continue to do this. It is to our advantage, it seems to me, to make exchange of goods between the United States and other countries as free as possible. But beyond that—getting into more specific questions on more specific items and commodities—there is just no time to do that here.

Q: My first question is: after the vanishing, so to say, of the "dollar gap" and the creation of the new economic organization for economic co-operation, as you mentioned in your speech, how much will the United States back the one or the other group, namely, the Common Market or the group of the Seven, the Free Trade area? It is clear, as Dr. Hallstein has emphasized, that the Six are against discrimination towards the dollar. The other group did not make it clear so far. So what is the American attitude? Which group will be picked by the United States? The second question is how much the United States is admitting difficulties because the eastern part of Europe, the predominantly agricultural part, is under Soviet domination and is hampering the economic and political unity of Europe?

A: First, you were wondering whether the Seven had made any offer similar to what Mr. Hallstein made. They did announce after a meeting in Vienna a few weeks ago that they were prepared to make an immediate 20 per cent reduction in their external tariffs to correspond to their internal 20 per cent reduction. In theory this is more than the Six have offered. Unfortunately, however, this is contingent on the Six doing the same. If the Six were to reduce now their external tariffs, the countries that have low tariffs would be moving away from a common external tariff instead of toward it. So that the Six regard this as a movement to block the development of the Common Market and to prevent it from accomplishing its purposes. I doubt if the Vienna proposal will be accepted, but they have made a generous offer. As to whether the United States is backing the one or the other, I think it has been clear for quite sometime that we have felt that the Six was not only economically but politically of great importance to the Western world, primarily because it would provide a means, through economic intergration, of making West Germany fully tied to the Western world and fully a part of it. At the present time, West Germany is a very co-operative member of Western society, but times do change. It had seemed to us that it was important to develop an organization which, beyond pieces of paper, would tie them closely to the West. Furthermore, it seems important too in a group of countries each of which has certain advantages and disadvantages in terms of future strength, to get them together. As a group they would be a much stronger unit. In Europe, such a strong unit on the side of the West could have an attractive force beyond the present line between East and West. It would also create a stronger defensive force. For all of these political rea-

sons, we have felt that it was of great importance that the project of the Six succeed, and we have backed it fully. At the same time, we have recognized the problem of the Seven who are now in the European Free Trade Area, the Outer Seven, so to speak. We have seen that they have problems, that their arrangement met some of these problems, and have indicated that we have no objections to their going ahead. If there are issues before the GATT of whether they met its criteria or not, we have said that we would consider these problems sympathetically. We have not tried to choose, although we have made clear that politically we would not want anything the Seven has done to block or interfere with the success of the Six. If this became the issue, which we hope it will not, we would have to back the Six.

Now your second question. I have the impression that while in the early postwar years, this division of Europe between the largely industrialized parts and the largely agricultural parts was a handicap and a problem, particularly with respect to Germany, this is no longer in this sense the case. There has been an adjustment made which has helped balance out the picture. There is still, of course, a very substantial flow of agricultural products back and forth across the two lines, and in parts of the Western world other than Europe, there seems to be a reasonable surplus of agricultural commodities which they can import, and we have no trouble meeting their needs. I would think that at the present time this agricultural-industrial split is not a significant problem. There are other economic problems that would be largely solved and relieved and Europe would have greater prosperity if there were not the present division. But on the whole it is more of a political problem than an economic problem at the moment.

A Hard Look at America's Unfavorable Balance of Payments

By HERBERT STEIN

ABSTRACT: The theory, so widely held by economists in the postwar era, of the "dollar gap" or dollar shortage has been invalidated. The evidence is clear. The dollar is not always subject to scarcity but to excess supply as well. There is need for no better verification than the deficit in the United States balance of payments. The immediate reaction to this deficit was twofold: there were those fearful lest the deficit continue, and those afraid that the measures taken to counteract the deficit would be harmful to our international economic policy. The fury has abated. The deficit has declined, inflationary movements have been quelled, and the anti-deficit measures taken in the international economic sphere have not been widespread. But it is too early to be complaisant. The deficit, though somewhat reduced, continues; moreover the problem of how to eliminate or reduce the deficit to a reasonable size remains. What measures should be taken to ensure the least cost to our economic posture, both domestic and international? More aware of the close interrelationship between our economy and others, we must now seriously consider a balance of payments mechanism. We must be prepared with a flexible mechanism should the contingency of an imbalance in our balance of payments occur.—Ed.

Herbert Stein, Ph.D., Washington, D. C., is Research Director of the Committee for Economic Development (CED). A member of the research staff of CED since 1945, Dr. Stein formerly served as an economist for the United States government. He is a graduate of Williams College and the University of Chicago, and has written U. S. Government Price Policy During the World War (1938), in conjunction with several authors; Jobs and Markets (1946); edited, Policies to Combat Depression (1956); and contributed to the recent CED brochure, "National Objectives and the Balance of Payments Problem" (1960).

AMERICAN officials are fond of quoting the remark made by Dr. Ludwig Erhard that the American dollar is the sun around which the world economy revolves. The moral of this paper is to observe, with Galileo "Nevertheless it moves." The dollar-centric view of the world economy is unrealistic and therefore dangerous. The dollar is a currency like other currencies, subject to the same laws of behavior and requiring similar care if its strength is to be preserved.

The furor over the deficit in the United States balance of payments has largely abated. I use the word "furor" in a relative sense. Relative to the degrees of excitement normally stirred up in this country by questions of international trade and finance, the balance of payments situation created a furor in the fall of 1959. Today worry about the problem is much less keen and widespread.

REASONS FOR THE FUROR

There were two main reasons for the furor, and these reasons by and large influenced two different groups of people. On the one hand were those who worried because the deficit might continue and even grow. To them the most important point was to stop the deficit. On the other hand were those who feared that the deficit would be stopped in the wrong way. To them the important point was to preserve our foreign aid programs and our policy of minimizing barriers to international trade and capital movements.

For the first group, those who feared the continuation of the deficit most of all, the chief facts visible in the fall of 1959 were these: We had had a deficit of \$3.4 billion in 1958 in our balance of payments. In the second quarter of 1959 the deficit had increased to \$4.8 billion at an annual rate. I use the

term deficit throughout to mean the sum of our gold exports and the increase in our short-term dollar liabilities to the rest of the world. This rate of deficit was large relative to our \$19 billion of gold. People could proceed, and they did, to count on their fingers the years until our gold would be exhausted or at least our ratio of liabilities to gold would reach a frightening size.

The reasonableness of projecting the 1958 and 1959 deficits into the future seemed to be confirmed by events on the domestic economic scene. We had a large budget deficit in the fiscal year 1958-59. The anti-inflationary tight money policy was under strong political attack. The steel industry and the steel workers union were locked in a struggle that might determine the future strength of wage-push inflation. In these circumstances it was easy to visualize the United States careening along on an inflationary course that the rest of the industrial world had already abandoned, with grave consequences for our balance of payments.

For the second group, who feared the deficit less than our reaction to it, the problem only became acute with the announcement, last October, that foreign economic assistance would be provided by our Development Loan Fund only to finance purchases in the United States. This was regarded by many as a major sacrifice of principle on the altar of the balance of payments. Debate was understood to be continuing in the Administration over the extension of this tied loan or grant policy to other parts of our foreign economic assistance program. Suggestions were being heard that foreign economic and military aid should both be reduced in order to balance our payments. Although Congress was not in session, legislation to curtail imports was accumulating for consideration in 1960, and the balance of pay-

ments deficit seemed to give added impetus to such legislation.

WHY THE FUROR HAS ABATED

In the past six months both groups have become more confident. The deficit declined from an annual rate of \$4.8 billion in the second quarter to \$4.1 billion in the third quarter and shrunk to \$2.0 billion in the fourth quarter. For the year as a whole the deficit turned out to be \$3.7 billion, as compared with earlier estimates that it would exceed \$4.0 billion. The best available estimate for 1961 is a deficit of \$2.9 billion.

Opinion about the inevitability of inflation has also changed drastically. It is now about as common to say that the age of inflation is over as it was a year ago to say that it would continue forever. The budget has been brought into balance and a surplus is in sight for next year. The steel settlement at least left alive the possibility that the rate of money wage increases would settle down to the rate of growth of productivity. A spontaneous decline of interest rates has taken some of the "steam" out of the political opposition to anti-inflationary monetary policy.

Meanwhile the conduct of United States foreign economic policy has been reassuring. The tied-loan step of the Development Loan Fund was not followed up by other agencies but was explained as a tactical move designed primarily to induce other industrialized countries to supply more capital to the underdeveloped world. The Administration's requests for military and economic assistance funds seem not to have been influenced by balance of payments considerations. The recent United States initiative in foreign economic policy has been Mr. Dillon's proposal to strengthen co-operation among Western Europe, Canada, and the United States. While it is probably hoped that this will have a favorable effect on our

balance of payments, it is certainly not an economically isolationist reaction to the problem. Proposals for legislation on trade have remained dormant in the Congress.

THE PROBLEM REMAINS

I think it is clear that last fall's excitement about the deficit and our likely reaction to it went too far. But I think that this spring's relaxation of concern has also gone too far. The sharp reduction of the deficit between the third and fourth quarters of 1959 was due in large measure to one nonrecurrent factor—advance repayments on some government loans. The forecasted decline in the deficit from \$3.7 billion in 1959 to \$2.9 billion in 1960 also would be due in large part to the passing of certain temporary items. This decline cannot be projected beyond 1960.

How large a deficit we can run without worrying about it is impossible to say. So much depends upon the expectations and confidence of those, at home and abroad, who hold dollars. Presumably we could run an average deficit larger than zero for a considerable period. But note that if the estimate for this year is correct we shall have a total deficit of \$10 billion for the three years 1958, 1959, and 1960. Seven years of zero deficits would be required to reduce the average deficit for the period beginning in 1958 to \$1 billion a year. I think it is fair to say that there are no signs of a spontaneous decline in the deficit to zero or to \$1 billion a year in the next few years.

The time has not yet come for declaring the age of inflation over, even though the certainty with which some people asserted the permanence of inflation was unjustified. After all, the evidence from which we would deduce the end of the inflation is still scantier than that recently used to demonstrate its permanence.

Neither can we yet be confident that the structure of American foreign economic policy is safe against the reaction to the balance of payments deficit. Congress has been distracted by other things. We have not yet had the debate over the foreign aid appropriations, and when that happens we will certainly hear more about the deficit. Also, there is still a considerable tendency in the country to view the balance of payments problem as a problem of protecting American industry against "unfair" foreign competition. Perhaps more important, while the existing posture of American foreign economic policy may withstand the balance of payments problem, that problem may yet obstruct new moves that would be desirable in trade and aid policy.

So we must continue to think and talk about the United States balance of payments. But we can now think and talk about it differently than we would have done two years or even six months ago. I believe that we have learned something from recent discussion of the balance of payments. At least, some points have been so obvious in the discussion that they should have been learned. I should like to comment briefly on some of the lessons gained from our recent experience and discussion before turning to the problems that remain unsolved.

LESSONS OF THE RECENT EXPERIENCE

Economists have had yet another lesson about the hazards of economic forecasting. Weighty tomes about the persistent dollar shortage were continuing to appear after the dollar shortage had vanished. We must either speed up the publication process or be more cautious in the future. Particularly, we shall have to be careful about making intellectual commitments to the idea of persistent dollar scarcity.

Why such a large number of econo-

mists were wrong about the dollar shortage is a question that will be debated for a long time. I would venture the opinion that in this case, as in several others, economists have erroneously interpreted as real, and therefore rather intractable, phenomena that were basically monetary phenomena and would yield to sound monetary policy.

A second lesson, this one not confined to economists, has to do with the nature of our relations with the economies of the other industrialized nations. The change that has occurred is clear if we compare the rationales of the Marshall Plan and the Dillon Plan. The Marshall Plan was a declaration of America's political interest in the European economy. The Dillon Plan is much more a declaration of America's economic interest in the European economy. In the Marshall Plan days and subsequently our economic relations with Europe were slack. Because of the excess demand for dollars our economy was largely insulated from the consequences of relative price levels, interest rates, and capital movements. Today the gearing between our economy and that of the rest of the industrial world is much tighter and runs in both directions.

As a direct consequence, we are much more aware of the relations between our own domestic economic policy and our international economic policy. For about twenty-five years prior to 1958, American economic thinking, in the universities, in the government, and in the country generally, was divided into two isolated compartments—one domestic and one international. This division is illustrated by the Employment Act of 1946, ideologically the most significant economic legislation of this generation. The Act sets forth a number of basic objectives and conditions that should govern our economic policy, but the Act does not refer to any goal for our

international economic position. The Act would probably be written differently in this respect, as in some others, if it were written today. We are, I think, only at the beginning of a recognition of the great variety of domestic economic policies in which we must hereinafter pay attention to effects on our international position.

CYCLICAL BEHAVIOR OF THE UNITED STATES BALANCE

We have, I hope, learned something about the cyclical behavior of the United States balance of payments. For many years the standard view was that the international balance of the rest of the world was highly vulnerable to a United States recession. In the old cliché, when the United States sneezes Europe gets pneumonia. It was believed that even a minor American recession—as judged by domestic expectations—would so depress our imports as to cause serious trouble for the rest of the world. This theory was somewhat shaken by experience during the 1954 recession, which Europe weathered rather well. But the real "eye opener" came in 1958 when it was the United States rather than Europe that suffered the balance of payments problem. The European recession slowed down our exports of capital goods and industrial raw materials, but our recession did not interfere much with our imports from Europe, which are largely consumers' goods. Our own raw material imports did decline, but these came largely from underdeveloped countries with small foreign exchange reserves. They had to reduce their imports from us when we reduced our imports from them.

It may not always be true that when Europe sneezes the United States will get "the shakes," but we should be prepared for the possibility. We should not be alarmed by the deficits we may

run during recessions but we should try to put ourselves in a position, during favorable cyclical phases, to withstand recession deficits.

The world should also have learned something in the last two years about the way the United States behaves in a recession. We heard a great deal in 1958 and early 1959 about the worries of the Zurich bankers over the large deficit in the United States budget. They apparently regarded this as a grave omen of fiscal irresponsibility, inflation, and weakness in the dollar. Their fears seemed to be contagious and even to feed back to the United States. But they should have known, and should have learned by now, that the United States budget will show a large deficit in recessions, in conditions when the deficit is not inflationary, and that it will quickly snap into balance when the recession is over. No deductions about the long-run trend of American financial policy should be drawn from our recession deficits.

Everyone who thought seriously about the balance of payments problem during the recent excitement must have encountered certain taboos. One is obviously related to the exchange rate of the dollar. It was not good form to talk about the exchange rate while we had a large deficit, because talk on this subject might disturb confidence and cause a run on the dollar. A similar, although weaker, taboo applied to discussion of the law which requires that a large proportion of our gold be held as reserve against liabilities of the Federal Reserve System. This requirement makes this part of the gold unavailable to meet foreign drains. Many people wished that in quieter times we had discussed these matters and arrived at conscious national decisions about them. But 1959 did not seem the year for that. There is, in my opinion, a lesson here. Let us be sure that we do have

a candid discussion of these matters when the atmosphere is once more calm.

WHAT THE PROBLEM IS

I shall refer to only one more lesson of our recent experience and discussion. This lesson has to do with what the balance of payments problem is and is not. The problem is not simply to bring our foreign payments and receipts into equality or into a sustainable relation. There are a great many ways to do this, and if we do nothing at all the deficit will come to an end anyway—certainly when the gold runs out. The problem is to eliminate or reduce the deficit in the best way, in the way that costs least in terms of national and individual objectives.

If we have a deficit of \$3 billion and want to eliminate it, we must sacrifice \$3 billion worth of something. We must give up some combination of foreign economic assistance, military expenditures abroad, private overseas investment, foreign travel and other services, private merchandise imports, and domestic use of goods and services that could be exported. We can choose the proportions in which we relinquish these various things. It is a mistake to think that solution of the deficit problem requires, as a matter of economic necessity, that we give up any particular item on this list. All that is required is that we give up enough in total. To decide what to yield is the task of statesmanship. To execute this decision is the task of economic policy.

There was a tendency in the early days of the balance of payments debate to fix upon our foreign economic aid and military expenditures as the things to sacrifice. But this was never an economically necessary choice, and in broader terms, in my opinion, it would be an unwise choice. The decision to spend X billion dollars a year on such programs has little political sex appeal

and no strong pressure groups for its support. The decision is made each year after most intense and unsympathetic scrutiny. More than in most other parts of the federal budget, it can be said that the decision to make these expenditures reflects a deliberate evaluation of serious national interest. Considering the nature of these decisions, it is absurd to say that they must be reversed because an economy capable of producing \$500 billion of goods and services cannot generate some combination of increased exports and reduced imports that will add up to approximately \$3 billion.

UNSOLVED QUESTIONS

Looking ahead to the future of the American balance of payments, it seems to me that there are three main unsolved questions. I call these questions unsolved quite literally, not as a polite way of saying that only I know the answers but quite candidly that I do not know the answers. The questions are:

1. Have we a satisfactory adjustment mechanism for keeping United States foreign receipts and payments in sustainable balance?

2. What change, if any, in the structure of United States exports and imports will be needed in the future? In my opinion, the essential question here is what will America produce best in a world where capital, technological know-how, and managerial capacity move across international boundaries with great ease and fluidity? This will be a better, more prosperous, and more stable world. The adjustment to it will create some problems for us, because the special productive abilities in which we have had the greatest advantage will be more widely diffused. How well we make the adjustment will affect the efficiency of our own economy, but will not control our ability to solve the balance of payments problem.

3. How can we generate the increase in world liquidity that will be required by the growth of the world's economy? How long can we rely upon gold as the basis of international means of payments, a reliance long since abandoned in domestic economies? Looked at from the other direction, will we be ready to entrust to an international central bank the essential functions now exercised by national central banks? What implications would such a development have for independent conduct of other domestic economic policies?

Except to recognize them as problems, space does not permit me to say more about the second and third of these questions. I shall confine my remaining remarks to the first question, which in the perspective of, let us say, the next ten to twenty years may be the most important.

It may be that we shall solve the current balance of payments problem through a combination of ad hoc measures. The list by now is familiar. Foreign nations should eliminate their discriminations against the dollar. Other industrialized countries should increase their capital exports to the underdeveloped world. We should stop inflation at home. We should make American producers more keenly aware of the opportunities and problems in meeting foreign competition.

Some such package of measures may suffice, and they may suffice for quite a long time. They may serve as a once-for-all adjustment to a once-for-all adjustment in foreign productivity and economic stability that has been taking place. But these measures do not constitute a balancing mechanism. They are not measures that can be applied flexibly, reversibly, and to the extent necessary to meet pressures on the balance of payments, the strength and timing of which cannot be foreseen. Once we have stabilized our price level we

cannot stabilize it further. Once dollar discriminations have been abolished they cannot be abolished again. And so on. These are all things that should be done. In fact, they should be done whether or not we have a balance of payments problem. This is why it has been so easy to agree on them. It is also why they cannot by themselves constitute a satisfactory balancing mechanism. We need something that can be done only if and to the extent that is required by the balance of payments.

WHAT A BALANCING MECHANISM IS

What I mean by a balancing mechanism can best be shown by listing the kinds of mechanism that economists have traditionally discussed. There are four principal means, aside from direct controls, by which it has been thought that a country's international payments could or would be kept in balance in the face of the varied and unpredictable forces that play upon those payments:

1. Prices and money incomes would decline in a country having a balance of payments deficit, partly as a direct result of a decline of exports relative to imports and partly as an indirect result of loss of monetary reserves. The decline of prices and money incomes would increase the deficit country's ability to export and reduce its ability and willingness to import.

2. Real incomes would decline in the deficit country, for similar reasons and with similar results.

3. Interest rates would rise in the deficit country, mainly because of the loss of monetary reserves, and capital would flow in from abroad.

4. The exchange rate of the deficit country would decline.

The common characteristics of these means for maintaining balance is that they can be used as much as necessary—*à l'outrance*—to achieve the result. For example, there is no assignable

limit to the possible decline of the exchange rate and therefore no assignable limit to the balance of payments pressure with which it can cope. In this it differs from, say, lectures by the Secretary of Commerce to exporters, which do have a visible limit of effectiveness.

These four methods of maintaining balance do more than illustrate what a balancing mechanism means. They constitute, I believe, a complete list of the possible elements of a balancing mechanism that have been conceived in more than a century of thought on the subject by economists. Again I exclude direct controls from consideration. I also exclude possible multilateral arrangements under which surplus countries would commit themselves to hold any amount of the currency of deficit countries. In such an arrangement deficit would cease to have its usual meaning of the accumulation of foreign liabilities that could be withdrawn in gold. However, it is inconceivable to me that any country would undertake such a commitment without assurance that deficit countries would employ some of the foregoing measures to limit their deficits. Otherwise the surplus countries give a blank check.

HAVE WE FORSWORN ALL REMEDIES?

To list these four means for maintaining balance is to see how alien they are to our avowed policies. We will not deflate, we will not allow employment and real output to fall if we can avoid it, we will not allow interest rates to rise beyond the point that is consistent with price stability and full employment at home, and we will not devalue. Unless someone has a secret weapon, this seems to leave us without a balancing mechanism.

In fact, we have more room for maneuver than this. The price level that counts is the relation between our price level and foreign price levels. While we

will not deflate, other countries may inflate, and surplus countries have some tendency to do so. We will all have stable price levels, but some will be more stable than others. On our side, the full employment and maximum production we maintain are not always quite full and maximum. Foreign competition can still cause unemployment and idle capacity that provoke a domestic reaction to meet the competition. Moreover, the level of interest rates that is consistent with high employment and price stability is not uniquely given, but depends upon certain variables that can be manipulated, notably the budget surplus. Perhaps we can, if necessary, use high interest rates in defense of the balance of payments, although at some sacrifice of economic growth.

Nevertheless, it seems an unsatisfactory strategy to try to work out a balance of payments policy in the gaps left by our failure, or the failure of other countries, to achieve price stability, high employment, and rapid growth. I make no predictions. The ebbs and flows of international economic forces may be sufficiently offsetting, our reserves sufficiently large, even this limited room for maneuver adequate, to keep us out of trouble. But no one can say with confidence that this will be true.

WHAT IS SPECIAL ABOUT THE DOLLAR?

Our recent and current deficits show us that the dollar is a currency like any other, not designated by Providence always to be scarce but liable sometimes to be in excess supply. We are therefore subject to the classic dilemma of the balance of payments—namely that a domestic policy of general price stability, high employment, and growth will not always be consistent with a fixed exchange rate. This dilemma does not only exist in theory; it has been en-

countered in fact by every nation in the world, except us, in the past twenty years.

The charter of the International Monetary Fund recognizes this problem and incorporates a way to deal with it. It is expected that members of the Fund will pursue antiinflationary policies in order to avoid balance of payments deficits. But no country is expected to put its domestic economy through the deflationary wringer in order to keep its international payments in balance. For a country pursuing sound and prudent internal policies, devaluation of the currency is a permitted remedy for persistent balance of payments difficulties.

But we have not thought that this problem or this remedy applied to us. There are obvious reasons for this. For so many years the dollar was the scarce currency and our reserves were so large. Moreover, there is a real difficulty in the way of devaluation for the United States dollar. The United States, as is frequently said, is the world's banker. Dollars are held as reserves by most foreign central banks as means by which they will meet temporary deficits in their own accounts. This imposes a responsibility upon us. But surely we are entitled to ask whether we must continue to bear this responsibility if it requires subordination of our own domestic economic objectives.

a persistent balance of payments deficit. This is not because I have any fondness for this solution and it is not my point to urge such a solution. My main point is that we need to be prepared with a better thought out and accepted philosophy of ways to deal with a balance of payments problem than we now have.

One may fairly ask why it is necessary now to consider remedies for a contingency that is not now present and may never occur. Why raise such confidence-disturbing questions now rather than wait for the problem to arise if it ever does? The answer is that the problem *may* come, and if it does we will wish we had considered these questions earlier. I would hate to see us twisting and squirming with inferior solutions—cutting our political and economic commitments abroad, imposing restrictions on trade, travel, and foreign investment, trying to hold down the domestic economy—because we are intellectually, psychologically, and institutionally unprepared to do better.

I do not like to end on such a somber note. Our position is both strong and improving. If we are reasonably sensible about inflation there is a good likelihood that our position will remain strong. That is why this is a fitting time to talk about more remote and less comfortable possibilities.

* * *

THE NEED TO BE PREPARED

I suppose it must be obvious that my own thinking leans toward inclusion of devaluation among the instruments by which the United States might adjust to

(Dr. Stein unfortunately was ill at the meeting and could not participate in the Question and Answer period.—Ed.)

Should We Reassess Our Foreign Aid Program?

By PAUL G. HOFFMAN

ABSTRACT: One and a quarter billion people in the underdeveloped countries are in the midst of the "revolution of rising expectations," perhaps the most important revolution ever known. The industrialized countries have recognized the existence of a need for improved living standards in these countries and have granted substantial bilateral assistance as well as assistance through the channels of the United Nations agencies. But the many national and international programs have not markedly affected the living standards of these people. To speed economic growth in the less-developed countries, we must reassess our assistance programs. Only by increased efforts and concerted action among the industrialized countries, in conjunction with the underdeveloped countries, can a notable improvement in per capita incomes of these people be achieved. The industrialized countries must realize that their own prosperity depends on a growing and expanding world economy, that it is, therefore, in their interest to help the less-developed countries achieve a more rapid economic growth. It must be recognized that investment in the underdeveloped countries is essentially trade, and, conversely, increased trade is development aid. The United States, for its part, will have to augment its aid program. We can afford to do more, especially when we know that our increased efforts will be creating a more prosperous world.—Ed.

*Paul G. Hoffman, New York City, is Managing Director of the United Nations Special Fund. He was the first Administrator of the Economic Co-operation Administration (Marshall Plan). A former President of the Studebaker Corporation, the Studebaker-Packard Corporation, and of the Ford Foundation, Mr. Hoffman has also been a member of the United States delegation to the United Nations. He is the author of *Seven Roads to Safety* (1939) and *Peace Can Be Won* (1951).*

FIRST, I will give a quick answer to the question, should we reassess our foreign aid program? It is an emphatic yes! To do so, I suggest, we need to know the dimensions, complexities, and nature of the problem of speeding the development of the less-developed countries. We must review the contribution external aid has made up till now and, learning from our past experience, seek the ways and means to improve its effectiveness.

We are in the midst of one of the most significant events of our time: the revolt of two thirds of the world's people against continued acceptance of poverty, illiteracy, and chronic ill-health. The yearnings of these people for a better living, if channeled correctly, can bring us a better and more prosperous world or, if their yearnings are ignored, a world of mounting tensions and explosive unrest.

Included in the revolt against poverty are, of course, the people of Communist China. It is not because of any indifference to the plight of the 650 million Chinese that they have not been included in United Nations programs, but rather because Communist China does not belong to the United Nations. Our principal concern in the matter of economic development is with the one and a quarter billion people who live in some sixty member nations of the United Nations or in some forty territories and communities associated with the United Nations.

AWARENESS OF THE NEED

The "revolution of rising expectations," as it has been aptly called, is of recent origin. Through countless centuries most of the forebears of these underprivileged people, who are now so determined to improve their lot, endured patiently the evils of poverty and ignorance. In all probability there was

always some smouldering unrest, but it did not burst into flames until the advent of World War II. Because most of the billion and a quarter people with whom we are concerned lived in colonies, they attributed to their colonial status the blame for their unhappy lot. Therefore their flaming unrest first took the form of a demand for independence. No less than twenty-two nations have won independence for their 800 million people in the short period of the 1940's and 1950's. Several other nations comprising many tens of millions of people will become independent this year. And there is explosive unrest in many of the remaining dependent countries. Unfortunately, independence of and by itself does not assure economic progress. Political revolt is only the beginning of a wider and deeper revolt against the indignity of poverty.

Another significant development of recent origin is a growing awareness that the richer nations in their own enlightened self-interest should assist the poorer nations in speeding their economic development. President Eisenhower was voicing this concern when he said in a television interview with Prime Minister Macmillan:

I believe that in a sense the problem of the underdeveloped nations is more important for Western civilization than this problem of the Soviet-Western differences, and quarrels. And there are about two billion people today living without sufficient food, shelter, clothing and health facilities.

This recognition that something should be done for the people in the less-developed countries—in the interests of all—first found expression in the Expanded Programme of Technical Assistance of the United Nations and in President Truman's Point Four program, both of which came into being in 1949. Prior to this time, responsi-

bility for assistance was left to the churches and other humanitarian groups which, of course, have long been concerned with the plight of the desperately poor and underprivileged in other lands.

Bilateral assistance

In the 1950's assistance to the underdeveloped countries increased substantially. The United States embarked upon a huge program of bilateral technical assistance through the International Co-operation Administration and bilateral lending through the Export-Import Bank and the Development Loan Fund. The United States also contributed to the programs of the United Nations, the Colombo Plan and the Organization of American States. Great Britain, France, the German Federal Republic, the Soviet Union and other countries also established bilateral programs for giving technical and other financial assistance.

United Nations Agencies

Then there were the United Nations agencies. First, those concerned with economic development through capital investment—the International Bank, the International Monetary Fund, the International Finance Corporation. Second, the group operating in the pre-investment field, whose function is to lay the foundation for investment by assisting in the making of resource surveys, the establishment of training institutes, and making available to the less-developed countries knowledge of new techniques in agriculture and industry. There is the United Nations itself, and its related agencies organized to give assistance in specific fields—education and science, food, agriculture, health, labor, civil aviation, atomic energy, and so on. And the United Nations Special Fund, which I will discuss later.

Low income

In spite of these multitudinous national and international programs in the 1950's, the results in terms of improved living standards were not very impressive. Before I give the figures, let me stress that they are not precise. Figures on per capita income in these countries are substantially understated as compared with those figures from the advanced countries. One of several reasons for this is that much home-grown product in the less-developed countries is not included in the national statistics. The figures do, however, provide a useful index of progress within those countries, and they have value for certain purposes of comparison. Even when allowing for their understatement, they show incomes in the underdeveloped countries to be appallingly and distressingly low.

The statistical income per person in the 100 countries and territories in the year 1950 averaged approximately \$90. It probably reached slightly over \$100 per person in 1959. Gross income grew at the rate of 3 per cent a year, but because there were 200 million more mouths to feed in these countries in 1959 than there were in 1950, the net increase in income per person was only about 1 per cent, that is, about \$1 a year. This is too slow—dangerously so.

THE PROPOSAL

We are now starting the crucial decade of the 1960's. Economic growth in the less-developed countries clearly should be speeded. The first task of each nation is to set its own goal and determine and execute its own program for achieving this goal. But in addition I propose:

That we—all of us together—fix as our goal to double in the 1960's, as compared with the 1950's, the annual per capita rate of economic growth in 100

countries and territories containing a billion and a quarter of the world's people. If we achieve this goal it will mean increasing the per capita economic growth rate of the less-developed countries from an average of one per cent a year in the 1950's to an average of two per cent in the 1960's. To do this it will be necessary for the less-developed countries to sustain an annual rate of economic growth of four per cent. This will mean a total increase of about 40 per cent and a per capita increase of nearly 25 per cent in ten years. It will mean increasing annual per capita income from the estimated present figure of around \$100 to around \$125 in 1970. This means increasing per capita income over the decade of the 1960's by about 25 per cent per person or an average of about \$2.50 per person per year.

Attainable goal

In my opinion this is a modest and practicable goal, entirely possible of attainment. Per capita income growth of 2 per cent a year is just about what was achieved in the United States of America from 1870 to 1929. It is, in my view, the very minimum we should seek to bring about in the less-developed countries today if explosive pressures building up in the world are to be released into constructive channels.

This goal may seem too modest, but this must be kept in mind: the average figures for proposed income increases, covering as they do one and one quarter billion people in 100 different country situations, conceal the exciting possibility that ten, fifteen, or more key countries will achieve a real breakthrough toward self-propelling, self-generating economies with enormous increases in living standards. And nothing is needed more today than examples of countries that—under free institutions—have achieved this goal. I may be over-optimistic, but it is my personal view that at least twenty countries can achieve self-sustaining economies in the

1960's. Think what an inspiration this would be to the remaining eighty.

Theoretically, the achievement of this 2 per cent per annum increase in personal income should be readily attainable, because the underlying reason for underdevelopment is underutilization of natural and human resources. Each day at the United Nations brings new evidence of the massive need for much more knowledge of the physical resources of these low-income countries. Not enough is known about mineral resources, river flows, soil content, industrial potentialities, or markets.

As for the human resources in the less-developed nations, they have been shamefully neglected. Only a very small percentage of the people who live in these countries have ever had the opportunity to acquire an education, most cannot even read or write and only a few have ever held positions of responsibility. There is an immense need for training of all kinds, from on-the-job training of artisans to the more complex sciences of technological institutes. And let no one say that the people of the less-developed countries cannot be trained to be good mechanics, good farmers, good engineers, good doctors, good administrators. May I recall a myth that was current in the United States not too long ago that the Russians were so lacking in mechanical aptitudes that they could not even run a tractor—and then came the Sputniks.

Yes, theoretically the goal I have proposed should be easily reached; but to achieve it, it will be necessary to place our priorities in the right order and to make our thinking and action accord with the facts. This means that there must be a sharp increase in technical assistance and particularly in preinvestment work in the underdeveloped countries, that a greater flow of private capital must be attracted,

and that public investment in basic facilities and services must be increased substantially. It also means that we must make a new approach to the task, based upon the fact of interdependence between the industrially advanced and the underdeveloped countries.

NEW APPROACH NECESSARY

Here, in summary form, is how I think we must approach the problem:

In the first place, all must recognize that today no single country, rich or poor, can achieve maximum economic growth except in an expanding world economy. All countries, whether their incomes are high, middle, or low, must in their own self-interest accept proportionate responsibility for the achievement of a rapidly expanding world economy and rising levels of international trade. The first responsibility of each country is to speed its own development. Its second responsibility is to assist other nations in accordance with its means.

Next, it must be recognized frankly that we in the industrialized countries promote economic development in the low-income countries because it is in our own interest to do so. At the same time, the leaders of the underdeveloped countries, for their part, must accept their own responsibilities for a maximum effort. Both must recognize that they are working together to accomplish a common purpose that will benefit all.

Economic assistance is not charity, and it must not be considered as such. If it is considered as charity, many nations will contribute nothing because the view is widely held, and I share it, that governments should not use tax money for philanthropic purposes. At best, support for charity would be spasmodic and lacking in the necessary continuity. Further, if economic assistance is considered charity, the effect

on the recipient nations is devastating: it saps the self-reliance of both the leaders and their people in the low-income countries. It tends to create the impression that solving their problems is someone else's business. Nothing could be farther from the truth. Paternalism in international relations, like paternalism in industry, generates resentment and results in half-hearted effort. External aid can only help those determined to help themselves, people who are willing to make real sacrifices and devote their maximum energies.

The third factor in the new approach is that economic assistance should be divorced from international politics. Helping to promote greater prosperity in expanding freedom is an objective worthy to be pursued for its own sake. We must not defeat the effort with political strings, nor try to buy goodwill with it, nor use it to try to make momentary gains in a cold war. Economic assistance is a task in which all nations should be urged to participate—in concert. Conflicting aims and competing programs can only lead to confusion and waste.

The fourth element of this new approach is that greatly expanded use should be made of the services of the United Nations and its specialized agencies operating in the developmental field. The needs of the developing nations for preinvestment and investment assistance are so great that the field should, of course, be open for any country, or organization, or group to help in any way of its own choice. But the advantages—political, economic, and technical—which repose in the United Nations and its related agencies should be more widely recognized.

Representatives of countries receiving assistance repeatedly declare their general preference for help through the United Nations because from this source it is much more acceptable

politically. Further, United Nations assistance is a completely co-operative endeavor, with a voice given to countries whatever their size or wealth and with all countries contributing to the costs. On the other hand, the United Nations can be "tough" with the underdeveloped countries and apply sound criteria for assistance. It cannot be accused of seeking any political or commercial advantage. Better results can be obtained through United Nations machinery at substantial monetary savings. And in the United Nations and its thirteen specialized agencies reposes the richest experience that can be found anywhere in virtually every field of development activity. The United Nations draws on the whole world for its technicians.

This brings me to the fifth point in the new approach I propose. It is that we recognize in a practical way the urgent need to speed and expand programs of technical assistance, especially work such as that of the United Nations Special Fund in surveying natural resources and training people in the skills they must have to make effective use of their rivers, forests, fields, and mineral wealth. Our aim is to raise income in the underdeveloped countries, and to do this by raising their production and productivity. This requires investment. But investment, public as well as private, will not venture into the dark. On the other hand, it is attracted by possibilities for its fruitful use.

The United Nations Special Fund

The United Nations Special Fund was organized a year ago precisely to carry United Nations assistance a new step forward by intensifying this essential preinvestment work. It is not a lending institution, but can be of immense service to lending institutions. Its resources are wholly devoted to the financing of

resource surveys, vocational and advanced technical training, and operational research. It concentrates on relatively large projects which will open doors to fruitful investment. During its first year the United Nations Special Fund approved projects to speed economic progress in fifty of the underdeveloped countries and territories in Africa, Asia, and Latin America. They involve expenditures of \$75 million. But as the Special Fund requires maximum self-help on the part of the recipients, the latter will contribute \$44 million to these projects, and the seventy-four governments which finance the program will contribute the remaining \$31 million.

Over half of the Special Fund projects thus far approved are intensive surveys to determine and demonstrate the feasibility of bringing large areas of land into agricultural production, for instance by irrigation, of harnessing rivers to produce electricity, of exploiting mineral deposits, and developing large-scale fishing industries. The second broad category of projects supported by the United Nations Special Fund will help those countries train their people in a variety of crafts from carpentry to mechanics, instruct them in management techniques, develop agricultural extension service, and teach engineering. Other of these United Nations projects will assist a number of countries in applied research, notably in finding new commercial uses for local materials and products. Finally, there is an interregional project to assist governments of a score of countries in Africa, the Middle East, and southwest Asia to control the Desert Locust, which periodically swarms across vast areas devouring all vegetation in its path.

All of the forty-four Special Fund projects approved in 1959 will be ex-

ecuted by the United Nations itself or one of its specialized agencies, using their experience and extending greatly the services they can perform in their particular fields. In its effort to facilitate capital investments, to introduce technological innovations, and improve technical skills, the Special Fund applies sound business criteria. It only helps countries to help themselves. It shares rather than bears the costs. It insists that a project it approves fall within the framework of a consistent economic policy. It only assists projects which are to result in sustained follow-up action. The Fund's assistance to training and research institutions is limited to support for not longer than five years, diminishing in each of the last three years. The whole emphasis is on obtaining significant increases in strategic areas of production and productivity. It assists only schemes which will contribute substantially and quickly to development.

Sound business practice requires that the United Nations program of technical assistance and the work of its Special Fund be expanded quickly in the coming year or two, and be somewhat increased in the following years. There is no doubt whatever in my mind that these millions of dollars in pre-investment work can attract billions of dollars of highly productive investment in this crucial decade.

TRADE AND INVESTMENT

Finally, I come to the question of investment as an essential part of the attack on the problem of economic development. The first point to note is that by far the larger part of the responsibility for supplying the capital needed to speed development must come from the poorer countries themselves. Even though their incomes are

pitifully low, a substantial percentage of them must go into savings to finance the major parts of their development programs which can be financed with local currencies. These countries must also earn by their exports the larger part of the foreign exchange required to finance their imports from the developed countries. This, of course, implies not only a tremendous effort on their part but also requires that the industrialized countries maintain a steady and preferably rapid pace of economic growth, and that they, and the developing countries as well, keep the channels of world trade open. Development aid is in essence trade—the supply of goods and services—just as increased trade is development aid.

I believe that the less-developed areas can raise their merchandise exports substantially in an expanding world economy in the 1960's. Over that ten-year period I estimate they should be able to earn around \$378 billion through the sale of their goods in world markets. On the other hand, if they are to double the annual rate of their per capita income growth in that period of 1961-1970, they will need to import from the outside approximately \$440 billion, which leaves a deficit of some \$62 billion. To this deficit of \$62 billion we have to add approximately \$8 billion to cover foreign exchange needed for transportation, communications, to service debt, and so on, for a total of \$70 billion.

At the present time approximately \$4 billion of capital flows annually for economic development from all outside sources into these countries. Over the ten-year period this would amount to \$40 billion, leaving a deficit of \$30 billion. \$10 billion of this deficit could be covered by increased private investment and bankable loans and increased exports. This leaves approxi-

mately \$20 billion which will have to be financed through what are popularly called soft loans but which, in my opinion, should really be called long-range investments. Ideally, this \$20 billion of investments should be furnished through multinational institutions such as the proposed International Development Association. However, this institution is starting with only a billion dollars of capital which, of course, falls far short of what is needed. Perhaps its capital can be expanded to a point where over the ten-year period it will meet half the needs for so-called "soft loans." The other half will have to come from individual countries or from regional associations. The United States will, in all probability, have to provide for half of this investment, approximately \$10 billion.

Can we afford it? The United States alone is planning to spend \$400 billion for defence in this same ten-year period and no one asks—or should ask—can we afford it? We cannot afford to refuse this investment in the future of these 100 countries because in a very real sense it is an investment in our own future.

QUESTIONS AND ANSWERS

Q: My question is to what extent would it be practical and sensible to divert funds from the military expenditure to the kind of program you have described?

A: I am sure Mr. Martin would join me in saying that neither one of us are military experts, and therefore, I would not have any way to appraise the military program. I think these should be considered separately. In other words are the military expendi-

THE BREAK-THROUGH

The stakes we are playing for are breathtaking. They are to turn rising tensions into constructive channels, to establish and sustain the dynamic environment from which steady increases in national income and human well-being will spring. The people in the underdeveloped countries must do their part to bring about the better life they seek, and we in the industrialized countries must do our part. Working thus together in a common program in the common interest, we can create a steady expanding world economy in which all of us will find increasing satisfaction and opportunity. The achievement, as I have suggested, of self-propelling economies by ten—perhaps twenty—of the less-developed countries by 1970 would have a tremendous stimulating impact upon the rest of the less-developed nations. In the 1970's many more would stage a break-through, and before the year 2000, the poverty, illiteracy, and chronic ill-health which have been the lot of most of the world's people since the beginning of time would be a memory.

tures needed? If they are, then we can afford them. Is the assistance to less-developed countries needed? Is it good business as well as good morals? If it is, we can afford it.

Q: How much from your experience, sir, as administrator of the Marshall Plan—watching all the time the activities of the United States giving economic help—do you have the impression that the help is going to the nation

and not to the government only, especially to dictatorial governments which are using force and slave labor?

A: I am not quite sure that I understand the question. If the question relates to the United States program of aid, then as an international civil servant, it would be inappropriate for me to comment on the United States program. I can tell you that as far as the program of the United Nations is concerned, in the economic field we

clearly would be out of line if we tried to pass critical judgment. We do have a perfect right to pass this judgment: Has the program a chance for success? Will it help the people? In other words, our goal is to try and engage in projects that will directly or indirectly bring about an improvement in the standard of living of people. You have a perfect right to inquire as to whether conditions make the outcome possible, and that is a judgment we do exercise.

COMMENTS

HONORABLE EDWIN M. MARTIN

I would like to comment on our giving assistance to countries which have dictatorial governments. For us this is a very difficult question that you have raised and it will always be one. It is impossible for one country or the United Nations to go into another country without the permission of the government. We cannot deal man to man, person to person, and consequently anything we do if it is good will be credited to the government in power. We cannot avoid this. If it is bad, then they take it too. But we have felt that we have had to take in some cases, much as we dislike it, the onus

of co-operating with the government which might be unpopular with certain parts of the people in order to be able to make assistance available which will help all the people. And that over time, if we are helping the people generally to improve their standard of living and their literacy, they will be in a better position to secure the kind of government we want and that they would really like to have, so that one has to take, I think, some short-term disadvantages in the hopes that there will be long-term benefits. But, they are disadvantages, and this is a real problem.

Implications of the Race Between Economics and Population in Latin America

By PRESTON E. JAMES

ABSTRACT: Hunger is the price today of the race between economics and population in Latin America. Thus, the primary problem is to achieve an adequate food supply at prices which the poor people can afford. The changes in economics and population must be seen in the perspective of the industrial revolution and the democratic revolution. The industrial revolution has provided the means to achieve a better life and the democratic revolution has provided the desire for and awareness of a better life. But the industrial revolution has also brought in its wake increased poverty. The industrial revolution, for example, tremendously advanced the public health services, but as the death rate declined population increased and more mouths needed to be fed. The industrial revolution by modernizing agricultural production increased the food supply but it also released people from the land who could earn higher wages in the cities. As the demand for and the price of food increased, less and less people could afford to buy the food. Thus, the hunger problem, and the need for tremendously increased agricultural productivity arose. Co-operative efforts among many disciplines are needed to devise balanced development programs—programs that will stimulate economic growth in Latin America but will obviate increased hardships.—Ed.

Preston E. James, Ph.D., Syracuse, New York, is Chairman of the Department of Geography, Syracuse University. He has been Chairman, Committee on Latin-American Geography, National Research Council; consultant, Conselho Nacional de Geografia (Brazil); member, Committee on Geo-Physics and Geography, Research and Development Board; and United States member, Commission on Geography, Pan American Institute of Geography and History. A graduate of Harvard University and Clark University, Dr. James has written many books on geography, among them *Latin America* (1942, 1950, 1959), *A Geography of Man* (1949, 1959), and *The Wide World, A Geography* (1959).

THE existence of a race between economics and population in Latin America is only a part of a larger and more complex process of change. There can be some concern that our economic planners and the formulators of our foreign policy may not grasp the nature and significance of this process of change soon enough, and that the policy-forming sector of the so-called "general public" may lack the background of understanding necessary for the formulation of wise policy. It is essential to see these current changes from the twin perspectives of history and geography—to understand that we live in a revolutionary age which had its beginnings only a short time ago as human history is measured, and that the twin revolutions of our time have been spreading from their center of origin, creating in each of the world's major culture areas a unique set of reactions. The race between economics and population in Latin America must be seen as a part of a world-wide process of recent origin.

Furthermore, the time has long since passed when the United States could hope to avoid involvement in these processes of change in foreign areas. Whether we like it or not, and whether we are prepared for it or not, the United States is, in fact, deeply involved in changes now taking place all over the world. No longer is it safe to neglect the continued study of any part of the world, however remote. If the third world war is to be a war of ideas rather than of hardware, it is precisely in the field of foreign-area study, and in the formulation of wise foreign policy that the war will be won or lost.

THE GREAT REVOLUTIONS

The great revolutions of our time are called the "industrial revolution" and the "democratic revolution." Both had their origins around the shores of the

North Sea in Europe, and both have spread independently and irregularly from that area. Before the middle of the eighteenth century there had been no such fundamental changes in the way of living since the rise of the early civilizations many thousands of years before Christ. The replacement of human and animal muscles by controlled inanimate power has profoundly altered the economic life; and the replacement of the law of status by the law of contract has given rise to a wholly new concept of the relations of man to man. But these revolutions have themselves changed in content as they have swept into new territory. As they now sweep over Latin America they are producing processes of change that are related to world-wide events but that are, at the same time, unprecedented and unique.

Population change is one of the first effects of the arrival of the industrial revolution. As never before, people are concentrated in cities. Because illiteracy and ill-health can most effectively be reduced where people live close together, the last decade has witnessed a marked rise all over Latin America in the percentage of people who can read and write, and a spectacular decline in the death rate. Since the population picture of Latin America has so recently been presented by the American Academy of Political and Social Science, there is no need to describe it here.¹ The facts are clear: that the population of Latin America as a whole is growing faster than that of any other large part of the earth, but that there are great differences within Latin America in the present density and in the rate of growth; that the most important currents of population movement are from rural areas to urban areas; and that a major cause of the

¹ Kingsley Davis (Editor), "A Crowding Hemisphere: Population Change in the Americas," *THE ANNALS*, Vol. 316 (1958).

rapid rise of the rate of population growth is the sudden decline of the death rate. Furthermore, these demographic changes are bringing about profound changes in the kind of life that people demand. The democratic revolution, now just beginning its sweep over Latin America, means that people are demanding an end to inequality before the law, an end to the existence of privileged classes—such as landowners, army officers, or foreigners—and an end to the system of second-class citizenship.

But in Latin America, these ideas are not exactly what they might seem on the basis of our own experience with them. Equality has a very definite meaning in Anglo-America—that John Doe is just as good a man as the President of the United States, and that every one, no matter what his economic or social status, has an equal right to look and act like "The man of distinction." In Latin America the concept of equality has a subtle difference of meaning. There it means the equal right to be different.² Equality among sovereign states means the equal right of each state to determine its own destiny. There is a certain massive inevitability to the development of deep-seated conflict when a colossus such as the United States becomes inescapably involved in the economic development of countries in which one cherished tradition is the equal right to be different.

UNBALANCED ECONOMIC DEVELOPMENT

The involvement of the United States in the economic development of Latin America is not new. Private investors have long sought speculative profits from Latin-American enterprise, and in the process a considerable amount of economic development took place. In

² John Gillin, "Ethos Components in Modern Latin American Culture," *American Anthropologist*, Vol. 57 (1955), pp. 488-500.

most instances, however, this kind of development was not an integral part of any over-all national plan of development. In one case, when Percival Farquhar envisioned a national railroad plan for southern and southeastern Brazil before World War I, the program was never put into operation. The arrival of financial aid for economic development from the United States since World War II, on the other hand, has been on a greatly expanded scale. Much has come in the form of private investment, and much has come from government loans and technical assistance funds.

But the resulting economic development has in most countries been carried on piecemeal, with little or no attempt to relate actual development programs to such over-all economic studies as exist. Since national economies are very complex mechanisms, made up of a bewildering array of closely integrated parts, a change in any one small part detonates a chain of reactions that spreads throughout the mechanism and produces unexpected and often disastrous results.

Consider what happens, for example, when funds are devoted to the improvement of public health. Every one favors spending funds for the attack on disease and pestilence. No one drew any conclusions from the example of British experience in Egypt, or of Dutch experience in Java—places where the improvement of public health produced a population explosion that greatly increased the volume of poverty. The United States did the same thing in Puerto Rico. With the discovery of the new insecticides and antibiotics the way was technically open to provide for a vast improvement of health. The results in the modern period have already been presented: more than any other single fact, programs of health improvement and disease control have created

the population explosion which, in turn, has created the race between population and economic development we are discussing.

What possible excuse is there in the modern world for instituting a program of health improvement without at the same time facing the problem of how to provide for more food? If more babies survive the first year of life—as they now do all over Latin America as a result of the programs of health education and the medical clinics—unless the food supply is also improved the net result can be nothing but a larger volume of suffering and poverty. Nor is the development of manufacturing industry alone an adequate answer to this problem. For when the people who crowd into the cities to seek urban employment receive such wages as they have never before dreamed of, their first want is more food. If the food supply remains inadequate, the price of food goes up, and the net result is greater hunger than existed before.

IMPROVEMENT OF AGRICULTURE

How is the food supply to be increased without increasing the cost per unit? In seeking the answer to this question we begin to throw light on some of the most difficult problems of our technical assistance programs. To increase the domestic production of food in Latin America requires an attack on certain traditional ways of living, certain long-cherished values, certain vested interests, that are entangled in the complex web of Latin American culture. Improving the supply of food is not something that can be handled quite adequately by the agronomists, because much more than agronomy is involved. Involved also is an attack on the inherited system of land tenure, on the existence of a privileged land-owning aristocracy. Here we have gone far

beyond the competence of agronomists, or even of land economists.

Programs for the improvement of agriculture usually neglect these social and political repercussions. But, in addition, such programs in many parts of Latin America are formulated and put into operation without benefit of precise knowledge concerning the nature of the resource base or of the present status of economic use. To gain such knowledge requires a land classification and use survey. I am not referring to the kind of general appraisal an economist might make based on over-all statistical data, nor the kind of chemical appraisal a soil specialist might make from soil samples only vaguely located on the map. I am referring to the kind of large-scale survey on maps that geographers have been advocating and developing for the past forty years. First the engineers must prepare accurate base maps—a need rapidly being filled for Latin America by the operations of the Inter-American Geodetic Survey. Up-to-date vertical air photographs are then required. Then categories of soil, slope, and drainage are formulated to describe the variations in the potential utility or productivity of the land. On maps of the same scale the existing use of the land is plotted. Such surveys bring together precise information regarding the critical differences from place to place in the quality of the resource base and the present pattern of use. On the basis of such information a rational plan for the improvement of agriculture can be formulated.

Offhand would any one disapprove of the expenditure of funds for such a survey to provide a basis for land redistribution or for a more rational agriculture? Yet the fact is that such surveys are almost everywhere resisted. There are too many interested parties who do not want the quality of the land to become public knowledge, who plan

to profit from the prevailing ignorance about land quality, and perhaps too many others who have never had the value of such a survey demonstrated. Years ago in our own country John Wesley Powell was attacked in the Congress for his efforts to map the irrigable areas of our arid and semiarid West; and when the Depression came along in the 1930's, one of the first activities of the Michigan state government to be eliminated, in the interests of economy, was the Michigan Land Economic Survey.

In Latin America we have clear examples of what happens when a survey is made, and what happens when no survey is made. Mexico carried out its land reform program in the 1930's without benefit of surveys—with results in rural poverty that can still be observed. When Bolivia redistributed its land, it turned to Mexico for advice. As a result no survey was made. On the other hand Puerto Rico completed a detailed land classification survey, and its efforts to improve the rural land use and to redistribute the land once held by the large sugar cane planters have been highly successful. In Puerto Rico it is possible to demonstrate how such a survey is carried out, how much it costs, and what you can do with the results.³

THE PLACE OF THE PIONEER

The nineteenth-century solution to the problem of increasing the food supply was to expand the agricultural area by moving out onto new lands. This was the solution that was applied to our own food problem in the late nineteenth century, when pioneer farmers moved onto the previously unoccupied prairie lands of the middle west. A similar movement resulted in the settlement and economic development of the Argentine

Humid Pampa in the period between 1880 and 1914. In the 1920's Isaiah Bowman directed a research project the purpose of which was to identify and describe the potential pioneer zones of the world from which an increase of the world's food supply might be derived.

But by 1920 this solution of the food problem was already out of date. In the period since World War II the food supply of the United States has been increased through the use of new kinds of machinery, through the use of improved breeds of animals or better kinds of plants, through the use of new kinds of soil conditioners and fertilizers, and the application of new techniques of land use. Yet the use of these new devices and methods has required fewer farmers than ever before. Between 1910 and 1914 it took 135 man hours of work to produce 100 bushels of corn; but between 1950 and 1953 it required only 34 man hours. In the period from 1935 to 1939 a farm worker in the United States could produce enough food to feed himself and ten others; by 1955 he could produce enough to feed himself and nineteen others. Farmers are leaving the farms because there is no need for their services wherever agriculture has become a large-scale enterprise. The day of the small pioneer farmer, cultivating his own land with his own muscles or domestic animals, is gone.

In Brazil, as in many other Latin American countries, the policy-makers are still thinking in terms of pioneer expansion. The idea is to start a great wave of new farm settlers onto the thinly populated woodland savannas of the interior. On patches of newly cleared forest, a thousand miles in the interior, yields of rice and corn are high; and the price of these foods in São Paulo and Rio de Janeiro are so high that it pays to ship the product to market by airplane. But if the need is

³ Clarence F. Jones and Rafael Picó, *Symposium on the Geography of Puerto Rico* (Río Piedras, Puerto Rico, 1955).

to supply larger quantities of food to the cities at lower prices, then the pioneer zones are not the answer. Modern agricultural methods applied to worn out and abandoned land near the cities could contribute to the solution of the food problem. In fact, the advantage of reclaiming worn out land rather than clearing new land is being demonstrated in São Paulo state—even while the politicians continue to call for a "westward movement."

Even in São Paulo, however, the application of modern agricultural methods results in a decrease of the farm people and hastens the already rapid movement from the thinly peopled interior into the cities. The fact which must be faced is that the solution of the food problem in Latin America—the provision of more adequate supplies of food without increasing the price of food—will inevitably result in an acceleration of the migration of workers into the cities.

URBAN EMPLOYMENT

It is at this point that a variety of new kinds of jobs must be provided in the cities. To provide such jobs without increasing the food supply, as we have already seen, only has the result of increasing the price of food. Yet to carry out a program of agricultural improvement without providing jobs for those who will be displaced is another way to invite disaster. Urban employment includes jobs in manufacturing industries, in mining, and in a great variety of service occupations. According to the economists for every person employed in a basic industry, there will be two or three employed in service occupations. An investigation of the structure of employment in Latin American cities, as compared with that of Anglo-American cities, would probably show that there was a much higher proportion in service occupations and a smaller

proportion in basic manufacturing industries. The need for a considerable increase of manufacturing industry is clear.

The development of manufacturing industries in Latin America, however, faces certain obstacles. At this stage of the industrial revolution with a middle class still poorly developed, Latin America is still composed, as it has been traditionally, of two economic classes—a small group of very wealthy people and a large group of very poor people. Where backlanders have moved into the cities but are not provided with adequate food supply and where inflation of prices has gone ahead faster than wages, the result is to increase the number of poor people. Meanwhile the urban poor have learned to hope for a better living and to demand it: before, as rural poor, they were apathetic, hopeless. The continued existence of only two economic classes, therefore, is becoming more and more of a political hazard. The lack of middle-income people is a major handicap for industrial development.

This handicap operates as follows. In Anglo-America when a manufacturer invests capital in new machinery for the purpose of increasing production, he can find more customers by lowering the price of his product. According to Anglo-American economic theory each drop in the price picks up an additional group of purchasers. Manufacturers, therefore, have adopted the principle of high volume of sales, low profit per sale. The benefits of the industrial revolution, as a result, have been shared widely among the people, and there is widespread popular support for the system.

In Latin America when a manufacturer invests capital in new machinery for the purpose of increasing production, he does not find more customers by lowering the price. He would have

to lower the price a long way to reach the poorer classes of people—people who would be happy to purchase his products but cannot possibly do so. Therefore, the manufacturer raises his prices, realizing that if his product is wanted the wealthy people will buy it almost regardless of price. Manufactured products are easily sold to a relatively few customers. The principle adopted is that of a low volume of sales, high profit per sale. As a further result, a relatively small proportion of the total population shares in the benefits of the industrial revolution, and no strong popular support for the system is generated.

The suggestion has been made, but never widely adopted, that a new theory of wages ought to be formulated. As long as wages are considered solely as a production cost, the manufacturer must continue to keep them as low as possible. But if some proportion of wages were considered as an investment in market expansion, this might lead to a more effective attack on one of the major handicaps to industrial development. Long-term thinking of this sort is not at all common in countries where returns on invested money sometimes run as high as 50 per cent per year.

RECOMMENDATIONS

Out of these considerations there emerge certain simple and perhaps rather obvious recommendations. But the fact that they are simple and obvious does not mean that they have been widely adopted by the economic planners and the formulators of foreign policy. Rather the contrary. In facing problems of economic development, each specialist seems to like to be alone: the agronomist resents the suggestion that a land survey is needed; the engineer cannot see far beyond his slide rule; the economist is suspicious

of any one who works with maps instead of statistics; and the population experts seldom think it necessary to establish the distribution of population with precision. The political and social scientists still have a lot to learn about interdisciplinary co-operation—and the time left to learn about Latin America is getting very short.

So far as programs of economic development in Latin America are concerned there is no excuse in the second half of the twentieth century for attacking parts of an economy piecemeal. The approach must be toward a balanced economic development, in which a number of formerly separate programs are linked. The very complex nature of a national economy requires examination from every possible point of view, and requires that development programs be a joint effort of a variety of specialists. How leaders can be found who can keep the specialists in line is one of the major challenges to the social scientists and the administrators of public affairs.

Second, there is no excuse for attacking problems of economic development blindly. Land should not be redistributed without accurate maps of land quality to guide the redistribution. Roads should not be planned solely from the point of view of the engineers, but should also make use of the maps made available in a basic population and resource survey. The survey is much less costly than the errors that result from lack of exact knowledge.

Third, there is no excuse for offering such out-of-date solutions as that of pioneer expansion into new lands, unless some special and unusual conditions make pioneering a proper solution. There are many Latin Americans who still want to take care of the increasing numbers of people by creating more subsistence farmers. But according to another point of view every person is a

potential worker and a potential customer, and the individual is too valuable to permit him to live in isolation, separated from the economic system of buying and selling—as so many people still live in Latin America. The new agriculture, with its vast increase of production per worker, is needed in Latin America, but to introduce it will require more than the services of agricultural specialists, for the changes that are bound to follow will affect all parts of the culture.

Fourth, there is no excuse for failing to appreciate the new spirit abroad in Latin America. The democratic revolution means rising expectations for a better life, and a new definition of human dignity here on earth. Where the Latin American demands the equal right to be different, our deep involvement in his economic, social, and political problems must not be marked by an effort on our part to force him into our own mold. Long ago the Cuban patriot, José Martí, said, "*nuestro vino es agrio, pero es nuestra vino*," our wine is bitter, but it is our wine. Anglo-Americans should learn as soon as possible not to be amazed and chagrined to find that the Latin Americans do not want our way of living.

Fifth, we need to know that because

of this basic desire to be different, each country in Latin America, each subdivision of the larger countries, constitute a unique and separate problem. No general policy of economic development will fit every case, and the effort to enforce or administer a general policy may have very bad results. Each country must be faced as a separate problem not only because of the differences of each land base, each endowment of resources, but also because of deep seated differences in the attitudes and traditions of the people. In dealing with Latin America there is no short cut for knowing about these differences and what they mean.

Finally, let us appreciate what has been accomplished in Puerto Rico. During the last decade that island has been transformed from a horrible example of colonialism to a shining demonstration of how a free people can attack what might seem to be insuperable problems. If the third world war turns out, in fact, to be a war of ideas, the idea of Puerto Rico may loom larger and larger in our thinking, until we come to see solutions achieved in Puerto Rico as vastly more important than all the Sputniks that are spinning through space and all the astronauts poised to follow them.

* * *

QUESTIONS AND ANSWERS

Q: You began your talk by saying that we have not learned the lessons of Egypt, Indonesia, and Puerto Rico, where public health programs instituted in these countries led to overpopulation. This sounded as though Puerto Rico was a bad example and yet you ended your speech by holding up Puerto Rico as a good example. This seemed to me a paradox. Could you comment on this?

A: The paradox was dissolved between 1948 and 1950 when the relation

of the United States to Puerto Rico was revised and when the present government of Puerto Rico came in. The United States and Puerto Rico up to 1940 was as good an example of the bad effects of so-called "colonialism" as you could find. But since that time we have actually found solutions through the interplay of free institutions. I think the development of Puerto Rico is one of the greatest things that has been going on in the so-called "cold war."

Our Reaction to Communist Infiltration in Latin America

By ARTHUR P. WHITAKER

ABSTRACT: The United States plays a difficult role in Latin America. Our activities are curtailed by the commitment since 1936 to the dictum of nonintervention, yet we must attempt to counter the influence of communism in Latin America. The present status of Castro's regime in Cuba highlights this dilemma. Although, at this time, Castro's government is not directly aligned with the Communist bloc, there are indications of increasing proclivities in that direction. A "hands-off" policy must continue to be employed by our State Department in Cuba as well as in other troubled areas to create a favorable climate of opinion towards our long-term interests. Although the actual membership in the Communist parties of Latin-American countries has decreased, both the Soviet Union and Communist China are attempting to penetrate the leading intellectual and labor groups through the means of propaganda and the well-known tactic of the "popular front." Our reaction to the Communist infiltration in Latin America must not lead to hasty measures. The United States must in the future attempt to combat Communist actions in Latin America by helping establish political democracy through fostering economic development and social reforms in its various governments.—Ed.

Arthur P. Whitaker, Ph.D., Philadelphia, Pennsylvania, is Professor of Latin-American History at the University of Pennsylvania. He was one of the two delegates sent from the American Historical Association to the International Congress of Historical Sciences, 1960. He is a former officer and consultant of the Department of State. A graduate of the University of Tennessee and Harvard University, Dr. Whitaker has taught in many universities in the United States and has lectured widely in South America. He has written many books on Latin American affairs, including *The Western Hemisphere Idea: Its Rise and Decline* (1954), *The United States and Argentina* (1955), and *Argentine Upheaval* (1956).

A DISCUSSION of "Our Reaction to Communist Infiltration in Latin America" logically begins with an understanding of what it is we are reacting to. First, how widespread and intense is Communist infiltration in Latin America?

Cuba, from all indications, is the principal danger spot today, but we cannot be sure of the degree of the danger even there. Fidel Castro, the Cuban *caudillo*, has denied repeatedly that he is a Communist, and this may be true. If he often gives the opposite impression during his hours-long radio rantings, perhaps the explanation is simply that, as James Reston recently said, Castro needs more sleep. He was not brought to power by Communists but instead the support of all classes and perhaps most of the well-to-do, educated, and democratic elements in Cuba. And there is no proof of communism in the main features of his regime since he came to power: land reform, expropriation, trade agreements with Iron-Curtain countries, nationalism, and anti-Americanism.

COMMUNISM IN CUBA

All these things could be and, in some cases, have been products of the indigenous social revolution, the revolution of rising expectations that is mounting in Latin America as in other parts of the world. Even trafficking with Iron-Curtain countries is not necessarily sinister, as we have admitted in other Latin-American cases. These include four democratic regimes: Uruguay, which made the first trade agreement with the Soviet Union several years ago; Argentina and Brazil, which in addition to trade agreements have obtained Soviet loans; and Mexico, which Soviet emissary Anastas Ivanovich Mikoyan visited late last year without causing a sensation remotely approach-

ing the one provoked by his visit early this year to Cuba.

The differentiation is quite justified, for Cuba is the only government suspected of being pro-Communist. However immune to Communist contagion Fidel Castro himself may be, no such immunity has been demonstrated by his two chief aides: his brother Raul, who commands Cuba's armed forces, and the ex-Argentine Che Guevara, who as president of the Cuban National Bank commands the country's financial forces. Again, Castro's Cuba has recently seceded from the left-wing, but strongly democratic and anti-Communist Inter-American Regional Organization of Workers of the International Confederation of Free Trade Unions (ORIT), and is trying to form a rival Latin-American federation of labor, which is expected to replace the Latin American Labor Confederation (CTAL) as a Communist front.¹ Communists have already been admitted to Cuba's own labor organization.

Most disturbing of all is the direct evidence given by three prominent Cuban military men, all former supporters of the Castro regime, who have independently defected from it within the past nine months in protest against its increasingly pro-Communist character: on July 1, 1959, Major Pedro Diaz Lanz, Chief of the Cuban Air Force; on October 21, 1959, Major Hubert Matos, Chief of the armed forces in one of Cuba's principal provinces; and on March 17, 1960, Lieutenant Commander F. G. Pons, Cuban naval attaché in Washington and

¹ *Noticiario Obrero Interamericano* (Mexico City), Nos. 33-34, February-March 1960, p. 1. This is the organ of ORIT. The CTAL, or Latin American Labor Confederation, founded in 1938, has always been dominated by the Mexican Vicente Lombardo Toledano, who has been described by some as a Communist and by others as only a fellow traveler.

member of the Inter-American Defense Board. In resigning his post, Commander Pons charged that the Castro regime is "a mask behind which hides international Communism" and that Fidel and Raul Castro are only puppets in the hands of the Communist mastermind, Che Guevara.²

THREAT IN REST OF LATIN AMERICA

What of the rest of Latin America? In all of it, signs multiply of increasing Communist efforts, sometimes successful, to permeate intellectual and labor circles, the two main target areas. For example, in Venezuela's principal university, the University of Caracas, the Communist party made great gains in the student elections of March 1960. Either alone or in alliance with the Democratic Action party, it gained control of six of the university's seven "faculties" or schools. And, as is well known, university students play an important political role in Latin America.

The striking point about this case is that Venezuela's present government is ably led by a popularly elected president, Romulo Betancourt, who has given it a decidedly left-wing orientation. However, he is democratic and anti-Communist, welcomes foreign capital, co-operates with the United States, and, significantly, has recently been openly critical of the Castro regime. All of this the Communists and Castro sympathizers cannot endure. They want to displace Betancourt, and they made a good beginning in the very recent University of Caracas elections.

Another example is the report from Santiago, Chile, early in March 1960 that no less a person than the Rector (President) of the University of Chile, Juan Gomez Millas, was about to leave for a visit to Peking as the guest of the government of the Chinese People's Republic. Gomez Millas was reported

² *New York Times*, March 18, 1960.

as explaining that the purpose of his visit was to observe teaching methods and the application of educational principles in Communist China. This may be all there is to it; Gomez Millas is an able scholar and his interest in the new Chinese regime's educational system is understandable. But the timing of his visit was unfortunate, to say the least.

Activities of Communist China

Communist China as well as the Soviet Union now gives active support to the growing Communist drive in Latin America. The rise of Chinese communism from an agrarian base has made it particularly relevant to the case of Latin America, where the population is still very largely rural and the need for agrarian reform is great.

Its relevance was pointed out nearly a decade ago in an exposé of Communist machinations in Latin America by a former Communist, Eudocio Ravines of Peru. Appropriately titled *The Yenan Way*, this exposé told how the Chinese experience was already being capitalized on in Latin America by stressing the rural rather than the urban "way" to the spread of communism.

The "Yenan way" is still being followed, and many observers think the latest illustration is provided by Fidel Castro's special variety of agrarian reform in Cuba, which has made him a hero to the country's peasants. But Communist China as well as the Soviet Union employs additional ways or approaches, such as cultural and radio channels and the air waves—Radio Peking regularly broadcasts to Latin America. The language barrier of Chinese is not much greater than that of Russian, and it is overcome in the same way, by using Spanish and Portuguese.

The results achieved by this Chinese propaganda, with one important excep-

tion, are not easy to estimate. By being kept persistently aware of the new Chinese Communist presence across the Pacific as well as the older Soviet presence across the Atlantic, the Latin Americans are given a sense of increasing encirclement by communism. Its propagators expect the growth of this sense to contribute to ultimate Latin-American acceptance of the doctrine that the triumph of communism is inevitable.

STRENGTH OF COMMUNISM

We, of course, do not believe that the triumph of communism is inevitable, but we should all recognize that it may make substantial gains, in Latin America as elsewhere unless we play our role correctly. We ought to give prayerful consideration to such questions as: How strong is communism in Latin America today? What are its potentialities for growth? And what should we do about it?

Estimates of its strength vary widely. For understandable reasons, it is given a very high rating by dictator Rafael Leonidas Trujillo of the Dominican Republic. He takes the gloomy view that the movement has got out of hand and that, while "community action [against it] may be partially effective in some cases, . . . in others the point of no return has been reached."³ The Panama Canal and our Guantanamo naval base in Cuba, he predicts, will be the next trouble spots. This prophecy was fulfilled before it was made.

Estimates of a private report

On the other hand, in a report prepared for the Senate Foreign Relations Committee by a private research organization, the Corporation for Economic and Industrial Research, of Arlington,

³ *New York Times*, April 6, 1960.

Virginia, and published late in February 1960,⁴ the present Communist threat in Latin America is described as being "generally of small dimensions." I have never been an alarmist on this subject. I have always deplored, and still deplore, the proneness of many of our people to blame all our postwar troubles in Latin America on "Communist agitators," as our troubles there in the 1930's and early 1940's were blamed on "Nazi-fascist agitators." Nevertheless, this report's conclusion seems to me altogether too optimistic.

The report unquestionably has important merits. It brings together a great deal of significant data and contains some acute observations. The difficulty, according to my analysis, arises from the report's use of the wrong measuring rods in arriving at its overall estimate of the present and potential communist threat in Latin America. As a result, it underestimates the danger. Too much weight appears to have been given by it to such facts as these: that the Soviet bloc accounts for only 2 per cent of the total foreign trade of Latin America; that it has extended only \$241 million in credits by way of economic aid to Latin America, with only three countries, Argentina, Brazil, and Cuba, as recipients; and that there are not more than 230,000 card-carrying Communists in Latin America's total population of about 190 million, as compared with more than twice as many Communists, 600,000, in a much smaller population in 1947.

All this documentation, and more to the same effect, is true, but it is largely irrelevant to the chief Soviet-Communist

⁴ *Soviet Bloc Latin American Activities and Their Implications for United States Foreign Policy* (Washington: Government Printing Office, 1960), Report No. 7 on United States-Latin-American Relations by the Subcommittee on American Republics Affairs of the Committee on Foreign Relations, United States Senate.

nist objective. Whatever the case may be ten or twenty years hence, the promotion of trade, of aid, and of Communist party membership in Latin America are not now ends in themselves. At most, they are useful instruments, and even as instruments they are not by any means indispensable to Moscow's and Peking's major purpose.

SOVIET UNION'S MAJOR PURPOSE

The purpose, as the report in question states, is to bring about the "political neutralization" of Latin America and the disruption of the Organization of American States by promoting anti-Americanism in Latin America and enhancing the prestige of the Communist bloc. A mistake is made in assuming that this can be accomplished only, or mainly, through such direct channels as trade, aid, and cultural exchange between the Soviet Union and Latin America.

In reality some of the most important of all possible instruments for achieving these purposes lie completely outside these channels and have no relevance to direct relations between Moscow and Peking, on the one hand, and Latin America, on the other. For example, the lead that the Soviet Union has gained over the United States in the space race has vastly enhanced Moscow's prestige, to the detriment of ours, among educated Latin Americans. For another, all Latin Americans, illiterate as well as literate, have been greatly impressed by the extraordinarily rapid economic development achieved under the Communist system, first by the Soviet Union and now by Communist China. Much as most Latin Americans dislike most features of communism, they have been particularly susceptible to the impact of this achievement because it represents success in an aspira-

tion which they have long shared but in which, under the capitalist system, they find themselves still frustrated after more than a century and quarter of political independence. Our own past mistakes have helped spread communism's image of itself south of the border.

Consequently, it is a waste of time to measure the Communist nations' influence in Latin America in terms of direct trade, aid, and even cultural relations. Not only are such instruments not essential to their purpose; they might even profit without them. Indeed, if I were a Communist and a political adviser to the Kremlin on Latin-American affairs, I think I would tell Krushchev that the intensification of Soviet relations with Latin America through any direct channel should be avoided at all costs. For in proportion to the increase of such contacts, the Soviet Union loses its unique, inestimable advantage over the United States in their rivalry over Latin America, namely, the advantage of remoteness.

The value of this advantage is suggested by several of our homely Anglo-Saxon sayings, ranging from "Familiarity breeds contempt" to "The grass is always greener in the next pasture" and "They all look good when they're far away." This may help explain why, although the Latin Americans retain a lively resentment over our interference in Guatemala in 1954, and our interventions in Nicaragua and other Caribbean countries in the first quarter of this century, not to mention the Mexican War of 1846, some of them seem already to have forgotten what the Soviet Union did to Hungary in 1956. Present Communist strategy, it has been suggested, is aimed at taking advantage of what memory of Hungary remains by provoking the United States into making Cuba an American Hungary.

Statements to the public

Naturally, such objectives are not publicly avowed by Communist spokesmen. A fair sample of what they do talk about when they are on display is provided by Mikoyan's speeches in the course of his visit to Mexico in November 1959. Speaking to a group of manufacturers in Mexico City on November 24, he congratulated Mexico on achieving a higher rate of industrial development (7 per cent per year) than the United States (2 to 3 per cent), and continued:⁶

We, the Soviet people, the communists, have delivered a challenge. We have stated that we are catching up with and overtaking the United States in industrial production—a bold challenge. Once they laughed at us. . . . But when they saw that we had built rockets, satellites, atomic power stations, the first civilian atomic ship . . . several special sessions were held in the U. S. Congress . . . and the question of the USSR rate of development was discussed. . . . In this matter we possess many advantages over capitalism. . . . In the United States . . . the main stimulus is profit . . . even in the best years the capacity for producing 20-25 million tons [of steel] remains inactive. . . . It is improbable that this would happen with us.

Four days later, at a luncheon given by two high Mexican officials, he spoke in a less irenic vein:

It goes without saying [said Mikoyan] that the rate of development of underdeveloped countries would increase—and that would be just—if the colonial powers which robbed these countries returned to them what they had robbed, even without interest. . . . Although many of the countries which had rid themselves of the

⁶ This quotation and the following one are taken from monitored broadcast texts obtained from a reliable source, as rebroadcast from Moscow.

colonial yoke have become independent states, economically they still depend on capitalist monopolies. In six Arab countries U. S. and British oil monopolies make monstrous profits. . . . During the past nine years these Arab countries have lost over 6.5 billion dollars worth of oil profits. . . . We ask for an annual interest of 2.5 per cent for our loans. . . . We are not looking for profits. . . . Apart from this, we give the underdeveloped countries, free of charge, licenses for the production of machinery and other articles based on our blueprints.

No specific mention of Latin America was made in this passage, but the reference was clearly implied, and Fidel Castro seems to have been echoing Mikoyan when he charged that, despite the sugar subsidy, Cuba has been systematically plundered by the United States throughout this century under the guise of investments. Yet throughout his speaking tour Mikoyan systematically coupled such thinly veiled incitements to "Yankeeophobia" with the portrayal of the Soviet Union as the champion of peaceful coexistence.

Soviet agents

It would be a mistake to discount the effect of even such guardedly hostile propaganda on Latin-American minds rendered receptive by years of real or fancied neglect and exploitation by the United States. And what the anti-Americanist Mikoyans of Soviet diplomacy only hint at, a substantial corps of trained Communist agents in Latin America make so explicit as to place no strain on the least lively imagination. Those agents operate in a variety of ways, the most public of which are the more than 300 Communist newspapers and magazines published in Latin America and numerous Soviet cultural and social societies in Latin America, which increased from forty in 1957 to eighty-four in 1958.

It would also be a mistake to think of these Communist agents as novices. Communism became rooted in Latin America in the 1920's. In Cuba, for example, its organization dates from 1925, and about the same time it had centers in Mexico City and Montevideo that served as a kind of regional headquarters for Middle and South America. Because of World War II and certain actions of the United States, the Communists built up their Latin-American membership rapidly during the 1940's until it reached an all-time peak of between 500,000 and 600,000 members in 1947.

Rise of the popular front

Since 1947 the cold war and the outlawing of communism by most of the Latin-American governments have cut that figure in half. But there are still enough Communists to foment trouble nearly everywhere, and, in any case, present Soviet policy does not favor building up Communist party membership. The aim now is to maintain small, disciplined cadres, to operate covertly, especially through non-Communist labor unions, and to extend Communist activities into the once largely neglected rural areas. The present sound policy line is to support nationalism, which, of course, means anti-imperialism, which, of course, as the Communists and many others define it, means anti-Americanism in the sense of hostility to the United States.

In pursuit of this policy the present tactic is to join forces with all nationalist groups that will co-operate, whether of the right, center, or left. In other words, there has been a return to the Communist device of the popular front of the 1930's, but with two differences. At that time the popular fronts were formed against Nazi Germany and Fascist Italy. If the Communists can arrange it, the Latin-

American popular fronts of the 1960's will be directed against the United States. Moreover, this will be a more concerted operation, and Moscow will orchestrate it. Until 1957 the stronger Communist groups in Latin America competed in a kind of imperialist struggle for control of the weaker ones. In that year each country was made independent of the rest, and all were placed under direct orders from Moscow.⁶

THE ROLE OF THE UNITED STATES

How should we meet this Communist threat? Let us take Cuba as a test case, for it illustrates the problem in its most difficult form. If there were much less Communist influence in Castro's regime, the problem would not arise at all. If there were much more, and it could be proved, the solution could be sought in the Anti-Communist Declaration of Caracas (1954), which would lead the way to multilateral enforcement measures ranging from diplomatic sanctions through economic sanctions to the use of armed force, as provided by the Hemisphere Defense Treaty, or Rio Pact, of 1947.

But this solution is not feasible now, since it requires a two-thirds vote of the American states, which we could not secure in the present state of Latin-American opinion. So we must look for a solution elsewhere. Our search should take account of both the handicaps and the advantages under which we operate in relation to the Castro regime.

Our handicaps

Let us begin with the handicaps. The first is public opinion at home and

⁶ William S. Stokes, "Democracy, Freedom, and Reform in Latin America," in Frederick B. Pike, (Editor), *Freedom and Reform in Latin America* (University of Notre Dame Press, 1959), p. 140.

abroad, which is divided into two schools of thought. One school that has strength in the United States holds that Castro is a Soviet tool. The other, that is prevalent abroad, even in the free world, holds that this is not proved and that Castro may be only an extreme nationalist demagogue. However much we deplore the latter view, we must respect it, for otherwise we may arouse indignation in the United Nations as well as the Organization of American States (OAS). Castro already has close ties with the Arab bloc through Nasser's United Arab Republic, which is co-sponsoring the conference of underdeveloped nations to be held in Havana later this year.

The second handicap is our inability to control the shipment of arms to Cuba. If Castro is a Soviet agent, one of his most likely courses of action will be to create confusion in neighboring countries by undercover promotion of guerrilla warfare. To do this he must obtain arms from abroad, and so far we have not been able to prevent this, even from free-world countries such as Belgium.

Finally, and most important of all, the United States is deterred by the absolute rule of nonintervention, to which it has been committed since 1936 under a succession of inter-American pacts and by a similar rule of the United Nations Charter. This is not a policy that we can change, but a binding, permanent international obligation. The South African racial discrimination case has just shown that these nonintervention rules can be almost worthless when the majority chooses to ignore them, but, in the Cuban case, the United States would not have the majority on its side if it decided to act now. As the *New York Times*' principal correspondent in Latin America wrote in January 1960, "Fear of United States intervention is so

deeply ingrained in Latin America . . . that Latin Americans prefer to take chances with Dr. Castro rather than see Washington apply economic or other sanctions against him."⁷

Our advantages

But will Latin-American opposition to remedial action through the OAS prevail indefinitely if the Cuban situation continues to deteriorate? This brings us to the advantages that offset our handicaps in dealing with Cuba. There have been many signs of growing opposition to Castro in other Latin-American countries and a few indications that some support has developed among them for the idea of imposing multilateral sanctions on his regime through the OAS.

The idea was publicly endorsed in January 1960 by President Kubitschek of Brazil. Although Brazil is much the biggest Latin-American country, no such action is likely to be taken any time soon, for two reasons. First, it would require an amendment of the OAS Charter, which prohibits multilateral as well as unilateral intervention, except when multilateral enforcement measures are authorized in the special and limited security situation covered by the Rio Defense Pact of 1947. In the second place, this absolute rule of nonintervention has long been sacrosanct to most Latin Americans. In 1945 they killed at birth a similar Uruguayan proposal for multilateral sanctions against the Argentine military dictatorship headed by Juan Peron. Nevertheless, Kubitschek's pronouncement may herald a widespread change in favor of enforcement action, especially since Brazil itself had previously been a strong supporter of nonintervention.

⁷ *New York Times*, January 31, 1960, reported by Tad Szulc, dated Rio de Janeiro, January 30.

Whatever form it may take, disapproval of Castro's excesses has grown apace in Latin America, where at its birth a year ago his regime was enthusiastically welcomed by almost everyone except Dictator Trujillo of the neighboring Dominican Republic. Not only have half of the other Latin-American governments flatly rejected invitations to Castro's projected conference of underdeveloped countries, but some of their leaders are in open and general opposition to his regime and are described as forming a kind of anti-Castro club. In addition to President Kubitschek of Brazil and Governor Muñoz Marín of Puerto Rico,⁸ they include noted left-wingers such as former President José Figueres of Costa Rica and President Betancourt of Venezuela, himself a former associate of Communists but now one of their most effective foes. Signs of growing "anti-Castroism" have also appeared in recent months in Mexico, Argentina, and Chile.

Finally, substantial opposition to Castro appears to be developing in Cuba itself. The opposition still has far to go before it becomes formidable; at the present time, according to one well-informed observer, Castro's support has only been cut from 90 per cent to 70 per cent of the Cuban people. But that is a marked change for so short a period, and Castro's measures may accelerate the process, especially if, as seems likely, they cause hardship among the masses, who are now the hard core of his following.

At any rate, Castro has already alienated many Cubans, both civilian and military, who as recently as a year ago were enthusiastic supporters of his revolution. There are persistent re-

⁸ Puerto Rico is, of course, an "associated commonwealth" of the United States, not an independent state, but it is nevertheless Latin American in language and culture.

ports that the Roman Catholic bishops in Cuba are preparing a public remonstrance against his encouragement of communism; but these reports have also been persistently denied, so that we shall have to wait and see.

The most important conclusion that emerges from this brief survey of the situation in Cuba, and in the rest of Latin America regarding Cuba, is that on both fronts Latin-American attitudes have been, and still are, changing rapidly and to Castro's disadvantage. This consideration should weigh heavily in our determination of the course the United States should follow in dealing with this outstanding problem of Communist penetration in Latin America.

This does not mean that we can sit with folded arms in the calm assurance that a fairy godmother will solve the problem for us. For all we know, Castro's stock may reverse its recent trend and start ascending, both at home and abroad. And a number of other disagreeable things may happen to complicate the problem still further, such as Castro's open or at least unmistakable commitment to communism. But it does mean that, along with the handicaps we are laboring under, there are certain factors in the situation that favor us; and our course should be plotted with a view to making the most of our advantages at the same time that we refrain from doing anything that is likely to add to our handicaps.

POSSIBLE FUTURE ACTION

How do we go about doing this? For the long run, I agree with our leading authority on the Communists in Latin America, Robert J. Alexander,⁹ that the best way to combat them is for the United States to help those

⁹ Robert J. Alexander, *Communism in Latin America* (New Brunswick: Rutgers University Press, 1957), pp. 399-408.

Latin-American elements that are working for political democracy along with economic development and social reform. I favor such a course not only for its negative, anti-Communist effect but also for its positive merits: it is the kind of course we ought to follow even if there were no Communists for us to combat.

Admittedly, this general principle leaves many troublesome questions unanswered. But at least it establishes some clear guidelines of policy that are different from, and better than, those that we have followed at various times in the past, including the recent past.

Admittedly, also, the principle is not compatible with the rule of nonintervention as broadly interpreted in Latin America, and our departure from the rule will no doubt offend those elements in Latin America whom it does not benefit. But in its present broad sense the rule is unrealistic and unworkable and serves mainly to multiply the Latin Americans' complaints against us. Our very observance of it has this effect. For example, many of them have roundly abused us for not intervening to rid them of dictators. Given the existence of this impossible rule, there is some ground for this complaint. For our wealth and power are so much greater than theirs, and our relations with them so close, that every act on our part, whether of omission or commission, constitutes in some degree an intervention in their affairs.

I am not proposing that we treat the rule of nonintervention as a scrap of paper. On the contrary, I hold that, having accepted it as a solemn obligation, we must observe it to the extent that good faith requires and common sense permits. But we should interpret it narrowly and, in the grey area of doubtful interpretation, orient our departure from it in accordance with the general principle stated above. And we

should also encourage the Kubitscheks of Latin America to work for an amendment of the rule of nonintervention that will bring it into closer accord with the facts of inter-American life.

These general prescriptions for the long run will not be of much assistance in dealing with immediate problems such as Communist infiltration in Latin America. This problem is now brought to a focus in Cuba. What should we do about the problem of Cuba?

Only broad courses of action can be considered here. Two such courses are open to us. One is the difficult course of punitive action against the Castro regime; the other, adherence to our government's present "hands-off" policy of patience and forbearance.

Punitive measures

I have recently heard a sample of the punitive course described in some detail. It included the following steps: (1) calling a consultative meeting of the OAS with a view to taking enforcement measures against the Castro regime under the Rio Defense Treaty, as authorized by the Anti-Communist Declaration of Caracas, 1954; (2) an official declaration by the United States government branding the Castro regime as a Communist dictatorship and a threat to the peace of the Americas; (3) the expulsion of Cuba from the OAS; (4) an embargo by the United States on trade with Cuba; and (5) a general inter-American quarantine of Cuba.

In my opinion most of Latin America is nowhere near to being ready for such drastic action at this time, and it would be disastrous for the United States to take it, either alone or with what little co-operation it might be able to extract from Latin America. I believe that dictator Trujillo's Dominican Republic and the authoritarian regime in Nicaragua are probably the only Latin-

American governments that would co-operate willingly.

To follow such a course now would be to repeat and compound our blunder in the somewhat similar case of Guatemala in 1954, which is still a source of resentment against us in Latin America. On that occasion we justified our intervention—it was not direct armed intervention—on the ground that the Guatemalan government was Communist-infected; but most Latin Americans, of all shades of opinion, right and center as well as left, were convinced that we were really acting in defense of the United Fruit Company, which they regard as a typical Yankee "capitalist monopoly." Today, in Cuba, one of the conspicuous American sufferers at the hands of the Castro regime is this same United Fruit Company. And as for the proposal of an embargo against Cuba, Castro may be a Communist but is that any reason why we should burn down the Cuban barn? Castro would be about the last of its inmates to suffer.

Other punitive measures of a milder kind have been suggested, such as cutting the Cuban sugar quota and freezing Cuban funds. They may be used later, in different circumstances, but, as of now, they are open to the same objections. In the present state of Latin-American opinion, they would give a great impulse to anti-Americanism, while wiping out the nascent "anti-Castroism" and turning Castro into a Latin-American David in courageous combat with the Yankee Goliath. They would also do great and perhaps lasting injury to the Cuban economy and so to its people.

"Hands-off" policy

I need hardly say that my own decided preference is for continuing our

present "hands-off" policy. It is not a heroic policy, but would it be any more heroic for us to step on little Castro? In any case, we are not concerned with heroism but with the course that will reward us best in the long run and still let us live with our consciences.

It seems to me that the "hands-off" policy, as it has developed so far, offers the best hope of meeting this difficult double requirement. This is the kind of policy recommended at the beginning of our relations with the new states of Latin America by one of our great Secretaries of State, John Quincy Adams. In 1827, after ten years of rich experience in relations with Latin America, first in that post and then as President of the United States, Adams declared that "to preserve those relations in amity, which is the unquestionable interest of all parties, will require on the part of the United States, an observing and persevering system of kindness, moderation and forbearance."

Such a "system" is no less requisite today. We have been following it faithfully in the difficult case of Cuba and, I think, with good results. I believe it has weakened Castro at home and abroad and has increased our international stature.

How long we shall have to palliate and endure, and what will come next, I would not venture to say. But I am confident that we have already found the best way of dealing with this particular case of Communist infiltration. I am also confident that the worst way to deal with it, and the best way to promote communism in Latin America at large, would be to embark on a course that might end in making of Cuba an American Hungary and of the land reformer Castro a martyr to anti-communism.

QUESTIONS AND ANSWERS

Q: I wonder if you would care to comment on the possible effects in Cuba and in other Latin-American states of President Eisenhower's blast the other day against Castro?

A: I wonder if you mean the one that was just published in the paper this morning? All I know about it is what I read in the paper, and the paper I could get this morning was the *Philadelphia Inquirer* which did not give as complete details as I would have liked to have. I should think that letter would cause a good deal of unhappiness in Mr. Castro's own circles in Cuba. I must say that for the rest, the other circles in Latin America, as well. I am not suggesting for a moment Mr. Castro is all by himself, but I think that this sort of thing is very good. I think it was a temperate letter. I think it was strongly and well stated, and while I certainly do not want to see the head of our government engage in name-calling with any other country, it seems to me that this was a very legitimate and probably a very useful statement. I do not think that one can take Castro's type of declarations forever. This particular reply, I think, was a very useful one and a permissible reply, partly because it did not in fact come directly from President Eisenhower. It came in the form of a communication which will be delivered by the Ambassador in Chile to the students in Chile, and it was not as if Mr. Eisenhower himself had got up and denounced Castro. I repeat, I think that it was a proper statement. I think that on the whole it will have a good effect; of course it can have some on the other side too.

Q: In considering the role of Communist infiltration in Latin America, is

it not necessary to consider the three following points: First, that all of Latin America is undergoing a thoroughgoing and tremendous social revolution. Second, that the attitude of the United States towards dictators in the past has been a distinct handicap in the answers which we Americans like to give to pro-Communist infiltrators in Latin America. And thirdly, that the achievement of a policy which would satisfy the perfectly legitimate nationalist aims of the leaders not only in Cuba but throughout Latin America would do more than anything else to assure the Latin Americans of the traditional warmth and friendliness of the American people towards the democratic elements in Latin America. In other words, that the best way of meeting the Communist attacks is by modernizing the type of economic, social, and political relationships which have given the Latin Americans perhaps this inferiority complex that has permitted them to become victims of Communist infiltration.

A: Answering the first point, I quite agree that we should recognize the existence of the fact that a social ferment, a social revolution is going on in Latin America. In fact, I mentioned that by name at the beginning of my paper, and I thought I had stressed the point very strongly. Apparently, I did not stress it as strongly as I should have. On the second point, I think the answer is yes. I think that although we are doing very well these days, recently we have not done what we should have in the matter of dictators. I would say yes. On the third point, I quite agree that we must recognize and make full allowance for the spirit of nationalism rising in Latin America. That is another point that I mentioned in my pa-

per and could not develop, in the time at my disposal, as I would have liked to do. I think it is quite true. I think though when you speak of modernizing our economic and social relations you open up a very wide vista with many, many difficult problems. I would like to say only one thing in conclusion, and

that is that I think that our respect for the rule, the absolute rule, of nonintervention is one of the best ways to show our respect for Latin-American nationalism. But we have to leave the positive work of nonintervention under the protection of the Latin Americans themselves.

Toward Better Understanding Between United States and Latin America

By ROY R. RUBOTTOM, JR.

ABSTRACT: The long-standing relations between the United States and Latin America rest on a firm foundation. Yet, certain misunderstandings have arisen which seem to cloud the relations in the Western hemisphere. Nonintervention in the internal affairs of another state is the fundamental principle that has guided the relations in the hemisphere. Since World War II, this doctrine has been supported by the principle of collective security agreed upon at Rio de Janeiro in 1947 and enforced by the Organization of American States. The misconceptions which exist relate to various subjects in military, political, and economic affairs. In military relations misunderstandings arise over the extent of the United States military assistance to the Latin-American countries and over the United States export-of-arms policy. In the political sphere, the United States is condemned for its continued support of the doctrine of nonintervention with respect to dictatorial governments in Latin America. The contentious subjects in economic affairs relate to United States development assistance programs and to commerce in primary products. It is indeed necessary to clear up these misunderstandings so that the channels can be open to continued constructive relations between the twenty-one republics.—Ed.

R. Rubottom, Jr., Washington, D. C., is Assistant Secretary of State for Inter-American Affairs. He has been Director of the United States Operations Mission in Spain; Counselor and First Secretary of the Embassy, Madrid; Director of the Office of Inter-American Affairs; Officer-in-Charge of Mexican Affairs; and Second Secretary of the Embassy and Consul, Bogotá. Prior to his appointment as a Foreign Service Officer in 1947, Mr. Rubottom was a student dean, banker, and naval officer. He received his education from the Southern Methodist University and the University of Texas.

IN the relations between the United States and Latin America certain problems exist which contribute to misunderstanding. These are the problems that I wish to analyze and discuss in this article.

Having returned from South America with the President one month ago, I can report that he received an overwhelmingly friendly reception everywhere he went. Much of this was due to his own personal magnetism and was recognition of the acknowledged leader of the victorious forces of World War II, but he was also enthusiastically received in his role as President of our country. Allowing for misunderstandings, some of them serious and deep, which do exist in Latin America's attitude toward the United States, I still think that there is a great reservoir of good will toward this country growing out of respect for the principles on which our relations have been founded and their day-to-day practice. I am convinced that the true basis of any unfriendliness toward the United States finds its roots in misunderstandings. Some of them are general throughout the area, while others are limited to one country or group of countries. We have made extraordinary efforts to overcome these misunderstandings, insofar as responsibility devolves upon us, but obviously a similar effort must come from the other side if understanding is to be achieved. Fortunately, the tradition in this hemisphere has been that men of good will on both sides have sought mutually agreeable solutions to their common problems. We should be realistic, however, and recognize the brutal fact that there are those in the Americas whose single purpose is to create ill will and thwart all efforts to reach understanding.

In this crucible of democracy, we have long since learned that, after the give and take of unfettered public dis-

cussion, workable compromise is possible to devise. This does not require sacrificing principle. In fact, we could not hope to settle our differences or to achieve agreement with parties who insisted that we sacrifice the principles on which we have built our own country and its relations with other nations, including our friends in Latin America. In fact, I know nothing better to suggest as a cure for misunderstanding in Latin America than frank talk and unceasing joint search for the truth.

Some criticism directed at United States policies toward Latin America is so broad and sweeping as to convey to the reader or listener that the governments and peoples of the Americas are incapable of setting their own guidelines, formulating their own policies, and evolving their own destinies. The implication is that the United States is somehow responsible for all the problems that arise in Latin America. On both counts, this kind of reasoning should be rejected. There are increasing signs of the social, political, and economic maturity in this vast region—indeed, some countries are world powers by almost any definition—but even the weakest or the most underdeveloped country would reject the thesis that they were not capable of self-determination. By the same token, the United States could never assume the responsibilities which properly are those of the individual countries themselves; we tried to do this once and earned the displeasure of the entire hemisphere, not to mention that of the countries in which we intervened, in the process.

NONINTERVENTION AND COLLECTIVE SECURITY

It is necessary to analyze the doctrine of nonintervention. Prior to the 6th Inter-American Conference at Montevideo in 1933, the governments of Latin America had been deeply concerned with

what they conceived to be the unwarranted interference of the United States in the internal affairs of some of their countries. They were even more concerned over our apparent unwillingness to subscribe fully to the principle of nonintervention. At the Montevideo meeting, we accepted this doctrine in principle. Following the abrogation of the Platt Amendment in 1934, our full agreement with this principle was made known in the treaty embodying nonintervention in specific terms in 1936 at Buenos Aires. Nothing that we had done previously in the realm of inter-American affairs had a more dramatic or favorable impact on our foreign relations than our acceptance of and faithful adherence to the nonintervention doctrine, now one of the most jealously guarded principles of the inter-American system.

Nonintervention is only one of the fundamental rules, if I may use the term, for international conduct in the western hemisphere. No less important for its material contribution to peace is the principle of collective security, which came to full fruition with the Inter-American Treaty of Reciprocal Assistance signed at Rio in 1947, following the initial steps taken during World War II toward establishing its form and substance. Specifying that an act of aggression against one nation will be considered an attack on all, the collective security agreement provides the machinery for action against a state that does not hold itself bound by the nonintervention agreement. Since 1948, the Rio Treaty has been invoked ten times. On six of these occasions the Council of the Organization of American States, through its Organ of Consultation, succeeded in bringing about a peaceful settlement, while the other four were solved by withdrawal of the charge of aggression or some other means.

Quite apart from binding the twenty-one republics to a solemn commitment not to intervene or resort to force of arms as a means of resolving differences, as well as providing a course of action in case of violation, the linked principles of nonintervention and collective security have given birth to a salutary psychological attitude in the general conduct of inter-American relationships. Each nation of our hemisphere, no matter how small or inadequately armed, now feels protected by the strength of the many allies that would come to its support in case of aggression. Each nation now has the foreknowledge that correct conduct in a serious dispute will be ascertained and approved by impartial investigation. Mutual trust based on confidence has alleviated much of the suspicion that was common in hemispheric relationships; equally noteworthy is the growing awareness of the interdependence of the twenty-one American republics.

Yet the hemisphere now hears a voice which is strangely out of tune. The Premier of Cuba has publicly stated that his government would not feel bound by the Rio pact. Surely he must know that Cuba has nothing to fear from any country in the Americas, all of which have watched with sympathetic interest the unfolding drama of that beautiful island-republic since it successfully fought for its independence only sixty-two years ago. No distortion of history can possibly erase the facts, to which there are living witnesses both in Cuba and the United States, of that glorious effort. Nor shall we forget that it was the privilege of the United States to provide a sanctuary for the beloved hero and patriot of Cuba, José Martí, after he had been forced to flee the island prior to the independence struggle.

Can it be that the present Cuban government is unmindful of the real

threat to their revolution, indeed the threat to freedom and to the cause of just and honest nationalism all over the hemisphere, which is represented by international communism? Would not the freedom-loving peoples in the satellite countries of Eastern Europe have appreciated a kind of Rio Treaty when they were overrun at the end of World War II?

MILITARY RELATIONSHIPS

Many misconceptions exist, both at home and abroad, concerning our military relations with Latin-American countries. In this important aspect of our total foreign relations in the area, the United States collaborates in many ways with Latin American countries. Our representatives deliberate as juridical equals on the Inter-American Defense Board to determine the means and methods of collective security. Our military missions serve in Latin-American countries at the request of the host government. In the various bilateral military assistance programs of our Mutual Security Act, the United States provides materiel and training to a number of countries.

During the last year, there has developed outside the executive branch some sentiment in favor of providing military assistance to Latin-American countries through multilateral channels and of terminating, or drastically curtailing, our present bilateral programs. For example, a recent study prepared by a university for the Senate Foreign Relations Committee recommends the establishment of a small auxiliary force of about a hundred men, contributed by various countries, to maintain security against threats arising from within the hemisphere. While this proposal is under study at the present time, I would be less than frank not to underline the political and military complexity of establishing a force that would be truly effective and acceptable to all twenty-

one republics in the inter-American community. Discussion of proposals for an international police force might be included under one of the items approved for the agenda of the 11th Inter-American Conference scheduled to open in Quito, March 1, 1961, but no early agreement is foreseen under even the most favorable circumstances. Obviously, such an agreement would require consultations within the individual countries, and it would take a long time to obtain the prescribed two-thirds support of the twenty-one republics, if it could be procured at all.

Some misunderstanding of the mutual defense assistance program also has appeared, both in Latin America and the United States. In this program the United States provides a relatively small amount of materiel and training to a few countries for regional defense needs. Far from serving as the main support of the entire military establishment in any country, as sometimes alleged, in no country does this assistance constitute more than 16 per cent of the total personnel strength of the local armed forces—and from this the ~~total~~ ranges downward to a ~~few~~ two per cent.

This small defense program neither supports nor endorses the additional forces that the individual countries may wish to maintain. The size and character of their total military establishments are within the prerogative of sovereign countries to decide for themselves, and it would be improper for the United States to go beyond a mere statement of belief that most countries probably could reduce their military expenditures without jeopardizing their security requirements. Naturally, the United States would welcome any opportunity to discuss the always difficult and complex subject of Latin-American arms limitations. A conference to discuss this question was proposed by the

Presidents of Chile and Peru, and President Lleras of Colombia has now joined them in this proposal in a statement made during his recent visit in Washington. To the extent that it is compatible with our own national interests, this country is prepared to bring its own programs and policies into harmony with any arms limitation arrangements that may be developed individually or collectively by our neighbors in this hemisphere.

CARIBBEAN ARMS POLICY

I wish to take this opportunity to make clear our policy on the export of arms and implements of war to the Caribbean area. The basic position of the United States is the observance of nonintervention and loyalty to the efforts of the American community as represented in the Organization of American States to maintain within this hemisphere a climate of peace and tranquility within which all American peoples can progress towards the full enjoyment of the benefits of representative democracy and economic progress. There has, however, arisen in various parts of the Caribbean area an atmosphere of violence and tension. Arms obtained in the United States have been utilized, against the desires of the United States government and people, in civil strife and in efforts to intervene by force in the internal affairs of other countries of the area. Accordingly, in March 1958, the United States adopted a policy of closely scrutinizing all applications for export of arms and implements of war to the Caribbean area and, in fact, of denying licenses for shipments from this country to the government of Cuba.

Since that time, there has been no lessening of tensions. The United States has not been able to return to its traditional policy of licensing the export of arms with the assurance that they would

be employed solely for legitimate purposes of defense. Instead, it was obliged to extend impartially to the entire Caribbean region its policy of careful scrutiny of all arms-export applications, denying those likely to result in additional tensions in the area.

This policy was made known to allied and friendly governments, who consult with the United States but who, of course, fully retain the right to make their own decisions in each instance. It should be amply clear that this policy is not directed against any particular country so much as it is directed toward the general aim of maintaining peace in the area.

FREEDOM AND DEMOCRACY

It is sometimes said that the doctrine of nonintervention has slowed down the march toward individual freedom and representative democracy in this hemisphere, that nations refusing to apply principles of basic human rights within their borders should not enjoy the "protection" of the nonintervention agreement. This position, in my opinion, is wrong. We have found, after long experience, that nonintervention provides individual nations the opportunity to evolve their own destiny and establish an atmosphere of freedom and human dignity.

Our common devotion to freedom with justice, and indeed to a broad application of democratic principles, should not be construed as an avenue of interference into the affairs of another nation where these same principles may not be in full application. This was a difficult question facing the Meeting of Consultation of Foreign Ministers in Santiago last August, and the decision was clearly stated that the principles of nonintervention are inviolable. Each nation must find its own political destiny without outside interference. This ban on intervention is

just as applicable to forces from outside the Americas as it is within. In his report to the nation, President Eisenhower stated his views this way: "If a tyrannical form of government were imposed from outside or with outside support by force, threat or subversion, we certainly would deem this to be a violation of the principle of nonintervention and would expect the Organization of American States acting under pertinent solemn commitments to take appropriate collective action."

CHILEAN STUDENT LETTER

During his recent tour to Latin America, President Eisenhower received a letter from an organization of university students in Chile. This letter seemed to be sincere and moderate, even thoughtful, but it also demonstrated much of the misunderstanding that exists in the mentality of many students of Latin America. Our Ambassador in Chile delivered the reply on behalf of the President to the student letter on April 8, 1960, and I wish to discuss some of the misunderstandings answered in that correspondence.

One of the phrases that impressed President Eisenhower as an indication of the depths of misunderstanding was the assertion that the United States looks "benevolently" on dictators in the Americas. Our democratic way of life has been so instilled in the makeup of our institutions that we cannot fail to be repelled by the tyrannical abuse of power by governmental leaders. We pointed out that we shall continue to favor the reduction and elimination of antidemocratic governmental practices if the solution is genuinely constructive, in accordance with international obligations, and represents the consensus of the inter-American community. It would only be foolhardy to become so obsessed with the destruction of un-

democratic regimes as to embark upon actions leading to chaos, anarchy, or their replacement by a new but even more dangerous form of tyranny. We hope the point is well noted by the students when they read in the reply that "democracy, unlike communism or any other form of tyranny, cannot be imposed from without by any nations or groups of nations. . . . What all of us can and should strive for is to improve and strengthen the admittedly imperfect democracies in which we live in order that they may serve as examples for others. This moral pressure by example strikes a responsive chord in the hearts of the people."

TRADE AND COMMERCE

That the United States should participate more fully in the economic development of Latin America is a point often made by our critics. The student letter advanced this idea and then added that "economic integration" would permit Latin American countries to "industrialize their economies and accelerate their development." Never in history has a country participated in the economic development of other regions so wholeheartedly as the United States has. The results have been mutually worth while and future prospects are still brighter. Our government has repeatedly and forcefully given its support to the concept of common markets in Latin America that stimulates trade expansion both within the area and with other regions of the world. Improvement of the knowledge and skills of the population has been a major effort of our technical co-operation and educational programs, affording these benefits to thousands of Latin Americans, under the sponsorship of both government and private enterprise.

The letter also points out that our government-owned Export-Import Bank

author does not discuss the social sciences or their contribution to the understanding of man in society. Dr. Weiss obviously considers the social sciences irrelevant to his argument, for he deals with ideal models rather than with actual societies. Only twice does he violate his own self-denying ordinance to mention an actual social situation—the mid-twentieth century controversy in the United States over civil rights and the League of Nations. "I asked myself," he says of his book, "not only how it is that men come to be part of public groups, but what ought to occur, if they are to move out of inferior into better states of affairs, from conventional traditionalized societies to state, to cultures, and then to civilization." The terms "state," "culture," and "civilization" must be understood in terms of specific definitions given by the author in this adventure in speculation. Dr. Weiss says: "... we live not in that Civilization [characterized by peace and prosperity and which can be achieved only through world government] but in a fragmentary realization of this—in a unit of civilization or *Culture*."

The author makes an exhaustive, and exhausting, dialectical analysis of man's "native" rights—"essential demands." "The answer here given to the vexatious problem of unalienable rights . . . agrees that native rights are absolutely unalienable, but only as constituent elements in a single constructed unalienable right. . . ." Dr. Weiss begins his discussion of law with "social" law, William Graham Sumner's folkways and mores though Sumner is not mentioned. The author advances to "positive" law and then to "natural" law. Putting aside the discussion through the centuries of the concept of natural law, Dr. Weiss uses a definition that fits into the development of his argument. "Natural Law" is compounded of our understanding of "the social good, of values that now prevail, of laws of nature that connect the one with the other, and of the fact that the social good makes the operation of some laws more desirable than the operation of others." "Natural Law stands in between positive law and a more comprehensive law, a Law of Civilization. . . ." Natural law "needs a society or state, but no

geration, and in most cases patently untrue, to accuse them of being interested solely in exploiting your countries."

RAW MATERIALS PRICES

The pricing of raw materials is a subject that is often interpreted to the disadvantage of the United States. In this case, the student letter took a quotation out of context from a report and arrived at the opposite conclusion. The full report shows how the development of low-cost resources benefits raw-material-producing countries as well as the countries which buy part of these raw materials. In fact, foreign producers and foreign countries have benefited substantially from policies of the United States government designed, not to obtain raw materials at the lowest price possible, but to give a fair return to suppliers in the United States and abroad.

The Ambassador's reply states: "Our appreciation that violent fluctuations of raw material prices can cause great difficulties for countries which are heavily dependent on the exports of one or two commodities has caused the United States to cooperate with primary producing countries, not only in Latin America, but elsewhere, and in many different ways, in efforts to overcome these difficulties. But the problem is deep-seated and requires basic solution of such matters as rates of economic growth, the need for diversification of production, and the balance of supply and demand. During the time that such fundamental adjustments are being worked out, it may be possible in certain cases to reduce the severity of price fluctuations by arrangements of various kinds among interested countries. In most cases it is possible for countries experiencing temporary balance-of-payments difficulties

as a result of commodity price declines to obtain external financial assistance calculated to tide them over."

The letter points out, that, far from obtaining raw materials at lowest possible prices, prices are supported for certain agricultural products and minerals. Foreign suppliers often obtain prices for commodities sold in the United States which exceed world market prices, at considerable cost to the United States consumer. With respect to imported raw materials which are not produced domestically, we customarily levy low duties or none at all and impose few internal taxes. This stimulates our consumption of these products and so redounds to the benefit of the exporting country.

These are a few of the general areas of misunderstanding. If one would care to dwell upon the effects of disparities, something might be said about the differing heritage of language and cultural patterns, the divergencies in psychological attitudes toward the problems of economics and politics, and the paradoxical comparisons of sociological

and ethnological structures. It is my belief that in the face of present day realities, these dissimilarities are less important than the principles and practices that we hold in common with the people of Latin America. Individuals do differ, and so do nations. What matters far more is their capacity to work together toward their common aims for the mutual good of all.

We must all maintain a balanced perspective toward Latin America. The problems there are great but even greater is the challenge and opportunity. In the ebb and flow of hemispheric developments, progress far outweighs regression. Our relationships with Latin America today are on a sound basis, and there is a constructive trend which should continue unabated into the future. We are jointly committed with our sister republics in what President Lleras Camargo of Colombia two days ago described as a "glorious, responsible and arduous task . . . of proving that a part . . . of the world knows how to live in a society of nations ruled by law and moving towards perfection."

The Problem of German Reunification

By HANS J. MORGENTHAU

ABSTRACT: The unification of Germany is at present impossible because of the irreconcilable interests of the United States and the Soviet Union. The Berlin issue, as it was raised by Khrushchev in November 1958, is the symbolic manifestation of the real issue which has separated the United States and the Soviet Union since the beginning of the cold war, that is, the permanence and legitimacy of the territorial status quo in Europe. The substance of the Berlin issue, by virtue of its symbolic character, is not negotiable, while the modalities of the Western presence in Berlin are. The Western presence in the former capital of a unified Germany symbolizes the provisional character of the division of Germany; by negotiating about its right to be in Berlin, the West would put into question the right itself and, with it, the provisional character of the division of Germany. The Western position is endangered by the Russian advantage of being able to satisfy the German national aspirations whenever it wishes by uniting Germany and restoring its eastern provinces to German rule. It is therefore imperative for the West to reconcile itself to the continuing division of Germany, while at the same time convincing the Germans that their hope to see their country united on tolerable terms lies in co-operation with the West.

GERMAN reunification is like the weather. Everybody talks about it, but nobody does anything about it. The analogy does not end there. For nobody does anything about the weather because nobody can do anything about it; and to a very great degree, especially in so far as the Western world is concerned, we do not do anything about German unification because we are unable to do anything about it. There is, then, a great gap between the verbal professions of interest in German unification and the actual unwillingness and inability to do anything about it. The reasons for this hopeless situation—hopeless in terms of German unification—lie deep in the very nature of the German problem as it presents itself not only to the Soviet Union and the nations of Eastern Europe but to the Western world as well.

THE GERMAN PROBLEM

In order to do justice to the German problem and the policies of the nations regarding it, it is necessary to take into account certain objective facts. First of all, even the truncated West Germany of today has already become the third most powerful nation on earth. This is one fact. Furthermore, and this fact goes back into history at least to the first unification of Germany in 1870, the other nations of Europe have regarded and still regard today a powerful, independent Germany as a threat to their interests, if not to their existence. And thirdly, the other nations of Europe have tried to counter this threat of a powerful, independent Germany, and this goes back even to the seventeenth century, by dividing Germany.

The present attitude of both the Soviet Union and the United States toward Germany was established immediately after the Second World War and has remained constant to this very day because of the objective interests

which both powers must pursue with regard to Germany. Considering the actual and potential power of Germany, neither side has been willing to contemplate all of Germany joining the other side as an ally or a satellite. Of this unwillingness, the division of Germany has been the logical result. In other words, what has happened in Korea and Vietnam has also happened with regard to Germany. Since neither side could accept the falling of the whole country into the orbit of the other side and since neither side had enough power to draw all of the country to its side, the division of these countries was a natural consequence of the actual balance of power, of the military and political stalemate between East and West.

THE FUTILITY OF NEGOTIATIONS

The negotiations which have been carried on over the unification of Germany between East and West in innumerable conferences since 1947 all ended in complete failure. They were bound to end so because they were not real negotiations at all. Either side could have had no doubt but that what it proposed was unacceptable to the other side or was acceptable only on the condition of unconditional surrender. The West has consistently proposed free elections for all of Germany which would decide not only the domestic regime but also the political orientation of a united Germany. Of course, the result of such elections has always been a foregone conclusion. If the East Germans could freely elect their government, Communists would not stay in power for twenty-four hours. If they could elect a foreign political orientation for themselves, they would not remain in the Soviet orbit for twenty-four hours. This we know, and this the Soviet Union knows, and for this reason the Soviet Union could never accept free elections in East Ger-

Hans J. Morgenthau, Chicago, Illinois, is Professor of Political Science and Director of the Center for the Study of American Foreign and Military Policy at the University of Chicago. He is at present on leave as Visiting Professor of Government at Harvard University. Dr. Morgenthau is the author of Scientific Man vs. Power Politics (1946), Politics Among Nations (1948, 1954, 1960), In Defense of the National Interest (1951), Dilemmas of Politics (1958), and The Purpose of America (to be published in the fall of 1960).

many, short of being forced to relinquish its foothold in East Germany and start the liquidation of its empire.

The Soviet Union, on the other hand, has consistently suggested the equal representation of East and West Germany in a common government or in a common commission which would make preparations for unification. In other words, the Soviet Union always insisted upon the minimum demand that the Communist domination of East Germany and the existence of two Germanies be accepted by the West as accomplished facts. Beyond this, the Soviet Union has tried to induce West Germany to accept into its midst a Communist "Trojan horse" which could undermine its government and social structure. This Soviet proposition has been and still is as unacceptable to the West as the Western proposition has been and still is to the Soviet Union. So the so-called "negotiations" over the unification of Germany have ended, as they were bound to end, in a complete and unmitigated stalemate. There is no doubt that both sides will continue to talk about unification as they talk about the weather, but there is also very little doubt that neither side in the foreseeable future is willing and able to do anything about it.

THE BERLIN ISSUE

It is in the context of this hopeless and entirely negative situation that one must consider the current issue of Berlin. For the issue of Berlin has not been created by Mr. Khrushchev for his own amusement. The issue is intimately connected not only with the issue of Germany but more particularly with the long-range objectives of Soviet foreign policy. In order to understand more clearly the significance of the Berlin issue as it was raised by Mr. Khrushchev in November 1958, one

has to go back to the objectives of Stalinist foreign policy.

The major objective of Stalin in Europe was the stabilization of the status quo. During the Second World War, he conceived of the postwar world and, more particularly, Europe being divided between the United States and the Soviet Union into two gigantic spheres of influence, with both superpowers governing the rest of the world in unison and the Soviet Union advancing whenever the opportunity arose. Stalin made numerous proposals, either directly or indirectly through neutral diplomats, for an arrangement with the United States by which at least Europe would be divided into two spheres of influence with the military line of demarcation of 1945 constituting the boundary of the two empires. The United States has consistently refused even to consider such an arrangement. The United States has always regarded the line of military demarcation of 1945 as a provisional line which after a final settlement would run much farther to the east than it runs now. Here again, of course, the division of Germany is the outward manifestation of this stalemate over the territorial settlement of the Second World War, which one side regards as provisional and the other side wants to have recognized as definitive.

Khrushchev has revived this Stalinist objective by raising the issue of Berlin in an acute and threatening form. He has created the Berlin issue as a symbolic manifestation of the over-all German issue, and here lies its significance. For as long as part of Berlin—that is to say, the capital of a once united Germany, the potential capital of a reunited Germany—is occupied by the Western powers, that occupation symbolizes the provisional character of the division of Germany. If the Western

powers were to leave Berlin, making it first a so-called "free city" and then allowing it to become a truly "free" city in the Communist sense—that is to say, a Communist city—they would relinquish that symbolic foothold in the former capital of a united Germany, symbolizing the potential unity of all Germany.

Furthermore, from the Russian point of view, as long as the Western powers are in Berlin by right and not merely by sufferance of the Soviet Union, a point to which I intend to return in a minute, the division of Germany is only provisional. For the status quo of Berlin implies paradoxically enough an instability in the status quo of all of Germany. As long as the Western powers are in Berlin, the division of Germany is only provisional. Once the Western powers have weakened their foothold in Berlin, in that measure the division of Germany is on the way to becoming permanent. And this is exactly what Khrushchev is aiming at. Through the instrumentality of the Berlin issue, he tries to force the West to recognize what it has refused to recognize for the last fifteen years, that is, the definitive division of Europe, with the Russian army standing 100 miles east of the Rhine and staying there for an indefinite future. So the issue that Khrushchev has raised is by no means limited to whether there ought to be eleven or eight or six or five or four thousand Western troops in Berlin, or whether they ought to be in Berlin by virtue of this kind of arrangement or another kind of arrangement. The issue Mr. Khrushchev has raised is the fundamental issue of who shall rule what, and whether what is ruled now by the Soviet Union shall be ruled by it in perpetuity, recognized in its legitimacy by the West. In order to make the over-all status quo in Europe more secure for the Soviet

Union, he has called into question the status quo of Berlin.

Thus the issue of Berlin in its true dimensions by far transcends the legal modalities of the Western presence in Berlin. The Western presence in Berlin and its modalities are a mere symbolic manifestation of the underlying issue from which the cold war between the Soviet Union and the United States arose in the first place and which divides the Soviet Union and the United States today, that is, the legitimacy of the status quo. That issue will continue to divide them as long as both sides defend their interests as they see them.

IS BERLIN NEGOTIABLE?

It has been said that the issue of Berlin is not negotiable. Mr. Adenauer has said it in the name of Germany, and Mr. Acheson has said it as a citizen of the United States, but speaking also for a considerable body of American opinion. They have said that the Berlin issue cannot be negotiated, and I must say that in so far as the substance of the issue is concerned, I agree with them. For if you live in your house and your neighbor tells you to get out, you cannot reply "let's negotiate about it." Either you stick to your right to stay in your house and that is that, or your very willingness to negotiate implies that you are not quite sure that you have the right to be where you are. You cannot insist on your right and make it the subject of debate at the same time.

Mr. Khrushchev is a much more subtle man than Mr. Stalin was, and by trying to change the legal foundation of the Western presence in Berlin, he really tries to undermine the legal right of the West to be in Berlin. At present, the West is in Berlin not by leave of the Soviet Union, not by virtue of a contract with the Soviet Union,

but by the right of the conqueror. Now Mr. Khrushchev says, on the face of it in a most reasonable manner—statesmen that try to separate you from what belongs to you appear often very reasonable—"The Second World War has ended fifteen years ago. Isn't it time to liquidate the war? Oughtn't we to have peace now?" What could be more sensible than this? And so he says, "Let's change the legal foundation for the Western presence in Berlin. Let's give up the right of the conqueror and you, the United States, Great Britain, and France, make a treaty with the Soviet Union, and we will allow you to stay in, and to have access to, Berlin."

However, there is a great deal of difference between being in Berlin on the basis of conquest and being in Berlin because the Soviet Union allows you to be there. For what the Soviet Union allows you today it can deny you tomorrow, and international treaties have a way of being left by the wayside when the situation under which they have been concluded changes. The Soviet Union has shown itself particularly adept, as have other nations, at making treaty stipulations conform to changing circumstances. This innocent-looking change in the legal right of the West to be in Berlin would really put the West at the mercy of the Soviet Union with regard to that right.

However, to say that you cannot negotiate about the substance of your right to be in Berlin does not mean that you cannot negotiate about the modalities of your presence. Certainly you can manipulate that right, you may debate the decorations of the house, the roof, the paint, the driveway. You can agree to building a different fence, say, a United Nations fence, if your neighbor does not like the fence you have. Or we can diminish our troops in a moderate way, or we can stop hostile propaganda. We can pledge

ourselves not to have atomic weapons in Berlin, which we would not want to have there anyway, and so forth. But you cannot sit down and negotiate about your right to be where you are without by implication casting doubt on that right.

If this is the nub of the Berlin issue, then the struggle over Berlin is really a struggle for Germany, and we should realize its significance. And those in our midst and more particularly in Great Britain who say that the Berlin issue is not worth bothering about and is not worth fighting for, if they face the issue squarely, are really saying that Germany is not worth bothering about and Germany is not worth fighting for. And this is exactly what Mr. Khrushchev wants us to believe. For once we have retreated in Berlin, we have not only started to give up Berlin, but we have started to give up much more.

THE SOVIET ADVANTAGE

This leads me to a point which is again part of the objective conditions with which all policy must come to terms, regardless of what it aims at and what measures it proposes. That is the basic fact that with regard to the unification of Germany and to the future allegiance of Germany the Soviet Union has an enormous advantage over the West. For the Soviet Union can unify Germany tomorrow if it wants to, simply by throwing the East German government overboard. And when it comes to the eastern provinces of Germany, it can restore all or a part of them to Germany overnight by dividing Poland again between Germany and the Soviet Union. After all, we should not forget that in the last two hundred years Poland has been divided four times between Germany and Russia. It has been divided not because of the whims of some statesmen, but because

of objective conditions of interest and power which made it advisable for both sides to come to an understanding on the prostrate body of Poland. In the game for the allegiance of Germany, these are the trumps of the Soviet Union which the West cannot match.

What has kept West Germany thus far on the Western side is its mistrust of the ultimate objectives of the Soviet Union and its confidence in the objectives and power of the West. In the measure that this mistrust and this confidence should diminish West Germany will be tempted to try to obtain from the Soviet Union what it wants, that is, unification and the restoration of the former eastern frontiers. The only hope the West has to prevent this from happening is to keep West Germany from becoming disillusioned with the West and to make it crystal-clear that the West will not accede to Soviet Union demands either with regard to Berlin or with regard to any other issue in which Germany has an interest. For if West Germany should believe, rightly or wrongly, that it cannot rely upon the West for support in the pursuit of its national objectives, it will naturally turn elsewhere, and the natural direction in which it will turn is the Soviet Union.

Mr. Khrushchev, who is a subtle but also a blunt man, has taken this possibility into account. He has said to one of his Western visitors that one of these days he will make a bargain with West Germany, and the West will then be left emptyhanded. This is a real danger. It is not yet an acute danger, but it is a real danger because it is inherent in the objective conditions of interest and power. Hence, the West must be on guard lest it is not lured into policies which will give both the Soviet Union and West Germany an incentive for bringing to pass what would be a real catastrophe for the interests and the

power position of the West. It is obvious that the prospects for German unification are dim as long as both sides keep their positions. There is no chance for the unification of Germany under Western auspices as long as the power and interests of the Soviet Union are what they are today. It is also obvious, it seems to me, that the prospects for German unification under Russian auspices will be greatly improved if the West should weaken in its resistance to changing the status quo in Berlin in order to stabilize, for the time being, the status quo in all of Germany.

WESTERN OPPORTUNITY

So far I have spoken primarily of American and Soviet policies. Ten years ago it would have been sufficient to do that, and I could have stopped here. But today it is, of course, necessary to speak of German policies as well. For, as I pointed out before, Germany has already become one of the great powers—economically and politically strong and in the process of becoming militarily strong again. Here lies another factor which strengthens the hand of the Soviet Union. For nobody fears the military power of Germany more than the countries of Eastern Europe, such as Czechoslovakia and Poland, who remember what happened to them fifteen and twenty years ago when Germany was very powerful indeed. And the support of the nations of Eastern Europe for the German policies of the Soviet Union is primarily motivated by that fear. Here is another problem and, I think, another opportunity for the West.

It is interesting to note that President de Gaulle alone of all the Western statesmen has seen this opportunity by declaring himself in favor of the Oder-Neisse line as the permanent eastern frontier of Germany. If all nations

would make such a declaration, in other words, if all nations would make it appear a hopeless undertaking for any German government ever to recover the regions east of the Oder-Neisse line, the present community of interests between the Soviet Union and the nations of Eastern Europe would be thereby weakened, if not destroyed, in so far as their policies toward Germany are concerned. And, I think, the nations of the West would also greatly contribute to the stabilization of order in all of Europe and to the promotion of freedom in eastern Europe.

These considerations have, of course, but an indirect and negative bearing upon my topic, the unification of Germany. They deal with policies and conditions which would make the continuing division of Germany bearable for all concerned. For unification cannot be brought about in the foreseeable future by diplomatic negotiations. Given the continuation of the present balance of military power, it cannot be brought about by force. It can only come about by the Soviet Union, which, as I said, occupies the key position in this situation, realizing that it is more to its advantage to relinquish East Germany than to keep it indefinitely.

WHAT PRICE LIBERATION?

The last question I want to raise then is how can one create an interest in the Soviet Union to yield East Germany? Two proposals have been made to create such an interest; one has been the neutralization of Germany—which was widely debated in the late forties—the other, more recently discussed, has been disengagement. Neutralization might have been possible perhaps ten or twelve years ago when Germany was both impotent and antimilitaristic. But a great power which is aware of its power and which is rapidly regaining its military strength, primarily

under Western instigation and auspices, cannot be neutralized from the outside. It can be neutral if it wants to be neutral, but no other power or group of powers will be able to impose neutrality upon it against its will. Thus nobody, I suppose, seriously thinks of the neutralization of Germany today.

The idea of disengagement, on the other hand, implies a retreat of the armed forces which face each other in the center of Europe at the line of demarcation of 1945, so that a zone free of the armed forces of both West and East would be created, comprising at least all of Germany and some adjacent territories to the east and west. I have always had difficulties in seeing the virtue of this proposal in strictly military terms. For obviously the danger of war does not arise from armed forces opposing each other in physical proximity in Europe. It arises rather from intercontinental ballistic missiles poised in readiness on both sides. This danger would not be affected by disengagement. This anticipated benefit of disengagement, if I understand it correctly, is really political. It is intended to create an incentive for the Soviet Union, by paying it a price, to loosen its military grip on Eastern Europe.

In the abstract, this is indeed a sensible proposition. But as a practical matter, it has become obvious from Mr. Khrushchev's words and deeds that he does not intend to strike a bargain for such a price. Being aware of the inner weakness of the Russian empire, on the one hand, and, on the other, being much more committed than Stalin ever was to the dynamic expansion of Communism, he intends to stabilize, not to dismantle, that empire. The Russian government cannot afford, in view both of this weakness and this dynamism, to retreat from any forward position, such as East Germany, without endangering its empire altogether. For

once it starts retreating there will be no way of knowing where the retreat will stop. Once the East Germans have regained their freedom, will not the Poles and Hungarians try to regain theirs? Furthermore, a political movement which claims to bring salvation to all mankind and looks forward to burying the non-Communist world cannot afford to retreat, it cannot afford to stop advancing. At the very least, it must stay where it is and must try to advance; for by retreating, it denies its very claim of being the "wave of the future," the ideal organization of society in whose image sooner or later the whole world will be organized. Thus it is impossible to visualize at present a price sufficient to induce the Soviet Union to forsake East Germany and thereby create the essential precondition for German unification.

This is obviously, in terms of German

unification, a hopeless outlook. But it is not necessarily a hopeless outlook in terms of the objective interests of all concerned. We and everybody else can live with a divided Germany, provided we can convince the West Germans that they also must live for the time being with a divided Germany. Knowing that Germany can at present not be united, we must nevertheless keep up their hope that one day it will. And we must convince them that their hope to see their country united on tolerable terms lies in co-operation with the West. This task requires a great measure of statesmanship, of subtlety, of courage, and of caution, and it carries within itself a formidable danger. That danger poses the real problem for Western policy: how to prevent the West Germans from becoming desperate about unification and making a bargain with the Soviet Union.

* * *

QUESTIONS AND ANSWERS

Q: I have two questions for Dr. Morgenthau. First, is the Soviet policy with regard to the reunification of Germany, in your view, motivated by the security considerations of the Soviet Union—that means by the fear of a reunited and eventually remilitarized Germany—or by the desire of the Kremlin to preserve or to keep its wartime conquests in Europe, or by the eventual ambitions to extend the Soviet and Communist domination westward over all of Germany and all of Europe? My second question is, would it not render the position of the Western powers in the forthcoming summit conference stronger, if they would switch from the defensive to an offensive? That is, to put the question of the liquidation of World War II in the right perspective and to raise both problems

that constitute the legacy of World War II, namely, the problem of Germany and the problem of the restoration of independence or freedom of the nine sovereign states that are now in Soviet bondage, by applying the principle of self-determination to the solution of both problems. By applying the principle that even Khrushchev in Afghanistan advocated for the tribes of Pukhtuns and also for the peoples and tribes of Africa.

A: If I still remember your first question, I think the Soviet Union is primarily motivated by the desire to keep what it has annexed and to annex more when the occasion arises. It is not primarily motivated by security considerations. I must disagree here respectfully with Mr. Warburg's inter-

pretation that there is an incompatibility between NATO and the unification of Germany, that is to say, that the dismantlement of NATO is a precondition for the unification of Germany. I believe that even if NATO had never existed, the Soviet Union would not agree to the unification of Germany on any terms acceptable to the West. As far as your second question is concerned, I would give a qualified positive answer to it. I think our policy has been much too negative all along. We always react to Russian moves rather than let the

Russians react to ours for a change. I found in the fall of 1956, and still find today, our inactivity in the face of the Hungarian revolution almost inexcusable. But on the other hand, there is, of course, a great difference between making verbal declarations and pursuing a policy. We have had enough of verbal declarations about liberation and so forth; everybody knew, almost everybody knew, that no action could follow those words. So I think it is wise to bring verbal declarations and actions somewhat in tune and not to promise more than one is able to achieve.

COMMENTS

JAMES P. WARBURG

I first want to make clear that I did not say that the choice was between reunification and NATO; I said that the choice was between a German military participation in NATO or German reunification—that is not the same thing. In the second place, I think it is all very well to say that we should take the offensive, but I have yet to hear from you, sir, or from anyone else, what the offensive should be. Now what I suggest is that we say to the Russians, "We opt for reunification at the price of the neutralization not only of the two German states, but as much as possible of the whole area in between us." I am not prepared to say that the Russians will accept this; I do say that we should make this proposal because if it is accepted you will settle the cold war as far as Europe is concerned. If it is turned down then it is perfectly clear where the fault lies and instead of reiterating the same demand that we want the Russians to give up their Germany under free elections in order that it may become a part of the anti-Communist alliance—this is what we have been saying when we demand that a

reunited Germany shall have the right to enter NATO—I think we should at last face this decision we have got to make. It is much too late, we should have done it a long time ago. But I still think we ought to set ourselves right with the world by making this proposal, which is sensible. I will go one step further and say that I am not at all sure that the Russians would reject it. Mr. Khrushchev, if he knows nothing else, is keenly aware of what the Russian self-interest is, and I suspect that he knows that ultimately the Soviet coercive position in Eastern Europe is untenable. If he could have a bridge built for him and receive something in exchange for it, he might very well consider this. Because unless he does it soon, these people are really going to be alienated from Russia in the long run; whereas, some of them might voluntarily associate themselves with the Soviet bloc economically, if they are not pushed too far. In any case, you can never find out whether the Russians will or will not enter a serious negotiation until you try, and we have never tried.

How Useful Is NATO?

By JAMES P. WARBURG

ABSTRACT: The North Atlantic Treaty Organization (NATO) was originally conceived as an alliance between the United States, Canada, and Western Europe for the purpose of guaranteeing their mutual defense. The assurance the alliance provided for the defense of Western Europe was beneficial and necessary in the face of the mounting Soviet threat. More and more the "shield" that NATO forces were to provide has become nothing more than a "tripwire," because the NATO military forces in Europe, according to the calculated estimates, are and have been since the inception of NATO inadequate to restrain a Soviet westward movement. Apart from the military co-operation provided for in the alliance, there were provisions for political and economic co-operation. These were left aside from the beginning, mainly because there were other organizations better suited to deal with them effectively. For these reasons, it seems that NATO has become an outmoded instrument for the pursuit of free-world interests. Perhaps, NATO could be used as a bargaining counter for an eventual peace settlement in Europe, but it may already be too late to use NATO for even this purpose.—Ed.

James P. Warburg, New York City, is a writer and lecturer on international affairs and domestic politics and economics. During World War II, he was Deputy Director of the Office of War Information Overseas, Europe. Mr. Warburg is the author of Germany—Key to Peace (1953), The United States in a Changing World (1954), Turning Point Toward Peace (1955), Danger and Opportunity (1956), Agenda for Action Toward Peace Through Disengagement (1957), and The West in Crisis (1959).

THE mere assignment of the question "How useful is NATO?" to a participant in this annual symposium seems to me interesting. It implies that NATO is no longer quite so much of a sacred fetish as it has been in the past.

Very likely, the new mood of skepticism which prompts the raising of this question arises out of four more or less recent developments in the European scene. I have in mind the resurgent nationalism of France under President de Gaulle—a nationalism which repudiates military or political integration and insists that France will co-operate as an equal with its friends but will not in any way dilute its sovereignty. I have in mind further the fact that, because of the Algerian war, French participation in North Atlantic Treaty Organization (NATO) has become little more than nominal and that, as a consequence, West Germany has become the central bastion of NATO defense. Third, I would suppose that the recent outbreak of anti-Semitism in Germany and the Bonn government's flirtation with Franco Spain have somewhat shaken confidence in that country's fitness to serve as a bulwark of Western democracy. And, finally, the unfortunate split between the so-called "Inner Six and Outer Seven"—between the Common Market countries and the Free Trade Area—has given rise to misgivings about the solidarity of Western Europe.

I do not wish to minimize any of these developments. Each is, indeed, a serious threat to the North Atlantic Treaty Organization. I would suggest, however, that these developments have arisen very largely out of the past and that, to some extent, they were made inevitable by decisions reached long ago.

At the end of World War II, the ideal of Europeanism had supplanted the spirit of nationalism which had caused so many wars. Soviet expansion into Eastern Europe reduced this ideal

to the dream of at least a united Western Europe. At the same time, fear of further Soviet encroachment strengthened the West European desire to draw together. The United States and Britain encouraged this drive toward unification.

But then two things happened:

The British, having encouraged European integration, decided to abstain from participation in it.

The United States, having taken a firm stand against German rearmament, reversed its position.

The resurgence of French nationalism is the direct result of French fear of being left in a West European union dominated by West Germany.

The resurgence of German nationalism is the direct result of the predictable failure of Allied denazification and re-education capped by the American demand for West German rearmament.

What has happened to Western Europe is, I think, very largely attributable to the panic generated in the West by the Communist rape of Czechoslovakia in February 1948. Fear of a Soviet military invasion of Western Europe led within thirty days to the signature of the Brussels Pact by Great Britain, France, Holland, Belgium, and Luxembourg. A year later, still greater apprehension aroused by the Soviet blockade of West Berlin led to the North Atlantic Treaty, in which the Brussels powers were joined by Norway, Denmark, Italy, Portugal, Iceland, Canada, and the United States. In 1952, Turkey and Greece became additional signatories.

A DEFENSIVE ALLIANCE

In order that the rather negative opinion which I am about to express concerning the present value of the North Atlantic Treaty Organization may not seem capricious or based upon

hindsight, I shall take the liberty of briefly tracing its historical evolution.

Exactly ten years before the North Atlantic Treaty was signed, during the anxious days of the so-called "Peace of Munich," I ventured to suggest in a speech before the Economic Club of New York that the only way to prevent Hitler from starting a second world war would be for the United States to declare at once that it would consider any attack upon Western Europe as an attack upon itself. It is scarcely necessary to state that, at that time, the suggestion of an Atlantic Treaty fell upon barren ground. The predominant isolationist sentiment was eloquently expressed by two other speakers, one of whom—a Democratic United States Senator—asserted that there would be no war in Europe and that in any case it would not affect the United States; while the other—later to become a Republican Secretary of State—said that "only hysteria would suggest that any of the dynamic have-not powers, Germany, Italy and Japan, would ever dream of attacking the United States."

I mention this little episode only to show that I have never been prejudiced against linking the defense of the United States to the defense of Western Europe, even when this idea was far from popular.

Ten years later, in May 1949, I was invited to testify before the Senate Foreign Relations Committee with regard to the North Atlantic Treaty then under consideration. My basic attitude remained the same; namely, that the United States should make it unequivocally clear—this time to the Soviet Union—that an attack upon Western Europe would be considered by the United States as an attack upon itself. Although I did not share the prevalent fear of a physical invasion of Western Europe by the Soviet Union, I recognized that the fear existed and that, if

nothing were done to allay it, anxiety might well paralyze the West European recovery which had begun under the Marshall Plan. This would again make Western Europe vulnerable to what seemed to me the real danger; namely, the danger of political subversion and penetration. Accordingly, I testified in favor of the proposed treaty.

However—and this is a big however—I took the position that the United States should *not* commit itself in advance to fighting an aggressor according to any preannounced strategic plan—least of all to a plan under which it would commit itself to defend Western Europe at the line of the Iron Curtain which ran through the heart of a partitioned Germany. My stated reasons were these:

1. That it is always wise in war to retain freedom of action as to strategy and tactics.
2. That, given our overhasty demobilization, it would scarcely be possible to build up land power in Central Europe capable of holding off 175 combat-ready Soviet divisions.
3. That any attempt to build such power would divert Western Europe from recovery to rearmament and thus make it once more vulnerable to political penetration.
4. That the fulfillment of a commitment to defend Western Europe at its frontiers would necessitate the permanent stationing in Germany of a powerful United States garrison, far in excess of the equivalent of two divisions then doing occupation duty.
5. That any undertaking by the United States to defend West Germany would inevitably lead to the demand that the West Germans contribute to their own defense—in other words, to the rearming of West Germany—and that such a demand would both undermine the morale of Western Europe and cement Moscow's hold upon Eastern Europe.¹

The Senators referred to the fact that Secretary of State Acheson had assured

¹ See Congressional Record on May 10, 1949.

them that Europe would not be diverted from recovery to rearmament; that no additional American troops would be sent to Europe; and that, in no circumstances, would the United States ever acquiesce in the remilitarization of Germany.

When it was pointed out that, if such were the administration's intention, any undertaking to defend Western Europe at its frontiers would be a cruel hoax upon the countries of Western Europe, the Foreign Relations Committee went on record to the effect that the North Atlantic Treaty would not be permitted to involve any such commitment.²

Yet, within weeks, the Truman administration did quietly take precisely this commitment. It did shortly send four additional American divisions to Germany. And, within a year, it demanded the rearming of West Germany.

Now, it is widely believed that this extraordinary reversal came about as the result of the Korean War. This is demonstrably untrue. Even before the treaty was signed, Maurice Duverger had written in *Le Monde*: "If one speaks of defending Western Europe against possible external aggression, it must be recognized that these words imply the restoration of the German army." In May 1949, *Le Monde* said: "The rearming of Germany is contained in the Atlantic Pact like the yolk in the egg." By the end of 1949, German rearmament was being discreetly discussed in Britain and in the United States although officially denied in both countries. I, myself, heard Field-Marshal Viscount Montgomery of Alamein advocate "rearming Jerry" in November 1949. On May 7, 1950, John J. McCloy, returning to the United States at the end of his term as High Commissioner in Germany, publicly expressed the opinion that German troops were

necessary to the defense of Europe.³ This was a month before the Korean outbreak.

The Korean War merely provided an excuse for publicly announcing a decision which had been previously reached as the inevitable consequence of undertaking to defend Western Europe in central Germany.

NATO'S MILITARY VALUE

It is not necessary to review the four years of pushing and hauling which followed upon Secretary Acheson's formal demand, in September 1950, for a German participation in NATO, at the end of which period the French rejected their own Pleven Plan for a European Defense Community and paradoxically agreed to the creation of a national German army.

Nor is it necessary to review the long series of meetings of the Atlantic Council at which minimum force goals were set which were never to be even approximately realized. It is sufficient to note that, at the Lisbon Conference of 1952, 80 divisions were set as the minimum required to restrain a Soviet invasion. At that time, NATO could muster about 18 divisions, half of them supplied by the United States, Great Britain, and Canada. Since then, the only substantial addition to NATO's European front has been supplied by Germany which now has furnished 7 not yet fully trained divisions. Meanwhile, Britain has reduced her forces and France has withdrawn practically all her NATO contingents to North Africa.

In 1954, when it had become obvious that Western Europe itself was unwilling or unable to make a serious effort to provide for its own defense, the

³ See E. S. Furniss Jr., *France, Troubled Ally* (New York: Harper & Brothers, 1960), pp. 50 and 62.

NATO Council decided that, if the NATO forces could be equipped with so-called "tactical nuclear weapons," 30 divisions, equipped with these weapons, would suffice for the central European front. This revised plan was based upon the theory that the resulting increase in fire-power would offset the deficiency in manpower—a theory which apparently failed to take into account that Soviet forces might be similarly equipped.

In spite of the reduction in manpower requirements, General Norstad is even at this late date complaining that he is short of the 30 divisions promised to him as a minimum.

On the other hand, by trying to save manpower, NATO has, as the saying goes, "painted itself into a corner" by rendering itself incapable of fighting anything other than the nuclear war which it was supposed to prevent.

The original concept was that the NATO ground and tactical air forces would provide the shield, while the United States Strategic Air Force provided the sword. The shield was expected to restrain an invasion long enough to gain time for negotiation, or for an appeal to the United Nations, before the sword would have to be unsheathed.

This concept is now invalidated. The shield has become little more than a tripwire assuring immediate United States involvement. The sword has been blunted by reason of the fact that the United States can no longer destroy Russia without itself suffering destruction.

As for the costly string of Strategic Air Command (SAC) bases erected in Britain, Spain, North Africa, and Turkey, these have served chiefly to arouse Soviet apprehension and to spur on Soviet efforts to develop countervailing long-range striking power. Without doubt, Soviet missile launchers are now

"zeroed in" on all of these establishments.

To summarize up to this point:

The original basic idea of NATO was soundly conceived as a declaration of American and Canadian solidarity with the West European nations which had pledged each other mutual assistance under the Brussels Pact of 1948. As such, the NATO Treaty gave Western Europe a needed reassurance and served, perhaps, as a useful warning to the Soviet Union.

The mistake, I think, was to stretch the treaty commitment into an undertaking to defend Western Europe at a line running through the middle of a partitioned Germany. This so-called "forward strategy" necessarily involved rearming West Germany and thereby disunited the West while solidifying the Eastern bloc. No other single factor has so effectively cemented the Warsaw Pact alliance as the fear of a rearmed Germany.

Moreover, it became evident that this forward strategy demanded a far greater effort and sacrifice than the West European countries were able or willing to undertake.

Since I, for one, have never believed that the Russians intended a military attack upon Western Europe unless they could first thoroughly undermine it politically and outflank it in Asia and the Middle East, it was my view that the Marshall Plan fulfilled the first essential in West European defense. Rearmament, if undertaken on a scale large enough to implement the forward-strategy commitment, would have arrested West European recovery, undone the work of the Marshall Plan, and rendered Western Europe once more politically vulnerable. Fortunately, from my point of view, this did not happen. But the fact that it did not happen—that rearmament was never undertaken on a scale commensurate with the com-

² See front page of the *New York Times* of May 11, 1949.

mitment—made NATO more of a provocation than a military barrier to aggression.

A POLITICAL ORGANIZATION

Article II of the North Atlantic Treaty provided for close economic as well as military co-operation among the signatories. The fact is, however, that the North Atlantic Treaty Organization has concerned itself almost exclusively with military affairs. The economic co-operation which has occurred within Western Europe and between Western Europe and the United States has been achieved first through the Organization for European Economic Co-operation set up under the Marshall Plan, and then, so far as the Inner Six are concerned, under the auspices of the European Coal and Steel Community, Euratom, and the Common Market. As a vehicle for economic co-operation among the signatories, NATO has achieved next to nothing.

There have, to be sure, been sporadic efforts to endow NATO with more of a politico-economic aspect. It has, for example, been suggested that NATO should become the instrument through which its members would supply economic aid to the so-called "underdeveloped countries."

It is difficult for me to think of a worse method of handling this crucially important problem. The emerging nations which require economic assistance are for the most part former colonial possessions of Great Britain, France, Belgium, and the Netherlands. These four nations are leading members of NATO. In addition, Portugal, an unregenerate colonial power, is a NATO member. To make NATO the channel through which the industrialized countries would direct their economic aid programs would, in the eyes of most of the recipients, color the whole effort with the psychological overtones of co-

lonialism. On the other hand, neither Switzerland nor Sweden, both highly industrialized nations, is a member of NATO, not to mention Japan which is probably one of the most important potential contributors to any plan of world-wide economic development.

Clearly, acting as the instrument for aid to economic development is one function to which the North Atlantic Treaty Organization does *not* lend itself.

What about NATO's usefulness as an instrument of promoting European unity?

If we mean by this all-European unity, it is obvious that NATO is scarcely the most likely organization in which the divided European trading community might be reunited. If we mean only West European unity, it is difficult to see how an organization which does not include Switzerland, Sweden, Austria, and Spain and which does include Greece and Turkey can furnish the ideal nucleus. The Organization for European Economic Co-operation would seem far more suitable, particularly in view of the unfortunate cleavage between the Inner Six and the Outer Seven which has recently arisen.

Finally, what about NATO as the instrument through which its member nations might co-ordinate and concert their policy in other parts of the world? Here the trouble lies not so much in the nature of NATO as in the divergent interests and policies of its members. How could NATO or any other organization hope to co-ordinate French policy with United States policy in North Africa or United States policy in China with that of Britain? NATO has not even been able to co-ordinate American, British, French, and German policy toward Russia with respect to the future of Germany.

To say this is not to say that co-ordination of policy among the Western powers is not to be desired. Of course

it is, just as the unification of Europe or even of Western Europe is to be desired. But to agree upon desirable objectives is one thing; to say that NATO is the most desirable instrument for attaining these objectives is another thing altogether.

A BARGAINING COUNTER

This brings me to the conclusion that NATO has probably outlived its usefulness, except possibly in one respect—namely, as a bargaining counter in negotiating with the Soviet Union toward an eventual all-European peace settlement.

Germany is the key to an all-European settlement. If the Western powers seriously wish to end the state of tension in Europe, they must at long last face a choice which has all along been inescapable. They must decide whether they want a German military participation in NATO or the reunification of Germany. They cannot have both.

If the Western powers decide that they cannot or will not forego a West German military contribution to NATO, then they must accept as more or less permanent the partition of Germany and the continued existence of a divided Europe. This will involve recognition of the German Democratic Republic and the renunciation of any idea of "liberating" Eastern Europe. This choice will also mean that the Western powers cannot reasonably expect West Berlin to remain as a Western-controlled island of freedom in the heart of the communist-controlled German Democratic Republic. The most they can hope for is that all of Berlin might be united as a free city under United Nations guardianship, with the United Nations possibly exercising its authority through a resurrected four-power *Kommandatura*. Even if Soviet agreement to such an arrangement could be

obtained—as it might be in the context of a Western recognition of the European status quo—it is difficult to see how, in the long run, the inhabitants of the free city could avoid becoming economically dependent upon the surrounding communist territory, thus eventually losing their freedom.

If, on the other hand, the Western powers were to decide that they want German reunification—and, eventually, all-European reunification—more than they want a West German military contribution to NATO, then the situation would arise in which NATO would become a bargaining counter.

Obviously, Germany cannot be reunited in freedom, so long as Soviet coercive power remains in the East German republic. It is equally obvious that the Soviet Union will not withdraw its coercive forces from East Germany without a countervailing Western withdrawal. In 1956, when the Soviet Union was in trouble in Hungary and Poland, I suggested that the Western powers might—as a start toward mutual retirement from Europe—offer to withdraw American, British, and French forces to the west bank of the Rhine in exchange for a Soviet withdrawal to the east bank of the Oder and Neisse rivers. This proposal gained some support in Washington but was strongly objected to by West German Chancellor Adenauer.

Since then, the Polish government has come forward with the Rapacki Plan, under which foreign troops would be withdrawn not only from the two German states but from Poland and Czechoslovakia as well. Mr. Hugh Gaitskell, leader of the British Labour Party, advanced a similar proposal which included Hungary in the neutralized zone.

The essence of all these proposals, including the rather vague suggestions put forward in 1957 by former United States Ambassador to Moscow, George

F. Kennan, is that the states in the neutralized zone be debarred from entering into military alliance with either NATO or the Warsaw bloc. This debarment would not stand in the way of their entering into whatever non-military association they might wish.

So far as German reunification is concerned, beyond troop withdrawal, it would be necessary to reach an agreement with the Soviet Union in which both sides undertook to permit the two German states to find their own way toward eventual reunification without any outside interference whatever. Pending such reunification, the status quo in Berlin might be preserved—possibly with some modifications—or else the United Nations might be asked to take over until the city could once more become the capital of a reunited Germany.

Now, as a practical matter, I see very little hope that, so long as Konrad Adenauer remains in power, the West will be able to reach any such decision. Dr. Adenauer has staked his political life upon his ability to make the people of West Germany continue to believe in a myth—the myth that they can both remain military allies of the West and achieve the reunification of their partitioned country. In this effort Chancellor Adenauer had the full support of the Truman administration and, until the incapacitation of Secretary Dulles, the equally strong support of its successor.

Prime Minister Macmillan and President Eisenhower are now clearly aware that the Adenauer-Acheson-Dulles policy has run the West into a dead-end street. I suspect that Mr. Dulles recognized this himself shortly before his tragic death. On the other hand, President de Gaulle, who doubtless likewise realizes the futility of the Western policy, is for reasons of his own supporting the German Chancellor's intransigence. Thus, the chances are that, in the forth-

coming negotiations, the Western powers will not be able to come to a clear choice between two mutually exclusive objectives.

If this is a correct forecast, the result will strongly favor the Soviet side because it, quite clearly, knows precisely what it wants; namely, the maintenance of the German and European status quo with the sole exception of the status quo as to West Berlin.

It is probably clear from what I have said that, in my opinion, NATO should be used as a bargaining counter in seeking to achieve the objective of removing Soviet coercive power from all of Europe outside of the Soviet Union's own frontiers. I must add that the pursuit of this objective begins to make real sense only in connection with a serious effort to achieve general disarmament.

The other choice—to accept as permanent the partition of Germany and of Europe for the sake of keeping West Germany in NATO—seems to me wholly undesirable.

The only way to defend Western Europe is to make peace in all of Europe. If war should come, NATO cannot defend Western Europe with or without a German participation. But a partitioned and rearmed Germany will always remain a threat to peace.

CONCLUSION

As a military alliance, NATO is obsolete, not only because it was conceived in terms of preventing the sort of war which can never again occur, but because all military alliances are becoming meaningless by reason of the obsolescence of war. The world's need is for a greatly strengthened world organization capable of enforcing universal disarmament—not for old-fashioned coalitions, alliance, and counteralliances.

As a political organization, NATO is

both too large and too small. It is too large for the creation of a consensus among homogeneous peoples. It is too small because it does not embrace all the peoples among whom a consensus might be attainable. In a world two-thirds nonwhite, NATO is a white man's club which does not even include some of the best of the white peoples. In a world two-thirds impoverished, hungry, and seeking change, NATO is essentially an association of those relatively fortunate nations which seek to preserve the status quo.

As a bargaining counter to be used in pursuit of a durable European peace settlement, NATO is an asset, but an asset the value of which is rapidly depreciating through disuse.

Given the apparent unwillingness of our government to join the British in overriding the stubborn intransigence of Chancellor Adenauer and the probability that this intransigence will continue

to be supported by President de Gaulle, it seems to me unlikely that NATO will be used as a bargaining counter in the forthcoming talks at the summit. In that case, it seems probable that the ultimate decision will be left until next year, when a new administration will be in office. Whether NATO will then still have any value as a bargaining counter depends upon intervening developments impossible to predict.

The one thing which seems to me clear beyond doubt or argument is that United States policy with respect to NATO, Germany, and a European peace settlement has—like our policy with respect to China—remained static throughout a decade in which conditions have radically changed. Whatever may have been the merit of our European and Far Eastern policies when they were initiated ten years ago, they are now not only inadequate but almost wholly irrelevant.

* * *

QUESTIONS AND ANSWERS

Q: Wise men learn by reason. Would it not be wise on the part of the United States to cut through the Gordian-like knot of the problems we have been talking about, by proceeding in the direction of total disarmament that Mr. Khrushchev said the Soviet Union desires and that the highest authorities, including President Eisenhower, say that we desire? Would not that condition do more to unify Germany, free Poland, Czechoslovakia, Rumania, and Bulgaria from the grip of the Russians, and provide the means to implement what Paul Hoffman said we needed to do in the world?

A: I said that the suggestion of an attempt to reach a German settlement, which I put forward, only made sense

in the context of a serious attempt to reach general disarmament. Of course this should be the objective. I think the questioner does not fully understand the Soviet proposal. What we have reached so far apparently is a condition in which the Soviet Union says, "We want you to agree that we all want universal general disarmament," and then there is some vague language about how it would be enforced. What we have said, and I do not approve of it myself, is that we want to move step by step without ever saying what our ultimate goal is. I do not think that first steps are worth while unless they are first steps towards something. Our government, I think, should make it unequivocally clear that it is our aim to achieve total universal disarmament.

down to the level of lightly armed internal security forces; and to have this disarmament enforced by a supranational enforcement agency—there is no other way to enforce it—endowed with the exclusive right to maintain and if necessary to use force to prevent illegal rearmament. So far, this has not been our declared aim. Secretary Herter made a very forthright speech on February 18 in which he almost said this, but not quite. There is more than a semantic difference between talking about international and supranational enforcement. International implies enforcement by international agreement between sovereign nation-states. This has been tried again and again and it never works; you can use it to enforce action against a small aggressor but not against a big one. I suspect that the Russians are very far from being willing to create the supranational agency under which alone you can really have universal disarmament. I agree with the questioner that this should be the context in which we try to do all these things, but it is not a question of which is chicken and which is egg. You cannot say you have to get disarmament before you can relax tensions; you cannot say you have to relax tensions before you can get disarmament. What you need is two simultaneous efforts.

Q: Is there not a certain danger in overrealism? Does not this overrealism lead to a new defeat, to new concessions? By overrealism I mean an acceptance of the status quo. I think, at this time, when there is a nuclear stalemate, moral values are a very dynamic force in all negotiations, and if we really abide by moral values we can expect much better results.

A: I would say that you are simply saying the same things I have been say-

ing. You are against accepting the status quo, which is the present condition in Eastern Europe and Eastern Germany. So am I. I do not think you alter it by simply digging your feet in and by staying in the same trenches in which you have stood for ten years. I think you must come forward with a constructive proposal. Now if you do not like mine, give me a better one.

Q: Is not your structure somewhat based upon glittering and unproven generalities? For instance, you referred to the revival of anti-Semitism in Germany, which is an assertion that has not yet been proven. In another part you mentioned that NATO has cemented the Eastern Alliance. This does not seem to me the case, since the cement became looser after NATO's establishment, just about 1956, specifically with respect to Poland and Hungary.

A: Well, these are two quite separate questions. I only referred to the recrudescence of swastika painting as one of things which probably make people a little skeptical, at the present time, about the solidarity of Europe. If you want my brief analysis of what this means, I do not think it is anti-Semitism at all. I think that this swastika painting is an expression of unregenerate German nationalism, and it happens to take this form because this is the symbol for this whole business. I am not surprised at this because there are high Nazis in the government, countenanced by us incidentally. I do not know how many of you know that the man who performs the same functions, and has for ten years, for Dr. Adenauer that Sherman Adams, until he got in trouble with Mr. Goldfine, performed for President Eisenhower, is a gentleman called Hans

Globke, who is co-author of the Nuremberg racial laws. I have also seen the German textbooks and the history books. The entire twelve-year period in most of these books is covered in about a page or a page and a half. Thus, it is not surprising, at all, that if you ask a German teen-ager who Hitler was, he does not know anything about concentration camps. Hitler was the man who built the *Autobahn*. So the only thing that surprises me is that this has not happened sooner. I do not think it is anti-Semitism; I think it is simply using the anti-Semitic symbol to express a resurgent Nazism. Now as to the second question: as I see it, and this is debatable, the revolt in East Germany in 1953 and in Hungary and

Poland in 1956 was not caused by and had nothing to do with NATO. This had to do with a relaxation of tensions after the death of Stalin, and, oddly enough—this is historically often the case—when a tyrannical regime begins to relax tension this is when your revolution takes place. You would think it would take place when the pressure on the people was greatest, but that is not the case. It usually takes place when the pressure is relaxed. Therefore I do not think this had anything to do with NATO. I do think that the formation of NATO and the rearming of Germany tied the Poles closer to Russia, and probably the Czechs and Hungarians as well, than they otherwise would have been.

Estimating National Power and Intentions

By CHARLOTTE AND GEORGE DYER

ADDENDUM

The article beginning on the next page is pertinent to the general subject of the conference on "Whither American Foreign Policy?", but the paper was not presented orally at the meeting. It is published here in the hope that it may help to stimulate a discussion on increased coverage and mechanization in gathering and analyzing the information necessary if sound decisions are to be made in foreign relations.

JAMES C. CHARLESWORTH
Special Editor

ABSTRACT: The rational formulation of American foreign policy is rendered extremely difficult by the great number of factors which must be taken into account by the decision-makers. These are beyond the capacity of any human brain, or even team of brains, to assimilate, evaluate, and reduce to forms upon which sound policy can be based. A weighted framework or model is needed, and some mechanical support for human thinking which would rationalize initial foreign policy estimation electrically. Such a device will also permit gaming. As a preliminary blueprint for this proposed device, *The World Analyst* classification system is used to divide national power into ten "factors": geographic, demographic, political, foreign affairs, economic, industry, transportation and communication, scientific, armed forces and biographic. To evaluate individual elements of national strength and weakness, these are cross-categorized on game boards in five panels: immediate national power, potentials for national power, destruction of such elements, aggressions between nations other than the United States, and acts of aggression towards the United States. Using a model of this sort a trial balance can be obtained between nations, and policy can be tested in advance.

*Drs. Charlotte and George Dyer, New Hope, Pennsylvania, are Directors of the Dyer Institute of Interdisciplinary Studies which they founded in 1952. They also teach political science at the University of Pennsylvania. Graduates, respectively, of Barnard College and Yale University, they received individual M.A. and Ph.D. degrees from the University of Pennsylvania. They have taught graduates and seniors at Yale University, and United States and foreign military personnel of all branches at staff schools. Besides numerous articles and reviews in scholarly journals, they are the authors of *The World Analyst* (1958).*

IN common with many other aspects of life in the United States, but earlier than some, American foreign policy has reflected the chaos associated with the 180-degree change from an economy of scarcity to the "affluent society." One hundred and fifty years ago, for example, the President and the Department of State suffered from an outright lack of information upon which to base crucial decisions.¹ Now to a great extent the reverse is true, and in most areas of consideration our agencies concerned with international relations are literally flooded with an embarrassing wealth of information.² Why such riches should be embarrassing rather than enlightening is well described by Roger Hilsman in a recent study.³ His "operators," though often clinging naively to the idea that their foreign policy decisions would be better if they had "all the facts," are really aware that if they did have all the facts the result would be only acute indigestion.

There are at least two underlying reasons why ulcers are the lot of decision-makers immersed in this sector of the economy of abundance. It is not just that there are too many "facts" about foreign nations available for any single human mind—or any staff collection of human minds—to assimilate. Also no over-all framework for the comparison of national "capabilities and vulnerabilities" has been established⁴—to say

nothing at the moment about "intentions"—nor have there been any mechanical means devised by which the most important elements of such a comparison might be rationalized and presented in digestible form to the human mind that must, ultimately, make policy decisions. The purpose of this article is to present a proposal for such a framework and its supporting mechanization.

Objections

Any proposal so sweeping and novel in its claims must immediately face two types of objections. The first is one advanced, notably in the Hilsman book, that "all" those facts which might conceivably have a bearing on a given foreign policy decision approach infinity as a limit. This is essentially a counsel of despair, and in justice to Hilsman it must be said that he recognizes the all-important role of selection. The present writers, while admitting that even the current price of horseshoe nails might have some bearing on the outcome of a battle or a contest for world empire, believe that a sound system of selection and emphasis can reduce the margin for error to manageable if not negligible proportions.

The second argument is the old one to the effect that "you can't add oranges and apples." This is the conceptual single track which has led previous thinkers into the intellectual cul-de-sac of trying to reduce the entire complex of national power to some over-all common denominator, such as dollars. To change the metaphor, it is on this Procrustean bed that the "facts" had to be stretched or chopped beyond any final

works as George B. Cressey's *The Basis of Soviet Strength* (New York: McGraw-Hill, 1945); and even in such fine efforts as Harold and Margaret Sprout's *Foundations of National Power* (2nd ed.; New York: Van Nostrand, 1951).

utility. The solution offered in this article bypasses the need for a rational common denominator by providing an electronic one, and conceptualizes a model of the "perfectly" strong society against which all others may be compared in all important details; hence, in terms of relative power, each may then be compared to any other.

NATIONAL POWER ANALYSIS

The central ideas for this proposal are so few and so essentially uncomplicated that it might be well to state them briefly in advance of a more elaborate exposition. One is that a system for organizing information on international relations can be devised which will comprehend data on so large a proportion of the essential elements of national strength and weakness that by means of it a trial balance between nations can be run at any time within an acceptable margin for error. Such a system is considered to be the one developed by the writers and known as *The World Analyst*.⁵

The second idea is that such a system can be expressed electronically to (1) illustrate visually the essential elements of national power so that a total relative value, in whole or for any major part, will be instantly apparent; (2) estimate with a high degree of probability the most likely of a number of possible future "courses of action," whether advantageous to us or not, by the governments or peoples of foreign nations; (3) warn in good time of other countries' dangerous hostile policies—or even "intentions"; and (4) test by means of "gaming" any new policy or plan proposed for our conduct of foreign affairs, and thus predict experimentally

⁵ *The World Analyst: A System for Analyzing and Classifying Source Materials on International and National Affairs* (4th ed.; New Hope, Pa.: The Dyer Institute of Interdisciplinary Studies, 1958).

the efficacy of such a policy without having to risk empirical procedures.

Let us consider each of the ideas listed above. By what means would it be possible to organize this vast quantity of information in such a manner that the decision-maker could instantly strike a trial balance, and comprehend at a glance the relative strengths and weaknesses of two nations?

It must be understood initially that all events are interrelated; none stands alone. For example, the political and economic progress of any nation throughout the year might be compared to the movements of a huge ball which is slowly pushed over a flat surface, impelled by countless pressures from many directions, each exerting a different weight. These pressures may be further likened to the various elements in each of the *World Analyst* ten factors, discussed below, which are used to assess the "strengths, weaknesses, and probable course of action" of a nation. The resultant of such pressures may push the metaphorical ball to the east or west, to the north or south, towards prosperity or depression, towards alliances with other nations or war, or hold it virtually static over long periods of time.

Each time any one of these factors is changed, by increasing or decreasing its momentum and point of impact, the whole speed and direction of the movement of the "ball" may be changed. Each factor is interrelated with every other, and may affect the others in a variety of ways. For example, if a large steel plant is built on the Delaware River, not only is steel output affected, but labor, housing, roads, water, sewage, schools, entertainment, railroads, and so forth—the list is unending—are in turn affected. Each one of these categories in turn affects others, and a chain reaction is begun.

If it were possible to show at any

¹ S. F. Bemis, *John Quincy Adams* (New York: Knopf, 1949), Chap. XII.

² This began early with the Department of State; see Dyer and Dyer, "The Beginnings of a United States Strategic Intelligence System in Latin America" in *Military Affairs*, Vol. 14, No. 2 (1950), pp. 65–83; amplified in "A Century of Strategic Intelligence Reporting," *Geographical Review*, Vol. 44, No. 1 (1954), pp. 49–69.

³ *Strategic Intelligence and National Decisions* (Glencoe, Illinois: The Free Press, 1956), especially p. 61 ff.

⁴ The inadequacies of previous attempts are suggested by such incomplete and unbalanced

given moment how all other subordinate factors as well as the nation as a whole are influenced when a major change is inaugurated in one or more factors, it should help national leaders to make sounder decisions. It would be enormously helpful if such decisions could be based on an accumulation of facts, instantly recorded and visibly presented in summary, rather than on intuitive opinions derived from labored study of extensive compilations difficult to retain and balance correctly.

Also if it were possible to show the decision-maker graphically, simply, and in advance the probable results of a proposed course of action, instead of requiring him to read many "appreciations" and reports and to remember the vast number of figures and data required, he might well achieve a better understanding of the whole situation. It might even permit him to formulate policies more rapidly as well as more correctly.

TEN FACTORS

To accomplish the desirable results suggested above a weighted outline of the factors which affect national power in any and all nations must be established, and each nation must then be compared to this model. *The World Analyst* constitutes such a theoretical model—a simple and carefully weighted outline for the analysis of national power and intentions. The outline is divided into ten major "factors" which in turn are divided again into many subheadings of various importance.

These factors include the following fields: Geography, Sociology, Politics, Foreign Affairs, Economics, Industry, Transportation, Science, Armed Forces, History.

For the sake of clarity as well as to conserve space, the illustration of this system's application to game theory will be limited to the principal head-

ings of one of the factors developed in, and here reproduced from, *The World Analyst*, with only one heading expanded. The letters and numbers to the left of the words are simply to facilitate the filing and retrieval of material either manually^a or by computer (see Table 1). However at this writing there are no numerical weighted values attached to the headings. Theoretical numerical values will have to be assigned to these headings and subheadings by an operations research team of selected experts.

ASSIGNMENT OF VALUES

It is self-evident that, within the context of power politics, not all of these headings are likely to be equally important. For example, the size of the labor force (.D121) and the armed forces (.D122) is vastly more important perhaps than the refugee (.D152) problem. However, under certain circumstances—as between Israel and the United Arab Republic—the refugee problem could also have considerable affect on the power relationships. The team of specialists, as stated above, would have to assign a theoretical relative numerical value to each of the factors. The assigning of such numbers would be a difficult but not an impossible task and would require the services of individuals who have a wide experience in each of the disciplines most nearly represented by the factors. It is highly probable that some of the initial values assigned would be altered over a period of time, after the device had been tested with known policies for international action, the outcomes of

^a If a manual system is used, and the file folders are arranged in the suggested order, a complete report outline for a nation "in depth" is possible by simply evaluating and synthesizing the materials found in the folders. Related information will be found grouped in adjacent file sections, and the report may be written in that order.

which have been reported and assessed in the past. But there is no reason why a relatively workable and accurate theoretical value could not be assigned to each factor after a preliminary period of trial and error.

After these theoretical values have been assigned, their total in each component, that is, political, economic, demographic, and so on, will represent the total power possible in this field for the model nation.

When comparing the power of any two nations, each element within each component of each nation will be given the theoretical value assigned to that subheading, or a percentage of it.

Steel production

For example, to determine the number of points to be allocated for steel production, the theoretical number assigned for steel production in the *The World Analyst* would be considered to be equal to the greatest present production of the largest steel producing nation in the world, as well as its possible potential in one year. This number would be credited to that nation. In this case the total number of points would be assigned to the United States, the greatest steel producer at the present time. All other nations would have assigned to them a percentage of this total, based on their relative position in the steel-producing scale. Thus in 1958 if the United States had 200 points representing steel, then the Soviet Union would only have 142 points, as its steel production in that year was reported at about 71 per cent of the United States total.

Conversely, with regard to the population factor, China with its probable 600 million people would have the full number of points assigned to population, while the United States, with about 175 million, would only be given 29 per cent of that number. However, in

* Charlotte L. Dyer and George B. Dyer, *The World Analyst: A System for Analyzing and Classifying Source Materials on International and National Affairs*, (4 ed.; New Hope, Pa.: The Dyer Institute of Interdisciplinary Studies, 1958) pp. 69-70.

the matter of education and technological training, the tables would be reversed, and the United States might have the optimum, and China a much lower percentage.

The factor of sea and land transportation, for example, is revealing. Where the importance of air or sea transportation looms large, those nations

having highly developed systems would show an advantage, but where foot transportation was required, the nations accustomed to this mode of travel might reveal superiority on their own home territory.

It may be argued that some factors in the sociological component, such as religion, will be difficult to evaluate. Also it may be objected that some factors cannot be compared with others, such as steel with religion. With the old system of trying to reduce all values to a common denominator such as dollars, this was true. However, with this new system, the difficulty is overcome.

Sociologists are among the leaders in the quantification of elements within their areas of competence. Thus, the initial assignment of points to the various subheadings found in the sociological factor should not be too difficult for specialists in this discipline. At least it should not be any more difficult for them than for economists to assign values to the elements in the economic factor, and rather less than for political scientists, perhaps.

Religion evaluated

The method of comparing the religious element between two nations in the sociological factor will be accomplished in the same manner as steel production is compared in the economic factor. If for example the sociologists decided that religion is so important that it should be assigned 250 points of the total amount of points assigned for the sociological factor, then the nation whose life is most affected by religion will be given this total amount. Portugal, being a theocratic state, might very well receive this amount. It would be possible to assign the same value to one or more nations, just as in any of the elements, provided that the nation was equally affected by religion; for

example, Tibet, before it was overrun by China. Other nations would be assigned a percentage of this number depending on how much their life was controlled and affected by religion. The initial assignment of these values for some ninety nations would be arduous, and would have to be done by persons who are very familiar with the nation in question. However, except in the case of a major revolution, this element would change very slowly, and would not have to be reviewed as often as, for example, some of the elements in the economic component.

The troublesome question of total number of points to be allotted to each factor will have to be decided arbitrarily for no one factor in its entirety is more important than another. In order that a country function it has to have some form of political structure, some form of economic organization, and so forth. If it lacks a whole component, such as armed forces, or scientific, it is seriously weakened, and this weakness must be reflected in the evaluation. So it is suggested that each of the 10 components be initially given the same number of points, for example, 10,000. Then each group of experts, within their discipline, will allocate these points among the elements of "their factor."

COMPARATIVE POWER VALUE

It is important to note that steel production and religion do not have to be compared. Each of the ten factors will be compared and contrasted with its opposite number in the other nation; sociology with sociology, economics with economics, and so forth. The decision-maker then has to compare and weigh only ten items against each other, instead of thousands. For example, in 1939 France's army was rated as one of the best in the world. It never occurred to anyone that it could be over-

run by the Germans in six weeks. Had *The World Analyst* system been in use it would have been apparent that discontent within France was so great that the sociological factor was weakened to the point of danger as compared to the German, which was excessively strong.

Results will not be 100 per cent accurate, but the resulting estimate by the means proposed in this article will be at least much more accurate than any other method that has been devised. Previously the most varied types of information—"oranges and apples"—have not been fitted into an over-all weighted pattern which can be measured against a theoretical model. By measuring each nation against this theoretical model, they can in turn be compared to each other. Thus the economic power of one nation may be measured against the economic power of another. The morale, homogeneity, or customs, and so forth, of one nation may be seen in relation to another's and a comparative power value derived.

ELECTRICAL DEVICE

After the assignment of numerical values the above system will be translated into a visual form which will indicate at a glance the following classes of information:

- (1) Relative over-all power of any two nations or groups of nations;
- (2) Potential reserve of a nation;
- (3) Degree of conversion of this reserve into present power;
- (4) Destruction by percentage of any factors in a nation and its effect on other components;
- (5) Acts of aggression against the United States by a nation;
- (6) Acts of aggression between any other two nations which might affect the United States.⁷

⁷ A second article is in preparation which will give further details of the electrical game testing board described below, how it is wired and how it will be "played."

It is proposed that the foregoing be accomplished by substituting electric light, measured in lumens, for the numerical weights assigned to headings and subheadings of *The World Analyst* system; by using, in other words, the physical phenomena by which light intensity or electrical flow through differing resistances varies like water pressure fluctuating in a pipe; and by a combination of these types of translation from calculated numerical programs into electrical impulses, producing a device which provides a warning system, a check list for the collection of needed data, and a method for better evaluation of a given situation.

Color banks

In order to do this, it is proposed that game testing boards electrically wired be provided. Each nation under consideration should be represented by its own game board.⁸ This board will consist, in a spatial-visual organization, of five vertical columns of different colors on which are arranged five banks of white lights arranged as follows:

- (1) Green column lights when added together would give a number in lumens which will represent the amount of assets the nation has at the beginning of the time under consideration, as well as a number of bulbs measured in lumens equal to the probable potential which the nation could develop during a given time span. The number of lumens are derived from the addition of the theoretical values assigned to the various headings in *The World Analyst*.

⁸ It will not be necessary to have ninety or more boards to represent the nations of the world. Being electronically controlled, a relatively few boards will suffice as they can be used first for the nations of Europe or Asia. After these results have been considered, the nations of South America or any other section of the world can be fed into them.

- (2) Yellow column lights would equal the probable potential mentioned in 1 above.
- (3) Red column lights represent actual destruction in a nation—that is, loss from acts of God, fire, war, strike, and so forth. Here, too, the number of red column lights and their lumens exactly balance the green column lights.
- (4) Blue column lights represent acts of aggression between two or more nations not including the United States, but which in the long run might involve the United States. The number and intensity of the blue column lights would be representative of the power of the nations involved.
- (5) Purple column lights represent possible acts of aggression of any kind toward the United States, not only to include conventional war, but economic warfare, political warfare, or alliances between other nations directed against the United States, and so on. The total number and intensity of the purple column lights should balance exactly the number and intensity of the green column lights, but would not be connected with them in any way.

These five banks of lights are crossed horizontally at exactly the same place by each of the ten factor headings, as well as any subheadings which are thought to be sufficiently important to include (see Table 2).

GAMING AND TESTING

At the beginning of play the green "power" lights would be on. The green "potential" would be off. The yellow "potential" on. The red, blue, and purple, all off.

It would not matter whether the boards were being operated to test a proposed policy—gaming—or whether the actual power differential between

nations were being measured; in either case its operations would be the same.

The green, red, and yellow boards will be connected in such a fashion that if any yellow-backed light were turned off, indicating a "potential" had been made a reality, an equal amount of light would come on in the green section. If any red lights were lit indicating some sort of destruction due for example to war, acts of God, major strikes, and so on, the green lights would automatically be dimmed in the various sections affected by this loss. The various sections would all be interconnected to show how a loss, for example, in rail transportation would affect the steel industry, food industry, and so forth.

The purple lights, representing acts of aggression against the United States, would not be connected with any other bank of lights, but would be turned on or off as such acts were attempted. If the acts turned out to be futile and harmless, they would only be shown on this board. But if they were actually harmful in any way, these results would show on both the red and green boards as indicated.

The blue board, representing acts of aggression between two nations other than the United States, would also show activity as it occurred. This board's activity might or might not be transferred to the red and green boards as indicated.

In gaming, a time scale will have to be applied to the operation of the boards. Thus, every minute of play might represent a certain number of days or weeks of actual time. When the boards are being operated for actual comparison, each event will be recorded as it occurs.

As the play proceeds, the beneficial as well as the harmful results of events or proposed policy will be transferred to the board, by turning on and off the various colored lights. With a photo-

electric cell continually trained on the boards, it will be possible from minute to minute visually to ascertain and translate into numerical values the increase or decrease of any section of the economy, to determine the total relative strength of the nation, and also to measure its power potential.

The blue and purple lights indicate the aggressive action taken by any nation in world events and would act as a cumulative graphic warning system against this type of action. The totaling and recording of such acts, graphically shown on the entire board, would give ample warning of possible serious events.

Accuracy of the results

The accuracy of the results if the game is being used to test a proposed plan will depend on the degree of accuracy of figures fed into it and the sophistication with which the initial values have been assigned. In the case of economic development, this may be forecast with a reasonable degree of precision. In the political field the forecast is much more difficult. It would have been difficult, for example, to forecast the relative displays of popularity shown to Mr. Eisenhower and Mr. Khrushchev, respectively, on their recent trips to India. It should be somewhat simpler when the happenings are recorded from day to day, as actual reporting of accomplished incidents will have the advantage of greater exactness in the allocation of values. The employment of the yellow or "power potential" bulbs should be of great utility. Had such a system been in effect before World War II the dangerous power potential and probable intentions of Germany might have been self-evident. When added to that of Italy and Japan, it should have given a warning that no one could have missed,

especially since the gradual shift from potential to reality would have been striking.

Very often, small unrelated facts, which in themselves are unimportant, can, when correlated, assume great importance; for example, the development of German sailplane clubs after World War I—the future fighter pilots—the statements of Hitler's aims made in *Mein Kampf*, and hundreds of other "straws in the wind."

As soon as percentages of the red, green, blue, purple, or yellow bulbs of any nation change radically, then an immediate investigation should be made in an effort to determine the underlying causes, direction of policy, and likely outcome. The mere fact of knowing what to look for is half the battle in finding the facts, and in estimating the results from the facts found.

This type of semiautomatic assessment would prevent to some extent the errors made, as at present, by groups of people sitting around conference tables and trying—essentially through "intuition"—to estimate reality in world affairs. Very often in this situation the strongest willed, or most persuasive, speaker is able to present a relatively unimportant issue as if it were a decisive major one, and so influence the majority to his way of thinking, against the better judgment of the others.

A person able to "see the whole picture" at a glance is better able to arrive at an accurate comparison of the status of competing nations each year, is protected to some extent from special pleading, and thus may well arrive at a far more just estimate of the current world situation.

SUMMARY

If this device for estimating national power and intentions and testing policy through gaming were installed and kept

up to date the following benefits might be expected from such a set of electronic "boards:"

- (1) Give a comparative measure of strengths and weaknesses between nations;
- (2) Provide a visual aid which not only indicates the comparative strengths between nations but graphically shows any major conversion in a nation from one type of economy to another, thus giving warning of the capability and intentions of a nation to wage war;
- (3) Show how an event happening in one field immediately affects related fields;
- (4) Show visually the cumulative increase or decrease in a nation of anti-American feeling;
- (5) Demonstrate graphically, and even predict, the accumulation and loca-

tion of "trouble spots" in the world which might cause concern to the United States;

- (6) Test the efficacy of a proposed policy in order to determine whether it should be put into effect or not;
- (7) Analyze the effective results of any major action taken by our government in peacetime or wartime in the past.

Such an arrangement has been needed to aid our statesmen for many years, and it is believed that if the above theories were developed, a truly valuable system might be developed. Certainly some device of this sort is essential to assist in the conduct of American foreign policy and to bridge the morass of uncounted, badly organized, and unassimilable "facts."

INTERNATIONAL RELATIONS

BERNARD BRODIE. *Strategy in the Missile Age*. (The RAND Corporation.) Pp. vii, 423. Princeton, N. J.: Princeton University Press, 1959. \$6.50.

Strategy in the Missile Age is a critical and disturbing evaluation of current American military practices by one of the nation's most distinguished naval historians. In large measure, the author merely substantiates what many military experts have been writing for years, but his search for meaning in both the past conduct of war and the strategic concepts which determined it has led him to the conclusion that nations have generally failed less in battlefield tactics than in strategy or the search for broad objectives. The Japanese attack on Pearl Harbor, he stresses, was tactically perfect but strategically stupid. Of the great strategists of the past Mr. Brodie prefers Clausewitz and Schlieffen, for they acknowledged the close relationship between war strategy and national policy. Schlieffen, for example, warned that if his plan failed to win an early victory over France, Germany should take immediate steps to achieve a negotiated peace. Such notions of employing war only when it could bring some conceivable gain to the nation were obliterated in World War I by German and Allied leaders alike. For them war became an end in itself.

In this context of rational policy the author analyzes the impact of nuclear weapons. To him the new destructiveness of weapons has revolutionized the strategy of war, for it removes the need of traditional modes of fighting and renders both air superiority and the precise definition of targets almost unnecessary. He discounts the current theory of a "broken-back" war which suggests that after initial bombings on each side the war would resume along conventional lines. When nations in the past improvised successfully after suffering heavy blows, they always had both the time and the incentive to organize such measures—factors that would not be present after a general thermonuclear attack. Never before have weapons placed the advantage so completely in the hands of the nation that strikes first.

Mr. Brodie concludes, as have others, that the only answer to the challenge of nuclear weapons is the re-establishment of traditional concepts of limited war which demand both limited means and limited ends. He finds the great danger in the antithetical arguments that war cannot be limited and that war has been eliminated and, therefore, ceases to be a danger at all. Both concepts result in the neglect of conventional forces. But the author criticizes as well the neglect of diplomacy, pointing out that there is no mathematical

equivalence between military strength and the ability to bargain successfully. Unfortunately he never explains fully the significance of this meaningful observation in terms of precise political settlements of cold war issues. If such matters were beyond the scope of this study, Mr. Brodie makes it clear that the only genuine solution to the dilemma of thousands of missiles accurately pointed to enemy targets lies in the diplomatic alternation of the present world environment.

NORMAN A. GRAEBNER

Professor of History
University of Illinois

FIELD-MARSHAL MONTGOMERY. *An Approach to Sanity: A Study of East-West Relations*. Pp. 94. Cleveland: World Publishing Company, 1960. \$2.75.

This slim volume by one of the distinguished military leaders of World War II who is now an important advocate of peace is a good example of what writing on world affairs should be: carefully deliberated ideas expressed with precision and effectiveness in minimum space. Civilian authors of bulky volumes on problems of world peace here face a real challenge from an expert on war.

The core of this book consists of the two Chichele lectures which Field-Marshal Montgomery gave at Oxford University in May, 1959, on "The Conflict Between East and West." The lectures are preceded by reprints of articles on the same theme which the author had contributed to the *Sunday Times* on the tenth anniversary of the North Atlantic Treaty Organization (NATO), April 4, 1959, and on other related topics.

Field-Marshal Montgomery makes his points swiftly and succinctly. In his opinion, the crucial error of the Allies in World War II was to leave all political issues for discussion "till the fighting was over." "Nations," he argues, "go to war for political reasons. When it is clear you are going to win, political decisions become paramount; it is then essential so to direct the operations that you end the war with a political balance favourable to win the peace."

This, he argues, the Allies failed to do—a failure which Montgomery attributes to President Roosevelt. The result was the dangerously unsettled and confused situation in Europe, particularly in Germany, which served the interests and purposes of Stalin. The creation of NATO in 1949 was a check on the Soviet Union. NATO, however, Montgomery contends, suffered from disunity among members, from their failure to transform a military alliance into an economic and psychological coalition, and from their inability to give NATO a global character. NATO, he says, has not seen the global wood for the European trees.

But Montgomery, while recapitulating the lessons of the past, concentrates on plans for the future. He has a horror of war and wants the world to achieve lasting peace. He quotes Robert Southey's poem, "After Blenheim": "And everybody praised the Duke/ Who did this great fight win./ 'But what good came of it, at last?'/ Quoth little Peterkin." He is thoroughly in agreement with Prime Minister Harold Macmillan's policy of seeking relaxation of tensions between the West and the Soviet Union. He is convinced that Khrushchev, whom he visited in 1959, is a very different man from Stalin. Mr. Khrushchev "is without a doubt a brilliant political leader with all the arguments at his finger tips. You would have to get up very early in the morning to get the better of him in discussion."

But how is peace to be achieved? Montgomery rejects the view of those who think the Russians are planning to attack the West the moment a favorable opportunity occurs. "I do not believe this for one moment," he says. "The plain truth is that neither side has any intention of attacking the other."

The achievement of peace, however, requires the West to face several realistic factors. It is illogical to expect Russia to agree that a united Germany armed with nuclear weapons can be integrated into the Western alliance. The reunification of Germany is not a matter of practical politics, for the present time at least. It is illogical to try to solve the German problem without first solving the European

The consequences of, or the anticipated consequences of, the disposal operations of P.L. 480 on foreign competitors created a furor at the inception of on over-all plans for a European settlement. It is illogical to work on the assumption that the East German government does not exist. "It does exist. And for a satellite of Russia the German Democratic Republic is prosperous." The problem of West Berlin should be settled with the assistance of the United Nations. On these points, too, he apparently sees merit in Moscow's proposals. And it is illogical to work on the assumption "that the true Government of China is in Formosa."

This list of "illogical" factors shows that Montgomery's views differ sharply from major United States policies. He gives high praise to the United States for its contribution to Europe's economic and military recovery in the postwar years. But he clearly favors Macmillan's policy of negotiations with the Soviet Union, proceeding, without "appeasement," "little by little, and bit by bit," to create confidence at each step.

If this is done, he believes that there will be a slackening of tension and that the West and Russia, for a generation ahead, can "live and let live." To this reviewer Montgomery's analysis seems realistic and sound—with one exception. That is when he asks whether, given time, "the Russians can become a part of Christendom." He apparently thinks this could happen. But need this question be pressed? Many nations which are not "part of Christendom" have in the past shown a greater capacity to "live and let live" than some avowedly Christian nations.

Program
University of Rochester

THEODORE ROPP. *War in the Modern World*. Pp. xv, 400. Durham, N. C.: Duke University Press, 1959. \$10.00.

It requires courage to undertake to survey the history of warfare through the past five centuries in less than 400 pages.

Professor Ropp has done a remarkable job of just that in this unique volume. It is not concerned with individual campaigns or battles so much as it is with trends and the changes that have been brought about by political, social, and economic developments through the centuries. Yet, the two-paragraph description of Napoleon's invasion of Russia and the one-paragraph account of the Battle for Leyte Gulf, in World War II, contain the essence of those events. It is arranged in three parts; from the Renaissance to the defeat of Napoleon, the nineteenth century to World War I, and the major wars of the twentieth century, with stress on Anglo-American ideas of the conduct of sea, land, and air warfare. Almost half of the volume is devoted to the third part.

The scope is limited generally to the important and major European wars of the period and to the major wars of the United States. The author also contains in his narrative "an introduction to the major military classics." Space considerations limit the extent of this introduction, but no one who has studied the works of Clausewitz, Jomini, Mahan, or even Douhet, for example, will seriously question Professor Ropp's evaluation of these men and their work.

An outstanding feature of the volume is the manner in which the Bibliography is presented. It is developed by means of Footnotes to the text so that the reader has the applicable reference before him as he reads. Before the period of World War II the Bibliography is selective. Whenever possible the latest scholarly work on the subject is cited, but other recognized or classical works are included. For World War II the Bibliography is comprehensive, and this reviewer knows of no book of merit on that war that has been omitted. The compilation of the Bibliography alone is a monumental piece of work.

This volume is much more than an introductory textbook to military history; it is a reference work of real worth. Political and social scientists who are unfamiliar with the field of military history should find it useful for discovering a ready answer to some question that might arise in this field. If the specific answer they seek

is not there, they will have an authoritative reference in military literature where it should be discussed in detail or which will steer them to such a discussion.

BERN ANDERSON

Rear Admiral
United States Navy (Ret.)

WALLACE MCCLURE. *World Legal Order: Possible Contributions by the People of the United States*. Pp. xvi, 366. Chapel Hill: University of North Carolina Press, 1960. \$7.50.

This volume is sponsored by the World Rule of Law Center, Duke University, School of Law. The author had the advantage of a Thomas Jefferson Fellowship awarded by the Alumni Board of Trustees of the University of Virginia Endowment Fund.

Dr. Wallace McClure, the author, is well known for his scholarly work on *International Executive Agreements* (New York: Columbia University Press, 1941). He served for some thirty years with the Department of State.

In an extensive Introduction on "World Law" various kinds of law, local, state, national, and supranational, are discussed. It is stated that "the universal chaos of nation-states insufficiently restrained by law has been made manifest in universal war."

In Part One there is an analysis of the place of the Constitution, statutes, and treaties in the United States. The leading cases are reviewed. The author makes a plea for the dignity and validity of treaties as now constituting, along with international common law, an effective method of dealing with the international relations of the United States.

Part Two is devoted to a discussion of Supranational Common Law and National Constitutional Law. As an introductory thought to this part the now celebrated case of *U. S. v. Curtiss-Wright Export Corporation* (1948) is cited, and much importance is attached by the author to the statement of the United States Supreme Court in this case that the Court "found warrant for its conclusions not in the provisions of the Constitution, but in the law

of nations." The case involved a United States arms embargo in the Gran Chaco war between Bolivia and Paraguay. With respect to international law and international customary law the author notes that "it would seem difficult to refute the presumption that a body of law that its courts acknowledge and draw upon as a source of rights and powers is law the rules of which the United States is legally bound to observe."

Part Three on the Legal Structure of the World Community includes an analysis of the United Nations as an "institutional component of legal order"—legislation, adjudication, aggression as a world-law crime, and enforcement of law. The constitutional development of the United Nations is discussed.

In chapter 12 the novel and interesting suggestion is made that "the President himself might head the United States delegation [to the United Nations] and that he should plan to devote more of his time to such meetings than has been true in the past."

A plea is made for more attention to the broad international objectives of the United Nations and less emphasis upon "policies of narrow self interest." The author favors a repeal of, or at least curtailed usage of, reservations which hamper the dignity and usefulness of the International Court of Justice. Threats of nuclear annihilation point to the new needs for a world legal order. The world has already witnessed the beginnings of an international police force in Korea (1950) and in the Suez crisis.

This significant volume contains a Table of Cases Cited, a Table of International Legislation and Constitutions, and a useful ten-page Bibliography.

Dr. McClure sees little hope in isolationism and in too much reliance upon national sovereignty. On the contrary he favors the striving for a world legal order, a stronger system of international law, a stronger world court, and in general the substitution of courts and conferences that is, the law for brute force in the settlement of international disputes. He is to be congratulated for his forthright and scholarly work which should be studied

to be appreciated fully since a brief review can hardly do it justice.

J. EUGENE HARLEY
Professor of Political Science
University of Southern California

Organizing Peace in the Nuclear Age. Report of the Commission to Study the Organization of Peace. Pp. xvii, 245. New York: New York University Press, 1959. \$3.75.

This eleventh report of the Research Affiliate of the American Association for the United Nations equals the standards set by its predecessors. Buttressed by a trio of supporting papers, the report first tackles the general theory of international legislation and then proceeds to discuss its practical application in the concrete case of the use of atomic energy. Conclusions of the report are summarized in a series of eighteen propositions. They range from a general adherence to "the ideal of a world system in which law and politics effectively combine their respective contributions," to the creation of world order through the belief that "every independent state" should be a member of the United Nations, to a recommendation that the United States make the International Atomic Energy Agency the "focal point and major instrumentality" of support for the development of the peaceful uses of atomic energy in other countries. Eighty-one members of the Commission signed the report, but five participants demurred from the implications of the phrase "every independent state" in the light of their opposition to the inclusion of the People's Republic of China under present circumstances. One additional member queried the view expressed in one of the propositions that enlargement of the Security Council would assure a more realistic and equitable distribution of seats. With all due consideration for the reservations, the report as a whole is a sensible, temperate, and even realistic set of proposals for the improvement of international organization and its role in the reduction of contemporary tensions.

The first of the supporting papers is Quincy Wright's study of the role of law in the organization of peace. In brief,

it is a group of thoughtful suggestions for improving the legislative, adjudicative, executive, and administrative procedures of the United Nations. Its companion essay by Arthur N. Holcombe argues for the expansion of the role of politics in the operation of the international organization. In particular he supports the development of the leadership of the middle powers in the politics of the United Nations. His theme is based on the proposition that the major powers in the Security Council rely too much upon violence or intimidation as an instrument of national policy. Whether the proposed solution—grossly oversimplified in this brief review—would be of much real effect is clearly debatable.

The final and by far the longest of the supporting papers is John G. Stoessinger's careful description of the establishment and the operation of the International Atomic Energy Agency. His analysis leads to the obvious conclusion that the high hopes engendered by President Eisenhower's original "Atoms for Peace" proposal in 1953 have hardly been fulfilled. The erosion of American support, to cite a major problem, has relegated the Agency to a secondary position. Yet he warns that disillusionment must not be permitted to obscure the possibilities for peaceful co-operation in the uses of atomic energy and suggests a number of ways for strengthening the Agency.

Altogether, it is healthy to ponder the conclusions of a group that insists on taking a long-run view of the international scene. It may well be that our one opportunity to enjoy that "long run" lies in the rapidity with which many more of us come to share a similar viewpoint.

clear age. Others deal with generalities, offering but a dribble of pious platitudes.

Dr. Kenneth Thompson, a political scientist, a thoughtful writer on problems of international politics, and a member of the editorial board of *Christianity and Crisis*, offers a different approach. Writing from the point of view of "the realistic moralist" he deals carefully with everyday "problems of power, of the gulf between individual and collective morality, and of the relation of national interest to higher aims and purposes" (p. 143). He holds that "one of our supreme tasks in foreign policy is to bring moral purpose and political realities into line and to understand their relationship more deeply and in terms that carry meaning for men in other lands." He states: "I believe that this overarching goal can be subjected to intellectual discipline, can be safeguarded at once from cynical nihilism or hypocritical moralism, and can be measured or played against the living standards of international political behavior. I believe that morality as distinct from moralism can be discovered and analyzed in international affairs as in other social realms" (p. 4).

In the course of his discussion, Dr. Thompson examines the opinions and judgments of a wide range of philosophers, statesmen, diplomats, and historians on the relationship between religious ethics and foreign affairs: In background and thought they range from the Protestant theologian Reinhold Niebuhr to the Catholic Judge Charles de Visscher, former member of the International Court of Justice, and from Churchill and Bismarck to George F. Kennan and Dean Acheson and historians Herbert Butterfield and Geoffrey Barraclough.

But the author goes beyond a lucid analysis of the thinking of others. He takes up such vital problems as armaments, colonialism, diplomacy, and the cold war and subjects them to the probing light of Christian ethics. Whether Dr. Thompson's readers agree or disagree with him on specific conclusions they will be grateful, in the reviewer's opinion, for his presentation of searching thought, moral courage, and readiness to promote a much needed public discussion in this vital field. Appre-

ciation is also due to the Lilly Endowment Research Program in Christianity and Politics at Duke University which sponsored these lectures and made possible their publication for the benefit of a wider audience.

JOHN BROWN MASON

Department of Political Science
Orange County State College
Fullerton, Calif.

EUROPEAN GOVERNMENT AND HISTORY

HENRY L. MASON. *Toynbee's Approach to World Politics*. (Tulane Studies in Political Science, Vol. V.) Pp. x, 153. New Orleans: Tulane University, 1958. \$2.00.

In an Appendix of some fifteen pages Mr. Mason deals with Toynbee's critics and remarks on "the incredibly unfavorable and hostile reception received by the *Study* on the part of its academic critics." As for him, he wants to preserve his independence with regard to "the rampant anti-Toynbeeanism common in many circles," and in his very last sentence he asks whether it may not be that "while the *Study's* inevitable weaknesses attract the ire of the various disciplines, its merits somehow fall between the several academic chairs?"

In fact he had introduced the critics on practically every one of his preceding 120 pages. Not a statement or a view of Toynbee's does he mention without recalling what others have had to say about it either in support or, mostly, in opposition. This undoubtedly adds to the interest of his book, although it is hardly the way in which the author might have composed a coherent analysis and conveyed a clear and consistent impression of his own view of the man and the work. The less so as his comments on the pronouncements, that he cites as he progresses, are often the reverse of incisive. He admits the truth of a great deal of the adverse criticism, sometimes he rejects it, but even when he admits it he is inclined to extenuate. Very often, moreover, in his rendering of the

strictures, he does not do justice to the point of view of their authors.

It is obvious that he is in sympathy with some of Toynbee's leading ideas. Toynbee's attempt to break away from Western complacency, his impatience with "parochialism," and his soaring imagination inspiring him to large global visions; the importance, too, he attaches to religion, not only in interpreting the past, but as the force which can redeem the present and the future—all that makes Toynbee in Mr. Mason's eyes an attractive and a significant figure.

Now it is not on account of these views that I want to criticize Mr. Mason or his book. The fundamental objection moved against Toynbee's work lies elsewhere. It is that his oft-repeated claim to be proceeding rationally and empirically and scientifically from established facts to proved conclusions is make-believe. All that Mr. Mason has to say about this, after quoting a number of critics who state this allegation in very precise terms, is that "those who accuse him of adopting an empirical cloak for purely spurious reasons hardly provide empirical evidence for their very serious charge." Apparently the charge that he rejects is that of acting in this way deliberately. But the charge that has to be met is that of being constitutionally unable to make the necessary distinctions.

It is significant that Mr. Mason is impressed with Toynbee's own rejoinder to me when I had called him "not a historian but a prophet" (*Journal of the History of Ideas*, 1955). Toynbee suggested that, to me, apparently, narrating events is the true function of the historian. In Mr. Mason's view, too, Toynbee is to be acclaimed as an innovator because his approach goes beyond "the ordinary or traditional historians' primitive fact-finding method." As if the "ordinary" historian could not admit that "examining" history, that to compare and to look for general conclusions, is a legitimate, and indeed a most valuable, part of his job! As if, for instance, we are not fascinated by Burckhardt, by Tocqueville, by Carl Becker, by Huizinga. If Toynbee's generalizations are considered to be "unhistorical," it is because the factual

foundations on which he builds them are so often unsound or faulty. Toynbee, in other words, evaded criticism by a crass misrepresentation of his critics' meaning, and Mason here follows him blindly.

In his "approach to world politics" Toynbee has been charged from many sides with an anti-Western bias which tends to weaken his attitude with regard to the revolutionary forces of our time. Mason gives a number of telling quotations and is palpably a little embarrassed by the problem. Nevertheless, here too, he ends on a defensive note. "Toynbee's analysis seems far from malicious towards the West," a conclusion which he fails to substantiate, "and his solution, an increase in spirituality, is about as un-Communist and un-Fascist as can be imagined." Nevertheless, Toynbee's rejection of democracy causes Mason real uneasiness, but once again he concludes: "This ambiguous and perhaps unfair view of contemporary democracy does not necessarily range Toynbee among the Communists or the Nazis." True, but the apologist is not facing the real issue, for who should dream of describing Toynbee as a Communist or a Fascist? The way in which Mason discusses the evidence of Toynbee's curious animosity against the Jews is exactly similar.

Let me in this connection remark that Romein, the Amsterdam historian, who was at one time one of Toynbee's avowed admirers, is not, as Mr. Mason says, "a Social-Democrat," but a Marxist. The distinction is relevant, and it is worth noting that the insistence on "an increase of spirituality" did not stand in the way of appreciation from this quarter.

One more small point is that Mr. Mason rebukes "that great anti-Toynbeean Trevor-Roper" for asserting that Toynbee called World War II "a supplementary war": Trevor-Roper ought to have looked more carefully at Table I of Vol. IX, p. 255. Well, I have looked at that Table again, carefully, and it bears out Trevor-Roper's statement.

J. F. C. FULLER. *The Generalship of Alexander the Great*. Pp. 336. New Brunswick, N. J.: Rutgers University Press, 1960. \$7.50.

This new Alexander book is very uneven. Were it to survive, like so many ancient historical works, merely as a series of fragments, some future scholar might well find it necessary to posit three separate "Fullers" to explain its diversity. One, and probably the one for whom there would be the largest number of fragments, would be labeled a compiler. He would be held to have copied his materials chiefly from Tarn, with excerpts from Droysen, Wilcken, Wheeler, Ferguson, and others, perhaps based on a convenient intermediary source book. The second author would be described as a free-swinging critic of his own day, a man of the stamp of Theopompus, invoking the past to pour scorn on contemporary statecraft. But the third author would be distinguished by his sound judgment on military matters and by his straightforward, no nonsense account of Alexander's campaigns. For General Fuller is all three of these persons.

Admittedly no classical scholar, he has been forced to read his sources through translations, yet his own disciplined imagination enables him to make sense of them, where more learned predecessors often betray their civilian limitations. However, when he expresses general judgments, as he not infrequently does, on the reasons for the decline of the city-state; on the character and intentions of Alexander; and on the lessons Greek history holds for the present generation, then he writes as and like an amateur.

Fuller's Alexander is essentially the Alexander of Tarn, except when he is in the presence of an enemy; for then he forgets about the brotherhood of man and remembers only that he is a soldier. Since Tarn's thesis has been effectively controverted recently (see Badian in *Historia*, 7, 425 ff.), this aspect of Fuller's book need not be discussed here. But Fuller makes a contribution of his own, particularly in four consecutive chapters devoted entirely to Alexander's fighting. The general account comes first (chap. 4),

and it is anything but a eulogy. We see that Alexander, like other famous military men, learned to profit from his mistakes (see pp. 99; 111; 119). This general survey is followed by three chapters of analysis. The discussion of Gaugamela, to cite one example, offers a new interpretation of the operations of the Persian left, that appears to make far better sense than the traditional account of the plundering of the Macedonian camp. But of the battles, by far the most interesting is that with Porus, where the moves and countermoves along the banks of the Hydaspes are clearly described and illustrated by useful diagrams even a layman, like the reviewer, can understand (pp. 189 and 192). A special feature of this book is the chapter devoted to "Alexander's Small Wars" (chap. 8), for this contains practical remarks on the details of drill and tactics, remarks that incidentally illuminate other accounts of warfare in the fourth century.

No student of classical warfare can afford to neglect this book. The thoughtful reader will not be prevented by the occasional bombast from doing justice to the great merits of a study on Alexander written by a professional military man.

TRUESDELL S. BROWN

HANS KOHN. *The Mind of Germany: The Education of a Nation*. Pp. 370. New York: Charles Scribner's Sons, 1960. \$5.95.

If any further evidence is needed of the scholarly stature of Hans Kohn, this superb new study provides it. This is intellectual history at its very best. It is a joy to read these sparkling pages written by a master historical craftsman.

Professor Kohn seeks "a tentative reply" to the question upon which much of the fascination of German history rests: How was it possible for a people such as the Germans, who had won enormous prestige in scholarship, music, literature, and philosophy, deliberately to attempt national suicide? The author's answer is that the responsibility for the disaster

must be borne by those Germans who rejected the humanitarian traditions of Western Europe. In this alienation from the West was the great tragedy of German history.

Based on his lifetime study of nationalism in the modern world, Professor Kohn rightly concludes that the sentiment of nationalism led the Germans to an errant path. "Perhaps the Germans have presented the most outstanding example in our times of the moral catastrophe, into which the malady of a self-centered nationalism and the accompanying *trahison des clercs* can lead" (p. x).

In a brilliant opening chapter the author traces the course of modern German history and leads the reader by short, deft strokes to the present. Germany did not succumb to Hitler, he says, because she had become part of modern Western society, but because this modern society had been imposed on premodern social and intellectual foundations which were proudly retained.

In succeeding chapters Professor Kohn examines these foundations by concentrating on key individuals in German intellectual history. He absolves the magnificent Goethe as a cosmopolitan who spurned the cult of the Middle Ages fostered by the romantics. He shows how such romantics as Novalis and the Schlegel brothers placed abnormal stress on "German-ness," with deplorable results later in the century. He describes the integral nationalism of Turnvater Jahn and his intellectual war against the West. He quotes Heinrich Heine as warning against a unified Germany that would terrorize all Europe.

Later chapters show how German liberalism began to wither in 1848, how in 1866, the *annus mirabilis*, liberalism gave way to nationalism, and how the liberal intellectuals finally surrendered to the might of Bismarck's *Eisen-und-Blut* empire. There is an extraordinarily fine chapter on Richard Wagner: "What separated Nietzsche from Wagner, was not only the master's Germanophilism and racialism but also Wagner's character, his lusting for honors, women, and gold" (p. 210).

Professor Kohn sees an astonishing

change of mind in the Germans in the last decade. He is firmly convinced that the new German Federal Republic is safely anchored to the West and that the new German generation is finding inspiration and social solidarity in a return to the principles of human freedom. "Germany's two hegemonial wars in the twentieth century brought the peoples and the civilization of Europe to the brink of catastrophe. Out of this catastrophe one great gain has come, a democratic Germany which is finally taking its due place in modern Western life" (p. 354).

The author is to be commended above all for his calm objectivity. His study throws more light upon the German mind than any other book written on Germany during the last several decades. It is "must" reading for all who would seek to understand the German catastrophe.

LOUIS L. SNYDER

ERNST FRAENKEL (Ed.). *Amerika im Spiegel des Deutschen Politischen Denkens*. Pp. 333. Köln und Opladen: Westdeutscher Verlag, 1959. DM 20.

America's growth from an only potentially important power on the periphery of the political world to its present greatness could not fail to make a deep impression on European statesmen and thinkers. The views expressed by them in the face of this astounding development are interesting in two different ways. In spite of errors of information and judgment they reveal aspects of American life which are less apparent to those immersed in it. At the same time they betray the breadth or narrowness of vision in those who unwittingly portray themselves in depicting America. Not only their personal power of comprehension but also the validity of their principles is put to a searching test. Professor Fraenkel served historians and generally the students of German-American relations well by providing them with a selection of utterances compiled with utmost care and discernment.

It will be hard to discover shortcomings save those which belong to the nature of anthologies. By reprinting a few pages

taken out of the context of a book or essay we are in danger of distorting or obfuscating the perspective intended by the author. In the present case this danger is effectively counteracted by the editor's introductory essay. Here the development of the German attitude toward the United States from the Revolutionary War to the present is competently outlined, and the reader is given a reliable framework within which he can place the documents.

The selection itself, being truly representative, embraces everything: expressions of enthusiastic admiration and outbursts of spite and contempt, evidence of deep and sympathetic understanding as well as testimonies of prejudiced arrogance, Goethe's and Jakob Burckhardt's wisdom but also the folly of Hitler who despised America as a hopelessly decadent country defeated by herself in the Civil War. Prevalent, however, is an endeavor to attain a balanced view and a just appraisal of American democracy.

HELMUT KUHN

Professor of Philosophy
University of Munich

JOSEPH ROTHSCHILD. *The Communist Party of Bulgaria: Origins and Development 1883-1936*. Pp. viii, 354. New York: Columbia University Press, 1959. \$7.50.

In 1883 Dimitar Blagoev, then a Bulgarian student at the University of St. Petersburg, organized among his friends the first Social Democratic group in Russia. On returning to Sofia he joined with Yanko Sakazov, who had studied in Germany, England, and France, to organize the socialist movement in Bulgaria. In 1891 twenty men gathered in the woods of Mount Buzluja near Sofia and founded the Bulgarian Social Democratic party. It remained for years largely a group of intelligentsia, and many leaders of other political persuasions spent an apprenticeship in Socialist ranks. "In 1910, for example, with but two exceptions every minister in King Ferdinand's cabinet had only a few years before been a zealous Socialist (p. 3)."

The Bulgarian Socialist party received

its inspiration from Russian, not French and German sources. In 1903, the same year that the Bolshevik-Menshevik division took place in the Russian Social Democratic party, a similar break occurred in the Bulgarian party. The "Narrow" party under Blagoev became the Bulgarian Leninists—dogmatic, doctrinaire, uncompromising as to theory and tactics; the "Broad" party under Sakazov, the Bulgarian Mensheviks—less dogmatic, more willing to adapt themselves to changing conditions and to co-operate with other liberal and reform parties. The Broad group was the strongest, due in part to further splits over doctrinal issues within the Narrow group. Capitalizing on the discontent following the Bulgarian defeat in the Second Balkan War, the Socialists won one-fifth of the vote in the December 1913 Sobranie elections, the Broad party winning 21 seats, the Narrow 16. In May 1919, the Narrow party changed its name to the Bulgarian Communist party, and became not only one of the first, but also one of the staunchest supporters of the Third International. The Russian leaders always looked upon the Bulgarian Communists with favor, partly because the Bulgarians were willing to accept the Moscow party-line, but also because Bulgaria after 1918, like Russia, was a revisionist state, and the Kremlin leaders saw in Greece, Yugoslavia, and Rumania, outposts of French and British imperialism. The Bulgarian Communist demand for a Balkan Federation—with Thrace, Macedonia, Dobrudja, Croatia, Slovenia, Montenegro established as independent members alongside existing states—won Moscow's approval. Moscow, however, was not able to force this policy upon the Communist parties of Yugoslavia, Greece, and Rumania. This is the basic, if not the only, reason why the attempt to unite the Balkan Communist parties into a Balkan Communist Federation remained stillborn.

Rothschild says little about theory or dogmatic differences but concentrates on tactics and the relationship of the left parties to the issues of the day. This makes the book far more than a party history, and some of the best and most

perceptive sections cover wider aspects of Bulgarian affairs. There is much in the volume on the economic development of the country, on labor legislation and labor organization, an excellent brief discussion of the Stamboliski dictatorship, the Communist-inspired insurrection of September 1923, the Internal Macedonian Revolutionary Organization and its policies, the explosion at the Sofia Cathedral in 1925, the Velchev-Georgiev coup in 1934, and so forth. Although the volume ends with the purge in 1936 of Bulgarian Communist party members, engineered by Dimitrov and Kolarov with Comintern support, the copious Footnotes often mention later events and the careers of various leaders after that date.

This is an excellent study, measured in tone, well documented, and a volume to be consulted by anyone working in Bulgarian history, particularly in the post-World War II period.

NEAL WOOD. *Communism and British Intellectuals*. Pp. 256. New York: Columbia University Press, 1959. \$4.00.

The British Communist party, as Mr. Wood points out, has followed in origins and leadership the pattern of Socialist development in Britain in that it is predominantly working-class. As a result its influence has been greatest in the trade unions and on matters affecting the short-term interests of their members. In politics its influence has been negligible, and the part played by intellectuals, except a handful of party bureaucrats, has been tangential. The intellectuals who, first in the nineteen-twenties and then in larger numbers in the nineteen-thirties, were attracted by the ideas of communism, were not unemployed and despairing professionals but quite "well-heeled" members, mainly educated at the fee-paying public schools and at Oxford and Cambridge, of an upper middle class which for long had exercised the role of ruling élite. They were, therefore, in the words of Beatrice Webb, "mild-mannered des-

peradoes." When their numbers were greatest they never represented more than a tiny minority of those who, by their intellectual activity, made the important decisions in British society.

This brief but well-documented book fairly and objectively describes the origins and motives of those who were attracted to Communist ideas in the two periods, the uses to which the Communist party put them, and the causes of their disillusionment. Whereas in the nineteen-twenties the Russian Revolution attracted for a short time many already active on the left in British politics, in the nineteen-thirties the conditions of mass unemployment and the growth of fascism politicized a number of literary and scientific personalities who had previously lived ivory-tower lives. The climate had been prepared by the collapse after World War I of traditional ideas on morality, the growth of relativism in philosophy, and the revolution in the natural sciences which undermined established habits of thought.

Disgusted with the society from which they had previously withdrawn, they reacted with almost mystic fervor to the promise of certainty through Marxist action. Brought up in a tradition of liberalism which owed much to the rationalism of the Philosophic Radicals, they found little difficulty in combining the idea of a social system claiming to be based on scientific theory with the crusading ideals of earlier campaigners for humane causes. This spirit reached its zenith with the gallant deaths in Spain of many young writers among the 543 British soldiers who were killed in the Civil War.

Mr. Wood rightly rejects the thesis that all support for communism among intellectuals is the result of neurosis, although this may often cause a predisposition to accept its values. What he fails to do is adequately to analyze the reasons of some, especially scientists, who find it so difficult to break their allegiance in face of the severest disillusionment. Here, surely, the clue is most likely to be found in some disturbance in personality.

While recognizing the inhibiting effect on the growth of the Communist party of Great Britain of a powerful democratic

labor movement, Mr. Wood perhaps underestimates the contribution which it made to the prevention of the growth of Communist influence among intellectuals. Its very defects of pressure to conform and bureaucracy prevent its being as easily moved as those who live mainly in the realm of ideas; while its broad federal structure offers a place for intellectuals whose interest in socialist politics is more than transitory. In practice, it performs the invaluable function of continuing to expose, as they are founded, the swarm of "front" organizations which Communist parties form. No one was ever left in doubt as to the origin of these "proscribed organisations," to which no Labor party member is supposed to belong. This did not prevent people joining them, especially in the late nineteen-thirties and nineteen-forties; but their effectiveness and power to command loyalty were very much reduced.

This sober study of a problem that has aroused interest in many democratic countries, and anxiety in some, is a useful contribution to the growing literature on the power of the Communist idea.

AUSTEN ALBU

Member of Parliament
Great Britain

MORRIS GINSBERG (Ed). *Law and Opinion in England in the 20th Century*. Pp. viii, 407. Berkeley and Los Angeles: University of California Press, 1959. \$6.50.

This useful, illuminating and, in some sections, brilliant volume illustrates one of the laws of literary natural history: that it is hard for a team to beat a man. The man in this case is Albert Venn Dicey whose *Law and Opinion* furnished the model for this symposium. Dicey had many faults. It might be unjust to describe him as shallow; it would not be unjust to assert that he had a talent for not noticing or accepting awkward facts that ran counter to his excessively symmetrical preconceptions. He was, in the medieval sense of the term, a "realist": nouns like "collectivism" were objective realities for him and did not need or

did not bear analysis. Dicey sought and found simple laws of politics, simple principles of political behavior, and transcribed his conclusions in lucid and deceptively cogent prose. The result was a series of books that may well have done more harm than good, a set of misleading minor classics.

The new "Dicey" is a very different and, in many ways, a superior work. The contributors are not content with disquisitions on vague nouns like "collectivism." Every chapter is significant, full of specific references and often of critical analysis based on an impressive body of knowledge of a type that Dicey never bothered to acquire. Yet Dicey wrote a book, while Professor Ginsberg has had to be content with editing a symposium. All the chapters are worth reading, all are in harmony in that they accept with little or no lamentation the fact of the welfare state, but not all are equally interesting.

American readers still learn a great deal, however, from the chapters that deal with the present state of British parties, especially from Professor Burns' subtle exposition of conservatism, his explanation by example of the Tory party's lack of a dominating ideology. The editors of *The National Review* might see treason of the clerks here, but the student of politics will be enlightened and even, in a way, edified. The account of the Liberals by Mr. R. B. McCallum is as able, but the subject is not so "ondoyant et divers." The account of the Labor party by the late G. D. H. Cole is not only an able piece of exposition but casts possibly unintended light on the present discontents of that party.

Of equal interest are the chapters on the social services. American readers are especially recommended to the section on "Health" by Professor Titmuss. They will learn of the great improvement in the income and status of the family doctor made possible by the beginnings of "socialized medicine" in 1911 and learn that one of the main beneficiaries of the new health service has been the lower middle class or perhaps just the middle class. The general popularity of the service is due to the very wide base of support it has acquired.

The American Medical Association might take note. This is also true of the extension of education. The beneficiaries have been white collar not blue collar families. The "eleven plus" examination is an ordeal, feared by parents as much as children, settling as it does the academic fate of the child and, in most cases, his social and economic destiny for life. The pressure continues after the "eleven plus" examination. I know of one London school of good repute where the parents go to night school to train themselves to help their children with their homework. These chapters were originally lectures, and there are occasionally marks of the genre. But if not a literary masterpiece, this is a most useful guide to the British welfare state, its politics, its law, its successes and failures.

D. W. BROGAN
Professor of Political Science
University of Cambridge

THOMAS H. D. MAHONEY, *Edmund Burke and Ireland*. Pp. x, 413. Cambridge, Mass.: Harvard University Press, 1960. \$7.50.

Burke's "imperial mentality"—to use Professor Mahoney's excellent term—embraced most of the great political problems which confronted England in his day. It gave no special pre-eminence to the problems of his native land, which perhaps stirred him less than did those of India, America, or revolutionary France. Yet in one sense Ireland was outstanding among Burke's causes. It was the first to excite him, and he pursued it the longest. It may also have been the shrewdest test of his conservative philosophy. The wrongs of Ireland were not new and sensational, like the crimes of the Jacobins or even the inequities of East Indian rule. They were long-tolerated realities of a familiar world. Burke spent five years of his boyhood in his uncle's Roman Catholic household in County Cork. The Penal Laws and the harsh restrictions on Irish trade, farming, and industry were among his earliest memories. If a conservative is merely a man who accepts the status quo, he could have made peace with such seasoned injustices; or when he left Ireland at twenty-

one, he could have turned his back upon them.

Burke was a more useful kind of conservative. He would not, like some of his countrymen, demand swift, violent remedies; he believed that deeply rooted evils took time and patience to cure. Neither would he put all the blame upon the English; in his day a small group of Irishmen, the "Protestant Ascendancy," were far more culpable. Separation of Ireland from England he rejected as ruinous to both countries, though more so to Ireland. But he found genuine remedies, of a drastic sort; and in nearly forty years as a British statesman, he watched eagerly for the times when they could be applied.

Professor Mahoney has told the story of Burke's services to Ireland more fully, clearly, and authoritatively than any previous scholar. Using the newly opened Burke and Fitzwilliam papers, he has treated some episodes virtually for the first time: notably Earl Fitzwilliam's ill-fated lord-lieutenancy in 1795 and the Irish mission of Richard Burke, Jr. He has not, naturally, exhausted his enormous subject. Portions even of the Fitzwilliam papers, in particular some at Northampton, he seems to have neglected. Many judgments of Burke's wisdom, and especially of his tactical competence, he could have made less tentative by wider investigations of events in Ireland. But perhaps what Burke once said of reforms can be said of historical narratives: it is not essential to complete them; one should leave something for one's successors to do.

THOMAS W. COPELAND
Professor of English
University of Massachusetts

SIDNEY POLLARD, *A History of Labour in Sheffield*. Pp. xix, 372. Liverpool: Liverpool University Press, 1959. 35 s. net.

This book by Professor Pollard is a report of a study of the slow development of conditions of labor, of the growth of labor organizations, and of the improvement of the lives of workers in a principal city of England—the city of Sheffield. The period covered is roughly from 1850 to

1940. These ninety years encompass the influences of the "radicalism" of the Chartists and Socialists, the coming of the heavy industries with many foreign workmen, the growth of broad industrial unions, and the influences of the armament race and of the war in the early years of this century.

Also included in this era are the changes in the steel-making processes and the mechanization of industry, both of which affected the number of workers and the types of skills required. Affected in turn were the wage levels and, as a consequence of this, there was improvement in housing, health, sanitation, and the general conditions of life.

Professor Pollard has had the opportunity of working in the University of Sheffield on a Douglas Knoop Research Fellowship in Economic History. He subsequently became a lecturer in the University. His study has taken him into the details of the history of industry, of worker organization, and of municipal activities in such a way to create for the reader a rounded story of this little sample of industrial society.

The reader will be interested in the introduction of the special types of steels such as the Taylor-White tungsten alloy, to name only one. This was developed in America and was used to make such items as high-speed tools. Stainless steel was another invention, first used in making rifle barrels but later a great transforming force in the whole field of steel usage.

But the main interest is in unionization and conditions of work. The coming of trade unions, sometimes locally organized rather than nationally introduced, the growth of industrial unions, and the improvement of urban conditions of life, especially during and since the war period of 1914–19, along with increments in the general level of prosperity have transformed the dingy, undrained town of Sheffield of a century ago into a modern English city. The newer unions were more active in this than were the older ones. "On the whole," says Professor Pollard, "workers in the light trades, of whom many were still acting as employers of labour or independent contractors, were

less militant than the men in heavy industry" in the struggle for organization and for improvement of wages and work benefits. They were also slower to modernize. Technical progress with its decline of manual skills seems to have been more characteristic of heavy industry than of the light crafts in steel and silver. Heavy industries, of course, were more subject to national influence than were light industries.

The research on the human and the industrial sides of life in Sheffield presented here is so thoroughly done that it will not need to be supplemented, when this period and subject-matter are concerned, for a long time to come. Because so much time is spent upon working conditions, health of workers, housing and sanitation, adult education, and other good causes, this is a study in social welfare as well as economic history.

The Bibliography is extensive and detailed; the Index is adequate. If general statements had been given at the beginning or end of chapters to serve as guidelines, the reader could more easily follow the direction of the author's thought. Perhaps, after all, there is some difference between a research paper, as such, and a printed study that is for the use of the general public. But this is immaterial; the book is a scholarly work that will furnish an example of fine research to all who study socio-economic history.

their view, social class weighed more heavily than nationality in education, professional attainment, and in determining their attitude toward the regime. The rest is concerned with such matters as the pattern of family life, industrial organization, and other aspects of internal life and administration. All these are discussed through an elaborate analysis of the statistical material provided by the inquiry, but the result is what one could expect from the special pressures of Soviet policy and from the general trend of the times. In the nineteen-forties and nineteen-fifties social conditions were changing rapidly everywhere and nowhere faster than in the forceful evolution of Russian society.

What the upshot of that evolution might be could hardly have been forecast by that dated and limited inquiry; nor does the authors' rich and, like the rest, well-written concluding chapter depend much on confirmation by that old grain of fact. They both spent a month in the Soviet Union in 1956-57 to get firsthand impressions and found the Soviet system well entrenched and no evidence that its subjects want or need to change it forcibly.

It is changing of itself. As it passes from the stage of sheer "effectiveness" to the more mature stage in which "efficiency" is the main criterion, the dictatorial features are sheared off as no longer necessary or suitable. The challenge it presents to the world springs precisely from that lively dynamism, not from the "unchanging character" of the system. Like the people of any other industrial society, the Soviet citizen is looking for "opportunity" for fair living, and as he is getting it "the crucial change in Soviet society is that now the main outlines of the system seem to enjoy the support of popular consensus." This is a solid political conclusion derived from an elaborate non-political inquiry.

WLADYSLAW W. KULSKI. *Peaceful Co-existence: An Analysis of Soviet Foreign Policy*. Pp. xxi, 662. Chicago: Henry Regnery Company in co-operation with

the Foundation for Foreign Affairs, 1959. \$12.50.

In the Introduction to his *The Soviet Regime: Communism in Practice* (Syracuse University Press, 1954) now in its third printing, Professor Kulski speaks of his hope that those of the younger generation who are searching for a better world will be warned against believing that a better world is being built in the Soviet Union. In his new book, which, in spite of its cost, may well be even more widely read than its predecessor, he gives another warning, this time to those he refers to as "wishful thinkers" and "well-intentioned people." They should not be influenced either by the new Communist general line or by its principal salesman—a type of party politician, more familiar on the American scene than the Russian—a poor farm boy who made good, who tells jokes, slaps backs, kisses babies, and "beats the drum" for peaceful coexistence and total disarmament.

The Communists, Professor Kulski says, have not had a change of heart. They have merely decided that circumstances make it advisable to use different tactics on a new battleground—the less developed countries—to gain old ends. What keeps the Soviet leaders from using against non-Communist ruled countries the same methods they used in Hungary is not a newly discovered "peace-on-earth-good-will-to-man" spirit but "the actual world wide distribution of power." We must not let this distribution of power shift in favor of the Communists by underestimating the seriousness of their challenge.

The author explains that he has not written either a history or a monograph but has analyzed "basic patterns, objectives, and means of Soviet foreign policy." These analyses are organized topically in fourteen chapters in which he discusses, among other matters, the following: Russian nationalism and its relation to communism; the residue of the Communist faith and the nature of Communist morality, strategy, tactics, and current objectives; doctrine and policy regarding the party, revolution from above, and underdeveloped countries; the Soviet record of violations of the five principles of

coexistence and of their practice of imperialism and colonialism; the Communist international movement especially since 1956.

On the much debated question of whether Soviet foreign policy is more nationalist than Communist, the author suggests that this is another instance of marriage between a creed and a territorial or ethnic unit. In this case the territorial unit, having identified itself with the creed, uses the creed as a weapon of expansion and control of the colonies or protectorates so acquired. The Soviet leaders are first of all Russian patriots, and their alliance with the Chinese Communist leaders is based on a mutuality of interests cemented by "a community of ideological beliefs." The Soviet Union is the senior partner of this alliance, which, the author believes, is not in serious danger of being disturbed by "ideological discrepancies." National communism is a form of resistance to Soviet imperialism as well as a heretical deviation from the general line.

Professor Kulski sees no likelihood of a disintegration or liberalization of the Soviet system or of any long lasting accommodation with or toleration of non-Communist systems. Present Soviet policy is to avoid nuclear war, to defend Soviet conquests at all costs, and to use all means short of a general war to divide and weaken the non-Communist world, and eventually to bury all non-Communist systems.

These brief references to the author's views, as I understand them, relate to only a small number of the topics discussed in this useful and abundantly documented book. They may indicate, however, the bases of selection and emphasis. Another writer might be inclined to place more emphasis on the significance of the scientific-technological revolution in respect to ideologies and social institutions, especially regarding relations between peoples and governments. In a time of such vast and rapid change, the rigidities of a totalitarian dictatorship may in fact be less formidable and enduring than they now appear.

Professor of International Relations
San Francisco State College

ALVIN Z. RUBINSTEIN (Ed.). *The Foreign Policy of the Soviet Union*. Pp. xviii, 457. New York: Random House, 1960. \$6.50.

The Foreign Policy of the Soviet Union is a collection of readings on Soviet foreign policy with an Introduction and extensive Notes by its editor, Professor Rubinstein of the University of Pennsylvania. It is the first collection of readings in Soviet foreign policy designed for the college classroom. Jane Degras' *Soviet Documents on Foreign Policy* and the Eudin and North collection on Soviet policy in the East and the Eudin and Fisher collection on Soviet policy in the West were designed to assist the research worker rather than the college student.

Professor Rubinstein has chosen his readings on the principle that the foreign policy of the Soviet Union is an amalgam of discrete elements. He accepts in part the thesis that Soviet statesmen seek the same objectives as their imperial predecessors: the "natural frontiers" and access to seas. But this is only one strand in Soviet policy as Professor Rubinstein tries to present it. Ideology is also accorded great importance because it is the basis for Soviet forecasts of the future and also because ideology describes the objectives of Soviet policy. Professor Rubinstein is too sophisticated a guide to accept all ideological statements at face value. He knows that some statements are ritualistic, and others are made to mislead, but this does not lead him to the sophomoric error of throwing out the baby with the bath water.

Professor Rubinstein, then, treats Soviet foreign policy as a knotty and complex problem. The college student using this book as his first introduction to the source materials on which any respectable judgment must rest, will find no simple key which will unlock all the doors to understanding. As the student reads materials on ideology, speeches made simultaneously to domestic and foreign audiences, notes of protest against the policies of non-Communist governments, propagandistic attacks on American disarmament policy, and Soviet analyses of the "colonial question," he will learn that the analysis of Soviet

foreign policy is a formidable task. But the skillful introductions to the various sections of the book and the concluding chapter of analyses by outstanding experts demonstrate that it is possible to understand Soviet foreign policies.

But these selections of divergent interpretations and Professor Rubinstein's own judicious introductions, which present the views of others in addition to his own, reveal to the student that there are no easy answers. It is fortunate, indeed that our first book of readings on Soviet foreign policy for the college student is such a good one.

HERBERT S. DINERSTEIN
The RAND Corporation
Santa Monica, Calif.

G. D. EMBREE. *The Soviet Union Between the 19th and 20th Party Congresses, 1952-1956*. Pp. ix, 365. The Hague: Martinus Nijhoff, 1959. Guilders 22.80.

In the period between 1952 and 1956 there were significant developments in both internal and foreign policies in the Soviet Union. Beginning with the convening of the Nineteenth Party Congress in 1952 and ending with the Twentieth Party Congress in 1956, George D. Embree has collected and collated a large amount of information taken from Soviet press and periodical literature. Relying heavily on the translations of Russian literature in *The Current Digest* of the Soviet Press and supplementing these with an extensive canvass of American, British, and German books and articles, the author has put together an impressive amount of information. The book has the semblance of a doctoral dissertation. It contains a Bibliography, Footnotes, long quotations, and documentation. Like most studies in current Soviet history, Embree's book is filled with a recitation of events as reported in *The New York Times*. He retells the story of the accomplishments of the Nineteenth Party Congress of 1952, the events which preceded the death of Stalin, the "Doctor's Plot," the situation confronting the party and the government after Stalin's death, the changes in internal policy, the machinations of Beria

and his purge. There is an eighty-two page chapter in which the new foreign and domestic policies are discussed. Starting with the interregnum in which Malenkov shares power with Khrushchev, Embree develops the story of the new collective leadership and of the economic changes and foreign policies which were the culture for the seed of Khrushchev's power to take hold and sprout in many directions. He goes into considerable detail in discussing Khrushchev's rise to power. Merle Fainsod, Bertram Wolfe, and a few other distinguished scholars have written on this topic in a more trenchant and penetrating manner, but young scholars like George Embree should be encouraged to replot the ground so that they may have the exercise and experience of collection and interpretation of data.

The penultimate chapter is a factual description of the events of 1955 concerning Soviet foreign policy, and the final chapter discusses the Twentieth Party Congress of February 1956. Starting with the decision in 1954 to embark on a program of foreign economic aid to underdeveloped countries, the Soviet Union continued in 1955 to extend its posture before the world in a different manner than during the Stalin era. The realignment of power in the Kremlin in February 1955 with the "resignation" of Malenkov and the appointment of Khrushchev's puppet, Bulganin, as prime minister brought the role of Khrushchev as the spokesman of Soviet foreign policy very much to the front of the stage. The year 1955 ends with Khrushchev and Bulganin "peddling their wares" in South Asia. Embree finishes his book with an account of the party and the economic changes wrought by the Twentieth Congress. He documents the story of the denigration of Stalin, the problem faced by Khrushchev to stave off an attempt to move him aside, and shows how Khrushchev was preparing the maneuver to weaken Malenkov and Molotov.

All these events are well known, but they make interesting repetitive reading. Dr. Embree might consider a sequel study of the following four years, from 1956 to 1960, and attempt to trace through the

last four years the events which consolidated Khrushchev's power. Such another volume would be of considerable value. The large print of this book makes it easy reading from the optical point of view, but next time an attempt should be made to prevent the inordinate number of typographical errors.

WILLIAM B. BALLIS
Professor of Political Science
University of Michigan

SERGE A. ZENKOVSKY. *Pan-Turkism and Islam in Russia*. (Russian Research Center Studies, 36.) Pp. x, 345. Cambridge, Mass.: Harvard University Press, 1960. \$6.75.

The twenty million or so Turkic speaking Muslims—Tatars, Uzbeks, Turkmens, Kazakhs, Bashkirs, Azeris, and others—of Russia constitute the largest non-Slavic and non-Orthodox population of the Soviet Union today. In the days of Jingiz Khan and his Golden Horde successors, Turkic nomads established their rule over much of what today is Russia. With the conquest of Kazan by Ivan the Terrible, the trend was reversed, and in the mid-nineteenth century the partly Turkic populated Caucasus region and solidly Turkic Central Asia became the last major territories to be incorporated into the ever expanding tsarist realms.

The advent of liberal, constitutional, and nationalist ideas to Russia in the late nineteenth and early twentieth centuries was bound to stir the Tsars' Turkic subjects into new political consciousness. The tsarist collapse of 1917 briefly seemed to present the alluring prospect of national independence; yet it is doubtful whether any of the essential prerequisites of nation-statehood were present. Religious consciousness competed with ethnic loyalty. The culturally more advanced Tatars in the West were scattered over a wide area—from the Crimea to Baku and Kazan—inhabited by Great Russians and other non-Turkic populations. The region of solid Turkic settlement from the Caspian to the Altai mountains was on a far more primitive social and cultural level. In addition, the energies of Turkic political

leaders during the climactic years of the Russian Civil War were consumed with quarrels over basic political ideals, such as that between the centralist Tatars of Kazan and the federalist or separatist Bashkirs of the Southern Ural, and over tactics in the fight against the resurgent Bolsheviks. By 1922 the Red Armies had fully re-established Russian control throughout the area.

Dr. Zenkovsky has provided us with the first detailed study of political developments among Russia's Turks during the crucial period from the 1905 Revolution to the Civil War. The merit of the book, however, lies far more in the choice of subject matter than in its treatment. The author labors under the decisive handicap of being unfamiliar with the languages of the Turkic peoples whose aspirations and activities he examines. He has obtained assistance in securing translations of excerpts of a few original documents—notably the Proceedings of the Muslim Congresses of 1906 and 1917. Otherwise, the bulk of his material is derived from secondary sources in Russian and other European languages. That Turkic names and citations, including references to these key sources, are hopelessly garbled, at times beyond recognition, is only to be expected under the circumstances. What is more surprising is that even the material from western sources suffers from this. For example, the author cited on p. 299, n. 8 is Jean Deny, not "J. Denis"; the nineteenth-century poet Namik Kemal has evidently been confused with Atatürk (see pp. 30, 341); there are no references to the important works bearing on Ottoman Pan-Turkism by E. E. Ramsaur, Bernard Lewis, and others; Nabih Amin Faris (p. 277) is not an "authoritative Moslem thinker" but a Christian.

In fairness to Dr. Zenkovsky it should be stated that the inaccuracies in which the book abounds are the result of carelessness rather than of deliberate distortion. Indeed, in a subject that could easily give rise to charged emotions, partisanship, and wishful thinking, he has maintained a commendable detachment of point of view. Nor has he attempted to fit his data into any explicit theoretical scheme.

The subject still awaits a treatment based on the combination of broad perspective and careful scholarship characteristic of such works as Pipes' *Formation of the Soviet Union* or Kazemzadeh's *Struggle for Transcaucasia*. In the meantime, Zenkovsky's book will serve as a preliminary, though not always reliable, exploration of a fascinating subject.

DANKWART A. RUSTOW
Associate Professor of International
Social Forces
Columbia University

EMANUEL POLLACK. *The Kronstadt Rebellion*. Pp. 98. New York: Philosophical Library, 1959. \$3.00.

The Kronstadt rebellion in March, 1921, was a dramatic episode in the early years of Bolshevik rule in Russia. The decision of the sailors on this island fortress to demand a relaxation of the harsh political and economic measures of the Soviet government; the efforts of that government, in the person of Kalinin, to win back the loyalty of the sailors by a personal plea; the growing intransigence on both sides; and finally the bloody suppression of the rebellion—such elements of drama make this episode a central issue in the interpretation of early Soviet history. The victorious government claimed that the rebellion was a White Guard counter-revolutionary plot, designed to undo the work of the revolution. Opponents of the Communists have seen it as the last effort of the Russian people to gain the political and economic rights denied them by the Bolshevik dictatorship. Historical scholarship in the West now interprets this episode as a reflection both of the disillusionment with Bolshevik policies shared by many supporters of the revolution, and of the single-minded determination of Lenin and his colleagues to suppress all forms of criticism within the revolutionary movement.

This monograph unfortunately fails to do justice to this important and controversial subject. Scarcely longer than a graduate term paper, it draws on a very limited range of materials and adds nothing to our knowledge or understanding of the

events with which it is concerned. In a brief chapter, supplemented by an Appendix, an effort is made to discuss the changing Soviet interpretations of the Kronstadt rebellion. Here again, however, the treatment is so lacking in detail and subtlety that only the most obvious conclusions are drawn. American scholarship has made great advances in recent years in the study and interpretation of Soviet affairs, but this monograph reflects no familiarity with these advances.

C. E. BLACK
Professor of History
Princeton University

NICHOLAS V. RIASANOVSKY. *Nicholas I and Official Nationality in Russia, 1825-1855*. Pp. viii, 296. Berkeley and Los Angeles: University of California Press, 1959. \$5.00.

A study of the theory that guided state policy during the reign of Nicholas I has long been overdue, and Professor Riasanovsky has succeeded admirably in providing such a study and throwing light on it from different angles. His material is grouped under these headings: the Supreme Commander, the Men, the Ideas, Home Affairs, and Foreign Policy. These, in turn, are followed by a general summary, in a final, short chapter, "Official Nationality and History." He has consulted an impressive number of authorities including periodicals and the original works of the chief authors who contributed to formulating the theory, obviously a time-consuming task since we are told that it took him six years. The thoroughness of his investigation precludes criticism of his scholarship. Some might disagree with his treatment of various topics, a hazard to which the vastness and complexity of the subject exposes him. This reviewer is forced to question one of the basic assumptions that underlies his whole work, while admitting that on this point divergent views are possible.

The author endeavors to deal with the events of Nicholas' reign in the general context of European history, for which much can be said. However, he goes further and discusses the cult which he calls nationality as a phase only of the national-

ism that developed throughout Europe in the late eighteenth and early nineteenth centuries. Surely it is a mistake to equate movements that grew out of such diverse backgrounds and that manifested themselves in such different ways. The distinctive type of feudalism that prevailed in the West, the presence there of a universal church, the tradition of Roman law, the influence of the guilds in the economic life, and the wealth and power of the towns clearly set absolute monarchy of western Europe quite apart from the autocracy of Russia. The latter was not as in the West a compact of the crown and the middle class against the aristocracy, but, on the other hand, a monolithic despotism enforced by terror and reducing all classes to a state of servitude.

Professor Riasanovsky may be right in his claim that Peter the Great and his regime were the models Nicholas took for his government; but it was Ivan the Terrible to whom Russia owed her autocracy and who formulated his theories in unforgettable language.

The reader is still left wondering why this official nationalism had so little hold on the Russian people that despite all the efforts of the state to expand its influence, it was so soon overwhelmed by a powerful movement in a contrary direction. The author does, indeed, speak of this unfortunate "split between governments and society" signs of which were not wanting in the works of the great writers even in Nicholas' day which assumed fateful proportions under his successor. But he seems to imply this came about through the harshness of Nicholas' regime. The causes must surely lie deeper in the forces of Russian history. The oppressive severity of censorship may have been a contributing factor. The widespread corruption in the administration, which even no remedial measures were able to check, undoubtedly aggravated the situation. But, it surely was a revulsion against the centuries-old system of what the Russians call, *opeka*, an all-embracing tutelage exercised by ruling minority over the majority, a system now hopelessly bankrupt, for which, however, it seemed no substitute could be found, since there were no institutions by

which the interests of minority and majority could be harmonized.

STUART R. TOMPKINS

Research Professor, Emeritus
University of Oklahoma

VLADIMIR GSOVSKI and KAZIMIERZ GRZYBOWSKI (Eds.). *Government, Law and Courts in the Soviet Union and Eastern Europe*. Volumes 1 & 2. Pp. xxxii, 917; xv, 921-2067. New York: Frederick A. Praeger (Atlantic Books), 1959. \$30.00.

Is Soviet law unique? A team of twenty-eight experts under the skilled guidance of two experienced comparatists concludes that it is, although some branches of the law and some countries of its reception show continuing strong influences of the civil law system of Continental Europe. Thus, "With all its real or merely seeming novelties, the Soviet criminal law is an offshoot of Continental European criminal law," and with regard to the countries of the Soviet orbit, "by and large the old administrative pattern of the bourgeois democratic state has been retained."

The interplay of tradition and Soviet pressure for adoption of Soviet patterns in Eastern Europe is made the basis for this monumental effort to analyze the law of Eastern Europe. What the Socialist influences upon law have been are set forth with precision, but it is noted that in spite of Soviet theory, elements of non-Socialist law remain, and the states of Eastern Europe seem unable to dispense with those elements. Still, this does not in the authors' view prevent the system resulting from the amalgam from being new. In words applied specifically to civil procedure but applicable generally, "It is like a new building erected with old bricks."

Investigators of Soviet legal institutions trained in common law, notably American lawyers familiar only with their own courtrooms, often return from Moscow impressed by Soviet legal novelties. These weighty volumes will correct these impressions, for the forms and many of the substantive rules of Soviet law are identical with those of Western European

legal systems. The real fascination lies in comparison of Soviet and Western European law to determine what socialism has added. Only with knowledge of the starting point can one distinguish new elements introduced to cope with a state-oriented economy and a mass-oriented society.

The authors deserve praise for what they have accomplished in preparing the way for Americans who approach European law for the first time, but only the persistent scholar will open these covers, for they are not light reading, nor could they be. They stand primarily as research sources for those seeking comparative materials, and this function is well performed.

Knowing as this reviewer does the voluminous nature of the material digested, he marvels at the cohesion that has been achieved. The authors obtain this by concentrating on that part of the law relating to the rights of the individual. Yet there are some tangents, as when the authors give a full record of the Soviet assumption of power in the Baltic states. This excursion into international law is valuable for those who know little of it, but it belongs perhaps in a separate study and not with municipal law. Further, numerous pages are devoted to a foreshortened history of Russia and its revolution, but some of these encumber an already long study, valuable as they are, especially with regard to land holding. Finally, the volumes were prepared during the period of speedy post-Stalin reform, and they cannot but reflect the confusion of the era which introduced changes while the book was in press. In spite of these criticisms, the work stands as a monumental study in a fascinating new field of comparative law, the law of comparative communism. As such the volumes belong on the shelves of every library concerned with development of the Soviet idea.

JOHN N. HAZARD

Professor of Public Law
Columbia University

HERSCHEL and EDITH ALT. *Russia's Children: A First Report on Child Welfare*

in the Soviet Union. Pp. 240. New York: Bookman Associates, 1959. \$3.75.

This "first Report on Child Welfare in the Soviet Union" is a fascinating account by two sensitive and astute observers. The Alts found universal friendliness on the part of "guides, chauffeurs, waiters, hostesses on airplanes, by porters and the baggage men. They all knew we were Americans, but this apparently did not restrict their spontaneous expression of warmth and friendship." They report that both their food and housing were good, and they did not overexert themselves. Yet after twenty-one days on Russian soil they wrote it would take some time to recover from the strain of the Russian experience. They felt the strain was due to the "joylessness of living and the depreciation of the individual, and the ever present fear which continuously communicated itself to us."

The state takes primary responsibility for the child's upbringing. It is held that "only as the family is completely in tune with the social order and expresses its purposes can it successfully prepare the child for life in that society." Russian parents seem kindly, protective, and solicitous but, with their long work hours six days a week, cannot give their children much direct supervision. They are helped by "patronage nurses" who visit each family regularly and give help and instruction in child guidance. Unsuitable homes are reported, and if they do not improve, the children are removed and placed in a boarding school.

The state provides well-organized kindergartens for four to seven years until regular school starts. Some good nursery schools are provided by the state and some by the unions. The writers were amazed by the perfect order in the nurseries and the good behavior of even the two-year olds, who were regimented yet treated with warmth and kindness. There are also a good number of nurseries which care for babies that are two months or older only going home on weekends with their families. Here some babies of two months are put into pens together to develop their social feeling early. Despite a highly organized and carefully staffed system, there is

considerable delinquency, "hooliganism," drunkenness in boys of fourteen and fifteen, and emotional and mental illness among children. The fact that these ills have not been eliminated is believed to be due to faulty upbringing in homes. Therefore there is a movement underway to provide boarding schools for all children from seven to seventeen. The ideal Communist personality would be left more and more to the state.

This plan may not receive widespread acceptance. Despite their will to the contrary, the Soviet commissioners have had to make concessions to human feelings and needs in providing incentives through higher wages, personal property such as cars, electric appliances, and private homes, and even some degree of inheritance.

It is impossible in a brief review to give an adequate account of the rich and illuminating details which fill these pages. The book is far more than an account of child welfare in the Soviet Union. It provides a vivid cross section of Russian life including some revealing glimpses and frank criticisms by Soviet citizens not planned for by Intourist! Just as the authors say after their crowded days of intensive study, "We need to know much more," we may say one needs to read much more than can be presented here to gain the full value of this admirable book. It is like opening a window onto the amazing social experiments in Russia today.

KATHERINE WHITESIDE TAYLOR
Supervisor of Parent Education
Baltimore Public Schools

UNITED STATES GOVERNMENT AND HISTORY

M. MORTON AUERBACH. *The Conservative Illusion*. Pp. xii, 359. New York: Columbia University Press. 1959. \$6.75.

One of the intellectual fantasies of the twentieth century centers about the diverse adventures of a number of American publicists in quest of conservation in an age of cataclysmic change, unrest, and unreason. These publicists possess little

in common save the designation of New Conservatives, and although some of them have occasionally made astute analyses of social conditions, they have on the whole probably received more attention than they merit from friendly and adverse critics alike. Mr. Auerbach's volume represents the most systematic attempt to relate the ideas of the New Conservatives to their context in the intellectual history of conservatism as exemplified by the writings of Plato, the Stoics, St. Augustine, John of Salisbury, and Edmund Burke—the transcendent values of all, according to the author, are harmony and tranquillity. These five theorists represent respectfully the five major forms of historical conservatism: authoritarian, "alienated," radical, "pure," and liberal, all of which have appeared in the twentieth century under new auspices.

After describing the historical forms of conservatism, Mr. Auerbach proceeds to analyze the ideas of the southern agrarians who in some ways represent liberal conservatism; Russell Kirk and reactionary conservatism; adjusted conservatism as propounded by John Halliwell, Herbert Agar in his later writings, Peter Viereck, and Clinton Rossiter; the corporatist conservatism of Peter Drucker; and the radical, neo-Augustinian conservatism of Reinhold Niebuhr. That everyone will not regard all of these writers as representatives of conservatism is no disparagement of Mr. Auerbach's careful analysis of their writings for which a discursive sketch like this is altogether inadequate as a mirror of the inner confusions, contradictions, and frustrations of much of conservative thought which Mr. Auerbach exposes with ruthless vigor.

Perhaps the most significant portion of the book is found in the three final chapters where the author points to the fallacy of the "New Liberalism" in its defense of liberal values in conservative terms, relates conservative ideology to theory and history, and concludes by associating the desire for harmony with the Freudian death wish. Hence, according to the author, "Conservatism does not speak for mankind but only for bewildered individuals and groups which are left be-

hind by historical development." Therefore, "to offer mankind Conservative harmony as its supreme goal, on the assumption that social and moral forces are decisive in history, is to offer an illusion; and to burden man with a superfluous sense of guilt for failing to achieve an illusion is to make a grim joke of a history which has too long borne unnecessary tragedies." In every way Mr. Auerbach has written an important book characterized by good writing, incisive comment, and shrewd analysis.

ROBERT J. HARRIS
Professor of Political Science
Vanderbilt University

DAVID CUSHMAN COYLE. *Ordeal of the Presidency*. Pp. v, 408. Washington, D. C.: Public Affairs Press, 1960. \$6.00.

This book was written with a double purpose. One, doubtless, was to exploit the market for timely entertainment in book form provided by a presidential campaign, promising the usual thrilling contentment. Seekers for such entertainment will not be disappointed. The author, who knows how to write fast-selling literature, has chosen ten of the thirty-three past presidents whose terms were distinguished for the reckless abuse heaped upon them by their more irresponsible and unscrupulous critics. The volume opens with Tom Paine's most outrageous animadversions against George Washington and closes with lurid details from "The Strange Death of Franklin D. Roosevelt" by one Emanuel M. Josephson. In-between is an artful and copious selection from the "mud" thrown at John Adams, Thomas Jefferson, J. Q. Adams, Andrew Jackson, Abraham Lincoln, Andrew Johnson, Theodore Roosevelt, and Woodrow Wilson. Any casual reader, who enjoys righteous indignation, will enjoy this book.

The second purpose is more subtle. It is not only in the buried past that unrestrained and fantastic vilification has been inflicted upon eminent public men. In our own time, as our author temperately observes, "we have seen the President of the United States called names that his

enemies felt to be richly deserved but his friends took as indecent outrages." It may be useful under such conditions, our author opines, to recall the outrages of former generations. "To aid in such an exercise is the main purpose of the book."

There can be no doubt of the practical utility of this fascinating volume. On the eve of a campaign, which threatens to rouse at least the customary amount of political passion, a reasonable warning against partisan "mud-throwing" is a valuable contribution to the political education of the American people. Some of the author's reflections on the record of the presidents' ordeals will provoke controversy. He quotes with approval John Fiske's dictum: "The statesman's business is to accomplish sundry concrete political purposes, and he measures statements primarily not by their truth, but by their availability as a means toward a practical end." This is obviously an attitude toward truth-telling that freely exposes the statesman to charges of lying. The more stormy the waters through which he is trying to steer the ship of state, the more freely the charge of liar is likely to be shot at him. Happily Mr. Coyle does not attempt to rate his ten presidents on any scale of veracity. Perhaps it will be enough for the curious reader in this campaign if he gains from this book some comfort, when the veracity of his favorite candidate comes under fierce attack.

ARTHUR N. HOLCOMBE
Professor of Government, Emeritus
Harvard University

DAVID A. SHANNON. *The Decline of American Communism: A History of the Communist Party of the United States Since 1945*. Pp. xiii, 425. New York: Harcourt, Brace and Company, 1959. \$7.50.

The failure of the Communist party in the United States during the postwar period has received much scholarly attention. However, it remained for David A. Shannon, Associate Professor of History at the University of Wisconsin, to document fully and interpret that failure.

In doing so, he has rendered a valuable service to all those concerned with the careers of radical movements in this country, and he has produced a study that will endure. Indeed, it is difficult to see how other historians can do much more than elaborate and further document the principal ideas he sets forth.

While Professor Shannon writes primarily as a historian, few readers of this volume will fail to be impressed by his sophisticated use of political and sociological materials. He shows, of course, a decent regard for the relevant facts, but he realizes that they do not speak for themselves. Accordingly, his interpretations are informed by insights into events and sensitivity to human roles that all too rarely shape the treatment of the life histories of political organizations. A good example is found in his exploration of Communist involvement in the Progressive party. Equally illustrative is his interpretation of the internal workings of the Communist party and the motivations and actions of its leaders during a series of institutional crises.

While some students of American communism have attempted to link the party with a native radical tradition and to see some of its actions as manifestations of indigenous protest, Professor Shannon clearly establishes its almost complete dependence on the Soviet party and diagrams its movements as responses to Kremlin demands. He concludes with the observation: "Of all the generalizations about the Communist Party of the United States and its history that might be made from the evidence, the most important and generally valid one is this: the American Communist Party was and is the willing instrument of the Soviet Union." With that statement few knowledgeable observers will fail to concur.

One wishes only that Professor Shannon had dealt more extensively with some of the methodological problems encountered in this study and that he had provided a longer and more inclusive bibliographical essay. However, for his purposes, he had no obligation to do so, and he can hardly be taken to task on these matters. He has said much about the Communist party

in the postwar period, and he has said it well.

WILSON RECORD

Associate Professor of Sociology
Sacramento State College

PAUL T. DAVID, RALPH M. GOLDMAN, and
RICHARD C. BAIN. *The Politics of
National Party Conventions*. Pp. xv.
592. Washington, D. C.: Brookings
Institution, 1960. \$10.00.

After the 1952 campaign a first-rate set of studies appeared covering the convention and pre-convention political operations in both major parties. Those studies have formed the basis for this new work, a comprehensive inquiry into America's "peculiar institution"—the national nominating convention. Devised first in the 1830's as a popular substitute for "King Caucus," the conventions have been extant for a century and a quarter—peculiarly American, peculiarly democratic, peculiarly republican.

The Politics of National Party Conventions is much more than a convention-by-convention recital of maneuvers and stratagems. This volume sets down a practical, documented anatomy of our quadrennial exercises in collective political action. Starting with a relatively brief fifty-page study of the background and adjustments of the convention method over the years, the authors consider the leadership in convention operations, correctly pointing out that a quadrennial mass gathering of this type is peculiarly subject to leadership need. Contrasts are drawn between the pattern of a political party in office, that is, in the White House, and a party out of power. A large number of charts are used to demonstrate what actually happened in a variety of leadership situations.

The authors then move to a consideration of the delegates—how they are divided among the states, how they vote, how they are elected. A particularly interesting chapter deals with the characteristics of the delegates themselves—their age, color, sex and religion, educational and income status, occupations and party experience. Finally, the nature of nominating campaigns and campaigning and the variety of tech-

niques used to translate the campaign into an effective and winning effort on the convention floor in the actual decision-making work of the party congress are discussed.

Somewhat apart from the study of conventions per se the authors offer some views on the relationship of convention action to final election results and some thoughts on the development of the convention process in the future. But this is mainly a book about the convention as it is now. It seems likely that the David-Goldman-Bain effort will remain the standard text and reference volume in this field for some time to come. It is authoritative, and its research is graphically supported in detail.

This volume will be ponderous for the average reader; it is not intended as a popular work. But it is understood that an "abbreviated" book will be made available later in the year for general use. The full volume, however, will be standard reading for all serious students of American politics, in this 1960 election year and for many years to come.

J. JOSEPH HUTHMACHER. *Massachusetts
People and Politics, 1919-1933*. Pp. x,
328. Cambridge, Mass.: Belknap Press
of the Harvard University Press, 1959.
\$6.50.

During the past quarter-century a number of studies of political behavior in a particular state have engaged the attention of political scientists. One thinks of California, Iowa, Louisiana, New Mexico, Tennessee, and Texas, in this connection. These are not uniform in method, emphasis, or style, but they are sufficiently alike to improve our understanding of American political action. Neprash's pioneer study of the Brookhart campaigns placed the emphasis on the tactics of an agrarian insurgent. Gosnell's studies employed advanced statistical skills to measure social forces and correlations. Most of the others combined psychological insights, ecological methods, historical documentation, and conventional assumptions about

motives to produce well-rounded analyses.

Huthmacher's Massachusetts study is a socio-psychological study of political forces in the Bay State during the period 1919-1933. It is an account of the transformation of political power from republicanism to democracy. The personal qualities and tactics of party leaders, such as Coolidge, Curley, Fitzgerald, and Gillette, are not ignored, but they are subordinated to other considerations. Just as in national politics during the 1920's and 1930's, Democratic leaders adhered to the traditional strategy of combining the South and West, and had to meet the challenge of the growing power of the urban East, so in Massachusetts the party leaders were obliged to follow a course which would mobilize under the party banner at least two of the major population groups.

Most Americans are well aware that prior to World War I, the dominant social and political groups in Massachusetts were comprised of Yankees, that is, "Old Americans" with English Protestant ancestors, but they probably are not aware of the extension of this group to include British, Scandinavian, and German immigrant stock. Apparently, these allied "Anglo-Saxons" have been rewarded for their support by means of social, economic, and cultural advantages, and not by political jobs.

In his treatment of the Irish Catholics, the author is on familiar ground. Since they were excluded from the society of the Old Stock Republicans, the Irish naturally cast their lot with the Democrats. Because of their heavy concentration in certain cities, especially Boston, they could win local elections but could not seriously threaten the Old Stock in the state. Here is where the third element comes in.

Huthmacher persuasively argues that the "New Immigrants," consisting of diverse racial, nationality, and religious groups, nevertheless constituted an element or force capable of being politically united because of common cultural ideals, problems, and frustrations. These "New Immigrants" were: French Canadians, Poles, Italians, Portuguese, Jews, and relatively minor settlements of Lithuanians, Greeks, Armenians, Syrians, and even Negroes.

Although the Irish were discriminated against by the Old Stock, the New Immigrants were in turn discriminated against by both of the former elements.

The book under review is the story of the attempts of the Old Stock Republicans and the Irish Democrats to effect an alliance with this third force. Sometimes the Old Stock Republicans would be weakened by internal dissension, such as characterized the rivalry between the Lodge and the Crane-Coolidge factions. In the 1920's, despite efforts to divide them, the Irish and the New Immigrants were united by the impact of national issues—prohibition, 100 per cent Americanism, Ku Kluxism, and immigration restriction. It was David I. Walsh who launched the first "revolution" which combined the second and third forces, and even enlisted under the Democratic banner, Yankees, liberals, and labor leaders who had formerly been associated with the Old Stock Republicans.

The hero of the book is Al Smith. As an "Urban New Immigrant" himself, Smith helped the Massachusetts Democrats to weld together the second and third forces. This coalition held firm from 1924 to 1952. It is not part of the author's design to explain how Roosevelt and Truman managed to retain the loyalty of the Democratic coalition in Massachusetts, but his references to their programs and leadership in the nation as a whole account for their success in overcoming Eastern urban reluctance to unite with the South and the West.

Although the author carefully avoids making any predictions for 1960, John F. Kennedy is mentioned only in the Preface, one wonders what the implications are of the new issues, internationalism and communism, which caused the loyalty of Massachusetts to the Democratic party to falter in 1952. Perhaps, as Huthmacher suggests in his reporting of the elections of 1920 and 1932, state leaders who wish to remain in power can do little more than adapt their policies and utterances to pressures originating outside of the state of Massachusetts.

ARTHUR MANN. *La Guardia: A Fighter Against His Times, 1882-1933*. Pp. 384. Philadelphia: J. B. Lippincott Company, 1959. \$6.00.

Fiorello H. La Guardia is fast becoming a legendary American hero, celebrated in song and story. It is fortunate, therefore, that so competent and perceptive a scholar as Arthur Mann has undertaken to do a political biography of this tribune of the people at a time when the record of his life is still fresh in popular memory.

Among all those public men who made their mark on the national scene in the years that bridged the two World Wars, La Guardia must be accorded high rank. An authentic product of an America in ferment, a symbol of the vitality of the "New Immigration" that began in the 1880's, a creative spirit by inclination and heritage, this New York-born, Arizona-bred, New York University Law School-educated son of an Italian father and a Jewish mother engaged in the good, tough fight for personal fulfillment, public acclaim, and civic righteousness. The story of his career is a colorful drama, reflecting the trials and triumphs of a generation of new Americans seeking place and position in an emergent urban-industrial society. Professor Mann, who has done important research in this field before, catches it all with a brilliance born of keen, analytical power and consummate literary skill.

As the first of two volumes on La Guardia, the book covers the period to the New York Mayoralty campaign of 1933. It draws on the La Guardia Papers in the New York Municipal Archives and on other primary sources, including records here and abroad, numerous interviews, and many published works, among them La Guardia's own autobiography, *The Making of an Insurgent, 1882-1919*. It uses, too, a wide variety of special studies, printed and in manuscript, dealing especially with Progressive politics in the 1920's and La Guardia in Congress. Mann has been indefatigable in his search for significant social and personal determinants of thought and action.

It all adds up to an absorbing and instructive account of a champion of the common man, battling his way to pre-

Songs of the Civil War

COMPILED AND EDITED BY IRWIN SILBER

The most complete collection of Civil War songs ever published, this beautifully illustrated book contains more than 125 of the most popular songs of the Civil War. Each song is presented in an appropriate piano setting in addition to guitar chords for the folk singer and guitarist. The author also offers notes on the historical and social context of each song.

ferment as consular agent, union lawyer, Congressman, aldermanic president, and mayoralty hopeful, and, in the process, breaking down the social and political barriers to power. On the hustings and through the columns of the press, especially the Hearst papers, La Guardia espoused an all-embracing program of reform, founded on the philosophy of the welfare state and the pressing needs and hopes of the urban populace. "I would rather be right than regular," he declared in 1924 as he campaigned furiously for Congress on the La Follette platform, and he made that his lifelong credo.

Perhaps the secret of La Guardia's success lies in the fact that he, like Franklin D. Roosevelt, whom he resembled in many ways, had a sense of history, which transformed him from a rough and tumble, if resourceful, politician to a statesman. He mastered the lessons of politics as he matured in responsible leadership. He responded instinctively to the growing demands for expertness in government in an age of specialization. His political life is stirring proof of the creative working of the democratic process in the big city.

FREDERIC N. CLEAVELAND. *Science and State Government: A Study of the Scientific Activities of State Government Agencies in Six States*. Pp. xvi, 161. Chapel Hill: University of North Carolina Press, 1959. \$3.50.

This book, based on more detailed studies financed by the National Science Foundation, brings together data on what California, Connecticut, New Mexico, New York, North Carolina, and Wisconsin are doing to promote scientific research and development. Its importance lies in the fact that it is the first systematic attempt to consider the scientific role of the states. It thus lays a foundation for further analysis and sets a pattern for future study.

Scientific competition with the Soviet Union has made it axiomatic that what

we as a nation do in the field of science is of overwhelming importance to national welfare. But it is often assumed that anything so labeled necessarily contributes to scientific research and development. Too often merely wearing a laboratory technician's smock or having microscopes and other instruments in an office are considered sufficient to qualify activities as research. Unquestionably, the meaning, significance, and relevance of scientific activities must be analyzed critically. The nation's research agenda must be reviewed carefully.

In this regard Dr. Cleaveland's volume is quite restrained. Its criticism of scientific activities in the six states is muted. Largely descriptive in nature, the book follows the presentation in the useful National Science Foundation surveys of *Federal Funds for Science*. In many respects, however, the author's data speak for themselves, and what is said is not encouraging.

The proportion of state research funds devoted to agriculture, for instance, will not make those happy who are concerned about burgeoning metropolitan problems. It is not that agriculture should receive less support, but rather that other areas require more. The general neglect of the social sciences should be disturbing to readers concerned with this field.

Dr. Cleaveland's presentation points to many important questions of public policy and permits the identification of research needed to examine more closely program content and administrative processes related to state scientific activities. The issues associated with the allocation of state research dollars require appraisal. The extent of political programming of research, as in the case of agriculture, needs to be evaluated. And, the basic question of how decisions with respect to the research agenda are made should also be reviewed. One wonders, for example, whether state legislatures are presently so constituted and equipped to make wise choices and sound policies on spending state research funds.

These are but a few of the problems which are implicit in Dr. Cleaveland's

data. Future studies, it is hoped, will undertake to deal with them explicitly.

NORMAN WENGERT

Professor and Chairman, Department
of Political Science
Wayne State University

WILLIAM J. SIFFIN. *The Legislative Council in the American States*. Pp. xiv, 266. Bloomington: Indiana University Press, 1959. No price.

This is an important book for readers seeking a comprehensive, incisive, and objectively critical study of one of the recent innovations in American state government. It also contains useful data for all teachers of American government—data throwing light not on the legislative council alone but on some of the central problems of federalism in the United States.

The legislative council's span of time, 1933–1960, coincides with what may come to be known as the twilight period of American state government. The night seems hard upon us. It was the hope and belief of many of the leading advocates and promoters of the legislative council that it might tend to revivify and reinvigorate state government, particularly the legislative branch. Professor Siffin's book makes clear why this has not happened and probably will not. By implication at least, it also raises the question of whether any sort of structural reform can suffice to rescue the states from the low estate of mendicant dependency on the federal government.

In interesting narrative the book tells of the beginnings of the legislative council idea, the political battles to gain its acceptance, the plans adopted in such pioneering states as Kansas, Michigan, Illinois, and Kentucky, its interrelations with the earlier legislative reference libraries and bill-drafting bureaus, and its variations under the impact of practical politics.

The author's judgments are temperate and well fortified with documentation. The tabular data are effectively presented, the Bibliography is excellent, and there is a fully adequate Index. Having been an attending delegate in the Moot Constitu-

tional Convention in Cleveland, Ohio, on December 29–31, 1919, when the legislative council was first proposed, the present reviewer has found Professor Siffin's account of that occasion especially interesting.

CHESTER C. MAXEY

President, Emeritus
Whitman College

FREEMAN CLEAVES. *Meade of Gettysburg*. Pp. xi, 383. Norman: University of Oklahoma Press, 1960. \$5.00.

General George Gordon Meade is best known to twentieth-century Americans as the commanding officer of the Union forces in the important victory at Gettysburg. Actually, he had a long and commendable military career and has suffered from a lack of attention on the part of historians and biographers. Mr. Cleaves, author of distinguished biographies of William Henry Harrison and George H. Thomas, now undertakes to remedy the neglect of this very solid Union general.

A graduate of West Point, where his record was far from impressive, Meade served at various frontier posts, with the Army Topographical Engineers, and under General Taylor in the Mexican War. Like many other young officers, he resigned from the army to accept civilian employment.

Meade's role at Gettysburg has been well studied and, especially his failure to effect an energetic pursuit of Lee after the battle, often criticized. On the other hand, there has been no adequate attempt, in recent years, to appraise Meade's role at such battles as Second Bull Run, Antietam, Fredericksburg, Chancellorsville, Gettysburg, and in the Wilderness Campaign. Working carefully through a mass of sources—War Office archives and records, regimental histories, reminiscences of associates and subordinates, a great many manuscript collections, and many newspaper files—Mr. Cleaves has sought to sift the truth and establish a fair evaluation of General Meade's services to the Union cause.

As biography, this leaves much to be desired. A scarcity of personal documents and papers, especially for the early period,

provides an explanation of the author's inability to delineate the man as successfully as he does the officer. The organization, with most of the book devoted to the years of war, also leaves something to be desired. As military history, however, this is excellent. Well researched and carefully documented, written in a clear and forceful style, this book should begin to restore the balance of military appraisal in favor of a highly competent and completely dedicated soldier.

RALPH ADAMS BROWN

Acting Dean
State University College of Education
Cortland, New York

HUDSON STRODE. *Jefferson Davis: Confederate President*. Pp. xvii, 556. New York: Harcourt, Brace and Company, 1959. \$6.75.

Biographical projects have a way of expanding between original design and finished product. Before Hudson Strode completed initial research on Jefferson Davis, he decided that the Mississippian's career required two volumes rather than one for adequate coverage. The first, subtitled *American Patriot* (1955), brought the narrative through secession. The remaining period proved a bigger task than the author contemplated; and the present book, *Confederate President*, closes on New Year's Day, 1864. Like the first volume, it is historical biography, with perspective limited chiefly to political, military, and diplomatic history. Economic conditions are largely ignored. The author devotes considerable attention to social life in Montgomery and Richmond; and, as in Volume I, he lightens the narrative with family affairs that exhibit the President as a warm and affectionate man.

Using effectively previous studies of Davis and his contemporaries and much printed and manuscript material, including many fugitive letters and journals, Professor Strode has produced a good though hardly a definitive account of the years 1861–1863. The Jefferson Davis that emerges from his pages differs markedly from the man often presented by earlier

writers. The much maligned President becomes a human personality, a lovable character in the eyes of intimate acquaintances who understood the extraordinary problems that faced the chief executive. Ill-health seldom diminished equilibrium and stability, even in periods of mental depression. Davis outwardly ignored the jibes of carping political and military critics who needed a scapegoat for Confederate failures; and he cultivated a selfless and devoted spirit. Despite optimism that continued through the darkest days of the Confederacy's history, Professor Strode concludes that "Jefferson Davis had a very sound sense of reality."

Appraisals of military and political leaders are usually judicious. The great collaboration of Davis and Lee parallels the earlier co-operation of Jefferson and Madison. *Confederate President* reflects the chief executive's unlimited confidence in Stonewall Jackson and Albert Sidney Johnston, whether in victory or defeat; and it presents Bragg and Pendleton more favorably than many previous works evaluated them. Joseph E. Johnston and Beauregard were major military problems; the first remains an unresolved enigma. Faultfinding generals and politicians, among them Wigfall, Stephens, Yancey, Rhett, Hunter, and Foote, made administration difficult, and the wonder grows that the southern Confederacy survived so long. Professor Strode's rehabilitated Jefferson Davis justifies the decision of 1861: delegates to the Montgomery Convention actually chose the ablest Southerner chief executive.

WENDELL HOLMES STEPHENSON

University of Southampton

ALLAN NEVINS. *The War for the Union: The Improvised War 1861–1862*. (Vol. 1.) Pp. x, 435. New York: Charles Scribner's Sons, 1959. \$7.50.

Despite the intense interest displayed in the Civil War, many of the opening moves in 1861 have been curiously neglected. Much has been written, of course, about the role of Lincoln, the Fort Sumter crisis, and the first battle of Bull Run, but for some reason the story of the way in which the rival governments

—one a recent creation and the other a captive of an immature political party—geared their states for war is not often told. In many respects, however, the first year was the most critical and instructive of the war. Whole new armies had to be raised, equipped, trained and competent officers developed to lead them. The border states, uncertain in their loyalties, had to be treated gingerly and public opinion mobilized for a powerful war effort. The events of 1861 may not have been as spectacular as those to follow, but they largely determined the structure of the war.

Professor Nevins has written a fascinating account of the first year of the war. Commencing in March, 1861, he shows how North and South each misread the signs and miscalculated the determination of the other. He describes the struggle between Blair and Seward for Lincoln's support before, and the struggle between Lee and his conscience after, the guns fired upon Fort Sumter. He examines the failure of the North to hold key arsenals at Norfolk and Harpers Ferry and to make good use of the enthusiastic army of volunteers that responded to Lincoln's call for troops to uphold the Union. His treatment of the first clash of "the greenhorn armies" at Bull Run which impressed a contemporary observer in Europe as "certainly the greatest joke in the world," the struggle for Kentucky and Missouri, and the political strains and alignments in Washington and the various state capitals provides fresh insight into some of the intricate problems that faced Lincoln's administration during this period of improvisation. And because the army is but the mirror of the state, the author has also provided a comprehensive view of Northern society and institutions at the time of the Civil War.

The War for the Union deserves high rank in the current literature about the Civil War. It is well written, evenly balanced, and obviously the result of extensive research, including some obscure foreign sources. If much of his material is familiar, Professor Nevins has dramatized an original theme—"the impact of the war on national character." Lincoln

emerges as a war leader of great promise who, despite the failures and frustrations of the first year, "was beginning to feel his strength; to ride in the tempest, and direct the storm."

JAY LUVVAAS

Assistant Professor of History
Allegheny College

PHILIP I. MITTERLING. *America in the Antarctic to 1840*. Pp. viii, 201. Urbana: University of Illinois Press, 1959. \$5.00.

For many years the frozen wastes of Antarctica seemed as forbidding a terrain to historians as to actual explorers. Only in the last half century, as exploration and settlement have steadily increased, has interest been gradually aroused. Nevertheless, most of the existing works about the seventh continent have come from the pathfinders themselves or from an array of able witnesses and reporters. The best of these journalistic efforts, such as those of Sullivan or of Kearns and Britton, are reliable surveys of exploration based on honest research in memoirs and secondary sources. Mr. Mitterling's study, however, is one of the first attempts by a professional historian to subject a phase of Antarctic history to closer scrutiny.

Although this book contains a brief analysis of general concepts concerning Antarctica as developed before 1800, the major portion is devoted to an examination of American exploratory enterprise in the first four decades of the nineteenth century. At first, during the years from 1800 to 1820, it was primarily a greedy search for fur that led Yankee sealers to the icy wastes. Then, commercial interest was combined with curiosity and some scientific interest to lead other pioneers such as the legendary Nathaniel Palmer and the enterprising Benjamin Morrell to probe further into the unknown regions. The knowledge which these men brought back finally led Congress in 1838 to underwrite the memorable United States Antarctic Expedition under Lieutenant Charles Wilkes. While the fascinating story of this amazing enterprise constitutes fully the second half of this volume a critical Bibliography provides further guid-

ance for those whose appetite has been whetted.

Mr. Mitterling has endowed his compact work with virtues not possessed by its journalistic predecessors. He has been unsparing in his search for data and has delved into a wide array of hitherto unutilized sources ranging from manuscript collections to United States Government reports. In addition, he has applied critical judgment to some controversial episodes of Antarctic history, such as the dispute over the first discovery. Finally, he has done more than tell a mere adventure story, for he has tried to set his subject into the broader framework not only of American diplomatic history but also of the relationship between government and science in nineteenth-century America. One would hope, therefore, that the author will continue his studies on these themes since with the present study he charts a route into a subject that deserves further exploration.

GERALD D. NASH

Assistant Professor of History
Stanford University

RICHARD C. WADE. *The Urban Frontier: The Rise of Western Cities, 1790-1830*. (Harvard Historical Monographs XLI.) Pp. 362. Cambridge, Mass.: Harvard University Press under the direction of the Department of History, 1959. \$6.00.

This volume is a valuable addition to the slowly but surely growing body of historical literature on American cities. Years of careful research and thoughtful analysis of contemporary newspapers, municipal records, travel journals, and older local histories have enabled the author to document what less painstaking scholars have only known in a general way: that the organization and development of new territories necessarily gives rise to urban centers in the midst of a "non-urban" milieu. This is true as much for the Ohio and Mississippi Valleys in the years 1790-1830, as it is for the Atlantic seaboard in Carl Bridenbaugh's period, 1625-1742. Within the broad centrifugal tides of westward migration there are always strong centripetal currents of population forming cities. In-

deed, town sites are located and in some cases developed almost before the eager farmers bring in their first commercial crops. The foundings of Pittsburgh, Cincinnati, Lexington, Louisville, and St. Louis all antedate the formation of the state governments which give them "legal" existence and which, incidentally, curb their authority to tax and cope with mounting "urban problems." Whether such pioneer communities survive and grow into cities depends, of course, on a multiplicity of conditions not all of which are subsequently fulfilled.

Having founded his towns, Wade is concerned: first, to trace their rapid rise through the beginning of the steamboat era, and, secondly, to show that by 1830 Western urbanization "had produced two types of society—one rural and one urban." Growth of the five major centers quickens after 1815, though Lexington, due to its landlocked position, does not seem to have recovered from the commercial depression, around 1820. Population of greater Cincinnati, on the other hand, grew from about 6,500 in 1816 to more than 26,000 in 1830; Pittsburgh and environs had reached 22,000; and Louisville about 13,000. The steamboat was clearly the decisive influence, but the successful merchants who dominated urban affairs had also realized that manufactures offered a much greater potential for growth than commerce alone. This broadening economic base, in turn, had fostered social stratification and led to greater ethnic and racial diversity; the "Negro problem" was severe in Cincinnati during the 'twenties.

The fact that economic, social, and cultural differences emerge, however, does not, for this reviewer, justify the conclusion that the West was divided into "two types of society—one rural and one urban." A dispersed population of low density cannot support schools, museums, or theaters in the same degree as a concentrated population, but this does not imply that "rural" people are indifferent to things of the mind or that urbanites are enthusiasts for culture. "Urban" and "rural" are not opposing community types with generically different attributes. In making this doubtful distinction, more-

over, Wade seems to negate his own cogent argument that the urban dimension of life is an integral part of Western community organization and structure. Thus, Henry Clay, Thomas Hart Benton, and William H. Harrison are not represented as "rural agrarian" leaders in national affairs; their private interests and public activities identify them as "urban" spokesmen for the larger Western community. It is unlikely that the urban-rural dichotomy will serve historians any better than it has sociologists.

ERIC E. LAMPARD

Department of History
University of Wisconsin

RICHARD WALSH. *Charleston's Sons of Liberty: A Study of the Artisans, 1763-1789*. Pp. xii, 166. Columbia: University of South Carolina Press, 1959. \$4.25.

Here presented is a study of a neglected social class in the American Revolution—the artisans. It helps to complete an analysis of the Revolution along social-class lines which has been examined for the colonial merchant by Schlesinger, the western land speculator by Abernethy, and the Virginia planter by Harrell.

Charleston was wisely chosen. It ranked fourth among the cities of Colonial America, was the largest city in the South, and contained a powerful artisan population. The master mechanics alone formed about 22 percent of its free inhabitants.

A large majority of the artisans were foremost in resisting the colonial policies of Great Britain. Economic self-interest, Walsh discovers, forced them into this course. They opposed the Monetary Act of 1764 and the Stamp Act because both were deflationary in a postwar period of economic depression. No one used more paper, glass, lead, and paint than they did—all taxed under the Townshend Acts. Such duties and the various restrictions on colonial manufacturing made competition with imported British articles extremely difficult.

A mechanic, perhaps Edward Weyman according to Walsh, initiated in Charleston the opposition to the new, oppressive British policy introduced after 1763. In

radicals among the planters, notably Christopher Gadsden, the radical artisans discovered experienced political leadership which they followed only until 1778.

Their break with the radical planters is convincingly explained. They wanted to prohibit the importation of slaves because of the competition of slave labor. They opposed the exemption of rice from the nonexportation agreement, for a complete boycott of British markets would make certain more markets for their own wares in South Carolina. They wanted a more representative government than the planters, even the radical ones, were willing to allow.

An explanation of the causes of the unswerving loyalism of a minority of the artisans is lacking. After the British occupied Charleston some of the radical artisans were constrained to pretend they had returned to their allegiance to the Crown. That they would have been completely ruined otherwise is adequately described.

The table of wages shows that skilled workmen received good wages in the late colonial period: a master carpenter, for instance, about two pounds of the current money a day and an ordinary one, whether Negro or white, about one pound.

ROBERT LEROY HILLDRUP

Professor of History
Mary Washington College

OTHER COUNTRIES

ROBERT E. SCOTT. *Mexican Government in Transition*. Pp. 333. Urbana: University of Illinois Press, 1959. \$5.75.

"The decision-making process and the interaction of interest groups which participate in it" is the focus which Professor Scott selects for his analysis of the Mexican political system. Outlines of this methodological approach have appeared in several articles published lately in scholarly journals, written by members of the Committee on Comparative Politics of the Social Science Research Council. If this particular study represents a valid application of Committee models, then the entire

Committee design requires a new appraisal. Frankly, the study is disappointing: it ignores the significant issues of Mexican politics, incorrectly identifies the official party as the focus of effective political power, provides us with no case studies, and, most surprisingly in a study of interest groups in the Mexican political process, disregards leading foreign interests, social clubs, novelists, and intellectual circles as well as Masonry and the communications elite.

As the first successful national social revolution of the twentieth century, the still-unfolding Mexican Revolution constitutes an important object-lesson for the entire underdeveloped world. Nonetheless, the study provides no insight here. Mexico's "take-off into sustained growth," to use Professor Rostow's expression, was a painful, valiant, and, at times, bloody struggle to toss off the historical shackles preventing our southern neighbor from establishing a social foundation upon which Mexico could build a modern society. Why American social scientists, nurtured in the nation which many foreigners respect as the father of pragmatism, cannot grasp the fact that revolutionary action, within the context of the image which each underdeveloped nation holds of itself, may constitute rational action remains a mystery.

The author asserts that "effective decision-making takes place in and around the revolutionary party." Organized industrial and communal agricultural labor wish it were true. Party leadership dreams of it, indeed, even speaks of it once a week on its regular television program. But, once again, this time at the party's third National Assembly, held the last week of March, 1960, party membership was restricted to a large extent to the laboring classes and popular masses. Industry and commerce, banking and insurance, top level bureaucrats, university and normal school administrators, and military men—in short, the interests which have really prospered since 1939—are still excluded from official party ranks. Are we to believe, as Professor Scott contends, that a proletarian oriented and staffed party would sponsor two decades

of government favoring its adversaries when "effective decision-making took place in and around the party?"

This reviewer prefers to credit Mexican leadership with more intelligence and consistency and, accordingly, to submit that effective political power centers in the bureaucracy, in which the official party plays a very minor role, and in a pragmatic, liberal, modern elite composed of families and interests dedicated to the Revolution and prospering with it.

ROBERT LORING ALLEN. *Soviet Influence in Latin America: The Role of Economic Relations*. Pp. x, 108. Washington, D. C.: Public Affairs Press in co-operation with the Woodrow Wilson Department of Foreign Affairs, University of Virginia, 1959. No price.

There has been a great deal of talk in recent years about the Soviet "trade offensive" in various parts of the world. All too much of this discussion has been sensationalist. Professor Allen's book is, therefore, most welcome, surveying as it does the facts concerning what has already occurred in this field insofar as Latin America is concerned and giving the reader some basis for judging the probable trends in the foreseeable future.

The first part of the work is devoted to a more or less detailed survey of how much trade has actually occurred between the Soviet bloc and the twenty Latin-American republics since the Soviet Union began its present foreign economic policy in 1953. His conclusion, and the figures he presents corroborate it, is that this trade has been relatively small in volume and value, has been concentrated in half a dozen countries, and has been sporadic. In no year between 1953 and 1958 was trade both ways with the Soviet bloc more than 2 percent of total Latin-American imports and exports.

Later sections of the book deal with the role of foreign trade in the economies of the respective areas, with the objectives of both the Latin-American and the Communist countries in seeking to increase commerce with one another, and with the

question of the complementary nature of the economies of the two regions. He ends with an evaluation of the whole problem and of the future prospects for trade.

Insofar as the Latin Americans are concerned, Allen points out that they are anxious to find new markets for the narrow range of exports upon which they depend for all their foreign exchange. At the same time, they are very anxious to find sources from which to obtain the capital equipment they need for their economic development as well as certain basic fuel needs such as oil and coal. They are particularly desirous of obtaining these products at no cost in foreign exchange.

The Soviet Union and its satellites dangle the possibility of fulfilling these aspirations before the Latin-American countries. They argue that through their bilateral trading devices they can provide the Latin Americans with a number of products they need without the necessity of payment in precious dollars and pounds, since the Soviet bloc works on the basis of barter. The attractiveness of these offers is heightened by the Latin Americans' tendency to exaggerate the extent of Soviet economic development, according to Allen.

However, the author feels that, although there will be an increase in Latin American-Iron Curtain trade in the near future which will be statistically impressive, there are several factors militating against the Soviet Union and its associates becoming a major factor in Latin-American foreign trade. These include the demonstrated unwillingness or inability of the Soviet Union in practice to provide the goods it so blithely hints it can make available; the red tape and bungling of the Soviet foreign trade bureaucracy, the poor quality and unfamiliarity of many of the Soviet goods, and the needs of the Soviets' own development program which will seriously limit the amount of capital equipment which the Soviet bloc will be able to provide. He cites the experiences which Argentina and other Latin-American countries have already had to buttress his argument. Finally, the author holds that the economies of the two areas lack the fundamental

complementarism which is the economic basis for extensive trade.

There are perhaps two elements which Professor Allen does not adequately stress and which may weaken his argument in actual practice. One is the possible political importance to the Soviet Union of the Latin-American countries. Although Allen notes this factor, the reviewer would be inclined to think that he does not stress enough the likelihood that, particularly in view of the growing anti-United States sentiment in Latin America, the Kremlin might well decide that the political gains to be made in the United States own backyard would be well worth the economic cost of unprofitable trade and loan agreements with selected Latin-American republics.

Second is the fact that the Latin Americans will prefer some markets, no matter how insufficient, to none at all. The fact, which Allen mentions but does not weigh heavily enough, is that the Latin Americans are desperately anxious to get rid of their actual or potential surpluses of mineral and agricultural exports, and may well be willing to get rid of them on relatively poor terms rather than not at all.

The new Cuban trade and loan agreements, signed since this book was published, may well indicate whether Professor Allen's conclusions are correct. The accords signed by Mikoyan and Castro are the most significant development yet in Latin American-Soviet economic arrangements. They are being watched very carefully by the rest of Latin America. They will undoubtedly have an important impact not only on trade between the Soviet bloc and Latin America, but on general economic and political trends south of the Rio Grande.

Rutgers, The State University

RICHARD N. ADAMS. *A Community in the Andes: Problems and Progress in Muquiyauyo*. Pp. xiv, 251. Seattle: University of Washington Press, 1959. \$4.75.

This is a report of a field study in anthropology undertaken in the town of

Muquiyauyo, department of Huancayo, Peru, during the period August, 1949, to May, 1950. Evidently, this particular town, composed of Indians and mestizos, had acquired a reputation for being unusually progressive as compared with other communities in the region. The study sought to explore the nature of this progressiveness and to describe how it came about. It was hoped that "delineation of these traits, besides providing a general account of the life in a Peruvian mountain community, might help solve problems faced in applied anthropology and provide a test for hypotheses in anthropological theory" (p. xi).

At first, attention was focused primarily on the history of the community as reflected in the town records and in interviews with older residents. Problems faced and solved by the community were traced. The author found it impossible, however, to explain how this particular town, and not another, became progressive. He reasoned that a community is a unique event and, that while certain factors may be selected for emphasis, these same factors may be present elsewhere and the same events might not take place. He, therefore, shifted his objective to focus on two goals. "First, to provide a description of the life of a Central Sierran mestizo and Indian community, since other studies made in this geographical region are not readily available; and second, to show through the recent history of this community how local history is directed through the presence of a few pressing unsolved problems, how each generation makes new attempts to solve these problems and in so doing brings drastic cultural and social change into the community" (p. xii).

The work is divided into three parts. Part I is historical and contains chapters on "The Setting Today;" "Land and Population;" "Political and Administrative Development;" "Developments in the Religious Organization;" "The Change in Social Class Structure;" and "Influences from the Outside."

Part II deals with contemporary life and contains chapters dealing with "The Farmer and His Land;" "Cultivation and Livestock;" "Crafts and Commerce;" "The

Home and Women's Activities;" "Clothing and Costume;" "The Cycle of Life;" "Activities of the Community;" and "Recreation, Indulgence, and Celebrations."

Part III is concerned with culture change in Muquiyauyo.

The author presents the following conclusions concerning the process of change: 1. "Every change that occurred was in itself not too great a change but was an attempt to solve some problem that faced the community at the time" (p. 202); 2. "The problems that demand solution are defined in terms of the culture of the community and the experience of its members" (p. 204); 3. "Not only will the problems be set but the solutions selected will be shaped by the culture and experience of the community members" (p. 206); 4. "Recognition of a problem and the exertion of efforts to solve it do not necessarily bring success" (p. 210); and 5. "In the process of solving one problem, new problems are often created" (p. 210).

Thus, while the original objective was not achieved, the study is useful in providing an analysis of a contemporary community in an area where such information is scarce and in showing the role of historical factors in shaping the present community patterns.

THOMAS M. FRASER, JR. *Rusembilan: A Malay Fishing Village in Southern Thailand*. (Cornell Studies in Anthropology.) Pp. xviii, 281. Ithaca, N. Y.: Cornell University Press, 1960. \$5.75.

This volume represents the first published study to "encompass the total socio-cultural organization of a Malay community." It is also the first major piece of research carried out among the Malay population left under Siamese rule with the end of British expansion northward up the Malay Peninsula.

This book is, therefore, doubly welcome. As a community study, Dr. Fraser has succeeded in giving a rounded picture of village life that rings true for Malay peasantry generally. Features such as "few

well defined formal roles of authority," and the lack of effectiveness this leads to in organisation beyond the elementary family, seem to be typical of Malay society everywhere.

But because of the wideness of his coverage Dr. Fraser is unable to pursue any point in great detail. This limitation is not, of course, peculiar to the volume under review, but a necessary consequence of choosing the community study for the presentation of research material. It is, however, particularly to be regretted in this case where there is no other source on the people described.

In addition to presenting a general picture of the society and culture of Rusembilan, Dr. Fraser is also concerned with the problems of the place of the Malay community within the Thai nation and the process of change within the community.

With regard to the first of these questions he clearly shows to what extent the Malays still cling to their separateness and keep their contacts with the Thai national majority, especially its official representatives, to a minimum. It would have been interesting to know to what extent irridentism is still active amongst the Patani Malays. The Malay Press in Malaya from time to time publishes stories of Siamese oppression of Malays in Patani—recently the seizure of Malay newspapers, pictures of Malay and other Asian political leaders, and the closure of some Arabic schools. Frequent contact with Malaya exposes the Patani Malays to political ideas in the Federation. In the neighboring state of Kelantan, state and federal elections were won by the Pan-Malayan Islamic party. This success is usually explained by the great influence of the religious school-teachers with the villagers. Dr. Fraser tells of the importance of religious education and explains the greater contemporary emphasis on religion as a reaction to change and Thai pressure. Does religion play a more passive role than in the Malayan East Coast States?

ROLAND YOUNG and HENRY FOSBROOKE.
Smoke in the Hills: Political Tension in the Morogoro District of Tanganyika.
Pp. xii, 212. Evanston, Ill.: Northwestern University Press, 1960. \$5.50.

In general, books about African political systems fall into two broad groups: detailed "functional-structural" studies by field anthropologists and the works of political scientists, which range from the aridly legal to the pompously sociological. Each creates its own feeling of dissatisfaction. It is the great merit of *Smoke in the Hills* that it avoids the worst extremes of either school while attempting to combine the advantages of both. This is an ambitious attempt which does not wholly succeed. Chapters III and IV give the reader the basic anthropological information on the social structure and the lineage system of the Luguru, and were written by Mr. Fosbrooke, now Director of the Rhodes-Livingstone Institute in Northern Rhodesia. While the anthropologist will have had his appetite whetted and as a consequence will feel frustrated with a fare of only forty pages, the political scientist, and perhaps the general reader, will regard Mr. Fosbrooke's contribution as a difficult obstacle before he is piloted into the calmer waters of Indirect Rule by Professor Young. But this sort of collaboration is valuable and with a little more integration, and possibly agreement over vocabulary, has a fruitful future before it.

Smoke in the Hills studies the manner in which social and political changes are taking place among the Luguru in the Morogoro District of the Eastern Province of Tanganyika. The Luguru, who were originally a mixture of other tribes, settled in the Uluguru Mountains and the plains below some 300-400 years ago. In course of time, they emerged as a separate tribal entity, and, in common with other tribes of Tanganyika, were faced with the necessity of adjusting themselves to European methods of administration.

In one of the most interesting chapters in the book, Professor Young shows the shortcomings of Cameron's idea of Indirect Rule. The assumption was that some

From Empire to Nation

THE RISE TO SELF-ASSERTION OF ASIAN AND AFRICAN PEOPLES

By **Rupert Emerson**. One of the twentieth century's most significant social developments is the emergence of national self-assertion and independence among the peoples of Asia and Africa. "Natives" have been transformed into "nationals" demanding their equal place in a modern world. "Mr. Emerson writes with a rare effort at impartiality and does not gloss over the difficult problems involved. . . . His thoughtful book will help the reader understand what is happening in our day for the first time on a global scale."—*N. Y. Times Book Review* \$7.75

The May Fourth Movement

INTELLECTUAL REVOLUTION IN MODERN CHINA

By **Chow Tse-tsung**. In protest against Japanese demands and the decisions of Versailles in 1919, the young Chinese intellectuals, steeped in Western ideas, initiated a cultural and socio-political reform movement which contributed to the rise of Chinese nationalism and communism. It culminated in the Incident of May 4th, 1919, when college students demonstrated in Peking against the government's foreign policy. Without understanding this complex development recent Chinese history remains a closed book. \$10.00

The CIO Challenge to the AFL

A HISTORY OF THE AMERICAN LABOR MOVEMENT, 1935-1941

By **Walter Galenson**. A study of the most critical period in American labor movement history. Prior to 1935, the American unions were weak. By 1941 a fundamental change in power relationships enabled them to penetrate the strongholds of industry. This study discusses the split in the AFL and the formation of the CIO; presents 18 specific case studies and analyzes various general aspects of the labor movement. 704 pages. 8 pages of significant photographs. \$9.75

Foch Versus Clemenceau

FRANCE AND GERMAN DISMEMBERMENT, 1918-1919

By **Jere Clemens King**. A vivid account of the complex series of negotiations and conspiracies concerning the Rhineland's fate after the first World War—a struggle that ended in the victory of Clemenceau and the signing of the Versailles treaty. \$4.00

New Zealand, 1769-1840

EARLY YEARS OF WESTERN CONTACT

By **Harrison M. Wright**. This first detailed discussion of early Maori-Western relations is concerned mostly with the changes wrought upon the Maoris by the westerners and also with the effect the Maori civilization had upon the Western activities and expectations in New Zealand. It is particularly instructive as a demonstration that misunderstanding between East and West is far older than our present century. \$4.75

kind of traditional authority could be utilized for modern administrative purposes. But what was to be done among the Luguru who, with no identifiable leader, had some 800 lineage heads? Inevitably, certain individuals were selected for administrative posts who in many cases took advantage of the new situation and thereby created fresh tensions within the traditional order.

The change from Indirect Rule to the modern local authority is a slow process, handicapped by a shortage of trained staff and finance. The District Commissioner continues to be the essential, standard-maintaining link between the local unit and the central government. The time when his functions will have been absorbed by the town clerk lies in the distant future. Professor Young has many pertinent observations to make on this vital aspect of developing political institutions.

In 1955 riots broke out among the Luguru as a protest against the administration's introduction of terracing in the mountains. Professor Young's analysis of the political and social factors which contributed to the disturbances is excellent. There is a chapter on urban government in the area, and the new forces generated by nationalist politicians are also scrutinized. The book is illustrated by photographs and has end papers locating the area under discussion.

A. J. MEYER. *Middle Eastern Capitalism: Nine Essays*. (Harvard Middle Eastern Studies 2.) Pp. viii, 161. Cambridge, Mass.: Harvard University Press, 1959. \$3.75.

In nine lively essays in this small book A. J. Meyer, Associate Director of the Harvard Center for Middle Eastern Studies and Lecturer in Economics at Harvard University, tackles some of the basic economic problems of the Middle East. Besides that, he deals with the problem of Cyprus, the "Copra Boat" economy, and

with Turkish land reform, which he calls an experiment in moderation. Two chapters deal with the question of what the West can offer: economic doctrine, economic policy, and a point of view.

The difference in the attitudes of Middle Eastern "oil-rich" countries provides an historical analogy, in the author's view, with the economic developments of another age in England and Spain. The former hoisted itself into the position of a world power because of the great natural resource of those days, gold, corresponding in importance to oil today, while Spain lost its world-power status and skirted bankruptcy. Similarly, oil gushers had brought Saudi Arabia close to bankruptcy and triggered the economic development of Iraq. Oil integration is another challenging problem mentioned in this book. It refers to the petroleum companies' efforts to aid the economy of the producing Middle Eastern countries by stimulating local enterprise—supplying a large number of company jobs; promoting the expenditure of wages for locally produced goods; fostering home-building and, generally, turning oil operations into one of the enterprises rather than into "the" Middle Eastern enterprise. The companies have learned from the nationalization of oil in Iran.

The "demonstration effect," popularized by James Duesenberry, engages the author's attention, too. This effect is expected to foster the revolution of expectations in such underdeveloped regions as the Middle East by exposing their people to a psychological shock treatment of showing them the life of the West. By viewing Western movies, for instance, the Middle East is expected to learn about the world in which there are people who have nearly everything, instead of possessing practically nothing. The results of this treatment Meyer says, are less than fortunate because they adversely affect the flow of private savings into investments, one of the great needs of the region.

In some of these countries, the author writes, remarkable skill has been exhibited in converting money into productive values, such as improved soil and dams, but much

more is needed. The United States, lavish elsewhere, has paid scant attention to some Middle East key countries, and too much emphasis has been placed on economically unproductive military expenditures. It would be remunerative for America to put more money into this region—outside oil—about half a billion a year. The multiplying effect of such aid would provide the United States economy with new frontiers of markets. The author also recommends closer contacts between America and the Middle East, more exchange students, and a better understanding on the Americans' part of the people of the Middle East. Language study is good but not enough. "Fluent arrogance is probably worse than uncontaminated arrogance."

In sum, the West and particularly America, should contribute its share in keeping Middle Eastern investment levels high. The most important contribution toward this end in the coming decade may be the maintenance of the high level of oil flow and the resultant high royalties, also emigrant remittances, and better markets for such cash crops as cotton. Surely, this is as safe a program as it is conservative. It is to be assumed that such a program could serve as the foundation upon which more enterprising and bolder programs could be built.

EMIL LENGVEL

Professor of History
Fairleigh Dickinson University

GEORGE LENCZOWSKI. *Oil and State in the Middle East*. Pp. xix, 379. Ithaca, N. Y.: Cornell University Press, 1960. \$6.75.

In the present age of technology, nationalistic fervor, and demographic restlessness, it is difficult enough merely to keep abreast of the rapidly shifting international scene. It is a real public service, therefore, when from an authoritative source comes a study showing enough of the interplay of deep-moving forces in international relations to be of value in the consideration of foreign policy. Such a study is the one under review. Its author, already distinguished for his contributions on the modern Middle East, has set forth here

the result of several years of intensive study, much of it pursued in the Middle East itself, of the importance of Middle East oil in the economy of Western nations, the relations of oil companies and corporate oil combines with host governments, and the effects of Western technology and industrial enterprise on local economies and local populations. The book thus deals mainly with relationships and problems hardly touched in previous writings on oil in the Middle East.

It is noteworthy that in his treatment of major problems arising in connection with oil exploration, production, and transportation in and from the Middle East countries, the author has paid particular attention to legal issues. These have been both numerous and varied. They have arisen, for example, over the validity of chartered concessions, the inclusiveness of grants, matters of corporate taxation in the field and at home, and the employment of labor—inevitable consequences of the exploitation of the principal natural resource in certain underdeveloped countries by powerful interests from abroad seeking to make a profit. The bearing of such questions on the shaping of attitudes among peoples increasingly imbued with the spirit of nationalism and the outlook for Western oil interests in consequence constitutes much of the theme of the book.

The moral drawn from this theme is illustrated in a final section of the book dealing with "repercussions of the Suez crisis." In this case-study are depicted the hazardous effects on the Middle East oil industry of political developments largely unconnected with oil operations. The moral, more or less applicable to any foreign-operated enterprise in an underdeveloped area, is summarized in the author's observation that "it . . . seems to prove that countries passing through the ferment of nationalist awakening no longer abide solely by consideration of economic self-interest."

Although not addressed to the general public, the book will be of much practical interest to the area specialist and the political scientist, as well as to the business executive with ventures overseas. It should

certainly figure prominently in the reading lists of students of international relations.

ECONOMICS AND LABOR

MICHAEL HARRINGTON and PAUL JACOBS. (Eds.). *Labor in a Free Society*. Pp. xi, 186. Berkeley and Los Angeles: University of California Press, 1959. \$3.00.

Last year a Congress which, at the time of its election, was widely heralded as the most liberal since 1936, proceeded to enact union reform legislation strongly opposed by organized labor. The passage of the Landrum-Griffin bill in the face of determined union opposition illustrates the type of problem with which today's labor movement is faced.

The task to which Congress set itself, to legislate a greater degree of democracy in union affairs, forms the central issue of this volume. The papers included here were presented to leading representatives of the labor movement, government, and the academic world at a 1958 symposium organized under the auspices of the Fund for the Republic. Also included is a brief summary of the discussion that took place at that conference.

This is a valuable volume for the casual reader or the experienced student of the labor movement because its well-known contributors are discussing issues that go to the heart of the union's function in today's society.

Perhaps the most stimulating contributions in the volume are those by foreign observers. Hugh Clegg provides insight into the reasons why on the issue of corruption British unions have a better record than their American counterparts. James McClelland traces Australian experience with union democracy and points out how the threat of Communist infiltration has led to greater intervention into the conduct of union elections both by the legislature and the courts.

Sumner Slichter's contribution is painted on a broader canvas. He comments on the chief interests of unions, the effect of increased union membership on union government, wage structure, and the economy as a whole. His general conclusion is that "business unionism" is too limited a goal for today's labor movement.

In a piece of a quite different key, Eric Fromm applies to the worker his views on man and his alienation from society. As Fromm sees it, the average worker is unhappy at his job, manipulated by management and unions, almost solely interested in consumption—keeping up with the Joneses—and readily conforms to fairly rigid social standards. Fromm's answer is called "humanistic communitarianism," a rather utopian ideal of adjustment and creativity which sounds useful, though it might prove a somewhat dull life, but no practical guidelines for attaining it are furnished by its designer.

Some of the papers focus more directly on the problem of democratic procedures in unions and in effect cover the ground which during the intervening two years, has been well explored in the press and the Congress.

Archibald Cox reviews the law before Landrum-Griffin on expulsion from union membership, union elections, and union trusteeship. Arthur Goldberg has a useful contribution pointing out the differences between the tests of democracy in the political sense and democracy as applied to union organizations.

David Cole who has been the arbitrator of many inter-union disputes, argues for a more active role by the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) in enforcing union democracy. He suggests an official investigatory body armed with subpoena powers. However, he does not explore whether such a procedure could prove effective considering the relatively weak ties that bind any national union to the national federation. It seems doubtful that Cole's suggestion could be adopted in the absence of additional far-reaching changes in union structure.

Cole also seems more willing than the other academic contributors to limit the

union member's freedom of expression on basic union issues. He is ready, for example, to deny the right of individual members to disagree with the AFL-CIO "no-raiding" policy. While this proposal for uniformity of opinion may be questioned, Cole has made clear how the traditional values of freedom can conflict with traditional union objectives.

PETER HENLE

Assistant Director of Research
American Federation of Labor and
Congress of Industrial Organizations

PAUL P. HARBRECHT, S.J. *Pension Funds and Economic Power*. Pp. 328. New York: Twentieth Century Fund, 1959. \$5.00.

This volume is one of several recently published by The Twentieth Century Fund which analyzes the influence that certain financial institutions appear to be having upon the basic nature of modern-day American capitalism.

The first few chapters attempt to trace the early development of the pension trusts as one of the primary centers of power in a newly emerging social system; to review the role they play in transition whereby the power to control property is passing from the hands of individual workers, for whom the pension trusts exist, to large financial institutions; and to examine their organization, operation, and objectives. These are followed by chapters dealing with considerations of external forces affecting their development and operation, such as the federal government and the courts. Finally the growing size of the pension trust is reviewed, and the extent of its economic power is examined.

The study ends with a socio-economic-legal treatise on the paraproprietal society, in which parallels between former eras in man's economic development—the ruling principle in Roman property organization, the laws of property, the migration of power, and the rights and property of the wage earner as a member of a pension program—and the present period of economic power are drawn together: "... Our society is called paraproprietal, or beyond property, because in it the connection between man and things, which is another way of

saying property, is so attenuated that the fundamental function of property is not dominant, though it still serves a purpose. Certain things began to be called property in Western society because they 'belonged' to a man, pertained to him in a special way, were 'proper' to him. They were, in a sense, the extension of his personality. Thus the fundamental notion of property is intimately connected with the ideas of 'own' and 'ownership.' But there is nothing personal about General Motors or the Metropolitan Life Insurance Company in this sense. 'Mine' and 'thine' have very little meaning when applied to them. Something that is owned by everyone is truly owned by no one. Ownership in connection with the modern institutional organization of wealth has very little of its former meaning" (p. 287).

That the author has been trained as a lawyer and not as an economist is evident throughout this work; but he has brought together some interesting data on a significant new development within the American economy. This development is indeed ripe for penetrating economic analysis.

PAUL A. DODD

Professor of Economics
University of California
Los Angeles

WILLIAM H. KNOWLES. *Trade Union Development and Industrial Relations in the British West Indies*. Pp. 214. Berkeley and Los Angeles: University of California Press, 1959. \$5.00.

The British West Indies are in many respects a model of an underdeveloped area whose political development has raced ahead of economic viability. After centuries of colonial rule based chiefly on the decreasingly profitable estate cultivation of sugar, self-government and limited federation were achieved two years ago. Complete independence can probably be attained but hardly afforded in the face of very serious economic backwardness. A monocultural agriculture, acute shortages of capital and natural resources, excessive population growth, high rates of illiteracy and semiliteracy, severe unemployment and underemployment, inadequate trans-

portation and communication systems, deprecatory attitudes toward manual labor—these constitute the principal factors militating against even modest economic development. Fortunately, there is no serious racial problem.

Against this background Professor Knowles has brought together the results of his intensive studies of British West Indies labor problems and labor movements, chiefly based on interviews of estate owners and managers, union leaders, politicians, and government administrators in 1953-54. In addition to specific analyses of the development of labor organizations in the different territories, he has devoted considerable effort to an explication of the peculiar nature and structure of British West Indies trade unionism and its most significant environmental determinants, to the all-important relationships between trade unions and the labor-based political parties, to the nature and ambitions of union leaders, and to the character of the industrial relations system which remains heavily influenced by traditional and paternalistic estate patterns of labor-management relations.

The study has some technical shortcomings. Most of the interviews took place six and seven years ago, well before the formation of the Federation. It is, therefore, in some respects outdated by the course of events, particularly as regards the attitudes of those interviewed. The author has, however, made an obvious effort to stay abreast of developments by including or inserting the most recent information available to him. Some chapters contain substantial sections of duplicate information, for example on the impact of the outside world on worker attitudes, on obstacles to union organization, and on sources of union leadership. There are some parts which seem like summaries of field notes, and one occasionally notices a peculiar organization of the material, as for instance indicated by the statement that "The possibility of creating jobs through industrialization and the limiting of further population growth by contraceptives will be discussed in the chapter on trade-union policies" (p. 21).

Nevertheless, this remains on the whole

a competent, insightful, and sympathetic treatment of the labor problem in an area that is presently overshadowed by the more violent events in neighboring parts of the Caribbean. Its struggle for a decent standard of living in place of poverty and economic stagnation commands our understanding and assistance. Students of economic development and of labor movements and those who are generally interested in the social and economic problems of this area will benefit considerably from Mr. Knowles' commendable effort.

Cornell University

MARTIN SEGAL. *Wages in the Metropolis: Their Influence on the Location of Industries in the New York Region*. Pp. xi, 211. Cambridge, Mass.: Harvard University Press, 1960. \$4.75.

In the period since World War II, a number of empirical studies of wage behavior in local labor market areas have been made. The book under review here differs from the other studies of specific labor markets in that it is not concerned primarily with the broad problem of wage determination but instead it deals with the more specific question: How do wages and other labor market conditions affect the location of industry in the New York region? Consequently, this study will be of interest not only to the labor economist but also to students of industrial location and metropolitan development, as well as to those interested specifically in the economic future of New York.

The book begins with a discussion of the factors that determine which industries in the New York area are particularly sensitive to labor cost considerations and which industries are largely insensitive. The author concludes that only about 1 per cent of the New York work force is presently employed in industries that are under powerful pressure to find lower labor costs elsewhere and that most of these people work in establishments producing low-priced lines of garments. Much of the remainder of the book is devoted to a

careful analysis of the present and prospective status of these "labor-sensitive" industries.

After demonstrating that at the present time New York labor costs in the lower-priced garment lines are relatively high, Mr. Segal asks whether we can expect these interarea differentials to disappear in the near future. His conclusion is that while various factors—the migration of labor, locational shifts in industry, collective bargaining, and minimum wage legislation—tend to bring about some convergence of wages, these forces are not strong enough to bring about any quick alteration in the position of New York as a high-paying region. Consequently, the labor-sensitive industries will continue to be under considerable competitive pressure from firms in other geographical areas.

In addition, there are a number of reasons for thinking that the labor-sensitive sector will come under increasing pressure from industries within the New York region that can pay higher wages and thus make it difficult for the labor-sensitive industries to attract and hold labor. For these reasons, the author is forced to conclude that employment in industries such as the lower-priced garment trades is likely to decline. However, this does not mean that New York is going to become a "decaying" or "stagnant" region. It is also true that employment in the industries for which New York has a special locational appeal seems to be increasing more rapidly than employment in general. Consequently, while the composition of the New York work force may change, there is no reason to expect total employment to fall off.

This brief resume does not do full justice to the argument of the book. Nor does it illustrate the author's skill in collecting and processing data as well as in applying the insights gleaned from other labor market studies to the locational pattern of New York. The only warning that must be given to the reader is that at many points this book will raise—but not answer—broader issues, such as the interrelation between wages and other factors determining location and the implications of this case-study for the general subject

of location theory. However, this book is but one volume in a series on the economic development of New York, and these broader problems may be considered in other contributions to the series as a whole.

WILLIAM G. BOWEN

Assistant Professor of Economics
Princeton University

RICHARD E. CAVES. *Trade and Economic Structure: Models and Methods*. Pp. viii, 317. Cambridge, Mass.: Harvard University Press, 1960. \$6.00.

With the virtually simultaneous publication of this work and a joint book on *The Canadian Economy* with Richard Holton, Professor Caves leaps into the rank of first-class economists in the field of international trade.

This book, which is a revised thesis, is an attempt to sort out and criticize the writing of the last sixty or so years on the factors affecting the character of trade. In a sense, it is a continuation in time of Professor Viner's monumental *Studies in the Theory of International Trade*. But Caves is less interested than Viner in extending the theory himself. He holds to the role of reporter. While most of the material is up to date—to 1958—there are occasional references to earlier neglected items. The main theme throughout the analytical account of the literature on the roles of factors of production, conditions of production, and demand in the determination of the structure of trade is the clash between the neoclassical theory and the Heckscher-Ohlin approach. In the end he awards the palm to the classical theory, perhaps relying too much on the empirical work of MacDougall.

The virtues of the book are manifold. Professor Caves writes well, and not without humor. His analytical powers are keen, and his facility for summarization impressive. The coverage is enormous, as shown by the twenty-page Bibliography. The book is superbly indexed. While the separation of positive static from welfare and dynamic aspects of the discussion provides a certain amount of repetition, the book, like Viner's, is hardly designed for discursive reading but is intended as a

reference. Since the Index is full and clear, the repetition offers no impediment to complete understanding.

There is little to say on the negative side. There are some slips, a few points on which it is possible to differ with his interpretation, and a badly distorted diagram on page 117. At times, too, the analysis becomes overly bookish, focused on small and subtle points rather than the significant and straightforward.

But these are minor blemishes in a major contribution. Professor Caves has put students in his debt with his highly useful *vade mecum* through the undergrowth of international trade theory. It is difficult to know whether we should ask him to continue the task, and in particular to review, as soon as he can read it, the exploding literature on growth and trade, or to regard his critical assignment as complete and ask him to "pitch in" and add to the verdure.

C. P. KINDLEBERGER

Professor of Economics
Massachusetts Institute of Technology

CARL KAYSER and DONALD F. TURNER. *Antitrust Policy: An Economic and Legal Analysis*. Pp. xxiii, 345. Cambridge, Mass.: Harvard University Press, 1959. \$7.50.

Apologists for monopoly have generated a fog of rationalization to the effect that: monopoly is inevitable, technologically determined, and socially beneficial; competition is destructive, inefficient, and obsolete; antitrust policy is irrational and futile; abatement of monopoly would involve disastrous sacrifices of efficiency. The effect, as intended, has been to induce public acceptance of, and to paralyze opposition to, monopoly; to destroy faith in competition and hope for its survival.

Kaysen and Turner dissipate this murk with the bright light of realism and common sense. They demonstrate that, in most sectors of the economy, monopoly is neither inevitable, efficient, nor desirable; that competition, given a favorable environment, can allocate resources efficiently and maximize general welfare; that antitrust, while presently defective, can be

transformed into a vital instrument of public policy; that monopoly power can be reduced without sacrifice of economic or technological efficiency. Their goal, then, is to reduce the present degree of monopoly in the economy and to increase the amount and vigor of competition.

The focus of their attack is market power, defined as a structural situation which permits a firm to behave noncompetitively, that is to restrict output and fix prices without losing a substantial share of the market because of the increased output or lower prices of rivals. Evidence of market power would include: 1. Failure of prices to reflect declines of demand or costs or excess capacity; 2. Persistence of abnormally high profits; and 3. Failure of new rivals to enter the market during periods of high profits. Where such market power exists it would be reduced by dissolution, divorcement, and divestiture, exempting only market power based on economies of scale, valid patents, and new processes, products, or marketing techniques. The anticipated result is limitation of market power, the maximum number of producers consistent with efficiency, a planned transition from "tight" to "loose" oligopoly.

Reduction of market power would not obviate the necessity for control of business conduct; remaining imperfections in markets would require continuous supervision to insure fair dealing. Accordingly, the authors would strengthen the antitrust laws governing business conduct, particularly restrictive practices, patents, and price discrimination. They would also modify regulatory and conservation laws, the tax system, government procurement, and international trade policies to promote competition.

Some will say the authors go too far, others not far enough, in limiting market power, but none can deny they are on the right road. Market power is the crux of the monopoly problem; it must be limited if competition is to survive. Kaysen and Turner, in this excellent reconnaissance study, have shown how it can be done.

HORACE M. GRAY

Professor of Economics
University of Illinois

SHIRLEY BOSKEY. *Problems and Practices of Development Banks*. Pp. xv, 201. Baltimore, Md.: Johns Hopkins Press for the International Bank for Reconstruction and Development, 1959. No price.

The present volume is a companion piece to the initial study by William Diamond, *Development Banks*, published in 1957. Both books are the work of staff members of the International Bank for Reconstruction and Development (IBRD); and have come out of the close relations—both financial and advisory—between the IBRD and these national credit institutions which have evolved during recent decades in the search for means to finance and, in general, to promote economic development in retarded countries. Building on the broad discussion in Mr. Diamond's book, Mrs. Boskey makes a detailed presentation of issues in the establishment of a development bank and problems in operating it.

Like the earlier volume, this study does not attempt a critique of concepts and policies of these banks from the standpoint of actual and potential contributions to development. Instead, it is a careful and sensible taxonomy and descriptive account. Occasionally, to be sure, the author goes to a deeper level, notably in asserting (p. 50) that the "combination of banking and developmental criteria in investment decisions is the distinguishing mark of a development bank"; and in that connection, stressing the limitations of loan standards which insist on "bankable" projects at the expense of developmental needs, as well as underlining the danger of "developmental" standards which threaten the solvency of the bank itself. But in subsequent pages the author often slips away from this complex definition. Particularly in the discussion of criteria for loans (pp. 51-55), she simply adopts the usual banker's concept that "profitability" is an adequate measure of "economic efficiency," of "economic importance," and even of "sufficiently high economic priority to warrant financing by the development bank." Much the same must be said of the discus-

sion of policy on interest charges (pp. 75-80), where criteria of bank administration and solvency take a long precedence over developmental considerations. Concepts of this kind express the prudence, the carefully restricted outlook, and the concern with direct results, which are suitable to the commercial banker; but these may not be entirely appropriate to the public or quasi-public institution which has been defined as promoting the long-range development of an entire economy, and must do so through all the lean years before affluence.

These ambiguities in the sections on criteria and investment policy do not minimize the solid worth of this book in other regards: in assembling the types and practices of the actual development banks, and in diligently expounding their operating problems and their administrative practices. In fact this volume provides an excellent body of material for some future study that will evaluate the development banks and their policies.

EDWIN P. REUBENS

Associate Professor of Economics
The City College

B. S. KEIRSTEAD. *Capital, Interest and Profits*. Pp. ix, 180. New York: John Wiley & Sons, 1959. No price.

Over time, theoretical studies on interest and profits have varied considerably. Each study has had its own particular emphasis on these returns to special types of economic activity. In addition, concepts of capital, saving, and investment have all had special meanings for practically every generation of economists. Professor Keirstead has provided a valuable service in seeking to clarify the issues on these topics and to establish precise theoretical conditions for their functioning. He in turn presents his own contribution to theoretical advance. After systematically examining the nature of capital in society and its various yields, he also presents several illuminating empirical studies on the role of capital formation in economic change.

In the first part of the book, theories of

profits, interest, and returns to stock are developed: many traditional concepts are examined, and some are rejected. A valuable graphical summary of the various interest rate theories is presented in Chapter IV. Incidentally, the graph on page 44 which shows the model of J. B. Clark is incorrectly labeled. Although the theory of capital developed by Keirstead depends upon other factors than used by Keynes in his theory of investment, there are many similarities. Keirstead believes that the liquidity preference theory of interest, the marginal efficiency of capital, and the multiplier are crude and misleading concepts. Likewise, the marginal productivity theory of distribution, especially with respect to interest, is shown as inadequate. He links monetary factors with real economic factors in forging distinctive views on interest. He considers that the rate of interest which allocates monetary savings depends primarily on government policy. Use is made of the theories of expectations and the element of risk and uncertainty. Profit which measures the incentive to invest becomes a reward for a real cost, necessitating payment either in a private enterprise system or in a socialist state. For the private sector, the rate of economic progress, depends on these entrepreneurial expectations of profits. For the public sector, it is blandly asserted the rate of economic progress depends on the ability of public policy to enforce savings and "to use resources effectively."

The second part of the book attempts to provide empirical evidence for the theories developed in the first part. The large screen of analysis used tends to blur the most valuable points emerging from the theories. There are five interesting essays which are unrelated apart from the narrow strands of reference to capital formation in economic development and the business cycle. One of these is a chapter on capital formation in "conventional societies," meaning stagnant, capital-deficient, underdeveloped societies. This unfolds as an historical survey of the ways by which shocks produce progressive economic growth. Another essay deals with the lack of response to capital inflow in the economic development of New-

foundland. Progressive economies can be maintained by favorable entrepreneurial profit expectations or by adequate amounts of forced savings. Capital from abroad by itself may be insufficient to provide the necessary stimulus.

Professor Keirstead's relatively short book contains much information. Relief is given to the logical inquiry by the asides on such unrelated topics as Russian roulette and the social role of the automobile. The consequence is that the same topics escape full critical focus. The book nevertheless represents a worth-while contribution on the important subjects it examines.

SOCIOLOGY AND EDUCATION

LUIGI LAURENTI. *Property Values and Race: Studies in Seven Cities*. (Special Research Report to the Commission on Race and Housing.) Pp. xix, 256. Berkeley and Los Angeles: University of California Press, 1960. \$6.00.

This study, one of a series on the housing problems of minority groups, is an analysis of the effects of urban migrations by nonwhites on real estate prices. Up to now, the issue had been joined by *ad hoc* opinions of realtors and land specialists who insisted that prices invariably collapsed and by experts in race relations who have countered "no" or "not necessarily." Dr. Laurenti joins those who say "not necessarily."

He has arrived at his conclusion by taking a number of neighborhoods infiltrated by nonwhites in varying degrees and patterns, then pairing them with comparable white study-areas and checking the sales prices of both over a period of years. The bulk of his statistical evidence is based on original studies he made in San Francisco and Oakland, California, and in Philadelphia, Pennsylvania. He then cites and analyzes studies conducted independently by others in Chicago, Kansas City, Detroit, and Portland, Oregon, which arrive at the same conclusions.

Although he has found that "the entry of non-whites into previously all-white neighborhoods was much more often associated with price improvement or stability than with price weakening," he tempers this with a finding that "no single or uniform pattern of non-white influence on property prices could be detected." It depends, he concludes, on any one of ten variables which may raise or lower prices or not affect them at all.

Dr. Laurenti's project, involving as it did the collection of price data from 1943 to 1955, on almost 10,000 individual sales, was an arduous piece of work and is an important contribution to the racial-relations field. It will be cited by civic groups in the numerous cities in which Negroes are moving into white areas.

How much effect his conclusions will have in settling the fears of white owners or in changing the minds of the real estate people is another matter. Price in the real estate market is governed by many intangibles, including bias, the prepossessions of mortgage lenders, and the emotions, controllable and uncontrollable, of home-owners. As the author himself concludes, there are no two cases and no two areas alike. An issue which has sparked mob action and dynamitings in Chicago, Miami, and elsewhere will not be put to rest by a disquisition.

Its main value will be to challenge the pat charge made by experts and pseudo-experts that values are always affected adversely by a minority infiltration. I hope, however, that it will not be cited—as it already has been—as proof absolute that minority in-migrations improve values.

Nor should the implication be drawn from it that market values are the only aspects with which home-owners are concerned. They may make money by selling to Negroes, yet oppose the shift in color compositions of their schools, neighbors, and associations. The problem is far too complex to be based on whether the arrival of a Negro neighbor is financially a boon or a bane. Many more hypotheses remain to be framed, many more fictions challenged, many more programs promulgated before all the facts are revealed and real

headway made toward understanding this sensitive issue in its complete context.

CHARLES ABRAMS

Professor of Housing and
City Planning
Massachusetts Institute of Technology

LEONARD REISSMAN. *Class in American Society*. Pp. xii, 436. Glencoe, Ill.: Free Press, 1959. \$6.75.

Leonard Reissman has written an excellent new book on the increasingly popular subject of class relations in American society. Although written primarily for graduate and undergraduate students of social stratification, this book's thorough coverage of the literature in a clear and jargon-free style should provide social scientists of allied disciplines to sociology, as well as the layman, with an excellent introduction to the subject.

The book is systematic and analytical. Though he covers the theoretical and substantive literature in an objective and comprehensive manner, Reissman has his own point of view. Thus he stresses that, while status-striving and the manipulation of the psychological nuances of class distinctions are important aspects of American social life, it is the attempt to understand the differential distribution of social, economic, and political power which, in the last analysis, makes the class concept a crucial variable in the study of human relations. Thus, one would hope that this book will be widely read as an antidote to the point of view recently popularized, for instance, in Vance Packard's summary of the sociological literature on status-striving.

While modern Americans are apparently preoccupied with social class and status-striving, this has not always been the case. Reissman traces the development of our traditional view of America as the land of equality and mobility, free of the Old-World devils of feudal caste, nobility, royalty, and servile masses. He convincingly shows how the doctrines of Karl Marx and his emphasis on the class struggle had little appeal for a nation with a frontier psychology; how the Protestant ethic and Horatio Alger myths led Ameri-

cans to stress the possibility of any man succeeding as long as he was willing to work, and had some luck and some brains; and finally how the ideology of individualism, supported to a great extent in fact, lead both social scientists and laymen in America to avoid the issue of class until comparatively recently.

With our peculiar historical background, then, it was not until the late nineteenth-thirties and nineteen-forties that American social scientists began to stress the class concept. While the publication of the *Communist Manifesto*, in 1848, according to Reissman, set the tone of European class analysis and the European intellectual's interest in history as primarily a class struggle, it was not until the American anthropologist, W. Lloyd Warner, began publishing his thorough and detailed studies of the status systems in Newburyport, Massachusetts (Yankee City) in the nineteen-forties that American sociologists engaged in the study of class earnestly.

This book not only outlines why and how our society eventually developed a class system and how the sociological interest in the system arose, it also discusses the important class theories, Marxian, functional, Weberian, and Warnerian; and social mobility, especially within the business and managerial elites; outlines what we know about the structure of national and local class systems; and summarizes the extensive literature on the social psychology of class values, attitudes, and behavior patterns. All in all, the book is comprehensive, clearly written, and interesting.

Assistant Professor of Sociology
University of Pennsylvania

REINHARD BENDIX. *Max Weber: An Intellectual Portrait*. Pp. 480. Garden City, N. Y.: Doubleday & Company, 1960. \$5.75.

Bendix's exposition of some of Max Weber's early untranslated studies, that initiates this book, introduces the reader at once to Weber's lifelong concern with modern Western individualism and rationality that led him to explore the many facets and ramifications of these puzzling

phenomena in his vast studies in the fields of the sociology of religion and of politics.

This may suggest what is old and what is new in Bendix's undertaking. Old is the content of Weber's major works, most of which are by now available in English. New, substantively, is the presentation of some, but not all, of those not yet translated; new, theoretically, is the systematization of Weber's opus, its interpretation. This interpretation is thoughtful and illuminating. It traces, above all, the logical and conceptual order that pervades Weber's studies; it explores their relation to his biography and to his and our time in only a minor way. There is very little information provided on Weber's antecedents and descendants, on the analyses and repercussions of his work, on the controversies it engendered, on the questions of what has remained of it, what has been superseded, and why. At best, Bendix's book thus is "an intellectual portrait" for those who must acquaint themselves with the content of Weber's studies before they can approach the traditions in which he stood and appreciate the extent to which he transcended them. Not only historically, but systematically, too, the book is frustrating, for it does not pull together the ordering of Weber's work that is presented throughout. One of the intellectual and historical problems of our time that Weber helped raise and even, if I may say so, personified—the relation between participation in history and systematic study of social affairs—is just broached, and only toward the very end, when Bendix expounds Weber's "political judgments and forecasts" (p. 456). Who was Weber the student of history; who, the systematic social scientist turning away from history; who, for that matter, the methodologist?

The book raises many more particular questions—I wish I had space to mention at least some of them. It clarifies and enlightens the thoughts of even the student who thinks he is familiar with Weber. Also, it will lead many readers to Weber himself, though it might prevent others, content with this summary, from turning to him. While I can understand Bendix's desire to see the result of his painstaking

and impressive effort in print, I still wish he had abandoned the project for a while and then finally refashioned it into a truly intellectual portrait of Max Weber.

KURT H. WOLFE

Department of Sociology
Brandeis University

PAUL K. CONKIN. *Tomorrow a New World: The New Deal Community Program*. Pp. ix, 350. Ithaca, N. Y.: Cornell University Press, 1959. \$6.00.

This is a book that needed to be written. It is not too clear that it presents a thesis, but it does present a record, a record which this reviewer feared might never be written with care and meticulousness. The compiling and interpreting of this record was not easy, but it has been done excellently. It is a record of the one-hundred communities built during the New Deal era.

The nearest approach to a thesis is that all of these communities and community schemes were rooted in the century-old prescription of "refuge in the land" or "back to the land," for alleviating the growing pains of urban industrialism. The author traces the history of this prescription from Thomas Jefferson's agrarianism to the National Recovery Act of 1933, one section of which provided for relieving urban unemployment by developing subsistence homesteads on the periphery of large industrial centers. Added to this was the idea, and ideal, of bringing the conveniences of urban living to the people on the land.

To this general thesis was added the struggle between bureaucratic and decentralized methods of building and operating these newly established communities and between individualism and collectivism. The author recognizes the oversimplification, and thus the inadequacies, of these dichotomous characterizations of contending forces and personalities represented in the hectic and continuous contention concerning each of these communities and programs. This reviewer, who worked in three of these community programs, probably even more than the author, knows that the presentation of the ideologies of the chief architects of these programs is

not only inadequate but precarious. But one of the merits of his account is that by such treatment, he was able to tread through a confusion of events which has thus far kept anyone else from writing a systematic account of one of the most significant series of experiments of the New Deal era.

Many, probably most, of the readers of this book will be more deeply interested in the ideological struggle waged in the planning and building of the communities than they will in the detailed descriptions of the communities themselves, or in what may appear to them to be the petty, even crank, ideas of many of the would-be contenders in the struggle. But to the extent that they disregard these details, they will fail to know what happens to ideologies when they are subject to the democratic process of the opposition of public opinion and sentiment and are put to the test of placing practical projects on the ground. This is the story which the detailed descriptions of programs and projects tell. It is the chief merit of the book, not only because it accomplished a difficult task, but because it shows, from the record, why even highly desirable changes cannot, in an affluent society, be accomplished by a "great leap forward."

CARL C. TAYLOR

Consultant on Rural Development
Ford Foundation

MAURICE R. STEIN. *The Eclipse of Community: An Interpretation of American Studies*. Pp. 354. Princeton, N. J.: Princeton University Press, 1960. \$6.00.

"A developed literary imagination is a great help in doing, and no less in reporting, a community study," says Maurice Stein, and while he did not intend it, he provided a compliment for his own work.

Professor Stein is a polished and clear-thinking writer. He had something important to say about communities. He organized an impressive array of materials about his subject and presented his thoughts in a very orderly way. His remarks and insights related to the several summaries of community studies made by him are of a high order in the tradition of scholarship.

Professor Stein divides his work into three parts. The first concerns itself with the historical roots of community study in which the works of Park, the Lynds, and Warner are discussed in a thoroughly energetic and analytical way to provide a tentative theory of American communities.

In the second portion of his work, Stein brings us up to date through insightful reviews of the social structure studies which underlie our modern social sciences. "Street-corner society," bohemia, caste and class—the traditional structure studies—are brought into current focus with meaningful discussions of World War II military communities and the popular revelations of the inner workings of suburbia.

The whole work is rather uniquely summarized in its remaining portion by turning the foregoing material before three different professional lenses, anthropological, psychoanalytic, and sociological, to allow the reader to view facets of community concepts in differing but congenial perspectives.

The book is a very useful one for serious students of community in that it brings together many scattered and obscure materials in a vital and fresh way. It provides cues for empirical research by telling us where we are now in regard to community study. It is written without pomposity and in a manner to attract any but the very superficial reader.

Recognizing how difficult it is to give titles to books, I reluctantly say that I had some difficulty with the title of this one, and vowed several times while reading the book that I would try to figure out what the title really meant, but never did. Suffice it to say, the reviewer thought highly of the book itself, and gratefully leaves the title to each reader.

FLOYD HUNTER

School of Social Work
University of North Carolina

H. WARREN DUNHAM and S. KIRSON WEINBERG. *The Culture of the State Mental Hospital*. Pp. xxiii, 284. Detroit: Wayne State University Press, 1960. \$5.00.

The state mental hospitals of our nation are undoubtedly among the best places in

the world for studying the problems of bureaucracy. And one of the favorite sports of medical sociologists, who are of course professional antibureaucrats, is hurling brick-bats at the long pilloried state mental hospital system. Dunham and Weinberg, in their study entitled *The Culture of the State Mental Hospital*, indulge themselves in this familiar exercise in ballistics skill. As one who favors the underdog, this reviewer's attention was accordingly divided between indignation at, and compassion for, the generally underpaid, usually ill-trained, and invariably poorly supported staffs of state hospitals for the mentally ill.

The data-collecting phase of the Dunham and Weinberg study was conducted at Columbus (Ohio) State Hospital between April and December 1946. Although the information presented in this work thus dates from the pretranquilizer era, when insulin and metrazol shock therapies were still fashionable, and physical restraints, such as ankle chains and strait jackets, were occasionally employed even in humanely operated institutions, the authors do not hesitate to claim that their study is representative of the current situation. Similarly rash assertions characterize the whole work: thus in the first chapter we are informed that "of all the mentally ill in our society, 97.6 per cent (as of 1947) are being cared for and treated in state hospitals"; and in the last, it is announced that this study has provided "ample evidence" for the statement that "the existing cultural climate of the state mental hospital affects the patient adversely." Period, there is no qualification of this statement and no context of comparison. Nor should any be expected, for the tone of the work is polemical, and the jargon of social science is inter-larded with the argot of unqualified opprobrium applied to the hospital staff, such as "backward," "paranoid," and so forth.

The virtue of the study, as well as its weakness, lies in the straightforward identification of the researchers with the patients rather than the hospital staff. After an initial two-chapter presentation of the history of the Columbus State Hospital and of the "employee culture," the re-

maining nine chapters are devoted to an earnest attempt to portray the desperate efforts of the right-less, honor-less, and power-less patient to retain self-respect and to win eventual release. The book's primary value lies in its recognition that the patient is encumbered in these efforts not only by his illness but also by the reality problems of survival in an institution many of whose staff members are more concerned with patient-control than with therapy. But, despite a sprinkling of statistical tables, liberal quotations from patient interviews, and the propounding of numbered findings, the study impresses this reviewer more as a diatribe than the ethnography it claims to be. State hospital staff members, like head hunters and cannibals, are after all members of the human race. However much as citizens we disapprove of certain of their practices, as scientists we attempt to understand them, even if our ulterior motive is reform. The justification for this dispassionate approach is that it is much easier to eliminate that which we understand than it is that which we merely abhor.

Dr. Dunham and Dr. Weinberg make again the familiar and generally agreed upon, even by state hospital staffs, point that the emotional milieu of the state hospital is oftentimes antitherapeutic. It is unfortunate that they have not turned their creative talents to the analysis of the reasons for the unsavory aspects of the system and the discovery of the practical remedies which might lead it to a state of higher grace. Such a voyage of discovery might reveal that the problem lies less with hospital staffs than with state legislatures and the citizenry at large.

K. ISHWARAN. *Family Life in the Netherlands*. Pp. xi, 291. The Hague: Uitgeverij Van Keulen, 1959. 19.50 guilders.

There are two extraordinary features of the book under review. First, the author

has reversed the usual direction of a social scientist going into the "field"; he has come west from India to study the family in The Netherlands. Second, while sociologists generally believe that the family in Western countries has shrunk in functions and in influence under the impact of industrialization and urbanization, Ishwaran does not share this belief.

Because he wished to conduct his study in the English language, he confined his study to university students. He had 411 respondents to a 52-item questionnaire. Eighty of these subjects also participated in intensive interviews. On the basis of these procedures the author describes the recent and contemporary family in the segment of Dutch society represented by the students.

In presenting the general cultural background the author asserts that religion is one of the important influences contributing to the stability and integration of the Dutch family. In the rural regions which he studied there is, he asserts, a direct relationship between the size of farm and the occurrence of the extended family. He believes that Dutch women are reared to be more oriented toward a life of marriage and domestic activity than are women in comparable Western countries.

The book is designed, however, not to describe the Dutch family but to determine whether or not it has changed "in its essentials" since the turn of the century, a period during which Dutch society has been undergoing social change. This question requires (a) an explanation of what is meant by "essentials," (b) comparable data with respect to these essentials for at least the end-points of a sixty-year span, and (c) the specification of a procedure in terms of which a decision can be made as to whether the data do or do not support the conclusion that the Dutch family has changed in its essentials.

With respect to the first of these points the author asserts that the "essentials" are institutionalized ways of fulfilling four core functions of the family as distinguished by Kingsley Davis: reproduction, maintenance, socialization, and placement of the individual in the larger social systems. This specification of the meaning of "essentials"

is very satisfactory to the reviewer, but it is distressing then to discover that data are not presented systematically in terms of the core functions.

On the second point it is uncertain just what information the author has on trends. At two points in the book he addresses the question. Once he refers to agencies and governmental bureaus which supplied "indirect material on which we drew substantially" (p. 7). At the other point he says that his information on the "attitudes and practices . . . fifty to a hundred years ago . . . has been gained from sources such as informants, statistics and general literature" (p. 219). There are a few tables reporting trend data with respect to such series as birth rates, divorce rates, and the participation of women in the labor force, but this reader could find no firm evidence on attitudes during the early period.

The absence of a formal procedure leaves the critical reader in doubt. Occasionally conclusions appear without supporting evidence, but the pattern of presentation is for the author to assert that the data do not support the generally held presumption of a change, then to indicate that, of course, the data do show some change, and finally after having specified some of the evidence showing change, to leave the reader with the uncomfortable feeling that it was virtually a matter of individual taste whether the change or the continuity should be emphasized. This reader derives the impression that if Ishwaran has a value-position he wishes the data to sustain, it is that most sociologists are wrong and the Dutch family has not changed in its essentials.

In the reviewer's opinion the task which the author set for himself could have been carried out but not by the ethnographic procedure used. For example, with respect to the function of socialization it would have been possible to show whether or not there has been an increase in the average number of years of schooling and in the average number of hours spent in school per year. An increase in either or both of these series would imply a reduction in the proportion of the socializing function being carried out by the family,

and surely American data support the conclusion that there has been a reduction.

Despite this reviewer's opinion that Ishwaran's method cannot lead to a conclusion about his central question, the book still has numerous virtues. His descriptive observations seem useful and informative. An interesting feature is the presentation of nine accounts of "a day at home." And he is at times felicitous in his diction and conceptualizing as, for example, when he characterizes the relationships between cousins as that of "ascribed friends."

Professor of Sociology
Northwestern University

ORVILLE G. BRIM, JR. *Education for Child Rearing*. Pp. 362. New York: Russell Sage Foundation, 1959. \$5.00.

It appears that parent education in the United States has passed through two historical stages and entered upon the third. The first, which characterizes all simple, folk societies, is the informal preparation of men and women for their roles as parents. Then, with industrialization, the culture becomes more complex and the informal preparation for parenthood gives way in part to formal preparation. Parent education, extant for more than half a century, is a manifestation of this change. And more recently still, with the coming of age of the social sciences, we have entered upon the third stage, namely, the critical appraisal of parent education from the standpoint of social science.

This book by Brim, undertaken at the behest of the Child Study Association of America and with the support of the Russell Sage Foundation, is the most searching and comprehensive study to date of the field of parent education from the standpoint of social science. The assumptions, objectives, procedures, and results of parent education are scrutinized, the deficiencies set forth, and the elements of a sound approach suggested. All of this is done with care, competence, and unusual clarity. The most significant part of the book is an evaluation of all the studies, the good and the bad, dealing

with the results of parent education programs. The review concludes on the pessimistic note that the results are inconclusive. We do not know how effective parent education is in changing parents or children. We have, then, become self-conscious and critical about the educational process in adulthood, but we have not yet developed sufficiently rational and sophisticated methods to enable us to know with confidence what we are accomplishing. That remains as a challenge for the future.

Professor and Chairman
Department of Sociology
Florida State University

IRVING D. HARRIS. *Normal Children and Mothers: Their Emotional Opportunities and Obstacles*. Pp. x, 287. Glencoe, Ill.: Free Press, 1959. \$6.00.

The major portion of this text is devoted to a discussion and interpretation of the data obtained in an investigation of the concepts of normality and latency, which was undertaken by a diagnostic team from the psychoanalytically oriented staff of the Illinois Institute for Juvenile Research. The Appendixes include abbreviated protocols of the twenty-eight boys and twenty-six girls who, with their mothers, comprised the sample population. These "Varieties of Normality (54 Profiles)" serve as an extension of the basic theme of the book, emphasis upon the richness of the variety of human nature and the wealth of appropriate solutions to normal growth problems.

The eight- and nine-year old children, of diverse socio-economic backgrounds, were selected on the basis of their adjustability at school. Since only one half of the fathers expressed their willingness to participate, the investigators did not pursue their original intent to include both parents in all aspects of the study. The acceptance of this limitation appears regrettable, for it would seem a tenable supposition that research involving twenty-seven children and both parents might have yielded results which were less tautological and potentially more valuable than those of this study, which is primarily one of

dyadic relationships between children and mothers.

As implied, much of the data serves to substantiate earlier expressed concepts of child development, particularly those of Erikson, Havighurst, Bossard, and Boll. The more unique contributions are those of the establishment of "rough" criteria for optimal normality in mothers and children. The criteria for the children were the outcome of the identification of six items which were considered the crucial differentiation among the fairly well, the well, and the very well-adjusted children of both sexes. These items were elicited from the mothers with regard to weaning and sibling rivalry; the responses of the children to two of the Despert Fables; and the children's modes of socialization and discharge of hostility as revealed in the psychiatric interviews.

The criteria for the children are stated as follows: "(1) a psychological readiness (based on previous experience) to open up to the environment outside the family; and (2) an active impulse life which prepares the child for the impulse storms of puberty" (p. 28). The criteria for the mothers are considered to be those of warm dependability, understanding, correction of the emotional climate afforded by their mothers if needed, and feelings of affection for their fathers. Approximately 25 per cent of both groups met these high expectations, while the majority could be considered as occupying various places on a continuum of mental health with the optimal group representing one extreme. The optimal group of children were among those checked four years later at puberty, and their sound adjustment in the school had been maintained.

Despite the reassuring tenor of the entire volume, the most meaningful use of this work would be that of encouraging parents to arrive at answers to questions, almost inevitably aroused in its reading, in individual or group counseling sessions.

Marriage Council of Philadelphia

RICHARD H. SHRYOCK. *The University of Pennsylvania Faculty: A Study in Amer-*

ican Higher Education. Pp. 259. Philadelphia: University of Pennsylvania Press, 1959. \$5.00.

Since 1954 the University of Pennsylvania has been engaged in one of the best conceived and most thorough self surveys ever undertaken by an American college or university. This volume constitutes one of its products.

Professor Shryock, a distinguished medical historian and 1951 president of the American Association of University Professors (A.A.U.P.), gathered his data by interviewing a random sampling of members of the Arts College faculty of the University, approximately one in four of each rank; by visiting, interviewing, and corresponding with faculty members in American and European universities and by exploring the literature including the other studies of the Pennsylvania Educational Survey. He presents his findings in fluent prose uncluttered by excessive statistics.

These findings cluster about two foci: his conviction that the prime function of "a real university" must be research and his strong advocacy of closer faculty participation in institutional policy-making. He also makes more than a score of pertinent recommendations about how faculty performance and morale might be improved, but these can only be cited as predominantly worthy if not insistent. The 400 words allotted the reviewer must be employed in the discussion of Professor Shryock's two pivotal propositions.

The first of them he states most forthrightly in the following passage: "The policy which a real university should follow, in confronting the respective claims of teaching and of research, can be stated quite simply. Every effort should be made to improve teaching *within the limits set by the primary obligation to research*. By the same token, any program to improve teaching which will inhibit research—for example, staffing a department largely with 'scholar-teachers' rather than with 'scholar-writers'—should be suspect" (p. 38). Professor Shryock reports that this statement represents the opinion of the majority of the faculty members he interviewed, but he does not assess the points of view of

the dissenting minority or of other critics of it. Thus he writes as a partisan rather than as an objective scholar seeking a workable solution to perhaps the most complex, vexing, and efficiency-inhibiting problem facing American colleges and universities.

Though bland, Professor Shryock's partisanship will not help the University of Pennsylvania or any other institution to resolve the emotive conflict between its teaching and research functions. Instead, the undergraduate will continue to be "short-changed" as he has been in most American universities since President William Rainey Harper of the University of Chicago propounded the "dominance-of-research" thesis beginning in 1892. To use a phrase that Henry Seidel Canby employed when writing about this conflict a quarter of a century ago, Professor Shryock, in this reviewer's opinion, had a strategic opportunity to lift the controversy to a higher plane; but he "muffed it."

On his second major theme of faculty participation in academic government, Professor Shryock has written perceptively and wisely. Unlike some other former presidents of the A.A.U.P., he recognizes "the values of competent administration" (p. 257) and also the necessity and even desirability of boards of trustees. His pleas for closer relationships of faculty members, administrators, and trustees in the making of institutional policy should help persuade faculty members at the University of Pennsylvania and elsewhere to think more kindly than some professors do of those legally responsible for the operation of American colleges and universities.

David Jacks Professor of Higher
Education
Stanford University

GEORGE N. SHUSTER. *Education and Moral Wisdom*. Pp. ix, 146. New York: Harper & Brothers, 1960. \$3.50.

This is one more of the genre of books presenting papers and speeches of college presidents delivered over an administrative career. Frequently such collections

are dreary polemics. Fortunately this present collection is of considerably greater worth. George N. Shuster is a Roman Catholic who has been president of Hunter College, one of New York's municipal colleges, for almost twenty years. He has maintained the integrity of both roles throughout his tenure, and the wisdom and prudence with which he has done so are reflected in the essays comprising this book.

He thoroughly understands the problems of a municipal college and the commuting students who inhabit it. He does not set any exalted goals for such an institution, nor is he condescending toward it. A college, in his view, should be a friendly, literate, and sometimes amusing place in which a relatively few things are taken very seriously. His job as administrator is to try to create such a place.

Academic freedom was frequently in the news during his presidency, and he discovered that some of the professors at Hunter were actually afraid to work with student political groups. In response to this he emphasized in clear tones that he valued and respected academic freedom but believed that it could be maintained only so long as those who wanted it were ready to pay a price for it. To the faculty, he urged participation in student political groups even if it involved some personal danger to them.

To the freshmen of Hunter College he extended always a warm but calm welcome. He promised them that some would awaken to the joys of scholarship, "free and brave, aware of vistas which are more endless even than landscapes of mountains and seas, cheerfully and humbly aware of one's very finite limitation in relation to the potential infinity of knowledge . . ." but warned that some would break in the quest.

President Shuster makes the most sense to this reviewer in an essay on education and wisdom. The pursuit of wisdom is not carried on through scholarship alone. Scholarship and specialization are valuable, but the wisdom students can acquire must come from the process of young minds meeting old ones in an essentially emotional context.

The problem which Roman Catholic

education has yet to solve is how to help young people change from the acceptance of a dogmatic education of elementary and secondary schools to the acceptance of a higher education which will enable them to question even their most fundamental religious beliefs. Until this is achieved, Roman Catholic education will always be open to the charge which Shuster himself made as a young man: that there were few, if any, genuine scholars among Roman Catholics.

Such brief epitome of some of the better essays clearly cannot do them justice. President Shuster's book is a good one which deserves wide reading.

LEWIS B. MAYHEW

University of South Florida

W. FRIEDMANN. *Law in a Changing Society*. Pp. xxvi, 522. Berkeley and Los Angeles: University of California Press, 1959. \$8.50.

In an extraordinarily concise yet comprehensive Preface the author has told fairly what he intends to cover in this book in a way that this reviewer cannot improve. Throughout the book little summaries are found, expressly purporting to be such, which from time to time put the reader in place.

It is my immediate and continuous impression that this book cannot profitably be read cursorily but requires serious and concentrated thinking on every page. The reader is also expected to be familiar with or to look up a vast number of decisions, articles, and references cited in addition to those which are abstracted in the text.

The author takes great pains to state both sides of controversial questions. More than twenty instances were noted in which he has bracketed specific problems with "on the one hand" and "on the other."

Part Six, Conclusions, entitled "The Rule of Law, the Individual and the Welfare State," summarizes the whole book and describes the various tensions between the several groups shown throughout the book to be striving for supremacy in contemporary society.

At the end of the book the author states as his ultimate conclusion that it is con-

ceivable that the almost fantastic progress of the means of transport and communication will at last alert the nations of the world to the anachronisms of national sovereignty. Mr. Friedmann believes that the only serious justification for any hope that the deeply divided and antagonistic nations and power blocs of the world may merge their powers and purposes in a universal organization equipped with more than debating functions, lies in the overwhelming threat of contemporary technological and scientific developments to the security and, indeed, to the survival of mankind. When we consider the destructive capacity of the hydrogen bomb, the development of intercontinental missiles which can cross the oceans in a few minutes at tremendous heights, the early prospect of manned rockets landing on the moon or, in years to come, even on planets, coupled with the capacity to set up service stations in outer space and the availability of all these overwhelmingly destructive devices to the major opposing powers, there appears to be an impelling force towards a far more advanced world order than that represented by the present world organization.

The author submits a persuasive case for his belief that the enormously destructive power of modern weapons will induce the contending blocs to remain at arm's length and to develop for this purpose such legal relations and contacts as are required for the maintenance of a live and let live coexistence.

This is by no means an easy book to read, but careful reading of it will be well rewarded.

HENRY S. DRINKER

Philadelphia, Pa.

WILLIAM ZELERMYER. *Invasion of Privacy*. Pp. vi, 181. Syracuse, N. Y.: Syracuse University Press, 1959. \$4.00.

This book attempts to appraise the development of legal doctrine in the field of invasion of privacy. The topic affords an excellent opportunity to analyze legal evolution as a response to a problem made compelling by the technological and social developments of the past century. Unfortunately, Mr. Zelermyer's treatment of the

subject, though advertised as "the most thorough and elaborate study of privacy yet made within the framework of tort law," fails to add much to what has already been said on the subject.

The method employed by the author, Professor of Business Law at Syracuse, is to describe the fact situations and decisions in a large number of cases where privacy is at issue. Cases are classified in terms of jurisdiction, with chapters on New York and Georgia, and type of invasion, for example, printed publications and television. This approach makes it difficult for the author to deal creatively with the central legal issues. Casual comments aside, there is no real analysis of the problems posed by the conflict between public interest in the dissemination of news and the individual's right to be left alone. The writer has chosen instead to assume that there is only one possible position and that the courts can and should clarify the present doctrinal confusion by providing every possible protection against invasions of privacy, even when these are unintentional, informational, concerned with a public personage, or unlikely to have bothered the "reasonable man."

Nor is there an adequate treatment of the theme of legal evolution, suggested early in the book. Dutiful reference is made to the celebrated article, "The Right to Privacy," published in 1890 by Warren and Brandeis (4 *Harvard Law Review* 193), which traced concurrent changes in social needs and legal policies in this area. The evolutionary theme might have provided an excellent framework for relating subsequent legislative and judicial changes to the social conditions which have affected the value placed on privacy. Instead, the crudest possible picture of legal development is drawn. We are told, for instance, that "Regardless of size, shape, or direction, the paths of the law form a unified network, with no beginning and no ending. These paths are followed by human beings, whose tendency is to follow them. Time or tide, fact or fancy, excuse or exigency, constraint or construction may cause pathways to deviate from their original locations, but the basic pattern of the law maintains its enduring form."

Without being unduly harsh, I think it is fair to say that this is an anachronistic view of the law. To deal adequately with what Gregory and Kalven have called the "clearest example of a 'new tort' arising in the past half century," a more sophisticated jurisprudence is surely needed.

RICHARD D. SCHWARTZ

Assistant Professor of
Sociology and Law
Yale University

EVERETT KNIGHT. *The Objective Society*. Pp. xv, 137. New York: George Braziller, 1960. \$3.75.

Mr. Knight, an existentialist who is an ardent disciple of Sartre and a defender of Sartre's brand of modified Marxism, writes his indictment of the cult of objectivity by the modern academic intellectual with forceful indignation and, in the process, reveals a good deal of that culture whose conscious cultivation he so bitterly condemns. He objects to a merely sterile and sterilizing scholarship. He is angry at an art appreciation which confuses aesthetics with collectors' accumulation and turns museums into mausoleums. He condemns a scientism which, arrogantly convinced of its sufficiency, denies meaning to man and society and fate. He damns as pure evil the killing and denying of life in the name of a precious cult of culture. He is convinced that the thinker and the scholar do not today fulfill their role, but are ignoring life and playing with thoughts as a means to escape it. Even though Mr. Knight is sometimes extreme, one cannot fail to be sympathetic with his generally just irritations and anger.

Nor would it be wise to deny his thesis that we make and shape our world in experiencing it and acting in it; that beyond such being and immersion there is nothing; and that the only true humanism is compassionate and committed action: acting, we become aware of and give meaning to ourselves as we recognize our fellows. It is exceedingly urgent to insist on the irrelevance, and indeed the positive evil, of a politics of enslavement to a standard of living, rather than of creative making and utilization. Likewise, Mr. Knight shows

clarity and perspective when he indicts that position which urges other peoples' indulgence in the leisure enjoyments, nice or nasty, of a middle-class society with a high standard of living, with nonsensical and insensitive unawareness that for masses of men in underdeveloped countries, who lack an adequate diet and live only in the short run when they manage to survive at all, such counsels of dubious perfection are a gross irrelevance.

Fortunately, Professor Knight is no vulgar activist. He fears above all the generic corruptions of fascism, overt and covert. Yet he provides no criteria whereby we might discriminate among types of activity. Unfairly, he ignores the correct elements in the attitudes and analysis of a long line of modern thinkers, from Bentham to John Dewey, and fails to note the grounds on which one may clearly distinguish between brutal and loving passion, contemplative and creative compassion. Perfectionist analyses may indeed lead to false and irrelevant issues and refinements, to fruitless debater's points, and to men sealed in ivory towers, with pure pointlessness cleansing and recleansing their perennially dirty line, which is unclean, by wild paradox, because forever virginally spotless. Yet, however dangerous the misconception of life achieved by the arrest and abstraction of analytical distinctions, it nevertheless surely remains true that contemplation, while not the sole good, is among valuable and properly valued activities; that disinterested inquiry is not irresponsible withdrawal but instead the means to more effective action; and that in some contexts "a plague on both your houses" is no search to be above or outside the battle, but a positive commitment, an act of war against both the contestants of the moment. In many controversies the intellectual third force is involved in the engagement and is designed neither to avoid responsibility nor to deny the necessity of power as means to create. Rather, it rests on a search for, and constitutes a means to, the necessary leverage to make a better world, where men can enjoy and utilize abundance to express their dignified essence. Thus may they live more abundantly in a world they make in the living.

In this sense, pluralism is no search for an escape. It is the essence of existential personalism.

THOMAS I. COOK

Professor of Political Theory
Johns Hopkins University

ALF ROSS. *On Law and Justice*. Pp. xi, 383. Berkeley and Los Angeles: University of California Press, 1959. \$6.00.

This is an uncommonly good book particularly to be recommended to those suffering from the logical and historical confusions involved in the revival of modern natural law theories. Alf Ross is Professor of Law at the University of Copenhagen. He has been strongly influenced by the Swedish philosopher, Axel Hagerstrom, as well as by contemporary logical empiricism. His intellectual antecedents really go back to the methodological aspects of Bentham's and Austin's thought in refreshing contrast to the murkiness of much of European metaphysical jurisprudence. The distinctive feature of the book is its attempt to offer an analytical and naturalistic interpretation of those features of the legal experience—the existence of norms and the consciousness of their binding character—which give rise to *a priori* notions of law. Professor Ross is very sympathetic to the American realistic school of jurisprudence whose fount is Holmes, but he is critical of the extreme behaviorism into which it debouches in the writings of jurists like Jerome Frank. He strives to synthesize the behavioristic and psychological approach by insisting that an understanding of juristic behavior must be predicated "on the hypothesis that in his spiritual life the judge is governed and motivated by a normative ideology of a known content." The exact significance in this context of "spiritual life" is left rather obscure. In places it seems synonymous with "mental life." Professor Ross fails to explain how changes in the "spiritual life" of a judge are to be recognized independently of their behavioral manifestations. If the reference is to language as ritual, how is the sincerity of the linguistic or ritualistic professions to be attested?

There are many other topics discussed

besides the nature and sources of law in this provocative and wide-ranging book. Professor Ross' discussion of the scientific determination of policy is interesting and reflects the views of Charles Stevenson. But it assumes a purist view of the nature of science and a failure to understand the many ways in which means and ends are interrelated. Despite what he says, many problems of "ought" or "should" are "solved," and not merely "resolved" by an irrational leap. He here seeks to settle matters which *au fond* are matters of empirical inquiry by easy definition in the manner made familiar by Max Weber. Professor Ross shows a surprising unfamiliarity with John Dewey's theory of valuation which, despite some of its difficulties in formulation, seems to be just the specific required for the theoretical deficiencies of this work. At the least Dewey's position should have been considered in some detail because it is precisely directed against the type of view defended by Ross.

The greatest merit of the book is that it raises all the key questions in a fresh and illuminating context.

SIDNEY HOOK

Head, All-University Department
of Philosophy
New York University

EDGAR H. S. CHANDLER. *The Hightower of Refuge: The Inspiring Story of Refugee Relief Throughout the World*. Pp. 264. New York: Frederick A. Praeger, 1959. \$6.75.

This volume, richly illustrated by numerous documentary photographs, is not an attempt to make a scientific analysis of the refugee problem. Dr. Chandler, Director of the Refugee Service of the World Council of Churches and President of the Standing Conference of Voluntary Agencies Working for Refugees (Geneva), states as his purpose "simply to tell the story of refugees the world over, and of the church's attempt to help them." In this he has admirably succeeded. His effective and compassionate presentation makes excellent use of field reports from experienced workers, innumerable interviews with dis-

placed refugees, and his own firsthand observation and direct participation in service projects all around the world.

Most of the twenty-two chapters take the reader to refugee units in countries of temporary asylum: Austria, the Philippines, Greece, the Middle East, Korea; to Berlin, Trieste, Hong Kong, Istanbul. In each of these settings we meet refugees as individuals. Skillful sketches bring to life the personal backgrounds of men, women, and children, the tragic events leading to flight and separation, their valiant efforts to cope with most depressing conditions, to gain a chance for a new life and freedom.

The reader is also introduced to many outstanding men and women giving their life's work to refugee service. We learn of their constructive projects to make waiting periods in miserable shelters and camps less wasteful; and of the incessant, patient struggle of staff members of many a voluntary agency devoting great skill, imagination, and diplomacy to achieving the goal of all refugee service: admission one by one to a new homeland, relocation, integration.

A chapter on certain resettlement projects in Latin America highlights the problems arising in receiving countries. A brief historical survey of the development of national and international instrumentalities for migration aid and of the significant role of voluntary agencies in this area is provided in a final chapter.

While the book is focused on the clients, projects, and personnel of the World Council Service to Refugees, it illustrates clearly the complex pattern of interagency cooperation in refugee movement and resettlement, the mutual interdependence and close partnership of voluntary and governmental service.

The book is warmly recommended reading for people with an uneasy conscience who would like to see the 1960 World Refugee Year offer more than a kindly thought to forty million homeless, waiting people.

Compact Background Reading on the Soviet Union IN ANVIL BOOKS

Louis L. Snyder, General Editor

SOVIET FOREIGN POLICY, 1917-1941

By GEORGE F. KENNAN, *The Institute for Advanced Study*

This brilliant account considers the political and personal motivations of the Soviet leaders, the nature of the policies they pursued, and their results.

192 pages, paperbound, \$1.25

RISE AND FALL OF THE ROMANOV

by ANATOLE G. MAZOUR, *Stanford University*

Within the framework of the Romanov dynasty, Professor Mazour traces the social, economic, and political aspects of Russia's history through three centuries.

192 pages, paperbound, \$1.25

BASIC HISTORY OF MODERN RUSSIA

by HANS KOHN, *The City College of New York*

A penetrating analysis of the broad trends in Russian development, this Anvil Book reviews domestic and foreign policy as well as literature, music and the arts.

192 pages, paperbound, \$1.25

THE RUSSIAN REVOLUTIONS OF 1917

by JOHN SHELTON CURTISS, *Duke University*

"Broad knowledge, sound judgment and power of style have combined to make this a text that admirably fulfills its purpose." American Slavic and East European Review.

192 pages, paperbound, \$1.25

THE THEME

This volume¹ is aimed at contributing to a sweeping change in the focus of American agricultural policy. It aspires to a prominent place on the desks of farm editors as well as on reading lists of agricultural policy courses. It hopes to influence the agenda of farm policy conferences and to command the attention of policy-makers in Congress, the Executive, and farm organizations. It transcends—even though it draws upon—recent symposia on the farm problem.² Admirable as these efforts are, they do not try what this volume attempts: to examine farm policy in light of the radically changed situation of the United States in the world. Certain differences of interpretation among authors of articles in this volume only underscore their concurrence with the general scheme.

Until recently our problems seemed essentially domestic. Even severe international crises seemed temporary and did not appear to jeopardize national survival. Now all this is changed. Our fate is conclusively involved with that of other nations. The next few decades seem critical in the race between population and technology. Fortunately we have immense capabilities, if we will only use them, to help underdeveloped countries. Whether the strength that we and our friends can muster will be enough this generation will probably never learn; but it is forced to the attempt by its religious convictions, by its heritage of democratic constitutionalism, and by its interest in survival. The population explosion, the rising demands and turmoil in the world, the spiraling efficiencies in mass destruction all indicate that nothing less than our best effort will do.

To show concretely and in detail how farm interests and farm policy relate to these transcending needs is the task of this book. Agriculture by no means monopolizes this lofty obligation, but a start must be made somewhere, and agriculture is fitting both because of the significance of domestic farm programs for economic foreign policy and also because the miracle of farm science illumines a forbidding future.

This book looks first at foreign economic policy and only later—and then briefly—at domestic farm policy. The order is deliberate. The domestic problem looms so large that it nearly blinds those concerned to everything else. It is not enough merely to catch the eyes of farm spokesmen—they must come to see their immediate problems in relation to the overriding needs of this nation and, indeed, of mankind. We must scrap the threadbare theory that the general welfare will automatically emerge if each group presses as hard as it can for its immediate interests.

Therefore, we open with a discussion of American agriculture as it bears upon trade among nations. How have our farm products entered into world trade; what has been agriculture's influence on trade policy; what would a desirable and consistent trade policy be; and what implications would it have for agriculture?

¹ The author is indebted to T. W. Schultz for his help in crystallizing the goal and in spelling out the organization of this volume.

² William H. Nicholls (Editor), *American Agriculture: Perspectives and Prospects* (New York: Columbia University, The American Assembly, 1955). Iowa State University Center for Agricultural Adjustment, *Problems and Policies of American Agriculture* (Ames, Iowa, 1959). Joint Economic Committee, *Policy for Commercial Agriculture*, 85th Cong., 1st sess. (Washington, D. C.: Government Printing Office, 1957). Harold Halcrow (Editor), *Modern Land Policy* (Urbana: University of Illinois Press, 1960).

This leads to an evaluation of governmental programs to dispose of farm products abroad and to an exploration of the possibilities—and the dangers and limitations—of using farm surpluses in foreign policy. In turn, this prompts an examination of the export of other kinds of capital—and here we are forced again to recognize what still comes as a surprise and even a shock to many people in this country and abroad: the overwhelming importance to economic growth of increases in human capital.

What kind of effort should this country make to extend farm science to underdeveloped nations and to adapt it to their needs? What changes in attitudes, in educational institutions, in administrative agencies are indicated? What can experienced men say of the tasks that confront us abroad, and how can we improve our domestic recruitment, training, and orientation so that we can fulfill our proper role in world economic development?³

Only after an extensive treatment of such issues do we turn to the domestic farm problem. One article deals with its crucial price and income aspects as these grow out of the chronic overexpansion of agriculture. Another probes relevant Canadian experience. Three papers deal briefly with separate commodities—cotton, wheat, sugar and wool—each of which plagues both domestic and foreign politics. Finally, the malallocation of human resources in agriculture is examined, less in its aspects of human poverty and disadvantage, appalling as these often are, than as a drag upon total productivity. In the coming world struggle we are inevitably shorthanded; we simply cannot afford the loss in annual production attributed to the employment of too many people in agriculture.

All this prepares us for a major and in many ways the most difficult question: How do we get the policies that we need? Fortunately authors here have been able to sharpen issues and to make useful proposals. But this is only the beginning of what should be a tremendous effort of mind and will. The job is to fix the attention of all those who are concerned with farm policy upon the highest objectives of this country—to pre-empt the first and controlling place on the agenda for the loftiest considerations.

After this must come the policy-makers. The entire process of farm policy formation must be informed by an understanding of the salient issues which, imprinted on enough minds in the farm sector, may bring about a major intellectual reorientation. This calls for conscious and sustained effort in the federal agencies, not only in the Office of the President and in the Department of State, but also in the United States Department of Agriculture. It calls for a corresponding determination in Congress, in the farm press, in the colleges of agriculture, and in farm organizations, not only nationally, but down into the last township Farm Bureau and the last local of the Grange and the Farmers Union.

We are, indeed, in search of a national purpose. But it is not enough merely to define it intellectually. It has to be grasped by people who are sweating over their own troubles. In agriculture it must penetrate through the barriers created by the overexpanded farm plant, the threat of falling farm incomes, the mounting costs of farm programs, and the growing public restiveness with the size of the farm budget. All these deepen the obsession in the farm sector with the domestic problem, as would be seen by an analysis of Congressional hearings, of United States Department of Agriculture reports and activities, of the farm press, of farm

³ See George Liska, *The New Statecraft: Foreign Aid in American Foreign Policy* (Chicago: University of Chicago Press, 1960) reviewed in this volume.

organization publications, and of the talk in farm meetings. Something must be done about the size of the farm plant, and we may be sure that no effort will be spared to find cures. But somehow the minds of those so engaged must still be fastened upon the larger issues before the country—and this must mean much more than merely settling upon foreign policy as a way to alleviate the domestic farm problem.

But a nagging doubt remains about our national purpose. How do we know that an upsurge of economic growth in the underdeveloped countries will herald peace, spread freedom, and add to human happiness? We cannot know this absolutely. We only know that it is our genius to produce more tools, more food, more machines; to make these things and then get them into the hands of people who need them; and to get these people into the habits of using and of continuously demanding and searching for, and expecting, better tools and methods of production. Yet the ultimate meanings of these added instruments lie beyond our grasp. A man's moral stature is not necessarily increased because he stands on a higher pile of goods. But in this time of staggering possibilities we have to rely on what we know how to do. The gap between the healthy and the poor nations grows; so does the clamor for equity. We know that we can help others to get ahead. But we cannot see the end of our efforts and theirs; even the proximate results—and whether they will be good or evil—are completely shrouded.

If there is no proof, there may still be conviction. Some will find it in religious revelation, others in political wisdom. To the latter, we might presume to say a word. Because of the delicate situation in domestic politics—this is an election year!—and more especially because we are not alone in this great task, let us turn to Charles de Gaulle of France whom Walter Lippmann recently declared to possess true genius. "This gift, which is more than leadership as such, is second sight into the nature of history. It brings with it the gift of prophesying what is going to happen. . . ." With it is carried "the ability to convey what his vision brings to him."

On the same day that Lippmann's tribute appeared De Gaulle declared in Washington, D. C.: "There can be no deeply rooted peace in our time without economic development . . ."

"In my opinion, fundamentally, and above and beyond all theories, all doctrines, all systems of government, the great task facing the world is to raise from poverty and start on the path toward economic development these 2,000,000,000 people who lack everything."⁴

CHARLES M. HARDIN

*Charles M. Hardin, Ph.D., Chicago, Illinois, is Professor of Political Science at the University of Chicago. He has lectured widely on farm politics in colleges of agriculture and has been a consultant to the Tennessee Valley Authority (1948), to the Secretary of Agriculture (1949), to the National Committee on Agricultural Policy since 1949, and to the International Bank on assignment to the Food and Agricultural Commission of Pakistan (1959). A graduate of the University of Wyoming, the University of Colorado, and Harvard University, Dr. Hardin has published *The Politics of Agriculture and Freedom in Agricultural Education* as well as a number of journal articles, including the prize-winning "Bureau of Agricultural Economics Under Fire," *Journal of Farm Economics* (1946).*

⁴ *New York Times*, April 24, 1960; for Lippmann, "Salute to De Gaulle," *Chicago Sun-Times*, April 24, 1960.

Trade and Agriculture Policy

By LAWRENCE WITT

ABSTRACT: Through trade agreements and inflation, tariff levels have been reduced to about one fourth the 1931-1934 levels. These advances toward a freer trading position have been hindered by the rapid growth in import quotas. Some sectors of American agriculture have been in the forefront of those seeking import limitations. The use of price supports in implementing American agricultural programs tends to encourage imports and discourage exports. In addition, price supports have stimulated new programs to encourage exports; such as by transferring purchasing power abroad, or by reducing export prices. These programs range from special loans, sales for local currency (Public Law 480), to export subsidies. Such attempts to insulate domestic agricultural prosperity from the world market divert individual attention and reduce the pressures which otherwise might strongly press for an active and liberal trade policy. Similarly these programs have lowered the influence of the foreign protests, by introducing the additional opinions of those benefiting from special sales. The present complex of programs and policies has quieted the voices of many of those strongly proposing freer trade in order to lower costs.

*Lawrence Witt, Ph.D., East Lansing, Michigan, is Director of Studies, International Programs and Professor, Agricultural Economics at Michigan State University. From 1943 to 1947 with the United States Department of Agriculture, he worked in technical assistance in Latin America. He has served as consultant to the Food and Agriculture Organization; Associate, Trustee, and Governor, Institute of Current World Affairs; Editor, and Vice President, American Farm Economic Association and delegate to the International Conference of Agricultural Economists 1952 and 1958. Dr. Witt is author (assisting T. W. Schultz) of *Training and Recruitment in the Rural Social Studies, Towards an International Dimension* at Michigan State University, and numerous professional articles.*

IMPORTANT sectors of agriculture have a vital interest in a strong export market. A third to a half of the cotton, wheat, tobacco, lard, and rice production traditionally has moved overseas. Historically, foreign markets provided the base for westward agricultural expansion. The foreign exchange earned supported the development of a transportation system, factories and other facilities to undergird American economic development. The export market continues today to be a major outlet for many farm products. Powerful agricultural interests have supported liberal trade policies, such as the Reciprocal Trade Agreements (RTA), so as to protect and expand such markets.

In recent years the operations of agricultural programs have imposed a series of restraints, import quotas, and escape clauses upon trade policies. Some sectors of agriculture have led the way for the whole economy in forcing exceptions, though other groups—bicycle producers, watch makers, and others—have been close behind.

These confusions and inconsistencies are in keeping with America's long history of vacillating trade policy. Before 1857 we had already gone one full circle of liberal trade, high tariffs, and gradual reductions. From 1862 to 1916 the nation moved again irregularly through such a cycle. In 1922 and 1930 tariffs were again raised, the Smoot-Hawley tariff being considered the highest in American history. In reaction to the mistaken idea that tariffs on exported products provided price benefits, agricultural interests compromised on a program of "equality for agriculture." The McNary-Haugen bills were designed to separate the foreign and domestic markets, permitting farm products to be sold at world prices abroad, while fetching a higher price at home.¹

¹ For a fuller review see: Murray Benedict, *Farm Policies of the United States, 1790-*

The depression of the thirties brought a disillusionment with a variety of past policies. Those agricultural groups selling heavily abroad—wheat, cotton, tobacco, pork, and lard—attributed part of their troubles to the virtual disappearance of the American farm exports. They began to recognize that purchases beget sales. Thus agriculture warmly embraced the Hull Reciprocal Trade Agreements program for two reasons. First, it promised to reopen foreign markets closed by the rampant protectionism of the period. Second, it promised to reduce tariffs on imported manufactures and cut the costs of certain agricultural inputs. Even so there were certain reservations, by commodity groups interested in sugar, wool, and to a lesser extent in butter.

At the same time, it was widely recognized that domestic problems made even a complete re-establishment of the foreign market an inadequate measure, and in any case would require some time to accomplish. Even before the RTA came into being, Congress passed the Agricultural Adjustment Act, striving to correct the domestic imbalance between production and consumption. The philosophy and implementation of this Act led to many conflicts and inconsistencies—a problem which is still with us.

PRODUCTION CONTROL PROBLEMS

Under the original Agricultural Adjustment Act (AAA) and in all of its later amendments, efforts have been made to control production. Successful production control raises the price in the United States market. To the extent that the price is increased, the United States ability to export affected farm commodities is reduced and the ability of competing countries is enhanced. In some cases, the difference

1950 (New York: The Twentieth Century Fund, 1953), pp. 207-238.

between the American and world price was large enough to attract goods to the United States over the Smoot-Hawley wall.

The latter point was recognized as early as 1935, when Section 22 was attached to the original AAA. This became the most significant limitation on competitive agricultural imports. This section directed the President to impose quotas on imports, whenever they were found to be interfering with any program operating under the AAA. Thus, cotton imports were placed under quota in 1939 and wheat imports in 1941.

The reduced ability to export could not be countered so simply. Although of minor significance, export subsidies for Pacific Northwest wheat in 1934 and for cotton in 1939 gave a limited preview of one means of enhancing exportability. Some restoration of foreign purchasing power occurred with world economic recovery and preparations for World War II. The passage of Lend-Lease provided another way of increasing foreign purchasing power. While viewed as a means of providing dollars—primarily for military purchases—during a period of extraordinary demands, the techniques involved foreshadowed the United Nations Relief and Rehabilitation Agency (UNRRA) and the Marshall Plan. This experience led into other techniques for bolstering foreign purchasing power, such as those represented by the Agricultural Trade and Development Act (Public Law 480).

One other aspect of the agricultural programs of the thirties needs to be brought out before considering the Reciprocal Trade Agreements. The Jones-Costigan Sugar Act of 1934 makes even more clear the ambivalent position of American agriculture. It imposed import quotas on sugar, with even smaller quotas on refined sugar. In fact, the

Sugar Act of 1937, 1948, and recent extensions essentially divide the market among specified states and territories, the Puerto Rican Commonwealth, and foreign countries. It has become a permanent means of protecting American beet and cane sugar producers. In renewing the Sugar Act next year, great forbearance will be required if the nation is to avoid mixing sugar protectionism and punishment for Fidel Castro.

RECIPROCAL TRADE AGREEMENTS

The Reciprocal Trade Agreements were heralded as a reversal of America's high tariff position, but the implementation of the program belied its high expectations. Only slowly through individual country agreements were tariffs lowered. Under the Reciprocal Trade Agreement, the President was authorized to negotiate and reduce tariffs up to 50 per cent of the 1934 level. During the negotiations the United States reduced tariffs on only as many dollars worth of trade as did the other country. The general interests of United States consumers in lower tariffs, regardless of foreign concessions, was nowhere given recognition in the negotiating procedures. Moreover, extraordinary efforts were made to deal only with commodities which were specific to the trade of the United States and the other country, even to the extent of further subdividing the complex division of commodities in the Smoot-Hawley Act. Thus most widely traded products were almost untouched until 1945.

In the first flush of enthusiasm after the war the President was given additional room for negotiation. This was done by setting the lower limit at 50 per cent of the January 1945 rate, thus assimilating the earlier reductions. The General Agreement on Tariffs and Trade (GATT) followed shortly, with simultaneous negotiation with 23 countries and including commodities sup-

plied by several or many countries. Negotiations at Geneva were almost scuttled by action of the United States with respect to wool. Australia and New Zealand insisted that tariff reductions on wool be part of the Agreement. The United States Congress was unwilling to countenance the price reduction this would mean for American wool. Only a Presidential veto of a proposed extra import fee and a support program for wool saved the negotiations.

By 1949 the burden of tariffs had been substantially reduced, from an average ad valorem rate on dutiable imports of 55 per cent in 1931-1934 to 14 per cent in 1948-1949. Measured against all imports, the reduction was from 19 to 6 per cent.² Since that time further small reductions have been made. Such figures show that real progress was made in easing tariff burdens, but they do not give a complete account of the tariff schedule.

Some tariffs have been and still are so high as to exclude imports, and are not included in the figures above. In 1953 there were still nearly 500 tariff rates in the United States schedule which exceeded 50 per cent ad valorem.³

Secondly, price increases, combined with specific tariffs, have drastically reduced the burden of many American tariffs, even without tariff reductions. Specific tariffs are more likely to be applied to farm products, and ad valorem or percentage tariffs to industrial products.

More generally, the full impact of the tariff reductions was not felt until the 1950's. The war so disrupted produc-

tion and trade patterns that finding something to export became the order of the day in many European countries. The United States was being called upon to supply deficiencies for a wide range of products. Few imports were able to take advantage of tariff reductions; only later did actual imports become a source of concern to American producers.

THE RETREAT OF THE FIFTIES

At the beginning of the 1950's, agricultural price support programs were still the order of the day. The government was heavily involved in the purchase and storage of agricultural commodities. Since overseas production was nearly restored, the acute demands for food were reduced. Some countries had developed and expanded their production of farm products and were competing with the United States. With many American prices above world prices, foreign exports moved more easily and imports were knocking on our doors. Hostilities in Korea obscured the trends for several years, but the pattern was clear.

In trade policy the United States continued to assert a liberal program, but gaps were appearing. The United States Congress had not accepted membership in the proposed International Trade Organization; efforts were being made to substitute GATT in its place as a long term commitment. Even GATT itself included many loopholes for nationalistic policies. Astute observers overseas were questioning whether the United States was willing to follow a low-tariff policy. Many argued that when pressures accumulated, a reversion to isolationism and protectionism was inevitable. Despite these doubts, the Mutual Security Administration encouraged European countries to expand production facilities—as in cheese—in order to increase exports to the United

States and thus reduce the prevalent dollar gap.

Even the extension of the Reciprocal Trade Agreements in 1951 was less clear cut. It included specific provisions for investigation by the Tariff Commission, if the question of injury to domestic producers arose. Section 22 of the AAA also was amended to prohibit the application of any trade agreement or international agreement inconsistent with the requirements of this section. Thus, under the pressures of these conflicts, Congress reversed itself and made any trade agreement subservient to the domestic agricultural program, if the two should conflict.

Action under other legislation brought new restrictions on agricultural imports. During the first half of 1951, a number of farm products were restricted by import licenses issued by the United States Department of Agriculture, under the Second War Powers Act. These included butter, flaxseed, peanuts, rice, rice flour, rice starch, and so on.⁴ Most of the restrictions continued after July 31, 1951 under the Defense Production Act of 1950, with fats, oils, and dairy products being added. Under Section 104 of this Act, import licenses were issued until June 30, 1953, for butter, cheese, casein, flaxseed, linseed oil, non-fat dried milk, various types of peanuts and rice. These provisions reflect the increasing use of quantitative controls as a means of controlling imports—a world-wide characteristic in recent years. While licenses for many products were issued freely, those for cheese were severely limited and for butter almost nonexistent.

Strong protests were lodged against the United States by Denmark, Canada,

the Netherlands, and New Zealand, and other protests followed. These protests, and retaliatory action by the Netherlands in reducing imports of wheat flour, led to a review of the policy.

In July 1953, these licenses were abandoned. But simultaneously and after a review by the Tariff Commission, a system of quotas and fees was instituted under the provisions of Section 22. The severity of the restrictions was loosened, but the effects were the same—the essential separation of the American market from the world market.⁵

Such restrictive devices, however, were just as inadequate for American agriculture as in the earlier periods. Farmers continued to produce substantially in excess of what could be sold at established prices. In 1953 agricultural exports dropped to the lowest level since 1945, and government stocks reached high levels. In the concern engendered by this decline in exports, attention turned again to a technique already being utilized, under Sections 402 and 550 of the 1953 Mutual Security Act. Strongly supported by the Farm Bureau, the Agricultural Trade and Development Act of 1954 (P. L. 480) was passed.

Sale of farm products

Under this legislation the sale of farm products was stimulated in three ways. The first technique was to provide a continuing support for a device used earlier—the gift of food to nations facing temporary food shortages, due to poor crops, natural disasters, and so forth. The second technique was the

⁵ As of January 1959 the following farm products were subject to import controls: sugar, dried figs, alsike clover seed, cotton and cotton waste, wheat and wheat products, tung nuts and oil, rye, rye flour and meal, malted milk compounds, butter substitutes, butter, dried cream, dried buttermilk, dried skim milk and dried whole milk, cheeses, peanuts, peanut oil, flaxseed and linseed.

³ Fletcher School of Law and Diplomacy (under direction of Harry Hawkins), "International Trade Policy Issues," prepared for and published by the Chamber of Commerce of the United States (February 1953), p. 4.

⁴ These and other restrictions listed later are assembled from mimeographed annual reports of the United States Tariff Commission, entitled "Operation of the Trade Agreements Program."

bartering of food for strategic materials. The third and most important was the authorization of sales for local currency, thus completely bypassing the foreign exchange market.

This legislation was to dominate the export picture, develop new strains with America's Allies, and stimulate farm leaders to think about how foreign development and surplus disposal might be associated. As presently renewed, P. L. 480 provides \$1.5 billion annually to stimulate farm exports. Other programs such as the International Wheat Agreement, Section 32 of P. L. 320—Seventy-fourth Congress—and the Mutual Security Act provide additional financial stimuli.

The effects of these actions are clearly apparent in looking at trends in total trade and in agricultural trade. During the five-year period between 1952–1953 and 1957–1958, total exports, in quantity, increased by 18 per cent while agricultural trade increased by 55 per cent. Thus most of the increase was agricultural. On the import side during the same period total imports rose by 20 per cent and agricultural imports remained constant.⁶ Agriculture is out of step both in policy and with actual market trends.

For the future one wonders whether the seeds of this policy are now growing rankly. Policies within the Common Market with respect to imports from outside the Six will raise the weighted average of the barriers against American imports. African areas are considered within and the United States outside. And because the United States has systematically excluded any major dependence on agricultural products from these areas, its bargaining power

⁶ United States Department of Agriculture, Foreign Agricultural Service, M-76, *Quantity Indexes of U. S. Agricultural Exports and Imports*, Revised (January 1960), Tables 2 and 6.

may be limited. In any case the Six and the Seven can, if they wish, point to many precedents in recent American agricultural and trade policy, as justification for actions which they may take in limiting exports from outside areas.

SUMMARY

In the past twenty-five years of trade and agricultural policy, several developments are evident. One is that trade policies have been relatively successful in lowering tariff levels, and in keeping them from increasing. The second is that import controls have been inserted into American policy largely by way of agriculture. Trade policy condoned a series of exceptions to the general liberal trade position, in order to attain major trade agreements. In many cases, the effect of lower tariffs is not to increase imports and lower prices, but to transfer purchasing power—formerly derived from import duties—from the United States Treasury to foreign producers able to sell in the United States market. The third is that, despite its weaknesses, agricultural policy has attained some of its objectives, including higher prices and some income transfer to agriculture. In so doing, it has reduced or removed agriculture's incentive for a strong position on foreign trade policy. Under the system developed, improvements in foreign trade usually do not translate directly into improved agricultural prices and welfare.

To say this, however, is not enough. Agricultural policy, by concentrating on support prices as a technique, has created real trade difficulties for farm products. In the process of resolving them, the way was opened for the use of import quotas and licenses on the one hand and for making the export market dependent on government policy and financing on the other.

A series of programs which indirectly

and directly aided exports have helped agriculture retain a role in export markets. Lend-Lease, UNRRA, Army Civilian Supply in occupied countries, the Marshall Plan, Mutual Security operations, and now P. L. 480 each have served to temporarily bolster foreign purchasing power and make imports less vital in the support of export markets.

The inconsistency of farm price raising and import price lowering—through tariff reduction—as techniques to promote farm and general welfare led to

the insulating and contradictory programs described above. The programs to augment foreign purchasing power helped reduce foreign pressures protesting against our restrictions on imports. At the same time import restrictions for farm products undercut and sapped the vigor which the Trade Agreements program attained in the immediate postwar years. Other sectors have taken advantage of this ambivalent position and pushed for similar exclusions or limitations in their own interests.

A Sound Trade Policy and Its Implications for Agriculture

By D. GALE JOHNSON

ABSTRACT: A move toward freer trade, involving reducing tariffs and export subsidies and eliminating import quotas, simplification of customs, and consistent maintenance of these changes, is in the national interest. Our role as a major world leader would be enhanced, and we would be making an important contribution to the development of poorer nations. Such a program would require adjustments in agriculture—major adjustments, in fact—but with appropriate policies American agriculture is capable of making these adjustments.

*D. Gale Johnson, Ph.D., Chicago, Illinois, is Dean, Division of Social Sciences and Professor of Economics at the University of Chicago. He has taught at Iowa State University, was a staff member of the Office of Price Administration (1942), and has been a consultant of the Departments of State and of Agriculture. A graduate of Iowa State University, Dr. Johnson is the author of *Forward Prices* (1947), *Trade and Agriculture* (1950), and *Stabilization of International Commodity Prices* (1956) as well as numerous journal articles.*

IN the world as it is constituted today there are three compelling reasons for the adoption of a truly liberal trade policy by the United States. First, a liberal trade policy would result in an increase in the real value of our national output by permitting a more efficient allocation of our resources. In our competitive struggle with the Communist area of the world, we cannot without great peril to ourselves fail to follow a policy that will allow an increase in our national strength. Second, the consistent following of a freer trade policy will enhance our role politically as the leader of the free nations of the world and will, at the same time, result in an increase in the economic strength of the other major nations. Finally, the maintenance of the largest single market in the world as a relatively free and available market would contribute significantly to the economic development of the poorer nations of the world.

We Americans should remember the role that a large and growing foreign market for our products, primarily agricultural goods, played in the development of our own economy in the period from 1870 through 1920. It was the export of agricultural products that provided the foreign exchange for the import of capital goods, and it was the expanding flow of exports that encouraged foreigners to invest in the United States. It was the ability of the United States to produce large amounts of farm products and to sell these products in the relatively free markets of Europe that was expected to provide the foreign exchange necessary to repay the large investments that were being made, if this should prove to be necessary or desirable. At that period of history, Europe provided the largest market existing in the world; today the United States has the potential for providing a large and stable market for many of the underdeveloped nations of

the world. Our huge national income and the productivity that makes that income possible is the necessary condition for the provision of a large market; our trade policies, however, must be modified if this market is to have the role in the free world that it could and should perform.

A LIBERAL TRADE POLICY

In the space of a few pages it would be most presumptuous of me to claim that I can even adequately outline the elements of a desirable and consistent trade policy. I certainly cannot claim that I can prove to the satisfaction of an honest skeptic that the outline I do present is definitely in the national interest. While I believe that it is in the national interest to adopt a free trade policy, with the exception of certain military items, I believe that many of the gains that are possible from free trade can be achieved by the adoption of a liberal trade policy that does not achieve free trade in the immediate future. But a liberal trade policy must move in the direction of fewer restrictions on trade between nations.

A liberal trade policy should include the following major elements. The degree of protection to domestic producers should be reduced to some maximum specified level, such as 20 to 25 per cent. Whatever protection that is provided should be afforded through tariff duties rather than import quotas or embargoes. The use of export subsidies should be minimized, though as long as tariffs are continued there is a similar reason, equally valid or invalid, to provide limited export subsidies in some export products. The administration of customs should be standardized and simplified so that importers have a high degree of certainty concerning the actual duties that will be levied. All too often tariff schedules are now highly complex and difficult to interpret; schedules

should be clarified and the number of different rates of duties should be reduced to a small number, perhaps four or five.

Above almost all else, whatever trade policy is adopted should be applied with consistency and certainty. Sudden and abrupt changes in tariff duties, quotas, or export subsidies disrupt trade and have serious political implications as well. Furthermore, domestic producers must be convinced that it is not possible for them to solve their problems by obtaining additional restrictions on trade. When Chrysler finds that it is losing auto sales to Ford or General Motors, Chrysler does not expect to be rescued by a special tax levied on the cars produced by its major competitors. Similarly the producers of actual or potentially imported goods should realize that they must compete in terms of cost and efficiency, and that they cannot rely upon being rescued by political pressure.

While there would be a significant gain to the United States by adopting a completely free trade policy, except in the case of actual military items, a large part of the gains in economic efficiency would occur if we adopted a simple tariff schedule of ad valorem rates, with a maximum rate of 25 per cent and with four other rates of 20, 15, 10, and 5 per cent. A strong case can be made for the position that if a domestic producer cannot produce a commodity for, at most, a premium of 25 per cent over the price of the same commodity when purchased abroad, the producer has no claim for protection. If the position of an importer with a tariff rate of 25 per cent is compared to the position of the exporter who must sell into the same markets that the imports come from, the relative advantage of the importer—one might say the relative subsidy of the importer—is greater than 25 per cent. This is true because there are freight, insurance, and other

costs that both the exported and imported products must bear. Thus the true degree of protection, relative to the producer who is an exporter, may be 35 per cent or more. While we may as a nation be willing to accept some inefficiencies in the use of our resources, it does seem appropriate that we place an upper limit on the amount of inefficiency that we are willing to pay for.

As Professor Witt points out in his article, the Reciprocal Trade Agreements Act has contributed substantially to a reduction of trade barriers. But the modifications that have been made in that act in recent years indicate that if further major gains are to be made in liberalizing trade a different attack may be required. Consideration should be given to a complete overhaul of our tariff acts to include the small number of tariff rates suggested above and simplification of our customs procedures.

IMPLICATIONS FOR AGRICULTURE

The implications of a more liberal and consistent trade policy to agriculture are quite considerable. With the existing import quotas and export subsidies agriculture is one of the most highly protected major sectors of the economy. The removal of much of this protection would require considerable change in certain sectors of our agriculture. The most important farm products that would be significantly affected are sugar beets, sugar cane, wheat, cotton, flax, and dairy products. The feed grains and fats and oils have been moving into international trade with some degree of subsidy involved in most transactions. With the exception of sugar, dairy products, and flax, the products mentioned above are export products. The protection that these products have received has come through export subsidies of various kinds, with import quotas and tariff

acting to prevent imports from negating the effects of the export subsidies.

It has been the domestic price support policies that has necessitated the use of export subsidies and import restrictions for the farm commodities. In recent years a large fraction—approximately 60 per cent—of all agricultural products exported from the United States have involved one form or another of export subsidy. Some have been direct such as the subsidy programs for cotton and wheat sold under the International Wheat Agreement; others have been somewhat indirect and were made in the form of agreements under various features of Public Law 480. Any immediate removal of the price support programs and the accompanying export subsidies and import restrictions would result in a great deal of economic distress for American farmers.

A move toward a freer trade policy which would involve a reduction in import barriers on several farm products and a reduction of export subsidies on others would require a number of adjustments in American agriculture. In the years immediately ahead, United States farm prices would be lower as exports were reduced from their present levels, as governmental purchases became less important, and as some increase in imports materialized. In the short run, unless special measures were taken as an offset, total farm income would be adversely affected.

FARM INCOMES AND SUBSIDIES

If the above paragraph represents a substantially correct indication of the impact of a freer trade policy on agriculture, does this mean that the national gain from such a policy would come at a very considerable economic cost to agriculture? I believe that the answer is in the negative. There are two reasons for a negative answer.

First, there is little or no evidence that there has been any significant economic gain, as measured by increased real income per farm worker or family, as a result of the price supports, trade restrictions, and export subsidies that have played such an important role in agricultural policy since the end of World War II. Second, while it may be true that farmers have gained little or nothing from the programs, large losses would result from the immediate abandonment of them; however, most of these losses can be prevented by the adoption of appropriate policies during the transition period.

Of these two reasons, the first is undoubtedly the most controversial. How is it possible that the support prices and billions of dollars of direct and indirect farm subsidies have not resulted in higher average incomes to farm families? Note that I do not claim that total farm income has not been increased by the programs; it undoubtedly has. But the position taken is that the average income of farmers has not been increased as a result of the "protection" afforded them. Direct proof of my position is hardly possible, but some analogies and some comparisons indicate the strong possibility that the result of these endeavors has not been to significantly increase the average real income of farm families.

If it were possible to increase average incomes—wages or return to farm operator families—by the means we have used, it would imply that incomes or wages should be higher in those parts of the economy that are protected by import duties than in those sectors of the economy producing for export. Quite the opposite is the case in the United States. A study by Professor Irving Kravis of the University of Pennsylvania, published in 1957, found that the highest wages were paid in export industries and that industries with tariff

protection paid lower wages than the national average. There is no implication that protection through tariffs, price supports, or export subsidies lowers the return to labor, but only that these devices are no cure for low incomes.

Until 1958 the Canadian farmer received relatively nominal price support or other forms of economic protection. There are a number of areas in the United States that are quite comparable to the major agricultural areas of Canada. In major respects the United States and Canadian economies have many elements in common. Both are high-income countries that have experienced significant increases in real income during the past three decades. In both countries there is and has been a large net annual flow of labor from farm to nonfarm employment. If price supports and higher prices resulting from the supports did result in higher average incomes, real farm incomes should have increased more rapidly in the United States than in Canada since, say, the mid-twenties. For example, during the nineteen-twenties the United States farm price of wheat was at most 10 per cent higher than the Canadian price; during the latter part of the nineteen-fifties the United States price has been approximately a third higher. Yet farm incomes have increased as much in the Prairie Provinces, the great Canadian Wheat belt, as in the northern spring wheat area in the United States. Comparisons of income change in Ontario, which is a general farming area, with similar areas in the United States revealed similar income changes.

The comparisons between the United States and Canada revealed two interesting differences. First, land prices increased substantially more in the United States than in Canada. Second, farm output increased somewhat less in Canada than in similar areas in the United

States. These differences imply that a major effect of the United States policy was to increase land prices, which means that new entrants into farming are likely to gain little from the higher prices that may result from price supports. The differences in the changes in output also mean that Canadian farmers were able to keep output expansion at roughly the same rate as demand expansion.

The ability of farmers to respond to changing conditions and to make satisfactory adjustments to these conditions is indicated by the Danish farmer. The Danish farmer has little or no governmental protection—a large share of his output is sold abroad and he buys many of his farm inputs, especially feed, from foreign nations. Despite this—or perhaps because of it—he has one of the highest incomes of Western Europe, even though all other European governments provide a considerable amount of protection for their farmers. Average real income of the Danish population has increased substantially since the end of the war and the Danish farmer has shared fully in that increase.

APPROPRIATE POLICIES

The important question is not whether the American farmer could adjust to the changed conditions that would result from a freer trade policy. Rather the most important question is whether we would design the policies that would facilitate the adjustment. For the last decade American farm policies have tended to give the farmer the wrong signals. These policies have implied that markets existed when they did not and have induced farmers to make decisions that were not in their long-run interest.

Except through the use of large-scale export subsidies, the American farmer cannot become competitive in world markets until our price-support policy

is changed markedly. But the changes in that policy must take time unless there is to be considerable financial and economic distress among our farmers. If a clear and consistent policy were followed, much of the adjustment could be carried out within five years. I can only sketch the nature of the policy changes that would be required. Price supports should be gradually lowered to approximately the world level, though modest export subsidies might be continued in the cases where prices are far out of line, such as wheat. A program for disposal of existing stocks in conjunction with aid to underdeveloped countries should be carried out. All of the governmental programs that have the effect of increasing farm output—irrigation, reclamation, agricultural conservation payments, watershed develop-

ment, importation of foreign farm workers—should be tapered off and stopped. But positive steps are also required. The first is to take all desirable measures to increase the demand for labor in the nonfarm sector of the economy. The more rapidly the demand for nonfarm labor increases, the easier it is for farm workers to shift to nonfarm jobs. The second is to undertake measures to ease the shift from farm to nonfarm employment for the millions of workers who will have to make this change in the next decade. These measures include improving rural schools, extension activities that provide information about nonfarm career opportunities, assistance in finding nonfarm jobs and housing, and a program that will help farm people to adjust to urban conditions.¹

Public Law 480 and Related Programs

By WILLARD W. COCHRANE

ABSTRACT: Surplus agricultural commodities have been moved abroad during the late 1950's under several programs: Public Law 480, The Mutual Security Act, and foreign dollar loans and credits. Shipments under these programs have bulked large in recent years—running close to 40 per cent of total agricultural exports and amounting to about \$1.5 billion. The emphasis in these programs has been on surplus disposal, rather than on the development needs of the recipient countries. Hence, it is not surprising that the potential for using the surplus food and fiber bounty of the United States to support and induce economic development has scarcely been touched. But policy actions are within our grasp for making more effective use of surplus food and fiber products from the United States in the recipient "underdeveloped" countries; food and fiber can be used as capital to finance economic development.

Willard W. Cochrane, Ph.D., St. Paul, Minnesota, is Professor of Agricultural Economics, University of Minnesota and President of the American Farm Economic Association (1959-1960). Previously, he has taught at Pennsylvania State University, the University of Wisconsin, and the University of Chicago. He has served with the Farm Credit Administration, the War Food Administration, the Bureau of Agricultural Economics, and the Food and Agriculture Organization. He has been a consultant to the Committee on Economic Development, the Office of Price Stabilization, the Agricultural Marketing Service, and the Agricultural Research Service. From 1957 to 1958, he was chairman of the Governor's Study Commission on Agriculture, Minnesota. Dr. Cochrane graduated from Harvard University, and has written *Farm Prices—Myth and Reality* and the prize-winning article, "Farm Price gyrations—An Aggregative Hypothesis," *Journal of Economics* (1947). He is co-author of *The Economics of American Agriculture and The Economics of Consumption*.

FOUR different avenues of foreign surplus disposal are employed under Public Law (P.L.) 480. First, and most important in terms of the volume handled, is the sale of surplus agricultural commodities to foreign countries for local currencies. This is the arrangement under Title I of P.L. 480 whereby the United States government accepts the national currency of a foreign country, which usually is not convertible into dollars, in exchange for surplus agricultural commodities. Second, Title II provides for grants of surplus agricultural commodities to friendly nations to meet emergency situations. Third, Title III authorizes the donations of surplus foods for domestic distribution and for distribution to needy persons overseas through non-profit, relief agencies. Fourth, Title III authorizes the barter of surplus agricultural commodities for strategic and other materials produced abroad.

In addition to the foreign disposal of surplus agricultural commodities under P.L. 480, such commodities are made available to foreign countries: (1) in exchange for their local currencies under Public Law 665—the Mutual Security Act—and (2) as the result of the extension of dollar loans and credits by agencies of the United States government, mainly the Export-Import Bank. In sum, numerous devices, some ingenious, some crude, are being employed to move surplus agricultural commodities abroad and to keep the domestic purchase-storage-disposal program from collapsing under its own weight. This is not a new development; the shipment of agricultural commodities abroad under these and other special government programs has formed a large part of the total agricultural exports since World War II.

PROGRAM OBJECTIVES AND OPERATIONS

The objectives of P.L. 480, as stated by Congress, are four in number, (1)

to promote economic stability for American agriculture; (2) to expand international trade in agricultural commodities; (3) to encourage the economic development of friendly countries; and (4) to promote the collective strength of the free world. If we give this formal listing of objectives a free translation, it turns out to be consistent with reality. Certainly the primary objective of P.L. 480 has been to move surplus stocks of agricultural commodities, acquired under price-supporting operations, out of the country to ease the pressure on, and even save, the price-support program. And the secondary objective has clearly been "while we are moving stocks abroad, let us do as much good with them as is possible." The secondary objective has included erasing the specter of famine, combatting undernourishment and hunger, and facilitating economic development. The objectives of the Mutual Security Program have been much the same as regards agricultural commodities: (1) dispose of burdensome surpluses at home and (2) buy as much military preparedness abroad as is possible.

During the period of July 1, 1954 to July 1, 1959, over 150 agreements, or supplements to agreements, were entered into with thirty-eight countries under Title I of P.L. 480.¹ The export-market value of all commodities shipped under these agreements amounted to \$3.7 billion. The countries receiving the greatest amount under Title I have been, in descending order of importance: India, Spain, Yugoslavia, Pakistan, and Turkey.

Exports under P.L. 480 accounted for about 27 per cent of total agricultural exports over the five-year period of op-

¹ For an excellent summary of program operations see *The Tenth Semiannual Report on Activities Carried on Under Public Law 480, 83rd Congress, As Amended, 86th Congress, 1st Session, House Document No. 206, July 30, 1959, and later Semiannual Reports.*

TABLE 1—UNITED STATES AGRICULTURAL EXPORTS UNDER SPECIFIED GOVERNMENT-FINANCED PROGRAMS AND TOTAL AGRICULTURAL EXPORTS, 1956-1959

FISCAL YEARS	PUBLIC LAW 480 (Per Cent)	MUTUAL SECURITY PROGRAMS (Per Cent)	CREDIT SALES (Per Cent)	TOTAL SPECIFIED GOVERNMENT PROGRAMS ¹ (Per Cent)	TOTAL AGRICULTURAL EXPORTS	
					(Per Cent)	(Million Dollars)
1956-1957	32.5	8.4	1.5	42.4	100	4,723.8
1957-1958	25.5	5.7	5.1	36.3	100	4,002.3
1958-1959	28.5	5.7	2.5	36.7	100	3,720.4

¹ It should further be recognized that "commercial" sales by the Commodity Credit Corporation at or below market prices are not included under this category.

eration, 1954-1959. And shipments under Title I, or sales for foreign currencies, accounted for well over one half of those P.L. 480 exports. But in some years barter sales have been sizeable—running up to 400 million dollars in 1956-1957.

Operations under P.L. 480 do not, however, complete the total foreign disposal picture. Exports of agricultural commodities resulting from the operations of the Mutual Security Program and from credit sales involving the Export-Import Bank and the Commodity Credit Corporation amounted to about 10 per cent of total agricultural exports over the period 1956-1959. Thus, agricultural exports moving directly under some kind of governmental program stood at 42 per cent of total agricultural exports in 1956-1957, and at 36 per cent in 1957-1958 and in 1958-1959 (see Table 1).

CONSEQUENCES OF THE PROGRAMS

The first, and least controversial consequence of foreign surplus-disposal programs of the United States in agricultural commodities, has been the effect on food consumption for the countries involved. Certainly the diets of many thousands of people living in poverty have been improved, in terms of both quantity and quality, as the result of these disposal programs. These are short-term gains, but they are im-

portant gains to people suffering from chronic undernourishment, and even starvation in some cases. Analysts sitting in their offices in the United States, enjoying rich and varied diets—although perhaps suffering from too great a caloric intake—would be crass indeed to ignore this direct and beneficial consequence to the lives of these people.

But these disposal programs have not greatly facilitated economic development in the countries involved. According to the Tenth Semiannual Report² roughly half of foreign currencies obtained under Title I of P.L. 480, or \$1.8 billion, has been allotted to loans to foreign governments for economic development. But, as of March 31, 1959, less than a third of that amount had been disbursed on projects. Further, we have no way of knowing how many of these paper projects have reached completion and have added to the stock of effective capital, or how many of these projects would have been undertaken anyway out of some kind of internal financing. Until we know more about the operation of surplus-disposal programs for agricultural commodities in the recipient countries, the suspicion must be that the operation of these disposal programs generally has not fostered economic development; this suspicion rests in part upon the project data cited above, but it rests

² *Ibid.*

more importantly on the attitude that has prevailed in Congress and this administration with respect to foreign surplus disposal, namely, "this is an emergency, and if we can find a home for our agricultural surpluses for a brief spell we will be all right."

But there are reports of instances where foreign disposals of food and fiber have been tied to specific development projects—for example, road building, irrigation construction—and productive capital has been formed.³ In part at least, and if we want to, we can use surplus agricultural commodities to finance economic development. The use of food and fiber surpluses to finance economic development may not constitute the most efficient way to support foreign economic development, but it is a way.

Further, surplus food and feed grains from the United States have played a major part in moderating and blunting the price inflation in India in the past several years, and may have saved India from scrapping, or drastically modifying, its second five-year plan of economic development. Certainly surplus agricultural commodities from the United States can be integrated with major plans of economic development in several underdeveloped countries, but as yet this potential remains largely unexploited.

The consequence around which the most controversy and the most confusion abounds is that concerned with the effects of foreign surplus disposal on the producers and production in the recipient countries. One view holds that the surplus-disposal operations of the United States have generally hurt producers in the recipient countries and,

more importantly, have acted to remove the incentive to increase total production in those countries, hence have acted to perpetuate their food-shortage problem. Another view holds that the surplus-disposal operations of the United States have generally been administered in such a manner as not to hurt the producers involved, and, through the beneficial effects on capital formation, have acted to increase agricultural production above what it could have been without the programs. And, of course, there are many combinations of views between those two poles.

Actually, no one really knows, in any general sense, what consequences foreign surplus-disposal programs have had on agricultural production in the recipient countries. And we will probably not know until we have some good, representative studies of the consequences of P.L. 480 operations in the foreign countries involved—studies which are not now underway to the knowledge of this writer. In the meantime we should be wary of general conclusions in this area, based upon summary analyses of brief visits to countries involved and projects by traveling experts. This is a difficult terrain in which to reach definitive conclusions; for example, controversy continues to rage over the effects of government programs on production in the United States.

Foreign competitors

The consequences of, or the anticipated consequences of, the disposal operations of P.L. 480 on foreign competitors created a furor at the inception of the program, but in the past several years the tumult and the shouting has abated. It has subsided because foreign competitors have become convinced that in the administration of Title I at least, the United States has no intention of stealing their regular commercial markets. In the administration of P.L. 480,

³ See, *A Note of the Utilization of Agricultural Surpluses for Economic Development in Japan*, publication of the Food and Agriculture Organization of the United Nations (Bangkok, 1958).

after the first year or two, the United States has consistently followed the "additional principle"—the principle that sales under Title I are in addition to regular commercial imports. Further, the United States has consulted formally and informally with third-party countries to protect the interest of those countries prior to entering into sales agreements with recipient countries. By these practices the United States, in the administration of Title I, has not encroached upon or damaged regular commercial markets of third countries. This is not to say that all foreign competitors are pleased with P.L. 480, but it is to say that the sophisticated administration of Title I has pulled the fangs of foreign criticism.

There is still criticism of the barter operations under P.L. 480 and competitive dollar sales by the Commodity Credit Corporation, and with good reason. But so long as we have surplus commodities, interest groups, and congressmen, there will be unilateral attempts to export the farm problem.

SHORTCOMINGS OF THE PROGRAMS

The consequences of foreign surplus disposal have been, as we observed in the foregoing discussion, good, bad, and indifferent. But perhaps the most important point to be made with respect to the operations of foreign surplus-disposal programs is their failure to produce, or generate, lasting benefits for the recipient countries involved. The potential of these programs to generate economic development has barely been touched. This failure to use our foreign disposal programs constructively to form capital and to increase worker productivity in the underdeveloped recipient countries stems from the limited conception of the potential role of these programs generally held by Americans. This myopic view has led to a program

structure with severe shortcomings. Those shortcomings are:

(1) The temporary, emergency quality of our foreign surplus-disposal operations. Although everyone likes a bargain, there have, as yet, been few lasting benefits to the recipient countries involved. Current consumption levels have been increased; and this can be important to hungry people. But little else has been achieved. Our foreign disposal programs have not been conceived as vehicles for inducing and financing economic development. They have been conceived by this administration as expedient, temporary, disposal measures, and they are treated in that manner by all concerned.

(2) The great uncertainty created in general by our foreign surplus-disposal operations. We, ourselves, do not know how long we will place primary emphasis on this type of adjustment, what forms the programs will take, the extent of the price concessions, and the nature of the side conditions attached to such sales. Plans of economic development of several years' duration based upon agricultural exports from the United States must be based upon either hope or conjecture, consequently they often are not made. This is the irresponsible aspect of our foreign surplus-disposal policy.

IMPROVEMENT OF PROGRAMS

The question may then be asked, what do we need to do to make these disposal programs acceptable to friendly competing nations and to contribute to economic development in the recipient nations? I would state the basic need as follows: in the disposal of surplus agricultural commodities in foreign countries, the United States must be prepared to make some policy commitments of long-run duration with respect

to program objectives, availability of supplies, means of financing, and so on. The specifics of this general course of action can be stated under the following seven points:

(1) Except in famine situations, surplus agricultural commodities in the United States, when disposed of abroad, are to be used exclusively to finance economic development. Economic development is here interpreted broadly to include education and training of the human agent as well as physical capital formation, but all food and fiber shipments must be related to, or integrated into a plan, or plans, of economic development.⁴

(2) Once "surplus" agricultural commodities from the United States become committed to a development plan, or project, of a foreign country, for whatever duration, one year or ten, they cease to be surplus commodities and the whole operation ceases to be a foreign surplus-disposal operation. At this point, the committed supplies become "development supplies" and become part of the aggregate demand for the farm products of the United States.

(3) Food and fiber supplies committed to development plans and projects would be financed by means acceptable to the recipient countries but with the basic objective of speeding economic development: perhaps by grants, perhaps by loans, perhaps by sales for national currencies. The financing principle to be followed here is one that maximizes economic development, not the pecuniary return to the United States.

⁴ This statement is not intended to constitute a rejection of multilateral commodity agreements; such agreements must play an important role in the expansion of foreign trade in the context of planned, or controlled, agricultural economies.

(4) Recipient countries must in every case provide evidence that these "development supplies" from the United States do not reduce their "normal" acquisitions of food and fiber from other countries. By this and the previous point, criticisms of foreign competitors lose their force.

(5) Since "development food and fiber supplies" could finance only a part of every plan or project, complementary programs to finance the purchase of hard goods, construction materials, and services would be necessary. In some cases, food and fiber supplies might finance up to 70 to 80 per cent of a project—for example, road building under an antiquated state of the arts—but in most cases the percentage would be lower. Hence, the financing of non-agricultural supplies must be a part of the total program.

(6) Competing nations burdened with agricultural surpluses—for example, Canada, Argentina—should be invited to participate in this "food for development" program. And to the extent that competing nations desired to participate, multilateral arrangements could be initiated. This is the way that a formal international program under the sponsorship of the United Nations might come into being.

(7) But until such time as a world program did come into being the Food and Agriculture Organization—or some other United Nations agency, or set of agencies—should be charged with the responsibility, and be provided with the necessary funds, to aid recipient countries formulate and execute plans of economic development. This provision would speed development where administrative experience and technical "know how" are most lacking.

Export of Capital?*

By ROBERT B. SCHWENGER

ABSTRACT: The financing by the United States of agricultural expansion seems, at first sight, to present a policy dilemma; namely that a government with large agricultural surpluses on its hands is being asked to provide capital to increase foreign production of the very commodities in surplus supply. In the practice, the dilemma breaks down because of failure of the assumption that the expansion of agriculture in the underdeveloped countries has been hampered by the lack of physical capital from abroad. In fact, the principal limiting factors have been of a local institutional and social character. Against these obstacles, the advance of the agricultural production needed for development has been actively promoted by the flow of United States capital to these countries.

Robert B. Schwenger, Washington, D. C., is Chief of the Division of Foreign Economic Policy in the United States Department of Labor. He served in the foreign relations section of the United States Department of Agriculture from 1934 to May 1960.

* The judgments made and conclusions reached in this article are the exclusive responsibility of the author and do not express United States government policy, but a number of former colleagues in the United States Department of Agriculture have helped generously.

THE special editor has asked for a frank general discussion of the role of United States capital in developing the agriculture of underdeveloped countries in the context of United States policy. This may seem to present a policy dilemma which a government official would have to evade. In fact, however, it is a welcome opportunity to suggest to the readers of this volume that the supposed dilemma is more logical than real.

THE APPARENT POLICY PROBLEM

The apparent dilemma relates primarily to capital available from United States government agencies such as the Export-Import Bank, the International Co-operation Administration, and the Development Loan Fund. It does not apply to international or interregional agencies, such as the International Bank for Reconstruction and Development, the International Finance Corporation, the International Development Association, or the Inter-American Development Bank, even though the United States contributes a large part of their capital. Neither is there any policy dilemma for private capital loans from individual Americans—or American firms—to agricultural enterprises abroad.

The dilemma may be stated, somewhat oversimplified, as follows: It is United States policy to assist economic development in the underdeveloped nations. One of their prime needs, during the current effort to achieve self-sustaining development, is a greatly increased supply of food. The quantities needed will probably exceed the amount that will be available abroad and capable of being physically moved from foreign producers to consumers in the underdeveloped countries—even if the necessary foreign exchange financing could be

found without imperiling development.¹ Therefore, a condition of successful development is the expansion of agricultural production in the underdeveloped countries to meet increased domestic need. This requires capital investment, since the agriculture of these countries has low yields and inefficient techniques. United States capital, therefore, should, pursuant to our policy of aiding development, be available for this type of investment on terms at least comparable to that for United States capital available for investment in the industries of the developing country.

But, it is contended, the United States has surpluses of the needed foods—large and burdensome surpluses of those most needed by underdeveloped countries—and it is United States policy, whether through direct action or through freeing market mechanisms, to reduce the supply of these foods—both in the United States and world markets—in order to bring their natural market prices into reasonable relation to the prices of things agricultural producers must buy. United States food producers and taxpayers are expected to take a dim view of United States government loans to underdeveloped countries for the purpose of producing more wheat and rice and corn.

The alleged dilemma appears even more serious if one turns to the needs of the underdeveloped countries for exports—to earn foreign exchange for increased food and development purchases from abroad. As primarily agricultural countries, most of them must depend on sales of agricultural products for this purpose. At this stage of their

¹ India alone is taking about 4 million tons of food grains annually and, in about five years, is expected to need of the order of 10 to 15 million tons over anticipated Indian production on the basis of present plans. Other large deficit countries will probably include Pakistan and Indonesia.

development, capital invested in agriculture seems to be the necessary means for making their economies viable. But United States agricultural policy, it is argued, can hardly be expected to support such investment if, as is often true, the products are already in world surplus and prices are already depressed.

OTHER LIMITING FACTORS

In the full context of the current world situation, however, this theoretical dilemma is hardly ever realized. Foreign capital is not usually the important factor limiting the expansion of agricultural production in the typical underdeveloped-country situation.

Elsewhere in this issue of *THE ANNALS*, the more important limitations will doubtless be reviewed. A suggestion of their nature can be given by mention of land-tenure arrangements which give no incentive to investment, social stratifications or exploitation patterns, and usurious credit practices—in local currency—which deprive the cultivator of the benefits of investment, transportation, and marketing facilities which create local surpluses even in times of national famine, and, above all, the force of tradition and taboo—often sanctified by religious institutions—opposing change. This type of factor inhibits investment in agricultural improvement even when capital is available. It slows down the useful effects in cases where investment is "imposed" by making new equipment available or setting up pilot operations through government or some outside agency.

In Iraq, until recently, capital was available in abundance, not only for direct investment but also for major irrigation and other quasi-industrial projects needed to benefit farm production. Most of the foreign exchange earnings from sales of oil were reserved for development programs by special legislation, and a government bent on

agricultural development was trying to apply this capital where it would increase production most. It had good technical assistance from abroad. Yet the complex of land ownership, tradition, and other institutional arrangements within which Iraqi agriculture is conducted has conspired to frustrate the effort. Iran is going through a similar effort to expand agricultural production—with capital and technical assistance available. The Shah is actively sponsoring an agrarian reform program. It will be interesting to see whether, with the traditional agricultural institutions of that country, the available capital resources can be applied in order to expand agriculture successfully.

On the other hand, once a farm producer is freed from archaic institutional limitations and is permitted to obtain a fair price in a situation where the need for increased production has created an opportunity for profit, he usually seems to be able to get the needed physical capital for expanding his output without public assistance. In fact, he seems to be able to do so even in cases where the product is in surplus if the opportunity for profit is artificially maintained. From 1957 to 1959, with attractive domestic prices, capital continued to pour into the extension of coffee plantation to the forested hillsides of Parana—at a rate approaching a half-million acres of new trees per year—after world prices had fallen more than a third from their 1954 peak and an enormous world surplus was in sight for at least five years ahead.

THE CAPITAL NEED

For the purposes of this discussion, the capital needs of an underdeveloped country can be usefully considered in the following loose categories:

(1) Direct investment in agriculture. This includes land, labor, materials, livestock, machinery, buildings, wells, and

other investment applied directly to production, by the producer or on his behalf, and not significantly for any nonagricultural purpose. Governments customarily count as direct investment in agriculture the general field of "extension"—that is, investment in the education of the producer to know about and use improved techniques of production—although this might perhaps be considered indirect investment because of the large nonagricultural benefits.

(2) Indirect investment to benefit agriculture—major irrigation and power projects, fertilizer plants, farm-to-market roads, and other supporting investment which will permit the producer to expand his output.

(3) Investment not consciously directed to agriculture—primary investment in the development of industry.

The capital needed for direct investment in agriculture in an underdeveloped country, once the other limitations on investment are sufficiently abated to get producers to use it, is typically of a local or national nature. It does not require much foreign exchange and, therefore, is not in itself dependent on loans from abroad. Moreover, it is small relative to the total capital, foreign and national, required for development. Hence, a government can, if necessary, usually allocate its foreign exchange to provide the small amount needed for direct agricultural investment from its own foreign earnings, without the use of foreign capital received as aid or loans.

The government of India, in its third development plan—beginning in 1961—even though greatly increasing emphasis on agriculture over earlier plans, provides less than 15 per cent of the total planned capital expenditures as direct investment in agriculture. A good part of this consists of extension-type activities—bringing technological knowledge to the villages. The rest is an estimate of what private entrepreneurs will invest—its direction depending primarily on

the relative profitability of different commodities in the Indian market. But, while the plan as a whole calls for somewhat more than one fifth of its capital in foreign exchange, the foreign exchange portion of the direct agricultural capital requirement is very much smaller.

From another point of view—that of net capital requirement for agriculture—it may be noted that, for most underdeveloped countries, a main concern is how to obtain capital from agriculture. In a largely agricultural country it is necessary to acquire national savings for investment in industry very largely by extracting from the agricultural community a surplus of currently produced income. Foreign capital can help, but there must be a substantial surplus of national production over consumption before self-sustaining development can be achieved. In effect, agriculture as a whole must save the direct-investment capital needed for its own expansion as well as some of that needed for industry.

INDIRECT INVESTMENT

The case is different when it comes to dams and irrigation systems, roads, fertilizer plants, warehouses, elevators, and other largely industrial investments which aid agricultural expansion. For many of these, the agriculture-aiding effect is overshadowed by other benefits to development. Moreover, the agricultural advantages are not necessarily pointed to a particular crop.

Many of these indirect investments to help agricultural expansion require very considerable amounts of imported material. The question of foreign capital is both relevant and important. In countries where land has been farmed for centuries, indirect investments—to bring plant food and water to the tired soil—give greatest promise of increasing agricultural production. To get the desired increases in Indian agricultural produc-

tion it is essential to apply much larger amounts of fertilizer. The facilities to produce this fertilizer require heavy capital investment to which the United States has importantly contributed. Where the most significant single need is irrigation, United States capital is available for that. Even in the case of the loan originally contemplated for the Aswan High Dam, the fact that Egypt is a large cotton-exporting country did not prevent approval from the point of view of agricultural policy. The later withdrawal was not due to agricultural considerations.

ALL CAPITAL HELPS

It seems quite probable, however, that, over any period of time, even the third category of capital need—that not consciously directed to agriculture but primarily to industry—tends to expand agricultural production, even though the industry in question produces items of no significance for agriculture—either direct or indirect. The expansion of industry spreads among more and more workers, their families and friends, a degree of the technical sophistication needed to enable agriculture to advance. In the process of growing up in the presence of industry—with opportunity for employment therein and advantage therefrom—there is implanted in the minds of people of a nonindustrial country the “magic” of applied science in place of whatever traditional “magic” has previously helped keep their agriculture primitive. The basic attitudes toward reality that go with understanding how to repair a machine, how to organize effort to gain efficiency by new specializations, or how to adopt a new process or technique will be carried inexorably into agriculture. The habit of making new things work is a powerful agent which time-honored institutions cannot resist indefinitely.

THE UNITED STATES ROLE

Thus, in a significant sense, practically all of the capital made available to underdeveloped countries by United States agencies, viewed as a whole, is a powerful factor in increasing agricultural production, although not necessarily at a rapid rate.

But, apart from that, the United States, in approving the loans requested by developing countries and giving technical assistance to their agriculture—a related matter—puts a high priority on the wishes of the government of the country requesting the funds. The United States is trying to help these countries develop from their present plight of having the bulk of their populations in agriculture—with people crowded on the land, underemployed, and inefficiently used even when they work—to a condition of substantial industrialization with their populations distributed—from an employment point of view—in such a manner that will advance individual opportunity and dignity in both industry and agriculture. Hence, there is emphasis on industrial development—except as needed to meet the growing food needs of the domestic population. For this latter purpose, however, the United States government is at times even more concerned than the local government that there be enough new investment in agriculture.

INVESTMENT IN SURPLUSES

Exports are another matter. It is rarely in the real interest of a developing country to expand the production of an agricultural commodity for export which is already in world surplus. This is true whether or not the United States happens to be an exporter of the product. It is as unfortunate, at this time in world affairs, to put additional capital into the production of coffee as of

wheat—for export. Demand is inelastic, exportable supplies greatly exceed what importing countries will buy—at any price schedule that yields an increase of exchange earnings with an increase of exports. United States reluctance to let its capital contribute to a worsening of this type of situation could hardly be considered a conflict of development policy with agricultural policy. A loan application for such a purpose might be a miscarriage of development policy. In the cases where underdeveloped countries request loans to expand production—for export—of commodities in world surplus, it is well to question whether the special interest of established producer groups² or the failure to work out imaginative plans for diversification and development have not unduly influenced the loan applications.

There will be cases where there is a real difference of opinion regarding a loan to expand agriculture in an underdeveloped country—and it is not impossible that United States agricultural

policy may be a factor in the United States view. It is believed that such cases have not been important. They have been negligible by comparison with the helpful effects toward balanced agricultural development resulting from United States lending and aid taken as a whole. A few cases are hardly evidence that underdeveloped countries have been hampered because United States agricultural policies interfered with United States capital aid.

In the perspective of history, it is not impossible that United States agricultural policies in the past fifteen years—for all their weaknesses—may be judged as one of the great contributions—albeit inadvertent—of the Western industrial world to the achievement of economic development in the previously less-advantaged countries. Certainly the flood of our farm surpluses has breached the levees of established Western commercial policy and is even now forcing new channels for the spread of our abundance. Official imagination is being flexed to envision magnitudes of capital flow adequate to complement the unplanned bounty. The turbulences incidental to such a flood will hardly be recorded as obstacles to development.

² The export products in many cases are grown on lands operated in plantation units, often owned by foreign capital or the local economic elite.

Scientific Manpower for the Less-developed Countries

By F. F. HILL

ABSTRACT: To stimulate agricultural growth through the application of science is a key problem of economic development. Numberless cultivators must be reached by—and must accept—integrated programs which include a range of services and commitments from technical advice to market assurances. Properly to aid cultivators requires enormous numbers of trained men and women who must essentially be local citizens rooted in their country's culture and problems. Even so, the United States can and should make an increased but more selective effort to help. The scope and complexity of the task together with the need to reach cultivators with all essential services recommend concentration in selected areas with long-term programs. The necessary emphasis upon the application of science makes educational institutions obvious instruments of this national policy, but they require long-term commitments with adequate financial help and a large amount of responsible freedom.

F. F. Hill, Ph.D., New York City, is Vice President of the Ford Foundation with primary responsibility for overseas programs. From 1952 until he assumed his duties at the Foundation in 1955, he was Provost of Cornell University. He was a member of the faculty and later head of the Department of Agricultural Economics at Cornell University from 1940 to 1952. His government positions include service with the Farm Credit Administration from 1933 to 1940, serving as Governor from 1938 to 1940, and in 1949 he was a consultant to the Economic Co-operation Administration. Dr. Hill is currently Deputy Chairman of the Board of Directors of the Federal Reserve Bank of New York.

THE majority if not all of the less-developed countries of the world urgently need to increase the quantity and improve the quality of their agricultural output. The urgency may arise, as in India, from the necessity of meeting the food requirements of a large and rapidly increasing population already undernourished or, as in Burma, primarily from the need for increased earnings of foreign exchange to help finance a program of general economic development.

Increasing the quantity and improving the quality of a country's agricultural production is basically a problem in the application of science and technology to the development of its agricultural resources. This involves much more, however, than knowing what existing techniques to apply to obtain increased yields and improved quality or how to develop new techniques to achieve these objectives. Even if appropriate techniques are available, the individual cultivator must first be convinced that they will in fact produce increased yields under his particular conditions. To convince him requires effective education and demonstration at the village level. He must also come to believe that he and his family will benefit sufficiently from the results to make it worth while to assume the production and economic risks involved. If he is a tenant, his decision will be affected in part by the share of the prospective increase in output which will accrue to him. If dealers' margins are excessive, the cultivator's incentive to increase production and improve quality will be reduced accordingly. Farmers in the less-developed countries, no less than in the United States, are sensitive to the possibility of declining prices if national output is substantially increased. Since small cultivators practicing a traditional agriculture make small cash outlays for operating ex-

penses and family living, they are under less compulsion to produce more for the market in the face of falling prices than are farmers in the United States.

But even if cultivators in large numbers in an underdeveloped country are convinced that the application of new techniques "will pay," measured in their terms, there are still important conditions that must be met before widespread adoption of new practices is likely. First, there must be in existence or created an effectively functioning supply line that makes available at the village, when needed, at reasonable cost, such production supplies and equipment as are required to put improved practices into effect. Second, since not every cultivator who might find it profitable to increase production is able to finance from his own resources the cost of the supplies and equipment required for the introduction of improved practices, credit on terms suited to the needs of the cultivator must be available at reasonable cost. Third, there must be a marketing system that moves farm products from the village to the consumer with minimum loss of quantity and quality and that returns to the producer a fair share of the price paid by the consumer.

THE PROBLEM

It is clear that not one but a number of conditions must be met if agricultural production in an underdeveloped country is to be materially increased. Solutions to the many problems involved are not to be had by simply exporting existing American institutional arrangements and technical knowledge to the less-developed countries even though these arrangements and techniques have created in this country a current embarrassment of agricultural riches. Each underdeveloped country must develop its own institutions rooted in its own cultural and institutional background.

Unless it is quite small, it must produce the greater part of the trained manpower required to staff these institutions—scientists, social scientists, administrators, and so on. Some of the trained manpower required can be brought in from the outside. Some can be produced by sending young men and women abroad for training. Foreign specialists and persons trained abroad can, and in the early stages of development frequently do, make contributions far out of proportion to their numbers. Seldom, however, will the number of persons in these two groups begin to meet total requirements. This means that the greater part of the scientific and administrative manpower required to modernize the agriculture of an underdeveloped country of any size must be trained at home. If appropriate educational and training facilities and programs do not exist, and they rarely do, they must be developed.

Agricultural development in such countries largely requires human and institutional development: training professional and administrative personnel for a wide variety of tasks; developing attitudes and points of view that will enable them to work effectively with each other and, when necessary, with the cultivators they are intended to serve; and providing educational and service institutions and institutional relationships that will make it possible for professional and administrative staff to function with maximum effectiveness in contributing toward the country's total agricultural effort. Above all, a shift from a traditional agriculture and way of life toward an agriculture based on modern science and technology involves not only acquiring new knowledge and skills on the part of millions of individual cultivators but far-reaching changes in their outlook and attitudes. Human and institutional change is a slow process usually better meas-

ured in decades and generations than in weeks, months, or even years.

SUGGESTED STRATEGY

It is the writer's belief that the United States can best assist the less-developed countries in improving their agriculture by placing major emphasis upon helping them develop key institutions and services and helping train the manpower required to staff them. Sending United States scientists and other specialized personnel abroad or bringing persons from the less-developed countries to the United States for training should be viewed primarily as a means to this end.

Growth and development of any kind seldom proceed uniformly over time. This is true of agricultural development within a single country as well as among countries. At present there are one or more underdeveloped countries in each major geographical region that have more agricultural development potential during the next decade than do others. These differences derive in part from differences in internal political stability, the aims, policies, and economic programs of current political leadership, variations in natural resources and, importantly, differences in the currently available numbers and quality of trained personnel, and in the vigor of institutions and flexibility of institutional relationships. These differences suggest the desirability of concentrating United States assistance in each major region first on a relatively limited number of key countries from the standpoint of agricultural development. This approach is likely to make the best use of scarce manpower and capital resources, both in the United States and host countries, and to accomplish the most in the shortest time in terms of demonstrable results. Demonstrated progress is of major importance in the

early stages of development in stimulating further progress.

Within each country selected for intensive effort it will usually be desirable, at least at the outset because of shortages of competent personnel and other resources, to concentrate on the development of a limited number of key institutions and training programs and, in the countryside, on a limited number of carefully selected areas. India's program announced last April which proposed a concentrated across-the-board effort to increase the production of food crops in one district in each of her fifteen states is a good illustration of concentrating scarce manpower and material resources in key areas in an effort to stimulate a shift from a traditional toward a modern agriculture.

Although concentration of United States efforts in key countries in each major geographical region and on key institutions and services and in selected production areas is desirable, it is imperative that the program include an attack on all the major bottlenecks limiting increased production. Experience has clearly demonstrated that results are likely to be disappointing if efforts are largely confined to one or two aspects of the total problem. It does little good to convince a cultivator that a particular set of practices will result in substantially increased yields if he believes that the economic risks involved in adopting them are greater than he can afford, or that his share of the increased output will be so small that the effort is not worth while. Furthermore, even if he is willing and eager to adopt improved practices, he will not be able to do so unless the necessary production supplies and equipment are available when he needs them and unless he can finance their purchase either from his own resources or through a loan at reasonable cost on terms suited

to his needs. To repeat then, this means (1) that improved practices must have been tested and demonstrated to the cultivator, (2) that he must be convinced that they will result in increased output on his particular holding and that his share of the increased output will be sufficient to justify his assuming the risks involved, (3) that the supplies and equipment necessary to carry out improved practices must be available at the village at the time the cultivator needs them at prices he feels he can afford to pay, (4) that, if he requires it, credit is available on terms suited to the cultivator's needs at reasonable cost, and (5) that the marketing system is reasonably efficient and returns to the cultivator a fair share of the price paid by the consumer. All these conditions must be met if new and improved production methods are to be adopted.

The emphasis placed upon selecting key countries in each major geographical region for intensive United States assistance and upon key institutions and areas within each key country does not mean that I would limit assistance to these countries, institutions, and areas. Political as well as other considerations make such an approach impractical. However, it is important, it seems to me, to concentrate sufficient resources in selected countries, institutions, and limited areas in an effort to achieve a noticeable increase in agricultural production in the shortest possible length of time; in other words, to develop pace-setting areas. An important consideration in the early stages of any development program is to demonstrate beyond doubt that the methods recommended will in fact result in increased production and higher levels of living. Once this has been done, one can intensify the programs in other areas as rapidly as resources will permit.

METHODS OF ASSISTANCE

The primary objective of all United States assistance, whether in agriculture or other fields, presumably is to help the recipient country reach a point as quickly as possible where such aid is no longer necessary. In agriculture this means that attention should be concentrated on helping host countries develop agricultural colleges, experiment stations, research institutes, extension services, supply services, credit services, and marketing services suited to their particular needs; in other words, to help them develop the basic institutional mechanisms required to bring about changes in agriculture over time including changes in the attitudes and outlook of cultivators. In appropriate instances, both financial and technical assistance might well be given in connection with large-scale intensive demonstration efforts such as the one previously referred to in the case of India.

Since institutions, services, and programs are being developed for the benefit of the host countries, they should, other than in exceptional circumstances, pay local currency costs and provide a part of foreign exchange requirements in proportion to their ability to do so. Project plans and agreements should provide for the gradual replacement of United States personnel by indigenous personnel as it is trained and for the gradual withdrawal of United States financial support with the host country increasing its contribution by stages until it is paying the full cost.

As previously shown, agricultural development is essentially a slow process of human and institutional change—a fact that should influence the planning of aid to agriculture in the less-developed countries. The development of a viable, effective agricultural college, experiment station, extension service, credit service, or marketing service in

an underdeveloped country may take ten years or longer. Personnel requirements and financing should be planned accordingly.

Proposed approach

We need, I think, to experiment with some new approaches in the financing of United States foreign aid programs. If, for example, we decide to establish an agricultural research center or a laboratory for nutritional studies in an African country to be fully staffed and financed by that country in, say, ten years, why not:

(1) Select the university or other United States institution best qualified to do the job and try to persuade it to undertake the assignment under contract. Or encourage the formation of an association of two or more universities or other institutions to accept the job, as the Associated Universities, Incorporated, which operates the Brookhaven National Laboratory for the Atomic Energy Commission.

(2) Formulate a general agreement upon the nature of the job to be done. Leave management decisions, including the determination of salaries and personnel policies, to the contracting institutions. Require the submission of regular operating and financial reports, but limit control to annual inspections and to audits such as those conducted by United States Department of Agriculture experiment station examiners.

(3) Make an outright grant to the contracting university or other institution in two parts, consisting of (a) the estimated capital costs of establishing the institution and (b) estimated operating expenses for a period of ten years.

(4) Tell the contracting institution to proceed with the job.

Because of the wide variety of specialized jobs to be done and the fact

that a primary objective of United States foreign technical assistance is to help the host countries train their own people to replace American staff as quickly as possible, it is neither feasible nor desirable to build up a career technical assistance staff to do the total job. In terms of both flexibility and of obtaining all the kinds of special competence needed, the career staff should be supplemented by borrowing of staff, for varying periods of time, from colleges and universities, the United States Department of Agriculture, and other organizations.

Unless colleges and universities can supplement existing staff—to have at least some manpower beyond the minimum requirements of the classroom—they will not be able to respond to requests for released staff time when the bulge in student enrollments strikes the country's campuses in the early 1960's. One possible approach to this problem might be for the federal gov-

ernment to make five- or ten-year grants to institutions willing to cooperate in foreign aid programs in amounts sufficient to cover the salaries of a specified number of additional staff members, with the understanding that the institution would be willing to negotiate on the question of released time for an equivalent number of staff members for overseas service. Such negotiations would have to be mutually undertaken in a "give and take" spirit respecting the precise number and the particular staff members to be released in a given year. Whether or not this particular approach is feasible, the fact remains that a new dimension has been added to our land-grant colleges and universities, in particular, namely, "overseas extension work." Institutional and financial provisions need to be made in executing this new activity as was ultimately done when extension was added to teaching and research in the United States.

Transfer of Basic Skills of Food Production

By CHARLES E. KELLOGG

ABSTRACT: Potentialities for more food in the underdeveloped countries with better soil and water use range from small to exceedingly large depending, in the first instance, on the kind of soil and what is known about it. The achievement of the potentialities is a very complex and difficult problem. For success in most places, several practices, such as those for water control, fertilization, kind and varieties of crops grown, and plant protection, must be changed at the same time if any of them are to give significant economic returns. Basic handicaps are a very low social status of cultivators in many countries and the lack of specific information requiring sound recommendations. Rarely can programs or practices be transferred from advanced countries of temperate regions to underdeveloped countries of the tropics or subtropics. Only basic principles and the skills to learn can be transferred. Those transferring skills from the advanced to the underdeveloped countries must be able (1) to analyze the problems and to invent effective practices and programs while in the area, (2) to work hard under less than ideal conditions, and (3) to be courteous at all levels of work from the cultivator to the highest officials of sovereign governments.

Charles E. Kellogg, Ph.D., Washington, D. C., is Assistant Administrator for Soil Survey, Soil Conservation Service. He has been in charge of the Soil Survey of the United States Department of Agriculture for some twenty-five years after service with the University of Wisconsin and the North Dakota Agricultural College. He has made many study trips abroad for the government of the United States and also as a guest of several foreign governments, research institutes, and foundations. A graduate of Michigan State University, Dr. Kellogg is the author of the Soils that Support Us (1941), Food, Soil and People (1950), and Our Garden Soils (1952).

THE world food problem demands attention. Although abundant food may not guarantee peace, severe food scarcities will guarantee no-peace. Generally countries must raise most of their own food. The percentage of the world's food requirements supplied through international trade will be small at best.

Since 1945 increased efforts have been made to transfer skills from the advanced to the underdeveloped countries. Yet food production skills have lagged far behind those that preserve life and that lead to increased material wants.

This lag results from several causes, not the least of which is a general failure to recognize the complexities. Most, including the writer, have suggested that the economic, political, and institutional aspects are more complex than the strictly physical and biological problems. Although probably true in most underdeveloped areas, this is a misleading generalization. The record shows that the development of reliable recommendations for soil use and management to realize the potential harvests is extremely difficult, especially in crowded countries. In this article I propose to suggest some of the reasons why the job is so difficult.

THE PROBLEM

The world food problem, in strictly physical terms—in calories per person—has probably been more serious many times in world history than it is at present. However, populations are now increasing, unevenly in relation to supplies. Certainly serious food problems could arise in many countries, partly because of a lack of the basic agricultural resources—responsive soils and water—but much more because the resources available are not used so effectively as they could be.

On the other hand, science has made possible an enormously improved agri-

cultural technology that is being applied to food production in many advanced countries at a continually accelerating rate. Not only has science increased the potentialities of traditionally arable soils; but also it has made economic food production possible from soils that were nonarable—unusable for food crops—by the methods known only a few years ago.

Still many countries face a food crisis. In social and political terms, the problem is far more critical than ever before.

For one thing the expanding economies of many underdeveloped countries have increased the demand for food; and the lack of it is a substantial cause of inflation. But another reason is more important: before world-wide travel and communication most of the people in the underdeveloped lands took food shortages and occasional famines for granted. The full rice bowl has been the symbol of both security and affluence for a long, long time in many countries.

Recently the people in countries short of food have learned that people elsewhere have abundant food. They have heard about America, for example, and some have been here. They are now unwilling to accept either chronic or occasional food shortages as a normal way of living. This new awareness is far more important in highlighting the food problem than any absolute scarcity. With the new burst of nationalism and the burning desires of these people to be recognized as full citizens of the world, they expect to have governments that will do what is necessary.

Yet raising the level of food production is an exceedingly complex process. It deeply involves science and technology as well as improved institutions for farm supplies, credit, land tenure, and food marketing and distribution. The most successful methods are now

products; (2) systems improved through the application of science but without industrial products; and (3) high-level systems that make full use of technology, including machines and chemicals. The differences in production per acre or per man-hour-acre are very different among these levels on the same kind of soil. But in countries where land is scarce and the need for food is great, such transitions are likely to be too slow.

Besides the difficulties of analysis and invention, we need to recall that people from advanced countries are primarily helping officials and technicians in the underdeveloped countries to use the basic principles and the learning skills. Rarely should they attempt direct work with the cultivators by themselves. They are helping to develop a skilled cadre to do the scientific, technical, and educational work, and to continue to meet the needs for the long years ahead.

THE SOCIAL SETTING

Many of the countries who have the greatest need to improve their food supply have only recently acquired their independence. The goals they conceive for themselves are not always the same as people from advanced countries think they should be. But the fact that they are independent sovereign states should not be forgotten for a moment.

In contrast to America and Western Europe, in most underdeveloped countries the cultivators who work in the fields have a low social status. This is an enormous handicap to agricultural improvement through the use of modern technology. Besides the fact that many cultivators are illiterate, communication is made even more difficult because so many people in the government services, perhaps unconsciously, regard them as inferior people. In the underdeveloped countries where food shortages are most severe, generally the

college curricula for agricultural scientists, compared to those for other professional careers, are the poorest and the standards for both admittance and graduation the lowest. According to a summary in the *New York Times* for June 28, 1959, less than 4 per cent of the foreign students coming to the United States study agriculture. Such a hapless lack of balance in educational effort is difficult to overcome while the socially degrading position of the cultivators seems to the young student to extend also to the professional men who serve them.

Although government leaders are trying to correct this situation, progress is slow. Moreover, many of them have this prejudice themselves, despite their efforts to overcome it. Yet experience strongly suggests that there is marked improvement only among those farm people who take a large share of the responsibility themselves. The dignity of the cultivator must be strengthened and respected. He must learn to help himself and to be self-confident of his own ability.

Unhappily, relatively few high government officials in the underdeveloped countries have a primarily rural background. Contrary to what many from advanced countries suppose, I have found these officials to be as able and as responsible as their counterparts elsewhere. But they lack agricultural knowledge, partly because of the low social status of farm people and partly because of the absence of a corps of agricultural scientists.

Perhaps the greatest handicap to agricultural improvement in many underdeveloped countries is the false notion that this improvement is a relatively simple matter. This unhappy idea has even been supported by some American and European advisers. The notion implies, firstly, that improved farming results from emphasizing a few

simple practices; secondly, that "someone" knows what these should be; and thirdly, that it is necessary only to find this "someone" and have him pass the "good word" on to the cultivators. None of these is approximately true for most undeveloped parts of the world.

SOME HANDICAPS TO BE OVERCOME

People in both advanced and underdeveloped countries must be helped to understand two basic ideas as they apply to particular areas and communities: (1) The potentialities for more food with better soil and water use range from small to exceedingly large, depending, in the first instance, on the kind of soil and what is known about it; and (2) the achievement of the potentialities is a very complex and difficult problem including scholarly scientific research and surveys, careful testing of alternatives, and full co-operation with cultivators regarded as equal citizens.

Where the full measure of these complexities is not understood, a tendency to short-cut them is inevitable. Many government leaders want to reach their goals quickly. And to get the votes in a democratic society they do need to show progress! They are attracted by the various agricultural advisory services of advanced countries without realizing that such programs, helpful as they are, are only partly responsible for the agricultural improvements of the past 150 years. A host of other essential public and private efforts also contribute to the result.

Besides public education and similar activities, many private agencies have functions of great importance in the advanced countries. For example, much of the stepped up use of fertilizers in the United States and Europe is due to the trade itself. In these countries, most improvements in farm machinery have been developed by private manufacturers.

Even individuals doing effective advisory work in the advanced countries may not themselves realize how much the results they seem to achieve depend both on basic data and on many other programs and institutions that they have always taken for granted, but that hardly exist in the underdeveloped countries. Thus, unconsciously they ascribe more of the results to advisory work than it has actually achieved, by itself, and promise far more for undeveloped areas than it can accomplish. With such a wrong diagnosis of problems requiring research and invention, the government leaders, the advisers, and the cultivators become frustrated with the results of the program.

Now this does not always happen. Some reliable data do exist in parts of these countries. Some advisers do have the skill to learn. They study the local conditions and experiences of their area of concern; they diagnose the basic problems; and they draw on the results of research and experience from similar areas, perhaps in distant countries where the soils are of the same kinds, and formulate dependable suggestions for transfers of both basic data and agricultural skills. That is, the oversimplification and superficiality that are so common are not universal.

Another kind of handicap results from the critical need for more food as well as from strong desires to progress along all other lines at the same time. Agriculture competes with programs for transport, housing, health, education, and industry, for skilled scientists and technicians, and for such materials as chemicals and steel. Curiously, in countries where food is the outstanding problem one may find the salary scales in the agricultural services lower than those in other less urgently needed services.

Naturally, the people in underdeveloped areas are struggling with the other

problems too—taxes, health, education, and so on. Other services are being changed also. With proper co-ordination these can help food production, rather than compete with it. But unhappily such co-ordination is difficult where the needs of agriculture are imperfectly understood. In crowded countries especially, the agricultural adviser finds few places to start afresh on a clean slate.

THE SUCCESSFUL ADVISER

Anyone undertaking to transfer the basic skills of agriculture from advanced to underdeveloped countries must have a well-disciplined imagination tempered with patience. He must not only use and be proficient in the skills, but he must also be able to teach them to others.

Many of us have seen good examples of people from advanced countries helping those in underdeveloped countries to make substantial progress. Such people vary from one another, of course, and their detailed methods vary with their personalities. But generally they seem to have a few vital characteristics in common:

1. They have unusually high competence in the basic aspects of their fields of learning and enough imagination to invent programs that fit the problem situation, which they are able to diagnose and to understand. Besides being outstanding specialists they have broad points of view that permit them to see how their own specialty must be related to others for successful results.

2. Successful advisers in underdeveloped countries have an enormous capacity for sustained hard work under less than ideal conditions. Hard work is necessary to complete the job. Perhaps even more important, a sense of urgency and the example of hard work spread to others.

3. Such successful advisers have good manners and courtesy, coupled with essential firmness. This gives them the ability to deal directly with top-level people in foreign governments, with the cultivators, and with other large groups of people.

One could not say that any one of these three is more important than the others. A lack of any one is an extreme handicap. A very few people who are barely adequate in America or Europe are successful abroad, but this number is very small indeed. Generally speaking, this kind of work requires men old enough to have gained experience and balance but young enough to be flexible and to work effectively within a new and different environment and with people having somewhat different ends in view.

Some say that a kind of "missionary spirit" is necessary. More important is the desire to learn and to be helpful. The able adviser who works hard at learning and at his task can influence social ends, mainly by his actions and especially by the results of his work, but little through talk alone.

REASONS FOR THE EFFORT

This is indeed a job that needs to be done for positive reasons. Americans have worked hard; and we still do. We have also been very fortunate. We have great resources per capita; we started with a great cultural heritage from classical Greece and Rome and from Western Europe; we have had great opportunities for individuals to succeed; and science and its resulting technology have had a chance to thrive.

We should share our experiences, not with any spirit of opposition or superiority but rather in the spirit of the Sermon on the Mount, with humility and thankfulness for the opportunities for constructive help.

Contributions of Colleges of Agriculture in Making Human Capital Available in Foreign Economic Development

By MERVIN G. SMITH and JOSEPH ACKERMAN

ABSTRACT: The United States agricultural colleges and extension services need to take a key role in our foreign policy. The need is great for trained people in foreign agricultural development. Agricultural colleges are conducting special assistance projects, training foreign students, and furnishing technical personnel. This has been valuable, but it is not enough if we are to be successful in the economic cold war and the world ideological conflict.

In our foreign assistance program much more emphasis is needed on the development process, the problem-solving method, broad planning, and longer-term programs. Consideration should be given to the cultural, psychological, institutional, social, and economic changes which must accompany rapid progress and economic growth. Our agricultural colleges need to strengthen their research and educational programs on managing and facilitating changes or adjustments to the rapid adoption of new technology. This is important: (1) if we are to make headway on our major domestic farm problem, and (2) if we are to develop an outstanding technical assistance program with underdeveloped countries.

Mervin G. Smith, Ph.D., Columbus, Ohio, is presently Chairman and Professor of the Department of Agricultural Economics and Rural Sociology of Ohio State University. He was Visiting Professor at Iowa State University with the Center for Agricultural and Economic Adjustment the first six months of 1960. He has spent approximately four years in agricultural attaché work and on a number of special assignments with the International Co-operation Administration.

Joseph Ackerman, Ph.D., Chicago, Illinois, is Managing Director of the Farm Foundation, an organization interested in improving the economic, cultural, and social conditions of rural people. Dr. Ackerman holds his Ph.D. degree from the University of Illinois, where he was formerly a member of the agricultural economics staff. He is presently serving as Secretary-Treasurer of the International Conference of Agricultural Economists.

OUR challenge today is to achieve significant improvement in the ability of the masses of people in the world to satisfy their basic wants. The Western nations and the Communist bloc are involved in an ideological conflict about the type of government organization, the place of the individual, and the method of achieving rapid economic progress in underdeveloped countries.

One of the serious limiting factors to progress in such countries is the lack of training and skilled human resources. The situation can be improved if the United States fully uses an important existing resource—its agricultural colleges. Since the underdeveloped countries are agrarian their development programs must stress rapid increase in agricultural productivity.

We must recognize that the people of the less-developed countries are becoming aware of the beneficial role science and technology have played in the Western world. They expect that scientific developments could also improve their living conditions. They want, and intend to secure, the modern advantages of education, research, and technology in order to improve their health, their diets, and in general, to obtain many of the material things we regard as necessities.

After 1945, the first emphasis was on recovery from war damage. Later, assistance was provided to develop the military strength of the free world against Communist threats. With the growing desire of people for progress, increasing thought must be given to economic and technical assistance.

FARM POLICY CONCERN

Before we analyze our foreign technical assistance program and the contribution of the agricultural colleges, we shall consider briefly our own farm pol-

icy and its relation to foreign technical assistance. Our success in the entire foreign assistance program may be influenced greatly by our domestic farm policies. To some extent, we have been trying to solve our domestic farm problem through exports. This has brought unfavorable reaction from foreign countries, some justified and some not.

Our farm problem is the result of unprecedented rapid adoption of new technology in agricultural production. Although we have made many adjustments in the last few years, too many resources still remain in farming, resulting in chronic excess production over consumption and continually depressed farm prices and farm incomes. The solution to this problem lies in facilitating more rapid adjustments of resources in farm production. We should also give separate attention to improvement of foreign trade and other foreign problems, but this is not the basic problem in agriculture. Special foreign trade schemes are not likely to solve the entire farm problem; these often affect adversely the economies of foreign countries, creating unfavorable foreign relations. Such programs arouse suspicion about the United States motives and hinder our efforts to promote economic development.

Agricultural colleges are giving some attention, but need to give more, to the economic and social adjustment problems in farming, in agricultural related industries, and in rural communities in the United States. Research and education on these problems will improve our effectiveness in training personnel for technical advisory work in foreign countries.

FOREIGN TECHNICAL ASSISTANCE

In considering the part the agricultural colleges and extension services can play in our foreign policy we need first

to make a critical analysis of our total foreign aid program which has consisted of three types of assistance: military, economic, and technical. Technical assistance has constituted only about 4 per cent of the annual foreign aid budget or about 150 million dollars of the total 3 to 4 billion dollars per year. The largest part of our expenditure has been divided between military and economic assistance. Both American and foreign people are confused about the difference between these programs and the objectives and motives behind each. We believe that administratively military assistance should be more definitely separated from the other phases, not only to distinguish between the programs but also to have each phase directed by qualified specialists.

Technical assistance is mainly investment in human resources, such as educational institutions, training programs, and so forth. It is not only the least expensive form of assistance but probably the most effective. It builds strong ties of understanding, confidence, and good will. Economic assistance is mainly an investment in physical resources, such as dams, factories, and so on.

Much of the economic assistance is for so-called "impact" or spectacular projects. How much we should spend for these and how much for institutional or human resources is a difficult question.

To court popular favor, the Communists have emphasized "impact" projects, yet their technicians equal or outnumber ours. In 1959 the United States International Co-operation Administration (ICA), which conducts most of our technical assistance work, had about 3,200 technicians abroad, including about 1,100 in agriculture. In 1958 the Communists were estimated to have abroad about 6,100 technicians

of whom significant numbers were trained in economics and administration—fields in which only a very few of our technicians are trained.

ICA has had much difficulty finding qualified technicians and has often been forced to hire personnel without proper training or experience. Administrators and technicians in technical assistance work should have a broad understanding of the whole development process. Training is required to develop ability to analyze relationships between various segments of an economy and to understand the production and marketing processes, social relationships, and the role of credit and education. Most technicians with training in the natural or physical sciences lack this training, yet they are in charge of most of our development programs.

Economic and social aspects

Not enough attention has been given to the economic, social, and cultural aspects of promoting progress in underdeveloped countries where the attitudes, methods of procedure, and even the social system must often be changed and geared to the promotion of economic development. The speed with which new technology can be adopted will depend on how rapidly the accompanying social and economic changes can be effected. Unless considerably more attention is given to these aspects progress will be too slow and political and social chaos may follow.

To illustrate, when a country wishes to develop a specific area, an economic analysis should be made. Unfortunately, many of our technicians lack experience in such studies. If the analysis suggests a colonization project, some of the items which should be considered in its development would be: selection and movement of farm people to the

area; training of technicians to advise the farmers; development of transportation facilities; development of associated agricultural supply, processing, and marketing industries; development of farmer organizations, perhaps including co-operatives; training of skilled and specialized leaders and labor to work in these organizations and related industries; consideration of social and cultural problems which are likely to arise; and development of governmental and other services in the community.

Applied education

Few persons in foreign technical assistance work have the background or training to handle all these. Our personnel tend to think in terms of the United States in 1960, rather than an economy with an agriculture more like ours 100 or 150 years ago, but with an adverse ratio of population to resources.

In order to achieve economic development democratically, the people must understand their problems and take part in programs to solve them. Few people in underdeveloped countries have sufficient education to study and analyze the problems, or to cope with the much more difficult task of developing solutions to these problems. Literacy is estimated to be less than 25 per cent. Basic to all development, and this needs to be stressed more in technical assistance, is elementary education: reading, writing, and arithmetic. Unless the masses can be educated, assistance programs will be difficult to establish and may be doomed to failure. The people must understand its importance, must be trained for specialized work, and be sufficiently involved to take interest and pride in doing a good job.

Our technical assistance programs have not gone far enough in developing wide participation in the problem-solving process of applied education. In

some countries having four-, five-, or six-year plans, few leaders and even fewer citizens have thoroughly studied the problems and developed an understanding of the procedures for solving them. For this reason, many phases of the plans are never carried out, especially at the local level.

Under the method of the Communists or the dictators, a few people develop the plans and procedures. The implementation of such programs and plans usually requires considerable regimentation rather than voluntary participation. The Communists believe in widespread education to develop the skills of people. They also use economists to develop their programs. However, they have little regard for people as human beings outside of the technical context.

Both administrators and technicians find their new roles in technical foreign assistance difficult. Impatient with the lack of training or incentive of their local counterparts, they have an impulse to move in and do the job themselves. Failure may be the result; success comes only when local people learn to do things for themselves.

An understanding of the people, the way they think and work, is essential to the success of a program. Such understanding comes best from working with the people on tasks of mutual concern. The people must be convinced of our desire for their advancement, and earning their confidence is sometimes a slow process. We cannot buy this confidence and friendship with money, material goods, and military equipment. It can only be gained through understanding and mutual respect. At the same time we should not underestimate the confidence we now have.

Recently one of the authors directed a short seminar on agricultural marketing and co-operatives for Latin America. The delegates, one to six per country,

showed much interest in the breadth of the approach needed to bring about development. Some of them indicated, however, that they would not be able to do much unless more of their leaders acquired an understanding of the problems involved and the many facets that require attention if development is to be achieved. The delegates indicated they might be able to develop a broad study program if the director of the seminar could meet for a few days with their associates and leaders. Not being intimately involved, he might persuade their associates to participate in a seminar and to interest them in studying their problems more intensively and in developing improved action programs.

Congress should put foreign technical assistance on a long-term rather than a year to year basis. Uncertainty regarding continuance of the program is a serious obstacle to technical assistance. Often foreign countries cannot start major long-run projects without assurance of our assistance. Administrators who can offer only one or two years of tenure are handicapped in hiring the best personnel. Effective planning is difficult in the face of an uncertain future. Continuity is disrupted, resulting in a waste of time and funds. In spite of the short-term planning technical aid programs have justified their investment by the improvements in the economies of many countries.

AGRICULTURAL COLLEGES

Technical assistance is a major national policy that our universities and colleges must support with research and education. Our agricultural colleges, including the extension services, can make important contributions in five main areas: (1) carry out specific foreign technical-assistance projects, (2) train United States technicians for work in this field, (3) train foreign students,

(4) do research work in foreign agricultural development and relations, and (5) conduct an educational program in this country to develop a broad understanding of world affairs and especially technical assistance.

College contracts or projects

In 1959 some fifty-three universities and colleges in the United States had contracts for varied types of educational institutional assistance in underdeveloped countries. Of the eighty-nine separate contracts or projects about one third were agricultural. While some projects have been generally productive, they can and should be considerably improved.

Some difficulties have been encountered in the working relationships between the colleges and the ICA. Apparently ICA in Washington has lacked understanding of the philosophy, policy, and operation of the colleges. This has led perhaps to more checking and restrictions in the management of the projects than the colleges would have liked. On the other hand, college administrators and personnel have not had a thorough understanding of the total foreign technical-assistance program and the part that college contracts can play in the program. College projects must be co-ordinated with the larger programs which ICA and other technical-assistance agencies are conducting.

Colleges of agriculture have much to offer in advising foreign countries in developing programs of agricultural education, research, and extension. Administrators and technicians assigned to the programs have often been unfamiliar with the conditions they were to meet. Moreover, project personnel have rarely been properly trained or experienced in the over-all development process. Most of the contracts are for help in developing agricultural colleges, extension serv-

ices, and experiment stations. Not enough attention has been given to the economic, social, cultural, and psychological adjustments required in the development of these institutions. These immensely important projects should be directed by our most competent and experienced educational administrators. Our educational and technical aid must be free from the suspicion that it is a part of a military or economic pressure program.

Training U. S. personnel

If our agricultural colleges are to participate in technical assistance for an extended period, the entire staff of the colleges of agriculture should become acquainted with the foreign contract program. The various departments need to be involved in the planning, training, and assignment of personnel.

The personnel or technicians working under the special college contracts are only a small portion of the number of technicians involved in our total foreign technical-assistance program. At least, some of our colleges of agriculture need to develop plans for doing an adequate job of training technical-assistance personnel. This requires the addition of new courses, obtaining qualified teaching staff, and some reorganization of the colleges. Special training should be offered in the process of economic development and especially in the history, culture, language, economics, and sociology of the foreign countries.

If special financing, outside of the regular state and federal funds for colleges of agriculture, is required the foreign technical assistance budget might provide for it. Both the colleges of agriculture and ICA need to take a critical and objective look at these problems and design programs within our colleges to meet the needs.

Training foreign students

An increasing number of the 47,000 foreign students presently attending universities and colleges in the United States are enrolled in colleges of agriculture. The number in agriculture is likely to increase in the next few years. Besides these regular students some 8,000 foreign nationals are being brought to this country for three months to one year of training—three fourths of them by the ICA. Over one fourth of this number are in agriculture. Nearly all of our land-grant colleges have been taking these students. The courses offered and the quality and orientation of instruction could be greatly improved, and everyone concerned must work to this end. Most foreign students should have training in administration, since many of them will later find themselves in administrative positions in their own countries. Arrangements should be made for research or study dealing with problems of the student's own country. Possibly selected institutions should receive financial help to specialize in the training of these foreign students.

Research

If agricultural colleges are to participate in foreign technical assistance they must conduct research in this area, particularly in the field of economic and social development, and they should receive funds for such programs from our foreign assistance budget and from other sources.

Public education

Our universities need to include courses on economic development in the general curricula. Our agricultural extension service should include foreign policy and agricultural technical assist-

ance in its educational programs for rural people.

Can the land-grant colleges in this country meet the challenges in these broad problem areas? They must assume greater leadership in helping to solve our domestic farm problem. They must also do their share in helping the less-developed countries of the world achieve rapid economic development and growth. The pessimist will forecast

failure, saying that the democratic educational process is too slow, and that the world-wide downfall of democracy is imminent. The optimist will say that we will meet this challenge, that the concern for the human being and his supreme rights and welfare will prevail so strongly that even the Communists and regimented systems will need to give greater consideration to the human being in the future.

Land-Grant Institutions, the Public, and the Public Interest

By ROLAND R. RENNE

ABSTRACT: The land-grant institutions constitute a revolutionary concept in education. Each state, by passage of the Morrill Act of 1862, was given a grant of public land. Later acts appropriated federal funds to pay part of the operating costs of these institutions and established agricultural experiment stations and the Co-operative Agricultural Extension Service to be operated by these institutions. These institutions fulfilled the need for educating the youth of the farming and "industrial classes." From "colleges of agriculture and mechanic arts" these institutions have broadened their curricula and have become for the most part universities. Although curricula have undergone great changes in number and in specialized content there is now a great need for further adaptation to the vast complexities of present-day national and international realities. The urgency for widespread understanding of peoples will require much less specialization at the undergraduate level and much more synthesis of material which will cut across rigid, traditional course lines. Establishment of divisions or centers for international problems and policies should be accelerated. To develop consumer understanding of agricultural programs and problems, the land-grant institutions should consider the development of more educational programs among workers and their families.

Roland R. Renne, Ph.D., Bozeman, Montana, is President of Montana State College. He has served as Professor of Agricultural Economics at Montana State College; as Chief of the United States Technical and Economic Mission to the Philippines (1951-1953); as Chief of the Joint World Bank—Food and Agriculture Organization Agricultural Survey Mission to Peru (1958-1959); and as Land Settlement Consultant to the United States Operations Mission to Ethiopia (1960). Dr. Renne is a graduate of the University of Wisconsin and is the author of Land Economics (1947, 1958), The Government and Administration of Montana (1959), and co-author with J. Wesley Hoffmann of The Montana Citizen (1937, 1940, 1960).

THE land-grant institutions as we know them today represent a co-operative undertaking with joint financial support by the federal and state governments for resident instruction at the college level, agricultural research through a system of experiment stations, and dissemination of agricultural and home economics information through the Co-operative Extension Service. There are sixty-eight such institutions in operation today, one in each of thirty-three states and Puerto Rico, and two in each of seventeen states—Massachusetts and sixteen southern states. Fifty-two of the sixty-eight institutions serve primarily white students and the other sixteen serve primarily negroes.

The federal act establishing such land-grant institutions is known as the Morrill Act of 1862, and the bill passed by Congress was signed by President Abraham Lincoln on July 2, 1862. The Morrill Act provided only for grants of public land to the states for the establishment of such institutions, and the states were permitted to sell parts of this land. Later, federal legislation was passed making federal funds available to cover part of the annual salaries and expenses of operating such institutions. The second Morrill Act of 1890 appropriated \$25,000 to each state for such institutions, and the Nelson Amendment of 1907 added another \$25,000 for each state. The Hatch Act passed in 1887 appropriated funds for agricultural experiment stations to be established in connection with the land-grant institutions created by the Morrill Act of 1862. The Adams Act of 1906 and the Purnell Act of 1925 provided explicitly for research grants at the experiment stations. The Smith-Lever Act of May 8, 1914 established the Co-operative Agricultural Extension Service, and made federal funds available to pay a portion of its costs. The Bankhead-Jones Act of 1935 added additional federal funds

for resident instruction, experiment stations, and extension services.

THE LAND-GRANT INSTITUTIONS

No other institutions of higher learning in the United States participate in the above federal appropriations, except the so-called "land-grant institutions." The above federal acts indicate the partnership of the federal government with state governments in providing resident instruction, agricultural research, and extension services for the people. Other institutions, including separated state universities, schools of mines, and some teachers colleges, participated in the land-grant, but none of these institutions participate in the annual federal appropriations for operating expenses. Consequently, the term "land-grant institution" as we know it today refers to only a part of the institutions that were given federal land grants.

The Morrill Act establishing land-grant institutions provides that these institutions have for their leading objects and purposes, "without excluding other scientific and classical studies, and including military tactics, the teaching of such branches of learning as are related to agriculture and the mechanic arts." Many of the land-grant institutions were known in the beginning as "A & M" colleges, or in other words, Colleges of Agriculture and Mechanic Arts. Today only eight of the sixty-eight institutions have, as a part of their official name, the term "A & M" and forty-eight are called "Universities." Only twenty, or approximately 30 per cent, of the sixty-eight are referred to as "Colleges." This change in name from "A & M College" to "State College" to "State University" shows the broadened scope of education provided by the land-grant institutions. Many of these names have been changed from

"College" to "University" in the past five years. The change in name in addition to reflecting the need for broadened educational services also reflects the declining importance of agricultural students in the total enrollment. It is significant that only nineteen of the sixty-eight institutions still use the word "Agricultural" in their official title. All of the institutions, of course, have schools of engineering which grew out of the term "Mechanical Arts." Four of the institutions carry the word "Technology" or "Polytechnic" in their official names, six carry the word "Science" or "Applied Science," one carries the term "Engineering," and one carries the word "Industrial" in its name. These last sentences epitomize the trend of the land-grant colleges toward university status.

A NEW CONCEPT OF HIGHER EDUCATION

The Morrill Act ushered in a whole new concept of higher education. These institutions were designed to serve primarily the sons and daughters of the working classes and the farm people. Evidence that this revolutionary idea met a strongly felt need in the United States and that these institutions have kept pace with the changing needs of the country is displayed in the following statistics. Although the sixty-eight land-grant institutions comprise only 3.4 per cent of the total colleges and universities of the nation, they enroll 18 per cent of the United States college population. They award 40 per cent of the Ph.D. degrees in all fields, 55 per cent of those in biology, all of those in agriculture, 43 per cent in the physical sciences, 53 per cent in engineering, 35 per cent in mathematics, 31 per cent in the social sciences, 28 per cent in business and education, 25 per cent in Eng-

lish, and 23 per cent in literature and foreign languages.¹

From the very beginning, because of the partnership arrangement between the federal government and the state governments in financing land-grant institutions, their campuses were not limited to the boundaries of individual states. Each institution was concerned with the problem of its home state within the federal setting, including national problems, policies, and programs. This was especially true in the case of agricultural education, agricultural research, and agricultural extension, but to a lesser degree in the other fields of study offered. As the position of the United States changed to its present one of world leadership with its technical assistance and other aid programs, the campus of the land-grant institutions has likewise expanded so that now the world is their campus. They are the principal recruiting grounds of the federal government, other friendly nations, foundations, and commercial interests abroad. Their system of co-operative agricultural extension services has been adapted to many parts of the world.

EDUCATION FOR WORLD LEADERSHIP

Education directed towards understanding other peoples is one of the important needs of our nation. Such understanding is prerequisite to effective technical and economic assistance, to expansion of world trade, and to the implementation of United States foreign policy. Adapting the land-grant college idea to underdeveloped nations by working directly with the people and by helping them solve their own prob-

¹ See Russell I. Thrackrey and Jay Richter, "The Land-Grant Colleges and Universities, 1862-1962: An American Institution" in *Higher Education*, United States Office of Education, Vol. 16 (November 1959), pp. 3-8.

lems through education and demonstrations is an important part of this implementation, for which specialization in limited technical fields will not suffice. The undergraduate curricula should be as comprehensive as possible in the humanities, social and natural sciences, without heavy specialization until the graduate level.

This education should provide the American people and particularly their leaders with the concepts, knowledge, and methods for understanding the nature of the existing international situation and the course of its development. To be fully effective this would require making a long overdue reappraisal of the social science curricula at the high school and undergraduate levels, in terms of the current world situation rather than in terms of the outdated view of narrow, highly specialized academic disciplines.² For a sound approach to almost any international problem the specialized academic departments of history, economics, sociology, political science, psychology, and so forth, must be presented, not as isolated fields, but as an organic synthesis. Furthermore, the broader the background of education of the individual the better he is able to comprehend complex international problems.

One of the most difficult problems in the effective preparation of students to cope with the realities of modern complex international relationships and policies is to find a way of adequately understanding "the many-faceted nature of social phenomena which avoids both emaciated generalization and indigestible masses of data."³ The interdisciplinary curricula are too often insufficiently integrated to be realistic in

terms of actual world problems. This situation is aggravated in many of the land-grant institutions by the heavy emphasis on the natural sciences—physical and biological sciences.

A few of the land-grant institutions have recognized the importance of meeting their international obligations more adequately by establishing an institution-wide agency or division on "international programs" or "international services" whose head—a Dean or Director—reports directly to the president. For example, Michigan State University calls its division "International Program" which is under the direction of a Dean. Montana State College refers to its unit as the "International Cooperation Center," which is administered by a Director. The University of Vermont has established a special Bachelor of Science degree in "International Science." These are each attempts to secure more interest from the entire campus by cutting across departmental and specialized division or college lines and thus service its international obligations on a parallel basis with its national and state obligations. It is hoped that most land-grant institutions will establish such campus-wide international centers or divisions promptly.

Even though land-grant institutions have grown rapidly in enrollments and services, many do not give a degree in the liberal arts and social sciences or, if they do, the degree is frequently a Bachelor of Science rather than a Bachelor of Arts. Under these circumstances it is very difficult to obtain strong liberal arts and social science instruction requisite for a broad understanding and appreciation of current international problems and policies. Because of the demands made upon the land-grant institutions to furnish personnel for international programs, they have a very special obligation to provide adequate

² See Theodore Geiger, "Education for the World Responsibilities of the United States" in *Looking Ahead*, National Planning Association, Vol. 8, No. 2 (March 1960).

³ *Ibid.*

training for this personnel. Greater emphasis, at least at the undergraduate level, on well-balanced, integrated, interdisciplinary studies would help to reduce the lag between American responsibility for world leadership and present American performance which, if it continues, may prove fatal to the program of the western nations.

SYNTHESIS VS SPECIALIZATION

Our social, political, economic, and industrial structures have undergone revolutionary changes in the last three quarters of a century, and our educational structure should be adapted to meet these changes. This adaptation cannot occur simply by the addition of more highly specialized courses, but must come through reorganization of our existing courses. Our educational structure has been characterized by a mushrooming and pyramiding of numerous specialized courses and curricula. This proliferation of courses and our multiple-major educational structure offers students a wide choice of professional and academic fields in which to specialize, but only within rigid specialized curricula. There is a great need for a shift from the multiple-major structure to the multiple-level structure, and we should regroup our highly specialized curricula, retaining those more applicable to modern everyday situations, consolidating others, and eliminating those which have become antiquated.

The overemphasis upon numerous highly specialized curricula is pronounced in the field of agriculture, and it is in this field where the land-grant colleges have had practically exclusive control. The large decline in farm population and agricultural enrollment has resulted in many small classes and expensive instruction because of the proliferation of agricultural curricula and courses. For example, in most land-

grant institutions there are numerous agricultural curricula such as general agriculture, agricultural economics, agricultural education, agricultural engineering, agronomy, animal industry, dairy manufacturing, dairy production, horticulture, poultry industry, range management, rural sociology, and soils. In each of these thirteen fields specific four-year tabulations of courses are set up, averaging around two hundred quarter credits or about one hundred and thirty semester credits.

Three or four land-grant institutions have already achieved a consolidation of these narrow, rigid, highly specialized curricula into four or five broader curricula such as agricultural business, agricultural production, agricultural science, agricultural education, and agricultural engineering. Much more needs to be done along these lines if agricultural graduates are to receive the kind of basic education in the sciences and humanities which is needed in today's world. These fewer and broader curricula make it possible for the individual to secure education in the basic principles and theories essential to develop the objective reasoning necessary for effective adaptation to varying situations and requirements in our modern society.

RESPONSIBILITIES TO LABOR

The land-grant institutions have manifested little interest in the industrial classes in spite of the fact that the Morrill Act emphasized that they were to be people's colleges for the education of the youth of the "industrial classes" which included both workers and farm people. There is no program to keep workers and their families abreast of current developments that most concern them. There is no labor extension service, there are few short courses, no demonstration projects, no annual fairs, or any similar services for

labor comparable with those for agriculture. It is true that the federal government has not appropriated funds, in partnership with the states, to develop a labor extension service in a manner comparable to the co-operative agricultural extension service, but within the states the land-grant institutions with very few exceptions have not taken any major responsibilities in the labor field proper.⁴

One of the greatest needs of American agriculture is that its problems, programs, and policies be understood by consumers. Workers' families constitute the largest single block of consumers. The land-grant institutions therefore have a special interest in and obligation to provide adequate information about these problems, programs, and policies to workers and their families. As has been pointed out earlier, these problems,

programs, and policies in the mid-twentieth century have a world-wide import.

Another very great need in American agricultural policy is unity of purpose and method among farm leaders.⁵ This will be difficult to achieve, but the land-grant institutions through concerted, dedicated efforts in education and extension programs ultimately may be able to achieve such unity. Perhaps the most important development in educational services rendered by land-grant institutions in the next decade will be synthesis. Farm problems do not occur in a vacuum nor do labor's problems.

Land-grant institutions have been pioneers in the educational services the country has needed to develop its natural and human resources. The next phase of their pioneering may well be to guide curriculum development and extension in the fields of international understanding and to integrate those domestic policies with international policies when the two are interrelated.

Potential Contribution of Agriculture to Economic Growth in Less-developed Countries

By SHERMAN E. JOHNSON

ABSTRACT: Substantial betterment of conditions in the less-developed countries is dependent upon both private and public action to achieve rapid increases in output. Improved technology is the key to higher output, but successful adoption requires additional capital and the learning of new technical and management skills. Agriculture can become a leader in economic growth by providing labor-intensive employment for rapid increases in food production. Larger food supplies also will lessen the inflationary pressures resulting from the construction phase of a development program. With the help of technical advisers, combinations of improved technology can be adopted that will greatly increase production per acre with a small investment of capital in relation to the resulting output. The combinations usually include chemical fertilizer, improved seed, pesticides, and better soil and water management. Help also will be needed in obtaining the necessary production supplies, in arranging credit at reasonable rates, in developing storage and marketing facilities, and perhaps even in providing for changes in the tenure system. All of these aids may need to be combined into one program in order to shift rapidly from a primitive agriculture to the beginnings of modern farming.

Sherman E. Johnson, Ph.D., Washington, D. C., is Chief Economist, Agricultural Research Service, United States Department of Agriculture (USDA). He was Assistant Chief of the former Bureau of Agricultural Economics, and during World War II was Chief of the Production Programs Branch of the War Food Administration. On leave from USDA in early 1959, Dr. Johnson served as Chairman of the Ford Foundation Team in India which studied food problems and wrote the report entitled "India's Food Crisis and Steps to Meet It." In the fall of the same year he returned to India to assist the government in developing a "Ten-Point Pilot Program" for increasing food production.

THE greatest unsolved problem of our times is the abject poverty of the masses of people in the less-developed countries. Their continuous struggle for food is a primary cause of international instability. Promises of rapid economic improvement have a powerful appeal to people who are living at bare subsistence levels.

Not long ago most of the people in the less-developed countries accepted poverty as their ordained lot, but airplane transport and radio communication have facilitated the spread of information that betterment is possible. They now expect their governments to provide conditions conducive to improvement. Leadership that inspires confidence in government and public institutions that facilitate progress are essential steps in development, but substantial betterment for the masses is dependent upon private as well as public action to achieve rapid increases in output of the entire national economy.

Improved technology is the key to higher output—in agriculture as well as other industries. But successful adoption of new techniques requires additional capital investment in order to establish new industries and to rehabilitate the old. New technical and management skills will need to be learned, and perhaps many of the established institutions that inhibit change will need to be modified. Moreover, the various segments of the total effort must be synchronized in order to prevent unbalanced production.

All of these activities will need to be undertaken within a relatively short period of time because a part of the demands for better living of the rank and file will need to be satisfied without delay if governmental stability is to be maintained. And total output must expand enough to increase per capita output, and not merely keep pace with

the increase in population. To achieve a synchronized program of this type requires competent leadership in both planning and program operation.

AGRICULTURE'S CONTRIBUTION TO GROWTH

Agriculture's contribution to the development of a self-generating economy becomes evident if we consider present conditions in the less-developed countries. Many of these countries are overpopulated, at least in relation to the resources that are now developed. From 50 to 80 per cent of the total population is dependent upon agriculture for a livelihood. Most of the farm villages are relatively untouched by the technical and economic changes of the last 200 years. Consequently, crop yields and livestock production are extremely low in comparison with the more-developed countries.

Annual income per person in the densely populated countries averages as low as \$60 to \$75, compared with more than \$2,000 in the United States. Food absorbs most of this meager income. Consequently, any increases in national income will be translated immediately into additional demands for food. Unless these demands are met with larger food supplies, inflationary pressures will develop that may be very difficult to control by rationing or by any other means. Unrest is easily generated in people who are impatient for specific evidences of betterment.

How can the necessary food be obtained? Domestic food production can be increased by two methods: (1) Adoption of improved production techniques, which will result in higher output per acre, and (2) development of additional land. The first method holds the greatest immediate promise in most areas. Even when additional land is available for development, it usually requires expensive drainage, clearing, or irrigation.

Scarcity of capital in the early stages of development, therefore, will place definite limits on land reclamation, unless it is a part of power development or unless improved production techniques can be readily adopted on the land which is reclaimed.

It may be feasible to supplement domestic production with food imports, but unless food imports are obtained under foreign aid programs, they will absorb scarce foreign exchange which is needed for other segments of the development program. Moreover, imports under special programs usually cannot meet all the needs of a rapidly increasing population.

Some of the less-developed countries produce food products for export. They also produce such so-called "industrial crops" as rubber, cotton, jute, and sisal. The industrial crops as well as such food crops as sugar, coffee, and tea are likely to be produced on large plantations alongside of the small farms producing mainly for family subsistence. The export crops provide foreign exchange; and increases in productivity should facilitate import of additional capital goods needed for growth in all sectors of the economy. We must recognize, however, that expansion of some of these crops may result in relatively saturated markets and declining prices.

Capital formation

We have said that additional capital and the requisite technical and managerial skills are necessary to adoption of the improved technology that is essential for economic development. Some capital and technical aid can be obtained from abroad. But the flow of private foreign investment and skills is inadequate; and although public aid programs can function as catalytic agents, they cannot perform the job alone. Capital formation must take place within the country—for invest-

ment in new industries, for exploitation of undeveloped resources, and for rehabilitation of the existing agricultural and industrial plants.

The new investment must include facilities for technical and management training in order to provide competent personnel to man the new enterprises. In many countries this will include establishment of a complete educational system beginning with the primary grades.

The smaller the margin above subsistence, however, the less opportunity there is for financing such investment by taxation or by other means of involuntary saving.

Here is, indeed, a dilemma. Capital formation within the country is necessary for economic growth. But there appears to be no margin for either voluntary or involuntary savings. Some of these countries, however, do have islands of progress in industry and trade. These isolated operations furnish the nucleus for industrial growth, but they cannot bear the entire burden of capital formation. Members of the small elite class perhaps can be induced to invest in new enterprises instead of hoarding their wealth or spending it on consumption goods. Heavy purchase taxes on goods other than the barest necessities also may siphon a part of the income of this class.

Within the agricultural sector some landlords and operators of the large farms have incomes sufficient to provide capital formation either through voluntary savings or by taxation. Agricultural capital for increasing food production can be built up by employment of unutilized rural labor on work which can be carried out with hand labor and simple tools. Terraces, surface drainage, minor irrigation development, access roads, and local storage facilities are examples of this type of construction. Fortunately, also, in most areas a com-

bination of improved practices can be adopted to increase yields per acre with a relatively low input of capital in relation to the resulting output. On present farms the additional capital will be used largely for current inputs of improved seed, commercial fertilizer, pesticides, and simple farm tools. But if these materials are to be made available to cultivators, they either have to be produced in factories within the country, or imported. This is likely to involve some scarce foreign exchange, either for building of factories or for importing of fertilizer and other supplies. Although some initial capital will be needed to utilize surplus labor effectively in agriculture, the returns are likely to be higher and the waiting period shorter than for most other investments.

In many of the less-developed countries, near-term expansion of food production is not severely limited either by the climate or by the soil and water resources. Present production per acre is so low that it could be doubled, or even trebled, by application of modern technology. The gap between present output and physical potentialities is well illustrated by crop yields in India. The average yield of wheat per acre is about 10 bushels, or approximately half the average yield in the United States. The average yield of rice is about 800 pounds per acre compared with about 3,000 pounds in Japan. The soil and water resources of India respond to new systems of farming. In some pilot areas, effective combinations of aid have enabled cultivators to obtain yield increases of 50 per cent or more. The return on the additional expenditure probably has averaged better than a ratio of 3 to 1.

DEVELOPMENT IN AGRICULTURE

Although the production potentialities of combinations of new technology and management assistance have been

demonstrated in most countries, we must recognize the impediments to general adoption of the new ways of farming. Perhaps the greatest handicaps to be overcome are illiteracy and the village people's lack of knowledge concerning conditions outside their own immediate environment. This lack of knowledge generates suspicion of outsiders. To break with tradition will require gaining the confidence of at least a small group of cultivators in each village who can be made aware of the benefits to them of adopting improved methods. They must then be willing to become innovators of the new system of farming, and help persuade others to follow their leadership.

Even after the "crust" of suspicion has been broken and the desire for improvement has been stimulated, there are still many obstacles to be overcome. An effective technological break-through requires development of farming systems which include a combination of improvements. Single measures such as better seed or use of commercial fertilizer may result in small increases in yields per acre, but when these improvements are combined with better tillage, and when pesticides are used as needed, the combination of practices will have a multiplying effect on yields.

Cultivators will need considerable technical and management assistance if they are to adopt successfully such a combination of improved practices. The seed, fertilizer, and pesticides must be available to the cultivators when they are needed—and in adequate quantities. Some improved tools and equipment also must be available. Most cultivators do not have either financial resources of their own or credit available at reasonable rates to purchase the needed materials and supplies. Consequently, credit arrangements will need to be devised that will provide loans at moderate interest rates and repayments based on

potential increases in output. Furthermore, the cultivators are operating so close to the margin of subsistence that they cannot afford to take the risk of either crop failure or lower prices. It may be necessary, therefore, to provide assurance to cultivators that they will be protected against lower crop yields and lower prices.

In some areas, the land-tenure system may prevent the cultivators from realizing sufficient gain from increased production to make the effort worth while. Perhaps also the physical fragmentation and dispersal of holdings will impede or prevent adoption of improved techniques. When land reform and consolidation of holdings are prerequisites to agricultural development, the process is likely to require courageous public measures to deal with these obstacles.

The guiding principle in furnishing technical and management assistance should be to help in overcoming any obstacle to successful adoption of the new farming program. This will include help in (1) adopting combinations of new technology, (2) obtaining the necessary production supplies, (3) arranging the credit to purchase supplies, (4) developing a market for the product, and (5) perhaps even helping to change established institutions such as the tenure system.

All of these steps may be involved in the transition from primitive agriculture to the beginning of modern farming. There are no panaceas. The assistance program will need to be tailor-made to overcome the obstacles that are encountered in each area.

In the laudable zeal for rapid change it is necessary for both native and foreign technicians to recognize that modern technology cannot be successfully transplanted from one country to another. It must be adapted to the culture and the environment of the people who are involved in the change. In

countries with much underemployment in agriculture, first attention must be centered on ways of utilizing, with a minimum of new capital, the available labor to increase total output. At this stage, labor-saving equipment would involve scarce capital and would displace labor that could not find other employment.

Production per acre can be greatly increased by improved practices that are suitable for use with hand labor and bullock power. Many tools are available that constitute intermediate steps toward a mechanized agriculture. Workers from less densely populated areas need to recognize that farming in many of these countries will remain a labor-intensive and small-scale agriculture, even when much greater efficiency has been achieved.

BALANCED ECONOMIC DEVELOPMENT

The end purpose of economic development is to provide a better living for the majority of the people. Economic development in the nonagricultural sectors is likely to begin by building new plants and equipment for new manufacturing enterprises. Such construction will provide more employment and increased income before the output from the new plants becomes available for purchase. A large portion of the higher income will be spent for food. If agricultural development has been undertaken to supply these growing demands for food, inflationary tendencies will be restrained. At the same time, farm people will obtain higher incomes from the larger output. They will then spend more for manufactured goods when these become available, which in turn will provide a wider market for the industrial sector. In both sectors the higher incomes will provide some margin for saving which will be available for new investment. The tax base also will be larger.

Improvements in agriculture, by themselves, may not generate sufficient momentum to raise the entire economy to a higher and self-generating level of production, but agriculture can become the leader in economic growth. The circle of stagnation can be broken by initiating developments in agriculture. Productive labor-intensive employment for rapid expansion of farm production can be provided in the early stages of the "take off" period. In food-deficit countries, this will mean more adequate food supplies, and use of scarce foreign exchange for other imports. In food-surplus countries, more foreign exchange

will be available for development of other sectors of the economy.

Eventually, the nonagricultural sectors of the economy should achieve sufficient momentum to provide employment for many of the underemployed workers in agriculture. By that time, the improvements in agriculture will have gathered sufficient momentum to continue their upward trend, and purchases by farm people for production and for better living will provide a growing market for manufactured products. In this way simultaneous development in agriculture and industry will result in rapid, self-generating economic growth.

growing weather had prevailed, the harvested area would have been more than 35 million acres smaller than it actually was and nearly 60 million acres smaller than it would have been without the conservation reserve.

Rather arbitrary assumptions about prices were made for the hypothetical situation. Cotton and wheat prices were lowered to levels that would permit dollar exports in recent volume without subsidy. Feed grain prices were raised moderately, and the expected volume of dollar exports was reduced below the amount sold abroad, with subsidy, in 1959. Exports under P.L. (Public Law) 480 were not considered part of the commercial market. The price estimates average only 75 per cent of parity, the present legislative price standard. All estimates are necessarily rough approximations. Aggregate normal-weather crop production was about 8 per cent too large in 1959 by these modest criteria. Total livestock production was only slightly too high but would have been excessive if expanded sufficiently to absorb the surplus production of feed grains and wheat.

More labor was employed in agriculture than needed in an ideal situation to produce either the actual or the market-adjusted volume. This was the case in important parts of commercial agriculture—the 44 per cent of all farms that in 1954 marketed 91 per cent of all farm products—but was especially true among the semisubsistence and part-time farmers whose units were much too small for efficient operation. There were 4,640,000 farms in 1959—by the old definition—but their output could have been produced by fewer than 2,000,000 units without adding to the number of larger-than-family farms. The farm labor force, according to estimates by the Department of Commerce, averaged 5,836,000 hired and family workers in 1959; at a very rough guess,

perhaps 3,500,000 would have been sufficient on larger and better organized farms.¹ But many of the apparently superfluous workers had limited skill for nonfarm occupations, were advanced in age, or for other reasons had no more potential earning power outside of agriculture than in it. To assume that an agriculture of fewer than 2,000,000 farms employing 3,500,000 workers is practicable in the next few years would be a misinterpretation of the estimates.

Any substantial reduction of labor in an ideal situation would be in part offset by an increase in machinery and equipment. This might not be large, however; many farms are equipped to handle more acreage than is presently farmed. Incidentally, if the reorganization of farm size, labor force, and use of capital considered here had existed in 1959, the superior management accompanying it would have raised crop and livestock yields and would have reduced still further the crop acreages for the market-adjusted situation.

THE COMMERCIAL FARM PROBLEM

At the end of World War II agriculture had a high production base, and during the 1950's the availability of new technology continued to raise potential production faster than peacetime markets expanded. Farmers have comparatively fixed resources of land and family labor and, unlike producers in much of industry, have no ability as individual firms to influence prices by varying their own production. Their economic incentives are to adopt new methods whether prices are high or low and to expand output without regard for total market outlets. A thrust of new technology often lowers farm prices in free markets by more than produc-

¹ The basic assumption for this estimate is that output per worker throughout agriculture could be at least as high as it was on economic class III farms in 1954.

tion costs per unit are reduced. Then all of the benefits of technology, and more, are passed on to the general public. When this happens in large sectors of agriculture, strong economic pressure is exerted to reduce labor and land resources. Even a large outflow of labor may have little effect on production and prices when technology is advancing and farms are being consolidated, however, and good land does not go out of production. During the extreme economic and weather vicissitudes between 1920 and 1959, cropland² varied less than 5 per cent from its average.

When technology is advancing rapidly, as it did in the 1950's and promises to do for years to come, chronic farm depression results. This was the situation in the 1950's, with one great exception: government programs diverted supplies from the market and prevented as much decline of farm income as otherwise would have occurred. The programs probably did little to hold resources in farming, but they raised surplus stocks and government expenditures for agriculture to unacceptable levels.

The immediate problem posed by the too-high rate of current production and by the 9 billion dollar stockpile of farm surpluses is a daunting one. Demand for total farm output is highly inelastic: if all crops available in 1959 with normal weather had moved into domestic consumption directly or through livestock, the farm price of corn might have fallen below 70 cents per bushel, wheat to 75 to 80 cents per bushel, and hogs to about 10 cents per pound. Disastrous is not too strong a word to describe the income effects of such prices. Larger exports would modify the domestic impact of selling in a free market, but trouble would appear abroad as well as at home. The prices at which

² Acreage harvested, lost through crop failure, or in the conservation or acreage reserve.

Canada, Australia, and other exporters could sell wheat might be reduced by one fourth without much increasing world trade in the commodity or our share of the total. Nations exporting corn, cotton, fats and oils, rice, and tobacco would be affected adversely, and among these would be some economically weak countries heavily dependent on agricultural exports for foreign exchange.

FOREIGN OUTLETS FOR SURPLUSES

Possibilities of using American farm products in aiding underdeveloped countries, as under P.L. 480, are not fully known. In the next few years the United States can supply large quantities of farm products without foregoing other goods and services, for we have large stocks on hand and excess resources in agriculture. In the more distant future, when labor can be engaged in other pursuits, a dollar spent for farm products will need to have as much potential benefit as a dollar spent in other ways to be a justified expenditure for foreign aid. If—as seems possible, but unlikely—large exports of farm products are warranted by this test, then a substantial contribution to solving the domestic farm problem without conflict with other policy will have been made. At least, we should be prepared to deal with the domestic problem in other ways while standing ready to furnish farm products to the extent needed.

Commercial markets abroad offer much less opportunity for depleting American farm surpluses than do exports outside of commercial channels. Dumping is ruled out for obvious reasons. World trade in farm products is greatly influenced by governmental policies, underdeveloped countries are increasingly restive about the price instability that has always plagued their markets, and international commodity

agreements rather than the classic precepts of free trade appear to be the next evolutionary step in regularizing exchange among nations. The United States is turning from old desires to gain domestic agricultural stability through exports to a recognition that international stability must be considered in shaping domestic farm policy.

MANAGING FARM PRODUCTION

The excessive rate of current farm production and the high potential for further increase are strong reasons for making supply control the central instrument of domestic farm policy. The desirability of routing income to agriculture through the market rather than through the federal budget, where farm programs and governmental services not having the market as an alternative compete for support to the disadvantage of both, is an additional reason for supply control.

The effectiveness of present acreage restrictions on controlled crops has been impaired by rising yields per acre, and the diversion of land from controlled to uncontrolled crops has made the restrictions almost wholly futile in curbing total output. The conservation reserve attempts to induce voluntary retirement of cropland by payments to farmers. Since the poorest cropland usually is the first attracted into the reserve, the program would have had to exceed 60 million acres in 1959 to adjust output to commercial markets. The program is resisted where retirement of much poor land depresses local economic activity, and it will become increasingly expensive if it is expanded enough to cut output importantly and to improve prices. A revised and gradually expanded conservation reserve has a useful role in speeding adjustments of both land and labor, but the size and urgency of the present general problem, together

with the special circumstances of wheat and some other commodities, require a direct attack through compulsory controls.

Serious administrative difficulties and the attitudes of farmers probably must restrict a supply control program initially to the most urgent and intractable aspect of the problem—controlling production of feed grains, wheat, cotton, and soybeans without shifting land to the production of other crops. Farmers voluntarily adjust livestock production more readily to the feed grain supply than they adjust total crop production to market outlets, though important differences exist within the livestock category.

Probably the only feasible way to control output of feed grains is to restrict acreage and to require land taken from the production of these grains to be held idle. A considerable potential for increasing per-acre yields exists, and it would be better use of resources and more profitable to farmers to apply controls to actual production than to acreage. But so large a volume of feed grains is fed to livestock on the same farms that direct control of bushels produced does not seem possible. For cotton, soybeans, and most wheat, sales quotas should be used, in addition to idling a portion of the cropland, to prevent the use of nonfarm resources—for example, fertilizer—to produce unwanted yield increases. Sales quotas can be extended to other crops and to livestock products where feasible and acceptable.

In a number of special situations, other types of controlled marketing already exist in the form of marketing agreements and orders or where farmer co-operatives have a degree of market power. These situations will grow in importance but cannot extend, for many years at least, to the large-acreage field crops. Decisions of marketing or proc-

essing firms determine the volume of farm output in some instances of vertical integration, and such situations will also become more important.

As a necessary supplement to production control and desirable on its own merits, a storage program to stabilize annual utilization and prices of controlled crops will be required. Wheat is such an aggravated case of imbalance between production and market outlets that domestic prices probably must be above export prices, and similar pricing may be needed for some other export crops.

Two important objections to production control are possible inefficiencies in use of resources and magnification of government power. The labor of succeeding generations is the principal agricultural resource likely to be in excess but having productive alternative uses. The common thesis that price supports are a prime reason for locking labor in agriculture is not supported by experience. The many inadequate farms on which unskilled people labor unproductively for low economic rewards became established in a free market, and more progress was made in solving the prob-

lem under price supports in the 1950's than at any time prior to the 1940's. Supply control in commercial agriculture is less relevant to labor mobility than the education and skills of farm people and the availability of attractive nonfarm jobs.

How productive agriculture is twenty-five years from now will depend more on technological progress than on any other matter. It is reasonable to suppose that technology will be developed and applied as rapidly in a stable agriculture under supply control as in any other circumstances likely to prevail.

Perhaps no group in America would be more disposed than farmers, other things equal, to reject the government intervention involved in supply control. But other things are not equal, and farmers individually and collectively are torn between their preference for freedom from government interference and their inability to cope with the massive farm problem without government assistance. To be successful, supply control must be supported by the majority of the farmers affected and should enlist their participation in making program decisions.

Cotton

By M. K. HORNE, JR.

ABSTRACT: The United States government functions as the price leader for cotton in international trade, and as an inevitable consequence it plays the role of residual supplier on the world market. This means that United States exports of cotton fluctuate widely from season to season, while other exporting nations enjoy greater market stability. By supporting the world price level and by serving as the stabilizing factor in the world market, this country has provided a little-recognized source of strength to many weaker nations. Foreign cotton consumption passed its prewar peak in 1950-1951 and subsequently has continued to rise at an average rate of 1.5 million bales a year; but foreign production expanded even more rapidly through the season of 1955-1956, so that United States exports were threatening to disappear almost entirely. While this country cannot presently escape the role of residual supplier, it can use its responsibility as price leader with reasonable regard for the problems of foreign producers and of its own citizens as well. Since 1955-1956, an export subsidy has placed restraint on the upward trend of foreign production and has improved the outlook for United States exports. The cotton farmer's opportunity to escape reliance on the export subsidy lies in shifting the emphasis of production costs from labor to constantly improving technology.

McDonald K. Horne, Jr., Ph.D., Memphis, Tennessee, is Chief Economist of the National Cotton Council of America. He is a former Professor of Economics, Director of the Bureau of Business Research, and Dean of the School of Commerce and Business Administration at the University of Mississippi. He is a member of the Economics Research Advisory Committee to the Secretary of Agriculture. Dr. Horne is the author or co-author of numerous monographs on cotton economics, notably, Price and the Future of U.S. Cotton (1955).

COTTON is a clear case of an agricultural commodity for which the United States government functions as the world price leader. This is true by virtue of some simple arithmetic. During the past five seasons we supplied 32 per cent of the cotton which moved in world trade. Of some forty other cotton-exporting countries there was none which could account for even half so much. The basic decisions governing the general price level at which we export cotton are made by one agency, the federal government. In other words, one decision-maker determines the price for a third of the international trade in cotton. So long as the foreign world depends upon us for this large fraction of its imports, we can, by withholding cotton except at a certain price, draw the whole market up toward the general vicinity of that price. And so long as we hold big stocks, we can, by selling cotton at any price, drop the whole market down toward the vicinity of that price.

This position of price leadership is accentuated by the fact that virtually all our competitors in cotton exports—Mexico, Egypt, and so forth—have neither the local finances nor the supplies of foreign exchange to permit them the luxury of holding their cotton through periods of price weakness. Only the United States can afford this dubious luxury.

Our role as the price leader is far from a comfortable one. Whenever price leadership exists in any commodity, the smaller competitors enjoy quite a trading advantage. When market conditions are tight and sales are easy to make, they can raise their prices up to or above that of the leader. When the market is glutted, they can nearly always continue making sales by cutting their prices slightly below that of the leader.

This is just the situation which has

bedeviled the makers of United States government policy toward cotton. In the season-before-last, for example—August 1, 1957-July 31, 1958—this country obtained 41 per cent of the world trade in cotton. This was because the volume of trade was relatively strong. Last season, on the other hand, was one of recession in the world cotton trade, and we received only 22 per cent of the business.

THE ROLE OF RESIDUAL SUPPLIER

It is charged, quite correctly, that in these circumstances the United States serves merely as the residual supplier of cotton to the world. Other countries, by selling below our price when necessary, can assure themselves of a market for their production year after year. In crudest terms, we take whatever market they leave us.

It is a great oversimplification, of course, to generalize in this manner without regard for differences in quality and merchandising efficiency. The quality of cotton is a thing of vast importance, complexity, and—I must add—controversy; but if space permitted a discussion of this subject we still would find that in a broad sense our country functions as the residual supplier.

There naturally is much criticism of the government for allowing itself to be caught in this weak bargaining position for the world market. Indeed the existing law undertakes to rid us of this position by ordering the Commodity Credit Corporation "to make cotton available at prices not in excess of the level of prices at which cottons of comparable qualities are being offered in substantial quantity by other exporting countries."

The difficulties are apparent. If the United States were a small factor in the world cotton trade, the government could not be the price leader even if it wanted to. But since it actually is

such a large factor, the government does not really have the power to abandon the role of price leadership. If we try to follow the prices of our competitors downward, we may drive them down further. We could find ourselves following downward a price which we ourselves were driving downward.

There seem to be only two routes by which we could escape the burden of price leadership. One would be by continuing to become a smaller and smaller factor in the world cotton trade until at length we no longer held the power to affect the price so decisively. We are much closer to that position now than in decades past. Indeed within recent years we seem to have experienced short periods in which the world received a foretaste of this condition. During 1955 particularly, for a number of months the United States was virtually out of the world market because, seemingly for the first time, other countries were pressing to sell more than enough cotton for the entire immediate export demand. For the first time the sellers of foreign-grown cotton were not competing primarily with the United States but rather with one another—and the world price took a steep plunge.

The other route would be by taking the government out of its role as maker of the general price level for United States cotton. It holds this role by means of support programs which tend to set a floor for prices and of large stock holdings which tend to set a ceiling at the level where these stocks may be released upon the market. In addition the law authorizes export subsidies which cause the export price to differ from the domestic. Currently a payment-in-kind subsidy on exports is in effect.

If the government relinquished this entire function, the United States apparently would no longer serve as the world price leader because there would

be no concentration of the basic price-making power. The whole structure of the world market presumably would be radically changed. It would resemble much more closely the classical concept of many buyers and many sellers, none in a position of special dominance.

The following comments, however, will deal with the situation in which we are today, in which we have been for a long time, and in which we shall be for some indefinite future time: the situation of the price leader.

THE EFFECT UPON FOREIGN PRODUCTION

The foremost cotton-producing countries of the foreign free world read like a roster of the strategically placed nations in the struggle for progress and freedom: India, Egypt, Mexico, Brazil, Pakistan, and so on. Surely we must have careful regard for their economic stability and progress. What is their interest in the United States cotton policy?

Few kind words are ever said for it in international councils, but as a matter of fact, this policy must have served as an enormous boon to the progress of less-developed nations.

The fundamental nature of cotton prices is not too commonly understood. On the demand side, it is fundamental that cotton is an industrial raw material. Seven eighths of the retail value of the typical product is added after the fiber leaves the farm. The notion that the mills can make quick and easy shifts between cotton and rayon belongs to theory, not to fact. Such shifts do occur, but they typically require years of sustained technical and merchandising effort. In the short-run, the quantity of raw cotton consumed does fluctuate quite importantly, but the fluctuations are governed by the requirements of the spinning mills throughout the world. These requirements change as

the mills respond to the up-and-down motion of the textile cycle. On the supply side, the quantity available in any short-run period is seriously affected by changes in the weather all over the world. These short-term fluctuations in both demand and supply are not caused by the price of raw cotton, nor can small price changes bring them into equilibrium. A tendency toward wide short-term fluctuations in prices is inherent.

In today's world, important expansion in cotton production requires long-range plans and substantial investments—even, to a considerable extent, in the underdeveloped countries. More and more, any significant expansion depends on great irrigation projects. Such investments involve great risks. It seems inescapable that United States cotton policy has served effectively to remove most of the price risk involved, as well as maintaining the world price during most of the postwar period at levels which were quite attractive to the foreign producer.

Under these conditions foreign free-world production rose to 12.4 million bales in 1950–1951—approximately equaling its prewar peak—and from that point proceeded to build up rapidly to 17.5 million in 1958–1959. This is indeed a healthy rate of growth, and it takes on greater meaning from the fact that in the decade of the 1950's the main trend of United States production was forced downward by acreage restrictions.

In addition to maintaining the world price, our cotton policy has provided reasonable assurance to every foreign producer that he could market his crop virtually every year, while we ourselves absorbed the impact of fluctuations in our annual volume of exports ranging from 7.5 to 2.2 million bales. Such is the lot of the residual supplier. In absorbing the main shock of changes

in the supply and demand situation, we maintained the only important stock of surplus cotton in the world, even when our carry-over reached 14.5 million bales in August 1955.

If we have regard solely for the interests of the foreign producing nations we evidently should think long indeed before abandoning our role as the great stabilizing factor in the cotton markets of the world. I would judge that few if any forms of "foreign aid" have meant so much to the strength and progress of the weaker nations.

THE EFFECT UPON UNITED STATES EXPORTS

What, on the other hand, is in the direct national interest of the United States?

I would think, first of all, that our policy needs to be based on a deep understanding of the basic economics involved—the real nature and function of supply, of demand, and of price. This is a prime obligation of a country which holds the burden of such over-towering leadership. I refer, most emphatically, to the supply, demand, and price of this particular commodity. We cannot afford the luxury of theoretical generalizations any more than we can afford that of narrow-minded self-interest.

In the present structure of the world market, it is futile for this country to try to free itself from the handicaps of price leadership. In struggling to do so, we would batter and punish other nations far more than we would help ourselves. And we still would find it impossible to export some normal portion of our production each season, as other nations tend to do.

Our real interest calls for a longer view. Though we are obliged to play the part of the residual supplier, we can profitably direct our attention to the size of the residual. We cannot keep

this from fluctuating a great deal between one season and the next, but we surely can take rational measures aimed at protecting or expanding the average size of the residual over a period of years. The residual involved is, in simplest terms, the gap between total consumption and production of cotton in the entire foreign world. If that gap disappears, we have virtually lost our export market. If it expands, our exports are bound to expand.

Many forces determine the long-range trend of foreign consumption and production. Some of them are entirely outside the province of our national policy or of private industrial policy. Others are within the proper reach of our influence. Sales promotion has a significant bearing on the volume of cotton consumption. Techniques of industry-wide promotion which have been pioneered for the past two decades in this country are now being transported to fourteen leading foreign nations by means of Public Law 480 programs, with major contributions coming from industry groups both in this and in the foreign countries involved.

In this context it is most interesting to examine the function of price. While our role as price leader is a handicap within the time span of a single marketing season, it certainly need not be if we can project our thinking over a period of years. Over the years—and only then—the price of cotton does indeed become a major influence upon the quantity consumed and the quantity produced. Whether we like it or not, our government holds the power, through price, to influence very materially the trend of both consumption and production abroad. This great power can be used with reasonable regard for the direct interest of our own producers as well as those in foreign lands.

A basic source of optimism is the

spectacular rate of growth in foreign cotton consumption. In the whole foreign world—Communist included—cotton consumption has increased in every single year since 1943–1944. It has doubled since 1946–1947! It exceeded its prewar peak level in 1950–1951, reaching 24.6 million. From that point it has climbed upward to 36.9 million in 1958–1959, and perhaps to 38.5 million in 1959–1960. An average increase of 1.5 million bales per year!

Surely in this dynamic market situation it is not greedy for the United States producer to hope that he might maintain his export market at the same average level, or even share modestly in the market expansion. The fact is, however, that throughout the postwar period to 1955–1956, the upward trend of foreign production not only equaled but exceeded the tremendous growth in consumption, so that our residual part of this market was trending downward and our export market was headed toward extinction. In the season of 1955–1956 the government embarked on a program of substantial export subsidies. In the ensuing years foreign production has continued an upward trend, but the pace of the increase has been sharply reduced, so that the residual between foreign consumption and production has begun to show an upward tendency and the outlook for United States exports across the years has improved.

A CHANGING PRICE POLICY

In the meantime the farmer is making a real effort to move with reasonable speed toward the point where he can hold a sound place in the world market without reliance on the export subsidy. Much has been achieved in the field of education on the real market significance of the cotton price. The prices received by farmers for cotton have had a pronounced downward trend over the past decade. The old clamor for 90

per cent of parity is seldom heard today. In 1958, with urging from the cotton industry and the cotton farmer, new legislation was adopted which set the support price on a downward course. For the season beginning August 1, 1960, it has been announced that the export subsidy will be reduced from 8 to 6 cents, accompanied by an offsetting reduction of almost as much in the support price to the farmer. More of this could occur in future years. The declining prices received by the farmer are the more significant because they come in an environment of rising prices for the factors of production. Not many American cotton farmers, even in the most efficient bracket, give much evidence of prosperity today. Neither, incidentally, do many cotton farmers in other lands.

In the cost of production, the great

disadvantage of the American cotton farmer is the price of labor. In many other aspects of production, he has a competitive advantage. As progress is made in the use of machines, chemicals, and scientific techniques in replacement of labor, the hopes of this country for a real comparative advantage in cotton production become brighter. The possibilities of such progress, even to the point of sensational break-throughs in several key problem areas, are quite enormous. If, in the next decade, the technology of cotton production remains rather dormant, it is likely that our genuine economic claim upon a large place in the world cotton market will decline. If great technological progress is made, as it can be, the United States farmer probably will achieve a real comparative advantage in the true classical meaning of the term.

Wheat

By R. L. KRISTJANSON *

ABSTRACT: Internal American agricultural policies as they affect wheat have been determined far too independently of the requirements of sound foreign economic policy. Public Law 480, which was passed to dispose of surpluses, particularly wheat surpluses, has not only tended to disrupt normal commercial trade but has also, mainly because of its temporary nature, failed to be as beneficial to underdeveloped countries as it could have been. To establish a sound wheat program, it is necessary to define the quantities of wheat needed by the underdeveloped countries. Since the amount of wheat required annually for other uses of wheat is known, the determination of the underdeveloped countries' needs would establish the magnitude of adequate internal supply control measures. Maximum use of surplus wheat to foster sound economic development programs can be encouraged by changing existing legislation to allow for the collection of more adequate information concerning the quantities of surplus wheat needed in the years ahead, longer-term surplus-utilization agreements, closer coordination between aid in the form of surplus wheat and other financial aid, and the limitation of surplus utilization to countries in genuine need. Only when these changes are made will the wheat program in the United States fit the requirements of sound foreign economic policy.

R. L. Kristjanson, Ph.D., Winnipeg, Manitoba, has been Director of the Statistics and Economics Division of The Canadian Wheat Board since August 1959. He received his Ph.D. from the University of Wisconsin in 1955 and subsequently was Assistant and Associate Professor of Economics at South Dakota State College. He served as Coordinator of the International Wheat Surplus Utilization Conference held at Brookings, South Dakota, July-August 1958. Dr. Kristjanson is the author of several technical bulletins and articles.

* The views expressed in this paper are those of the author and do not necessarily represent the views of The Canadian Wheat Board.

INTERNAL American agricultural policies as they affect wheat have been determined far too independently of the requirements of sound foreign economic policy.

Past policies of the United States Department of Agriculture have been primarily determined by the attempt to achieve two goals—efficient production of agricultural products and a distribution of income within the United States that was favorable to the agricultural sector of the economy. The techniques used to achieve these goals have been many and varied, but one of the effects of these policies has been production of wheat that consistently and increasingly outstrips the effective demand for that commodity. The magnitude of the resulting surplus is constantly brought to the attention of the American public.

As the surpluses of wheat mounted the hue and cry from the farm bloc was to dispose of these surpluses. The result was twofold—a considerable increase in the amount of money invested in attempting to find industrial uses for the surpluses and secondly, the passage of Public Law 480.

Public Law 480 was a conception that grew out of a domestic agricultural program. Its emphasis was entirely internal, and it was conceived as a temporary program to dispose of excess agricultural commodities—primarily wheat—that had proved such an annoying and embarrassing problem.

The effects of Public Law 480 on other food surplus-producing countries has been, to say the least, extremely disconcerting. Particularly during the first few years after the law was passed the effect on other food-exporting nations was to have them live in constant fear that the American colossus backed, as they saw it, by a treasury with infinite funds would step in and take over commercial markets on which the livelihood of their farmers depended.

For example, the Canadian farmers and their spokesmen were particularly concerned that the United States Department of Agriculture in its zeal to dispose of its surplus problem would barter wheat in Canada's traditional markets in Western Europe. For the Canadian wheat farmer this would mean financial ruin since the Canadian government cannot afford to subsidize to any great extent the production of a crop whose value is so large in relation to the resources of the Canadian economy.

EFFECTS ON RECIPIENT COUNTRIES

Nor was the operation of Public Law 480 entirely satisfactory from the standpoint of recipient countries. Since Public Law 480 was designed as a measure to dispose of surpluses, it has been clouded with a great deal of uncertainty as far as recipient countries were concerned. To use surpluses to their maximum benefit it is essential for the recipient country to know how much, what kinds, and for what period of time surpluses will be available. For example, if India is to use surplus wheat effectively as a partial substitute for capital in her five-year economic development plans, it is essential that the planners know the amount of wheat that will be available for several years in advance. However, since Public Law 480 was considered a temporary surplus disposal scheme by its originators and administrators, Public Law 480 agreements were mostly annual agreements with no certainty of their continuation.¹

In criticizing a program that was devised as a temporary expedient to solve

¹ Special editor's note: The United States and India have announced a sale of 16 million tons of wheat and one million tons of rice, delivery to be over four years' time, for approximately \$1,276,000,000 to be paid in rupees of which 80 per cent will be given to India as long-term loans for economic development. *New York Times*, May 4, 1960.

an embarrassing domestic problem, one may easily lose sight of its highly beneficial effects. Through the fog of bureaucratic terminology, such as Title I, Title II, Title III, soft currencies, and so on, one can nevertheless see that hungry people were able to obtain food which otherwise would have been denied to them. No economist or political scientist will ever measure the importance of this contribution, but it can hardly be denied, however critical one is of Public Law 480, that on humanitarian grounds it has been an extremely desirable program.

Since 1954 valuable experience has been gained in the administration of Public Law 480. Recognition has gradually grown that the barter feature of the program is simply a crude technique of price cutting and will have detrimental effects on American commercial sales, as well as commercial sales of friendly competing nations when this bartering is pursued in normal commercial wheat markets. Valuable knowledge has also been gained about the generation of soft currencies as a result of Title I transactions. It is now generally understood that the sale of surpluses for soft currencies and loaning these currencies to the recipient country does not constitute a double gift, but rather is a single gift of food for which the United States receives in return currencies of very limited value.

PROBLEM OF OVERPRODUCTION

One effect of attacking the wheat problem as a domestic one, and then passing legislation to dispose of the surplus, has been that the domestic program has never really grappled with the problem of overproduction. When Public Law 480 performs the function of providing a "happy dumping ground" for the agricultural program, then really effective supply control measures will not be forthcoming.

The total annual requirements of wheat for all uses with the exception of wheat for noncommercial export requirements are quite stable and are known. The market for wheat in the United States is approximately 600 million bushels a year. The commercial export market for American wheat is approximately 150 million bushels a year.

The need then is for a program that defines the quantities of wheat that are needed for well-planned and well-organized programs of economic development in the underdeveloped countries. When this quantity is determined and projected into the years ahead and to this are added the quantities of wheat that are required for other uses, then and only then will the extent of the supply control measures for wheat production be known. Whether the supply control measures take the form of an expansion of the Soil Bank program including taking whole farms out of production as Professor Earl O. Heady of Iowa State College has suggested, or whether it is a system of supply control based on marketing quotas as Professor Willard Cochrane of the University of Minnesota has suggested, the magnitude of the needed wheat production adjustments will be established.²

² Both proposals have the same serious weakness. They ignore the political repercussions that will result from the implementation of these proposals. If Professor Heady's proposal were enacted into law and whole farms were either leased or bought on a scale large enough to solve the overproduction problem, the effects on small towns and communities in the more rural states would be devastating. Given the agricultural bias in the composition of the United States Congress the law would quickly be changed. Professor Cochrane's proposal has a similar weakness. Marketing quotas limit what a farmer can market—not what he will produce. If the marketing quotas were stringent enough to solve the overproduction problem, surpluses would accumulate on farms instead of in government storage bins. Again, given the composition of the

The amount of wheat that can be utilized effectively by the underdeveloped countries in the years ahead will depend on the type of program that is used to distribute the wheat. The maximum use will not be made of surplus wheat if the program is so administered that the underdeveloped countries receive only such wheat and only at such time as it is politically expedient within the United States to dispose of it.

POLICY CHANGES NEEDED

Some of the requirements for a sound wheat surplus utilization program would seem to be:

(1) The establishment of a division within the Foreign Agricultural Service to determine the needs of the underdeveloped countries for surplus wheat. The role of this division would be not only to determine needs within the framework of practical workable development programs, but also to project these needs for a five- to ten-year period so that agricultural policy-planners within the United States would know how much wheat would be needed for this use in the years ahead. This division would, of course, have to consult and keep in close contact with the Food and Agriculture Organization of the United Nations and representatives of other wheat surplus-producing nations. A precedent for the types of studies needed has been made by the Ford Foundation in predicting the food needs of India.³

(2) The activation of Title IV of Public Law 480 so as to allow for authorizations of surplus wheat to the underdeveloped areas for periods of five to ten years. As was indicated above,

United States Congress the accumulation of surpluses on farms would not be tolerated.

³ *India's Food Crisis and the Steps to Meet It* (New Delhi: Government of India, 1959).

it is essential to sound economic development planning to know the extent of the surplus wheat available for a time period long enough to provide for sound planning.

(3) The amendment of Public Law 480 to allow for integration with other forms and types of financing economic development projects. The number of international and bilateral financial arrangements seem to be increasing at a steady rate. If surplus wheat is to be used as a partial substitute for capital in development projects its availability must be contingent on the availability of complementary financial aid.

(4) The strict limitation of surplus wheat utilization on the basis of need. Rules should be established whereby countries with a per capita income above a certain level are declared to be commercial markets and hence will not receive wheat through barter or sales for local currencies. By establishing a rule such that no country with a per capita income of \$200.00 or over will receive wheat donations would have the effect of protecting American commercial markets for wheat. It would also protect the commercial markets of other wheat surplus-producing countries and assure that the United States did not create new areas of economic distress in other parts of the world in its attempt to aid underdeveloped countries.

If the changes outlined above were made, Public Law 480 would become a program that would allow for surplus wheat utilization, rather than being a dumping policy for a domestically oriented wheat program. The over-all domestic wheat program could then be fitted into a policy that was internationally oriented and one that was worthy of a country whose economic power is so great that its every move has economic and political repercussions throughout the world.

Sugar and Wool

By EDWARD F. RENSHAW

ABSTRACT: The production of sugar and wool in this country is encouraged by protective devices which illustrate the peculiar vulnerability of the democratic process to a well-organized, dispersed interest. In pursuing their own narrow interest both groups have unintentionally fostered competition from substitutes which could destroy large segments of their respective industries. Spectacular growth in the consumption of synthetic fibers and the development of a variety of artificial sweeteners suggest that even the most cleverly organized monopolies are threatened by technological progress. The consumer who has been taxed by the sugar and wool interests may gain more in the long run than the producers who must adjust to a kind of competition for which the best protection is no protection.

Edward F. Renshaw, Ph.D., Chicago, Illinois, is a member of the faculty of the Department of Economics, the University of Chicago. He has recently accepted a cooperative appointment for 1960-1961 with the United States Department of Agriculture and the Giannini Foundation. Professor Renshaw's monograph, *Toward Responsible Government*, received an award of merit from the American Farm Economic Association (1959).

UNDER the Jones-Costigan Act the domestic market for sugar was divided between United States and foreign producers. The principal instruments for dealing with the sugar problem under the act were:

(1) The determination each year of the quantity of sugar needed to supply the nation's requirements at prices reasonable to consumers and fair to producers; (2) the division of the United States sugar market among the domestic and foreign supplying areas by the use of quotas; (3) the allotment of these quotas among the various processors in each area; (4) the adjustment of production in each area to the established quotas; (5) the levying of a tax on the processing of sugarcane and sugar beets, the proceeds of which to be used to make payments to producers to compensate them for adjusting their production to marketing quotas and to augment their income; and (6) the equitable division of sugar returns among beet and cane processors, growers, and farm workers.¹

In 1936 the Supreme Court ruled that the tax on processors of agricultural commodities was unconstitutional when used as a device to control production. Thus, provision 5 above was supplemented by an authorization to the Secretary of Agriculture to make payments out of the federal treasury from funds appropriated for that purpose. Aside from that change, however, and the to-be-expected continuous quota revisions, the sugar control program of the 1950's is still the program of the 1930's.²

In another context this author has discussed the probable cost of the sugar program to the consumer.³ It is in the neighborhood of one to two dollars

per person per year. William Pendleton has written an excellent article in which he describes the history of "American Sugar Policy" as well as the political considerations involved in the restrictive Sugar Act of 1948, since extended.⁴

About 85 per cent of the United States output of sugar beets is grown on western irrigated farms. One of the paradoxes of government interference in the market on behalf of sugar is that an inefficient sector of our economy has inadvertently been used to justify some extremely wasteful investment in reclamation. The complementarity between sugar beet production and public investment in reclamation illustrates the well-known political-economic process by which relatively small gains to vocal and politically astute minority groups can be compounded into an exorbitant total social cost provided the cost to any individual taxpayer is sufficiently small to go unnoticed or to be hidden within a context of policy objectives that the voter automatically assumes are good for the country.⁵

The sugar program is unique in that even the foreign suppliers have a vested interest in its continuation. If the domestic industry is as unable to compete as many advocates of protection claim, the real beneficiaries from the program are foreign producers who are allowed to sell a portion of their crop in the United States at the protected price. In recent years, the price of raw sugar in the United States, less the protective tariff, has averaged two or three cents above the price prevailing in the world market. The windfall accruing to certain foreign countries, in particular Cuba, heavily dependent upon the ex-

⁴ William Pendleton, "American Sugar Policy," *Journal of Farm Economics*, Vol. 33 (1948), pp. 226-242.

⁵ Edward F. Renshaw, *Toward Responsible Government, An Economic Appraisal of Federal Investment in Water Resources* (Chicago: Idylla Press, 1957), pp. 17-24.

port of sugar, is a threatening weapon of diplomacy.

Congress, in recent months, has been under tremendous pressure to grant the President authority to reduce Cuba's sugar quota. Considering both the amount and the way in which capital belonging to United States citizens has been appropriated, some sort of economic retaliation is probably inevitable. The relevant question would appear to be, is a reduction of Cuba's sugar quota an optimal retaliatory instrument? The answer, it seems to me, is no.

A better device would be to freeze, say, two thirds of the two-cent-per-pound premium Cuba obtains from the sale of her quota in our protected market, with the understanding that the money will be used to compensate those individuals who have had their property seized. To keep the program above-board, payments should be based upon an independent appraisal of property values by a neutral nation.

The advantage in this approach, it seems to me, is that it can be defended on moral grounds. The economic benefits accrue to the injured parties rather than to secondary parties hoping to take advantage of an unpleasant political development.

If the more advanced countries of the world agreed among themselves to discriminate by imposing, temporarily, special tariffs against the goods of countries expropriating foreign capital—to insure just compensation in that event—much of the present reticence on the part of private interests to invest capital in politically unstable countries would disappear. Without foreign capital and the technology which comes with it, the road to economic prosperity and political maturity for the so-called “underdeveloped” countries is likely to be much longer and more apt to follow the Soviet pattern.

Considering the far-reaching reper-

cussions of any move that might be interpreted as “retaliatory” on the part of the United States, Congress ought to consider seriously the possibility of establishing a precedent which will promote economic and social stability in the free world as opposed to a reflex reaction which will only benefit a few sugar growers who have already been granted special privilege.

WOOL

Wool is of particular historic interest because of its key role in American tariff policy. According to Blinken:

The wool tariffs have traditionally been at the center of American tariff battles. For all practical intents and purposes, the 1929 Smoot-Hawley tariff debates were waged about Schedule 11, that section of the tariff laws dealing with wool and wool manufactures.⁶

When the General Agreement on Tariffs and Trade, concluded by the State Department at Geneva, was released in November, 1947, the comparative calm with which it was greeted was marred only by the backwash of the wool tariff controversy. The *New York Times* reported that “there were 3,500 American products listed for tariff reduction in a State Department announcement, November 17, but the western wool growers, members of Congress, and Chamber of Commerce officials had eyes for only one—wool.”⁷

Wool production in this country is at the present time encouraged by means of a fixed tariff and a system of compensatory payments. Under the National Wool Act of 1954:

(1) An annual production of 300 million pounds of shorn wool—about one-third more than we are now producing—is to be encouraged as a measure for our national security and promotion of the general economic welfare. (2) An incentive price is

⁶ Donald M. Blinken, *Wool Tariffs and American Policy* (Washington: Public Affairs Press, 1948), p. 9.

⁷ *Ibid.*

established to encourage this larger production. (3) The price will be obtained by means of payments to growers to bring their income from wool up to the incentive level, rather than by raising prices in the free market. (4) A portion of the duties collected on imports of wool and wool manufactures is appropriated to finance the payments. (5) Section 708 of the act provides a self-help feature whereby wool growers can work together more effectively in developing and financing advertising and promotion programs to improve the demand for the industry's products and, thereby increase the prices received in the free market.⁸

The wool act is unique in that the burden of maintaining a high-level price support for United States production is shifted in effect onto the foreign producer. The dual protection afforded by the tariff and the compensatory payments has been greater in recent years than the tariff which existed prior to the 1948 Trade Agreements Act.

IMPORT FOR DOMESTIC POLICY

According to Professor Willard Cochrane a combination of circumstances is causing the cartelization of agriculture. “I am convinced that society is eventually and inevitably going to grant monopoly powers to agriculture, via government, to permit and enable the many producers in agriculture to act in concert.”⁹ In *Farm Prices, Myth and Reality*,¹⁰ the main outlines of a monopolistic course of action for agriculture are again set forth; the monopolistic features, however, are cloaked in the

¹⁰ Minneapolis: University of Minnesota Press, 1958.

guise of a “public-utility approach to the price-income problems of agriculture.”¹¹ Cochrane likens his comprehensive supply control program primarily to the sugar program.

While both the sugar and wool¹² programs deserve special consideration as ways of obtaining the price support end without contributing to domestic surpluses, doubt can be raised as to whether they have helped to reduce the income disparity vis-à-vis agriculture and the rest of the economy.

It does not appear that sugar producers enjoyed a more affluent position than other farmers in 1949, the most recent year for which data are available.¹³ Furthermore the data are not inconsistent with the hypothesis that the gains from the sugar program have been capitalized into land values.¹⁴ Admittedly the position of land owners is enhanced by an increase in land prices resulting from the program, but it does not follow that the young farmer just becoming established or the farmer who wants to enlarge his holdings finds himself in more advantageous circumstances by an increase in the ‘cost of doing business.’ Price support programs which act to inflate land values could, in the long run, aggravate more than help farmers make the kind of adjustments that are necessary in order to obtain the benefits from the new and

¹¹ *Ibid.*, p. 172.

¹² Under the National Wool Act of 1954 there has been a dramatic decline in Commodity Credit Corporation (CCC) holdings of wool. Over 180 million pounds of wool were accumulated by the CCC from the 1952, 1953, and 1954 price-support loan programs. At the beginning of the 1955 marketing year existent stocks totaled 150 million pounds. The CCC holdings were progressively liquidated under the incentive program and were no longer a depressing influence on the market by the end of 1957.

¹⁴ *Loc. cit.*

better production possibilities afforded by technological progress.

FOREIGN POLICY IMPLICATIONS

Sugar and wool are two of the most perfectly organized monopolies in existence. They are widely dispersed throughout the United States and assured of continuing Congressional support. Neither commodity is significantly dependent upon net treasury outlays to maintain its price supports. In view of these factors it would be unrealistic to advocate a policy of free trade in sugar and wool regardless of the desirability of that objective.

The issue, it seems to me, is whether they should be given such a high level of protection that they become growth industries. After World War II a sizeable expansion in United States sugar production was permitted. The present program seems to be directed toward allocating a fixed historical share of the United States market to domestic producers. If population continues to increase and if synthetic sweeteners do not increase significantly in relative importance, this policy could foster the growth of an inefficient industry.

A prime objective of the National Wool Act was to increase domestic production. Increased domestic production was to be encouraged at a time when the share of the United States market supplied by foreign producers was declining.

The argument advanced for maintaining a fixed share of the market and even increasing the domestic share is couched in terms of national defense. But this argument is fallacious. The United States has never been successful at increasing the production of either sugar or wool in time of war. Past wars have simply made us more dependent than ever upon imports.¹⁵

¹⁵ Cuban sugar is produced virtually in our own back door. The logical way to provide

The most important factor to consider in connection with the defense argument is the changing concept of war itself. Strategists are now speaking in terms of short wars, even minute wars. For a war that is expected to last less than six months, it is the efficiency of the economy prior to the outbreak of hostilities that is important. Even if the war were expected to last longer, it is not certain that our aim should be self-sufficiency; shipping hazards must be balanced against the vulnerability of atomic attack. The destruction of foreign production is not likely to be given so high a priority as the destruction of United States productive capacity. In either event it would seem the height of foolishness to exhaust our own natural resources and to promote the growth of inefficient industry at home, thus weakening our allies, at a time when the cold war is clearly being fought on the economic front. If we lose the latter, we are almost certain to lose a hot war, regardless of our self-sufficiency.

A reasonable kind of protection would be directed toward maintaining a level of support that would insure domestic producers the lower of either (1) a fixed total output or (2) a fixed share of a declining domestic market. If all the so-called "developed" countries were to adopt protective policies of this kind, the world economy could be expected to adapt to a policy of free trade without severe adjustments. It is not unreasonable to believe that economic progress in the free world could be accelerated at little or no cost to vested interests by making the "right to grow" more contingent upon economic efficiency.

for our defense needs with respect to wool would be to stock pile that commodity. See: *Wool Tariffs and American Policy*, op. cit., pp. 57-62.

Lessons from a Comparison of United States and Canadian Farm Policy Approaches

By DAVID L. MACFARLANE

ABSTRACT: Professor Johnson's unpublished paper entitled "Income and Resource Effects of Canadian and United States Farm Policies: A Comparison" demonstrates that the policies followed in Canada until 1958 were quite satisfactory compared to those pursued in the United States. Canadian costs have been far lower regardless of the method of measurement; changes in Canadian farm incomes over thirty or more years have been just as favorable; and Canadian resource adjustments have been by economic standards more desirable than those of the United States. The last point is particularly clear in the case of the wheat economy and in the relatively greater expansion of livestock production. The emphasis in Canadian farm policy has been on production payments, for example, feed freight assistance, prairie farm rehabilitation—a farm development program—prairie farm assistance—a crop insurance scheme—and premiums on high grade hogs. These contrast with parity payments and attempts at restriction of output in the United States. While desirable resource adjustments have been made in Canadian agriculture, returns per farm and per worker are substantially lower than those prevailing in the United States and only half those in nonagricultural occupations. Thus the challenge to farm policy is greater in Canada than in the United States, and political pressures demanding a more aggressive approach to the farm income problem become stronger each year.

David L. MacFarlane, Montreal, Quebec, has been a member of the staff of McGill University since 1947. He came originally from the Canadian prairie region and after graduate studies at the University of Minnesota, the University of Chicago, and Harvard University worked for five years in Kentucky before entering wartime service with the Canadian government. He is a co-author with John D. Black of *The Development of Canadian Agriculture to 1970* (1958) as well as the author of many papers on Canadian farm policy.

MANY analyses of the American farm programs have considered in some detail their implications to the foreign policy of the United States. Professor D. Gale Johnson's book entitled *Trade and Agriculture* is perhaps the most notable of these works. However, little comprehensive work has been devoted to detailing the comparative implications of clearly different farm policies on farm economies which have much in common.

Professor D. Gale Johnson has prepared a paper in which he undertakes such a comparison with respect to Canada and the United States.¹ While it is most unfortunate that Professor Johnson's valuable paper has not been published, the writer has permission to quote from it and generally to employ it as a point of departure for much of the present paper. Johnson's major focus is on the consequences which flow from the pursuit of divergent farm policies in these two countries. He has used many imaginative and yet unsophisticated analytical techniques in handling a most difficult subject. It may be appropriate to commence this paper by quoting several of Johnson's major findings:

On the basis of the evidence brought together in this paper, the Canadian farm policy as it operated until 1958 was a reasonably satisfactory one compared to the policy followed across the border. This conclusion rests upon the following points. . . . First, the relative cost to the government of the Canadian farm programs for price and income support (regardless of how they are measured) has been only a fraction of the cost in the United States; second, the general changes in the income of the farm population has been at least as favorable in Canada as in the United

¹ "Income and Resource Effects of Canadian and United States Farm Policies: A Comparison," University of Chicago Office of Agricultural Economics Research, Paper 5912 (April 6th, 1959).

States; third, the resource adjustments that have occurred are, in several cases, more appropriate than has been true in the United States; and fourth, the current price structure in Canada is much more consistent with the underlying demand and supply conditions than is true in the United States.

The Canadian experience in the major wheat areas indicates that it is possible to adjust resources and farming practices to a substantially lower price of wheat than prevails in the United States without a significant effect on the return to labour. In the Prairie Provinces there has been a much greater emphasis on summer fallow than in the regions across the border; there has also been a significant shift towards livestock and feed grain production as sources of income, shifts that did not occur in comparable areas in the United States.

The Canadian experience tends to cast doubt upon the "inevitability of output outrunning demand" because of the continuing advances of technology. . . . The Canadian experience supports the prediction of traditional theory of the firm and the industry that output grows in response to change and demand and factor supply conditions and does not just increase "willy nilly" in response to purely technological considerations. It is certainly true that technical conditions in production have a great deal to do with relative product prices. And if relative product prices fall because of resource economies output would surely be larger than it would in the absence of the economies, but this is very different than saying that the increased output is caused by changes in techniques.

Finally, the Canadian and the United States experiences taken together indicate that the factor supply adjustments that have occurred, especially in the labor market, have been sufficient to result in some long run improvement in the relative income position of farm workers and a very substantial improvement in the real income position as conventionally measured. The rise in real incomes has not been due to improvement in the relative prices in farm products; if anything relative farm prod-

uct prices have fallen over the past three decades. The improvement has been due to the significant increase in the marginal physical product of labour which, in turn, resulted from technological change, general improvements in resource efficiency and a

substantial reduction in labour employment, both absolutely and relatively to all other outputs. There is no reason to believe that the general improvements in technology and productive efficiency will not continue; consequently further in-

creases in the real income of the farm workers will depend upon further reductions in the farm labour force.

CANADIAN FARM POLICY

It is appropriate at this point to examine briefly the Canadian farm industry and Canadian farm policy which have drawn more than mild praise from Professor Johnson. Until 1958, Canadian farm policy is clearly characterized by restraint with respect to the use of subsidies from the public treasury and the total absence of direct production controls. Professor Johnson's very useful summary of the types of payments from the federal treasury used in support of the farm industry in Canada and in the United States is reproduced in Table 1. The restraint shown by the Canadian government in supporting agriculture becomes more evident if an adjustment of the data in Table 1 is made, removing the influence of purely emergency programs with which any government would have to deal whether or not it had an agricultural policy. These adjustments include (1) the cost incurred by the outbreak of the foot-and-mouth disease, included in price supports and totaling 70 million dollars; (2) the payment of 65 million dollars to wheat farmers to compensate them for a five-year wheat contract with the United Kingdom that was not concluded by the Canadian government because of either misunderstanding or bad faith; and (3) the cost of butter price support during the period following the legalization of margarine in 1949—production and sale had been illegal for nearly sixty years—amounting to approximately 10 million dollars. This adjustment reduces the eight-year total of farm program cost to 312.7 million dollars or an average of less than 40 million dollars per year. The adjusted costs of federal farm programs distributed over the eight-year period averaged

2 per cent of gross farm income and 3.5 per cent of net farm income.

It is further evident that a very large proportion of government payments to Canadian farmers, after considering the adjustments indicated in the previous paragraph, were primarily intended to be production payments, for example, feed freight assistance, prairie farm rehabilitation—a farm development program—prairie farm assistance—a crop insurance scheme—and premiums on high grade hogs. Thus price support and other programs for the purpose of influencing farm prices have been of negligible importance.

PRICE SUPPORT LEGISLATION

But this policy ended in the fiscal year 1957–1958—the last year in Johnson's table. In that year a new government passed price support legislation which was much more comprehensive, making support mandatory for nine products at a level of at least 80 per cent of the average price of the previous ten years. The following year, the government began to subsidize milk for manufacturing purposes on the basis of 25 cents per hundred gallons. The new supports were carried out, for more than a year, by a purchase program which placed in government hands embarrassingly large supplies of pork, dairy products, and eggs. Losses by the new Agricultural Stabilization Board, largely on the products noted, amounted to about 58 million dollars in fiscal year 1959–1960. These losses as well as the difficulty of trying to sell, dump, or give away surpluses resulted in deficiency payments for hogs and eggs. Ostensibly for the purpose of combating vertical integration, the deficiency payments apply only to one hundred hogs and 4,000 dozen eggs per farm per year. Though this plan was in operation for only a few months at the time of this writing, it is realizing its avowed pur-

pose of restricting production. Both because of its discriminatory aspect and because the major farm organizations advised against deficiency payments, the present program is under vigorous attack. Major Canadian farm organizations have generally been statesman-like and have suggested supports at a level which would provide no incentive to increased production. At the same time, in consideration of the grave difficulties involved in marketing, they have pressed vigorously for direct payments on wheat. Stringent quotas are applied to farm deliveries. These have typically been low because exports have lagged in the face of United States non-commercial wheat exports.

CANADIAN WHEAT FARMERS

One other aspect of Canadian farm policy should be noted. It lies in the role of the Canadian Wheat Board which is a monopoly marketing agency for wheat, oats, and barley. The Board pays an initial delivery price, which operates as a floor price on these grains, and makes further payments as the crops are marketed. The support on "No. 3 Northern," an average grade, has for some years been \$1.32 basis "Ft. William" or generally about \$1.10 to \$1.15 at farm level. The farm price of wheat has averaged \$1.25 to \$1.30 in recent years compared to an average farm price close to \$2.00 in the United States. The general position of the Canadian wheat grower is that he could compete fully with the United States producer, but can scarcely be expected to contend with the United States Treasury.

As Johnson correctly points out, Canadian wheat farmers have made substantial adjustments to the low price of wheat and to the more buoyant prices for livestock and livestock products. He cites that in the 1926–1929 period almost 70 per cent of the cash receipts

of farmers in the Prairie Provinces were from wheat and that by 1953–1957 the proportion had fallen to 44 per cent. In the two-year period 1958 to 1959, it fell further to 37.3 per cent. In contrast to this drastic remaking of Canadian Prairie agriculture Montana and North Dakota show no reduction in dependence upon wheat. Johnson makes the point that total farm output in the United States has expanded somewhat faster than that of Canada. And he could have added that this occurred in the face of a faster rate of growth of Canadian population.

RESOURCE ADJUSTMENTS

Johnson stresses as consequences flowing from Canadian agricultural policy the extent to which farmers have made adjustments in resources used—and they have been very substantial. The most important of these relates to the labor force in Canadian agriculture which has declined from 1,200,000 in 1941 to 748,000 in 1958. This is a somewhat greater reduction than the United States has experienced. Comparative adjustments in other production factors are indicated in the following tabulation which shows percentage change in capital invested in real estate, machinery, and livestock from 1941 to 1958:

PER CENT CHANGE IN AGRICULTURAL INVESTMENT, 1941–1958

Resource	Canada	United States
Real Estate	127	231
Machinery	265	389
Livestock	202	168

While many limitations attach to the use of these data they suggest that a smaller increase in the use of machinery and a greater increase in livestock investment have been associated with the very modest Canadian farm programs.

This would be expected in terms of Johnson's analysis since American farm programs have aided crops more than livestock while the generally "free" market in Canada has had the opposite result. The larger comparative increase in real estate values in Canada is probably due to the unduly low levels during the depression period which in the case of Canada extended at least through 1941.

THE LESSONS

What lessons emerge from this comparison of Canadian and American farm policy? First it is necessary to make unmistakably clear the fact that while desirable resource adjustments have proceeded more quickly in Canada, they have not been accompanied by any improvement in income. Apparently most of the benefits of these adjustments were quickly transferred to consumers. Johnson points out that over a thirty to thirty-five year period real returns per worker in the two countries have increased to the same extent. However,

in either absolute terms or compared with returns to workers in other industries earnings of farmers are deplorably low. And in Canada, they are not only about 20 per cent less than in the United States, but farmers in the latter country apparently have considerably higher earnings than nonfarm sources.

Thus the challenge to farm policy remains. With aggressive and expensive programs the United States has failed to meet the generally accepted income criteria of farm policy; without them Canada has also failed. And while the atmosphere for constructive adjustment is more propitious in Canada no resolution of the farm income problem is in sight—and barring substantial redirection of policy Canadian farmers seem assured of at least another decade on the tortuous path through the economic "meat grinder." A redirection may of political necessity come in the form of relatively large direct payments and/or an expansion of production payments. That such benefits would be retained in agriculture is uncertain.

Toward Better Use of Human Resources in Agriculture*

By JAMES G. MADDOX

ABSTRACT: During the last twenty years this country has seen the sharpest decrease in farm population in our history. However, American agriculture is still overstaffed. What can be done to alleviate this oversupply of labor in agriculture? Public action in several areas will be needed. A more rapid growth of the total economy would attract substantial numbers of people out of agriculture. Educational opportunities for rural people in primary and secondary schools should be enlarged and reoriented to provide better training for nonfarm occupations. Farm people should be aided in analyzing and evaluating nonfarm employment opportunities of various types. Likewise, they should be provided with more adequate information pertaining to nonfarm jobs, and a loan program to enable farm boys and girls to obtain specialized training for nonfarm work would be helpful. In many areas of chronic rural poverty the needed redevelopment programs should aim at: creating nonfarm jobs in these areas through industrialization; assisting some people to move out of the areas; and providing liberal credit and farm planning assistance for those who remain in agriculture. The results of public programs of these kinds would be an increase in the efficiency of the national economy and improved incomes for the farm as well as nonfarm population.

James G. Maddox, Ph.D., Raleigh, North Carolina, is Professor of Agricultural Economics at North Carolina State College. For more than a decade he was employed in the Farm Security Administration and the Bureau of Agricultural Economics in the United States Department of Agriculture. Later he was Assistant Director of the American International Association, a privately financed technical assistance agency with agricultural projects in Venezuela and Brazil. Dr. Maddox holds degrees from the University of Arkansas, the University of Wisconsin, and Harvard University.

* The views expressed in this paper are those of the author and do not necessarily correspond to the official views of the School of Agriculture of North Carolina State College.

APPROXIMATELY 21.2 million people were living on farms in the United States in the spring of 1959. This was the smallest farm population reported since data first became available in 1910. It was 15.5 per cent below the 25.1 million people who lived on farms in 1950. Since 1940 there has been a net decline of 9.3 million farm people, which must have been the sharpest decrease in any twenty-year period in the history of the country.

Nevertheless, there is evidence that American agriculture is still overstaffed. The federal government is spending large sums to support the prices of several farm products. It also maintains complex programs of acreage control. Yet, surpluses continue to mount; the purchasing power of farm commodity prices declines; and much of the labor employed in farming earns less than many nonfarm workers in fairly comparable types of employment. These considerations alone point to the conclusion that too many people are trying to make a living by farming.

But this is only a part of the picture. The natural rate of population increase is much higher than is necessary to maintain a stable farm population. At the same time, a technological and organizational revolution is sweeping through agriculture and rapidly decreasing the labor required to produce a given output. Fewer farm people would be employed in the future than in the past, even if there were no price and surplus problems. Clearly, if equal returns to comparable kinds of farm and nonfarm labor are to be achieved—a condition which would both increase the efficiency of the national economy and improve the income position of agriculture—many people now employed in farming, as well as those who are coming into the farm labor force each year from the natural rate of population

growth, must shift to other occupations.

OVERSUPPLY OF LABOR

How great is the oversupply of labor in agriculture? How many people would have to leave farming during the next decade in order to bring the earnings of labor in agriculture to a level comparable to those in nonfarm occupations? On the basis of existing knowledge about the way in which the total supply of agricultural products responds to changes in prices and costs and the extent to which capital can economically be substituted for labor, an accurate answer to these questions is virtually impossible. An annual net migration of one to one and one-quarter million people out of agriculture, for the next ten years, could probably take place with relatively little effect on total farm output. A shift of this magnitude would drain off the net natural increase in farm population as well as an additional 900,000 to 1,000,000 farm people per year. Though such a rate of change might have little effect on total farm output, it would result in a significant rise in per capita farm income.

Income comparisons

Comparisons between the average annual returns to farm labor and the yearly wages of employed factory workers or the average per capita net incomes of the farm and nonfarm populations indicate that farm people earn only about one half as much as those employed in nonfarm occupations. There are, however, numerous difficulties in such comparisons. First, there are differences in the age, sex, education, and experience of the farm labor force compared to nonfarm workers. Second, the purchasing power of a given income in urban areas is probably lower than on farms. The magnitude of these differ-

ences is not accurately known. However, per capita farm incomes which are 65 to 70 per cent of per capita nonfarm incomes may result in farm labor receiving about the same real returns as nonfarm labor of equivalent ability.¹ Even so, average per capita net farm income would need to increase substantially above the levels of recent years, if labor of comparable ability is to receive approximately the same return in farming as in nonfarm occupations.

However, there are wide variations in the incomes of farm people. Income data pertaining to national averages are of limited value. The Census of Agriculture shows that about 62 per cent of all farms in the United States in 1954 produced approximately 91 per cent of the total value of agricultural products, while the remaining 38 per cent produced only about 9 per cent of the value of farm output. The former group, which we call "high production farms," had gross sales of \$2,500 or more per farm in 1954. The latter group, designated as "low production farms," had gross sales of less than \$2,500 per farm.

A study covering the period 1947 through 1956 indicates that the average family income, from both farm and nonfarm sources, on high production farms was higher than the average income for nonfarm families from 1947 through 1952 and ranged from 79 to 89 per cent of nonfarm family income from 1953 through 1956. In contrast, the families on low production farms had average incomes from both farm and nonfarm sources which ranged from 42 to 51 per cent of the average incomes of nonfarm families during the decade from 1947 through 1956.²

¹ See "Labor Mobility and Agricultural Adjustment," by D. Gale Johnson, *Agricultural Adjustment Problems in a Growing Economy* (Iowa State College Press, Ames, 1958).

² See "The Current Income Position of Commercial Farms," by Nathan M. Koffsky

Although the earnings of high production farms have probably worsened since 1956, the major problem of low returns to agricultural labor is certainly centered on the low production units—which numbered approximately 1,800,000 farms, not including residential and institutional units, in the United States in 1954. The number has probably decreased since that time, and the migration of young people from such farms has been heavy. Consequently, it is hazardous to guess the number of people who presently reside on low production farms. However, it is likely to be in the range of 5 to 7 million.

Approximately 48 per cent of the low production farms in 1954 were in the ten states of Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Arkansas, and Oklahoma. The South is the center of the most serious low-income problem in American agriculture. In this region, farms are small, capital is scarce, the natural rate of population increase is high, there are relatively few nonfarm jobs, and those which are available are most commonly in low-wage occupations. If equality of returns among farm and nonfarm workers of comparable abilities is to be achieved, occupational shifts must be far greater in the South than in any other major region of the country.

POSSIBLE PUBLIC ACTION

Public action will be needed in the years ahead to stimulate the growth of nonfarm jobs and to assist farm people to shift into nonfarm occupations. A rapidly growing economy requires a high degree of geographic and occupa-

and Ernest W. Grove, *Policy for Commercial Agriculture*, Joint Economic Committee (Washington, D. C.: United States Government Printing Office, November 22, 1957).

tional mobility among members of the labor force. Public policy may need to give attention to this problem in several sectors of the economy, but agriculture is the major sector, at the present time, in which greater occupational mobility would increase national efficiency significantly. The following types of public action are in order:

First, the rate of economic growth in the total economy should be raised.

Second, the abilities of farm people to become productive workers in nonfarm occupations should be enhanced.

Third, farm people should be given more assistance than they now receive in analyzing and evaluating their future prospects in various types of employment.

Fourth, farm people should be supplied with more adequate information respecting nonfarm employment opportunities than they now receive.

Fifth, a specialized loan program to aid selected farmers and maturing farm youths to shift out of agriculture should be inaugurated in those states where low incomes, high rates of population increase, and limited opportunities in agriculture are prevalent.

Sixth, there are numerous "special areas" in which a complex of integrated activities aimed at developing nonfarm jobs and reorganizing existing farm units should be undertaken.

Increase in GNP

The average rate of increase in gross national product for the total economy might well be raised to around 4 or 4.5 per cent annually. There are both many difficulties in and many justifications for such a course of action. It would be important in assuring a sufficient demand for labor in nonfarm occupations to attract substantial numbers of people out of agriculture. To achieve such an objective will require monetary, fiscal, and price stabilization policies which are far afield from the subject of this paper. The remainder of the

discussion, therefore, centers attention on the other areas of public action suggested above.

Enlarged educational opportunities

The second of these—programs to enhance the abilities of farm people to become productive workers in nonfarm occupations—would involve enlarging the educational opportunities of the rural population. It is probably the single most important step that government can take in bringing about a better allocation of labor in the economy. The main lines of emphasis of an expanded educational effort for rural people should be: (1) to provide improvements in the general quality of instruction in elementary and secondary schools in rural areas; (2) to provide a sequence of vocational courses in the existing rural high schools both for youngsters and for adults, which are aimed at fitting farm people for nonfarm jobs; and (3) to provide for an expanded number of specialized vocational schools in rural areas, which are organized and operated for the purpose of preparing rural people for nonfarm types of employment.

The responsibilities for implementing these improvements in rural education should be borne mainly by state and local agencies which administer our system of primary and secondary schools. In order to provide the necessary authority and funds, however, important legislative action will be necessary. Moreover, there is little reason to believe that the task can be accomplished on the scale which is needed without substantial utilization of federal funds. Space is much too limited to permit an adequate exploration of this problem. Pertinent light is thrown on it, however, by the following data for 1955-1956.³

³ *Statistical Summary of Education: 1955-1956*, Office of Education, United States Department of Health, Education, and Welfare.

	EXPENDITURES PER PUPIL IN AVERAGE DAILY ATTENDANCE IN PUBLIC, ELE- MENTARY AND SECONDARY SCHOOLS	EXPENDITURES FOR ELEMEN- TARY AND SECONDARY SCHOOLS AS A PER CENT OF PERSONAL INCOME
United States	\$388	3.57
Kentucky	179	2.56
Tennessee	229	3.59
North Carolina	242	4.07
South Carolina	292	5.44
Georgia	222	3.39
Alabama	206	3.62
Mississippi	171	3.94
Arkansas	197	3.71
Louisiana	358	4.81
Oklahoma	331	4.49
Average for 10 southern states	244	3.91
Average for 38 other states	435	3.53

In most southern states, where the need for education is greatest and where educational expenditures per pupil are lowest, a higher percentage of personal income is devoted to education than in other regions. With only two exceptions—Kentucky and Georgia—the ten southern states listed above made a greater effort in 1955-1956, relative to the incomes of their citizens, to educate their children than was true of most nonsouthern states. For instance, in Mississippi, the state with the lowest expenditure per pupil, 3.94 per cent of personal income was used for elementary and secondary education in 1955-1956, compared with 3.44 per cent in New York, the state with the highest expenditure per pupil.⁴ This contrast epitomizes an important aspect of the educational problem in the United States. If rural education is to be improved significantly in the states where the need is greatest, federal aid will be essential.

⁴ The expenditure per pupil in average daily attendance in public, elementary and secondary schools in New York in 1955-1956 was \$584.

Some changes in rural education, however, are not wholly dependent on a new program of federal aid. There are opportunities to make adjustments in the uses for which present funds have been allocated. For instance, there appears to be little justification for a continuation, at the present scale, of vocational agricultural training in rural high schools. Most future graduates of agricultural high school courses will not enter directly into modern, commercialized farming. The aims and methods of the present system of vocational agricultural training should be shifted to give greater emphasis to training youngsters for nonfarm jobs.

Career counseling

The third suggested area of public action—greater assistance to farm people in analyzing and evaluating alternative employment opportunities—should become the responsibility of the Agricultural Extension Service. Research may often be needed on which to base such educational effort. The important aim would be to teach farm people, particularly young people, how to think through the problem of choosing a career. One would be rash to imply that there is only one solution to the problem for each individual or that an optimum solution can always be achieved. In this respect, however, the problem is similar to numerous others, about which farmers are often given educational assistance by the Extension Service. The need is for a continuing program, in which the focus of emphasis is on teaching farm people how to analyze their future prospects in various types of occupations. The intensity of effort should vary by regions, but there is hardly an agricultural area in the United States in which farm people could not be benefited by an educational effort of this type.

Nonfarm employment

The fourth area of needed public action—providing to farm people more adequate information with respect to nonfarm employment opportunities—appears to call for a revitalization of the United States Employment Service and its affiliated state agencies. As this organization now functions, it does not appear to be serving farm people in an adequate manner. In many areas of the South, where farm incomes are low and farming opportunities are scant, there is a noticeable paucity of information about job opportunities in the urban areas of the North and East. For the Employment Service to serve the best interests of farm people in low-income areas, a specialized program may be necessary. Because there are often local antipathies toward a decrease in the number of farm workers, federalizing the Employment Service's functions should be carefully considered.

Loan programs

The South and a few other scattered areas have such a high ratio of rural population to capital and land resources, such a high natural rate of population increase, such a deficiency of nonfarm job opportunities, and such a plethora of low-income farm people that a special loan program to enable maturing farm boys and girls to obtain apprenticeship training or to attend specialized vocational schools or colleges should be inaugurated. It could be administered by the Farmers Home Administration without involving the establishment of a new agency. Legislative authority and an increase in appropriations would probably be necessary.

Such features as the eligibility requirements of borrowers, the maximum size of loan, the length of the repayment

period, the type of security, and the interest rate should be established by the lending agency. Loans of this type would probably range from \$200 to \$2,500 and would be repayable in monthly installments after the borrower had finished his or her period of training. They would be analogous to loans which many colleges now make to selected students. In most cases, however, they would be made to rural youths who are interested in taking a specialized vocational course which would range from only a few months to perhaps as long as two years. Ten million dollars per year for loans of this type, over a ten-year period, would be of inestimable value to thousands of farm boys and girls.

Redevelopment programs

In various regions of the country, but particularly in the South, there are numerous areas of chronic rural poverty, which are in need of specialized redevelopment programs.⁵ Many of these areas are heavily populated, lacking in natural resources, culturally isolated from the main stream of economic development, and poorly supplied with roads, schools, and other community facilities. Within recent years many young people have migrated out of such areas, but farm enlargement is taking place slowly and industrial growth appears to be centered mainly around the larger cities. As a result, many of the areas of chronic rural poverty are in great need of new capital and new entrepreneurship.

Integrated programs of redevelopment which provide liberal amounts of credit and farm planning assistance to those who remain in agriculture so that they can enlarge and improve their

⁵ For a delineation of such areas see: *Development of Agriculture's Human Resources*, United States Department of Agriculture (April 1955).

farms, which provide vocational training for those whose only opportunities are in nonfarm occupations, and which encourage the growth of industry and service trades in these areas are sorely needed. Opportunities and potentialities vary greatly from area to area. The first major step, therefore, should be to conduct an economic study of each area which would culminate in recommendations for action programs. The financing and co-ordination of such a series of studies will require federal action, though much of the work might be done through contracts with Agricultural Experiment Stations. Subsequently, a series of Special Area Development Authorities may be needed to carry forward the recommended programs of redevelopment.

The six areas of public action which have been suggested in the preceding paragraphs involve a combination of federal and state action. Those which are educational or informational in content should be national in scope and should become continuing functions of government. The educational loan program and the special-area redevelopment activities should be limited mainly to the South and a few other relatively small areas where the low production farm problem is most serious. If this combination of programs were pursued with vigor and imagination for the decade ahead, it would greatly increase the efficiency of the national economy and improve the incomes of the people who leave agriculture, as well as those who remain in farming.

The Executive and Farm Policy

By JOSEPH S. DAVIS

ABSTRACT: The national interest requires a reversal of the costly drift of farm policy in the area involving price supports, production controls, and surplus stocks and disposals. There is a dangerous trend toward continuing rise in surplus stocks, of wheat and corn especially, in spite of heavy exports under subsidy and special programs. Disagreements between the Executive and the Congress have prevented or seriously delayed desirable legislative changes, and fear of the farm vote has hampered more far-reaching proposals. In arriving at decisions on farm policy the Executive operates under handicaps arising from tradition, politics, and entrenched ideas, practices, and vested interests. Needful changes therefore require wide support based on clearer and broader public understanding. There is urgent need for fresh penetrating reappraisals—from the viewpoint of the nation as a whole—of the real farm situation in perspective, of the farm programs and their impacts, and of goals appropriate to changed agricultural conditions. Materials for such reappraisals are abundant, but the task calls for vigorous new efforts within and outside the government. A specially constituted interagency committee might perform this service, but this could advantageously be paralleled by a nongovernmental undertaking reinforced by individual efforts.

Joseph S. Davis, Ph.D., L.H.D., Stanford, California, is Director-Emeritus (since 1952) of the Food Research Institute of Stanford University. He was Chief Economist of the Federal Farm Board, 1929-1931. He served on the National Research Council's Food and Nutrition Board, 1940-1945, and Agricultural Board, 1945-1948. In 1953-1954 he was economic adviser to the Randall Commission and in 1955-1958 a member of the President's Council of Economic Advisers. Among his publications are Wheat and the AAA (1935), On Agricultural Policy, 1926-38 (1939), Wartime Food Management (1943), "What Kind of an Agriculture Does America Want" (1945), and The Population Upsurge in the United States (1949).

I HAVE been asked to grapple with the question: How can policy-making in the Office of the President and the United States Department of Agriculture be improved in order to produce a farm policy adjusted in accordance with the requirements of sound economic foreign policy?¹ To this baffling question no one can give a thoroughly competent and satisfying answer, if indeed there be one. I am not presumptuous enough to promise one. I shall offer a few leads, but with little confidence that they will prove of value.

SCOPE OF THE DISCUSSION

At the outset, let us limit the topic. In various parts of farm policy the current programs are well established, working reasonably well, and more or less readily modified as conditions change. Several others are open to criticism, and some of these are resistant to fundamental change, but their defects have relatively minor impacts on the economy, the federal budget, and international relations. By contrast, the programs involving price supports, acreage allotments, surplus concentration, and surplus disposal are highly controversial and widely recognized as, for the most part, costly failures in spite of some useful by-products. Yet the President and the Congress have repeatedly been unable to agree on needed modifications, and various compromises have been sadly disappointing. The present mongrel program is neither Presidential nor Congressional. The President's Special Assistant on economic affairs

¹ Such a reconciliation of farm and foreign policies was seriously sought in 1953-1954, by the Commission on Foreign Economic Policy chaired by Clarence B. Randall. Unfortunately the Randall Commission was unable to come to effective agreement in this area. See Commission on Foreign Economic Policy, "Report to the President and the Congress" (January 1954); "Minority Report" (January 1954); and Staff Papers . . . (February 1954).

rightly said late in 1959: "The farm price-support and production-control legislation now on the statute books does *not* represent the Administration's farm policy. . . . Clearly the public will not tolerate indefinitely the heavy cost and the growing stocks which result. . . ."²

In concentrating upon this crucial area, I shall ignore areas of lesser importance which also seem to defy significant improvement. Examples are the highly protectionist tariffs, import quotas, and regulations affecting a great variety of competing agricultural imports. These are not in harmony with our avowed general policy in international trade. Yet I see no prospect that they can be dealt with until the more glaring defects can be at least partially overcome.

ABUNDANCE AND SUPERABUNDANCE

"Sustained abundance" was officially proclaimed, by Secretary of Agriculture Clinton Anderson in 1947, as a prime objective of postwar farm policy. With rapidly advancing technology and long delayed reduction in wartime price supports, this goal was quickly over-attained. Varied and protracted attempts at production control have largely failed, and persisting superabundance now threatens to become permanent. Yet for wheat and corn, in particular, price supports are at levels that generate surpluses faster than they can be disposed of by all sorts of devices, at home and abroad. Losses on surplus disposal, costs of carrying surplus stocks, and other costs involved in the mis-called "stabilization of farm prices and income," impose heavy burdens on the hard-pressed federal Treasury. These constitute a large proportion of the Department of Agriculture

² Don Paarlberg, "In Support of the Administration's Farm Policy," *Journal of Farm Economics*, Vol. 42 (May 1960), pp. 401-412.

budget, which nowadays totals about 40 per cent as much as estimated net farm income from farming.³

Virtually no one endorses or supports this "program" in its present form, and farmers generally evince extreme dissatisfaction with it. Yet it has been highly resistant even to minor improvements and politically invulnerable to drastic revision. The President has exercised his veto repeatedly to prevent its worsening, but the Congress has repeatedly thwarted his efforts to revise it substantially, and the forced compromises—such as the Soil Bank and the latest corn program—have had unhappy consequences. Thus the nation continues in the grip of a badly working, indefensible system. This extremely costly failure reflects on all of us. Somehow the impasse must be broken.

EXECUTIVE POLICY-MAKING

In considering changes in farm policy the Executive labors under several handicaps arising from tradition, politics, inertia, and so on.

The President, rarely well versed in agricultural affairs, typically relies heavily on his Secretary of Agriculture, whose huge agency is traditionally viewed as "The Farmers' Department." All too limited contributions are made by other agencies that are deeply concerned in present-day agricultural policy, notably the Bureau of the Budget and the State and Treasury Departments.

Competition for the "farm vote" has led, as in 1948 and 1952, to pre-election legislation which obstructs needed program changes. Key statements and commitments made to win farmer votes

³ "Economic Report of the President" (January 1960), p. 212, and Bureau of the Budget, "1961 Federal Budget in Brief" (January 1960), p. 26.

in political campaigns exert grave influence on proposals that may seem desirable or undesirable with fuller knowledge—a special handicap for a newly elected President. Political acceptability of possible changes carries heavy weight in policy decisions, and fear of committing "political suicide" hampers courageous moves.

Further obstacles lie in deeply entrenched concepts, formulas, and practices, such as the artificial "parity" idea and the un-American nonrecourse loan, and in the vested interests that have been built up, as in the huge volume of storage for wheat, corn, and cotton surpluses.

It requires extraordinary courage for the President and Secretary of Agriculture to admit failure when a given policy had been urged as a highly promising change and to avoid unwarranted optimism over an improvement in farmers' income, agricultural exports, or surplus stocks, even when this is due to transitory factors or to heavy drafts on the federal Treasury.⁴ Yet this sort of courage is necessary if policy is to be advantageously reoriented. Ways must be found to render it easier for such courage to be displayed.

Despite the unwholesome drift in this phase of our farm policy, some signs of progress can be noted. The President's agricultural messages and Economic Reports have come to display somewhat more realism and candor and have shown less tendency to over-

⁴ Boris C. Swerling, "The Farm Policy Debate: Discussion," *Food Research Institute Studies*, Vol. 1 (Stanford University, February 1960), pp. 100-103.

Secretary Ezra T. Benson referred last April to "outstanding progress in recent years in restoring American agriculture's position in the world market." But his base for comparison was the exceptionally poor export year 1952-1953, and he failed to mention that most of our "dollar sales" abroad are heavily subsidized.

promise. The overambitiously labeled "Food for Peace Program" is important because it provides for serious international consultations in connection with surplus disposals overseas, initially for wheat.⁵ The Rural Development Program has made a beginning in the attack on the special problems of low-income rural areas. Other examples could be cited.

NEED FOR REAPPRAISALS

Hope for significant improvement in the controversial farm program must rest on much clearer and far broader public understanding of the real farm situation. On this basis income taxpayers, housewives, and other nonfarm groups concerned, as well as the press, would be justified in taking strong positions on farm policy issues. Moreover, farmers of many types and levels could be helped to look beyond their immediate personal interests and ask themselves whether the demands, hitherto made in their name, and the special privileges accorded to many of them, are justified by results and fair to the nation.⁶

There is urgent need for penetrating reappraisals—from the viewpoint of the nation as a whole—of the agricultural situation, farm policy objectives, each of the major programs, the defects that call for correction, the political obstacles

to wise policy changes, and the merits and demerits of proposed changes. There is special need for succinct summaries not only of the points on which wide agreement exists but also of the issues on which there is still serious disagreement. Despite enormous efforts made in many quarters and a growing mass of articles, reports, hearings, and studies, we still lack a realistic presentation of farm problems combined with candid critiques of farm programs in operation. And Swerling was right in saying in his discussion of Paarlberg's recent paper: "Little progress has been made toward formulating attainable goals appropriate to present-day farm conditions."⁷

The need for realistic reappraisals is even greater because politics so thoroughly bedevils farm policy. Biennial election campaigns and debates in both Houses of Congress give rise to distortions of facts and loss of perspective, as well as to unwise commitments on the part of newly elected or re-elected representatives and the President. The 1960 political campaign may provide fresh illustrations.

Many attempts to do something of this sort have contributed valuable materials toward the desired product, but none provides the model for a fresh appraisal now. It might best be undertaken both at the government level and as a private project.

There is hardly any other area of national policy in which the informational basis is so nearly adequate. This is due chiefly to the enormous research and multifarious publications of the Department of Agriculture and the state agricultural colleges, experiment stations, and extension services, many independent individuals and groups, and committees of the Congress. Yet there are few areas in which the failure to

⁵ See my paper, "Food for Peace," in *Food Research Institute Studies*, Vol. 1 (May 1960).

⁶ The declining weight of the total farm vote and the diversity of interests among farmers are seldom given enough attention. I strongly suspect that improved analysis would show that common impressions of what farm voters conceive to be in their interests are seriously in error, and that hard-headed farmers would welcome forthright presentations which included hard facts realistically faced. The American Farm Bureau Federation holds this view, and endeavors to act upon it.

⁷ Swerling, *op. cit.*, p. 100.

grapple effectively with obstinate policy issues has been so serious and protracted.

Such analyses and appraisals should greatly facilitate formulations of proposals for policy changes and for marshaling arguments in their support.

HOW APPRAISALS MIGHT BE MADE

I do not consider altogether happy the outcome of several cabinet committees, a few mixed commissions, and several Presidentially appointed committees or commissions. Accordingly I should not propose one of this kind for the task in question.

The National Agricultural Advisory Commission, heavily weighted with farmers, has met with Department of Agriculture officials for two days in each quarter and served some useful purposes. But the Commission has not justified the hopes that were held at its establishment in 1953, and I see no prospect that it could make the urgently needed reappraisal.

Nor can the task be wisely entrusted to the Department of Agriculture. Its permanent technical staff is numerous and competent, but its members are understandably cautious in dealing with matters involving criticisms of Congressional and Administrative actions and pronouncements.⁸ At the policy level there are only a few overworked persons who must necessarily work under the Secretary, who has positions to defend before Congressional committees and farmer organizations. The experience, grasp of subject matter, and ideas of all these need to be drawn upon, and drafts on specific topics could be pre-

⁸ See Possible Methods of Improving the Parity Formula: Report of the Secretary of Agriculture Pursuant to Section 602 of the Agricultural Act of 1956, 85th Congress, 1st Session, Senate Document No. 18, February 1, 1957. This did not go to the heart of this entrenched concept.

pared by some of them, but it would be too much to expect from the Department the kind of definitive appraisals, from a national standpoint, that are most needed.

An effective interagency task force or committee might be able to undertake the job. This could be composed of selected policy-level representatives of the Departments of Agriculture, Commerce, State, and Treasury, the Bureau of the Budget, and the Council of Economic Advisers. This group could be charged with preparing, in the perspective of the whole problem, a series of reports in which the national interest would be stressed. Drafts of these could be studied and discussed in the several agencies and then be considered by the National Agricultural Advisory Commission, the Council on Foreign Economic Policy, and the Interagency Committee on Agricultural Surplus Disposal.

Such a task should not be conceived as a "quickie," though pressure should be exerted to insure a fairly steady stream of output. The committee should have a small special staff, besides enlisting aid from the agencies represented and from individual specialists outside of the government. The President would be informed of the progress of the work, be aided in his politico-economic thinking, and have opportunities to bring his own ideas gently to bear on it; but he should resist temptations to dominate it.

In due course, the matured reports could be published, without fanfare, for serious critical review by independent economists. Upon them could be based popularizations of the significant results for wide circulation.

Lack of space precludes elaboration of my suggestion of a parallel undertaking under appropriate auspices outside the government, but I believe this has merit. And there is scope for arti-

cles by individuals designed to contribute to this end result.

CONCLUDING OBSERVATIONS

The foregoing suggestions are made without any assumption about the outcome of the 1960 elections and regardless of the positions that may be taken and commitments that may be made by the successful candidate for the presidency. These might more or less severely restrict the scope and character of subsequent critical appraisals within the government, for a time at least, but would not obviate the need for them.

Wise revision of the discredited parts of the farm program to bring it into far better accord with economic realities,

budgetary sanity, and our foreign economic policy is a large job that cannot be quickly or easily achieved. It will be more difficult if the new Administration should be firmly committed to actions determined in advance of adequate analysis.

In view of the uncertainties immediately ahead, it seems futile to propose ways in which specific policy formulations should be arrived at. Experience seems to make it clear, however, that these should be much less exclusively drafted within the Department of Agriculture than has hitherto been the rule and that leaders in closely related agencies should have ample opportunity to influence their final character before the President makes the final decision.

Congressional Farm Politics and Economic Foreign Policy

By CHARLES M. HARDIN

ABSTRACT: The primacy of foreign policy centers attention upon Congressional politics with its wonted stress upon local and particular issues. Farm political influence is considerable in Congress where domestic farm policies, often with unfortunate effects upon foreign policy, are strongly rooted. Farm politicians in and out of Congress must help improve the legislative process in order to give the emergent national concern in a sound and effective foreign policy its merited support. While some adaptation of present procedures is possible, the needs of the times require a courageous examination of more sweeping proposals for change.

THE obvious primacy of foreign policy underlines the rising significance in foreign affairs of Congress and especially the House of Representatives. Despite improved organization and staffing to focus more effectively and steadily on world affairs, Congress is still extremely responsive to local interests in shaping and financing both foreign policy and also domestic policies that have a clear and present bearing upon foreign policy. If Congress is to address itself to the great issues of national survival and national purpose in a manner that will vindicate representative government, those interests and groups with the greatest voice in the legislative branch must consciously recognize the problem and commit their strength to its solution. High among the major legislative interests and often foremost among them is agriculture. Hence a grave responsibility rests upon all persons associated with Congressional farm politics, first, to co-ordinate farm policies better with foreign policy and, second, to assume their due responsibility in generally reorienting and, if necessary, reorganizing Congress to play a more adequate role in foreign policy. Granted, the obligation goes beyond agriculture to other groups just as the problem transcends Congress to include related parts of the political process: public opinion, political parties, the President, and the administration generally; but the focus here is upon agricultural politics in Congress.

FARM POLITICS IS CONGRESSIONALLY ORIENTED

Farm politicians in the United States work happily and, on the whole, effectively through Congress. True, executive leadership has sometimes been crucial both in advancing and in frustrating farm policies. Most farm leaders most of the time have been suspicious of the Executive. Their power is mag-

nified in the Congressional constituency by virtue of the equal representation of states in the Senate and of the control of Congressional redistricting by state legislatures which are typically dominated by nonmetropolitan interests. Within Congress their power is enhanced by the seniority rule which elevates to controlling positions, especially to committee chairmanships, many more legislators from rural areas than the proportion of farm population in the country justifies. The usual Presidential constituency, in contrast, is different, larger, and much more nearly centered in the great cities.

Farm price policy illustrates the Congressional bent of rural politicians. The agricultural bloc of 1921 was formed in, and realized its early triumphs essentially through, Congress—just as it met defeat of its price program in Presidential vetoes of McNary-Haugen bills. Executive initiative was vital in the Agricultural Marketing Act of 1929, in the Agricultural Adjustment Acts of 1933 and 1938, in the Second Price Control Act of 1942, and in the Agricultural Acts of 1954 and 1958. But Congress took the leadership in 1934 with the Bankhead Cotton and Kerr Tobacco Acts, and in 1940–1942 when farm price supports were raised to 90 per cent of parity and legislatively guaranteed to continue for two calendar years after the formal cessation of hostilities. Congress frustrated the flexible price proposals of the Executive in 1948 and the Brannan Plan in 1949; it tempered the Eisenhower-Benson farm bills in both 1954 and 1958. During farm politics' "modern period"—which began when farm prices fell in 1920—farm policy has repeatedly been stalemated by Executive-Congressional conflicts—1926–1928, 1930–1932, 1948–1953, 1955–1956, and 1959–1960. In the earlier years, however, stalemate meant going, without an effective farm pro-

gram. Since World War II it has meant maintaining a complicated and expensive farm program which the Executive has been determined to change.¹

BEARING OF FARM POLITICS ON FOREIGN POLICY

Farm politics has affected American foreign policy for both good and ill. National benefits beyond exaggeration have issued from agriculture's great and growing productivity which in itself is consequential largely to long-range public policy, beginning even before the Morrill Act of 1862, of applying science to agriculture. A tremendous output of farm produce in critical times has strengthened this nation, its allies, and other countries as well—not least, those nations that our allies and we have defeated in war. Meanwhile, growing agricultural efficiency has continued to release resources for other economic sectors.

Agriculture has had a mixed influence upon foreign trade policy. Many farm products, especially cotton and tobacco, and, to a less extent, wheat and lard, have heavily depended upon export markets. Until recently the cotton South has solidly supported free trade. Since the 1930's the American Farm Bureau Federation, with few qualifications, has favored periodic extensions of the Reciprocal Trade Agreement Act, as has the National Farmers Union (NFU), despite the apparent conflict with the purposes of price-support policies the NFU has endorsed since about 1949. Long an apostle of "the American market for the American farmer," the National Grange has recently relaxed its opposition. On the positive side, in the Foreign Trade Development and Assistance Act, in the Mutual Secu-

rity Act, and related programs, farm politics has effectively pushed the foreign disposal of domestic surpluses but with some intention—partly fulfilled—to help economic development in recipient countries.²

On the other hand, agricultural protectionist interest, expressed especially—though not exclusively—by commodity organizations, have tried with some success to restrict foreign trade. Since the McKinley Tariff of 1890 and the Wilson Tariff of 1894, our tariffs, quotas, and domestic price programs for sugar have repeatedly disturbed Cuban economics and politics—severely after 1929, in 1940, and in 1948, but more mildly in many other years. Wool politics nearly disrupted the 1947 Geneva negotiations which led to the General Agreement on Tariffs and Trade (GATT). Protection of dairy products under the Defense Production Act of 1951 brought a charge by eight nations that this country had nullified and impaired GATT.³

Domestic price support programs have not only been written essentially without regard for foreign economic repercussions, but since 1935 agricultural price legislation has provided both for subsidized exports of surpluses and also for the protection of domestic programs from the upsetting effects of agricultural imports. Quota restrictions were tightened and made mandatory by the Defense Production Act of 1950, provisions of which were allowed to lapse in 1953 only after executive commitments to administer more vigorously the restrictive provisions of the earlier law—Section 22 of the Agricultural Adjustment Act of 1935.⁴

⁴ D. Gale Johnson, *Agricultural Price Policy and International Trade* (Princeton University, 1954), pp. 9–10.

Price support programs have often been followed by domestic surpluses which have been subsidized and sold abroad, although not in great amounts—except for wheat under the International Wheat Agreement—until the Agricultural Trade and Assistance Act, and related programs, of the 1950's. As noted elsewhere, efforts have been made to reconcile this program with the trade of friendly nations having competitive farm exports. But the heavy production in the United States together with the export policy continues to harass not only the prospects of friendly exporting countries but also the economic development of countries that this nation is trying to help. Thus *The Second Five Year Plan*⁵ for Pakistan notes that its projected increases for cotton production have been cut 17 per cent because—among other things—of uncertainty about the "disposal policy for cotton surpluses in some . . . countries. . . ."

Finally, agricultural programs are notoriously costly. To find money for these and other heavy spending programs, Congressmen search for possible budgetary economies which they regularly find in foreign policy expenditures.

In 1945–1957, the House of Representatives cut the President's recommendations for Mutual Security appropriations by 10.4 per cent and for the Department of State by 13.6 per cent;⁶ although the Senate typically raised the annual figures on both items, the final slash remained a testimony to the fact that neither the State Department nor the Mutual Security Administration has a group behind it such as farmers, labor, the veterans, or the supporters of rivers and harbors bills or of protection for merchant shipping.

WHAT MAY BE DONE?

A scholarly survey of the Congressional role in foreign policy warmly commends the efforts of many enlightened Congressmen—including some in the "farm bloc"—and of some Congressional staff workers to improve the present system. "Yet the question remains: is this enough? The evidence presented in the preceding chapters—the procedure of uncoordinated and slipshod control—supports the conclusion that it is not."⁷ The needs can only be hinted at here. The Congressional contribution to foreign policy should be co-ordinated and integrated rather than cut into bits and pieces for division among a score of committees. The Foreign Affairs Committee of the House should have prestige in proportion to the importance of the problems assigned to it. The Congressional approach to the budget must be integrated and co-ordinated with the Executive's. To achieve these ends requires much better party leadership. Even effective bipartisanship in foreign policy, so far as it is desirable, needs a degree of party leadership now virtually unknown.

Only in this way can Congress develop "the sense of corporateness for determining policy, so that the Senate and the House—rather than their committees—are in fact the heart of the process of determining policy."⁸

This is indeed a large undertaking. Whether evolution reinforced by exhortation can achieve an effective approach to the problems of our time—here exemplified, though by no means exhausted, in the effort to integrate farm policy and foreign politics in the national interest—is extremely doubtful.

True, there is evidence that Congressmen have more leeway than they think in raising or lowering farm price supports. The fate of Congressmen seeking re-election cannot be shown to hinge on whether they voted for "flexible" or "rigid" price supports.⁹ Rather, their fate is much more dependent on the fortunes of their political party—and in their turn, these fortunes rise and fall with the more general tides of hope and fear in the electorate.

But will more partisanship help? It can be argued that spurts of partisanship in farm politics have sharpened the

Hardin, "Farm Price Policy and the Farm Vote," *Journal of Farm Economics*, Vol. 37, No. 4 (November 1955).

difficulty of securing domestic policy that is compatible with foreign policy in the national interest. In reflecting on this "counter thrust," we must first remember that present methods work very badly. Second, we must think of partisanship not as simply grafted on our present divided and splintered politics but as emergent in a changed—and, I think, eventually a profoundly changed¹⁰—political system. We must work toward national parties that empower, engage, and constrain both citizens and their responsible leaders. An initial step is to follow the advice of President Eisenhower: to end the biennial Congressional elections and to synchronize elections of the entire House of Representatives with the quadrennial choice of the President.

Farm Policy, Foreign Policy, and Farm Opinion

By LAUREN K. SOTH

ABSTRACT: The United States has excess farm production and technical agricultural resources which could be used profitably in overseas development programs. The export of these farm resources would benefit American agriculture and would cost American consumers very little. To accomplish such a shift would take (1) more government intervention in the farm economy and (2) more United States involvement in international programs. How would the American farm "public" respond to proposals for such changes in policy? The largest and most powerful organization, the Farm Bureau, would resist these changes in farm and foreign policies, and although other groups—especially the Farmers Union—would favor action, the combined weight of farm organizations would be opposed. Some recent changes in farm opinion, however, may point to modification of farm organization attitudes in the future.

Lauren K. Soth, Des Moines, Iowa, is Editor of the editorial pages of *The Des Moines Register and Tribune*. A graduate of Iowa State University, Mr. Soth was in charge of economic publications for Iowa State University from 1934 to 1947. He is Chairman of the National Planning Association agriculture committee and Vice-Chairman of the National Conference of Editorial Writers. He was winner of the Pulitzer prize for editorial writing, for editorials in 1955 which brought about the exchange of farm delegations with the Soviet Union. He was a member of the United States agricultural delegation to the Soviet Union in 1955. Mr. Soth is author of the book, *Farm Trouble* (1957).

IN recasting farm policy to better suit the purposes of the nation's foreign policy, what changes are politically "possible," or feasible, so far as the pressure groups and the opinion-makers in agriculture are concerned?

Anyone who generalizes about "farm opinion" in the United States stands on dangerous ground. There are so many different kinds of agricultural business in this continental country, so many diverse farm economic interests that a national farm opinion does not exist. With that caveat explicitly stated, let me stand this dangerous ground and generalize about farm opinion.

To begin with a sweeping generalization, farm people and farm organizations subscribe to what may be called the "feed the hungry" doctrine. They would like our food surpluses to be used for helping the undernourished of other countries. This stems from natural humanitarian instincts, as well as painful awareness that American agriculture produces more than can be consumed at home without drastic declines in prices.

FOREIGN ECONOMIC DEVELOPMENT

When it is a question of providing foreign countries with technical aid to help their farmers produce more, American farmers are not so unswerving in their support. Some fear that the United States might be building up foreign competition for American farmers. On the whole, however, farmers and farm organizations have supported the Point Four program.

Thus, the general lines of American policy toward the underdeveloped countries of the world find an agreeable response in agricultural circles.

Does this mean that farm organizations would respond enthusiastically to a large expansion of foreign agricultural programs which would call for substantial alterations in domestic farm policy?

Not necessarily. They would respond enthusiastically if they felt the change would increase farm income or at least not worsen it. But if they thought the change would be costly to them, they would oppose it—regardless of the larger welfare of the country as a whole. In this, of course, farmers are not different from other people. They would argue, as their leaders have many times in the past, that if the action proposed is in the national interest, then it should be paid for by the people as a whole.

For example, one way to help the underdeveloped countries would be to provide easier access to the American market for their exports of agricultural products, but United States farm organizations would object strongly to lower tariffs, larger quotas, or other liberalization of United States trade barriers against foreign agricultural products.

Farm organizations are thoroughly in accord with a policy to expand exports of United States farm products for the benefit of people in underdeveloped lands and American agriculture. But there is disagreement about ways and means, and an expansion of government subsidy programs would meet fierce resistance from some farm groups—on ideological grounds. Strange as it seems in connection with such practical people as farmers, ideology may well be the most important factor involved in gaining the support of farm groups for the programs contemplated in this volume. Before discussing this, however, it is necessary to examine the economic impact of these programs on United States agriculture.

IMPACT ON DOMESTIC AGRICULTURE

American agriculture has large excess capacity in relation to present domestic markets. In recent years something like 6 or 8 per cent of output has been stored or disposed of through noncom-

mercial channels. Moreover, new technology and new capital invested in agriculture are advancing output faster than the growth of population and rising nonfarm income per person are increasing the commercial market demand.

Clearly, commercial farmers as a group would be in a better economic position if some way could be found to restrain production. If output could be lowered by 6 or 8 per cent, farmers would receive the same prices in the market without government purchases and disposal operations. If production could be reduced somewhat below this level, farm prices would rise and net incomes of commercial farmers would be higher. The sharply inelastic demand for food—becoming more inelastic as the country gets richer—means that the adjustment in output could be small and still yield substantial returns to farmers.

By the same token, an increase in the quantity of farm products detoured outside commercial markets and made available to people of the lesser developed countries also would produce higher income for farmers.

Let me couch this in another way: the United States has excess agricultural resources which could be used profitably in overseas development programs—to the benefit of American agriculture and with little cost to American consumers. A small decrease in the food supply available to American consumers would mean a substantial rise in prices to the farmer but only a modest increase in retail prices of food. This is because the raw farm products constitute a relatively small proportion—38 per cent in 1959—of the total food bill.

In theory, therefore, the American public could make a given contribution to foreign economic development at less cost through using its excess agricultural resources than in any other way.

The demand for farm products is much more elastic in the underdeveloped countries than it is in the United States. Thus there is a genuine economic gain for all concerned from this international transfer: a gain to American agriculture; a gain to the foreign recipients of aid; a smaller cost to the American taxpayer than if he provided the same amount of aid—at dollar cost—in the form of industrial goods and technology.

There is no doubt that United States agriculture could "spare" a third or more of its overhead production-improvement organization—namely the United States Department of Agriculture technical research and educational services, combined with the state land-grant college experiment stations and extension services—without strain.

Indeed, agriculture would gain from such a shift if the reallocation of its educational services slowed down the accretion of new technology in American agriculture. It probably would not, because (1) private research in technology would expand to offset part of the reduction in public research, and (2) research by American scientists on technology for India, Peru, and Ghana would produce some useful techniques for American farming. But in any event a reduction of public effort devoted to converting basic scientific knowledge into new American farm technology certainly would do no injury to United States commercial agriculture.

This looks like magic—an easy way to help the poor countries and help ourselves at the same time. Why has something so eminently sensible and "economic" not been done long ago? Why does not the United States ship three times as much grain under Public Law (P.L.) 480? Why is not the Point Four technical assistance program three times as large as it is?

FARM OPINIONS

The answer is, of course, that such a massive reallocation of farm production and farm resources would be extremely difficult to arrange politically—both on the foreign scene and on the domestic. This article is not concerned with the difficulties of “putting over” such a policy in the recipient countries or in competing farm export countries. Nor is it concerned with the difficulties of explaining and selling to the American public this abstract idea about a “least-cost method” of helping the poor countries. It is only concerned with whether the idea would be salable to United States farmers and farm organizations.

To compress the problem to a workable size for analysis, one is compelled to erect some boundaries. So I shall be dealing with the attitudes of what the census calls “commercial” farmers—and primarily with attitudes of those engaged in major crop and livestock farming. The subsistence, part-time, and very low-income farmers do not really enter in the equation, because they do not participate in the leading farm organizations and because they are not greatly concerned with the kinds of farm policies here discussed. The “Point Four” technical aid programs America uses to help its own “underdeveloped” farm areas have an important bearing on this country’s relations with the outside world, but that is another issue not directly associated with the one at hand.

To derive a reasoned judgment about this complicated question of political behavior, one must resort mainly to inferences from stated positions and reactions of major farm organizations, along with signs of trends in farm opinion.

The massive changes in foreign and farm policies here proposed would require a considerable expansion of gov-

ernment activity in the farm business. United States agriculture would have to be adjusted in order to suit the requirements of a national policy of assisting underdeveloped economies reach what Walt W. Rostow calls the “take-off point” of sustained economic growth.

This might involve drastic adjustments—in cotton, for example, to open up a larger portion of the United States and Western European markets to Brazilian, Egyptian, Indian, and Mexican cotton. It is unthinkable that the United States would suddenly eliminate price protection and quota protection for American cotton growers without substituting some form of direct subsidy or adjustment payments. In this century governments do not repeal “corn laws,” as the British did in the 1840s, without compensating the victims of an action taken in the national interest.

The changes suggested also imply a high degree of co-operation with other countries, including participation in international organizations, such as a world grain stabilization agency. The international transactions we are discussing could not take place through the private market system. It would be impossible for the United States to supply the underdeveloped countries with, say, 750 million bushels of grain a year for ten years—easily within our capacity—unless Canada, Argentina, Australia, and other exporters were brought into the operation—to say nothing of the leading commercial importers of grain who might be directly affected.

As clues to the American farm reaction to a major policy alteration of this nature, then, we may ask, what is the attitude of farmers and farm groups to more government management of the farm industry, and what is their attitude toward more “internationalization” of the farm business, with the relinquishment of some phases of national sovereignty in this field?

Farm Bureau

When the questions are put in this blunt fashion, they nearly answer themselves. American farm policy leaders are not ready for such violent changes.

The leading farm organization, the Farm Bureau, with a million and a half members, comprising within its own membership a substantial majority of all the commercial farmers of the country, stands staunchly against more government action in agriculture. It wants a reduction of such action instead. In the last dozen years, the Farm Bureau has moved into increasingly doctrinaire opposition to government “controls.” Its faith in “free markets” has remained firm in the face of declining farm income.

Recent statements by Farm Bureau leaders and the resolutions passed at the December 1959 convention show that the organization would be opposed to expansion of foreign aid programs, including the P.L. 480 sales of farm products for “soft” foreign currency.

The Farm Bureau in early 1960 called for a reduction in foreign aid spending as a means of correcting the deficit in the international balance of payments of the United States, showing more concern for the unfavorable balance of payments than the Eisenhower administration itself. In its 1959 resolutions, the Farm Bureau said, “Economic aid in the form of capital investment should be substantially reduced.” The organization said that “Public Law 480 was designed as a temporary measure to help relieve problems caused by unrealistic domestic farm programs.” It said that it is now time “to make a critical review of this (P.L. 480) program. . . . We do not question the need for a more adequate food supply among people in many parts of the world, but we do question the wisdom of American commitments which may jeopardize

commercial trade and our financial stability.”

The Farm Bureau showed alarm that foreign aid might be used to promote socialism: “Every effort should be made to prevent the misuse of U. S. taxpayers’ money representing the fruits of free enterprise to establish, promote and support socialistic schemes.” It resolved that Development Loan Fund loans should be granted only when the recipient country follows policies that “attract private investment.”

Since many of the underdeveloped countries believe they can achieve rapid economic progress only by a high degree of government enterprise, the conditions laid down by the Farm Bureau would be unacceptable. Besides, the newly independent countries resent “conditions” of this kind on loans from the rich, capitalistic United States.

Further indications of the reaction of the Farm Bureau to proposals for a large expansion in foreign agricultural aid, from the 1959 resolutions:

We should avoid the perpetuation of programs which give away our farm products. . . . We are opposed to proposals to establish agencies within the United Nations through which large sums of U. S. money (or a major portion of U. S. surplus agricultural commodities) would be channeled for economic development programs. . . . We believe the United Nations could become a more effective world forum if it did not dissipate its efforts through numerous and elaborate economic and social welfare programs.

The Farm Bureau was generally international in its viewpoint until recent years. It was an early backer of the reciprocal trade agreements, strongly supported the United Nations, the Marshall Plan, and similar policies. It continues to advocate trade agreements and a freer trade policy. But in recent years it has become identified with some poli-

cies of right wing nationalist groups, probably because of its agreement with these groups on domestic policy.

For example, it "vigorously opposes" repeal of the Connally amendment to United States participation in the World Court. This amendment reserves to the United States the right to determine whether any case in which it may be involved before the court is a domestic matter or is subject to jurisdiction by the court. President Eisenhower has asked several times for the repeal of what he calls this "self-judging" amendment.

The Farm Bureau, even in late 1959, was still echoing the demand that the "United States should make sure that the staff of the United Nations is subject to reasonable security controls." It did not say how the United States could subject the staff of this international organization to its own national security controls.

On domestic farm policy, the Farm Bureau wants to "eliminate government regulations" just as soon as possible. It flatly opposes production payments—calling them "unsound and dangerous"—wants to move in the direction of eliminating acreage allotments and quotas, and thinks "the government should refrain from direct participation in the marketing of farm products."

It is evident that the kinds of foreign policy and farm policy changes suggested in this volume would be completely incompatible with the Farm Bureau's policies.

Other organizations

The other general farm organizations would be more agreeable than the Farm Bureau to increased government intervention in agriculture.

The National Farmers Union would support the policy changes suggested, both on the domestic scene and in for-

eign affairs. The Farmers Union advocates making Public Law 480 a long-range program with expanded appropriations. It has favored international agencies to stabilize prices of farm commodities, such as a "world food board." It also has supported economic aid through United Nations agencies. It has recommended production payments for a number of years.

The National Grange falls somewhere between the Farm Bureau and the Farmers Union in its general approach to both domestic and foreign policy. This is a considerable change both for the Grange and the Farm Bureau in the last twenty years. In the 1930's the Grange was quite nationalistic and protectionist on tariff and trade policy. In recent years, however, it has moved more in the direction of free trade and has backed foreign aid programs, but with reservations somewhat like those of the Farm Bureau. It is in domestic farm policy that the Grange has shown more willingness to accept government action than the Farm Bureau.

Even if the Grange were to be counted—along with the Farmers Union—as generally sympathetic to large-scale adjustments in farm and foreign aid programs, which would be stretching the evidence a good deal, one would have to say that organized agriculture as a whole represents a negative influence. This is because of the size and political strength of the Farm Bureau as compared with the other two organizations.

It may be argued that these farm organizations do not truly represent the opinion of farmers. A good deal of evidence could be produced that most farmers do not agree with the "free market" policies of the Farm Bureau. Scientific sample surveys of opinion in Iowa and Wisconsin in recent years have shown farmers to be more favorable to price supports, direct payments,

and acreage controls than the Farm Bureau is.

The most recent Iowa Poll, conducted by the Des Moines Register, showed a much higher percentage of farmers—44 per cent—in favor of price supports based on parity than were in favor of the Farm Bureau plan of price supports based on an average of market prices for three previous years—24 per cent. The Farm Bureau is overwhelmingly dominant in Iowa, with more than 100,000 members.

Votes on marketing quotas in the wheat, tobacco, and cotton areas would indicate that many Farm Bureau members do not shudder at the idea of government regulation of marketing.

However, the farm organizations do speak for farmers, and the Farm Bureau speaks loudest of all. Unless the members demand changes in the policies and the leadership of their organizations, it must be assumed that they are satisfied and that the organizations accurately represent member opinion.

DISSENTING FARM VOICES

Plainly, it would take an overthrow of the present leadership of the Farm Bureau to provide unified farm organization support for major changes in farm policy which would make a bigger contribution to underdeveloped countries. In the early years of the Great Depression, the major farm organizations did co-operate fairly well in setting up the original Agricultural Adjustment Act and in other farm legislation. What indications are there that farmers might force a change in the policies of their organizations now?

A few such indications may be cited. The National Farm Organization, a new group only four years old, has been winning members in the Midwest on a platform of production control, withholding commodities from market, and "collec-

tive bargaining" with the buyers of farm products.

Some commodity organizations, like the National Wheat Growers Association, have advocated production controls, including quotas on the number of bushels a farmer could sell, and multiple pricing. Even the Farm Bureau has had some rumblings. The biggest state Farm Bureau organization, the Illinois Agricultural Association, passed a resolution in 1959 for compulsory acreage retirement. The Illinois delegation was not able to secure acceptance of this resolution in the American Farm Bureau convention, but it indicates some resistance to the national Farm Bureau policies.

The unpopularity of Agriculture Secretary Ezra Benson among farm people certainly is an indication of disaffection with present farm policies. The heavy farm vote on the Democratic side in the Wisconsin primary points in the same direction. The fact that no politician in either party associates himself with Benson policies in the Middle West is significant, and Vice-President Nixon has plainly tried to divorce himself from Benson. By and large, Benson represents the policies of the Farm Bureau.

So it is conceivable that after the 1960 election some change in farm organization policies might occur. The Farm Bureau has not always been as rigid in its position as it is today. In 1920, for example, the Iowa Farm Bureau was agitating for the withholding of farm products from market, as the National Farm Organization does today. Maybe it will become less dogmatic in its opposition to government action in the future.

But as the situation stands right now, the only reasonable conclusion is that the farm pressure groups would be opposed to the kinds of farm and foreign policies proposed in this volume.

Farm Organizations and the National Interest

By ROSS B. TALBOT

ABSTRACT: A world-wide contest for power between the nations of the free world and those within the Communist orbit is the dominant phenomenon within international politics today. This situation is certainly not new, but the pace is accelerating. Within the next decade or so the loyalties of the underdeveloped and uncommitted nations will be molded. Food can be a significant weapon for the United States, both in terms of national interest and national morality. One major difficulty, however, is the inability of American farm organizations to see the central issue of our times and to concentrate their unified efforts upon this objective. They tend to confuse rhetoric with reality and thereby dissipate our national strength through their misunderstanding of the crucial goal. A White House Conference on Farm Policy is proposed as a means for beginning the redirection of American farm policy. The genius of American politics seems to call for a new accommodation in view of the threatened national security and the mounting dissatisfaction with present farm policies.

Ross B. Talbot, Ph.D., Ames, Iowa, is Associate Professor of Government at Iowa State University. A graduate of Illinois Wesleyan University and the University of Chicago, Dr. Talbot has previously taught at the University of North Dakota.

THE July 1959 issue of *The National Grange Monthly* declared: "... Russia is bent on an over-the-years goal of taking control of the world, whereupon man, as a mortal being and an individual with rights and privileges, would vanish into generations of darkness." If this grim estimate of the situation is accurate, the people of the United States and our allies in the "free world" have abundant cause for concern. Should the more optimistic view of Harrison Salisbury, and Lauren Soth of the *Des Moines Register*, accurately predict the direction in which United States-Soviet relations are moving we would probably discover that the thaw is only partial—a modest shifting of strategy and techniques away from the present and dominant military emphasis. Whatever the trend, the 1960's will be the decade of decision. One important area of decision must concern farm policy. The present farm policies of the United States are unsatisfactory, domestically and internationally. Solutions to this "farm problem," constantly being advanced, will not be reviewed in this paper. Rather an attempt will be made to suggest, procedurally, a new and dynamic framework in terms of our national interest in which the farm problem might be alleviated, if not solved. It is assumed that this crucial redirection can occur only through fitting domestic farm policy more effectively into an appropriate foreign policy.

Our political system consists of a "polity of pressure groups," according to Walter Lippmann, and his phrase is especially apt for the area of farm policy. National farm legislation is constructed through a complex and usually tendentious intermingling of different power centers—the national farm organizations, key members of certain Congressional committees, the United States Department of Agriculture

(USDA), the President, and other interests. Out of this environment has come a "hodgepodge" of farm laws which are expensive in operation, contradictory in policy directions, and thus inaccurate in terms of diagnosis and prescription. The nature and growth of our political system has, admittedly, made the development of systematic and responsible policies most difficult. Nevertheless, it is assumed that: (1) a rational farm policy can be worked out in terms of our national interest, (2) such a redirection of policy can only result if there is a reconciliation of ideological and personality differences among the major farm organizations, and (3) for reasons already stated, it is clearly mandatory that dramatic attempts be made to provide an intellectual and political atmosphere in which these farm policy and organizational differences can be analyzed and adjusted. Thus it is proposed that the next President of the United States call into session, as soon as possible after his inauguration, a "White House Conference on Farm Policy."

Before outlining the goals and structure of this proposed conference we must ask: Which are the major farm organizations? How did the present intergroup schism come about? Why might a White House Conference on Farm Policy resolve these policy differences and factional feuding? How could such a reconciliation be in the national interest of the United States?

AMERICAN FARM ORGANIZATIONS

The American Farm Bureau Federation (AFBF) is clearly the largest and most powerful of all the farm organizations. With an individual membership—one to a family—of some 1.6 million in 1959 it overshadows the National Grange with its 789,031 family members and the National Farmers Union's

543,472 family members.¹ The two different methods of calculating total membership make it difficult to do an exact comparative analysis as to size. However, the Farm Bureau's strength, per state, is apparently exceeded by the Grange in the New England area, the Middle Atlantic states, Ohio, Oregon, and Washington. The Farmers Union has more membership than the AFBF in the Dakotas, Montana, Minnesota, and Oklahoma, although the Farm Bureau has substantial strength in those states too, excepting South Dakota and Montana. The budget for the National offices—Chicago and Washington, D. C.—of the AFBF for the year ending November 30, 1958, was nearly \$1,500,000, which places it much above the other farm groups in terms of organizational wealth.

The National Council of Farmer Cooperatives (NCFC) has a total membership of more than 3.5 million, but it is a confederation; actual power is located in the 126 state and regional co-operatives and the nearly 5,000 local co-operative associations they represent. Thus the NCFC suffers from the weakness of all confederations; the national organization exists at the sufferance of its sovereign masters.

The National Farm Organization (NFO), with most of its membership in Iowa and Missouri, was organized in 1955 as a protest movement against low livestock prices and appeared to have a renewal of organizational energy in 1959. Whether the collective bargaining power approach of the NFO will substantially influence the organizational strategy of other farm groups is unclear.

Then there is an abundance of commodity organizations, such as, the National Association of Wheat Growers,

¹ The last two membership figures are for 1958 and the comparisons, by state, are also based on 1958 data.

the National Corn Growers Association, the National Milk Producers Federation, and the National Cotton Council. An estimated fifty to sixty special commodity groups are more or less active on the national political scene. Recent attempts of some thirty-six of them to co-ordinate their activities through a National Conference of Commodity Organizations (NCCO) have met with only minimal success.

SCHISM AMONG FARM GROUPS

Disagreement among the major farm groups can be viewed in historical, geographical, ideological, and leadership terms. The following discussion will concentrate on the nature of the ideological and the leadership differences among the three general farm organizations. It is primarily through a reconciliation of these differences that the necessary adjustments in farm policy may be accomplished.

The Farm Bureau

To cite Justice Holmes, the AFBF's national leadership is convinced that the United States Constitution embodies Herbert Spencer's *Social Statics*. Their major premise is that the iron laws of supply and demand will, if unfettered by government controls, govern farm yield so that it is produced as efficiently as possible and only in such amounts as the market can sustain. The AFBF is so overwhelmingly concerned about a free market philosophy that it may be losing sight of national and international goals which will have to be sought through the use of several political and economic methods.

Historically, the international policies of the Farm Bureau have been positive and broadly oriented. Their efforts for freer international trade have been in the liberal and internationalist tradition. Public Law 480 was probably conceived in the Chicago office of the AFBF. In

recent years, however, the leadership of the organization has become involved in, if not the leader of, the "New American Right." The dangers of positive government are continually brooded upon and harangued against. The traditional axiom—that government is best which governs least—seems to govern the recent policy statements of the Farm Bureau. Power is, truly, a dangerous weapon but the domestic and foreign policy of the United States may suffer certain defeat if this eighteenth-century axiom is considered to be a principal guideline for policy determination during the remainder of the twentieth century. In this time of trouble and crisis, the nation has a right to demand a high order of statesmanship from one of its most powerful political associations.

The Farmers Union

The National Farmers Union (NFU) is a composite of frustrations touched with humanity. Historically, it is a protest organization with a strong leaning toward liberal—to some extent, socialist—ideologies. Jeffersonians in their adulation of the small family farm as the backbone of American democracy, they cling to a stereotype that is rather rapidly fading away.

The central tenet of Farmers Union ideology—the family farm—is confusing, and perhaps misleading, the NFU in its efforts to bring about major changes in farm policy. The Poage-McGovern bill—often termed the Family Farm Income Act of 1960—is designed to use the instrument of national government to achieve parity of income for farmers. Thus the family farm, it is assumed, would be preserved. But the provisions of the bill seem to present genuine hazards for American foreign policy. The record of the NFU is clearly pro-internationalist. Nevertheless, the enactment of the presently

sponsored legislation might well further aggravate American foreign policy—"The wheat title [in the Poage-McGovern bills] provides 100 percent parity market price for domestic food and export wheat by means of managed marketings."² Can this "managed marketing" method be fitted into a foreign policy which is in the national interest?

The National Grange

Born of agrarian agitation and protest, the Grange has become so much of a social and fraternal organization that it is difficult to analyze its political capacities. Of the major farm organizations, the political base of the Grange seems to be clearly the weakest. Yet the Grange is respected in the nation's capital. The most probable reason for such a situation appears to be the confidence that the politicians have in the good sense of the organization itself. Not that the Grange is always "right," but there is a realization that no ideology, of an economic nature, binds it to a policy position in which the national interest will not be the paramount consideration.

Leadership differences

The nature of the leadership—or personality—differences can only be summarized. What De Tocqueville termed the "... secret propensities which govern the factions of America ..." seems to operate within the leadership of the farm organizations. The Farm Bureau leaders, notable since the advent of Allan Kline and then Charles Shuman to its presidency, have inclined toward the "passion" of aristocracy³—not of

² National Farmers Union, *Farm Legislative Status Report and Farm Economics Situation* (March 22, 1960), p. 7.

³ Alexis de Tocqueville, *Democracy in America* (Phillips Bradley, Editor), (New York: Alfred A. Knopf, Inc., 1945), Vol. I, p. 178.

an hereditary, nobility type such as characterized the Old World but an aristocracy based on economic success in the business of farming. The Farmers Union leadership has been moved by the democratic "passion"—the belief in human equality and the willingness to socialize in order to achieve that goal. Since perhaps the mid-1940's, and particularly within the last decade, these differences have sharpened. They will not be reconciled in any simple fashion. To compound this problem is the bureaucratic consideration: after many years of tenure and activity the permanent personnel of an organization is not as amenable to the dissolution of policy differences as either the organizational membership or the nation might deem possible and beneficial.

The Grange leadership is pragmatic and not inclined toward the use of the political weapons of scorn and derision. Whether it has the political power and skill to be the "broker" in this area of ideological disunity is an issue open to debate.

A WHITE HOUSE CONFERENCE

Students of the American political system are quite generally convinced that the President of the United States is the major policy-maker. If he is not the innovator, he must be the catalyst. Otherwise no substantial unity and direction in public policy will occur. Consequently, we have proposed that the President issue the call for a White House Conference on Farm Policy. The Conference should be personally inaugurated by the President, and make its final report, including policy proposals, to him directly. The power of his office, the influence of his new electorate, and the magnitude and seriousness of the problem should provide the atmosphere for conciliation and positive action. If the election produces a President and Congress of the same political party, the

recommendations of the White House Conference might well become the basis of legislation. Even a split decision in the November election does not foreordain failure. Both nominees for President will be committed to the pursuit of basic changes in the farm program.

One foundation for such a conference is, at this writing, being laid at the Center for Agricultural and Economic Adjustment (CAEA) at Iowa State University, which is formulating plans for a Farm Policy review meeting in December, 1960. If these plans mature, this could well become a preparatory meeting for a later White House Conference. Those invited to the Iowa State meeting will be a few members of Congress who hold important positions in the legislating of farm policy and their committee staffs, certain officials of the USDA, the legislative representatives and research directors of the major farm organizations, a select group from the land-grant and private universities, and a cross sections of officials from other interested and concerned pressure groups.

The agenda of this proposed CAEA meeting will call for the following presentations—the nature of the present farm problem, a summary of its historical development, and a review of the major areas of farm policy legislation—price and income, soil bank, and surplus disposal programs. During the first part of each session, the "statement of policy" of the major bills of farm legislation will be analyzed in terms of the goals set forth therein as compared with the achievements that have been forthcoming. Following, there will be analyses of alternative methods which might be used to realize more effectively the policy objectives. The last half-day of the meeting will be utilized in the development of an over-all reappraisal of farm policy in terms of varying goals and methods.

Those who would attend the White House Conference should be selected from the very highest echelons of the national public and private organizations; this is particularly important in regard to the representatives of the farm groups. Certainly, the presidents of the three major farm organizations need to participate. Also, there should probably be ranking representatives from the NCFC and the major farm export-import groups—wheat, cotton, tobacco, wool, and sugar. It would seem prudent for the President to invite, too, those members of Congress who are ranking members of the House and Senate Committees which act in the areas of foreign and farm policy. The goal of the selection process will be to find the golden mean—not so large a membership that important decisions will be frustrated; not so small a membership that the centers of influence will be neglected.

Policy studies—such as those emanat-

ing from the Ames meeting—should precede the Conference itself and be made available, at an early moment, to the participants. However, this is not the place to discuss the mechanics of the Conference. Our principal emphasis is upon the energy and dispatch of the incoming President; if he inaugurates, sets the tone for, and sustains a constant interest in, the Conference it might well be of real benefit to the nation. The power, pomp, and prestige of his office will do much toward mitigating the divisive tendencies that are now so apparent between our national farm organizations.

This proposal, if of any considerable value, will not harbor postponement. The next President, barring a serious recession or sensational incidents which might weaken our international position, may well be the chief executive for the next eight years. Never will the warmth and strength of his mandate be more potent than in early 1961.

The Extension Service and Public Policy

By WALLACE E. OGG

ABSTRACT: If the United States is to have a foreign agricultural policy which is consistent with our over-all foreign economic policy it may be necessary to find some simultaneous solutions to our current farm problems. The Co-operative Extension Service is uniquely equipped to meet the challenge of providing a firm educational base for facilitating adjustments needed in American agriculture and also for a consistent foreign agricultural policy. But meeting this challenge will not be easy. The Extension Service and probably the whole land-grant institution would face a major reorientation of the extension educational program. Emphasis and support would have to be shifted from preoccupation with the technology scientific research has made possible to a much broader program of education designed to help society manage social and economic change. Whether extension can rise to this challenge may determine whether the United States can have a consistent foreign agricultural policy.

DOES the Co-operative Extension Service have a role in the task of integrating foreign agricultural policy and domestic farm policy? The answer would seem obvious to anyone familiar with the historic role of the Extension Service in the scientific and technological revolution in agriculture. It is questionable if the integration can be achieved without the effective participation of the Extension Service.

At this time, the Extension Service is not actively participating. It is talking to itself about the responsibility in national conferences, and a few state programs have done a little. For the most part, however, the state programs do not include this responsibility.¹

EDUCATION ON FOREIGN POLICY

Why is the Extension Service not more actively involved in education on foreign policy? One reason is that an adequate program is so complicated that a superficial program might be worse than none at all. Others include tradition, a given audience, and a reluctance to approach this audience and a potentially much expanded one with a new and relatively uncharted educational area.

In the past, life for the Extension Service in most states has been fairly simple and—given the objectives—eminently successful. The goal has been to extend the use and applications of technological research to farm people. Evaluations could simply measure rates of the adoption of practices by farm people.

As indicated by other articles in this

¹ The recent market study tours sponsored jointly by the Foreign Agricultural Service and the Federal Extension Service have sparked considerable interest. Subsequent meetings and radio and television programs have been conducted. A sense of responsibility has been created, and one is aware that most specialists involved are a bit frustrated by the fact that they have not done more.

publication, accepting responsibility for an educational role in the development of foreign agricultural policy should not be taken lightly. The responsibility would include an objective analysis of the dynamic world situation and the broad outlines of the commitments that the United States has made in foreign policy. It would have to include an analysis of the place of foreign agricultural policy as part of our foreign economic policy. Commitments in the latter area include a combination of balanced technical assistance—balanced in the sense of including assistance with both technological innovations and social and economic adjustments to them. Commitments also include the export of capital to developing countries.

As these countries improve their productivity, trade, based on comparative advantage, will be a necessity—to provide market outlets for developing production and sources of commodities that can be purchased and imported more economically than produced at home. In the modern world of planned and controlled trade, this will probably not be nineteenth-century free trade. It will have a good deal of government direction, but the planning will need to be based on the principles of comparative advantage in order for economic development to flourish.

There may be alternatives to this developing outline of policy which should be explored. Certainly there are alternatives within our foreign policy commitments that will need exploration for specific policy implementation.

It already has been clearly indicated that it will not be enough merely "to wrench farm attention away from the home front." A foreign agricultural policy consistent with our over-all foreign policy goals probably is not politically feasible unless it is related to and based upon simultaneous solutions of some of the domestic farm problems. If

Wallace E. Ogg, Ph.D., Ames, Iowa, is Professor of Economics at Iowa State University and Public Affairs Co-ordinator for The Center for Agricultural and Economic Adjustment at that institution. Since 1949 he has been in charge of the Public Affairs adult education for the Iowa State University Extension Service. In the summer of 1959 he was chairman of the European Study Team of extension public affairs specialists who studied the European market for United States farm products at the request of the Foreign Agricultural Service and the Federal Extension Service.

so, this means that nonfarm people also have a stake in domestic farm policy.

A sound program

A sound educational program will have to explore these problems and the alternative choices to deal with them. It will have to explore the complex relationships between foreign agricultural policy and domestic farm policy. This is indeed a large undertaking.

An educational program will have to face frankly such areas of conflict as:

(1) Problems related to the level of output. There are sharp conflicts between efforts to contain our excess agricultural capacity and a consistent trade policy.

(2) The inevitable fact that anticipating a really successful development program in agriculture for economically underdeveloped countries will generate fears of new competition and additional pressure for agricultural adjustment in this country.

(3) Competition for both legislative attention and funds between foreign agricultural policy and domestic farm policy.

A sound educational program should also recognize the complementary relationships between domestic farm policy objectives and foreign agricultural goals of:

(1) An adequate domestic educational program to facilitate needed adjustment in our agriculture. A program of vocational and educational counseling of youth and adults, technical vocational training, and college or university education for capable young farm people who are now bypassed would be only part of a much broader national educational effort for economic growth and national defense.

(2) A domestic reallocation of both labor and capital from farming to other industries and services. This would not only relieve income problems in farming and strengthen the rest of the economy but would also reduce political resistance to foreign agricultural policy.

(3) Reallocation of scarce scientific technologists from research and extension

work in the United States to foreign economic assistance. This would be consistent both with agricultural adjustment in the United States and with foreign economic development.

It is complicated enough to try to communicate the idea that only a simultaneous solution to domestic farm problems and foreign agricultural policy problems is likely to be politically feasible. It is even more difficult to do this in a way appropriate to objective education. And objectivity is imperative.

In an economy conditioned to high-pressure and superlative advertising and selling, the prestige of the Extension Service rests on a firm foundation of objectivity with technical information. This objectivity also must be maintained with education for foreign agricultural policy. Temptation would be strong to become the advocate of a program if only because the need for good policy is urgent. But the temptation must be resisted.²

A further complication lies in the need to expand the audience of the Extension Service. It is not sufficient to educate public opinion in agriculture. True, an effective educational program for the farm audience could make it easier for politicians to treat domestic problems in a perspective centered on foreign policy. But this may not be enough. The conflicts between domestic farm policy and foreign agricultural policy are not the exclusive concern of farm people. Because of the urgency of foreign policy, the nonfarm public could decide to resolve some of these conflicts at the possible expense of the interests of farm people. In this case, it is important that the nonfarm public

² This does not mean that the work of education is ended once people come to the threshold of action. As people decide what they want to do, education assumes a service and counseling role.

understand as fully as possible the areas of conflict and complementary interest so that conflicts are minimized.

Students of co-operative extension education have been saying that the audience of the Extension Service must be expanded to include the nonfarm audience in any case. The public affairs program often is mentioned as a candidate for this expansion. Talking about expansion, however, is much easier than achieving it. Extension education—for farm people—is highly respected by nonfarm people who know about it. But it seldom occurs to them to come to the Extension Service—unless they have a lawn, household, or garden problem.

Notable starts on broad programs in public affairs have been made in a few states, but these are only the beginnings. With so limitless an audience and such definitely limited resources, the plaguing question of where to begin raises its ugly head.

CAN EXTENSION MEET THE CHALLENGE?

Considering its past and present tradition of extending technological information, can the Extension Service rise to the occasion and participate effectively in educating public opinion on the related problems of foreign agricultural policy and domestic farm policy?

The Extension Service already has done a good deal of soul searching on this subject. For a little over fifteen years, the Extension Service has been saying to itself that extending technological information in farming and homemaking is becoming less important—and that public affairs education, including both farm policy and foreign policy, should receive increasing attention. This was mentioned in the Land Grant College Association's report, "Postwar Agricultural Policy," pub-

lished in October 1944.³ It was emphasized in the so-called "Kepner Report" of 1946⁴ and again in the "Joint Committee Report on Extension Programs Policies and Goals," published in 1948.⁵ Recently the Scope reports have re-emphasized these same ideas.⁶

There has been progress. Assisted by the Farm Foundation and encouraged by the Federal Extension Service, almost all states are represented at the Foundation's annual National Policy Conference. Most states make available some printed material on public policy issues. Perhaps half of the states conduct occasional meetings on national policy issues, and four or five states have more intensive programs with one or more full-time specialists in public affairs. Several of these states have conducted extensive programs on international understanding and foreign policy. Even in the most advanced states, however, there has been almost no actual reallocation of resources in public affairs programs.

The new programing has been made possible almost entirely by adding specialists in the field of public affairs.

Technical production education has been expanded at the same time. The pressure on local county educational programs has been to add to programs rather than to substitute.

All in all, only limited programing in this area and an almost infinitesimal amount of total resources have gone into education to develop informed public opinion and leader education on foreign agricultural policy. But if the job is to be done, the Extension Service probably will have to do it. And, in many ways, the Extension Service is uniquely equipped to do the job.

No other agency for formal or informal adult education has the organizational resources possessed by the Extension Service. In each state, the Extension Service is an arm of a land-grant college or university, with access to an impressive array of the resources of these institutions—including access to almost all of the available knowledge and research on domestic farm problems and foreign agricultural policy. There is access also at these institutions to the kind of educational resources needed for an understanding of the international situation and a program related to and dependent on foreign policy. There is access to both the best knowledge needed in agriculture and the political scientists, sociologists, historians, anthropologists, and others who are experts on the world situation and foreign policy.

The state extension services reach into every rural and urban county in the United States. Each county office has a staff of professional adult educators—in tune with most of the rural leaders in the county and, in many cases, urban leaders as well. The Extension Service has the experience and know-how to organize and conduct effective educational campaigns, using direct teaching, indirect teaching, printed materials, and mass media.

Thus, in part, the Extension Service is well equipped by its organizational and other actual and potential resources to conduct the needed educational program. On the other hand, the strong traditional commitment of resources to technological education, among other factors, inhibits the Extension Service from meeting this new challenge.

WHAT IS REQUIRED?

To the extent that the domestic farm problem is partly one of adjustment to technological progress, the land-grant system and the United States Department of Agriculture may be said to have helped create the problem. Both are deeply concerned at the present time with adjusting their own programs toward more emphasis on facilitating adjustment.

What if the Extension Service were to adopt the broader challenge in the task of integrating domestic farm policy and foreign agricultural policy? If it does, it will probably involve much more than the addition of a new program and a few new specialists. It would involve a completely new orientation. Among the kind of changes, this reorientation would require:

(1) The acceptance of and responsibility for positive leadership on the part of administrators—college and university presidents, deans, directors of extension, and chairmen or heads of departments—who have a contribution to make in

(a) The mobilizing of external support so that the budget for the work can be formal and protected;

(b) The mobilizing of internal support so that an effective program can be developed and implemented;

(c) The organization of necessary administrative, supervisory, service, teaching, research, and extension staff resources; and

(d) The implementation of necessary staff training at the state and local levels.

(2) The development and implementation, with continued administrative leadership, of a program consistent with the nature of the problem and the educational needs of the people to be reached.

(3) The streamlining of traditional programs at both the state and local levels to permit reallocation of resources to the new programs.

(4) Special and determined effort to reach the nonfarm audience.

To reorient the whole program of the Extension Service in this direction will mean accepting the responsibility to go on a new, unfamiliar stage in a new and unscripted role in which the importance of administrative and objective subject-matter leadership cannot be overemphasized. Whether the Extension Service leadership is ready to accept this chal-

lenge remains to be seen. The consequences of the choice may be profound. It may not be possible to have the kind of foreign agricultural policy that the world situation demands from the United States if the Extension Service does not accept this new role.

If the Extension Service elects to continue its traditional job of extending only new farm and home technology and to leave education on adjustment problems and foreign agricultural policy to other institutions and agencies, the Extension Service of necessity probably will fill a declining role in our society. But if it elects to launch out in response to this new challenge, it will have both a new and broader audience and a new reason for existence.

Agricultural Policy, Politics, and the Public Interest

ECONOMICS

DENNIS H. ROBERTSON. *Lectures on Economic Principles*. (Vol. III.) Pp. 164. London: Staples Press, 1959. Distributed by John de Graff, New York. \$3.50.

This is the last of three volumes which reproduce a course of lectures that Sir Dennis Robertson delivered at the University of Cambridge prior to his retirement in 1957. Earlier volumes were reviewed in *THE ANNALS* for September 1958, and January 1959, respectively. The third volume deals with money and business cycles. Appendices reproduce addresses to international groups.

The main interest of this volume to American students of the social sciences is likely to be in its demonstration that Keynesianism in the postwar period has not by any means received unqualified acceptance in its home university. This is not to say that Robertson rejects such elements of the Keynesian doctrine as anti-deflation policy pursued through public finance and monetary channels, planning government construction to use public works as counterdepression measures, and the general run of automatic and discretionary controls of the over-all level of business activity. But he has some very critical comments to make.

"I am definitely of opinion," he says, "that in his later work Keynes, while he continued to contribute to, also marred by distortions and exaggerations of various kinds, a fruitful body of doctrine which had been moulded over several decades by many hands." This view Robertson exemplifies in Keynes' dramatization of the contrast between mass unemployment and full employment, which according to Robertson oversimplified the problem of objectives in the 1930's. Robertson criticizes attaching much importance to an ex-post equality of saving and investment when, as Hawtrey pointed out, a distinction might well be made between intended investment and investment which is no more than an unintentional accumulation of unsold goods. Robertson also argues against the Keynesian view that wage reductions necessarily augment rather than lessen the amount of unemployment. He considers the assumption of an "immutable income-consumption function" to be mistaken and is dubious about the mathematical models of the business cycle which have become fashionable in recent years. He thinks that these may point the way to advances in cycle theory but says that they neglect the part played in investment by innovations and discontinuities. The multiplier, Robertson feels, is an "extremely unreliable instrument for short-run or cyclical prediction."

As with the earlier volumes, these lectures contain a great deal in small compass and should interest American teachers as examples of how teaching is conducted in British universities.

EDMUND WHITTAKER

Professor of Economics
Colorado State University

WILLIAM G. BOWEN. *The Wage-Price Issue: A Theoretical Analysis*. Pp. xv, 447. Princeton, N. J.: Princeton University Press, 1960. \$8.50.

The gist of this interesting study can be stated rather simply. In a period of full employment we are confronted with what Paul Samuelson calls "the biggest unsolved economic problem of our time," namely whether there is a built-in inflationary bias in our institutions of wage and price setting. To this question Professor Bowen does not provide a conclusive answer. Instead, he concentrates on the issue of whether the behavior of any particular social group or institution can properly be regarded as the "cause" of inflation and, consequently, be held responsible for it. The reply is in the negative, as may be expected. Certain behavior patterns of the various agents operating on the labor market must coincide with certain policies of the monetary authorities and a failure of the engineers and managers to provide a sufficiently high rate of increase of productivity in order for the wage spiral to arise. Of all of these necessary conditions, none is sufficient by itself to "cause" an inflationary movement. To single out one of these as "responsible" is inadmissible and betrays bias.

These results can be obtained by a rather simple process of analysis. The author, however, provides us with a goodly quantity of further material. This book is divided into five parts. The first presents what Bowen calls the "dilemma model"—the chain of events which imposes upon society a choice between inflation and unemployment. Part II deals with the process of wage determination, one of the key elements in the dilemma model, while the price-setting aspects of the dilemma model are dealt with in Part III of the study. This section includes a discussion of the

cost-plus pricing process, which is rather fair and a useful summary of the literature with some helpful comments of the author. The next part of the book deals with monetary policy: One of the main issues presented is that of the effectiveness of restrictive monetary policy. Part V, finally, presents the conclusions of the author.

One of the most useful contributions of the book is its successful attack upon a classification of types of inflation which has been *en vogue* in the last few years: demand versus cost inflation, buyers versus sellers inflation, spontaneous versus induced inflation, and so forth. A basic difficulty of these classifications is that no practicable way exists by which we can decide how much of any given price increase can be ascribed to either of the two types. The reason is that in many cases, as a result of monopolistic competition, demand and cost schedules are interdependent. Moreover, the term "inflation" covers a multitude of price movements in divergent directions many of which are again interrelated. Finally, neither demand nor cost inflation could persist without the requisite behavior of the monetary authorities.

This review falls far short of a full description of the contents of this exceedingly useful volume. The book is a highly necessary warning against the pitfalls of thinking in large aggregates, indispensable as the latter are on certain levels of abstraction.

ADOLF STURMTHAL

Philip Murray Professor of
International Labor Studies
Roosevelt University

F. THOMAS JUSTER. *Consumer Expectations, Plans, and Purchases: A Progress Report*. (Occasional Paper 70.) Pp. xviii, 174. New York: National Bureau of Economic Research, 1959. \$2.50.

Expectations about the future can and do influence the present and prospective spending and saving of consumers, and in the aggregate, consumers' decisions can initiate changes in the general level of economic activity. Hence a knowledge of consumers' current attitudes and expectations might provide the policy-making economist with valuable predictions of the

immediate future. The hope of deriving a trustworthy short-run forecasting tool from information supplied by consumers about their plans has inspired a substantial amount of empirical work and some theoretical study of the nature of expectations over the past ten years. Mr. Juster's careful study of the data on buying plans obtained from the membership of Consumers Union late in 1957 and early in 1958 is directed towards the formulation of a theory of data collection on decision-making among consumers. Without such a theoretical frame of reference, empirical work cannot progress beyond the demonstration of a high correlation between changes in consumers' buying plans and subsequent changes in actual purchases over a brief span of years.

Starting with a contingent action view of consumer behavior, the author carried out an empirical examination of the data from the two surveys to ascertain how buying plans are related to expectations about income, prices, and other constraints on expenditures and what kinds of survey questions provide the most reliable information on purchasing decisions. The statistical analysis shows that "definite" plans to buy durable goods within the next six months are more closely related to general expectations and to the financial circumstances of the consumer than plans over a longer time-horizon. The consumers with improved personal situations or with favorable expectations reported more buying plans for the near future than other consumers. These results imply that buying plans for the six months ahead are probably the most trustworthy indicators of future action.

The buying plans for the short run were, however, closely related to consumers' expectations about their financial situation over a much longer period. Optimism about their economic situation as much as five years in the future may account for relatively more buying plans in large part because new homeowners or prospective home buyers purchase and often own more durable goods than established homeowners and renters. The purchase of a home demands assurance of a favorable financial outlook over a longer period than

the purchase of an automobile or of various types of household equipment. The location of new homes in the recent period of metropolitan expansion has made the automobile a primary necessity, and home buyers' plans to buy automobiles are no different than those of other consumers. Buying plans cannot be used with confidence for forecasting purposes without a greater understanding of the nature of consumers' long-run financial expectations and commitments. This progress report on work that is a part of an extensive investigation of expectation data is quite hopeful. The collection of more adequate survey data can provide the basis for tracing the effects of changes in expectations on buying plans and actual purchases. The best information on expectations can be determined experimentally by comparing how well the answers to different types of questions serve as predictions of actual purchases in every situation that could arise.

DOROTHY S. BRADY

Professor of Economics
University of Pennsylvania

HERBERT V. PROCHNOW. *The Federal Reserve System*. Pp. xiv, 393. New York: Harper & Brothers, 1960. \$6.50.

The Federal Reserve System is a collection of essays by authorities in the field of banking and finance, carefully edited by Herbert V. Prochnow. The authors of the separate chapters have been chosen from financial institutions, the universities, and the Federal Reserve System itself. All of them, by virtue of past experience or close contact, have an intimate knowledge of the System and its problems. In a book containing much detail there are bound to be some overlaps and inconsistencies, but in *The Federal Reserve System* these are at a minimum, and the quality of exposition is generally excellent.

The title of this book recalls an earlier publication of the same name, subtitled, "Its Purposes and Functions." There are few students of economics and finance during the last twenty years who are not familiar with that little paper-bound volume published by the Board of Governors

in three editions between 1939 and 1954. There is a significant difference, however, between the earliest edition, bound in gray, with its mechanical charts and cold tabular material, and the latest edition with its two-color pie charts and modern format. Viewed together with the publications of some of the Federal Reserve Banks, it signals a growing realization of the importance of broad professional and public understanding of the role and activities of the Federal Reserve System and the desirability of "popularizing" its problems.

The Federal Reserve banks have continued to expand their coverage of many aspects of System functions, always reaching for broader audiences. The Board of Governors in Washington, concerned with more delicate policy questions and with communication at a different level, has apparently found it more difficult to do so. However, if the Board has seen fit to forego a new edition of *The Federal Reserve System* or of its 1941 *Banking Studies*, Herbert Prochnow's volume is a worthy substitute. It brings descriptive and historical material up to date, and it continues in the direction pointed by its predecessors—toward greater depth of analysis and greater understandability. This volume does not attempt to "popularize" in the sense of providing a simplification; but it does give the reader a sense of reality that is often missing in treatises on central banking or in official pronouncements. This is accomplished not only through the authors' grasp of the facts and their familiarity with the institutions concerned but also through their willingness, at times, to allow their personal convictions to emerge.

This book will be useful for several types of audiences. For the student in college it will provide an excellent summary of the origins of the Federal Reserve System and its functions and some good, factual background for the study of monetary theory. For the informed business man or professional, it provides a wealth of little-known detail in proper perspective. A lucid explanation of Federal Reserve Bank Statements and an excellent summary of all Federal Reserve Regulations, while available elsewhere in different form, are

most welcome. For the general public and for the legislator it cannot, by itself, bring full understanding, but it can provide good "feel" for the complexities and difficulties as well as the opportunities of monetary management. This volume undoubtedly will become one of the "standards" of the literature of central banking.

DAVID C. MELNICOFF
Philadelphia, Pa.

JAMES WASHINGTON BELL and WALTER EARL SPAHR (Eds.). *A Proper Monetary and Banking System for the United States*. Pp. viii, 239. New York: Ronald Press, 1960. \$6.00.

This book is a study by a group of conservative economists who were selected by a subcommittee of the Executive Committee of the Economists' National Committee on Monetary Policy to describe accurately "the fundamental errors in principle and practice in our monetary and banking structure" and to offer "specific recommendations for improvement . . . in the interest of the public welfare."

A model bill designed to provide us "with a gold (coin) standard and redeemable currency and to correct other defects in the monetary system" appears early in the text, and the last sentence in the book recommends its enactment. However, the co-authors do not go completely back into history, for they do not advocate the re-appearance of the gold clause contract. "All bonds and other securities issued by the government or private enterprise should be payable in dollars. Such an arrangement permits the debtor to pay in any type of dollars which he finds convenient, and the creditor, if dissatisfied, is free, under a gold standard and redeemable currency system, to convert the dollars received into any type of dollar which he may prefer" (p. 45).

From the political angle it is difficult to believe that the model bill can be adopted in the easily foreseeable future. The last nationally known politician to speak boldly in favor of the pre-New Deal gold standard was Harold Stassen. The monetary aspects of the Roosevelt revolution seem nearly unchanged in even minor details as

far as the law is concerned after almost eight years of traditionally 'sound money' party rule, at least in the eyes of the executive branch of government.

There is a chapter on "A Proper Central Banking System" which contains a recommended rewording of the Title of the Federal Reserve Act designed "to state more fully than is now the case the appropriate purposes of the Federal Reserve System." This would add to the usual purposes of elasticity, rediscounting facility, and more effective supervision other purposes, such as: "to protect the integrity and purchasing power of the United States dollar; to promote profitable production and employment; to facilitate consumption and to foster a high standard of living." Bell thinks that, as a result of the Employment Act of 1946, "Efforts are constantly being made to force the Federal Reserve System under the control (of the Act) and to make the banking system an instrumentality of the government" (pp. 225-226).

Pressures toward the monetization of public debt are deplored. They make the proper role of the central bank more difficult. But in view of the wars and economic convulsions of the incredible past fifty years, how could these pressures have been avoided?

ROBERT ROCKAFELLOW
Professor of Economics
University of Rhode Island

EDWARD S. MASON (Ed.). *The Corporation in Modern Society*. Pp. xv, 335. Cambridge, Mass.: Harvard University Press, 1959. \$6.75.

This symposium of fourteen essays attempts to analyze the influence of the corporation on American life. The role of the corporation in the social, economic, and political environments is examined from the viewpoints of lawyers, economists, sociologists, and political scientists. The viewpoint of the businessman or the professional manager is missing.

According to the editor, he has tried to the best of his ability to assemble the ideas of a number of knowledgeable contributors to various aspects of the problems raised by the emergence of the large

corporation in modern society. Among the main questions and issues considered are: To whom are corporate managements responsible, and to what purposes? How much power do large corporations have, and how is this power limited? Who are the managers of large corporations? From what groups do they come, and how are they selected? What effect has the separation of ownership and management had on the meaning and justification of private property?

The effects of the separation of ownership from control on methods of corporate financing and the uses of corporate funds are considered. Evaluation is made of the contribution of the corporation to research and development in the United States. Attention by some of the contributors is given to the nature of the corporation's relationships to its labor force, to its owners, and to its vendors and customers. An assessment is made of the corporation as a form of government; and the role of American corporations overseas is discussed. Included are essays about the nature of the corporation in Great Britain and certain aspects of Soviet industrial organization.

Edward S. Mason, in his editorial introduction, provides the reader with a synopsis of the main points of the fourteen contributors. He organizes the principal questions asked about the present and future impact of the corporate system on society as follows: (1) the problem of legitimacy; (2) the problem of power; (3) the managerial revolution; (4) the changing character of private property; (5) the corporation and the state; and (6) the major contributions of the authors of the essays.

Inasmuch as the book is composed of a collection of essays, different points of view about the corporation are presented. Any reader will find himself both agreeing and disagreeing with the divergent ideas expressed. In a Foreword, Adolf A. Berle, Jr. suggests that the American problems of the latter half of the twentieth century will be as much philosophical as economic. For those who agree, this excellent symposium is recommended.

The authors of the essays have provided a basis for present analysis and further

study of the impact of the corporation on American life.

RALPH L. NELSON. *Merger Movements in American Industry 1895-1956*. Pp. xxi, 177. Princeton, N. J.: Princeton University Press, 1959. \$5.00.

This study began as a Columbia University doctoral thesis and was completed at the National Bureau of Economic Research under the direction of Professor George Stigler. It is one of several studies currently under way there on industrial organization. The book deals only with manufacturing and mining mergers and covers primarily the period, 1895-1920. However throughout, and especially in a final chapter, Dr. Nelson ties in his material with Willard Thorp's classic, *Recent Economic Changes, 1919-1928*, subsequently extended by Dr. Thorp and by the Federal Trade Commission. There have been four previous studies on the great merger period, 1898-1903, but none on the "dark age" of 1904-1919. When Dr. Nelson undertook to analyze that neglected era he found the data in the four earlier studies so difficult to use that he pushed his starting date back to 1895. He reworked the sources used by the earlier four, John Moody, Luther Conant, Myron Watkins, and the Census, of which the chief was *The Commercial and Financial Chronicle*, added new cases or dropped old ones not suitable to his tables, and thoroughly reorganized the findings. These appear in 62 Tables in the text, in 23 Appendix Tables, and also in 6 charts. He devotes an entire chapter and also part of the Appendix to explaining in considerable detail his statistical methods and to justifying the decisions that he had to make where the data were inadequate. This reviewer was impressed by his care and patience and by his ingenuity and good sense in finding new ways of analyzing the data.

There were three great merger movements in modern American economic history, namely those of 1898-1902, 1926-1930, and 1946-56. Each was relatively less important than its predecessor. Dr. Nelson draws a distinction between consolidations, many firms assembled all at once, and acquisitions, a gradual process. Consolidations were more characteristic of the earlier period. He overlooks the fact, it seems, that anti-trust sentiment itself has made consolidations today hazardous. He is also interested in the periods of little merger activity, and he likewise analyzes the movement in terms of industries most affected by mergers. There are indeed very few approaches to his problem that he has overlooked.

For many scholars the most fascinating portion of his study will be his judgment on the four major explanations of the upsurges in mergers, especially of the 1898-1902 one. His data do not sustain Myron Watkins' hypothesis that mergers were devices whereby producers could preserve profits in the face of slackening demand and greater pressure of competition. Nor does he give appreciable credence to the reasoning of Joe Bain that improving transportation brought about national monopolies. He accepts in part only the explanation that by 1900 a large national capital market had developed and was the cause of mergers. The hypothesis that he finds most acceptable is the oldest and simplest of all, namely, that business leaders sought market control and hoped for monopoly profits. In each of these cases his reasoning is skillful and provocative. In an Appendix he draws on H. W. McCrosty's study of the simultaneous British merger movement for further support of his own analysis and conclusions.

In general, Dr. Nelson finds that the peaks and troughs in mergers follow surprisingly closely those of business cycles. Merger upsurges and stock market booms have a close correlation.

University of Illinois

LEO GREBLER. *Housing Issues in Economic Stabilization Policy*. (Occasional Paper 72.) Pp. xi, 129. New York: National Bureau of Economic Research, 1960. \$1.50.

This monograph is the story of the intricate manipulations of the housing and mortgage markets between 1955 and 1958. It is a tale of governmental intervention through selective housing credit controls fraught with the difficulties of reconciling two broad national objectives—the promotion of stable prosperity and the advancement of better housing. The author of this brilliant piece of economic and political analysis is one of the few persons who truly understands what has been going on. He leads the reader through the maze with a scholarly clarity and a lucid style.

The period between 1955 and 1958 was selected for study because the multiplicity, frequency, and scope of the administrative actions affecting the housing sector of the economy exceeded anything previously experienced. This experience best serves the purpose of the author in evaluating governmental housing credit policies in relation to general economic stabilization policies. For the full perspective, one should first read Professor Grebler's companion piece, *The Role of Federal Credit Aids in Residential Construction* (Occasional Paper 39, National Bureau of Economic Research, 1953) which deals with federal credit aids in their impact on new nonfarm residential construction from 1935 to 1951. In combination, these two Papers recount the economic history of postdepression real estate finance and serve, as no other writings in published form, as a textbook description and a scholarly interpretation.

The first phase of the period covered by this study was one of housing expansion in 1953-1954, "a classic response to easy credit." In 1955, the overbuilding of the previous year led to a series of selective credit controls to curb the exuberance in the housing sector though, at the same time, clear restraint of the general business boom was delayed until late in the year. In 1956-1957, only a few months after the housing controls became operative, governmental policies shifted to steps to help

check the decline in the supply of funds available for home building and purchase.

Among the imperfections in governmental controls which are revealed are the time lags in giving effect to policy and the frequency of policy shifts. This undue flexibility created uncertainties in an already uncertain milieu and induced successive expansion and contraction in mortgage lending which accentuated fluctuations in residential construction. However, the exceptional volatility of federally assisted construction was not entirely explained by the existence of Federal Housing Administration (FHA) and Veterans Administration (VA) programs and their administration. The author apparently does not see a fundamental conflict between long-range housing goals and basic economic stabilization policy though short-run compromises may be required. Finally, he judges that stability of residential construction independent of general construction and the general economy is an impractical and undesirable objective.

RICHARD U. RATCLIFF

Professor of Land Economics
University of Wisconsin

Economics and the Policy Maker. Brookings Lectures, 1958-1959. Pp. xiii, 209. Washington, D. C.: Brookings Institution, 1959. \$2.95.

The eight essays contained in this slim volume are the Brookings Lectures for 1958-59. The lectures were addressed to "professional specialists and public officials" and were "designed to present a review of the uses of economics by policy makers in the conduct of public and private affairs." The lectures I enjoyed most were those by Sidney Alexander, Mark Massel, and Louis Shere although neither these nor the other lectures contain particularly new insights or particularly fresh approaches. But to expect these in a series of semipopular lectures would be unrealistic. The five-page Foreword by Robert D. Calkins summarizes the volume adequately.

JOHN A. BUTTRICK

Associate Professor of Economics
University of Minnesota

SOCIOLOGY AND EDUCATION

SEYMOUR MARTIN LIPSET. *Political Man: The Social Bases of Politics*. Pp. 432. Garden City, N. Y.: Doubleday & Company, 1960. \$4.95.

Professor Lipset, a sociologist at the University of California in Berkeley, addresses himself to various audiences, ranging from innocent laymen to "hardboiled" practitioners, for whom he provides abundant Footnotes and methodological asides, and to a wide variety of topics as these are exhibited in a wide variety of countries—the United States, Canada, Western Europe, Japan. His quotations extend from Aristotle to Talcott Parsons, from classic treatises to obscure monographs. He deals with the broad sociology of politics; with class structures and other factors as they affect the growth and problems of party systems; with the reasons why people vote—or fail to vote—as they do; with the particular niceties of the American political scene, including the behavior of the American intellectual; and with the politics of "private government" as this is illustrated within the trade-union movement. The result is not an easy book. The component chapters do not always form an integrated whole. Some of Professor Lipset's generalizations are, inevitably, so general that they seem either truisms or else too slippery to grasp. His historical account of American political parties is open to objection.

But if these are faults, they are admirable ones. *Political Man* is a remarkable book, with more ideas in it than are to be found in a dozen orthodox academic treatises. While specialists may quarrel with him on points of detail, few if any living scholars in the social sciences can match him in intellectual energy or in width of allusion. Like many contemporary sociologists, he is interested in consensus, mass culture, anomie, the end of ideology, and so on. But on all these somewhat hackneyed themes of our time he has something fresh to say or to suggest. He manages to avoid being trapped by the conventional originalities, such as today's novelties are tomorrow's banalities, and he

is neither "liberal" nor "conservative," nor yet again clinically detached. Thus, he notes that democracies which have two-party systems depend upon something very close to consensus. Too much vitality is a sign of too much dissension; apathy among voters may be a healthy rather than an alarming symptom. American economic mobility is actually no greater than that of other industrial societies such as Britain and West Germany, though the belief in greater mobility is an important element. American intellectuals have a far higher status than is commonly recognized: again, their belief in their own lowliness is an interesting feature. On these and many other aspects of political man, Professor Lipset speculates brilliantly. His book does far more to indicate the vigor of democratic communities than do any of the spate of current works which are overtly designed to laud the democratic way and purpose.

MARCUS CUNLIFFE

Professor of American History
and Institutions
University of Manchester

ELI GINZBERG (Ed.). *The Nation's Children*, Vol. I: *The Family and Social Change*. Pp. xvii, 252. New York: Columbia University Press, 1960. \$4.50.

ELI GINZBERG (Ed.). *The Nation's Children*, Vol. II: *Development and Education*. Pp. xvi, 242. New York: Columbia University Press, 1960. \$4.50.

ELI GINZBERG (Ed.). *The Nation's Children*, Vol. III: *Problems and Prospects*. Pp. xvi, 242. New York: Columbia University Press, 1960. \$4.50.

These three volumes constitute the working papers for the Golden Anniversary White House Conference for Children and Youth held in Washington, D. C., in the spring of 1960. At the request of the Steering Committee of the Committee on Studies, thirty-four writers in education, religion, medicine, psychology, business, social work, economics, and anthropology contributed thirty-one chapters, to which Eli Ginzberg added editorial introductions. Lists of suggested reading to supplement

each chapter are appended to all three volumes.

The two-fold purpose of the papers, directed to the educated layman rather than to the specialist, was not to present original research but to (1) "help to outline the major developments in the field of children and youth since the 1950 Conference" and (2) "provide a basis for charting directions for the next decade."

The first of these purposes is certainly achieved. The papers devoted to stating major developments are so well done they need little comment. They succeed admirably in revealing the nature of the demographic, industrial, and institutional changes which have transformed our society in this century. Nowhere outside of textbooks has so much pertinent material been brought together and presented so simply and well.

Whether or not the second purpose—provision of a basis for charting directions for the next decade—is achieved will not be determinable until the decade runs its course.

The reported dissension in the Conference with respect to resolutions supporting the Southern student auditors suggests, in the first place, that the direction charted by the Conference was not clear-cut. Furthermore, there will certainly be loud lamentations from opponents of "the welfare state" over Eveline M. Burns' relentlessly logical statement of the case for improved provision for children by the government. These same people may protest also against the increasing burden of voluntary welfare services to children proposed by Elizabeth Wickenden.

Ginzberg was at some pains to reconcile relatively minor differences in figures of average family income used by different authors. He makes no attempt to reconcile more fundamental differences, such as those between the paper by representatives of three major religious faiths and the paper by Norman Cousins. Cousins, with his usual eloquence, attacks precisely the parochialism represented by the religious writers. Cousins urges us to stop thinking in terms of East and West, assuming that each is an entity. He wants us to think in terms of loyalty to the human common-

wealth, which he sees in no way as a threat to loyalty to one's own country. The three religious leaders still think in terms of America's "mission to the world"—a mission which many peoples of the world have come to resent.

At the risk of being invidious, the following statements are presented as among the many useful guidelines for charting future directions: "could we but give to every child in the land the same opportunities for intellectual stimulation now enjoyed by the children of professional, technical, and kindred workers, we could increase our 'talent pool' fivefold" (2, 133); "... the most important single clue to the quality of change in the Negro family and in the Negro community is found in the job picture, particularly for the male" (1, 136); "... farm-reared youth who migrate to cities are relatively unsuccessful..." (3, 36); "A Southern white man who recently returned to the South after eight years in other parts of the world said that the most startling change he noticed was that 'Negroes look you straight in the eye now'" (3, 74). There are many others, stark and challenging.

But knowing trends, amassing facts, summarizing developments are not enough. "... effective development of publicly [and privately] provided goods and services... will depend upon... how much people care about the well-being of children and families..." (3, 179). And, as Nelson Foote points out, no one who has ever agitated for school bonds would ever assume that people do care enough (3, 1-2). In any event, the major developments of the past decade have been ably traced; they can provide a basis for charting future developments. It is now a problem of strategy.

JESSIE BERNARD

Professor of Sociology
Pennsylvania State University

LEE RAINWATER with the assistance of KAROL KANE WEINSTEIN. *And the Poor Get Children: Sex Contraception and Family Planning in the Working Class*. Pp. xiv, 202. Chicago: Quadrangle Books, 1960. \$3.95.

There is amusing irony in the observation that sex has something to do with contraception and that it can be regarded as a new if not profound insight into the causal system underlying the use, regularity, and effectiveness of contraceptive practice. J. Mayone Stycos pointedly reminds us in the Preface to this volume that sex has been almost totally ignored in fertility research. Although his claims are somewhat exaggerated, the criticism is well taken and provides an appropriate introduction to the work of Rainwater and Weinstein which was sponsored by the Planned Parenthood Federation of America and represents the first of a series of "Social Research Studies in Contemporary Life" edited by Burleigh Gardner.

The study is described as a "pilot investigation of the psychosocial factors involved in family planning and contraceptive practices by working class men and women." The data are from interviews conducted with a quota sample of forty-six married men and 50 married women drawn from the working classes in Chicago and Cincinnati. The analysis and presentation take the form of developing typologies of "upper lower and lower lower class" contraceptive and sexual behavior, replete with numerous verbatim quotations from the interviews, occasional statistical estimates of prevalence, completely inappropriate considering the nature of the sample, and most importantly the deduction of provocative hypotheses and speculations.

A considerable number of these deductions are worth taking seriously such as religious belief seems more to disorganize efforts at contraception than to prevent them completely. The implication that lower class males are less concerned with contraceptive responsibility and are less interested in their wives' sexual sensitivities than middle class males seems worth investigating in connection with contraception. The authors seem to exhibit considerable insight into the culture of the lower classes relevant to contraception. Their account of the value systems of fatalism, wishfulness, and luck seems particularly relevant for understanding contraceptive behavior.

Other factors are also enumerated which

if true in any important statistical sense would be quite pertinent to an explanation of contraceptive behavior. The amount of premarital ignorance about sex, conception, and contraception is one such factor. The woman's apparent concern about fecundity as it relates to her perception of the adult female role is another. The significance of sexual conflict for contraception effectiveness is still another. The authors also include some very neat social psychological analyses of the perceptions of familial roles, self-images, and male and female perceptions of sexuality, all within the context of lower-class culture.

This book should be read by anyone doing research in contraception of the social psychological aspects of fertility because it is rich in suggestions for research. Stycos most appropriately concludes his Preface with the hope that "the present investigation will not be interred in the ever-expanding graveyard of 'exploratory studies' whose tantalizing hypotheses are indefinitely left in limbo." And let the readers remember that this research has no empirical basis whatsoever for estimating the prevalence of any characteristic or evaluating the validity of any proposition.

One general question seems in order, and that is the significance for understanding differential fertility in contemporary American society of research organized around the class dimension when it is clear that class is rapidly diminishing in significance for fertility. At the moment—and this generalization is supported by two recent large-scale studies of fertility—religion is far more important than class in the determination of fertility and contraceptive practice. This in no way, of course, compromises the importance of this work for the interests of the Planned Parenthood Federation.

CHARLES F. WESTOFF

Associate Professor of Sociology
New York University

WILLIAM H. NICHOLLS. *Southern Tradition and Regional Progress*. Pp. xviii, 202. Chapel Hill: University of North Carolina Press, 1960. \$5.00.

The author of this book, an economist, through the use mainly of secondary

sources, has examined the factors in the shaping of Southern attitudes and policies in relationship to economic progress. He emphasizes the persistence of the agrarian idea; the creation of a Black Belt aristocracy with political power out of proportion to its numbers; the lack of an adequate sense of social responsibility in respect to matters intellectual and economic; and a strong tendency to conformity of thought and action, especially in relation to the race question.

The author considers acceleration of urbanization and industrialization essential to increasing progress of the South. City population is regarded as more progressive and tolerant than rural elements. Inequitable representation in state legislatures, a condition not peculiar to the South, should be rectified so that urban sentiment will not be unduly hampered by rural strength. There is suggested an economic program, fostered in part by the states and in part by the federal government, to correct the economic ills of the region, particularly those that retard small and middle class farmers.

Professor Nicholls concludes that the race tradition of the South is its greatest barrier to progress. He is alarmed at the possibility that the integration controversy may result in partial abandonment of the public school system, a step which he feels would lead to deterioration in education and probably would produce adverse effects upon industrial development. This alarm, which many share, and the author's sympathy with integration are, however, factors which seemingly have helped make his appraisal of Southern education, especially since the Civil War, the least satisfactory part of his book. The treatment is flimsy; neither the difficulties encountered nor the relative advances made in the field of education are adequately emphasized, while the persistence of the private school idea, with its alleged relevancy to the integration question, is overemphasized. Whatever may be said in condemnation or praise of segregationists, this reviewer feels that sentiment for private schools is the least significant factor in motivating their stand.

Conformity of thought is represented as one of the main aspects of the Southern

tradition, but, excepting his demonstration of general conformity on the race question, the author leaves the reader somewhat confused as to the extent of this principle (pp. 23, 135-140, 145). Whatever its shortcomings, this book, written avowedly for a purpose, follows closely its central theme and is, on the whole, suggestive and thought provoking.

HENRY H. SIMMS

Professor of History
Ohio State University

MYRON LIEBERMAN. *The Future of Public Education*. Pp. ix, 294. Chicago: University of Chicago Press, 1960. \$5.00.

According to the description on the jacket, this book is "the most provocative book about the subject (the public schools) in years." This is a rather extravagant statement but not without precedent in the long history of publishers. That the author does launch an informed attack on almost every aspect of public education is true. But whether he will succeed in provoking counterattacks remains to be seen. Perhaps his object is merely to provoke thought on the part of his readers. This, in the opinion of the present reviewer, he has accomplished.

In his opening paragraph the author dissociates himself from all contemporary movements, theories, and personalities. In this sense he pursues a policy of "neutrality" among the contending parties. He declares flatly that he is not "an advocate of basic education, progressive education, the three R's, social adjustment, or stricter discipline." At the same time he endeavors to demonstrate that each and all of these approaches fail to go to the root of the problem of raising the level of instruction in our public schools. That root, he contends, is to be found in the broad framework of our educational system and, more particularly, in its "power structure" which is "anachronistic and dysfunctional."

The author predicts a profound revolution in this realm during the coming generation—a revolution which already is long overdue. The foundations of the system under which we now operate, he observes, were laid in our early agrarian society with

its great distances, its primitive means of communication, and its relatively self-contained neighborhoods and communities. It was in this society that our tradition of local control and the untrained teacher was developed. Now we live in a closely integrated society marked by fabulous mobility and close interdependence from border to border. Education consequently has become, not only an essential national concern, but also a vast enterprise on which the welfare of the nation rests.

In this brief review it is possible to mention only the two most basic theses of the book. The first is that the weakness of the public school derives from the system of local and even state control. There is little chance of improvement until the nation as a whole, by means of appropriate instrumentalities, assumes major responsibility for the support and direction of public education. The second thesis pertains to the role of the teaching profession. Only through a powerful organization of teachers can the necessary reforms be achieved. The profession must lead the way and guard jealously its rights and responsibilities. The role of the citizens should be strictly limited to the setting of the great goals and purposes of education. The determination of the means for achieving these goals and purposes is a purely professional task and should be left entirely to the teachers. These are truly provocative theses and should stimulate wide and thoughtful discussion of "the future of public education" in the United States.

GEORGE S. COUNTS

New Hope, Pa.

MARJORIE FISKE. *Book Selection and Censorship: A Study of School and Public Libraries in California*. Pp. ix, 145. Berkeley and Los Angeles: University of California Press, 1959. \$3.75.

Research for this study was undertaken during the years 1956-58 on a grant from the Fund for the Republic. Focusing on the source of library censorship, self-imposed or originating outside the institution, it sheds light as well on professional attitudes and behavior in the school and in the

community. Impetus for the study came from concern over pressures for the removal or restricted circulation of specific titles and general subject matter on the shelves of public and school libraries in California over a period of several years. The field work centered on twenty-six communities whose libraries serve the majority of the state's population. About 300 persons were interviewed in the course of the study.

The first chapter consists of an analysis of book selection practices, which were frequently found to be at variance with professional theory and established standards. The need for reliable methods of determining community needs and interests as a guide to book selection was noted, as was the absence of systematic efforts at qualitative appraisal and balance of subject matter. In school libraries varying degrees of deference to administrative personnel were observed.

Sources of censorship pressure were examined with the conclusion that individuals apparently acting independently have been more vigorous and persistent than the religious organizations and community groups which are popularly supposed to be sources of criticism of library policy. The most successful means of meeting attacks on library book selection policies at present seems to be affirmation of existing policies and support by the local press. Severe cases of controversy may lead to a habit of self-imposed censorship. However, where the library and its personnel enjoy a favorable status in the community greater freedom of book selection is exercised.

Many avenues worthy of further investigation are opened up by this very tentative survey. The entire study is more valuable as a challenge to further research than it is for its conclusions. The latter are based on such a limited geographical area that they cannot be accepted as typical of the climate of book selection in the United States. The value of the study lies in its examination of several cases of censorship and of the opinions and practices of numerous librarians and school administrators on the subject of actual or possible attacks on their policies.

This volume should be in the office of

every head librarian and school administrator. It should stimulate further research into the character of the library as a public institution. Aspects of the problem particularly deserving of attention are the public image of the library and the status of the librarian, criteria for book selection, the personnel shortage in libraries, factors influencing financial support of libraries, and administrative problems of school libraries.

EZRA SOLOMON and ZARKO G. BILBIJA. *Metropolitan Chicago: An Economic Analysis*. Pp. xix, 208. Glencoe, Ill.: Free Press, 1960. \$7.50.

This study is a cameo of the Chicago metropolitan economy—carefully cut and delicately contrived. Like any cameo it provides a miniaturized and restricted view, in which lies much of its charm and interest. Yet in this case we lose too much of the full profile from concentrating on what might be likened to, say, the lips and chin of a famous beauty.

Lest this criticism be taken too far amiss, let us at once describe what the authors have most admirably succeeded in doing.

Making use of what are in the main readily available data for most of the larger and some of the smaller metropolitan areas, and adjusting data which were not so readily available, they have outlined the salient features of the development of this metropolis. This outline is the most detailed and vivid over the past decade, and this sharper focus is due almost entirely to the very substantial improvement of small-area data during this time. Similarly, the outline is clearest in relation to those magnitudes which are most closely related, as was the authors' intention, to the nationally important accounting of: "employment, output, income, and saving" (pp. 4-5).

The choice of and focus on these particular magnitudes constitute both the strength and the weakness of this work. What the authors have done here is a model of clar-

ity and completeness which is within the grasp of analysts working in perhaps fifty standard metropolitan areas. It makes full use of recent advances in data collection. It is geared to the now-familiar quantities of national accounting and is therefore readily comprehensible to the educated lay reader. It provides an historical perspective, it relates the Chicago economy and its growth to that of the national economy, and within these broad sweeps it provides many valuable insights. To many, including perhaps your reviewer, one could wisely say: "Go thou and do likewise."

Yet for all of these virtues, there remains an unsatisfying sense of lack of fulfillment, which may stem from the somewhat overambitious claims of the authors in relation to their total achievement. Thus, a certain novelty is claimed: "It is only in the past few years that economic analysis as such has been applied to the systematic measurement and interpretation of metropolitan economies as individual entities," and "... the economic aspects of local area analysis have been invariably treated as subsidiary" (by a number of other disciplines and interest groups). The present work still falls short of an economic analysis in the most general sense and is more nearly a sound exercise in statistics; still worse, it displays not much if any more sophistication than some of the preceding literature with which the authors have apparently a "too-rapidly-passing" acquaintance.

It is quite true that economic analysis has much to offer to local area analysis. It is true that consistency with national accounts is desirable. It is true that available statistics permit increasingly detailed study. But both other economists and members of lesser breeds such as urban geographers and planners have discussed with more penetration the primary role of trade relations in the growth of local areas, thus indicating the greater relevance of international trade theory than the theory of national accounts to the problems in hand. A pursuit of these problems leads as well into delicate matters of industrial location and of urban function, in part as measured by nonmanufacturing employment, and in all three realms the problems of data col-

lection and analysis are most serious. At this level of maturity, metropolitan economic analysis is neither simple nor inexpensive.

Metropolitan Chicago should therefore be taken gladly and studied well for what it is, rather than for what it professes to achieve.

BRITTON HARRIS

CHESTER RAPKIN and WILLIAM G. GRIGSBY.
Residential Renewal in the Urban Core: An Analysis of the Demand for Housing in Center City Philadelphia, 1957-1970 with Reference to the Washington Square East Redevelopment Area. Pp. 131. Philadelphia: University of Pennsylvania Press, 1960. \$3.75.

Residential Renewal in the Urban Core by Chester Rapkin and William G. Grigsby deals with a question of urgent importance to most large American cities: "Can middle and upper income families be induced to return to the center of the city to live?" It was prepared for the Philadelphia Redevelopment Authority under contract to provide a basis for determining the marketability of proposed apartment towers and of rehabilitated houses in a run-down but historical section of Old Philadelphia.

Fine techniques were developed by the authors for relating the area market problems to the projected metropolitan housing demand, and the derivation of the results was presented with such clarity and supported by such an amplitude of summary tables that the reader has little difficulty in following the entire process, and may add interpretation of his own. Because of this, the report is an important contribution to the field.

As advice to potential investors, the basic purpose for which the study was made, the report is cautious and conservative, stressing possible pitfalls and difficulties but still sufficiently positive to have inspired the developers to proceed with plans to spend \$40,000,000 in the area for residential development. Within this context, the report is a success.

However, the publication and wide dis-

tribution of this report place it in an entirely different frame of reference. The issue shifts from the immediate investment decisions to the long-range effect on the development of American cities. Here the problem, often found in books on this subject, is the intermixture of statistical fact and subjective judgment and the danger of confusion between the two, giving the personal bias of the authors disproportionate significance.

The basic technique used in the study is to project, by highly developed statistical means, the total metropolitan area demand for housing and then to estimate the portion of this that will be satisfied in a specific area. Here a critical element is the changing preferences of the people. The statistical projections flow logically out of statistical trends but the shifts in preference have little basis in documentation, and are not supported by the kind of research which reveals emergent trends not yet generally evident. This is particularly significant because of the assumption of the authors that center city is not a suitable environment in which to rear children.

This issue of whether or not families with children will live in center city is important because it will have a major bearing on whether the new generation will include leaders familiar from childhood with urban life and urban problems. The implication drawn by the authors from their study that "it is not likely that the number of families with youngsters will increase materially in center city" is a point of view not directly derived from the statistics nor supported by research of a scope sufficient to justify it. Because the book is surrounded by excellent statistical material, it assumes an aura of authority that it does not deserve and so contributes to its own fulfillment.

History will determine whether the projections of this book are correct or whether there are dynamic emergent factors not taken into account which will draw people, even including children, to the centers of our urban civilization.

Between War and Peace The Potsdam Conference

By HERBERT FEIS

An absorbing dissection of the web of negotiations preceding the Potsdam Conference and an account of the conference itself that brings to life more clearly than ever before the issues and the personalities involved in that moment of triumph between victory and cold war, between hope and disillusionment. Herbert Feis, author of *The China Tangle* (\$7.50) and *Churchill-Roosevelt-Stalin* (\$6.95), adds new luster to his reputation as a masterful historian of modern diplomacy with this new book which is likely to remain the standard reference on the subject and which is vital to an understanding of postwar history. 368 pages. Maps. \$6.50

Gifford Pinchot: Forester-Politician

By M. NELSON McGEARY

In this first published biography of a colorful figure, Mr. McGeary covers Pinchot's schooling at Yale and in Europe, his career as America's first native-born forester, his intimate association with Theodore Roosevelt while acting as head of the U.S. Forest Service, and his emulation of Roosevelt while serving as governor of Pennsylvania. "A significant contribution to the history of forestry, of the Progressive era, and of Pennsylvania politics. It is a readable, balanced, objective, and original study of a major figure in 20th century American history."—Frank Freidel. 520 pages. \$8.50

Demographic and Economic Change in Developed Countries

SPECIAL CONFERENCE SERIES No. 11, NATIONAL BUREAU OF
ECONOMIC RESEARCH

Experts on population research team together with economists to apply the techniques of economic analysis to demographic material. The contributors assess the interrelationship of demographic and economic changes in industrially advanced countries, including Europe (except Iberia and the Balkans), Oceania, North America, Japan, and the Soviet Union. There is an evaluation of the variables in fertility as they affect the labor force which shows, among other things, how much the number of women entering the labor force affects the entire economic structure of a country. Published for the National Bureau of Economic Research. October. 620 pages. Tables & Charts. \$12

EDGAR M. HOOVER and RAYMOND VERNON. *Anatomy of a Metropolis: The Changing Distribution of People and Jobs Within the New York Metropolitan Area.* Pp. xvi, 345. Cambridge, Mass.: Harvard University Press, 1959. \$6.00.

The problem of metropolitan areas has been called the "number one domestic challenge" in the area of government today. We have made relatively little headway with this problem partly because the public, whose support is needed for effective solutions, does not yet understand the need for remedial action and partly because the specific information required by specialists to devise new forms of local co-operation has been largely lacking. *Anatomy of a Metropolis* is the introductory volume in a series on the New York Metropolitan region, which represents the first full-scale scholarly effort to reveal to the public the need for area-wide planning and to provide the specialized information on which such planning must be based.

The series was sponsored by the Regional Plan Association, an early pioneer in metropolitan planning, and conducted by the Harvard Graduate School of Public Administration. Three years of intensive research and planning by a special staff, sparked by Harvard faculty seminars and assisted by a distinguished advisory committee, preceded the publication of this volume.

Anatomy of a Metropolis was written by Raymond Vernon, Director of the Metropolitan Region Study, and Edgar M. Hoover, Professor of Economics at the University of Pittsburgh, aided by specialists who did the spade work. It analyzes the vast shifts in population, employment, and housing that have recently taken place in the twenty-two countries that comprise the New York Metropolitan Region and attempts to project future changes for a quarter of a century.

Its most dramatic finding is that in the next quarter of a century the region's "central core," New York City proper, will experience a decline in jobs, business, and people. This decline in jobs will come because assembly-line plants like automobile or airplane factories must be built along horizontal lines. However, in activities

permitting vertical expansion in skyscrapers or requiring a great diversity of professional or trade services the city will continue to grow. By the same token, population in Manhattan and its traditional "bedroom" boroughs will thin out, while the "grey areas" of slums and blight will spread. At the same time, manufacturing and population will mushroom in suburbia and exurbia.

The New York Metropolitan area contains the greatest aggregate of people, jobs, and wealth in the United States, but the changes described in this volume typify those in metropolitan areas throughout the nation. Indeed, preliminary data from the census of 1960 are confirming the trends foreshadowed in this study, not only in the region it describes but also in the rest of the country. That is why this valuable work, embodying the best thinking of experts in many areas, will serve as a model for metropolitan surveys for a long time to come.

FREDERICK SHAW

Research Associate
Board of Education of the City
of New York

LOIS MACDONALD with the assistance of MURRAY B. NESBITT, PETER F. FREUND, and SAMUEL N. SEIDMAN. *Leadership Dynamics and the Trade-Union Leader.* Pp. xi, 156. New York: New York University Press, 1959. \$2.50.

Business, voluntary organizations such as the Red Cross and the Boy Scout movement, as well as the civilian and military branches of government, have paid increasing attention—financial and otherwise—to the torrent of research reports emanating from social psychologists and sociologists concerned with the study of small groups, leadership, and bureaucracy. Labor unions, on the other hand, have for the most part ignored this kind of material or have been downright hostile to it.

The authors of this book set themselves the exceedingly difficult task of ordering the findings of these reports to determine whether or not they might not after all have usable implications for the problems which the labor movement faces today.

Chapter I of the book, therefore, sets the stage by describing these problems: the change from organizing and recruiting members to administering contracts; the oligarchic tendencies which seem inevitably to accompany the increasing size and complexity of the labor movement; and the expansion of union activities into the political and other fields. Chapters II and III survey the findings of social psychologists and sociologists respectively; Chapter IV covers the relatively few studies of leadership actually undertaken in unions; and Chapter V summarizes.

The authors' attitude toward the products of the "behavioral scientists" is a sense of exasperation mingled with continued hope. In this they seem to mirror accurately views which are today quite frequent among economists, political scientists, and other representatives of the older social sciences. Militating against the likelihood that the behavioral scientists' material is applicable is its internal lack of agreement and conclusiveness; its preoccupation with method as against content; and the fact that the settings in which findings have been obtained range from the unrealistic, *ad hoc* student groups, to the noncomparable, leadership in the military. Yet the authors—and they are not alone—are loth to write off these findings altogether. These studies are, after all, the only massive body of empirical findings on leadership and administration that even attempt to be additive. How, without making the attempt empirically rather than on an *a priori* basis, can one be sure that leadership even in student groups may not bear similarities to leadership in more serious situations? The authors' judgment is therefore poised in the middle and, being of necessity an *a priori* judgment, it cannot be anything else.

This reviewer wonders whether the authors' condensation of the various fields they have tackled, heroic effort though it was, will be meaningful to all but a few of the outsiders for whom it is intended. From the insider's point of view there will be questions concerning the organization of the material—the subdivisions of the social psychology chapter, for instance, are by research group rather than by underlying

concept, and therefore are confusing to the reader—and there will also be questions on matters of fact. But given the difficulty of the task and barring a great deal more time, it is doubtful that others could have compiled a much better book.

HENRY A. LANDSBERGER

Associate Professor
New York State School of Industrial
and Labor Relations
Cornell University

CHARLES H. LANGE. *Cochiti: A New Mexico Pueblo, Past and Present*. Pp. xxiv, 618. Austin: University of Texas Press, 1959. \$10.00.

This study is outstanding in its workmanship and in its comprehensiveness. With scrupulous attention to detail, Dr. Lange has integrated the results of his own field work with almost all published information on Cochiti. He has also ransacked manuscript sources in Santa Fe, Albuquerque, and Philadelphia and examined collections of photographs in Los Angeles, Washington, New York, and Denver. To an extent which few anthropologists have equaled he has combined the skills of the archivist and historian with those of the fieldworker. The product has a satisfying firmness of documentation and a constant dimension of time perspective.

The book begins with a succinct survey of the environmental setting. There follows a more extended account of the prehistory and history of the Pueblo. The economic base and subsistence are next considered. The chapter on political organization encompasses only some thirty-five pages, but the very interesting phenomenon of factionalism is treated in many different contexts in the volume. Indeed no description of Pueblo life can fail to discuss "politics" under the headings of religion and social organization as well as when devoted to government as such.

It has become customary, rightly or wrongly, for anthropologists in writing about Pueblo cultures to give the most extended scope to religion. Lange is no exception. But his chapters and sections on ceremonial organization, cosmology, witchcraft, medicine and secret societies.

ceremonial calendar, and paraphernalia are remarkable for their rich specificity. The reader learns which identified persons danced in what order, exactly how they were costumed, and the like. Lange critically relates his own interviews and observations to reports in the literature.

The chapters on social organization and life cycle contain good material but are somewhat less full-bodied, and the handling is more conventional. The forty-two Appendices contributed by Lange are models of reporting the minutiae of demography, kinship, art and material culture, and so forth in such a way that the specialist can both check generalizations in the body of the text and also utilize the raw data for different kinds of analyses. The Appendix by Gertrude Kurath on choreographies and songs is excellent, though highly technical. The final Appendix by Robin Fox on linguistics is cautious, tentative, but highly sophisticated.

One may regret that Professor Lange has not permitted himself more interpretations and a concluding chapter which was generalizing and perhaps comparative. Perhaps this will follow in another book. In any event one should not cavil at an author for what he has deliberately not decided to do. This is intended as a descriptive study, and it is a fine one. The inevitable limitations of time and of the skills that a single fieldworker can control mean that some topics are neglected—as Lange himself recognizes. This reviewer could wish that the author had given more amplitude to the presentation of his field methods. The work extended from 1946 to 1952 with the subsequent trips in 1957 and 1958—the data from which were not fully incorporated in this volume. But so many visits to a single community must have inspired some reflections on changing contexts through time and with cumulative experience. Finally, it is regrettable that all Cochiti terms as recorded by Lange, Kurath, and Fox were not reduced to the same phonetic alphabet.

These, however, are minor strictures. This is a serious, honest book which adds greatly to our knowledge of the Southwest and which sets high standards of recording,

synthesis, and presentation. It deserves the handsome job of bookmaking which the University of Texas Press has provided.

CLYDE KLUCKHOHN

Professor of Anthropology
Harvard University

EDWIN J. THOMAS, DONNA L. MCLEOD in collaboration with PAULINE BUSHEY and LYDIA F. HYLTON. *In-Service Training and Reduced Workloads: Experiments in a State Department of Welfare*. Pp. 130. New York: Russell Sage Foundation, 1960. \$2.50.

This monograph is a timely publication. Since it presents the findings of an evaluative study in which social workers and social scientists participated, it illustrates a newly developing method of collaboration between these two professions. It is of interest to those concerned with social welfare in general as it confirms the feasibility of experimental studies in a state department of welfare and provides new data concerning the Aid to Dependent Children (ADC) Program, a program of increasing concern to professional social workers, to legislators, and to the public.

The project evaluates the usefulness of in-service training and reduced workloads for the ADC program in certain counties in Michigan. Two separate experiments were conducted, each covering a time span of one year. In each the "effects of reduced workloads as well as of training were independently assessed" to determine if such aids help to forward the purposes of the 1956 Amendments of the Social Security Act related to non-financial services, that is to "help maintain and strengthen family life." In one experiment a training supervisor, a member of the research group, trained personnel directly responsible for services to ADC recipients while in the second experiment the same training supervisor provided training for a group of supervisors who then transmitted this knowledge to the welfare workers. Within this framework several control groups were established: some workers received the training as well as a reduction in caseload; others received only training; a third group

utilized certain administrative devices designed to save time. There was also a "no change" group. An elaborate plan of objective tests, questionnaires, and an "experimental" interview involving the use of an actress was utilized in evaluating how much the workers changed in knowledge and performance. Comparisons were made among the various control groups.

Most of the verified results are what a professionally trained social worker might have anticipated. For example, the workers changed more in terms of knowledge than in actual performance. In future studies it would be interesting to see if the addition of supervision in application of casework principles with the recipients—the workers only received continued supervision on administrative and eligibility content—might contribute to improved performance. One puzzling finding is that workers trained by the agency supervisors "changed" more than did the supervisors themselves. Although it is suggested that there was some shift in the focus of the training program for the latter group this does not seem a sufficient explanation. A major conclusion that will be supported wholeheartedly by those concerned with the public social services is "if the rehabilitative objectives of the 1956 Amendments of the Social Security Act are to be realized . . . it seems apparent that long, intensive on the job training will have to be given along with much smaller caseloads."

Of particular significance to administrators of public programs is the conclusion that training alone is not so helpful in improving the quality of service as a reduction in caseload which permits the "opportunity for frequent family contact."

The material is presented in a clear, orderly, readable style and while it in essence presents nothing startlingly new, it is probably indicative of a trend in social welfare and in social work, that is, the verification through the application of social science research methods of clinical data long recognized by trained practitioners. The authors present their methods and findings in detail and are modest in their presentation. While one can take minor exception to certain parts of the material—for example, "casework" is never

clearly defined—it is a useful contribution to the goal of improving services in the ADC program. The training program content which is fully outlined in the Appendix could be of great value to those responsible for the training of public welfare personnel. It is to be hoped that the factual verification of the need for both training and reduced caseloads will be of assistance to administrators in providing the skilled services needed by the 2.2 million children and their families presently receiving Aid for Dependent Children.

PHILOSOPHY AND RELIGION

JOHN WILD. *Human Freedom and Social Order: An Essay in Christian Philosophy*. Pp. xi, 250. Durham, N. C.: Duke University Press for the Lilly Endowment Program in Christianity and Politics, 1959. \$5.00.

This is an original and challenging book devoted to the problem of the meaning of human existence and freedom from the perspective of a Christian, existential philosophy. In the course of his devastating attack on the rationalism and humanism which stems from classical Greek thought, Professor Wild is led to question the major theses of the realistic philosophy which he himself had advocated so persuasively in his earlier works. Since the publication of his *The Challenge of Existentialism* (1955) he has undergone a thorough conversion to the existentialist mode of thinking and in the present work finds himself completely disillusioned with the claims of traditional, rationalist philosophy that human reason is capable of providing universal, objective knowledge of nature, God, and man. According to the author, an authentic Christian philosophy based on an adequate synthesis of reason and faith has not yet been achieved by either Augustinians or Thomists. This essay is viewed as an attempt to present the outlines and conditions of such a synthesis.

Announcing

seven anthologies of Western thought designed to provide the modern reader with integrated, readily understandable introductions to the major scientific and philosophical concepts which have determined—and continue to influence—the history of mankind.

CLASSICS IN SCIENCE

A cohesive presentation of great scientific ideas from the writings of Aristotle, Pythagorus, Ptolemy, Copernicus, Galileo, Newton, Lavoisier, Faraday, Darwin and many others. Edited and introduction by E. N. da C. Andrade.

CLASSICS IN PHILOSOPHY AND ETHICS

An authoritative examination of philosophic thought, with selections from Plato, Descartes, Spinoza, Kant, Huxley, Xenophon and other great thinkers from all the ages. Edited and introduced by C. E. M. Joad.

CLASSICS IN ECONOMICS

The basic principles and their practical applications, expounded in the writings of Smith, Keynes, Cripps, Hayek, Marx, Engels and other distinguished economists. Edited and introduced by G. D. H. Cole.

SOURCEBOOK IN PSYCHOLOGY

A survey of psychological research and clinical techniques as presented by Freud, Jung, James, Watson, Northcott, Bain and many outstanding contemporaries. Edited and introduced by James Drever.

CLASSICS IN BIOLOGY

A demonstration of the fundamental unity of all living things, by Mendel, Lister, Dahlberg, Weiner, Lady Mary Wortley Montagu, et al. Edited and introduced by Sir S. Zuckerman.

CLASSICS IN SOCIOLOGY

An overall review of man's endeavors to live happily with his fellow, as seen by Flinders Petrie, Whitehead, Pym, Russell, Shaw, Müller, Milton, Rousseau and other social observers. Edited and introduced by Donald Macrae.

CLASSICS IN WESTERN CIVILIZATION

The political and cultural evolution of a significant concept, defined and chronicled by Toynbee, Spengler, Savonarola, Erasmus, Locke, Luther and divers others—including Hitler and Mussolini. Edited and introduced by D. C. Somervell.

According to Wild, the rediscovery by Husserl and Heidegger of the concept of the *Lebenswelt*, translated as "the world of lived experience," is the most noteworthy philosophical achievement of our time (p. 90). Henceforth the primary function of philosophy is the clarification, through phenomenological analysis, of the structures of this human world and of the philosophic categories necessary for its comprehension. Since the basic assumptions of philosophic analysis are not demonstrated by any available evidence, the philosopher must seek the aid of faith to provide a "guiding image" for his formulations. Reason, in the sense of exact understanding, and faith, as exemplified through what Paul Tillich has called "ultimate concern," are autonomous and independent of each other and, at the same time, dependent on each other. Faith and reason are said to be in a state of "dialectical tension" (p. 87). There is no pre-established harmony between faith and reason, and a special decision is required in each instance to establish which element shall prevail. The Christian philosopher will utilize Christian revelation as his guiding image of faith but will not feel bound to accept any dogmatic or absolute interpretation of his faith. For Wild, no one philosophical conception of the *Lebenswelt* is final because our human truth grows and declines with historic experience. Hence an authentic Christian ethic is not based on the humanistic assumption of a fixed human nature and a prescribed form of self-realization, as classical theology tends to assume. Christian ethic is based on faith in the disciplined expression of freedom and on man's capacity for self-transcendence (p. 180).

Human Freedom and the Social Order merits serious consideration for its fresh examination and appraisal of controversial philosophical and theological problems. In spite of the author's assurance, this reviewer has serious misgivings concerning his uncompromising attack on classical, rationalistic thought and his relativistic evaluation of human reason. Nevertheless, I find myself in sympathy with his ultimate concern that philosophical thought be made

relevant to the imperatives of human existence.

ROBERT O. BYRD. *Quaker Ways in Foreign Policy*. Pp. xxi, 230. Toronto: University of Toronto Press, 1960. \$5.00.

This book shows clearly and adequately that the Society of Friends or Quakers has for three centuries had a fairly consistent foreign policy based on a coherent theory regarding the nature of man and the universe. It also shows how this policy has been expressed and sometimes implemented through petitions, letters, and deputations to governments and through a variety of activities both educational and in the field of practical humanitarian service. It is surprising that such an extensive record as this can be made of a small, decentralized group whose religion is primarily directed, not toward the outer world, but toward the spirit or light within all men and whose social doctrines, especially those which concern peace and human equality, have been so much at variance with prevailing popular opinion.

The book is designed to be descriptive and analytic though some attempt at evaluation is made in an epilogue which is intended to indicate that Quaker doctrines are more practical and expedient than they are generally considered to be. Since Friends have depended on an inner sense or intuition of the intrinsic rightness or wrongness of an action regardless of its apparent results, the author devotes little space to the success or failure of their undertakings though he indicates that a noncompromising application of Christian principles in a non-Christian world sometimes is successful in the long run. The struggle for religious liberty in England and America, during which Quakers endured persecution, was successful because they took an absolute, not a relative, position. William Penn's holy experiment in establishing the commonwealth of Pennsylvania was a success as long as the Quakers were in control. Yet Quakers

have generally been gradualists rather than revolutionaries, not because they were willing to compromise, but because they did not expect their absolute position to be adopted by others except by degrees. When they advocated modifications of foreign policy, it was always in the direction of less reliance on military compulsion and other forms of coercion. This included unwillingness to approve of forcing an extreme position on people not inwardly prepared to accept it. Evil, they felt, must be outgrown rather than violently suppressed.

The peculiarity of the Quaker approach stems primarily, says Dr. Byrd, from a conviction that there is "that of God in every man," a phrase much more used by this author than by Quaker writers in general. Awareness of "that of God within" creates a belief in the infinite worth of every individual and a sense of unity and community with all men and all life.

For the solution of international problems Friends rely on agreement achieved through spiritual power which is not coercive. The search for security is not a primary motive. The Quaker method starts from within, individually and eventually nationally. It works from within outwardly into wider and wider circles.

The first part of the book is theoretical, and the second part historical. The multitude of events described indicates that Friends have not been satisfied with a purely negative peace policy but have continually urged governments to take a positive action in the direction of arbitration and disarmament. Friends have admitted the need of a police force but have disagreed on the morality of an international police army. The main modern Quaker contribution to foreign affairs has been the creation of pilot projects, mainly educational, in an attempt to reduce tensions by increasing international and interracial understanding.

This book is an excellent contribution to the subject. It is the only study which adequately covers Quaker efforts in the first half of the twentieth century. While it raises more questions than it answers, these are questions which concern our most difficult problem of today, that of foreign

relations. If the Quaker doctrine can not be fully realized at present, it may, at least, represent the direction in which men and nations should move.

Wallingford, Pa.

CARL J. FRIEDRICH (Ed.). *Community. Nomos II.* Pp. viii, 293. New York: Liberal Arts Press, 1959. \$5.00.

This volume of the Yearbook of the American Society of Political and Legal Philosophy is based on the discussions and papers presented at the meeting of that society in 1957. The central problem of the conference was to explore the meanings and implications of the concept of community, mainly from the point of view of historical, philosophical, and legal thought. Of the sixteen papers presented in the publication we observe such titles as, "The Community as the Legal Order," "The Co-Organic Concept of Community," "The Crisis in Community: Challenge to Political Theory," "Community—After the Apocalypse," "The Principal Structures of a Community: A Sociological Analysis," "Community as a Matrix," "Community, Communication, and Communion." Two papers deal with community in terms of publicity and secrecy, one in relation to the role of the Supreme Court. Perhaps the most comprehensive is the initial chapter by Friedrich, "The Concept of Community in the History of Political and Legal Philosophy." Talcott Parsons attempts, as one might expect, to consider the community as an aspect of a social system, emphasizing four structures which he refers to as the locational, the occupational, the jurisdictional, and the communicational. To this reviewer, one of the most stimulating chapters is presented by Benjamin Nelson, "Community—Dreams and Realities." Anyone who feels comfortable about modern society or who finds satisfaction in some of the platitudes erupting from the high priests of political power, whether democratic or authoritarian, could profitably ponder on Nelson's tough-minded realism.

One finds in the volume a variety of interpretations of the concept of community. The volume is not limited to con-

ceptual meanings but is also concerned with basic problems such as the function, character, and abuse of power, totalitarianism in the modern world, and the challenges of nationalism to social theorists. Some of the writers view community in a broad sense, almost the equivalent of a national society; one is concerned with the conventional conception of community as human organization in a local setting.

To read this book is a vigorous intellectual exercise. While its appeal is mainly to philosophers and historians, some of the chapters would be of special interest to behavioral scientists.

NOEL P. GIST

Professor of Sociology
University of Missouri

EMILE DURKHEIM. *Montesquieu and Rousseau: Forerunners of Sociology.* Translated by Ralph Manheim. Pp. xvi, 154. Ann Arbor: University of Michigan Press, 1960. \$3.95.

In the first essay of this book, written in 1892, Durkheim discusses Montesquieu's contributions to the founding of social science under such captions as: Conditions necessary for the establishment of social science, Montesquieu's classification of societies, the extent to which Montesquieu believed that social phenomena are subject to social laws, and Montesquieu's methodology. Durkheim concludes that no earlier writer had perceived so clearly as did Montesquieu the conditions needed for the founding of social science.

According to Durkheim, Montesquieu also "instituted a new field of study," now called comparative law. Durkheim commends Montesquieu's methodological conclusion that laws cannot be understood apart from "morality, trade, religion, etc." or separate from "the form of society." Thus Durkheim claims that Montesquieu foreshadowed the unity of social science. Although Durkheim admits "an element of ambiguity in Montesquieu's concept of law," he believed that Montesquieu laid the groundwork for a science of sociology, although his discussion of this point is incomplete and unclear. His use of the terms social science and sociology is not differentiated, and his inference that Mon-

tesquieu was the father of sociology appears to claim too much.

In the second essay, Durkheim seeks to determine what Rousseau meant by a "state of nature," and why, according to Rousseau, people departed from this state to found societies, why Rousseau believed that this shift was not inevitable, and how it was that he believed that the state of nature and a civil nature are reconcilable. Durkheim points out how Rousseau and Descartes were alike in that each sought "to clear the mind of all mediate judgments." Durkheim accepts Rousseau's belief that the state of nature is satisfactory for man as long as conditions are simple and stable, but no longer so, when conditions change and arouse new wants. Durkheim explains how Rousseau posits "the establishment of a body politic," and how he defines "the social contract." Durkheim contrasts Montesquieu and Rousseau at the point of results in their thinking, —the former emphasizing a normal division of functions and mutual service, while the latter believed the individual to be hostile to the common will.

In the Foreword, Henri Peyre reviews Durkheim's life briefly, and in a statement supplementary to the two essays, George Davy, one of Durkheim's successors at the Sorbonne, compares Durkheim, Montesquieu, and Rousseau, stressing how Durkheim regarded Montesquieu as a precursor and no more of the modern social sciences. Durkheim's two essays are as valuable today as when they were produced in describing some of the basic ideas which led to the founding of sociology. The essays reveal Durkheim at his best in the role of a lucid thinker, effective writer, and a fervent diagnostician of some of the origins of social science.

OVERTON H. TAYLOR. *The Classical Liberalism, Marxism, and the Twentieth Century.* Pp. viii, 122. Cambridge, Mass.: Harvard University Press, 1960. \$3.50.

This small volume contains four lectures given at the University of Virginia by

Overton H. Taylor, a Harvard economist. It aims at contrasting the basic philosophies in conflict between "classical liberalism," which the author believes characterizes American and Western capitalism and democracy, and Marxian communism of Russia and other Communist areas. The author traces the development of "classical liberalism" which came to fruition in the eighteenth and nineteenth centuries. The emphasis is upon basic freedom for the individual and is in contrast to the "cult" of the New Dealers and Fair Dealers, enthusiasts for the trend towards the welfare state, or "humanitarian big government." The author considers some areas of justifiable government intervention, but he favors a return to a point somewhere between "strict laissez faire," and "the semi-socialist, so-called liberalism of today." An earlier volume of collected writings contains essays written under the influence of the liberalism the author now condemns, as well as essays representing recovery to his present position, but he there described himself as "a perpetually troubled, mind-changing moralist."

Perhaps more stimulating than the defense of a moderate conservatism found in these lectures, is Dr. Taylor's discussion of Marxism and the distinctions between Karl Marx and the modern Communist version. He stresses the need to acquire a deeper understanding of Marx than is usual, as Marx was "a truly great scholar and thinker no matter what or how we think about him." As an economist, he believes that Marx's insights into the dynamic, evolving aspects of capitalism and the business cycle cannot be dismissed. The element of utopianism in Marx, however, was the greatest weakness, and "professed builders of his utopia are now making it a hell." The Communists have also given an emphasis to revolution beyond that of Marx.

In assessing the appeal communism has for some peoples, the author calls attention to the reality of oppressive class governments which existed in areas won over to modern communism and to the fact of rapid industrialization and modernization which they are achieving. The fatal omission is in the field of ethical or moral

progress, and the response of the West must be union upon a single sound moral vision. As for imperialism, the main cause is the chaos of a world of sovereign nations. International government and an effective body of international law must replace this chaos.

DALE PONTIUS

Associate Professor of Political

Roosevelt University

DOUGLAS V. VERNEY. *The Analysis of Political Systems*. Pp. v, 239. Glencoe, Ill.: Free Press, 1959. \$6.75.

Within the covers of this small volume, the author has tucked a surprisingly rich conspectus of government and politics as they exist among the nations and peoples of the modern world. His methods are empirical, his categories are clearly defined and entirely relevant to contemporary experience.

The work is divided into three main parts. In the first he examines governmental structure and finds that most present governments fall into one of three systems: presidential, parliamentary, and convention. A few are combinations of two or more, while five may be called *ancien regimes* and nine more are unclassifiable. Most Communist states operate under the convention system. Each of the three basic systems is carefully described and explained. Many of the author's insights in this part challenge commonly held dogmas and stimulate refreshingly a new look at governmental structure.

The second part of the book is concerned with the political process. Here the author discusses theories of general participation and theories of limited participation. In the first group he considers the theory and practice of "classical" democracy, representative and delegate democracy, and interests and pressure groups. These last, he thinks, should be regulated "to assure that in making their contribution to the political process [they] do not lose touch with their members or act contrary to the public interest."

The three chapters which deal with elite theories, with the "iron law of oligarchy," and class war, offer a succinct analysis

OXFORD books of exceptional interest

The Peoples and Policies of South Africa

Second Edition

By **LEO MARQUARD**. Since the publication of this book in 1952, considerable changes have taken place on the African continent. This enlarged edition contains much new material, and the author has re-examined various racial problems and their ramifications in education, law, religion, and social life. He discusses the past and present relations of the British, the Afrikaners, the Africans, the Colored people, and the Asians who inhabit the Union of South Africa. *End paper maps.* \$5.00

Thought Reform of the Chinese Intellectuals

By **THEODORE H. E. CHEN**. In this thoroughly documented account Professor Chen discusses: the Chinese variety of psychological brainwashing; how Mao's government employed it on Chinese intellectuals from 1950 to 1957; and the degree to which the thinking of Chinese intellectuals has been reformed. His study is based on examination of confessions that have appeared in Communist Chinese newspapers and on government pronouncements. \$5.00

The Public Service in New States

A Study in Some Trained Manpower Problems

By **RT. HON. KENNETH YOUNGER**, *Director-General, Royal Institute of International Affairs*. This is a study of the transfer of responsibility from members of the British Colonial Service to locally recruited officials in a British dependency when independence or self-government is granted. The Federal and Regional Service of Nigeria forms the core of the study as the author examines the way that arrangements have been working out in practice since 1954. \$2.60
paper \$2.00

OXFORD UNIVERSITY PRESS

Kindly mention THE ANNALS when writing to advertisers

of contemporary governments and societies which should prove quite useful to the student of political science in his consideration of problems of government personnel.

The final chapter, entitled "Government and Political Process," is in the nature of a conclusion based on the earlier analysis. This synthesis sheds considerable light on contemporary problems in political science. There is a separate examination of the applicability of democratic and Communist theories to the development of underdeveloped countries. The author concludes that the achievements of communism are largely economic and Communists seem to be blind to the need for political growth. He feels that as national economies in the underdeveloped countries reach a level acceptable to their residents the political shortcomings of the Communist creed will become increasingly apparent. Then full, genuine popular participation will be demanded, and nothing else will do.

To those who wish to clarify their thinking about certain aspects of political theory and about government and its activities in the modern world, this little book is confidently recommended as well worth reading.

HARVEY WALKER

Professor of Political Science
Ohio State University

INTERNATIONAL RELATIONS

KENNETH W. THOMPSON. *Political Realism and the Crisis of World Politics: An American Approach to Foreign Policy*. Pp. ix, 261. Princeton, N. J.: Princeton University Press, 1960. \$5.00.

Mr. Thompson has for many years been one of the ablest exponents of the "realist" school of international politics. In this volume, which is based on a set of lectures, he presents the main and, by now, familiar themes of "realism": the absence of absolutes in world affairs, the permanence of power conflicts, the limited freedom of action of the foreign policy-maker, the differences between individual and collective morality, the difficulty of effective diplomacy in a democracy. As in many of

Hans Morgenthau's works, we find here a sharp criticism of traditional American approaches to world politics: isolationism and collective security, excessive faith in naked power and extravagant legalism, the tendency to moralize too much, and the habit of speaking with too many voices. Indeed, the book sounds like a mass of expiation for the deadly sins of liberal optimism, enlightenment, faith in progress, and "sectarian Christian perfectionism," conducted in a realists' Pantheon, where we find, along with Mr. Thompson, those men whose ideas he praises throughout: Niebuhr, Kennan, E. H. Carr, Morgenthau, Spykman, Lippmann, and Dean Acheson's policy-planners. Together they preach of "the inevitable tragedy of human existence, the irreducible irrationality of human behavior, and the tortuous character of human history."

It is an eloquent sermon, and no one can deny that the demons which Mr. Thompson exorcises deserve to be chased away, and are indeed very difficult to drive permanently out of American foreign policy. However, two serious questions may be asked. First, does the battle still need to be fought so hard? Haven't those evil spirits lost much of their strength, and is it entirely fair to see in every crisis or mistake of recent years a trace of their presence? Secondly, are the principles with which realism proposes to replace the illusions of the past able to provide us with sound guidance? I doubt it on two counts. To help us understand the world around us, realism proposes two tools which are a bit too awkward for good use: history and the concept of the national interest. Now the former supposes a far more thorough discussion of its relevance and interpretation than is provided here, and the second is treated as if it were an easily identifiable and objective reality, which it certainly is not. To help us solve the political and moral dilemmas which both block and require action, realism merely repeats that everything is "fraught with dilemmas" and that problems have to be faced "on their merits," but does not tell us what the merits are. The civilized despair, or the informed sigh, about moral ambivalence is not much better than

the trenchant and crude moralism which it displaces: both are oversimplifications and escapes. To warn us against absolutes is good as long as it is intended only to remind us of the perils of moral absolutism in a divided world. But in a revolutionary period, to talk about the moral content of all national interests comes dangerously close to an invitation to desist from moral judgment altogether. To plead for expediency rather than principle risks making us forget that expediency all too often means bowing to the principles of one's antagonist.

Indeed, the lodestars which Mr. Thompson points out to us: diplomacy, compromises, and the British approach to foreign affairs, re-enforce this reader's suspicion that the realists' conservatism is simply a case of fatigue of liberals who have lost their faith in—or illusions about—man but preserved their hope for—or illusions about—accommodation and restraints. It might be beneficial for present-day liberals to "accept the wise doctrines of . . . the Policy Planning Staff," but it is unfortunate to see realists take almost as a model the policies of a nation—Great Britain—whose twentieth-century diplomacy, inspired by nineteenth-century traditions, could be used as an almost permanent exhibit of egregious errors. Having purged our mind of the poisonous foods it has absorbed in the past, the "realists" leave it hungry for better nourishment which they do not provide.

STANLEY HOFFMANN

Associate Professor of Government
Harvard University

WILLIAM T. R. FOX (Ed.). *Theoretical Aspects of International Relations*. Pp. xii, 118. Notre Dame, Ind.: University of Notre Dame Press, 1959. \$3.25.

The distinguishing mark of postwar social science is the quest for organized bodies of theory capable of providing a measure of unity and coherence for the major disciplines. This little volume is a sample of progress in the international relations field. It contains seven essays prepared for an inter-university seminar conducted in 1957 at Columbia University. Its contributors are a former policymaker, Paul H. Nitze, a theologian, Reinhold Nie-

buhr, and economist, Charles P. Kindleberger, and four political scientists, William T. R. Fox, Hans J. Morgenthau, Kenneth Waltz, and Arnold Wolfers. The authors discuss the elements, the nature and limits, the uses, the actors and the central concepts of a theory of international politics. One contributor evaluates international political theory from the standpoint of economic theory and another in the light of classical political philosophy.

None of the theorists claims a monopoly for his approach to the theory of world politics. Each is content to add to the sum of knowledge of "normative," "scientific," or "rational" theories. Individual authors contribute in their own right, and we are indebted to the Committee on International Relations of Notre Dame University for publishing the cogent and incisive essays under one cover. Each essay was presented to the Columbia Inter-University Seminar composed of the seven authors and fifteen younger theorists from nearby universities and centers. Every author was given an opportunity to revise his paper in the light of the successive seminar discussions which extended in each case over a two- and three-day period. No inquiry into theories of international politics can afford to pass over this important collection of papers that illustrates so graphically the unity and diversity of prevailing approaches. For example, Professors Fox and Wolfers reflect a strong leaning toward the behavioral sciences. Mr. Nitze applies the experienced practitioner's corrective to theories he finds insufficient, and Professor Morgenthau and Dr. Niebuhr illustrate the usefulness of "strong" organizing principles or concepts for the development of theory.

If the reader feels a sense of disappointment on completing this excellent study, he can trace it primarily to "a missing chapter." At no point does the editor or any of his colleagues consider the relationship of the parts to the whole. In economics, we have witnessed a lively discussion on the relation of partial to general theories or concepts of microeconomics to macroeconomics. Professor Kindleberger viewing international theory from the outside invites attention to this problem. I suspect the inherent modesty of each con-

tributor coupled with the present stage of development of international theory explains the absence of such analysis. Perhaps other scholars who use the book may be stimulated to complete this unfinished task. In so doing they will exploit the valuable insights of this significant treatise in an emerging field of study.

KENNETH W. THOMPSON

Director
Rockefeller Foundation

RAYMOND H. DAWSON. *The Decision to Aid Russia, 1941: Foreign Policy and Domestic Politics*. Pp. xv, 315. Chapel Hill: University of North Carolina Press, 1959. \$6.00.

The enthusiasm with which the British and American governments welcomed Hitler's invasion of Russia, June 22, 1941, is well known. Churchill's pungent remark, "If Hitler invaded Hell I would make at least a favourable reference to the Devil in the House of Commons," has been often quoted, as has Secretary Hull's telephoned message to the President: "We must give Russia all aid to the hilt." Both Churchill and Roosevelt promptly announced their intention to give all possible aid to the Soviet Union in its fight against Nazi Germany. Yet it was not until November 7 that the President signified that the Soviet Union was eligible for aid under the Lend-Lease Act. It is the reason for this long delay that Mr. Dawson has set forth with great detail in his well-written and well-documented monograph.

Starting with the debate over the Lend-Lease Bill, January to March, 1941, he shows that the opposition made repeated attempts to exclude Russia from the benefits of lend-lease. The Administration forces, aware of the possibility of a breach between Russia and Germany, successfully opposed such attempts. When the break came, therefore, the Soviet Union was legally eligible for lend-lease aid, but Roosevelt feared that the extension of such aid would arouse formidable opposition to the new appropriation for lend-lease, which was essential for continued aid to Britain. Aid to Russia, therefore, was temporarily financed by purchase of Russian gold and

other hand-to-mouth expedients, while the President tried to mollify hatred of the Soviets, especially hatred based on religion. His rather amusing attempts to secure proof of religious freedom in the Soviet Union were futile, but the Vatican co-operated in a statement distinguishing between communism and the Russian people. Congressional opposition, clearly less formidable than the President had supposed, collapsed. The new appropriation for lend-lease, with no restrictions on where the President might use it, was signed on October 28, 1941. Ten days later Mr. Roosevelt informed the Lend-Lease Administrator that he had on that day found that the defense of the Soviet Union was "vital to the defense of the United States," and hence that the Soviet Union was eligible for lend-lease aid. Mr. Dawson's book makes a valuable contribution to the history of Soviet-American relations.

JULIUS W. PRATT

Hobart and William Smith Colleges

GEORGE LISKA. *The New Statecraft: Foreign Aid in American Foreign Policy*. Pp. xv, 246. Chicago: University of Chicago Press, 1960. \$5.00.

Under the auspices of the University of Chicago's Center for the Study of American Foreign and Military Policy appears another worthy addition to the notable series of recent volumes. George Liska's study of foreign aid is erudite, insightful, and provocative. It is surely one of the very few really important books on his subject.

The most distinctive element of this study is its focus upon the instrumental nature of foreign aid, including economic assistance, as a weapon in the arsenal of the donor for short-term or long-term security goals. Liska has very little squeamishness about American intervention in the internal affairs of recipient powers; even a "noninterventionist" aid policy is seen to have "interventionist" consequences. Liska's only plea is that "a decent measure of control is more likely to flow from an attitude of detachment than from one of involvement;" "intervention" but not "identification" with those governments or

factions that are, directly or indirectly, being aided is "the beginning of wisdom in foreign aid policy."

I may, as Liska warns, be guilty of "mechanistic thinking" in finding this distinction not completely tenable. And there are numerous other points where he seems to rely more on confident assertion, illustrated by specific episodes, than upon really thorough empirical testing of his hypotheses. But usually Liska's judgment seems to me sound and politically sophisticated—considerably more so than The Proposal by the Massachusetts Institute of Technology group whom he evidently regards as his chief antagonists. Furthermore, Liska has evidently read very widely—one of his most interesting chapters draws intriguing parallels between contemporary foreign aid and previous forms of intergovernmental subsidies from the last three centuries. In all, Liska's study is a notable example of how much an imaginative scholar with a fine analytical mind can accomplish by means of library research, without group efforts or field studies, even in the area of current foreign relations.

Unfortunately the form in which the material is presented sometimes detracts from its logical clarity and readability. In particular, the first and last chapters seem structured in a more aggregated than integrated fashion. But the middle chapters are so meaty that they deserve careful perusal by anyone who specializes in contemporary American foreign policy. Hopefully, many such readers will be inspired to attempt some further empirical testing of Liska's richly provocative insights.

H. BRADFORD WESTERFIELD

Assistant Professor of
Political Science
Yale University

JAMES R. SCHLESINGER. *The Political Economy of National Security: A Study of the Economic Aspects of the Contemporary Power Struggle*. Pp. vii. 292. New York: Frederick A. Praeger, 1960. \$5.00.

Since World War II many American students of diplomacy, modern history, international relations, economics, and poli-

tics have been provided a new focus for their work. That focus is the concept of national security. It is a concept so broad and so vital that it has compelled the re-examination of conventional political and economic ideas and the formulation of some refreshingly new ones.

The Political Economy of National Security takes its place as a most worthy example of this new scholarship. Among its more impressive qualities is its perspective, and yet the breadth of the author's views does not prevent his identification of specific details. Professor Schlesinger sees national security as a most complex phenomenon, and economics is for him but one of several related components of national strength. His selection of facts about productive capacity and economic resources is pertinent, and his objective treatment of them is reassuring to anyone who attempts to establish, say, comparative Russian and American potentials.

He treats accurately and coherently such disparate factors as manpower, taxation, budget allocations, dangers and advantages of autarchy, and both the facts and the concepts of economic growth in Russia and the United States, yet never loses sight of the relation of each factor to national security as a whole. Although the author addresses himself to economics, he sees, as his title clearly implies, that for national security the only economy that matters is political economy. The basic issues are political issues, and his analysis of them is most penetrating. He points out how much the political conditioning of the American mind disqualifies this country for the role it is now called upon to play—our belief, for example, that "stability is the normal course for human relationships," our belief that "wealth is a cure for political ills," our reluctance to "readjust our domestic habits to the demands of national security." He calls for more realism for problems we have been unwilling to face—the necessity of a greater budget allocation for security purposes—as well as for developments we have unduly feared, such as the exaggeration and the meaning of Soviet economic growth. His analysis of the political and economic costs and values of American aid to underdeveloped countries

should give both the skeptic and the sentimentalist much to think about.

A long review of Professor Schlesinger's book could find some statements of fact and some implications of policy to criticize; a short review can only express appreciation for a first-rate work of analysis and for an informative treatment of a very complex problem. The quality and workmanship of this book deserve the gratitude of scholars and the attention, hopefully, of government officials responsible for national policy.

MURRAY DYER. *The Weapon on the Wall: Rethinking Psychological Warfare*. Pp. xxi, 269. Baltimore, Md.: Johns Hopkins Press, 1959. \$6.00.

This book should be read under the shadow of a U-2. It also goes well with a speech by Fidel Castro or Nikita Khrushchev.

It is a straight-talking, straight-thinking consideration of where we stand in the ideological struggle of our time and what we can do about it. Of all the books written on our national propaganda program, this is the freshest and, on many points, the most insightful.

Dyer, who worked for Office of War Information (OWI), the Associated Press, the Columbia Broadcasting System, and the National Broadcasting Company, once taught at the Japanese Naval College, and wrote this book while a member of the Operations Research Office of Johns Hopkins, goes right to the heart of the matter. He says that Americans have never understood how to use the force of fact and idea in the present world. To clear our heads of the military limitations of "psychological warfare," the unsavory connotations of "propaganda," and the neuterness of "information," he suggests a new term: political communication. This is not limited to a shooting war. It is not anything a citizen of a democracy need feel ashamed of doing, and it is conceived of as a fourth arm for attaining national objectives; the others

are diplomatic, economic, and military. Dyer's discussion of what political communication should be in a nation like this is one of the illuminating sections of his book.

Most of his book, though, is concerned with the problems of attaining an adequate program of political communication. The volume was delayed sixteen months while it was passing through government clearance committees, and the reason is not difficult to guess: it stepped on the toes of very large federal agencies. He was telling, with as much frankness as was permitted him, the sickening story of the battle between the agencies over who should do what in psychological warfare.

Dyer feels that even if the program should logically be run by one of the present agencies, the interagency battles of the last fifteen years have now made that impossible. Therefore, it must be administered in the Office of the President. The President himself must take leadership. Chiefly he must lead the government in the belief that, just as state and defense are significant and vital, so is political communication an imperative and key activity. Dyer rightly says that this sort of attention will overcome countless barriers that have stood for years in the way of the program.

He suggests that the President have a co-ordinator in his office to ensure that the whole policy of the nation is expressed. An agency under the control of one of the great federal departments, Dyer argues, could hardly be expected to rise above the politics of its department after the "give-and-take" of determining policy. This suggestion will surely be resisted strongly because of earlier experiences with super-agencies and co-ordinators. His other recommendations are less controversial. Among them are a national college of political communication, to raise the study of this subject "from training to teaching," and a permanent joint congressional committee on political communication, parallel to the Joint Committee on Atomic Energy.

But none of these devices will yield results, he insists, without "national leadership that can light up the premises behind a free people" and "action governed by those premises." Then "active, militant

political communication" will acquire significance.

ASIA AND AFRICA

GABRIEL A. ALMOND and JAMES S. COLEMAN (Eds.). *The Politics of the Developing Areas*. Pp. xii, 591. Princeton, N. J.: Princeton University Press, 1960. \$10.00.

The study of comparative government has hitherto been confined to the major powers, most of which were located in Europe and America. Thus each state could be viewed as a unique product of social, economic, and ideological forces over a period of centuries. The minor powers could be regarded as variants upon the major themes of the development of forms of government—the transition from feudal monarchy to democracy. The countries of Latin America were potential democracies which had failed to fulfill their ambitions. Asia and Africa contained few independent states, and these were anachronistic survivals often teetering between tyranny and anarchy. The rest of the world was safely under Western tutelage and might, conceivably, begin to take the first steps along the road that would lead to responsible self-government.

The fifteen years since 1945 have changed that concept of the world. There are now some 100 states in existence or about to be created. They cannot be ignored, and it cannot be assumed that their highest ambition is to imitate their favorite Western power.

We need to know the political problems of the developing areas. Yet it is obvious that the traditional approach to comparative government has limitations. No doubt it is possible and necessary to have students of politics who have some knowledge in depth of the language, history, and outlook of the people of Laos or Ghana or Liberia. But there is a danger that each

specialist may be so convinced of the uniqueness of 'his' chosen country that he will be unable to understand the wider issues that concern all or most of these countries. Obviously it would be a vain hope to expect to find an expert who would be equally competent to discuss more than a handful of such states.

Messieurs Almond and Coleman and their collaborators, Lucian Pye, Myron Weiner, Dankwart Rustow, and George Blanksten, have attempted to meet this difficulty in two ways. Firstly they have propounded an analytical framework of concepts and standards of evaluation. Secondly they have invited five area experts to apply this theory to the groups of countries that they know best.

This is a pioneering work and, as such, it is hardly surprising that its quality is somewhat uneven. Each of the discussions of the five areas contains valuable and original insights, especially those dealing with South Asia and the Near East, though this preference may well reflect the bias of this reviewer. But their merit seemed to increase the farther they departed from the theoretical basis set forth by Mr. Almond. For the theory is largely divorced from history. Each state is presented for classification as it stood at the moment of writing. Thus Mr. Coleman groups Ethiopia and Liberia in one category; and, among others, Mauritania, Ghana, Gabon, and the Sudan in a second; Sierra Leone, Uganda, and British Somaliland in a third; and Kenya and the Belgian Congo in a fourth.

Those political scientists who rely heavily upon social anthropology have often criticized writers who rely on history and law for their undue formalism. But Messieurs Almond and Coleman seem to be producing a formalism of their own which is the more rigid for its attempt at logical rigor. Happily most of their contributors have declined to be confined to their procrustean bed.

RUPERT EMERSON. *From Empire to Nation: The Rise to Self-Assertion of Asian and African Peoples*. Pp. x, 466. Cambridge, Mass.: Harvard University Press, 1960. \$7.75.

"At this uncertain point in history no definitive answer can be given to the question whether the nationalism of Asia and Africa will turn out to be a blind alley, leading nowhere except to ultimate disaster, or the path leading toward internationalism which nineteenth-century liberalism proclaimed nationalism to be" (p. 396). Thus, Professor Emerson, fundamentally in sympathy with the newly emerging nations' desire to make a successful transition from colonial status to self-government, expresses his doubts as to the likelihood of a life without travail for them.

Roaming the world for illustrative material, he cites the pitfalls they face. Who is to speak for the nation? Will the abolition of colonial rule see the triumph of the old tribal chieftains or the westernized intellectuals? At what point should self-determination stop in order to avoid fragmentation? What effects will rising populations, limited land resources, a shortage of capital and skills, pressures for social welfare, unresolved problems of irredenta and so forth, all in a cold war setting, have upon these lands? Professor Emerson does ask most of the pertinent questions.

While his work is not exceptionally novel, it does in intelligent fashion deal with fundamentals, constituting a good synthesis of the problems of postimperialism. The first four and last five chapters seem most rewarding. It is not to be expected that one will agree with all of his views, for example, the minimizing of colonial issues as factors in World War I (p. 23), but, on the whole, he couches his ideas with sufficient qualification to create the impression of judicious evaluation. He can deftly puncture the hypocrisy of the imperialist's rationalizing and as readily highlight the illusions of many anti-imperialists.

For the most part he is sufficiently skeptical not to be oversanguine regarding the prospects for the future. He thinks there will be many more "strong-man" governments, and though favoring financial aid

to underdeveloped areas, cautions against expecting quick or easy progress. A broader discussion of economic problems might have replaced or supplemented the overly extended six chapters on The Anatomy of the Nation.

The book gives evidence of wide-ranging knowledge and displays perceptive analysis, though one or two of his examples may fall into the category of arbitrary selection. In a style that is academic but not dull, he has written a good book—and as with many good books, both beginners and experts will find value in it.

WALLACE SOKOLSKY

FRANK N. TRAGER (Ed.). *Marxism in Southeast Asia: A Study of Four Countries*. Pp. 381. Stanford, Calif.: Stanford University Press, 1959. \$7.50.

A study of the penetration of Marxism into Southeast Asia is certainly needed, and the authors of this work are to be complimented for undertaking so ambitious a project. Their book is divided into background chapters devoted to the historical development of Marxism in four Southeast Asian nations and two analytical sections contributed by Professor Trager. In the historical part, John Seabury Thompson has contributed a balanced and lucidly written account of the development of Marxist ideas and movements in Burma, while Milton Sacks provides a long-awaited history of Vietnamese Marxism which adds much to our knowledge of the Viet Minh's intellectual roots. Jeanne Mintz' chapter on Indonesia is balanced rather unsteadily between a history of Indonesian communism and a general survey of the political situation in that country, an unevenness which owes much to the difficulty of dealing with an area in which nearly every political movement has been influenced by Marxism. David Wilson faces the opposite problem in handling Thailand where no measurable Marxist influence has been felt; he has met it with a highly stimulating analysis of Thai society in terms of its receptivity to Marxist ideas, an approach which is most welcome since, while we are

beginning to acquire a literature on how Marxist movements have grown in Southeast Asia, few writers have scratched more than the sociological surface in explaining why they have arisen.

Professor Trager's contribution on "The Impact of Marxism" is the keystone of this work; it is therefore unfortunate that it is also the weakest part and that his efforts to generalize for the entire Southeast Asian area result more often in oversimplification than in insight. A major stumbling block for the reader is the author's inconsistency in his use of the term "Marxism"; sometimes it appears as a body of ideas, sometimes as an organized movement; sometimes it seems identical with communism, and at other times it may include the social democrats and even some nationalists. Perhaps the major objection, however, is that Professor Trager divides Southeast Asian politics into categories which are both limited in scope and Western in origin—a compartmentalization which leads him to the curious conclusion that throughout Southeast Asia a three-party system of government is developing which will result in the establishment of a tropical version of Swedish social democracy.

RUTH THOMAS McVEY
Cornell University

J. H. BRIMMELL. *Communism in Southeast Asia: A Political Analysis*. Pp. ix, 415. New York: Oxford University Press under the auspices of the Royal Institute of International Affairs, 1959. \$6.75.

Increasingly students of modern Asian affairs have concerned themselves with the variable phenomena associated with Marxism in Asia. Whatever calm there may be in the writing of their texts there is a sense of urgency in the topic. This has been accentuated, if not created, by the successes of the Communists in China, North Korea, North Viet Nam, their clear cut linkage with the Soviet Union and its satellites, and their combined threat to the rest of Free Asia. Obviously, whatever is learned about Communist Marxism in this Asian setting has practical significance for counterpoising policies and programs.

The immensely important concern with Chinese communism—a true descendant of Marx, through Lenin and Stalin—must not be allowed to absorb our exclusive attention. For Marxism, ideologically and otherwise in both its Communist and Socialist garbs, has been, according to Brimmell, if not "the" most dynamic influence in the area, at least one of the most potent influences in Southeast Asia since World War I.

Communism in Southeast Asia has the merit of recognizing both the extent of the canvass to be examined and its roots in an aggressive, missionizing ideology which first came to Asia largely under the inspiration and leadership of Lenin. Brimmell offers a history and analysis of this Leninist version of Marxism up to 1958 as it affected the countries of Southeast Asia, that is from Burma to the Philippines. It is most important for us to note that though the indigenous and emigre followers of Lenin, Stalin, and latterly Mao Tse-tung have tried armed rebellion, infiltration, subversion, and every other device in their arsenal, they have failed except in North Viet Nam to establish their control in any country of the Southeast Asian region. But they continue to try, and, therefore, it is, to say the least, prudent for us to learn about their trials and errors. We may not have too many chances in the future. The time we now have has been bought initially and in significant degree through the awakening, understanding, and effort of indigenous Nationalist Southeast Asian leaders.

Communism in Southeast Asia is useful for all readers concerned with this problem. The general reader will profit from some of the author's swiftly paced political summaries, for example, on the conditions in these lands as colonies which promoted Asian nationalism (pp. 169–175). Specialists in the area will reject or question various data offered by Brimmell, for instance, his treatment of the origins of the Burma Communist party and of the Burma Nationalist organization, the Anti-Fascist People's Freedom League (pp. 117, 121, 155, 157, 186). Many Americans will be justifiably annoyed by what amounts to a form of British anti-American stereotypy (p.

391 ff.). Despite these criticisms the book is evidently as worth having as it was worth writing.

WALTER RUBEN (Ed.). *Die Ökonomische und Soziale Entwicklung Indiens: Sowjetische Beiträge zur Indischen Geschichte*. Pp. x, 308. Berlin: Akademie Verlag, 1959. DM 22.00.

This book contains a collection of eleven papers by various Soviet authors on the social and economic history of India, mostly since the onset of British rule. Only two essays deal with the pre-Muslim and Muslim period. The papers vary greatly in quality, and one or two are extremely poor and seem to have been included mainly for their ideological undertone.

The underlying purpose of all papers is to show that India since the eleventh century has passed through a period of "feudalism," which by the end of the nineteenth century gradually came to be replaced by "capitalism." Moreover, the attempt is made to show that the "lower forms of capitalist enterprise" are gradually losing out to the factory, that is, the cottage industries and small enterprises tend to be replaced by larger firms. In brief, the papers in this book are designed to clarify the Marxian theory of capitalist development, and this framework clearly stands out—including especially Marxian terminology as well as numerous references to often unrelated works of Marx and Lenin.

If we disregard the statements of doctrine and the special Marxian terminology, we have—except for a few papers—a number of quite competent essays on recent economic history of India. The sources used by the Soviet authors are the same as those employed by Western scholars: they are mostly settlement reports, accounts of travelers, parliamentary papers, district gazetteers, and documents of the East India Company. Of course, the data extracted from these sources by the Soviet

scholars are designed to show the nature of feudal, and particularly capitalist, exploitation of the Indian peasants and workers by the landed aristocracy and the industrial and financial bourgeoisie.

This book is an interesting example of Soviet historical writing, at about the end of the Stalinist era. Though it is, on the one hand, infested with a strong doctrinaire bias, it presents, on the other, a host of interesting and well-documented data from Indian economic history and draws attention to some otherwise little explored aspects of the Indian economy mainly in the eighteenth and nineteenth centuries. In particular, the discussion of village communities in Maharashtra in the early nineteenth century, the early phases of the *zamindari* system under the East India Company in Bengal, and the problems of tenancy relations in Tamilnad in the interwar period repay study. Anyone who reads German with some ease will find it interesting to browse in this book, in part for the substantive problems discussed there, and in part to examine the way in which orthodox Soviet historiography deals with the economic history of an underdeveloped country of Asia.

BERT F. HOSELITZ
Professor of Social Sciences
University of Chicago

K. P. BHAGAT. *A Decade of Indo-British Relations, 1937–47*. Pp. xv, 521. Bombay: Popular Book Depot, 1959. Rs. 25.00.

The last decade of British rule in India was one of great importance in forming and hardening the political conditions that have prevailed in India since 1947. The period encompassed the inauguration of the 1935 Act, the experimental provincial governments (1937–1939), wartime politics, the rapid rise of the Pakistan demand; finally, partition and independence. Professor Bhagat has addressed himself to an analysis of this crucial period.

Unfortunately, the author has not contributed much to a better understanding of the decade. Relying heavily on the admirable series of "Annals" edited by N. N. Mitra, with scattered additions of evidence from a number of other standard

sources, Professor Bhagat has outlined in tiresome detail, and with hundreds of truncated quotations, a week-by-week review of the critical political issues of the times. As a reference, the book is not always reliable; the analysis and interpretation are lacking in insight and objectivity. For one case, the Pakistan issue is not fairly treated, unless one accepts the official Congress stand uncritically.

For some curious reason, the phrase "... it was this dynamic nationalism which was one of the most potent factors that demanded British withdrawal from India ..." (p. 37), or paraphrases of the same thought, reappears in the book over thirty times by my count—repeated three times on page 62 alone! There are several other similarly questionable clichés that, used over and over, tend to round out this 521-page book.

This book represents a serious attempt by an Indian scholar to use careful techniques of documentation and footnoting, no doubt impressed on him in his graduate training in the United States. There is nothing wrong with these techniques, properly used. But content, insight, and relevance surely must come first. Despite the enormous amount of work that appears to have been poured into the preparation of this study, the result cannot be commended.

The Index is generally good, as is the organizational layout of the book. Typographical errors abound.

RICHARD L. PARK

Associate Professor of Political
Science
University of Michigan

FRANK MORAES. *The Revolt in Tibet*. Pp. 223. New York: The Macmillan Company, 1960. \$3.95.

This book is one of the best popular descriptions of the Chinese subjection of Tibet during the period from 1950 to 1959. The author, an Indian journalist and scholar who is well known for his books on Mao's China and on Nehru, combines in this well-written book the documentary evidence of treaties and agreements with the personal accounts of participants including that of the Dalai Lama himself.

The book begins with an account of the flight of the Dalai Lama from Lhasa and then deals with the historical background of Sino-Tibetan relations and of India's role in the present tragedy of Tibet. It is interesting because of the critical view taken by an Indian observer of Nehru's actions and policies.

In discussing the Indian responsibility for the seventeen-point agreement which the Tibetans were forced to sign in 1951 and the agreement between India and China of 1954, the author points out the inconsistency of Nehru in claiming that he had to follow the British acceptance of Chinese suzerainty or overlordship over Tibet without insisting on any practical guarantees for Tibetan autonomy. For Nehru there was no difference between sovereignty and suzerainty, and he was most vague about the legal consequences of Chinese control which according to him had existed unchallenged over the last several hundred years. By accepting in the treaty of 1954 the Chinese phrase "the Tibet region of China" Nehru had gone far beyond anything the British had ever recognized and thus, in the author's view, not only accepted what actually was a British "imperialist" concept but had given away, without consulting the Tibetan government, any legal basis for challenging China's breach of the treaty she had signed with Tibet.

One weakness of this most informative book may be found in its organization. The author changes from accounts of present events to descriptions of history and back again. Material on events in Tibet alternates with material on foreign relations. The author is forced into repetitions and cross references that interfere with the continuity of the story.

A more serious shortcoming of the book may well be the author's misreading of the doctrinal past of Chinese communism and of the relationship between Communist China and the Soviet Union. He shares with many others the mistaken view of Mao Tse-tung's doctrinal heterodoxy and of the alleged special role of the peasants in the Chinese Communist revolution, a myth that seems to die hard. From this mistaken view of Communist China's dif-

ference the author is led to the belief in a Soviet fear of Communist China and to the idea that "it is in Soviet Russia's interest that Asia should not be made Communist too quickly. If India has been disillusioned about peaceful coexistence with Communist China, the disillusionment with the faith in the more peaceful approach of Soviet Russia and in the conflicting policies of the two Communist powers may yet have to come.

SIAO-YU. *Mao Tse-tung and I Were Beggars*. Pp. xviii, 266. Syracuse, N. Y.: Syracuse University Press, 1959. \$6.00.

Siao-yu (Siao Shu-tung), a Chinese emigré academician now living in Montevideo, was a schoolmate of Mao Tse-tung after the latter entered the First Normal School in Changsha in 1912, and an intimate comradeship was maintained between the two until 1921 when Siao-yu rejected Mao's invitation to attend the founding session of the Chinese Communist party. Both were co-founders of the New People's Study Association, a main nucleus of the eventual Chinese Communist party, in Changsha in 1914; and both were active in the student-worker study program under which progressive Chinese studied in France after 1919. This charming book consists of Siao-yu's autobiographical reminiscences of his friendship with Mao and his reconstruction of the innumerable conversations between them on a large variety of subjects—on politics, morality, personal affairs, and the situation in China just prior to the organization of the Communist party. It may be read for pleasure as a literary achievement in its own right, but its prime importance arises from the fact that it constitutes a significant body of original source material concerning the personal life and ideational development of Mao Tse-tung as a young man between nineteen and twenty-eight. Siao-yu has reconstructed long conversations from memory—"my memory is one of my most precious gifts," he remarks with pride—

after a lapse of more than forty years, and consequently his reporting might be impeached on many matters of detail; yet the story he tells is generally compatible with what little is known of the subject from other scanty sources of information, and the Mao Tse-tung who emerges from these pages becomes an entirely credible Chinese personality.

The title of the volume is derived from a single episode in their long friendship. In the summer of 1917, when Siao was a teacher at Ch'u Yi School in Changsha and Mao was still a student at the normal school, the two decided to travel afoot in Hunan Province as simple beggars—panhandling for meals and lodging, writing poems and inscribing mottoes in return for small-change, and visiting with former schoolmates—in order to learn about the countryside and experience the life of the beggar (pp. 76-164). The comrades discussed their personal problems, and at meals and abed talked about the wide range of topics that might have engaged the interest of any two bright, thoughtful, and perceptive young men. More directly valuable for the purposes of history is Siao's reporting about the affairs of the New People's Study Association and the student-worker movement, as precursors of the Communist party, and about the young progressive or revolutionary leaders of the time. Nearly every important figure in the early history of the Communist party, including several who have survived the years, finds mention or characterization in these pages. Robert C. North's excellent "historical commentary and notes" (pp. 209-253) correlates Siao's reporting about Mao with the material previously supplied by Edgar Snow and Emi Siao, Siao-yu's Communist brother, in their own biographic interpretations of Mao Tse-tung, so that the book comes to incorporate nearly everything we know about Mao's early years.

Los Angeles

PING-TI HO. *Studies on the Population of China, 1368-1953*. Pp. xviii, 341, xxxii.

Cambridge, Mass.: Harvard University Press, 1959. \$6.00.

Every few years we have seen some contribution to the study of China's population and its historical development. This book is the broadest in scope available in Western languages. It also contains the most thorough examination of the problems that are involved.

More than one-third of the text describes the records of population in China from the beginning of the Ming dynasty; and a chapter reviews the data on land utilization. A chapter is devoted to interregional migration during this period; and one each to changing patterns of land utilization, "other economic and institutional factors" affecting population, and "catastrophic deterrents." A conclusion draws together many of the earlier points, and Appendixes summarize some of the official data on population growth, changing geographical distribution, food imports, and a remarkable series of natural calamities recorded in Hupei Province. The text is documented copiously, though not always authoritatively on demographic topics.

The author very ably explains the strange implications of these population records when treated as statistical data. The numbers have different meanings at different times and places in Chinese history. He demonstrates that these figures do not represent an aggregate picture of the Chinese population. From this it would seem to follow that the attempt to fix its size and measure its growth is ill-advised. Having convinced us on this point, however, the author proceeds to make the attempt, as has been done many times before. This demographic effort, which is a major part of the book, is its weakest portion.

The more significant part is the discussion of the factors bearing on historic population growth in China, particularly as related to political institutions. The careful reader can find additional material on this point even in the early chapters on the nature of the population records which contain the most thoughtful review of the administration of these records yet available. It seems a pity that these factors could not have been made the main object of the study and that the high level of

effort and skill squandered on assembling aggregate figures were not spent more judiciously on the institutional factors—perhaps in a detailed exploitation of certain local histories. As it is, these subjects are treated rather lightly.

GEORGE W. BARCLAY

White Plains, N. Y.

MINORU SHINODA. *The Founding of the Kamakura Shogunate 1180-1185*. Pp. xii, 385. New York: Columbia University Press, 1960. \$7.50.

Until this present volume appeared, no one book in a Western language was devoted to a detailed treatment of the founding of shogunal power, organized feudalism, in Japan. In fact, but little interest has been manifested by Western writers for the source materials necessary for such a study, one of which is the *Azuma kagami* [Mirror of Eastern Japan], a semiofficial history covering the years 1180-1266. Mr. Shinoda's study, which concentrates on the so-called "Gempei War" (1180-1185), is based on this source. The *Azuma kagami* was compiled by the Kamakura shogunate itself and "proposes to present largely the point of the [sic] view of the founders." Biased it may be, but its study does much to clarify the aims of those who established the new, nonimperial power in eastern Japan. In Part II, which constitutes roughly half of the volume, the author has provided a translation of five of the fifty-two chapters of this principal source. He constantly refers to this translation in the Footnotes of Part I.

Doubtless written at the end of the thirteenth century, the *Azuma kagami* is a chronological record of the shogunate in diary form. Since the Nara period (710-794) "official histories" had regularly been compiled and the *Azuma kagami* was meant to be of this type. It is written in an irregular and unorthodox *kambun*, and would seem to indicate that the warrior class responsible for the compilation was unfamiliar with this sort of writing. Its reliability as a historical source has been questioned, for besides incorporating house records of certain military families and those of religious establishments, it also

relied on the imaginative war romances to complete its account. "However, the reliance is far from excessive and it is more or less limited to details of the military campaigns and battles fought in Western Japan. Moreover, these historical romances as well as the other works drawn on by the editors were themselves primary sources, and hence their use by the editors to supplement shogunate materials—far from diminishing the reliability of the *Azuma kagami* as a historical source—has enhanced its over-all value." A more serious charge is the bias shown for the Hōjō family.

In Part I, Mr. Shinoda not only carefully draws the over-all picture of the crucial years between 1180 and 1185, but he is at pains to sketch the full background of feudal institutions: *shōen*, local lords, the evolutionary character of the founding. His discussion of the Gempei War is detailed; to some it will appear overly so. Mr. Shinoda's book can be used as a detailed complement to Sir George Sansom's fine general treatment of this period in *A History of Japan to 1334* (Stanford: Stanford University Press, 1958).

E. DALE SAUNDERS

Assistant Professor of Japanese
Studies
University of Pennsylvania

KAZUO KAWAI. *Japan's American Interlude*. Pp. vii, 257. Chicago: University of Chicago Press, 1960. \$5.00.

This is an important study of selected controversial aspects of the Japanese reactions to American influence during the Occupation period. Its author was editor of the *Nippon Times* during World War II and the Occupation. He holds a doctorate in political science, and his experience includes eighteen years of teaching at American universities. To these qualifications for knowledge of his subject he adds a lucid literary style and a scholarly concern that accomplishments as well as failures shall be recognized. His book is based primarily upon his own notes and editorials, but he acknowledges aid to focus and perspective obtained from writings enumerated in his Bibliographical Notes.

He begins by examining possible reasons for the unexpected early passivity and the subsequent co-operative spirit exhibited by the Japanese people. His own explanation derives from their "situational ethics" combined with the consideration shown by the Supreme Commander for the Allied Powers (SCAP) administration. After pointing out that a background for democratization already existed in Japan, he proceeds to deal with the major features of the ambitious reformist program, those relating to the constitution, the Emperor, political reorganization, the location of political power, big business, labor, agriculture, economic recovery, education, and social change. His analyses and observations are fresh and thought-provoking. Without overloading his treatment with references to personalities, incidents, and other data already dealt with in earlier studies, he adds to our knowledge and contributes to our understanding. Political scientists will find especially helpful his ideas on the increasing deference of the bureaucracy to the political parties, the resultant improvement in the power-position of the Diet, the growing influence of younger, locally supported political novitiates as opposed to machine bosses, and the lag in popular appreciation of local self-government. Economists will value his clarification of the prewar attitude of opposition of the great trusts toward militarism, his explanation of the political maneuvering of the labor unions, and his answer to the population problem: more industrialization and more export trade. All readers will find his treatment of the socialistic bent of the university faculties instructive, though to this reviewer he overstates their ivory-tower Marxism and gives too little attention to their desire to see Japan free to develop her own foreign policy. He reserves his severe strictures for the Occupation's inane educational reforms, noting justly that they set up for Japan a uniform system which is being discarded in the United States.

HAROLD S. QUIGLEY

Professor of Political Science,
Emeritus
University of Minnesota

EUROPEAN GOVERNMENT AND HISTORY

CARL LANDAUER in collaboration with ELIZABETH KRIDL VALKENIER and HILDE STEIN LANDAUER. *European Socialism: A History of Ideas and Movements from the Industrial Revolution to Hitler's Seizure of Power* (Volumes 1 & 2). Pp. xviii, 1179; ix, 1193-1894. Berkeley and Los Angeles: University of California Press, 1960. \$20.00.

Recent books on socialism have been unusually bulky. The work edited in 1952 by D. D. Egbert and S. Persons on *Socialism and American Life* comprised two volumes of almost 1400 pages; only in 1958 G. D. H. Cole concluded a six-volume set of the *History of Socialist Thought*; and now we have C. A. Landauer's almost 2000 pages on European socialism.

It seems as if now, when socialism has lost much of its former vigor and appeal, and has been replaced by communism in eastern Europe and parts of Asia, and suffered apparently permanent setbacks in the countries in which capitalism has been successful, extensive post-mortems on socialist policies and socialist political movements have become the vogue. The particular formula which Landauer has developed appears to perform this function best. At the beginning he concentrates on European socialism, notably in western Europe, and still more specifically the socialist movements in Germany and France. These were the countries in which most of the new ideas, parties, factions, and sects in the socialist camp flourished and grew. Secondly, Landauer devotes the bulk of his account to the events since 1890, that is, since the revival of the socialist movement in the Second International. Whereas before 1890 socialist parties were either outlawed or existed only on the fringes of Europe's political structure, after that date these parties were the organized representatives of mass movements which increasingly became eligible for participation in government. Hence the story of socialism as a movement—in contrast to the history of socialist thought which had its most important development in the first half of

the nineteenth century—enters into its most significant phase after the turn of the twentieth century.

The consequence of this is that Landauer's book, though designed to deal with both ideas and movements, contains much more material on the latter than the former. Thus, in principle it becomes a history of the socialist movement, chiefly in continental Europe, in the period from about 1890 to the outbreak of the second world war. And since Landauer was, for a significant portion of this time, a close observer of and an active participant in the European socialist movement, some of the history described in the book is an account of events which were personally witnessed or closely followed at the time of their occurrence by the author.

Though the two volumes concentrate on events which have been treated before by historians, the work presents a new and refreshing approach. Landauer has remained a social reformer and democratic socialist, and this philosophy permeates the pages of the book. But there is no distortion of viewpoint, and the valuations of the author are apparent more by the selection of facts discussed than any conscious partisanship or bias. Even the discussion of the rise of Nazism and fascism is an orderly account of social and political developments, rather than an emotionally or politically inspired story. The book tries to demonstrate and to instruct rather than to blame or to praise. The outcome is a lively and reliable account of an important piece of recent European history, and since the author conscientiously sticks to the topic he has selected for analysis, special emphasis is placed on events and episodes which were of crucial significance for the development of socialist movements and parties and which, in spite of their intrinsic interest and importance, often found only scanty treatment in general histories. Hence—to select only a few cases—such points as the details of political developments in Bavaria after the end of the first world war, the relations between the German Center party and various rightist elements, or the internal struggles in French left parties and labor unions, events which in the long run were of profound political

importance for Germany and France—are placed in their accurate political-historical perspective. The value of the book is enhanced chiefly in that it does provide, because of its focus and the philosophy of its author, an important supplement to much of the general social and political historiography of Europe in the first half of the twentieth century.

A brief comment should be made on the last chapter of the work, entitled "Socialist Theory in the Twentieth Century." Whereas the remainder of the work is primarily devoted to the discussion of socialist movements, this chapter is limited to an exposition and critical evaluation of ideas. As such it constitutes a concise discussion of post-Marxian economic theory, and it summarizes some of the best German economic writing in the period between 1890 and 1914. The high intellectual level and the profound moral earnestness of this post-Marxian economic and political theory contribute greatly to an explanation of why so many members of the European intelligentsia were attracted to socialism.

The book has a Bibliography of almost thirty pages and two excellent and detailed Indexes which enhance its usefulness as a work of reference.

PETER G. RICHARDS. *Honourable Members: A Study of the British Back-bencher*. Pp. 285. New York: Frederick A. Praeger, 1959. \$5.00.

Parliamentary government in Britain has undergone a profound change during the past hundred years. It is still formally true to say that the Prime Minister and members of the Cabinet hold their offices only for so long as they have the support of a majority of the House of Commons, but it would be most misleading not to add that, in the conditions of the modern totally disciplined party system, it is almost inconceivable that this majority should be lost except as the result of a general election. At the general election of 1959 the Conservatives won most of the seat -- there is a Conservative gov-

ernment, supported by a majority which can be expected to vote solidly for the present government no matter what it does. It seems, then, that the function of the majority of members of Parliament is to give the Government automatic support, while that of the minority is to offer criticism which can always be swept aside. "Lobby-fodder," "sheep"—these and similar terms are currently applied to members of the House of Commons, and the use of these terms is not altogether unjustified.

Perhaps the most important fact which emerges from Mr. Richards' very thorough and well-directed inquiry is that, although members of the House of Commons vote like sheep, voting is no longer their real means of self-expression. Of the 365 Conservative members elected in 1959 about fifty hold some office in the Government, and the others vote faithfully, as they are instructed, for all the Government's policies. However, they exercise a real and substantial influence, both as individuals and collectively, on the formation of the Government's policy, both in principles and in detail. The medium of their influence is partly public, through speeches and questions on the floor of the House, partly private, through expressions of opinion in the ever more important private party committees which correspond more or less with the main executive departments, and partly personal, through their constant daily contacts, as individuals, with individual ministers during the long hours which all must spend in the Palace of Westminster. There is reason to call this the best club in London, and once a man has received his first appointment to the lowest rung on the ladder of ministerial office, his chances of promotion depend in part on the impression he makes on his fellow members, not only those of his own party, but those of the Opposition too.

Mr. Richards produces a great quantity of highly significant new information as well as some very welcome statistical tables, though some of these could with advantage have been a little more comprehensive. He presents a clear and well-balanced picture of the contribution of back-bench members of Parliament to the British political process, and he shows how

it is that despite strictly controlled voting, many of them nevertheless have a part to play on behalf of interest groups, regardless of how much these groups may tend to exert their influence directly on the members of the executive departments.

If there is any flaw in the picture which he presents it is that it may perhaps slightly overemphasize the role of the backbenchers in the formation of governmental policy, in legislation, and in administration. This is perhaps just as well, because there is need for a corrective to the current exaggeration of the contrary. This book is a strictly political analysis—its value will be greatest for those who have already some knowledge of the basic theory and practice of British government and parliamentary procedure.

ARNOLD KRAMISH. *Atomic Energy in the Soviet Union*. Pp. x, 232. Stanford, Calif.: Stanford University Press, 1959. \$4.75.

After World War II, the United States and Great Britain issued comprehensive reports on the development of their atomic energy programs and subsequently supplemented them by period progress reports. The author, a member of the research staff of The RAND Corporation, sets out to supply similar information for the Soviet Union. He has screened many thousands of issues of Soviet newspapers and technical journals for this purpose. He has succeeded in giving the general reader a full, revealing, and stimulating account of past Soviet atomic energy research and its future aims.

The author shows that Soviet nuclear research started in earnest in the decade after 1920 and that, by 1940, it was evident "that in theoretical ideas and in knowledge of experimental techniques Soviet scientists were equal to their counterparts in the West" (p. 21). They scored a remarkable number of "firsts": Among other discoveries for which they are justified in claiming priority, they were the first

to observe the flight path of cosmic rays (p. 6), the first to observe a laboratory nuclear reaction caused in bombardment by cosmic particles (p. 7), the first in Europe to use a cyclotron (p. 19), and they were the first, in 1940, to obtain conclusive proof of the spontaneous fission of uranium (p. 28).

Contrary to the United States and Great Britain, the Soviets, in June, 1941, almost completely stopped their atomic research and concentrated instead on problems of immediate urgency. The author suggests a number of reasons for this decision and emphasizes that "there is a good deal of evidence that the Soviet political leaders did not become fully aware of the military aspects of nuclear energy until it was too late for them to transform their large-scale research effort into a development and production program" (p. 36).

In 1943, Soviet scientists resumed their research, and in November, 1947, Molotov could state that the Soviet Union knew the secret of the atom bomb. In 1949 the Soviets exploded their first atomic weapon and in 1953 their first hydrogen device, and they were the first to start work on the H-bomb (p. 127). In 1949 Soviet scientists commenced work on the peaceful use of atomic energy and put the first atomic power plant which delivers electric current into operation (p. 144).

My main impressions, after reading this valuable book, are: first, Soviet espionage seems to have played a smaller part in their advance in nuclear physics than is commonly assumed; second, Soviet scientists would have been capable of developing the atomic bomb during the last war and had they done so, the years after 1945 might have been less peaceful for the West; third, further advances in controlled thermonuclear research are likely and, as the author points out (p. 209), "the Soviet Union stands a very good chance of establishing further thermonuclear guideposts of political and technical significance."

Gerrards Cross
Bucks, England

U. W. KITZINGER. *German Electoral Politics: A Study of the 1957 Campaign*.

Pp. ix, 365. New York: Oxford University Press, 1960. \$7.20.

This study of the 1957 West German Bundestag election is dubbed by its author "as being of the Neanderthal variety" and "sets out to be no more than one observer's very personal impressions corroborated or modified by the observations of colleagues with more detailed knowledge of the campaign in certain areas of the Federal Republic." It seeks, as the author tells us, "to continue the series of Nuffield election studies which has now been carried on for twelve years."

Clearly the author is a modest man, and his accomplishments in the book demonstrate at least that he has learned a lot of German politics in a very few years. In fact, in addition to presenting an excellent analysis of the strategy and tactics of the campaign, not to mention its various detailed facets, Mr. Kitzinger has particularly distinguished himself in a number of chapters, for instance Chapters IV, X, and XIV which deal with the process of selecting candidates, campaign finance, and voting behavior. Here for the first time in English we have a good explanation of the German nominating procedure. True, it is not a thorough analysis of all the contests, but as the author correctly says "a sketch of the patterns that seem to have emerged." Similarly, the very sophisticated discussion in Chapter X, together with a detailed Appendix of campaign expenditures, is a very helpful contribution.

Elsewhere in this very readable and useful volume, the author illuminates other dark corners of German politics to give a complete picture of the 1957 election. For instance in the explanation of party mergers and alliances, of the influence of the churches, trade unions, and other interest groups, and in the analysis of campaign media, the author is clear, precise, and adequate. To be sure, any important election deserves and could include more than one brief volume. Actually an earlier German study of the 1953 election is nearly twice as large as the present one under review. But in *German Electoral Politics* the reader is given a reasonably intensive and inclusive analysis of this crucial Ger-

man election of 1957 which adds luster to the long list of Nuffield College election studies and brings great credit to the author and his few collaborators.

The book includes, in addition to the special Appendix on campaign expenditures mentioned above, three illuminating, detailed studies of local constituencies: one from Lower Saxony, one from Bavaria, and one from the Rhineland. These analyses add depth and local color and detail to the over-all review.

The author concludes his study of the election by pointing out that it was the usual nonvoter who voted in 1957 who "gave the Government its resounding victory" and that "C.D.U.'s absolute majority of votes was won only with the help of the postal voters." Making good use of the rich German electoral data, without exhausting it, and observing electoral phenomena very acutely, Kitzinger has given us a welcome and quite indispensable contribution to an understanding of politics in the Federal Republic.

JAMES K. POLLOCK

Professor and Chairman
Department of Political Science
University of Michigan

DOUGLAS V. VERNEY. *Public Enterprise in Sweden*. Pp. x, 132. Liverpool: Liverpool University Press, 1959. 21s, net.

Sweden's welfare state is not built primarily upon the basis of public ownership. The welfare state comprises a system of social insurances, co-operatives, public aids to housing, collective bargaining, and a redistribution of income via transfer payments and taxes. Still, though Sweden is basically a private enterprise country, public enterprises contribute not a little to her highly developed welfare state.

Unlike Britain, Sweden has not achieved her public enterprises by means of a program of nationalization. There has been little threat to private enterprise, and cordial relations exist between the public and private sectors. The state and private enterprise, for example, may collaborate in building a power station. In the case of electric power the state generates about 40 per cent of the aggregate power produced.

For the most part, public enterprises in Sweden were owned by the state from their inception. There has been little transfer of ownership whereby private enterprise has been taken over by the state. Public ownership has developed through a process of natural growth over a long period of time. Domestic private capital was inadequate to cope with large real ventures like railways and the telegraph. Thus the tradition of civil service operation of enterprises took firm root in Swedish soil. Without this tradition, timber and waterfalls might have been transferred from the Crown's domain to private companies. Instead, the Power Board and the Forest Board became great Civil Service Trading Agencies.

Public enterprise has to be sure been extended piecemeal by the state taking over here and there a considerable number of small individual enterprises which have continued to face private competition. There is state competition in road passenger transport, road haulage, restaurants, ferries, iron works, and even, to a very limited extent, in commercial banking. In other fields state monopolies prevail, as in wine and spirits and tobacco. Indeed the tobacco monopoly was formed to finance the old-age pension scheme adopted in 1913.

Mr. Verney's book is concerned not with the economics of enterprises but with administration. In Britain the prevailing form of organization is the public corporation. In Sweden the main forms are: (a) the great Trading Agencies and (b) the State Companies, often relatively small units.

The British public corporation is a separate legal entity. The Swedish Trading Agencies are not, but are operated as a part of the Civil Service. The Swedish State Companies are more like the British public corporation. They are separate legal entities and acquire property in their own name. Their employees are not civil servants. They are governed by the provisions of the Companies' act which governs private companies. They carry the same corporate prefix, namely AB, attached to their name as private companies, and so are not easily distinguishable from

private companies. But the state is the stockholder and, therefore, the Minister occupies, so to speak, the stockholder's seat.

Mr. Verney's study is a valuable contribution not only to our knowledge of modern Sweden but especially to the problems of administration and control.

ALVIN H. HANSEN

Lucius N. Littauer Professor of
Political Economy, Emeritus
Harvard University

EDMUND BURKE. *The Correspondence of Edmund Burke*. Volume II, July 1768–June 1774. Edited by Lucy S. Sutherland. Pp. xxiii, 566. Chicago: University of Chicago Press, 1960. \$12.00.

This second volume of the definitive edition of Burke's correspondence appears on schedule; the plan of the general editor, Professor Thomas W. Copeland, calls for a volume each year until the series of ten is complete. For the years 1768–1774 we have here 253 letters, including 185 written by Burke himself—all those known to exist—of which 55 are in print for the first time. Of those addressed to Burke the most important are from his political chief, the Marquess of Rockingham. Miss Sutherland's Introduction is wholly admirable, and her extraordinary knowledge provides in her notes a sure guide through the many obscure references in the text.

This correspondence, largely political in nature, provides nothing like a continuous story, for Burke, as Miss Sutherland points out, wrote letters not as a literary exercise nor for pleasure but to serve practical needs. Consequently, most of these letters were written between rather than during parliamentary sessions. Even so, they make clear once again that Burke's contribution to the Rockingham Whigs was not that of a leader determining policy but was rather derived from his qualities of mind, his skill in debate, and his restless energy in prodding some of his sluggish aristocratic associates. "You are in general somewhat Languid, scrupulous and unsystematic," he wrote to the Duke of Richmond in November 1772.

Though always loyal to the lead of his chief, Burke's ideas and his oratory helped

transform a loose connection into a self-contained group within the Whig Opposition. The Rockingham Whigs would have no part in a Whig coalition except as a single party and on their own terms. This position Burke voiced in one of his great pamphlets, *Thoughts on the Cause of the Present Discontents* (1770). And for a time the Whigs remained divided and ineffective. A semblance of unity came with the emergence of Lord North's policy in America. On reception in England of the news of the Boston Tea Party, Burke wrote Rockingham (February 2, 1774), "Your Lordship will find all your friends, though not active, yet all in their posts; in good humour with one another; . . . firmly attached to their principles and to your Lordship. As to others I hope they begin to know to whom it is they owe their present situation."

It is useful to fill out Burke's role in politics. But also, in letters hitherto not in print, we catch heart-warming glimpses of a happy family life, and an extended correspondence reveals Burke's devotion to agriculture and his success as a farmer at Gregories, his country estate. In contrast, we have darker passages concerning his wholehearted acquiescence in the questionable financial ventures of Richard, his brother, and of William, his cousin, by which a common family purse was maintained. These volumes will make readily available what material there is in the Burke papers for the study of his family life and personality.

ALFRED F. HAVIGHURST

Professor of History
Amherst College

F. S. L. LYONS. *The Fall of Parnell, 1890–91*. Pp. xii, 362. Toronto: University of Toronto Press, 1960. \$6.50.

"In the history of modern Ireland the downfall of Charles Stewart Parnell stands out as an event of immense significance. His tragedy—romantic, total, irrevocable—overshadowed his own generation and ever since has kept its hold upon the Irish imagination."

With these words Dr. F. S. L. Lyons, Fellow in History at Trinity College, Dublin, begins the first full-length study of the

tragic last year of Parnell's life. He has retold the familiar story in an objective way, with ample documentation. He has made good use of some of the collections of papers which have only recently become available, notably the Dillon papers and the Gill papers. Documents in the latter collection throw new light on the Boulogne negotiations, late December 1890 to early February, 1891, and on the circumstances under which John Dillon and William O'Brien, while in confinement in Galway jail following their return to English jurisdiction after their sojourns in America and France, reached basic agreement on the strategy to be followed upon their release in late July, 1891.

Dr. Lyons does not neglect the human side of the story. He has many revealing comments on some of the main actors in the drama, especially Parnell himself, William O'Brien, John Dillon, T. M. Healy, Thomas Sexton, Justin McCarthy, John Redmond, Timothy Harrington, and Henry Harrison. Other important participants—Gladstone, Joseph Chamberlain, Sir William Harcourt, John Morley, Cardinal Manning, Archbishops Croke and Walsh, Michael Davitt, and, curiously enough, even Captain O'Shea and Mrs. O'Shea—are often referred to, but they remain shadowy figures in the background. Dr. Lyons handles the whole "O'Shea affair" delicately and adds little to the information that has long been available about this much-discussed subject. He seems to accept the thesis, first advanced in detail by Henry Harrison nearly thirty years ago, that Captain O'Shea "was not a deceived husband but had, on the contrary, connived at the relationship between his wife and Parnell," although he is careful to point out that this still "remains a hypothesis." He is obviously an admirer of Parnell, but while he sees in Parnell's fall a case study of "greatness overthrown by mediocrity" he concludes, nevertheless, that "Parnell was to a great extent responsible for his own ruin."

The main focus of the study is not on personalities but on "the broad issues of national policy which the crisis brought into the open." The split in the home rule movement in Ireland, momentous in

itself, led, in his judgment, to three major consequences: it "deeply and permanently changed" the Irish Parliamentary Party; it subjected "the relations between the church and a section of the laity . . . to a severe, perhaps unprecedented, strain;" and by making the Irish nationalists in Westminster dependent on the Liberal alliance it affected "the whole future of Anglo-Irish relations."

This volume is the first in the Second Series of Studies in Irish History, under the general editorship of Professors T. W. Moody, J. C. Beckett, and T. D. Williams. It maintains the high standards of the volumes in the First Series and is a real credit to Irish historical scholarship.

NORMAN D. PALMER

Professor of Political Science
University of Pennsylvania

ERICH RAEDER. *My Life*. Translated by Henry W. Drexel. Pp. xvii, 430. Annapolis: United States Naval Institute, 1960. \$6.00 (\$4.50 to members of the Naval Institute).

Grand Admiral Raeder has written a factual, sincere, and very readable story that covers his life, and in particular the forty-nine years that he served his fatherland. Few officers are alive that had a more interesting career; and there are few who suffered more as a result of professional defeats and the fickle course of history.

He was an officer in and contributed measurably to the training and efficiency of the first German Navy. He describes those times when, at the turn of the century, the Kaiser, his brother, Admiral Prince Heinrich, and Admiral Von Tirpitz bent all efforts to build and train a fleet that would approach parity with that of Britain. It was Raeder's fortune to serve in this fleet as the brilliant Chief-of-Staff of Admiral Von Hipper at both the battles of Dogger Bank and Jutland.

Raeder, outstanding leader and personnel expert, was chosen to rebuild the post-World War I Navy that fought World War II. This interesting period could be summarized with the observations: Hitler never understood the proper use of sea power, and Goering flatly refused the Navy

an air arm—all leading to Raeder's final acceptance of the conclusion of the now deceased Von Tirpitz, that "The German people never have understood the sea."

In building the new Navy, Raeder recognized that discipline must be based upon "a respect for the dignity of the individual" rather than the code of the old Imperial Navy where established class distinctions were taken for granted. Raeder stressed "the intelligent treatment of all subordinates." It is of interest that he encouraged religion in the fleet, but he soon ran afoul of the super-race myth of the Nazis that was the essence of the so-called "German Religious Movement." Raeder was devoutly religious, a powerful prop that sustained him in his ordeal of trial and imprisonment.

The Admiral had many differences with Hitler and his lieutenants, some of them over the Nazi attacks on the Christian churches and the treatment of the Jews. Many of Raeder's beliefs were anathema to the new regime of "super-men." Also in the areas of strategy and tactics, Hitler and Raeder often disagreed. This led to Raeder's resignation in 1942 as the Commander-in-Chief of the Navy. Admiral Donitz took over the Naval High Command.

These memoirs should be of absorbing interest to both professional and reserve officers of all Navies. Those in other services and, in particular, students of military history should find in the autobiography of this dedicated old sailor, superb staff officer, and born leader some of the reasons why the Führer lost the war.

LELAND P. LOVETTE

Vice Admiral
United States Navy (Ret.)

LOUIS LISTER. *Europe's Coal and Steel Community: An Experiment in Economic Union*. Pp. 495. New York: Twentieth Century Fund, 1960. \$8.00.

This book will inevitably be compared with William Diebold's *The Schuman Plan: A Study in Economic Cooperation 1950-1959*, which was reviewed in these columns in January, 1960. No comparison is intended here except to indicate that the two books cover to a large extent the same

ground. But while Diebold's volume presents a broad, comprehensive investigation of the European Coal and Steel Community (ECSC) within the historical and political conditions of the time, Mr. Louis Lister, an expert on the coal and steel industries in this country and a member of the United States delegation to the Community in 1952-1953, has limited the scope of his study to a technical economic examination of the institution. He concentrates on the essential economic developments of it during the first six years.

Launched in 1952, the Coal and Steel Community, comprising Belgium, France, West Germany, Italy, Luxembourg, and The Netherlands, was the first major step of the movement for European integration. Its basic economic aims were to federate the coal and steel industries of the member nations under a supranational authority and "promote greater average productivity and efficiency" in the two sectors "by means of greater regional specialization in the most advantageous districts" of a free trade area. After a brief survey of the historical background of the ECSC idea, of its organization and objectives, and a description of the agency's producing areas and markets, Lister subjects the actual workings of the Community to careful scrutiny in order to ascertain how effective it has been in reaching its goals. He analyzes costs of production and investments, corporate concentrations, restrictive business agreements and price practices in each of the two industries, as well as the external commercial policy, transport rates, and social policy of the member states.

Lister's evaluations of the Coal and Steel Community are noteworthy and may be summarized. He makes clear that, though the Community has succeeded in abolishing customs barriers to the trade in coal and steel among the member nations, it has not achieved complete economic union. The author blames this on the insistence of the members of maintaining intact the traditional forms of national sovereignty and their unwillingness to support a central authority. But then "The coal and steel industries," he argues, "were not the most tractable ones with which to start the experiment of freeing trade and prices be-

cause freight costs in both industries tend to create separate markets, because of the structure of ownership and the long history of concerted practices, because individual governments exercise strong influence over the two industries, and because the coal industry is so labor intensive." And as the national governments "have continued to exercise power even in the fields from which they were supposed to have withdrawn" under the terms of the ECSC Treaty and have been reluctant to sever the coal and steel industries from their economies, this has resulted in the Community remaining "a partial economic union."

However, with regard to promoting greater average efficiency by means of greater regional specialization and trade, Lister notes that, though "Competition through the price mechanism has not been legislated into existence in the steel industry as the means for raising average efficiency through greater regional specialization, . . . Greater economies of scale through concentration may . . . well be one of the results of the early history of the common market so far as the steel industry is concerned." In the coal industry, on the other hand, "Improvements in average efficiency through greater regional specialization . . . depend in present circumstances not on the price mechanism but on administrative decision and coordination. Attainment of the best results for the least amount of capital thus far has depended on exhortations from the High Authority, hoping that each country or mining district will plan its future with the welfare of the Community as a whole in mind."

ARTHUR LEON HORNIKER

Washington, D. C.

UNITED STATES GOVERNMENT AND HISTORY

RICHARD E. NEUSTADT. *Presidential Power: The Politics of Leadership*. Pp. xii, 224. New York: John Wiley and Sons, 1960. \$5.95.

This is not an investigation of the presidential power derived from the Constitu-

tion, statutes, and usage but instead a study of the President's status, prestige, and influence that in fact empower him "to execute the office of President." Neustadt wants to know "what he does today looking toward tomorrow from today" that invigorates the executive arm. It is astounding how long such a supremely significant investigation has been delayed, but here at last are the "facts of life" that every young president should know.

Eisenhower, the amateur, assumed that to give an order sufficed and reacted with shocked astonishment when his directions bounced back while Truman, the professional, accepted such failures with resignation. Mere formal power to direct may prove futile. A president who fails to publicize adequately his purpose may experience what Eisenhower did when he failed to clarify any intentions with respect to Little Rock, and Faubus judged he could act in defiance of a federal court order.

Bold strokes of the president that once astonished the public, such as Theodore Roosevelt's intervention to settle the anthracite coal strike in 1902, are routine today prescribed by statutes while usage, quasi common law, now obligates the president to do what the statutes omit. Let him neglect legislative leadership or fail to push his budget before Congress, and his indispensable prestige can plummet. Eisenhower experienced this when he failed to sense the peril in his Secretary of the Treasury Humphrey's bombing of his budget of 1957 with the prediction of a "hair curling" depression.

Instead of standing firmly by his own budget, the president admitted it was too high, thereby virtually inviting Congress to cut it. Eisenhower Republicans in Congress were dumbfounded. Such was the confusion created and the consequent damage to the President's prestige that a year later when a technician of the Bureau of the Budget speaking before a House subcommittee closed his recommendation with the statement that it was "essential to the President's program," the phrase was greeted with hilarious laughter. But from this nadir of presidential prestige, a "new Eisenhower" arose, recovered the initiative,

vigorously defended his budgets, and the laughter stopped.

Public prestige as an essential of presidential power stands out in bold relief in the contrast between the President Truman of early 1948 when his party sought to discard him and the later militant victor of the 1948 election. The president himself must preserve his prestige since no one else can. Franklin Roosevelt habitually did this. Eisenhower belatedly learned the lesson.

WILFRED E. BINKLEY

Professor of Political Science
Ohio Northern University

CARTER GOODRICH. *Government Promotion of American Canals and Railroads 1800-1890*. Pp. x, 382. New York: Columbia University Press, 1960. \$7.50.

This penetrating and scholarly work is a major contribution to an understanding of United States economic development in the nineteenth century; but peripherally it also illuminates certain crucial contemporary problems of economic development. Drawing upon his own well-known research and administrative experience in the international field, as well as on the incisive work of many other students of the early promotion of transportation, Professor Goodrich casts much light on internal improvements in the 1900's. He demonstrates that in the period 1815-1860 public agencies—federal, state, and local governments—contributed about 70 percent of the construction costs of canals and between 25-30 percent of the construction costs of railroads. In the south, the proportion was 55-75 percent; and for three of the four trunk lines, it was about 50 percent.

If the evidence indicates clearly that laissez faire policy was a myth, what policy did prevail and what were the forces determining that policy? Professor Goodrich's work clearly illustrates that public policy was pragmatically aimed at stimulating economic growth through whatever means appeared to be most effective in the particular situation: "The rejection of the federal government as the principal agency of the [internal improvement] program is partly to be explained by constitutional

Basic Values of Western Civilization

Shepard B. Clough

Although much has been written about our way of life in the West, most people can only vaguely define our basic values, and little attention has been given to making these values explicit. In this book, Shepard Clough appraises Western man's basic values—those which "reflect in essence the choices which men have made . . . as to the way they live, the wants and desires which they attempt to fulfill, and the order with which they strive to achieve recognized goals."

The Cabinet and Congress

Stephen Horn

This book surveys the attempts which have been made since Washington's time to bring the Cabinet and Congress into closer rapport. The author evaluates both the advantages and the disadvantages of proposed reforms. He examines the reform issue historically and analytically, using contemporary manuscripts and documents, interviews, public opinion polls, and a questionnaire of his own devising. Dr. Horn also discusses the conditions under which proposals for reform arise and estimates the possibilities for reform in the future.

Essays in American Historiography

PAPERS PRESENTED IN HONOR OF ALLAN NEVINS

Edited by Donald Sheehan and Harold C. Syrett

Written in honor of Allan Nevins, these essays on the writing of American history deal with subjects ranging from the Confederacy to the era of Franklin D. Roosevelt. Included are discussions of the robber barons, the muckrakers, the evolution controversy, and pragmatism. An appreciation of Professor Nevins by John A. Krout, Vice-President of Columbia University, introduces the essays.

OF MAN AND POLITICS: AN INTRODUCTION TO POLITICAL SCIENCE

OTTO BUTZ

"It fills the need for an introduction to political science that not only takes account of the great classical tradition, but also of new trends."—Peter H. Odegard, *University of California*. 1960, 304 pp., \$4.00

CONSTITUTIONAL POLITICS

GLENDON A. SCHUBERT, *Michigan State University*

Thoroughly explores the political, social, and economic factors affecting the decisions of Supreme Court Justices. Professor Schubert presents 70 carefully edited cases, each accompanied by such pertinent data as facts underlying the policy issue; lower court action; policy alternatives argued by concurring and dissenting judges; how each justice voted; and the decision of the court as a body. 1960, 751 pp., \$8.50

GOVERNMENT AND PRIVATE ENTERPRISE

CORNELIUS P. COTTER, *Stanford University*

Professor Cotter aims to clarify *how* and *why* the government undertakes to regulate business in the United States, and to explain the process of policy making and its associated problems. August 1960, 486 pp., \$7.00 tentative

scruples and the doctrine of states' rights and perhaps even more... by the inability of rival local and regional interests to agree on a common national program."

The aid that government agencies gave to promote internal improvements varied and reflected the spirit of improvement and innovation that permeated much of our early economic development. Most people know of the federal government's largess in granting wide tracts of land to promote the construction of railroads, but the general involvement of cities, counties, and states in the construction of railroads and the variety of techniques used by these units to promote construction—such as stock subscription, mixed enterprise, loan guarantees, and the like—are less widely known.

Starting with a chapter on the federal government's role in internal improvements early in the century, Professor Goodrich details a federal-state-local contrapuntal pattern of government promotion throughout the century. Next, the book deals with the activities of states, counties, and cities in the many efforts to penetrate the Appalachian Barrier and in the widespread commitment to internal improvements on local and sectional levels up to the Civil War. The book then returns to the federal intervention theme, 1850-72, when the rapid and ubiquitous growth of railroads was expedited by monumental federal land-grant subsidies and other assistance. Re-counting the details of the state-local programs from 1861 to 1890, Goodrich develops finally the theme of local-sectional interest.

Without doubt the great value of this work is the very richness of material which makes possible a more meaningful view of United States economic development and government policy in transportation—a view much closer to the realities of the times, realities that have been put into quantitative terms. Moreover, despite the many caveats about applying mechanically the "lessons" of history to contemporary problems, it is clear that at the very least, Professor Goodrich's categories of developmental and exploitative internal improvements help to put any underdeveloped

country's transportation problem in a useful frame.

CHESTER BOWLES. *The Coming Political Breakthrough*. Pp. xi, 209. New York: Harper & Brothers, 1959. \$3.75.

The election year of 1960, thinks Chester Bowles, can see a "political breakthrough" for the American people from twelve years of "marking time" to a new national consensus releasing all our energies for an assault on the problems and perils which beset us.

How can this come about? The author, a Member of Congress from Connecticut whose distinguished public career is too well known to need recounting here, bases his optimism on a "theory of political growth." The two parties, operating within the "framework of a broadly accepted code of conduct," alternately enjoy power. Leaders of the minority sense a demand for new answers to old problems; as the "party of hope" they engineer a "breakthrough" to a new consensus, first opposed, then joined, by the "party of memory." Three such breakthroughs have occurred in our history—in 1800, 1860, and 1932, each followed by a period of dominance by the party achieving them.

The new breakthrough will come because of our growing concern over the challenge of the Soviet Union, with its threat of nuclear war. To meet it successfully, says Bowles, we must win the friendship of the other two-thirds of mankind. How? The task is "to demonstrate in practical terms that the American Revolution, as Jefferson once said, 'belongs to all mankind.'" Reaffirming the dimension of moral power is the new realism.

Our program must consist essentially of two goals. The first is to build an adequate defense barrier for the free world against the Soviet power system. The second is to develop free societies behind the barrier and revitalize our own democracy.

The key to the problem, Bowles clearly believes, lies in unleashing and driving the

American economy. Khrushchev, he reminds us, has declared economic war on us, with a confidence based on the Soviet economy's seven-year annual growth rate of 9.5 per cent. Bowles believes we must reach and maintain a rate of 4-5 per cent; not inflation but slow growth rate, caused by restrictive governmental policies, is the real danger. But rising prices and recessions must and can be controlled by bolder and more sophisticated use of compensatory spending by government. Our pressing needs, which if met will improve the quality of our life, are inventoried specifically and convincingly.

Which is the "party of hope"? Not the Republicans, thinks Bowles—a liberal President would be shackled by conservatives in his party. The Democrats can be, if they face courageously the right of Negro citizens to full equality.

One strength of the book is that its ideas are not really new—we have done all that it suggests, discontinuously and imperfectly perhaps, or proved that we could. Surely another is the author's boundless faith in American capacity for achievement once we set our faces to the task.

RALPH K. HUITT

University of Wisconsin

MONROE BERKOWITZ. *Workmen's Compensation: The New Jersey Experience*. Pp. xiii, 298. New Brunswick, N. J.: Rutgers University Press, 1960. \$6.00.

This is the first in a series of studies projected by the Institute of Management and Labor Relations of Rutgers University designed to analyze and appraise conceptual and operational problems in such fields as social insurance which affect the interests of management and workers in New Jersey. The primary purpose of the present study is an objective examination of the functioning of the workmen's compensation system of that state, but the findings are comprehensively compared with experiences in other jurisdictions throughout the United States.

Following an introductory statement of workmen's compensation problems in general, in which the development of work-

men's compensation legislation and the provisions of the New Jersey statute are set forth, the author proceeds to a critical examination of the trends in such legislation and the New Jersey experience. Detailed attention is given to the adequacy of workmen's compensation payments, permanent partial disabilities, the administration of workmen's compensation claims, the administration of the New Jersey act, the financing of the program in New Jersey through private insurance companies rather than an exclusive state fund, rehabilitation and medical care, second injuries and the employment of the handicapped, heart cases and radiation hazards.

The merits and deficiencies of the New Jersey statute and its administration are examined in detail with admirable objectivity. The author does not confine his attention to a critical review of shortcomings in the New Jersey experience but throughout the study weighs constructively comparative programs of remedial action, drawing generously upon the more liberal and progressive measures in other jurisdictions.

In the final chapter the author discusses "The Future of Workmen's Compensation." Valid criticisms as well as unwarranted exaggerations concerning the operation of workmen's compensation programs are clearly recognized, as is the urgent need for improvement. He is admittedly pessimistic with regard to the probability of effective improvement, except perhaps through incorporation of the workmen's compensation program into an integrated social insurance system at the federal level. The suggestion of such incorporation will, of course, immediately revive the endless controversy over centralization versus decentralization of political control and administration.

This is an unusually valuable study which will richly repay thoughtful reading by all who are interested in and concerned with the workmen's compensation program, not only in New Jersey but throughout the United States.

GORDON S. WATKINS

Chancellor and Professor of
Economics, Emeritus
University of California, Riverside

CARL BECK. *Contempt of Congress: A Study of the Prosecutions Initiated by the Committee on Un-American Activities, 1945-1947*. Pp. xii, 263. New Orleans: Hauser Press, 1959. \$4.50.

This is a useful little book. It cannot, however, be regarded as a substantial treatise on the law of contempt procedures or as a definitive study of congressional investigations. It is, rather, a well-organized compendium of committee hearings, congressional actions, and court decisions arising from the business before the Committee on Un-American Activities in the period 1945-1957. The scope of the study, the mass of evidence reviewed, and the brevity of the text (189 pages) preclude extensive investigations or a full analysis of all pertinent issues.

Beginning with two introductory chapters: "I. Development of the Contempt Process" (pp. 1-16) and "II. The Power to Subpoena Documents" (pp. 17-40), the study moves to an examination of hearings conducted by the Committee, emphasizing especially its exercises of contempt procedures, and to a summary analysis of subsequent steps including final disposition in the courts. The author has carefully assembled a mass of data and catalogued it in terms of the constitutional issues involved. He has briefly yet conscientiously traced the history of each case to its final disposition. In Appendix A he presents and identifies all contempt citations for the earlier period, 1787-1943. Appendix B and an Addendum list in chronological order all citations originating with the House Committee on Un-American Activities. In another half-dozen pages, Dr. Beck presents in tabular form selected information on a wide variety of contempt cases. The book also contains a Table of Cases, a Selected Bibliography and a brief Index. The documentation is adequate.

Even though apparently overambitious in scope, the study bears ample evidence of scholarly dedication, of great industry, and of some ingenuity in approach and treatment. Handicapped as he is by textual limitations, Dr. Beck nevertheless finds some space to state his opinions, convictions, and biases. He is impliedly unsym-

pathetic, perhaps thoroughly disgusted, with the activities of the Committee on Un-American Activities, hostile towards its procedures, and critical of both congressional and judicial review of much of the work of the Committee. One may infer that the evidence demonstrates abuses of power by the Committee and an almost complete abdication of basic responsibilities by Congress and, to a lesser degree, by the courts. I am not quite sure where the author stands on interpretations of constitutional issues. The doubts arise because too frequently Dr. Beck's appraisals and criticisms are limited to unargued and undocumented assertions and are otherwise beclouded and enfeebled for want of adequate development. In spite of its limitations, teachers and researchers in this area and period of constitutional interpretation will be indebted to Dr. Beck for this compilation of basic data.

HAROLD M. DORR

Professor of Political Science
University of Michigan

CORWIN D. EDWARDS. *The Price Discrimination Law: A Review of Experience*. Pp. xxii, 698. Washington, D. C.: Brookings Institution, 1959. \$10.00.

Corwin D. Edwards has produced an exceedingly illuminating and important volume even though he found it impossible to carry out his original plan. It had been hoped and planned to give only a minimum of attention to litigation before the Federal Trade Commission and the courts and to ascertain from field interviews and case studies "what happened after orders under the Robinson-Patman Act were issued" (p. ix). Unfortunately the original plan could not be fulfilled; hence it was revised "to include an analysis of the litigation under the Robinson-Patman Act as well as the changes in business practice that followed this litigation" (p. xiii). No endeavor was made to "analyze the scope and effect of the private law suits" (p. xiv) because information derived from such proceedings was not readily available.

The volume begins with a brief legislative history of the Robinson-Patman Act. This section will illuminate little for in-

formed readers but will provide some perspective for the initiated. After brief discussions of the content of the statute and of enforcement by the Federal Trade Commission, the leading provisions and issues are discussed, including brokerage, proportionality in payments and services, quantity and volume discounts, quantity limits, functional discounts, territorial discrimination by price formulas, meeting competition as a defense, cost justification, and miscellaneous matters. Practitioners—public and private—business executives, scholars, and students will find all of these interpretive reviews tremendously useful and revelatory.

In two final chapters Dr. Edwards makes an over-all appraisal of the price discrimination law and suggests the lines along which the law might be revised or rewritten. The author concludes that the law has been only partially successful, partly because it was written too largely in terms of the problems and conditions in the food industries (p. 621) and experience has indicated that "the problem posed by discrimination was more complex than had been envisaged by Congress" (p. 620). On the credit side "there is strong reason to believe that the statute has afforded effective protection against the price-cutting activities of predatory would-be monopolists and that it has substantially reduced the discriminatory advantages in price enjoyed by large buyers" (p. 622). On the opposite side have been the tendencies (1) to reduce the vigor of competition (p. 630), (2) to diminish the flexibility of prices, to make sticky prices stickier, and in general to reduce the responsiveness of the price system (p. 631), and thus (3) to evoke a dual standard in public policy under the Sherman and Robinson-Patman Acts (p. 633).

Suggestions regarding policy are made in the perspective of the above consequences and the belief that "the objective of preserving equal opportunity is an appropriate focus for a law of price discrimination" (p. 641). Space cannot be taken here to review all aspects of the suggestions for amending or rewriting the law. In essence "the focus of public policy should be shifted from efforts to control market be-

havior to efforts to prevent undue concentrations of power" (p. 641). A remodelled statute with this focus admittedly "would bear little resemblance to the Robinson-Patman Act" (p. 646).

But this interpretive sketch, like the author's own summary (see p. 656), suggests far too little concerning the full treatment by Dr. Edwards. *The Price Discrimination Law* should be on the must list for all concerned with the Robinson-Patman Act.

E. T. GRETHNER

Dean, Graduate School

University of California
Berkeley

Continuing Legal Education for Professional Competence and Responsibility. (The Report on the Arden House Conference, December 16-19, 1958.) Pp. xviii, 315. Philadelphia: Joint Committee on Continuing Legal Education of the American Law Institute and the American Bar Association, 1959. \$5.00.

This book is an annotated version of the statement of the consensus reached during a four-day conference at Arden House. The conference, called by the American Law Institute and the American Bar Association, of 110 members of the bar, including some judges and law teachers, considered in the main the problem of how through continuing legal education an awareness of professional responsibility could be maintained and increased among the bar. While the conference was called to consider both questions of competence and responsibility, the emphasis during the course of the proceedings shifted to responsibility. It was recognized that "Programs for continuing education thus far have placed a major emphasis on professional competence and have not always given to professional responsibility the attention it should have. In the future these programs must also emphasize the professional responsibilities of the lawyer. They must help the lawyer to fulfill a wide range of professional responsibilities: to the courts, to the administration of justice, to law reform, to the law-making process, to his profession, and to the public." In addition to the annotation of the consensus

statement, the volume contains in Appendices the addresses given at the conference by Judge Learned Hand, John Lord O'Brian, Dean Erwin Griswold, Judge Charles Wyzanski, Jr., and Robert Blakely, and contains also various accounts of some continuing legal education programs now in effect in the United States. The conference was made possible by a grant from The Fund for Adult Education.

In part the volume then is an addition to what has been described by Professor Mathews of the Law School of Ohio State University as a "crescendo of hortatory material" dealing with the need for action or education in the field of legal ethics or professional responsibility. The annotation sets forth a "classification of opportunities and responsibilities which may clarify further consideration." This classification includes responsibilities (1) "in actual practice towards lawyers, judges, the administration of justice and the public"; (2) "in areas adjoining actual practice, such as the administration of justice, selection of judges and the like; reform of law both procedural and substantive; representation of all persons, although poor or unpopular"; (3) "in other areas which have recently become important, for example those concerning the development of administrative and international law, and professional relations with foreign lawyers"; (4) "to take judicial, legislative and government positions and in the conduct of these offices"; (5) "to the profession through active participation in the work of the organized bar"; and (6) "to the public of a general character, such as service on educational and charitable boards, leadership of public opinion and community leadership."

This volume may provide some insights for those interested in the process of communication within a somewhat sprawling profession which possesses considerable monopoly power, although much less perfect than that devised for the practice of the medicine, and for those interested in the reactions of a segment of a profession which has correctly regarded itself as charged, along with some other groups, with special responsibilities for leadership in civil affairs. The volume must be taken

as an expression of faith, a manifesto, and in some mysterious way it will be an effective guide to action. Future action will be reflected in the work of bar associations, law schools, and special professional adult educational groups. It will be reflected also in the conduct of the bar and perhaps the understanding of the public, with respect to such matters as the representation of unpopular causes or persons and the reorganization of the courts for the better administration of justice.

EDWARD H. LEVI

University of Chicago Law School

ROBERT H. BREMNER. *American Philanthropy*. Pp. vii, 230. Chicago: University of Chicago Press, 1960. \$4.50.

Dr. Bremner, a professor of history at Ohio State University, gives himself no small task in writing this book by accepting a very broad definition of his subject. "The aim of philanthropy in its broadest sense," he says, "is improvement in the quality of human life." He therefore endeavors to present in popular terms, from earliest colonial times to the present, American voluntary activities in the fields of charity, religion, education, medicine, humanitarian reform, social service, war relief, and foreign aid. He is the first to admit that "readers may look in vain for mention of favorite philanthropists," though he does mention many, and that he must limit himself to "a narrative of some of the major trends in American philanthropy." The book has no footnotes, an omission that will distress students in the field but probably delight general readers.

Granted these limitations, *American Philanthropy* is an interestingly written, informing introduction to the changing patterns of American philanthropy and reform movements through three centuries. It is properly critical of indiscriminating efforts, including the society lady who admired bread lines and asked about the costs because "I'd love to have one," but also mentions those so fearful of pauperizing the poor that the only commodity they dared offer was advice. The author places considerable emphasis upon the de-

velopment of social work and "scientific philanthropy" and the later expansion of government services into areas once a primary responsibility of private agencies. The concluding sections of the book, appraising developments during and since the Great Depression, seemed to this reader fuller and better balanced than the early historical chapters. Financial data are scarce and inadequate. A final chapter looks forward to the world responsibilities of American philanthropy.

There is an excellent Bibliography for suggested further reading and a good Index.

F. EMERSON ANDREWS

Director, Foundation Library Center
New York, N. Y.

LESTER J. CAPPON (Ed.). *The Adams-Jefferson Letters: Complete Correspondence Between Thomas Jefferson and Abigail and John Adams*. Vols. 1 and 2. Pp. li, 638. Chapel Hill: University of North Carolina Press for the Institute of Early American History and Culture at Williamsburg, Va., 1959. \$12.50.

The correspondence of John Adams and Thomas Jefferson, declares Dr. Julian Boyd, dean of editors of the writings of American statesmen, "remains unrivaled, in the United States at least, for its revelation of two writers' minds and characters, its literary distinction, and its historical importance." I would not limit its rank and purview to America. It is almost as if Voltaire and Rousseau had exchanged intimate friendly letters on men and measures, philosophy and politics, throughout their long lifetimes. In the case here noted, each of these two men had been fathers of American independence and presidents of the United States. And in one of the most remarkable personal exits in history, both departed this life on July 4, 1826, almost within the same hour, exactly fifty years after adoption of the Declaration of Independence, which they had combined to draft and sign.

The correspondence of these great men, throughout their half century of United States history, has long since been available in print and admired by their posterity. But it has never been brought together in one convenient publication.

Readers formerly had to pick it out from successive editions of the over-all writings of Jefferson and of John Adams. Most of these editions were published before historical editing had reached its present refinement of perfection in this country, and, in them, selected letters of Adams and Jefferson were usually taken from the writer's retained copies rather than from the actual letters as signed and received. There can be a significant difference in the two documents.

A project to publish the 380 letters—189 from Adams, 164 from Jefferson, 27 from Abigail Adams—by themselves, in one edition, has been on foot since 1948, conceived by Carl Bridenbaugh, former director of the Institute of Early American History and Culture at Williamsburg, Virginia, forwarded by successive editors, Donald Murgidge, and Lyman Butterfield, and supported by a grant from the Rockefeller Foundation.

But it fell to the capable Lester J. Cappon, present director of the Institute, to take over and carry through the project. The present volumes may properly be credited to him, and their quality proves that the work could not have been entrusted to a more capable scholar, nor the printing to a more competent press.

SAMUEL FLAGG BEMIS

Yale University

MAX HALL. *Benjamin Franklin and Polly Baker: The History of a Literary Deception*. Pp. xi, 193. Chapel Hill: University of North Carolina Press for the Institute of Early American History and Culture, Williamsburg, Virginia, 1960. \$5.00.

This is a lighthearted book about a lighthearted subject—one of Benjamin Franklin's roguish literary escapades. The affair had its beginnings in April 1747, when a leading London newspaper, the *General Advertiser*, printed a dramatic courtroom speech purported to have been delivered "at Connecticut near Boston in New England" by one Polly Baker "who was being prosecuted for the fifth time for bearing a bastard child."

The account reported Polly as admitting the charge but, at the same time, denying indignantly that she was guilty of any real wrongdoing against God or man. Said Polly, "I have brought five fine children into the world at the Risque of my life." She had not, she said, "debauched any woman's husband or enticed any youth," nor had she ever refused "any bonafide proposal of marriage." Declaring dramatically that the man who had originally seduced her was now a magistrate of the court, she inquired "how could her offense have angered heaven" when "God has been pleased to add his Divine skill and admirable workmanship" in the formation of her children's bodies and "crowned it by furnishing them with rational and immortal souls."

The entire story was of course a clever and bawdy literary fraud, apparently contrived by Franklin with the connivance of the paper's editor. But the account swept like a brush fire through the press of Britain, the continent, and America. At least five British newspapers had published the tale within a month. The *Gentleman's Magazine* picked up the tale immediately, embellishing it with the additional information that the guilty magistrate had been so overcome with remorse that he had married Polly on the spot and that she had subsequently borne him fifteen additional children. By July and August, the story was front-page news in the *Boston Weekly Post-Boy*, the *New York Gazette*, and the *Annapolis Maryland Gazette*. Polly's story was in vogue in France during the 1770's, when the Abbe Raynal incorporated it in his *Histoire Philosophique*, and both Diderot and Brissot de Warville thereafter used the tale for their own purposes to propagandize against the Ancien Regime. It was Franklin himself who revealed his authorship in an offhand fashion to Raynal, and subsequent scholars from Jefferson and Voltaire to Carl Van Doren have quite generally accepted this account as correct.

The subject of the present work is hardly profound, but the author has nonetheless turned it into a kind of model of historical scholarship and literary criticism. By his zeal and conscientiousness in collecting the evidence, collating documents, and in

matching conflicting accounts, he has succeeded in producing a *delightfully* written and scholarly book.

ALFRED H. KELLY

Professor and Chairman
Department of History
Wayne State University

G. M. WALLER. *Samuel Vetch: Colonial Enterpriser*. Pp. x, 311. Chapel Hill: University of North Carolina Press for the Institute of Early American History and Culture, 1960. \$6.00.

The course of eighteenth-century history is not solely explained by a knowledge of the British colonial system. Workable in theory, perhaps, that system was certainly beset by adventitious factors. The life of Samuel Vetch illustrates the problems which arose in shaping a colonial policy, the general ineptitude of eighteenth-century bureaucracy, and the tangled process by which Americans groped toward colonial maturity. The availability of family manuscript collections in more recent years has permitted an evaluation of the interrelationship of many activities that previously had to be treated as separate political, commercial, or personal occurrences. A biography such as this provides valuable insight into the history of the period. Enlivened by glimpses of family life a biography can be far more readable. The publication of this volume is well justified even though the basic facts of the career were mostly established in studies published before 1900.

The birth and early training of Samuel Vetch in Scotland, family life with his father, a leading clergyman of proscribed Covenants, flight to Holland and education there, service on the continent as an officer in the armies of the Protestant Alliance, the great hopes and dismal collapse of the efforts of Scotland to colonize the Isthmus of Darien in spite of hostile English merchant influence in court, and arrival of the starving refugees in the harbor of New York in August 1699 are all covered in two short chapters. Vetch was a cousin of Robert Livingston. He soon contracted with him for food and supplies for the refugees, established major business contacts with the firm of Delancey and

Wenham, and married Margaret Livingston. For a decade his trading activities from New York and Boston, as close to the edge of the law as was then customary, led directly toward plans for British expansion against French Canada. Vetch's knowledge of the St. Lawrence and the coasts of lower Canada contributed much to his later success as an official.

A few historians previously have recognized the importance of Vetch in connection with the expeditions against Canada, but only now is his full contribution evident. His achievement was remarkable in that he successfully merged a number of colonial plans with those of the Ministry in London, maneuvered for years, bribed where it was customary, combined church, partisan, and Scottish nationalist support, and efficiently led expeditions in the field. He risked his entire personal fortune and died in debtors' prison in London in 1732. But he had personally seen the earlier British victories in Canada in 1710, and his wife lived to the years of the final successful British attacks nearly half a century later.

CHARLES M. THOMAS

Professor of International Relations
Air University
Montgomery, Ala.

BRUCE CATTON. *Grant Moves South*. Pp. x, 564. Boston: Little, Brown and Company, 1960. \$6.50.

One does not have to read very far into this book before realizing that an excellent choice was made in selecting Bruce Catton to complete the multiple volume biography of Ulysses S. Grant which the late Lloyd Lewis began a decade ago with *Captain Sam Grant*. Catton's national reputation as a writer on the War Between the States is enhanced by *Grant Moves South*. For years Grant was overshadowed in American historiography by other military leaders. Moreover, Grant has been blamed for the low public morality and general dishonesty in the national government during his two terms as President. From this nadir of popularity he has only recently emerged. Unfortunately neither Kenneth P. Williams, the author of *Lincoln Finds a General*, nor Lloyd Lewis lived to com-

plete their studies on Grant. In the publication of this volume a notable step has been taken in the evaluation of Grant as a military and political leader.

Grant Moves South covers a period of a little more than two years, June 1861 to July 1863. Physically, Grant never looked like a military hero. His habits of dress and his mannerisms contributed to his nondescript appearance. That Grant successfully emerged as the ablest military leader of the Union and the co-ordinator of all the federal forces is attestation enough of Lincoln's correct evaluation of Grant's ability. At last, the Commander-in-Chief had found his General. Indeed, Lincoln and Grant possessed many similar and admirable traits of character.

Although Catton focuses attention on military strategy and tactics more sharply than other biographers of Grant have done, he never loses sight of the many complex problems which plagued his subject. The general was forced to cope with such matters as contraband commerce, mails, passes, slaves, and supplies. The author's discussions of these problems are full and revealing, as is his entire writing about Grant during the period dealt with in his book.

As Lincoln was growing in stature by meeting his responsibilities as President, Grant likewise was developing by facing his problems on the field of battle. The author concludes that Grant did not arrive at the fullest development of his faculties until the height of the Vicksburg Campaign, July 1863. Henceforward, with Lincoln's support, Grant was confident of his success.

In the avalanche of books on the War Between the States now flowing from the presses, *Grant Moves South* occupies a conspicuous position among the best. All persons interested in biography will welcome this book and will await with anticipation the volumes which will complete the biography of Grant.

GEORGE C. OSBORN

Professor of History and Social Science
University of Florida

DONALD BRUCE JOHNSON. *The Republican Party and Wendell Willkie*. Pp. ix, 354. Urbana: University of Illinois Press, 1960. \$5.50.

Looking back at the election of 1940 Irving Stone once wrote of Wendell Willkie that he was the only defeated candidate "who, a few weeks after the election, was being patted enthusiastically on the back by his erstwhile opponents and kicked in the rear with equal enthusiasm by his erstwhile friends," and small wonder. The Republicans, the party of McKinley and Hoover, had selected an internationalist, a political innocent, an inept organizer, and horror of horrors, someone who had once voted for Franklin Delano Roosevelt and saw some value in much of the New Deal's social legislation. How he managed to obtain the nomination, yet ultimately lose his party, is the substance of this definitive, exhaustive, and strikingly well-written book.

The basic story is familiar. Confronted by mediocrities, guided by northeastern financial giants and Ogden Reid's New York *Herald-Tribune*, and utilizing a clever publicity program, Wendell Willkie's image was favorably impressed upon millions. He was, in addition, a fresh, candid, articulate personality and the perfect opponent for Roosevelt. After his defeat, he continued as the "loyal opposition," traveling around the world and trying to lead the Republicans into an acceptance of the Administration's support of the British and later, into an acknowledgment that this country had fundamental postwar international obligations it could ignore only at its peril.

In the early months of 1944 he entered the primary in a Wisconsin so thoroughly isolationist that "the record of its representatives on the floor of the House prior to 1944, was one of complete opposition to the principles for which Willkie stood." Why he chose to make his stand there remains something of a mystery. The author believes this decision was determined by his advisors and the hope that "if he could win a majority of the twenty-four delegates from this area . . . he would be off to a flying start. . . ." Unwise as it now seems, he was adjudged a favorite by many seasoned observers. Furthermore, Wisconsin's impossible cross-filing preferential primary law has impaled keener politicians on the cross of enthusiasm generated by the heat of campaigns. Perhaps he should have ignored Wisconsin; yet the

nomination would have never been given him again, for this extraordinarily free man who had so many admirers outside his party had so few within it.

Flushing, N. Y.

OTHER COUNTRIES

S. D. CLARK. *Movements of Political Protest in Canada, 1640-1840*. Pp. viii, 518. Toronto: University of Toronto Press, 1959. \$6.50.

In at least one important respect, this study by Professor Clark of the University of Toronto is iconoclastic. It challenges the traditional view that the Canadian people have always shunned the radical experiments of the United States and have invariably sought through an orderly process to adapt their political traditions to changing circumstances. Through a detailed examination of Canadian protest movements from 1640 to 1840, the author proves that Canada has had her full share of radicalism and convincingly argues that "in terms of the kinds of movements which grew up, there was no essential difference between Canada and the United States."

The Canadian movements resembled those in the United States simply because they were inspired by similar influences. On both sides of the boundary vast land masses and ineptness of political administration bred political discontent and offered unlimited opportunities for the growth of radicalism. The ultimate outcome, however, was different. South of the boundary the spirit of the frontier was able to incorporate its principles and programs into the American constitution; whereas north of the boundary the frontier spirit regularly met defeat. The American revolutionary movements succeeded because they came to be identified with the strengthening of the American political community as a whole; the Canadian failed because they came to be associated with disloyalty; "they meant exposing the frontier to forces of American expansion and threatening

thereby the separate political existence of the Canadian community."

In most respects the book is admirable. The various movements are thoroughly and carefully analyzed; the arguments are documented by extensive quotations from original sources; and the prose, while not distinguished, is serviceable. The reviewer, however, is inclined to challenge some of the author's very broad statements. For example, he questions whether the French settlers actually viewed the English attacking forces of 1690 as "something of the character of liberation" (p. 24); whether the Canadian habitant population viewed the British conquest of 1760 "as an act of emancipation" (p. 89); and whether "the American Revolution began as a movement for the political liberation of the population of Nova Scotia and Canada" (p. 50). He likewise views as too unequivocal the assertion that the western American movement of political democracy "forced the American Republic into war with Britain in 1812" (p. 237). British violation of American neutral rights is generally admitted to have also been a factor of some significance. But all of the examples relate to matters about which there are grounds for a difference of opinion.

Professor of History and Government
St. Lawrence University

EDWIN LIEUWEN. *Arms and Politics in Latin America*. Pp. xiii, 296. New York: Frederick A. Praeger for the Council on Foreign Relations, 1960. \$4.75.

This valuable book goes far toward supplying a long needed systematic discussion of the role of Latin America's military in politics. In fact it goes farther than that, for Professor Lieuwen's study covers more than its title indicates. The book is divided into two parts, Latin America's Armed Forces and Military Aspects of the Latin American Policy of the United States. The first and longer section deals with the position of the military on the domestic scene, under such chapter headings as "The Armed Forces and the Social Revolution," "The Changing Role of the Armed Forces: An Analysis," and "The Latin American

Military Today." The second portion of the work concerns itself with United States policy, in chapters headed "Evolution of Policy, 1898-1959," "Analysis of U. S. Policy," "Critique of U. S. Policy," and "Policy for the Future." Also included are two Appendices, one a specimen of an agreement for a United States military mission with Nicaragua and the other a specimen of a military assistance agreement with Honduras, and an adequate Bibliography.

Although the two parts of the study are related, and the thesis of the second portion would be a great deal less compelling unless prefaced by the first, they are quite distinct in approach and in over-all effectiveness, with the section concerning United States policy the more successful of the two. The disparity arises because in his first section, dealing with the domestic situation in twenty different countries, the author has to cover a mass of complex material in a relatively restricted number of pages. Almost inevitably, a few minor errors of fact slipped past him, but I shall neither count them nor quote any, so that I can demonstrate my scholarship by adding a snide "sic" after them, for the impressive truth is that an amazing amount of complicated material has been presented with a minimum of human mistakes. Instead, I shall merely warn the nonspecialist that Mr. Lieuwen's generalizations, valid as they tend to be in global terms, sometimes oversimplify the complex social, economic, and political factors at work in a specific situation. At the same time, this book suggests just how fruitful further, more specialized analyses of Latin America's military could be.

In dealing with United States policy as regards military affairs in the area, the study grapples with a much more manageable problem, and does so both incisively and well. Mr. Lieuwen's thesis that this country's arms supply and military training programs provide neither additional international force in the struggle against communism nor incentive toward responsible, civilian government in the individual states concerned is well documented. So is his contention that our military and civilian leaders are well aware of this fact.

Taken as a unit, *Arms and Politics in Latin America* is an excellent example of the truism that foreign policy-makers must know a great deal about the domestic conditions of the countries with which they are dealing if they hope to provide meaningful and constructive courses of action for this country. I am pleased to see the Council on Foreign Relations encouraging such studies.

ROBERT E. SCOTT
Associate Professor of Political Science
University of Illinois

CARL S. SHOUP and others. *The Fiscal System of Venezuela: A Report*. Pp. xiii, 491. Baltimore: Johns Hopkins Press, 1959. \$8.75.

This book is an outgrowth of a study conducted by a commission composed of economists and tax law experts from the United States and Great Britain. This commission, constituted in 1958 at the request of the government of Venezuela, included Carl S. Shoup, as Director, and John F. Due, Lyle C. Fitch, Sir Donald MacDougall, Oliver S. Oldman, and Stanley S. Surrey. The report is a collaborative effort, with authorship of individual sections undesignated.

The two opening chapters deal with the distribution of income and other general economic considerations relevant to public finance. Nine chapters dealing with specific taxes follow, with heavy emphasis upon income taxes and sales and excise taxes. The five concluding chapters cover such topics as state and municipal finances, governmental accounts and reports, non-tax revenues, and an analysis of the tax system and economic stability as well as an estimate of the costs of education and health. Four Appendices contain additional material on detailed matters. Throughout the report, there is an admixture of factual information, economic analysis, and policy recommendations, both general and very specific indeed.

The report is very competently done. Although it contains a massive array of facts, as well as detailed analyses and recommendations, the net effect is not that of a reference handbook. The book is clear, incisive, and straightforward, and a

continuing analytical framework protects the excursions into detail from discursiveness. Although written with clarity rather than sprightliness, the book should attract the interest of many readers. For those interested specifically in the Venezuelan economy, the report presents a wealth of information and a host of policy recommendations. For those concerned with the methodology of case-studies, this book presents a careful and workmanlike model. Finally, for the perhaps even larger numbers of economists, political scientists, and others interested in growth and development, this report sheds much light. It reveals, factually, an economy largely dependent upon a single commodity, with a highly concentrated income distribution, but with more wealth—largely from oil—than possessed by most underdeveloped economies. Within this context, the estimates in the report regarding capital requirements, sources of savings, and so forth, as well as the tax recommendations, are of keen interest. This book is, in short, a very useful addition to the growing library of case-studies in economic development and national economies.

ARNOLD WIZNITZER. *Jews in Colonial Brazil*. Pp. x, 227. New York: Columbia University Press, 1960. \$7.00.

Professor Wiznitzer has gathered much detailed information about individual Jewish settlers in colonial Brazil and about cases where they were brought before the Inquisition at Lisbon, and his study throws much new light on some phases of Brazilian colonial history. Many Jews fled to Brazil, and others were deported to the colony as convicted heretics after the King of Portugal attempted to compel all of his Jewish subjects to accept Christianity in 1497. They were active in the establishment of the sugar industry and in trade, and they maintained close relations with another large group of exiles who had taken refuge in Amsterdam. Most of the "New Christians" continued to practice the old religion secretly.

After the Dutch conquest of northern

Brazil, the Jews in that region were able to give up any pretense of being Christians. Their number was augmented by immigrants from Amsterdam, and they played an important role in commerce and finance and obtained most of the contracts for the collection of taxes. Professor Wiznitzer thinks that they comprised about half of the white population of approximately 2900 in 1645. Though the local Dutch Calvinists often attempted to interfere with their religious freedom, the policy of the West India Company, which ruled the colony, was a tolerant one. The Jews often fought more tenaciously against the Portuguese than the Company's own mercenary troops, and nearly all of them fled to Holland when the Dutch were finally defeated. Some later returned to the New World to settle at New Amsterdam or in the West Indies.

Smaller groups of Jews at Rio de Janeiro and São Vicente and São Paulo remained in Brazil. The Jesuits used their influence to protect them from persecution, but, in the century that followed the Dutch wars, many were sent to Lisbon for trial by the Inquisition. In most cases they were given relatively light sentences, but eighteen were executed as heretics between 1644 and 1748. Persecution practically ceased after the Marquis of Pombal stopped all discriminations against New Christians in 1773, and thereafter the Jews were absorbed in the Brazilian Catholic population so that there were few if any who still practiced their religion at the time of independence.

Trends in Church Membership in the United States

By BENSON Y. LANDIS

FOREWORD

Taken together, the articles in this volume are in remarkable agreement on the main outlines, trends, and problems of religion in the United States today. Their viewpoint, by design, is naturalistic; that is, they analyze our religious institutions in much the same way as one might analyze a political party, a corporation, or a school system. None of them is concerned here with the validity or the character of the theological discourse or with the relative merits of one or another denominational view. All of them are concerned, and some of them are a little uneasy, about the organizational form and the quality of religious observance in our society. In general, however, the tone is optimistic, much more optimistic than would have been anticipated several decades ago. Following the substantive articles of this symposium, a final article will examine some of the major themes which are found in these pages and present them as an interwoven whole.

RICHARD D. LAMBERT

ABSTRACT: American religious bodies—excepting the Church of Christ, Scientist—have officers who make public reports of the numbers of their adherents. During recent years the “latest information” available has appeared in the annual *Yearbook of American Churches*. Two hundred and fifty-one bodies reported 109,557,741 members, equal to 63 per cent of the estimated population in 1958, in the *Yearbook* for 1960. The figures from church headquarters are made public at irregular intervals and are not gathered by uniform methods. The *Census of Religious Bodies*, which did gather figures by means of standard forms, has been discontinued. The average size of local congregations has increased 50 per cent since 1926, and church membership advances at a more rapid rate than the population. However, church statistics have many defects, and it is not known what effect the mobility of the population has had on church records and on record-keeping. Roman Catholic and Protestant bodies are reported to have now about the same numerical relation to one another as they had in the early 1900’s, but since 1950 the Roman Catholics have reported the more rapid gains. One study indicates that the more conservative denominations report larger growth than those known as the more liberal. Many professional workers challenge the frequent use of extensive church statistics as evidence of the vitality of the institutions or of religious revival.

Benson Y. Landis, Ph.D., New York City, is Editor of the research publications of the National Council of Churches and compiles and edits the annual *Yearbook of American Churches*. He has participated for many years in the Association of Statisticians of American Religious Bodies. His writings include *World Religions* (1957) and a bibliographic essay on sources of statistics of religious affiliation in the *Journal of the American Statistical Association*, June 1959. He has had a special interest in American agriculture and the churches in rural communities.

At no time in American history have so many people or a greater proportion of the people been affiliated with religious bodies. Statistics supplied by the current *Yearbook of American Churches* reveal that 109,557,741 persons, or 63 per cent of the total population of the United States, are affiliated in 251 religious bodies. The *Yearbook* is a reference work compiled and published annually by the National Council of Churches, New York. Its reports indicate membership totals mainly for 1958 or for a twelve-month period ending in 1958. Statistics were gathered from the forty-nine states and the District of Columbia. Figures for Hawaii will be included in the next annual edition of the *Yearbook*.

REPORTS FROM ALL FAITHS

Reports come from all faiths and are sent to the *Yearbook* by the statisticians of the religious bodies. With the exception of the Church of Christ, Scientist, all the religious bodies in the United States appoint persons to gather figures from their local congregations or parishes. The Church of Christ, Scientist reports that it has a rule forbidding the compilation of its church membership as well as the reporting of such figures for publication. The latest information about the number of persons affiliated with the Church of Christ, Scientist appeared in the federal *Census of Religious Bodies* for 1936, published by the Bureau of the Census, Washington. According to that compilation the number of persons in the Church of Christ, Scientist was 268,915. It does report the number of branches throughout the world, 3,200, a figure published in the *Yearbook of American Churches* for 1960.

The *Yearbook* reports "the latest information" that is available from the headquarters of the religious bodies.

Many denominations, however, do not publish figures annually. The information published in 1960 includes figures for probably more than half of the local parishes or congregations for the year 1958. A few of the reports are for the year 1936. Others are for recent years prior to 1958. The *Yearbook* lists a few bodies which compile figures and consistently decline to have them published, but these are not believed to be large bodies. These exceptions notwithstanding, the data officially reported to the *Yearbook* does account for all but a relatively small percentage of the persons claimed as members by the religious bodies.

WHAT IS A RELIGIOUS BODY?

The religious bodies for which the *Yearbook* has reported figures during recent years are virtually the same as those listed in the *Census of Religious Bodies*, 1936. Although the term religious body, or denomination, has never been strictly defined, the *Yearbook* lists those bodies which have been generally accepted through the years as separate denominations. These are characterized by more than one local unit, by a program broader than that of a local church, by a denominational literature, and by some method of ordaining or licensing clergy or leaders. There are many informal fellowships or associations that are more or less religiously oriented which are not regarded as denominations. These are not listed. The *Yearbook* also does not list groups commonly regarded in the United States as cults. And a few very small sects are omitted because documentary information is impossible to obtain.

The number of local churches reported by the 251 religious bodies was 309,449. This number refers to local organizations. It does not take into account buildings or houses of worship.

The number of local church buildings has not been compiled in recent years. In the *Census of Religious Bodies*, for 1906, 1916, 1926, and 1936, the number of local churches which reported buildings of their own consistently was about 90 per cent of the total number of churches. According to annual estimates made by the United States Department of Commerce, there has been a marked rise in expenditures for new religious buildings since World War II: from \$251,000,000 in 1948 to \$935,000,000 in 1959.

MEMBERS PER LOCAL CHURCH INCREASING

The average membership of the local church has been increasing for all religious bodies. Since 1926, the number of members per local church has increased about 50 per cent: from 235 in 1926 to 354 in 1958.

Among the 251 religious bodies reporting statistics for 1958 there were 82 with memberships of 50,000 or more. These had over 98 per cent of the total church membership. Thus there were 169 bodies with constituencies equal to only about 2 per cent of the total membership.

Data on age groups, sex, occupations, and attendance are seldom recorded locally and are not reported nationally by the religious bodies. It is also not reported what proportion of the members counted contribute money to their churches, or in what ways members are involved in local church life.

STATISTICS NOT STANDARDIZED

Can comparisons be made between the latest information and earlier statistics? What can be said about trends? Between 1890 and 1958 there were thirty compilations of church membership. Five of these were made by the

Bureau of the Census according to standardized methods. The other compilations were made by the *Christian Herald*, a periodical published in New York, and by the Federal Council of Churches and the National Council of Churches. The National Council has compiled the latest information annually since 1951. The difficulty is that the private compilations were not made by uniform methods. Because of the lack of uniformity and the irregularity with which figures are reported, there currently are no national statistics compiled by standardized methods. Thus no direct comparisons between religious bodies can be made on a national basis.

The federal religious censuses were made by means of standard forms mailed to the pastors and clerks of local congregations. The figures were summarized by denominations and were distributed by states, counties, and cities. The *Census of Religious Bodies* for 1926 is generally regarded as the most adequate book on church statistics ever published in the United States. The 1936 statistics were much less satisfactory. The Bureau of the Census stated that the census for that year was "incomplete." It seems that about 20 per cent of the local churches did not report to the Bureau even after a series of requests. The number of local churches recorded by the census was about 20 per cent lower than the number reported that year to the *Christian Herald*, which had collected figures in various previous years. The 1946 *Census of Religious Bodies* was begun but never completed owing to the refusal of Congress to make an appropriation sufficient for the project. In 1956 no recommendation was made to Congress by the administration concerning the matter, and no member of Congress appears to have been sufficiently interested to raise a question about it, and no official of a religious body appeared

before a congressional committee to request an appropriation for the purpose. Officials of religious bodies have occasionally made representations to the Bureau of the Census regarding the value of these projects.

As the censuses between 1906 and 1926 indicate, there has been a tendency on the part of some religious bodies to report on a more inclusive basis in the later as compared with the earlier years. Thus some of the alleged gains reflect in part changes in the method of reporting. It would appear, however, that there have been no major changes in the basis of reporting since the year 1926.

WHAT DEFINITIONS OF MEMBERSHIP?

Since the year 1926, the following seem to be the bases on which memberships are reported. The Eastern Orthodox Churches include all persons in the nationality or ethnic groups being served. The Jewish congregations regard as constituents all Jews in communities having congregations. The Roman Catholics count all baptized persons, including infants. Most Protestant bodies count only the persons who have attained full membership, and previous estimates have indicated that all but a small percentage of these are over thirteen years of age. The Lutheran bodies and the Protestant Episcopal Church, it should be noted, report all baptized persons rather than only those who have been confirmed and have attained full membership.

Another factor affecting membership statistics is the high mobility of the people during recent decades on local church records and record keeping. This is hardly documented at all. Church affiliation is a formal matter, and when people change their residences their local church affiliations are not automatically changed. Many persons mov-

ing from rural to urban areas have been commonly observed to retain their memberships in the rural churches for considerable periods. The same situation has recently been noted when people move from suburb to suburb, or from city to suburb. It may not be unusual, as a suburban minister recently remarked to the writer of this article, for a church to have 900 members on its rolls but not to have a mailing address for 200 of them.

Finally, about seventy religious bodies, including some that are large, have been reporting their memberships in round numbers which appear to be estimates.

SOME COMPARISONS

Because of the nature and the limitations of the data, a discussion of trends must be done with recognition of the inadequate sources for strict and direct comparisons.

In general, religious affiliations reported have been increasing more rapidly than the population. For example, total church membership as officially reported in the *Yearbook of American Churches* for 1960 has been estimated to include 36 per cent of the population in 1900 and 63 per cent in 1958.

Considering only the statistics of the larger groups, and referring as bases to the federal religious censuses of 1906 and 1926, some comparisons can be made.

In 1906 there were 35,068,058 members of bodies of all faiths, of whom 14,210,755, almost 40 per cent, were Roman Catholics. In 1958 there were recorded in the *Yearbook* 109,557,741 persons of all faiths. Of these, 39,509,508, or 36 per cent were Roman Catholics. Protestants in 1906 numbered 21,040,835 persons, or almost 60 per cent of the total of 35,068,058 persons as members of all faiths. In 1958 Prot-

estant Churches reported 61,504,669 persons, or 56 per cent of the total of 109,557,741 members of all faiths. In 1906 the number of persons neither Catholic nor Protestant was reported to be only about one half of 1 per cent of the total. During the interval the marked gains were registered by the Eastern Orthodox, who reported only 129,606 constituents in 1906, and 2,545,318 in 1958. The Jews, who reported only heads of families in 1906—101,457 persons—reported 5,500,000 persons in 1958, an estimate of the number of all Jews of all ages in communities having Jewish congregations. Both Roman Catholics and Protestants reported smaller proportions of the total religious affiliations in 1958 than in 1906, both being less by approximately 4 percentage points.

Over a shorter period, 1926 to 1958, the following comparisons can be made. Protestants numbered 31,511,701 persons in 1926 and were 27 per cent of the total population of the nation. In 1958 Protestants numbered 61,504,669 and were 35.5 per cent of the population. Roman Catholics numbered 18,605,005 in 1926, 16 per cent of the population; and 39,509,08, or 22.8 per cent of the population, in 1958.

For the period since 1950, we find that the Roman Catholics numbered 27,766,141 in 1950, according to the *Official Catholic Directory*, and 39,509,508 in 1958—a gain of over 42 per cent. Protestants, according to reports in the *Yearbook of American Churches*, numbered 50,021,960 in 1950 and 61,504,669 in 1958—a gain of 23 per cent. Thus the gains of the Roman Catholics have been generally more rapid than those of the Protestants since the year 1950.

TRENDS IN GROWTH

"The more conservative groups have had greater success in enlisting members

than have the more liberal groups,"¹ observes Richard C. Wolf, Associate Professor of Church History in the Oberlin Graduate School of Theology. For seven years Professor Wolf studied changes in American religious life. The article compares the 1906 statistics of church membership which appeared in the *Census of Religious Bodies* with statistics of fifty years later as reported by the religious bodies themselves.

During these fifty years the estimated population increased almost 100 per cent, while the officially reported church membership of all bodies in 1956—100,162,529—represented a gain of about 190 per cent over the 1906 figure of 35,068,058, which is the corrected figure published in the 1916 Census. In 1906, 186 denominations reported; in 1956, 258 reported.

The increases in membership in the large bodies and the large families of bodies have been pronounced. In 1956, eleven denominations and families of denominations, each with over 1,000,000 members, reported 92 per cent of all Christians; in 1906 these eleven bodies and families of denominations had 90 per cent of all Christians. There were sixteen Baptist denominations in 1906, and twenty-six in 1956; fifteen Methodist bodies in 1906, twenty-one in 1956; twenty-four Lutheran bodies in 1906, eighteen in 1956; four Eastern Churches in 1906, eighteen in 1956. Professor Wolf concludes that neither merger nor division seems to have a "definitive role in denominational growth." Nor does he find the growth explained by the type of organization or by the type of program. Considering the eleven large bodies and groups each with 1,000,000 or more members in 1956, and arranging them by rate of growth and by "theological mood," Professor Wolf finds that

¹ Richard C. Wolf, "Religious Trends in the United States," *Christianity Today*, April 27, 1959.

the more conservative bodies report by far the largest gains.

EXAMPLES CITED

Some examples of denominational growth should be cited. In the fifty-year period, the Churches of Christ, the Latter-day Saints, the Lutherans, the Baptists, and the Roman Catholics reported gains much above those of the Presbyterians, Methodists, Disciples of Christ, and the Congregationalists.

The Southern Baptists report a gain far in excess of the American Baptists, formerly the Northern Baptists. The Lutheran Church, Missouri Synod reports a gain above that of the United Lutheran Church. The Presbyterian Church in the United States, often called the Southern Church, reports a gain in excess of that of the United Presbyterian Church in the United States of America.

Adventists, Brethren, and Mennonites give figures showing gains far above those of the Friends, Universalists, and Unitarians.

Roman Catholic gains are below all of the following: consistently conservative Lutheran bodies, the Latter-day Saints, the Baptist bodies generally, the Churches of Christ, the Mennonites, and the Adventist bodies.

Professor Wolf concludes in these words: "Admittedly such statistical study cannot say anything precise about the relative impacts which the various denominations have made upon the nation's religious life. Nevertheless the study has value in the degree to which it throws light on some trends which have marked the American religious community, especially the Christian segment of that community, in the first half of the twentieth century."

VARIOUS INTERPRETATIONS

It has been said that the official figures on religious affiliation are of par-

ticular interest to church officials, to the common man, and to the newspapers of the nation. To church officials they appear to be related to the usual rivalry among institutions. It has been observed that the common man ordinarily thinks of religious institutions in terms of size. And the newspapers often publish figures as part of their discussions of an alleged revival of religion.

The figures here cited are viewed differently by many social scientists and by other professional persons, including clergymen and others working in the local churches. Social scientists frequently challenge the use of extensive church figures as evidence of the vitality of institutions. And ministers and specialists in religious education working in congregations often allege that many of the contacts of local church members with their institutions are superficial. There are also informed persons who observe that there has been more activity and more church growth in the suburbs of the nation and in the smaller cities than in rural areas or in the "inner sections" of the larger cities.

Two additional sources on religious affiliation should be noted: a church distribution study and a survey of a sample of the civilian population conducted by the Bureau of the Census. Data from 114 religious bodies for the year 1952 were published in a series of eighty bulletins entitled "Churches and Church Membership in the United States" by the National Council of Churches. These bulletins revealed a total membership of 74,125,462 persons in 182,856 local churches in the 114 religious bodies co-operating. Roman Catholic and Jewish figures were included along with figures for many large Protestant denominations. The large Negro Protestant bodies as well as many others, totaling 137 in number, were not studied because the figures were not obtainable for states, counties, and cities on a com-

parable basis. This study brought out significant differences between the metropolitan and the nonmetropolitan areas. Fifty-seven per cent of the people of the nation lived in metropolitan areas, according to the 1950 Census of Population. In these areas were found 46 per cent of the Protestants included in the study and 75 per cent of the Roman Catholics and all but a small percentage of the Jews. Forty-three per cent of the people lived in the nonmetropolitan areas. These included 54 per cent of the Protestants studied and 25 per cent of the Roman Catholic membership. On a regional basis, comparing denominational strength with population distribution, the Protestants were strongest in the South and weakest in the northeast; the Catholics were strongest in the northeast and weakest in the South.

A RECENT SURVEY

For several decades there has been an interest in the inclusion of a question on religion in the decennial Census of Population. In 1956 the Bureau of the Census began a consultation among many agencies concerning the inclusion of the question "What is your religion?" in the forthcoming population census of 1960. The question was tried in a few localities, and in March 1957 a sample of persons over fourteen years of age in 35,000 households in all parts of the nation were questioned. Officials of the Bureau of the Census indicated that if the question were used in 1960 it would probably be asked only of a sample of 20 per cent of the households enumerated.

Considerable discussion of the proposal ensued in church circles and elsewhere during 1957. Roman Catholic officials and press were, with one exception, in favor of the proposal; Jewish press and agencies, again with one exception, were opposed; Protestant offi-

cials and press were apparently sharply divided.² Religious liberty—the freedom of the individual in relation to the power of the government—was the overriding consideration among those opposed. A journal edited by Roman Catholic laymen, *The Commonweal*, New York, regarded the inclusion of the question as an invasion of privacy. *The Commonweal* seems to have been the lone Catholic dissenting voice.

Asking the question was favored by those who felt that there was some value in learning the religious leanings of the people by localities, states, and regions. It was opposed by some persons with experience in population surveys as of little value for research purposes because the replies would indicate both preference and affiliation with no distinction between them.

After careful study of the discussion, the Director of the Bureau of the Census issued a statement on December 12, 1957 to the effect that the Bureau would not ask a question on religion in the census of 1960. It was recognized at the time that a considerable number of persons would be reluctant to answer and the refusal to answer would be legally punishable. The value of statistics based on the question was not considered great enough to justify overriding such an attitude. Cost factors were also a consideration. In the statement it was also said that the decision did not preclude inclusion of the question in some later census or the publication of information obtained in voluntary surveys.

On February 2, 1958, the results of a voluntary inquiry appeared under the title *Religion Reported by the Civilian Population of the United States; March 1957*. Two out of every three persons fourteen years of age and over reported themselves as Protestants and one out

² Information Service of the National Council of Churches, Vol. 37, No. 6.

of every four as Roman Catholic. More women than men were reported for the major religious groups. Ninety-six per cent of the respondents reported a religion; 3 per cent stated that they had no religion; and 1 per cent made no report on religion. It was found that the more rural the community, the higher the proportion of Protestants;

the more urban the community the higher the percentage of Roman Catholics. About 100,000 persons were included in the sample. Figures were stated to be not comparable with the reports of the religious bodies, because the latter included only formal affiliation, while the survey of the population asked simply about religion.

Historic Waves of Religious Interest in America

By TIMOTHY L. SMITH

ABSTRACT: The current high prestige of religion has provoked a re-examination of earlier periods of spiritual awakening in America, but it has not yet produced any lessening of the traditional emphasis upon mass crusades conducted by professional evangelists. Most significant are four decades in American history—the 1790's, and 1850's, the ten years from 1895 to 1905, and the 1950's—when Christianity made major adjustments of thought and practice to cope with new social conditions. The latter three periods in particular differ from one another sufficiently to raise a question about attempts to generalize on the sociological conditions or the cyclical recurrence of religious revival. The awakening of the 1850's witnessed major attempts to apply Christian principles to the social needs of the growing new cities. That of the progressive era, perhaps similar in spirit but widely different in its forms, dealt with the amoral and revolutionary tendencies of industrial society. And the present groundswell of religious concern arises from a complex of factors whose kinship seems to be mostly one of timing. Industrialization seems to have created the kind of society in which stress along boundaries of social change increases rather than decreases man's need for clarification of the ultimate issues of life.

*Timothy L. Smith, Ph.D., is Professor of History and Chairman of the History Department at East Texas State College. A graduate of the University of Virginia and Harvard University, Dr. Smith is the author of *Revivalism and Social Reform in Mid-Nineteenth-Century America* (1957). He is currently taking a year's leave of absence, under a grant from the Fund for the Advancement of Education, to study the role of education in American history.*

GENERAL accounts of American religious history have traditionally emphasized three or four great periods of evangelical revival distinguished by the ministrations of outstanding pulpитеers. The "first great awakening" of the colonial era, in which the names of Jonathan Edwards and George Whitefield stand out, was succeeded by a time of spiritual declension in which rationalism, deism, and unitarianism prevailed.

A "second great awakening" began about 1800. Western campmeetings, revivals in Eastern colleges, and the new tract, Bible, and home mission societies broke the back of Deism, saved the frontier from "barbarism," and set the ship of state on course toward Christian harbors. Most students of the subject have viewed Charles G. Finney's evangelistic campaigns between 1828 and 1835 as the climax of this second awakening. After that, America's preoccupation with industrialization, westward expansion, the Mexican war, and the slavery fight seem to have undermined vital piety.

Dwight L. Moody's career began a third great epoch of revivals after the Civil War. Soon, however, a new kind of religious conviction, based as much on the new science as on the old revelation, replaced evangelical Christianity with the Social Gospel. Despite occasional later bursts of enthusiasm under such preachers as J. Wilbur Chapman and Billy Sunday, thoughtful observers concluded that the day of socially significant revivals had passed. Moral guidance would come instead from the behavioral scientists.

The eruption of what some have called the "fourth great awakening" in the decade now closing, however, revealed an unexpected persistence of piety on both popular and sophisticated levels. It has dramatized the need for a re-examination of previous waves of

religious concern. As yet, however, little has been done to disturb the traditional delineation of the historic cycles of revival or to direct attention away from professional evangelists to the role of what Franklin H. Littell calls "the whole people of God."¹

The aim of this brief essay is to underline important periods of religious interest which came about independently of the leadership of notable "soul winners" and in some cases in spite of them. I believe that from the vantage point of the inner life of the American faiths, Catholic, Protestant, and Jewish, religious ideas and practices have more or less steadily increased their hold upon American life since the 1790's. Overattention to the sensational events which periodically caught the public eye has distorted our view. Far more important were the major readjustments which popular piety made to social realities about once in every fifty years—in the 1790's, the 1850's, at the turn of the twentieth century, and in our own day.

Professional evangelists, after all, have proven an opportunistic breed, more apt to exploit than to create a new religious situation. They represent the bloom rather than the root of religious awakenings; and the fruit is sometimes bitter. William G. McLoughlin and Bernard A. Weisberger have recently made this fact clear to many of us; Burt Lancaster's

¹ See Will Herberg's chapter on "The Contemporary Upswing in Religion," *Protestant, Catholic, Jew: An Essay in American Religious Sociology* (rev. ed.; New York: 1960), pp. 46-72; William G. McLoughlin, *Modern Revivalism: Charles Grandison Finney to Billy Graham* (New York: 1959); Bernard A. Weisberger, *They Gathered at the River: the Story of the Great Revivalists and Their Impact upon Religion in America* (Boston: 1958); and the manuscript summary of Littell's address delivered at a series of conferences of American church historians in the winter and spring of 1959.

portrayal of Elmer Gantry will reach the rest.

PROBLEMS OF INTERPRETATION

One of the major problems facing historians seeking to understand recurrent waves of piety in America is the choice of evidence. For example, those who rely upon contemporary newspapers are apt to be misled by their tendency to report only those events which affect matters of immediate public concern or which are intrinsically sensational. News of the awakening which swept through both the Northern and Southern armies during the Civil War, for example, filled space in the public press far out of proportion to actual accomplishments.² Fifty years later, Billy Sunday's pulpits with the devil made excellent news copy; but reporters' accounts afford little insight into the total evangelistic effort of the American churches in the decade of World War I. If, on the other hand, one surveys year by year the literature issued by churchmen themselves, a clearer picture emerges. But there also emerges the risk of bogging down in materials which pay relatively little attention to the social impact of spiritual fervor.

Another central historiographic problem arises from the effort to relate religious innovations to issues of class, status, and power. Historians once traced the western phase of the second great awakening to a spontaneous and perhaps psychopathic flight of the frontiersman from unnatural isolation. Now it appears, from the writings of Sidney E. Mead, Ray Allen Billington, and Clifford S. Griffin, that religious and political conservatives seized control of that movement in order to bridle ramp-

² See Lemuel Moss, *Annals of the United States Christian Commission* (Philadelphia: 1868); and W. W. Bennett, *A Narrative of the Great Revival Which Prevailed in the Southern Army . . .* (Philadelphia: 1877).

ant democracy. Federalism, Calvinism, and Whiggery, best personified in the Reverend Lyman Beecher, were the keel, rudder, and sail of the ship of Zion, we are told; the Holy Spirit provided only the wind.³

Use as opiate

Two unpublished studies of the "prayer meeting" revival of 1857 and 1858 have documented Theodore Parker's charge that businessmen promoted it with the aim of diverting the people's attention from their moral duty to the slave.⁴ Similarly, William McLoughlin stresses the evidence of what he believes was the pressure of business interests upon evangelists Sam Jones and Billy Sunday to reject the "godless social service nonsense" of Christian progressivism and to confine their social message to the questions of prohibition and American nationalism.⁵ All of these support to some degree Karl Marx's comment that the capitalist class used spiritual religion as an opiate, to deaden the people's outrage at injustice and exploitation.

Psychic need

A related question is whether periods of unusual fervor reflect simply one of

⁵ See McLoughlin, *Modern Revivalism*, pp. 298-99, 397-99, and *passim*.

several responses to widespread social tension. During all of our great wars, for example, reverence for things divine has increased sharply among all classes and at all levels of sophistication. Not only isolation but the newness of their social surroundings impelled Kentuckians to the emotional outburst of 1800-1802. They were endeavoring to form stable relationships with people they had not known before, amidst every kind of conflict over land, custom, and liberty. A few became frontier philosophers, but many more fell under the power of primitive religious experience. Later on, mass immigration from Europe in the 1840's and 1850's created another kind of ecological frontier, the urban slum, and the spiritual results were analogous.

Much other evidence suggests that localized awakenings were but the crackling sounds of stress within the leading edge of change. Richard Hofstadter has explained how the "psychic crisis" of the 1890's undergirded populism and imperialism and laid the foundations of the progressive movement. It also sustained in the movement for social Christianity a powerful outburst of religious fervor, different from previous ones, to be sure, but nonetheless organically bound up with everyday realities. Another illustration is the growth after 1920 of the small revivalist sects. They occupied the social no-man's land separating the old residents of cities and towns from those newly come from the countryside.

TWO CRUCIAL DECADES

Wesley M. Gewehr long ago described the extension of the colonial "great awakening" to Virginia in the period between 1770 and 1800. Especially in the 1790's it laid the groundwork in thought and feeling and tested the methods of evangelism which Method-

ist, Baptist, and Presbyterian preachers exploited fully in both colleges and campmeetings during the "great Western revival" of the following decades. Not least important was Bishop Francis Asbury's development of the circuit-rider system. Thus, in the period when the popularity of Tom Paine and Tom Jefferson seemed to the pious an omen of national apostasy, Protestantism made the fundamental adjustments of organization and simplifications of doctrine which were necessary to carry the gospel to the rootless and mobile frontiersmen.⁶

Pastoral evangelism

Similarly, Charles C. Cole and I have recently published studies of the mid-nineteenth-century era which depict a basic reorientation of American evangelical faith to the task of Christianizing an increasingly urban culture. True, the fortunes of individual revivalists declined after Charles G. Finney left New York for the wilderness at Oberlin. But the system of voluntary church membership and support, which is the chief factor distinguishing American Christianity from that of Europe, required every pastor to be an evangelist. Albert Barnes in Philadelphia, Edward Norris Kirk at Mount Vernon Church in Boston, and George B. Cheever at the Church of the Pilgrims in New York seemed more memorable than individual Methodist clergymen only from the fact that their terms in a single pulpit covered a lifetime.

By 1850, evangelical religion had attained an eminence which Europeans used to the state-church system found

⁶ Wesley M. Gewehr, *The Great Awakening in Virginia* (Durham, N. C.: 1930); Barton W. Stone, "A Short History of the Life of Barton W. Stone" . . . in Rhodes Thompson, comp., *Voices from Cane Ridge* (St. Louis, Missouri: 1954), pp. 36-52.

almost unbelievable. Leading periodicals published under Congregational, Baptist, New School Presbyterian, and American Lutheran auspices promoted earnest soul-winning as a means to usher in the Kingdom of God and raised questions at the same time about professional evangelists. Revivalist pastors played key roles in the establishment of scores of colleges, including not only Oberlin, Knox, and Illinois, but also Andover, Amherst, and Mt. Holyoke, Gettysburg, Wittenberg, and Western Reserve, Rensselaer, Colgate, and Rochester, and Illinois, Connecticut, and Ohio Wesleyan. They were the chief supporters as well of the interdenominational tract, Bible, and home missionary societies, and of the Evangelical Alliance, America's first venture in ecumenical organization.⁷

Humanitarianism

It is difficult but necessary for modern students to realize that in this epoch pastors who adopted the new revival measures were also devoted to progressive theology and humanitarian reform. Only thus could they have won the support of so many, both in and outside the churches, who wished Christianity to become a dynamic force for the perfection of human society. Particularly important is the fact that Eastern and urban pastors now led the way in activities once more characteristic of the frontier. They were particularly concerned with ways to evangelize the impoverished immigrants in the slums. A major purpose was to make Protestants of Catholics, to be sure. But the attempt required them to recognize that they had an urban civic duty as well.

⁷ See Timothy L. Smith, *Revivalism and Social Reform in Mid-Nineteenth-Century America* (New York: 1957), pp. 37-38, 59-62, 219-24, and *passim*; and Charles C. Cole, Jr., *The Social Ideas of the Northern Evangelists, 1826-1860* (New York: 1954).

THE CHALLENGE OF THE CITY

In September 1856, the New York Sunday School Union allocated to churches of every denomination responsibility to visit homes and organize mission Sunday schools in a destitute area of the metropolis. The plan caught the imagination of key laymen. By the following spring two thousand visitors, working in teams of two for each block, were blanketing the city with weekly visits to every home that had no church affiliation. They provided material relief on an individual basis wherever they found a need. The idea spread rapidly to other communities, notably Philadelphia, Brooklyn, Hartford, and Buffalo. That a year of great revival followed in the winter of 1857-58 should be no surprise. A working laity rapidly developed the necessary attitudes of concern and expectancy. They had experienced the emotional shock of exposure to raw human suffering, and they brought new grist to the mill.

Revival of 1858

Methodist, Baptist, Congregationalist, and New School Presbyterian churches provided most of the lay leadership of the noonday prayer meetings which swept over the cities of America after January 1858. Remarkably enough, however, "Old School" Calvinist pastors found their laymen also swept along in the popular tide. Even Episcopal and Unitarian congregations were deeply affected. At Harvard, Frederick Dan Huntington, leader of the "evangelical" wing of Unitarians, held weekly meetings for prayer and testimony in Appleton Chapel. He announced his conversion to Trinitarianism in 1859.

Succeeding years brought no reaction at all against revivalism. On the contrary, ministers of many denominations united to promote city-wide campaigns and other interchurch activities which

extended the movement to groups previously untouched. Most notable, perhaps, was the work in cities of the Young Men's Christian Association and the American Sunday School Union. A companion organization, the United States Christian Commission, evangelized the Northern armies during the Civil War. Dwight Moody was in fact the heir of this revival movement. In some ways he betrayed it by his determination to exclude from his preaching all reference to social issues.⁸

Eminent divinity

Many observers bore witness to the profound revolution which had taken place in the status of evangelical Protestantism. When Charles G. Finney returned to Boston for union meetings at Park Street Church in 1858, the Reverend Edward E. Hale, Unitarian pastor at the South Church, welcomed him heartily. "He believes, as we believe," Hale wrote, "that the tide of the Spirit is always at high water. And so, in his own side of the church, they criticize him, and his, as much as they dare, as 'Perfectionist.'" Hale went on to declare that the doctrine beneath Finney's language was the one from which the Old Calvinism was to meet its doom. "It is the Quaker doctrine, the Methodist doctrine, the Ultra-Unitarian doctrine, the Transcendental doctrine—that God is, every moment, with every child, in a union so close that nothing can be compared with it." Another Unitarian pastor, James Freeman Clarke, rejoiced meanwhile that under the influence of the revival the churches were rising "out of dogmas into the life of the Spirit," where new manifestations of "liberality of opinion and practical

⁸ See Weisberger, *They Gathered at the River*, pp. 175-219, for a sympathetic but penetrating account of Moody's career; and Smith, *Revivalism and Social Reform*, pp. 63-79, 100-101.

goodness" would add strength to their common bonds.⁹

Travelers from Europe who visited America during the decade were convinced, as Isabella Bird Bishop said, that "the transformation of society into the kingdom of Christ" was to be the great work of the American churches. As compared with the nation's preachers, a writer in *The Atlantic Monthly* declared, "no class has such opportunities for influence, such means of power." The vast sums given by laymen to erect new church buildings, the handsome salaries of urban pastors, the tremendous multiplication of church colleges and periodicals, and the new friendliness toward religion by men in political life were all marks of that decade's flood tide.¹⁰

New Protestantism

What made the era most significant, however, was the completion of the decades-long task of remolding American Protestantism to meet the needs of a new age. Lay participation and control in the spiritual and ecclesiastical work of the churches expanded rapidly at the expense of the traditional predominance of the clergy. The spirit of interdenominational brotherhood swiftly replaced sectarian bigotry, and ethical concerns displaced dogmatic zeal in evangelical preaching and writing. Equally important, the Arminian view that all men could be saved by freely accepting God's gift of grace undermined the Old Orthodoxy so fully that few besides conservative Presbyterians would admit they were Calvinist at all.

⁹ *The Watchman and Reflector*, April 15, 1858, quoted Hale's sermon at length; see also James F. Clarke, "The Revival," *The Monthly Religious Magazine*, Vol. 19 (1858), p. 351.

¹⁰ Isabella (Bird) Bishop, *The Aspect of Religion in the United States* . . . (London: 1859), 188-89; *The Atlantic Monthly*, Vol. 1 (1858), pp. 862-63.

An older generation of historians interpreted all the major movements of the antebellum era—the extension of democracy, the growth of public education, utopianism, the antislavery crusade, and literary transcendentalism—as essentially reactions from traditional piety in favor of secular humanitarianism. The evidence demonstrates, however, that concern for the common man was as central in religion as in politics. Churchmen led the way in establishing academies and common schools, not so much in opposition as in anticipation of laws providing state support for public education. Christian millennialism, as displayed in the writings of Edward Beecher, Charles G. Finney, and Gilbert Haven, reawakened the Puritan dream of a holy community and applied it to the entire nation, contributing at least as much to the American heritage of hope as the secular utopianism of Robert Owen and Frances Wright. On the antislavery front, Theodore Dwight Weld, George B. Cheever, and Orange Scott wielded a gospel sword whose cutting force was greater than Garrison's. And Methodist perfectionism, spilling over rapidly into the Congregationalist, Presbyterian, and Baptist communions, proclaimed a transcendentalist platform which stood foursquare on the Rock of Ages, and thus reached plain men in a way Emerson could not.¹¹

Powell, *The Movement for Industrial Education and the Establishment of the University, 1840-1870*, *Semi-Centennial History of Illinois*, Vol. 1 (Urbana, Illinois: 1918), 159 ff.; Harry E. Pratt, "Peter Cartwright and the Cause of Education," *Illinois State Historical Society Journal*, Vol. 28 (1935-1936), pp. 271-78; and Society for the Promotion of Collegiate and Theological Education at the West, "Memorandum Book, 1843-46" (manuscript, Houghton Library, Harvard University), pp. 126-234.

THE PROGRESSIVE MOVEMENT

We may now profitably shift our attention to another crucial decade, 1895 to 1905. No professional evangelist towered over these years. Moody's star was setting, and Billy Sunday was still relatively unknown. Yet the religious view of life was a central feature in every part of the movement for reform which we call progressivism.

Broad Christian commitment

In no other decade between the Civil War and the 1950's was the public commitment of the American people to "Christian" standards greater. Consider the attacks on the evils of monopoly, corrupt municipal government and slum housing; the concern for the welfare of the immigrant, the Indian, the Negro, and the indigent native-born; the new solicitude for children displayed in efforts to establish playgrounds, kindergartens, and juvenile courts, to promote progressive schools and visiting nurse's associations, and to secure the passage of laws outlawing child labor and regulating the employment of women; and, finally, the assumption of the "white man's burden" of civilizing and "Christianizing" primitive people beyond the nation's shores. In state legislatures and theological seminaries, in the new organizations devoted to human brotherhood and Christian socialism, and in the fashioning of the Federal Council of Churches of Christ in America, a morality which was older and more Christian than the Gospel of Wealth prevailed. The careers of a trio of women, Ida Tarbell, Jane Addams, and Frances Willard, perhaps illustrate best the way in which old-fashioned principles contended with the amoral tendencies of industrialization.

In any other generation the action of

the Democrats in three times nominating for the presidency a Christian pacifist and evangelical, William Jennings Bryan, would have been incredible. The same is true of what happened in 1912, when the most liberal wing of Republicans bolted their party to seek the reelection of Theodore Roosevelt. Their convention went delirious singing "Onward Christian Soldiers" and, to the tune of an old revival hymn, "Follow, follow, we will follow Roosevelt."¹²

Achievement of peaceful reform

The spiritual crisis of the turn of the century seemed to contemporaries as deep as that of the 1850's. Conscience had won out over interest in the previous one, but only by violence. In the intervening years man's inhumanity to man had taken on new forms. Monopolists in the oil, steel, and meat-packing business defended themselves by brazen appeal to a religion of success. The merciless exactions of tenement-house landlords exceeded only in degree the exploitation of new immigrants by political bosses who were sons of the old. The refusal of English and American-born skilled workmen to identify themselves with the aspirations of the laboring class at large weakened the position of all workingmen. No defense is implied here, either, of the sentimentality, the frequent ignorance of social forces, and the insecurity about their status which thrust middle-class Protestants into the progressive movement.

The gains in retrospect seem small, but they came this time not through violence but by legislation and voluntary action. Religionists can scarcely be ashamed of an era when faith helped

¹² See Richard Hofstadter, *The Age of Reform: Bryan to F. D. R.* (New York: 1954); and Lawrence Cremin, "The Origin of Progressive Education," *The Educational Forum*, Vol. 24, no. 2 (January 1960), pp. 133-40.

set the pattern of peaceful reform which has proven the twentieth century's best answer to the challenge of communism.¹³

Intellectual synthesis

Perhaps the best explanation for the success of the progressive movement is that it allied an intellectual elite whose inspiration came from reform Darwinism with an army of preachers, school-teachers, and social workers whose guiding light was social Christianity. Both groups rejected the reactionary Gospel of Wealth and the social Darwinism which sustained it.¹⁴

Although the first rumblings of fundamentalist reaction on the one hand and of positivist social science on the other indicated some sand in the gearbox, the rank and file clung to the belief that science and education, Christianity and democracy, were reciprocating cylinders in the engine of progress. They justified virtually every kind of "progressive" activity in terms of both William James's psychology and Charles M. Sheldon's Christianity. So appealing was the synthesis to the popular religious mind that, as William G. McLoughlin points out, even professional evangelists found it necessary to pay lip service to reform. Billy Sunday frequently volunteered that he supported "progressive orthodoxy" in religion, "Christian social service" in reform, and Theodore Roosevelt in politics!¹⁵

¹³ See, for example, Marc Karson's discussion of the role of Roman Catholicism in the labor movement in *American Labor Unions and Politics, 1900-1918* (Carbondale, Illinois: 1948), chapter 9.

¹⁴ See, generally, Richard C. Hofstadter, *Social Darwinism in American Thought* (rev. ed., New York: 1959); Ira Brown, *Lyman Abbott, Christian Evolutionist* (Cambridge: 1953); and Charles Howard Hopkins, *The Rise of the Social Gospel in American Protestantism, 1865-1918* (New Haven: 1940).

¹⁵ McLoughlin, *Modern Revivalism*, pp. 364-99, 402.

Discord and particularism

By 1925, the fragmentation of the progressive synthesis, pathetically symbolized at the Scopes trial, was complete. The irreligion of the jazz age may, however, have been more superficial than real. Surely, the young writers and poets were in rebellion. The social scientists embraced behaviorism, eugenics, and Freud, and eliminated preachers and welfare workers from their councils. Fundamentalist Protestants organized crusades against evolution and joined the Ku Klux Klan.¹⁶ But the result was not so much to destroy as to regroup the forces of religion. Roman Catholics, for example, turned to their church with new fervor, partly from anxiety that Americans seemed intent upon keeping them strangers in the land. The flourishing growth of holiness and pentecostal sects was an omen of the future: the Protestant working class could not give up its faith. And out of the discord over what was true in religion emerged a great concern for preservation of the truth in particular religions.

THE PRESENT RESURGENCE

By comparison with these previous decades of awakening, today's rebirth of the prestige of piety seems unique indeed. Just to identify its obviously new facets is sufficient to nullify superficial generalizations about sociological laws and religious cycles. One is the wholesale return of third-generation descendants of European immigrants to the faith of their grandparents. Will Herberg has explained how the second generation's rejection of the concept of the ethnic community left a void which a broadly inclusive identification with

¹⁶ See Henry F. May, "Shifting Perspectives on the 1920's," *Mississippi Valley Historical Review*, Vol. 43 (December 1956), pp. 405-27.

Catholic or Jewish faith now fills.¹⁷ Another is the amazing assertion of the religious spirit in the Negro's nonviolent "stride toward freedom." The sit-in movement displays a radically different motivation and pattern of behavior than liberal "Negro leaders" of an older generation expected. Conservative Southern whites find it equally mystifying. Hymn-singing and martyrdom bid fair to work the social revolution which agitation and political pressure could not, despite everything which critics of "Christian reform" have said.

New intellectual climate

In the worlds of literature and philosophy, meanwhile, the intellectual crisis which psychoanalysis and the new social science provoked in the 1920's produced quite another breed of religious prophet. Long before evangelical Christians heeded Billy Graham, intellectuals were listening to T. S. Eliot and Reinhold Niebuhr. Writers like William Faulkner and Eugene O'Neill had only questions to offer, not answers, of course. But honest questions serve far better to promote a religious awakening than answers which merely paper over cracks in the wall.

New, also, is the shape of the theological, social, and ideological issues which set the stage for mid-twentieth century piety. The amazing victory of militant neo-orthodoxy over modernism, both in the seminaries and at the centers of administrative power in the great denominations, was won in only fifteen years after 1940. It fundamentally altered the pattern of Protestant thought and life. Only thirty years ago, Reinhold Niebuhr's prophetic call to a theology grounded in the mystery of Biblical revelation and looking to a redemption not within but beyond history, seemed an unintelligible shout in the

¹⁷ Herberg, *Protestant, Catholic, Jew*, pp. 31, 47, 153.

dark. Soon, however, morally concerned intellectuals found the neo-orthodox reconstruction of Christianity a tonic to their souls. It was surprisingly analogous to that which fundamentalist revivalists offered beaten men and women in store-front churches across the land.

Novel social stimuli

Although previous wars had contributed their part to religious awakenings, the staggering dimensions of World War II combined with the creation of atomic weapons to produce a new sort of social crisis. It called for many kinds of religious answer. Not the least of several expressions of militant pacifism, for example, was the renunciation of nationalism and war which Jehovah's Witnesses believed to be the path to the Kingdom of God.

Meanwhile, on a different plane, the new "red scare" played a part. In the popular mind, the conflict between communism and capitalism was clearly reducible to a "spiritual" interpretation. That Christians on this account often ignored the economic facts of international life in their preoccupation with the so-called "battle for the minds of men" does not diminish the significance of this factor in the current wave of religious concern.

Finally, and altogether unpredictably, the divorce of religion from instruction in the public schools, including especially the high schools where the meaning of modern science should have been seriously studied, has succeeded less in clearing the way for secular ideology than in preserving in a compartment isolated from scientific scrutiny the heritage of evangelical faith. The exclusion of the Bible and religious observances, which fundamentalists believed was a threat to traditional piety, has turned out, perhaps more alarmingly, to have restricted the incorporation of the scientific outlook into the American child's

real world. A contest with God, home, and mother, as every politician knows, is a hard one to win.

Basic sources

Of course, influences familiar in past awakenings have contributed to the current one. Undoubtedly the most important of these is the persistence of the old-time religion among the mass of ordinary men. Professor McLoughlin has told this story in terms of the growth of fundamentalism. If one is looking specifically for the background to Billy Graham's success, the point is important. Even Graham's supporters, however, come from a much wider band on the Protestant spectrum. Who can say that theories about the premillennial return of Christ, the substitutionary atonement, and the verbal inerrancy of the scriptures are really their dominant concern?

The truth is that fundamentalism, like previous popular reconstructions of Christian ideology, draws its real strength from the common ideas of sin and forgiveness, love and duty, death and resurrection, which have been handed down from father to son and mother to daughter from generation to generation. In this respect, there is little difference between Protestant and Roman Catholic piety. Not the inerrancy of scriptures, but the sense of divine sovereignty; not the virgin birth, but the need of a new birth; not the Second Coming, but an awareness of immanent judgment are the spiritual forces which repeatedly drive men back to their gods.

CONCLUSIONS

In conclusion, then, the main factors common to the recurrent cycles of religious interest which this essay describes have been tensions resulting from rapid social change, the determination of large numbers of religious leaders to do some-

thing about them, and the persistence among the mass of ordinary men of the simple ideas of evangelical religion. It seems reasonable to suppose that if the pace of social revolution continues to accelerate in the ratio characteristic of the last one-hundred years, the strain upon individuals will drive them to a continuing exploration of the ultimate issues of life, whether in the name of "religion" or not.

Ironically enough from the standpoint

of the Marxists, industrialization may turn out to unveil more the spiritual than the economic nature of man, precisely because it supplies physical needs so well while taxing spiritual resources to the breaking point. Is it not true that in the last ten years more than any other men have sought for that brotherhood which would bind them together in mutual awe and reverence toward one another, and toward the ultimate concerns of their lives?

Theology and the Present-Day Revival

By SYDNEY E. AHLSTROM

ABSTRACT: The current upsurge of interest in religion in the United States is two-fold: popular and theological. The locus of religious thought has shifted in the twentieth century from Europe to the United States, and the present religious revival is distinguished from earlier ones by the activity of a significant number of first-rate intellectuals contributing to a renewed theology and a fresh philosophy of religion. Neo-orthodoxy among theologians, ecumenicalism among churches, and a religious curiosity on all levels are major aspects of the contemporary situation. The reinvigoration of theology now underway in the United States represents a confluence of many streams of religious thought: an existential idealism begun in Europe; the philosophical and ethical lessons of Plato, Aristotle, and the classic Stoics; a concept of creative dialogue with the world, society, and culture springing from nineteenth-century liberalism; the demythologizing of the Scriptures; an approach to dogmatics which does not dismiss philosophical issues; and an insistence upon an ethic which is Christocentric, theologically oriented, and biblically grounded but also relevant to the situation of the contemporary individual.—Ed.

Sydney E. Ahlstrom, Ph.D., New Haven, Connecticut, is Associate Professor of American Church History at Yale University where he combines teaching in American History, American Studies, and in the Divinity School. Between 1952 and 1954 he was an instructor in history at Harvard University where he received his doctorate in American History in 1951. He has published articles and essays on American religious history, and he is currently completing a history of American religion.

WHEN we search for an event which clearly marks the beginning of the "contemporary" period in American Christianity, none serves so well as the Great Depression. In Europe Jacob Burckhardt had shuddered even in 1871 with premonitions of a world governed by *terribles simplificateurs*, "a fixed and supervised stint of misery, glorified by promotions and uniforms, daily begun and ended to the sound of drums."¹ Kierkegaard, and Dostoevsky before him and Nietzsche after him, had similar premonitions. When the armistice came in 1918 to a torn and blanched continent, a number of uncommonly prescient men perceived both the collapse of the political order and a crisis of Western civilization.²

But to the United States of "Only Yesterday" all this was strange and unnecessarily grim. The war had been "Over There," a vivid adventure for most Americans and soon a redolent memory. The failure of the peace became chiefly an excuse for both political and theological isolationism. The influence of the churches fell to its lowest ebb. The liberals took new and more daring theological and biblical positions, to which the fundamentalists responded with horror and righteous wrath; the "Monkey Trial" in Dayton, Tennessee, provided the most spectacular religious news of the postwar decade. Walter Rauschenbusch and Washington Glad-den died in 1918; the temperance movement and pacifism became surrogates for the Social Gospel. For most churches it was the heyday of the lawn social. Fleeing a fictional Elmer Gantry and a very much alive Bruce Barton, the intellectuals abandoned the Church in droves, with H. L. Mencken piping the

tune. By almost every legitimate canon of measurement the great depression came upon religion during the booming but troubled Twenties.

NEO-ORTHODOXY

Yet, in a certain sense, even this era had its "underground men" quietly developing a revulsion for the culture-protestantism in which both liberals and conservatives seemed to be conspiring to rob the Christian message of relevance and prophetic content. H. Richard Niebuhr brought his thought to focus in 1929 with trenchant reflections on *The Social Sources of Denominationalism*. He called attention to the problems of human historicity in a way that confounded the reigning traditions of theological liberalism without giving any facile consolation to its enemies.³ Before Niebuhr's work appeared in print, Douglas Horton had already found Karl Barth's *Das Wort Gottes und Die Theologie* on the Harvard Divinity School's new book shelf, and Horton immediately undertook the translation of Barth into English. In 1957 he looked back on that event—which in a literary sense marks a turning point in American theology:

Only those who are old enough to remember the particular kind of desiccated humanism, almost empty of other-worldly content, which prevailed in many Protestant areas in the early decades of this century, can understand the surprise, the joy, the refreshment which would have been brought by the book to the ordinary and, like myself, somewhat desultory reader of the religious literature of the time.⁴

² Ludwig Wittgenstein, Oswald Spengler, and Karl Barth each signed the prefaces to epoch-marking books in 1918.

Events and crises

After 1928 and 1929 theological events both literary and personal occur with increasing rapidity, with the harsh noise of the Crash hastening the process. The year 1932 marked the passing of the old order in more ways than one. The acute realism of Reinhold Niebuhr's *Moral Man and Immoral Society* and H. R. Niebuhr's translation of Paul Tillich's *The Religious Situation* ruffled the placid waters of liberal social Christianity and because both works were conceived on the borderlands of secular and religious concern, they reached a new kind of American audience. Speaking more directly to the Church in that year was Walter Lowrie's long-gestated demand that we give heed to the "theology of crisis."⁵ A close acquaintance with Albert Schweitzer's *Quest of the Historical Jesus* (1906) and cognate works was readily apparent in his impassioned analysis; and his emphasis clearly foreshadowed a lifetime's preoccupation with making Kierkegaard known to the English-speaking world. The theological *annus mirabilis* came in 1934 when a half-dozen major works made neo-orthodoxy a self-conscious movement of Christian thought, drawing deeply from traditions that had been spurned for two centuries, invigorated by fresh concern for the biblical message, and determined to speak relevantly to the total human situation. Edwin Lewis issued a *Christian Manifesto*, Walter M. Horton struggled to formulate a *Realistic Theology*, Reinhold Niebuhr published *Reflections on the End of an Era* and turned to *An Interpretation of Christian Ethics*, George W. Richards found *Beyond Fundamentalism and Modernism*, *The Gospel of God* and joined with Elmer G. Homrig-

⁵ Walter Lowrie, *Our Concern with the Theology of Crisis* (Boston, 1932).

hausen to edit a volume of Barth's sermons. Nearly every one of these men, moreover, described or documented a critical turning point in his own life and thinking. Like many other liberals of their generation, they moved, as Richards said—in a statement that also reveals the degree to which this stream of thought had German as its *lingua franca*—"from Schleiermacher, Ritschl, and Troeltsch to Kierkegaard and Barth." Before Reinhold Niebuhr delivered his Gifford Lectures on *The Nature and Destiny of Man* in a world darkened by war, the theologians were also responding to another grisly phenomenon: the atavistic barbarities of Adolf Hitler. But with National Socialism there also came the "Barmen Declaration" and the heroism of a "confessing church" in Germany. In 1936 Sverre Norborg of Norway sent an "unpretentious book . . . across the Atlantic as a greeting from a continent in fatal crisis . . . a greeting from the *Unknown Europe*, hidden from the shrieking headlines of newspapers, living its rich and victorious life, whatever befalls it."

That Unknown Europe [he said] is the living communion of believers throughout all the nations of what seems to be a dying continent. . . . They have not been "re-thinking" Christianity, or been busy remodelling its message. They have *heard* a Word, coming from the Other Side of mere human possibilities.⁶

In the meetings and committees of the ecumenical movement these interchanges were deepened.

Upsurge in America

It would be impossible here to recount in detail or even in outline how during the next few years a new theological

⁶ Sverre Norborg, *What is Christianity* (Minneapolis, 1936), pp. vii-viii.

temper made itself felt in America.⁷ The process was a complex one. Books and men that had been ignored during the Twenties took on new significance; other new thinkers were found for the first time; and still others arrived in person. Paul Tillich's American career began at Union Theological Seminary in 1933-34. Many diverse trends of thought came to a focus: Russian, Berdjaev; Spanish, Unamuno; Swedish, Nygren and Aulén; English, Forsythe and Temple; French, Marcel, Maury, and Maritain; German, Heim and Gogarten; and pre-eminently two Swiss thinkers, Emil Brunner and Karl Barth. The two books which best clarify to even the most unprepared mind the nature of these exciting new theological currents are Barth's commentary on *The Epistle to the Romans* and the work translated by Dr. Horton which was mentioned above. It was the intense, existential message of the young Barth that put its indelible imprint on American neo-orthodoxy. Other "discoveries" followed: Kierkegaard, Pascal, Luther, Calvin, and Augustine; and beneath all came a re-entry into the strange world of the Bible. The biblical world was entered not just to seek the religion or social teachings of Jesus or the prophet Amos, but to apprehend the evangel, the kerygma, the proclamation of the gospel, the good news of God to his covenant people. Gradually men even became aware of how the message of Christian hope was as meaningful to twentieth-century Christians as it had been for those who were nourished by

⁷ For more detail, see my "Continental Influence on American Christian Thought since World War I," *Church History*, Vol. 27 (Sept. 1958). On both liberalism and its critics, see H. S. Smith, *Changing Conceptions of Original Sin* (New York, 1955); John Dillenberger and Claude Welch, *Protestant Christianity* (New York, 1954) and C. F. H. Henry, *Fifty Years of Protestant Theology* (Boston, 1950).

the New Testament Apocalypse under the persecution of Domitian.

New biblical emphasis

Quite aside from various superficial readings "from Luther to Hitler," the "Luther renaissance" and later a "Calvin renaissance" began to change the academic approach to the Scriptures even in the old liberal bastions where biblical research had become merely an ancillary aspect of Near-Eastern and Hellenistic studies. Genesis gradually ceased to be a hornets' nest of the Fundamentalist Controversy and—without the slightest abandonment of historical research and scientific textual criticism—became a foundation stone for a Christian's theological understanding of the world. Thanks to Kierkegaard, the account of Abraham and Isaac on Mount Moriah far from being an immoral vestige of primitivism came to reveal a whole dimension of the religious life. The Gospels were untangled from the synoptic and Johannine problems to allow a concern for the gospel, and St. Paul was restored to the canon as something more than the villain who twisted the pure religion of Jesus into an Hellenistic mystery cult. Yet, again, there was no inclination in either case to repudiate historical methods or findings. Indeed, it must be emphasized at this point that one major feature of neo-orthodox thinking was its complete willingness to join contemporary philosophical discussion, to share the liberal respect for scientific endeavor, and to accept and extend the nineteenth century's massive tradition of religious scholarship. Along these lines the neo-orthodox departure proceeded down to and, with explicitly reduced impact, during the Second World War. It was not a monolithic orthodoxy but a renewal with latent tendencies by no means visible when the war

post-Civil War period it probably achieved little more than surface effects on the basic pattern of American religious growth. Even after World War I when professional mass-manipulation of the Billy Sunday variety suffered a decline, revivalism of a less pretentious sort continued unabated in the small towns, in the urban rescue missions, among countless sects, and in individual congregations of the revivalistic denominations. In general, therefore, it is far more important to perceive the continuing impact of revivalistic Protestantism than to emphasize great oscillations in American religious activity.¹²

Recent popular trends

Having duly emphasized this point, one may cautiously concede that during the Twenties American Protestantism suffered a decline which continued after 1929.¹³ Contributions for missions and benevolences were declining despite the prosperity. Church-going and membership declined as well. During the later 1930's, however, the membership losses sustained by American churches during the darkest days of the Depression were gradually recouped and the rate of expansion prevailing since the Civil War was resumed. Then after the Second World War there did, undeniably, occur a surge of piety, an upswing in religion or a revival of interest in religion as it has been variously termed. Martin E. Marty, who has most trenchantly described *The New Shape of American*

¹² See Timothy L. Smith, *Revivalism and Social Reform* (Nashville, 1957); B. A. Weisberger, *They Gathered at the River* (Boston, 1958); W. G. McLoughlin, *Modern Revivalism* (New York, 1959) and *Billy Sunday Was His Real Name* (Chicago, 1955); and the essays of S. E. Mead and R. S. Michaelsen in H. R. Niebuhr and D. D. Williams (Editors), *The Ministry in Historical Perspectives* (New York, 1956).

¹³ Robert T. Handy, "The American Religious Depression, 1925-35," *Church History*, Vol. 29 (March 1960).

Religion, finds this latest revival beginning in the late 1940's and noticeably ebbing in the late 1950's; but he takes great pains to distinguish it sharply from the older revival tradition that runs from Jonathan Edwards down to Billy Sunday, and he means down. "Since World War II," he says, "we have been witnessing the first great awakening not of mainstream Protestant Christianity as such but of a maturing national religion."¹⁴ Will Herberg asserts substantially the same thing and adds important observations on the relation of these trends to America's immigration heritage. These and still others who have studied the phenomenon concur that this most recent revival has been marked by an extraordinarily large component of pious utilitarianism in which religion has been made ulterior to almost every conceivable human need from nationalism and free enterprise to business success and "praying your fat away." Most would probably agree, moreover, that the postwar American situation—its affluent society, its lonely crowds of gray-flanneled organization men, its vast numbers of upward-mobile status-seekers, rootless and insecure, its trembling awareness of hydrogen bombs, fallout, and the fact that a blow at the enemy would be suicide—all this has created religious needs both shallow and deep.

These needs have led to many manifestations, of course, but pre-eminently to a huge nation-wide quest for peace of mind and confident living which could be expressed, and answered, with all degrees of profundity and realism. In its most debased and popular forms it has led to a veritable new reformation according to which salvation comes simply through religiosity-as-such. The mate-

¹⁴ *The New Shape of American Religion* (New York, 1959), p. 10. See also A. Roy Eckardt, *The Surge of Piety in America* (New York, 1958).

rial principle of this new reformation seems to consist of positive thinking, or justification by faith in faith. Its leading apostle is Norman Vincent Peale, with the wise and perceptive Rabbi Joshua Loth Liebman as its best-selling forerunner, and Dwight D. Eisenhower as its most distinguished exponent.

Curiosity about religion

Closely related to these forms of utilitarian piety has been another which is characterized chiefly by an interest in religion, frequently at a very high intellectual level and often in the university. It may or may not be accompanied by great confidence in religiosity-as-such or the assumption that religious curiosity is certainly good and possibly redemptive. A genuine or even intense curiosity about or fascination with religion is its hallmark, and it may lead a person merely to taste some popular book, to take up the study of some religious topic or course, to become a disciple or fan of some religious poet, or to dedicate himself to a lifetime vocation of religious research. These remarks, let me add, are in no sense pejorative. I share this interest. But it is important to see that such interest has become a significant part of the revival, and that it is qualitatively far removed from older conceptions of religious interest.

All of the foregoing manifestations of revival have been essentially individualistic, even self-centered in their appeal. Christianity, however, has been persistently corporate in its emphasis and expression—from the Feeding of the Five Thousand and the Last Supper on through its permutations in every age. Of Judaism the same must be said. As could be expected, the American permutations of the present day are no exception. Just as Luther's justification by faith in no sense reduced the significance of "the Holy Catholic Church, the

communion of saints," the contemporary justification by faith in faith similarly leans heavily on the lonely crowd's need for community and its preference for a community which, in Milton J. Rosenberg's phrase, offers "the pleasures of sacred gregariousness . . ."¹⁵ The revival, in other words, has not simply led men to the kind of Emersonian individualism which stresses each man's original relation to the universe. It brings people into the churches; and, especially in rapidly growing suburban areas where many of our industrial society's most urgent human tensions are felt, it results in automatic congregational growth. A dedicated pastor of a long-established church in a Massachusetts town told me on one occasion, "The people keep joining the church without my lifting a finger. I don't know what they want because they don't seem to want much of anything. The thing's gotten out of hand and I don't know what I can do." His predicament reveals a major fact of the day.

Mass revivalism

In this context a brief consideration of Billy Graham is in order for almost solely on his broad and manly shoulders has rested the burden of reviving mass revivalism and preventing it from becoming only a cheap and emotional accommodation of vague American yearnings or a sentimental reversion to a not-so-old "old-time religion." Not sufficiently realized, however, is the significance of his solitariness in the field and the drastic contrast of this situation to that in the days of Moody and Sunday from 1870 to 1917 when the country was criss-crossed by roving teams of competing revivalists. So important is the one man, Graham, that

¹⁵ "The Social Sources of the Current Religious Revival," *Pastoral Psychology* (June 1957), p. 34.

positive or negative reactions to his methods provide very useful information to the taxonomist of American religious bodies. Now Graham is ecumenical in a sense, though nondenominational is a better description of his stance. His city-wide campaigns depend on the cooperation of an extremely wide range of churches; in many cases he works through local councils of churches which some of his most fervent admirers refuse to join. But he is not a flaccid accommodationist catering only to vague religious interests and nostalgia. Like all men who have to depend on an organization and who have to sell a standardized product to a mass audience, he nevertheless becomes a victim of the very forces he would oppose. Madison Avenue has put its unmistakable mark on the crusader's tactics and even on his message, which becomes increasingly slick and rounded off. His shortcomings thus illuminate the spirit of the times as much as do his successes.

Revival in Judaism

The present state of American Judaism allows many similar observations, though the qualifications entered in the final section of this paper would also apply to a degree. A Jewish revival and a highly visible return to the synagogues is taking place; and as Nathan Glazer and others have pointed out, it has taken place to a large degree in the new social setting created by the current migration to the suburbs and by the corresponding occupational shift.¹⁶ To these forces must be added the powerful stimuli provided by Nazi persecutions, the rapid growth of Zionism and, still later, the actuality of an Israeli republic. As a result the Ameri-

can Jewish community has become not only remarkably homogeneous in its social composition but more determined to root its Jewishness in some form of its religious tradition. Living in this new situation amidst Christian neighbors who, whether Protestant or Catholic, are on the average much more regular in their religious participation, Jews are returning to increased observance and to providing a Jewish education for their children. Whether Glazer's further view that conformity and "other-direction" sum up and explain this development is very doubtful. He exaggerates its superficiality. But the fact of a revival remains.

Roman Catholicism

Of Roman Catholicism no easy generalizations are possible. Following Will Herberg, one may make two assertions in the present context. The prominence of the Irish among American Roman Catholics and their dominance in the clergy and hierarchy has had much to do with the Church's easy and persistent fusion of religion and nationalism. Nor is it enough to say, merely, that Catholics are in general patriotic; both in neighborly conversation and through national spokesmen they proclaim the great usefulness of the Church in the advancement of national aims in a hostile world, and they often do so in accents that blend indistinguishably with the maturing national religion that Dr. Marty has described. Arthur Mann goes too far in saying that "the idea that religion is handmaiden to democracy has made such headway that American Catholicism, American Protestantism, and American Judaism appear like parallel shoots on a common stock."¹⁷ But the general point is worth making.

A second aspect, not unrelated to the

¹⁶ "Charles Fleischer's Religion of Democracy," *Commentary* (June 1954), p. 557; quoted by Marty, *op. cit.*, p. 78.

foregoing, is the now general Roman Catholic acceptance of its tradition as one of three great faiths of this country—or, in John Courtney Murray's phrase, as one of the four conspiracies, for he rightly sees secularism as an active ingredient in the melting pot.¹⁸ In other words, the Church in a practical way accepts the basic—and, for the foreseeable future, unchangeable—pluralism of American life and the statistical fact that since the ending of immigration, and despite the influx of nearly a million refugees since 1935, the Roman Catholic Church has grown somewhat more slowly than Protestantism.¹⁹ Though with less force than in established state-churches, this acceptance of pluralism conduces in its own way to nominal, superficial religion. Roman Catholicism, however, does not often magnify or even concede the utility of religiosity-as-such. Contrary to what many Protestants would like to think about "Rome's keen sense of expediency," its constant emphasis is on its own uniqueness and on the dangers that by acculturation a genuinely Catholic way of life may cease to exist. If the Christopher movement were cited as an exception, it must be answered that it is an exception and a minor one. If Bishop Fulton J. Sheen were cited as the Roman corollary of Dr. Peale or Rabbi Liebman, it must be insisted that he stands in radical contradistinction to them. He is in command of nearly all the persuasive arts, but with far more success than Billy Graham he seeks to transcend the advocacy of belief in belief with a more substantial, prophetic message. He preaches no minimized Catholicism however popular his apologetics may be. His theology rests on the Thomistic foundations out-

lined in his *God and Intelligence in Modern Philosophy*, published in 1925, and he develops the mystical and existential emphases latent in that tradition. It has been my own observation, moreover, that approximately the same statement would hold even for the most simplified Roman Catholic tract literature, including that which, in C. S. Lewis's phrase, is aimed at the "swing vote." Those ecumenically-minded Roman Catholics who emphasize the evangelical, or, if you will, Protestant, aspects of their church have made far less headway in America than in Europe.²⁰

If some effort were to be made to bear out Arthur Mann's extreme statement quoted above, it would, I suspect, require careful motivational research among Roman Catholics in suburban areas of second and third settlement. I would be surprised if such study did not reveal that the widespread current interest in religion, with all its ramifying roots in genuine human need, was often leading Catholics as well as Protestants and Jews back to affirmative religious participation rather than to apostasy and indifference. In these days fewer Catholics than formerly are tempted to change their names and join Protestant churches for social or business or political reasons. That these and other factors in many cases result in very superficial appropriation of the faith probably every priest would admit. Good Catholics no doubt shudder to hear some of the things their nominal brethren say; but as with Protestant churches and Judaism, the rising number of nominal brethren is a vital aspect of America's revival of religious interest.²¹

PRESENT THEOLOGICAL TRENDS

Neo-orthodoxy and the revival of religious interest are unquestionably major aspects of the contemporary situation. The surge of popular piety, however, was to so large degree a response to peculiarly American needs in the post-war world and therefore so singularly tame and conformist that important creative achievements could hardly be expected from it. True to these expectations, the revival has been unaccompanied by the emergence of new institutions or the bursting of traditional structures and practices such as came with the other great revivals in the medieval, reformation, and modern periods or in the long, unbroken series of American Protestant revivals of the nineteenth century. The chief contemporary exceptions may be certain trends towards denominational federation or consolidation and the growth of community churches.²²

In contrast to this state of affairs, the movement of vigorous theological protest and revision which waxed in the 1930's led almost necessarily in the postwar years to new and more constructive movements in Christian thought. The purpose of this final section, therefore, is to review some of the more enduring recent theological developments and in the process say something of a deeper renewal of the church which is making headway beneath the banality and sensationalism of the popular revival already discussed.

No facile generalizations

American theology since the neo-orthodox period defies neat and unified characterization. The most important

Riddle of Roman Catholicism (Nashville, 1959), p. 172, and valuable throughout.

²² See Robert Lee, *The Social Sources of Church Unity* (Nashville, 1960).

fact is that it has been renewed. Twentieth-century Christendom has seen a theological renaissance unparalleled since the age of the Reformation. Americans, moreover, have avidly participated in it, and with a catholicity of interest noticeable in few other countries. As a consequence theologians have come to occupy the place in American life that during the half-century after James and Royce was occupied by secular philosophers or almost secular liberal theologians. American philosophy has been preoccupied chiefly with formal questions and has nearly abandoned the large issues of human existence.²³ Since the deaths of Dewey and Whitehead, it would be difficult to find any American philosophers of public eminence who have addressed themselves to the problems of men. The major fact about the American theological enterprise is its broad concern with the whole gamut of human problems. It is determined to make its efforts responsive to contemporary science and literature and relevant to the decisions men make in this world. At the same time it has taken up with renewed vigor its special role of speaking to the church and articulating its faith.²⁴

Biblical scholarship and theology

As one attempts a more detailed characterization of this enterprise, the new locus and importance of biblical scholarship and exegesis are the inescapable points of departure. The Dead Sea Scrolls, the gnostic materials found in Egypt, and archaeological evidence have

²³ Political scientists, economists, sociologists, and psychologists seem also to be fleeing from normative concerns in great numbers.

²⁴ On recent trends and theologians, see D. D. Williams, *What Present Day Theologians are Thinking* (2nd ed.; New York, 1959); D. W. Soper, *Major Voices in American Theology* (2 Vols.; Philadelphia, 1953-55).

been brought into the field of inquiry, put under analysis, and consecrated to the single purpose of better understanding the Holy Scriptures. Any thing or any auxiliary discipline that can shed light is welcomed. As it happens, the findings of recent decades have tended to vindicate or approach many traditional interpretations. An earlier dating of the Fourth Gospel, for example, has been justified. The Masoretic text of the Old Testament has been shown to be surprisingly accurate. The historical basis of many Old Testament men and events has been vindicated. In other cases, traditional views have been cast into deeper doubt. In general, new discoveries tend to be assimilated into older debates and positions; but there is frequently very little correlation between the conservatism of the scholarly findings and the theological position of the scholar concerned, except among right-wing evangelical groups which tend to applaud scholarship that supports tradition and denounce as liberal or even communistic that which tampers with old texts or requires new interpretations.²⁵ It should be said in this connection that since the publication by Pope VII of the encyclical *Divino Afflante Spiritu* in 1943 Roman Catholics have begun to make an important entry into the whole field of biblical criticism and there is no reason to doubt that in time their contributions will enter the mainstream of the continuing enterprise. They at least may be spared the charge of communism.

Biblical scholarship, however, is increasingly understood not only as a de-

partment of scientific historical studies but also as contributory to biblical theology; scholarship and exegesis are thus inextricably joined in a task involving matters far larger than the dates, authorship, and texts of documents. Exegesis of both the Old and New Testaments is, in turn, closely linked with the task of Christian preaching. The resurgence of interest in biblical study is thus related to the restoration of the preaching office in the Church; and much of the renewed interest of theological students in the Greek and Hebrew languages stems from their theological and homiletical responsibilities. To indicate the further interrelation of things, it should be said that the Luther renaissance and many brilliant studies of Calvin and of Puritanism accentuate this concern. In New Testament studies these trends are also furthered by the method of "form criticism," *Formgeschichte*, with its emphasis on the biblical kerygma, proclamation or message, and on the importance of the oral tradition and the apostolic pericopes, or preaching units, as materials of the synoptic gospels. Very few truly germinal contributions in this field have come from America; but the works of John Knox and Paul Minear in New Testament and William Albright, John Bright and Millar Burrows in Old Testament, to name but a few, witness to the emergence of a creative and fully mature tradition of biblical scholarship. The serious concern and accompanying ferment are of primary importance to any interpretation of contemporary American theology.

Ecclesiology

As if the concept of interrelation had not been sufficiently stressed already, it must be underlined again in discussing the importance that the problem of the church, ecclesiology, has taken in

²⁵ Recent introductions explicate and document these trends: see Bernhard W. Anderson, *Understanding the Old Testament* (New York, 1957); Franklin W. Young and Howard C. Kee, *Understanding the New Testament* (New York, 1958); the introductory essays, *Interpreter's Bible* (12 Vols.; Nashville, 1951-57); and Henry, *Revelation and the Bible*, *op. cit.* (note 9 *supra*).

recent decades. The need to face these issues was highlighted in the ecumenical movement almost from its beginnings. As the Faith and Order Commission first faced its task in 1927 and as through the years its dozens and hundreds of committees and study groups have probed the issues that lay beneath the church's clearly visible divisions, the centrality of ecclesiology became inescapable. Questions about the ministry, the sacraments, and the essence or ontology of the church became burning questions. The contemporary situation in its totality, including the transformation of theology implicit in that change, brought to the fore the very problems which the Enlightenment, pietism, romanticism, and revivalism had slighted, ignored, or derided. Historical studies contributed much that was new by laying bare the great concern of the apostolic and early Church for precisely these matters. Reformation research only confirmed this emphasis by demonstrating the centrality of the eucharistic controversy to the first major divisions of Protestantism. Recognizing how important such issues are, contemporary theologians have turned major efforts toward their illumination. In this process, as was inevitable, biblical study has had a primary place, not only for what it might say of the cult and polity of the apostolic church but because the church is, in the ringing phrase of Ephesians, the body of Christ. To understand itself, the church is driven to deepen its understanding of its Head; Christology and ecclesiology flow into each other.²⁶

Effects on practice

Alongside this specifically theological impulse was another movement, out-

²⁶ Claude Welch, *The Reality of the Church* (New York, 1958), exemplifies this impulse, and cites much of its literature.

wardly more practical, in that it had to do with practice, but with large theological implications, the so-called "liturgical renaissance." Here again biblical, early historical, and Reformation studies made large contributions and, as was inevitable, theological emphases were translated into the worship of the church. The impulse has at least three points of origin: in the Lutheran revival of the nineteenth century and cognate movements among the German Reformed, in the English Oxford movement, and in Roman Catholicism, especially in France, Belgium, and Germany, and notably among the Benedictines.²⁷ The movement seeks most directly to reinvigorate the worship and devotional life of the Church, but only after broadening and deepening the idea of worship, *leiturgia*. The royal priesthood of all believers, therefore, is of vital importance—with large consequences for traditional notions of the laity. The movement also seeks to simplify, purify, and clarify the worship of the church while at the same time claiming every depth and resource that tradition can offer. In its desire for genuinely liturgical preaching it responded to many contemporary theological emphases. Among Roman Catholics it awakened interest in the vernacular mass and lay use of the Bible, thereby underlining the liturgical significance of reformers like Luther and Cranmer. Yet this movement was not restricted to those communions which preserved traditional worship forms. In Presbyterian and other Reformed churches there were efforts to forego the excesses of Puritanism and reclaim

²⁷ See E. B. Koenker, *The Liturgical Renaissance in the Roman Catholic Church* (Chicago, 1954) and Massey Shephard et al., *The Liturgical Renewal of the Church* (New York, 1960); J. D. Benoit, *Liturgical Renewal* (London, 1958); L. J. Binkley, *The Mercersburg Theology* (Lancaster, Pa., 1953).

the less radical attitudes of Calvin and the German Reformed leaders. A great surge of scholarship on the Puritan tradition revised the deprecatory views of many who owned that heritage, awakening a powerful emphasis on expository biblical preaching as a corrective to many revivalistic and sentimental innovations of the nineteenth century, and carrying over as well into architecture and hymnology. Pervading this entire movement of renewal, as must be apparent in even this brief account, is a more serious concern for the meaning of church membership and a desire to realize a deeper understanding of the church as a fellowship, a *laos*—a people or laity—of God, an *ekklesia*—assembly—of God. Accompanying this hope came an impulse considerably broader than the liturgical movement itself to introduce where it had faded the idea of preparation for membership. This approach to the ancient catechumenate, pale though it be, involves the presumption that the Church is custodian of an objective message and has a positive teaching role.²⁸

System in theology

The Church's assumption of a teaching role is but the practical corollary of the intensely intellectual task of the systematic theologian, namely, the rigorously reasoned formulation of dogmatics. By 1930 dogmatics had almost become a swearword in most American religious circles. Successive waves of rationalism, revivalism, romanticism and liberalism had almost entirely eroded the idea of a scientific discipline for studying the faith of the

²⁸ See E. B. Koenker, *Worship in Word and Sacrament* (St. Louis, 1959); Hendrik Kraemer, *A Theology of the Laity* (Philadelphia, 1958). On the changing views about religious education, see H. S. Smith, *Faith and Nurture* (New York, 1941).

Church. Apologetics had flourished mightily since its heyday in the Enlightenment. Post-Kantian idealism inspired a vast literature in the philosophy of religion, and the nineteenth century historical revival virtually made historical theology the Church's handmaiden. But through all these vicissitudes dogmatics languished. During the last two decades, however, some of its ancient dignities and perquisites have been restored both in realms where fundamentalism once ruled with anti-intellectual absolutism and where liberalism more indulgently sought to evoke a message from the religious consciousness itself. This is not to say—as some wishful critics have said—that the churches are being victimized by a new dogmatism. Even if every American systematic theologian, whether confessional or ecumenical, were in full agreement with his colleagues, it would be a half-century before their combined influence could make even a mildly significant penetration at the local or parochial level. There is small danger that American Christianity will be swept by dogmatism! At the present time the chief fact of interest is that theology as a rigorous and more or less systematic pursuit is becoming an increasingly lively enterprise. It continues to work, as it must if it is to flourish, in close union with philosophical, historical, and, above all, biblical disciplines.

Confluence of mainstreams

American theologians reflect their country's varied background. At the same time they manifest the integrative effects of both a more widely opened door to the great tradition and the social forces of church unity operative in the United States. Within this common approach to common problems one may discern at least six diverse trends,

none of which can be justly treated in the brief statements possible here. The first of these trends is deeply indebted to Paul Tillich and reflects his existential idealism. Committed to the ontological concerns of the post-Kantian tradition, above all, Hegel and Schelling, its broad and catholic correlation of human problems and Christian answers is expressed in philosophical rather than exegetical argument. Closely related is a second trend in which is continued the long enterprise of turning Plato, Aristotle and classic Stoicism to Christian purposes, as did Augustine and Aquinas and Richard Hooker in their characteristic ways. This is, of course, the dominant trend in Roman Catholicism, especially in America, and also a persistent feature of Anglican thought. The widely varying uses of Whitehead should also be noted in this connection. A third trend, related to the above two, may be noted, I think, in the renewed interest being shown in Friedrich Schleiermacher, F. D. Maurice, Horace Bushnell, and other great nineteenth-century liberals, though it is by no means always being turned to the development of a new liberalism. Thinkers in this group obviously share much with H. Richard Niebuhr and Tillich, most of all in their determination to keep theology free from what they might call dogmatism and open to creative dialogue with the world, society, and culture. They do not emphasize a radical disjunction between the church and the world; and they inherit a measure of the liberal's optimism about Christendom and the formation of a Christian society. A fourth trend owes much to Rudolf Bultmann and through him to the existential philosophy of Martin Heidegger, but always with the biblical orientation indicated by Bultmann's two greatest works, a commentary on St. John's Gospel and a *Theology of the New*

Testament. During recent decades Bultmann has done more to invigorate biblical theology than any other thinker, and it is appropriate to designate a trend with his name even though many whom he has influenced do not share either the radicalism of his demythologizing or his confidence in Heidegger as the lamplighter of Christian theology. In his emphasis on making the scandal of the gospel relevant to the present era, Bultmann shares a concern with each of the three foregoing trends.

Less accommodating to the ways and wisdom of the world and possibly—perhaps as a result—less influential among American theologians is a fifth trend which is best designated by the massive, Christocentric effort of Karl Barth to disengage dogmatics from all kinds of crippling alliances. This takes its most monumental form in the volumes which Barth significantly named *Church Dogmatics*. Also in this group may be included various Scottish, Swedish, and German theologians as well as the leading thinker of the very conservative Netherlands Free Church, G. C. Berkouwer. In this group dogmatics flourishes in its purest form, being rooted in the Scriptures and guided by the church's creeds and confessions. In the case of Barth it is carried on with the freedom of great genius and has led not at all to a dismissal of philosophical issues. In certain sectors of this group are those who would dismiss Barth as a modernist. These ultraconservative evangelicals, however, are to be distinguished from fundamentalists by their efforts to confront the modern world's problems. Yet they are linked to their past and to each other by extremely formal and objective views of "special" revelation. This "inscripturated Word" nevertheless seems unable to resolve many critical issues that divide them; they agree to disagree, and perhaps for this

reason should be separately grouped in this essay.²⁹

The sixth trend here delineated owes much to an initial impulse given it by Reinhold Niebuhr and is specially marked by its strong ethical interests. It would be discussed in an entire separate section if space permitted. Not being a pure species it could, through different thinkers, be linked to several of the foregoing groups, though perhaps most usually the fifth. Its thought is marked by an insistence that a Christian ethic—or the life of the Christian in this world—can make sense only when it is Christocentric, theologically oriented, and biblically grounded. It is suspicious of abstract or autonomous principles, often including natural law philosophies insofar as they ignore the situation of the individual person. Yet it affirms the goodness of the creation, the significance of law, and the meaningfulness of the Christian's vocation in the institutional life or orders of the creation. Luther is frequently a great resource to such thinkers, and also Dietrich Bonhoeffer, who was put to death by the Nazis in 1945.³⁰

The above groupings are incomplete and stripped of many nuances. Most lamentably not shown here are the ways in which the underlying categories become blended in actuality. Nor do they record the degree to which many theologians are influenced by psychological theory, the liturgical movement, logical positivism, philosophical analysis, studies of language, myth and symbol, and by literary trends. Edgar Brightman and the continuing influence

of idealistic personalism at Boston University and in the Methodist Church are not discussed at all. It will be remarked, too, that little is said of Reinhold Niebuhr who has unquestionably been the most influential thinker in American theology during the last quarter-century. The difficulty here lies in the fact that the influence of his Christian realism is everywhere and that it has shown an amazing consistency and durability ever since it began to take shape between 1930 and 1940. His neo-orthodoxy has been behind and leading into most of the creative developments of the postwar period even when he himself would not always follow these leadings.³¹

Prospects

A comprehensive survey of American theology, if undertaken, would show, I believe, that the country's legendary pluralism is an enriching fact though also a disappearing one. Diversity, however, leads to catholicity as well as homogeneity; and in this fact there is reason for believing that the impressive uniqueness of the American religious experience will in time bear some distinctive fruit. In the United States voluntarism, freedom, church-state separation, and positive, constructive "laicism" have long and abundantly flourished. In almost every faith and communion, whether its roots are in old state-church traditions of Europe, in strong movements of tolerated dissent, or in circumstances of positive persecution—or in all three, as is the case with Roman Catholicism—this situation has conduced to new and exciting developments that will probably be reflected sooner or later not only in practical achievements but on a theological plane.

³¹ See Charles W. Kegley & Robert Bretall (Editors), *Reinhold Niebuhr*, Library of Living Theology (New York, 1956).

Ironically, though understandably, the most significant manifestation of this possibility was Roman Catholic Americanism.³² In Protestantism, so far, the American contribution has consisted chiefly of a disposition to activism, the Social Gospel, and more recently a sociologically and theologically rooted social ethics. But from the theological ferment of the present day we can

perhaps expect still other developments. In the meantime, this same ferment can be expected to do much toward sublimating the traditional anti-intellectualism of American Christianity. It may further reduce the alienation of the intelligentsia which was so prominent during the past century or more when so many churches seemed to have set themselves athwart the entire movement of modern science, scholarship, and literature. Finally, it may extend that deeper revival of the church which goes on at the level of faithful commitment rather than religious interest.

Church and the Laity Among Protestants

By PAUL M. HARRISON

ABSTRACT: Increasing attention is being paid on the fringes of the major Protestant denominations to the role of laymen in the work of the churches. A theology of the laity is in process of development and represents an effort to distinguish between ecclesiastical and secular vocations of the church's ministry. Despite emphasis, however, on the doctrine of the priesthood of all believers there is a subtle clericalism in the denominations which undermines the role of laymen. This points to a major dilemma in contemporary Protestantism. The rapidly developing institutional bureaucracies of denominations and of local congregations create needs of their own which must be met before the churches can attend to the goals for which they were originally established. In this situation laymen are almost inevitably utilized as subordinates to ministers in the work of the institutional church. Seldom is the ministry aware of the developing conception of clergymen as assistants to laymen who are active ministers in the world. On the frontier of Protestant action there are exciting experiments to seek solutions for this dilemma but the work is usually frustrated by a tendency to institutionalize the experiments and by the apathy of the laymen themselves.

Paul M. Harrison, Ph.D., Yale University, is an Assistant Professor of Religion and Society in the Department of Religion, Princeton University. He is author of *Authority and Power in the Free Church Tradition* (1959).

EVENTS in the current century have disturbed the confidence of Christians. The advance of the Communist and nationalist ideologies, the heroic but retarded response of the churches to fascist barbarities, the collapse of evangelistic work in China, and the difficulties of missionary enterprise in Indonesia, Africa, and India have all had an effect upon the outlook of the leaders of the church. More immediately, the denominations in America are frantically attempting to keep pace with unheralded revolutions in urban, suburban, and rural society. In the age of the affluent society, pitchmen who hawk their wares on late and early television shows stand on the highest rungs of the nation's prestige ladder while the ministers who most effectively compete with them adopt their techniques and subconsciously pervert the meaning of the central symbols of the faith. Samuel Miller, Dean of Harvard Divinity School, notes that the Sermon on the Mount has been distorted to read: Blessed are the prosperous; blessed are those with fulness of spirit and aggressiveness; blessed are the cheerful, the optimistic, and those who think positively.¹ The meek, the humble, the poor, and the peacemakers are unfit companions in a land where ownership and virtue are one.

A SECULAR MINISTRY

It is critical alterations like these which have been responsible for a renewal of interest in what churchmen call the ministry of the laity. The role of the professional clergyman is changing. Many of them realize that if they rigidly maintain their traditional patterns of action they cannot cope with

¹ Samuel H. Miller, "The Practice of Religion in a Technological Culture," in a lecture given at the American Baptist Convention, Rochester, N. Y., June 1960. (Mimeographed), pp. 1-2.

the evolving situations of the revolutionary world. The World Council of Churches recently proclaimed that "one of the greatest tasks of the Church today is to grasp clearly the significance of the lay ministry in the world."²

Recent developments in this country, dramatized by such experimental projects as the East Harlem Protestant Parish, the Judson Memorial Church in Greenwich Village, and the Christian Faith and Life Community in Austin, Texas, emphasize "the development of an effective secular ministry in contemporary society."³ Recognizing that a secularized church in a technological culture is not amenable to the customary practices of the ministry and that the pervasive image of revivalistic evangelism has placed the professional clergyman at a disadvantage, the leaders of these experiments are engaged in developing what they hope will result in a transformation of the layman's role. But these isolated events represent the exception to the lay situation in Protestantism. Less dramatic procedures portray the life of the ordinary churchman in the local congregations.

In contemporary usage the term "laity" describes "the vast body of church members who spend their lives in what is called a secular occupation. . . ." In the early church *laos* meant the whole people of God, and *kleros* signified the whole church and

² "The Laity—The Christian in His Vocation," in *The Christian Hope and the Task of the World* (New York: Harper & Brothers, 1954), Chap. VI, p. 1.

³ For example, see Ross W. Sanderson, *The Church Serves the Changing City* (New York: Harper & Brothers, 1955), Chap. 8.

⁴ "The Laity," *op. cit.*, p. 1. Louis Rumpff defines the laymen in similar terms of "those who earn their living by secular work or as housewives." See "Laymen, Churchmen in the World," *The Student World*, Vol. 49, No. 3 (Third Quarter, 1956), p. 208.

was not confined to the priesthood. The work of the clergy and the laity "can only be defined in relation to the ministry of the church as a whole."⁵ Thus the doctrine of the priesthood of all believers "does not refer to the priestly character of every Christian, as if the Christian fellowship were simply a collection of individual priests who have organized themselves for various purposes. The priesthood of all believers refers to the priestly character of the Church as a whole [I Peter 2: 9-10] from which individuals both clerical and lay derive a common priesthood. . . ." It is on this interpretation of the church and its people that contemporary Protestants base their understanding of the ministry of the laity.

THE SCOPE OF THE SUBJECT

There are so many Protestant laymen in so many churches doing and believing so many different things that almost any generalization can immediately be controverted by mutually contradictory facts. American Protestants report approximately sixty million laymen in 280,000 churches.⁷ Among these people there is the dignified elder of St. John's Episcopal Church in New York City as well as the recent convert to the Two-Seed-in-the-Spirit Predestinarian Baptists of rural Kentucky.

The magnitude of the subject can be suggested in another way. Sociologists have discovered that one fruitful

⁵ Hans-Ruedi Weber, "The Ministry of the Laity in the Missionary Outreach of the Church," *The Student World*, Vol. 49, No. 3 (Third Quarter, 1956), p. 224. For a Roman Catholic description of the role and status of layman and priest see George H. Tavad, *The Church, the Layman, and the Modern World* (New York: Macmillan Co., 1959), Chap. 1.

⁶ Charles D. Kean, "Clergy and Laity," *The Student World*, Vol. 49, No. 3 (Third Quarter, 1956), p. 240.

⁷ *Yearbook of American Churches for 1959* (New York: National Council of the Churches of Christ in the U. S. A., 1960), p. 267.

method of analyzing social phenomena is to develop a typology of the problem to be investigated. Thus in the sociology of religion typological distinctions have been made between churches, denominations, sects, and cults.⁸ American laymen can be classified according to these four institutional types and generalizations can be made about each. The scope of the issue can be illustrated by developing other categories of laymen. Liston Pope, for example, has subdivided laymen into several types and subtypes on the basis of social class, occupation, education, and political preference.⁹ Other classifications can be developed such as age and sex; residence—rural, urban, suburban; degree of church participation—dormant, marginal, modal, and nuclear;¹⁰ and intensity of belief.¹¹

In order, however, to restrict the compass of this paper, attention will be paid exclusively to generalization about laymen in the major Protestant denominations in America and typological categories will be avoided for lack of space. Three topics will be considered: laymen in relation to religious organization, to the ministry, and to the secular community.

⁸ For example, see Liston Pope, *Millhands and Preachers* (New Haven: Yale University Press, 1942), pp. 117-140.

LAYMEN AND RELIGIOUS ORGANIZATION

According to Roman Catholic theologians the "holy priesthood" refers in a general way, as in Protestantism, to the whole church, but it refers more specifically to the priestly hierarchy. The dogma of the Catholic Church places the hierarchy in a position which is ontologically prior to the existence of the laymen.¹² In the Protestant situation in America only a comparatively small number of churches, largely confined to the Lutheran and Episcopal traditions, are willing to abide by this hierarchical principle. The Reformation was grounded first of all in the doctrine of the absolute sovereignty of God and the finitude of all things under God—including priest and church. Secondly, the Reformers emphasized the doctrine of justification by faith and the priesthood of all believers. Protestants have not been consistent in their support and understanding of these difficult doctrinal foundations. They admit that the believer cannot see God and often fails to confess his sovereignty, the sinner cannot fully experience justification, and the laymen can clearly distinguish himself—and frequently prefers to disassociate himself—from the clergy.

Perhaps because of this situation the doctrine of the priesthood of all believers has never been efficacious on Protestantism.¹³ At the lay experiment in Austin they are "perceiving the subtle clericalism in the Protestant Church and uncovering the meaning of the term 'laity.' They are insisting that the primary ministry in the Church is that of laymen in the world." The fact that many Protestant leaders

admit there is a critical need for a theology of the laity is indicative of some dissatisfaction with the work of the churches. The lay developments in this country and Europe represent an effort to distinguish between Christian ecclesiastical vocations and Christian secular vocations, between the valid ministry of the clergy and the equally legitimate ministry of the laymen. But again, the isolation of these experiments must be emphasized for even among Protestants whenever the question of the authority of the laymen is raised, "the finger of an exclusively priestly voice and authority is immediately raised also."¹⁴ Among the majority of ministers there appears no sympathy for the lay movements except when they represent an effort to assist the institutional ministry. It has been noted that many of the vaunted seminary courses for laymen are faintly disguised efforts to clericalize the laymen.¹⁵

THE ORGANIZATIONAL DILEMMA

The Reformation tradition, and its reaffirmation by the neo-orthodox movement, places contemporary Protestantism in a paradoxical dilemma which has an important effect upon the life of every churchman. The doctrine of the finitude of all things under God explicitly includes the finitude of the visible Church. Therefore, the church in history can never legitimately become an end in itself. But on the other hand, if the missionary and evangelistic obligations of the church are taken seriously the churches must develop efficient organizational forms which lead to the displacement of the

original goals due to the requirements of bureaucratic procedures. The results are paradoxical since the values and goals which the organization was created to preserve and achieve tend to be uprooted by the goals and values of organizational self-perpetuation. Peter Selznick describes this process in terms of organizational imperatives. The bureaucracy creates needs of its own which must be met before the group can attend to the goals for which it was established.¹⁶ These organizational imperatives impinge upon all the activities of laymen in the institutional church. John Casteel observes that "when the layman is in the church he acts as he has been taught to act as a churchman: he does his duty to the institution; he supports it with time, money, and attendance; he listens but keeps his counsel."¹⁷

In every social activity, religious and secular, the lives of Christian laymen, according to Charles Page, "have become bureaucratized. Their interests and activities in the urban world are multi-divided, segmentalized, routinized and ritualized. . . ."

They listen and look, occasionally applaud and commend, frequently ignore and condemn, the offerings of others. They are members of inactive majorities, mass-witnesses of spectacles, spectator-citizens, spectators of sport and entertainment, spectator-worshippers in the urban church. In this last capacity they may even regard their weekly or less frequent attendance as a kind of periodic soul-cleaning routine—a routine one follows in an orderly, rational, and systematic fashion in about the

same manner that one calls upon the dentist or physician¹⁸

In a pluralistic and bureaucratized society Christian laymen maintain membership in a variety of secular and religious activities. This often results in competition for the layman's time, money, and talent. More serious is the potential or existing conflict of role images, values, and goals. The layman thus experiences an ambivalence toward the churches and their demand upon his resources. The congregations become "one more organizational activity. They make the same demands upon the behavior of people as do other organizations in society."¹⁹

ORGANIZATIONAL LITERATURE

Each of the self-perpetuating denominational bureaucracies of Protestantism includes an agency for lay activity. The author was graciously assisted by the executives of several of these groups when they sent a ten-inch stack of pamphlets and charts to augment the writing of this paper. The primary theme of this literature is an appeal to laymen to witness to the call of the gospel through support of the local churches and co-operation with the program of the denominations. For example, the intention of a pocket-size card distributed by the Southern Baptist laymen's organization can be summed up in the following phrases: "loyalty to Christ, to the church, and to the pastor as leader of all its work; cooperation with every agency and organization of the church and denomination; evangelism; increased circulation

of denominational publications; tithes; advance in church budgets; patronage of denomination institutions."²⁰

For almost four centuries Protestants have indulged themselves with critical remarks on the subject of the intricacies of the Roman Catholic hierarchy. The Catholic Church is indeed a unique phenomenon in the realm of religious organization. Reporting on a study made by the American Institute of Management, the *Times* notes that "the Roman Catholic Church got an 'A' yesterday for administrative efficiency. Its numerical grade was 88. . . . The Standard Oil Company of New Jersey was at the top of the class with 90 plus. . . ." ²¹ However, the major Protestant denominations have kept pace with the organizational revolution which accompanies our industrial development. The organizational chart of one relatively minor subagency of the Missouri Synod Lutherans—the Lutheran Laymen's League—resembles closely the bureaucratic plan of Standard Oil of New Jersey.²² There are no exceptions to this phenomenon among the large Protestant denominations. The professional staff of another lay organization proudly reported its activities for 1959. "The staff travelled over 225,000 miles, spent over 200 days 'on the road,' participated in 431 Council and Chapter meetings attended by a total of over 28,000 men. . . ." ²³

Working slowly through the ten-inch pile of denominational pamphlets issued for the instruction and stimulation of

laymen one is impressed first of all by the amount of material devoted to various spiritual exercises on how to pray, how to read the Bible, how to make an evangelistic call, and how to be a good Christian layman. One of the early leaders of the Judson Memorial Church is critical of this appeal to the laymen. "There is no compelling sense of urgency about such a presentation of the gospel. Underlying this approach is the modus of salesmanship technique in which the assumption is implicit that the 'product' is not really necessary in its own right to the person, but can perhaps be made to seem so."²⁴ A major part of the remaining material in these pamphlets is an appeal to organizational impulses of the modern churchman. "We would like to have all these men assume their rightful places in every phase of the life of the Church."²⁵ Instruction on how to organize the first meeting of a local lay fellowship is carried to the last detail: "Cooperate with the local church's Lay Development Committee. . . . Select one or two men to act as hosts. . . . Invite the past president of the State or National Association. . . . Check on ventilation and lighting—the room should not be too hot or too cold. . . . Seats should be arranged in a semicircle. This is very important!" ²⁶

LAY ATTITUDES TOWARD THE CHURCH

It is not surprising that "the laity perceives the church as an organization," and that "they perceive the minister as the local functionary of that

²⁴ Robert W. Spike, *In But Not of the World* (New York: Association Press, 1957), p. 74.

²⁶ "Men's Fellowship Work in the Church" (Philadelphia: American Baptist Convention), p. 5.

organization."²⁷ The contributions the laymen are asked to make "are essentially aimed at maintaining the denomination as an organizational entity."²⁸ In the words of one layman, "the only time the minister calls is when he wants me to do a job. When I'm sick the assistant minister calls." The clergyman knows that his professional future depends upon his ability to fulfill the organization imperatives of the denomination, but the opinion of many laymen is expressed by the words, "I belong to St. Brick's, but they don't pay much attention to me until they want me to help with the Everymember Canvass."²⁹ But this is not necessarily the prevailing opinion among laymen. Whyte discovered that in the Protestant churches of suburbia the need to belong to a group was of key importance. The organizational methods that people learn in their secular pursuits are eagerly transferred to the sphere of the local church.³⁰ In relationship to their laymen the Protestant churches in America are engaged primarily in "picking up the pieces" and maintaining the equilibrium of individuals and social groups. There is a prevailing and increasing emphasis upon the development of personal and group counseling techniques, and the sermons on Sunday extol the virtues of togetherness, fraternal love for the brethren, harmony in group relations, a healthy family life, and protective concern for those in the community who are less fortunately endowed with the talents and material advantages of this life.

The interests of laymen, as well as the nature of the organizational imperatives of a local congregation, are revealed by an analysis of the kinds of

jobs which laymen accept or reject. In a city church of 500 members in which there were 475 tasks for laymen, Frederick Shippey distributed the tasks among eighteen basic categories. He found that 103 tasks, 22 per cent, were unclaimed by the lay people. The tasks which were fully appropriated were in the following categories: committee work, financial matters, property and buildings, missionary promotion, religious literature, and record keeping. Job categories which attracted the lowest number of participants were as follows: visitation of constituency, group work, office work, and entertainment.³¹

Protestant laymen willingly and even eagerly participate in the organizational process. Their occasional complaints and their constant efforts to avoid the less exciting and routine tasks only proves that they are not yet angels. In their work with laymen, denominational officials and local ministers may succumb to institutional pressures, they may be motivated by self-interest more often than the Christian idealist would prefer, and they may lack imagination or even the strength of their convictions. Nevertheless, for the most part laymen appear satisfied with the church as it is.

LAYMEN AND MINISTERS

The polymorphic role of the Protestant clergy in contemporary America does not place these men in an enviable social situation. The lay membership of these voluntary religious associations look to their ministers for leadership in maintaining, at the same time, the material solvency and the spiritual integrity of their institutions. The minister must be an organizational director of the highest calibre, but because of the requirements of his religious voca-

tion he must avoid any taint of bureaucratic officiousness. He must, nonetheless, be an efficient bureaucratic official. A booklet published by the Disciples of Christ inadvertently outlines the problem. Christ must run the church, the author says, and if he is not in constant charge of the church, "there will be no church at all. If the administration of the Holy Spirit is not present, the spirit dies within the church and it remains only a hollow shell." But the "spiritual side" of the church must be "augmented by a functional side."

Essentially the plan is this: A congregation selects a minister who serves as "chief of staff" of the church government. The church is then organized into various departments, each department allotted a certain task in the church's work. The congregation selects from its ranks the men and women who are to head these departments. These department heads form a kind of "cabinet" to assist the minister in the over-all management of the church. Finally the minister and his "cabinet" appoint churchmen to various department committees.³²

"A church today which would have an effective program must have dedicated laymen sharing the responsibility of its ministry with a wise and able pastor." To assist the minister we should "encourage him as men rally to his support with time, talent, and money."³³ In describing the relationship of laymen and minister these words characterize one of the principal themes of the denominational pamphlets. The ideal role of the laymen is to act as assistants to the clergy. The laity are presumably doing a job that the minister could do better if he had the time, the money, and the energy. He has the training and the talent.

³² Mark Rutherford, *The Christian Layman and His Church* (St. Louis: Bethany Press, 1958), pp. 27-28.

³³ "Why a Men's Fellowship" (New York: American Baptist Men), pp. 2, 7.

Charles Page emphasizes the relationship of antipathy which exists in every bureaucracy between the professional expert and the clients. These attitudes are not officially sanctioned by the policies of the bureaucracy, in fact, proclamations which emphasize the element of service to the clients are constantly made.³⁴ Antipathy occurs also in the churches where the laymen are being educated by the minister for they are the constant recipients of his specialized training, in pulpit, committee meeting, and classroom.

As the clergyman's tasks and skills become segmentalized and specialized, the social distance between himself and his parishioners increases. . . . His expertness is not simply a monopoly of know-how in matters officially defined as sacred or spiritual . . . but includes intellectual prowess in other fields. He masters the complexities of political issues, of economic analysis, of international affairs, of sociological and psychological investigation, of psychiatry and psychoanalysis. He may even publish learned books in these subjects, and frequently not as an amateur. Most of the members of his congregation, on the other hand, are necessarily amateurs. And . . . they either resent and resist the special claims of the expert or they praise him unduly. . . . The minister of the large congregation who has successfully avoided both antipathy between himself and his clients and the "bureaucratizations of spontaneity" has managed an adaptation of real proportions.³⁵

Although this characterization of the relationship which exists between clergy and laity can be overdrawn it corresponds to the ambivalence laymen feel toward their participation in the work of the church. They love it and hate it. The church is critical of them and fills them with guilt, but it comforts them in their need; the church demands everything from them that they most

³⁴ Page, *op. cit.*, p. 140.

³⁵ *Ibid.*, p. 149.

dearly cherish but at the same time they confess that it promises them eternal redemption. So the Protestant laymen have come to terms with their clergymen and with their own ambivalence. They realize that under the pressures of the modern organizational environment the minister has necessarily become the pastoral director of an institution which differs in no significantly visible way from other institutions to which the layman claims membership. They believe that in an invisible way, in a manner which is not entirely explicable, the authority of God still resides in the church and its ministry despite the cultural adjustments which are inevitable.

As the polity of all the churches, whether they are episcopal, presbyterian or congregational by tradition, has been modified in the direction of the political structures of Canada and the United States, so the institutional status and authority of the ministry are being modified in the direction of the democratic type of political, educational and economic executive or managerial authority.³⁶

The Protestant minister is respected and obeyed in his role as pastoral director insofar as he demonstrates a capacity for executive leadership and insofar as he is able to combine this with a spiritual authority derived from the Bible, from the traditional doctrines of the church, and from the dynamic of his own personality. As a source of authority, especially in Protestantism, the power of the minister's personality must never be underestimated.³⁷

³⁶ H. Richard Niebuhr, *The Purpose of the Church and its Ministry* (New York: Harper & Brothers, 1956), p. 90.

³⁷ Kenneth Underwood, *Protestant and Catholic* (Boston: The Beacon Press, 1957, pp. 97-122; Paul M. Harrison, *Authority and Power in the Free Church Tradition* (Princeton: Princeton University Press, 1959), Chaps. 4-5.

THE POWER OF LAYMEN

Laymen exercise a tremendous power in the Protestant church, not because they possess an authority which is theologically legitimated by such doctrines as the priesthood of all believers, but because the doctrine of the church in the major portion of Protestantism is inadequately defined and the relationship between clergy and laymen has never been explicitly and fully developed. The authority of the clergyman prior to the Reformation resided in the traditional doctrines of the church which substantiated the official authority of the priestly hierarchy. Priestly authority further resided in the authority of the Scriptures, and the Scriptures were in turn interpreted by the hierarchy of the church. The Reformers rejected this procedure because they believed it was a circular validation of power. But in Protestantism the problem of authority has never been so rationally solved. There exists a pluralism of authority, so that even within a single denomination there can be found vast differences of opinion as to the legitimate locus of authority. The possible authorities are: the Bible, the creeds, the local minister, the whole group of the ministry and the agreement they reach, the national denominational council, the state or local council, the local church, and the individuals within the church. In recent years some American denominations have been seriously wracked by debate on the issue of authority.

In this situation it is difficult if not impossible for the local minister to understand "by what criteria he orders his activities and the use of his time." This is, "in sociological jargon, the problem of authority, the problem of defining the basis of legitimation for his various activities."³⁸ If the minis-

³⁸ James M. Gustafson, "An Analysis of the Problem of the Role of the Minister," *The*

ter's authority is improperly defined—within American Protestantism this is clearly the case since the Episcopal Church represents no consistent illustration to the contrary—the local minister is exposed and susceptible “to all the idiosyncracies and ideologies of the particular groups to which he is called to minister.”³⁹ The adjustment he most often makes is to the class ideology of his community. Liston Pope, for example, has shown that despite protestations to the contrary by the industrialists and clergy of the South, ministers were often acting as “moral police for the industrial overlords.”⁴⁰

Without a traditional and official source for the legitimation of his authority, the Protestant minister has been forced to insert into the vacuum left by the displacement of historical dogma the power of his own personality and the persuasiveness of his intellectual skill. This places an inordinate burden upon the local clergyman and upon his integrity as an individual divested of the comfort and support of his professional brethren. In times of social crisis the Protestant minister who opposes the dominant laymen of the community usually stands alone and is eventually forced to conform to the popular prejudices of the community.

MIDDLE CLASS VALUES

Laymen willingly follow the leadership of the clergy in ecclesiastical affairs but distrust or ignore their opinions on issues of crucial secular significance. William Meyer discovered no important difference in the attitude of laymen in their responses to various kinds of ministers. He made a study of two

Journal of Religion, Vol. 24, No. 3 (July 1954), p. 187.

³⁹ *Ibid.*, p. 188.

⁴⁰ Pope, *Millhands and Preachers*, *op. cit.*, p. 149.

churches, one with a “run-of-the-mill minister,” the other with a “dynamic leader” who possessed unusual gifts and was deeply loved and respected by his congregation. In the latter church the dynamic minister was able “to obtain a greater involvement of members in church activities,” but he was not able “to bring about significant attitude changes in most of the congregation. His energy, enthusiasm, drive, and leadership produce responsive reactions in the members and they find themselves more willing to do things. . . . It did not bring action in those areas of community life about which members had deep-seated attitudes. As the pastor himself stated, this was particularly evident in respect to Negro-White relations.”⁴¹

The authority of the Protestant minister in relation to the laymen has been critically tested in the Southern racial crisis. Most ministers who have been firm in their convictions and bold in stating them from the pulpit have been relieved of their posts. Many citations can be offered to support this allegation but suffice it to say that ministers in Little Rock were forced “to admit the staggering conclusion that as clergymen they were largely without influence in the time of trouble. . . . What they were proclaiming as sacred, many of their own church members rejected as impractical and unrealistic.”⁴²

This situation has been summarized: when lay parishioners hold divergent views on an issue, the ministry will be equivocal in its position; when the laymen are partisan on an issue the ministers will be equally committed to the

⁴² Robert R. Brown, *Bigger than Little Rock* (Greenwich, Conn.: The Seabury Press, 1958), p. 82.

lay position.⁴³ Waldo Beach observes that even though the Episcopal Church “is officially inclusive, its witness has been stifled by culturally conditioned laymen.”⁴⁴

According to the denominational literature for laymen the churches must maintain a constructive relationship with the secular community. This literature, however, is more often directed toward the middle-class virtues than toward the transformation of existing political and economic structures which may be the source of social injustices. Lay organizations must “make a contribution to clean entertainment, healthy recreation, social betterment, and good government.” They must “help the church start mission churches which provide worship services and Sunday schools in unchurched areas, make the church more attractive to the community,” and “through . . . discussion of community and world needs, develop an interest that will apply the teachings of Christ to the solution of many problems.”⁴⁵

The majority of Protestant laymen see through the glass darkly when they seek solutions for social problems. They dwell in a middle-class ghetto and remain so effectively isolated from the rest of the world that they readily accept the myth that they alone possess true virtue and protect all significant value. A bank president participating in a small church discussion group asked, “Why shouldn’t the Board of Trustees be made up of prominent community leaders? They’re the ones who

⁴³ Charles Y. Glock and Benjamin B. Ringer, “Church Polity and the Attitudes of Ministers and Parishioners on Social Issues,” *American Sociological Review*, Vol. 21, No. 2 (April 1956), pp. 148–56.

are most aware of what’s going on . . . and can help the church do the things that are best for the community.”⁴⁶ Contemporary American Protestantism often substitutes television for the golden harps, tail fins for angelic wings, the three day week end for heavenly rest, and the psychoanalyst’s couch for the suffering of the cross.⁴⁷

LAYMEN AND THE WORLD

In this final section we shall attempt to illustrate and summarize the thinking of those church leaders who stand at the forefront of the ministry of the laity. Efforts are being made to relate the churches in new ways to the problems of the secular community. Laymen are in a unique position for they are related to the secular environment in ways which can rarely be achieved by the professional clergy. “It is the laity, living and working in the world, which daily experiences the deep gulf between what the Church stands for and what the world drives at. They are moulded, mangled, confused or suffocated by the dominant trends of thought.”⁴⁸ Hendrik Kraemer, when he wrote these words, also noted that the laity represents the sector of the church which must bear the burden of the church’s encounter with the world, and must “voice and incarnate . . . Christ’s relevance to the whole range of human life.”⁴⁹

This is the fundamental theme of the new lay movement. An effort is being made to discover ways in which laymen can carry the church into the world without compromising Christian theological and ethical ideals and without removing the laymen from participation

⁴⁶ Meyer, *op. cit.*, p. 249.

⁴⁷ See H. Richard Niebuhr, *The Kingdom of God in America* (New York: Harper Torchbooks, 1959), p. 196.

⁴⁸ Kraemer, *op. cit.*, pp. 113–14.

⁴⁹ *Ibid.*, p. 114.

in the vocation of their choice. The enormity of the difficulties is apparent to everyone. Few laymen are theologically trained for the task. The Sunday school clichés are useless, the advertising techniques of the religious organizations are believed to be self-defeating, the ancient symbolic phrases of the evangelistic crusades stimulate repugnance more often than they arouse nostalgia, but the greatest problem is the specific relevance of Christian doctrines to secular vocations. Having rejected the monastic ideal as well as distinctions of sanctity between clergy and laymen, Protestants are faced with the problem of discovering the meaning of the doctrine of the priesthood of all believers within the contemporary situation. This involves first of all the necessity of understanding the role of the professional clergy and the function of the institutional church. Those who are on the forefront of the lay movement believe that no longer can the laity be treated as assistants to pastors who are maintaining the institutional programs of the church.

It is not the duty of the laity to help the pastor to carry out his pastoral work: it is the pastor's duty to equip the laity to carry out their work in the world. . . . We must not "missionize" the world into the Church; but the Church in its mission must go out into the world. If the life of the older and younger churches is examined from this point of view, a great deal of the activity of the Church and of its missions will be exposed as wasted effort and church-narcissism.⁵⁰

This raises another problem, for how can the Protestant minister whose basis of authority is already extremely tenuous engage in a serious conversation with the laity in order to discover the legitimate authority of the layman as a Christian missionary to the world? The vested interest of the clergymen mili-

⁵⁰ Hans-Ruedi Weber, *op. cit.*, p. 224.

tates against the efforts of the advocates of a lay priesthood. Words like these are viewed with suspicion by ministers: "It is precisely when the laity are engaged in their 'secular' occupations that they are working in the service of the Church. They are fulltime Christians just as much as the pastor is. The usual distinction between the sacred and the secular disappears completely."⁵¹

The minister distrusts the laymen, not only because they threaten his authority, but because they conform so easily to the pressures and prejudices of the secular environment. It is the trustee more often than the minister who benefits from the profits of economic exploitation, and it is the deacon, seldom the minister, who is chairman of the White Citizens Council.

But if the preacher is rarely involved in these activities, it is equally true that he seldom engages in an extended, serious, and equal conversation with a layman to discover the full meaning of the emotional impact that confronts a man who refuses to participate in the anti-Semitic, anti-Negro, or antilabor charades of his business colleagues. The import and significance of the daily pressures experienced by the laymen would be incomprehensible to the minister who has never once passed the portals of an executive office or a labor hall.

The leaders of the new lay movement believe that the "secular clergy" of Protestantism have much to teach the professional ministers if they are willing to fully associate and communicate with the layman in the midst of his weekly enterprise and become a participating witness to the amenities of the layman's secular career. It is this kind of technique which is used most effectively by ministers of the innercity slum parishes. Before they speak—certainly before they preach—to the Negro or Puerto

⁵¹ *Ibid.*, p. 223.

Rican outcast they join him in his caste society. They may attend a movie with the gang at four in the morning, stand with them while they make the decision to go on a rumble, or sit with them while they try to come out of a heroin spin.

A young Protestant layman who practices law in East Harlem and who lives on the notorious block of East 100th Street between First and Second Avenues wrote a moving account of his experience which can be used to summarize the intention of the contempo-

rary laymen's movement. He concludes that to be a Christian is to possess the extraordinary freedom to share the burdens of the "common, ambiguous, transient, perishing existence of men even to the point of actually taking the place of another man whether he be powerful or weak, in health or in sickness, clothed or naked . . . fed or hungry, at liberty or in prison, young or old, white or colored, rich or poor."⁵²

Church and the Laity Among Catholics

By JOHN J. KANE

ABSTRACT: The relation of the Catholic laity to the Roman Catholic Church is clearly defined by obligations incumbent upon adherents throughout the centuries. The attitudes of the lay Catholics toward their church vary. On one hand, a variety of charitable, professional, and social organizations with a distinctively Catholic orientation flourish. On the other hand, less than half the Catholics in some dioceses attend mass regularly, although regular attendance is required and expected. The Catholic laity belongs, organizationally, at the bottom of the Church hierarchy. This stems historically from the prestige of the priests and monks who preserved the Catholic intellectual heritage during hostile onslaughts throughout the Christian ages. The reluctance of the Church in America to welcome lay participation has historical roots in an early trusteeism which humiliated and embarrassed the young Church in this country. The current growing demands upon the Church and the resulting burden upon facilities and clergy as well as the increase in numbers of educated and able Catholics will lead the laity into fuller participation in the business of their Church.—Ed.

John J. Kane, Ph.D., has been a member of the Department of Sociology at the University of Notre Dame since 1948 and head of the department since 1953. He was formerly an instructor in sociology in St. Joseph's College, Philadelphia, and President of the American Catholic Sociological Society in 1952. He is author of Catholic-Protestant Conflicts in America, Marriage and the Family and has contributed to the American Sociological Review, The American Catholic Sociological Review and other journals and periodicals.

THE Roman Catholic considers his church a divinely instituted organization founded by Jesus Christ, the Second Person of the Trinity, true Man and true God, in which and through which he can work out his eternal salvation. At the beginning of life, unless he is a convert, he is inducted into the Church via the sacrament of Baptism and at the end of life he is prepared for eternity through Holy Viaticum and Extreme Unction. As a youth he is prepared for and receives the sacraments of Penance, that is, confession in which he tells his sins to a duly authorized priest, repents of them, and firmly resolves to sin no more in order to receive absolution; and Holy Eucharist, the reception of the Body and Blood of Christ. Shortly thereafter he is confirmed in his faith sacramentally, and later may be married in the sacrament of Matrimony, or if a male raised to the priesthood through the sacrament of Holy Orders. Some Catholics, of course, never receive either Matrimony or Holy Orders. Thus the Church through an outward sign instituted by Christ to give Grace provides for the most important rites of passage in most human lives—birth, marriage, and death.

The central fact of Catholicism is the sacrifice of the Mass which Catholics, except for a serious reason, must attend on every Sunday and on holy days of obligation. There is also an annual obligation of receiving Penance and Holy Eucharist during Easter time, a period extending from the first Sunday of Lent until Trinity Sunday. Every Catholic parent must instruct his children in the faith. If possible, such instruction is supplemented by a child's attendance at Catholic schools or Sunday schools. There is a hard core of beliefs which Catholics must accept. They must also accept the moral obligations set forth in the ten commandments and the com-

mandments of the Church.¹ Over the centuries thorough interpretation of these commandments and their application to daily life have been set forth by church authorities aided by theologians and philosophers. Catholicism is a way of life which extends into the minutiae of daily living.

This is not to say that every individual Catholic, even adult Catholics, is fully aware of all teachings of the Church on such matters. Neither would it be accurate to claim that all Catholics rigidly adhere to all obligations of the Church. Some fail through ignorance, some through human frailty. Others lose their faith and leave the Church. Contrary to a belief popular in Catholic circles, some embrace another religion. The number of non-practicing Catholics and of converts to other denominations is simply unknown and tends to be ignored in the estimates of membership in the Roman Catholic Church.

On January 1, 1959, there were 39,505,475 Catholics in continental United States including Hawaii, Alaska, and the personnel of armed forces and various overseas services. The world Catholic population is estimated at 527,643,000.² Unlike some Protestant denominations, the Catholic Church counts membership from the moment of baptism, thus including infants and children. In 1926 Protestants constituted 27 per cent of the total population of continental United States; Roman Catholics, 16 per cent. By 1958 Protestants made up 35.5 per cent of this population, Catholics 22.8 per cent. The rate

¹ The commandments of the Church cover such matters as the obligation to hear Mass on Sundays and on holy days of obligation, to fast and abstain on days appointed, to obey the marriage laws of the Church, to contribute to the support of pastors, and to perform the Easter duty.

² *The National Catholic Almanac* (Paterson, N. J.: St. Anthony's Guild, 1960), p. 354.

of growth was almost identical for both, Protestants having a slight edge.³

PRESTIGE OF THE CHURCH

Crowds thronging Catholic churches on Sundays, the number of edifices and in some cases their magnificence, the Catholic education system extending sometimes from nursery school to the graduate and professional level, the numerous other parallel institutions and societies such as hospitals, orphanages, reformatories, the press, the Knights of Columbus, the Catholic War Veterans, and professional societies seem to attest to the esteem in which Catholics, especially American Catholics, appear to hold their Church. More recently, Catholic Action, the Liturgical Movement, the Christian Family Movement, the Cana Conference, and other developments point in the same direction. But this bright picture has a dark side which often is neither entirely recognized nor appreciated when pointed out.

Sociological surveys of actual religious practice, such as the percentage of Catholics who usually hear Mass on Sunday, reveal that only about 48 per cent attend Sunday Mass in Germany. In large European cities the percentage is even lower—27 per cent in Munich and 26 per cent in Nancy. The practice of Catholicism in some Latin-American countries, beset by a dearth of clergy, is poor. In some large American dioceses the number of Catholics reported by pastors on the basis of baptisms, with due allowances for deaths,

³ *Christian Century*, Vol. 16, p. 1045. In a population survey made in March 1957 sponsored by the United States Bureau of Census of 35,000 households in 330 sample areas across the nation those indicating religious preference fourteen years of age or over, Protestants made up 66.2 per cent, Catholics 27.7 per cent. Dorothy Good, "Questions on Religion in the United States Census," in *Population Index*, Vol. 25 (Princeton: Office of Population Research, 1959), pp. 3-16.

immigrants, in-migrants and out-migrants, is almost 60 per cent below the number that could be expected from such calculations. Similar estimates made on a national scale show the number of Catholics to be about ten million less than should be expected. Studies of regular attendance at Sunday Mass in some United States dioceses reveal that they average between 30 per cent and 46 per cent.⁴

The number of invalid marriages, that is, those contracted outside the Church, in which one or both parties are Catholics is unknown. About three out of every ten valid Catholic marriages, in the United States, is a mixed religious marriage.⁵ Investigations show that such marriages are a source of leakage from Roman Catholicism. Despite Church regulations that Catholic children shall be educated in Catholic schools, in the United States only about 60 per cent of Catholic children in these age brackets do attend Catholic elementary or Catholic high schools. On the college level, only about one third of Catholic students are enrolled in Catholic colleges or universities. This is due only in part to the lack of adequate facilities. Vocations to the priesthood, the brotherhood, and the sisterhood have not kept pace with the demand, and the ratio of laymen to priests has become larger.

SANCTIONS

Sanctions exist within the Roman Catholic Church for the violation of the law of God or church regulations. Sins may be forgiven by the priest in the sacrament of Penance under the conditions noted earlier. Catholics who enter into marriage before a civil magis-

⁴ John G. Milhaven, "Sociological Soundings of U.S. Catholicism," *America*, Vol. 93, No. 5, pp. 124-25.

⁵ John L. Thomas, "Are They Marrying Their Own?" *Catholic World*, Vol. 174, p. 125.

trate in some dioceses or a non-Catholic clergyman anywhere are excommunicated. The marriage is invalid. It should be noted, however, that this does not apply to the marriage of non-Catholics before civil or non-Catholic religious authorities. Such a marriage is considered valid, and in the event of divorce, a Catholic may not marry either of the divorced persons during the lifetime of the other partner. Strictly speaking, Catholic parents may be excommunicated if they fail to send their children to Catholic schools. In actual practice there are two reasons why this is rarely, perhaps never, carried out in the United States. First, Catholic schools are unavailable in certain parts of the country. Second, in very many cases it would be impossible for Catholic institutions to accommodate all Catholic students, particularly on the college and university levels. Excommunication is a very serious penalty in that it denies access to the sacraments. If the individual repents and satisfactorily alters his or her way of life, excommunication can be lifted. Severe sanctions exist for the priest who enters into marriage. The foregoing examples illustrate rather than exhaust the possible sanctions that the Church may employ. Space does not permit a full discussion of this topic.

STRUCTURE OF CATHOLICISM

The Roman Catholic Church is hierarchical in structure. At the apex is the Pope, the Bishop of Rome, whom Catholics believe is in direct succession to St. Peter. Immediately below him are the bishops of the world and under them are the duly ordained priests. Lowest in rank are the laity. Cardinals are members of the Sacred College of Cardinals who advise and assist the Pope in the government of the Church. There are three ranks, cardinal deacon, cardinal priest, and cardinal bishop.

Except that a cardinal bishop must be a bishop these designations bear no relationship to the individual's rank in Holy Orders. Formerly, a primate was a bishop without the rank of patriarch who had jurisdiction over all metropolitans and bishops of a given area or country. He was himself subject only to the Holy See, that is, the Pope. This position is no longer recognized in canon law but the title is retained by some archbishops and, in certain cases, it provides a position of precedence outside of the local hierarchy.

A patriarch is a bishop who has the highest rank after the Pope in the hierarchy of jurisdiction. Today there are seven patriarchs: the Patriarch of the West, the Pope; the Coptic Patriarch of Alexandria; the Melkite, Syrian, and Maronite Patriarchs of Antioch, the Armenian Patriarch of Cilicia, and the Chaldean Patriarch of Babylon. While the power and importance of patriarchs, other than the Patriarch of the West, have declined greatly since the schism of the East, they are still independent of any authority except that of the Pope and his delegates. With the exception of the Coptic Patriarch, appointed by the Holy See, patriarchs are elected by their bishops and their election is confirmed by the Pope.⁶

From the third century onward it is necessary to distinguish another category of the faithful: unordained monks and other religious brothers and nuns. In the strict canonical sense these are not clerics and have no hierarchical rank.⁷ In actual practice, however, monks and nuns are not considered lay persons. Canon law recognizes their precedence over the laity in the first

⁶ *A Catholic Dictionary* (New York: The Macmillan Co., 1949), pp. 74, 371, 401.

⁷ Yves M. J. Congar, O.P., *Lay People in the Church*, translated by Donald Attwater (London: Bloomsbury Publishing Co., Ltd., 1957), pp. 3-8.

paragraph of Canon 491.⁸ Unordained brothers, sisters, and monks take vows of poverty, chastity, and obedience, wear a prescribed type of dress known as a habit, and follow a religious rule. They may be engaged in the education of youth, in nursing, or in social work, or they may be engaged exclusively in contemplation, like the Carmelite nuns. Secular institutes have more recently been founded. These are composed of men or women who practice the evangelical counsels and take vows without losing their lay status.⁹

ROLES OF PRIESTS

A priest is a sacred minister empowered through Holy Orders to celebrate Mass, administer the sacraments, to preach, and to bless.

The priest is the key person in any Catholic parish, and his role in the functioning of the parochial system is so important that without him the parish would cease to exist. From the sociological point of view, he is the most essential of the four elements in the canonical definition of the parish. The concept of a "religion without a priesthood," or of a religion in which the ministers of God are merely employees, directors, or supervisors of congregations, is completely alien to the religious institution of Catholicism. All parochial activities, strictly so called, directly or indirectly depend upon the priest. They touch upon him in some way even when they do not completely revolve around him.¹⁰

Priests may be divided into two major categories, the regular and the secular clergy. The regular clergy are members of religious orders or congregations and follow a religious role under a supe-

⁹ Philips, p. 10.

¹⁰ Joseph H. Fichter, S.J., *Social Relations in the Urban Parish* (Chicago: University of Chicago Press, 1954), p. 123.

rior. They also take vows of poverty, chastity, and obedience. The secular clergy are immediately under their bishops, take vows of chastity, a vow of obedience to the bishop, but no vow of poverty. On January 1st, 1959, there was a total of 52,689 priests in the United States. Of these, 31,961 were secular clergy, 20,728 were regular clergy.¹¹ While the roles of the regular and the secular clergy generally show some variations, there is a tremendous overlap. Most secular clergy are priests in parishes or occupy administrative offices within the respective dioceses. Regular clergy are more likely to staff high schools and colleges, to preach missions within their own country, or to go to foreign missions. But some of the regular clergy also staff parishes and some of the secular clergy teach in high schools and colleges.

A parish is a definite territorial area in which there is a church, a congregation, and a pastor who has the care of souls. In larger parishes the pastor may have one, two, or as many as four or five assistant priests or curates. But parishes reveal great variations by reason of size, the structure of the congregations and the geographical area in which they are located. These factors modify the roles of the parish priest.

Father Fichter states that the large urban parish is not an organized formal group but rather a social unit which may be identified as a statistical population, a social aggregate, or a category.¹² Within its boundaries there will be found Catholics of diverse occupations, different educational levels, various racial and ethnic backgrounds, and other social characteristics. Because of its size some parishioners may not be known to any of the parish priests. Theoretically, when a Catholic moves

¹¹ *The National Catholic Almanac*, op. cit., p. 435.

¹² Fichter, op. cit., pp. 18-19.

into a new parish, he is supposed to report to the pastor or one of the pastor's assistants. In practice, this does not always occur. The close, personal, intimate, face-to-face relationship that characterizes the small rural parish does not exist for many large urban parishes. An annual census of the parish is not always possible although such efforts are made in some dioceses. In every large city there are certain downtown parishes located in business or interstitial areas with few parishioners but large congregations during the week. These congregations are drawn to morning Mass, noon Mass, or sometimes afternoon Mass, to confessions or to devotions from day-time workers in the area. Transients from nearby hotels may also attend such churches, particularly on Sundays. In these cases, only very few of those in attendance are known to the priests and the priests are strangers to them.

While racial and ethnic parishes are now becoming a largely historical phenomenon, some still exist. The ethnic or nationality parish, Irish, German, Italian, Polish, or other, played an important role in the last century and during the early part of this one. They were established to care for the needs of the immigrants; the church was staffed by priests of the same national origin as the parishioners; sermons were delivered and confessions heard in this tongue and sometimes this language was taught in the parochial schools. They probably slowed acculturation to American ways, but they also provided a cushion against a too rapid Americanization which could result in the "marginal personality." With the practical elimination of immigration, the need for ethnic parishes no longer exists and insofar as they continue, they are a needless duplication of services. Sometimes they are located across the street from each other. In the city of Philadelphia,

for example, in the space of four or five city blocks there were three Catholic churches, Irish, German, and Polish.¹³

The roles of priests in racial and ethnic parishes have been quite different from the roles of priests in the usual American parish. This was especially noticeable in the past and is noticeable at present to a lesser extent.

In Ireland, and for a long time in America, the clergy were almost the only educated persons. . . . Priests read and wrote letters for illiterate Irishmen, gave them medical and psychiatric advice, served as marriage counselors, acted as moderators or chairmen of various Irish movements, protested to authorities about discrimination, religious or national. The priests' functions were not and could not have been purely ecclesiastical. They were active social workers in behalf of their people, they were the leaders and almost the only leaders the illiterate or poorly educated Irish could or would entirely trust.¹⁴

The racial parish still exists and is apt to be so identified by some persons even after it has become integrated. In many sections of the United States, Negro Catholics may make a choice of the parish they will attend. They may become members of the parish within whose boundaries they live or, if they prefer, they may become members of a Negro parish if one exists in their city. In the colored parish a pastor's role, usually a white priest, inevitably involves leadership in interracial work. Despite his race, he may become a spokesman for the Negroes of his city. There are also parishes, such as the Chinese parish, which are both racial and national in composition.

¹³ One exception to the statement about the decline of the ethnic parish is the Puerto Rican parish established in some cities as a result of the heavy immigrants from that island during recent years.

¹⁴ John J. Kane, *Catholic-Protestant Conflicts in America* (Chicago: Henry Regnery Co., 1955), pp. 52-53.

The social structure of most parish congregations is mixed, that is, it contains members of different social classes. But since most parishes have definite territorial boundaries, there is a distinct possibility that one social class may tend to predominate. This is obviously true of the parishioners of the downtown church mentioned above. Most American Catholics in the past and to some extent in the present tend to cluster in the middle class and below, or to use a more neutral term, the working class. But certain parishes, especially in the new suburbia, may be largely upper middle class. Such a class structure may influence the tone of parish societies and somewhat modify the roles of the priests. Parents in these parishes are likely to show a keener interest in the parochial school because they have higher educational expectations of their children.

The roles of priests are also influenced by the part of the country in which the parish is located. The high status accorded to Catholic priests in Boston even by persons who are not Catholics can be attained only with difficulty in certain sections of the South where Catholics are sparse. The possibility of Catholic influence in community leadership in such areas depends very largely upon the personality of the priest, his willingness to mingle with non-Catholics, and to join with the community in civic activities.

Father Fichter has distinguished several other roles which the parish priest must play. In his administrative role, the pastor not only "runs the parish" but he is also a "sort of super president and super treasurer of all the official constituted societies of the parish." While he may assign the direction of such organizations to one of his assistants he may intervene at any time, take over any meeting, and change the plans as he decides. The business-man role,

which is particularly that of the pastor, carries an obligation to raise and administer parish funds. He must render accurate reports to his bishop and, while he may have the assistance of lay trustees and the advice of bankers, it is his responsibility to keep the parish solvent. At times this is a difficult and trying task. He may be admired or criticized for it by his parishioners. Some hail his acumen as a business man; others criticize his constant pleas for money. His civic role requires participation in numerous community activities. Luncheon speeches at service organizations, the pronouncement of the invocation or benediction at public dinners, co-operation with mayor's committees on various projects, and sponsorship of programs for reform all become his lot.¹⁶

Aside from the role of pastor or assistant priest in a parish, priests are editors of newspapers and magazines, principals of high schools, presidents of colleges and universities, teachers in both kinds of educational institutions, directors of Catholic social service, superintendents of diocesan schools and directors of various lay activities such as the Cana Conference, the Christian Family Movement, and others.

THE LAITY

The status and role of the laity in the Church are in a state of flux. This can be readily illustrated by two widely circulated anecdotes. Cardinal Aidan Gasquet tells of an inquirer who asked a priest, "What is the position of the layman in the Church?" The priest replied, "To kneel before the altar and to sit beneath the pulpit." The cardinal then added that the layman also had to put his hand into his pocket. Financial support of the Church is certainly an important function of the layman, and it is so stated in the commandments

¹⁶ Fichter, *op. cit.*, pp. 129-132.

of the Church. But it is not his sole function. Another story is told of Pope Pius X who asked some cardinals what was the greatest need of the Church in contemporary times. One cardinal replied that more priests were needed, another that more churches were needed, another more schools. Finally the Pope interrupted them to say that what was most needed was a dedicated laity.

In Jewish and early Christian tradition the word laity referred to a sacred people and there is no distinction between lay people and clerics in the vocabulary of the New Testament. The first use of the word layman as opposed to priest occurs in a Roman document, a letter to the community at Corinth written by Clement of Alexandria.¹⁶ Between the end of the eleventh century and beginning of the thirteenth century, Father Yves M. J. Congar believes, deep changes occurred in the clerical-lay relationship, and these changes have persisted until the present time. In 1092, confirming the foundations of the Canons of Raitenbach, Pope Urban II said, "From the beginning the Church has offered two kinds of life to her children: one to help the insufficiency of the weak, another to perfect the goodness of the strong."¹⁷ The implication seems to be that the lay state is a concession to human weakness. The dictionary of Catholic theology does not mention the word layman, and of 2,414 canons in the Code of Canon Law, only forty-four are devoted to the chapter on the laity, "De Laicis."¹⁸

A number of historical circumstances have contributed to the lower status of the laity in Catholicism. It was monks and priests who preserved the intellec-

tual heritage during the barbarian invasions. During some periods of Western history, literacy itself was almost the exclusive prerogative of the cleric, and the right to the "benefit of clergy," a provision in civil law, was determined by ability to read. Monsignor Philips points out that attempts to suppress all hierarchical authority during the Reformation were countered by the Church with a vindication of papal and episcopal authority. Many catechisms, especially in their original form, were drawn up with this anti-Protestant motive.¹⁹

The history of the Catholic Church in the United States is still haunted by the ghosts of trusteeism, a controversy which occupied the American Church from 1815 to the end of the Civil War. The first Catholics in the original thirteen colonies built churches and then sought priests to staff them. They administered the temporal matters, selected their pastors, determined their salaries, and eventually in the 1820's tried to nominate the Bishop of Philadelphia. Rome, in a most temperate letter, refused this request. Two factions were formed at St. Mary's Church in Philadelphia. Violence occurred at their meeting and militia had to be summoned to put down the riot. Trusteeism was not confined to Philadelphia, and it proved an embarrassing, humiliating experience for the young American Church. While trusteeism no longer exists, the fear it engendered of entrusting to the laity their rightful share of work in the Church still persists.²⁰

Historically the American Catholic laity, with the exception of English Catholics who arrived prior to the Revolution, were usually of the laboring class, illiterate or poorly educated, as

¹⁶ Congar, *op. cit.*, pp. 1-2.

¹⁷ *Ibid.*, p. 9.

²⁰ Rt. Reverend Monsignor Carl J. Ryan, "Ghosts of Trusteeism," *Homiletic and Pastoral Review*, Vol. 57, p. 705.

incapable as they were unwilling to assume their proper leadership. Out of sheer necessity priests spoke as authorities in areas rather far removed from ecclesiastical matters. To some extent they still do and this is at least in part due to a lack of lay initiative.

CLERICAL-LAY RELATIONSHIPS

The whole question of clerical-lay relationships is a delicate matter, too far reaching and complex to be dealt with adequately in the space of an article. As a matter of fact, several books have been published on the subject and it is a favorite topic in Catholic periodicals.

Three extreme attitudes in clerical-lay relationships are clericalism, anti-clericalism, and laicism, none of which is presently found in the United States, although they are not absent in Europe and in Latin America. Clericalism occurs when the clergy unduly extends ecclesiastical authority and influence beyond its rightful sphere.²¹ Anti-clericalism opposes the Church's rightful concern about social, economic, and political affairs, even when these affect the religious welfare of its members, as in the case of Communist political activity. Laicism is the opposite of clericalism; it is the undue extension of secular authority and influence into ecclesiastical matters. So far as the Roman Catholic Church is concerned, laicism is of less importance than anti-clericalism today. The proper spheres of Church and lay authority are more easily defined theoretically than practically. Those who would attack the Church readily cry "clericalism," while some churchmen, such as the one cited above, who consider it to be the function of the laity to kneel before the altar and to sit beneath the pulpit, may prematurely shout "anti-clericalism." Michael De La Bedoyere has defined the

²¹ *A Catholic Dictionary*, *op. cit.*, p. 101.

"clericalist layman" as one who believes "only the priest can do real Christian work, and he wants to help him." He considers the work of the lay apostolate as a pale reflection of the priestly apostolate, a view sometimes shared by priests. He claims that the promising Catholic child is identified as the "pious" child and the "sacristy" child. The laymen who are always at the beck and call of priests and will not move a finger without consulting them are taken as a model of Catholic reliability and obedience.²²

He adds that there are many laity who have no feeling of oneness with the priest nor care to experience any. He says they feel the occasional need of the priest to save their souls or sign a form but their sense of loyalty depends upon a common minority cause and the physical contact which worshiping in the same building involves.²³

Some Protestant spokesmen have noted what they consider the inferior position of the laity in the Church and point particularly to the lay teacher's position in Catholic educational institutions.²⁴ Certainly in the past the lower status of the laity has been obvious. It has by no means disappeared although at times it has been exaggerated by statements of disgruntled laymen who project experiences at the hands of an excessively authoritarian pastor or priest onto the entire clergy. But, as pointed out above, the present relationships are in the state of change and of necessity they will change. Catholic laymen today have considerably more formal education than in the

²² Michael De La Bedoyere, *The Layman in the Church* (Chicago: Henry Regnery Co., 1955), p. 6.

²³ *Ibid.*, p. 11.

²⁴ Martin E. Marty, "Dialogue Within the Catholic Church," in Philip Scharper (Editor), *American Catholicism, A Protestant-Jewish View* (New York: Sheed & Ward, 1959), p. 23.

past and many of them wish to have a more active part in the apostolate.

Two milestones since 1930 clearly indicate the changing status of clerical-lay relationships. One is the call to Catholic Action by the popes and bishops, the other is the development of the Liturgical Movement. Catholic Action under the ecclesiastical authority of bishops attempts to replace the priest by laymen insofar as this is canonically possible. It is essential today because it is impossible or unfeasible for priests to do the necessary work of evangelization and teaching in some places where these are most needed.²⁵ The Liturgical Movement generally means a more active participation by the laity in the Church services, particularly the Mass. The *Missa Recitata* in which the congregation makes the responses to the priest at Mass and recites aloud certain parts of the Mass, oddly enough, has been resisted by some lay people. Other laymen, however, press vigorously for Mass to be said and sacraments to be administered in the vernacular. Neither Catholic Action nor the Liturgical Movement should be considered something new; they are, rather, revivals of past practices.

The increased birth rate following World War II and the consequent demand for more Catholic schools and teachers to staff them mean an increasing use of lay persons as teachers and professors. The lay teacher has ceased to be, as he was once considered, a necessary evil. Today he is a desperately needed asset and in the future without his services the Catholic education cannot continue even at its present level and certainly cannot be expanded to meet future needs.

Toynbee has pointed out that a pro-

²⁵ De La Bedoyere, *op. cit.*, p. 77.

letariat is not formed because people are placed in a subordinate position but rather when they are compelled to live in a society of which they do not consider themselves active members with rights. "Lay people will always be a subordinate order in the Church; but they are on the way to recovery of a fuller consciousness of being organic, active members thereof, by right and in fact."²⁶

THE FUTURE OF THE ROMAN CATHOLIC CHURCH

The future of Roman Catholicism behind the Iron and Bamboo Curtains is uncertain. Thoroughly accurate information cannot be obtained, but, from what is known, its future seems precarious. But it should be recalled that such a situation is scarcely novel and that the Church has survived crises from her beginning. The words of her divine Founder that He will be with her till the end of time and that the gates of hell shall not prevail against her are a major source of reassurance. In some parts of Europe and Latin America the practice of the faith is less fervent than could be desired, particularly among the working classes. In other sections of the world—among which the United States is included—the Church is thriving. More active participation by the American laity and the development of various movements cited seem to indicate a fervor and vigor for the future that may exceed that of the past. On the purely sociological level, the truly great asset of the Roman Catholic Church is her ability to adapt to changing times without altering the repository of faith and morals. That such adaptations will have to be made is obvious; that they will be made seems certain.

²⁶ Congar, *op. cit.*, p. xxiii.

Church and the Laity Among Jews

By MARSHALL SKLARE

ABSTRACT: Judaism is an ethnic church with all born Jews who have not converted to another religion having equal religious rights whatever the extent of their commitment to Judaism. A distinctive religious configuration in the Jewish community results from this fact as well as from the lack of separation in Jewish tradition between the obligations of laity and clergy. While membership in the household of Israel and in its religion is a hereditary right and obligation, membership in a particular congregation is an act of conscious affiliation. Congregations have become increasingly influential in the Jewish community as they have ceased to limit their concerns to religious worship and study by adults of Jewish sacred texts. Contemporary congregational programs include a wide variety of activities with special emphasis on religious education for children. One manifestation of the expansion of the synagogue is its greater utilization in the fund-raising drives for general Jewish causes. The impact of congregational affiliation and activity upon the congregant, especially upon the level of religiosity and ritual observance, is yet to be measured. It is apparent that both in Reform, in Conservatism, and in Orthodoxy the attitudes and life patterns of the laity depart markedly from ideal norms.

Marshall Sklare, Ph.D., New York City, is Director of the Division of Scientific Research of the American Jewish Committee. He serves on the Research Committee of the Religious Education Association and is a specialist in the field of racial, ethnic, and religious groups, with particular emphasis on the sociology of the Jewish community. He is the author of *Conservative Judaism: An American Religious Movement* (1955) and editor of *The Jews: Social Patterns of an American Group* (1958). He is currently engaged in the "Lakeville Study," an investigation into attitudes of residents of a Midwestern suburb.

SEVERAL characteristics of the Jewish religion in terms of church and laity require analysis in order to establish a framework for a discussion of the contemporary American synagogue. Of prime importance is the ethnic stress of the Jewish religion, resulting in the fact that Judaism represents a type of ethnic church. Membership in the Jewish religion overlaps with membership in the Jewish community. The fact of birth entitles the individual to membership in the religious community. Furthermore, the definition of Jewish religious law—he is Jewish whose mother is Jewish—is reinforced by both Jewish and Gentile public opinion. In the United States only a small segment of ultra-Reform Jews and a group of Jewish converts to Christianity have seriously suggested splitting the atom of ethnicity-religion in Judaism.

The results of this articulation of religion and ethnicity include the fact that there can be no strong division in Judaism such as exists in other religions between the "saved" and the "damned," between those who have "confessed" and those who have not done so, between those who have accepted the "truth" and those who live in error. All Jews may claim equal membership in the Jewish "church."

Nevertheless, several important distinctions are encountered in Judaism. One is the distinction between the learned and the ignorant. The students of the vast corpus of Jewish religious law are to be distinguished from those who remain in ignorance of all but its most simple stipulations and to whom its intricacies will remain unknown. The other distinction is between the pious and the nonobservant, between those who carry out ritualistic and moralistic requirements and those who neglect them.

The contrast between the learned and the ignorant has been obscured on the

contemporary scene. The rise in secular learning, the changing character of Jewish scholarship, and the impact of non-Jewish religious traditions have severely attenuated this long standing distinction. The division between the observant and the nonobservant continues, though not in accordance with the rigid categories of yesterday. The contemporary distinction is generally between degrees of observance rather than between those whose observance is perfect and those whose observance is only partial.

To the Jewish layman the present-day rubrics of Orthodox, Conservative, and Reform are not always designations indicating denominational affiliation. Rather they may measure the degree of observance of the commandments—*mitzvot*—of the Jewish sacred system. The individual may continue to observe *kashruth*—the laws relating to food—in the home but neglect them on the outside. Consequently he may no longer describe himself as an Orthodox Jew but rather as a Conservative Jew. Another comes to neglect *kashruth* both outside as well as inside the home; he no longer describes himself as a Conservative Jew but rather he feels that he is a Reform Jew.

While all three groups—Reform, Conservative, and Orthodox—are in the midst of elaborating an institutional structure which appears to be denominational in character, the articulation of religion and ethnicity in Judaism limits the impact of such elaborations.¹ The

¹ Federations exist for each of the three groups: the Union of American Hebrew Congregations for the Reform group; the United Synagogue of America for the Conservative group; and the Union of Orthodox Jewish Congregations of America for the Orthodox group. The Reform federation is the oldest and the best organized of the three. The Conservative federation was relatively inactive until the 1940's, becoming an important agency after that period. The Union of Orthodox

fundamental distinction continues to be between Jews and Gentiles rather than between the three wings of American Judaism.

LAITY AND CLERGY

It has been emphasized that the ethnic stress in Judaism results in both believer and nonbeliever holding equal membership in the Jewish church. We may now explore the distinction between laity and clergy. As elaborated in Judaism this distinction contrasts sharply with the dichotomy which is characteristic of many other religions. According to Jewish tradition, identical behavior is expected of the layman and the rabbi. Spiritual exercises and religious observances are equally incumbent upon all males. Furthermore, the areas where rabbinical intervention is required are few in number. All *rites de passage* can be celebrated, all holidays observed, all religious services held, all *mitzvot* performed without rabbinical supervision. The traditional agenda of the rabbi does not include serving as a priest—a conductor of public worship; a preacher; a cleric—an official empowered by the state to perform certain ceremonies; a rector—an administrator of a religious institution or parish; or a pastor.² No “call” is ordinarily heard by the fledgling rabbi.

The rabbinical office derives from a Jewish Congregations is a loosely organized group. The synagogues affiliated with the Young Israel movement, however, have achieved a measure of co-ordination, and the Yeshiva University Synagogue Council also has become a force in the Orthodox group. The Synagogue Council of America, an overall agency, is composed of both rabbinical and lay representatives from each of the three groups. It has confined its efforts to representing the common interests of Reform, Conservatism, and Orthodoxy before interreligious, governmental, and Christian agencies.

² It should be noted that the rabbi traditionally was a communal rather than a congregational functionary.

distinction suggested earlier, the gulf between the learned and the ignorant. All scholars are entitled to respect; the greatest masters of Jewish learning are qualified to serve as conservators and interpreters of the tradition. More exactly, the rabbinical degree entitles the holder to serve as the head of an academy of Jewish learning and as the president of a tribunal. He is thus a teacher and an adjudicator; he possesses a doctor of laws degree and a license to teach. Since the cultivation of learning is incumbent upon all, it is expected that some of the scholarly will pursue learning as an avocation and hence will not exercise rabbinical prerogatives. In contemporary Orthodox schools of higher learning—*yeshivot*—it is still not assumed that all advanced students are aspirants for the office of rabbi. Reform and Conservative schools, however, are largely seminaries, that is, training institutions for religious professionals.

These changes serve as clues to the departure from traditional norms and hence to a growing distinctiveness between the functions of the layman and the rabbi. The addition of pastoral, priestly, clerical, and several other roles serves to transform the rabbi into a clergyman and the nonprofessional into a layman. The distinctiveness of the roles is hardened not only by general societal trends toward specialization but also by the sharp limitations of Jewish knowledge evidenced by lay persons; such limitations preclude their sharing in functions formerly reserved for nonprofessionals.

The institutionalization of differences in religious obligations between laity and clergy has not yet been achieved. Nevertheless in practice a wide distance between the level of religious observance of the rabbi and that of the layman is evident. This occurs in Reform, Conservatism, and Orthodoxy. In all three

the difference in level of observance of *mitzvot* between clergyman and layman tends to be substantial. There is a tendency to accept the difference as an appropriate one and to castigate as insincere the rabbi who is only as observant as the layman.

CONGREGATIONAL AFFILIATION

While membership in the household of Israel and in its religion is a hereditary right and obligation, membership in a congregation is an act of conscious affiliation. Such membership is characteristic of American Jewish life; in the European lands from which the ancestors of most American Jews came the individual did not affiliate with a congregation in the sense customary in the United States.

The typical American Jewish congregation is formed by local residents who join together to hold religious services and to establish a school for their children. They raise the funds necessary to build an edifice and to hire a professional staff. Generally the synagogue is organized in the form of a corporate body which holds periodic membership meetings at which the affairs of the institution are discussed, officers and board members elected, and contractual obligations with the rabbi and other professionals reviewed.

Membership in the congregation is open to all. There is generally no test of the applicant's religious attitudes or of the intensity of his religious observance. In many Reform or Conservative congregations the applicant is commonly sponsored by a member of the congregation or by one of the professional staff. Individuals who are financially irresponsible or who have an abhorrent moral reputation may thus be screened. There are a few Orthodox congregations which inquire into the applicant's level of observance; they restrict their roster to

those whose behavior is in conformity with certain selected religious norms.

Motivations for affiliation are extremely varied, but the desire to give a Jewish education to one's children plays a leading role. Jewish religious schools are increasingly becoming institutions sponsored by individual congregations rather than independent entities. This is particularly the case in suburban areas. Some congregations make membership mandatory for enrollment while others adjust their tuition fees to provide a financial incentive for membership.

The desire to attend religious services on the High Holidays—*Rosh Hashanah* and *Yom Kippur*—is another leading motivation for congregational affiliation. Daily services, Sabbath services, and festival services are open to all, but on the High Holidays tickets are distributed only to members. In some instances tickets are sold to the public and members are afforded a reduction in fee. Most High Holiday services are conducted by congregations. The number of “mushroom synagogues” opened by private entrepreneurs each fall is decreasing and the phenomenon is rarely encountered in middle-class areas or prestigious neighborhoods. Congregations will frequently hold overflow services for the High Holidays, thus increasing the number of available seats in much the same manner as was formerly done by the mushroom synagogues.

The desire of a considerable segment of the Jewish population for elementary Jewish education and for seats at High Holiday services, when combined with present institutional arrangements, assures many congregations of a sizeable membership roster and long-term fiscal stability. However, those who are motivated solely by the desire to have their children confirmed—*Bar Mitzvah*, *Bas Mitzvah*, or Confirmation—are poor

prospects for long-term membership. They delay joining until the child is of elementary school age and may resign soon after the performance of the ceremony.

Membership dues provide the bulk of the income of most Reform and Conservative congregations. Where the practice is to allow each family two seats for the High Holidays, dues may average about \$175 per year. New or expanding congregations will add building assessments. School fees may be additional.

Some Orthodox congregations are large institutions organized along the same lines as Reform and Conservative synagogues. Others place no emphasis on developing a membership roster; they derive the major portion of their income from High Holiday seats, from the auctioning and sale of synagogue honors, from individual solicitations, and from periodic appeals to worshipers. There are also instances of Orthodox synagogues which are not organized as corporate bodies. One example is the prayer houses of Chassidic groups. Here we encounter an instance in the Jewish community of sectarian rather than denominational behavior, for the adherent becomes a follower of a dynastic religious leader endowed with charismatic qualities rather than a voting member of a corporate body. The followers of the Chassidic leader, *rebbe*, elect no officers or board. The *rebbe*, and those designated by him, constitute the leadership.

CONGREGATIONAL PROGRAMS

The traditional program of the synagogue was confined largely to religious worship and the use of its quarters for groups devoted to the study of various sacred texts. One important departure from this program, the development of elementary Jewish schools, has already been noted. Previously, *melamdin*,

elementary-level teachers, formed their own schools, conducting classes in their place of residence or sometimes giving instruction in the homes of pupils. This system was still in use in immigrant areas; however, the *talmud torah*, or communal school, soon became popular. This was followed by the congregational school, presently the regnant form of elementary Jewish education.

The provision for religious services remains an important area of congregational functioning. Their frequency, duration, and character vary markedly according to whether the congregation is Reform, Conservative, or Orthodox. There is also some variation within each of the three groups. Orthodox congregations generally hold services three times each day. The daily prayers, however, can be recited at home as well as at synagogue. Reform congregations, on the other hand, generally hold services only on the Sabbath.

Levels of attendance differ widely, but in most cases it is only on the High Holidays that the majority of the congregation attends any one service. Then the crowds strain the facilities and attendance is high regardless of the day of the week on which the Holidays fall. While a core of faithful daily or weekly worshipers is commonly encountered in all three groups, the typical member attends only a handful of services during the year in addition to those held on the High Holidays. An invitation to attend the confirmation of the child of a friend, the desire to recite the memorial prayer for a member of one's own family, interest in the subject of the sermon, the desire to hear a celebrated guest speaker, all may play a part at one time or another in motivating the occasional worshiper.

The ten-man quorum necessary for holding a public service is present in most Orthodox and in many Conservative congregations daily. Recruiting the

tenth man has become a subject for humor. No ingenuity is required for Sabbath and festival services; a quorum is assured. Attendance at a Sabbath or festival service in large congregations may be considerable, but satisfaction is rarely expressed about the ratio between the number of members and the number of worshipers. At periodic intervals many Reform and Conservative congregations make strenuous efforts to raise the level of attendance.

On the subject of affiliated organizations, we find that they constitute a bulwark of support for the congregation. They compensate, in one sense, for the limited participation of the membership in public prayer. The sisterhood is the strongest such affiliate. Sisterhoods are found in all medium- and large-sized Reform and Conservative congregations, and in some Orthodox congregations. The Reform groups are joined together in the National Federation of Temple Sisterhoods, the Conservative group in the National Women's League of the United Synagogue. The sisterhood is commonly in competition with Jewish women's associations which are not synagogue based. Conservative sisterhood members will frequently belong to Hadassah, Reform members to the National Council of Jewish Women.

The prosperity of the sisterhood is indicative of the increasing importance of women in the functioning of American Jewish congregations. Women did not take part in the study circles of the traditional synagogue, and while they could attend the religious services they came as auditors rather than as full participants. At contemporary Reform religious services, however, the proportion of women is frequently higher than men and their participation in the service is extensive. The trend in Conservative congregations is more attenuated but still very noticeable. The election of women to congregational boards

is now commonplace. It came about initially because of the importance of the sisterhood in the total program of the synagogue. Women sometimes serve as officers in Reform congregations.

The men's club is less successful than the sisterhood, but is nonetheless an important organization in Reform and Conservative congregations. Programs are less elaborate and frequently less serious in content than those of the sisterhood. Fund-raising is more casual. Men's clubs are also in competition with secular Jewish associations, most frequently with the B'nai B'rith.

While all adult females are invited to join the sisterhood and all adult males the men's club, several age-graded and specialized clubs are found in the well-organized congregation.³ One of the most successful is the "couples club" composed of younger married persons. Another is the parent-teacher organization. Some congregations have "golden-age clubs" meeting on their premises, and some have organizations or hold entertainments for younger unmarried adults.

Programs of youth activity are sponsored in most Conservative and Reform congregations. Since only a small proportion of young people continue their Jewish education during the high school years, such groups serve as the only tie with the institution. Parents value the organizations for the recreational opportunities which they afford as well as for their indirect influence in discouraging dating across ethnic-religious lines. The National Federation of Temple Youth has chapters in most Reform congregations. Its opposite number in the Conservative movement is the United Synagogue Youth.

³ For an attempt to establish a congregation without affiliated organizations see Arnold Jacob Wolf, "Experimental Synagogue in Suburbia," *Reconstructionist*, Vol. 26, No. 7 (May 13, 1960), pp. 15-19.

A recent development is the growth of summer camping for children and youth. Camping previously was in private hands or under the sponsorship of secular Jewish organizations. During the past decade both the Reform and Conservative movements have developed a network of camps throughout the nation. Much less vigorous has been the development of adult retreats.

The recreational programs of individual congregations vary widely. Some, particularly in the East, maintain swimming pools and gymnasiums. Models for such developments were the settlement houses and the Jewish centers founded at the turn of the century in immigrant neighborhoods or in areas of second settlement. Many congregations now sponsor day camps during the summer months and nursery school programs during the school year.

ADULT STUDY

The final aspect of the congregational program which requires review is the traditional one of serving as a center for the study by adults of Jewish sacred texts. This type of activity has been continued in many Orthodox synagogues although in attenuated form. For several decades many Reform and Conservative groups shifted their educational emphasis to public forums featuring nationally known speakers on general topics of current interest. The older tradition lived on more as a historical memory than as current practice, while the limitations of such lecture series became obvious over a period of years. Concurrently the gap between the ever increasing educational level of the congregation, a substantial proportion of whom had attended college, and the low level of their Jewish education was apparent.

In recent years public forums geared to attracting the widest possible audiences have been de-emphasized.

Courses dealing with textual study have sometimes been reinstituted in modernized versions, but current study programs are more likely to include Hebrew language courses, instruction in how to conduct various ceremonies in the home, instruction in the ritual of the synagogue, survey courses of various periods of Jewish history, and courses which deal with contemporary Jewish problems. While guest speakers are utilized, their topics are more closely geared to Jewish concerns. It is generally conceded that adult study is a frontier area with activity lagging behind the interest manifested in the congregation's recreational and associational program.

PHILANTHROPY

In the traditional synagogue funds were raised or donated for a wide variety of philanthropic purposes. With the growth of Jewish federations and welfare funds in the early decades of the century, fund-raising for local, national, and international Jewish needs became centralized; the larger fund-raising organizations made little use of the synagogue for their campaigns. Such organizations did not wish to limit their solicitation to synagogue members. They found, furthermore, that even affiliated persons gave in modest amounts when approached through the synagogue. One important reason for this result was that the focus of the activity of the individual was becoming more occupational than congregational. In a community of independent businessmen and free professionals, many of whom had had close interpersonal contacts or a thorough knowledge of each other's affairs, an occupationally based campaign was feasible. This type of solicitation has been highly effective and is still the fundamental mode of organization for large campaigns.

There is, however, a trend toward returning to the older tradition of the

utilization of the synagogue as an avenue for fund-raising efforts. The rise in synagogue affiliation makes a larger public available than formerly through congregational channels. The development of varied congregational programs has given the average member a stronger tie with the institution. The ability of the synagogue to evoke sizeable contributions for its own purposes and for "denominational" bodies has given the institution new stature in the eyes of fund-raising executives. All of this has resulted in greater utilization of the synagogue for solicitation for general Jewish causes. Congregations in the larger communities are asked to sponsor fund-raising dinners and commonly do so for selected campaigns. While a sizeable proportion of the largest donations announced at such dinners do not represent "plus giving," the donor having already been contacted through the trade division of the campaign, some additional money is raised through these affairs.

At the dinners for local, national, or international Jewish needs the sights are high. Most congregations also sponsor a variety of funds established for the receipt of small donations. These are given to mark a variety of occasions—a birth or a birthday, an engagement or a marriage, the recovery from an illness, the death of a relative or a friend.

THE IMPACT OF THE SYNAGOGUE

Because there are no studies which provide data on the changes which take place as a result of joining a congregation, it is difficult to give a valid account of the impact of the synagogue upon its membership. And because the impetus for joining is frequently the desire to provide a Jewish education for one's children with the attendant willingness to modify the Jewish atmosphere of the home to conform somewhat more closely

with that of the religious school, it would be difficult to trace any changes which occur in the life pattern solely to the results of congregational affiliation.

Given Judaism's ethnic church character and the fact that all Jews are equal members in the household of Israel, were there even less secularism in the Jewish community than obtains at present we would expect few dramatic instances of religious transformation which motivate or follow upon congregational affiliation and involvement. Instances where a type of conversion experience has taken place are occasionally described in the press, but these generally have little connection with belonging to a congregation.⁴ The usual correlate of synagogue affiliation—even for the more seriously involved person—is the shift of the individual to a network of new interpersonal associations, to give him a somewhat richer insight into spiritual problems and Jewish values, and to confront him more directly with the problem of his observance of *mitzvot*. Whatever changes in life pattern occur can frequently be traced not so much to a conversion experience but to co-optation into the leadership and committee structure of the congregation.

The operation of the modern congregation demands a variety of professional specialists. The newest is the executive director, an official who specializes in the administrative, fiscal, promotional, and building-maintenance problems of the congregation. But even with the addition of this manager the structure of the synagogue provides a variety of positions for the congregation member.

⁴ For a Conservative example see Morton Gerla, "Two Who Returned," *United Synagogue Review*, Vol. 11, No. 4 (Winter 1959), pp. 12-13. For a Chassidic example see Zalman M. Schachter, "How to Become a Hasid," *Jewish Heritage*, Spring 1960, pp. 33-40. See also Arthur A. Cohen, "Why I Choose to be a Jew," *Harper's Magazine*, Vol. 218, No. 1307 (April 1959), pp. 61-66.

Whether or not actual power is in the process of shifting from volunteer to professional, the tradition of lay control is well established. The table of organization calls for a sizeable number of committees, with some turnover in their personnel inevitable. Opportunities for workers thus are numerous. And there exists the possibility that the individuals will assimilate some of the ideal norms of the institution in whose behalf they labor. This process, however, occurs only in a limited number of cases. The available research points to the existence of a wide disparity between the norms preached from the pulpit and those established in creed and code, and the actual beliefs and pattern of life of the laity.⁵

In Orthodoxy the model of required observance is clear but the model is less clear in Reform and Conservatism. The desire for a code of normative beliefs and practices has been articulated in the Reform movement. It has been claimed that unless religious standards are unambiguous and certain essentials required of every Reform Jew, the impact of the movement will necessarily be limited. Those who have had reservations about the promulgation of a code of normative beliefs and practices have questioned whether the very concept of a code, and any implication of sanctions, is not antagonistic to the central ideals of Reform Judaism. The diversity of practice among Reform Jews

⁵ For a significant report on Orthodoxy see Howard W. Polsky, "A Study of Orthodoxy in Milwaukee: Social Characteristics, Beliefs and Observances," in Marshall Sklare (Editor), *The Jews: Social Patterns of an American Group* (Glencoe, Illinois: Free Press, 1958), pp. 325-35. For the Conservative group see United Synagogue of America, *National Survey on Synagogue Leadership* (New York: United Synagogue, 1953). For an optimistic report on Reform see National Federation of Temple Brotherhoods, *Current Reform Jewish Practice* (New York: National Federation of Temple Brotherhoods, n. d.).

has prompted critics to ask whether a code might not multiply strife and defection rather than increase normative adherence. The critics have prevailed and "guides" rather than "codes" have been promulgated. The guides have been issued by individual rabbis rather than by authoritative Reform bodies.

The approach of the Conservative movement has been similar to that of the Reform. Although standards are less ambiguous, no substantial attempt has been made either to promulgate a code, to interfere with the freedom of the individual, or to penalize the non-conformist. One approach of the Conservative movement has been to stress standards of congregational rather than individual practice. Thus no inquiry is made into the observance of *kashruth* by synagogue members but the "Standards for Synagogue Practice" of the United Synagogue states that:

Recognizing *kashruth* as another basic tenet of Judaism, congregations will take all steps necessary to insure proper observance of *kashruth* at all functions on the premises of the synagogue and at functions away from the synagogue which are held under their auspices.

Another approach of the Conservative movement has been to inaugurate campaigns aimed at increasing adherence to particular religious observances rather than calling for a generalized reawakening to all religious norms. Program materials and congregational aids are generally issued, but results have not been objectively measured. The most notable campaign has concerned observance of the Sabbath, a crucial aspect of the Jewish sacred system and one where the distance between religious norms and the life pattern of the laity has been exceedingly wide. The campaign publicity not only stressed the man-God relationship but also emphasized the social utility of Sabbath observance for,

in this case, its contribution to improved mental health.

CONCLUDING REMARKS

The successful institutional adaptation of the synagogue has been made on a variety of levels. The role of the rabbi has been redefined—new roles have been added and the older ones of judge and teacher have either lapsed or been reformulated. The synagogue member has become a layman. Modest demands are made upon him for religious observance and manifold opportunities are provided for participation in synagogue affairs. Religious education and recreation for the young are stressed as well as attractive leisure-time activities for the mature. The modern synagogue is conducted in a way which is in accord with the advancing class and status level of the Jewish community. Increasingly less emphasis is given to adherence to a deviant culture in addition to loyalty to religion. To the individual the existence and prosperity of the neighborhood congregation point to the promise of Jewish survival at a time when the acculturation process is sufficiently advanced to make it difficult to take survival for granted.

The institutional growth of the synagogue movement since World War II has been exceedingly impressive. There has been some growth also in the Jewish community center movement. The centers are almost exclusively devoted to

providing for the leisure-time activities of members of the Jewish community. They have group workers rather than rabbis for leaders, and they offer little systematic instruction for the young. Although the center movement has expanded, the synagogue movement has expanded far more rapidly and seems to be more appealing within the Jewish community.

The prosperity of the synagogue is also impressive when congregational gains are compared with those made by Jewish organizations. Some associations—Zionist groups, for example—have declined. Other mass organizations, like the B'nai B'rith, have maintained their membership or made small gains. But the rate of growth even of the successful agencies does not compare with the gains made by Reform, Conservatism, and, to a considerably lesser extent, Orthodoxy.

There is, then, a strong predilection among members of the Jewish group for synagogue affiliation in spite of considerable secularization and of consequent wide departures in attitudes and life patterns from religious norms. Such a predilection presents a challenge of considerable proportions for a religious institution: its very success may serve to mask its failure. Furthermore, increasing involvement with the synagogue in comparison with Jewish ethnic associations presents the synagogue with grave responsibilities for determining the future character of Jewish life in America.

Financing the Local Church

By WILLIAM H. LEACH

ABSTRACT: The social heritage of the Christian church derives from Judaism, and methods of financing today's local churches can be traced from the pre-Christian era. Many leaders insist that the Jewish tithe of the Old Testament should be the basis of church support today. The process of local church finance in the earliest days is described in this paper and compared with the new, complex methods which are practiced by contemporary churches. Churches have grown—in numbers and wealth—with the changing society. There is a great difference between the "collections" of two generations ago and the budgeting and accounting principles of the successful churches of today. With some of the larger churches operating on annual budgets of three quarters of a million dollars, and with sixty to eighty persons on their payrolls, a serious consideration of business methods in church finance is clearly warranted.

William H. Leach, Litt.D., Cleveland, Ohio, is a Presbyterian minister and the editor of Church Management. He has written nineteen books in the fields of church administration and homiletics, the latest of which is Handbook of Church Management (1958). He is active at present as a lecturer and as a church building consultant.

THE Christian Church descends directly from Judaism; its founders were Jews, and any concept for financing the local groups of worshipers would naturally be influenced by the Judaic cultural heritage. The early Christian churches, unlike the Jewish communities, were independent organizations; they lacked any state affiliation, and they could not depend upon a state, governor, or king to collect taxes or contributions from the people to pay the costs of operating local Christian societies.

THE TITHE

The religious institutions in the Jewish nations of Israel and Judah were supported by levies made upon the people for the upkeep of the temple, the priesthood, the Levites, and other employees of the religious institution. The term for the levy used in our English translations of the Bible is "tithe" which means "tenth." There are many supporting instances in the Old Testament to show the principle of the tithe. The following from the book of Deuteronomy is a good example:

Ye shall tithe all the yield of your seed, which comes forth from the field year by year. . . . And if the way is too long for you, so that you are not able to bring the tithe . . . then you shall turn it into money, and bind up the money in your hand, and go to the place which the Lord your God chooses.¹

At the end of every three years you shall bring forth all of the tithe of your produce in the same year, and lay it up within your towns; and the Levite, because he has no portion or inheritance with you, and the sojourner, the fatherless, and the widow, who are within your towns shall come and eat and be filled.²

During the history of these Jewish nations, however, the principle of the

tithe was not continuously observed. There were periods during which it was largely ignored. The Old Testament books of Ezra and Nehemiah relate some of the difficulties in collecting the tithes to rebuild the temple. In the book of Malachi we find the prophet accusing his people of robbing God by not paying their tithes for the religious institution.

From the days of your fathers you have turned aside from my statutes and have not kept them. Return to me and I will return to you, says the Lord of hosts. But you say, "How shall we return?" Will man rob God? . . . Bring the full tithes in the storehouse, that there may be food in my house; and thereby put me to the test, says the Lord of hosts, if I will not open the windows of heaven for you and pour down for you an overflowing blessing.³

The tithe, as expressed in these selections, seems to have little significance in contemporary Judaism.⁴

While the term "tithe" appears but a few times in the New Testament there is evidence that the followers of the Christ gave generously from their means. It should be remembered that these early Christian churches were, above all else, Christian fellowships. Those who had resources contributed to the aid of their less fortunate friends. At one time there was a common treasury; some gave their entire possessions. The first lay officers, the deacons, were given the responsibility to feed the hungry, the widowed, and the poor.

The Apostle Paul, who possessed a

³ Malachi 3: 7, 10.

⁴ Interesting discussions of this and other closely related subjects are found in three recently published books: Richard Byfield and James P. Shaw, *Your Money and Your Church* (Garden City, N. Y.: Doubleday, 1959); Hiley H. Ward, *Creative Giving* (New York: Macmillan Co., 1959); Thomas K. Thompson, *Stewardship and Contemporary Theology* (New York: Association Press, 1959).

THE ANNALS OF THE AMERICAN ACADEMY

76
 their chicken suppers and earned, with much consecration in toil, the dollars which contributed to the support of the minister and paid for other activities of the church.
 But the real day of church stewardship was still to come.

CHRISTIAN STEWARDSHIP

The modern concept of local church support is based on a simple statement of Christian stewardship. The constitution of the National Council of the Churches of Christ in the United States of America defines Christian Stewardship as follows:⁷

Christian stewardship is the practice of systematic and proportionate giving of time, abilities, and material possessions, based on the conviction that these are a trust from God, to be used in his service for the benefit of all mankind, in grateful acknowledgement of Christ's redeeming love.

This is a very broad statement which is not concerned with the methods used to implement the principle. Some, undoubtedly, would have preferred to have the tithe recommended as a principle of giving. Tithing still is a most effective way of financing churches. Many people who tithe insist that they receive spiritual benefits from the practice. It may still be a potent factor. Christian stewardship, however, involves more than the tithe.

The financial obligations of today's local church fall in three areas:

First, there is the cost of suitable real estate and the expense of proper buildings for the program of the church. Money for this purpose is usually designated as "cap-

tal funds." Second, there is the amount of money needed for the local church program. This amount includes the salaries paid to the ministers and other employees, the cost of church building maintenance and insurance. Third, there is the amount of money to be raised for the extension of the church program in new areas at home and abroad. This must include the teaching ministry of the gospel; the healing ministry of doctors and nurses; and the social ministry of feeding the hungry and extending aid in times of emergency.

FINANCING CHURCH BUILDINGS

The number of church buildings erected during the past fifteen years has been tremendous. Year after year the total amount spent for new church construction has increased. In 1959 it approximated one billion dollars.⁸ There are indications that it will be just as high in 1960. The need for these buildings has resulted from vast population movements, the increased birth rate among American families, a new religious interest, and a new concept of the type of building adequate for the modern church program.

The modern church has a multicelled program. Hence it requires a multicelled structure. The simplest church today requires a physical plant which has facilities for worship, education, fellowship, administration, storage, heat and ventilation, and parking. Today many of the denominations are reluctant to encourage a church to build unless it has at least five acres of land. One acre of parking surface, for example, accommodates only one hundred automobiles.

Before 1900 the average congregation, in planning new building, placed more than three fourths of the total building

in the worship unit. The sanctuary was the church. Today, educational and social needs require more space than worship does. The result is that the total cost will be about equally divided between the sanctuary and the other units.

There is, first of all, the expense of purchasing satisfactory real estate. That varies, of course, among communities, but the areas will be few where suitable land can be purchased for less than one thousand dollars per acre, and it may cost ten times that figure. For a congregation of five hundred people, the cost for real estate, plus the building necessary for a well-balanced program, with architectural fees and landscaping, can hardly be less than four hundred thousand dollars. The cost, in most instances, will be greater. Since churches of this size may be running on operating budgets of twenty to fifty thousand dollars, it is easy to see that the financing of a new building is something quite apart from the annual church budget. It requires a different technique.

New buildings are financed by capital fund campaigns conducted by local leaders or supervised by professional fund raisers. These funds are augmented by contributions from the denomination, memorial gifts from members and others, and loans from banks or other lending agencies.

The professional fund raiser has found a fertile field in the current era of church building. Some of the denominations have established their own bureaus to help the churches in their campaigns. There are, of course, many reliable firms and individuals who direct campaigns on a fee basis. Most of the campaigns solicit pledges to be paid weekly over a period of years. Three years is a popular pledge span at the present time. Professional leadership, commercial or denominational, usually produces more pledges in fund campaigns than local, volunteer leadership.

FINANCIAL RESOURCES

With the inflationary costs of today, very few congregations are able to secure sufficient funds for a complete, new building in one financial campaign. The campaign must be supplemented. Occasionally, but not often, churches have had sufficient foresight to amass substantial building funds prior to the need for the building. Perhaps every congregation should follow the example of industry and set aside a definite amount each year for replacing the house of worship. It is unusual at present to find this plan in practice among churches.

Memorial contributions often are available after the completion of the campaign. Any effort to solicit such funds should be delayed until the overall canvass has been completed. A duly appointed committee can compose a list of memorials which would be acceptable to the church. Memorial gifts may furnish organs, windows, chancels, chapels, and even rooms and pews. The total cost of building is thereby reduced. Even with this additional income, many churches are unable to authorize the construction of the complete structure.

There are two alternatives to building a complete, new structure. One alternative is to build the church by units. New architecture styles with ground level, expansive buildings can readily be adapted to this scheme. The second alternative is to negotiate a loan with some lending institution and to undertake a mortgage. There has been a recent revival of an old practice for permitting church members to lend the money. The members who make the loans accept debenture notes based on Sunday offerings of the church. This can be a very simple matter if the notes are not offered for public sale; or it can develop into a full-fledged issue of mortgage bonds cleared by the state securities commission or agency.

⁷ Constitution of the National Council of the Churches of Christ in the United States of America (New York: National Council of Churches, n. d.).

⁸ The F. W. Dodge Corporation reports that the amount spent on church building construction in 1959 reached \$799,500,000. Other sources give higher estimates.

Any loan, whether protected as a mortgage or based on church income, must be paid in regular monthly, quarterly, semi-annual, or annual payments. From the time that the loan is granted, the local church budget must provide for repaying it in an orderly way.⁹

THE ANNUAL CHURCH BUDGET

In church finance, the decade of 1900-1910 marks the division between the pioneer church and the modern church in America. Two innovations were introduced which revolutionized church incomes. The first was the "every member canvass," which is a plan by which every family in the parish or congregation is reached for a pledge toward the support of the church. The second was the improvement in printing processes which allowed weekly contribution envelopes to be printed, numbered serially, and dated chronologically, in one operation. This made it possible to give to each individual a package of fifty-two envelopes, each carrying the name of the local church, in which to pay his pledge. Weekly payments revolutionized church finance, increased the giving by congregations many times over, simplified accounting procedures, and made it possible to project a yearly financial program.

Envelope manufacturers have co-operated in making giving easy. Envelopes of many sizes and varieties are offered; there are single pocket envelopes, duplex envelopes, and triplex envelopes; some are printed in colors for variety. One manufacturer even prints brief homilies on the back of his church envelopes.

This growth in income made possible

⁹ An excellent study of budgeting and the every member canvass is found in Richard Byfield and James P. Shaw, *Your Money and Your Church* (Garden City, N. Y.: Doubleday, 1959).

the multiplication of service units in the church program. In the same era, 1900-1910, graded Sunday school lessons were introduced; church offices began to make their appearances; and, for the first time in American history, the minister, as the head of the church, found himself responsible for directing an organization in addition to conducting services.

During the ensuing decades many variations of the every member canvass have developed. Denominational leaders originally emphasized the biblical method. Jesus sent out his disciples in pairs, and church solicitors went out two by two. Subsequent variations have placed less stress on biblical authority and more on thoroughness and results. Some churches substituted "loyalty Sundays" for the canvass; others solicited on a group rather than household basis. In church building campaigns, an effort currently is made to have the solicitor represent the same income bracket as the persons solicited. Many churches have experimented with direct mail canvasses. Regardless of methods used, however, the two basic principles remain. Every member and affiliate must be given the opportunity to make a pledge, and weekly contributions must be stressed. The point has been made many times that two dollars per Sunday is greater than one hundred dollars per year.

The church budget usually is made before the solicitation of pledges takes place. A frequent procedure is to have the prepared budget in the hands of the prospective contributors before they are solicited. A pledge, then, is a vote of approval for the budget.

The preparation of a church budget may be a very simple or complex affair depending upon the size of the church, its program, its financial resources, and its responsibilities. The budget is a detailed estimate of the amount of money

the church will need to operate during the forthcoming year. In the pioneer days, budgets were not made. A pioneer budget would have listed few expenses: the minister, the custodian, insurance, taxes, a few public utilities, building maintenance, and perhaps a subscription to missionary work.

The local church budgets of today, exclusive of building funds, range in the Protestant churches from four or five thousand dollars to three quarters of a million dollars. Every church that makes a budget starts with two general classifications, local church expenses and benevolences. The first is self-explanatory. It includes subclassifications such as salaries and pensions, music, church school, building maintenance, publicity, debt retirement, and so on. The second classification, benevolences, includes contributions for the various missionary and denominational programs, denominational activities, interdenominational activities, and social service.

After the classifications have been subdivided, the expenditures of the past year are compared with the estimated needs of the next year. What employees should have wage increases? Will heating costs increase? What painting and decorating is advisable? The trustees, or the group handling this study, will require information and estimates from each department of the church program. The committee must consider the departmental requests along with other requirements and decide how much of each request can be accepted and referred to the congregation.

Members of the finance committee usually are volunteer workers, and, in larger churches, they give much time and effort in trying to reconcile figures and to produce a budget within the financial resources of their church. When the budget has finally been composed, it may be given to the canvassing committee which will have charge of or-

ganizing the campaign for the solicitation of pledges.

There is a growing effort to develop a means of soliciting and collecting the necessary funds without the tiring work of personal visitation. Some churches have successfully made their canvasses without a formal budget. In a pre-budget canvass, members are asked to give to the church as the Lord has prospered them. The resulting increased pledges, in many instances, have been astounding. The proponents of this plan argue that the average person will give more generously when he is asked to thank God for the good things of life, than when he is asked to pay for salaries, public utilities, and debt reduction. But the plan is still—in the view of this writer—just one more idea to vary the every member canvass.

There have been some experiments in trying to secure church support through assessments on the members or a definite membership fee. These have not, as a rule, been successful. The rule earlier mentioned, which was laid down by the Apostle Paul, is to stress the importance of personal stewardship as the most effective method of fund raising for the church.¹⁰

ACCOUNTING

After the canvass has been conducted and the pledges secured, the remaining aspect of church finance has to do with the efficient collection of pledges, the proper recording of amounts paid, the acceptance and payment of the financial obligations. During the ages, religious services have included, as a vital part

¹⁰ Detailed studies of church budgeting and accounting can be found in William H. Leach, *Handbook of Church Management* (New York: Prentice Hall, 1958); John C. Brauer, *Efficient Church Management* (Philadelphia: Westminster Press, 1960); David R. Holt, II, *Handbook of Church Finance* (New York: Macmillan, 1960).

of the worship service, the receiving and blessing of gifts from the members. The "offertory," in the early church, was the opportunity for each of the congregation to receive the elements of holy communion. The meaning of the term has been changed in the contemporary church. The offering is the opportunity for the congregants to present their gifts to God. A typical prayer of dedication is as follows:

O God, of whose bounty we have all received; accept this offering of thy people; and so follow it with thy blessing that it may promote peace and good will among men, and advance the kingdom of our Lord Jesus Christ. Amen.

The theology of the offering is well expressed in the words of a hymn written in 1864 by Bishop W. Walsham How:

We give Thee by Thine own,
What-e'er the gift may be:
All that we have is thine alone,
A trust alone from Thee.

A great proportion of pledges are left at the altar of the church by those who have made pledges. Giving in that manner has the aspect of an act of worship.

Tabulations are necessary. The gifts must be counted to ascertain that the enclosures correspond with figures marked on the envelope. The accounting is the responsibility of the church treasurer or financial secretary. In a church which has a professional staff, one of these officers supervises the count and the actual work is done by one of the office secretaries. Most churches use patented forms which are obtainable from religious supply houses. Weekly sums are listed, usually for quarterly periods. Contributions are recorded in three areas: local expense, benevolence, and church building. Experience shows the efficacy of statements sent either

monthly or quarterly to each church member. When the contributor uses weekly offering envelopes, which are dated for each Sunday, he automatically makes a weekly report of his contributions. Sending a quarterly statement to him will either commend him for his faithfulness or remind him to meet his obligation for any amounts which are still due.

The financial secretary must have a system for keeping a record of individual Sunday contributions. He must also keep a receipts journal in which he records the totals from the Sunday offerings along with amounts mailed into the church office, income from interest, rents, dividends, and any other revenue items. He must keep a disbursing journal in which expenditures are entered. The wise church accountant will use a system which enables him to keep a current daily check on the total disbursements for each classification of the budget.

HOW MANY TREASURERS?

It has been shown that there are three main financial requirements of the local church—the local church expenses, benevolences, and new church construction. Traditionally, the churches have had two treasurers—one for the local church account, a second for benevolence funds. With the increase in staffed church offices, the two accounts can usually be handled through the same desk. The building fund, however, presents a complex problem. The pledges for the capital fund should be segregated from the other funds of the church and should be entrusted to a different treasurer. When the time comes that the church is able to take over the financial obligations of the new building, the building committee may ask to be discharged and the building fund can be integrated into the local church budget.

One interesting concomitant of the growth in size and wealth of local congregations is the addition of the office of church business administrator. This office usually is a full-time position held by an individual who has had business experience. The church business administrator is responsible for all office procedures, for raising all except capital funds, and for accounting.

Some final admonitions might be added.

Every congregation should require an annual audit of its books, and this audit should be made by some unrelated agency. All officers and employees who handle church funds should be bonded, not only for security reasons, but also to assure contributors that the Lord's business is conducted in an orderly way.

Ecological Changes and the Church

By TRUMAN B. DOUGLASS

ABSTRACT: The Church, as a human institution, is affected by every social and cultural change which occurs in its environment. Of all human institutions, however, the Church is probably the most conservative. The current awakening of religious interest throughout the United States presents the Church with many opportunities and confronts it with potential dangers. The danger exists that emphasis upon quantitative growth will obscure the need for qualitative excellence. A well-educated laity will embarrass the church whose educational standards for the clergy fall below those for business and the professions. Although the churches speak boldly for liberal reform, they lag behind government, the armed services, sports, and industry in implementing liberal programs. It is not certain that the Church speaks relevantly to an urban-dominated culture. It is certain that the churches have overlooked many opportunities in the innercity areas. Although denominational ties have lost much meaning among laymen, many denominations aggressively perpetuate their separate existences. Unions between differently organized denominations, rather than reunions within splintered denominations, indicate real accomplishment in social adjustment.—Ed.

Truman Bartlett Douglass, D.D., LL.D., L.H.D., is Executive Vice President of the Board of Home Missions of the Congregational Christian Churches. He is a former president of the Home Missions Council of North America and was the first chairman of the Broadcasting and Film Commission of the National Council of Churches. He currently is chairman of the Department of Worship and the Arts of the National Council of Churches. He is author of Mission to America (1951), Preaching and the New Reformation (1956), Why Go to Church (1957), and articles in religious and professional journals.

AN adequate review of ecological changes as they affect the Church would include consideration of nearly all the major sociological changes that have occurred in American life in recent years. These changes constitute important aspects of the environment with which the Church interacts. There is scarcely any feature of human society which does not influence the estate of the churches. Economic conditions, population shifts, family life, class structure, race relations, education, leisure, changes in the distribution of age groups, the condition of the general culture, the definition and redefinition of social goals—all have their consequences for the Church.

Because the Church is in many respects a conservative institution, these ecological changes frequently present themselves to the Church in the form of problems and dilemmas for those who shape its policies, plans, and program.

There are, of course, churchmen who adopt what is essentially a transcendentalist view of the Church. They would claim that in its essential characteristics the Church is untouched by outward change. They feel that the lines of the Doxology which read, "As it was in the beginning, is now and ever shall be," apply equally to the teachings of the Christian Gospel and to the primary features of the Church. If, however, one believes, as does this writer, that in addition to its divinely given attributes the Church bears the marks of a human institution, then every change occurring in society and its culture has implications for and effects upon the Church.

QUANTITATIVE CHANGES

Some conspicuous quantitative changes have had major effects upon the life and activity of the churches. The population upsurge and increased mobility constitute such obvious features of

twentieth-century American society that the Church, even in its most conservative expressions, has not been able to ignore them.

A quarter of a century ago the Protestant churches were persuaded that the period of church extension—of establishing new churches—was virtually ended in the United States. This conviction was articulated at a congress of home mission boards held in Washington, D. C. under the sponsorship of the Home Missions Council of North America. At this meeting the conviction was expressed that the settlement of the country had been completed, that the population had reached a point of stability, that the nation was adequately provided with churches, and that, therefore, the home mission boards could turn their energies and resources to other tasks.

These prognostications were completely negated by subsequent events—primarily by the population explosion, the wartime and postwar migrations of the American people, the continuing suburban trend, and the creation of multitudes of new communities. As a consequence, the intimation that the churches would refrain from major efforts in the field of church expansion has proved to be far from correct. For a number of years the churches have been organizing new congregations at the rate of approximately 10,000 per year. The value of new construction of religious buildings rose from \$117,000,000 in 1923, to \$863,000,000 in 1958 and will closely approach a billion dollars in 1960.

Thoughtful church leaders are beginning to realize that these expansionist phenomena have their dangers. There is danger that the denominations will be more interested in reaping a statistical harvest than in making certain that the religious needs of communities are well served. Churches are likely to give more

attention to quantitative growth than to the improvement of the qualitative excellence of their programs. There is danger that in the vast reshuffling of our population, and in the attendant concentration of the churches upon numerical increase, individuals will be lost to view. A mobile population requires more mobile forms of pastoral care than the Protestant churches have yet devised. It is more impressive for the minister's record to add ten new members to the rolls of his church than to make certain that ten old members who have moved to new places are established in churches in their new homes. There is danger that with all the building and rebuilding of church edifices, churches will be known for the comfort and modernity of their structures rather than for the Gospel they preach and for the quality of Christian life exhibited by the congregation.

THE RELIGIOUS REVIVAL

Church members now constitute 63 per cent of the population of the United States. This compares with 16 per cent in 1850 and 22 per cent in 1900. There is much debate about the accuracy of these figures. One variable which is not taken adequately into account in comparing the statistics reported by the churches is the changing conception of a church "member." For example, in the case of the Episcopal Church, in 1916 only 1 per cent of its members were children under 13, as compared with 26 per cent in 1926. Efforts have been made to standardize the statistics by calculating the percentage of people aged 13 and over who are recorded as church members, since denominations vary greatly in their practice of enrolling children. When this correction is made the figures do not show, as is frequently assumed, a steady rise in the proportion of church members in the total population since the beginning of

the century. They show, rather, a decline from 1916 to 1940—55 per cent in 1916 and 50.7 per cent in 1940—and a notable rise thereafter. "In other words the American revival dates not from 1900 or before, but from 1940 or shortly after."¹ The growth since 1940 has been impressive—from 50.7 per cent to 63 per cent of the population in 1958. Today the membership of religious bodies in the United States exceeds 110,000,000.

There is a question whether this increased popularity represents a success or an embarrassment for the churches. It has produced, according to Martin E. Marty,²

... the erosion of particularity, the smoothing of the edges of witness, the loss of religious content. Particularity is challenged by a blurry, generalized religion; distinctive witness is confronted by amiable syncretism; theological content is often replaced by sentiments about religion. There are intimations that many churches represent a kind of American Shinto and that their popularity is gained by their identification with the "American way." They have tended to become simply one aspect of the general culture rather than being in tension with it and exercising a critical function toward it.

CLASS AND RACE

The effects upon the churches of changes in the class structure of American society are largely indeterminate.

Evidence is abundant that a revolution is occurring in the racial and class composition of our nation. One relevant set of facts pertains to the composition of the labor force. The number of farmers, for example, declined from 16.5 per cent of the labor force in 1910 to 7.3 per cent in 1950. The proportion of farm laborers declined from 14.5

¹ Michael Argyle, *Religious Behavior* (Glen-coe, Ill.: Free Press, 1958), pp. 28-29.

² Martin E. Marty, *The New Shape of American Religion* (New York: Harper, 1958).

per cent in 1910 to 4.3 per cent in 1950. During the same forty year span, professional persons increased from 4.4 per cent of the labor force to 8.5 per cent, and the proportion of clerks, salespeople, and those in similar occupations increased from 10.2 per cent to 18.9 per cent.³ White-collar workers increased in number from 5,115,000 in 1900 to 21,600,000 in 1950. They now constitute 36.6 per cent of the labor force as compared with 17.6 per cent in 1900.⁴ There has been a parallel change in the distribution of income. In 1929, 65 per cent of the population had incomes under \$3,000 per year. In 1951 this portion was reduced to 46 per cent. The proportion receiving incomes between \$3,000 and \$7,500 rose from 29 per cent in 1929 to 47 per cent in 1951.⁵

Little is known of the effects of these changes upon the Church. No significant amount of research has been done in this field. It seems evident, however, that some of the widely held presuppositions regarding the relationship between social class and the churches have not been substantiated. For example, it might have been expected that with the virtual disappearance of an American proletariat, the so-called pentecostal sects—churches which allegedly drew their membership primarily from the economically disadvantaged groups—would have ceased to flourish. This has not been the case. The Assemblies of God increased their membership from 6,700 in 1916 to 148,000 in 1936; they continued this growth and reached a membership of more than 505,000 in 1958. The Pilgrim Holiness Church had 5,300 members in 1916, 20,100 in 1936, and 32,600 in 1958. The Pentecostal

Holiness Church had 5,600 members in 1916, 20,100 in 1936, and 32,600 in 1958.⁶

Conversely, the churches which might have been expected to benefit from the number of what Vance Packard calls "the strivers for upward mobility"—namely, such denominations as the Episcopal, Congregational, and Presbyterian Churches—have exhibited no gains which are disproportionate to those made by other denominations which presumably offer fewer social advantages.

At least three factors seem to have contributed to the failure of church members to behave according to anticipated formulas. First, church affiliations seem to be more stable than other social affiliations and do not seem to be affected—at least not immediately—by a change of status. Second, some of the Pentecostal sects have steadily grown more respectable, have changed their character to conform to the changed class status of their membership, and have taken on more of the ways of the conventional "old-line" churches. For example, the General Conference of the Seventh Day Baptist denomination has joined the National Council of the Churches of Christ in the United States of America. Third, the evangelizing zeal of the Pentecostal groups has not waned as their members have acquired economic advantage and social status—nor has the zeal of such denominations as the Episcopal, Congregational, and Presbyterian notably increased, it would seem, as changes in the class structure of the nation have presented them with the sociological bases of larger opportunity.

One of the anomalies in this area of class-race relationships is the fact that the denominations which have been

known as churches of the proletariat have made slower progress toward the integration of Negroes into their membership than have some of the longer established and presumably more socially conservative bodies. In 1950 a survey of Presbyterian, United States of America churches disclosed that out of 2,706 reporting congregations, 832 were integrated. A 1958 study of Congregational Christian churches in metropolitan areas found that 12 per cent included Negro members and that 49 per cent were willing to accept Negroes as members. The Protestant Council of New York City asserts on the basis of a recent study that half the churches in that city have an interracial membership. Liston Pope estimates that about 10 per cent of the total number of Protestant churches in the nation are interracial.⁷ This figure is five times as large as the corresponding figure for ten years ago. There is no evidence that the Pentecostal sects have shown any similar disposition toward integration. This is probably due, in the first place, to their tendency to make a radical separation between faith and social ethics and, in the second place, to the fact that many of these sects have their greatest strength in the South.

The most intensive study yet made of the attitudes and practices of a single denomination respecting racial integration covered the Congregational Christian churches in standard metropolitan areas. Questionnaires were sent to all the churches of that denomination in such areas. When congregations showed themselves willing to participate in the study, interviews were held with the minister and at least one lay official. Of the 1,500 churches of the denomination located in standard metropolitan areas, 1,054 took part in the study.

Two significant and encouraging facts

⁷ Liston Pope, *The Kingdom Beyond Caste* (New York: Friendship Press, 1957).

were disclosed. First, some modest gains in racial inclusiveness were revealed. The survey showed that 26.6 per cent of the churches in metropolitan communities included in their membership representatives of at least one minority group. A less thorough study made twelve years previously revealed that only 17 per cent of these churches could be classified as inclusive.

Second, in the opinion of ministers and lay leaders, well over half the congregations studied—63.4 per cent of them—would support their pastors in implementing a policy of racial inclusiveness.

There were some disheartening findings. Nearly half the local churches that were studied had no definite policy for receiving members of racial minorities. Approximately 70 per cent said they had never confronted a situation that required decision in that area of policy. Since the study was limited to highly urbanized communities where the size of racial minorities has rapidly increased in recent years, it is evident that the churches are not aggressively pressing toward a policy of racial inclusiveness.

In the opinion of a large number of lay officers of churches, the pastors would have more support for programs of desegregation in the community than in their own churches. Dr. Herman Long, the director of the study, considered this the most negative finding.

A majority—51.4 per cent—of the lay respondents from the Midwest believed that there are exceptions to the denomination's announced policy of unconditional hospitality to members of all racial groups. It is alarming that what has been considered the southern pattern may also be the midwestern pattern.

A general result of the study was to indicate that in a period of history when events in the realm of human relations

move with lethal swiftness the churches proceed with glacial slowness. The extent of integration in the churches compares unfavorably with accomplishments in other areas such as employment in federal and state governments, the armed services, professional sports, labor unions, institutions of higher education, and so on.⁸

CITY AND SUBURB

The city and the suburb are obverse sides of a primary problem-area for the work of the churches. Nearly every denomination has acknowledged publicly that from the standpoint of institutional strength it is losing ground in the inner city. Most denominations also acknowledge that with the whole nation coming under the influence of a predominantly urban culture, the failure of the Church to find its place in the city raises questions concerning the relevance of its message and program to modern society.

Curiously, some denominations are troubled almost as much by their successes in the suburbs as by their failures in the inner city. This seems strange, for in a number of instances denominational programs of suburban expansion were undertaken as a deliberate plan for compensating losses of institutions and members in the central metropolitan areas.

Meanwhile, the "exploding metropolis" continues to explode. The 168 standard metropolitan areas have steadily increased their share of the country's population. In July 1958 these areas included 59 per cent of the total population of the United States. Within these areas, the suburbs continue to

grow at a faster rate than the central cities. Between April 1950 and July 1958, about 12.4 million people were added to the population of communities adjacent to our larger cities, giving an average annual increase of 3.7 per cent annually. This is almost three times the rate of growth within these cities and more than double the rate for the country as a whole. While, for example, there has been no appreciable population change in New York City, Jersey City, and Newark, the adjacent communities have increased at the rate of 3.9 per cent a year. A gain of 1.6 million persons has occurred in the New York-Northeastern New Jersey standard metropolitan area. This gain is exceeded only by the increase in the Los Angeles area.⁹

The embarrassment of the Church concerning its suburban prosperity has been mentioned. The Church does not minimize its responsibility for providing religious ministries to the millions of people who have moved to the burgeoning suburbs, nor does it ignore the fact that many of these people occupy positions of strategic influence in American society. The Church is ill at ease over its success because of the relative simplicity of its adaptation to a suburban environment. Church leaders are beginning to recognize that the task of establishing a successful church in a new, rapidly growing suburb is scarcely more difficult than the problem of establishing a filling station on a new superhighway. The Church is disturbed at finding itself too readily at home in a one-class community. It is haunted by the consciousness of its essential nature as an inclusive fellowship in which distinctions of "Greek and barbarian, wise and simple, bond and free" are transcended.

⁸ Herman H. Long, *Fellowship For Whom? A Study of Racial Inclusiveness in Congregational Christian Churches* (New York: Department of Race Relations, the Board of Home Missions, 1958).

⁹ Metropolitan Life Insurance Company, *Statistical Bulletin* (New York: Metropolitan Life Insurance Co., October 1959).

On the other hand, the problems of the Protestant churches in the central city are not simply functions of population increase or decrease. There appears to be something in the urban community and its culture which is alien, if not hostile, to the Church. For example, during a period when 200,000 people were moving into New York City in the area below Fourteenth Street, seventeen Protestant churches moved out.¹⁰

One probable cause of the Church's alienation from the city is the fact that a large proportion of ministers come from rural and small-town communities. A recent study of the sources of the Protestant ministry revealed that in a sampling of 1,709 ministerial students only 36 per cent came from cities of more than 25,000 population. Because of their rural and small-town origins, many ministers bring to their work in a city church a distaste for city ways. Facing the life of the city, the average Protestant minister's dominant emotion seems to be not the "love that casteth out fear," but the fear that excludes love. He is terrified by the vast agglomeration of human beings, by the city's monstrous vitality, myriad forms, restless energies, and by the impudent way in which it deals with the proprieties which a polite, middle-class Protestantism identifies with a "Christian culture." The minister is likely to be disabled from dealing with city people by his moralistic approach to their problems. He looks with disapproval upon an institution of such importance as the neighborhood tavern. He is appalled by the extravagance, late hours, and alcoholic excesses of city people and judges these "sins" far more harshly than small-town snooping, gossip, philistin-

ism, and cruelty toward the nonconformist.¹¹

OTHER CULTURAL CHANGES

Other changes in the culture are presenting the Church with problems and with opportunities only partially realized.

There is, for example, the growth of leisure. More and more the attention of the individual American and the family is centered on the use of the hours and days away from productive work. Approximately 15 per cent of total consumer expenditures are annually spent on leisure-time activities. With the arrival of the five-day week, and with the prospect of the four-day or even three-day week, the Church must reconsider its program in the light of a three-day or four-day "sabbath." The inviolability of the hour of eleven o'clock on Sunday morning and the universally observed time for corporate worship is brought into question. One church in New York City has had some success in its experiment with holding its weekly service of congregational worship on Friday evening in the summer time. Many churches are developing programs of adult education—often in the form of small groups engaged in the study of theology and biblical subjects—as ways of providing constructive leisure-time activities.

Another major cultural change is what Peter Drucker calls the educational revolution. Education today, instead of removing people from the productive enterprise into a leisure class as it often did in the past, has become almost a prerequisite to effective participation in the productive process. This fact constitutes an authentic revolution.

¹¹ Truman B. Douglass, "The Job the Protestants Shirk," *Harper's Magazine* (November 1958).

What does this revolution mean for churches that have set mediocre standards for the education of their ministry? What does it mean for churches whose outlook has been essentially anti-intellectual. The presence in their congregations of large numbers of persons who have been trained in the principles of critical thought constitutes a new situation which the churches have only begun to face.

DENOMINATIONAL IRRELEVANCE

Finally, a general observation that must be made about the changed situation of the churches is that the denominational system which characterizes religious affairs in America is becoming increasingly irrelevant to the actualities of our society and culture. While this irrelevance is becoming more clearly visible, the denominations, with their enlarged memberships and increased financial prosperity, become more self-assertive and tend to dominate the religious scene.

All churches in the United States, including the Roman Catholic Church and the "undenominational" association of Community Churches, are also sects. As the sectarian system becomes stronger and its constituent denominations become increasingly powerful, it also becomes less and less pertinent to the realities of American life. The so-called religious revival of the last decade has to be appraised in the light of the increasing irrelevancy of the fundamental structure of the Church in this nation.

The irrelevancy has been produced by some of the social and cultural facts that have been considered in this article.

One of these facts is the mobility of the American people. No church, not even the largest, is ubiquitous. When people are moving to the extent that

the American people have been moving since 1945, many of them settle in places where no church of their traditional denominational affiliation is present. In consequence, many of them change their denominational associations. They discover that this can be done without impairing—often, indeed, enriching—their religious experience. Many pastors of urban churches annually receive by transfer from congregations of other denominations three or four times as many members as they receive by transfer from congregations of their own denomination. It is evident that for many persons denominational loyalty ranks low among the considerations which influence their choice of a local church. Convenience of access, good Sunday School facilities for the children, the general excellence of the church's reputation and program, even availability of parking space may be more important factors than the continuance of an existing denominational affiliation.

A recent survey which included interviews with 4,100 members of Congregational Christian churches in all parts of the country, revealed that only one member out of three was originally a Congregationalist.¹² The churches studied derived over one half of their present membership from four other denominations: Methodist—18 per cent; Presbyterian—15 per cent; Baptist—11 per cent; and Lutheran—8 per cent. Two per cent of the members included in this study originally were Roman Catholics.

On the point of the historic theological and ecclesiological controversies which produced the separated denominations, the indifference of the laity is monumental. It has increasingly come to be recognized by both clergy and

¹² Yoshio Fukuyama (Research for doctoral dissertation, University of Chicago).

laity that many of the persons who avoid the Church do so not because of the "offense of the Cross," but because they are repelled by the offense of competing denominations.

DENOMINATIONAL DILEMMA

Can anyone seriously believe that these separated clans and tribes of the Christian family have any relevance to the real problems that humanity confronts in our time, or that their prosperity or lack of it provides any standard for judging the advance of the Christian movement? The statistical records of the denominations are not only notorious examples of the do-it-yourself craft of "how to lie with statistics," but are virtually meaningless as measurements of Christian accomplishment. One reads the recruiting literature of almost any denomination and tries vainly to find some resemblance to the criteria of the New Testament. The motivations to which appeal is made are not essentially different from the apologetic for the Junior Chamber of Commerce or the Neighborhood Improvement Association. They say, in effect:

Join us because we are a great organization with so many million members and so many thousand congregations. We have a noble tradition; we were brought to this country by passengers on the Mayflower. We have spawned the following well-known personalities. In this nuclear age, when the whole world is a neighborhood, we have missions from northern Greenland to Tierra del Fuego. Furthermore, through the influence of our great personalities and our spiritual teaching we are one of the chief bastions for the defense of the American way of life.

When a denomination is asked what is the relationship of this type of publicity to Christ's summons to "leave all and follow me," or to "do the things I command you," the answer is, "None whatever." This discontinuity is widely recognized. The response of intelligent persons to the typical forms of denominational propaganda is worse than incredulity; it amounts to boredom.

Thus the movement toward the overcoming of denominational disunity is generated not only by religious considerations but also by sociological factors. At the present moment it is being somewhat retarded by the economic prosperity of the denominations and by the illusions of omniscience which this prosperity produces. While there are some four hundred state and local councils of churches representing the cooperative tendencies of Protestantism, the denominations are reluctant to assign to them any real responsibilities except statistically unproductive functions such as work with agricultural migrants, share-croppers, and American Indians.

The dilemma of denominationalism gives a significance far greater than their quantitative dimensions to the movements toward actual unions of denominations—particularly those movements which aim at a reconciliation of fundamental differences of polity such as the differences between the episcopal, presbyterian, and congregational systems. Such unions are far more important than the reunion of separated branches of the same denominational family. One such union—the union between the Evangelical and Reformed and the Congregational Christian Churches—has already been accomplished in this country. Others are under consideration.

Religion and Education

By ROLFE LANIER HUNT

ABSTRACT: Sunday schools, vacation church schools, summer camps and conferences, released time, and church-related elementary and secondary day schools are the principal programs for religious instruction in the United States today. A trend toward more nonpublic schools on the elementary and secondary levels can be observed. An opposite trend can be observed in higher education. Organized attempts are being made to co-ordinate efforts in religious education made in the home and by mass communications media with the efforts of the churches and the major faiths. In a broad sense, no institution which permits or encourages the discussion of ultimate values is without a religious aspect. The public schools, therefore, are brought within the pale of the discussion of religion and education. An intelligent appraisal of the needs of the United States for religious education, narrowly or broadly understood, requires answers to questions which have not yet been researched.

Rolfe Lanier Hunt, Ph.D., Mt. Vernon, New York, is Executive Director, Department of Religion and Public Education, National Council of the Churches of Christ in the U. S. A., New York, and a Visiting Lecturer in Education, New York University.

EDUCATION becomes religious, in a formal sense, when instruction is given in the tenets of one of the organized faiths. It is commonly expected that the beliefs taught will be represented as the true faith and that the students will accept them as such.

The most popular form of religious education in the United States is the Sunday school. The 39,564,925 pupils enrolled in the Sunday schools of the United States in 1958 amounted to 22.7 per cent of the total population. The comparable figure for 1926 was 17.9 per cent. While the total population was increasing 53 per cent during the years 1926-1959, Sunday school enrollments gained 90 per cent. During the same period, church memberships gained 105 per cent in the United States.

The total enrollment includes 35,850,699 persons reported as Protestant, and 3,714,226 reported as non-Protestant. The enrollment of Protestant children is distributed among the different age groups as shown in Table 1.

In considering the impact of the Sunday school, it is useful to note the proportion of each age group in the total population enrolled in the Sunday school. For this purpose, comparative figures are available for 1958.

TABLE 1—SUNDAY SCHOOL ENROLLMENT BY AGE-GROUP PERCENTAGES¹

SUNDAY SCHOOL DIVISION	AGE GROUP	PERCENTAGE OF ALL SUNDAY SCHOOL PUPILS
Cradle Roll	Under 2 years	7.2
Children's Division	3-12	38.0
Youth Division	12-23	19.5
Adult Division	24 and over	35.3

¹ Data for Tables 1 and 2 and in accompanying text were gathered by Helen Spaulding, Bureau of Research and Survey, National Council of Churches in the U.S.A., August 1960.

A total of 278,857 Sunday or Sabbath schools had the services of 3,674,730 adults—over 2 per cent of the total adult population of the United States—as teachers and officers.

The Board of Education of the Methodist Church distributed 6,975,991 copies of curriculum materials for the July-September quarter of 1958. In the first eight months of the year, they sold 40,000 filmstrips and records for the church-school curriculum.

In theory, the Sunday schools represent a major educational effort of the Protestant and other churches using them, yet it should be realized that the Sunday school is only part of the educational program in these churches. Most pastors conceive of the pulpit ministry as an effort in education. They intend their congregants to learn through sermons as well as to worship through participation in such other portions of the service as Bible-readings, affirmation of faith, hymn-singing, and the like. Returns from a questionnaire sent to 450 Methodist churches indicate that 65 per cent have Bible study for the whole congregation separate from the formal Sunday school, and 47 per cent of these projects are scheduled during the week rather than on Sunday. Methodist Men enroll more than twelve thousand clubs with regular meetings, and the Women's Society of Christian Service is one of the church's most effective educational arms. These agencies and efforts can be matched by reports of similar activities in many other denominations.

The denominations co-operate in many aspects of the work of the Sunday schools—in the preparation of outlines for curricula of the different age groups, in the training of teachers and administrators, and so on. Thus, fifty-five committees across the country have reviewed and evaluated more than 2,500 pieces of audio-visual material available for use in church school, and their clas-

TABLE 2—1958 SUNDAY SCHOOL ENROLLMENTS RELATED TO TOTAL UNITED STATES POPULATION AGE GROUPS¹

AGE GROUPS	PROTESTANT SUNDAY SCHOOL PUPILS	UNITED STATES POPULATION	PER CENT PROTESTANT SUNDAY SCHOOL PUPILS IN AGE GROUP
Cradle Roll	2,581,000	11,668,000	22.1
Children's Division	13,623,000	32,604,000	41.8
Youth Division	6,991,000	30,327,000	23.1
Adult Division	12,655,000	99,465,000	12.7

sified judgments are recorded in an *Audio-Visual Resource Guide* published by the National Council of Churches, with continuing reviews reported monthly in the *International Journal of Religious Education*.

SUMMERTIME EDUCATION

To utilize the free time of children during the summer, many churches operate "vacation church schools" and "vacation Bible schools." In 1958, a total of 108,124 vacation church schools in the United States enrolled a total of 7,598,940 pupils under the instruction of 1,158,585 teachers and officers. The enrollment of pupils represented a 2.1 per cent gain over that of the preceding year.

In the year 1958, a total of 7,063 summer camps and conferences sponsored by Protestants enrolled 801,871 campers and delegates supervised by 91,744 leaders and teachers. The reported number of campers and delegates represented an increase of 23.5 per cent over the preceding year. More than half the children who attend camps in the United States attend church-sponsored camps.

The following table shows the percentages of participants and leaders in summer programs as they are distributed according to age. The figures are derived from statistics supplied by eight denominations which reported a total of 230,602 campers and five denominations which reported a total of 32,180 leaders.

Many educational leaders report that vacation church schools and summer camps, affording large blocks of time for directed and sustained effort, are better opportunities for teaching and learning than the Sunday schools.

RELEASED TIME

The programs of religious instruction operated by churches for pupils who ask to be excused from public schools in order to attend are usually described as programs on "released time." A vari-

TABLE 3—ESTIMATED AGE-GROUP PERCENTAGES IN CHURCH CAMPS²

AGE GROUP	PER CENT OF CAMPS AND CONFERENCES	PER CENT OF CAMPER AND DELEGATES	PER CENT OF LEADERS
Children under 12 years	20.2	20.4	19.6
Camps for Junior High School pupils, 12-14 years old	35.3	36.6	40.2
Camps and Conferences for youth 15-23 years	26.6	32.3	35.2
Conferences for adults	12.8	5.9	2.4
Family camps and conferences	5.6	4.8	2.6

² *Ibid.*

ant is the "dismissed time" program in which all students are dismissed and those who choose to attend religious instruction can do so. Figures on these classes and their enrollments are hard to secure. State departments of education seldom require reports of this nature, and denominations thus far have asked for few reports on the matter from their local churches. Estimates of enrollment range from two and a half to five million children. Some programs of released time include only pupils in one grade; other programs are broader. A few programs extend into high school and may or may not be scheduled for credit.

The Church of Jesus Christ Latter-Day Saints, often called Mormon, was a pioneer in released time. Its system of seminaries, built on church-owned properties adjacent to the public high schools they serve, began in 1912, a year before Gary, Indiana, attracted nation-wide attention by introduction of week-day religious classes conducted during school hours. The system today includes 126 released-time seminaries, and approximately four hundred non-released-time seminaries giving religious instruction before or after school. This writer's visits to a representative sample of them found them to compare favorably in buildings, equipment, and qualifications of teachers with the schools to which they were attached. In these situations, the public school typically allows one-half unit of credit for the first year's study of the Old Testament and another one-half unit for the second year's study of the New Testament. Third and fourth years devoted to Church History and Doctrine usually are done without high school credit. The seminary teachers are recruited from among the regular subject teachers in the high school who have had at least two years of teaching experience. They are given extra training

and pay and have responsibilities in counselling and guidance.

After an initial delay, the Roman Catholic Church has come to make extensive use of released time programs. In some cities parochial school pupils are dismissed in order to free the buildings and teachers for pupils coming from the public schools. In other places, the Confraternity of Christian Doctrine, an adjunct of the National Catholic Welfare Conference, recruits lay teachers. With this system, they often prefer simultaneous release of all pupils from the public school.

To make use of full-time trained and professional teachers of religion, Protestants sometimes prefer the plan of "staggered time." This permits the trained teacher to work all day long with one class after another. This is done by the teacher in the Mormon seminary.

Programs of released time are maintained by practically all religious groups to some extent. Christian Scientists and Jews operate such schools in New York City, for example. The majority of the denominations in the National Council of the Churches of Christ promote a co-operative approach to the released time program. They encourage their local churches to collaborate in providing personnel and facilities and to use a common curriculum. The recommended curriculum, by action of the National Council of Churches Committee on Weekday Religious Education, will be directed toward interpretation of the child's experience in the public school in the perspective of "the revelation of God within the totality of man's experience."³

Disputes over the legality of programs of released time have been quieted by the decision of the United States Su-

³ "Relation of Religion to Public Education," *International Journal of Religious Education*, April 1960, p. 32.

preme Court in the *Zorach* case of 1952. That decision allows released time programs provided they make no use of the school machinery.

STAFFS AND SCHOOLS

The number of professionally employed "directors of religious education" is growing in the churches emphasizing Sunday and other church schools. Paul H. Vieth reported 1,003 persons so engaged in 1926. In 1958 it is reported that 11,258 persons were so engaged. Under the leadership of the pastor, these persons devote full-time professional skills to parish work in religious education.

The United States Office of Education estimates that in the 1959-1960 school year full-time non-public schools

TABLE 4—NONPUBLIC HIGH SCHOOL GRADUATES AS PERCENTAGES OF ALL HIGH SCHOOL GRADUATES IN THE UNITED STATES⁴

SCHOOL YEAR ENDING	PER CENT OF ALL HIGH SCHOOL GRADUATES
1920	11.6
1930	9.2
1940	6.4
1950	11.4
1956	11.5

enrolled 5,400,000 pupils in kindergarten through eighth grade out of a total of 33,380,000 pupils enrolled in those grades. The Office of Education estimates an enrollment of 1,100,000 out of a total enrollment of 9,590,000 for ninth through twelfth grades. It should be noted that the term nonpublic includes church-related schools and also

TABLE 5—ENROLLMENT IN PUBLIC AND NONPUBLIC ELEMENTARY AND SECONDARY SCHOOLS⁵

Total public and nonpublic school enrollment is estimated at 42.7 million for the 1959-60 school year. Of this total, 36.2 million are enrolled in public schools and 6.5 million are enrolled in nonpublic schools. Since the school year 1939-40 enrollments in nonpublic schools have increased from 9.4 to 15.2 per cent of total enrollment.

⁴ Adapted from *Health, Education, and Welfare Trends* (1960 Edition; Washington, D. C.: U. S. Government Printing Office, 1960), p. 60.

⁵ *Health, Education, and Welfare Trends* (1960 Edition; Washington, D. C.: U. S. Government Printing Office, 1960), p. 56.

schools under private auspices which may be either profit-making or non-profit.

The Office of Education predicts a gain of 200,000 pupils for nonpublic schools in 1960-1961 as part of a total gain of 1,000,000 pupils in kindergarten through eighth grade, and a gain of 100,000 pupils as part of a total gain of 700,000 pupils in grades eight through twelve.⁶

Table 4 shows the percentages of high school graduates who were produced by nonpublic schools.

The nonpublic enrollment for 1920 was divided between 16,000 boys and

20,000 girls, and in 1956, 73,000 boys and 90,000 girls were reported. In the years 1940 and 1942, boys exceeded girls by 2,000 in enrollment of 7,800 and 8,100 respectively. In the public high schools, 1956 graduates included 607,000 boys and 646,000 girls. It is estimated that in 1958, 64.9 per cent of the persons seventeen years of age graduated from high school in the United States.

Tables 5 and 6 show the Office of Education long-term report of trends in enrollment for public and nonpublic elementary and secondary schools.

Tables 5 and 6 make no distinctions

* Total reported Protestant enrollment: Kindergartens 18,058; Elementary 263,839; Secondary 76,842.

^a Includes schools with kindergartens but no schools with grades above grade 8.

^b Includes all schools with one or more grades 9-12, including schools with elementary grades also.

^c Includes all schools with one or more grades 9-12, including schools with elementary grades also. Does not include junior colleges or other institutions on college level that offer precollege level courses.

^d Enrollment figures for this denomination were for 85 nursery-kindergartens, 112 elementary schools, and 84 secondary schools.

^e The schools sponsored by this denomination comprise the National Union of Christian Schools.

^f Included with figures for secondary schools.

^g Does not include 550 for which level of instruction was not known.

^h One school only reporting enrollment.

ⁱ Eight schools only reporting enrollment.

^j Two schools only reporting enrollment.

^k Includes 1,992 pupils in nursery schools.

^l Includes an estimated 600 pupils in nursery grades.

between kinds of nonpublic schools. Reliable data on church-related elementary and secondary schools are notoriously hard to collect. The best summary available seems to be the one done by Bertha Blair. Her findings are shown in Table 7.⁸

According to a survey made in September 1959 of 3,349 Protestant full-time elementary day schools in North America, some 47.39 per cent were Lutheran, 38.34 per cent in the Lutheran Church-Missouri Synod. The same survey reported 173,474 students in Lutheran elementary schools, and 121,949 students in elementary schools of other Protestant denominations. In

⁸ Bertha Blair, "Church-Related Elementary and Secondary Schools in Continental United States," Bureau of Research and Survey Information Service (New York: National Council of the Churches of Christ in the U. S. A., January 3, 1959).

January 1960, the Lutheran Church-Missouri Synod reported 8,019 students in seventeen high schools under their auspices.⁹

The 1960 *Official Catholic Directory* reports 8,786,270 students under Catholic instructions. The distribution among educational institutions of all Catholics who are enrolled as students is shown in Table 8.¹⁰

Technically, the term "parochial school" describes a school operated by a parish and under the control of the parish priest. A school sponsored by the bishop for a diocese, or a school operated by a religious order such as the Society of Jesus, is not accurately classified as a parochial school. Nevertheless, the term is widely used to describe all church-related schools.

A survey in 1958 of Jewish education in the United States showed that 553,600 Jewish children were attending Jewish schools, an increase of over 130 per cent during the last 10 years.¹¹ An estimated 40-45 per cent of Jewish children of elementary school age attend such instruction. The Conservative groups account for 39 per cent, Reform for 28 per cent, and Orthodox for 21 per cent of the schools, with Yiddish and multiple-oriented schools accounting for the rest. Nearly all of the schools are under direct control of local congregations. Almost all of the whole-day schools are sponsored by the Orthodox, one half of the weekday afternoon schools are sponsored by the Conservative group, and the Reform group supports many Sunday schools.

⁹ These figures are supplied in a letter from William A. Kramer, Associate Secretary of Schools, Board of Parish Education, Lutheran Church-Missouri Synod, St. Louis 2, Missouri, May 23, 1960.

TABLE 9—ENROLLMENT BY TYPE OF JEWISH SCHOOL¹²

TYPE OF SCHOOL	NUMBER ENROLLED	PER CENT OF ALL ENROLLED
Full time day schools	42,651	7.8
Weekday afternoon schools	261,287	47.2
One-day Sunday schools	249,662	45.0
	553,600	100.

The objectives of Jewish education as formulated in the different curricula include knowledge—Bible, history, customs, Hebrew, Yiddish; practices and participation; beliefs and attitudes—understanding of Judaism, heritage; and a sense of belonging and identification.¹³

An estimated 80 per cent of all Jewish children in the United States receive some Jewish schooling at some time during school age.¹⁴ A majority attend three or four years, a sufficient time for effective preparation for Bar Mitzvah or confirmation. Some 60 million dollars per year is reported spent on Jewish education in the United States.¹⁴

A poll of 1,560 Jewish community leaders revealed that 75 per cent were opposed to the Jewish day school. The 25 per cent who supported the day school were chiefly Orthodox and Conservative constituents.¹⁵ The majority opposed the day school because they felt that common school provided their children a better preparation for life in the religiously pluralistic adult society of the United States.

HIGHER EDUCATION

Enrollments in public four-year colleges and universities from 1949-1950 to 1959-1960 rose at the rate of 83.8 per cent, as contrasted with a rate of 31.8 per cent in private institutions including church colleges. Enrollments in public junior colleges increased at a rate of 128.3 per cent during the decade; enrollments in private junior colleges increased 24.7 per cent.¹⁶

Private institutions traditionally have enrolled the majority of students in higher educational institutions in the United States. Public institutions have been gaining, however, and they currently enroll nearly 60 per cent of the students. Church leaders have had to exert great effort in order to maintain the relative status of the church schools. Thus the Protestant Episcopal Church has more than doubled its contributions to its six four-year colleges and to its religious ministry to students and faculties in other colleges and universities. Within the decade, the Southern Baptist Convention increased two and a half times its support of its thirty-one senior and twenty-one junior colleges. In the American Baptist Convention, 2,287 churches in thirty-eight states pledged \$4,539,000 in the first half of a campaign for \$7,500,000 for their colleges and student work.

The Southern Presbyterian Church, officially known as the Presbyterian Church in the United States, has doubled its annual contributions to operating expenses, adding more than 30 million dollars to their assets in the decade. The Presbyterian Church in the United States of America—now becoming by

¹⁶ Annual Report on the Progress of Education in the United States to the 23rd International Conference on Public Education, Geneva, Switzerland, cited in United States Department of Health, Education, and Welfare, Office of Education, Press Release HEW N-53, July 7, 1960.

merger the United Presbyterian Church in the United States of America—has multiplied by four times its national appropriations to its colleges and student programs. It has especially emphasized raising salaries of faculties in a campaign in which national funds are matched by local funds. This church has a large scholarship program and it maintains over 120 student centers in colleges and universities other than its own.

The Methodist Church has just completed a quadrennial emphasis on higher education. It supports 118 colleges and universities, 162 Wesley Foundations at state and independent colleges and universities, and 245 other units of the Methodist Student Movement. They report increases in national funds from \$3,953,486 in 1956 to \$6,814,302 in 1959 for the colleges and universities, and from \$777,984 in 1956 to \$1,844,656 in 1959 for the student program. In addition thirty-three annual conferences during the quadrennium engaged in campaigns for capital funds for higher educational institutions. Their goals amounted to \$41,651,638, with \$35,306,031 achieved in cash and pledges and success expected in meeting the full goal. During the quadrennium, endowments of Methodist Church colleges were increased by more than one fourth to an amount of \$418,023,548. The valuation of the physical plants also was increased by one fourth to \$592,070,020. The Disciples of Christ, the Congregational-Christian, the Evangelical Lutheran, the Church of the Brethren, the Church of God, and many other denominations are making parallel efforts. One congregation of the Seventh-Day Baptist Church gives an average of ten dollars per member annually to support a college. New church colleges are being established, for example, a university in Alaska and two colleges in North Carolina by Methodists,

a university in Florida by Presbyterians, and so on. Roman Catholics have the announced aim of taking care of all their students in their own colleges. Jewish groups have established Brandeis and Yeshiva Universities.

The American Association of Theological Schools in the United States and Canada is the accrediting body for Protestant schools of theology. The Association reports that in the 1958-1959 school year eighty-two fully-accredited schools of theology enrolled 18,631 students, and forty associate schools enrolled 3,140 students. The eighty fully-accredited schools which reported that year had full- and part-time faculties numbering 1,725 members; the property assets of sixty-seven schools totaled \$138,383,944; and eighty-one such schools had current budgets totaling \$24,686,495.¹⁷

Some data on Roman Catholic theological enrollments has already been given. Seminaries are also operated by the Conservative, Orthodox, and Reformed branches of Judaism in the United States. New York, Chicago, and Cincinnati are notable as Jewish theological centers.

THE HOME AND OTHER AGENCIES

The home teaches religion. Common experience shows that the religious example which most influences the child is the example of his parents. There is a dearth of objective data on the basis of which trends in religious practices and teachings in the home can be evaluated. Churches are making fuller efforts to assist parents in teaching religion to children in the home. For example, in one year the Methodist Church Board of Education distributed 2,242,500 leaf-

¹⁷ These figures are supplied in a letter from Jesse H. Ziegler, Associate Director, American Association of Theological Schools in the United States and Canada, Dayton 2, Ohio, March 14, 1960.

lets and pamphlets on family life and publishes *The Christian Home*, circulating 200,000 copies monthly, relating current issues of family living to the Christian faith. Similar papers are published by other denominations. Boards of education of the Protestant Episcopal Church and the Presbyterian Church in the United States have recently published new curriculum materials which involve co-ordinated efforts by parents in the home and teachers in the Sunday school.

The brevity of this article makes it necessary to omit much of interest in assessing religion and education in the United States. The National Association of Evangelicals, for example, brings together many churches with educational programs. Methodist churches sponsor 13,221 troops of the Boy Scouts of America, Roman Catholics sponsor 12,686 troops, Baptists 7,291, Presbyterians 7,190, Lutherans 5,639, and five other denominations sponsor more than 1,000 such local units each. Religious bodies sponsor 50.1 per cent of the 129,097 Boy Scout units which enroll over 3.5 million youth in the nation.

All of the churches have programs of teacher training for church-school teachers. For example, over 250,000 persons were enrolled in study courses sponsored by the Methodist Church for the improvement and personal enrichment of teachers in the church school. Other boards, such as those on temperance or world peace, carry on other educational programs. The denominational boards of social action associated with the Division of Christian Life and Work of the National Council of Churches, for example, are currently sponsoring study groups in hundreds of churches on the theme "Christian Responsibility for Freedom."

Television and radio programs could be the subject of a separate article. National networks and many local sta-

tions give public service time in addition to purchased time to series of religious programs. Experiments are made in collaboration between stations and churches. "The Rainy Season," for example, posed problems of older adults on television. It was heard and used as material by eighty-seven discussion groups in churches of one denomination. Network and local television and radio programs are aimed at specific audiences, some at children, some at youth, some at adults.

The Religious Education Association, a professional association of religious educators from all the faith groups, encourages the exchange of experiences. It publishes *Religious Education* as one means of circulating research reports.

THE PLACE OF VALUES

The definition of religious education accepted at the beginning of this report directed attention to the educational effort of organized religious groups. By another definition, religion is simply loyalty to ultimate values.

Schools are established by those who think they have something to teach, and educators seek to transform the world as it is into the world as they believe it ought to be. This is also the concern of religion. Both education and religion provide some continuity with the past and some vision for the future. The facts with which the school deals are not simple, for every fact is expressed within some conceptual framework, within some interpretive scheme. The selection of facts to be taught is governed by some set of ultimate values which guide choice. In school, youths look for answers to questions about the origin, destiny, and meaning of life. These are religious questions. In the United States we say that every individual has a right to an education. And this is an expression of a religious conviction about the nature of the universe

and man's place in it. Within the wider definition of religion, public education is perhaps the greatest religious force in American life today.

Private schools derive their orientation from the values of the group supporting them. That group most often is a self-conscious segment of society such as an economic, social, or religious group. The church school is based upon the governing convictions of its sponsoring religious body. Parochial schools operated by different churches should not be completely equated, for the schools reflect the views of the parent churches which may differ widely in values and beliefs.

Public schools derive their values from the needs and interests of the society as a whole or of its majority groups. Because the public schools are operated by the people through the state, there is always a tendency to make the state itself an object of deification, to accept the state as constituting the highest value. Yet political theory in the United States still emphasizes that the government exists to serve the people.

In the United States, the public schools are expected to inspire the young with the ideals of American democracy as embodied in our traditions and in our documents such as the Declaration of Independence, the Constitution, and the Bill of Rights. These concepts derive from a theistic view of man and of society. Man is seen as a creature endowed by his Creator with inalienable rights of life, liberty, and the pursuit of happiness. Governments derive their just powers from the consent of the governed. Men and nations live under a Divine Providence and a Supreme Judge. Schools are intrinsically religious when religion is conceived as relevant to every human activity and whenever the educative process becomes the occasion for asking

the most profound questions, entertaining the highest hopes and expectations, and making the basic decisions.

Questions of how the public schools should deal with matters of religious concern inevitably arise. More lawsuits are pending on such issues than are pending in the more publicized field of racial desegregation of public schools. It is appropriate to note that in a society in which most children attend public schools, memberships in Catholic, Jewish, and Protestant religious organizations have increased to unprecedented proportions.

Proposals for use of tax funds for the education of children in the church-related schools are being seriously advanced and considered. Precedents can be gleaned from the social welfare field, from government programs of aid to higher education, and from other areas for urging tax-supported aid on elementary and secondary levels of education. It would be helpful in future deliberations if some answers were available to questions such as these:

What differences exist between the students produced by the public schools and those produced by the church-related schools as operated in the United States?

What differences exist between the students produced in American schools and the students produced by schools in which an established religion is taught in countries whose practices are offered as precedents for us?

What are the differences in people who have had religious education in varying amounts and those who have not?

How can religious learning be fitted into a developmental sequence and provide a basis for a curriculum, perhaps assigned to co-operative educational arrangements as suggested by released time, division of responsibility between church and state?

Answers to such questions would probably cost twenty million dollars and twenty years of effort—but would they not be worth the price?

Religion and Politics

By LUKE EBERSOLE

ABSTRACT: The controversy over mixing religion and politics has not kept religion apart from government. Religious groups participate in a wide variety of political activities. But religious groups in the United States are not organized as political parties or political machines. There is a relation between religious affiliation and party affiliation. The correlation, however, does not usually indicate a "religious" vote. In part, the relation reflects socio-economic status. For Catholics and Jews it is very much a result of awareness of minority status. As minority awareness declines, trends in voting change. There is no pattern of voting for or against candidates because of their religion. The importance of religion in a presidential election cannot be assessed on the basis of other elections. The election of a Catholic president would not change the nature of our government, but it would have an effect on American politics.

*Luke Ebersole, Ph.D., Knoxville, Tennessee, is Professor of Sociology at the University of Tennessee. He previously taught at the University of Maryland. He is the author of *Church Lobbying in the Nation's Capital* (1951), *American Society* (1955), and he has contributed to various books and periodicals.*

IN the controversy over mixing religion and politics, a distinction frequently is not made between religious political action and the joining of church and state. Without regard for its historical meaning, the principle of separation of church and state is often used as the chief basis for criticism of political activity by religious groups.

The legal basis for separation of church and state in the United States is contained in the provision of the First Amendment that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." In the years since its ratification there has been considerable contention over its specific application, but there is rather general agreement that its authors meant to prohibit the federal government from regulating and supporting religion.¹ On the whole, the "wall of separation" has been well maintained.

The framers of the Constitution were equally concerned about the control that religion might exercise over government. The coin of disestablishment had two sides. At the same time that it granted freedom to religion from regulation by the state, it foreclosed a major means for religious domination of the state. There could be no state church or churches.

But separation of church and state as set forth in the First Amendment does not cover the whole range of relations between religion and government. Other than to disestablish the church or churches, it does not define the legal place of religion in government. Religious political movements, religious political parties, organized religious pressure groups, and church lobbying are

outside the purview of any Constitutional provision.²

PRESSURE AND LOBBYING

In practice, religion has not held itself aloof from government. Organized efforts to sway government in the name of religion have long been part of the political process. A survey of a few past movements and organizations shows how varied the political interests of religious groups have been. Since 1844 the Christian Amendment Movement has been attempting to have religious language written into the preamble of the Constitution. One of the purposes of the Know-Nothing Party was to prevent the election of any but staunch Protestants to public office. Churchmen played prominent roles on both sides of the political struggle over slavery. Immediately following its appearance in 1874 the Woman's Christian Temperance Union launched a prohibition campaign. The Knights of Columbus has attempted to use the machinery of government to achieve its ends. The Lord's Day Alliance was formed in 1888 to represent Protestant denominations in their efforts to secure the enactment of legislation to preserve Sunday rest and worship. In the present century the most conspicuous political activity of the churches was the drive for national prohibition under the direction of the powerful Anti-Saloon League. The Methodist Board of Temperance moved to Washington in 1916 in time to aid in the prohibition campaign. The National Council for Prevention of War, working closely with church groups, started its campaign in Washington in 1921. Between the First and Second

² The only other specific reference to religion is contained in Article 6: "... no religious test shall ever be required as a qualification to any office or public trust under the United States."

World Wars many religious groups were active in the peace movement and opposed governmental action that might lead toward war.

Some of these older groups still continue their efforts to influence government in Washington. In addition, new organizations have appeared. A number of religious groups have formed agencies which have the assigned function of providing their constituents with information about government and also of representing their respective denominational or interdenominational church bodies before the federal government. The Catholic Church has had offices in Washington for more than four decades. Most of the Protestant agencies have maintained offices in Washington since the end of the Second World War. Among the groups with Washington offices are the Friends Committee on National Legislation, the Legislative Committee of the Congregational Christian Council for Social Action, the Council for Christian Social Progress of the Northern Baptist Convention, several Methodist organizations, the National Lutheran Council, the National Council of the Churches of Christ in America, the American Zionist Committee for Public Affairs, the National Catholic Welfare Conference, the National Conference of Catholic Charities, the Christian Science Committee on Publications, and Protestants and Other Americans United for Separation of Church and State. This list might be expanded to include other national organizations and also groups that operate on the state and local levels.

The activities of such organizations vary greatly in the degree to which they are political. Some church agencies in Washington function only to channel information concerning legislation and governmental action to the church public. Others have become experts in the art of influencing government. They

take their place among the lobbyists in informing, advising, and persuading legislators and administrators. The efforts of many national and local groups consist chiefly of sporadic campaigns of propaganda and pressure. By passing resolutions, appointing delegations, calling mass meetings, and sending letters and telegrams, religious groups across the country pressure and protest, approve and disapprove governmental action.

There are many critics of the participation by religious groups in the affairs of government. Church political action agencies are often charged with taking positions that are not representative of their constituents. In many cases the charge is true, as it is true of other organizations that attempt to speak for large and heterogeneous groups. In their study of the Protestant Episcopal Church to find the relationship between parishioners' attitudes and official church policy on social issues, Glock and Ringer reported that on all but one issue on which the church has a committed policy the parishioners are divergent. The single area in which there is agreement is the United Nations. They also found that on most social issues the policy of the church is more liberal than the attitudes of parishioners.³ In a letter prefacing the final report of the National Lay Committee of the National Council of Churches, the chairman wrote: "Clergy and laity active in organized Protestantism seemed to have lost the capacity to understand each other. We, as lay people, were alarmed and unhappy as the National Council assumed the right to speak increasingly on subjects in which

¹ Since 1925 the First Amendment has been interpreted to mean that the states also shall not regulate or support religion.

it was difficult to see ethical or spiritual content for that inarticulate and voiceless body called "34 million Protestants."

Some of the opposition, of course, follows from the premise that, no matter what the issues, organized religion has no place in government. Indeed, there are some critics who seem to believe that all pressure groups should be removed from government. They would prefer to have the National Association of Manufacturers, the American Federation of Labor and Congress of Industrial Organizations, the Farm Bureau, and other interest groups, along with religious groups, cease political activity and leave government to function in a pressureless vacuum.

No matter how religious groups resolve the issue of their proper place in government, it appears that their present organized pressure and lobbying efforts are not contrary to the intent of the Constitution. No church organization is in a position to dominate government in the United States. The political forces of religion are dispersed, not centralized. They often display disagreement, not consensus. Moreover, the attempts of religious groups to influence government are usually based on utilitarian and broadly ethical considerations, rather than on strictly sectarian and theological grounds. The churches in this country are not political rivals of the state. Religious groups are doing nothing more than participating in the democratic process of discussion, pressure, and consent by which government policy is formed.

NO RELIGIOUS PARTIES

Unlike religious groups in several European countries, religious groups in the United States have not formed political parties. Only once has a party with avowedly religious purposes achieved even a modicum of political power. The

Native American Party, which became the Supreme Order of the Star-Spangled Banner or Know-Nothing Party, was committed to the election of Protestants. The program of the movement derived not from what it was for but from what it was against. In a predominantly Protestant country, the erection of Catholic churches, schools, and convents gave rise to a deeply rooted set of suspicions, fears, and hates. The Know-Nothing Party was the political embodiment of religious hostility. It fought against every form of Catholic influence in the United States. A few years after the peak of its strength in the middle of the last century, the Know-Nothing Party was dead. But Know-Nothingism has been felt many times in American politics in the small waves of Anti-Catholic and Anti-Jewish feeling that have moved across the nation.

Not only are there no religious political parties in America today; there are no politico-ecclesiastical machines comparable to the Anti-Saloon League in its day. Founded in 1895, the League grew into an organization supported by as many as 60,000 agencies and spending as much as \$2,500,000 a year. Although temperance societies in and outside of the churches co-operated, it was the churches that gave the organization its strength. The League had a simple and unchanging platform. It would settle for nothing less than destruction of the entire traffic in liquor. It was geared for quick and effective action toward this end. Control was centralized. Funds were bountifully supplied. League henchmen were located throughout the land. Most important, the League could employ the one sure method of exerting political pressure; it could control votes. At the height of its strength the Anti-Saloon League achieved unprecedented political power.⁵

⁵ See Peter H. Odegard, *Pressure Politics* (New York: Columbia University Press, 1928).

It cannot be alleged that there now exists a political machine prepared to deliver a bloc of Protestant votes, nor that there is a political machine able to deliver the Jewish vote. But the charge is made that the Catholic Church has a political apparatus that can control the Catholic vote throughout the United States. The case against this belief is stated by Elmo Roper.⁶

I think I can . . . dispel . . . the myth of a captive, precommitted Catholic vote. . . . Catholic voters are just as free, just as unfettered, just as intelligent, and just as divided in their voting preferences as any other group. . . .

One can only hope that both our politicians and our people will one day acknowledge what seems an obvious truth: that Catholics are many things. For example, they are not only Irish—they are Italians, they are Germans, they are Frenchmen, and they are Poles. Catholics are liberals—and they are conservatives. Catholics belong to labor unions—and Catholics are unhappy about labor unions. Catholics are Republican—and they are Democratic.

Most students of political behavior concur in the judgment that the Catholic Church does not constitute a political organization capable of delivering the vote of its members. Catholic laymen, like other laymen, are responsive to many political cues other than those that might be provided by church officials. Moreover, Catholic officials have demonstrated little inclination to present a united front in support of particular candidates for public office. Like the leaders of other churches, Catholic leaders are politically divided.

DO THEY VOTE RELIGION?

Despite the absence of religious political parties and of politico-ecclesiastical

⁶ *Saturday Review*, Vol. 42 (October 31, 1959), p. 22.

machines ready to deliver blocs of votes, is there a relation between religion and voting? Is there any indication that religion enters into the choice that the American registers at the polls? This is a complex matter involving many often contradictory factors. We shall consider only a few.

It is necessary to make a distinction between voting when local measures are at stake and voting in national elections. The greatest evidence of religious bloc voting or of occasional ecclesiastically encouraged voting is to be found below the level of national politics. It is apparent that at times local actions produce a religious vote. In 1948 in Massachusetts, Catholics voted in vast numbers because of a referendum measure to allow state health officials to disseminate birth-control information. In California in 1958, there was an outpouring of Catholics because of a referendum issue which would have made parochial schools subject to taxation.⁷ In local liquor referendums, organizations led by Protestant ministers sometimes arouse the "church vote." But in view of the difference in drinking habits among Protestants and within each denomination, such voting can hardly be called Protestant, or even Baptist or Methodist.

Turning to the broader question of the religious composition of political parties, there is some indication of a relation between religious affiliation and party affiliation. It is an elementary political assumption that although Protestants, Jews, and Catholics are both Republicans and Democrats, Protestants tend to be more Republican than Democratic, and Catholics and Jews tend to be more Democratic than Republican. The evidence, however, is not unmixed,

⁷ Peter H. Odegard, *Religion and Politics* (New York: Oceana Publications, 1960), pp. 123, 124.

and the relation between religion and party is probably not as consistent as is widely believed.

On the basis of a small-scale study of the 1948 election and a nationwide study of the 1952 election, the University of Michigan Survey Research Center provides some evidence concerning the voting behavior of Catholics and Protestants.⁸ In 1948 the Catholics contacted during this survey expressed a strong Democratic preference. Forty-nine per cent voted Democratic; 15 per cent of the nonvoters had a Democratic preference. This produced a total Democratic preference of 64 per cent. Twenty-five per cent of the Catholics surveyed voted Republican; 2 per cent of the nonvoters had a Republican preference. This produced a total Republican preference of 27 per cent. In 1952 the total Democratic preference among Catholics was 53 per cent, of which 43 per cent were voters and 10 per cent were nonvoters. The total Republican preference was 47 per cent, of which 41 per cent were voters and 5 per cent were nonvoters.

Protestants questioned by the 1948 study seem to have had a Democratic preference which did not show up in their vote. The total Democratic preference among Protestants was 53 per cent, of which 25 per cent were voters and 28 per cent were nonvoters. Thirty-four per cent of the Protestants had a Republican preference, of which 28 per cent were voters and 6 per cent were nonvoters. In 1952 the total Democratic preference among Protestants was 39 per cent—26 per cent voters and 13 per cent nonvoters. The total Republican preference among Protestants was 57 per cent—45 per cent voters and 12 per cent nonvoters.

In general, these findings conform to

⁸ Angus Campbell, Gerald Gurin, and Warren E. Miller, *The Voter Decides* (Evanston, Ill.: Row, Peterson, 1954), p. 71.

the assumed relationship between religion and party, but they show that the relationship is varied and sometimes tenuous. In a Democratic year, Catholics voted Democratic two to one. In a Republican year, Catholics divided their vote almost evenly, giving the Democrats a slight edge. Protestants, in a Democratic year, had a Democratic preference which they did not vote. In a Republican year they voted Republican not quite two to one.

In several studies of particular communities, Catholic-Protestant differences stand out more definitely. In Erie County, Ohio, in 1940, 60 per cent of the Protestants said they intended to vote Republican, whereas only 23 per cent of the Catholics indicated a Republican preference.⁹ In Elmira, New York, in 1948, Catholics voted Republican only half as much as Protestants.¹⁰

In the case of American Jews, the relation between religion and party affiliation has been marked. For many years Jewish immigrants gave their political loyalty to the Republican Party. But since the 1930's the Jewish vote has shifted to the Democrats. In 1936, Ward 24 in Chicago, which probably had a higher proportion of Jews than any ward in the nation, voted 96 per cent for Roosevelt. National surveys show that in 1940 and 1944 more than 90 out of 100 Jews voted Democratic. Since 1948 the Jewish Democratic vote has diminished but the decline has not been great.¹¹

ECONOMIC STATUS

Does the correlation between religion and party, whether great or small, consistent or fluctuating, actually represent a religious vote? So far as Protestants are concerned the answer is in the negative. Protestants are much too diverse in their political attitudes and behavior to be treated as one group. After an analysis of politico-economic attitudes in eight major religious groups, Wesley and Beverly Allensmith concluded as follows:¹²

Differences can be shown between major Protestant denominational groups which are as great as differences between such groups and non-Protestant groups. Thus differences between Congregationalists (taken as a group) and Catholics (as a group) are in general no greater than differences between Congregationalists and Baptists.

The source of Protestant political differentiation is not religious but economic. Among Protestants there is a close correlation between socio-economic status and political behavior.

With considerable justification, many political observers have also applied a socio-economic interpretation to the party identification of American Catholics. In *The Future of American Politics*, Samuel Lubell wrote:¹³

Because they came to this country late, these immigrants and their children were concentrated in the lower economic rungs. . . . Catholicism . . . coincided largely with discrimination and sweated labor, with immigrant minorities who were looked upon as inferior beings—in short, the lower class.

On the other hand, the Erie County and Elmira studies showed that when

¹² Wesley and Beverly Allensmith, "Religious Affiliation and Politico-Economic Attitude: A Study of Eight Major U. S. Religious Groups," *Public Opinion Quarterly*, Vol. 12 (Fall 1948), pp. 388, 389.

¹³ Samuel Lubell, *The Future of American Politics* (New York: Harper, 1951), p. 39.

Catholics and Protestants on various socio-economic levels were compared, Catholics voted more Democratic than Protestants on all levels.¹⁴ Catholics of high economic status voted more Democratic than Protestants of low economic status. In addition, liberalism or conservatism on economic issues was not the determining influence in party alliance. Catholics who agreed with the Republican position on economic issues were no more Republican than liberal Protestants. On each level of liberalism or conservatism, Catholics were more Democratic than Protestants.¹⁵ In Philadelphia, Glantz found no difference between Catholics and Protestants at the top level of stratification, but in the middle and lower classes there was twice as much Republicanism among Protestants as among Catholics.¹⁶ Thus while the economic status of Catholics has an important bearing on their party affiliation, it does not offer a full explanation.

For the Jewish group taken as a whole, the economic class theory of politics is not relevant. The economic position of American Jews has been improving rapidly. Yet while this improvement was taking place, the Jewish vote shifted from Republican to strongly Democratic. Within the group, economic differences have had little effect on voting in national elections. Political attitudes, too, appear to be unrelated to economic status. Only a relatively small proportion of Jews are manual workers, but they tend to share certain of the attitudes held by groups having a large proportion of workers.¹⁷

¹⁷ Wesley and Beverly Allensmith, p. 381.

MINORITY STATUS AWARENESS

What we see in the party affiliations of Catholics and Jews is not in a true sense "voting their religion." Religious issues are rarely involved. Whatever political consensus exists, and it is sometimes small, is not so much a result of religious cohesion as it is a result of awareness of minority status. Berelson, in Elmira, found the following:¹⁸

The more closely the members identified with their minority group, the stronger their Democratic vote. Regardless of the particular measure, those minority members who feel close to their own group (or who feel hostile to the out-group) are more likely to express the group's political preference (i.e., vote Democratic) than their fellows.

Religious intolerance, ethnic discrimination, low economic position, urban concentration, and residential segregation have all contributed in varying degrees to Catholic and Jewish minority feelings. In cities with large Catholic populations the Democratic party early became an agency of Catholic social participation, protest, and power. Once established, party allegiance tended to be transmitted within the group and from generation to generation.

One of the reasons why Jews first associated themselves with the Republicans was that Catholics were Democrats. But in the campaign of 1928 and during the 1930's, the Democratic Party came to be defined as the party of the city, of social protest, and of hope for minorities. Increasingly Jews found identification with the Democratic Party to be more compatible with their own status. When in the late 1930's and early 1940's Franklin D. Roosevelt became the symbol of opposition to Hitlerism and Jewish persecution, the Jewish sense of affinity with the Democratic Party was

intensified. For a period the Jewish transfer to the Democratic Party was almost complete.

The need for Catholics and Jews to hold to a minority-group political identification has greatly decreased in the last generation. Occupational and economic mobility, political and educational achievement, cultural assimilation, and increased religious tolerance have removed much of the reason for minority protest. Indeed, when the Michigan Survey Research Center attempted to measure the degree to which the relationship between religion and party is psychologically meaningful, it was discovered that most voters, including minority group members, do not think of their religious group as preferring a particular party.¹⁹

But even though the stimulus for minority political sentiment has weakened, minority-group patterns of voting persist. Without consciously voting as Catholics or Jews, people tend to vote like others who have had similar experiences and like the people with whom they associate most intimately. For urban Catholics and Jews these people are often members of their own religious group.

There is evidence, however, that the changing status of ethnic and religious minorities is causing political change. The Elmira researchers saw a decline in the Catholic Democratic vote. They also found more Republican voting among younger Catholics than among older Catholics. "The succession of generations seems to be softening the religious difference."²⁰ While Jewish defection from the Democratic ranks is small, there are signs that in some communities Jewish voting is beginning to

¹⁹ The investigators recognized that their results may have been influenced by the reluctance publicly to associate religion with politics. See Campbell *et al.*, pp. 206-15.

²⁰ Berelson *et al.*, pp. 69, 70.

move toward a pattern more influenced by economic status. For both Catholics and Jews it may be expected that as minority feelings diminish, occupation and economic and social class will gain in importance as determinants of their political behavior.

CANDIDATE'S RELIGION

Hitherto we have dealt with the party preferences of religious groups, irrespective of who the candidate may be. We are still left with the question of whether the religious affiliation of the candidate himself is a factor in the vote for or against him.

The argument that the religion of a candidate can help to attract support was used by the supporters of Senator John F. Kennedy in his bid for the Democratic vice-presidential nomination in 1956. According to their analysis, the Democratic Party was losing Catholic votes. They held that in 1952 Democratic Catholic candidates for Congressman, Senator, and Governor ran ahead of the Democratic presidential candidate. They argued, too, that a Catholic vice-presidential candidate would not hurt the party ticket. Thus, they took the position that Catholics would vote for a candidate because of his Catholicism, but that non-Catholics would not vote against him as a Catholic.

The claims of the Kennedy supporters were refuted by a group of social scientists in a study released by Ralph M. Goldman and John H. Romani.²¹ They showed that in 1952 there was no significant difference between the vote for Catholic and non-Catholic candidates. Catholic Congressional candidates ran ahead of the party ticket, but so also did non-Catholic Congressional candidates. Through an analysis of election results in states in which religion was claimed to be a factor, the study showed

²¹ *U. S. News and World Report*, Vol. 41 (August 17, 1956), pp. 44-46, 132-35.

that a large Catholic population did not give an advantage to a candidate who was a Catholic. At the same time, a large non-Catholic population did not put a Catholic candidate at a disadvantage. In every state the situation was the same. A pattern of religious voting could not be established. A study of this type cannot be interpreted to mean that Catholics never give special support to a Catholic candidate. But it does help to refute the assertion that Catholic candidates receive general and predictable Catholic support.

There can be no doubt that religious affiliation has been a factor in the making or breaking of many political careers. Catholics and Jews have held almost every type of public office. But the willingness of party leaders to accept them as candidates, as well as their own realistic aspirations, have frequently been governed by the rules of political "availability." For Catholics and Jews, availability has been influenced by religion. The same is true of Protestants in predominantly Catholic or Jewish areas.

RELIGION AND THE PRESIDENCY

The 1960 election has again raised the issue of voting for or against a presidential candidate because of his religion. Notwithstanding objections and disclaimers, religion was an issue from the beginning. In accepting the Democratic nomination, Mr. Kennedy made an effort to remove religion from the campaign when he expressed the hope that no American would waste his franchise by voting either for him or against him because of his religious affiliation. Earlier, however, Mr. Kennedy had recognized that religion was part of 1960 presidential politics. He warned Democratic leaders that if he did not receive the nomination, it would be taken to be on account of his religion, and the Democratic Party would suffer. The

¹⁸ Berelson *et al.*, pp. 71, 72.

implication was that rejection of a Catholic candidate would result in loss of Catholic Democratic support. At the same time a number of prominent Catholic political leaders and religious leaders were fearful that Mr. Kennedy's candidacy might meet with enough opposition to change the comfortable climate in which Catholics in public life have functioned.

Evaluation of the importance of religion in a presidential election is singularly difficult because there is little in the 1960 election that can be compared with the past. The campaign of 1928 was hard fought and even vicious. Religious prejudice was fully exploited. In some Democratic strongholds the Catholicism of the candidate outweighed party loyalty. Even so, in retrospect it appears that religion may not have been as decisive in the defeat of Al Smith as was originally supposed. Religion aside, 1928 was a year of battle between country and city, native born and foreign born, privileged and underprivileged, drys and wets. After a study of 173 counties in eight Northern states distributed across the country, Ogburn and Talbot concluded that prohibition sentiment was decidedly more important than anti-Catholicism in the Democratic defeat.²² Whatever the effect of the religious controversy in 1928, that campaign does not answer many questions about the present. The pattern of politics has changed, as have also attitudes on religion.

Studies of voting in local and state elections have limited relevance in assessing the influence of religion on a presidential vote. In local and state elections the religion of a candidate may not be known by many voters. In a presidential election the voter can

hardly fail to know. By common consent the presidency has been regarded as a public office requiring a unique set of political qualifications. Catholics and Jews have been mayors, senators, and governors, but no Jew has been a candidate for the presidency and only twice have Catholics been candidates. Voting to fill offices that have many times been held by members of all major religious groups cannot be compared with an election in which there is a Catholic candidate for the presidency.

Moreover, victory or defeat for Mr. Kennedy is not the test of the place of religion in presidential politics. Win or lose, many questions will remain to be answered. Did the Democratic candidate receive stronger Catholic support than usual? If so, in what areas? Did he lose votes among non-Catholics? If so, in what areas? In areas with large Catholic populations, what issues other than religion might account for strong or weak support? What issues other than religion might account for strong or weak support in areas with small Catholic populations? These and others are questions answers to which will need to wait for a careful analysis of the 1960 election.

CONSEQUENCES OF 1960

As this article is being written, the results of the election are not known. Nevertheless, a few observations about its possible consequences may be allowed. The election of a Catholic as president almost certainly would modify the pattern of politics. The sequel probably would be a strengthening of Catholic Democratic loyalty. It is likely that some Catholics would rally to the Democratic Party as the party that was again willing to disregard traditional religious qualifications for a presidential candidate. But such a gain for the Democrats could be temporary.

The net effect might be a loss of Catholic support inasmuch as the election of a Catholic president would further diminish the need for a minority-group political orientation. In the long run, any decline in out-group feeling would be expected to cause Catholic voting to be determined by more nearly the same factors as Protestant voting.

If Mr. Kennedy is defeated, the result will be different. No matter what the real reasons, defeat would be interpreted by many Catholics as a rejection of one of their own. There would be lingering frustration and consequent awareness of minority status until the last political door is opened. In this mood some intensification of Democratic allegiance might be anticipated.

It is not to be expected that the election of a Catholic as president would alter the structure of government. The fears of direct ecclesiastical control of a president grow out of a failure to understand the nature both of American Catholicism and of American government. That on some matters a Catholic president would hold attitudes influenced by his religion is to be assumed. Presidents who have been farmers, businessmen, educators, generals, and Protestants have not divested themselves of all prior attitudes upon entering the White House. The real question is whether the issues on which a Catholic president might feel bound by his religion are public issues, whether they are national issues, and whether they are clearly contrary to democratic tradi-

tion and practice. There are relatively few social issues on which Catholicism has an official position. Divorce, birth control, censorship, and state support of parochial schools are among the issues on which there is an official policy. Of these the major matter of national relevance is support of education. It is not inevitable that on this or any other policy a Catholic president would share or feel compelled to support the position of his church. Moreover, a president does not rule from a protected position of private preference. He governs in a public role delimited by traditions and precedents, pressures and counter pressures, Congressional co-operation and resistance, and political support and political punishment.

For those who are apprehensive about a Catholic in the White House, the contest would not end with the election. The actions of a president who is a Catholic would be vigilantly scrutinized. Every suspected move would become the subject of private and public discussion and would be filed for future political reference.

It is reasonable to assume that a Catholic in the presidency would be equally aware of public watchfulness. The presidency is the ultimate symbol of political acceptance, and it does not seem probable that a president who is a Catholic would wilfully and knowingly do anything to reverse the confidence of the electorate that the duties of his office can be fulfilled without partiality to any religious group.

Religion Among Ethnic and Racial Minorities

By J. OSCAR LEE

ABSTRACT: Churches of racial and ethnic minorities have developed and exist to serve the religious and social needs of these groups. This function has been shaped and reinforced by practices of racial and ethnic discrimination in American society. The goals and programs of racial and ethnic churches are affected by such factors as the movement toward desegregation and integration, the aspiration to full participation in community life, mobility, urbanization, and changes in socio-economic status. Although ethnic churches for persons of European background have virtually disappeared in America, churches of other ethnic and racial minority groups—Negro, Puerto Rican, Spanish-speaking people of the Southwest, American Indian, Chinese American, and Japanese American—continue to exist as significant institutions. Both the Protestant and the Roman Catholic churches recognize that discrimination and segregation contradict their basic beliefs and teachings. There has been a movement toward desegregation and integration within the life of the churches themselves. Because the pattern of ethnic and racial segregation in the churches is related to the pattern of ethnic and racial segregation in society, the churches have had to concern themselves with the elimination of policies and practices of discrimination and segregation in all areas of community life.

J. Oscar Lee, Th.D., New York City, New York is Executive Director of the Department of Racial and Cultural Relations of the National Council of Churches of Christ in the United States of America. He is an ordained minister of the Baptist Church. He is editor of Interracial News Service, author of A Manual for Cooperative Work in Race Relations, coauthor of The Christian Citizen and Civil Rights, and he has written articles on religious and social subjects for various periodicals.

DURING the past two decades the problem of race relations in the United States has moved into the forefront of the social problems confronting the nation. In spite of the numerous crises it has provoked, one of the most far-reaching social developments in the nation during the last ten years is the progress which has been achieved in eliminating the pattern of compulsory racial segregation. Moreover, we have been made aware by the mobility and urbanization of the Negro population that Negro-white relations are no longer a problem of the South alone. Increased awareness of the situation of Mexican Americans, Puerto Ricans, American Indians, and other ethnic and racial minority groups has caused the nation to recognize other dimensions of the problem. A third aspect of the problem which is gaining recognition is the international overtones of racial relationships in the United States vis-à-vis a world in which the achievement of human rights for all people is an increasingly important concern.

One cannot deal with religion among ethnic and racial minorities without seeing it in the context of the churches' concern about race relations. The churches have been especially preoccupied with this problem in the past twenty years. This interest has included: an examination of the pattern of racial segregation in American society; a determination of the religious and ethical implications of racial segregation; and movement to eliminate racial segregation from the life and work of the churches. One result of this process is that an increasing number of Christians agree that racial segregation must be rejected since it is a violation of the spirit and the teaching of the Christian gospel. In fact, many religious leaders consider the elimination of segregation from religious institutions as probably the most cru-

cial and urgent problem which the churches face today.

The problems of ethnic and racial minority groups are a concern of most of the churches in the nation. Mobility and urbanization, however, and other socio-economic changes which have affected the lives of people belonging to these ethnic and racial minority groups have special meaning for the churches of which they are members. They are important factors in determining the goals, functions, and programs of these churches. The changes in goals, functions, and programs which many of the churches have faced in the past twenty years are not only in response to demands for adjustments to new ways of life, but also may be indicative of changes in attitudes about the role of religion in meeting the needs of persons and groups.

The limitations of space and the specifications set forth for this article make it necessary to confine it to a consideration of the churches as religious institutions and how they have been affected by social changes.

THE NEGRO CHURCHES

The largest nonwhite minority group in the United States is the Negro-American group. In 1950, the United States Census indicated that there were 15,482,000 nonwhites in the United States and that Negroes constituted more than 95 per cent of this group. Negroes are mainly found in separate Negro denominations. These denominations are the National Baptist Convention, United States of America, Incorporated; the National Baptist Convention of America; the African Methodist Episcopal Church; the African Methodist Episcopal Zion Church, and the Christian Methodist Episcopal Church. While accurate membership figures for these denominations are not available,

it is estimated that the five Negro denominations have approximately ten million members.¹ Comparisons of this estimate with estimates made in previous years would seem to indicate that these denominations are growing in membership. There are approximately 600,000 Negro members in the predominately white Protestant denominations of which about 366,000 are in the Methodist Church.² According to the *National Catholic Almanac* for 1960, there were, as of January 1959, about 595,155 Roman Catholic Negroes in the United States. This is an increase of 20,000 over the preceding year.³

These figures indicate that a high proportion of the Negro population are members of churches belonging to the five Negro denominations. But they reflect more than this. They point to the central place that the churches have occupied and continue to occupy in the life of the Negro community. In a very real sense, it is the Negro's own institution in that it is organized, led, developed, owned, and controlled by Negroes.

Center of opportunity

Blocked as the Negro is by the pattern of racial segregation from full participation in the total life of the community, the Negro church affords him the opportunity for full participation in an organized group. Charles Johnson has aptly described the role of the Negro church.⁴

¹ *Yearbook of the American Churches, 1960* (New York: The National Council of Churches, 1960), pp. 253, 257.

² "Proceedings of the General Conference of the Methodist Church, 1960," *Daily Christian Advocate*, Vol. 1, No. 3 (April 29, 1960), p. 105.

³ *National Catholic Almanac, 1960* (Garden City, N. Y.: Doubleday and Co., 1960), p. 473.

⁴ Charles S. Johnson, *A Preface to Racial Understanding* (New York: Friendship Press, 1936), pp. 153-54.

It has provided a substitute for political organization and has furnished a channel for social as well as religious expression; it has been the center for face to face relations, for communication, for recreation and for physical as well as psychological escape from their troubles. It has been welcomed by Negroes even in areas where physical separation in worship was not demanded.

Even though Negro communities have developed many types of organizations to serve various social, political, and civic purposes, the Negro church still occupies a central place. It is to the churches that these organizations turn when they need to communicate with the entire Negro community or desire mass support for a program or project. The Negro churches are not only composed of the masses of the people, but the churches are also an important medium through which these masses shape and express their aspirations. Moreover, the Negro minister has the historic role of leader in the community. In the days after slavery, he was the principal if not only leader in many communities. While this has changed as teachers, medical doctors, lawyers, and other professional and business people assume a share of the leadership burden, the Negro minister still occupies an important place of leadership. He still has direct contact with the masses of the people who are members of his congregation and who look to him for counsel and guidance on many problems.

Negro churches play an important role in the shaping and the expression of the aspirations of the masses of Negro people, and these aspirations are important in shaping the goals, functions, and programs of the churches which must attempt to meet the felt needs which confront people in a period of rapid social change.

Mobility and urbanization

The mobility and the urbanization of the Negro have been mentioned. These are probably the two most important factors affecting Negro life in the last twenty years. This movement of Negroes to urban areas first gained momentum during World War I and continued in the period between 1920 and 1930. In the depression years there was very little movement. During World War II it gained considerably greater momentum. According to data published by the United States Bureau of the Census in 1900, 77 per cent of the Negro population lived in rural areas and 23 per cent in urban areas. By 1950 this had changed radically; 37 per cent lived in rural areas and 63 per cent in urban areas. Also, much of this movement has been from the southern to the northern, midwestern, and western areas of the country. Indicative of this trend is the fact that the Negro population in the thirty largest cities of the North, Midwest, and West more than doubled in the decade 1940 to 1950. This trend appears to have continued in the decade 1950 to 1960.

The movement from rural to urban areas and from South to North has worked far-reaching changes in the status of Negroes. Eli Ginsberg points out in *The Negro Potential* that between 1940 and 1955 the number of Negroes in nonfarm civilian employment increased from about 3 million to about 5.5 million, a proportionately larger expansion than for the labor force as a whole. Although most of the nonfarm employment available to Negroes is unskilled or semiskilled, a higher income has become available to Negro families in urban areas than was available in the rural South. Ginsberg states that in 1954 the median money income of Negro farm families in the rural South was \$742 annually. For Negro families in

urban areas it was \$2,876. The higher income was reflected in better living conditions, better health, and increased education. The status of Negroes has been affected and the economic opportunities for Negroes have been altered by social and political efforts in the past two decades to eliminate racial discrimination and segregation from public schools, higher education, employment, public transportation, and public accommodations. These changes have generally been accompanied by a clarification of the goals which Negroes seek. The racial church has, in many cases, been the only available channel through which the Negro could find social expression and could exercise leadership on the basis of character and ability.

In the movement from rural areas to urban areas, Negroes encounter a different group of social problems. Major problems are racial discrimination in housing and the slum conditions in city areas where most Negroes are forced to live. These are often accompanied by poor housing, poor schools, and poor community facilities and services. Another set of problems revolve around unemployment and underemployment. The rate of unemployment among Negroes continues higher than the national average. Involved in this is the fact that many of the better types of jobs are unavailable to Negroes and in the South many of the ordinary semiskilled and unskilled jobs in industry are unavailable. Also, there is increased recognition that major attention must be given to encouraging Negro youth to acquire skills. Still another set of problems centers around racial segregation and discrimination. These include the disenfranchisement of Negroes in the rural South; discrimination in the use of public accommodations and facilities; frequent instances of personal violence against Negroes; and a growing resolution to work for the elimination of dis-

criminary practices based upon race as soon as possible.

The changes and problems suggested above are relevant because the Negro church is confronted with them as it plays a role in the adjustment of Negroes to urban life. In this connection, these problems have affected the goals, functions, and programs of the Negro churches.

Mobility and urbanization have affected the rural Negro church. In 1947, Dr. Harry Richardson made the following observation:⁵

Indeed, in sharp contrast to the increases reported were the cases of losses in membership, many of them so great as to reduce the size of some churches, and in a few cases, to close the churches completely. All the cases of extreme loss were due to migration or emigration from rural areas to urban centers. . . .

This movement has been accompanied by the growth of many existing urban churches and the establishment of many new ones. On the whole these urban churches are larger than the rural ones. Urban churches as a rule possess sufficient financial resources to employ full-time leadership which enables them to conduct a continuous program. This contrasts with the general pattern in the rural churches. The program of most of these churches is confined to conducting worship or preaching services one, two, or three Sundays a month, under the leadership of a pastor who lives in another community and who travels to the church for this particular purpose. Possibly this is a reason for the suggestion that the urban Negro church penetrates the community more than the rural one does and that its program is more practical in its community outreach.

⁵ Harry V. Richardson, *Dark Glory* (New York: Friendship Press, 1947), p. 54.

Social relevance

Another important development seems to be an increasing interest in the integration of religious values into life. In the book, *Religion of Negro Protestants*, Ruby Johnston says:⁶

Religious ideas are significant in action. The religious ideas and actions of the Negro reflect the 'interests' of the collectivity. There is a close relation between the common value attitudes of the group and religious ideas.

There appears to be substantial agreement among many Negroes that in addition to worship and religious education the church should be active in promoting the social advancement of the race. There is an expectation among an increasing number of Negroes that the churches should be active in the improvement of the community, cooperate with community welfare and civic organizations, and engage in social action to correct injustice, particularly in race relations. Possibly the classic example of the realization of this expectation is the Montgomery, Alabama bus boycott which was led by ministers with the full and active support of their churches. This movement drew the admiration and support of Negroes nationally. These expectations have affected the programs of many churches which are including such activities as education in social and community problems, recreation, social service, and social action. Changes in the status of Negroes as well as the social problems which they confront in urban areas are factors in stimulating these expectations and this development.

Contrast of old and new

This is not to imply that the religious beliefs which are traditional in the Ne-

⁶ Ruby Johnston, *The Religion of Negro Protestants* (New York: Philosophical Library, 1956), p. 33.

gro church have disappeared. There are still a substantial number of Negro church members who hold to religious concepts which emphasize personal salvation, pietistic individual living, and a better life after death. Also, there are many people who find escape in emotional expression. However, despite this, the emphasis on social concern and action may mean that such factors as the pressure of urban problems, increased education, and a better understanding of methods of group action are effective in changing the traditional attitudes of Negroes about the role of religion. Ruby Johnston in the book cited above presents an interesting discussion on the decline of traditional religion and emotionalism among Negroes.⁷ While shouting and the use of the verbal expression "amen" continue to be practiced in many churches, the tendency appears to be that a smaller number of people, usually the older ones, engage in them.

Store-front churches

Emotional expression as a factor in the religious experience of the Negro raises the question of store-front churches and the movements of "personal saviors." Dissatisfaction about emotional expressions works two ways, and it is at least one index to class stratification in the churches. There are those people, usually members of the growing Negro middle class, who resent emotional expression in the church. Some of these people become members of churches with more restrained services. These churches usually emphasize a rational and action-oriented approach to religion under the leadership of a well-trained minister. At the other end of the spectrum are those who are dissatisfied with the restraint on emotional expression or who feel that the church does not provide the warmth of fellowship or who

⁷ *Ibid.*, pp. 3-15.

may have a doctrinal difference. These people withdraw to organize a church of their own. Many of these groups start as store-front churches.

Leadership appears to be a key factor in the destiny of these churches. Some are started for no other reason than that a person with some leadership capabilities decides to organize a church. The ministers of many of these churches have practical leadership capabilities but little academic or professional training. Some of these churches have a short span of existence because they are led by people who aim to exploit the members; others are quite permanent and still others grow into larger, established congregations. This is testimony to the practical leadership capabilities of some of the ministers who serve these small congregations. The people, usually of limited educational background and opportunity, who are members of these churches seem to find security by participating in a small group which emphasizes what is called the "old time religion." Some of these store-front churches may be affiliated with one of the five Negro denominational groups mentioned above, but the large group of them are identified as Holiness Pentecostal, Faith Healing, or Spiritualist.

Personal saviors

Many of the movements of the "personal saviors" are national in scope. Some of the better known examples are the United House of Prayer for All People, the Father Divine Peace Movement, and, more lately, the movement of Mr. Elijah Mohammad which calls itself "Muslim." It is difficult to summarize these movements because they vary greatly in purpose, organization, content of belief, and practices. Estimates of the number of people who belong to these various cult movements vary according to the source. While there are no reliable figures, it is apparent that

the vast majority of Negroes do not belong to them. One has to be careful in making generalizations about these movements, but their centers of strength appear to be large urban centers. They are centered around strong leaders who have a unique appeal to masses of people. They seem to relieve and to release the psychological tensions of people who are extremely frustrated by the problems of urban life. Both their appeals and their activities are dramatic enough to attract considerable publicity. These movements appear to be closely knit organizations and to exercise a considerable degree of control over the personal lives of their adherents. It seems safe to say, however, that while these movements may serve the need of their adherents, they do not have a great influence in the Negro community as a whole.

CHURCHES OF ETHNIC GROUPS

The great immigration from European countries prior to World War I made its impact upon the churches. The immigrants brought the religion of their home countries with them. In these immigrant churches the language of the homeland was spoken and some of the customs as well as traditions were maintained. As the children of these immigrant families grew older, they wished to be thought of as Americans; they spoke English and exhibited little desire to master the language of their parents. This made it necessary for the churches to hold some services in English. In effect, the churches became bilingual, but even this was temporary. The stoppage of the tide of European immigration, the depletion of the first generation by death, and the opposition of the second and third generations to the use of a foreign language have produced a gradual disappearance of the bilingual feature in many of these

churches. In some cases these churches have had to close because the second and third generations have moved to other neighborhoods. In the cases in which these churches have made successful transitions, they have had to forego their preoccupation with European customs, traditions, and language in order to serve the current needs of their congregations. It is the judgment of many competent observers that when such a church fails to do this, its future is not promising.

This is only a part of the story of ethnic groups in the United States. Puerto Ricans, Spanish-speaking people of the Southwest, American Indians, Chinese Americans and Japanese Americans have churches with distinctive characteristics.

Spanish-speaking people

The Spanish-speaking population in the United States is a large one. This brief statement will deal with two groups, the Puerto Rican and the Spanish-speaking people of the Southwest. The latter group is defined to include naturalized immigrants from Mexico, native-born persons with parents or grandparents born in Mexico, alien Mexicans in the United States either on a temporary or permanent basis and Spanish Colonials largely concentrated in New Mexico and southern Colorado.⁸ This definition is indicative of the difficulty of defining precisely the Spanish-speaking population of the Southwest. However, the bulk of this population is either Mexican by birth or the native-born descendants of persons born in Mexico.

The Migration Division of the Department of Labor of the Common-

⁸ Bureau of Research and Survey, *Spanish-Speaking Americans* (Unpublished manuscript by Blair, Lively, and Trimble; New York: National Council of Churches, 1959), p. 14.

wealth of Puerto Rico estimated that the population of Puerto Rico as of July 1, 1958 was 2,317,000 and that as of December 31, 1958 there were 849,000 Puerto Ricans living on the mainland of which 77 per cent were living in New York City.⁹ The 1950 United States Census reported that there were 2,448,977 white persons of Spanish surname in five Southwestern states and persons in other states born in Mexico or with one or more parents born in Mexico. Of this number 1,998,415 were native born and 450,562 were Mexican born. It is also reported that 1,519,812 of the Spanish surname population in 5 Southwestern states or 66 per cent were urban dwellers. The five Southwestern states are Arizona, California, Colorado, New Mexico, and Texas.

There are substantial differences between the Puerto Rican population and the Spanish-speaking population of the Southwest. For instance, one of these differences is that Puerto Ricans are citizens of the United States and movement within the country constitutes migration. On the other hand, the people of Mexican origin are immigrants from another country. There are some similarities. Many of the people of Mexican origin came from an agrarian society and some of the Puerto Ricans came from a similar type of society. Both groups came from societies in which the characteristics of Spanish culture and the traditions of the Roman Catholic Church are predominant. The majority of both groups have settled in urban areas. They speak Spanish and those who have not mastered English experience difficulty in communication. Both groups experience a lack of full acceptance in American society because of their ethnic background. Even though some people of Puerto Rican and Mexican background, because of education

⁹ *Ibid.*, p. 49.

and skill, have gained a degree of acceptance, these groups are victimized by socio-economic disabilities.

These factors are reflected in the churches. The Spanish-speaking people of the Southwest come from a Catholic background. Catholicism was taken for granted in Mexico. There was little knowledge that other religious forms existed, and this was true of Protestantism, also. Religion was deeply interwoven into the life of the community. Thus those people coming into the country were predominantly of Roman Catholic background. Several competent observers have indicated that they were nominal Roman Catholics. It has also been pointed out that only a small proportion of those in this country are active members of the Roman Catholic Church. Possibly one of the reasons for this is that religion is not so fully integrated into community life in an urban-industrial society and is therefore unable to meet the needs of the people as it had done in an agrarian society.

Mexicans

Mexican Americans in the United States are attracted to Protestant churches, but the total number is small. Some attend English-language Protestant churches. It is reported, however, that few local Protestant churches in the border areas exhibit active interest in attracting Mexican Americans. The fear of not being accepted as well as difficulties of language may deter many Mexican Americans from joining these churches. Also, there are churches which serve Mexican Americans. A study of eighty-one Mexican churches in 1959 indicated that fifty-one claim less than one hundred members each. Sixty-three of these churches reported under one hundred in average attendance. Twenty-five of the churches reported using some English in the services and fifty-three used no English. The denominational

distribution of these churches was as follows: Disciples—three; United Presbyterian, United States of America—twenty-one; Methodist—twenty-two; Congregational—three; American Lutheran—six; Church of God—two; Episcopal—five; American Baptist—nineteen.¹⁰ These figures indicate that the Protestant churches serving Mexican Americans are small in size and that the total number of members involved is small.

Puerto Ricans

The fact that Puerto Rico is predominantly Roman Catholic in religious background is well known. It is reported that probably 80 per cent of the island population would say they were Catholic if pressed with the question of religious orientation. However, most recent observers note that perhaps 20 per cent or less actually practice the public and obvious manifestations of the Roman Catholic faith.¹¹ It is estimated that at least 10 per cent of the population of the island could be characterized as Protestant. Protestantism has been on the island for about fifty years. Protestant denominations are working in 522 areas of service on the island; 413 of these areas are identified as rural.¹²

Puerto Ricans bring their religious traditions to the mainland with them, but some observers believe that a larger proportion of Puerto Ricans in New York City than on the island do not

have an active relationship with the Roman Catholic Church.¹³ However, many Roman Catholic parishes serve the religious and social needs of Puerto Ricans. But the report *Midcentury Pioneers and Protestants* says:

In summary, it would seem fair to say that few Protestant churches established in communities into which Puerto Ricans are moving have made an attempt to welcome the Protestant Puerto Ricans. Few churches have reached out to help the newcomers in their adjustment process. Even fewer have attempted to evangelize the Puerto Ricans.¹⁴

The few English-language Protestant churches that do serve Puerto Ricans offer activities designed to integrate them into the congregation, such as released time religious classes, Scout troops, athletic leagues, forums, and other types of leisure-time and recreational activities. Some churches conduct worship services in Spanish at various times and a few churches have Spanish-speaking staff members.

The report mentioned above established the existence of 181 non-Roman Catholic Spanish-speaking churches in New York City in 1953. Some information was gathered about 169 of these churches. Ninety-two of the 169 churches were identified as Pentecostal; thirty-eight were conducted by Protestant denominations; thirty-four were independent; and five were connected with New York City Mission Society. Ninety-six of the 169 churches which returned completed questionnaires reported 9,965 church members of which 8,239 were said to be active. The average total number of members per church was about 103 and the total average attendance at the main Sunday Worship Service was about 102. Seventy-one of the ninety-six churches reported memberships of less than one hundred each and forty of the seventy-one had member-

¹³ *Ibid.*, p. 10.

¹⁴ *Ibid.*, p. 14.

ships under fifty. It should be pointed out that three of these churches had more than three hundred members and three others had more than five hundred members. However, seventy-nine of these churches are completely self-supporting and forty-five have full-time pastors. The number of these churches appears to be growing. Seventy-one of the ninety-six churches were organized between 1940 and the first six months of 1953.¹⁵ Most of these churches are small, but they are self-reliant and active institutions.

The case of the Mexican Americans and the Puerto Ricans seems to indicate that neither Roman Catholics nor Protestants have developed an effective strategy for working with these groups. Yet it must, in fairness, be said that there is awareness of the need for such a strategy, and interested church groups are grappling with the problem.

American Indians

Both Roman Catholic and Protestant churches have conducted missionary activities among American Indians for a long period of time. In 1951, thirty-six Protestant denominations were doing mission work among these people. While there are no reliable statistics, it is estimated that there are between 65,000 and 70,000 Protestants and about 95,000 Roman Catholics among American Indians. In addition to meeting the spiritual needs of these people, this work has concerned itself with their social, material, and economic problems. These missionary programs have been concerned with education, family life, land problems, economic development, health, and work with American Indians to achieve responsible participation in community life on and off the reservation. This has required a great deal of adaptability because American Indians vary from those who occupy

prominent places of leadership in American society to those who lead a very primitive tribal existence.

Of the 400,000 persons counted as Indians in the United States about 300,000 live on or near reservations. Much of this land has a low productive potential and with the increasing Indian population, it is unable to support the people who live on it. This suggests an important recent development among American Indians. Indians are leaving the reservations, some for work as agricultural migrants and others for jobs in urban centers. The movement of Indians to urban centers has become more pronounced since World War II. This movement flows into cities such as Minneapolis, Minnesota, Rapid City, South Dakota, Chicago, Illinois, Salt Lake City, Utah, and Los Angeles, California. Migration to urban centers confronts Indians who have lived in rural areas with the problems which are connected with adjustment to urban life. Problems such as employment, housing, and the use of community services and facilities are often compounded by the strangeness of the city and in some places by discrimination against American Indians.

The churches, both Roman Catholic and Protestant in many cities, have recognized the need to help American Indians adjust to and become a part of church and community life in urban centers. The result is that they have established programs to work with other interested community agencies to accomplish this.

Chinese

The United States Census of 1950 reported 117,629 Chinese in the United States. The estimated total for 1958 is 135,000. Rose Hum Lee says:¹⁶

¹⁶ Rose Hum Lee, *The Chinese in the United States of America* (Hong Kong: Hong Kong University Press, 1960), p. 278.

¹⁵ *Ibid.*, pp. 10-22.

¹⁰ Bureau of Research and Survey, *Missionary Opportunity Among Spanish-Americans, Report on Local Church Questionnaires* (Mimeographed; New York: National Council of Churches, September 1959), pp. 1, 6, 9.

¹¹ *Midcentury Pioneers and Protestants—A Survey Report of the Puerto Rican Migration to the U. S. Mainland and, in particular, A Study of the Protestant Expression Among Puerto Ricans in New York City* (Mimeographed; New York: Protestant Council of the City of New York, March 1954), p. 3.

¹² *Ibid.*, p. 2.

The Chinese brought with them no organized religious system per se, but they imported a complex blend of traits selected from two ethical systems—Confucianism and Taoism—as well as some religious practices identified with Buddhism.¹⁶

The Protestant home missionary movement started work among Chinese about 1853. The Roman Catholics started work in San Francisco about 1900. San Francisco today is the largest center of Catholic activities among Chinese. Roman Catholic missions were organized in Philadelphia in 1939, Chicago in 1941, and New York in 1949. By 1952 there were sixty-two Protestant Chinese Churches and missions and six Catholic Churches and missions. It is estimated that there were about 6,000 members in the Protestant Chinese Churches and about 3,000 in the Catholic Chinese Churches. This, of course, does not represent an accurate picture of the number of Chinese Christians because many Chinese attend churches which are predominantly white or interracial in membership.

In addition to religious services, the Roman Catholic centers conduct a social program to meet the needs of Chinese people—English classes for adults, parochial schools for children which sometimes supplement their courses with studies in Chinese culture.

A study of the sixty-two Protestant Chinese Churches in 1952 shows some of the characteristics of these churches.¹⁷ Forty-three are denominational, five are interdenominational, and fourteen are independent. Twelve are self-supporting groups; twenty-six receive some aid from denominational mission boards; fifteen depend entirely upon, or receive the major part of their support from mission boards; and seven are small

groups with limited programs. The average Chinese Church has 155 members with the range running from less than fifty members to over one thousand. The average budget is about \$5,260. The data on membership indicates that some of these churches are growing in size and that there is a higher proportion of young people among Chinese church members than among non-Chinese church members.

The history of Protestant mission work among Chinese reveals continuing interest in the adjustment of Chinese to American life and in combating discrimination against Chinese. This interest continues. In addition to normal programs which are carried on by churches, the Chinese church appears to emphasize work with young people and pastoral counseling. Many of them maintain classes for those who wish to learn English as well as classes in Chinese language and culture. In this connection it might be mentioned that there is a trend toward the increased use of English in these churches. Possibly this might be due to the increasing influence of American-born Chinese.

INTEGRATION IN THE CHURCHES

The previous discussion has considered the churches among racial and ethnic minorities. In a sense, this is testimony to the fact that these groups are separated in varying degrees from the main body of the churches. The concern about the elimination of segregation from religious institutions has been mentioned. The positive goal is the inclusion of persons in the congregation and the activities of the church or church-related institution on the basis of religious commitment without regard to race or ethnic origin. The churches are taking positive steps in this direction. Space does not permit more than mere mention of some of the highlights of this development.

The Roman Catholic Church has been clear and forthright in its policy that racial segregation is contrary to the teachings of the Church. On this basis it has moved forthrightly to eliminate it from the local parishes, parochial schools, and church organizations where it exists. Hundreds of Catholic parishes have members of all races in their membership. Catholic organizations, such as the Catholic Interracial Councils, the National Federation of Catholic College Students, and the National Catholic Welfare Conference have made major contributions toward improving race relations both within the Church and in the community.

The National Council of Churches and most of the major Protestant denominations have adopted statements either renouncing the practice of segregation in the churches or affirming a ministry which is inclusive of all people regardless of race or ethnic origin who desire to participate in a particular church or church-related institution.

These statements have provided the basis for the achievement of integration of national and regional church organizations. Significant integration has taken place in councils of churches. Racial minorities are integrated in the organization of the National Council of Churches. This is true also in state and city councils of churches, even in states where segregation is enforced by law. Several of the predominantly white denominations have moved to eliminate racial segregation from their national and regional organizations. Several are currently grappling with the problem. The Negro denominations face the problem of integrating white people into their organizations. A number of denominations with predominately white membership are carrying on various types of programs aimed at the elimination of segregation in local churches and church-related institutions. While many

Protestant church-related institutions have always been open without regard to race, there are numerous instances of others which have in recent years adopted and pursued policies of inclusive service to all people. However, it is widely acknowledged that much more progress must be made.

The local church has presented a difficult problem, but even here there is movement. While there are no reliable figures on the total number of Protestant churches which have members of more than one race, recent studies by denominations indicate they are increasing in number. While the figures of the denominational studies are not comparable, they would seem to indicate that possibly 10 per cent of the Protestant churches have members of more than one race and that most of these churches are located in urban communities where people of two or more races live together. To be sure, the percentage is small, but it involves hundreds of churches, and it is significant because movement among Protestant churches appears to be in the direction of integration.

CONCLUSION

It seems clear that a major function of the churches of ethnic and racial minorities is to serve the religious and social needs of their people. This function is shaped and reinforced by ethnic and racial discrimination, which is a dominant factor influencing every aspect of the lives of people belonging to these minority groups. Their aspirations are an influential factor in shaping the goals toward which these churches work. The church programs are determined to a large extent by the problems and needs which confront ethnic and racial minority peoples. These churches are dynamic in that they are affected by social changes such as mobility and urbanization as well as the increasing and imperative demand for full participation

in community life on the basis of ability without regard to ethnic or racial background. There is evidence that this in turn has affected the expectations of people about the role or roles of the churches in meeting the needs of people who face the necessity of adjusting to these changes.

The very existence of churches which serve people belonging to a particular ethnic or racial minority group is, in a sense, a testimony to the pervasiveness of racial segregation in our society. It is clear that segregation based on ethnic or racial background is a major problem confronting the churches. At the same time, many people in the churches recognize that this is a basic contradiction

of Christian principles and teaching. In recognition of this, there is a movement to eliminate segregation and to achieve inclusive practices in all areas of church life. While the churches face the responsibility of taking increasing initiative in accomplishing this, it must be recognized that desegregation and integration of the churches is related to desegregation and integration of the total community. For instance, many churches find that racial segregation in housing makes it extremely difficult, if not impossible, to achieve integration in fact in the churches. Therefore, the churches face the challenge to work for the elimination of segregation from every aspect of American society.

Sects and Cults

By MARTIN E. MARTY

ABSTRACT: Sects and cults constitute a third Christian force, in addition to Protestantism and Roman Catholicism, in contemporary America. Sects are particularist groups with a basically negative orientation. Cults tend to be positively oriented and to be organized around a charismatic leader. Any discussion of the various religious groups in the United States must take into account the differences in context, rather than the differences in content, between them. Religious context largely determines whether or not religious groups are in the mainstream of historical development. The principal distinction between sects or cults and denominations is that sects or cults are established to achieve the spatial and psychic context of isolation. The denominations currently adapt to middle-class beliefs and values. The sects and cults are uneroded, unexposed, intransigent, and withdrawn. They provide a haven from social interpenetration and complexity. They do not wish to be assimilated into the mainstream of religious thought and practice. The sects and cults, in almost every particular, provide a counter current in the mid-twentieth century religious revival.—Ed.

Martin E. Marty, Ph.D., Chicago, Illinois, is Associate Editor of The Christian Century and the minister of the Lutheran Church of the Holy Spirit in Elk Grove Village, Illinois. He is a writer and artist on the staffs of several religious periodicals. He is the author of A Short History of Christianity (1959), The New Shape of American Religion (1959), "A Dialogue of Histories" in American Catholics: A Protestant-Jewish View (1959), and other books and articles.

THE conventional tripartite division of American religion into Protestant, Roman Catholic, and Jewish has been widely criticized for its neatness and its limitations. The Eastern Orthodox churches obviously do not fit into any of the divisions. There are millions of Americans who either adhere to a great world religion other than Christianity or Judasim or profess a secular religion of humanism or ultimate devotion to democratic processes. This six-fold division still does not do justice to the inclusiveness of organized religion in America. A large and growing cluster of denominations and forces, most of them of Christian orientation, do not find recognition within Protestantism nor do they wish to be numbered with classic reformed churches.

THIRD FORCE

This cluster, which we here refer to without derogation as sects and cults, has assumed sufficient proportions for the president of a large interdenominational seminary to call national attention to them as being a "third force" in Christianity in America. The first two forces, of course, are Protestantism and Roman Catholicism. President Henry Pitney Van Dusen—in the interest of a theology centered on witness to the Holy Spirit—is surprisingly positive in his regard for this force. He finds it primarily in the "Spirit-centered" churches, that is, the Pentecostal and Holiness bodies.

The current growth and fluidity of pattern among these sects and cults runs counter to many of the major trends in the revival of religion which has followed the Second World War. These groups have made it necessary to alter the conventional ways of thinking about churches as institutions in order to understand the appeal and classification of religious feeling to which the sect is a response. Traditional cate-

gories still are useful but they fail to account adequately for the context in which sects and cults appear today.

THE MAINSTREAM

The first and most obvious observation about the sects and cults is that they do not conform. A survey of the twelve major histories of American religion or American Protestantism—from Robert Baird in 1844 to Jerald C. Brauer in 1953—confirms suspicions garnered from less disciplined reading: historians and sociologists as well as laymen have evolved certain ways of classifying American religious groups according to whether or not they belong to the mainstream of the nation's experience. The categories do not always follow the lines one would expect. "Stream" is not a static category, and groups once in the mainstream at another time may be out of it. "Mainstream" is Ralph Henry Gabriel's term, but it is matched by Leonard Bacon's distinction between groups only "incidentally connected" with the history of American Christianity and others which are organically connected. William Warren Sweet, the dean of modern historians in this field, speaks of "indigenous" and of "typically American" churches. Andrew Drummond spoke of "Americanized" and "definitely American" churches. Each lacks precision in defining the mainstream, but all twelve remarkably agree on what belongs in it.

Statistical data, for example, do not explain the place of denominations in the mainstream. Many mainstream groups are no larger than the Pentecostals, but the Pentecostals do not belong. Never in American religious history has size, that most American form of measurement, explained the national significance of a religion. Roman Catholicism, Lutheranism, and continental Reformed groups were of relatively immense size before they came to

be accepted in the mainstream. Similarly, attempts on the basis of polity to distinguish denominations that belong from sects and cults which do not belong have been unsatisfactory. Episcopalianism has been considered by many historians, particularly in the past, to have a nondemocratic polity. Methodism also has been seen in this light. But both were considered to be as much a part of the American scene as were the Baptist and Congregational bodies.

Class distinctions provide some explanation, just as they have in classic writing on sects. But while membership in denominations might vary along classic economic and social lines from Episcopalian to Unitarian affiliation among the wealthy and influential classes to Methodist and Baptist affiliation among the lower classes, lower class identification did not by any means exclude a body from the mainstream, certainly not since the age of Jackson. The churches which historically served the disinherited and uninfluential elements in society might still be in the mainstream. Theological generalizations, references to the substance and the content of the faith, provide almost no help in forming a generalization, although a century ago the evangelical bodies were squarely in the mainstream and the bodies which were not evangelical—Roman Catholic, Universal, Shaker, socialist—were insecure.

CONTEXT, NOT CONTENT

The approach which this article takes to the position of sects and cults in the present scene is that factors other than those which classically have determined ecclesiastical institutional life are operative in America. Internal conditions, matters of content, are of secondary importance. The degree of religious comprehension in the lives of adherents, the claims made on their devotion, the tenacity with which they hold the

church's tenets, the theological acumen, the richness of worship, all factors that are important in generalizing about most of historical Western Christendom, are secondary in American life. Instead, certain external conditions, matters of context, are of primary importance.

In this light, new distinctions emerge which help in the present task of understanding sects. There have been historic transformations. Until the modern period of realized pluralism, national origin was significant; to be of Anglo-Saxon provenance was of great help. Thus, a review of American churches in 1836 by Reed and Matheson provides the clue:

Blot out Britain and America from the map of the world, and you destroy all those great institutions which almost exclusively promise the world's renovation; but unite Britain and America in energetic and resolved cooperation for the world's salvation; and the world is saved.

Conversely, less than a century ago historian Daniel Dorchester could speak of Germans and Irish immigrants as having . . . low habits and ideas, retaining supreme allegiance to a foreign pontiff, or controlled by radical, rationalistic, materialistic, or communistic theories. . . . Can religion and morality endure the severe strain and the virtue and intelligence of the people be preserved?

Needless to say, these ethnic distinctions have largely disappeared.

Other almost mystic accidents of national history contribute to uncritical historical generalizations on the location of denominations. Historic identification with the religion of New England guaranteed a place to bodies like the Congregationalists which saw their relative size diminish but their symbolism on greeting card covers offer a guarantee of security. Identification with the struggles of religious liberty and voluntarism stood Baptists, Quakers, and some others in good stead. Participa-

tion in the major movements of national religious life—expansion through the frontiers, the involvement in successive great awakenings or revivals of religion—enhanced denominational claims.

The result of the foregoing for the discussion of sects is this: Americans tend to classify denominations in relation to their typical or mainstream status by a set of subtle contextual norms. Most of them revolve around the dialogue of American churches with their environment. The more exposed a group has been or becomes, the more its claims are eroded by its place in a pluralist society, the more it has been seen in harmony with main themes of national history, that much more does it belong. The more isolated, intransigent, withdrawn, the less exposed and eroded a group has been, no matter what its size and influence, the less it has come to be regarded as a normative religious expression for America. The largest remaining body of unexposed believers belong to what is known as sects and cults, and they can best be accounted for and located by this approach.

PARTICULARISM

Why are sects and cults of third-force Christianity and its fringes growing so rapidly today? What is their reason for existence? What part will they play in the future? These questions raise theological and sociologically perplexing problems. The widespread observation that ideologies are being diffused and even buried today—as argued by Daniel Boorstin and Daniel Bell—in politics, philosophy, and religion, is countered by the spurts of energy and growth of religious groups who make much of their different and, sometimes, completely esoteric systems of belief. The tendencies to homogenize religious beliefs and groups, so ably chronicled

by Will Herberg, William Lee Miller, Stanley Rowland, G. Roy Eckardt, and others, seem relevant until one encounters the growing sects and cults. The temptation of Americans to cancel the varieties of religious experience and institutional options with apathy—probably as a reaction against bewildering evidences of pluralism and competition of claims—is evident and can be documented. People are identified with religious institutions, but they lack apparent conviction or passion. Yet the sects and cults refuse to participate in this oversimplification of a pluralist heritage. They noisily assert their particularities even at the sacrifice of participation in inclusive American religious institutional *Gestalten*.

These basically religious considerations disturb those who try to classify nonmainstream sects and cults, but sociological factors further complicate the picture. Social historians depict the affluent society as one in which the masses have attained the historic status and have acquired the historic values of the middle classes. America has become, in its prosperity, a panmiddle class society. Its religions, no matter what their historic origins, tend to take on appropriate characteristics. The obvious examples would be the lavish institutional outlays of the large urban Southern Baptist churches in which a plush setting and the current technological devices serve groups which derive their historic warrant for existence from their disinherited positions. Yet the sects and cults are not dependent on middle class inclusiveness, and even where they succeed amidst relative prosperity, they do so without vital contact with the culture. Since World War II, the normative growth of American denominations has come about through their easy and uncritical identification with suburban value systems. Yet the sects and cults are not dependent on the

situations which make mere belonging to religious organization so attractive.

Thus, paradoxically, the sects and cults show most remarkable growth in a period during which most documented social and theological factors and events seem to contradict their claims. This necessitates revision not only of historical observation but also of sociological classification. So significant an exception to the rule, while it may prove the rule, may also enlarge the definition of the rule. The late twentieth century conceptions of mainstream American denominations must be related to non-typical sects and cults.

SECT AND DENOMINATION

"Sect," in this context, is obviously not a translation of "denomination." One guide in the perplexing problem of locating sects today has been that "sect" has become a less satisfactory term for denoting what should be called, neutrally, "denominations." When the obsolete terminology appears it tends to be used by organized antiorganized-religion fronts or is used thoughtlessly. When *Life* magazine in 1957 referred to the Congregational Christian and Evangelical and Reformed bodies as sects, reaction was instant and significant. In our classification, the term is used without any sense of patronization or derogation. It is used in relation to groups which would readily accept some term to set themselves off from the typical or mainstream denominations which desire to be part of the nation's *mores* and its *ethos*. This does not mean that the sects in question want to be thought of as partial; ordinarily they do assert catholicity or wholeness; their witness is seen to be the hope of a rejecting world. But asserting this witness necessarily involves separation from other witnesses, and this separation is at the basis of the term "sect."

DRAMATIC GROWTH

It is not important or possible here to shed new light on the quest for statistical precision in discussing the non-mainstream groups. Statistics are, at best, relative; they are notoriously slippery when provided by religious groups. The quest is further complicated by the dynamism of sect growth and change—the process of fission seems to be part of the essence of sect life—and by the fact that many sect and cult statistical summaries are kept secret. Finally, for strategic reasons, sects may feel called upon to exaggerate their size at moments when growth enhances a claim or to exaggerate their diminutiveness at moments when smallness seems to substantiate the theological and ethical correctness of a group's concerns. Suffice it here to say that the smaller sect-type bodies are, for the most part, experiencing dramatic growth against the pattern of middle class church identification. And economic support for the isolated groups is disproportionately higher than is that of the more prosperous, settled churches. Yet the marked and perhaps nervously exaggerated growth of Dr. Van Dusen's third force is not a necessary factor in the need to account for its presence: the mere fact of survival would occasion this quest.

SECTS AND CULTS

The thesis here is that negatively-oriented sects gain their current attractiveness from their attempt and relative success at isolating people from competing value systems; and that positively-oriented cults, usually gathered around charismatic persons or clans, succeed to the extent that they provide surrogates for interpersonal relations or attachment to significant persons in an apparently depersonalizing society. To the first group would belong sects like

the historic Adventist bodies, some of the Churches of God, the primitive bodies, the Jehovah's Witnesses, the Pentecostals, the Assemblies of God, and other eschatological groups; to the second would belong the cults which offer substance in place of meaning. Among them would be the Peace Mission Movement of Father Divine; the "I Am" Movement, in some respects, the Oxford Group Movement; Unity School of Christianity; Theosophy; New Thought; and others.

The sects with an essentially negative orientation to the world were originally and in a different society organized around charismatic leaders, but they are not dependent on charisma for survival. A philosophy of history and an anti-world context are basic for them. The cults with an essentially positive orientation to the world and to material or substantial values need the presence of the charismatic leader, and they often flounder in the absence of charisma. Since the latter group, apart from fanatic devotion to the person of the founder, takes on characteristics of mainstream American religion in its substantial offers to a prosperous society, it is not necessary to account for them as an exception, and they will receive further consideration only when they illustrate the quest for surrogates for personality. It is the sect, then, that concerns us, and the cult concerns us only as it partakes of the character of the sect.

THE SECT PHENOMENON

"Sect" is etymologically closely related to what we are here calling "cult." That is, it does not derive from the Latin *secare*, *sectum*, to cut, as is commonly thought, but from the positive *sequi*, to follow. It should refer to "a group having in common a leader or a distinctive doctrine . . . a following," according to Webster's *New Interna-*

tional Dictionary. But origins do not explain present significance, and history and sociology displace etymology. The dictionary continues, "In religion, the believers in a particular creed, or upholders of a particular practice; . . . a party dissenting from an established church. . . ." This definition is of some use if we recall that establishment can belong as much to *ethos* and *mores* as it can to legal sanction.

The amiable neutrality of this definition has been displaced by attempts to establish "sect" as a distinct and distinctive category from "church" or even "denomination." The decisive and still most creative work in this respect, whatever its present-day limitations, has been done by Ernst Troeltsch and Max Weber. They describe the sect as essentially a society established by contract as opposed to the institutional and "natural" or organic ecclesiastical body. As they point out, success is one of the hazards of sectarian life, and many historic sects, in this sense, tend to take on the character of churches as they establish themselves in society. This is true of Baptist and Congregational bodies in the Old World which came to predominance in the mainstream of the New. Weber and Troeltsch account for this in part by the quieting of religious fervor in the second generation, although a variety of political factors also play their part in post-Revolutionary developments. Troeltsch and Weber leave us in their debt for their attempt at isolating the meaning and historic purposes of sects. H. Richard Niebuhr produced the classic American work, *The Social Sources of Denominationalism*, written at a time when economic and social considerations played a much larger part than they currently do in theological setting. He stressed genesis and entry. One is born into the church, a "natural social grouping," but he must join the sect. The church is the auto-

matic way for the individual to be located in religious society; the sect is the outlet for self-determination against the grain of religious or secular society. There are limitations to Niebuhr's distinction. People constantly are joining churches, and members of sects bear children into the sect. This led Niebuhr to point out that in the decisive sense a sect lasts only one generation. The deficiencies of Niebuhr's helpful work are apparent in the prolonged image of certain sects across the centuries and in the resuscitation and revivification of certain undying sectarian impulses whether they be of the classically negative sectarian or normatively positive cultic varieties. The Montanists illustrate the negative and the Gnostics illustrate the positive aspects of the tendency to recur. Ellsworth Faris, in *The Nature of Human Nature*, pointed beyond these definitions, but he did not fully develop the perceptive notion that the contemporary significance of such groups is their isolation in a modern world. A fourth useful and illuminating approach was Howard Becker's designation of the "ecclesia" as a compulsory group and the sect as a voluntary group. A denomination, according to Becker, is a sect in its later generations, and cult is personal, quasi-mystical religion. Joachim Wach made original contributions to the study of sects, particularly in the development of the idea that sects originate during times of change or collapse in old orders. Finally, Dietrich Bonhoeffer, in his sociological study of religion, made a point that in content there was no essential difference between church and sect. This leads us to pursue the contextual question for the illumination of sect and cult bring to settled denominationalism. Rather than concentrate on many of the enduring features—charisms, emotions, positive and negative aspects, and so on—it is profitable in this limited context to stress

one factor that accounts for sect importance today.

To isolate this factor it is necessary to develop a construct by which our whole society can be viewed.

SECTARIAN ISOLATION

One fruitful approach is the distinction between a society which can be described in diagrammatic terms and one dialogically defined. Or, to borrow the acute observation of the Jesuit scholar Walter J. Ong: spatial metaphors are largely obsolete for depicting current forms of community and communication; interpersonal metaphors are decisive. The importance of the sect in what Faris calls its isolation will emerge against this setting.

All the spatial pictures—ward, ghetto, sector, valley, and, in its static sense, parish—are obsolete or becoming obsolete as approaches to the nurture of religion in a free society. Only a coercive society can depend upon spatial images and the realities to which they point for nurture of ideology. The sect can be seen as a quasi-voluntaristic reaction against the erosion of spatial settings. What accounts for the change? When "inner direction" and "tradition direction" were real possibilities, the diagrammatic way of looking at the human community was feasible. People lived in physical and psychical independence of one another. Truth could be sustained and perpetuated by reference to the whole, local, undisturbed community.

Almost every documented feature of what it means to live in the modern world militates against perpetuation of the spatial relation. Population growth has removed both actual and psychic distance between peoples who hold to different ultimate or even proximate value systems. The extreme mobility of modern life brings people into new contact both in their geographical, hori-

zontal movements and in vertical class adjustments. Men have long known nomadism, but nomads of today move not as clans but as individuals; they do not carry community religious patterns with them. Transportation advances, the juxtaposition of ideologies, and, most of all, the interruption of all spatial illusions and realities by instantaneous, efficient, and total means of mass communication render the diagrammatic approach impossible as a permanent strategy. That this interruption has obvious assets is clear. Few modern men would ignore or undo these factors of modernity. At the same time, much restlessness, rootlessness, and anxiety have come to light in recent years.

Religious groups in America, particularly the mainstream groups, provide little buffer against the jostling which the interpersonal world has brought. Denominations which adapt and conform to the value systems of a middle-class society become the captives of it; their distinctiveness erodes and their particularity is muffled. This means that anyone who seeks refuge from easy identification with a casually this-worldly religiousness must move in one of two directions.

One possibility is for him to accept a religious constellation which in part affirms the world and tells him that not all the stimuli he receives from his environment are harmful to his religious development. This amounts to agreeing that his milieu is, after all, God's workshop. And that dialogue with the environment can be a revelatory and redemptive experience. Many of the most noted Christian theologians are seeking to prove the truth, or Biblical warrant, of this position. Nurture, however, remains complicated in such a setting; theology must be transferable and almost, we might say, portable. It

is easy in such a conjunction of religion and world to see rapid dissipation of religious energies and relapse into unsatisfying identification with the restless contemporaneity which the individual sought to escape.

The sectarian possibility is for the individual to seek a group whose philosophy of history contradicts the existing values so dramatically that the group sustains itself at least through a generation. The comfort, the appeal, and the sanction of the sect, in this instance, are that it provides surrogates for insularity through apparent psychic if not always possible physical distance from worldliness and competing systems. The sect provides the illusion and sometimes the reality of a buttress against encroaching and eroding forces which contradict personal beliefs. The sect organizes itself, if not in physical spatial contradistinction from other groups, at least in psychological distinction and distance.

Thus, modern sects remain segregated in varying degrees with little contact beyond their own organization. This is unlike almost all other social groupings today where a mass society creates an apparent availability of prosperity to all. The sects sometimes actually are nomadic, preserving community by moving. A Milwaukee fundamentalist group followed its pastor to the southwest. Some sects achieve isolation by walling themselves in. An extreme apocalyptic cult in Arizona did this. Ordinarily, mass media of communication are criticized and motion pictures, picture magazines, and television barred by a sect because of their dialogical interruption of temporarily sustained barriers. The consciousness that the group's philosophy of history runs counter to all that the world and established religious groups offer helps cultivate the feeling of isolation.

AUTHENTIC SIMPLIFICATION

One of the obvious appeals of the sect in the modern world is comparable to the appeal of monasticism. Despite the fact that both set high standards and that the calling makes demands of discipline, rigor, or Puritan zeal which would be unattractive to the hedonistic escapist, both sectarianism and monasticism provide authentic simplifications of an overly complex society. In this sense, sectarianism is a form of escape from complication. For some sects this may eventuate in a prideful relation to those outside; for others it develops an authentic humility and spirit of service which motivates missionary activity and seeks to serve those who do not and will not conceivably become part of the nurtured system of values. One thinks here of the historic peace churches insofar as they retain characteristics of the sect type. The cult in our usage differs in that it depends upon some withdrawal and isolation in order to offer not less but more in the middle of the world. Through esoteric and mystic approaches, substance is proffered instead of sacrifice being solicited. The cult offers some escape through attachment to the charismatic person at a time when a dialogical, interpersonal society tends to level and plane personality.

No attempt has been made here to account for the authentic religious vision in sects or even in cults. This is not because the vision is to be downgraded, but because it falls beyond the scope of social analysis. One authentic appeal of the sect is that it provides authority and usually a coherent system of beliefs and hopes, an attraction that cannot be denied in a time of confusion. But this appeal becomes important here only for the way in which it is sustained and nurtured: in prolongation of relative isolation.

THREE CONTEXTS

In the period before Christendom emerged as the entity which expressed interpenetration and interpermeation of church and world, symbolically until 313 A. D., the sect provided Christian distance from a pagan world, as in Montanism. In the period of Christendom, symbolically until the later eighteenth century, the sect provided Christian distance from establishment and complaisance, as in Waldensianism and Albigensianism. In the period of post-Christendom, the sect provides religious distance from religion. It displaces all philosophies of history and all leaderships but one. It is not difficult for the sect, as it relates to the Christian doctrine of the Holy Spirit, to claim primitive warrant for what it is doing. Most sects do this. It can point to an authentic prototype in early Christian discipline. The theological question as to whether or not the sect is adequate in the post-Christendom constellation is basic to the choice people in a Christian culture make between church and sect.

Will the pressures of life in a society where the spatial metaphor seems doomed by the factors essential to modernity also doom the sects? If the factors themselves dissipate, sectarian impulses may be prolonged. If the ideologies of the sects prevail, the impulse will be transformed, perhaps into churchliness. If a sect could attain coercive powers in a community, it could nurture life based on the diagrammatic assumption. None of these three possibilities seems worthy of serious speculation to anyone outside the sects. Yet the sectarian impulse, having survived in the West in at least three basic concatenations of circumstance, would, no doubt, erupt in surprising and durable new ways. There seems

to be a need in the hearts of many religious people for the preservation of distance from the world. In the present situation, the failure of communication between the sects and the churches doubtless contributes to the detriment of both. Yet the sects, with a calculation that goes beyond the rational to the profoundly instinctive, recognize that authentic communication means the beginning of the end of the diagrammatic or spatial construct they have succeeded in establishing or preserving in the contemporary world. Actual communication, in other words, could mean the death of the sect. The contribution of the sect to the larger society is, therefore, made best through the sympathetic observer who carries with him a picture of the advantages

of particularity and assertiveness back to the world of dialogical complexity. It is, no doubt, through the publicists of the third force that its force might be felt on Christians and other religious people who easily accommodate themselves to an existing culture. On this level of interaction the sects and cults become socially important to those they do not directly attract and serve. It is on this level, the level of the sect in the culture of a world where spatial and psychic barriers have been removed for most people, that the discussion of sect and cult could move beyond Weber, Troeltsch, Niebuhr, and Wach. The resulting discussions of nurture and discipline could be meaningful in the study of education, politics, and the arts and sciences in a democratic society.

The Ecumenical Movement

By ROSWELL P. BARNES *

ABSTRACT: The ecumenical movement is primarily the result of an internal dynamic arising from religious convictions, but it is also in part a response to social forces and historical developments. It is more inclusive than the major Protestant denominations in the American tradition and broader than the organizations which promote co-operation among the churches. The churches are not seeking to establish a monolithic church structure under centralized authority and control. The councils, in which they achieve order and at the same time maintain their freedom, may be suggestive to other institutions which desire to keep freedom and order in balance in modern mass society. Distinctions must be drawn between unity and uniformity, between agreement and mutual understanding. The community of interest among Christians rests primarily on common presuppositions derived from their faith. Intensive study of differences in doctrine and church polity improves mutual understanding and enlarges the areas of agreement. Participation in the ecumenical movement is changing the perspective of American churches with regard to national and world problems. Extensive association in international consultations and specialized agencies dealing with international affairs, in the missionary enterprise, and in interchurch aid and disaster relief corrects provincialism.

*Roswell Parkhurst Barnes, A.M., D.D., L.H.D., New York City, is Executive Secretary of the World Council of Churches in the United States and is responsible for the work of the United States Conference for the World Council of Churches. He was Associate General Secretary of the Federal Council of Churches (1940-1950); Executive Secretary of the Division of Christian Life and Work of the National Council of Churches (1950-1954); and Associate General Secretary of the National Council of Churches (1954-1958). He is author of *A Christian Imperative and Under Orders*.*

* The opinions expressed in this article are the responsibility of the author, and do not express the views of the World Council of Churches or of United States Conference for the World Council of Churches.

WHEN we consider the ecumenical movement in American society, we must constantly remember that we are concerned not with a national phenomenon but with an expression of a world phenomenon in a national situation. To speak of the American ecumenical movement would involve a contradiction in terms, for what is ecumenical is of the whole inhabited earth. In Christian terms, it is the whole Church in all its historical manifestations in the whole world.

The United Nations Educational, Scientific and Cultural Organization speaks of itself as ecumenical with etymological and factual justification. It is composed of, and concerned with, peoples—nations, races, cultures—of nearly all parts of the world. Ecumenical shirts and neckties have been advertised in New York papers; they are decorated with drawings of a wide variety of human types.

In general usage, however, the ecumenical movement is the trend toward unity among the Christians of the world. It has been associated popularly in America and elsewhere with the gravitation of Protestant and Eastern Orthodox churches toward a close community among themselves, notably during the last few decades. Since the Reformation and until recently, the trend had been toward division, magnifying the special tenets of faith emphasized by particular denominations. The ecumenical movement reverses that trend and focuses attention on the basic aspects of faith held in common.

But Protestants and Eastern Orthodox Christians do not limit the scope of the ecumenical idea or the movement to themselves. They recognize that in principle, and at some points in actuality, the Roman Catholic Church on the one hand and certain Christian groups of recent origin on the other hand are encompassed within an accurate use of the term *ecumenical*.

A distinction must be made between the ecumenical movement and its principal expression in councils of churches. The movement is much broader than its organized manifestations. It is a matter of spirit, purpose, and behavior. The World Council of Churches, which is its most obvious expression and instrument as it is popularly understood, is composed of 178 national church bodies in more than fifty countries. But it does not include in its membership the Roman Catholic Church, nor the Southern Baptist Convention, the Lutheran Church-Missouri Synod, nor the Pentecostals, nor numerous other smaller groups in this country.

However, there are Roman Catholics, Southern Baptists, Missouri Synod Lutherans, and Pentecostals who are committed to the cause of Christian unity and who co-operate with the churches in the World Council in the effort to bring it about. Most Roman Catholics maintain that the only possible unity would be that which would result from a return of all Christians to their Church. Some work and pray for unity as God may will, implying that a "return to Rome" is not necessarily the only way.

So wherever we find in this country a spirit and effort to further Christian unity in the whole world, in the nation, and in the local community, we find a manifestation of the ecumenical movement. The National Council of Churches of Christ in the United States of America and the 873 state and local councils of churches are committed to this purpose. When we consider the ecumenical movement, we have in mind the councils but much more.

INTERNAL AND EXTERNAL PRESSURES

Basically, Christian unity is a given fact derived from a common belief in Jesus Christ as God and Savior. It is, therefore, not created by men, but gratefully acknowledged and manifested.

It is furthered and developed by men as they progressively respond in obedience to what they believe to be God's will. Christ prayed for his followers of all time "that they all may be one." The ecumenical movement is essentially an expression of conviction, a matter of faith derived from biblical and theological authority.

But there are external contributing factors, some expediential, some inherent in historical developments. This is not to say that they are without theological sanction, for God works in and through history.

One of the important factors of expediency has been the need, recognized by missionaries in non-Christian cultures, to reduce competing and seemingly contradictory interpretations of Christianity which have made other people wonder whether there is really a Christian faith or only a variety of sects having their roots in some vague and remote common origin. The varying denominational emphases have made some sense in the West, which has understood their origins and their common basic faith, but they have made little sense in many parts of the world.

The need for making a common impact in the world, for aggregating and strategically deploying all resources, has been and still is an inducement to magnify common beliefs and to co-operate. The International Missionary Council has been serving this need for half a century. That Council will probably be integrated with the World Council of Churches in 1961.

In some lands of the younger Christian churches, and even more in the United States, the mobility of the population—including church members—is conducive to unity. Many Protestants join a church of a denomination other than the one with which they have been affiliated if there is none of their own in a community into which they move. Even if they can find one of their own

at a distance, they may join another because of convenience, the church program, the minister, its being the church of their children's friends, or other considerations.

Consequently, many a Protestant church has more members who came to it from churches of other denominations than who were always in its own denomination. It is inclined to try to make Christians raised in various traditions feel at home. Consequently it may not emphasize its peculiar traditions and beliefs.

Certain aspects of societal evolution have encouraged Christian unity. The world-wide alignments of interests and influences, consolidating ideological, military, racial groupings, have encouraged Christians to come together. The emergence of mass societies having mass media of communication and requiring large constellations of like concerns has made it almost necessary for church groups to co-operate.

In the United States, if it were not for the broadly representative National Council of Churches, there would be competition among the churches in radio and television broadcasting of religious programs. Government agencies would be seriously handicapped if they could not get information and advice on matters of concern to the churches from a few representative centers. Otherwise they would find it necessary to go to all the larger churches separately. From the point of view of the churches, co-operation has been desirable if not necessary to achieve satisfactory relations with the government.

FREEDOM AND ORDER

Circumstances have made it highly expedient for the churches to co-ordinate their interests and efforts for the purpose of achieving effective influence in the life of the nation. In the never-ending tension between freedom and

order in the institutions of religion as well as in those of political life, the nature of modern society encourages emphasis on the side of order.

From the time of the Reformation until recently, freedom had been magnified. A church could easily pursue its own course and a nation could live in isolation. But with the emergence of mass society and the alignment of political powers in the world community, isolation has become difficult and irresponsible in both religion and political life.

At the same time, there is a resistance to the trend toward order, because the order which had prevailed before the reformation swing to freedom had been maintained by centralized authoritarian control by an ecclesiastical hierarchy. And in countries where order has been achieved by a reformation church or an Eastern Orthodox church being "established" by the state with special privileges, freedom has frequently—though not always—been impaired. Our national tradition has been founded on a repudiation of order achieved by monopoly of any type.

Thus, while the churches have recognized the need for more order among themselves they have at the same time persistently cherished the notion of freedom. The ecumenical movement has sought to achieve unity without uniformity, and to maintain diversity without anarchy. In other words, it has resolved to keep freedom and order in balance.

The councils which the churches have set up serve this purpose. By voluntary association in the councils the churches achieve order and maintain freedom at the same time. They preserve their respective sovereignties without mutual hostility. They further co-operation without uniformity. They aggregate their resources for an effective impact

in mass society at the world, national, state and local territorial levels.

Achievements

The churches in the National Council have achieved a large measure of order in foreign missions, home missions, the allocation of time among themselves on radio and television. They have co-ordinated overseas relief and reconstruction, service to refugees, and church extension. They are gaining in concerted impact on social problems such as juvenile delinquency, interracial tension, and political corruption. They provide certain services through the councils which they could not provide at all or as well separately; for example, the production of the Revised Standard Version of the Bible, the nomination of chaplains to prisons, and the provision of worship materials for use in services on ships of the United States lines.

Thus in organizational structure, procedures, and methods of operation, the voluntary co-ordination of the churches is demonstrating how to keep freedom and order in balance in a democratic mass society. Many millions of church members, who are also citizens, are habituated to, and disciplined in, a pattern of relationships which in many respects can be applied to governmental and other community affairs.

In the early history of our country, the organization and group processes and disciplines of the covenant fellowship of the local church had a pronounced influence on community life. The national constitutional structures and procedures of the churches were reflected in the forms of government set up for the new nation.

Today the councils of churches, as institutional manifestations and instruments of the ecumenical movement, are demonstrating in the religious life of the nation a solution to one of the most

urgent and difficult problems of our society—maintaining a balance between freedom and order consistent with democratic principles.

Social responsibility

A basic contribution of the churches to the nation's life is still, as it was in the beginning, the cultivation of the disciplines which make the freedom of democracy responsible and safe. But in the contemporary intricately interdependent society, mass impacts, highly organized power groups, and the expanded role of government are conducive to large combinations under centralized controls. Individuals and small groups do not seem to count; their creativity, initiative, and discipline seem less important. There is danger that freedom and order get out of balance, the latter outweighing the former.

The churches have escaped the danger. Again, as at the beginning of our national history, they may influence the temper and the institutional patterns of our public life.

FACTORS OF RESISTANCE

A few individuals and groups—most of them never having had experience in the councils—fear that the ecumenical movement, by moving toward order, is moving toward centralized control and the impairment of the freedom of those who participate in it. They see large groups of people at council meetings and assume that some one must be trying to build a "super-church." This is a basis for opposition to the movement in some quarters.

Also, there is an inherent encouragement to denominational particularism in the movement. Association with others often accentuates emphasis on one's own particular tradition and doctrine. However, just as internationalism may be contributory to sound nationalism rather than to cosmopolitan-

ism, sound ecumenicalism may likewise be conducive to sound denominationalism rather than to a vague lowest-common-denominator religion. The Statue of Liberty has a strong emotional appeal to me when I pass it after a long stay abroad, but it does not lessen my sympathetic concern for the peoples with whom I have been associated. So the ecumenical movement does not dilute one's faith; it enriches it. But some who are not in it are not aware of this fact and therefore magnify their separateness in extreme isolationism.

Another factor in the opposition is a concept of the nature of Christianity and of the role of the church. There are some who regard religion as an extremely individualistic matter divorced from the problems of society. For them, the role of the church is to prepare souls for eternity by its rites and sacraments and to have nothing to do with public affairs. Inconsistently, however, these same people often insist that the church in a Communist-dominated country should challenge the ideology of the state and its political, economic, and social policies. The churches in the ecumenical movement are concerned with social problems.

Just as there are some isolationist nationalists who still live in the intellectual world of the nineteenth century, there also remain church groups of a similar mentality and social philosophy. They tend to associate themselves with sympathetic social and political groups in a determined effort to resist the march of history.

THE EXTENT OF THE MOVEMENT

Despite these and other separatist factors—some derived from misconceptions and others from variant beliefs—Christian solidarity is developing on all fronts in America. To estimate the extent of the ecumenical movement, it may be helpful to think of it in terms

of three concentric circles representing three steps of progression from the settled, organized core to the experimental frontier at the periphery, even though the lines are not definite or fixed.

Core groups

Within the first circle are the Protestants. They have much in common in tradition, theology, the concept of the church and the function of the church in society. They have been frustrated and disturbed in conscience by the competitiveness of their divisions and have had most experience in developing a pattern of co-operation. They have provided most of the initiative, leadership, and resources for the councils of churches in America.

The Protestant churches have largely eliminated their earlier stultifying fragmentation. There was a time when they could be characterized as "a congeries of contentious and contending sects." That certainly does not apply today. The Protestant churches as a whole can present a co-ordinated aggregate impact when they feel the need to do so.

Beyond co-ordination, Protestant denominations have been establishing more structural unity among themselves. There have been numerous mergers between denominations of the same "family," or general tradition and theological position. The Methodists formed one church composed of the former northern and southern churches and the Methodist Protestant Church. There has recently been one large Lutheran merger and another has been authorized. In the Presbyterian family, the United Presbyterian Church in the United States of America represents a merger of two denominations. Earlier, the Evangelical and United Brethren churches united. Well over seventeen million members have been involved in these unions.

Notable merger

But mergers have not been limited to denominations within a family. One of the most significant has been that of the Congregational Christian and the Evangelical and Reformed denominations, each of which represented earlier mergers. Those two denominations had different traditions and forms of government—the former had a decentralized congregational polity, emphasizing the autonomy of the local covenant fellowship; the latter had a presbyterian form of government, vesting more authority in a group of churches.

Through the Faith and Order movement, one aspect of the ecumenical movement, the churches are constantly attempting to work toward agreements on theological positions regarding the nature of the church and its doctrinal formulations of the Christian faith. On the basis of such agreements the churches could unite or at least manage some semblance of unity by, for example, recognizing each other's ministries.

National Council complex

The second concentric circle in the ecumenical movement in the United States includes Eastern Orthodox and other ancient Oriental churches along with the Protestant denominations. This grouping represents a wider variety of traditions, doctrines, and forms of ecclesiastical organization than is found among Protestants alone. There is more basic agreement among all Eastern Orthodox churches on matters of theology and forms of church government than there is among Protestant churches.

This wider circle marks the range of membership in the National Council of Churches and most of the state and local councils. Most of the program

activities of the councils reflect the desire for co-operation. However, they are giving increasing attention to faith and order studies. Theological discussion is lively and usually creative. At the present stage, progress is more marked in mutual understanding than in agreement on basic issues.

Need for knowledge

The distinction between understanding and agreement is of the utmost importance in analyzing the ecumenical movement. After a long history of isolation from one another, the first step in the development of Christian community is an understanding by each church of what the others believe and why they believe it. Without such knowledge, each may attribute to the others beliefs which the others do not hold.

Misunderstandings are conducive to estrangement, tension, and antagonism. As they are eliminated, or even reduced, the spirit of trust and fellowship develops. Some disagreements have been based on misinformation or misinterpretation; and even though other disagreements persist, they become less a source of irritation and more a cause of concern. Then the effort to achieve agreement becomes more intense and at the same time more relaxed. Contentiousness is eased by understanding and the discipline of close association in a common purpose.

It is possible, however, that the objective of co-operation may become so absorbing that the only agreement diligently sought may be that of achieving a united front for the sake of effective action in society and that little attention may be given to developing more basic unity. For this reason it is sometimes charged that a council of churches retards progress toward significant unity because the council is based on the assumption of the indefinite continuation

of the sovereignty and autonomy of the present separate denominations.

Current ecumenical frontiers

The third concentric circle marks the widest extent of the ecumenical movement. No one can measure its dimension, because its limit is determined by the spirit and purpose of people. It includes those people who may not be related to any of the councils or other organized expressions of Christian unity but who are committed to it in principle and exert influence toward the development of understanding and brotherliness among Christian groups. Many Roman Catholics share this spirit and purpose, as well as many members of Protestant churches which keep themselves separated from councils of churches.

One of the most important features of the movement within this widest circle is the improvement of communication between churches which have little close association and between individual leaders and members of such churches. Roman Catholic and Protestant theologians are meeting for joint discussions. Protestants, Eastern Orthodox, and Roman Catholics are studying each others' publications and exchanging comments. Serious dialogue is much more frequent than formerly.

It should be noted that this widest limit of the ecumenical movement does not reach beyond the bounds of trinitarian Christian faith. It does not encompass or seek to encompass all who believe in God in some way. It should therefore be clearly distinguished from religious syncretism.

Being strict about its basis of trinitarian faith and concerned about the theological and traditional differences which divide the churches, the movement is separated clearly from ethical humanism. At the same time, as the churches find greater depth and confidence in their faith through the ecumenical movement, they are becoming more

menical experience, they often become more co-operative with groups of other religious faiths, or with secular groups, in social welfare and civic improvement projects.

UNITY VERSUS UNIFORMITY

No simple and satisfactory answer can be given to the question, "What are the prospects for pan-Christian union?" If by "union" is meant one monolithic institution embracing all Christians under one ecclesiastical authority, the answer is fairly easy. It is certainly not possible in the foreseeable future, and probably not desirable ever. The World Council of Churches has disavowed it as an objective. It might be a reasonable theoretical objective of the Roman Catholic Church, but not of Protestants who believe in freedom.

Pan-Christian "unity" may be quite a different matter. In a sense, it exists now; for all Christians are one in certain essentials of faith. There is general agreement that this given unity should be more visibly manifested than it is at present. How it should be manifested is a matter of major discussion in ecumenical circles. The nature of the unity we seek is not defined; but for most persons in the ecumenical movement it lies somewhere between the present situation and one monolithic church. For some, the visible organizational expression of unity in a council of churches would be sufficient if all churches were included; for most, it would not be sufficient.

This author would state the confident personal judgment that the prospects are good for rapid progress during the next several decades in pan-Christian mutual understanding, trust, harmony, and organized co-operation in the pursuit of common social objectives such as peace, justice, and social welfare. Christian unity is a matter of both spirit and form. As it is achieved in

spirit, the possible and desirable forms will become apparent.

ECUMENICAL PERSPECTIVE

As the ecumenical movement progresses among the churches in the United States, their influence becomes more co-ordinated. The Protestant churches represent the predominant religious tradition and force in American life. Most of the major Protestant churches, along with the principal Eastern Orthodox churches, are associated together as members in the National Council of Churches. Thus they have the means to achieve mutual understanding, to define their common purposes, and to aggregate their resources in the pursuit of their agreed objectives. At many points churches which are not actually members of the National Council co-operate with the member churches in their programs.

The 50 state councils of churches, 42 with paid staff, and the 823 local councils, 226 with paid staff, also serve the churches in their respective territorial areas. They are all autonomous, being responsible to the church units which constitute them. Their constituencies are generally affiliated with the denominations which comprise the National Council, though there are variations. In many respects, their policies coincide with those of the National Council. There are also 68 councils of religious education which help to co-ordinate the work of the churches at some points.

Thus it can be seen that the visual impression of separate church buildings with different denominational names and various forms of worship and government does not provide an accurate concept of the organizational expression of religious life in this country. For voluntary co-ordination has achieved unity in many aspects of the impact of the churches upon the community.

The ecumenical movement has resulted not only in the development of new structures and procedures and the improvement of mutual understanding among our churches but also in a broader perspective of analysis and judgment. As a world-wide movement, it brings the churches of the nation into close association with those from varied settings facing a multitude of problems.

We Americans find fresh insight into the problems of our society when we compare notes with colleagues who face analogous problems in other situations—race, alcoholism, juvenile delinquency, mass communications, the urbanization of agrarian cultures, the power alignments of free-world and Communist interests, the functions of national agencies and of international agencies in Africa.

REFLECTIONS AT ST. ANDREWS

Let me be concrete. This article is being written between sessions of consultations related to a meeting of the Central Committee of the World Council of Churches being held in the ancient university at St. Andrews, Scotland, in August 1960. I talk with clergy and lay people in small scheduled groups, at meals, in the lounges, or walking on the campus, for minutes or for hours at a time. Many have been colleagues for ten or twenty years, some longer. A few are almost strangers.

Among the topics of serious conversation have been the present position of moderates and left- and right-wing radicals in several countries in Africa; the present situation with regard to apartheid in South Africa; the "teddy boys" of London and the youth gangs of New York; disturbances over race in England and the United States; the dynamics of present-day nationalism in Greece and Japan and its effects upon the churches; cultural trends in Spain; and the behavior, more than the results, of

the recent Democratic and Republican conventions in the United States. In all these conversations competent people fresh from the scenes of the problems are being questioned.

American national image

As seen from the inside, events often have quite a different meaning from what they seem to have as seen from the outside, but each view may correct the other. We Americans seldom stop to think how our conventions lend themselves to reporting by pictures, television, radio, and newspapers overseas. They are the most dramatic episodes in our national political process. They are interesting to other people. They make more sense to us than to outsiders; they are hard to explain to non-Americans. And the greatest distortions of American political life arise from the inevitable tendency for others to generalize from the spectacular incident. The more thoughtful and orderly aspects of an election year, being less newsworthy, less obvious, are not called to people's attention in other countries in such a way as to correct the impression gained from the conventions. Even so, it is good for us to see ourselves as others see us.

Ecumenical association corrects our own analysis of our own problems, our appraisals of situations in other countries, and our judgment as to our relations with other nations. Obviously, this observation applies especially to religious affairs and the particular concerns of the churches, which occupy most of our time at such ecumenical gatherings.

There are nearly 500 people involved in these exchanges of views at St. Andrews, including wives and husbands of some official participants, staff, and interpreters for the few who do not speak English. Among this number are more than 100 from all sections of the United States, most of them in positions of

national or community leadership. Some of us are here for four weeks. And this is typical of many similar occasions.

Extended effects

The accumulated experience of a large number of leaders in such associations is gradually having an effect on the world outlook and the political and social philosophy of the people in the churches and consequently on their influence in the nation.

The churches have also set up special organizations to deal with international problems. The Commission of the Churches on International Affairs, sponsored by the World Council of Churches and the International Missionary Council, relates the churches of many nations to one another for mutual advice and support and represents their common interests to the United Nations and other intergovernmental agencies. Its members are predominantly Christian laymen of experience and standing in dealing with world problems in public affairs. Its staff has special competence in its field of operations.

This world body helps to co-ordinate the interests and activities of more than twenty related national commissions, and more than 300 correspondents around the world. In the United States its primary channel of communication with the churches is the Department of International Affairs of the National Council of Churches. Some denominations and some local councils of churches have similar groups. Through the National Council's department, its member churches keep in touch with developments in American foreign policy and make overtures to the government when authorized to do so by the central governing body of the Council.

Understanding of the problems of the world is deepened both by normal ecumenical associations such as those at St. Andrews and by agencies dealing

specifically with international affairs. But there is something special about such associations. There are many world travelers who talk with people of many lands. There are many organizations which deal with world affairs. What is different about ecumenical associations and work?

Areas of agreement

Within the ecumenical movement people discuss and collaborate on the basis of a fundamental common faith. Although they do not agree on all theological interpretations of that faith, they do agree on many essential presuppositions. They have the same supreme loyalty to God in Christ. They have the same general understanding of the meaning of history under the sovereignty and redemption of God. They all regard nations as subject to the laws of God. They recognize all peoples as bound together in mutual responsibility. Therefore they are committed to seek peace, justice, and freedom for all within God's creation and concern. They share standards of moral integrity.

This is not a complete list or analysis of agreements, but it is sufficient to indicate why ecumenical association and collaboration are different from others and how they help to hold the world together.

American actions

In two other ways American churches are closely associated with other peoples. The missionary enterprise has aroused widespread interest in their circumstances and aspirations. Mission study groups in most churches acquire considerable insight and information. Missionaries from our country and leaders from the younger churches promote mutual sympathetic understanding.

Also, during the last several decades, but especially since World War II, American churches, along with those of

her nations, have participated in a vast program of relief, reconstruction, interchurch aid, and service to refugees, co-ordinated by the World Council of Churches. Some 75 million pounds of clothing have been collected here and distributed overseas. About 180,000 refugees have been resettled in this country by our Protestant and Eastern Orthodox agencies. The churches in the National Council are contributing about two and one-half million dollars a year through their co-operative program in Church World Service. Medical supplies and cattle, sheep, chickens and

a great variety of other material items are sent all over the world. This massive demonstration of concern for the welfare of other people has built up sympathy for their needs of all kinds.

We conclude, therefore, that in the ecumenical movement the American churches are making a more effective witness to their faith, providing a better ministry to a confused generation, and exerting a more helpful and relevant influence in the nation as it faces the hazards of unprecedented power and responsibility in an unstable and apprehensive world.

Current Trends in Religion—A Summary

By RICHARD D. LAMBERT

ABSTRACT: The decline in support for religion among the populace and the intelligentsia which marked the opening decades of the twentieth century has been reversed during the years since World War II. On the one hand, swelling church memberships have been accompanied by a bland popular piety. On the other hand, intellectuals have undertaken a challenging new era of revisionist theology. The supply of clergymen has not kept pace either with the increasing memberships or with the expanding functions of the churches. One result is the enhanced importance of the laity. The financial needs of the churches have induced them to approach ever more closely the methods and structures of business. The divisions between the various denominations on doctrinal and ethnic points have lost much of their relevance, and efforts at merger and unification have been productive. The splintering and growth of sects and cults continues.

Richard D. Lambert, Ph.D., Philadelphia, Pennsylvania, is Associate Professor of Sociology at the University of Pennsylvania. He is Assistant Editor of the *Annals* as well as special editor of this volume. His publications include *Indian Students on an American Campus* (1953), *America Through Foreign Eyes* (1956), *Religion, Economics, and Violence in Bengal* (1950), and numerous articles in professional journals.

THE purpose of the present article is to present in capsule form the main arguments and viewpoints which emerge from the fuller treatments in the earlier articles.

First, how many people are involved in church activity in our country? Table 1 presents data from the decennial census on the number of people who return clergyman as their occupation. It also contains a set of comparisons of the number of church members and the total population per clergyman and the proportion that clergymen represent in the economically active section of the population.

It will be noted that there was in 1950 one clergyman for every 507 church members and for every 881 persons in the population at large. The number of clergymen has not increased as fast as church membership, nor has it increased as fast as the general population or that portion of the population which is economically active. The increasing number of lay church members per clergyman is both a result of the increasing size of congregations concomitant with the urbanization of America and of the decline in recruitment for the ministry in the face of competition from other professions.

Table 2 contains the estimated changes in the number of people who are members of religious bodies for the same decennial census years.

TABLE 1—CLERGYMEN IN UNITED STATES, 1910-1950

CENSUS YEAR	NUMBER IN THOUSANDS	CHURCH MEMBERS PER CLERGYMAN	TOTAL POPULATION PER CLERGYMAN	CLERGYMEN PER 1,000 ECONOMICALLY ACTIVE
1910	118	326	779	3.2
1920	127	380	832	3.0
1930	149	394	824	3.1
1940	141	457	934	2.7
1950	171	507	881	2.9

TABLE 2—TOTAL MEMBERSHIP IN UNITED STATES RELIGIOUS BODIES, 1910-1950

CENSUS YEAR	NUMBER IN THOUSANDS ¹	PER CENT TOTAL POPULATION MEMBERS	PER CENT POPULATION AGED 13 AND OVER MEMBERS ²
1910	38,497*	41.2	55.0
1920	48,251*	45.6	54.1
1930	58,754*	47.8	53.4
1940	64,502	48.9	50.7
1950	86,830	57.6	63.7

* Estimated for these years by straight line interpolation between religious census years.

Landis, in his article for this issue, reports that there were 251 distinct religious bodies in 1958 with a total membership of 109,557,741 members equivalent to 63 per cent of the population. It will be seen from column two that the percentage of the population of the United States which was claimed by the religious bodies as members had increased steadily since 1910. Religious figures are notoriously inaccurate as a result, at least in part, of the differences in the definition of church membership over time and among denominations. But one disturbing factor is removed from the calculations in column three. By restricting the comparison to those who are over thirteen years of age both among church members and in the population, we correct both for the aging of the United States population and for the varying practices in reporting children as members. We note from this comparison that church affiliation declined mildly from 1910 to 1940 and then took a spectacular jump after 1950 which gives every indication of continuing to the present time. The correction

for age makes the mid-century religious revival even more spectacular.

AUTHENTICITY

The fact of this revival has been amply documented and discussed. What is surprising is the almost unanimous suspicion with which it is greeted. Ahlstrom reflects the attitudes of the vast literature on the subject when he frowns upon the "pious utilitarianism," the peace of mind cults, the contentless faith in faith, the bland conformity in the upsurge of popular piety. But Ahlstrom describes another aspect of the revival which he considers more durable and more valid, namely, the increasing religious trend of the intelligentsia. This reverses the ecclesiastical malaise of the nineteen twenties and thirties when intellectuals tended to consider religion one of the least worthy forms of irrationality and to believe that man's relationship to the universe was a scientific, as distinct from a theological, problem. During the nineteen forties and fifties theologians have vigorously re-entered as scientific specialization has tended to withdraw science from the broader stage. The two streams of popular piety and intellectual resurgence are antipathetic, an antagonism reflected in the almost uniform disdain which intellectuals among the clergy heap upon the instrumental, circumscribed piety which they observe as so characteristic of the American public today. This expression of clerical disapproval of popular religion is, in a way, the price paid by the clergy for freeing itself from the onus of the Scopes trial and the Babbitt image. More importantly, though, it reflects a conflict between the desire of our religious "middlemen" to attend to their relationship with God and the demands of the public that they attend to their relationships with their clientele.

THE CLERGY AND THE LAITY

The relationship between the clergy and the laity is full of contradictions and imprecision. Differences in the sanctification of the clergy and the power of the clergy over the lives of the laity lie at the heart of the classic institutional contrasts among denominations and religions. Kane begins his article on "Church and Laity Among Catholics" by saying, "The Roman Catholic considers his Church a divinely instituted organization founded by Jesus Christ." Later he indicated that "A priest is a sacred minister empowered through Holy Orders to celebrate Mass, administer the sacraments, to preach, and to bless." Harrison points out in his article "Church and Laity Among Protestants" that "only a comparatively small number of churches, largely confined to the Lutheran and Episcopal traditions, are willing to abide by this hierarchical principle." And elsewhere, quoting from Charles Kean, he writes, "The priesthood of all believers refers to the priestly character of the Church as a whole from which individuals both clerical and lay derive a common priesthood." Sklare, in his article on "Church and Laity Among Jews," notes that "According to Jewish tradition identical behavior is expected of the layman and the rabbi. . . the rabbinical office derives from a distinction—the gulf between the learned and the ignorant." In practice, however, the three great traditions are moving closer together. Among Catholics, while the priest remains the key figure in the parish, the role and status of the laity in religious affairs have been rapidly increasing. Among Protestants, "Whenever the authority of the layman is raised, 'the finger of an exclusively priestly voice and authority is immediately raised also.'" Among the Jews there is "a growing distinctiveness between the

functions of the layman and the rabbi. The addition of pastoral, priestly, clerical, and several other roles serves to transform the rabbi into a clergyman and the nonprofessional into a layman."

All three groups, then, have a new balance of power in clerical-lay relationships. This new balance is, in part, a result of the disappearance of the monopoly of education by the clergy. But, to a greater extent, it arises from what Harrison, quoting Philip Selznick, calls the "organizational imperatives" of religious life in America which are common to Catholics, Protestants, and Jews alike. The very size of the enterprise, the repetitiveness of the activities, the large number of functionaries involved at all levels of the religious endeavor impel religious organizations to take on a bureaucratic form, and the needs of this form of organization become primary ends in themselves, often taking precedence over the stated goals which the organization is dedicated to serve. This is a phenomenon by no means limited to religion, but its growth is made easier by the fact that the religious enterprise does not measure its success by objective standards. In business monetary success provides a ready scoreboard by which organizational efficiency can be measured. There is no way in which a religious bureaucracy can measure in quantity or quality the piety it has generated among its followers. It is not surprising that several authors have remarked upon measures borrowed by churches from the field of business. Many churches have adopted the concrete measures of success such as the sumptuousness of the buildings as an indicator. And they count the number of their adherents in the manner of a Trendex rating. The numerology of membership, like its prototype, pays little attention to the attitudes among the audience so long as the audience is captured regularly.

FINANCIAL PROPORTIONS

The magnitude of the endeavor contributes to the impression that religion is big business in America. For new church construction alone, Americans spend close to a billion dollars annually. To this sum must be added salaries and maintenance for the church physical plant, the cost of seminaries and other educational institutions and hospitals, funds for missionary projects, and the unaccounted ancillary enterprises such as the production of Bibles, vestments, periodicals and tracts, rosaries and religious medals, and the like. The sum becomes staggering. Leach reports that for a congregation of five hundred people the cost of real estate and architectural and landscaping fees alone will be at least four hundred thousand dollars. In addition to this there will be an annual operating budget ranging from twenty to fifty thousand dollars.

Unlike other institutions of comparable size, however, churches in America have few ways of guaranteeing a regular income. Their product, if such a term may be used, operates in the worst buyers market imaginable. Churches cannot enforce the payment of dues as a labor union can. They do not enjoy the coercion available to the state in its taxing power. Although tax exemption may lighten the costs to some extent, nothing is thereby added to income. The traditional way of financing the church—real estate ownership—today provides some income, but most churches in America are making payments on the mortgage rather than collecting rent. Since church income depends, then, upon voluntary contributions—which, at best, fluctuate widely—it is not surprising that religious institutions seek to employ all the pressures they can command to regularize and maximize their income. They must do so under an em-

barrassing ethic which treats monetary affairs as slightly defiling for spiritual preceptors. And they must be cautious lest too gross an assault on the clientele will defeat its purposes. As a result of the continual hunger for funds, local churches must devote a considerable portion of their energies to promotional activities. Consequently, as Harrison remarks, the church appears to many of its members to reach them only in financial drives. This impression is deepened by the increasing use of the professional fund raiser whose techniques have a depressing sameness whether he is speaking in the name of an American Legion post, a church, or a political party.

Two tendencies are noticable in the pursuit of funds. One is, as Leach remarks, a "growing effort to find some new scheme which can produce the money necessary without the tiring work of personal visitations." The second is the attempt to regularize the flow of income with annual budgets, prorated pledges, and weekly envelopes for all members styled along the lines of installment buying. In view of all this, the cost accountant can be seen to achieve the same dominance he is coming to enjoy in so many other areas of American life.

THE NEED TO EXPAND

The constant need of the local church for funds to carry on its present activities is at war with the built-in institutional imperative to expand both its membership and its functions. The competition over membership figures is notorious. To some extent the comparative figures reflect different conceptions of what makes a member. The Roman Catholic Church and some Episcopal and Lutheran bodies consider all baptized children as bona fide members whether they become active in church affairs as adults or not. Those religious

bodies whose definition is primarily ethnic, such as the Jews and the Eastern Orthodox, enumerate all members of their ethnic or cultural group who reside in a community where there is a congregation. Most Protestant groups count only those who have, by their own volition and maturity, accepted full membership in the church. The attention given to the size of membership and to its constant expansion derives to some extent from the evangelical mission of the church. A correlative to that seems to be that the validity of the message and the effectiveness of the clergy somehow depend upon the number of adherents, particularly new adherents. There are some groups for which this is not true, particularly the ethnic churches, where proselytizing is at a minimum. Here the emphasis is upon drawing the ethnically-defined clientele into fuller participation and upon preventing its assimilation into other denominations. It is also true that some churches, particularly in suburban areas, are disturbed by the large numbers of uncommitted persons who fill the pews but remain outside the organizational reach of the church. The way Jewish temples have adapted themselves to this circumstance is interesting. They realize a part of their income through the sale of seats for the few annual rituals at which participation is almost compulsory.

All religious groups extend their organizational boundaries by encouraging the formation of satellite lay organizations which are church based but primarily fraternal, educational, or recreational in their interests. The combination of these three interests with the doctrinal message is the most characteristic organizational form in American religion. The dilemma this poses for the church is mentioned by Harrison, who quotes Thomas Bennett, "The congregations become one more organizational activity. They make the same demands

upon the behavior of people as do other organizations in society." It is true that the selection of fellow members is made upon the basis of common religious allegiance, but the superimposition of religious instruction usually takes a distant second place to other organizational functions. Some of these satellite groups, at the same time, become agencies for initiating and policing fund drives. In this way they remove the debasing activities connected with the pursuit of money from the immediate purview of the inner sanctum.

EDUCATION IN RELIGION

The most important of these secondary organizations and the ones most closely related to the churches' principal purpose are the educational institutions. Hunt tells us that about 42 per cent of the United States population between the ages of three and eleven is enrolled in Protestant Sunday Schools. About four million Catholics and 350,000 Protestants are enrolled in full-time, church-related elementary and secondary schools. Almost half the Jewish children of elementary school age receive instruction in Jewish schools. Some 80 per cent receive "some Jewish schooling at some time during school age," usually for three or four years. The number of people of all denominations who receive some formal religious instruction attests to the demand for such services from the American public, but the proper relationship between religious and secular education has been a vexed one throughout American history. The question has been "settled" many times only to become unsettled again. The current resolution whereby religion is something to be added to a hard core secular education, whether by released time or an occasional school period or the ritual of morning prayer or any other device, is subject to constant negotiation. The infusion of religion

throughout the curriculum is practiced only in the church-related schools and even there the insertion of religious doctrine into a subject like trigonometry is most difficult. No one argues for a return to the days when religious instruction was the sole function of organized educational institutions. Nor does anyone argue that churches do not have a right to utilize the organized educational process through which all of our young must pass for the propagation of religious ideas. The argument is over who shall pay the bill. The current debate wears the linguistic garb of an ideological dispute over the separation of church and state. Sometimes the relative primacy of the parent as against the state is drawn into the argument. Its essence, however, is graphically demonstrated by such an uncivil exchange as that between Cardinal Spellman and Mrs. Roosevelt over the provision of funds. We are back, then, in the area most essential to church survival. The California electorate recently defeated a threat to withdraw tax exemption from Catholic schools. There is constant Catholic pressure for support of such ancillary services as school buses, lunches, and medical care. These are cases in point which illustrate that behind the debate lies the fear that one side or the other will gain an advantage in the interdenominational wars for membership.

CHURCH JURISDICTION

Where the jurisdiction of any set of social institutions overlaps with other social institutions, there is a jousting for supremacy. This may involve business and government, family and the educational system, or it may involve the church in relation to all of these. The least formal of the disputes is the sovereignty of the church over the family, and the denominations differ widely upon the extent to which family affairs

are considered within their domain. The variation ranges from rather detailed family canon among the Catholics to celebration of minimal rites of passage and the provision for mediation in cases of family discord among some Protestant groups. The interlocking of education and religion has already been discussed. In the areas where religion and business impinge upon each other, church efforts have been generally confined to a rising tide of books and pamphlets aimed at raising the ethical level of business transactions.

Under the aegis of the social gospel, many of the clergy have felt impelled to promote policies which they interpret as the embodiment of the ethical principles in their religious code. This call carries the cloth into many a reformist battle where the immediate relevance of religious doctrines has not been altogether clear to the laity. Their ventures into secular policy can, for the most part, be identified with the liberal viewpoint. Racial equalitarianism remains almost the only surviving issue for liberalism today. As Lee points out, this, more than any other issue, tears at the cleric in numerous ways. The position of his denomination and his personal position as well frequently are at sharp variance with the sentiments of his congregation, which are strongly felt and anti-integration. The members of his congregation are armed with powerful sanctions. They may withhold financial support, boycott the church, or request a new pastor if he strays too far beyond the parochial culture of his parishioners. The churches are uneasy in the face of this issue. The uneasiness reflects not only genuine ambivalence among the clergy but also an awareness of the pressures which the laity can potentially use against the clergy. Generally, the effective limits to the adventures of the clergy in public policy are those cultural limitations which charac-

terize the laity and those views from which the laity will not be parted. Few clergymen pursue a course beyond those limits. A surprisingly large portion of clergymen, in view of the limitations, have taken positions on integration which are far in advance of their congregations.

AREAS OF CONTROVERSY

The most controversial institutional overlap of the churches with secular affairs is in the field of politics. As Ebersole points out, until recently the impact of religion on politics was primarily a matter of pressure brought to bear in specific issues about which the Protestant clergy felt strongly. The outstanding examples of such issues are prohibition and the abolition of slavery. Perhaps Washington felt more beleaguered in the heydays of the Women's Christian Temperance Union and the Anti-Saloon League, but many church groups retain well-staffed lobbies in the capital today with a view to exerting pressure over specific issues. In the nineteenth century, Catholicism was important as a primary target on the national political scene for the nativist parties such as the Know-Nothings and the American Protective Association. On the local scenes, the ethnic vote, much of it Catholic, contributed to the success and durability of the political machines in the metropolitan areas of the northeast and spawned a tradition of ethnic and religious distribution of appointive posts. Since the short-lived party of Bishop Hughes in 1841 which swung the balance between the Whigs and Democrats in New York, there has never been an avowedly Catholic party. Nonetheless, the expression "the church" in politics refers to the influence of the Catholic hierarchy upon the political opinions of their laity. This takes several forms in operation. The most conspicuous are the church pronouncements on legisla-

tion which the church considered directly related to dogma. The issues which generate the most conflict with other denominations concern the prohibition of information, particularly birth control information, and the censorship of entertainment considered immoral by an official of the church. As in the Holyoke incident of 1940 and the bitter political campaigns in Massachusetts of 1942 and 1948, these matters strike Protestants as unjust interferences by the church into politics and as a denial of civil liberties. Ironically, the Catholics in Massachusetts were working to prevent the repeal of a birth-control law, a law which had been passed in 1869 at the urging of the Protestant clergy. Catholicism has entered politics less directly in the second type of issue wherein the strength and interests of the church are involved. Such issues, in the main, relate to public support for Catholic education and vary in scope from local school board fights to the United States Congress where dispute was generated by the Barden Amendment to the Federal Aid to Education Bill (HR4643). A third type of issue concerns unofficial Church support for a variety of political views such as opposition to right-to-work laws or support of strong anti-communist legislation. The Church stand on these issues often is indistinguishable from the stand of a broad section of the general public. On such issues the Church is at its least organized and is probably among the least effective of the interested political pressure groups.

All of the issues mentioned above come to focus in the current debates over the Catholic vote and the submission expected of Catholic office-holders to Church discipline. Most politicians operate upon the assumption that Catholic voters will tend to choose a Catholic candidate over a non-Catholic candidate. The current drift of opinion seems

to indicate that the Catholicism of a candidate is always significant for Protestants in the more fundamentalist bodies. It gains significance for others if there is an issue related to religion in the campaign. By and large, Catholicism does not currently seem to be an insurmountable handicap, and possibly, on balance, it could become an asset.

SURVIVAL

One of the most enduring generalizations about religion in general is that it is the most resistant to change of all institutions. It is for this reason that most major religious changes throughout history have come about through conquest or revolutionary upheaval. Significantly, though, Kane remarks that "The truly great asset of the Roman Catholic Church is her ability to adapt to changing times without altering the repository of faith and morals." We can be sure that the adherents of other denominations would claim as much for them. This juxtaposition of conservatism and flexibility shows up in the attempts of various churches to adapt to the rapidly changing culture and environment of America today. Among the most far-reaching changes is the decline in importance of such older centers of loyalty as geographic locale and ethnic affiliation which were the rocks upon which the churches were built in America. The rigid boundaries formed by these differences nurtured denominational separateness and provided the churches with clienteles already defined. The more recent great mobility of the American people and the blurring of ethnic lines has produced what Marty refers to as the loss of the diagrammatic effect or the spatial metaphor for defining community and communication. Marty suggests that the growth of sects is a "reaction against the erosion of spatial settings." The sect provides the

comfort of conservatism because its doctrines are immune to the evidence of the worldly setting. And it substitutes for "physical spatial contradistinction from other groups . . . various substitutes in psychological distinction and distance." The cult, Marty argues, does not seek separateness for it is internally bound by a sort of hierarchical togetherness in which the interpersonal relations are more important than the doctrine.

The majority of church groups have sought neither the answer of the sect nor of the cult. Rather, clinging to the old spatial orientations, they have fled the cities for the suburbs in pursuit of their clientele. They have tried to adjust to the cafeteria-like religious services and the denomination-blurring homogenization of the suburban church. Douglass notes the churches' embarrassment in having adjusted so easily. He observes guilt over their abandonment of the urban proletariat, now racially and ethnically separate. He sees the decline in the relevance and meaning of what he calls the "separated clans and tribes of the Christian family."

Only the urban-based churches of ethnic groups which feel themselves under assault retain the old tradition. Among the Jews, for instance, the vignette of our times is the chic, suburban, middle-class Jewish mother who tries to raise her children in a ritualistic tradition she earlier discarded in the name of intellectual enlightenment. The flourishing of the Hasidic community is a more extreme case. Lee, quoting Charles Johnson, points out that the Negro church has provided a substitute for political organization and has furnished a channel for social as well as religious expression. It has been the center for face to face relations, for communication, for recreation, and for physical as well as psychological escape from troubles. It has been welcomed by Negroes even in areas where physical separation in wor-

ship was not demanded. Other ethnic and racial groups such as the Puerto Ricans, Spanish-speaking peoples of the Southwest, American Indians, Chinese-Americans, and Japanese-Americans still retain in their church affiliation some of the functions which the immigrant churches of the great Atlantic migration performed.

For other groups, however, a man's ethnic affiliation is no longer so important a fact in his life. Time has blurred the old highly fragmented sectarian and denominational differences into what Will Herberg calls the "triple melting pot," three great communities with religious labels reading Protestant, Catholic, and Jewish. It is one thing, however, to indicate the declining relevance of minor sectarian splits for the laity. It is another thing to demonstrate it for the clergy. Self-contained formal organizations resist vigorously all tampering with their boundaries, whether these organizations be the branches of the military service, companies, educational institutions, or churches.

The ecumenical movement, in an attempt to reunite the fragmented denominations in the face of strong institutional resistances, proposes as a solution a loose confederation which permits the retention of denominational sovereignty in internal affairs while supporting a uniform foreign policy. Barnes makes the point that advocates of this movement take great pains to reassure wary denominations that they will not be submerged in the over-arching bureaucracy. The ecumenical drive has had some notable successes among Protestant groups, but it has made little progress in wooing Catholic support. It does not extend to the Jews.

The future of denominationalism is difficult to assess. We can be reasonably sure that a church will survive. At no time in history has there not been between men and their gods other men

who spoke more intimately, more knowingly, and perhaps more effectively in the sacred discourse. From time to time a people has tried to sweep away these middlemen as they would sweep cobwebs from before their eyes, but others always have taken the places. Today, the sweeping aside takes the form of secularization and homogenization in the

churches themselves. As old doctrinal cleavages, so irrelevant in American thought today, fade in importance, it is probable that new doctrinal and procedural distinctions more suited to the current divisions within our society either will establish new denominations or will be quietly adopted by the old ones.

SOCIOLOGY AND PHILOSOPHY

PAUL M. HARRISON. *Authority and Power in the Free Church Tradition: A Social Case Study of the American Baptist Convention*. Pp. xix, 248. Princeton, N. J.: Princeton University Press, 1959. \$5.00.

In this valuable contribution to the sociology of religion, the American Baptist Convention, a major American denominational organization, is studied by one of its own members, who is not only sociologically oriented but also sufficiently sophisticated in the methodology to analyze functionally the consequences of large-scale organization, mechanization, and bureaucratization in a religious institution. The author's empirical research involved the use of unstructured and focused interviews and schedules and an examination of Baptist histories and sundry other written materials, reports, correspondence, and directives. In providing a comprehensive analysis of the structure and function of his church polity, comprising approximately a million and a half members and 6,400 churches, the fourth largest Baptist group in the United States, the author employs the theoretical background for understanding social systems developed by Talcott Parsons, Robert K. Merton, and Marion J. Levy, Jr.; he also utilizes the interpretation of ecclesiastical authority and power provided by Robert Michels and Max Weber, with supplementation from Lasswell and Kap-

lan's views in their study, *Power and Society*. Incidentally, while adopting Weber's typology of authority, Harrison, following an observation of Carl J. Friedrich, introduces two modifications into the Weberian "ideal-typical" conceptualization of the bases of "legitimacy," by suggesting two subcategories of authority—"rational-pragmatic" and "quasi-charismatic."

The primary problem which this analysis confronts is the discrepancy between the polity of the American Baptists and their doctrine of the church. The latter for over a century has stressed the freedom of the individual in religious matters and that of the local congregation to manage its affairs without church councils or associations and regardless of denominational officials who legally cannot possess power. Yet despite the absence of a hierarchy, the Baptists have developed an "impressive denominational organization" which in power and complexity recalls the bureaucratic structures in government and business. Despite the desire of the Baptists to curtail the influence of ecclesiastical personnel, which was a major consideration in the formation of the Convention, its officials have secured more power over local church activities than recognized as legitimate by ideologists of the Baptist movement. This has led to the suggestion that the polity system be altered to recognize the power of the denominational leaders, but this alteration would entail a change in the doctrine of the church.

After defining the problem of authority in a congregational church dedicated to the affirmation of "the freedom of man under the freedom of God," Harrison scrutinizes the history of the Baptist denomination first in Europe and then in the United States, and the forces and pressures from which the Convention emerged in 1907 in order to introduce greater efficiency into the missionary and promotional enterprises of American Baptists which had grown greatly during the nineteenth century. He then proceeds to analyze the contrast between the formal system of authority and the informal system of power, with special interest in the pragmatic power of the professional executives, their policy-making scope, their conservative leadership patterns, and their operation as organization men.

Because the Baptists have rejected, in principle, presbyterial and episcopal politics, this Free Church movement has been bedeviled by the quest for some primary locus of authority; this has been sought variously in the individual soul, the local congregation, the Bible, or particular theological tenets. For the official ideology maintains "the freedom of the individual in all matters of faith and practice" and the autonomy of the local Church apart from councils, associations, or denominational officials. It emerges from the author's analysis that although Baptists have energetically affirmed that the social system can operate *sans* established lines of authority, leaders have inevitably arisen within the group whose acquired power in the discharge of their responsibilities may even exceed that obtained by leaders in the hierarchical denominational organization. The growth of the Convention has produced the inversion in roles, for although it was designed to serve the autonomous free churches, the extension of its power and of its "bureaucratic" functionalities has in various ways seriously compromised the autonomy of the constituent churches and displaced the role of the individual church. "The preservation of the Convention's organization and program has now become an ultimate purpose of the denomination."

Pragmatically the author devotes his

final chapter to a postscript for Baptists, drawing the consequences of the location of authority in a congregational church order in which all ecclesiastical order must be penultimate. He affirms the necessity of an "associational discipline" for the Baptists who, because of their failure to produce a "pure democracy," must seek alternatives to some form of associational polity which will provide a countervailing power to the apparently inevitable tendency toward centralization and rationalization.

Transcending the limits of the denominational structure in question, this study raises more general problems, such as the relation of authority and power, particularly in the free church tradition. Apart from its careful analysis of the Convention, this work also challenges certain accepted formulations of Baptist ideology, for instance, that it is primarily a quest for congregational autonomy, stressing that the primacy belongs to the principle of the sovereignty of God, whereas individual freedom and congregational autonomy are only means. This raises the interesting general question of whether the later formulation of a religious ideology does not regularly distort original positions and syncretize doctrines which are not fully compatible, for example, individual freedom and congregational autonomy. It may be hoped that similar studies may be undertaken of the phenomena of rationalization, bureaucratization, intragroup tension, and doctrinal ambiguity in comparable congregational structures, such as the other Baptist organizations, Congregationalism, Unitarianism, the Disciples of Christ, the Society of Friends, and Judaism.

The author has provided a select Bibliography, sundry tables and charts, and a full Index.

EPHRAIM FISCHOFF

Lynchburg, Virginia

GEORGE B. DE HUSZAR (Ed.). *The Intellectuals: A Controversial Portrait*. Pp. viii, 543. Glencoe, Ill.: Free Press, 1960. \$7.50.

In his introduction to this anthology, De Huszar tells us that the "modern intellectual is seen to have emerged around the time of the French Revolution" and asks

our indulgence for the exclusion, among others, of classic pieces by Plato, Ibn Khaldun, Petrarch, Leonardo da Vinci, Montaigne, Cervantes, and Francis Bacon. The reader may console himself: almost everybody else is here and accounted for. By way of doing penance the editor has assembled excerpts from the writings of no fewer than sixty-six scholars, from Aron to Znaniecki, whose contributions are classified according to the following scheme: Emergence of Modern Intellectuals, Nature of Intellectuals, Types of Intellectuals, Role of Intellectuals, Intellectuals and Modern Ideologies, and Intellectuals in Various Countries. The result of this prodigious enterprise is predictable. *The Intellectuals* is judiciously edited and is characterized by considerable scope and attention to representativeness, but it is subject to the customary querulous complaints about "unevenness" and "fragmentation."

The over-all impression created by this volume is that the contemporary intellectuals are dreadfully unhappy about the state of the universe, themselves, and each other. The fearfully articulate new conservatives warn shrilly that through default or active connivance the liberal intellectual is preparing the ground for the total triumph of the welfare state, the collapse of traditional values, and the ultimate demise of freedom. The prose and the accompanying calls to duty suggest nothing so much as reading backwards the *Nation*, circa 1937. But the all-powerful vanguard, having bypassed Marx, exhausted Freud, and recently rediscovered the mass society, scarcely appears very reassured about its diabolical powers. Quite to the contrary the man of ideas stationed a little left of center seems primarily preoccupied with his formal right to dissent. His twin concerns are a vigilant defense of civil liberty and his alienation from the mass society; the product of his ruminations often takes the form of invocations not to "conform."

This posture of defensiveness appears strange when one considers that, despite the rhetoric of defeat which one hears on all sides, the liberals have won most of their recent major battles.

The basic insights of Marx, Freud,

Dewey, and Mencken—among the most germinal influences of our time—have ceased to shock, and the heresies of yesterday have become quite respectable. Who is not now prepared to concede that the state must cushion the effects of poverty, that ideology is related to social structure, that women have the right to pursue careers, that alcoholism is a disease, that mothers are fallible, that proof is lacking for doctrines of racial superiority, and that God did not really create the world in precisely seven days?

The widespread emergence of enlightenment is still another indication of the permanent paradox confronting the man of ideas in America—each new victory contains its own potentialities for malaise. The intellectual is by tradition an angry man who stands at the periphery and says nay. But anger thrives best in defeat, and too often now the intellectual finds himself the possessor of a free floating militancy in search of a substantive issue. He finds it a dreary fact of life that in most of the public controversies in which he engages the nature of the dispute is instrumental rather than moral so that the man who wishes to leave a useful imprint on history is obliged to deal with means rather than goals and with techniques rather than superior intentions. This is not the sort of task for which the intellectual is best equipped. He tends to be uncomfortable in affirmation, at best devoid of passion as he pursues "positive" objectives.

All of this suggests why the victorious intellectual adopts the essentially procedural slogan of "nonconformity" as his rallying cry for a kind of peevish holding operation, a program of preparedness in the event of future intellectual warfare. To the extent that the doctrine of nonconformity has a substantive message it consists of the view that majorities are inherently bad and asserts its disenchantment with the mass society with its complexity, its bureaucratization, its aesthetic uniformities, and modes of social control. But since it is rather unlikely that we shall escape from this universe, the cult of "nonconformity" is essentially frivolous; it offers us poetic despair at a time when we are in real need of serious analyses. A philoso-

a comprehensive survey of the political theories that are shaping

the course of 20th-Century history...

Contemporary Political Ideologies

edited by Joseph S. Roucek

- * Because aggressive and opposing ideologies have set the armies of the world marching in two World Wars—
- * Because new tensions and conflicts threaten to bring us into total and final disaster—

It is vital that we understand the many doctrines that influence political life and form the spiritual basis for every social struggle. The editor of *CONTEMPORARY POLITICAL IDEOLOGIES* brings together the efforts of 19 distinguished social and political scientists, historians and economists, each a specialist in his area, to present this thorough treatment of the most widely-accepted political theories of our time. The essays are arranged under the following headings: Variations in Marxism and Neo-Marxism; Remnants of Socialism; New Nationalism, Colonialism and Pan-Movements; New Democracies; and Cross Currents. Articles include: "Soviet Russia's Reluctant Satellites," by Edward Taborsky; "Colo-

nialism at the Crossroads," by Wallace Sokolsky; "Racial Theories of South Africa," by Colin Rhys Lovell; "Japan's Reforms," by David Henry Kornhauser; "Rejuvenated Italy," by Tibor Kerekes; "India's Ghandism," by Howard Boone Jacobson, and many more.

CONTEMPORARY POLITICAL IDEOLOGIES focuses on the ideas that have motivated the rulers and peoples of the world to action. Up-to-date and authoritative, it provides insights into the driving forces behind Nationalism, Capitalism, Communism, Socialism and all other major systems of thought that dominate our troubled century. Regular edition \$10.00 Students' edition \$6.00

W. D. BORRIE and others. *The Cultural Integration of Immigrants: A Survey Based upon the Papers and Proceedings of the UNESCO Conference Held in Havana, April 1956*. Pp. 297. Paris: UNESCO, 1960. Distributed by the Columbia University Press, 1960. \$3.00.

This volume and the conference on which it was based dealt with the imposing problems of cultural integration encountered by the immigrants of the postwar period. The massive displacements of population in the past fifteen years have created imposing difficulties for the migrants themselves and for the countries which received them. This little volume presents a stimulating analysis of the problem based upon a thorough survey of the literature of the past two decades. It should be read with interest not only by students but by all those concerned with shaping public policy in the immediate future.

The very title reflects the degree to which the contributors to the volume have mastered the new insights and concepts of this period. They have discarded the conception of assimilation that so long dominated the thinking in this field and that demanded that a newcomer reshape himself at once to the existing patterns of the host society. Instead Professor Borrie and his collaborators treat integration as a two-way process in which the immigrants and the culture they find upon arrival exert a reciprocal influence upon each other. Their treatment reflects a much sounder apprehension of the problem and of the possible solutions to it than was common before 1945.

The heart of the volume is a long, thoughtful summary by W. D. Borrie. An incisive theoretical analysis is based upon

a good account of the postwar migrations and leads to stimulating discussions of the role of the state, of voluntary organizations, and of mass media and education. Professor Borrie's conclusions with regard to the general economic, social, and cultural aspects of the problem are thoughtful and sound.

Of the large number of papers submitted by the delegates to the conference, only four have been published. Three are case studies of intracontinental European immigration by J. Zubrzycki, of the Brazilian situation by Neiva and Diegues, and of the developments in Israel by Julius Isaac. The fourth published essay is an account of group settlement by C. A. Price. The whole forms a useful and thought-provoking volume.

JOHN H. ROHRER and MUNRO EDMONSON (Eds.). *The Eighth Generation: Cultures and Personalities of New Orleans Negroes*. Pp. xi, 346. New York: Harper & Brothers, 1960. \$6.00.

The Eighth Generation is a superior research study carried out by an interracial, interdisciplinary staff which included psychologists, psychiatrists, a sociologist, an anthropologist, a linguist, psychiatric social workers, interviewers, and graduate students. The difficulties of collaboration on the part of specialists from several fields seem to have been successfully overcome in this follow-up study almost twenty years later of Allison Davis' and John Dollard's *Children of Bondage*. The present research team had the advantage of numerous studies of the Negro community and Negro personality made during the past two decades, but their project represents a considerable advance theoretically and methodologically over previous investigations.

Rohrer and Edmonson, and their associates, attempted to locate 107 of the 277 former New Orleans teenagers studied by Davis and Dollard in the late 1930's. Forty-seven of the ninety people found were interviewed, and twenty of these were selected for intensive testing and interviewing. While acknowledging some mid-

dle-class bias in their small sample of a universe of 200,000, the authors think that "the status context" of these persons reflects fairly well that of the city as a whole.

Social stratification is traced from the Creole social structure of 1800, called by the authors a biracial society of three culture-castes—or semicastes—and three classes, through the two-caste system, slave and free, with three classes within each of two free color-castes, which they outline for the 1850's, to the biracial society of three classes seen by them in the 1950's. Social organizations within the Negro community of New Orleans are succinctly delineated.

Throughout the volume the concept of social class is handled with sophistication. Davis' and Dollard's conclusion concerning the primacy of class over color is accepted as valid "for many individuals," but the present writers view the class interpretation at times as being forced. Myrdal's conclusion that class factors are not the only intervening variables is endorsed, and the position is taken that race can have no generic meaning for Negroes. These researchers were unable to substantiate Kardiner's and Ovesey's hypothesis that self-hate is present in all Negroes. This viewpoint is questioned mainly because no experience was found reaching an entire population which was sufficiently general to produce a similar reaction in all individuals. Rohrer's and Edmonson's data led them to conclude that there may be four or five types of family systems among American Negroes.

The twenty subjects fall into five major groups: four culture groups—the Middle Class, the Matriarchy, the (male) Gang, and the (isolated) Family—and a residual group of the culturally marginal. A vague cultural determinancy is avoided by relating cultural influences to the intrapsychic functioning of each individual.

The values, self-conceptions, and antagonisms which are associated with the several primary role identifications are set forth in general terms and are spelled out in case histories. The analyses of the matriarchy and the gang are among the most valuable contributions of the book. Also of great importance is the authors'

treatment of the variety of meanings and the variety of psychic consequences of being Negro. The point of view and the conclusions of this study are well summarized in the following passage: "The interrelationships between primary role identification, ego identity, and the techniques used for maintaining ego integrity are not a matter of simple cause and effect nor of independent and dependent variables. Each of them influences and is influenced by the others. . . ."

To those who lack psychoanalytic orientation, some of the interpretations of the individual's "psychodynamic functioning" may seem rather strained, but all who read this book will be impressed with its insights and with the cogency of its conclusions.

An investigation of dialect and society proved to be rather inconclusive. It was found that the Negro community of New Orleans is not clearly segmented if it is assumed that some shared linguistic usages should be associated with the segmentation of a society.

NATHANIEL WEYL. *The Negro in American Civilization*. Pp. xi, 360. Washington, D. C.: Public Affairs Press, 1960. \$6.00.

Nathaniel Weyl originally intended to "trace the Negro's changing status under the American Constitution." His discussion of the changing formal definitions of the relationship of Negroes to the American social system is probably the best part of the book.

Weyl goes on to conclude that racial integration in the public schools has caused a decline in their intellectual quality and that Negro migration is causally related to a significant rise in crime, delinquency, and immorality. He infers a causal correlation between the increasing proportion of urban Negroes and Puerto Ricans and the seeming decline in the social and economic significance of the city as a metropolitan center. Most of these conclusions are inadequately documented.

The author has few "positive" recommendations. He seems to favor integrated equality with respect to political rights and public services, but segregated equality in education and housing. He views the Supreme Court desegregation rulings as unfortunate examples of judicial legislation that must now be supported primarily because of the fundamental significance of the judicial process. His "solution" is both a strategy and a principle: there should be greater provision for individual differences through homogeneous grouping of children of different intellectual capacities into different public schools. This is counter to the "racial blending" advocated in New York City. Since he seems to conclude that most Negroes are by heredity intellectually inferior to most whites, Weyl's intellectually homogeneous public schools would tend to be racially homogeneous as well, and the integration campaign would simultaneously be short-circuited. He could not anticipate the new direction of the present nonviolent demonstration campaign.

We may view *The Negro in American Civilization* as a statement in a classically Marxian class struggle. Weyl is analogous to the middle classes which are forced to take sides during the social and ideological conflict. His school proposal is a formalistic compromise, the function of which would be to retard the rate of social change and thereby re-establish the social peace. As a formula it will probably be acceptable to moderate whites who are uncomfortable about "complete" racial integration. It may also be acceptable to many Negroes who reject the idea of hereditary inferiority but who want to remove themselves from the class struggle and be treated as persons rather than as representatives of a type.

LEONARD BLUMBERG

Associate Professor of Sociology

Temple University

SHELDON and ELEANOR GLUECK. *Predicting Delinquency and Crime*. Pp. xx, 283. Cambridge, Mass.: Harvard University Press, 1959. \$6.50.

In this book the Gluecks, who were among the first to pioneer in the design of methods to predict various phases of criminal behavior, bring together the results of their work covering a span of about a quarter of a century. The book not only contains a clear and precise summary of the theoretical basis upon which predictive methods rest but also includes a great variety of expectancy tables which may be utilized to increase the effectiveness of both preventive and treatment measures. This, it is assumed, may be done by employing methods which summarize systematically and concisely the factors associated with deviant behavior in the selection of individuals most apt to respond to available specific treatment or preventive programs.

In general, the argument in support of the use of predictive devices rests upon the assumption that all delinquents and criminals are not alike in their capacity to respond successfully to any specific treatment or correctional measure. The nature of the response is conditioned by or associated with certain clusters of pretreatment factors that characterize the individual delinquent or criminal. That is to say, not all delinquents respond successfully to probation or to parole. Some delinquents, on the basis of their backgrounds, would profit from being placed in an institution rather than on probation. The decisions concerning what should be done with any specific individual delinquent should be based upon knowledge of what is most likely to bring about his rehabilitation. It is this kind of knowledge that predictive devices are believed to provide, and the utilization of these instruments in the decision-making process should, it is hoped, increase the efficiency of correctional and preventive work.

Although the results of the work of the Gluecks, as well as of others in the area of prediction, are well known, little unfortunately has been done to discover whether the results if used in making decisions actually improve the effectiveness of treatment and preventive programs. Only a few of the prediction tables developed by the Gluecks and by others have been subjected to a rigorous test to determine whether they work. The attempts that

have been made to test the efficiency of the Glueck tables have used study designs that do so indirectly. It is only recently, in 1952, that a really rigorous study was begun to test the validity of the Gluecks' Social Factors Prediction Table first presented in their *Unravelling Juvenile Delinquency* in 1950. Until the results of this study and of others are definitive it will be impossible to evaluate the role that prediction devices might play in the control and treatment of delinquents and criminals.

It is to be hoped that the book *Predicting Delinquency and Crime* will be instrumental in developing research designed to test whether predictive devices actually work.

ELIO D. MONACHESE

University of Minnesota

MORRIS JANOWITZ. *The Professional Soldier: A Social and Political Portrait*. Pp. xiv, 464. Glencoe, Ill.: Free Press, 1960. \$6.75.

For many reasons, few of them rational, sociologists have done little research on the place of military institutions in American society. Janowitz, in his recent *Russell Sage Bulletin, Sociology and the Military Establishment*, and now in this more extensive volume, has contributed much toward remedying this neglect.

The professional soldier whose "social and political portrait" the author attempts to paint is not simply the career soldier. Janowitz is using "professional" in a stricter sense. His attention is restricted to the successful officer who becomes a "military leader," a general or flag officer prior to the second World War or a "two-star" officer subsequently and, in certain sections, his concern is exclusively with those much more select numbers who comprise what he regards as the power-holding "elite nucleus" of the military establishment.

This "social and political portrait" painting is portraiture with a purpose—indeed, a tendency. He is concerned with the import of the evolving professionalism of military leaders for major politico-military issues of the present and future. In sketching the emerging professional self-

identity of the military leader and the bodies of ethics, responsibilities, ideologies, and skills associated with that identity, his attention is constantly cast on the nature of the influence our military leaders are likely to exert. The material he presents appears oriented largely toward explaining why certain military leaders lend their weight to what the author regards as sound positions with respect to these issues and others support unsound ones. It is this orientation that integrates his discussions of the social origins, career lines, hierarchical organization, life styles, ceremonies, and beliefs of the military professional.

In his analysis he uses systematic data from several sources: biographical data on a sample of 761 of the generals and admirals of the past 50 years; questionnaires originally collected from Pentagon staff officers by Masland and Radway for their study of military education, and "intensive interviews," presumably by the author, with "a sample of 113 future military leaders." He occasionally introduces comparative information on foreign military forces and also makes free use of anecdotal information from a large variety of sources.

The author's preconceptions about the model of the future military establishment are evidenced in the number of officers of each of the three services he has included in his sample of "future military leaders": Army, 54; Navy, 32; Air Force, 27. Some Air Force officers will feel that this is one of many manifestations of the bias of a "ground-pounder" who does not understand the role the Air Force plays. Admirers of General Douglas MacArthur and of "absolutistic" military doctrines are also likely to be unhappy with some of his comments.

Janowitz has firm command of his data and is inclined to tolerate no disobedience from them. On occasion, he firmly leads the data to his objectives, even when they are powerfully inclined in another direction; his reverse interpretations of a clear-cut difference between Air Force officers and officers of the other services in conservative-liberal identifications (pp. 240-241) are illustrations.

His purposefulness, however, makes the author's selection, presentation, and analysis of data on the military of singular

pertinence and utility. Never before have so many critical sociological facts been presented in one place regarding central questions which political and social scientists are asking about military institutions and their role in the contemporary world. More important, by applying a sociological perspective to these issues, Janowitz raises new questions that others should be asking.

ALBERT D. BIDERMAN

Senior Research Associate
Bureau of Social Science Research
Washington, D. C.

SIDNEY HOOK (Ed.). *Dimensions of Mind*. Pp. xiii, 281. New York: New York University Press, 1960. \$5.00.

The mind-body problem remains an unsolved puzzle, the complexity of which has only been increased by the development of computers, robots, and teaching machines. This volume, comprising twenty-nine papers delivered at New York University's third annual Institute of Philosophy, held in May of 1959, illumines some dark corners of the problem but—to nobody's surprise—provides no novel or thoroughly persuasive solutions. The levels of discussion and argument are, however, consistently higher than is usually the case in a symposium, and the angles of regard from which the topic is perceived are usefully diversified. Philosophers, psychologists, and computer-communications experts contribute thoughtful, and sometimes even witty, ideas, and there are few places where one can find a fuller exposition of the practical as well as the purely intellectual ramifications of a conceptual issue that has plagued our species ever since it became reasonably self-conscious and knowledgeable about itself.

Despite the diversity of approach, there are some shared assumptions among most of the symposium participants that make for an odd homogeneity among men who often disagree sharply with each other. For example, only one or two contributors dissent from the general proposition that it is impossible for one to know other minds—or selves—directly. While it is quite conceivable that this position may be correct—in the sense of most fruitful—its widespread acceptance here means that

the mind-body problem is attacked almost exclusively from a positivistic, objectivist point of view. There are others. And the significance of these other outlooks lies in the newly evolving interest in a question that is relevant but ignored in this provocative anthology: Are there differences between the sciences of man and those of the nonhuman universe? One need not have an answer to this query to discern its importance for modern considerations of the dimensions of mind.

Similarly, one of the paradoxes of mind is that thought, its most ubiquitous product, if not its defining attribute, is at once a form of behavior in the service of needs and drives, many of which are somatically instigated, and the primary device by which men transcend their most primitive motives and control their actions. One looks in vain for a discussion of this rather central point in these explorations of the relation of mind and body.

But such omissions may be little more than a reflection of the intellectual finitude that leaves all our major efforts a little troubled, whether we work as individuals or capitalize, as is the case here, on the productive frictions of group discussion. Meanwhile, *Dimensions of Mind* rewards handsomely those who take serious joy in the puzzle of man.

EDWARD JOSEPH SHOEN, JR.

Professor of Clinical Psychology
Teachers College

BARTLETT H. STOODLEY. *The Concepts of Sigmund Freud*. Pp. xii, 274. Glencoe, Ill.: Free Press, 1959. \$6.00.

The author of this book is, as he states himself, neither a psychiatrist nor a psychoanalyst. He considers the effectiveness of the theory in "terms of the facts Freud presents." It is the sociological approach, that is, the postulated road "from the libidinalized ego to the collective representations of Durkheim," that interests him. The libido theory is analyzed in Chapters 9 and 10, and the failure of the libido theory to explain the socialization of the ego is demonstrated. This is done in a somewhat scholastic way. The author quotes extensively from Freud, and only

occasionally does he enliven these quotations by reference to facts that might be present in the mind of the not too well versed reader.

It is, on the other hand, a valuable trait of this book that it makes the reader travel in the path of Freud's thoughts from the primary conceptions of the classical phase of the libido theory to the time when Freud tried to understand the socialization of the ego.

Readers who will not shun the effort of plodding through many quotations will in the end find themselves rewarded, if not with a definite insight, then at least with the anticipation of how psychoanalysis can be utilized in the social sciences and of the way psychoanalysis may develop its own motivation theories under the impact of a sociological view.

W. G. ELIASBERG

New York, N. Y.

EUGENE A. WEINSTEIN. *The Self-Image of the Foster Child*. Pp. 80. New York: Russell Sage Foundation, 1960. \$2.00.

The value of this small book of seventy-five pages is twofold. First, it adds to the growing body of knowledge about self-conceptions and their function in a social system, and, secondly, it clearly indicates that this concept has some very practical utility in an analysis of the foster-home situation and that from paying attention to this variable the work of the social worker and the agency in foster-home placement may be facilitated.

In concentrating his attention upon self-conceptions, Weinstein pays attention to a variable which has frequently been overlooked in the research efforts of the social scientist. His work emphasized that in an analysis of social relationships in general and foster home relationships in particular, the behavior of any party in the relationship is in part a function of his self-conceptions, including his role definitions, which in turn are related to the manner in which he defines the current situation.

This book primarily reports a study in which this orientation is applied to the foster-home situations of sixty-one children. The self-dimension is measured in terms of answers to questions such as:

Who am I? Where am I? Why am I here? and What is going to happen to me? These answers are in turn related to the foster child's relationship with his natural parents, his foster parents, and the case worker, and significant relationships are discovered.

Some of the practical implications of paying attention to self-conceptions are reflected in conclusions such as: (1) Children who identify predominantly with their natural parents have the highest well-being rating of any group in the study. (2) Children whose natural parents visit them regularly but who also tend to identify with their foster parents are more adjusted than children with similar identification patterns but whose parents do not visit them. (3) Adequate conceptions of the meaning of foster status and the role of the agency are important for the child's well being.

Although its theoretical discussion is not so extensive as this reviewer would have hoped, the book is a worth-while addition to the library of both the pure and the applied social scientist.

PHILIP BAGBY. *Culture and History: Prolegomena to the Comparative Study of Civilizations*. Pp. ix, 244. Published in Great Britain in 1958. Berkeley and Los Angeles: University of California Press, 1959. \$5.00.

This volume may be characterized as a layman's attempt to find a more meaningful approach to history. The author is not satisfied with history as a chronicle of events nor with the manner in which historians interpret events. He considers history to be "only a semi-rational activity" and searches instead for "a more rational, a more 'scientific' approach."

His search leads him to the discipline of anthropology, where he finds concepts which, according to him, make it possible to discern regularities in the historical record corresponding to the laws of science. The greater part of the volume is devoted to these concepts. Foremost among them

are "culture," defined as regularities in the behavior of mankind, such as customs and beliefs, "a culture," by which is meant the customs and beliefs distinctive of a group of communities; and "a civilization," which is said to be a culture with cities.

The author is at his best in discussing these concepts. In simple language, he gives the history of their development, their range of meanings, and a precise, original definition for each of them. In addition, he examines the ways in which anthropologists and other social eventists have interpreted culture change. The book will be most useful to readers who are interested in these problems.

The author is less successful in applying anthropological concepts to history. He presents a reasonably good outline of the world's great civilizations in the next to the last chapter; but when he tries, in a brief final chapter, to compare civilizations and to perceive regularities in their development, he is not very convincing. He produces little more than previous writers although, as he points out, little more can be expected, since his work is preliminary.

The author's approach in the final chapters is closer to that of the philosophers of history, such as Spengler and Toynbee, than it is that of the anthropologists who have written upon the subject. He tends to stress the role of ideas and values in the development of civilization, whereas most anthropologists would start with more empirical factors, such as irrigation and writing. The reader who wishes to know the anthropological approach to the problem would be better advised to consult works such as Julian H. Steward, *Theory of Culture Change: The Methodology of Multilinear Evolution* (Urbana, 1955) and Leslie A. White, *The Evolution of Culture: the Development of Civilization to the Fall of Rome* (New York, 1959).

IRVING ROUSE

Professor of Anthropology
Yale University

EDWARD McNALL BURNS. *Ideas in Conflict: The Political Theories of the Contemporary World*. Pp. xiv, 587. New York: W. W. Norton & Company, 1960. \$6.95.

This is a book of the first order. Burns is exceptionally able in the realm of contemporary political thought. This well-written volume is far more than a summary and catalogue of ideas. This reviewer is greatly in the author's debt.

Ideas in Conflict is a comprehensive and panoramic exposition, interspersed with critical and perceptive comments, of the beliefs and issues that constitute the substance of twentieth-century political thought. The author covers a staggering and ramified field. He deals with positivism, pluralism, socialism, democratic collectivism, Fascism, communism, Nazism, idealism, conservatism, existentialism, romanticism, imperialism, nationalism, internationalism, and cosmopolitanism. He presents, also, various religious, psychological, anthropological, and sociological approaches to political theory. Finally, Burns discusses democratic and antidemocratic thought, power politics, geopolitics, various schools of jurisprudence, nonviolence, passive resistance, and contemporary approaches to the nature of political theory.

Although the book does not deal with Burns' own political philosophy per se, it is clear that he is deeply troubled by the current wave of pessimism about man—the belief that human nature is evil and vile. He conceives such a view to be incompatible with the possibility of human progress (pp. 450, 459). Conflicting conceptions of human nature, he believes, separate the children of light from the children of darkness and animate philosophical warfare. The contemporary philosophical conflict "has no necessary connection with the familiar polarity of democracy and totalitarianism but grows out of a cleavage along broader lines. On the one side are those philosophies which take an optimistic view of human nature, recognize the possibility of progress, accept the universality of change, welcome inquiry and experiment as sources of knowledge, and emphasize the values of tolerance and freedom" (p. xiii). On the other side are those philosophies which deny these propositions. Burns champions the "optimistic" view. His dichotomy expresses a widely held, though perhaps erroneous, presupposition. There is no compelling evidence

for the assumption that there is a necessary relation between doctrines of human nature and such specific beliefs as the possibility of progress, the inevitability of change, and the desirability of tolerance, freedom, inquiry, and experimentation. Consider, for example, Reinhold Niebuhr's eloquent defenses of freedom, tolerance, experimentation, and other institutions designed to achieve greater justice. In regard to progress, everything depends upon its definition and criteria. Progress in and toward what? No sane individual can deny the possibility of scientific and technological progress. Moral progress is another and more difficult problem.

Critical reflection indicates that almost any ideological object of value has both friends and foes among those who are "optimistic" and those who are "pessimistic" about the human estate. Indeed, such adjectives as these are too ambiguous and elusive to be made the basis of any meaningful philosophic division. Perhaps Morris R. Cohen would call such labels "snares and stones of stumbling." Besides, "human nature" itself is by no means a univocal term.

SAMUEL DUBOIS COOK

ECONOMICS AND LABOR

WILHELM RÖPKE. *A Humane Economy: The Social Framework of the Free Market*. Pp. 312. First English edition. Pp. 312. New York: Henry Regnery Company with the assistance of the Institute for Philosophical and Historical Studies, 1960. \$5.00.

Wilhelm Röpke as a young doctor of political science worked on reparations for the Weimar Republic; studied in the United States; returned to Germany as economic advisor to the Brüning government. As refugee from the Nazi regime, he taught in Turkey. Repatriated after the war he again entered the government, and is sometimes called the "architect" of the economic policy of the present West German government. This is an American

translation of a book published in German in 1958.

Röpke is a solidly based, nineteenth-century classical economist of the school of F. A. Hayek and Ludwig von Mises. He wants as little government in economics as possible. Current practices in public finance and high taxation he considers a kind of "fiscal socialism." Competition and price determination by free market are essential. The most dangerous monopoly at present is obviously that exercised over wages by labor unions. Rising population is a peril; the emerging mass-society threatens the essential graces and dignity of human life. Planned society, if successful, could lead only to complete boredom resulting from comfortable slavery. The "open market" and the free market economy, he insists, are not mere devices of economics but moral imperatives, though he considers undue commercialism, such as that which produced "Mother's Day," unhealthy. Some regions of life, he concedes, are beyond the laws of supply and demand.

Social security, in this doctrine, is an illusion. The Rooseveltian phrase, "Freedom from Want," is dangerous dogma. It is even more dangerous when carried to the international plan as, for example, by the European Coal and Steel Community. Industry and occupation should be small-scale. "Decentrism" should be a continuous goal.

The three most threatening enemies of society and of human freedom are, Röpke thinks, taxation, welfare legislation, and inflation. As full employment necessarily means inflation, so a margin of unemployment—Röpke thinks it can be low but insists on its necessity—is a safeguard. All these conclusions are placed on a moral basis, since, according to Röpke, economy on any other basis impairs the ultimate protections of individual spiritual life. The author unhesitatingly names "three great ruiners of history," to wit: John Maynard Keynes, Jean Jacques Rousseau, and Karl Marx.

Well, if this is what Röpke effectively advised the Weimar government in 1930-1931, its fall in 1933 is not wholly surprising. Regrettably, the world just now

is working on rather different lines. It is pleasant to have this neat, clear-cut, "all-wool-and-a-yard-wide," John Stuart Mill theory of nineteenth-century laissez faire economics, all based on safeguarding the moral dignity of the individual. But one wonders how the individuals described, unfortunately, quite accurately, by Charles Dickens, Emile Zola, and Upton Sinclair felt about their spiritual dignity thus mightily preserved. I can, of course, understand the revolt of men like Röpke as the Nazi state ground them out of existence. Reacting against that, they do not want any kind of state control in economics, anywhere, any time, or on any terms. But I suggest that there are other states than those dominated by either Nazis or Communists—and that the nineteenth century has passed into history. If it returned today, 75 per cent of its population would probably revolt immediately. In the foreseeable future, even to satisfy Wilhelm Röpke and Ludwig von Mises, the world is not likely to return to the economic practices and doctrines of the year 1860.

For antidote, try Karl Polanyi's *The Great Transformation* which argues powerfully that the twentieth-century revolutions resulted directly from the inhumanities of the free-market economy of the nineteenth.

RICHARD EELLS. *The Meaning of Modern Business: An Introduction to the Philosophy of Large Corporate Enterprise*. Pp. xi, 427. New York: Columbia University Press, 1960. \$7.50.

The subtitle of this book, "An Introduction to the Philosophy of Large Corporate Enterprise," adequately states its purpose. It is concerned not with all business but with business as represented by the large corporation. And the interest of the author is not so much in what corporations do as in what they should do in a well-regulated society. The large corporation and its counterpart, the large trade union, are relatively new forms of social organization and, unlike the church, the army, the university, and other traditional forms, their prerogatives and responsibilities are not yet well demarcated in law or in public atti-

tudes or opinions. The author is suitably modest in calling his study "An Introduction" to this subject and, indeed, in the light of current thinking, it is difficult to write more than an introduction. As such, the book provides a highly useful guide to contemporary thought, and its usefulness is greatly increased by extensive Footnotes commenting on the literature.

The theme is developed through the use of certain ideal constructs, the "traditional corporation," the "metro-corporation"—mother corporation, and the "well-tempered corporation." The traditional corporation typifies the firm operated solely in the interests of its owners with a single eye to the maximizing of profits. It is the firm of traditional economic theory, and, indeed, it is the corporation in the established contemplation of the law, with management exclusively responsible to the owners. This traditional corporation, according to received doctrine, serves the interests of society as well as the interests of its owners, mainly because of the limitations placed by the market on antisocial types of behavior. Currently, there is a rather strong reaction in business and other circles against the vague but far-reaching claims of social responsibility advanced by modern management, and toward the philosophy of the traditional corporation. If business takes care of its own profits, it is said, the market will take care of the interests of other groups. But will it?

The "metro-corporation," as delineated by the author, represents the other extreme. Here the owners, far from being the sole claimants to earnings, are merely one group among many, including suppliers, workers, customers and, frequently, a vague entity variously called the public, society, or the general interest. The constraints of the market no longer limit the freedom of action of the firm and, in place of the market, we have the responsibility of management to these various clienteles. The "metro-corporation" is conceived as serving not economic man but the whole man. This notion, according to the author, claims too much. He is willing to admit that the large corporation has, to some unspecified extent, escaped from the limitations of the market. But he is not willing to con-

cede the claims of corporate management to be sole arbiters of the division of the proceeds of business enterprise.

This leads him to a consideration of the position in society of the "well-tempered" corporation. The analogy is to the keyboard of a piano. Of the seventy-eight intervals in a single octave, "not a single one is in perfect tune, though every interval could be improved if there were not others to think about." This suggests that although the perfect harmony of perfect competition may not be achievable in a society dominated by the large corporation there are restraints that may prevent too great a discordance between the private and the public interest. Unfortunately the discussion of the nature of the restraints and of the character of the resulting accommodation here takes refuge in analogy and in somewhat rotund pronouncements at once vague and impressive. But the reader should, perhaps, curb his tendency to cavil. This area of discourse is a cavern in which illumination is as yet both dim and fitful. The author has put us in his debt by showing us at least where the cavern is.

EDWARD S. MASON

Professor of Economics
Harvard University.

JOHN M. FIRESTONE. *Federal Receipts and Expenditures During Business Cycles, 1879-1958*. Pp. xvi, 176. Princeton, N. J.: Princeton University Press, 1960. \$4.00.

MELVILLE J. ULMER. *Capital in Transportation, Communication, and Public Utilities: Its Formation and Financing*. Pp. xxviii, 548. Princeton, N. J.: Princeton University Press, 1960. \$12.00.

These volumes fall in two different series of National Bureau studies. Mr. Firestone has furnished the most recent contribution to the series on business cycles. It deals with the role of federal receipts and expenditures. Mr. Ulmer provides the most recent contribution to the series on capital formation and financing. It deals with the "regulated industries." Where Firestone is following in the path of Wesley Mitchell, Ulmer's intellectual parent is probably Raymond Goldsmith.

The volumes are, however, alike in the National Bureau tradition of assembling for the first time a great range of detailed quantitative data. Nearly half of each book consists of statistical Appendices, including notes on the data and estimation methods, as well as comments on the quality of the results. The two are also alike because they contain for the general reader not one but two summaries of the principal findings. In the Firestone volume these are found in the first chapter and supplemented in a Foreword by Geoffrey Moore. In the Ulmer volume, the general reader should peruse a longer and more detailed Foreword by Simon Kuznets together with Ulmer's own concluding ninth chapter.

"Built-in flexibility" is a relative newcomer to the economist's kit of tools and jargon, but Firestone shows that the federal government has been practicing it involuntarily since 1879 or perhaps earlier. Government receipts have acted in a "stabilizing" direction, rising in booms and falling in depressions, except for wartime and some immediate postwar business cycles. Government expenditures have shown no such flexibility but rather an upward trend. The federal budget has accordingly tended toward surplus in boom and deficit in depression, in substantial accord with the precepts of the "new economics." All this flexibility has arisen behind the backs of legislators and in contradiction to the precepts of "sound finance" as maintained by most of them. Indeed, Firestone shows that when legislative changes were made, their effect was more frequently destabilizing than otherwise, as was to be expected from contemporary views of fiscal soundness. Until 1913, the main stabilizer was customs receipts, which naturally rose and fell with the state of trade. Since 1913 it has been the personal income tax and has become increasingly powerful as the rate and progressiveness of this tax have risen. Firestone is, if anything, too complacent at times in emphasizing the role of flexibility, built unconsciously into our fiscal system by ostensible budget-balancers, in mitigating the business cycle since 1939.

Three significant war cycles—World War I, World War II, the Korean War—are covered by Firestone's data. Despite tax

increases, expenditure increases in each wartime period have accentuated inflationary booms and destabilized the economy.

Ulmer presents a less optimistic picture of the future of capital formation in the regulated industries than Firestone provides of the federal budget as a cyclical stabilizer. He covers approximately the same period, 1880-1950; the greater length of his study is due to the necessity of separate detailed estimates for the regulated industries as a whole and for a number of important subgroups with special problems, for instance, steam railroads, electric light and power, telephones, street and electric railways, local bus lines, and miscellaneous others.

These industries have all grown along roughly S-shaped or logistic statistical trends. These trends have by now flattened out, or in some cases, for example, street railways, actually declined. As percentages of the national income, the decline has been quite general. Whether Ulmer ascribes this to fate—the logistic curve—or to unpredictable random shocks—the automobile—or rather to his division of responsibility between the two, is not entirely clear. At any rate, barring extraordinary developments in such new "public utilities" as atomic power, Ulmer sees no outstanding growth possibilities in the regulated industries.

In addition, these regulated industries have tended increasingly toward lower capital coefficients and higher rates of internal financing. A capital coefficient is the dollar amount of new investment required for a dollar increase in output. This has been falling for the regulated industries as the basic fixed capital plant has been built up. Internal investment is the financing of investment from "ploughed-back" profits and from depreciation reserves. It was not important in the regulated industries at the beginning of the period studied by Ulmer, but the significance particularly of depreciation reserves has been increasing steadily despite price inflation. Both these developments point in a single direction: declining relative or even absolute demands for outside capital investment by these industries. Or in different words, Ulmer expects the regulated industries to play a

consistently smaller role as outlets for the public's savings.

This reviewer believes that the author feels that the regulated status of the industries concerned has had little effect on these results and predictions. This is a topic of considerable controversy, particularly in inflationary times, when the regulatory process may lag behind cost increases and result in partial confiscation. It is unfortunate that we do not have an explicit statement of Ulmer's position on this controversial issue. Perhaps National Bureau policy is responsible for avoiding it, since it involves a good deal more than "the facts" of the case.

MARTIN BRONFENBRENNER

Professor of Economics
University of Minnesota

ROLAND I. ROBINSON. *Postwar Market for State and Local Government Securities*. Pp. xxiv, 227. Princeton, N. J.: Princeton University Press, 1960. \$5.00.

This study of the postwar market for state and local government securities is the first to be published in a series of studies on the postwar capital market in the United States being undertaken by the National Bureau. Companion studies of the markets for Treasury securities, corporate securities and loans, and residential mortgages will serve to complete the investigation of postwar capital markets.

In the course of the present study, Dr. Robinson considers in detail the problems of the market, the demand for funds by state and local governments, the supply of funds by investors in the securities of these governmental units, the marketing of new issues, the secondary market, and the tax-exempt feature of such securities. A final chapter deals with the market for tax-exempt revenue obligations—such as toll road bonds—contrasted with the full faith and credit obligations of state and local units.

Much of the substance of a study of this sort is concerned with technical details of the market which, though highly important, are of little interest to the general reader. It will suffice here to point out that data on this market are much less readily available than on the markets for

Treasury and corporate securities, which made the gathering of much of the material an arduous task. This fact makes it difficult to draw definite conclusions in some instances. Nevertheless, the information amassed by Dr. Robinson in the course of his investigation has been sufficient to make the study eminently worth the effort.

One point of general interest in this piece of research is related to the advantages derived by state and local units through the tax exemption feature applicable to interest on their securities. In this connection the author demonstrates that the tax-exempt feature has favored investors far more than the issuing governmental units in recent years and that the smaller local governments, which need help the most, derive very little benefit therefrom. Dr. Robinson suggests that a direct subsidy by the federal government, equal in dollar amount to the savings afforded by tax exemption, would save the federal government a goodly sum and permit the benefits to be disbursed in a more equitable manner in accordance with the need of the local governments.

From a purely financial standpoint, a direct subsidy would doubtless save the federal government a substantial amount, and, from an ethical standpoint, the funds might be more equitably disbursed. From a political viewpoint, however, it would mean further concentration of power in the central government, a disadvantage which, in the reviewer's mind, would far outweigh any possible benefits. Also, it is highly improbable that such a subsidy, once instituted by the federal government, would for long be confined to the dollar savings now accruing to the state and local units through the tax-exempt feature.

ROY B. HELFGOTT, W. ERIC GUSTAFSON,
AND JAMES HUND. *Made in New York:
Case Studies in Metropolitan Manufac-
turing*. Pp. xv, 388. Cambridge, Mass.:
Harvard University Press, 1960. \$6.75.

This is the second volume in the New York Metropolitan Study, a series devoted to analyzing the forces shaping the tri-state

area comprising the nation's largest and most complex metropolitan region. It amplifies the summary of the characteristics of the region's manufacturing economy presented in the initial study, *Anatomy of a Metropolis*, by examining three key industries—women's and children's apparel, printing and publishing, and electronics—to discover how they respond to interacting economic, social, and cultural forces.

In each case, the approach is similar: the past, present, and future of the industry is surveyed to find meaningful generalizations which account for the rise and decline of particular segments of that industry in the region.

Despite their diversity, these industries exhibit similar patterns of growth and dispersal. In each, there has been an exodus of lines closely associated with intensive division of labor, employment of low-wage and unskilled workers, standardization of products, and large-scale production. The geographic advantage of the Midwest in a nationwide market has also played a part. The city has retained its attractiveness, however, for branches of industry producing unstandardized products, such as fashionable garments, magazine articles, or brief assemblies, and producers of goods whose volume is small or unpredictable, such as women's high fashion shoes or military electronics. The region offers a common pool of materials, equipment, and skilled labor which can provide such producers with specialized goods or services on short notice when sudden demand arises. The presence of such facilities, in turn, generates certain economies, for it reduces the need for investing in specialized equipment or hiring technicians on a permanent basis. In addition, the concentration of interlocking industries in a small area facilitates face-to-face communication, so necessary for constant buying, selling, consulting, adjusting, checking, and the like. When unstandardized products, such as high style dresses, magazine advertisements, and electronic rocket equipment, are being produced.

To leave the impression that this book does no more than trace impersonal economic forces would be distinctly unfair, for each author has an intimate understand-

ing of the industries he surveys and manages to convey some of their color and spirit. In this sense, this volume of industrial case histories can be read not merely as part of a series, but as an individual study of three important industries that account for some 28 per cent of the manufacturing jobs in the region. It offers, in its own right, a solid contribution to the literature on the economy of the metropolis.

FREDERICK SHAW

Board of Education of
the City of New York

BENJAMIN CHINITZ. *Freight and the Metropolis: The Impact of America's Transport Revolutions on the New York Region*. Pp. xv, 211. Cambridge, Mass.: Harvard University Press, 1960. \$4.50.

This volume is one of a series dealing with the New York Metropolitan Region. It is concerned with the impact of freight transportation on the growth and structure of the area. The first three chapters relate to New York as a port through which flows a large part of the import and export trade of the country. These chapters describe the early rise of New York as a port; its relative decline—though continued absolute growth—since the Civil War; and its future in the foreign trade of the country. The port's relative decline is attributed to (1) geographic shifts in population; (2) the reduction in its margin of superiority in service over other ports; and (3) the higher costs of moving freight to and from New York as compared with other ports. It is apparent that New York could not have maintained its early dominance unless other ports and areas of the country had failed to develop their economic potentialities. For the future, a modest increase in the export-import tonnage over the next twenty-five years is predicted, but a further decline is indicated for its share of the United States total.

The second part of the book deals with the New York area as a manufacturing center. It is shown that because of the disadvantage of higher transport costs there has been a tendency for the region to specialize in industries generating little freight

in relation to employment, while industries sensitive to transport costs have tended to avoid the region. Three developments since the 1920's are noted which have been drawing industries closer to their markets. These are (1) the rise of the manufacturer's transport costs in comparison with his other costs; (2) a widening spread between the costs of transporting manufactured products and raw materials; and (3) a lowering of transport costs on short hauls relative to long hauls. These developments have caused many industries to follow population shifts, to the detriment of the New York area. On the other hand, the trend toward market orientation has brought to the populous New York area, as an important market, some establishments representing industries formerly concentrated in other parts of the country. Recent developments in transportation are noted which might slow down or reverse the trend toward market orientation of industries.

Although this study is distinctly centered in New York it should prove of interest to economic historians and economists generally because of its analysis of economic factors responsible for and limiting the growth of an important area.

University of Illinois

W. KLOOSTERBOER. *Involuntary Labour Since the Abolition of Slavery: A Survey of Compulsory Labour Throughout the World*. Pp. 215. Leiden, Netherlands: E. J. Brill, 1960. No price.

The major purpose of this excellent survey is to appraise the validity of H. J. Nieboer's theory, as expressed in *Slavery as an Industrial System* (1900), that slavery, or compulsory labor, is associated with conditions of "open resources," free land or other means of sustaining life or making a living without the help of capital. Where the living is easy, primitives dislike to work merely for money. They are not interested in improving their economic status or in helping to develop the resources of their country. Thus if they are to work beyond the necessary minimum, somebody has to make them. This task has been undertaken

BARNES & NOBLE

Announcing an important new series

UNIVERSITY PAPERBACKS

UP

This is a new reprint series comprising important works in such varied fields as literature, history, the social sciences, and many others—selected from the works of outstanding authors to meet academic need on the student and faculty levels. The books are each 5½ x 8½, with high-gloss covers. They are all complete, unabridged, and contain the same illustrations as the original editions.

GREEK POLITICAL THEORY

Plato and His Predecessors
Ernest Barker. "Barker writes a clear style free from . . . pedantry . . . and further, he writes as a man moving in the world of today."—*The Saturday Review* \$1.95

A HISTORY OF POLITICAL THOUGHT IN THE SIXTEENTH CENTURY

John W. Allen. "It is solidly based on an examination of the sixteenth-century ecclesiastics and philosophers whose debates are far from having lost their practical importance."—*The Spectator* \$1.95

AN INTRODUCTION TO SOCIAL PSYCHOLOGY

William McDougall. The first successful attempt to replace the philosophies of Bentham and Mill by a consistent theory of human motives. \$1.95

A SOCIAL HISTORY OF THE AMERICAN FAMILY

Arthur W. Calhoun. Social codes and customs from the Colonial period through the Civil War to 1918. "Undoubtedly the most complete treatise on the subject yet produced."—*American Historical Review* 3 vols., each \$1.75

THE CONCEPT OF MIND

Gilbert Ryle. "It is one of the most stimulating essays in philosophy published during the past quarter of a century."—*The Nation* \$2.25

POLITICAL IDEAS OF THE AMERICAN REVOLUTION

Britannic-American Contributions to the Problem of Imperial Organization 1765–1775

Randolph G. Adams. With New Commentary by Merrill Jensen. "The republication of Randolph Adams' book is welcome not only because it brings again to our attention a truly seminal work but also because Mr. Jensen's commentary has added considerably to its significance."—*So. Atlantic Quarterly* \$1.50

THE SACRED WOOD

T. S. Eliot. \$1.25

FORM AND MEANING IN DRAMA

Humphrey D. P. Killo. \$1.95

LANDMARKS IN RUSSIAN LITERATURE

Maurice Baring. \$1.25

SHAKESPEARE'S TRAGIC HEROES

Lily Bess Campbell. \$1.95

Ready Early 1961:

ARCHAEOLOGY AND SOCIETY

Grahame Clark. How archaeologists find and explore prehistoric sites, and how they are able to reconstruct the lives of the people who lived there. Lavishly illustrated. \$1.95

THE HISTORY OF THE ENGLISH PEOPLE IN THE NINETEENTH CENTURY

Elie Halévy. "It is quite impossible to over-praise his work or to exaggerate its importance."—*The Observer* 6 vols., each \$1.95

MOLDERS OF THE MODERN MIND

Robert B. Downs. An authoritative summarization of the great books that shaped our civilization. \$1.95

AN INTRODUCTION TO THE FRENCH POETS

Geoffrey Brereton. \$1.95

pulsory labor with their attendant abuses of fundamental human rights do not disappear through legislative reform. Such undesirable conditions can be eliminated only through the slow process of education and the countervailing power of organized labor. Entrepreneurs and managers must be helped to realize that genuine progress can be accomplished only by seeking to develop voluntary co-operation and by learning how to work effectively with rather than through people.

Two minor criticisms may be made about Kloosterboer's book. In a survey of compulsory labor throughout the world, one misses a discussion of conditions in China and other Far Eastern countries. The book would also be more useful if the author had provided a Subject Index.

But such criticisms do not detract from the value of Kloosterboer's work. His survey is both scholarly and timely.

PAUL FIGORS

Professor of Industrial Relations
Massachusetts Institute of Technology

WALTER GALENSON. *The CIO Challenge to the AFL: A History of the American Labor Movement 1935–1941*. Pp. xix, 732. Cambridge, Mass.: Harvard University Press, 1960. \$9.75.

Professor Galenson's excellent volume is a welcome addition to the literature dealing with the formation and early years of the Congress of Industrial Organizations (CIO) and the rise of unionism in the mass production industries. Some of the earlier works dealing with this period were strongly partisan, as contrasted with Galenson's more objective and scholarly approach. He has profited also from the use of sources, including minutes of the American Federation of Labor (AFL) Executive Council and of the CIO, that were not available to earlier writers.

After presenting a background discussion of the AFL-CIO split and the relations between the two federations in the years that he surveys, Galenson devotes separate chapters to unionism in the industries of greatest interest to him. Twelve of these—steel, automobiles, coal mining, electrical and radio manufacturing, rubber, men's

clothing, women's clothing, textiles, meat packing, lumber, petroleum, and maritime—were those in which the CIO was dominant, whereas only five chapters, dealing with the Teamsters, the Machinists, the building trades, printing and publishing, and railroads, are devoted primarily to AFL unionism, and some of these receive rather sketchy treatment. It is evident that the main title of the volume is more descriptive of the contents than the subtitle. A summary chapter deals with such general aspects of the labor movement as membership, finances, strikes, political action, legislation, corruption, attitudes toward Negroes, agricultural unionism, and foreign affairs.

The volume treats differences of opinion within each of the federations as well as the major conflict that raged between them. The dependence of the CIO upon government help in organizing mass production industry is emphasized, as is the change in structure of some of the leading AFL affiliates in response to the CIO threat. The present merged federation, the author suggests, is far removed from the AFL of Gompers and Green in terms of concepts of jurisdiction and national union sovereignty, as well as in size of staff, degree of authority, and type of political action.

Economic factors affecting an industry, Galenson believes, were often more crucial than the social philosophy of the union leadership in determining organizational success. Yet dynamic leadership, such as that furnished by John L. Lewis, was needed to take advantage of an organizing opportunity. It is equally clear, in this account, that Lewis bore major responsibility for the split into rival federations.

Galenson has made exhaustive use of sources, both primary and secondary, and unpublished as well as published, and has documented his discussion with almost seventy pages of notes and references. His work is as carefully done as it is thoughtful and judicious. The student of industrial relations will find in it a full and impartial record of an important era in labor history.

JOEL SEIDMAN

Professor of Industrial Relations
University of Chicago

HENRY PELLING. *American Labor*. Pp. vi, 247. Chicago: University of Chicago Press, 1960. \$5.00.

This brief survey of American labor, from the colonial era to the Labor-Management Reporting and Disclosure Act of 1959, is one of a series published as the Chicago History of American Civilization. The author, Henry Pelling, is an Oxford social historian who has written extensively on the British labor movement.

Mr. Pelling tells us that *American Labor* was written during the course of a single summer, and it obviously does not pretend to be an original piece of research. The purpose was rather to present in simple form the main features of American working life, the broad sweep of labor's organizational development, the unique aspects of the American labor scene. Standard sources were used, and the interpretation advanced will be quite familiar to the American student.

One might quibble with the author about his facts in a few places. There is a great deal more than "little doubt" that John L. Lewis was responsible for the failure of the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) unity negotiations in the nineteen-thirties; the formidable figures of Hutcheson and Wharton were looming in the background just in case Lewis weakened. The United Mine Workers flirted with the AFL in 1943, and the author leaves the impression that their efforts to affiliate came to nought. Actually, their application for membership was renewed in 1946, and this time was successfully consummated, although Lewis withdrew soon after. In general, however, Mr. Pelling handles his facts in an exemplary manner, and this, combined with a lucid style, makes the volume ideal for textbook purposes.

If *American Labor* had been published in paperback form at \$1.50 instead of in hard covers at \$5.00, I should have assigned it unhesitatingly in my introductory labor course. However, in view of the price, it does not enjoy any particular advantage over the one-volume histories of Dulles and Rayback. It is a pity that the cost

factor should thus limit the usefulness of a very worth-while book.

WALTER GALENSON
Professor of Industrial Relations
University of California

E. M. HUGH-JONES (Ed.). *Human Relations and Modern Management*. Pp. x, 256. First American Edition. Chicago: Quadrangle Books, 1959. No price.

Because five of the eight contributors to *Human Relations and Modern Management* are European or English, the book, which is the introductory volume of a series called Studies in Industrial Economics, presents viewpoints on management that might otherwise remain unfamiliar to the American reader. In the Introduction, the editors of the series, E. M. Hugh-Jones, University College of North Staffordshire; J. L. Meij, University of Groningen, Holland; and J. P. Miller of Yale, declare their purpose to be the study of the problems of "the micro-world of the firm, and the influence of its behaviour on society as a whole" by "interchange of ideas and results on an international basis."

In view of the development of the idea of economic community in our time, the text offers Americans interested in business a timely opportunity to compare notes with their foreign colleagues.

With one or two exceptions the over-all quality of the papers is high, and not infrequently the European contributors express themselves better than do their American counterparts. It is the reviewer's impression, however, that the more abstract essays dealing with topics like fundamental principles of management and industrial social systems do not succeed so well as the more empirical presentations.

Two outstanding chapters are those by R. W. Revans, of the University of Manchester—on "Human Relations, Management, and Size," and E. F. L. Brech, well-known English management consultant,—on "Human Relations in the Board Room." Professor Revans calls attention to the statistical fact that in the British coal industry the number of accidents increases more than in proportion to the size of the mine,

while in the United States practically the opposite is the case. As a revealing explanation he suggests that "morale begins at the top and is in some way transmitted through the management structure down to the very coalfaces where the men work; further analysis of the records shows beyond doubt that junior managers tend to pass on the quality of treatment that they themselves get at the hands of their superiors."

Mr. Brech's excellent study of the board room is also concerned with the role of executive management in setting the tone of a business enterprise, but his approach is horizontal rather than vertical. With the aid of a number of cases he diagnoses the infirmities of management at its highest level. This discussion is both interesting and informative. He seems to locate the failings of the corporate high command in the temperament of the "old man."

Part of Mr. Brech's study deals with the politics of the board of directors and top executive management. However, he also discusses some of their attitudes towards the corporation as an institution. He believes that as a group they have generally been too absorbed with "technical problems of production or research, or actively immersed in major sales activities. He discerns a "lazy" attitude towards the work force, traceable perhaps to the days of labor surplus in the 1920's and 1930's.

A short list of references following each chapter offers wider reading in English and European publications.

RICHARD EELLS

Public Policy Research
General Electric Company

ARTHUR M. ROSS AND PAUL T. HARTMAN.
Changing Patterns of Industrial Conflict. Pp. x, 220. New York: John Wiley & Sons, 1960. \$6.50.

Ross and Hartman analyze patterns of industrial conflict in fifteen countries by using six comparative statistical measures: union membership as a percent of nonagricultural employment, number of workers involved in strikes as a percent of union

membership, the involvement ratio—the ratio of workers involved in strikes to the number of nonagricultural employees, the duration of strikes, the loss of time by strike per hundred union members, and the average loss of time per hundred nonagricultural workers.

The relationship between membership involvement and the duration of strikes is found as the most significant, and it is used to define four distinctive patterns of conflict characterizing the industrial relations of this century. The derived patterns are a northern European pattern—with a first and a second variant, a Mediterranean-Asian pattern based on data from France, Italy, India, and Japan but with broad applicability to most of the underdeveloped countries, and a North American pattern. Australia, Finland, and South Africa are seen as *sui generis* and discussed separately.

The central finding of the study is that "strike activity is declining generally throughout much of the industrialized world." The "withering away of the strike" characterizes northern Europe and is most notable in Denmark, Germany, The Netherlands, and the United Kingdom which make up the first variant of the northern European pattern. Here the data show very low membership involvement and strikes of short duration. The abandoning of the strike as a form of industrial conflict is less obvious in other areas but sufficiently clear to justify the authors' contention.

But why fewer strikes? The answer is found in the changes of the essence of the various industrial relations systems, including the rise of workers' conservatism—a corollary of higher incomes; union maturity—with which come lessened factionalism, changes in employers' attitudes and policies; and, in a major way, in a worldwide expansion of the role of the state. Each of the causes is discussed in broad general terms as well as in specific details. Though moderately stated, the conclusions are clear and forthright; they show insight and full realization of the complexities of the issue. Thus, on the role of the state—

a knotty issue on which opinion is divided and about which much has to be written—the authors conclude: “. . . but sustained and purposeful human effort generally achieves its objective to some extent, and we see no reason to doubt that the repeated efforts of governments throughout the world to reduce overt manifestations of industrial conflict have had a certain amount of success. . . .”

The book can be said to be divided into roughly equal parts: (1) The first six chapters dealing with the general argument, the data with their shortcomings and limitations, the techniques, the findings, and the theoretical and methodological issues; (2) The five following chapters describing in greater detail the relationships between economic and political institutions and strike activity in each of the countries studied; and (3) The final chapter dealing primarily with the study's implications for the United States and concluding that here, strike activity “may well increase” periodically, but will continue to diminish over a longer period of time. The “withering away of the strike” in European fashion is not envisaged.

Scholars, practitioners, and policy-makers—even though aware of the general drift of strike frequencies—will profit greatly by reading the book. *Changing Patterns in Industrial Conflict* should be widely used as supplementary reading in basic college instruction about labor; it should be required reading for all students majoring in labor; and it is a must for the specialist in comparative labor and labor theory.

ROBERT EDWARD LEE KNIGHT. *Industrial Relations in the San Francisco Bay Area, 1900-1918*. Pp. x, 463. Berkeley and Los Angeles: University of California Press, 1960. \$6.50.

With Dr. Ira B. Cross leading the way in his *Collective Bargaining and Trade Agreements in the Brewery, Metal, Teaming, and Building Trades of San Francisco and History of the Labor Movement in California*, a number of studies have dealt

with various facets of these interesting relationships. Professor Robert Knight has made a valuable contribution to an understanding of industrial relations by centering his study upon the San Francisco Bay area and by limiting the period from 1900 to 1918. By doing this he has been able to delve deeply into the economic and social relationships that made San Francisco a “union city.” The successive steps by which this was accomplished, especially the successful millmen's and waterfront strikes of 1900 and 1901, respectively, were important labor advances leading to union acceptance by the San Francisco community.

Professor Knight has successfully sought answers to questions such as why the San Francisco employers were either unable or unwilling to fight for the open shop, and why the community was inclined to be sympathetic in its attitude toward the unions. He points out that in this cosmopolitan area, the reasons lie in the basic customs and habitual standards of the people, in the composition of the population, and in the geographical location of the city. The San Franciscans were liberal and democratic from the earliest days, and they were far separated from competition from the East. As a result, not only could the employers accept unionization without fear of competition from outside, but there were positive advantages for them in the union shop because wages and purchasing power were high; there were long periods of industrial peace; and the unions were, in general, trustworthy. This trustworthiness extended so far that the people granted the unions political power during the years that P. H. McCarthy was mayor of San Francisco.

The San Francisco Labor Council and the San Francisco Building Trades Council, as might be expected, occupy the center of the stage, and considerable attention is given to the activities of their officers and the actions of these bodies, but the East Bay labor councils and unions are not neglected. One of the most valuable aspects of the study is the careful attention given to the various employers' organizations; the foundation of the present multi-employer type of bargaining was laid in these years.

The reader will be impressed with the careful evaluations that Professor Knight has given to the roles of the labor leaders and to those of the leading representatives of the community. The labor leaders were guided very strictly by “business union” principles; the leading representatives of the community frequently turned the balance of power in favor of the unions.

Any community, possibly, may have particular aberrations, and San Francisco's departure from the normal came with the Mooney and Billings case, which Professor Knight describes and evaluates. Human behavior is such that some San Francisco employers continue to say to the present day, in spite of the weight of evidence on the other side, that Mooney and Billings were guilty. The conservatives' fear of radicalism neither dies nor fades away.

FREDERICK L. RYAN

Professor of Economics
San Diego State College

JOSEPH W. GARBARINO. *Health Plans and Collective Bargaining*. Pp. xi, 301. Berkeley and Los Angeles: University of California Press, 1960. \$5.00.

More than twelve million workers are enrolled in health insurance plans in which unions have a voice. Since most of these arrangements include workers' dependents, it is estimated that more than one-fourth of all persons covered by health insurance participate in plans influenced by unions. As the title of Dr. Garbarino's book indicates, his study includes health systems that are a result of collective bargaining.

Actually, the title is somewhat inaccurate since the writer also includes health plans that have not been negotiated by unions and management. Moreover, most of his research is devoted to medical and hospital insurance around the San Francisco Bay Area. California and the Bay Area are to some extent different from the rest of the United States in respect to health insurance. In the first place, it is doubtful whether any state has had a governor who was such a formidable supporter of compulsory state health insurance as the present Chief Justice, Earl Warren. Secondly, the Kaiser Foundation has been open to the public in the Bay Area since 1945. Through its own staff, hospitals, and

outpatient centers it offers comprehensive medical, surgical, and hospital policies covering 85 to 90 percent of all expenses. These factors furnished unions around the Bay Area important leverage in negotiating with the county medical societies, especially in the late nineteen-forties. Every expansion of Kaiser facilities continues to be a powerful weapon for organized labor in bargaining with the medical profession.

To this reviewer, two of the most interesting sections of the book are Chapters VIII and XI. Chapter VIII deals with the Pittsburg, California, incident of 1953. Here the reactions of the medical profession to a union local negotiating with the Kaiser Foundation Health Plan somewhat resembled management tactics in a strike. Fearful of losing substantial income, the Pittsburg private practitioners made several counter offers and attacked union officials through such devices as full-page advertisements, direct mailings, handbills, and speeches.

In Chapter XI, the author attempts to predict the future of health plans. Some unions, particularly those which are dissatisfied with their present contracts, he believes, will support a comprehensive federal program for the entire nation. However, Professor Garbarino predicts that most unions will work for governmental programs as a supplement to their negotiated plans. According to him, these organizations will also generally support the “category approach” to legislation selecting such problem groups as the recipients of old age pensions.

Students of health plans, especially those related to organized labor, will find this objective study most useful.

MELVIN J. SEGAL

AMERICAN GOVERNMENT AND HISTORY

ROBERT H. CONNERY and RICHARD H. LEACH. *The Federal Government and Metropolitan Areas*. Pp. x, 275. Cambridge, Mass.: Harvard University Press, 1960. \$4.75.

This volume is the first serious effort by political scientists to outline and analyze the proper relationship of the federal government to the many difficult and complex problems confronting the metropolitan areas of the United States. Since probably two thirds of our people now live in these areas the book should be of value to everyone seriously interested in American government.

The authors are respectively Professor and Assistant Professor of Political Science at Duke University. While neither has special competence in the urban intergovernmental area, both are well-trained scholars who deal with their subject objectively.

The chapter headings indicate the scope of the work. The nature of federal programs is first described: housing, water resources, air and water pollution control, airports, military installations, civil defense, highways, and recreation. One wonders why urban highways are discussed, and metropolitan area education omitted.

There follow chapters on "The Representation of Metropolitan Interests in Washington;" "The Congress and Metropolitan Areas;" "Presidential Leadership;" a discussion of the advantages and disadvantages of a department of urban affairs; and, finally, "The Case for Federal Action."

The authors conclude, not surprisingly, that "metropolitan problems cannot be solved without federal leadership;" that "to date, no President has exerted himself in behalf of an attack on metropolitan problems;" and that because rural interests dominate Congress "there is little likelihood of effective action in the long run unless leadership is exerted from the White House."

The final chapter contains a series of recommendations based largely on a somewhat pessimistic prognosis of the chances of immediate effective political action.

It is most ungracious for a reviewer who is mentioned favorably six times in the book to speak critically of a volume so soundly conceived and written. Yet cannot compel the statement that the authors suffer from that same political lag which they deplore in urban, congressional, and presidential leadership. Moreover, Mes-

sieurs Connery and Leach are on sounder ground when they outline the problems than when they suggest the solutions. Perhaps this is due to their inexperience on the firing line: For example, as these lines are written the bill to establish a department of metropolitan affairs, which the authors contend is not politically feasible, is on the Senate calendar with a favorable committee report. The Democratic Platform promises to "give the city dweller a voice at the Cabinet table by bringing together within a single department programs concerned with urban and metropolitan problems." A specific "ten year action program to restore our cities and provide for balanced suburban development" is outlined. The Republicans can hardly do less in their platform without opening themselves to the charge of turning their backs on the metropolitan areas of America, which will gain them few votes.

There is a real chance for effective federal action in the next twelve months. Those who are interested in following the fight intelligently will be well advised to read this book even if they find some of its conclusions less than persuasive.

JOSEPH S. CLARK

United States Senator
from Pennsylvania

WILLIAM BURLIE BROWN. *The People's Choice: The Presidential Image in the Campaign Biography*. Pp. xiv, 177. Baton Rouge: Louisiana State University Press, 1960. \$4.00.

In a time when there is much discussion of campaign techniques and a bumper crop of biographies of presidential hopefuls has just been produced, a study of campaign biographies of candidates for the American presidency is a timely contribution. *The People's Choice* states that such biographies have been a feature of every campaign since 1824 and attempts to: 1) present the appeals they have made and note the changes between 1824 and 1960; and 2) "attempt to relate each appeal and its evolution to the society toward which it was directed." For example, the reader is given some conception of how popular

America as a Mass Society

AMERICAN SOCIETY

by DON MARTINDALE,
Professor of Sociology,
University of Minnesota

Organized around the theme of mass society, this new introductory text from *The Van Nostrand Series in Sociology* portrays the dramatic changes in 20th century America with their accompanying liquidation of traditional values.

Professor Martindale marshals historical and comparative materials that relate the distinctive aspects of American society to the development of Western civilization; provides four rich chapters on the institutions of play and the arts in 20th century society; extends the theory of community; and presents a new approach to the theory of institutions. Careful discussion of such concepts as social control and community provides an intellectual challenge to beginning sociology students.

1960, 570 pages, \$6.75.

Algeria—An Impartial View

ORDEAL IN ALGERIA

by RICHARD M. BRACE,
Professor of History,
Northwestern University,
and JOAN BRACE

Ordeal in Algeria represents one of the first attempts to write an impartial account of the controversial French-Algerian problem. Carrying the story to the brink of the present (the uprising last January and the changes wrought by it), the authors paint a vivid picture of the tragic struggle which touches on so many important aspects of modern history. The result is a clarification of the complex issues behind the war for independence and a documented account of the fantastic machinations that destroyed the Fourth Republic and threaten the Fifth.

November, 450 pages, \$4.95

pose, an effort to secure preferment, access to a winner, or what. Indeed, the study proceeds to show that many campaign contribution situations do not involve persons at all but are gifts to a National Committee or to some special referendum purpose—to tax chain stores, to regulate the oil business, to promote socialized medicine, or whatever it may be the dollar-giving voter wants.

Dean Heard's work is a mine of information, competently constructed for maximum utility to the researcher, the student, or the general reader. He has assembled a wealth of detail that is difficult to obtain, and offers his analyses of this material in a clear, concise style. In the present state of the social sciences, it gives one real pleasure to read a book in which the author can tell what someone said in an interview without asking the reader to "... 'cognize' conscious verbal materials. ..."

RICHARD M. SCAMMON

Governmental Affairs Institute
Washington, D. C.

GEORGE S. BLAIR. *Cumulative Voting: An Effective Electoral Device in Illinois Politics*. (Illinois Studies in the Social Sciences, Volume 45.) Pp. xi, 145. Urbana: University of Illinois Press, 1960. No price.

The cumulative voting form of minority representation has prevailed in elections to the Illinois House of Representatives since 1870 and in nominations to that body since 1910. Its essence is the use of three-member districts in which the voter is permitted either to divide his three votes among as many persons as are to be chosen or to consolidate his support behind a lesser number, even to the extent of casting his entire vote for a single candidate. The result is that each representative district regularly elects two members from the dominant party in the area and one from the local minority.

That result alone would cause many to concur in the Blair identification of cumulative voting as an effective device, since the original motivation was displeasure with a North-South sectionalism that produced phantoms of Republicans from one part

of the state and Democrats from the other. In addition, the compelled minority representation divides the aggregate party delegations in quite precise accord with the parties' proportionate state-wide strength. An incidental characteristic is that most representatives are re-elected despite political upheavals, so that the average level of legislative experience is uniformly high.

Most objections to cumulative voting are analyzed in the Blair volume and deemed to be neither inherent defects nor traceable exclusively to the minority representation device. We are thus informed not to place particular emphasis on the lack of November contests in half the districts, because this is a result of the frequency with which the majority party in an area chooses to nominate but two candidates and the minority party a single contender. Such other manifestations as difficulties in counting the variously marked ballots and the tendency for cumulative voting to mean a narrow working majority for the party in power are also minimized.

The volume under review covers the period extending to 1956, when the Illinois General Assembly was reapportioned and redistricted for the first time since 1901. This alone suggests that anything like an unqualified endorsement of cumulative voting should be deferred pending an opportunity to examine the reciprocal impact, under twentieth-century conditions, of district realignment and assured minority representation on a district basis.

More than that, the competently framed and executed Blair study is still not sufficiently comprehensive to provide full insights into intraparty behavior under the conditioning influence of cumulative voting. What kinds of groups and candidates really benefit from a minority representation formula applicable at the nominating stage? And for the November election, what is the effect of being unable, in the typical case, to disassociate efforts for increasing the size of the party delegation from the risk that an added nominee will only unseat one of the party's incumbents?

JACK F. ISAKOFF

Professor and Chairman
Department of Political Science
Western Reserve University

MURRAY B. LEVIN. *The Alienated Voter: Politics in Boston*. Pp. viii, 84. New York: Holt, Rinehart and Winston, 1960. \$1.25.

This is a case study, with an interpretation and analysis, of the Boston mayoralty election of 1959. That election provided an unusual opportunity to investigate the nature and size of the phenomenon known as political alienation—an attitude in the electorate that it is "politically powerless, because it believes that the community is controlled by a small group of powerful and selfish individuals who use public office for personal gain." Many of the partisan, religious, sectional, and other factors that are common in elections were not present in this one: both of the candidates were Irish, Catholic, Democratic politicians, natives of Boston. The election, moreover, occurred in an off year, when the candidacies of nominees for national and state offices did not bring broader issues than Boston problems into the campaign.

One candidate, John E. Powers, had ample campaign funds and obtained endorsement from most of the leading figures in Boston religious and political life. The other, John F. Collins, called his opponent's campaign "power politics" and used the underdog appeal in his own. He won.

With the support of the Boston University Graduate Fund, a public opinion survey—data are given in the Appendix—was conducted three days after the election. Boston is "a sick city," and the results of the survey clearly showed that at least in Boston a strong attitude exists that the situation is hopeless: "Of those who voted for Powers, 43 per cent thought he would be no better when in office than Collins, while 57 percent of those who voted for Collins thought he would be no better than his opponent." The attitude of hopelessness increased with age: "The older voters, particularly the group over 50, who have lived in Boston for a long time, are more cynical about the political process. This group tends to believe more strongly than younger voters that the candidates are not very different and that all politicians are insincere and corrupt. Many of them expressed the view that they have seen too many

mayors come and go to believe that an election makes much difference." The book analyzes the attitude further in terms of the social and economic status of the voters.

The dangers to democracy of widespread feelings of political alienation are obvious. The present work offers the suggestion that a more realistic theory of democracy should replace eighteenth-century theories, and that "a re-examination and reorganization of the political structure is also indicated."

DAYTON D. MCKEAN

Professor of Political Science
Dean, Graduate School
University of Colorado

GLENDON A. SCHUBERT. *Constitutional Politics: The Political Behavior of Supreme Court Justices and the Constitutional Policies That They Make*. Pp. xvi, 735. New York: Holt, Rinehart and Winston, 1960. \$8.50.

Professor Schubert has produced a pioneering text, and it is almost axiomatic that pioneering efforts are given a "yes, but" reception. The author describes his book as a "behavioral approach to the Supreme Court," and thus invites criticism both from the antibehaviorists and from the splinter factions among the behaviorists themselves. He is writing about the political role of the judiciary, and thus can be assailed, even if largely *pro forma*, by those who profess that the judicial process is not political. He has taken a definite position—in favor of the court's assuming a dynamic role in national policy—and thus cries havoc upon the classic concept of a judiciary which was supposed, although it never really did, to confine its function to what Mr. Justice Holmes once described as applying legal litmus paper to constitutional issues.

This is a text about the Constitution suited for political science majors and pre-law students, and as such it focuses, as the author explains in his Preface, "upon the decision-making behavior of Supreme Court Justices, and upon the policy-making role, in selected major areas of substantive constitutional politics, of the Justices as a group and as the formal leaders of a governmental agency." While the substance

of the major constitutional opinions is included in the book, emphasis is on "how and why the Supreme Court makes certain decisions (i.e., chooses certain policy alternatives in preference to others), and with what consequences."

As such, the text is excellent—a much better approach, indeed, than preparing a casebook in the law school tradition for nonlegal students. The work should help advanced undergraduates to understand the mechanics and strategy of the judicial process, the general philosophy of constitutional adjudication as reflected in the Frankfurter and the Douglas-Black schools, and the practical politics of spelling out a specific constitutional rule. The author acknowledges the recent work of Jack W. Peltason, C. Herman Pritchett, Alpheus T. Mason, and others in this area, but his book stands on its own particular merits.

The organization of the book is sufficiently efficacious to be worth special mention; the subject is divided into four major topics: The mechanics of staffing and operating the court in the federal system; the practical position of the judiciary in a government of separated powers; the basic constitutional principles arising from the federal-state relationship; and these principles as they apply to relationships between government and the individual.

Professor Schubert's tables and statistics will evoke the most violent criticism. The mildest protests will be issued against the breezy captions for some of these, for example, "Pay-Off Matrix for the Hughberts Game." Arguments that both the statistical and political analyses in some of the charts are "wrong" will be more pertinent. The most anguished outcries will be over five "scalograms" of as many civil rights issues, mostly involving the Warren court, which the author has reserved for the end of his text where he perhaps hopes that the student will be sufficiently prepared to follow his analysis.

On the whole, this reviewer would give this book a "superior" rating. He would like his own students in a law school course on the Constitution to have studied such a book in a prelaw political science seminar, although at the same time agreeing with the book's anticipated critics that it

should be used with caution. He is reminded of the example of a brilliant social psychologist under whom he once studied, who made it clear that the course lectures would be entirely in support of the instructor's challenging theory of institutional psychology, but the required reading would be entirely devoted to the criticisms of this theory. Whoever uses the present book in a similar manner ought to have a highly rewarding result.

WILLIAM F. SWINDLER
College of William and Mary

G. THEODORE MITAU. *Politics in Minnesota*. Pp. 140. Minneapolis: University of Minnesota Press, 1960. \$1.95.

Despite its brevity, this book covers a wide range of topics. Included among them are party patterns and leaders; the election laws of Minnesota and party organization in that state; an analysis of the so-called "nonpartisan" legislature; and an examination of some of the more important pressure groups operating in the legislature. In addition, there are biographical sketches of Minnesota's members in the national Congress, a list of the governors and their terms of service, and several pages of voting statistics. For those who are interested in more extensive reading, there is an excellent Bibliographical Note.

The book does not describe the actual organization of state and local governments, nor does it cover government operation. Moreover, there is only a very limited discussion of issues.

The political situation in Minnesota is particularly significant since the percentage of voters who habitually split their tickets or who switch allegiance several times in a lifetime seems to be unusually large. As the author points out, this means that "no party can rest on its laurels." Constant readjustment and readaptation are necessary. Under these circumstances, one might expect the two political parties to pull toward the middle-of-the-road and to take very nearly identical positions on issues. Apparently this has not been quite the case. The Democratic-Farmer-Labor party has been "New Dealish" and closely associated with the liberal wing of the national Demo-

cratic party. It has been committed to high and fixed supports for farm products. It has also favored the protection of the rights of organized labor, more social welfare services, and an international emphasis in foreign policy. The Republican party, on the other hand, has been more conservative on economic matters and more sympathetic to private rather than governmental responsibility. Similar differences are apparent on the state level.

As Professor William Anderson points out in the Foreword, "There must be many citizens of Minnesota and many political observers elsewhere, who have long felt the need for just such a book as this—a brief, systematic, reliable, and up-to-date account of politics in Minnesota." Similar studies would be equally valuable in many other states, if made by people who are well qualified for the task. It is obvious throughout this volume that Mitau is well qualified and that he has made an authoritative contribution to greater political understanding.

E. ALLEN HELMS
Professor and Chairman
Department of Political Science
Ohio State University

GILBERT Y. STEINER AND SAMUEL K. GOVE.
Legislative Politics in Illinois. Pp. x, 208. Urbana: University of Illinois Press, 1960. \$4.50.

The late James Hilary Mulligan, author of the poem "In Kentucky," is responsible for the lines: "The landscape is the grandest/And politics the damndest/In Kentucky." In the language of the conventions, Kentucky yields to Illinois.

Messieurs Steiner and Gove have produced an uncommonly good book on state politics which differs from both traditional and behavioristic analyses in two important respects. In the first place it is concerned with the policy-making process in the General Assembly of the State of Illinois and with the sources of policy leadership within the institutional framework of the Illinois state government. It is neither a manual of legislative organization and procedures nor a Freudian interpretation of the legislative product, although it deals in a thoroughly competent way with both

the mechanics and the human imponderables of legislative action. In the second place, after establishing the institutional framework, its argument is developed through a series of case studies of legislative action involving major issues of public policy, bringing into bold relief the ways in which legislative institutions and legislative behavior interact.

The first three chapters of the book, entitled "The Legislative Process," "Pressures on the Legislature," and "The Influence of Standing Committees," make explicit and clear the general conditions under which the Illinois General Assembly, and probably most state legislatures, do their work. First, the legislative output is the product of planned and managed logrolling. Second, the major pressures on the legislature are public pressures—the Governor and the Administration program and the local officials, of whom the Mayor of Chicago is not the least,—while the press and the private lobbies occupy an important, but generally secondary, position. Third, legislative policy is decided by political leaders, including leaders outside the legislature, and the free range of standing committees is far less extensive and their role as policy determinants less consequential than is the case in Washington.

The remaining four chapters of the book deal with: (1) legislative redistricting and its consequences; (2) legislative action in the reorganization of state fiscal administration; and (3) legislative proposals for judicial reorganization. The two chapters on 1955 redistricting and its consequences not only provide a highly illuminating example of the way in which forces and pressures organize themselves around so pervasive a problem in basic political power, but also constitute an interesting commentary on *Colegrove v. Green*, the Gateway Amendments, and the Illinois redistricting amendment of 1954, as well as on the federal redistricting amendment resolution recently introduced by Senator Clark. The chapter on fiscal reorganization is the story of legislative initiative in tightening financial management following the Hodge scandal of 1956. It affords many interesting comparisons and contrasts with President Truman's action in clearing the Bu-

reau of Internal Revenue of overlapping personnel. The chapter on judicial reform lends color and emphasis to what is perhaps the most significant and permanent truism of Illinois politics: "The combination of a determined Republican Governor exercising effective control over downstate Republicans and a determined Democratic Mayor exercising effective control over Chicago Democrats is more likely to produce any desired result than is any other combination of public or private interests."

ROWLAND EGGER

Chairman, Department of Political
Science
University of Virginia

DAVID J. SAPOSS. *Communism in American Politics*. Pp. viii, 259. Washington, D. C.: Public Affairs Press, 1960. \$5.00.

This volume is mainly about the American Labor party, the Wallace Progressive party, and the use of established political party machinery and the American labor movement by American Communists in their long-range propaganda program for domination in American politics.

With the prospects for world revolution dimmed, Moscow dictated a policy of working within the traditional political parties. Some gains came during the period of social unrest in the 1930's in their active endeavor in the California Democratic party and the Minnesota Farmer-Labor party. These were soon disadvantages with strong, unfavorable reaction from labor and even from some radical elements who earlier had favored direct collaboration with the Communists. The author declares that thereafter neither the Communist party nor any openly acknowledged Communist organization participated directly in what became known as Popular Front movements (p. 17). This is not a generally accepted view.

Generally the emphasis was on disguised methods through undercover activities intended to conceal the real purposes of furthering the Communist program. Their leaders resorted to camouflage, pretending to be liberals, while plotting to dominate liberal and labor groups in the interest of the Communist cause.

The emergence of the Soviet Union as

an American ally in World War II cleared some obstacles for more favorable action. Communist slogans were the slogans also of the two major parties. But dissension among the Communists and within labor's ranks ended the American Labor party as the chief vehicle for political action. The New York branch soon became the nucleus of the new Wallace party. The story of the rise and fall of Henry Wallace is a familiar one. Whether he was duped or not, his progressive movement had far more noise than strength. Perhaps convinced of their lack of voter strength, Wallace and his supporters encouraged or permitted obvious pro-Soviet groups to come into positions of party influence. But because of Wallace's resignation as party leader and the Soviet support of North Korea in the early 1950's, the party rapidly declined.

Dr. Saposs concludes by saying the American Communist movement "continues to operate as a vassal of a foreign power. . . Its success depends on the intellectual climate and lack of awareness of its true intentions" (p. 229).

This book is recommended for anyone not familiar with the American Labor party and the Wallace Progressive party. Those who look for something new will find little. The volume is readable but is hampered by excessive use of quoted materials and an exceptionally heavy reliance on newspaper sources.

ADAM C. BRECKENRIDGE

Professor of Political Science
University of Nebraska

RAY D. HENSON (Ed.). *Landmarks of Law: Highlights of Legal Opinion*. Pp. xiv, 461. New York: Harper & Brothers, 1960. \$8.50.

This collection of essays and articles is organized in two roughly equal parts. Part I, entitled "The Theory of Law," brings together a variety of modern views on the broad subject of jurisprudence. In terms of chronology, the entries range from 1897, Holmes' "Path of the Law," to 1958, Walter Probert's article, "Law, Logic, and Communication." Of the sixteen items, Holmes accounts for three, and Dean Pound, two.

In Part II, "The Substance of Law," the editor has brought together such classics as Warren and Brandeis' seminal article "The Right to Privacy" and such recent items as an analysis of the background of a 1958 decision of the Eighth Circuit Court of Appeals, involving the ownership of notes taken by William Clark in the course of the Lewis-Clark Expedition.

The editor's Introduction to the volume explains his choices by the admission that, considering the abundance of legal writing, personal taste will obviously prevail. I can only applaud his taste. To have Lon Fuller's "Case of The Speluncan Explorers" within reach on my bookshelf is a pleasure I have long awaited. Indeed it would be difficult to argue that there is any one item in the volume that one would delete—though, of course, other possible choices might be suggested.

It is, perhaps, unfortunate that the editor and his publisher chose to provide the volume with a subtitle and the jacket with a descriptive text which do not accurately reflect the contents. The jacket announces that the reader will find here "Great decisions and commentaries of this century which embody the wisdom, humor, and irony of the law in confronting human problems." But there are no decisions—though this century has had and still has some great decision writers—and I could find little that I would class as humor or irony. To the law-trained person, even the word "opinion" in the subtitle may be misleading.

But this matter of the title is a petty objection. The volume presents a fine choice and an excellent arrangement of what are indeed some of the landmarks of recent legal thought. We are in the editor's debt for having brought them together within the covers of one book.

FRANCIS H. HELLER

Professor of Political Science
University of Kansas

DAVID DALE MARTIN. *Mergers and the Clayton Act*. Pp. xii, 351. Berkeley and Los Angeles: University of California Press, 1959. \$6.00.

This volume grew out of a doctoral dissertation for the University of California,

Los Angeles. The author is now Associate Professor of Business Economics and Public Policy at Indiana University. He tells the story of Section 7 of the Clayton Act—the antimerger section—to the most recent available date, focusing his account closely on that one section. He traces the legislative history of its enactment as part of the 1914 antitrust legislation, its emasculation by judicial decisions, the legislative history of the 1950 amendment, and its more successful enforcement, including some lower-court decisions. When and if fresh Supreme Court decisions become available, a more definitive account may be possible. Meanwhile, Professor Martin's record renders a useful service. It gives the careful reader material from which he can frame his own summary, which may or may not agree fully with that of the author.

The revival of the effectiveness of Section 7 hinges on two main points: (1) The new section covers mergers by acquisition of assets as well as by acquisition of stock, thus closing a loophole which had been used with crippling effect; (2) Effect was given to the intent, which was present in the 1914 legislation, to check monopolistic tendencies in their incipency. This required that lesser degrees of immediate effect be made illegal than were required to establish a Sherman Law violation. The author credits the 1950 amendment with this second effect, though nothing in the verbal changes cited definitely requires this. Apparently, it must be attributed to renewed and strengthened expressions of legislative intent, as well as an altered judicial climate, more favorable to accepting the judgments of the Federal Trade Commission. Thus the Commission gained the result which the author blames it for not explicitly seeking in the 1950 amendment.

The omission of merger via assets in 1914 was deliberate, but this hardly warrants the author's conclusion that Congress intended Section 7 to attack only aggressive tactics and holding-company abuses. This approximately characterized one group, to which concessions apparently had to be made by those who wanted a more inclusive attack on incipency. On this there

was in 1914 no clear and predominant legislative intent, such as had developed by 1950. The author's account of cases, while useful, is elliptical in spots, leaving the interested reader's curiosity not fully satisfied.

JOHN M. CLARK

Professor of Economics, Emeritus
Columbia University

JOSEPH DORFMAN AND R. G. TUGWELL.
Early American Policy: Six Columbia Contributors. Pp. 356. New York: Columbia University Press, 1960. \$6.00.

This book consists of half a dozen essays on political and economic thinkers of the early republic. Its unity is a little adventurous, since its subjects are linked mainly by their association, at various times from 1774 and thereafter, with Columbia College. But the pietistic aspect of the book is minimal; the essays are crisp and scholarly; and the result enlarges our knowledge of the public policy debates of the first century after independence.

The essays vary in character. Those on less familiar people, like John McVickar, Henry Vethake, and William Beach Lawrence, concentrate on gathering and setting forth the basic facts of forgotten lives. Alexander Hamilton, John Jay, and Francis Lieber are better known figures; and here the authors deal more in interpretation.

The Hamilton essay, though its argument seems less audacious now than when the authors first set it forth a quarter of a century ago, is easily the most brilliant in the book. Professors Tugwell and Dorfman see Hamilton, not as the devil figure of Jeffersonian folklore, but as an able, high-minded, and creative statesman. While he had his class partialities, these did not, in their view, exhaust his politics; "if it was desired to have business men profit from the establishment of union this was never for the sake of the businessmen but always in the interest of union." Their conclusion is generous but just: "We were better prepared for the years through which we later passed because Hamilton lived and loved his country, when our Constitution was first beginning to be created."

The attempt to rehabilitate John Jay probably exaggerates his chances for the

Presidency and does not erase the impression of a deep and fundamental blandness in this impeccably dignified man. The essay on Francis Lieber is more like a catalogue than an interpretation and does not go far towards revealing the inwardness of this learned and versatile figure. Nonetheless, both essays, like the volume as a whole, offer an interesting, if at times somewhat random, commentary on our early intellectual history.

ARTHUR SCHLESINGER, JR.

Professor of History
Harvard University

WALTER HUGINS. *Jacksonian Democracy and the Working Class: A Study of the New York Workingman's Movement 1829-1837.* Pp. vi, 286. Stanford, Calif.: Stanford University Press, 1960. \$6.00.

The work of Turner, Beard, and Commons at the turn of the century focused the attention of historians on the environmental and economic aspects of American history. The allegiance of the West to Jackson and its share in the new Democratic party have been obvious, although the complexities of Western motives and desires need further study, but the part played in the creation of "Jacksonian Democracy" by the urban workingmen's parties and the labor movement in general has been accepted without detailed exploration of their composition or reasons for supporting Jackson.

It is this careful study that Mr. Hugins has undertaken for the New York workingmen's movement for the brief period 1829-1837. He has examined its connection with the new Democratic party and with both Tammany and locofocoism and has made not only a biographical catalogue but also an occupational analysis of the workingmen in the labor movement and in politics during the period. A third section of the book indicates the connection between the New York workingmen and the reformers and gives an account of the workingmen's position on the critical antimonopoly and bank issues.

Mr. Hugins has done a great service to the social historian by placing in perspective the various components of the "rise of

New Books on World Affairs

Yearbook of the United Nations 1959

This Yearbook describes the work and proceedings of the United Nations and its related inter-governmental agencies during 1959. Intended as a reference book to help further such knowledge and understanding, it describes developments and debates on contemporary topics, including proposals for suspending nuclear weapon tests, disarmament with its related problems, the peaceful uses of outer space and many more. A comprehensive reference work for everyone concerned with international affairs: diplomats, public officials, scholars, writers, teachers, librarians and others.

\$12.50

The Cabinet and Congress

by Stephen Horn

This book surveys the attempts which have been made since Washington's time to bring the Cabinet and Congress into closer rapport. The author evaluates both the advantages and the disadvantages of proposed reforms. He examines the reform issue historically and analytically, using contemporary manuscripts and documents, interviews, public opinion polls, and a questionnaire of his own devising. Dr. Horn also discusses the conditions under which proposals for reform arise and estimates the possibilities for reform in the future.

\$6.00

Settling Disputes in Soviet Society

by John N. Hazard

This book gives authoritative, accurate information on the Soviet legal practices which came to light during the recent trial of Francis Powers. Professor Hazard gives the history of Soviet legal institutions during the formative years of the Revolution and relates this material to the present state of Soviet law. He describes how the Revolutionaries attempted to establish simple, quick "people's justice," in place of the cumbersome procedure of Tsarist courts. The author views the subsequent developments of the Soviet judiciary in light of these early developments.

the common man." It can no longer be asserted that the Jacksonian "Revolution" was the result of any conscious unity of agrarian and labor interests. In the first paragraph of the text he states that the rise of the workingmen's party in New York in 1829 was unrelated to the political changes in Washington but "was largely the result of local factors, economic and social as well as political," and the rest of the book gives ample proof for this statement. Twenty tables indicate the occupation and party activities, the political affiliation, and the voting record of 850 carefully selected members of the movement. Biographical sketches are provided whenever possible for all the leaders in the movement and in the faction of the New York Democratic party which they supported.

This exploration of the New York movement makes it quite clear that there was no common ground in ideology or issues and no close connection in activities or organization with the Western Jacksonians. The New York political agitation was anti-monopolistic and antiaristocratic and in defense of the rights of the journeyman mechanic, although it was not closely connected with the infant labor organizations. The list of manuscripts, newspapers, and periodicals used by the author is impressive, and the tables represent both meticulous research and adequate proof for his major conclusions. The Bibliography and Index are comprehensive and detailed and will be very useful to workers in the field.

ALICE FELT TYLER

Minneapolis, Minn.

MERRILL D. PETERSON. *The Jefferson Image in the American Mind*. Pp. x, 548. New York: Oxford University Press, 1960. \$8.50.

There is no end to the making of books about Thomas Jefferson, nor should there be. This book is neither a biography of Jefferson nor a history of his times. It is a study of what history has made of him. As interpreted by the author, the concept of *The Jefferson Image* was a composite representation of the historical character and of the ideals and ideas, the policies and sentiments usually identified with him. As have all outstanding personalities, Jefferson

presented a perplexing array of contradictions. In spite of, or possibly because of, this fact, the impact of the Jefferson image on America has been tremendous. For example, in the realm of political thinking alone, the "Sage of Monticello" united the basic ideas of provincialism, agrarianism, and democracy.

So universally appealing has the American mind found the versatile Jefferson, that scarcely a movement has evolved that has not had Jeffersonian imagery associated with it. Nineteenth-century southerners saw Jefferson as the "Father of States Rights," while a century later extreme nationalists saw the Jeffersonian spirit as the directing force of the New Deal.

Although the Jeffersonian image has always denoted change, it has not always evolved evenly. There have been periods, as the author correctly states, in which there was an eclipse. From the Jacksonian era to the appearance of Randall's *Life of Jefferson* in 1858, Jefferson suffered from an avalanche of detractors. Although the Jefferson symbol was influential in the Jacksonian mind, Jackson's aggressive nationalism played havoc with Jefferson's provincialism. Moreover, Jefferson's concept of government was antiauthoritarian to the degree that sometimes it appears as if rebellion seemed natural to him. The masterful Lincoln combined Jefferson's principles with Hamiltonian authoritarianism to produce the Jefferson-Lincoln tradition. After the Civil War, Jefferson's image faded until the dawn of the twentieth century when it reappeared with much of its luminous enchanting power.

The new interest in this idealistic philosopher was chiefly in two areas, namely, the man and his politics. The beauty of Jefferson's domestic character was successfully established by the literary efforts of Parton and others. Senator George Vest and Congressman John Sharp Williams proclaimed Jefferson's politics in a day when most men were Hamiltonians. By 1900 historians were devoting more attention to Jefferson, but it was not until the publication of Bowers' *Jefferson and Hamilton* (1925) that American scholarship was won to the Jefferson image. With this conversion, Professor Peterson declares, Jefferson

sonian imagery was investigated, analyzed, and written about from every angle. All of this greatly enriched the American mind.

With the dedication of the Jefferson Memorial by Franklin Roosevelt in 1943, during the Jefferson Bicentennial, the "Sage of Monticello" passed into the American pantheon, where, as the first of the great American liberators, he lives on.

The author has written a fine, scholarly book. The guide to the sources alone comprises approximately sixty-four pages, an achievement in itself. This book is a "must" for all students of Thomas Jefferson.

GEORGE C. OSBORN

Professor of Social Sciences
University of Florida

HERBERT APTHEKER. *The American Revolution 1763-1783: A History of the American People: An Interpretation*. Pp. 304. New York: International Publishers, 1960. \$3.50.

This book, the second volume in *A History of the American People*, is an historical synthesis based on the work of many historians, discussed in the text or listed in the Bibliographical Note, and on contemporary newspapers, "letters, diaries and writings." There are occasional Footnotes but practically no specific references.

The clue to the author's theme is expressed in the last line of the book: the American revolution was "a momentous landmark" in "the continuing struggle" to establish a social order in which the people direct their own affairs. He has presented a series of chapters on various aspects of the revolution, many of which have topics which would demand full books, such as "England and the Revolution," "The British Empire and the Revolution," "Diplomacy of the Revolution," and two on social and economic effects of the revolution, each handled in approximately twenty pages. One chapter, called "The Nature of the Revolution," is really an historiographical essay in which he presents various historians, past and present, and their emphasis in interpretation. The author himself

leans toward "the philosophical outlook" of Marx and finishes the book by giving his own idea of the cause of the revolution. It was the result of the interpenetration of three currents: first, conflict in interest between the rulers and the vast majority of the colonists; second, the class "stratification" in the colonies; and third, the developing sense of American nationality. He thinks the revolution, in its opposition to colonialism, its democratic trend toward political and social democracy, and its assertion of the right of national self-determination, could justify Lenin's characterization as "one of those great . . . really revolutionary wars."

In his analysis of the first current of conflict he treats the subject of British colonial policy, which he is apt to view from the standpoint of colonial propagandists without also furnishing the views of the other side. For example, he lists restraints on manufactures as a potent cause of revolution without mention of the freedom the colonists possessed to manufacture anything and everything except certain stages in the wool, the hat, and the iron manufactures. He ignores the attempts of the colonists from time to time to develop manufactures such as glass and paper, but usually without success because, as the governors' answers to a questionnaire of 1767 showed, they were not ready for it. He refers to the monopoly given by the navigation acts to British shipping but fails to note that the colonists were here classified as British and by the regulation greatly profited both in the shipping and in shipbuilding. He mentions the restrictions on westward expansion as a hardship and charges that the government failed to keep its promise that the proclamation line of 1763 would be only temporary. He ignores the fact that the line so sketchily mentioned in the proclamation was later in 1768 drawn more realistically farther west by careful surveying and by treaties with the Indians.

As an historical synthesis the book contains many significant parallels, and much of it is interesting to read. However, it lacks unity because of the great volume

of factual detail included from condensation of so many histories.

VIOLA F. BARNES

Professor of History, Emeritus
Mount Holyoke College

LEO HUBERMAN and PAUL M. SWEETZ. *Cuba, Anatomy of a Revolution*. Pp. 176. New York: Monthly Review Press, 1960. \$3.50.

Messieurs Huberman and Sweetz have written an interesting book which deserves serious consideration. It is the only extended study yet made of the Cuban Revolution as a revolution, and it is done by two professionals—left-wing Socialists who apply the "scientific" measuring rods of their own brand of Marxism.

To say this is to indicate the limitations of the book. It is heavily biased in favor of the Revolution, which is seen with starry-eyed vision through rose-colored glasses. "One of the most original and important social transformations of our time . . . a development of enormous historical interest and importance . . . one of the great historic and prophetic events of our time"—so we are told.

This may be so, but the authors themselves concede at the beginning that it is too early to pass judgment. Of one thing they are certain. "For our part we have no hesitation in answering: *the new Cuba is a socialist Cuba* . . . This is the first time—ever, anywhere—that a genuine socialist revolution has been made by *non-Communists*."

Considering that the authors only spent three weeks in Cuba last March to get firsthand information for their book, they have done a surprisingly good job of description and analysis. There are a lot of facts, and they are used with understanding. This is where their Marxist technique serves a purpose.

"A revolution," as they truly say, "is a process, not an event." Their interpretation of the reason for the poor news coverage of the revolution in the United States is that "bourgeois reportage and scholarship . . . are constitutionally incapable of understanding historical phenomena in

their development, that is to say dialectically, and hence must interpret them irrationally, in terms of surprise or catastrophe or both."

There is some truth in this, but, as a "bourgeois" journalist, I see the failure of my colleagues to be rather in their professional and technical insufficiencies. The revolution is not being described in the American mass-media of communication as a social revolution in its own terms and as a Cuban and Latin-American phenomenon. And the value of this book, for all its bias and deficiencies, lies in the fact that the "process" being described is treated as a Cuban social revolution. It may or may not, as the authors see it, be "helping to blaze a new trail for humanity to a brighter socialist future." But it is the most important social upheaval in Latin America since the Mexican Revolution, and it is having a more profound effect on the Western hemisphere than any event since the Wars of Independence 150 years ago.

This is reason enough to welcome the interpretation that is made by Huberman and Sweetz.

HERBERT L. MATTHEWS

Editorial Board
New York Times

OTIS A. SINGLETARY. *The Mexican War*. Pp. vii, 181. Chicago: University of Chicago Press, 1960. \$3.75.

This small volume is one in the Chicago History of American Civilization series published by the University of Chicago. Professor Singletary has attempted to fulfill the prediction for the project, "that the layman who is seeking a sound introduction to a particular segment of history cannot do better than to consult the appropriate item in this series." The author has managed to meet this challenge, but little else.

Dr. Singletary fails to tell the story of our plenipotentiary, John Slidell, and his crucial mission to Mexico, in its proper light. Mexico offered to accept a commissioner; Polk sent an "envoy extraordinary and minister plenipotentiary." This diplo-

matic misstep was as much a cause of Slidell's failure as any other.

The author has attempted to tell the story of the coming of the war with a mere mention of the famous cabinet meeting of May 9, 1846. And this gathering of Polk's Cabinet has helped to make the adjective "mendacious" applicable to him. The author passes over the fact that General Taylor moved with considerable reluctance to the Rio Grande.

The chapters dealing with the war are well done. The story of unpreparedness on both sides sounds like the editorials of some of our current newspapers. The harsh words that were exchanged by the commanding generals of our armies are similar to the writings of Bradley, Patton, and Stilwell. The appointment of political friends to command rank seems to have set the scene for the large number of Brevet-Generals that overran the White House after the Civil War.

The story of General Winfield Scott and his expedition to Mexico City reminds one of a Gilbert and Sullivan operetta. Scott's political ambitions had postponed his appointment for months, even though the administration realized that victory would not be decisive without an attack on the Mexican capital. Santa Anna was able to get Scott to sign an armistice that weakened the American position. This respite gave Santa Anna an opportunity to regather his army; the two week rest gave the Mexicans an opportunity to refortify Mexico City.

When Professor Singletary tells the story of a battle, he is most effective, but when he tackles the diplomacy behind it, he leaves much to be desired. The chapter, "The Diplomacy of War," contains much material that the author has discussed in a preceding chapter, "Politicians and Generals." To discuss the diplomacy of the Mexican War in twelve pages is quite an historical feat.

Historians have complained for years that one of their greatest problems is the continued half-truths and lapses that mar our works of history. The reviewer is aware of the restrictions under which Dr. Singletary must have worked. To write a definitive history of the Mexican War in

one hundred and sixty-two pages is an impossibility. Perhaps it would be better to give up the *Reader's Digest* approach, at least in the field of history.

Fordham University

EUROPEAN HISTORY

EDWARD HALLETT CARR. *Socialism in One Country 1924-1926*. (A History of Soviet Russia, Vol. 2.) Pp. viii, 493. New York: The Macmillan Company, 1960. \$7.50.

This is the second of a series of three volumes which E. H. Carr is devoting to that period of Soviet history during which the slogan of "socialism in one country" became the party line.

The first half of the volume, chapters eleven through nineteen, deals with the struggle for power within the Soviet Communist party from the autumn of 1924 through the early months of 1926. It commences with the appearance of Trotsky's *Lessons of October* and a consideration of the way in which the Triumvirate of Kamenev, Zinoviev, and Stalin created the deviation of "Trotskyism." After tracing the genesis of the "socialism in one country" doctrine, the author presents a detailed account of the dissolution of the Triumvirate. In separate chapters he relates the conflict within the Party to developments in the Soviet literary world and in the Komsomol organization. One of the best chapters is that dealing with the Fourteenth Party Congress in December, 1925, at which Zinoviev's Leningrad organization was easily defeated by Stalin's machine. Attention is also given to changes in the party membership and to the various measures taken to reduce political illiteracy within the party's swollen ranks including the establishment of various Communist "universities" and other institutions for indoctrination. The emergence of the local control commissions and of the Central Control Commission is charted in terms of the development within the party of a counterpart of the secret police.

The second half of the volume is devoted to governmental affairs and includes treatment of the Central Executive Committee and of developments within the national republics primarily from a constitutional point of view. Other chapters deal with the determination of regional administrative units, the local soviets, the Red Army and the security organs.

As in previous volumes, Carr has carefully documented his account from Soviet sources, but he has also relied upon various of Trotsky's publications issued in exile and has utilized many valuable unpublished data from the Trotsky Archives at Harvard University. Enjoying no apparent limitations on space, the author has included numerous rare quotations and an enormous amount of detail which at times give parts of the volume the appearance of a reference work. It is not likely that he will have any competitors approaching him either in general scope or in depth of detail.

JOHN S. RESHETAR, JR.

Associate Professor of Political Science
University of Washington

GEORGE VERNADSKY. *Russia at the Dawn of the Modern Age*. (A History of Russia, Volume IV.) Pp. ix, 347. New Haven: Yale University Press, 1959. \$7.50.

Russia at the Dawn of the Modern Age is the fourth in the planned nine-volume *A History of Russia* by Professor Vernadsky and the late Michael Karpovich. This composite work, the chronological starting point of which occurred in the period prior to Kievan Russia, was the most ambitious study of Russian history ever attempted in English, and in its scope might well have eclipsed the Russian classics such as Soloviev or Kliuchevsky. But with the untimely death of Professor Karpovich in November of last year, it is uncertain whether the work will in fact come to fruition.

The volume under review deals with the post-Mongol period when the unification of Great Russia was achieved, and the basic patterns of the political institutions of tsarist Russia were laid down. In Western Europe it was the age of the Renaissance and Reformation, and repercussions

of these movements were felt even in Russia.

The domestic and foreign policies of the Muscovite Grand Princes, Ivan III and Vasili III, affairs of West Russia—Belorussia and the Ukraine—the decline of Lithuania, the rise of the Ukrainian Cossacks, and the Church Union of Brest, 1596, are the main threads followed in the discussion. Of particular interest are the careful examination of foreign policies, notably lacking in the writings of older Russian historians, and the resuscitation of such a figure as Vasili III. Coming between his father Ivan III—to whom most credit has hitherto been given as the pioneer unifier of the Russian lands—and his son Ivan IV, the dramatic and perhaps pathological Ivan the Terrible, this interesting Muscovite prince has been too often passed over as a mere figure of transition.

Professor Vernadsky has a sure command over his difficult materials, and his presentation is at once detailed, informative, and stylistically agreeable to read. Crisp strokes delineate character, as with his terse description of the rather complex personality of Vasili III.

Excellent supplementary materials include maps—some quite unusual—genealogical tables of ruling houses and princely families, Polish and Russian, Bibliography, and both a Glossary of foreign terms used and a general Index.

If one were to say anything negative about this work, it is the "old-fashioned" tone that is present on occasion both in presentation and interpretation. But perhaps this quality is an inescapable attribute of the classic.

DAVID HECHT

Associate Editor
Collier's Encyclopedia

DENIS SINOR. *History of Hungary*. Pp. 310. New York: Frederick A. Praeger, 1959. \$5.00.

We are told on the jacket that this is "a lucid and readable history" of Hungary "based almost exclusively on original sources." For the latter we must accept the publisher's word, for there are neither Footnotes nor Bibliography; with regard to the former the reviewer can hardly share

the publisher's enthusiasm. The author, Professor of Hungarian and Altaic studies at Cambridge University, states as his aim to give the general reader a continuous narrative history and to provide the historian with a reliable handbook. If the reader wants a political history of the reign of one king after another, here it is; the same can be said for the historian who is seeking factual details especially about dynastic and family relationships. Much of this information and the material on the rules of Transylvania are very difficult to obtain, and should prove useful to historians.

The book is conveniently divided into six parts: the first three bring the story up to the Turkish conquest during the sixteenth century in 150 pages; the fourth covers the period of Turkish domination in 80 pages, leaving about 60 pages for the period from circa 1700 to the end of World War I, with only 10 pages devoted to the years 1920-1944. Only now and then does the author permit himself excursions into social, religious, or economic history, but the few pages that he does give make a reader wish for more. Two and one-half pages on the Reformation with only slight subsequent references to the Counter Reformation seems scant coverage, even in a volume where emphasis has been placed on brevity. The author speaks only of Hungarians, the other nationalities within the kingdom are first referred to as aliens (p. 253), and after 1867 as minorities (p. 277), although early in the volume he writes, "From its inception, Hungary was a multilingual, multiracial realm" (p. 38). In the volume one misses any real discussion of the status of Croatia within the monarchy or an appreciation of the plight of any of the minorities. The following statement indicates Sinor's point of view: "Ignorant politicians and naive scholars alike were distressed at the oppression of the minorities [before 1914] and failed to notice that the treatment they received was not worse than that meted out to Hungarians. They also failed to perceive the obvious, namely that oppression would be infinitely worse under the rule of any of these maltreated national groups" (p. 277).

The reader who dips into the volume for the later periods will be troubled by the au-

thor's use of Hungarian words, which are not always clearly explained even the first time they are used and are not all listed in the Index. While the difficulty of giving a precise translation must be admitted, it seems hardly necessary in a book specifically designed for the English reader (p. 9) to use *jobbágy* regularly for peasant—serf—or *megye* for county—defined as department by the author, or *nádor* for Count Palatine, "dignitary second only to the King" (p. 39), and many others. The word "Delegations" is an accepted term used in connection with the Austro-Hungarian government under the *Ausgleich* of 1867, and it seems hardly appropriate to replace it by "committee." Anyone used to working in Central and Eastern European history is prepared to accept various spellings of places and names, but why use Moldova and Walachia on p. 176 and Moldavia and Valachia on p. 212, with no reference under either spelling in the Index? The latter, by the way, omits all listing of the Kings of Hungary, even though this is a volume filled with dynastic history. The volume does include a select and useful list of dates.

E. C. HELMREICH

Chairman, Department of History
Bowdoin College

FREDERIC B. M. HOLLYDAY. *Bismarck's Rival: A Political Biography of General and Admiral Albrecht Von Stosch*. Pp. x, 316. Durham, N. C.: Duke University Press, 1960. \$7.50.

"A rival of Bismarck," says Professor Hollyday of Albrecht Von Stosch. And it is true that the General and Admiral who became the first secretary of the imperial navy aspired to this title. Indeed Bismarck distrusted Von Stosch because he suspected that Von Stosch was aiming at the highest political office in the German empire. However, Professor Hollyday's "political biography" makes it abundantly clear that Von Stosch had few qualities to recommend him for such responsibilities. A gifted officer, who had distinguished himself as administrator and as field-commander, he owed his appointment to the Crown Prince Frederick William, to whom

he became attached during the war of 1866. It is one of Professor Hollyday's aims to destroy the legend that Von Stosch was a liberal at heart, and as such, the favorite candidate of Frederick William and of the Crown Princess Victoria, who opposed Bismarck on ideological and personal grounds. Professor Hollyday had access to Von Stosch's unpublished memoirs, and he has used these, together with the printed source material, in a sagacious and discerning manner. He pictures Von Stosch, not as a liberal, but as a conservative nationalist with strong feelings of loyalty toward the Hohenzollern dynasty. Nevertheless, Von Stosch's closest political friends belonged to the National Liberal party, and Von Stosch shared most of their opinions and prejudices. He favored a strong Fleet and colonial expansion for Germany; in a word, he was an imperialist. His judgment may have been sound on practical details, but he was lacking in political vision, both in foreign affairs and in domestic concerns.

In the long conflict with Bismarck, Von Stosch was moved less by disagreement on the principles and aims of German policy than by greed for power. Bismarck returned the hostility with the full force of his ire, and was as unscrupulous in his choice of weapons as he had been during the "Arnim affair." It is, nevertheless, difficult to entertain much sympathy for Von Stosch; he was definitely Bismarck's inferior in the mastery of international relations and was just as shortsighted as Bismarck in his assessment of Germany's internal problems.

One may, therefore, question whether Von Stosch deserves a "political biography." The value of the book under consideration lies not in its portrait of a high-ranking German official, but in its contributions to the working of the political machinery that Bismarck had created in 1867 and that he dominated until 1890. The system was tailored to guarantee the control of the executive power in the hands of the chancellor; its caesaristic features, to speak with Max Weber, made no provisions for new developments, once the caesar was removed or lacking. It was unavoidable that the system deteriorated when the Kaiser exerted the imperial prerogative un-

checked by the resourcefulness and the wisdom of the old chancellor.

Indirectly, this volume also contributes to our knowledge of the hapless Crown Prince. Frederick William, emerges from Professor Hollyday's book as a man without spirit or determination and with little genuine interest in the unsolved problems of imperial Germany. His opposition to Bismarck was largely based on impotence and spite, and held, in the eyes of this reviewer, no promise for constructive developments. If Von Stosch was guilty of ambition, he was, at least, not blind to the shortcomings of the Prince.

The over-all impression that the reader gains from Professor Hollyday's book is very like the viewpoint already presented by other sources—the Holstein Diaries, for instance. Germany's political life tended more and more to aimless intrigue and jockeying for position. The seeds of the disintegration that took place in 1918 had all been planted; it only seems strange that their fruition was so long delayed.

GERHARD MASUR

Professor and Chairman
Department of History
Sweet Briar College

ALFRED DIAMANT. *Austrian Catholics and the First Republic: Democracy, Capitalism, and the Social Order, 1918-1934*. Pp. xii, 325. Princeton, N. J.: Princeton University Press, 1960. \$6.50.

The book is a synthesis and a culmination of Professor Diamant's earlier and smaller studies in Catholic philosophy and its impact on the First Austrian Republic. For the sake of a proper understanding of Austria between 1918 and 1934, it was most desirable that this book was published. Up to now, Socialist thought in the politics of the First Republic has been quite widely known and fairly well articulated. But the corpus of Catholic social ideology and its influence on the Austria since St. Germain were not systematically clarified. This is why the present work, closing as it does a large gap, will be highly valued. Aside from its worth for Austrian political scholarship, the book is also important for a richer view of Catholic social

thinking generally, beyond the twentieth-century Austrian framework.

Professor Diamant's two major concerns are Catholic criticism of democracy and Catholic criticism of capitalism. He traces both to their pre-World War I origins and then shows how they combined to lead to the anti-Marxist protest in the nineteen twenties and thirties and finally to the corporative authoritarian Constitution of 1934. At the same time he competently explains how the often contradictory positions, ranging from a semi-Christian socialism to fascism, caused severe internal struggles within the Christian Social *Lager*, and how hopeless it was to arrive at a common denominator satisfactory to the whole anti-Marxist complex in the First Republic. Professor Diamant also solved the harsh problem of explaining how the pressure of this internal struggle among anticapitalists, antidemocrats, procapitalists, prodemocrats, and various combinations thereof, added to the pressure of foreign developments, caused the prodemocratic forces to be sacrificed in the interest of the 1934 "solution."

The author is to be congratulated not only for making a splendid contribution to scholarship but also for doing it without overdrawing his case at any time, for using his sources closely and *sine studio*, and for avoiding, even in his rather subjective Epilogue, sheer polemics. One wonders what this book might have been without Professor Diamant's self-discipline and sense of restraint. To illustrate: The book may reinforce the view of fair-minded Marxists that Catholic corporativists are hopelessly antiquated in their vision of a preindustrial society, but the book will probably convince them that Catholic criticism of the mechanization, dehumanization, and collectivization in our society stems from an honest anxiety about the fate of modern man.

ROBERT SCHWARZ

Associate Professor of History
Carnegie Institute of Technology

HAYWARD KENISTON. *Francisco de los Cobos: Secretary of the Emperor Charles V.* Pp. xvi, 463. Pittsburgh: University of Pittsburgh Press, 1960. \$7.50.

Francisco de los Cobos was not only Secretary of the Emperor Charles V. He was also, as Dr. Keniston makes abundantly clear, *fundidor*—officer in charge of minting and assaying all specie—of the Indies, *regidor* of Valladolid and Ubeda, *contador mayor* of Granada, Grand Commander of the military order of Santiago, owner of towns, castles, and palaces—in short, one of the most influential men in Spain.

Professor Keniston carefully traces the rise to power of this man who was born into the lower gentry in Ubeda about 1477, served the Catholic Kings and then, before the young King Charles had been on the throne a year, traveled to Flanders to begin thirty years of service at his side.

In the final chapters the author presents the reasons which he assigns for the success of Cobos. Cobos was industrious. He was loyal to his king, first, but also to his friends and putative friends. He was a skilled political tactician who pursued a wise strategy: he limited his activities to the political and financial administration of Castile and its possessions and thus avoided conflict with other royal councillors such as Granvelle.

Dr. Keniston's meticulous biography is founded upon a wide knowledge of Spain, Spanish literature and history, and Spanish and other European archives. But the book is, as the author acknowledges, defective in a vital condition: almost no private papers of Cobos exist. Lacking these essential documents the biography takes on a tangential character; it becomes an account of known political events mixed with a thorough catalogue of the promotions, emoluments, gifts or bribes, official papers, nepotistic practices, and public family relationships of the Grand Commander. The influence of Cobos upon the emperor is clearly established as a general principle, but the specific authority of the Secretary is not enumerated, except in terms of his power to control access to the monarch.

Yet the book is an important one in the sadly undercultivated field of Spanish history, and probably no more excellent book could be written on this topic. The author displays Spanish administration from the

The Hoe and the Book: *An Italian Experiment in Community Development.*

By F. G. FRIEDMANN, *Wells College*

INTO many isolated villages in southern Italy, UNLA—an organization formed chiefly to wage war against illiteracy—has come, to set up community centers where villagers and peasants can learn to read and write. Adult education courses and discussion groups have aimed beyond immediate goals to the establishment of community consciousness and the attempt to bring people away from their suspicions, frustrations, and resignations into a new spirit of co-operation with each other.

The author cites many instances of the program's success and has perceptive comments to make on its possible future achievements.

Parliamentary Government in France: *Revolutionary Origins, 1789–1791*

By R. K. GOOCH, *University of Virginia*

AS the title suggests, this book deals with the hints of the parliamentary or cabinet system of government that emerged from the constitutional debates of the National Assembly. Introduction of the regime into France has traditionally been regarded as dating from the Restoration, but Professor Gooch's narrative offers for the first time the premise that "certain Revolutionary leaders possessed a striking understanding of the essentials of the system which was being evolved in England, that those essentials were in considerable measure actually put into practice in France during the years 1789–1791, and that there developed even this early certain tendencies toward modification which have prevailed down to the present time."

ASIA AND THE ARAB WORLD

I. D. S. WEERAWARDANA. *Ceylon General Election 1956.* Pp. 262. Colombo: M. D. Gunasena & Company, 1960. Rs 15/—.

The election of 1956 stands out as a landmark in Ceylon's political history because its course was dramatic, its temperature feverish, and its results largely unanticipated. An eminent Ceylon historian even christened it with the portentous title "The Revolution of 1956."

It is this historic event that is the author's subject matter. "My aim has been partly to tell the story of an Asian general election and partly to relate that story to the conflicting and sometimes confusing web of a complex and heterogeneous society." The story is fairly well told, but its meaning inadequately analyzed.

If indeed the election was "revolutionary," then the key to its nature is the answer to the question why the United National Party (UNP), a party that remained firmly in power from 1947-1956 and complacently expected another term of office, was not merely defeated but crushed. The author has plotted the immediate issues and brought the actors on stage, but the impression is that we are witnessing the climax of the drama without fully understanding its unfolding. In short the analysis lacks perspective and historical depth. The immediate misdeeds of the UNP and the exuberances of Sir John must be separated from the fatal strategy of opposition groups, and this again from the vastly more important social processes that led to the emergence of new pressure groups. To understand their aspirations and strength

one has to delve many years into the past and trace the nature of elite formation in colonial times, the distribution of wealth, prestige, and power in a constricted society, and the economic processes in the twentieth century that at the rural level led to the emergence of a new acquisitive and socially mobile elite having unity with traditional eclipsed interests and claims to recognition as conservers of traditional culture and religion. No less important is the acceptance by the rural masses of these ideological themes as valid measures for broadening and reconstructing the society.

One way of calculating the significance of this election is to look at the social composition of the elected rulers. The author in Chapter IV provides the information, in somewhat incomplete form, but fails to draw the inferences. The majority of candidates including those in the winning party were educated by the English, followed middle-class professions, and certainly did not spring from the masses. This poses the classic Marxian question regarding the relationship between the political representatives of a class and the class they represent. The author's casual remark that "the situation of course will not last for ever" is too facile an opinion on the intricacies of the politics of an Asian country.

The policy of the new government both in theory and practice is some indication of the character of its politicians and its supporters. In Chapter X the author moves from story-telling to evaluation, and he characterises the Mahajana Eshkath Peremuna (MEP) in glowing terms, "It combined therefore liberalism, socialism and nationalism." On the basis of the information he provides, it is equally arguable that the orientations of the MEP and its supporting pressure groups show sectarianism—later manifest in communal riots; that the exclusion from citizenship of Indian labor, which has for several generations contributed vastly to national wealth, cannot be the basis of a socialist society; and that a party with which minority groups strongly disagree cannot be national. It is true that the MEP manifesto proclaimed some socialist economic measures. But the gap between pronounce-

ment and intent is seen in action. The MEP's motley composition of right and left and other opposites appeared in later disastrous power struggles and the sabotage of progressive legislation such as the Paddy Lands Bill.

The indecisive election of 1960 and the now impending election should help us to judge the significance of the 1956 election. The UNP has staged a comeback as a major party; the MEP has split up, and its core group at the eve of election has been forced to make new left alliances. The gains of 1956 in regard to language and religion have become consolidated, but Ceylon politics has yet to crystallize into a battle between the right and the left. Mr. Weerawardana's national, liberal, socialist sun has still to rise.

B. B. MISRA. *The Central Administration of the East India Company 1773-1834*. Pp. xii, 476. Manchester: Manchester University Press, 1959. Distributed by Barnes & Noble. 45 s net.

Professor Misra of the University of Bihar has, in this work, supplemented his *Judicial Administration of the East India Company 1765-1782* (Patna, 1953) with a massive study of the development of the East India Company's administration in Bengal into the British Government of India. Twenty years ago, Professor C. H. Philips, who contributes a Foreword to this book, presented a masterly account of the Company's home administration and of the subordination of both its home and Indian administration to the British government, in his *East India Company 1784-1834* likewise published by the Manchester University Press. Together, these two books cover the field of Indian administrative history during this period in so thorough and competent a manner that they are unlikely ever to be superseded. Dr. Misra's work is by no means of mere academic interest. The present Government of India is so much the heir of its predecessors that every aspirant to a career

in any of India's administrative services, high or low, would benefit from a careful reading of what Dr. Misra has to say. As long as India remains preponderantly an agricultural society composed of several hundred thousand villages, many of the problems presented to the young administrator in 1960 will not essentially differ from those confronting the Company's covenanted servants two centuries ago.

To students of political science, whether in India or elsewhere, the chief interest of this volume will lie in its drawing together of many facets of Indian administrative history which have formerly received separate or partial treatment. There have been previous studies of Mughal administration, of British-Indian judicial administration, and of British-Indian revenue and financial administration, especially of such measures as Cornwallis' "permanent" revenue settlement in the 1790's, but there has been no study of the period which has welded all this together. The peculiarly intimate connection between judicial and revenue administration in modern India has its Western counterparts and analogies chiefly in the Middle Ages, and the topic is not one which has attracted Western medievalists. Even if it had, the Western medievalist lacks the deep knowledge of Muslim and Hindu institutions which is essential. Therefore an Indian scholar profoundly versed in these matters and fully conversant with the evolution of Western institutions is the best interpreter of the bewildering mass of material in the East India Company's records. Dr. Misra has given a very clear exposition of the Mughal administrative system, of the influence upon it of the decline and fall of an effective Mughal central authority after 1707, and of its supersession by a British central authority evolved over half a century of trial and error, adapting, discarding, and then readapting a basically Indian framework in the light of British experience.

In Indian terms, this story is one of the scattering of power, formerly centered at Delhi, among numerous regional and even local authorities, and then the reinvigoration of one of these—a new *nawab* of Bengal, that is, the East India Company, who reasserts himself and gradually estab-

lishes his sway over almost all the others. In British terms, it is the story of the Company's penetration of the *mufassal* through its civil servants—self-seeking traders metamorphosing themselves first into revenue-collectors, then into judges and magistrates, and finally into professional administrators—ubiquitous representatives of a new and not wholly Indian "country-power" dominating nearly all other "country-powers" of the subcontinent by 1834. Dr. Misra's method is to describe the structure of the Company's "supreme government" of Bengal in the late eighteenth century before proceeding to analyze revenue administration, the administration of civil justice, of criminal justice, and finally the evolution of personnel—the foundation of the modern Indian Civil Service. He is at pains to point out the instances in which British-Indian administrative practice, due primarily to utilitarian influence, was ahead of British administrative practice at home.

Many of Dr. Misra's readers will regret the excess of detail and the concentration upon the administrative machine rather than upon the men who ran it. Indeed the work would have been better balanced had the documentation of almost every administrative change been sacrificed to make possible more than cursory treatment of the administrative history of the other two presidencies. Apart from Sir Thomas Munro's achievements, developments in Madras are hardly mentioned, and Bombay is almost entirely neglected. Somewhat more attention to the careers of individual civil servants would have brought out more clearly the intimate connection between administrative and social history, which much concerns Dr. Misra. He points out (p. 196) that the class of rural capitalists created by the Permanent Settlement and interspersed with several layers of absentee landholders "constituted a new feature in the social history of the country." We look forward to the further development of that theme in his forthcoming work on the evolution of the Indian middle-class.

HOLDEN FURBER

Professor of History
University of Pennsylvania

FRANK MORAES. *India Today*. Pp. 248. New York: The Macmillan Company, 1960. \$4.00.

Frank Moraes proves once again that he is one of India's best journalists and trenchant political observers. A few years ago, his *Report on Mao's China* startled India with its frank and searching report of those facets of Communist China which official India refused to acknowledge or convey to the Indian public for fear of disturbing friendly relations between two great Asian neighbors. Had India paid more attention then to Moraes' book and less to Nehru's tranquilizing speeches, there might have been better mental preparation for recent Chinese moves in Tibet and the frontier regions of India.

As an astute political observer who has proven that he is worth listening to, Moraes turns the searchlight of critical analysis inward to report to his countrymen and the free world on the state of India and to warn of impending crisis. In surveying what his country has done with twelve years of independence, he finds much that is impressive and remarkable. But this totality of achievement, outstanding as it might be, does not erase the hard fact that India is, "not yet" a democracy but only a "developing democracy" increasingly on the defensive against communalism on the right and communism on the left. The battle for a modern, rational, progressive India has not been decisively won, and the prospects of victory are not bright unless India adopts a "new attitude of mind." In highly critical terms, Moraes describes Nehru's India variously as "inchoate" and "amorphous," neither Eastern nor Western, and guilty of shedding ideals for ideas, that are implemented by a new, growing, "monstrous" bureaucracy of declining caliber, and little initiative or intellectual integrity. This Great Leviathan is led by a single omnipotent individual with an "authoritarian streak" who, while neither a demagogue nor dictator, is "perilously near" to both characterizations.

Nehru's great weakness, and India's danger, is that in both his domestic and foreign policies, he has failed to provide "a decisive moral resistance to Communism" by

-blunting sharp distinctions between democracy and communism, the free world and the Soviet world. At home he has paved the way for communism by suffusing programs of co-operative farming, land ceilings, and high taxes with a spirit of stateism amounting to "undue regimentation" and "excessive bureaucratization" of both public and private life that "oppresses" the people. Abroad, his willingness to give the Soviet bloc the benefit of the doubt when they are in the wrong is "unconscionable."

The difficulty, as the author sees it, is not that Nehru's objectives of democratic socialism for internal development and non-alignment in foreign policy are wrong, but that they are being implemented very badly. Nehru, the successful strategist, is defeated by Nehru, the unsuccessful tactician, whose short-term methods obscure and confuse his long-term objectives. In his zeal to obtain worthy objectives, he propels democratic socialism beyond the democratic and nonalignment beyond genuine neutrality.

Meanwhile, India still needs to achieve national unity and consolidation and to imbibe and implement the spirit and workings of democracy, while the fissiparous forces of entrenched orthodoxy and communism gather strength beneath the surface awaiting Nehru's demise.

Seeing that the Nehru era will draw to a close in a few short years, Moraes presents a few possibilities after Nehru's death or withdrawal. The chances are excellent that a successor government will move to the right of Nehru's policies. If the Congress party remains united, which is questionable, a strong demand will arise in the country for a strong Opposition party as a center or right of center group. But the best chances for democracy in India lie in the Congress splitting into two main groups, a right and a left, who between them could gather the conservative and non-Communist forces around them to establish a stable workable two-party system in India. Moraes anticipates the possibility of the Congress left merging with the Praja Socialist party and other socialist forces to form a formidable party that might be able to wrest political power from

conservative Congress forces. Led by Jayaprakash Narayan, Asoka Mehta, J. B. Kripalani, and with the outside moral support of Vinoba Bhave, such a new party should be able to govern India in a new type of Gandhian democratic socialism that avoids the extremes of reactionary obscurantism or totalitarian communism. They should be able between them to fill the void left by Nehru, since no individual can hope to do this, and continue the work of creating an integrated, progressive Indian India that can help significantly, perhaps even "decisively," in the world effort of blending the achievements of a Western science with the Eastern spirit of man's affinity with God.

Moraes' predictions and assumptions are no doubt controversial and will excite comment both in India and abroad. It remains to be seen whether he proves as good a prophet as he is a writer.

THOMAS A. RUSCH

Assistant Professor of Government
Los Angeles State College

China and the United Nations. Report of a Study Group Set Up by the China Institute of International Affairs. (National Studies on International Organization.) Pp. xi, 285. New York: Manhattan Publishing Company for the Carnegie Endowment for International Peace, 1959. \$3.00.

Among the twenty-odd volumes initiated by the Carnegie Endowment for study of the relations of particular countries with the United Nations, none has the particular value of *China and the United Nations*, since it springs from firsthand experience with a local Communist party, certain Communists, and communism in general that goes back to the very early 1920's. The book, however, has the limitations as well as the strengths of a short historical record, a record, moreover, in which the United Nations—principal supporter of the Free China government at Taiwan—continues to play a not inconsiderable role. The result is an account that is straightforwardly factual on practically every topic in which the United Nations has been involved, not only since its inception but

also during its germination from the League of Nations period to the Dumbarton Oaks Conference. Necessarily missing from the account is the detailed, highly penetrating, and sophisticated understanding of Russian and Chinese Communist maneuvers as exemplified by the writings of such Chinese liberals as Hu Shih, George K. C. Yeh, T. F. Tsiang, and Chiang Monlin, not to mention the authors of this particular study themselves.

China provides a unique opportunity, of course, for the examination of mutual security organizations since it suffered from extensive foreign exploitation in the nineteenth and early twentieth centuries, the inaction of the League of Nations in 1931, the Sino-Japanese War, and the Communist assumption of power after World War II. While the study considers these and other topics ranging from United Nations voting procedure and trustee arrangements to collective security and technical assistance, its main focus is on China's case against the Soviet Union and the question of Chinese representation—the actual headings of the two concluding chapters and the content, explicit or implied, of much of the other nine chapters. The treatment of these subjects is accurate. It may not appear accurate to readers who make such a cult of so-called "two-sided" objectivity that they maneuver facts to produce two sides. To this reviewer, who is persuaded that observed fact includes the observer, the case presented against the Chinese and Russian Reds is a trifle pallid. Personal observation at Taiwan and Hong Kong and reading, when time allows, of the mainland Communist press lead this reviewer to conclusions that would hardly be politic for Free China writers to make concerning subjects that involve United States foreign policy and thus United States aid.

The writers do, however, present a good factual case for the vitality of Free China culture, for the dubious permanency and the culturally anti-Chinese character of the mainland regime, and for the duplicity of Communist dealings and negotiations. It is particularly helpful to have in one place a list of Soviet violations of the United Nations Charter and of the Sino-Soviet treaty of 1955, itself a humiliating agree-

ment that the United States prepromised at Yalta to force on an unknowing Chinese government. Perhaps it may even be that the book does represent true Chinese sophistication and that understatement may serve to awaken foreign opinion more readily than full and pointed statement.

State of New Jersey

CHANG-TU HU. *China: Its People, Its Society, Its Culture.* (Survey of World Cultures.) Pp. 610. New Haven, Conn.: Human Relations Area Files (HRAF) Press, 1960. \$10.00.

This valuable book in the Survey of World Cultures series is the first comprehensive study on the Communist state led by Mao Tse-tung—a state which by the year 2000 will have a population of 1.5 billion or more than half the present world population. Here can be found twenty-four well-written chapters on Chinese society: the historical setting, geography, and population, ethnic minorities, languages, religion, social organization, family, dynamics of political behavior, theory, and structure of government, diffusion and control of information, foreign relations, basic features of the economy, organization and use of manpower, financial system, agriculture, industry, domestic and foreign trade, public health and welfare, education, science and technology, art and intellectual expression, values and patterns of living, and national attitudes. The most important sections of this significant volume are found in the portions dealing with the intellectuals, the middle class, and the peasantry.

Generalizations are difficult to give regarding the feelings of the intellectuals, but a few deductions are valid. The majority are patriotic and accept the Communist emphasis on loyalty to the state in contrast to the age-old loyalty to the family. Many are gladdened by the manner in which Communist China has taken a dominant position in world affairs and, after years of frustrations, achieved unity.

A new middle class is emerging. The

scholar-gentry and landlord classes are being supplanted by the rise of an urban population. Many Communist party members have stepped out of obscure niches in society into high governmental positions. The peasants are losing their fear of the supernatural and entering a new, fascinating life, a life of education, blending science and some of the better features of materialism.

Communist China, for good or evil, is thus described: "The legacy left by twenty centuries of Chinese cultural primacy in Asia, combined with memories of a hundred years of Chinese weakness in the face of western and Japanese intrusion after 1840 and augmented by the drives of modern Chinese nationalism in the twentieth century, has now passed to the account of the Chinese Communist party. Peking is again the capital of a unified China under firm, centralized control. The regime in power in Peking, however, is radical and Communist, not conservative and Confucian. . . . China's international influence is now dynamic, endowed with distinctively new characteristics, powered by political and technological forces never found in the imperial past" (p. 257).

THOMAS E. ENNIS

Professor of Modern European
and Asian History
West Virginia University

CHOW TSE-TSUNG. *The May Fourth Movement: Intellectual Revolution in Modern China*. (Harvard East Asian Studies 6.) Pp. xv, 486. Cambridge, Mass.: Harvard University Press, 1960. \$10.00.

Though scholarly, this book is not a dry treatise. It contains such an absorbing account of the May Fourth Movement that it might well have been journalistically entitled "The Awakening of the Dragon." This movement, named for the student mass demonstrations of that date in 1919, marks a turning point in China's recent history, as Dr. Fairbank has rightfully indicated on the flyleaf. The Chronology of Relevant Events; the Appendices analyzing the social forces of the period, itemizing the schools, colleges, and universities involved, and presenting the data on com-

plementary workers' strikes; the detailed notes on each chapter; and the lengthy Index demonstrate the amount of effort which was put into the volume. This book is truly worthy of its beautiful physical presentation. Only a Chinese could so successfully have read and digested the numerous Chinese source materials. However, it is just on this score that a minor criticism may be leveled. Much of the detail in the body of the book is inconsequential, and its wealth of such details, multiplied by a great deal of repetition, detracts from the readability of the text.

It is interesting to note that in speaking of this movement, which protested the authority of Confucian ethics as a state ideology for China—although this system had proved effective in Imperial Japan, Dr. Chow follows the Confucian method of "Rectifying Names," in that he is particularly careful to define his terms. He states clearly that he is considering principally the years 1917 to 1921 and discoursing on the preliminary intellectual phase of the movement as well as on the later attack on tradition and conservatism. He describes well the "new-thought tide," the literary revolution, the student activities, the merchant and worker strikes, and the boycott against Japan inspired by patriotic sentiment resulting from the Twenty-one Demands and Shantung and the desire to modify tradition in the light of Western science and democracy. He therefore concludes that the movement was a combined intellectual and sociopolitical one to achieve, through the modernization of China, national independence, the emancipation of the individual, and a just intellectual, social, and political development in the following decades.

This reviewer, having had the good fortune to attend many lectures given by Dr. Hu Shih, is pleased at the recognition given to Dr. Shih's great influence on the Chinese literary renaissance and at the excellent discussion of this subject. However, the question of whether the Liberals, the Kuomintang, or the Chinese Communist party is right in claiming leadership of the movement and denominating it as a precursor of their own development is purely a matter of subjective interpretation and cannot

be decided by any quantitative measurement.

ALBERT E. KANE

Bureau of Indian Affairs
Department of Interior
Washington, D. C.

MOHAMED ALWAN. *Algeria Before the United Nations*. Pp. xii, 121. New York: Robert Speller & Sons Publishers, 1959. \$3.50.

MICHAEL K. CLARK. *Algeria in Turmoil: A History of the Rebellion*. Pp. xvi, 466. New York: Frederick A. Praeger, 1959. \$6.00.

The first of these timely volumes is the outgrowth of a master's thesis which was prepared at American University. Its author, First Secretary of the Iraqi Embassy, is to be commended for having produced an objective, although somewhat technical, study which is based on thorough research and surveys at the United Nations.

After identifying the sources of the Franco-Algerian conflict, Mr. Alwan presents a systematic analysis of the progress of the issue in the United Nations. Procedural and substantive arguments as well as underlying political factors relevant to each significant vote are ably and dispassionately summarized. The study also provides much instructive data concerning the bloc voting system which is operative in the United Nations. Students of political behavior will be particularly grateful for a thirty-eight page Appendix that contains tabulations of votes on the principal resolutions pertaining to the Algerian question.

In a concluding section of this short monograph, Mr. Alwan offers a few speculations concerning probable developments. Some of his predictions have been proven faulty by events that have occurred since completion of his manuscript. Thus, the de Gaulle government did have a "solution to offer which is basically different from those proposed previously" (p. 73), and the Assembly did not recognize the independence of Algeria in September, 1959 (p. 75). On the other hand, the author was correct in predicting "sooner or later France will have to negotiate" with the Algerian rebels.

It is to be hoped that the direct negotiations which began in mid-1960 will find

both groups—Algerian and French—attempting to be as realistic and temporizing in their demands as Mr. Alwan suggests the restoration of peace requires them to be. Although he is confident of ultimate statehood for Algeria, it is significant that this Arabian scholar-diplomat proposes an interim solution that is far short of this goal.

Sharply in contrast to the realistic moderation displayed by Mr. Alwan is the uncompromising partisanship which is apparent throughout Michael K. Clark's *Algeria in Turmoil*. This *History of the Rebellion*—from 1943 to 1958—was prepared by a journalist who for several years was a correspondent for the *New York Times* in the Middle East and North Africa. His firsthand contacts and observations enable the author to report in great detail on the carnage that has accompanied this devastating civil war. Thus, the principal contribution of Mr. Clark's detailed work lies in its chronological account of the course and the consequences of the rebellion. It also provides an invaluable guide to "who's who" on both sides of the conflict. The author's emphasis on personalities probably led to the unfortunate decision to limit the book's Index to the proper names of the principals involved in the struggle. This decision vastly reduces the usefulness of the author's work for reference purposes.

Readers will do well to discount the publisher's claim that this "is a complete analysis of the political, religious, and ethnic realities that underlie the present Algerian struggle." The author's discussion of the basic social conditions and social forces at work in the Algerian situation is generally fragmentary and rarely documented. The sources that are cited, however, are usually articles from French newspapers.

The most serious defect of Mr. Clark's effort, as previously noted, is his extreme partisanship. The story he tells and the "analytical, rather than merely descriptive, objectivity" he professes have produced a work that cannot fail to be widely praised among the Europeans whose homes are in Algeria.

A review of only a few of the biases and distortions that dominate Mr. Clark's work is possible in the space available

here: (1) Arab nationalism is a bogus and inferior nationalism that has not discovered the twentieth century. Its leaders are megalomaniacs and unrealistic dreamers who are hated and feared by most of their own people. (2) Moslem culture is inherently antidemocratic, intolerant, terroristic, and the enemy of progress. The *Koran* is frequently quoted as "proof" of these charges. (3) Independence, therefore, has been a tragedy for all of France's former colonies in North Africa and the Middle East. Frenchmen who are reluctant to fight for the status quo are sacrificing "a precious part of the nation's patrimony."

And, in addition, the French "leftists," the "Parisian intellectuals," and their powerful allies within the Catholic Church who aid the anticolonialist movement are guilty of "moral fraud" and are imbued with a "strong strain of Vichy." The United Nations decision merely to discuss the Algerian situation vitiates "the concept of an international policy grounded in law." The author is convinced that he who "capitulates" to the new anticolonialism—even by negotiating with rebel leaders—"digs his own grave." The bases of French capitulation are varied and are to be found, for example, in "ponderous judicial rituals" and in failure properly to impose martial law. Thus, "France, if brought to her knees in Algeria, would have been vanquished, not by the rebels, but by her own internal rot, just as Rome was" (p. 132). But responsibility does not rest with France alone. Britain and America have "betrayed the West" by concessions to rebels which, if continued, will permit the Soviets to establish their hegemony in the area. All this, we must remember, is offered in the name of "analytical objectivity."

The duty of France, according to Mr. Clark, is to reject the softness that has characterized past policy, and prudence requires the United States to help France preserve the status quo and the situations of strength that once accompanied it. The rebellion must be thoroughly crushed to preserve liberty and to permit social progress in "a true racial partnership." Peace must be followed by reforms in Algeria, but the European minority must be pro-

tested against the Moslem majority, at least until the latter are thoroughly westernized.

The fundamental difficulty with Mr. Clark's suggestions concerning Algeria's future is that there is no evidence to suggest that the rebellion can be suppressed or that its leaders will accept the "association with France for orderly evolution" he regards as essential. A solution that ignores power realities is meaningless. Meanwhile, the rebellion daily adds new scores to be settled when the leaders of nine million Algerian Moslems are in a position to dispense justice among one million Algerian Europeans. The dilemma facing statesmen is truly grim, but there is no reason to hope that turmoil in Algeria can be abated by following the counsel of Mr. Clark.

H. PAUL CASTLEBERRY

Professor of Political Science
Washington State University

KEITH WHELOCK. *Nasser's New Egypt: A Critical Analysis*. (Foreign Policy Research Institute, University of Pennsylvania, Number 8.) Pp. vii, 326. New York: Frederick A. Praeger, 1960. \$6.00.

This is perhaps the most comprehensive and critical study of Egypt since the Revolution of 1952 ever written by a Western writer. Although Lacouture's *Egypt in Transition*, reviewed in THE ANNALS by the present reviewer, provides a more detailed background of the story of the Egyptian Revolution, Wheelock's book pays more attention to the impact of the Revolution on social, economic, and cultural development than Lacouture's. The author of this book is a young scholar who, although not an Arabist, has visited Egypt several times and has become fully acquainted with its modern history and culture. He established close relations with a number of high ranking officials in the Egyptian Government and interviewed President Nasser.

The first three chapters of the book are devoted to a short account of the background of the Egyptian Revolution and the structure of the military regime. Although less detailed than Lacouture's account, a

more balanced evaluation of military rule is given. Wheelock deplores Nasser's military dictatorship but admits that the regime has provided a stable government and ended the monarchy that brought Egypt to the brink of anarchy. Four more chapters are devoted to the social, economic, and cultural development. Mr. Wheelock is justified in paying more attention to the social and economic problem than to the political, because it is in this field that the ultimate success or failure of the Egyptian Revolution should be judged. Mr. Wheelock pays tribute to the efforts of Egypt's experts who are undertaking to solve Egypt's greatest problem, namely, the race between economic development of the country and its population growth. Although no previous Egyptian government could with courage attempt what the present rulers of Egypt have accomplished, it is doubtful whether the economic development can keep pace with the rapid growth of population. Mr. Wheelock's treatment of cultural development is too brief, and, although he rightly observes the rigid control of schools by authority, he fails to indicate the decline in the Egyptian literary and cultural life which was maintained at so high a level in the interwar period.

The last four chapters are devoted to a study of Egypt's foreign policy and its relations with Western and Eastern powers. Mr. Wheelock is more critical in evaluating Nasser's achievement in his foreign than in his domestic policy. Although Nasser secured certain concrete advantages in his ventures—full sovereignty for Egypt, a respected position among small powers, control of Suez Canal, and so forth—Mr. Wheelock thinks, not without justification, that Egypt's relations with its neighbors and the Great Powers are far from satisfactory. "Nasser is skilled in the game of political survival," writes Mr. Wheelock, "he has also been extremely lucky. He has played the cards of 'positive neutrality' for high stakes and, to date, bluff and courage have kept him in the game. But Egypt has benefited little from Nasser's international adventures. Much has been undertaken in the name of lofty principles, yet Egypt has paid a high price for Nasser's tactical success."

Most of the material of the book is drawn from sources in Western languages, including official reports published by the Egyptian government. Mr. Wheelock has verified some of his data by his close contacts and interviews with Egyptian government officials, civil and military; but he has neither used local Arabic sources nor consulted some leading Western reviews, such as *The Middle East Journal*, *Orient* and *Oriente Moderno*. There are several relevant studies in Western languages which he likewise failed to consult.

GEORGE A. LIPSKY. *Saudi Arabia: Its People, Its Society, Its Culture*. (Survey of World Cultures.) Pp. 366. New Haven, Conn.: Human Relations Area Files (HRAF) Press, 1959. \$7.00.

BENJAMIN SHWADRAN. *Jordan: A State of Tension*. Pp. xii, 436. New York: Council for Middle Eastern Affairs Press, 1959. \$7.00.

These volumes, devoted to the history and development of two neighboring Arab states, are important contributions to an understanding of an area to which American scholars are only now beginning to pay adequate attention. For decades the interests of British, French, and German scholars there have been keener than our own. These interests also appear in each case to have followed the march of political events. That, at least in part, accounts for the more tardy activity of American scholars and writers in this field. Until the end of World War I in 1920, America prided itself on a strictly "hands-off" policy in the territorial problems connected with the break-up of the Ottoman Empire, which possessed the extensive area of the present Arab states. Then followed the feverish exploration of the vast oil resources of the Arab World which awakened American public and private participation and created a desire on their part to become more enlightened about the people, culture, history, international politics, and resources of this area.

Except for the most recent period in which the State of Jordan was rather artificially bound together, little has popularly been known of the historical background of this state or the reason for its existence. Therefore, the author does a service to his readers in sketching, briefly and with clarity, conditions in the bronze and iron ages, the conflicts in Old Testament times, the tragic and cruel battles between Jews and Romans, and the struggles between Byzantines, Arabs, the Crusaders, and the Turks. After the overthrow of the Ottoman Empire and the struggle of the imperialist powers for the pieces, one enters the period of the formation of the new Arab states, of which the former Transjordan, now known simply as Jordan, is one. The aggressive and astute leader of Jordan was King Abdullah ibn Husain. He had real difficulties with members of his family, but he got along well with the authorities of the British Empire. The story of the rise and overthrow of Glubb Pasha—Major John B. Glubb, the organizer and commander of the famous desert patrol—is a fascinating episode in the tempestuous life of Jordan.

In the last decade the immixture of Soviet Russia in Middle Eastern affairs and the emergence of Nasser in Egypt as self-appointed potential leader of the Arab World threatened weak Jordan with additional major tensions. In a sense, and for a time, it was a case of the Soviet Union and Nasser leaning upon each other. A concluding comment of Professor Shwadrán is, "Should the West decide to stop Nasserism, expose it for what it was, and, with a dynamism comparable to that of the Soviet Union's, help all the elements that were ready to resist Nasserism, stability could be established in the Middle East, and the attempt of the Soviet to dominate the area could be defeated." The present judgment of the author might be different.

There is a great contrast between the weak and artificial state of Jordan, which has been "pushed around" by the great Powers, and the Kingdom of Saudi Arabia in whose concerns these same great Powers maintain a scrupulous "hands-off" policy. As the center and source of Arab culture including in its domain the holy places of Islam, Mecca, and Medina, this country is

the most conservative, and doubtless the least well known, of all the Arab states. Dr. Lipsky's volume, written in collaboration with seven other specialists, is the fourth book to be published in a series entitled *Survey of World Cultures*. Works on Poland, Jordan, and Iraq have already been published in this series. The first sentence in the Preface of this volume states that, "The focus of this book is on society as it functions. Emphasis is on the dynamics of the culture, the presence and impact of forces in change, the constant attitudes and behavior, the abiding values."

None of the Arab countries was more primitive or conservative than Saudi Arabia. Its dealings with the outside world were at a minimum; indeed in some parts, it was a closed society. But since the discovery of vast quantities of oil in this huge country, tremendous changes have come in its life and culture—in the political, social, and economic organization. The result has been a challenge of the old traditional institutions that could not resist the inevitable changes that ensued. In this situation it is inevitable that the author should describe the dramatic and sudden changes that have overtaken Saudi society. Their great leader, Ibn Saud, from whom the country itself takes its name, now years after his decease, is a great influence in tribal, religious, and the newly developing political affairs. These several loyalties are important in binding together an embryonic nation in which loyalty to a family is dominant in the thinking of the people.

The influence of the bedouin in Arab society, and especially in Saudi Arabia, is significant. In his concluding paragraphs, the author observes that "it is the bedouin who is romanticized in Arab society as well as in others: brave, virile, bold in war, magnanimous to the defeated, a defender of Islam. Ibn Saud's identification with this stereotype was one of the great sources of his strength, and he made every effort to epitomize himself as the virile, bold, magnanimous leader." The wealth from oil is producing great changes, and among them is the blurring of the bedouin ideal. Nomadry and tribal society are gradually giving way to more settled life. The deepening importance of urban life and the new

Politics and Culture in International History

By ADDA B. BOZEMAN

If Western diplomacy is to function effectively among non-European peoples, one of our most vital needs is to understand how and why the goals, methods, and traditions of these nations differ from our own. This timely book fully explains the ways in which ancient civilizations established cultural systems, ideals, and values that not only persist today, but grow in importance as new republics seek to establish national identities. By recapturing the separate traditions and ideals of diplomacy from different regions and different times, Mrs. Bozeman has located fresh sources for improved world cooperation today.

The Soviet Cultural Offensive

By FREDERICK C. BARGHOORN

Ever since Stalin's death, the cultural offensive has been one of the distinct marks of Soviet foreign policy. Professor Barghoorn, who served for four years in the U.S. Embassy in Moscow and who has made three trips to the USSR since 1956, analyzes the role of Soviet cultural diplomacy in areas of the free world. On the basis of official Soviet statements and of historical records of Soviet actions, he shows the ways in which the Soviet state tries to use cultural exchange for its own purposes and what the Kremlin hopes to gain. He points out the difficulties and the rewards of continuing the exchanges and offers suggestions for future Western policy.

Wages in Germany, 1871-1945

By GERHARD BRY

Professor Bry treats the important changes that took place in wage behavior during the existence of the German Reich as a political unit. Trends in money and real wage levels, long-term changes in the wage structure, and cyclical fluctuations in rates and earnings are analyzed against the background of major institutional changes in the labor market and in the economy at large. In addition, wage movements in Germany are compared with those in Great Britain and in the United States. Published for the National Bureau of Economic Research.

class of oil workers eager for improved education and a higher standard of living forecast changes that are bound to transform even Saudi Arabia into a society of more modern aims and purposes.

Useful maps and tables are included in both of these volumes, as well as a Bibliography. Professor Shwadran's work includes also a profusion of illustrations many of which bear witness to the rich archaeological remains in Jordan. The volume on Saudi Arabia has a list of generally available Recommended Readings and a longer listing of Other Useful Sources. It also brings together for convenient use eleven tables as follows: Publications of Saudi Arabia, Radio Stations, Budget Estimates, 1957-58, Development Monthly Stocks, Crop Production Estimates, 1948-1952, Balance of Trade, Direction of Saudi Arabian Trade, Hospitals, and Weekly Timetable of Primary Schools in Saudi Arabia. Our appreciation and understanding of these countries has been greatly furthered.

EDGAR J. FISHER

Acting Head, Department of

Saint Paul's College

EMIL LENGVEL. *The Changing Middle East*. Pp. 376. New York: John Day Company, 1960. \$5.75.

This is Mr. Lengyel's story of the changing Middle East, essentially during the decade since 1950, the era of the so-called "Pax Americana." This decade is replete with all the problems which have confronted and continually confront the American people and the world at large as the Middle East moves from the periphery of interest to the focus of attention.

There is no doubt of the fundamental changes which are gradually revolutionizing the world of the Middle East and, for that matter, of the greater world of which it is an integral part. In this volume, Mr. Lengyel literally has covered the Middle Eastern waterfront and moved into the deserts and oases beyond, from Libya to Iraq, Turkey, and Iran, and from the Persian Gulf to the Sudan. The author has caught something of the spirit of the changes, the ideologies and the tech-

nologies which are altering old outlooks and habitual modes of living, and of the leaders, with all their human frailties, who now have the stage. There is, however, a certain journalistic approach which is often superficial and sometimes flippant. If the chapters that deal with the events in Lebanon and Iraq during the year 1958 appear well balanced, they do not probe deeply, while the chapter that deals with Israel and Palestine is hardly a model of balanced or objective historical writing.

The Changing Middle East is designed neither for the student nor the scholar. It contains neither maps nor a Bibliography. When the general reader, still interested in the Middle East, has completed this volume, he should turn to the equally convenient, but more authoritative, guides to Middle Eastern history and contemporary developments by Bernard Lewis, William Yale, Sydney Fisher, and George Lenczowski, all of which are of recent date.

INTERNATIONAL RELATIONS

W. W. ROSTOW. *The United States in the World Arena: An Essay in Recent History*. Pp. xxii, 568. New York: Harper & Brothers, 1960. \$8.75.

This is "an essay in recent history" issued by the Center of International Studies of the Massachusetts Institute of Technology. It is an able book by a sincere scholar who seeks to understand why World War II did not yield better results from our standpoint.

Essentially, it is the familiar explanation that the Russians fought the war for political reasons and the British for mixed reasons, but the Americans concentrated on military objectives and lost East Europe. The Western Allies should have established "such a strong *de facto* position throughout Europe during the war that Moscow would have to negotiate defensively to ensure its national security. The problem was not defined as one of forcing the Soviet Union into a position . . ." (pp. 144-45).

This postulation omits the following basic factors: (1) The resolute rejection

by the appeasement governments of Britain and France during 1934-39 of many Soviet offers to help stop Hitler and their determined presentation of East Europe to him at Munich in 1938; (2) Churchill's equally stubborn frustration of our efforts to open a Second Front in Europe in 1942, 1943, and the first half of 1944; and (3) Our consequent dependence on the Red Army to bear the brunt of driving back the Germans from Stalingrad to Berlin and Vienna, and of winning the war in Europe. After Munich, it was never possible both to win the war and to keep the Russians out of East Europe, except by a massive assault on and through Germany into Poland that would have cost us enormous casualties and saved the Russians some of their millions of dead and years of devastation. Churchill was never willing to do this, and we felt compelled to support him in the long African and Italian detour, in peripheral war which could not be decisive. Nor was it ever possible thereafter to dissuade the Russians from keeping their hard-won security zone in East Europe.

Nowhere is there any recognition that the "loss" of East Europe was inherent in World War II, could not have been prevented, and cannot be reversed. On the contrary, the end of the cold war is made to depend, as always, on (a) "the granting of political freedom to Eastern Europe" and (b) "the creation of an effective international system of nuclear arms control," which would "permit international inspectors to roam the Soviet Union on a scale and with a freedom that would make Russia virtually an open society in Western terms" (p. 422).

The "truce" lines inherited from the war must be "steadily protected from direct or indirect assault." This includes, presumably, the perpetual defense of such untenable positions as West Berlin and Quemoy-Matsu-Formosa. We are summoned to "mobilize the strength, will, and imagination to bring about the process of persuasion in the Communist bloc which, by denying all other alternatives, would permit without major war the gradual evolution and release of the forces for good within it" (p. 538). In other words, we

must continue trying to enforce containment until the Communist threat is diminished.

Given the tremendous dynamism which they demonstrate, which is partly engendered by our armed encirclement, this is indeed a somber outlook. Like all balance-of-power thinking since time began, the book is certain that everything we do is defensive and "reactive," while all that the Communists do is offensive and hostile. Communism is defined repeatedly (pp. 424-425) as "a society structured and motivated for war." There is no suggestion that the Soviet Union has suffered three invasions from the West since 1914; or that the Soviet Union and China are beleaguered by our armed bases encircling their frontiers, blockaded and "contained" in every known manner; or that this is a game which is self-defeating.

The book contains thoughtful discussions of internal issues, including problems of administration. It presents alternatives on many questions and is written in a constructive spirit. It is notable also for its recognition that hereafter there is to be a diffusion of power instead of a polarization.

I am continually impressed by the willingness of American scholars to permit their Footnotes to be placed in a morgue in the back of the book. In this case, the author attempts to minimize the process of flapping the pages back and forth by sequestering the Footnotes in six different parts of the book, but this solution only makes more places to look if the place is lost. The Footnotes contain long tables and quotations which are difficult to consider in context. Few readers will ever try. It is reasonable to expect that the continued disuse of Footnotes will decrease them to the point where scholarship itself is undermined. Many will find it increasingly difficult to document their work faithfully, knowing that few will ever laboriously disinter the Footnotes.

ROBERT A. GRAHAM, S.J. *Vatican Diplomacy: A Study of Church and State on*

the International Plane. Pp. xii, 442. Princeton, N. J.: Princeton University Press, 1959. \$7.50.

The author of *Vatican Diplomacy*, Father Robert Graham, associate editor of the Jesuit weekly *America*, recognizes that his subject matter involves the two topics, religion and politics, that are often thought of as threats to the decorous cohesion of a social gathering. And, though this index of prohibited social topics is frequently and happily disregarded, the interrelation of religion and politics is a notorious "heat-raiser" for it inevitably challenges the secularism which may tolerate religion as an archaic theme suitable for interesting discourse. Moreover, the Catholic concept of a visible church, a society so autonomous that its papal monarch maintains diplomatic relations with sovereign states, still presents difficulties for many Protestants, notably in the United States where a principle of nonestablishment is often supported by an emphasis on the necessity of separation of church and state.

The subtitle accurately categorizes the book. In Father Graham's view church diplomacy is necessary because of the dualism of the temporal and spiritual spheres and all the more necessary because of the plurality of political authorities. The necessity and propriety of Vatican diplomatic activities derive primarily not from the temporal sovereignty of the Pope but from the utility of promoting co-operation between authorities over distinct spheres that in practice cannot and should not be isolated. Indeed, the author, in recognizing the value of the freedom acquired by the church in modern, liberal, constitutional states, sees papal diplomacy as a response to the differentiation of international civil society.

Papal diplomacy is ecclesiastical, that is, concerned with the church and its activities. In its broad outlines, however, he insists, "papal diplomacy conforms closely to the genius of diplomacy in general" (p. 7). The reader of this book, which ranges through the origins and organs of modern papal diplomacy, through its international legal aspects as well as papal diplomacy in two World Wars and in relation to the United States and the Soviet Union, will

agree that it makes an important contribution to the study of international relations and diplomacy and, of course, church and state. There is protocol aplenty in its pages, but often enough the "striped pants" matters involve questions of political symbolism that inevitably play a large part in the intercourse of the representatives of sovereignties. The volume provides new and relatively new light on many historical issues from the diplomacy of Bismarck to French imperialist claims in the Ottoman Empire and China. Students of international relations may find the work of the Congregation for Extraordinary Ecclesiastical Affairs, "to reconcile principle with expediency," particularly interesting. Unfortunately, material is not available for much of the modern period. The same holds true for much Vatican source material on modern diplomacy, but the author has done remarkably and painstakingly well in opening up the subject in this comprehensive and dispassionate study.

M. A. FITZSIMONS

Professor of History
University of Notre Dame

GUNNAR MYRDAL. *Beyond the Welfare State: Economic Planning and Its International Implications.* Pp. xiii, 287. New Haven, Conn.: Yale University Press, 1960. \$4.50.

In these anxious times of world revolution when each week brings forth a new political or economic eruption, the need for a clear perspective of the process of change is indeed urgent. If the unfolding events are to be properly assessed and if we are to have some chance of averting catastrophe, we must be able to penetrate history's veil and overcome the narrow myths and preconceptions which often inhibit intelligent action. In *Beyond the Welfare State*, Gunnar Myrdal suggests, with his usual wisdom, where we are going, why, and what the essential prerequisites are for shaping the course and reaching the destination.

Myrdal's theme is one which commands attention and reflection: at the same time as the welfare states of the Western world, including the United States, are moving

more and more toward economic integration and planning, the effects of this development have been to accelerate the tendencies toward disintegration in the world community. The trend toward increased planning has been determined in large measure by the internal accommodations to the major economic interest groups and by the complications of the international crises which have, in recent decades, confronted the world. With the many restrictions imposed on a free market economy in time impeding its effective operation, democratic governments have been compelled to maintain the economy in balance through co-ordination and extension of over-all controls. The forces of economic nationalism which extended their policies widely during the Great Depression contributed much to the breakdown of international stability that existed in the period before the first world war. Economic nationalism furthered international anarchy—political and economic. This international disintegration has continued as the widening material gap between the "have" and "have-not" nations has aroused sharp international class conflicts.

The only democratic solution to the extension of state intervention domestically and to the continued breakdown of the world community is the welfare world. In Myrdal's own words:

"... though planning is continually being necessitated by the rising volume of intervention, the purpose and accomplishment of planning in the Welfare State is ... constantly to simplify, and largely to liquidate, old and new intervention: to substitute a few, mostly overall state policies for a growing mesh of detailed and direct ones, and ... to recondition the national community in such a way that for the most part it can be left to the cooperation and collective bargaining of the people themselves, in all sorts of communities and organizations beneath the formal state level, to settle the norms for their living together. ... When once the national Welfare State has come into existence and built its moorings firmly in the hearts of the peoples who in the democracies have the political power, there is no alternative to international disintegration except to begin, by in-

ternational cooperation and mutual accommodation, to build the Welfare World."

One hastens to emphasize that Myrdal's solution is not, by his own admission and discussion, as simple as the sketching of it may imply. Myrdal stresses the economic, social, political, and psychological barriers to the fuller realization of the democratic welfare state and the implementation of a welfare world. His is not a utopian solution; it is the only solution, however, consistent with the ideals of liberty, equality, and brotherhood which is possible given the realities of the world today. It is a solution which, paradoxically, calls for more government intervention of a certain quality in order to reduce the role of the state in regulating our lives.

Myrdal's little book reflects not only a keen insight into domestic and international economic developments and problems but also a profound understanding of human nature and the social process. Not only is its author a citizen of the world, he is also a worldly scholar whose thinking transcends the narrow bounds of ethnocentrism and cultural myth.

CHARLES HOFFMANN

HUGH SEARON-WATSON. *Neither War Nor Peace: The Struggle for Power in the Postwar World*. Pp. 504. New York: Frederick A. Praeger, 1960. \$7.50.

The author, Professor of Russian History at the University of London, is an internationally recognized authority on East European history. His present book is not a mere history of the cold war; the subtitle of the work reveals its true scope.

In the first part the book tells the story of international conflict, from the end of the last war to the time of Stalin's death, in various parts of the world. Three trends emerge from this survey: the conflict between Russia and the West in Europe, the growth of nationalism in the Middle East and Asia, and the establishment of totalitarianism in China. "Both totalitarianism and nationalism are revolutionary forces, and derive their strength from revolution-

ary conflicts, between class and class and between nation and nation" (p. 99). Hence the scope of the author's exploration into the causes of conflict: He first discusses the two main forces of class conflict—between peasants and other classes and between industrial workers and the upper classes of urban society. In this context the author also examines the role of the intelligentsia as revolutionary leader, especially in underdeveloped societies, and the seizure of power. From this discussion of the forces of revolution the author proceeds to an examination of the nature of totalitarian power, of anti-European nationalism, and of Soviet and colonial imperialism including racialism. In the light of this analysis the author resumes the story of international conflict in the years since Stalin's death and concludes with a discussion of the problems presently facing Western policy. There is little space to record the author's opinions. "I have stated my conviction that the two main themes of the last fourteen years are totalitarianism and anti-European nationalism" (p. 12). "Today almost every nationalist movement and racial conflict is an international problem. Indeed it is on this ground that the conflict between the totalitarians and the West is principally fought" (p. 10). "In the underdeveloped societies it is the intelligentsia that is leading the nationalist, modernist and revolutionary movements" (p. 182). "The appeals of communism to the intelligentsia ... will not diminish" (p. 450). "The peoples of the northwest corner (of North America and Western Europe) are going to need all the skill and leadership they can find if they are to survive the dangers which press on them both from the 2,000 million who live in poverty, and from the ambitions of the totalitarians" (p. 464). "In Soviet society there exist both pressures for reform and pressures for revolution, the former coming mainly from the State bourgeoisie and the latter mainly from the intellectual youth. At present the former are the stronger of the two. The communist party is far stronger than either. It is thus possible that the party will resist both types of pressure for a long time. But Russia no more than any

other country can remain impervious to change" (p. 244). "There is not necessarily any harm in using their phrase, 'peaceful coexistence,' provided that it is understood that peaceful coexistence and cold war are exactly the same thing. . . . It is only when it is believed in the West that 'peaceful coexistence' is something new, denotes a change of heart in the Soviet leaders and a desire for true friendship with non-controlled governments and nations, that harm is done. Provided that this error is avoided there is no reason why the West should not successfully endure the condition of permanent warfare without shooting war, and survive until, whether through evolution or revolution, men come to power in the Soviet Union who genuinely renounce totalitarian imperialism" (pp. 256-67).

To have elucidated the underlying problems from every angle is the author's merit. His combination of the descriptive and the analytical method makes the book all the more valuable for the resulting uniformity of approach and treatment. The selection of his material is admirable, his treatment authoritative, and his conclusions are convincing. This is history at its best.

OTTO HEILBRUNN

Gerrards Cross
Bucks, England

LEO PERLA. *Can We End the Cold War: A Study in American Foreign Policy*. Pp. xii, 251. New York: The Macmillan Company, 1960. \$4.50.

In 251 pages of analysis and criticism of our thinking and conduct in the prosecution of the cold war the author seeks to demonstrate that we must finally end it as the price of survival in a nuclear age. In addition, we must abandon resolutely and with a realistic sense of urgency the archaic and now suicidal notions regarding statecraft that we have nurtured from the time of Machiavelli. Mr. Perla's "minority report" calls for "an entirely new and revolutionary approach, a truly ethical diplomacy" (p. 11). This, in his opinion, is "a most obvious necessity in terms of common sense and pragmatic realities" (p. 42).

The Machiavellian dictum that there should be two moral standards, one required in the sphere of interpersonal relations and another justified for national conduct, has, with few exceptions, been the accepted rule in the foreign relations of national states. And present-day writers, like George Kennan and Hans Morgenthau, endorse it—the former reluctantly—in terms of national interest and in view of the absence of a supernational authority capable of dispensing justice in the international sphere.

In the author's view, this endorsement, reluctant or otherwise, of the double standard today, even with the elastic "national interest" thesis currently employed to justify the amoral conduct of national states, amounts to a prescription for the eventual suicide of the human race. In an age when both sides possess nuclear weapons, force as an instrument of foreign policy has become obsolete, and sole reliance upon it will lead to mutual annihilation.

It is therefore imperative that if we would survive we must end the cold war and create "an entirely new ethic in foreign relations" (p. 235). The scheme of values necessary for survival will reverse the order which at present places money, power, and material possessions first and will elevate moral qualities to first place. "In union and cooperation, in mutual aid and brotherly love we see not only practical idealism but a biological necessity" (pp. 237–38). We cannot expect "a radical change in Russian character and conduct before we ourselves take any bold and imaginative steps to lay foundation stones for peace" (p. 241). To build a sane world order we must "forsake all doubletalk, double-standard ethics, double-standard reasoning, and double-standard judgment" (p. 245). And, while maintaining reasonable military strength, we must be willing to "assume prudent and gradually increasing risks for peace based on faith in our fellow men" (p. 251).

FRANK M. RUSSELL

Professor of Political Science,
Emeritus
University of California
Berkeley

IVAR SPECTOR. *The Soviet Union and the Muslim World 1917–1958*. Pp. xii, 328. Seattle: University of Washington Press, 1960. \$5.00.

One of the serious problems of the Soviet government has been the reconciliation of the classic Marxist attitude of uncompromising hostility toward Islam with the new policy of rapprochement with the Muslim world. In fact, all evidence shows that Islam has always been conceived as potentially more objectionable and obnoxious than any other religion in the Soviet Union.

The present work, earlier versions of which have appeared in mimeographed editions, is a study, based largely on Soviet sources, of the Muslim world as a field of marked Soviet and Communist interest. The author has placed greater stress on the periods when Soviet policy in regard to the Muslim world has been most dynamic than on those in which relations have been largely routine in nature. Thus, greater emphasis has been granted to the Bolshevik Revolution and the years immediately following it, from 1917 to 1925, and to World War II and the postwar period, when the Soviet regime gave a degree of priority to its relations with Muslim countries that was not characteristic of the thirties. Emphasis has been also given to those Muslim countries with which the Soviet Union was first in closest contact, namely, the border countries of Turkey, Iran, and Afghanistan. Official Soviet relations with most of the Arab countries, and with Pakistan, and Indonesia, date either from World War II or the postwar period, and, even in recent years, the Communist party has ordinarily operated underground in those areas. The impact of the Bolshevik Revolution on Muslim countries forms the core of most of the chapters, and Chapter Nine is a pioneer effort in the direction of an evaluation of the Soviet cultural impact on the Muslim world.

The most valuable feature of Spector's survey is that it is based largely upon Soviet primary sources, although the author frankly admits that such documents are all carefully supervised and scrutinized by the authorities. Interestingly enough, this is

publicly admitted by Soviet specialists in the first volume of *Novyi Vostok (The New Orient)*, published in 1922. One valuable contribution of the book consists in the inclusion of the first complete English translation of the "Documents of the Programs of the Communist Parties of the East"—Turkey, the Arab countries, and Palestine—as published by the Marx-Engels-Lenin Institute of the Central Committee of the all-Russian Communist party in 1934. These documents are indispensable for the understanding of Soviet relations with the Muslim world; not only have they never been renounced by the Soviet Union, but recent developments in the Middle East indicate that they are still being implemented, thus serving as a warning to the world what the fate of that region will be under any Communist regime.

JOSEPH S. ROUCEK

Chairman and Professor
Department of Political Science
and Sociology
University of Bridgeport

FRED ALEXANDER. *Canadians and Foreign Policy: The Record of an Independent Investigation*. Pp. 160. Toronto: University of Toronto Press, 1960. \$3.95.

This little book by an Australian scholar is an analysis of Canadian opinion, or rather attitudes, on foreign policy. Although the book is the fruit of a three-months' visit to Canada in 1958, Professor Alexander writes from the perspective of two previous visits and a reading acquaintance with Canadian developments.

The titles of the more important chapters give some indication of the ground covered: "Economic Realities;" "Strategic Interests;" "Political Trends;" "Cultural Considerations;" "Idealist and Spiritual Influences;" and "Nationalism and Regionalism."

Canadian-American relations loom large in nearly every chapter, but no larger than they are in fact, economically, strategically, and culturally. Canadians, the author feels, are beginning to evaluate realistically the assets, as well as the liabilities, of their North American partnership even if they seem unduly shrill at times

about United States policy and particularly about economic policy. Regarding Commonwealth relations Professor Alexander finds Canadians surprisingly nostalgic in their attitude towards the United Kingdom but somewhat confused and uncertain about their relations with the rest of the Commonwealth. Despite the centrifugal pulls of regionalism, he detects a growing national consciousness which, if not yet a synthesis of regional interests and loyalties, is at least an effective working compromise as reflected in external relations.

His technique is neither that of quantitative measurement nor that of sampling opinion, but it is rather that of personal interviews with political leaders and leaders of other functional groups. There is perhaps a heavy weighting of the views of university dons, among whom as a university professor Professor Alexander naturally found congenial spirits. The technique is as old as journalism and in the hands of a less skillful and impartial investigator might well have produced only journalistic results. But Professor Alexander has done similar studies elsewhere, and he has the true scholar's objectivity, even though he dispenses with the usual scholarly impedimenta of Footnotes and Bibliographies.

This book can be unhesitatingly recommended as a useful contemporary analysis, not so much of what Canadians think of foreign policy, but of why they think the way they do about it. The author's colloquial and incisive style and apposite quotation or paraphrase of comments of Canadians he interviewed make this book easy to read, indeed, so easy that the reader may underrate its value.

R. A. MACKAY

Canadian Embassy
Oslo, Norway

THOMAS HOVET, JR. *Bloc Politics in the United Nations*. Pp. xviii, 197. Cambridge, Mass.: Harvard University Press, 1960. \$6.50.

As explained by Lincoln Bloomfield in his Foreword, Mr. Hovet was asked to undertake this study of negotiating and voting blocs, part of the United Nations Project of the Massachusetts Institute of Tech-

nology Center for International Studies, because of his access at New York University to a uniquely comprehensive collection of statistics on United Nations votes and because he was cognizant of their use and application. Mr. Bloomfield indicates that he is not disappointed with the result. This reviewer joins him in regarding it as "the most comprehensive and penetrating analysis thus far made of this important development in international politics."

Mr. Hovet devotes successive chapters to "History and Method," "An Over-all View of Blocs and Groups," "Bloc and Groups Examined Individually," "Bloc and Group Coalitions," and "Some Policy Implications." This analysis is reinforced and illuminated by seventy charts at the end of the book, in addition to numerous charts and tabulations interspersed in the text. The study "embraces an over-all survey of the blocs and groups that have developed, an individual consideration of each of the blocs and groups, an examination of the combinations and coalitions of blocs and groups in the United Nations, and some conclusions on the role of the United States in relation to blocs and groups" (p. 13).

The analysis is based on official records, secondary source material, interviews with officials of the United Nations and various delegations, and examination of General Assembly voting. The study of voting is based on an "adjusted gross" number of roll-call votes and "significant resolution" roll-call votes.

In a sense the title is misleading because Mr. Hovet defines "bloc" as a group of states that votes regularly in caucus and whose members are bound in their votes by caucus decision. By this definition there is only one true bloc—as he points out—the Soviet. His study is chiefly concerned with established "caucusing groups" and "regional groups" which have common interests without enforced voting solidarity. These groups show varying degrees of solidarity in Assembly voting. What the study does not attempt to show is the extent to which patterns of greater uniformity exist within the groups themselves. Thus in the case of the Latin-American group, while the over-all record of cohesion is not high,

a more detailed analysis would show a high degree of cohesion among certain members of the group.

Mr. Hovet finds that bloc and group politics in the General Assembly are increasingly important phenomena certain to be extant as long as the United Nations itself. It is also clear that bloc and group politics require different skills in the conduct of Assembly business than were demanded of professional diplomats of the past. His study should be of great value to those thus engaged, as well as to those whose interest is of a more theoretical nature.

LELAND M. GOODRICH

Professor of International
Organization and Administration
Columbia University

RICHARD N. ADAMS and CHARLES C. CUMBERLAND. *United States University Cooperation in Latin America: A Study Based on Selected Programs in Bolivia, Chile, Peru, and Mexico*. Pp. xxxii, 264. East Lansing: Institute of Research on Overseas Programs, Michigan State University, 1960. \$3.50 paper-bound; \$4.50 clothbound.

BRUCE LANNES SMITH. *Indonesian-American Cooperation in Higher Education*. Pp. xxii, 133. East Lansing: Institute of Research on Overseas Programs, Michigan State University, 1960. \$2.00 paper-bound; \$3.00 clothbound.

In January, 1957, Michigan State University's Institute of Research on Overseas Programs began a three-year study of the international programs of American universities. First to appear was a reference volume describing the 382 programs carried out in some 70 countries by 184 United States universities and presenting useful over-all statistics. The two works on Indonesia and Latin America reviewed here are part of a projected series of eight "country studies," describing selected projects in a country or group of countries. Projects include such diverse forms of cooperation as establishing an Economics Research Center in Chile, sending American undergraduates to study in Mexico, and expanding the curriculum of teachers' colleges in Indonesia. Projects are sponsored

by the United States Government, private foundations, participating universities, and occasionally by business firms.

Educational problems in Indonesia and Latin America show a certain similarity, despite historical differences between the two areas. Both must educate a wider segment of the population to provide a broad base for economic progress and political stability, and both must train more teachers, providing them with greater incentive to perform an effective job and to remain in the teaching field. Administrative problems associated with university affiliation are also similar: resolving conflicting objectives, especially when more than two parties are involved, recruiting personnel who are both professionally qualified and able to work effectively in a foreign culture, and maintaining long-distance communications. Case histories appended to each volume make instructive reading.

The studies disagree on some points. Smith stresses the need for extended tours of duty for American personnel to take advantage of the area knowledge they gradually acquire. Adams and Cumberland argue that turnover of personnel has certain advantages, since new men who have not been subjected to a long period of frustration bring fresh ideas and enthusiasm to the job. In selecting an individual or institution to render assistance to a foreign university, Smith says that only the best man in the field will be acceptable, while Adams and Cumberland favor an institution which may not be the best in its field, but is similar to the affiliated institution. In both these instances a cogent argument can be made on either side.

The Latin-American study suffers from the rigid conceptual framework within which the authors chose to work. Topics of vital interest, such as undergraduate study abroad for Americans and creative innovation in developing countries, are introduced but not pursued sufficiently to shed light on the subject. The Smith study, informal in style with touches of humor, is also more enlightening. The author's sympathetic understanding of Indonesia is conveyed to the reader. He describes Indonesia's educational problems

with clarity and makes clear the frustrations experienced by both Americans and Indonesians living abroad in such passages as: "Besides police registration of cars, Indonesians enjoy registration of all individuals, repeatedly." He suggests a solution to the perennial problem of foreign students working for American degrees which may not be recognized or useful at home: take courses abroad for credit but obtain a degree, if desired, from a university at home.

Two basic problems common to programs of university affiliation are how to transcend cultural differences so that methods and ideas which work in one country are applicable in another and how to make the affiliation equally beneficial to both parties. The Latin-American and Indonesian studies amply document these problems but find no solutions. The studies do, however, offer some important recommendations that are relevant to these problems: 1) training of teachers and establishing libraries should be given the highest priority overseas, since these will pay educational dividends in years to come; 2) despite the immediate need for trained people in technical and professional fields, the humanities and social sciences should not be neglected; 3) all personnel going overseas should be exposed to language and area orientation of some kind, preferably before being sent abroad but otherwise after arrival in the foreign country. Both studies agree that, to be truly successful, an international program must produce an institution or group of individuals competent to continue their work after the affiliation ends.

KENNETH HOLLAND

President
Institute of International Education

LOUIS P. LOCHNER. *Herbert Hoover and Germany*. Pp. vii, 244. New York: The Macmillan Company, 1960. \$5.00.

In his long career as a statesman, former President Hoover was required to deal with Germany and the Germans at almost every critical turning point in his public life. He headed the Committee for the Relief of Belgium during the German occupation in World War I; he waged a suc-

successful fight at the Paris Peace Conference to raise the blockade of the Central Powers and permit food to reach the starving populations; as President he conceived and initiated the Hoover Moratorium to avert the financial collapse of central Europe; and after World War II, as chief of a special mission to Germany, he rendered a report on economic conditions which contributed substantially to the reversal of our occupation policies and the beginning of reconstruction in the devastated country.

To each of these focal points in Mr. Hoover's career, the author, who for many years served as chief of the Associated Press bureau in Berlin, devotes a narrative chapter deepened by personal knowledge and experience of the events which he describes. Added to the chapters on public affairs are accounts of the Hoover translation of Agricola's *De Re Metallica*, Mr. Hoover's first encounter with a major German figure; his sponsoring of the European Children's Fund after World War I; the publication of the Hoover memoirs in Germany after World War II; and the public honors accorded him on his visit to Germany in 1954. The latter account serves well to remind us of the veneration attached to the former President's name in Germany. An admirer, speaking to a group of German children, expressed it quite simply: "I believe he saved more lives than any other man of our times."

It must be said in conclusion that Mr. Lochner's book makes little pretense of critical or probing scholarship, nor does it add greatly to our knowledge of events. In fact, Mr. Hoover has been such a diligent and prolific historian of affairs in which he played a major role that he leaves only gleanings for others. However, from the Hoover papers, but mainly from the subject's printed works, the author has assembled a warm tribute to a great figure in American and world history.
