FOREWORD

An issue of *THE ANNALS* devoted to government and science needs no justification. The challenge to our scientific and technological position, implicit in Soviet space conquests, has resulted in a virtual consensus that government should act to correct such deficiencies as may exist.

But this consensus disappears amid the welter of diagnoses as to what is wrong with our system and an even greater quantity of prescriptions and panaceas as to what should be done.

The national government is clearly committed to a dominant role in stimulating, promoting, and supporting science, scientific research, and technological development. Since World War II numerous programs have been initiated and tremendous sums have been made available for research and development. And the willingness of Congress to underwrite further expansion is not flagging. Cold war threats and general competition with post-Sputnik Russia effectively deter tendencies toward niggardliness or economy in this sector of public expenditure.

Yet the very ease with which financial support for scientific programs can be secured may obscure many difficult and perplexing policy and administrative problems connected with the role of government in scientific research and development. Money alone will not eliminate shortages of trained manpower. It may even complicate scientific progress by, among other things, intensifying bureaucratic tendencies and increasing restrictions on desirable freedom for research. Money may also distort the content of research programs and divert the application of research energies. And in any case, financing is but one part of a complex problem.

In a recent address Dr. George B. Kistiakowsky, the President's scientific adviser, suggested the fundamental character of the challenge facing the American people, by emphasizing that the country needs a general upgrading of its citizens' intellects, if we are to progress scientifically. He pointed out that even the generally held concept of science is usually erroneous in that the average citizen gets technology all mixed up with science and confuses products that enhance human comforts with ideas of science.

"Our national objective," Dr. Kistiakowsky declared, "should not be the creation of an elite corps of intellectuals, but rather one of raising and improving the intellectual tone of our whole society. . . . We cannot achieve a desirable level of scientific activity until there is not only its acceptance by society but a conscious desire to cultivate and encourage intellectual excellence."

If indeed Dr. Kistiakowsky's description of the problem is somewhere near the truth—and I fear that there is much evidence to support his views—then the problems facing us are truly tremendous. They will not be solved by mere tinkering; they will require a reshaping of public attitudes, a redirection of public energies, for we are then talking about social, political, and economic change.

This issue of *THE ANNALS* presents no consensus of views, but it does present some clear and appropriate analyses. Selection of the topics for treatment was no easy task. Some subjects which are obviously important are not dealt with. Articles on rocketry and space research, on science and foreign policy, on scientific manpower, on geophysics, and on many other topics would have been appropriate

and significant additions to those which are included. But space limitations prevented their inclusion. Nevertheless, an impressive start has been made by the several authors in exploring the subject of government and science and in laying a foundation for an understanding of some of the complex policy and administrative problems in this critical field of national interest. Unquestionably, it is only through such exercises in critical analysis that we can move in the direction of creating the values which Dr. Kistiakowsky feels are so necessary. If this issue contributes in a small way to such a re-examination of basic values, it will have justified itself fully.

I would, incidentally, like to express my appreciation to Mr. Edward Dawson, who assisted with the preparation of this issue during the four months that I was out of the country.

NORMAN WENGERT

*Norman Wengert, LL.B., Ph.D., College Park, Maryland, is a Professor of Public Administration at the University of Maryland. He is presently on leave, serving as Deputy Director for Studies of the Outdoor Recreation Resources Review Commission. He has been a Research Associate with Resources for the Future, Inc., and has served as a staff member in the Office of the Secretary of the Interior. He has also held various administrative positions with the Tennessee Valley Authority. He is author of *Natural Resources and the Political Struggle* (1955) and *Valley of Tomorrow: TVA and Agriculture* (1952).*

The Challenge of Government Science

By JOHN C. HONEY

ABSTRACT: The failure of government science to meet Russian accomplishments in space research poses fundamental questions about American governmental and social institutions which are of deep concern to public administrators. These questions do not find their solution in relatively minor adjustments of the administrative machinery such as have been made since the fall of 1957. They relate to our pluralistic values, our lack of a sense of national purpose and our system of Presidential leadership made weak by the checks and balances which are grounded in the Constitution.

The contrast between Russian and American scientific capacities, and the relative ability of the two societies to plan and to direct resources to those activities which further the national interest, lead to the following basic questions: do we need constitutional reform to provide for a stronger Presidency and for a modification of the costly and inefficient federal system? Must we not anticipate national planning so as to assure that the creative and productive capacities of the country go first to efforts of high national importance? Beyond these basic questions there are a number of urgent matters which challenge public administrators, for example, the quick development of an effective research communications system and the treatment of scientists in government in a manner commensurate with their importance to the national well-being.

John C. Honey, Ph.D., New York City, is Executive Associate of the Carnegie Corporation. He previously served four years as director of government studies in the National Science Foundation. Prior to that time he was on the program planning staff of the Secretary of the Interior. A graduate of Bard College and The Maxwell School, Syracuse University, he has also taught at a number of institutions and has conducted research for the Office of Naval Research on problems of large-scale research organization.

IT COMES as a shock to realize that the challenge of government science to public administration today lies largely in the failures of governmental science. The challenge, of course, reaches far beyond public administration, even when broadly conceived as embracing every aspect of the governmental processes. American society as a whole is involved in this failure of governmental science.

Although federally financed research and development amounts to something less than half of all science in this country it is, from the public point of view, the most responsive and responsible. Industrial firms pursue research as an adjunct to their individual productive efforts and economic objectives. Universities encourage it to advance knowledge in general and to enlarge the capabilities of their faculties. But government conducts and supports science in the fulfillment of its national responsibility. When the national interest suffers a severe setback through the inabilities and failures of major government research programs, as it did in the fall of 1957, and has on numerous occasions since, it is unavoidable to conclude that the processes of government—public administration—face a serious challenge indeed.

How could failure arise out of the great structure of American governmental science with its thousands of dedicated and creative servants, its hundreds of laboratories—some governmental, some located elsewhere but financed with public funds—its unending flow of marvelous achievements? And how on the other hand was it possible for the Soviet Union, which only forty years earlier had been in the throes of revolution, which less than two decades before had been physically wracked by the greatest war in history, to show scientific progress well beyond American capacity?

These are questions which thoughtful citizens, including many directly engaged in the governmental processes, have been driven to ask. In spite of early assurances from some politicians that the gap in accomplishment between Soviet and American science was nonexistent or of little moment, the continuing evidence belies such views. The notion that we had never intended to be in the race with Soviet science in the exploration of space reassured only the most naive. Governments are responsible and effective only insofar as they succeed in meeting national needs and interests. It could scarcely be argued, for example, that the impetus given by Russian accomplishments and American failure to the nations of Asia and Africa to find their solutions in the Communist pattern, were of no significance to the national interest.

Weaknesses in government science

Observers of the government scene had been concerned prior to 1957 with a number of weaknesses in the relationship of government to science. The organization for the conduct of scientific affairs was clearly chaotic. At the top there were several bodies, notably the National Science Foundation, the Interdepartmental Committee for Research and Development, and the President's Science Advisory Committee, in addition to the National Security Council, all with responsibilities for advising the President on national science policy. The respective roles of these organizations, as policy framing and advising agents on scientific matters, were at many points unclear. Furthermore, several of the most important research bureaus were illogically and inhospitably housed in major departments. Others existed in a kind of "power limbo" as independent agencies.

Leadership in this period was a mat-

ter of special concern to those who saw the government's research programs as particularly crucial. The interest in scientific affairs in the White House was tepid; the advisers on science policies were timid or distracted by other responsibilities, or unsure of their authority. The derogation of basic research by a Secretary of Defense in this period and the vacillation over defense research budgets were symptomatic of executive branch attitudes. It was not possible, either, to detect extraordinary Congressional leadership.

As for the scientist in government, he had been assaulted by McCarthyism and had witnessed the spectacle of a Secretary of Commerce siding with parochial business interests against the detached findings of the National Bureau of Standards in the famous battery additive case. Furthermore, the government scientist was paid as other civil servants; no better in spite of the unique function he fulfills. He could rarely attend professional meetings; could almost never travel abroad. His communications and publications were restricted by security regulations, many of which transcended the bounds of sense and utility.

The government's current and anticipated needs for scientists and engineers were largely unknown. This was equally true for the universities and industry. In consequence it was not possible to give informed attention to the potential supply in the universities of the country and to provide guidance and incentives for spurring the output of technically equipped manpower. Education proceeded as it always had, a highly individualistic operation.

Science in the Soviet Union

Since October 1957, there has been a gradual realization of the true nature of the status of science and education in

Russia. We have learned of the national dedication to learning which pervades the Soviet Union. We are beginning to understand the extent to which the communist leadership is willing to divert resources to education and science. The able, technically trained person occupies an honorific position quite different from that which is his lot in the United States. His material rewards are high, so high in fact that it would be a severe downward adjustment for him to exchange positions with American university and government scientists. He is aided in his work by excellent equipment; he has access to practically all important foreign scientific works, in translation. Perhaps of greatest significance is the evidence that Russian science is largely carried on in a context of social purpose and that creative talents still produce with remarkable vigor.

New American response

The last two years have witnessed two levels of response with respect to American science and the research programs of the government. The first of these is action-directed, and is evidenced by many administrative steps described in other articles of this issue. The second level of response is found in a greater sense of urgency and a growing feeling that more profound problems and more fundamental changes may be implied in government science than have yet been widely articulated.

This deeper, second level of response probably reflects an expanding awareness among American citizens that Russia's achievements in science threaten the United States and all democratic governments, not only militarily but in the very essence of their institutional arrangements for implementing the philosophy of popular sovereignty. Some of the problems related to national pur-

pose, leadership, goal-setting and planning which come to the fore as we look at the current state of governmental science are discussed in the following pages.

NATIONAL PURPOSE AND LEADERSHIP

With growing frequency these days one hears in responsible quarters that the United States lacks a sense of national direction. Contrasts are drawn to the Soviet Union where American visitors are finding a widespread urgency and purpose in every type of activity. The Soviet problem is simple, of course. National purpose has been predetermined by the leadership. It is unitary, easily articulated, and constantly pressed upon the citizen. In essence it is the development of communist society and its extension to other parts of the world. What is meant by "communist society" is growing in attractiveness: in terms of security, increasing material comfort, excellent educational opportunities, health benefits, recreational and artistic outlets. Of great importance is the sense of national *esprit* associated with accomplishments in space research and exploration.

In the United States the noble ideal of individual self-fulfillment has been and remains the central theme of the nation. This objective, worked out in a frontier environment and under the aegis of a governmental structure designed to dilute authority, has resulted in an astonishing pluralism. Every man sets his own goals, and in ordinary times his conscience as much as his government dictates the degree to which he will actively contribute to the national interest. The multitude of goals and the high degree of similarity in range of interests of the two national political parties reflect the pluralistic nature of our society. It also suggests, as does the history of third parties in this coun-

try, that unitary approaches seem to be antithetical to our national make-up.

The problem which presents itself in the competition for national progress between Russia and the United States is well illustrated in the treatment of scientists and engineers and in the provisions for technical education in the two countries. The success of communism depended in great measure on the expansion of the technical base of Soviet society. In consequence attractive conditions have been provided for scientists and engineers, and scientific accomplishments are widely rewarded and honored. Technical education and scientific education have been made the birthright of the able and gifted and are provided without cost, in fact with subsidization of the individual. In the United States, while we admire the creative scientist, we have done relatively little to reward his unique capacities and contributions, in part, on the grounds that egalitarianism forecloses undue attention to the gifted. Few special educational opportunities have been available to the potential scientist. Talent has risen to the top through the interplay of many social and individual forces and it has been smothered and lost in a similar manner. The planned emergence of the gifted to posts commensurate with their capacities has been unheard of in the United States.

Our national purpose

The only occasions upon which it has been found fitting to enunciate a national purpose have been emergency ones—in this century the two great wars and the great depression. And in the latter case national purpose rapidly dissolved into partisan feuding as soon as the first remedial steps to avert economic collapse had been taken. In these periods science found its place in the scheme of the national effort;

through the National Research Council in World War I; through the National Resources Board's report, "Science—A National Resource"; and through the Office of Scientific Research and Development (OSRD) of World War II.

It grows clearer with each emerging piece of evidence on Soviet Russia and Red China that the purposes of the state are exercising a powerful influence on the peoples of those nations. Lacking the physical threat of depression or war our own national purposes remain as diffuse as during any peacetime period in the past.

The fundamental question is thus posed whether the United States, given the highly individualistic character of the goals which move its citizenry, can meet the competitive challenge of communism. In the abstract and ideal situation, each citizen would be animated so that his energies would be distributed in appropriate amounts to meeting social responsibilities and to fulfilling his own capacities. The practical problem for the student of government is to determine whether measures may be taken which would provide clearer opportunities for the enunciation and implementation of national purpose.

Limitations of our constitutional system

This being a time of national and cultural peril unparalleled in American history, it is perhaps not too imaginative to speculate about some elements of our constitutional system and their utility for the present. We seldom reflect on the possibility that the act of genius of 1789, if blindly adhered to in the twentieth century, may spell national failure. We infrequently ponder on whether the rate of adaptation to modernity which our system of judicial review permits is so slow that as a nation we may already be on the brink of

displacement as a great power. The economic and political values which motivated the framers of the Constitution were eighteenth-century responses to mercantilism, autocratic government, and the needs of a loosely knit agrarian community. The tightly interwoven, heavily populated, complex society of today may not be able to function effectively upon terms set so long ago.

Do we find, for example, a frustration of the means for framing and enunciating national purpose in the built-in competition between Presidency and Congress? History, and administrative experience, demonstrate beyond doubt that strong institutions have strong spokesmen. Under our prevailing system of checks and balances, Presidential leadership of a high order comes about only through the juxtaposition of crisis situations and forceful personalities. We have no assured continuity of leadership in the office of the Presidency and hence one of our primary sources for the generation and articulation of national purpose is in constant ambiguity. The Office of the Presidency, freed from some of the constraints of Congressional review, less limited in ultimate program and fiscal responsibility, and more able to move at home and abroad—that is, unhampered by Congressional and judicial pressures—might be a source of national purpose which is now seriously wanting.

Important issues

Under such circumstances there could be a resolution of one of the important issues affecting science that has confounded the federal government for many years, namely, the level of support to be devoted to fundamental research. There is no absolute answer to the problem; whether we encourage basic research depends on many fac-

tors. For example, does the scientific community find the flow of basic knowledge adequate or is much applied and developmental work frustrated because we lack underlying facts? Are other nations supplying us with basic knowledge and is this a reasonable arrangement given our own strong inclinations to applied and practical work? Are the talents of the scientific community for fundamental research being adequately utilized or are they being diverted to the production of hardware? These considerations and many others go into the ultimate formulation of a position on fundamental research. If the national interest suggests, after reasonable exploration, that increased funds must be diverted to basic research, the strong Presidency could effect such a move. As it is, the currents that flow around the processes of making funds available for fundamental research are so numerous and unpredictable that real doubt remains as to how well the national interest has been served.

While we tend to argue that what emerges from the prevailing system of give and take serves, in general, the common good, this supposition too must be questioned. It is conceivable in an age of rapid change and ever rising challenge that the pressures exerted through this system reflect a parochialism which has little bearing on the true national interest.

Similar doubts must be raised about the efficacy of the constitutional distribution of responsibilities between states and central government. The trend has long been toward the modification of the states from sovereign powers within the federal framework to administrative units. Can we risk awaiting the outcome of the evolutionary process or are more radical measures implied, such as possible constitutional reform?

These are profound and serious questions, ones which students of govern-

ment and administration may need to explore in earnest as the challenge of communist accomplishment grows.

POLICY AND PROGRAM FORMULATION

In the absence of clear national goals which the nation is striving to fulfill it is not possible to develop in our research and development programs the sharp sense of direction and purpose which will permit a determination of priorities and emphases. The technically trained man in automotive engineering is, under the prevailing scheme of things, performing work no different in value from that done by the engineer engaged in government rocket research. Indeed, if wages be the criterion we place a considerably higher value on automotive engineering.

There are profound implications for American society in the realization that the communist competition is demanding that we set priorities and direct application of our inevitably limited resources to those activities which most directly affect and serve the national interest. One can foresee the modification of our entire system of production and distribution, with controlled output of consumer goods and a severe restriction on the peculiarly American institution of "want-creation" as a likely development. Public service oriented activities would expand faster than at present since the government would divert a higher proportion of the national income to education, research, health, housing and cultural endeavors.

If such predictions are accurate the national government will need to devise and administer systems to control production and distribution. It will have to find means of diverting resources to socially desirable ends while retaining such essential ingredients of democratic society as widespread consultation and channels for the expression of dissent.

A tremendous challenge will be presented to public administration under such circumstances.

Planning of research and development

Exploration of these larger social, economic, and cultural implications of the present crisis goes beyond the intended scope of this paper. However, we can appropriately look at the existing arrangements for program planning especially with reference to how they affect the government's research and development activities. For in this area it is possible that some practical moves for improved practice can be made with relative ease. Thoughtful attention to the program-planning process inevitably forces a concern for clear articulation of national objectives, knowledge about the current status of the nation's strategic position, and knowledge about manpower and resource supplies.

At present, planning for the government's research and development activities is no more well developed or long range than is planning for any governmental functions. Since nearly all such research is carried on for practical purposes it is bound, in its conception, to reflect the approaches taken in the government to planning and programming generally. Characteristically, federal operations are conceived on a short-term basis, reflecting the budget and appropriations systems. Lacking long-term goals, government thinking is usually dominated by a "crash" and *ad hoc* atmosphere. The research and operating problems being faced reflect the questions which have previously been posed and these in turn depend in great measure on the machinery employed.

Planning under the National Security Council

At present, the broadest issues related to the national security and de-

fense are handled in the National Security Council (NSC), which assesses the nation's security posture at any given time in the light of the evidence available, and arrives at judgments which are then recommended to the President. The military research and development program is designed to be consonant with the policy positions which emerge from NSC deliberations and subsequent Presidential decisions. Crucial to the matter of how foresighted the NSC can be—how anticipatory of the major future lines of action which the government must pursue—is the nature of its planning. Authoritative critics say that since it is composed of several Department representatives it suffers on two counts: first, the immediacy of operating responsibilities colors its sights and forces it to concentrate on the here and now rather than the future; and second, it can never serve as a detached, reflective agent to examine future needs and responsibilities of the government since it must try to resolve conflicting departmental views and come up with compromise solutions for the President.

Given such national security planning machinery it is not surprising that research and development planning has been too little oriented to the more distant future but rather too much concerned with immediate problems and conflicts. While there are many contributing factors, certainly the foregoing explains in part our failure with respect to space research. Farsighted planning would have included a vigorous program of outer space experimentation, recognizing the extreme significance to the free world of maintaining a posture of pre-eminence in this technical and scientific realm.

In another respect the National Security Council arrangement is highly unsatisfactory for planning purposes; one which bears directly on research

and development. While the NSC has been concerned with the national supply of technical manpower, it has never been in a position to see this problem in the context of the entire problem of education in a democratic society. This is precisely because of the security orientation in the NSC mandate. Until the training of scientists and engineers can be dealt with as one facet of the national problem of future manpower needs, until their training can be planned for a substantial period ahead, say at least ten or fifteen years, taking into account industrial, university, governmental, and other requirements, we are bound to come up with fragmentary and distorted results.

Other federal agencies

In recent months the Office of the Science Adviser to the President has expressed the view that we have need for long-range planning to determine the direction in which the national scientific effort should move. Indeed the intention has been expressed by that office to engage in such planning. However, it seems certain that the planning of research and development, including attention to the problems of education and to the encouragement of basic research, needs an environment of greater generality and more detachment from operational demands than can be found in either the Office of the Science Adviser or the NSC.

The other agency at the Presidential level which is, in fact, concerned with all activities of the executive branch is the Bureau of the Budget. Its functions of policy and fiscal review and the limitations inherent in this review process are almost too well known to mention. The Bureau has been, especially in recent years, the President's agent for effecting economy and for striving to bring expenditures and income into balance. But at no time in

its history has the Bureau been sufficiently detached from the annual budget process to permit the kind of perspective on departmental and agency plans and programs, to allow it to qualify as a planning body.

In the departments and agencies planning is still in a most rudimentary state. A few departments have had, or now possess modest units concerned with policy and program development which use secretarial services in common. In some instances research has been considered beyond the scope of the planning units. By and large, in spite of the heavily applied character of departmental research, there has been little interplay at a planning level between policy, operating and research people.

A POSITIVE PROGRAM

One can readily construct a formula for the rational determination of goals and program plans to embrace the totality of government responsibility including research and development. This formula might consist of a Presidential planning board or Chief of Planning in the White House, equipped with staff and authority to muster the extensive information required to formulate long-term, five- or ten-year, goals and schedules of annual programs. With such a central planning body in the White House, complementary planning units might be found in each department and agency, and in the major subunits thereof. These would have access to a common pool of basic data about the national condition, for example, population projections, economic indicators, available and anticipated resources, and manpower supplies.

Formulas of this kind are easy to construct in the abstract, and are perhaps far from the reality of any national planning machinery of the future. But they serve to suggest the nature of the need, and speculation may be warranted

since few public administrators, be they students, scholars or practitioners, if the literature is indicative, are directing much thought to the development of such machinery. The public-planning function has been given lip service for a generation as an element in the administrative process. But the planning which receives most attention is directed to urban government and to physical planning, in a quite limited sense.

Numerous other opportunities for administrative inventiveness are at hand in the government's research endeavors. We need to develop really adequate arrangements for communicating research findings and to provide rewards and incentives to the scientist in the public service which are commensurate with his value and not simply with egalitarian philosophy. We need to channel funds to the secondary schools and universities for classroom and laboratory construction purposes, as well as to as-

sure scholarships for all persons of sufficient ability to profit from higher education. We need to discover better means of expeditiously concentrating large-scale resources on major research problems, where the national interest is involved, and where the heavy cost of research tools precludes ordinary approaches. It would also be desirable to work out with the states allocations of mutual research responsibility in shared program areas.

However, attention on the part of public administrators to such specifics as these should not convey an impression that the government is now successfully meeting the competitive challenge from Soviet Russia.

Only when we see a widespread public interest in facing the fundamental problems inherent in our own political and social structures can we feel hopeful that popular government may be able to meet the challenge of communist accomplishment.

Recent Developments in the Relationship of Government to Science

By E. R. PIRE and R. N. KREIDLER

ABSTRACT: National concern for science has increased as the recent developments in the relationship of government to science testify. The government's extensive role in scientific activities is witnessed by the numerous agencies and department divisions which have been created or extended in their scope. The growth of government-science operations has brought with it the present experimentation for a better administrative structure. One of the newer attempts to promote co-ordination in governmental science was the Presidential appointment of a Special Assistant to act as a liaison between government and science in the executive branch. He is particularly well suited for this role of co-ordinator as chairman of both the Science Advisory Committee and the Federal Council for Science and Technology. The augmentation of the government's role in science and the accompanying proliferation of scientific agencies has created a need for scientists who are both versed in technical subjects as well as in the operations of the government. These specialists may be secured if the academic institutions realize the nation's growing need.—Ed.

Emanuel R. Pire, Ph.D., New York City, is Director of Research, International Business Machines Corporation, and a member of the President's Science Advisory Committee. He served as Chairman of the Committee's Panel on Research Policy, whose report, "Strengthening American Science," was published by the White House in December 1958.

Robert N. Kreidler, M.A., Washington, D. C., is on the staff of the Special Assistant to the President for Science and Technology, and serves as Executive Secretary of the Federal Council for Science and Technology.

DURING World War II and in the period following, members of the scientific community have evolved relationships to government and national policy quite similar to those developed by economists, lawyers, and social workers during New Deal times in the nineteen thirties. Beginning with Vannevar Bush, a succession of men, including Oliver T. Buckley, L. A. Du Bridge, I. I. Rabi, Detlev W. Bronk, James R. Killian, Jr., and, at present, George B. Kistiakowsky, have served both as chief delegate of the scientific community and as symbol of the involvement of science in national policy.

This involvement, which started with the restricted technological requirements of a "hot war," has grown with the mounting diplomatic and economic pressures of the "cold war" to include a far-reaching concern with problems of national survival and world leadership. Indeed, its present scope may be described as "intellectual preparedness" for the requirements of national and international life in today's revolutionary world.

The first outlines of this broadening involvement of science with government are recorded in the Senate hearings of the Seventy-ninth Congress. At that time the Senate was exploring the problems of transition from war to peace and assessing and evaluating alternatives for the postwar period. Out of these hearings, especially the testimony of Vannevar Bush, came the first of a series of new government agencies which were to codify and give substance to the newly important and newly identified relationships between science and national life, and between scientists and public policy.

This article will seek to explore some of these relationships and the need for public understanding of the reasons for their existence. It also will be con-

cerned with what can be expected of them, and how these new relationships are developing into an institutional framework, the normal device by which citizens manage their public affairs in a democracy.

THE NEW AND THE OLD

Before beginning this discussion, a large part of which will be concerned with the creation of new government agencies dealing with science, two observations need to be put on the record.

First, the Atomic Energy Commission, the Office of Naval Research, and the National Science Foundation, the major innovations in the family of new federal agencies for science, were truly a new approach in a major sense. Yet, they also were logical outgrowths of wartime agencies, such as the Office of Scientific Research and Development and the National Defense Research Committee. Moreover, they had historical roots in a whole family of institutions going back to the early years of the Republic. The Public Health Service, the Department of Agriculture, the Geological Survey, the Weather Bureau, the Coast and Geodetic Survey, the National Bureau of Standards, and the National Research Council of the National Academy of Sciences are only a partial catalogue of the long involvement of government with science.

While recognizing that something new between science and public policy began to happen in the postwar years, it also is clear that it was not so new as to be without roots and precedent in our national past. To emphasize this continuity is not only useful to those with a taste for the threads and patterns of history, but also is of some significance in understanding the evolution of the broadening relationships of government to science which are still in midstream.

Parallel with the 1930's

The second observation takes us back for a moment to the parallel with the New Deal when a new family of agencies was created to carry out public policy in the economic and social areas. At that time, many new public functions which might have been lodged within existing cabinet departments were vested, instead, in newly created agencies outside of departments. This proliferation of independent agencies was motivated, in part, by the pragmatic urge to get on with the job, but also by the desire in Congress and the Executive Office to observe the efficacy of these operations in some detail. Independent agencies had their own hearing in Congress and their own review in the federal budget process. They also had a certain prestige position in the Washington complex. The White House social calendar included receptions for heads of independent agencies who, in number and by protocol, did not quite fit into the more traditional White House nights for the Judiciary, the Congress, and the Cabinet. In passing, we might observe that after the first Sputnik was launched, science, too, was included in the White House social calendar.

After nearly two decades of administrative experience, the government began to change the status of the host of independent agencies generated in the prolific days of the New Deal. Some were moved under the roofs of existing cabinet departments, others were pulled together in the new Department of Health, Education and Welfare, still others remained independent.

Although this analogy to the New Deal period can be overdrawn, the government still responds in similar ways in its search for new scientific and technical functions that are required, and in its experimentation with alternative formulas for getting these functions per-

formed. Presently, there are many patterns. The structures of several cabinet departments have been modified to strengthen the role of science, and new policy groups have been established in the Executive Office of the President. In fact, since World War II, there have been two major modifications each year in the organization of science in government. All these actions have been motivated by a compelling desire to find coherent and orderly ways for undertaking a growing number of scientific activities. With the federal government supplying half of the total national expenditure in science and technology every year, it has not been easy to determine which scientific and technological activities should remain in independent agencies, which should be brought together within some existing cabinet department, and which should be the province of a new agency. Moreover, it has been difficult to determine the best way to formulate a government-wide policy for science, and the best way to incorporate scientific judgments and assessments in the formulation of national policies, both domestic and foreign.

Effective administrative structure

The present ferment and the present experimentation with the administrative structure are symptomatic of the search for ways to have the total job done most effectively, that is, government operations, and ways to make it possible for Congress and the executive branch to observe, understand, appraise, and govern. To the extent that Congress, on the one hand, and the executive branch, on the other, should, and must, control and direct all public agencies in fulfilling their responsibilities to the electorate, the search is bound to continue.

Part of the difficulty stems from the fact that the term "science" is used broadly and loosely within government

and without. It includes, in this paper, technology. For it covers the broad spectrum of basic research, the search for new knowledge and understanding; applied research, the early attempts to convert science into technology; and, finally, engineering or development, the design and building of something new and useful. Unless "science" is understood in this broad context, important elements in the relationship of government to science are irretrievably lost.

The relationships of science to military operations and to such things as public health and agriculture are well understood. But in the contemporary age of the cold war—thaw, or not—science has intruded into diplomacy, disarmament, psychological warfare, and the development of economically depressed areas of the world. In these broader aspects of national policy, the scientist now joins hands with the government policy-maker, the educator, and the economist, in his concern with the total vigor and dynamics of the nation's economic and intellectual life. The new "age of science" has greatly enlarged the responsibility of government not only for the economic and social well-being of the nation but also for the health and progress of its scientific and technological achievement. Under these conditions, the scientific community, no less than the body politic, and the technical "braintrusts," no less than the man on the street, need to understand better the relationships of government to science.

SCIENCE IN GOVERNMENT OPERATIONS

In order to detail some of these relationships, it may be useful to describe the responsibilities of a few government agencies, both independent agencies and cabinet departments, which illustrate the variety of ways in which government and science interact.

The oldest postwar independent agency is the Atomic Energy Commission. It uses science and technology to meet the nation's needs within a vast area of responsibility from the development of nuclear power to the manufacture of nuclear bombs. The spectrum of its technical operation ranges from sophisticated manufacturing to the conduct and support of fundamental research. The size and scope of this effort illustrate only slightly the working-out of Parkinson's law; for aggressive technology requires an intimate association with basic research to uncover fundamental knowledge, and forge it, through engineering activities, into realities. Inevitably, the scope of the Commission's responsibility requires close relationships with industry and academic institutions not only in the physical and engineering sciences but also in the biological and medical sciences. Atomic energy has wide international aspects too, as the discussions on peaceful uses and suspension of nuclear tests serve to remind us. Thus the Commission's uses of science and technology cannot be confined to its own operations; they become inevitable factors in the formulation of domestic and foreign policies.

Chronologically, the next postwar scientific agency to be established was the National Science Foundation. The Foundation is charged with the major responsibilities for the support of basic research and education in the sciences, and this obviously cannot be done without the direct participation of the nation's universities. So it is that the Foundation has become greatly involved in, first, graduate education, and then, of necessity, with undergraduate education and even high school instruction and curriculum. The Foundation's interests overlap with those of the Atomic Energy Commission, the Department of Health, Education and Welfare, and with most federal activities in science

and technology. The National Science Foundation is concerned also in the foreign field, as its roles in the Antarctic Program and the International Geophysical Year amply attest.

The nation's youngest scientific agency is the National Aeronautics and Space Administration. Historically, it is the successor to the National Advisory Committee for Aeronautics, an agency which provided the scientific and technological basis for the aircraft industry. The Space Administration's emphasis now, of course, is on space activities, but its operations likewise extend to industry and education. For whether we like it or not, we are heavily involved in a cold war rivalry for technological and scientific supremacy, and space has become a battleground, both in the technology of vehicles and the elegance of scientific experimentation.

Although the public responsibilities in atomic energy, basic research, and space exploration were placed in independent agencies, the lack of an obvious cabinet department to house them was in all likelihood the least compelling reason. More probable was the desire in Congress and the executive branch to deal with these areas directly in order to facilitate the identification of problems and objectives, to control budgets, and to more easily evaluate performance. In two instances—the Atomic Energy Commission and the National Aeronautics and Space Administration—Congress also established special committees of its own in response to a heightened public interest.

Science in the departments

A number of cabinet departments also have scientific and technical activities either in support of their own departmental operations or to provide government-wide technical services. The largest of these, of course, is the De-

partment of Defense, where there is a critical need for maintaining close working relationships with the scientific community in order to stay in the forefront of weapons technology. Since time and again, scientific research has resulted in major improvements in weapons and the development of revolutionary new weapons, the Department of Defense must conduct and support a vast program of scientific research and development. Because of the size, character, and scope of its scientific operations, the way in which the Department of Defense uses and supports science and technology has a major impact on the economic and educational life of our own and other nations and on domestic and foreign policy.

The ever-growing role of science in the operations of the Department of Defense has brought with it many managerial changes in the last decade. The most recent reorganization resulted in the appointment of assistant secretaries for research and development in each of the military departments, the creation of the Advanced Research Projects Agency, and the establishment of a new post, Director of Defense Research and Engineering, to which Dr. Herbert York, a scientist, was appointed.

In the State Department, the post-Sputnik reaction led to the appointment of a science adviser to the Secretary and the re-establishment of scientific attachés in six major missions abroad. Similarly, following the meeting of the heads of government of the North Atlantic Treaty (NATO) Organization countries in December of 1957, a science adviser to the Secretary General of the NATO was appointed and a Science Committee established to advise the North Atlantic Council.

These changes in organization in the State Department reflect the enlarged role of science and technology in foreign affairs. We are witnessing their

increased use on many international problems ranging from disarmament to world economic development. There is, furthermore, a rapid extension of scientific co-operation among nations. New programs for furthering scientific exchange are providing manifold opportunities for scientists to work together on common scientific problems.

There are other government departments, however, which have scattered scientific and technical activities, originally placed there for historical reasons, which are no longer of major departmental interest. These technical bureaus, despite a government-wide or national need for their services, do not always receive proper attention from their parent department. They have become, in effect, a bypass along the new roads the department has traveled. In the Department of Commerce, for example, the National Bureau of Standards receives over sixty per cent of its support from other federal agencies. The Weather Bureau has similar problems. Originally, the Weather Bureau was located in the Signal Corps of the Army, but it was later transferred to the Department of Agriculture. This might suggest that "weather" was more important to farmers than to the Army. When the Civil Aviation Agency was established in the Department of Commerce, the Weather Bureau was moved from Agriculture to Commerce. Was "weather" now more important to aviation than to farmers or the Army? Last year, aviation was moved out of the Department of Commerce into the new Federal Aviation Agency, but the Weather Bureau stayed where it was. Was "weather" now less important to aviation than it had been, but more important to commerce than to farmers and the Army? Obviously, the services of the Weather Bureau are important to many federal agencies and to the nation as a whole. If it cannot obtain

proper support for its operational programs and research activities from a parent department, even though it serves other public agencies and numerous private institutions, its technical services are bound to be inadequate to the needs of all.

Similar observations can be made about the Coast and Geodetic Survey, another scientific and technical organization in the Department of Commerce, and the technical bureaus of the Department of the Interior. In the latter department, the Geological Survey, the Bureau of Mines, the Fish and Wildlife Service, and the Bureau of Commercial Fisheries all conduct scientific activities not only in support of the Department's own mission, but in order to provide other government agencies and private institutions in industry and education with scientific and technical data. In all these cases, adequate support must either be forthcoming from the parent departments, or these activities must be identified and studied to determine the feasibility of regrouping them.

SCIENCE IN THE WHITE HOUSE

A partial enumeration of the independent agencies and cabinet departments which use science and technology in the conduct of their operations indicates the scope and depth of the government's reliance on the nation's underlying scientific resources, and the interactions of science and technology with government operations. Obviously, broad guidelines are needed that adequately provide for dealing with common problems and competing needs, but which recognize that science and technology cannot be isolated from agency missions and operations.

Within the last two years, the President has taken three major steps to increase his use of advice and assistance in the development of policies governing the over-all relationships of

government to science in the executive branch. He appointed a Special Assistant for Science and Technology, moved the Science Advisory Committee from the Office of Defense Mobilization to the White House, and created the Federal Council for Science and Technology by executive order. These three actions reflect the seemingly paradoxical needs of the Presidency. The first two grew out of the President's need for informed scientific advice as free as possible from personal or departmental positions in the development of national policies. The third, recognizing that policy cannot be made in a vacuum, provided for the participation of policy officials from those government agencies with major operating programs in science and technology in the formulation and execution of policies.

Although the Special Assistant has unique responsibilities that differ from those of the Science Advisory Committee, together he and the Committee can serve the President in a number of ways. They can make intensive studies for him on various aspects of research and development programs. They can undertake other assignments for him of an advisory kind and provide answers to specific questions. They can mobilize the best scientific advice of the country and make recommendations with regard to ways in which American science and technology can be advanced by the government to serve the nation's interests. And they also can take the initiative in three specific policy-making areas: (1) in identifying and calling attention to the need for policy; (2) in securing the most competent examination of problems; and (3) in recommending alternative solutions.

A reading of the Committee's public reports on space, research policy, and science education reveals that a broader approach was undertaken than merely a merging of the views and objectives of

federal departments and agencies. In trying to define what the government should do by direct action or stimulation and what the private sector of our society might be expected to do, these reports were a first attempt at dealing within the federal government with the totality of the nation's problems in these areas.

A large part of the work of the Special Assistant and the Committee, of course, is taken up with certain problems of national security whose major content is technological in character. In dealing with many of these problems, such agencies as the Department of Defense, the Atomic Energy Commission, and the State Department naturally will have their own departmental views. These individual positions may be valid from the point of view of the agency's statutory responsibilities and functions, but they will not always include an analysis of the technological choices open to the policymaker which would permit an evaluation of possible alternatives. Since the Special Assistant and the Committee are not directly concerned with supporting agency objectives they frequently can provide the President with an opportunity to examine more than one course of action.

Special Assistant as liaison

The Special Assistant, although a member of the President's Science Advisory Committee and, in fact, its chairman, has individual functions to perform for the President that the Committee cannot undertake. He is in a position to inject daily the scientific and technological judgments required in formulating public policy. While the Committee advises, the coupling of this advice with administration policies is the particular responsibility of the Special Assistant. In addition, because he is in constant contact with government agen-

cies and departments, the Special Assistant can present within the inner operations of the White House his own views on achieving integrated operations in science and technology.

Although the Committee and the Special Assistant provide advice on policy matters, a means for obtaining the participation of the operating agencies is needed both to develop and execute government-wide policies. The Federal Council for Science and Technology was established, also under the chairmanship of the Special Assistant, to perform this function. Now broad scientific and technical programs, such as oceanography which is of interest to the Departments of Defense, State, Commerce, Health, Education and Welfare, and Interior, the Atomic Energy Commission, and the National Science Foundation, can be evolved for the government as a whole. For the participation of all interested agencies is necessary in achieving coherent planning and mutual support. In this way oceanography can be viewed as a national resource, and the needs of this science, the needs of the agencies, and the needs of the nation can be considered as a whole. The interactions of the President's Science Advisory Committee and the Federal Council for Science and Technology, through their common chairman, the Special Assistant, may ensure that special fields of science vital to the nation can be given attention even though they do not fit into any specific department or agency. The procedures of the past, where every scientific field was viewed in terms of a narrow departmental need which, in turn, cut it into bits and pieces in the annual budget cycle, can now be modified.

WHERE DO WE STAND?

The ferment in the relationships of government to science and the rash of

experimentation with the structure of science in government are producing a pattern that, although evolving slowly, is taking definite shape. The structure created at the White House level in response to the need for broad policies and direction will most likely continue.

The cabinet departments, too, are getting their houses in better order. Greater attention is being given to providing, at the secretary's level, for a policy official who can oversee all of the scientific and technology activities of a department and provide policy guidance for their activities. At the same time such an official can supply the secretary with technical advice in the formulation of broad policies. The existence of the Federal Council for Science and Technology has been an important factor in this regard, since it required the departments to send, as representatives, policy officials who could speak for their departments as a whole. Ultimately, it may be necessary in some of the older departments to have a special assistant for science and technology or an assistant secretary. For this pattern, which already exists in the Department of Defense with the appointment of a Director of Research and Engineering, has strengthened the scientific and technological operations throughout the Department. The Department of State, on the other hand, has special problems and has yet to evolve a satisfactory structure for properly relating science and technology to its responsibilities.

Among the independent agencies, the National Aeronautics and Space Agency and the National Science Foundation found early in their history that it was valuable to have technically trained people as directors. The Atomic Energy Commission has not had a technical person as chairman but has always numbered one scientist among its commissioners.

SCIENTISTS TO FILL THE NEW POSTS

Underpinning all the recent developments in the relationship of government to science, the creation of new scientific agencies and new government posts, are people. The many new jobs created in response to the increased importance of science and technology in our national life must be filled by people not only who understand the importance of science and technology to the nation but also who understand scientists and engineers.

Although it is not obvious that we will have enough scientists and engineers with the background and breadth of understanding about problems of government and public policy who can contribute the insight and understanding of their specialties, there are some hopeful developments. The scientific mobilization that occurred during World War II produced technical people who, by participating in new enterprises for the design of weapons, gained invaluable experience in industrial operations and in the operations of the military departments. They learned, as scientists learn, by doing and by experimentation of the interactions of science with government.

The current generation of young scientists and engineers is not gaining this experience and knowledge in anything like the same degree as the special environment of wartime provided. Nor is it adequately recognized as an important skill in our society to which our academic institutions should more fully respond. Yet people are being trained. One major training ground has been in

the government itself. The Atomic Energy Commission, National Aeronautics and Space Agency, and the Department of Defense, to name a few agencies, are training hundreds of young people. The younger staff members at Geneva, who participated in the nuclear test cessation negotiations, for example, were given a rare and unique kind of training. Similarly, the laboratories in universities and industry that do work for the government provide an experience similar in many instances to that provided at Los Alamos and the Radiation Laboratory during the War. These are valuable potential sources of a special type of talent that the nation may soon find indispensable.

Although a more rational handling of the relationship of government to science will depend heavily on finding qualified people to fill the new jobs, it is well to remember that in 1930, hardly anyone was called a "labor relations expert;" now every industrial company has one. The climate that will pull well-trained scientists and engineers into public service is dependent upon an increased understanding of the role of science in society, and this understanding is growing.

From time to time in the history of our nation, progress often has depended upon new approaches to problems and issues. In the last few decades this nation took far-reaching actions in the economic and social fields. At present, national attention is focussed on science. History would again seem to indicate that it is no time for despair, but, rather, a time of great opportunity and challenge.

Influence of the Past: An Interpretation of Recent Development in the Context of 200 Years of History

By A. HUNTER DUPREE

ABSTRACT: Although the eighteenth century spoke bravely of internationalism in science, its scientists were put under heavy pressure by the rise of the nation-state. Ease of communication in the nineteenth century made it seem as if science were the product of an international community, while at the same time science was becoming more dependent on nationally divided institutions for support. When in the twentieth century the free flow of information ceased, it became clear how closely science was tied to the various national units. The same pattern can be traced in the relation of basic to applied research. The eighteenth century saw the two brands of research as closely linked, but in the nineteenth specialization drove the two activities wide apart to form separate traditions. In the twentieth century military problems brought basic and applied research together again. Likewise the same pattern can be traced in the evolution of institutions within national units. The eighteenth century could envision comprehensive scientific institutions, but the nineteenth century created government, industrial, and university research institutions in separate compartments. The problems of the mid-twentieth century are defined by the basic relations among the various institutions within the nation, the very relations which the peculiar characteristics of the nineteenth century had obscured.

A. Hunter Dupree, Ph.D., Berkeley, California, is Associate Professor of History at the University of California. He received his A.B. at Oberlin College and his M.A. and Ph.D. at Harvard University. He is author of *Science in the Federal Government: A History of Policies and Activities to 1940* (1957) and also of a biography of Asa Gray, 1810-1888 (1959).

SIR Joseph Banks, President of the Royal Society of London, was writing to his counterpart of the Institut de France in 1804, at the time the war had recently been renewed. He insisted that it had "always been my wish to promote the scientific intercourse among Nations—notwithstanding any political divisions which might subsist between them." Yet the hard facts of the struggle with Napoleon put his ideal under strain. If "I cannot maintain a correspondence with learned Englishmen in France, without being accused of employing them for political objects; and if gentlemen of known reputation and honour cannot visit your Country for the purpose of giving and receiving scientific information, without being exposed on every turn of public affairs, to the vile imputation of acting as Spies, . . . it will be impossible for me—either to preserve a constant intercourse of good offices between the Men of Science in the two Nations; or to insure for learned Frenchmen, who may come to England, those marked attentions and civilities, which it is my wish that they should receive in time of war as well as peace."¹

The scientist of the middle of the twentieth century will smile at this lofty ideal of the age of the philosophes. He well knows that national interest has become a paramount force in the affairs of science, that continued intercourse between the scientists of warring nations is beyond the imagination of practical men. Even while he smiles, however, the scientist harried by security checks and the demands of military research looks back at the eighteenth century with a feeling that it was a paradise for science and a model which

¹ Joseph Banks, London, to the President of the First Class of the National Institute of France, January 30, 1804, manuscript in the historic letter file, Gray Herbarium, Harvard University, Cambridge, Mass.

might apply in the nuclear age if only men would be reasonable. Science knows no nation, and any connection between national interest and science, where it cannot be ignored, is a matter for shrugging apology.

THE RISE OF NATIONALISM AND SCIENCE

Admiration for eighteenth-century internationalism in science usually leads to the quotation of sentiments such as those of Sir Joseph, which can be found in great numbers in the documents of the years between 1770 and 1815. Nevertheless one must go on to ask: Why does the ideal of the complete internationalism of science become so explicit in the very years that the modern nation-state was taking shape? Is there no historical connection between science and the rise of nationalism? Is science, unlike art, literature, religion, politics, and philosophy, completely divorced from one of the primary forces at work during the past two centuries? The very explicitness of the pronouncements of the men of the era of the American and French Revolutions is a sensitive indication that the rise of nationalism was in fact straining the internationalism of science. Sir Joseph Banks was eloquent about the rights of scientists in wartime precisely because he was under attack in London by pamphlets, aptly signed "Misogallus," which accused him of being a collaborator with the French. And he was writing to the President of the First Class of the Institut de France not because communication was really so free between the two warring countries, but rather because the unsporting Napoleon had thrown so many vacationing Englishmen, members of the Royal Society as well as others, into jail with the collapse of the Peace of Amiens.

The difference between the eighteenth century and the twentieth lay not so

much in the absence of a connection between science and nationalism as in the fact that science had not yet made itself practically relevant to the affairs of nations. The eighteenth-century man took an intimate connection for granted. The great exploring expeditions of the late eighteenth century, the very ones which developed the scientific corps of naval expeditions to a high peak of specialization and efficiency, were inseparably mixed in their objectives. Louis Antoine de Bougainville went around the world in the joint service of science and France. Captain James Cook combined his objectives in the same way. For explorations of such scope, both military support and a nationalistic motive brought success where science alone was insufficient. Hence the eighteenth century knew well that an intimate connection between science and the nation-state existed.

Illusion of internationalism

The insight of the eighteenth century was lost, however, because of the peculiar experience of the nineteenth century. The general peace which lasted from 1815 to 1914 provided the backdrop for scientific accomplishments of unprecedented splendor. It was the century of the rise of chemistry. It was the century of Charles Darwin and the coming of age of biology. Even physics, seemingly so well worked out, moved into a new period of creativity before 1914. The great accomplishments of the nineteenth century seemed to be the work of an international community. None of the Western nations had a monopoly on science, and there was little to suggest that the two overshadowing phenomena of the century, the rise of science and the rise of an exclusive nationalism, had anything to do with one another.

The peculiar characteristic of Western civilization in the nineteenth cen-

tury which masked the connection between science and nationalism was ease of communication. Not only did the fruits of technology provide steamships and railroads to make communication easier, but the possibility of the migration of people, and hence of knowledge, from one part of the world to another came within the reach of the masses in Europe. This easy flow of people and ideas over national borders, a flow which had much to do with building the United States into a great and populous nation, gave an illusion of the existence of an international community for at least the Western world. Science flowed over national borders even more easily than other kinds of ideas. Those who lament American backwardness in science in the nineteenth century often overlook the fact that the very ease of communication with the scientific centers of Europe contributed to seeming backwardness. Alexis de Tocqueville is often quoted on the lack of American interest in abstract science. He is less often given credit for pointing out that the availability of European research removed the necessity of the repetition of such work inside the American national unit.

The ease of international exchange of scientific information all over the world produced such striking results that most scientists made the unspoken assumption that science was exclusively an international phenomenon completely divorced from the interests of nation-states. This assumption made it easy to overlook a profound dependence of science on the nation-state which was growing up all during the century almost unnoticed. Science is dependent on the institutions which house it and give it support, however much individual reputations outshine their institutional setting. During the whole of the nineteenth century after 1815 the support of science polarized around na-

tional institutions. Even the universities, German, British, and American, increasingly differentiated themselves from one another along national lines. Certainly government efforts in science, which were reaching huge proportions before 1914, were very much tangled with considerations of national interest. This connection did not worry anyone very much, however, because national institutions, even government ones, participated in the free flow of information which fed science such a rich fuel.

Impenetrable barriers

The first World War gave science a considerable jolt, and patterns of a close relation between science and weapons research emerged. The generation of scientists which fought the war nevertheless concluded from their experience that the national implications of scientific research belonged to that one horrible episode alone, and they emphasized a more self-conscious international feeling than they had before the war.

George Ellery Hale shifted his attention from the National Research Council, which he had been instrumental in creating for the purpose of the United States war effort, even before hostilities ceased. He saw the International Research Council, to which he turned his energy, as the logical institutional development for the postwar world. Hence American scientists shared little of the isolationism of their fellow citizens during the 1920's, and some of them could believe, in the interwar eddies of history, that a true international community of science not only existed but provided all the support which science needed.

But under the blows of depression, totalitarianism, and war the illusion of a true international community for science vanished, along with all sorts of other aspirations for a true international

community. A lack of free flow of peoples and information became a major characteristic of the mid-twentieth century. Speed and ease of transportation were irrelevant as national boundaries became impenetrable barriers to the movement of ideas. The scientists were rightfully dismayed, for the feeder of science in its great age, the nineteenth century, was gone. At the same time, they became aware of the hold that their national institutions had on them.

Nations such as the United States found uses for scientists which were intimately connected with survival. Much as they regretted the loss of the old feeling of world-wide community, many saw that the national interest in science represented new opportunities as well as inconvenient restrictions. The rapidity with which this adjustment was made is one of the great themes of the history of science during the second World War.

OTHER HISTORICAL DILEMMAS

The scientists who had reached maturity in 1939 had to make other adjustments. These adjustments were necessary in realms where history had placed them in situations that were completely obscured by the scientists' own ideas about their place in history. Just as internationalism in science had, like free trade, seemed the natural order of things because of unique factors operating in the nineteenth century, the relation of applied to basic research presented a historical problem to the generation entering the war. They were also ill prepared to understand the division of responsibility among the institutions in their own national units. The movements sketched in the ideas concerning nationalism and science can also be traced in the relation of basic to applied science and in the institutional development within the nations.

Applied versus basic science

In the eighteenth century, while science was largely in the hands of the genteel and technology largely in the hands of artisans, the happy lack of specialization allowed a free movement between basic and applied research. Alexander von Humboldt, Count Rumford, and in America Benjamin Franklin and Thomas Jefferson all showed the ability to combine an interest in science as a system of philosophical ideas and as a tool of men. If the eighteenth-century accomplishment in science as "ideas" overshadowed the practical results of science as "a tool of man," the philosophes still kept the two enterprises in close range of one another.

The order of the nineteenth century was specialization. The sciences themselves fragmented into specialties. In addition, the spectrum which runs from basic to applied science also became specialized. It would be easy to compile long lists of the accomplishments of basic research before 1914 and then match them by equally impressive and unprecedented achievements in technology. Even though basic science played an increasing part in these technological marvels, quite clearly two different groups of men wrought the discoveries in basic and applied research. So far apart did these two groups drift that they lost touch with one another. The basic scientist reserved his feeling of fellowship for other basic scientists like himself. He felt independent of the man concerned with practical problems and superior to him. And the results on both sides of the gulf were so spectacular that the parochialism of both basic and applied scientist became entrenched. In the last third of the nineteenth century a fundamental change took place, that is, the systematic harnessing of science to the problems of technology. Applied science began to earn its repu-

tation as the servant of man. Yet the two separate groups tended to go their separate ways as long as they had reasonable latitude in choosing the lines of research they wished to follow.

The experience of the first World War suggested that a marked acceleration in applied research, for instance concerning weapons, would quickly lead to questions for which basic research had no answers. At the same time the urgency of applied research drew off potential manpower from the supposedly cloistered haunts of basic science. The policy of the postwar period attempted to perpetuate the separateness of the two guilds. Occasional laments in the 1920's and 1930's indicate that thoughtful men feared that basic research was somehow losing out to applied research, but they did not explain clearly how advance in the applied area could detract from basic research, and they did not do very much about it. Weapons research was generally so unpopular a field in the interwar period that it provided little impetus to applied research and almost none at all to basic science.

On this theme too the generation of scientists who had matured by 1939 found that they had to make most difficult adjustments. Many of them were proud of being basic scientists, the choosers of their own problems by criteria fiercely divorced from practical considerations. Yet in the war effort they found their skill as scientists stretched to the utmost in solving problems which were, undeniably, terribly practical in their immediate results. What they had confidently left to the engineers before the war now became their business. And the engineer found that he was dealing with basic questions. All along the spectrum from basic to applied the gradations between the bands became blurred. The myriad definitions of basic and applied research which have sprung up since the second

World War have only emphasized the impossibility of drawing a line. And the basic scientist can no longer avoid many of the dilemmas which the admitted practicality of his work entails.

National institutional structures

A third line of historical development has played directly into the confusion of the scientific scene since 1940. Because many scientists were not aware of the close tie between science and their own national units, which the support of science entailed, they did not understand clearly the internal institutional organization in which they worked. In the United States especially the institutional structure was hard to understand because it was less centralized than in many of the other great scientific nations. Here again the eighteenth century and early nineteenth century had produced plans for the organization of science. Jefferson, John Quincy Adams, and others in the early Republic, had clearly envisioned a national university and a full set of scientific institutions for the country. They failed not in conceiving the structure of the institutions but in reducing their plans to working organizations. Their successors, who incidentally profited unawares from the great peace of the nineteenth century, created institutions as they needed them without asking ultimate questions about their nature and orientation. Great government scientific research agencies arose under the guise of mundane functions such as a Depot of Charts and Instruments or to meet the need for medical care among merchant seamen. Even the American university, which rose rapidly as the home of scientific research after 1870, asked few questions about its relation to other scientific institutions, such as those in the government, which were actually senior to it.

Shortly after 1900 a division of labor

among the scientific institutions of the country became firmly entrenched. The government limited itself to those areas of applied research which aided its own operations or which served some special segment of the population unable to provide for its own scientific service. The farmers were the most conspicuous example of the special segment. The government had no responsibility for basic research except in a few enclaves like the Smithsonian Institution, and indeed, congressmen asked very embarrassing questions when an agency such as the Biological Survey launched a program too evidently basic science. And even though government science prospered, the men who chose its service seemed somehow less pure than their confreres elsewhere. Industry looked neither to the government nor the universities for research, but began to develop its own laboratories. While one or two pioneers allowed considerable latitude to their scientists, the universal rule in industrial research was to stick close to the problems related to the products of the company. The industrial research laboratory developed a world of its own, with its own traditions.

Universities foster basic science

The universities, formed between 1870 and 1900 and financed to a new state of affluence in the twentieth century by the largesse of great wealth, were the keepers of basic research. It was their business to foster science independent of the vulgar uses which filled the minds of the government or industrial scientist. In their graduate schools, the universities trained scientists to a new pitch of specialization, but those who went into government and industry to undertake applied science usually had little effect on the academic institutions in which they had been trained. Indeed the scientists who dwelled in the halls of basic research had little sense

of being encased in an institution at all, much less one limited by its nationality. The instances were few where equipment was so expensive and complicated that the scientist had to think in large scale terms as an institutional administrator rather than as an individual.

American society possessed no mechanism for adjusting the relations among science as housed in the government, industry, and the universities. As long as the comfortable division of labor seemed to work, no one felt the need of adjustment. Industry and government accepted their role; the universities gloried in theirs. Co-ordination of their activities seemed not only unnecessary but also dangerous. The scientist of 1939 accepted this division as the natural order of things. He took his institutional arrangements so completely for granted that he tended to deny he had any. He was a free agent in the universe, and anything modifying his complete and untrammelled individualism was the worst of disasters.

New patterns emerge

In the despised haunts of applied science, however, new patterns had long been emerging which changed the scientist's relation to his underlying institutions and indeed his whole way of conducting research. As early as 1880, the Department of Agriculture stopped trying to be a university organized by divisions of knowledge and began shaping itself around the problems it needed to solve. Thus discovery did not come out of nowhere. The unsolved problem came first. Then specialists from various fields worked until a solution was found. Specialists remained in their own fields, but the problem brought them together with other kinds of specialists in a team. A generation later industry took up the same general approach. The results of this change of method are spread across the face of

the twentieth-century world. But the scientist was no longer the lone hero, choosing his problems and assaulting by his unaided individual wit. The problem approach and team organization were the engines which revolutionized the relation of science to the military at the outbreak of the second World War.

In all three of the lines briefly sketched above there was plenty of fuel for the disillusionment of the scientist who had reached maturity by 1939. He thought science was international, soaring quietly above the fevered interests of nations. He thought basic science was unconcerned with the uses to which it was ultimately put. At least that was none of his professional affair. He thought that his position in the institutional structure of his nation was either unimportant or nonexistent. The world since 1939 has seemed triply horrid.

Had the second World War joined the first as a temporary disruption of these three views of science in a vacuum, the postwar organization of research, and with it the life of the individual scientist, might have reverted to its nineteenth-century mold. Yet the postwar scientific scene has shown no sign of resembling even remotely the dominant beliefs of the 1930's. A new age has arrived which seems to be but a beginning.

THE TWENTIETH-CENTURY OUTLOOK

Internationalism in science in the mid-twentieth century is not a description of an actual state of affairs but rather the glimmer of a distant goal. The free interchange of information which wrought such miracles in the nineteenth century would do good service today, but the factors which made it possible have vanished. The national unit, with its military stake in science, is more robust than the international commu-

nity. Any increase in flow not only requires painful negotiations but is tied to the cause of internationalism in general. Science is not a separate sphere which can be gaily international while the world remains sundered. Scientists' hopes lie with those of the rest of mankind.

The harnessing of whole national scientific establishments to military applications pulled all scientists, whether they tagged themselves as basic or applied, into the same network. The most seemingly esoteric of basic discoveries are credited in advance with the possibility of practical applications. On the other hand the most practical of problems call for theoretical solutions far beyond the dreams of basic scientists. The world is no longer amazed when a formula becomes a bomb. And physicists working on bombs can complain that the mathematicians who furnish them formulae only work on the easy questions. Nothing in the postwar world, certainly not the thermonuclear bomb or the penetration of space, has lessened this interwoven pattern.

In the new institutional patterns the other two changes are clearly reflected. The national research establishment has laid bare its underlying structure. The neat, logical division of labor among the government, industry, and the universities has broken down. In its place stands a single structure linked together by a network of grants, contracts, and research corporations. The government, by the very nature of its interest in survival, is the major component in the new structure. Both the universities and industry look to it as the prime source of research funds and clues for the direction which research must take. Yet the government has not simply taken over science in the United States. The phrase "federalism by contract"

more accurately describes the state of affairs. Moreover, the problems of adjustment among the institutions of science are impossible to ignore.

None of the problems facing science in the postwar world can be solved by pointing to the limitations of the understanding of the generation which went into the second World War. In a very real sense that generation acted in response to the underlying historical realities instead of to their partial analysis of the place of science in history. In the free world they quickly chose a more limited allegiance than some distant and unembodied internationalism. They immediately turned brains versed in theory to practical problems which were relevant to the immediate crisis. They began changing their institutions and their relation to the government even before the outbreak of hostilities. Although some in 1939 believed that science could go its way without facing the problems of society, and although some still talk as if they wish it were so, scientists have not persisted in acting as if they live in a special vacuum.

It should help in perspective if not in finding solutions to realize that science has never operated in a vacuum according to rules of its own, however much the nineteenth century made it seem to do so. The major characteristics of the postwar scientific establishment have been many years in the making. Society faces a serious problem in digesting science as an integral part of its structure. But this is not a completely new problem or one more intractable than many others. Scientists can still seek solutions which recognize internationalism, the pursuit of knowledge for its own sake, and individualism, but they must seek them in the same context as the rest of mankind.

The Need for a Department of Science

By HUBERT H. HUMPHREY

ABSTRACT: The Senate Committee on Government Operations, in which Senator Humphrey has taken an active role, has concerned itself with the need for a science department in the government. A Department of Science and Technology they have found would be a very necessary and essential adjunct to our governmental system. Its main purpose would be the co-ordination and centralization of the now dispersed federal scientific activities. The new Department would promote the clear-cut responsibility and authority in government science needed for the enhancement of our national security. Yet the reorganization of the existing science units contained in various departments and agencies of the government, has met strenuous opposition from sources in the Administration. In addition to the proposed bill providing for the creation of the Department of Science and Technology, the Senate Committee has initiated another bill now before Congress which provides for a Commission to study the various problems connected with the creation of such a science department.—Ed.

Hubert H. Humphrey, A.M., LL.D., Washington, D. C., is United States senator from Minnesota. He has served an active career in public office as senator since 1948 and as mayor of the City of Minneapolis (1945-48). During World War II he served on various administrative boards. He was Director of the Training Re-employment Division and Assistant Regional Director of the War Manpower Commission. He has taught political science at Malcaster College, St. Paul, as a Visiting Professor, the University of Minnesota, and the University of Louisiana.

THE *First Finding* of the original Hoover Commission on Organization of the Executive Branch of the Government, submitted to the Congress in February 1949, and upon which the reports of the Commission were based, was that "the executive branch is not organized into a workable number of major departments and agencies which the President can effectively direct, but is cut up into a large number of agencies which divide responsibility and which are too great in number for effective direction from the top."¹

The proposal to create a Department of Science and Technology within the executive branch of the federal government, which I first proposed more than two years ago, was based upon that sound principle of government. This was three months before "Sputnik" brought the Congress and the American people to the realization that extensive reorganization of federal science programs was necessary if we, in co-operation with other free nations of the world, were to reassert our leadership in the field of science.

During the last decade the United States and the entire world have been caught up and swept along by fantastic advancements in the scientific world. The executive branch of the federal government and the Congress have, fortunately, taken the initiative, through more or less haphazard and unrelated actions, to provide a spearhead for progress to meet the challenge of greater technological advancements. It is imperative, however, that this country continue to be the motivating factor and maintain its lead in scientific development, and be prepared to carry on a comprehensive and constructive pro-

gram to meet the challenge of world communism. To continue this leadership, a complete re-evaluation must be made of present federal operations in science, research, and technological fields, and effective steps taken with the least possible delay to co-ordinate and improve the existing organizational structure of our government which carries on these functions.

DEVELOPMENT OF SCIENTIFIC AGENCIES

To meet the many problems as they arose, new agencies were created and efforts made to bring about improvements in the federal science programs. The Congress has provided necessary funds as required in support of such programs, and I am confident it will continue to do so. Among the most progressive steps taken to meet the objectives in the civilian science field were the appointment of a Special Assistant to the President for Science and Technology; the creation of the President's Advisory Committees on Science and Technology and on Government Organization; the establishment of the Interdepartmental Committee on Scientific Research and Development, later superseded by the Federal Council for Science and Technology; the extension of the authority of the National Advisory Committee for Aeronautics through the creation of the National Aeronautics and Space Administration; and the establishment of Committees on Science in the House and Senate.

While these steps have been helpful and undoubtedly are necessary actions in pursuit of the over-all objective of efficient government operations in the field of science, further consideration must be given to still existing inadequacies not only in these agencies but in other areas which must be co-ordinated with operations of a similar or related character and reorganized under more cohesive administrative controls.

The basic approach to reorganization recommended by the Hoover Commission was prophetic in regard to the present status of science operations of the federal government. There are approximately fifty agencies which perform some science and research activities having direct application to the over-all science program of the government. In addition to the four Presidential advisory groups dealing with science, there are three major independent science agencies or commissions and more than forty components of other departments and agencies which operate science and engineering programs supposedly related to the major departmental mission for which the departments were established, or for which special agencies were created.

Some of these internal agencies, such as the National Bureau of Standards and the Office of Technical Services in the Department of Commerce, are performing services not directly associated with the primary mission or even related functions of the departments in which they are now located. Consequently, they do not receive the technical administrative direction necessary to insure operation at their highest potential. On the other hand, some of these internal agencies, which include the National Institutes of Health, the Agricultural Research Service, the Advanced Research Projects Agency, and the Science Advisor to the Secretary of State, perform services which most authorities on science programs of the government feel do have direct application to the program areas of the respective departments in which they are located and should retain their present status.

CO-ORDINATION OF FEDERAL ACTIVITIES

From the beginning, the Senate Committee on Government Operations, on which I serve, in its studies of the prob-

lems, studiously avoided involving the civilian science activities with the applied science and research programs of the military departments which pertain to national defense and come within the jurisdiction of other committees, or with advisory or co-ordinating agencies or officials within the Executive Office of the President performing high administrative and policy functions under the direction of the President.

The major objective of the science and technology act of 1958, which I introduced as Chairman of the Subcommittee on Reorganization and International Organizations, was to bring about, under a Secretary at the Cabinet level, co-ordination and centralization of those federal activities now scattered among existing departments, as well as those which had grown haphazardly following World War II in the field of civilian science.

It was proposed, as an approach to these problems of reorganization and improvement of science programs and for the purpose of eliminating duplications and waste of scientific, technological, and engineering manpower, to (1) promote closer co-operation between federal agencies which carry on science activities; (2) improve, co-ordinate, and expand the federal science information and documentation programs; (3) afford adequate federal support for education in physical sciences and engineering; (4) encourage the establishment of institutions in areas of broad basic scientific activity, such as oceanography, meteorology, etc.; (5) to establish and maintain science programs abroad through the use of foreign currency credits; and (6) to improve and elevate the status of science within the legislative branch by creating standing committees in the House and Senate which would have direct jurisdiction over civilian science programs of the

¹ Commission on Organization of the Executive Branch of the Government, *First Finding*, a report to the Congress, February 1949 (Washington: Government Printing Office, 1949), p. 3.

federal government. Thus full Congressional evaluation of all such activities and the relationship of these widely scattered agencies to similar programs and operations would be assured. All of these committee recommendations, except the proposal to create a Department of Science and Technology, have been activated in varying degrees, although continued re-evaluation and further appropriate actions to fully implement these programs are necessary to achieve fully the objectives sought.

A new department

The Committee on Government Operations was confronted from the beginning with four primary problems: (1) Would a Department of Science and Technology afford the necessary administrative controls and science leadership required to correct existing deficiencies in federal operations in science and research; (2) Would such centralization of functions and supervisory control afford an answer to the multitudinous duplications and waste that presently exist in our federal science programs; (3) Would it in any way impair any of the independent activities and basic objectives of certain of the specialized agencies which had been established by the Congress and the President, or cause any disruptions in existing science and research programs; and (4) If a Department of Science were to be created, which independent agencies, or components of existing federal departments, should be incorporated within such a department?

Provisions of the bill

In an effort to avoid disruptions of existing programs and to ensure that full appraisal of these problems could be made before any permanent reorganization was proposed the bill introduced in the Eighty-fifth Congress, and again in the Eighty-sixth Congress, to create

such a Department of Science and Technology merely provided for grouping of federal science agencies. The proposed Secretary of Science would have administrative control over certain of the independent agencies: the Atomic Energy Commission, the National Science Foundation, and the National Advisory Committee for Aeronautics, now the National Aeronautics and Space Administration; and certain components of existing departments: the National Bureau of Standards and the Office of Technical Services of the Department of Commerce, and the science functions of the Smithsonian Institution. The bill provided for no change in the basic statutes governing the operations of any of these agencies. Rather it was designed to promote more administrative efficiency in the government's scientific activities and to provide a framework for better co-ordination of all scientific functions. The committee proceeded under the assumption that, if a department was established, internal reorganization could be effected as experience and operation needs required.

There have been other suggestions relative to the creation of a Department of Science, which involve entirely different approaches. The proposal outlined by Dr. L. V. Berkner, President of Associated Universities which operate the Brookhaven National Laboratory for the Atomic Energy Commission, has received a considerable amount of support from scientists and administrators of science programs. Under Dr. Berkner's plan, the National Science Foundation, the National Aeronautics and Space Administration, and the Atomic Energy Commission would retain their independent status as specialized agencies, while the proposed Department of Science would set up centralized components in various areas of physical sciences, such as oceanography, meteorology, climatology, and standards.

OPPOSITION TO REORGANIZATION

In recognition of the varying points of view held by those who were active in the federal science program, the staff of the Senate Committee on Government Operations, in carrying out the committee's directive to draft suggested legislative proposals to meet the needs of the government, made numerous contacts with officials carrying on various science programs. Except in one or two instances, there was strenuous opposition to any change in the present organizational structure.

The Hoover Commission in its concluding report also warned of this type of resistance to any proposed reorganization efforts, as follows:

It is natural to expect vigorous opposition to reforms from agencies and groups, each of which approves heartily of reorganizations that do not affect its own immediate interests. The Congress must be prepared to accept this fact and give careful attention to the validity of arguments of those who would seek to escape reorganization, as many have so successfully done in the past.

... While honest differences of opinion certainly may exist as to the best method of accomplishing any particular reform, such differences should not be accepted as valid arguments against the desired objective. Once the practice of exempting certain agencies and excepting particular functions has begun, the chances of achieving substantial improvements in the efficiency of the Government will speedily diminish.²

At the hearings which followed the introduction of the bill proposing the creation of a Department of Science and Technology in the present Congress, all officials of the federal government who

testified were vigorous in their opposition to any legislation to bring about better co-ordination of science activities, and insisted on maintenance of the status quo.

Political interference with science

Objections were also expressed on the premise that it would inject politics into science activities; that the establishment of a Department of Science and Technology would bring scientists under bureaucratic control, which would be detrimental to the performance of the functions presently vested in various federal agencies.

This fear apparently exists only with reference to the brand of political overlordship emanating from an executive department; the brand of political control which could issue from the Executive Office of the President, and it seems to me most inconsistently, is apparently regarded as a benevolent variety of political control. This attitude ignores the fact that the President enjoys complete authority over the administrative functions of the executive departments, all independent agencies, and over the policies he establishes within his own office. In all instances, the appointees are named by the President. Those whom the President sees fit to vest with wide authority in the Executive Office of the President are his own selections, while those who are at the head of the departments and agencies must undergo close scrutiny as to their qualifications in their respective fields of operation before they receive Senate confirmation.

With particular reference to political interference, it is important to remember similar alleged forebodings in relation to the establishment of the present Department of Health, Education and Welfare, under which socialized medicine and federal control of education in the United States was said to be in-

² Commission on Organization of the Executive Branch of the Government, *Concluding Report*, a report to the Congress, May 1949 (Washington: Government Printing Office, 1949), pp. 47-8.

evitable. Nothing could have been further from the truth. It is a matter of common knowledge that, in the world-renowned laboratories and clinics of the National Institutes of Health of the Public Health Service, an arm of the Department of Health, Education, and Welfare, the freedom of the research scientist to pursue his investigations, wherever they may lead, is a zealously guarded personal prerogative. Of course there is political control, but a control executed by a government of laws; a control which has enabled this country to take a pre-eminent position in today's world.

It is necessary to remember, too, that a Department of Science and Technology would be new in name only; its constituent agencies would be taken from those which now administer the relationship between science and the government. The need for the new Department exists because these relationships are being administered without the co-ordination so urgently demanded by the exigencies of the time. This objective is in accord with another recommendation of the Hoover Commission, that "The numerous agencies of the Executive Branch must be grouped into departments as nearly as possible by major purposes in order to give a coherent mission to each department."³

Progress in other areas

It is fortunate that real progress is being made in some scientific areas, as originally proposed in the Science and Technology Act of 1958, despite the present continuing disorganization. An illustration of this is afforded by Title

³ Commission on Organization of the Executive Branch of the Government, Recommendation No. 12, *Report on General Management of the Federal Government*, February, 1949 (Washington: Government Printing Office, 1949), p. 34.

IX of the National Defense Education Act of 1958 of which I was also a sponsor. This legislation requires the National Science Foundation to form a Science Information Service and an advisory Science Information Council to provide for the accumulation, translation, indexing, retrieval, and other services necessary to promote more effective availability and dissemination of the scientific literature of the world. Pursuant to this enactment, the Science Information Service was established and the Science Information Council was appointed.

Further, the National Science Foundation announced formation of the Federal Advisory Committee on Scientific Information, composed of representatives of seventeen federal agencies engaged in scientific information activities, the purpose of which, according to the Foundation, is to provide "an integrated approach to the Government phase of the intensified national science information effort." Also, the National Science Foundation supported the establishment, within the National Bureau of Standards, of the Research Information Center and Advisory Service on Information Processing, primarily to encourage automation in the processing of scientific information. However, the progress thus far made, through the information program and other programs now actually under way, toward effective co-ordination of all the government's scientific interests is grievously outweighed by that which still remains to be done.

Operations differ

One of the most persistent arguments constantly advanced against the creation of a Department of Science and Technology is that the programs, responsibilities, objectives, and operations of each of the federal agencies engaged

in science activities are different in character and have special fields of responsibility, which must be rigorously preserved. Those who make this contention insist at the same time that there must be a uniform science policy. Thus, while contending that a Department of Science would drain off manpower and scientists now engaged in the various programs operating within their own areas of activity, the fact that a centralized agency would bring all related science activities into closer contact and tend to eliminate the existing competition for and wastage of scientific and technological manpower, is completely ignored. The heart of this argument, as I understand it, is that the only way to ensure co-ordination is to continue the multitude of independent agencies operating in specialized fields and to have superadvisory or co-ordinating scientific groups within the Executive Office of the President act as their guardians.

Clear-cut responsibility

Those who place their reliance on co-ordinating devices such as interagency committees for improving communications and for providing stimulus to government science activities fail to recognize the built-in limitations of these approaches. By their very nature interagency committees cannot be creative except at a very low level of operation. They are inevitably restricted by the views of the most pedestrian and unimaginative members. Their product will almost certainly be a kind of lowest common denominator of their combined ideas. What is needed is dynamic, forceful, and continuing leadership which could best come from a cabinet department with clear-cut responsibility and authority in the field of science and technology. For it seems to me that the present structure of the federal gov-

ernment in other areas, with the programs devised and implemented by the concerted action of the Chief Executive and the Congress, is the obvious answer.

STUDY COMMISSION

At the hearings held before my subcommittee in April of this year, a number of witnesses suggested that, in order to solve some of the above outlined problems, a Commission patterned along the lines of the Hoover Commission should be established to make a study as to whether or not a Department of Science and Technology should be created. If such a department were found to be desirable, the Commission should then recommend to the President and the Congress which functions now being performed by other departments and agencies of the government should be transferred to such a department. It was suggested that the Commission should be composed of eminent authorities in the field of science, representatives of the federal government agencies which were engaged in basic civilian science activities, and members of the legislative branch of the government.

At the conclusion of these hearings, the staff of the Committee on Government Operations drafted a bill providing for the establishment of such a Commission. The bill was introduced as Senate bill 1851 on May 5, 1959. It was the view of the Committee that its provisions were broad enough to authorize the Commission to study: the need for strengthening American science and technology, one of our essential resources for national security and welfare; the reorganization of the existing departments and agencies to promote better centralization and co-ordination of federal science programs and operations; and the formulation of effective policies for training, recruiting, and utilizing scientists and engineers.

Witnesses testify

At the concluding hearing of the Committee, which was held on May 28, 1959, witnesses were invited to direct their testimony not only to the bill proposing the creation of a Department of Science and Technology, but also to the proposed establishment of a Commission on a Department of Science and Technology. Some of the spokesmen for the administration who testified at these hearings contended that there was no need for legislative action and opposed both proposals. Their opposition to the creation of a study commission to determine what might be done to improve and co-ordinate federal civilian science programs was based on the contention that the President's Science Advisory Committee and the Federal Council for Science and Technology, both of which were then headed by Dr. James R. Killian, Jr., would provide all the necessary information upon which the President could take appropriate action to bring about governmental reorganizations to correct deficiencies in present operations.

Government witnesses who opposed the creation of a commission to study these problems repeatedly placed heavy emphasis upon the personal ability and qualifications of Dr. Killian and the confidence placed upon him by the President and the scientific community. Yet, at that very moment, Dr. Killian's resignation had already been submitted to the President. Without reflecting in any manner upon the qualifications or potential leadership of any of the science advisors to the President, I think Dr. Killian's resignation makes it more imperative than ever that Congress reassert its legislative prerogatives in the field of science. An accountable officer, whether a member of the Cabinet or otherwise, should be made responsive to the needs of Congressional committees

which are attempting to eliminate the existing deficiencies in the science program of the federal government.

A real need exists

An analysis of the testimony of spokesmen who were representing the President at the hearing, will force the inevitable conclusion that it is the desire of the present administration to center within the Executive Office of the President all control over civilian science operations. If these recommendations are accepted, they would deny to the Congress access to information which is essential to the legislative branch if it is to perform its normal constitutional functions. It tends to pre-empt the scientists who are thoroughly informed and conversant about governmental science operation for the benefit of the President alone, and effectively prevents the Congress from obtaining information from qualified experts in the fields of science.

It was the conclusion of the Committee that a real need exists for a bipartisan Commission to study the problems related to the proposed creation of a Department of Science and Technology. Such a bipartisan Commission could find an equitable solution to the present chaotic conditions of federal science. The bill to establish such a Commission is now awaiting approval by the Senate and the House of Representatives next session.

It has been stated by many who oppose a Department of Science that scientists must be free to learn through observations and contacts with other scientists in order to cope with the problems of science in their own fields. It would be hard to imagine a better means of effective observation than to have the basic science programs co-ordinated under central administrative control, where daily observations and contacts

could be made as required, without having to make separate approaches to a number of individual officials and agencies carrying on related science programs with no central co-ordination of policy or operations.

Decision with respect to a creation of a Department of Science and Technology, or of another kind of authority

of no less eminence, is, in my judgment, the overriding issue and the obvious need. Fettered leadership, which experience has so often demonstrated, is all that can be expected from makeshift, compromise arrangements devoid of statutory authority and totally dependent upon voluntary co-operation for its achievements.

Research and Development, Economic Growth, and National Security*

By HAROLD J. BARNETT

ABSTRACT: Vital interest exists today in government research and development. Thinking people will discuss the underlying causes for the new interest. They may question, as Dr. Barnett does, the prevalent belief that research and development can be equated with economic transformation or that an increase in economic growth necessitates only an increase in government-sponsored research and development efforts. Accepting the fact that a correlation exists between research and development and economic growth, it is necessary to examine the paths open to the government in selecting its policy. Does not the uncertainty involved in research for future military innovations demand a recognition that multiple paths must be tried to achieve the desired results? The ends may best be achieved if government policy indicates only the objectives and allows the decisions for research-in-particular to be made by the separate research organizations. In the nonmilitary fields of research and development, it may be useful for the government to allocate funds to the universities for their research candidates and for the equipment to be used. Though research and development efforts do not necessarily cause economic transformation, there have been some demonstrable positive results, such as the revision of the negative premises for economic growth of natural scarcity theory.—Ed.

SINCE World War II, there has been a strong surge of public interest in research and development. There is wide belief that government should undertake and stimulate larger efforts. The new interests and attitudes, however, do not arise from new findings and deeper understanding of the social effects of research and development. Rather, the activism has developed out of yearnings and fears—a society's aspirations are always largely compounded from emotional drives. These may, in this case, be exerting a most desirable social thrust. But the origins of the beliefs and explicit forms of social improvement which they contemplate should be examined.

RECENT INTEREST IN RESEARCH AND DEVELOPMENT

One origin of the wide interest in acceleration of research and development efforts is simply excitement over recent developments in pure science and the spurt of applied technical advances of the past fifteen years or so. Great advances in the pure science of chemistry and physics, and in atomic energy, computers, automation, satellites, plastics and other synthetics, miracle drugs, and so on, have whetted our appetites for their fruits, for more advances, and for more excitement.

The other two origins of the awakened interest in research and development are based on more reasoned premises. They are beliefs that research and development play a unique role in economic welfare and in national military security. The causation, which we now briefly discuss, is indicated in the following diagram.

It is generally asserted—we inquire into its truth later—that the rate of economic growth depends upon the pace of research and development. In turn, economic welfare is thought to depend upon economic growth. In one respect, this latter proposition is necessarily and obviously true, that is, if economic welfare is defined as output per capita and economic growth is defined as the rate of increase in output per capita. In addition, however, there is a more complicated hypothesis of the dependence of economic welfare upon economic growth. Since the thirties, very large powers for governmental intervention have been legislated into permanent United States statutes to prevent cyclical recession and depression. For the discharge of this responsibility, there is a substantial body of opinion which believes that rapid economic growth must be the major weapon. Since the rate of economic growth is believed to depend upon the rate of research and development, it is held that research and development should play a major role in promoting economic welfare, through averting depression.

Industry and ideology compete

Let us now turn to the chain which runs "research and development fosters economic growth which fosters military security":

(1) Soviet industry is reported to be growing at two or three times the United States 3 to 4 per cent yearly rate. If sustained, such difference in growth rate would have the Soviet Union surpass the United States industrial size in a generation or less. If, as is widely believed, industrial size and military strength may be equated, then the laggard relative rate of growth of the United States renders it militarily insecure, and the rate should be stimulated.¹

¹ For a view that industrial size and military strength should *not* be equated in view of changed military technology, see H. J. Barnett.

Harold J. Barnett, Ph.D., Detroit, Michigan, is Professor of Economics at Wayne State University. He recently was Director of Economic Growth Studies, Resources for the Future, Inc. He has held numerous government positions, including The President's Cabinet Committee on Energy Policy (1954-55) and The President's Materials Policy Commission (1950-51). He has also served as consultant to the RAND Corporation since 1948.

* I am indebted, for critical comments on an earlier draft, to P. Cootner, K. Dofis, P. Glick, W. Hirsch, C. Hitch, H. Jarrett, S. Miller, G. Perazich, and N. Wengert. The errors which remain are mine.

(2) The United States philosophy of political and economic freedom is in a serious cold war competition with Soviet type communism in the underdeveloped nations of the world, particularly in the Far and Middle East. In these nations, political and economic freedom are not firmly established; and democratic and communist parties must contend for popular support. The ability of Western-oriented democratic parties to retain leadership depends upon achieving rapid advance in economic welfare; the advance is necessary to meet the demands of impoverished masses seeking betterment. The view is held that if the United States can achieve sustained and rapid growth, guide these growth-aspiring nations, and provide economic assistance, then extension of the Soviet dominion can perhaps be halted. If, on the other hand, the growth rates of the democratic nations fail to satisfy aspirations and fall short of demonstrated growth rates in Russia, China, and other communist countries, then, it is feared, most of the underdeveloped nations will fall into communist party hands. In summary, the cold war is viewed as a complicated contest in economic growth between the United States and the Soviet spheres, with vast populations in Asia and Africa at stake, and wherein the United States plays the principal role as example and leader in the free world.²

Arms race

Finally, a major reason for heightened public concern for research and development is the recent, rapid Soviet advance in military technology. The Soviet Union has almost caught up to the United States in nuclear weapons, she has surpassed us in missiles and rockets; we face an arms race in a modern form, a race for military research and develop-

ment. Indeed, in the present fluid state of military technology, there is considerable danger that the nuclear stalemate—"the balance of terror"—will be broken if we do not at least overtake Russia's missile technology lead, and match the technological pace in other major arms. These considerations indicate an apparent need for more and more effective research and development in the military sphere.

We may summarize the recent increased interest in research and development in the following way. There is great concern on the part of our government and leading citizens over the economic growth required: to maintain the industrial capacity necessary for the national security; to exert United States leadership in the free world; and to promote domestic economic welfare. If, in addition, research and development are considered major determinants of growth, then much of the interest in growth shifts to research and development. Thus research and development, already foci for reasons of military technology and scientific excitement, also become poles for the concern over economic growth.³ For these reasons research and development have leaped into social prominence since World War II, after having been relatively ignored in public policy, with the exception of the specialized patent discussions and agricultural research programs.

RESEARCH AND DEVELOPMENT EXPENDITURES AND THE NATIONAL ECONOMY

The upper line of Figure 1 shows "real" national output—gross national product in constant prices, that is, ad-

³ "The significant part played by research and development activities in impelling growth as well as improving our defense capabilities is now generally recognized." 1959 *Joint Economic Report*, 86th Congress, Senate Report, No. 98, p. 11.

FIG. 1. Gross national product, gross private investment, and population.

The Changing Relation of Natural Resources and National Security," *Economic Geography* 49(57).

² Under Secretary of State C. Douglas Dillon has stated both relations of economic growth and national security, stressing the latter, in a speech "The Challenge of Soviet Economic Expansion," Washington Evening Star (May 7, 1959).

justed for price level changes—and its growth since 1870. The long term growth rate is approximately $3\frac{1}{2}$ per cent per year. There are also shown some of the determinants of the growth rate—population; and investment in producer durables and construction. Figure 2 compares gross national product, gross private investment, and expenditures on research and development as defined and reported by the National Science Foundation; these data are not adjusted for price changes.

The research and development expenditure figures were 1.5 per cent, 2.2 per cent, and 2.3 per cent of the national output in 1953, 1956, and 1958, respectively. These are small ratios. Research and development expenditures in 1956 were about the same as aggregate outlays on tobacco products, toilet articles and barbershops, and the same as advertising outlays; they were only 30 per cent of automobile and automobile service costs and about 60 per cent of recreation outlays.

Or, to further show that annual research and development expenditures are relatively insignificant in size in the United States economy, we note that they are only one-third as large as the loss of output which the nation experienced from excessive unemployment in the 1957–58 recession. On the average annual research and development expenditures cost the American economy only about \$200 per family. This total outlay is less than the average yearly increase in family income. The impact of doubling or trebling research and development expenditures therefore, even if no benefits were received therefrom, would in magnitude involve no more than deferring income advances for a year or two.

Now if the outlays are of such small size, how does one arrive at the prevailing popular belief that the rate of expenditures on research and develop-

ment plays so compelling a role in economic growth and should be increased? I can only surmise that the general reasoning might go about as follows:

The rate of increase in real national output has been roughly two and a half times the rate of increase in labor input. Real output has increased perhaps twice as fast as the sum of labor and capital input, measured in constant prices. Then, half of economic growth is due to improved productivity of labor and capital. That is, half of economic growth is due to economic transformation. The origin of improved productivity or economic transformation is improved knowledge, which is the result of research and development. Thus, research and development can be inferred to have played a major role in economic growth. Therefore, if we increase research and development expenditures, we can hasten economic growth.

To the extent this reasoning underlies the popular belief, it permits detection of possible errors.

The major error is that which equates economic transformation with the results of research and development expenditures. In the above statement economic transformation is a residual, a catchall, for all causes of increase in the ratio of output to the labor plus capital input. Economic transformation thus includes economies of scale; social innovation of all kinds; increased quality of a literate and educated populace; shifts in composition of economic output away from low productivity sectors to high productivity ones; spatial and geographic shifts of population and economic activity; the effects of mineral exploration and findings; vocational training of labor force entrants in schools; factor (input) substitutions in the most comprehensive sense. It includes the effects of Colonel Drake's oil well discovery; of Henry Ford's tin lizzie; of Einstein's off-duty scribbling while a patent clerk; of railroad installation of diesels twenty years after their

FIG. 2. Gross national product, gross private investment, research and development, in billions of dollars.

invention, financed from profits of the war and postwar years; of a great increase in international trade; and of a substantial substitution of capital for labor. It is an error to equate economic transformation, which by definition "does" account for perhaps half of our growth, with knowledge, however broadly this might be defined and even though this is one source or cause of economic transformation. Increased knowledge is not a sufficient condition for such transformation.

Errors in definition

Further error occurs if "knowledge" is equated too readily with research and development results. The major activity which perpetuates and extends knowledge and creates knowledgeable people is education, not research and development. In the year ended June 30, 1958, we produced 9,000 Ph.D.'s and other nonmedicine doctors, some of whom presumably made original research contributions in their dissertations. We also produced 365,000 bachelor's and first professional—including medicine—degrees; and 65,000 second level, master's, degrees. We educated tens of millions of school children. If we are seeking understanding of knowledge as an origin of economic transformation, should we not add education to research and development? ⁴ If we do so, if we have to add the nation's annual education bill of \$15 billion to the \$10 billion of research and development expenditures, then the cost of originating economic transformation becomes much greater. It is then more difficult to

⁴ Since writing this, I find that Professor T. W. Schultz has attempted to relate economic transformation to education in a more ambitious effort. For this interesting analysis, see "The Emerging Economic Scene and Its Relation to High-School Education," *The High School In a New Era*, edited by Francis Chase and Harold Anderson (Chicago: University of Chicago Press, 1957).

contemplate decisions which would require very large percentage increases in these outlays.

It is a further error to equate a broad definition of research and development with the much narrower concept which the National Science Foundation, for practical reasons of measurement difficulty, has had to use in its survey data of research and development expenditures. These surveys are of organizations formally engaged in research and development; wherein groups and efforts could be classified as to their purpose or aim. They are also surveys of input, not of results. But the broad definition of research and development which relates to economic transformation is one which captures not input efforts, but rather results, however informal the effort and however accidental or by-product the results are from other activities. Until it has been shown that national research and development results correspond very closely with national research and development expenditure as defined by National Science Foundation, it is a matter of faith to assume very close correspondence, and it is naïveté to assume an identity.

Finally, the very notion of a single factor cause of economic transformation—research and development expenditures, knowledge, or any other—is quite simpleminded. No one condition can ever be sufficient in a complex, dynamic economy. If we transposed all United States technical libraries to Uganda, how much economic transformation would necessarily result? For economic effect, knowledge needs capital investment to serve as carrier of the techniques; trained manpower as operators; entrepreneurs or other agents as innovators; incentives for the various parties, including, in a free economy, buyers for the goods, and profits for the risktaker; economically adequate legal and social institutions; and so forth.

We now have, in our kit of technical knowledge, tools to generate mammoth increases in output, but have not the social desire, drive, understanding, or social capacity to do differently. An economy is an extremely complex social organization, a fact which the technocrats of a generation ago never seemed quite able to grasp. Why should it then be thought that further increments of technical knowledge necessarily would or should produce economic effect?

Of course it is true that availability of a large fund of technical knowledge, at home or which can be borrowed abroad, permits more rapid economic development than if the fund is small, provided that other conditions for economic change are present. The Chinese annual growth in heavy industry of about 20 per cent in its first five year plan and the reported Soviet industrial growth of 10 per cent last year demonstrate this, if the reported figures are true. But technical knowledge alone is not enough; social drive and other economic conditions are also necessary.

PUBLIC POLICY AND ECONOMIC MANAGEMENT

Most of us subscribe to the belief of our political and military leaders that Soviet expansionism and adventurism are likely to precipitate world war if the United States does not at least match the pace of Soviet weapon development and strength. If the view is valid as a basis for policy, then the probable cost of United States failure in this regard is at best vast destruction and conquest of the free world by the Soviet Union, and at worst something approaching world suicide. Preservation of the stalemate by matching military weapon development during a period long enough to permit reason to become dominant in international relations is, I assume, a prime national objective.

Military research and development

If we have such an objective, then there is a corollary for military research and development behavior. We should, I think, act in spite of our substantial ignorance concerning correspondence of results with research and development input efforts. If we observe Russia outpacing us, as is true today, I see no alternative to thrusting greater funds and manpower into the military research and development effort in the hope that results will at least move somewhat in the same direction as effort. If we act in this manner, we may be committing error; it is possible that the combination of expansion in this sphere and our lack of management skill may, particularly in the short run, produce just the opposite of the result intended. This has happened before in economic affairs. But the greater probability is that the increased effort will help, not hurt, both the pace of military research and development results and the pace of improved weapon procurement. This tends to be the greater probability because in individual narrow spheres—a company, an industry, in this case military hardware—we have been able to observe substantial correspondence between research and development results and research and development efforts. The reason it tends to be more true in individual spheres than in the economy as a whole is because other economic sectors can be robbed of their talent, and because the objective is not so ambitious as generalized economic transformation of a free society.

But with respect to programming and management of the military research and development effort, the evidence is piling up that uncertainty of the outcome, of specific results, is the most basic characteristic of military research and development. The corollaries to this finding, which has analogies in a

great variety of other areas characterized by high uncertainty—from raising children to the economic principles appropriate for a free choice society—are:

1. to confine high level programming and direction to statements of objectives, leaving to research personnel the choice of pathways and techniques for achieving them;

2. to conduct research and development in discreet sequential stages, in order to "buy" information and remedy ignorance, so that expensive final development and procurement decisions will, to a maximum degree, rest on valid, knowledgeable premises;

3. to foster substantial competition and "duplication" in research and early prototype efforts—where the uncertainty and unpredictability are greatest—both to buy information and to spur inventive genius.

There is a great deal of direct evidence that centralization and strong, detailed, and early programming of military research and development tend to be less productive of major advances and more costly than more competitive, uncontrolled, and exploratory approaches. Two exemplary cases are the World War II Manhattan District and Office of Scientific Research and Development. The former sponsored vigorous competition among different groups working separately toward the same objective, with great success. The latter could not have been more un-co-ordinated and still be called an organization. Yet it was also spectacularly successful.⁵ For the postwar period the example of missiles, in which the United States is still not out of the crisis stage of having fallen behind the Russians, is instructive. We made the mistake of deciding early that long range ballistic missiles had prospects too poor to justify major research and development efforts. And then, when the Russians proved this wrong and we started to rectify the error, we almost made the

⁵ See C. J. Hitch, *op.cit.*, below.

mistake of too early decision as to which missile research and development efforts should be pushed. Fortunately, inter-service rivalry kept competition alive sufficiently long to prove its practical necessity in the uncertain research and development sphere of ballistic missiles. Burton Klein's comment on this point is informative:

Ten years ago the experts generally agreed that ballistic missiles were not likely to be nearly as promising bets as long-range cruise missiles. Things went wrong when the government, on the basis of these shaky predictions, chose to spend fortunes—and large fortunes they were—in the development of cruise missiles and to spend comparatively negligible amounts on ballistic missile technology . . .

A recent instance, and one that shows the value of having independent agencies sponsor research and development, is the Navy's development of a solid-fuel rocket engine. Several years ago none of the services was much interested in such an engine. But when the Navy decided to develop a submarine-launched ballistic missile capability, the Polaris, it had to develop a solid-fuel engine. A liquid-fuel engine just wouldn't do. As a result it found that this was a surprisingly promising engine—so promising that now all three services plan to use solid-fuel engines.⁶

Multiple paths

C. J. Hitch, head of the RAND Corporation's economics division, has tried to indicate how the competitive principle can be brought to bear in military research and development. He points out that the most expert predictions of the results of research and development efforts have been notoriously unreliable. Frequently the only way to learn whether an idea will work is to test it; therefore, the quickest, and frequently cheapest, device is to try multiple paths. The greater the importance of the prob-

⁶ B. Klein, *What's Wrong With Military R & D?*, RAND Corporation, P-1267, pp. 15-16 and 21.

lem and the greater the uncertainty, the more is such "wasteful" behavior required. Also, the cheaper the multiple paths, the more sensible to try, and they are cheaper at the early stages of the research-development-procurement chain. Finally, the competitive spur among people and groups is a most effective one, a fact the Russians have also learned and successfully exploited in research and development.⁷

B. H. Klein's and W. Meckling's other RAND case studies of past research and development results also emphasize the inherent uncertainty and the error potential of too precise and too early programming. They point out that of twenty-four aircraft developed since World War II, in only three was the final engine the one initially planned. Some engines were designed for fighters, others for bombers, but original intent had little influence on ultimate use. One engine, originally designed for a bomber, was so successful it was used in eight fighters and five other bombers. With respect to missile uncertainty, Klein and Meckling paraphrase a *Time* magazine report as follows:

The ICBM program suffered from a lack of support because the guidance problems were so severe that the rest of the program was not pushed. The unexpected development of the H-bomb suddenly made even very inaccurate ICBM's useful. We were

⁷ C. J. Hitch, "Character of Research and Development in a Competitive Economy," *Proceedings of a Conference on Research and Development and Its Impact on the Economy*, National Science Foundation (Washington: U. S. Government Printing Office, 1958). An early seminal and general statement of the danger of too detailed or too distant programming under conditions of uncertainty appeared in an internal RAND paper by A. Alchian. The Committee for Economic Development has recently come to similar conclusions—see *The Problem of National Security* (July 1958), cited in *Proceedings of a Conference on Research and Development and Its Impact on the Economy*, *op. cit.*, p. 14.

unfortunately at that time in no position to benefit immediately from this development. We would have been in an even worse position but, luckily, an entirely different program—the rocket booster for the Navaho cruise type missile—had been pushed so far that we could use it as a basis for the ICBM engine.⁸

Three main points stand out from the evidence. First, the type and degree of programming should be related to the degree of ignorance and uncertainty. In early stages of exploration—compare the Lewis and Clark expedition—it is frequently the greatest wisdom merely to point the explorer in the desired direction and state a general goal. Second, research should be viewed as a dynamic process because even unsuccessful efforts reduce ignorance. The new information should be used in making revised decisions of goals, directions, and ultimately, pathways. Third, the competitive drive and process are powerful instruments to research accomplishment; they can be robbed of potency by bureaucratic constriction.

Nonmilitary research and development

Outside the military area, we have a major concern for sensible government research and development policies in the interest of economic welfare and growth. Both welfare and growth are new statutory social objectives of the federal government—in the Employment Act of 1946, as amended, and elsewhere—and so there is no question of the propriety of government activity, even on a large scale.

But there is a question of what is sensible behavior, in view of our great ignorance of the social relation of government research and development to national welfare and growth. I think it follows from our ignorance that our

⁸ B. Klein, and W. Meckling, "Application of Operations Research to Development Decisions," RAND Corporation, P-1054, pp. 13-16.

first priority should be economic and other social research on the subject of research and development. We should become very active in sponsoring study designed to learn and understand how significant additions to technical knowledge are made, what are their economic and other social effects, and what these analyses suggest for government research and development behavior. Until we know more, there is a danger in being overly active in government-sponsored research and development.

While in general we should be initially quite passive with respect to government stimulation of nonmilitary research and development, there are some probable exceptions to the generalization.

One possible exception is that of government grants to higher-level educational institutions, without specification as to purpose beyond their use in university education and research. This would be more an act of faith than a reasoned step to economic welfare and growth. But it has several virtues over the more purposive device of trying to improve welfare and growth through technical research and development programmed in its particulars by the government. First, our belief that economic progress derives from higher education—including the research and development that faculty and graduate students do of their own choice—is stronger than that such progress results from programmed technical research and development. Second, general grants of the type suggested avoid the danger of distorting the production of Ph.D.'s and other graduate students, and of malforming or unbalancing the accumulation of understanding and knowledge. For example, most of our intellectual leaders believe that the limiting factors in growth and welfare are more to be found in inadequate economic and other social knowledge and understanding than in physical science areas. This is

why, for example, outstanding technical schools like Massachusetts Institute of Technology, Carnegie Institute of Technology, and California Institute of Technology are now giving increased emphasis to the social and behavioral sciences. I would suggest that the objective of advance in knowledge can, both with respect to the areas selected for emphasis and with respect to the forms of activity necessary for knowledge acquisition, be better managed by the universities, traditionally responsible for this function, than by government legislators and administrators.

Research equipment allocation

Another possible exception to the generalization that government, pending improved understanding and skill, should be extremely passive in economic allocation to nonmilitary research and development concerns research tools. If, somehow, the government could sponsor improvement in the quality, and perhaps quantity, of research equipment and information available to be drawn upon by independent research efforts, then government would be improving productivity within research and development, without, however, risking distortion or misdirection of research and development efforts. In part this is already an active government function: library and information dissemination work, translations, research on and production of radioactive tracers, research on computers, standards and measurement research, geological exploration, and so forth. The cases in which tool improvements—such as tracers and computers—permit research never before possible are very exciting.⁹ But the question is whether such efforts—making available tools and information, and training in the use of new tools—should

⁹ Re tracers, see H. J. Barnett, *Atomic Energy in the United States Economy*, Ph.D. dissertation, Harvard University (August 1952), Chapter 2.

be expanded. The danger is that in some of these functions the government inevitably implicitly favors certain areas and prejudices others. And what starts out to be a neutral effort to increase productivity in research and development could turn out to be economically very "unneutral," even apart from the direct influence of political pressure groups.¹⁰

Other areas for economic research

A long-standing problem concerning technological change is its possible tend-

¹⁰ I am dissatisfied with my discussion in the four preceding paragraphs. First, as noted, it is rather subjective. And, second, the implicit premise of optimality in the structure and processes of research and education is suspect. Thus, I am uncomfortable about some of the questions which my critics have asked. For example, Professor Norman Wengert has asked, "Are you assuming an unseen hand operating in the choice of Ph.D. major fields and dissertation subjects? The idea of knowledge for its own sake is appealing, but in fact many pressures are at work, some of which are completely irrelevant and irrational in pushing graduate students in one or another direction." And, at another place he points out, "The universities, of course, also program their activities, and except for the top institutions, I am not at all sure they do as good a job as some federal agencies. It is my feeling that the manner in which our agricultural research has developed, especially that undertaken by the land grant colleges, represents a desirable kind of programming, because it is so largely permissive, resting on agreement as to general areas of investigation but leaving specific implementation to the several research stations and their personnel. The role of pressure groups in agricultural research, of course, poses a special kind of problem." Professor Werner Hirsch has raised a different embarrassing question, "I am greatly intrigued by the problems that arise when government, and the same holds for foundations, steps in and finances research and development activities. Whose work should be financed? If we agree that we do not know in advance which is the most promising area of research, what guide lines do we have to allocate funds? In the past we have given money to those who have the best reputations and are associated with the institutions having the best reputations. In doing so we run a

ency to create unemployment, at least in the short run. This obviously deserves study. For example, it is clear that distress among farmers is to some extent attributable to rapid technological change in agriculture, deriving in part from government-fostered research and development. Another important area for economic research is the role of research and development in making the economy effectively competitive. Research and development results can play a major role in the creation of "countervailing power"—that is, in developing substitutes for commodities subject to private market control. On the other hand, there are clearly cases in which research and development have, at times, operated significantly to reduce competition—the aluminum and shoe machinery cases are examples.

There are many other areas which need economic research before we may with assurance become active in artificially stimulating research and development. For example, it has been alleged that research and development play a most important role in growth and full employment by increasing the demand for consumer and capital goods; that the research and development sphere operates under increasing returns to scale, since each new piece of knowledge can be connected with all other preceding pieces; that research and development activity promotes economic stability, since it is not subject to cyclical recessions; and that there is no necessary relation between the industry

most serious risk of weakening our research system and our system of higher education. A few institutions have bushels of research and development funds. They actively recruit researchers from middle-sized and small institutions; particularly the better people are induced to leave the second-echelon institutions. If this continues, we will end up with relatively few excellent institutions and masses of very poor ones, obviously a very narrow base on which to build research and development in the long run."

of research discovery and the industry of application of research results. Some of these are discussed in the recent National Science Foundation volume, particularly in the articles by Professors Slichter and Fox.¹¹

RESEARCH AND DEVELOPMENT VERSUS NATURAL SCARCITY

I close with a few affirmative paragraphs on an exciting economic and social accomplishment of research and development, the gradual erosion of a basic premise of "the dismal science"—a premise which was once believed so certain it was viewed as natural law. I refer to the accomplishments of research and development in undermining the economic significance of natural resource scarcity, both in doctrine and in fact.

The Malthusian dilemma was that population would grow rapidly, and that the pressure of population on limited agricultural land would inflict diminishing average and marginal returns to future increments of population. Ricardo's subsequent innovation indicated that natural resource scarcity obstructs growth long before the Malthusian limits are reached, because incremental unused land is of persistently declining quality. Jevons transposed the Ricardian position to coal availability, which he viewed as a *sine qua non* of economic welfare; and he introduced another force responsible for natural resource scarcity, that is, depletion. The American conservation movement extended the doctrine of natural resource scarcity as an obstacle to eco-

¹¹ S. H. Slichter, "Technological Research as Related to the Growth and Stability of the Economy," and B. Fox, a discussion of an article by R. E. Burgess, "Impact of Research and Development in the Chemical Industry," *Proceedings of a Conference on Research and Development and Its Impact on the Economy*, National Science Foundation (Washington: U. S. Government Printing Office, 1958).

nomie growth. It found the natural resource limits to be multidimensional; and, since natural resources are a system of interdependent variables in ecological balance, then over-all scarcity can be engendered by quantity or quality limits of a single resource.

These and other warnings of strenuous conflict between natural resource scarcity and economic growth were not trivial expressions. Yet, with hindsight, we may observe that their authors, some of them great thinkers, committed a major error, and so their prophecies, at least for our time and the foreseeable future, are wrong. They neglected or gave inadequate attention to the results of future research and development and of other increments of knowledge. What the brilliant scientist, Sir William Crookes, did not foresee when he predicted only starvation for growing populations from diminishing supplies of nitrogen, was that fixation of nitrogen from the air would be discovered a generation or so later and remove this threat of disaster. Prophecies of crises from exhaustion of favorable coal reserves have similarly failed, due to the inability to foresee other research and development results—the opening of alternative energy sources and advances in coal mining technology. Gifford Pinchot's forecast of economic blight from timber famine has failed because he did not foresee a further research and development result—technological substitutions sufficient to make the economic effect of reduced timber supplies and higher timber costs of very minor national economic importance.

In agriculture, research and development have facilitated the economy's transition to engine and electric power and relieved agricultural land of the burden of providing calories for work animals. If the United States today had to rely upon work animals for its horsepower, the feed for these animals

would require fifteen to thirty times as many acres of crop land as are in use in the United States. Land shortage has been further averted by more recent research and development which have made possible the production of synthetic fibers, releasing natural fibers equivalent to five to ten million acres. Recent developments in chemical fertilizers, insecticides, hybrid plants, and so on, have greatly increased crop yields per acre.

In minerals, natural resource shortage, in the face of vast increases in mineral demand—more than thirty-fold since 1870 and four-fold since 1900—has been averted by a combination of two means. One is not research and development in a narrow sense—the finding of new reserves as fast as known ones are used. But the other does rest on research and development—improved methods of production, extraction, transportation, refining, and utilization, which have offset the fact that the new reserves are frequently of lesser physical grade or less accessible. Further, baneful economic effects of incipient shortages in individual minerals have been averted by research and development of inexpensive substitutes based upon economically more plentiful resources—aluminum, taconite, magnesium, and plastics are examples.

In modern economies, the meaning of goods and resources has changed radically because of research and development. For example, more than 90 per cent of the increase in real gross national product in the United States since 1870 has been of nonagricultural origin. The method of transforming materials into final goods has become far less merely a mechanical one; rather it is now, to a considerable degree, a controlled heat and electro-chemical process. Finally, the natural resource building blocks have changed very radically; they are now atoms and molecules. This

has changed the meaning of natural resources for societies which indeed have access to modern technology and capital. The same ultimate world physical limits still exist, of course, but not the same economic limits. How many taconite iron atoms and sea-water magnesium atoms and bromine molecules constitute plentitude, and how many scarcity? Furthermore, recent research and development have given us a three-dimensional world, as compared with the one which was economically sustained almost entirely by surface resources.

Of course, research and development have not vanquished once and for all the threat of natural resource economic scarcity. Indeed they can never do so with certainty, so long as populations continue to increase—the galaxy itself is not large enough to sustain infinite demand. This is what accounts for considerable apprehension among some students of natural resources and population growth. But I would point out that we have come very far from Malthus, yet have only penetrated a tube four miles into the earth's crust, still have not mined the ocean floor or the seas themselves, still have vast areas of the globe which have never been seen by man. We should not underrate the further results of research and development—assuming we avoid world destruction while we employ the most recent achievements.¹²

Science, Government, and Society

By VINCENT HEATH WHITNEY

ABSTRACT: Historically men have sought knowledge in a variety of ways both for its own sake and in order to increase their control over the environment. Science has increasingly made its impact on society through technical applications of scientific findings. Science has thus helped to alter social structure. At the same time increases in population, in social differentiation, and heterogeneity have made necessary large-scale organization. The effect has been felt in the structure of science and the role and status of the scientist; for example, the individual scholar has been replaced to a considerable extent by the scientific organization man. Government encouragement of some areas of scientific research has expanded enormously in the United States, inevitably within a bureaucratic framework. In the process the scientist has come to be valued not for his scholarship but for his ability to provide solutions to specific problems and thus to increase national power. Bureaucracy has a price, but it is an organizational form which is understandably and functionally necessary and to which science must adapt.

Vincent Heath Whitney, Ph.D., Philadelphia, Pennsylvania, is chairman of the Department of Sociology, University of Pennsylvania. He served from 1948 to 1957 as chairman of the Sociology Department at Brown University and in 1957-58 was on leave as Associate Director of the Demographic Division of The Population Council. In addition to various professional articles, he has written Atomic Power: An Economic and Social Analysis with Walter Isard (1952) and has contributed chapters to other books. He served as President of the Eastern Sociological Society (1957-1958).

EVERY article in this issue of THE ANNALS illustrates the relationships among science, government, and society. The majority deal with specific consequences of the expansion of scientific activities by American federal, state, or local governments. As a result, I do not propose to repeat here the specific history of scientific development in the United States, especially of the use of science and scientists in government, nor to re-examine the particular illustrations of the consequences of such development for the economic system, the universities, the field of public administration, and the many other concrete areas which have already been presented in some detail. Instead I shall try to indicate in general terms and from the perspective of sociology the significance and some of the possible consequences of the recent rapid expansion of scientific activity in and out of government.

THE PLACE OF SCIENCE IN SOCIETY

The search for understanding is as old as the history of mankind. Understanding has been sought for two related but distinct reasons. The first is to satisfy the desire to know for the satisfaction of knowing, and the goal is "pure" knowledge. The second is to gain control over some aspect of the material or human environment, and the goal is power. Each era has had its predominant method of seeking understanding. In small preliterate societies trial and error or magic has served as the approved way to search for new knowledge and control. Philosophy, religion, and science are other ways of formulating problems and seeking answers which have come to characterize the intellectual activities of specific times and places. Probably no one approach has ever had exclusive ascendancy; and this is especially true in modern civilizations which are characterized

by a high degree of differentiation and variation. But even here some dominant method of seeking the answers to intellectual problems can be identified for each society. This method is a reflection of the prevailing organization of human activities in that society and consequently is also a function of the accumulation of prior knowledge and understanding at any given historical moment.

Stages of scientific inquiry

This suggests why—although the tradition of science is one of long standing¹—the utilization of science as the characteristic method of inquiry in any society is so recent, if indeed it yet stands clearly above alternative approaches. Certainly not until the nineteenth century did science achieve wide acceptance anywhere. Earlier, scientific inquiry had been the exclusive property of a tiny group of persons, generally men of unusual education, leisure, and wealth, who were uniquely able to pursue knowledge for its own sake. For these private enterprisers science was not a profession nor an occupation. Neither was it a way to find solutions of immediate practicality to current technical or social problems. It was rather a predominantly intellectual activity, pursued in a spirit of disinterested inquiry, and so it remained until very recent times. Ultimately the findings of these independent scientists, mostly through the applications made by other men, were to alter social structures and related individual attitudes and behavior profoundly. For the moment the knowledge that resulted from their patient searching remained

¹ See George Sarton, *Introduction to the History of Science* (Baltimore: Williams and Wilkins Co., 1927). Volume 1 uses nearly 800 pages to cover the period from the time of Homer to that of Omar Khayyam, that is, to the second half of the eleventh century.

the property of a fragment of the population and served the important function of raising new questions which demanded still further search for answers. It did not directly affect the lives of hunters and fishermen, peasants, serfs and nobles, guildsmen and merchants, nor did it alter the organization of families, economies, religions, or governments. In short, it was not an activity affected with an apparent public interest.

The impact of science gradually came to be felt by a wider segment of society through the applications of scientifically derived knowledge. In those nations which were undergoing the series of technological innovations and social changes customarily called the Industrial Revolution, individuals who were not themselves scientists were able to utilize scientific findings to create wealth. Their medium was the technical application, and their interest in science was its use to increase their control over some aspects of their environment. Ownership, or even use, of such applications was the basis for the rise of a new business élite and was so clearly associated with improvement of social status and economic and political power that science and technology came into an inseparable association. Science was increasingly seen as useful and practical to the extent that it promoted productivity and higher standards of living. Since these were valued positively in nations undergoing modernization, it is not surprising that the scientist was increasingly in demand to provide specific kinds of knowledge which could solve technological problems or improve technical processes of production. As a consequence the scientist as a learned scholar working in relative isolation on problems of no immediate practical worth was rather rapidly replaced by the scientist as a member of an organized profession

whose work was dictated by problems requiring immediate, concrete answers. Inevitably the demand for scientists rose sharply with this new estimation of their practical worth. Scientists came less and less to work alone, more and more to form a part of a team associated most frequently with industry and with certain private organizations, particularly the universities. Although the latter were sometimes viewed as the last refuge of the scientist as true scholar, such a picture was itself imaginary. The university scientist, as much as his colleagues in industry, found organization necessary both because of the nature of the problems on which he was now working and in order to win the support of industry. Moreover, a high proportion of the students who filled the classes of the university scientists were being trained for positions in industry.

Science and society

Science was one factor producing pronounced alterations in the social structure. It was inevitable that the new organization of society would similarly alter the role and status of the scientist and the position and character of science itself. The leading sociological theorists, from Auguste Comte to Max Weber and Karl Mannheim, have always emphasized this close relationship between the social structure and the personality and behavior of the individual. One cannot be understood apart from the other.²

To explain the alterations in the position of science in the United States and the changes in the role, attitudes, and behavior of the scientist it is essential to explain the parallel changes which have occurred in the several institutional systems, such as work, family, religion, and government. This is because of

² C. Wright Mills, *The Sociological Imagination* (New York: Oxford University Press, 1959), pp. 5-8.

the interdependence of persons, families, and communities—and, in a broader context, of nations—and the multiple linkages among social institutions. Obviously, not every person influences every other person, even indirectly. It is equally true that not every institutional change produces a direct and immediate reaction in all other parts of the social organization. Yet there are long chains of subsequent effects set in motion by prior effects which can at least in theory be traced back to an initial change. Ultimately, innovations of sufficient importance modify an area of societal organization, such as government, and require either further modifications in that particular institution or adaptations in related institutions. This is because a society is an organized system and not a series of discrete systems without linkages. It is impossible to maintain science today as a disinterested inquiry into purely intellectual problems by lone individuals utilizing their own leisure and funds. It is as impossible as it would be to maintain the federal government as a weak agency of a federation of jealous states limited to a few hundred employees at most and restricted to a small number of clearly defined tasks such as raising a militia and defending the nation against actual invaders.

Changes in American society

Science is a part of, and one among many causes of, the thoroughgoing transformation of society which has taken place in all those nations which have undergone modernization and, to a lesser extent, in those which have not. There is no space here to trace these enormous changes, but they are known in a general way to all of us. A few of the most important can simply be noted. First, knowledge has been vastly multiplied and is still enlarging at an increasing rate. In anthropological

terms, the culture base has been extended. The longer the base, the greater are the opportunities for recombining items already in existence, which is the basis for developing new artifacts and new ideas, in short, new knowledge. Man's increasing inventiveness is a function of his ever widening understanding rather than of an increase in his innate intelligence. This increasing inventiveness produces, second, a higher rate of technological and social change than past societies have known. Paradoxically, change has become a constant—to the point where some educators insist we can train our children only to be flexible. Third, our population in the United States has increased fairly rapidly and is continuing to do so with the result that there are now nearly 180,000,000 people in the country. Fourth, despite our increasing population, we have raised even more rapidly our per capita income. This has been based on increasing specialization and differentiation of functions made possible by rises in many technological and economic factors such as utilizable innovations, capital per worker, and quantity of output,³ and by social inventions and changes as diverse as new forms of business organization, contraception, and the increasing employment of women outside the home. Fifth, heavy immigration and high internal mobility, coupled with a high level of specialization, have produced a nation characterized by wide differences in beliefs and behavior, in status and wealth, in occupation and type of residence, in short, a heterogeneous nation.

If we attempt to summarize this great transformation of American society, we see that it represents a fundamental change in social structure based princi-

³ Some of these are discussed in Sumner Slichter, "Some Economic Consequences of Science," *The Annals*: Vol. 249 (January 1947), pp. 99-110.

pally on discovery and invention, which have been greatly augmented as basic research and applications have both increased our knowledge and our ability to acquire additional knowledge. Closely related have been a rapid rise in population, made possible by the increase in our ability to support human life adequately, and the development and spread of metropolitan communities, in which some half of the American people are now living.

Organization displaces the individual

The United States is a big country both in area and in population. That is the explanation at the most elementary level for the fact that it has developed big businesses, big labor organizations, big government, big religious organizations, and big research organizations. Organization reflects the demonstrated fact that goals involving the separate actions of a number of persons can ordinarily be attained more effectively when each person is assigned certain duties than when each is allowed to act as he thinks best at the moment. There are exceptions to this in the actual execution of much scientific research, where the individual worker can secure the best results if he is simply given an understanding of what is sought and the freedom to pursue whatever approaches seem to him most likely to be fruitful. But even such activity ordinarily takes place within an organizational framework; and this kind of freedom is in fact part of the plan, a sign of good organization.

Large size, elaboration, and complexity themselves cost something in terms of waste of time, effort, funds, and enterprise. I am not arguing that they do not; sometimes the price is prohibitive. Neither am I insisting that in the United States today there is no place for the individual scientist working largely on his own. I am saying that

in an era of large-scale organization and in human societies where institutional systems are interrelated, it is not possible for one area of activity, scientific research, to retain the characteristics which were associated with it in a society in which small-scale operation was predominant. Scientific research is a type of behavior which requires certain predisposing attitudes such as a recognition of the necessity for objective observation and the desire to report results honestly. It is a patterning of relationships among men based on understood rules which have been developed over time to support those values which scientists believe necessary if their goals are to be achieved. These attitudes and relationships undergo modification as the social structure, of which they are a small part, is altered. They have clearly been affected by the increase in size and complexity both of large segments of contemporary society and of the more limited area of scientific inquiry itself.

This means that the individual has been superseded as the customary unit of scientific investigation. He has been replaced by the organization. In physical science, and increasingly in social science, problems to be attacked are too big for one man. They require the approaches of several types of specialists, of men from several disciplines. They demand more knowledge than one man may possess or readily acquire. They cannot be answered without laboratories and computers and other types of equipment which are expensive and often not available to one investigator. I hope there will always be scientists who can reflect on grand questions on a grand scale or pursue small projects of no immediate apparent consequence without organizational help or interference. I hope that organizational structure can be greatly improved to create the freest possible effective work-

ing conditions. But these are matters to be discussed at another time. Scientific research cannot proceed on a seventeenth-century basis in the twentieth century.

SCIENTIFIC RESEARCH WITHIN GOVERNMENT.

So far I have purposely avoided any reference to government interest and involvement in scientific research. Many of the points which have already been made help to account for the tremendous increase in scientific research and research training under government auspices, described in other articles. Clearly, large-scale government, despite its ineptitudes and even harassments, is the single organization big enough to cope alone with the requirements of large-scale science. The federal government today is inevitably immersed in power politics on a world scale. The steady flow of technological applications which, rightly or wrongly, is thought to be essential to the maintenance of national power and status, and in some areas to impose requirements of secrecy, makes necessary not only vast numbers of technologists with some training in science but also an ever increasing number of scientists, some of whom are presumably engaged in basic research.

There is a need for social scientists and social science research although in comparison with the demand for scientists and research in the natural sciences this need is perceived only dimly.⁴ For if American society is to continue along present lines it must strive to avoid war, maintain full employment, and develop controlled use of natural resources essential to an industrial economy.⁵ There

⁴ See the article by Harry Alpert in this issue.

⁵ Detailed statements will be found in Harrison Brown, *The Challenge of Man's Future* (New York: Viking, 1954) and Richard Meier, *Science and Economic Development* (New York: John Wiley and Sons, 1956).

is a noticeable need for basic research in the area of population—studies of fertility, population growth and distribution, and migration—since all of these profoundly affect American life. The very size of these problems again clearly indicates that they can be studied adequately only with the support of the federal government or some other large organization. Of course, state and local governments can and will be involved as well but to a much lesser degree. Similarly, government will utilize the facilities of private research institutes, colleges, and universities, principally the latter, to support particular research projects. Industry too is spending many millions of dollars each year on research, but this is understandably research for private purposes. Some of it may be of great significance ultimately for the American economy and society. But this in no way obviates the fact that research on problems of national import cannot be left to the chance interest of individuals, private organizations, or lower levels of government.

There is still a sharp inclination in the United States, strongest perhaps among laymen but also readily identifiable among scientists, to emphasize the desirability of independent individual effort and to deprecate the necessity for increasing involvement of government in all aspects of life including research activity. This is one variation on the nostalgic wish for a return to the "good old days." Such a wish when examined carefully usually turns out to be a wish to recapture certain selected attributes of a total situation which would no longer be acceptable. Many of us in our longing for grandmother's homemade ice cream forget the laborious task of turning the hand freezer; and in the last analysis we prefer to take our ice cream factory-made after all. Similarly many of us have a per-

sonal preference for the older conception of the scientist as a disinterested scholar pursuing truth for truth's sake according to his own interests, and some of us may still be able to assume such a role. By the same token we resent, and up to a point, resist, the bureaucratic structure which develops around all large and unwieldy activities. As an alternative, we accept bureaucracy and become "conformers," a term which is frequently used as an accusation or an epithet today. I am not arguing for conformity when I repeat that as increases occur in the size, differentiation, and complexity of any structure, for example science, increasing organization of activities is a functional necessity. The problem for the scientists who seek to defend such values as freedom—which I purposely leave undefined—is not how to prevent organization but rather how to shape organization to maximize their own goals and to minimize practices and procedures which they believe to be inimical to the pursuit of their activities. One way is obviously through organizations of their own.

Some consequences for society

In itself the interest of the American government in scientific research is not new. As Louis Wirth has pointed out, "Franklin and Jefferson urged it, and our Constitution provides for it. Federal, state, and local agencies have themselves for many decades carried on scientific research in many fields."⁶ The National Academy of Science was created by Congress in 1863 at the request of President Lincoln. President Wilson established the National Research Council at the time of the first World War. In June 1941 an executive order of

⁶ Louis Wirth, "Responsibilities of Social Science," *The Annals*: Vol. 249 (January 1947), p. 144.

Franklin Roosevelt set up the Office of Scientific Research and Development.⁷ Specific departments and agencies have sponsored research of diverse character for some time and have clearly established the principle that science is invested with a public and indeed a national interest.

But this is not to say, as Wirth does, that there is "nothing new" about scientific research activities of government and their consequences both for the scientific community and for the larger society. The vastly increased scope of government involvement is itself new and the impact of such a program is far more wide reaching than anything previously known in this country.

A fundamental consequence of government in science is the shift in emphasis both as to what constitutes the main concern of science and also as to the proprietorship of scientific findings. The scientist assumes importance in the eyes of Congress, the government administrator, and the general public not because of his erudition or his scholarly aims or his ability to add to the total of human knowledge but because he can provide practical solutions to specific problems. To use my earlier figure, the scientist can help the administrator to control the environment and thus to increase his organization's power relative to inanimate objects or other organizations of human beings, for example a foreign government.

The scientist thus becomes a unit in a more or less impersonal structure developed initially at least for some rather specific purpose. He may work with relatively great or relatively little freedom but he will be working for an organization which provides him with necessary support, including his own livelihood, and which in consequence claims for itself the right to "own" his findings, permitting them to be dis-

⁷ *Idem*.

bursed if it sees fit or restricting them for any of a variety of reasons. It may be because an administrator believes there are legitimate grounds for enforcing secrecy. It may be because Congress or rival agencies or other "bodies" can less readily assess the value of information or the need for continuing specific programs when materials are classified. It may be simply a reflection of the fact that bureaucracies tend to self-aggrandizement.

Bureaucratic organization can hamper science and introduce inefficiencies and frustrations. These may be fatal for individuals but they are unlikely to hamper the advancement of science itself seriously, particularly if scientists act in a mature and responsible way to make clear to administrators the conditions under which scientific work thrives and to insist on free exchange of all possible knowledge not only beyond bureau or agency boundaries but beyond national boundaries. Though problems develop when science becomes an organized activity one must not forget the vast stimulus to the training of scientists and to their use which is provided by the great increase in government scholarships and employment, described elsewhere in this issue.

In this expansion, just as the role of the scientist changes from that of scholar or intellectual to that of organization man, changes in status will also occur. The demand for trained men is likely to increase economic status. The increase in numbers and anonymity may decrease social status and prestige for the average scientist although the exact nature of such changes, especially in the face of the scientist's already ambivalent status, is hard to predict.

Overemphases

It is entirely possible that some areas of science will be disproportionately emphasized at the expense of others.

To cite two examples, government has recently seemed more willing to put funds and men into nuclear research than into acoustics; into natural science than into social science. In the latter case there is frequently a failure to realize that science not only solves problems but also creates them and that many of these are at heart problems of human relations. Controlling the use of nuclear devices demands more research in political science, sociology, and economics. Despite the requirement to do so in the Atomic Energy Act, the Atomic Energy Commission has yet to undertake research assessing the social and economic impact of nuclear development on the American economy. Other examples might be cited, but the point is that a heavy concentration of research activities in government or under government sponsorship can hinder the development of specific fields at the same time that it promotes that of others. The same thing is true if overemphasis is placed on research applications at the expense of basic research. The results can be costly if scientists working in the neglected fields fail to make themselves heard. This is especially so with respect to social science since the major consequence of the increased emphasis upon natural science in recent years has been to extend the ability of individuals to produce and to destroy material objects without a compensating extension of knowledge required to assure that society will benefit from these technical advances.

In sum, the changes which are taking place in scientific activity reflect similar changes which can be observed in other areas of American society. Here we find that there have been a great many changes in the role and status of workers associated with the proliferation of occupations and the general rise in skills and the employment of skills. Notable has been the shift from self-

employment to employment within large organizations on a wage and salary basis. These are changes in social structure which are reflected in the lives of individuals as problems requiring personal adjustment. At this level such changes will continue to affect the individual scientist as he moves more and more into the role of scientific organization man.

On the societal level these changes serve to re-enforce similar changes in business, education, government, reli-

gion, and other areas of life. They are in line with increasing specialization and the organization of specialties into bureaucracies. As long as such organizations of scientists can contribute to the long-run increase in material well-being and can help to maintain American society in a world of competing and co-operating societies, present trends will probably be accelerated and the popular faith in the scientific method as the "proper" approach to solving problems will be strengthened.

The Government's Growing Recognition of Social Science

By HARRY ALPERT

ABSTRACT: Important new developments have strengthened the standing of the social sciences in the federal government. Historical analysis emphasizes the recency of the government's recognition of the national contributions of social science research. Significant progress has been made despite critical fluctuations. Five factors contributing to the more favored governmental position of social science research are (1) changing congressional attitudes; (2) acceptance of the social sciences at the White House level; (3) inclusion of the social sciences as part of broad definitions of scientific disciplines; (4) the general post-Sputnik interest in American education; and (5) the concern with redressing imbalances in American higher education. Research support for the social sciences is growing but a critical shortage remains in funds for fellowships and assistantships. The social sciences approach the next decade in a climate of acceptance and encouragement.

*Harry Alpert, Ph.D., Eugene, Oregon, is Dean of the Graduate School and Professor of Sociology at the University of Oregon. He has taught at City College of New York, Queens College (Flushing), American University, and was Visiting Professor at Yale University and the University of Washington. He has been a research consultant at Columbia University and Cornell Medical College. He is past Vice-President of the American Sociological Society and a past President of the American Association for Public Opinion Research. His government service has included assignments with the Office of War Information, the Office of Price Administration, the Department of the Air Force, the Research and Development Board, the Bureau of the Budget, and the National Science Foundation. He is the author of *Emile Durkheim and His Sociology* (1939), and a contributor to *Freedom and Control in Modern Society* (1954) and *The Human Meaning of the Social Sciences* (1959).*

THEY never had it so good." This vernacular phrase may startle grammarians, but it describes accurately the present position of the social sciences with respect to support and interest by the federal government. As the result of important new developments which have served to consolidate the standing of the social sciences in the federal government, there is every likelihood that the ten years from 1950 to 1960 will be viewed as the "March" decade of the social sciences. March, according to folk weather lore, comes in like a lion and goes out like a lamb. Similarly, the nineteen-fifties may be said to have come in with a roaring antipathy to the social sciences and to be departing with attitudes of positive interest and quiet acceptance.

That it has taken so long for the federal government to develop a *modus vivendi* with the social sciences is quite ironical, for its involvement in social research was written into the United States Constitution. By providing for a decennial census and making this count of the population the basis for representation in Congress, our founding fathers made a social science activity the ultimate basis of political power.¹ In fact, the gathering, analysis, and dissemination of social and economic statistics has continued to be one of the three major ways in which the federal government relates itself to the social sciences. The other two are: exploitation and utilization of the findings and results of social research; and direct support of social sciences through the intramural conduct of social science research in the federal government's own research laboratories and units or through contracts and grants for extramural social science studies at colleges and universities, other nonprofit organi-

zations, and business and commercial establishments.

PRE-WORLD WAR II STATUS

Up to World War II, the role of the federal government in the social sciences consisted largely of the first two of these functions, namely, producing mass statistical series and exploiting social science findings produced outside of the government. During the nineteenth century, the social sciences played a modest but effective role in the development of government powers and programs. Don K. Price has called attention to the contribution of economic and statistical series in the growing development of the regulation of business, as well as to the impact of John R. Commons' institutional economics on labor legislation and of Charles Francis Adams' studies on the regulation of railroads.²

Even as late as 1940, the government's direct activities in the social sciences were still predominantly confined to the collection and analysis of statistical information.³ However, the roots of later developments in the government's social science programs were discernible in the 1920's. The appointment by President Hoover of a research committee on recent social trends provided significant White House endorsement of a major social science enterprise. Further impetus for governmental support of the social sciences came in the thirties from the practical programs of the New Deal. An outstanding example was the Department of Agriculture's Division of Program Surveys which assumed the leadership in introducing the sample interview survey as a basic social science

² *Ibid.*, pp. 11-12.

³ The several paragraphs which follow are adapted from the author's chapter on "The Growth of Social Research in the United States" in Daniel Lerner, editor, *The Human Meaning of the Social Sciences* (New York: Meridian Books, 1959), pp. 73-86.

tool and as an instrument of governmental policy.

IMPACT OF WORLD WAR II

But the defense mobilization period and World War II itself were undoubtedly the major catalytic events leading to the expansion of the federal government's programs of social science research. The events of the war on both the military and civilian fronts and the problems of postwar adjustment as they affected the nation and the individual provided the social sciences with dramatic opportunities to demonstrate their practical value and essential role in modern society. A brief review of illustrative uses of social science during World War II lists eight examples of problem areas in which important social science research accomplishments were achieved: soldier orientation and morale; analysis of command problems, particularly among Negro troops; more efficient use of psychiatry; venereal disease control; analysis of the American soldier's problems of adjustment, combat performance, and response to mass communications; evaluation of Japanese morale; estimation of war production requirements; and regulation of prices and rationing.⁴ To this list may be added the media analysis activities of the Office of War Information and the Foreign Broadcast Intelligence Service; the propaganda studies of the Library of Congress, Department of Justice, and various intelligence agencies; the surveys of war bond purchases and other evaluations of the effectiveness of drives; the testing of the public comprehension of governmental information materials; and research on national character and other problems related to a better understanding of the behavioral characteristics of foreign peoples.

⁴ Russell Sage Foundation, *Effective Use of Social Science Research in the Federal Services* (New York: Russell Sage Foundation, 1950).

POSTWAR DIFFICULTIES

The immediate postwar period of demobilization witnessed the dismantling and disappearance of many of these wartime programs. Dissatisfaction with the limited accomplishments of some of these social science activities was expressed, largely as the result of the disillusionment which set in when excessive promises of achievement were unfulfilled. Social scientists became their own worst enemies by promising too much, too fast and accepting funds in excess of what could be effectively expended. Moreover, the social sciences have suffered from their minority group status among the scientific disciplines. Like minority groups on the labor market, they are subject to the rule of "last hired, first fired." Thus, many social science programs were speedily demobilized because of their relatively low priority and because of a failure to appreciate their long-range implications and future contributions.

Nevertheless, significant efforts were made to continue programs which had demonstrated their effectiveness during the war. The Office of Naval Research, created shortly after World War II, supported research on manpower problems, personnel and training, group morale, organizational structure, and related social psychological areas. The Army continued, in abbreviated form, its studies of opinions and attitudes of American soldiers. The new Department of the Air Force, proud of the accomplishments of the Aviation Psychology Program, organized units to undertake and support research in problems of selection and training, manpower, leadership, human relations and morale, and psychological warfare. When the Research and Development Board was established in the Department of Defense it included a Committee on Human Resources.

¹ See Don K. Price, *Government and Science* (New York: New York University Press, 1954), p. 5.

However, the skepticism and disenchantment which many of these programs engendered did not provide a favorable environment for their persistent growth and development. There set in, consequently, a period of recurring ups and downs, of "acute, and sometimes critical fluctuations," as Leonard S. Cottrell, Jr. has described it.⁸ A "starts and fits" pattern became evident: an activity got started and then was curtailed or discontinued when some congressman or general threw a fit. The Division of Research of the Housing and Home Finance Agency, the excellent survey research unit of the Veterans Administration, the Air Force's Human Resources Research Institute at Maxwell Field and its Personnel and Training Center at Lackland Air Force Base were but a few of the research units which experienced difficulty.

Despite the "on again, off again" character of some of these programs, the long term trend was toward increasing appreciation of the social sciences as valuable national assets. As the post-war pattern of extramural support developed, the social sciences, too, received encouragement, although not at the same rate and magnitude as the physical and life sciences.

THE "MARCH" DECADE

The "March" decade, 1950-60, will perhaps be viewed historically as the turning point in federal government recognition of the social sciences. The full measure of the change from the "lion" to the "lamb" phase of this decade may be observed in comparing the National Science Foundation Act of 1950 with the National Defense Education Act of 1958. In the former legislation, the social sciences are included only on a

⁸ Leonard S. Cottrell, Jr., in Foreword to Morris Janowitz, *Sociology and the Military Establishment* (New York: Russell Sage Foundation, 1959), p. 5.

permissive basis and are referred to only as "other sciences." In the 1958 act, the section dealing with graduate fellowships mentions no limitations whatsoever with respect to disciplines. Moreover, a separate title provides for research and experimentation in more effective utilization of television, radio, motion pictures, and related media for educational purposes. This act also recognizes the importance of improving statistical series in the field of education.

Note must be taken, also, of other evidences of changing attitudes toward the social sciences, such as the establishment, in December 1958, of an Office of Social Sciences within the National Science Foundation; the appointment, in the Spring of 1959, of a sociologist, President Logan Wilson of the University of Texas,⁹ as a member of the National Science Board; and the expansion of the social science research activities of the Department of Health, Education, and Welfare.

In the vernacular of the boxing ring, it may be said that the social sciences were, for several years, definitely "rocky and punch drunk," but were still on their feet when the fight was over. They have survived Cox Committee and Reese Committee investigations. They have endured pariah status and innumerable reorganizations. They have weathered appropriation storms which threatened to cut off funds for studies of child-rearing practices, mother-love among lambs, population dynamics, message diffusion, and other projects which became the pet peeves of individual legislators.

MAJOR DYNAMIC FACTORS

In attempting to assess the major factors that account for the more favorable position in which the social sciences

⁹ Dr. Wilson was subsequently required by Texas law to give up his membership on the National Science Board.

find themselves at the end of this decade, I am able to identify five important considerations: (1) changing Congressional attitudes; (2) acceptance of the social sciences at the White House level; (3) inclusion of the social sciences as part of broad umbrella definitions of scientific disciplines; (4) the general post-Sputnik interest in American education; and (5) the concern with redressing the imbalances in education which stemmed from the earlier almost exclusive emphasis on natural science and mathematics. Brief comments on each of these five factors follow.

CHANGING CONGRESSIONAL ATTITUDES

In his report on the crucial Senate debate in 1946 which preceded the vote to exclude from the then pending bill to establish a National Science Foundation the specific provision which created a Division of Social Sciences, George A. Lundberg concluded that the Senate thought of the social sciences as at best "a propagandist, reformist, evangelical sort of cult."⁷ The unfortunate phonetic confusion of social science with socialism reinforced such viewpoints. Just a few years later, however, more positive attitudes were being expressed. In 1953, the Cox Committee, in its "Final Report," noted the special importance of the social sciences in the contemporary world. It stated:

It is entirely possible that in a time when man's mastery over the physical sciences threatens him with possible extermination the eventual reward from the pursuit of the social sciences may prove even more important than the accomplishments in the physical sciences.⁸

⁷ "The Senate Ponders Social Science," *The Scientific Monthly*, Vol. 64, No. 5 (May, 1947), p. 399.

⁸ "Final Report" of the Select Committee to Investigate Foundations and Other Organizations, 82nd Congress, 2nd Session, House Report No. 2514, Union Calendar No. 801 (Washington: Government Printing Office, January 1, 1953), pp. 9-10.

Other important turning points in Congressional expressions toward the social sciences were the vigorous statements by Senator Estes Kefauver's Subcommittee on Juvenile Delinquency in 1955, 1956, and 1957; the 1955 recommendations of Representative Richard Bolling's Subcommittee on Economic Statistics of the Joint Committee on the Economic Report; Senator Hubert Humphrey's report to the Senate in 1957 of his experiences in the Middle East; and speeches by Senator Wayne Morse, Representative Charles O. Porter and others.⁹ This year neither house of Congress raised any objections to the National Science Foundation's request for \$2,000,000 for support of basic research in the social sciences in fiscal year 1960, even though this represented a considerable increase over the \$850,000 appropriated for this purpose for fiscal year 1959. (The actual budgetary allowance for social science research in the National Science Foundation for fiscal year 1960 is \$1,600,000.)

This is an encouraging picture, indeed. But Congressional confusion regarding social science has by no means been completely eliminated. Negative attitudes still persist and need to be reckoned with.¹⁰

WHITE HOUSE INTEREST

The White House, too, has shown increasing interest in the support of the social sciences. In his State of the

⁹ For details and references, see Harry Alpert, "Congressmen, Social Scientists, and Attitudes Toward Federal Support of Social Science Research," *American Sociological Review*, Vol. 23, No. 6 (December, 1958), pp. 682-686.

¹⁰ See, for example, *Independent Offices Appropriations For 1960*. Hearings Before the Subcommittee of the Committee on Appropriations, House of Representatives, 86th Congress, 1st Session (Washington: Government Printing Office, 1959), p. 527. For a discussion of persisting negative attitudes, see Harry Alpert, *op. cit.*

Union message delivered on January 9, 1959, President Eisenhower expressed his desire to undertake a systematic study of American values, goals, and social trends, comparable to the earlier Hoover Committee study.

The objective, President Eisenhower said, would be "the establishment of national goals that would not only spur us on to our finest efforts but would meet the stern test of practicality." He hoped that this new study would be concerned, among other things, "with the acceleration of our economy's growth and the living standards of our people, their health and education, their better assurance of life and liberty and their greater opportunities." He noted that the report of Hoover's Recent Social Trends Committee "has stood the test of time and has had a beneficial influence on national development." Here, indeed, is a significant compliment to social science.

And in its report on "Strengthening American Science," issued December 27, 1958, the President's Science Advisory Committee included social psychology among the scientific disciplines for which a strong case could be made for intensifying the nation's scientific effort. The Committee stated, "And advances in social psychology might help to reduce tension and conflict at every level of human intercourse—in our communities, in business and industry, in Government, and even among nations."¹¹ Furthermore, as previously noted, President Eisenhower has appointed a social scientist to the National Science Board. This policy-determining body for government science on January 23, 1959 adopted the following statement:

The National Science Board recognized the importance, as well as the complexity

¹¹ *Strengthening American Science: A Report of the President's Science Advisory Committee* (Washington: Government Printing Office, 1958), p. 4.

and difficulty, of research in the social sciences. It is clear that the intellectual, economic, and social strength of our Nation requires a vigorous approach to social problems, with scientific techniques of study making their maximum contribution.¹²

PROTECTIVE UMBRELLAS

The social sciences have prospered best in the federal government where they have been included under broad umbrella classifications of the scientific disciplines such as agricultural sciences, military sciences, medical sciences, and health sciences. Under such umbrellas and in close company with scientific areas which enjoy the prestige and status of biological or physical sciences, the social sciences have enjoyed a protection and nourishment which they normally do not have when they are identified as such and stand exposed, "naked and alone."

Agricultural research has been heavily supported by the federal government from its very inception. Quite early the concept of agricultural sciences was broadened to include not only biological research but agricultural economics and rural sociology as well. In fact, for many years the Department of Agriculture's Bureau of Agricultural Economics was internationally famous for its leadership in significant areas of social and economic research. Although from time to time specific social science projects of the Department of Agriculture have suffered Congressional attack, there has been little question of the legitimacy of the inclusion of social research in the scientific program of the Department. In fact, one appropriations committee, with remarkable indifference to the distinction between biological and social science research, once included, in a list of fields for

¹² Reproduced in *Congressional Record* by Representative Charles O. Porter, March 10, 1959, pp. A 1969-70.

which research funds were not to be expended, the orchids of Guatemala, the flora of Dominica, child-rearing practices, research methodology, and population dynamics.

The Medical Sciences and Health Sciences rubrics have also provided generous hospitality to the social sciences. Social science research projects are given careful and sympathetic consideration by at least five study sections of the National Institutes of Health: Behavioral Sciences, Hospital Facilities Research, Mental Health, Nursing Research, and Public Health Research. Social scientists serve as members of these study sections as well as on several other committees of the National Institutes of Health. The National Institute of Mental Health's Laboratory of Socio-Environmental Studies is outstanding in the quality of its research program.

Research undertaken by the military establishment in relation to the defense needs of the nation develops strong immunities to Congressional or other attacks if military authorities certify its importance to the mission of the Department of Defense. Despite the ups and downs previously referred to, the Army, Navy, and Air Force have arrived at a realization of the importance of basic research in the social sciences. The Office of Naval Research includes a Psychological Sciences Division. The Air Force has established a Behavioral Sciences Program in its Office of Scientific Research. And here is the testimony of an Army General presented recently before an appropriations committee:

We can never afford to neglect basic research and the Army wants to do more of it whenever we find applicable projects to further this increase of scientific knowledge. Such research is not confined to the physical sciences. Investigation of the social sciences to help us to utilize more effectively our manpower and insure man-

machine compatibility with complex engines of war being developed is vital. Should we neglect these important considerations we only aggravate the trend in which the physical sciences are outstripping the social sciences and may, in time, reach a point where the machine may destroy its maker.¹³

These are the words of Lieutenant-General Arthur G. Trudeau, Chief of Research and Development, Department of the Army.

Another important umbrella for the social sciences is Operations Research. The various operations research units supported by the federal government have invariably included a social science component.

IMPACT OF SPUTNIKS

The social sciences have not been indifferent to the whirl of the Russian Sputniks and have directly felt the impact of these successes in space technology. It was recognized that Soviet Russia's accomplishment was not only the result of advances in science and engineering but also the consequence of a social system that was capable of making and carrying out significant decisions. Interest developed in studies of the social, economic, and political implications of the space age. It became imperative that we keep ahead of the Russians in the social science fields. For this reason, Vice-President Richard M. Nixon encouraged the formation of a committee on National Support for Behavioral Science which reported on social science needs to the President's Scientific Advisory Committee. Substantially increased appropriations were made available to the National Science Foundation, and in the National Defense Education Act of 1958, Congress

¹³ *Department of Defense Appropriations For 1960. Hearings Before The Subcommittee on Appropriations, House of Representatives, 86th Congress, 1st Session* (Washington: Government Printing Office, 1959), p. 339.

officially declared as national policy the doctrine that the defense of this nation depends upon the mastery of modern techniques developed from complex scientific principles, and, as well, upon "the discovery and development of new principles, new techniques, and new knowledge."¹⁴

REDRESSING IMBALANCES

For a time, it looked as if only the natural sciences and mathematics would be the beneficiaries of the increased responsibilities of the federal government toward research and education. Programs were quickly organized to improve the quality of science teaching, to train more scientists and engineers, and to intensify the pace of research in the physical, mathematical, and biological sciences. It became evident, however, that the neglect of other areas of scholarship and learning would spell national disaster. The government's difficulties in international relations led to intensified interest in language study. Soon voices were heard calling attention to the need to redress the imbalances in American education which a predominant concern with the natural sciences and engineering was creating.¹⁵ Cognizance of this requirement is found in the newly released report of the President's Science Advisory Committee on "Education for the Age of Science." This report stresses the fact that, "Today in America we need a very wide variety of human talents."¹⁶ It goes on to urge that "a proper balance be maintained in our educational offerings."¹⁷ To achieve such a balance we

must encourage intellectual leadership in the humanities and social sciences as well as in the natural sciences and mathematics.

HEALTHY PROGNOSIS

The social sciences thus face the nineteen-sixties in an atmosphere of encouragement and with the active support of influential well-wishers. Research funds are becoming more plentiful. The federal government alone will soon be spending in the neighborhood of \$60,000,000 a year in support of the social sciences. This estimate does not include the \$100,000,000 or so that the Decennial Census of 1960 will cost.

MORE FELLOWSHIPS NEEDED

A major problem, however, remains. The most urgent need of the social sciences is expansion of the pool of available trained, specialized manpower. Recent studies have indicated that the length of time required to obtain the Ph.D. degree is strongly influenced by the availability of financial support to graduate students in the form of assistantships and fellowships. It is here that the social sciences, and humanities, too, are most seriously disadvantaged vis-à-vis the natural sciences. The major bottleneck in the advancement of the social sciences is not research funds, but fellowship and scholarship opportunities for basic and advanced training. If the social sciences are to fulfill the general public's expectations of them, they must double, at least, the number of trained practitioners. To make the training process more productive and more effective, however, additional fellowships and other types of financial support for training are an imperative and critical necessity. Title IV of the National Defense Education Act has been extremely helpful in this regard. Almost a fourth (23 per cent) of the first 1,000 graduate fellowships

were awarded in the social sciences. The various training programs of the National Institutes of Health also provide valuable opportunities for social science education. But more needs to be done. The National Science Foundation, for example, has the basic legislation to include the social sciences within its "Education in the Sciences" program. It also has reasonably adequate funds for training and education. It has broadened its conception of the social sciences in its research support program. Only administrative nearsightedness prevents it from giving the social sciences, broadly conceived, their deserved place within the various program activities of its Division of Scientific Personnel and Education.

COMPLACENCY TO BE AVOIDED

We can be proud of the achievements of the social sciences in government, but we cannot afford to be complacent. Certain past mistakes must be avoided: premature promises, excessive expectations, hasty growth, disastrous indifference to the political process, unwarranted impatience with the administrative processes of justification and review, and lack of concern with

the public image of the social sciences. By careful planning and effective operations a solid basis can be established for future growth.

Advance in the social sciences will depend most immediately on what in fact social scientists do: how well they teach at the undergraduate level, how well they communicate with the general public, how effectively they respond to calls from industry and government for help in resolving practical problems, and how much they devote to fundamental research. It depends also on their willingness to cultivate patience and humility.¹⁸ Charles Dollard has well defined the problem: "The long-term contract of the social scientist with society is not to perform miracles but to bring to the study of man and his problems the same objectivity and the same passion for truth which have in the past given us some understanding and control of the physical world."¹⁹

Special Problems of Military Research and Development

BY WILLIS H. SHAPLEY

ABSTRACT: Many of the problems of military research and development are not special, either because they are common to other comparable research and development programs or because they are common to other parts of the military programs. The military programs are concerned with research, but the main emphasis is on development and on the entire chain of activities necessary to improve the capabilities of the operational forces. The magnitude and complexity of the programs are tremendous; these factors, particularly the complex nature and interrelations of their objectives, are at the root of most of the problems of military research and development. The basic organizational problem is to find a way to centralize responsibility for the crucial decisions involving selections among alternative military capabilities and technical approaches, while at the same time decentralizing detailed management to allow a maximum of freedom and flexibility in the actual conduct of research and development work. The problems of military research and development culminate in the budget process. Making the proper allocation to military research and development within the over-all limitations and distributing this amount to individual research and development projects are the most difficult problems of our time.

Willis H. Shapley, Washington, D. C., is a graduate of the University of Chicago. At the present time his title is Chief of the Air Force Section of the Military Division, Bureau of the Budget, where he has served since 1942. His responsibilities include, in addition to budgetary matters related to the Air Force and the National Aeronautics and Space Administration, general responsibility on a Bureau-wide basis for matters relating to military research and development. In 1956 he received a Rockefeller Public Service Award.

PARADOXICALLY, the most useful way to open a discussion of the special problems of military research and development seems to be to consider the contrary proposition that there are no special problems of military research and development. Two principal lines of argument can be advanced to support such a proposition, and while they may not in the end be fully convincing, they carry a large measure of truth and will serve to put into perspective the problems of military research and development, be they special or otherwise.

One can argue with some cogency that what appear to be special problems of military research and development are, for the most part, problems in non-military research and development as well, and that they become identified with military research and development because their counterparts in nonmilitary research and development are not so conspicuous or so well publicized. The many problems resulting directly or indirectly from the sheer size and complexity of the military research and development programs cannot be fairly charged either to the military content or to the military environment of the programs. Corresponding problems of large-scale administration exist in varying degrees in the larger nonmilitary programs, and the same bureaucratic frustrations for which the military agencies are traditionally blamed are all too often encountered in civilian government agencies, in industry, and even in universities. Shortages of first-rate scientific and technical personnel are a continuing problem for nonmilitary and military programs alike. Even some of the problems scientists have with military secrecy and security have counterparts in proprietary research in industry. The counterpart of wasteful interservice rivalry is usually called healthy competition.

Taking a different approach, one can make a strong case that many of the problems of military research and development are not peculiar to research and development, but are manifestations of broader problems of military policy or management. The difficult problems that arise from the interplay between technical possibilities and military requirements are fundamental problems of military planning, and involve strategy, tactics, and logistics as well as research and development. The budgetary problems of military research and development are a part of the broader problems involved in the total military budget, both in the determinations of the total amounts and in the decisions on complicated and interrelated details. Instances of duplication and confused or overlapping jurisdiction in military research and development are for the most part the result of deeper problems of roles and missions and arise from inherent complexities in the variety and interdependency of military requirements. Problems of administrative competency and technical qualifications and training of military personnel are not limited to the research and development area. The reluctance to discontinue programs which have passed their period of usefulness, one of the principal present problems in military research and development, was also evident in the persistence of the cavalry and the battleship.

Considerations such as these do not prove that there are no special problems of military research and development, but do suggest what is perhaps the main conclusion of this article, that the principal problems of military research and development in the United States are either inherent in the conduct of a large-scale organized research and development effort or, more importantly, the consequence of the dynamics and dilemmas of the broader problems of

national defense we face today and in the years ahead.

RESEARCH AND DEVELOPMENT

It is advisedly that we are speaking of research and development, not just research. The spectacular and well-publicized successes of scientists in World War II and the importance which has rightly been attached to establishing broad and continuing support for basic research have occasionally had the effect of distracting attention from the importance of development, and have created somewhat the impression that scientific research by itself produces national or military strength. It has long been customary to justify additional expenditures for basic research on the grounds of its contributions to national strength, and more particularly, except perhaps in the medical field, to national defense.

At the same time it is fashionable in scientific circles to deplore the large sums going into development, especially for military weapons and equipment, and to urge a redistribution of budgetary wealth in favor of more research. This suggestion may have merit in particular cases, but the notion that there should be more emphasis on research and less on development as a matter of principle is clearly fallacious. To the extent that research is justified by possible practical applications, military or other, the role of development must be recognized, not as a menial adjunct to the higher efforts of pure science, but as an equally essential link in the chain of achievement.

In military research and development, the primary concern is with development, but the chain does not stop there. Newly developed weapons and equipment must be tested and evaluated, both for technical performance and for suitability for use by military units. Appropriate tactics and employment concepts

must be evolved; combat troops and maintenance personnel must be trained in the intricacies of the new equipment; and sufficient quantities must be produced for deployment or stock-piling. And there are other vital links at the other end of the chain. Operational military requirements must be carefully analyzed in the light of technical possibilities and possible countermeasures within an over-all strategic framework. Before specific development can begin there must be design and feasibility studies.

In all this effort, scientific research plays an important and essential role in providing new knowledge, ideas, and techniques. It is a necessary part of the process, but not sufficient to achieve the goals. In an important sense, the prime problem of military research and development is to make the entire developmental process work from pure research and analysis to practical operational equipment in the hands of trained troops.

MAGNITUDE AND COMPLEXITY

The magnitude and complexity of the present military research and development programs are difficult to comprehend. Using dollars as the most convenient yardstick, one can identify a total of almost \$6 billion of the Department of Defense fiscal year 1960 budget as going for research and development expenses of one sort or another, including expenses of the directly related activities of test and evaluation, but excluding production of new items for equipping and training operational forces or for stock-piling. This total—more than one-seventh of the total military budget—can be regarded, in round numbers, as being made up of about \$700 million for research, about \$4,800 million for development, including test and evaluation, about \$200 million for pay and allowances of military

personnel, about \$150 million for construction of facilities, and another \$150 million set aside as an emergency fund for unforeseen requirements in the research and development field.

In addition to all this, substantial but hard-to-define portions of the research and development activities of the Atomic Energy Commission and the National Aeronautics and Space Administration are essential parts of or directly support the military research and development programs. In total, military research and development currently accounts for approximately 80 per cent of the government's total annual outlay for research and development, and provides the financial support for a little over one-half of all the research and development in the United States.

Some aspects of the complexity of this vast effort on military research and development can be seen in the scope and variety of the activities it encompasses. There is basic research in almost all branches of the physical, engineering, life, and behavioral sciences, including theoretical work, laboratory research, and large-scale experiments, such as those involving high altitude balloons, satellites, or polar expeditions. There is applied research and technical development in almost every field of technology—metallurgy, electronics, propulsion, and so on—so various are the requirements and problems of the military development programs. The development programs themselves cover thousands of different kinds of items, ranging from prosaic but vital improvements to paints and preservatives to fantastically complex aircraft, missile, and electronics systems. Test and evaluation programs may, at one extreme, involve only simple, small-scale tests on a shake-table in a laboratory; at the other extreme, the test and evaluation of each new type of aircraft and missile requires a major manufac-

turing effort to produce dozens of costly test articles and the use of elaborate test facilities and ranges stretching as much as a quarter of the way around the world.

Then there is the great variety in the methods by which military research and development activities are carried on. There are many different types of government laboratories, development centers, and test installations, some operated directly by the government with civil service and military personnel, others by operating contractors, and a few by a mixture of both. All sorts of industrial concerns, universities, and other private institutions perform military research and development by contract. There are many different kinds of contractual arrangements, and the contracts themselves range all the way from a few thousand dollars for several months of theoretical research by one or two university scientists, to hundreds of millions of dollars a year for the development of a major weapons system by a prime industrial contractor with a whole host of subcontractors and associates.

OBJECTIVES

However, the most complex aspect of the military research and development programs lies in the relationships of these programs to their objectives. This type of complexity is at the root of most of the problems of military research and development.

In general, the ultimate objective of the military research and development programs is to provide or enhance military capabilities in support of national military policy. This is easily said; the difficulties arise in translating such a general statement into specific objectives for individual research and development programs. The ends of national military policy are not always clear, change

from time to time, and are often controversial.

Even if one assumes general agreement on certain basic objectives—such as (a) maintaining an offensive and defensive military posture that will deter a Russian attack on the United States or its allies and (b) maintaining an adequate capability for dealing with limited war situations that are likely to arise—the range of possible objectives of military research and development is not appreciably narrowed. Many different types of military capabilities can contribute to each of these basic objectives; many different kinds of weapons systems can be conceived to provide each type of military capability; and many different technical approaches can be followed in developing each kind of weapons system. Each weapons system development presupposes or requires the development of components; the development of components depends on general technical development; and technical development in turn is based on principles and possibilities that have emerged from applied and basic research.

For these reasons, the objectives of the thousands of separate projects in the military research and development programs cannot be simply and directly related to national policy objectives. In the case of the development programs, the projects fall into groups comprising alternative technical and military approaches for the same or related objectives. At the research end of the spectrum, it is more a matter of attempting to anticipate the nature of future developmental requirements and choosing the lines of basic and applied research which appear most likely to uncover technical possibilities of future military significance.

Thus the establishment of objectives for both research and development involves difficult problems of selection

among alternatives which themselves are seldom clear-cut. The fact that the entire complex of interrelationships is continually changing as time goes by—with changes in the international situation, intelligence estimates, military requirements, technical evaluations, scientific knowledge, and so on—further complicates the problems of selection and creates the need for continuous reappraisal of the relative contributions the various projects can be expected to make to the ultimate objectives. To working scientists and to enthusiasts for particular programs, the repeated reappraisals and the resulting frequent changes in programs and objectives often seem to be an unnecessary bureaucratic harassment, but from the standpoint of the management of the programs as a whole, they are a painful necessity.

ORGANIZATION

One of the most serious problems raised by the size and complexity of the military research and development programs is how the effort should be organized. It is obvious that so large an enterprise cannot, as a practical matter, be planned and administered in detail from one central point, such as the Office of the Secretary of Defense. It is also clear that to promote and secure the advantages of initiative and imagination on the part of creative scientists and engineers, a high degree of freedom and flexibility should be allowed to laboratories and other organizational levels directly concerned with actual scientific research and specific development projects.

These considerations point in the direction of a highly decentralized organization. The answer is not so easy, however, because, as we have just seen, military research and development is so much a matter of selecting among alternative approaches. The judgments in-

involved in making these choices, and the appraisals of the relative importance of the military requirements on which they are based, cannot be made unilaterally by people or organizations that are directly concerned with only a part of the problem and are not in a position to appraise all of the alternatives in relation to the pertinent over-all policy considerations.

The complexity of the program, sketched above, is such that to be made properly many of these decisions have to be made, or at least carefully guided and reviewed, at very high levels in the hierarchy—at the headquarters levels of the military departments, for example. With the increasing variety of alternative technical possibilities cutting across the historical organizations and missions of the Army, Navy, and Air Force, the situation is developing more and more to the point where almost every significant technical program choice or decision has ramifications which transcend any one military service, and thus requires appraisal, decision, and perhaps active direction or co-ordination from the broad central point of view of the Office of the Secretary of Defense.

This is the organizational dilemma. Too much central direction will lead to an impossible bureaucracy that would stifle progress. Too little central direction will permit competing alternative programs to run wild on a unilateral basis. Scientific discoveries and technological break-throughs cannot be decreed by the Pentagon, but, on the other hand, crucial national decisions on choices among weapons systems should not be left by design or default to those down the line who have less than the full scope of responsibility and competence for making them.

In theory, the answer is obviously to centralize only the decisions that have to be made at the top and decentralize

everything else. The practical difficulty is that merely to identify on a current basis the problems that need to be resolved at the top requires a complete and continuing review of the entire program on a fairly detailed basis. The central staff organization required for these purposes is necessarily large, and inevitably gives rise to knotty problems of internal organization and co-ordination of the central staff itself. These problems are formidable and discouraging, but should not be forever insurmountable. It is to be hoped that the evolution of the office of the Director of Defense Research and Engineering, established by the Department of Defense reorganization act of 1958 as the latest attempt to improve central leadership and control of military research and development in the Department, will demonstrate that a balance can indeed be achieved which will give at the same time both more effective central control of major decisions and more decentralized responsibility for detailed management and actual conduct of research and development work.

Role of civilian agencies

The question is sometimes raised whether it would not be better to have military research and development performed by a civilian agency outside the Department of Defense. The success of the Office of Scientific Research and Development (OSRD) during the Second World War, the contributions made over so many years by the National Advisory Committee for Aeronautics, and the present important role of the Atomic Energy Commission can each be cited as different ways in which significant aspects of the military research and development program have been carried on by civilian agencies.

It will never be possible to re-create the environment in which the Office of Scientific Research and Development

made its contributions. It is no longer a question of mobilizing science for defense purposes—the present annual peacetime level of effort is already much greater than the total of all OSRD expenditures during World War II—and it is doubtful whether in any future major war we will have the time and safety to do research and development on weapons and equipment that will influence the outcome.

The success of both the Atomic Energy Commission and the National Advisory Committee for Aeronautics in operating large government-controlled laboratories is at least partly attributable to their civilian setting. At the same time, the fact that each of them has operated in areas of specialization which, while highly important, are relatively narrow compared to the total range of military research and development activities, has kept the task of co-ordination with the purely military programs within manageable limits. By contrast, the National Aeronautics and Space Act of 1958 did not give the new National Aeronautics and Space Administration a clearly defined role in relation to the "space" activities of the Department of Defense, and the initial experience has been that the problems of co-ordination have tended to offset the hoped-for advantages of a separate civilian agency.

The establishment early in 1958 of the Advanced Research Projects Agency as a civilian organization within the Office of the Secretary of Defense represents a new approach which provides a mechanism whereby military research can be done under full control of the Department of Defense but without assigning it to any one of the three military departments. It is too early to say whether a new pattern is being established or to appraise its merits, but it seems clear that the future evolution will be in the direction of centralizing

responsibility for military research and development in the Secretary of Defense and his Director of Defense Research and Engineering.

For the foreseeable future the importance of close integration of military research and development with other aspects of the military programs and the need for authoritative central determination of military research and development objectives will undoubtedly outweigh the advantages that might be gained through the establishment of a separate civilian agency for military research and development.

THE BUDGETARY PROBLEM

Of all the problems of military research and development, the ones that generate perhaps the most controversy and confusion are those that involve, in one way or another, the budget. To some, these all seem to boil down to a very simple problem with a very simple answer: not enough money is the problem, and more money, the answer. Of course, one of the basic budgetary problems is always the question of how much money is enough, and the answer always at some point comes down to a matter of judgment. But the question seldom if ever arises in such simple terms, and the most difficult problem of all is to identify the areas where such judgments have to be made and to define the problems in such a way that the relative merits of each claim for money can be evaluated. This, of course, brings us back to the problems of reappraisal and selection discussed above.

An important point, which is often lost sight of and misunderstood, is that the apparent preoccupation with budgetary problems at all levels of the military research and development program does not stem from an exaggerated concern for money, economy, or book-keeping as such, but from the fact that virtually all of the substantive and pol-

icy problems of the programs necessarily have significant budgetary implications. Budgetary decisions are one of the principal regular administrative mechanisms for making substantive program decisions.

This is not to say that financial limitations do not play an important part in the budgetary problems of the military research and development programs. Over-all limitations on the total budget do in fact exist at any given time, and even though they are not necessarily expressed as rigid ceilings in specific dollar amounts, they have to be taken as the framework within which the forward planning of all federal programs, civil as well as military, proceeds.

As a practical matter in the development of the federal budget, once the general magnitude of the over-all totals has been tentatively determined—a major decision of national policy based on consideration of the urgency of the demands on the budget and the economic and political implications of prospective alternative budget totals—it is necessary to establish tentative planning figures for the principal agencies, including the Department of Defense. These planning figures guide the preparation of detailed budget proposals which show the impact on the programs of the assumed planning figures and permit the consideration of alternatives, including, if necessary, reconsideration of the initial planning figures themselves.

Impact of limitations

In this situation, it quite naturally seems inconceivable to the managers or proponents of any single military research and development program that it is really their project that has to suffer in the budget decisions. It is

hard for them to see why their sometimes quite modest requirements cannot be met by a slight adjustment in other programs without changing the planning totals, or, failing that, why the economy of the country would be ruined by such a relatively small increase in the over-all totals.

It is true that the immediate impact of any particular budgetary restraint can be alleviated either by "robbing Peter to pay Paul" or by a decision to increase the total by the amount required. The first course merely results in a different set of decisions in the selection process. The second represents a chipping away at the economic and political judgments which led to the planning figures in the first place, and the question of how rigidly they are to be adhered to is again a matter of economic and political judgment.

But neither course will satisfy all claimants, especially in the military research and development programs. The almost unlimited proliferation of military requirements and technical approaches, together with the inexorable increases in cost as projects move from research into development, will conspire to generate pressures for additional funds within any foreseeable plausible total budget. The distribution of the total budget between military and non-military, the division of the military budget as between research and development and the other essential costs of national defense, and finally the selective allocation of research and development funds to the myriads of individual projects, taken together, constitute one of the most formidable and awful problems of our time, and one which should command the best efforts of the officials and scientists who have to deal with any of its many ramifications and the sympathetic understanding of the public.

Budgeting for Science: Presidential Responsibility

By WILLIAM D. CAREY

ABSTRACT: "Science," as it is categorized without verbal exactitude, is a new and troublesome concern of the Presidency. Executive oversight of science as it impinges on public policy is in part exercised, and can be appraised, in the context of budgetary decision-making. Political scientists will find it rewarding to ponder the adequacy of the Presidential machinery for evolving science policy and balancing priorities within the discipline of the federal budget. Can the scientific community reasonably look to the federal government for the degree of sufficiency, stability, and venturesomeness of support which it seeks, given the competition of other urgent public needs for budgetary sustenance? Upon reflection, the institution of the Presidency for choosing priorities and tackling vexing technological questions is found to contain reassuring strengths. At the same time, preoccupation with the snarled traffic of relentless decision-making leaves unresolved a number of basic, long-term problems in the design of the relationship of science to government.

William D. Carey, Washington, D. C., is Executive Assistant to the Director of the Bureau of the Budget. A graduate of Columbia University, he went on to do post-graduate work in public law and government at Columbia and later at Harvard University, where he was a Littauer Fellow. His entire government service has been with the Bureau of the Budget. He has served the Bureau in various capacities, including, Chief of the Labor and Welfare Division (1952-58), Chief of the Commerce-Maritime Branch of the Estimates Division (1949-52), and Chief of the Atomic Energy Unit (1946-49).

LAST May, before a blue-ribbon audience of scientists and business and philanthropic leaders gathered at the Waldorf-Astoria, the President prefaced a major address on science with the greeting: "Fellow Innocents." Though said in jest, the words were indicative of the problems of the Presidency in establishing the rightful place of science as a new and at times bewildering partner of the national government.

Few aspects of public policy afford such tantalizing opportunities for exploration and discovery as the interaction of government with science and technology. We are still on the fringes of understanding the significance and future implications of this trend. We are, indeed, fellow innocents.

Popular attitudes cloud rather than illuminate the government's search for a comprehensive policy toward its role in science. When science is viewed as an all-absorbing investigation of the basic nature of man's environment, it plays to nearly empty seats. But if science is a subpolar pageant, or a multi-million-dollar effort to hurl a mouse into outer space, it acquires a curiously high value. The distinctions between science and technology, between research and spectacular demonstration, are still unclear, and so they are all vaguely fused into "science." The beginning of wisdom would necessitate defining some terms.

FEDERAL SUPPORT OF SCIENCE

Budgeting for science (and technology), like all budgeting, is an art of making choices, hopefully if not precisely conforming to the scale of contemporary social values. When the desirable equilibrium between resources and requirements is lacking, or, more baldly, a shortage of funds exists to satisfy all petitioners, this process of choosing becomes a very considerable undertaking. In the national govern-

ment, the institution of the Presidency assumes much of the responsibility for the fiscal decisions which determine the direction and distance of public policies. The Presidency has, accordingly, been a target for criticism on the part of those who have felt, at one time or another, that the budget did not provide enough support or assurance of stability for science.

How much support is "enough"? That is a question by no means the monopoly of the advocates of science. It has been raised in every area of public policy, and will always be raised because the nature of budgeting produces what might be called a fiscal law that dissatisfaction shall be distributed uniformly. As for "stability," no one can be against it as an objective to be pursued, but the fact must be faced that when science becomes an instrument of public policy, it serves an essentially unstable master. To seek optimum stability through so dynamic and unpredictable a device as the budget, is to expect more than it can deliver. In such a setting, science runs some calculated risks which are basic to the political process. The same public opinion which urges greater scientific and technological achievement is capable of simultaneously demanding economy in government, along with tax relief.

The inescapable fact is that the policymakers in the national government, including those in the executive branch, have no special intuition to guide them toward absolute values where science and technology are concerned. Science, Dr. Vannevar Bush has said, is "the endless frontier," and it follows that any level of budgetary support is at best only relative justice. Like everything else associated with the equities of budgeting in the national government, the claims and aspirations of science must run the gauntlet of relative priorities in a setting of acute competi-

tion for funds, and under the handicap of a "language barrier." At the same time, we cannot view the role of science and technology in our affairs by the comparatively simple standards of an earlier and less complex era.

All things considered, science and technology have not fared badly in the budgetary sweepstakes. Only two decades ago, federal support for all science was at the level of 100 million dollars annually. In the budget for fiscal year 1960, a special analysis reveals that expenditures under the head "research and development" will reach 5.5 billion dollars. Of course, these are not wholly comparable figures, but they do have comparative meaning. The clue to all this prosperity is, of course, suggested by the fact that over four-fifths of the 1960 amounts are directed primarily to the needs of national security, and the totals are heavily distorted by the fantastic costs of hardware development.

Even so, the blush is not entirely off the rose. The same budget analysis brings out the additional point that at present the federal government supports about half the research and development of the nation. "Science" is doing very well at the hands of government, if the aggregates can be taken at their face value.

But can they be? Do the sheer weight and built-in fertility of research and development effort on this scale really control the final totals which appear in the budget, or is there an apparatus of decision-making which lends a reassuring tone of deliberate choice and validity to the astronomic results?

"Reasonable austerity"

Even the scientific community itself is not wholly without apprehension in this regard. While its general tendency is to rejoice in the latter-day miracle of the loaves and fishes, an occasional dissenter rises up with a minority report.

Such was the case at a recent symposium on basic science, when Dr. Merle Tuve of the Carnegie Institution of Washington spoke of the dedication to pure research which characterized those private research institutions established many years ago "when there was less financial and technical exuberance, with regard to the support and administration of research effort, than we see all about us today." And he observed that "suitable provision for the recruitment (of the lively individual investigator) and his welfare and increase in his number is unquestionably of much greater importance than the provision of spectacular facilities carefully calculated in tons and dollars by the business men and politicians of science surely to outdo the Russians in the same field."¹

Dr. Tuve then proposed the guideline of "reasonable austerity" to protect the researcher from becoming a manager or "big operator." As Merle Tuve explained:

Austerity as an essential requirement for creative research may sound harsh and out of date to most of the big operators and many of the young technical men in research today. For our discussions, however, I wish you would just recall to yourselves some of the examples of finished basic research which you most honestly respect and then answer the austerity question silently for yourself. . . . The undeniable fact is that creative work is nearly always done with limited resources and under difficult conditions. I suggest that this austerity is to a considerable extent a necessary discipline for the critical faculty and a basis for the Spartan choices which must be made by the investigator as to emphasis and deletion in the course of any basic research. . . .

¹ "Basic Research in Private Institutes," Carnegie Institution of Washington, preliminary draft of paper read to the Symposium on Basic Research, New York City, May 15, 1959.

This is quoted at some length, though only in capsule, not as an illustration of the majority view but, to use Dr. Tuve's own words, as "a little mustard." It is the sweet relish, however, that is more popular. Spartan austerity is possibly an acceptable abstraction to which many would subscribe but few would be prepared to embrace, in or out of the scientific fraternity.

DECISION-MAKING PROCESS

It is inevitable that as the costs of research and development assume large and increasing proportions, while federal fiscal policy attaches a central importance to balanced budgets, the criterion of budgetary priority looms larger in the decision-making process. This is true not only in the vast and troublesome area of weaponmaking, but even in the "austerity" zone of basic research. For example, some of the most tempting adventures in basic science are to be found in the field of high energy physics, but it is a costly path to follow when the instrumentation turns out to be a two-mile linear accelerator the construction price of which is more than 100 million dollars, to say nothing of annual operating expenses.

This illustration affords us a useful peep-hole into the anguish of decision-making. Here is only one facet of basic science, albeit a strategic one. The entire scale of government-supported basic research is in the vicinity of one-half billion dollars, if the statistics can be trusted to yield a credible measurement. Across the wide spectrum of the subject matter of basic research, the plea is made for greater support. Possibly, the fertilization of the entire area through spreading another 100 million dollars would provide a massive tonic to American science. Would this be a wiser application of scarce tax dollars than a rifleshoot investment of so much in a single instrument, of speculative ur-

gency, for high energy physics alone? To the lay administrator, the answer could seem obvious. But the lay administrator must not forget that he is an innocent. His views are weighed, along with those of the scientists. The decision to underwrite the project is forthcoming only after a blend of scientific opinion is formed and the need for leadership in a critical area of proficiency is apparent. It may well be the right decision. In any case, the circumstances illustrate the heavy and not always black-or-white choices which are submitted to the Presidency.

But the decisions arising in the area of military weapons development are of an even higher order of difficulty. The adoption of missile-type weapons by the three branches of the services, each branch conscious of its missions, has necessarily led to some profusion of missile systems and incidentally to the identification of status with competing missile programs. To complicate the situation, extensive private contractual interests are involved in the ultimate fate of each of the weapons systems. To bring order out of such a complex, without committing serious error, constitutes one of the most severe modern tests of Presidential management, as well as one of the most thankless.

Presidential aids

An extensive managerial apparatus has evolved gradually to aid the President in dealing with these problems. Within the Department of Defense, responsibility has been focused in a Director of Defense Research and Engineering who advises the President from one tangent while the Joint Chiefs of Staff advise him from another. In the field of space technology, the President is guided by the new National Aeronautics and Space Council, comprising the heads of the military and civilian agencies with an interest in the subject matter. The

broader field of general-purpose research and development is gradually being brought into perspective through the Federal Council on Science and Technology. Ranging across the entire military-civilian complex, as the chief agent and adviser of the President, is the Special Assistant to the President for Science and Technology.

But except for the Special Assistant to the President, the role of the consultative bodies is essentially that of agreeing on goals and needs, and defining agency jurisdictions. They do not, and probably could not, due to the well-known limitations of interagency consultative mechanisms, undertake the evaluative process of selection and decision on the particular merits of individual scientific or technological efforts within their limited funding capabilities. Nonetheless, they perform a positive role in the larger structuring of executive management, planning, and co-ordination. The newly created Federal Council on Science and Technology has contributed a great deal, for example, to the over-all understanding within the executive branch of the needs and opportunities for research in the fields of oceanography, basic materials, and meteorology.

The evaluative, or critical, role at the Presidential level is performed in large part by the Bureau of the Budget and the Special Assistant for Science and Technology. In the case of the Bureau, this role is deeply rooted in its institutional character as it has evolved under successive Presidents. The Bureau has developed to a high degree the art of critical examination, and although its skills are predominantly nonscientific, the techniques and processes it employs have been shown to be applicable to the President's decision-making role in science and technology.

Nothing could be more natural in a complex government than to employ the

budget process to facilitate decisions for the President. In a way, the budget is a digestive organ with financial limitations on how much can be fed into it. In federal management practice, the budget is the arena of deliberate decision, and the function of budgeting carries with it the corollary of unlimited examination of expenditure requirements.

Budgetary Process

A rare glimpse of the Bureau of the Budget's technique of challenge was afforded in the printed record of hearings held on May 20 and June 17, 1959, by the Preparedness Investigating Subcommittee of the Senate Committee on Armed Services. The subcommittee had before it the Director of the Bureau, and was questioning him on the extent of the Bureau's role in determining the defense budget for fiscal year 1960. In explaining the Bureau's doubts as to the justification for certain expenditures on missile programs, the Director's testimony was as follows:²

Now with respect to the three programs, Atlas, Titan, and Minuteman, our projections indicated that the financial implications over the years 1959 to 1962, inclusive, that is 4 fiscal years, amounted to almost \$7 billion for those programs. Now our question was do we get \$7 billion worth of value in developing all three of these programs? First of all, there is the protective factor of the SAC Force and the other striking forces in being and the other programs under development, including Polaris.

Now Atlas, however, is our earliest available ICBM capability. It has presumably less growth potential than Titan, it may be quite vulnerable to surprise attack under certain conditions. Titan at that time was

² Testimony of Maurice H. Stans, Director of the Bureau of the Budget, Hearings, Preparedness Investigating Subcommittee of the Committee on Armed Services, U. S. Senate, May 20 and June 17, 1959 (Washington: Government Printing Office), pp. 231-32.

far less developed. It was entering a crucial period of flight testing. It appeared to be, from what we could learn, the most formidable of the ballistic missiles that were being planned.

On the other hand, it was going to be very expensive, and if it were succeeded promptly by the Minuteman, the question was whether it represented an expenditure that would be justified, and whether our defense would be adequate without it.

As a liquid-propellant system it involved major problems of maintenance and readiness, and while the introduction of storable propellants was feasible, that still involved a considerable amount of research and development.

There was some concern on our part as to whether there was an indication of slippage of the capability dates of Titan, and if that were the case, then it would even narrow the time period between the successful Minuteman and the introduction of the Titan.

On the other hand, Minuteman was in a very early stage of development at the time of our budget consideration. Once it was successfully developed and in large-scale production, it would be the least expensive of the deterrent systems. It would require a minimum level of maintenance. It would be much easier for Minuteman to be hardened and put underground.

However, we were not quite certain that the development of the Minuteman could be successfully accomplished with the level of costs estimated by the Air Force. Or whether or not the timetable could be wholly relied upon. And finally, we had no estimate of the cost of hardening the Minuteman system that we could rely upon.

Now, we took all of those things into consideration and suggested that consideration be given to these three alternatives:

First, phase out the Atlas program as rapidly as possible, relying on manned bombers until the availability of the Titan and the Minuteman. Alternatively, continue the Atlas program as currently planned to provide that initial intercontinental capability, cancel the Titan, and

proceed with the Minuteman on a rapid but orderly basis. Or third, continue the Atlas program but with some reduction in the number of squadrons, continue the Titan program with a relatively small number of squadrons but still adequate to provide a heavy striking power, and at the same time proceed with Minuteman on an orderly basis.

Now those are the questions we raised. Those are the factors we developed and discussed with the Secretary of Defense. And from there he, with the advice of the scientists that were involved in the programs, and with the President, came to the conclusion that now appears in the budget.

From the sequence of thought described by the Director in the foregoing instance emerges the function of "staffing" of a difficult budgetary problem in the light of the significant factors. This function of the Bureau has come to be valued by all modern Presidents. The final decision is that of the President, but the quality and relentless tenacity of the staff work of the Bureau continue, in the era of "exuberance" in science and technology, to figure prominently in the final outcome.

Science Advisor to the President

Of more recent vintage, but overriding all else in terms of its impact on the changing character of the Presidency, is the role of the Special Assistant for Science and Technology. Born of the incredulous national reaction to the Soviet success in launching the first earth satellite, the office of the Special Assistant has grown in less than two years to a level of status and effectiveness that has little, if any, precedent.

The reasons are diverse. First of all, the traffic of science and technology into the circle of Presidential decision is heavy enough to sustain a full work program for the Special Assistant. Secondly, the President has made it unmistakably clear that the Special Assistant

for Science and Technology is his right-hand man in his assigned area, and that he speaks on behalf of the President. Thirdly, the President has assigned a positive responsibility to the Special Assistant for leadership in strengthening United States science and the federal government's part in it. Finally, the first incumbent of the position has demonstrated the personal qualities of vigor, energy, and capacity that the situation has required, while at the same time he has successfully created a *modus operandi* with the heads of government departments and agencies. In addition, he has had the benefit of diligent work on the part of a Science Advisory Committee, comprised of many of the country's ablest educators and scientists. While the natural tendency of the student of administration is to doubt the workability of unattached special Presidential assistants, the history of the Special Assistant for Science and Technology, on all counts, runs to the contrary.

In a recent address before the National Press Club—itsself a significant indication of the stature of the office and its occupant—the departing Special Assistant has given his estimate of the role of a high level adviser to the President on science and technology.

In his remarks,³ Dr. Killian recognizes the role of the President in motivating effective staff work.

Let me first express some unabashedly enthusiastic sentiments about my experience. I have derived deep satisfaction from working for the President. I have always found him to be an *enthusiasm amplifier*, and always interested in scientific and technological developments. I have never been in to see him, nor has the Science Advisory Committee, without coming out with a sense of lift and renewed zeal—and usually, I might add—some new task or as-

³ Remarks of Dr. James R. Killian, Jr., Special Assistant to the President for Science and Technology, at the National Press Club, July 7, 1959. Washington, D. C.

signment. He is persistent in his desire for information—the rough with the smooth. If his science advisers at any time have not advised, it was not because he failed to afford them the opportunity.

Relationships with Scientists

In Dr. Killian's estimation, the real significance of his assignment has been the "creation of a new and more useful relationship between science and government at the policy-making level." As proof, he declares that government has more readily secured the services of the country's scientists, who have responded with enthusiasm. It is a revealing observation, suggestive of the disposition of citizens not only in science but in other occupations to absent themselves from the wedding feast unless and until the summons is delivered by a courier of their own persuasion. Perhaps this is harsh, but the difficulties of the President in securing skilled help are too well known to require elaboration. To the extent that Dr. Killian has moderated the problem with respect to science and technology, the benefits are considerable.

In Dr. Killian's view, moreover, there now exists a larger universe of reciprocal understanding between the scientist and the public official.

... It is now easier for the policy-maker to get the scientific input he needs in his policy-making and to use it with confidence. The generalist and the specialist, the administrator and the scholar, have devised better ways of matching impedances, of working together, each respecting the other's domain and special talent. The scientists have learned to relate themselves better to policy-making without stepping out of their objective role as scientists. The scientists have been able to observe at first hand the way in which many decisions, even those with a large technical content, turn on factors other than technical—social, diplomatic, economic, military, or political. Thus, the policy-makers better understand

the role of science in many policy decisions and the fact that these decisions can go wrong if the scientific component is overlooked or wrongly handled. There has also been a growing understanding that scientific method and analysis, contrary to popular opinion, do not always yield a single, mathematically exact, incontrovertible answer; that the scientist and engineer, however objective and competent, must sometimes be limited to dusty answers or multiple answers when policy-makers are "hot for certainty."

With these observations, the present writer categorically concurs. Whether the particular issue has arisen in any one of the possible contexts of basic research, applied science, or weapons development, the role of the Special Assistant for Science and Technology has been effective as interpreter and mediator between disagreeing parties, as a mechanism for developing new approaches and needed facts in the framing of policy decisions, and as a helpful device for appraising research needs against the stern facts of budgetary life.

Although Dr. Killian has not expressed it in these terms, the elevation of science and technology to the level of the Presidential office has tended to mature the political responsibility of the scientific community. Scientific advice has now been stitched into the fabric of statesmanship, and with the success of the coup, so to speak, the revolutionary fever is abated. Science may still be critical of public policy, but its criticism is increasingly more informed, confident, responsible, and constructive. The great beginnings have been taken to close the long-standing gulf between science and public policy, to the benefit of both, and in particular to the advantage of Presidential responsibility.

SIGNIFICANT QUESTIONS

Nevertheless, there is more to be done. The foundations for effective

Presidential action in matters of science and technology have been built well, and show promise of enduring. In this framework, it may now be possible to proceed with the search for solutions to some of the great issues that have been generated by government-in-science. Even though we may have to be content, for a time, with "dusty answers" when we would rather be "hot for certainty," government and science in their new-found nuptials must deal with these nagging questions:

Is government tending to mobilize science too much for national security reasons, with the result that hardware requirements are overinfluencing the course of scientific innovation?

Is there an optimum plateau for government support of science in the United States, apart from the pressures of defense?

Will the national interest require permanent support of science and technological effort at somewhere close to current levels, even if international tensions ease?

When 70 to 80 per cent of university research is dependent upon the flow of federal funds, can we continue to believe that education and science will remain truly independent and free?

Should public policy undertake larger and continuing sponsorship of basic science in the nation's long-term interests, even at the expense of curtailing the present emphasis on spectacular developmental work and outer space exhibitions?

These questions illustrate the background concerns of government in this age of preoccupation with science, technology, education, and survival. They have been on our conscience for a decade, with the solutions still no closer. Because public policy is both fragile and transient, the present contentment which pervades the partnership of science with government cannot justify deferring these fundamental problems merely because our hands are full with

today's and tomorrow's problems. A great change, under the pressure of contemporary dangers and imperatives, is being wrought in our time in the relationship among government, science, and higher education; however, it is a change in which the hand of deliberate design should be in greater evidence.

The process of budgeting for science and technology in the context of Presidential responsibility shows encouraging elements of quality, depth, and perspective. It would be a better process than it now is, however, if it had the needed flexibility for the adequate reflection of changing national values. As things now stand, the annual budget is leashed by the costs of national security, debt charges, and a formidable array of "untouchable" benefit and subsidy expenditures which, in the aggregate, reflect yesterday's priorities rather than the new values toward which we might prefer to move. In such a setting of limited Presidential discretion in budget-

making, new opportunities can be accommodated only in small measure, or through the escapist route of deficit financing. If, for example, fundamental science is not supported with the largesse so religiously urged by its proponents, the reason is not a lack of sympathy on the part of the budgetary authorities but more accurately the inertia of the political process which prevents coming to grips with the task of restating the prime concerns of public policy. To the extent that the budget is treated by the political process as a kind of gift catalogue, rather than an instrument of deliberate national progress toward worthwhile goals, it will not fulfill its potential.

For all that has been accomplished in the structuring of Presidential leadership and responsibility, much more awaits doing in the design of public policies, both coherent and stable, for the fabulous future. Innocents all, we have work to do.

Congress and Research: Experience in Atomic Research and Development

By CLINTON P. ANDERSON and JAMES T. RAMEY

ABSTRACT: Congress has delegated much of its work in relation to atomic research and development to the Joint Congressional Committee on Atomic Energy. The Joint Committee has certain advantages for dealing vigorously with atomic research, including its ability to act for both Houses as a unit, its right to be kept fully informed by the Atomic Energy Commission, and its legislative jurisdiction including annual authorization legislation. The role of the Joint Committee has been evolving from an interest primarily in the weapons program and security to an equal emphasis on peacetime research and development, international co-operation, and declassification. Recently the Joint Committee has tended to stress its informational function through the conduct of various public hearings and dissemination of reports. Of particular importance in recent years has been its policy-making function in atomic power development, basic research facilities, and research in atomic hazards.

Clinton P. Anderson, Washington, D. C., is United States senator from New Mexico. First entering public life in 1933, he is presently Chairman of the Joint Committee on Atomic Energy and serves on the Senate Committees on Finance, Interior and Insular Affairs, Aeronautical and Space Sciences and the Select Committee on Water Resources. Prior to his first term (1948-54) in the United States Senate he served as Secretary of Agriculture under the Truman Administration and before that served three terms in the House of Representatives.

James T. Ramey, LL.B., Washington, D. C., has been Executive Director of the Joint Committee on Atomic Energy since 1956. He served with the Atomic Energy Commission as an Assistant General Counsel (1947 to September 1952) and as Assistant to the Manager, Chicago Operations Office (1952-56). He taught political science and administrative law at the University of Tennessee (1942-44) and conducted a seminar on atomic energy law at Northwestern University Law School in 1955.

THIS article will be concerned with the interest of Congress in atomic energy research and development, and more particularly with the role of the Joint Committee on Atomic Energy. The editors have wisely permitted the authors to concentrate on a subject with which they are familiar, rather than to attempt to cover the entire breadth of the relationship between Congress and science. It is hoped, however, that this examination may cast some light on the larger problem and may illuminate the question of Congressional leadership vis-à-vis the executive branch. It also may indicate some unique adaptations of governmental institutions to new forces and circumstances.

ESTABLISHMENT AND ORGANIZATION

Congress has applied Woodrow Wilson's maxim—that it does much of its work through committees—in full measure to the Joint Committee on Atomic Energy.

The Joint Committee on Atomic Energy was established by law in 1946 at the same time the Atomic Energy Commission (AEC) was created. It consists of eighteen members, nine from the House of Representatives and nine from the Senate. No more than five from each House may be from the same political party. The 1954 amendment to the basic Atomic Energy Act of 1946 provided that the chairmanship of the Committee should rotate every two years between the House and the Senate.

Congress did not break precedent in establishing a Joint Committee on nuclear energy, as such, in 1946. There were other joint committees, such as on taxation, on printing, and on the economic report. It did break precedent in giving the Joint Committee legislative functions, and also in requiring the AEC and other executive agencies to keep the

Joint Committee fully and currently informed. The latter requirement was of immediate importance to the Joint Committee in the early days when its role of "watchdog" over the secret activities of the AEC was paramount. The legislative function of the Joint Committee, as discussed below, has become more important in the last few years with the passage of the 1954 amendments.

FUNCTIONS AND ROLE

Generally speaking, the Joint Committee engages in four types of functions: legislative; investigative; informational; and policy-making. These functions will be outlined below.

Legislative function

The Joint Committee on Atomic Energy, by statute, is the legislative committee for referral of all bills relating to the Atomic Energy Commission or primarily to atomic energy, and may on its own initiative introduce or return bills in either House.

The 1954 amendment and subsequent legislation have had considerable effect on AEC research and development programs. Of particular importance has been Section 261 of the Atomic Energy Act of 1954, as amended in 1957, which requires legislative authorization of appropriations for (1) the construction or improvement of facilities, including research facilities, and (2) the atomic power demonstration program carried on in co-operation with private and publicly owned utilities.

Investigative function

The Joint Committee has not found it necessary to utilize this traditional Congressional tool to any great extent in relation to the research program but on occasion pursues AEC reports to see what is actually being done, and makes studies as discussed below.

Informational function

Under Section 202 of the Atomic Energy Act the Joint Committee is directed to make continuing studies of problems relating to the development, use, and control of atomic energy. This Section specifically directed the Joint Committee to hold hearings during the first sixty days of each session to receive information on the development, growth, and state of the atomic energy industry. The Section also provides that the members of the Joint Committee shall report to their respective bodies as to matters within the jurisdiction of the Joint Committee on Atomic Energy.

The Joint Committee also conducts special hearings of an informational nature on the Commission's basic research programs from time to time. Thus, in 1954 the Joint Committee held hearings on progress in research on agricultural, medical, and other applications of radioisotopes; in 1956 this information was brought up to date, and another series is planned for 1960 or 1961. In 1958 a series of hearings was held on basic research in the physical sciences. In 1957 and again in 1959 extensive hearings were held on the problem of radioactive fallout from nuclear weapons tests, and considerable attention was paid to the status and needs of research in connection with this problem.

These hearings on research and development programs are published and distributed quite broadly by the Joint Committee. For example, 20,000 copies of the 1957 fallout hearings were printed in two large volumes and an index, totaling 2,200 pages. The Joint Committee also publishes, in the form of Committee prints, various reports on hearings, collections of materials prior to hearings, and staff studies.¹

¹ See Joint Committee print "Membership, Legislation, and Publications of the Joint Committee on Atomic Energy" (Washington,

Although in the early days the Joint Committee tended to give emphasis to the problem of security for information, the Joint Committee, beginning in 1949, came to recognize the positive aspects of a vigorous declassification and publication policy in the field of research. Particularly since 1954 the Joint Committee has urged a greater degree of declassification in such fields as controlled thermonuclear research and reactor development. Sometimes members of the Joint Committee have had to stimulate the executive branch to declassify research results which were being held up for policy rather than security reasons. Thus, the Defense Department's report on its High Altitude (fallout) Sampling Program (HASP) in March 1959 was made public by the Chairman of the Joint Committee rather than the Defense Department. Although it was conceded that no security classification was involved, it was held up with a "confidential" label because it contradicted the predictions of an AEC Commissioner as to the rate of fallout.

Policy-making function

Possibly the most unique function of the Joint Committee has been its policy-making or recommending role in the atomic energy field. This function is explicitly recognized in Section 202 in relation to Congress itself by authorizing the Committee to report its "recommendations" to Congress by "bill or otherwise." However, it remained for the Joint Committee to apply this concept to the executive branch.

In the past and particularly in relation to the military development of nuclear energy, the Committee's policy recommending function has been carried on informally. Classified discussions

D. C.: Government Printing Office, March 1959), for a complete list of Committee hearings and publications.

and executive sessions with top AEC and military officials and the White House have been the principal means of persuasion. The original decision by President Truman to proceed with the vigorous development of the hydrogen bomb was influenced more by Senator Brian McMahon, then Chairman of the Joint Committee, and some of his associates, than by the members of the Atomic Energy Commission. Senator Jackson, in his article in the November 1953 issue of *THE ANNALS*,² pointed out that the corollary effort to increase the AEC raw materials program and to add facilities for the production of the fissionable materials uranium 235 and plutonium was initiated and spurred on by the Joint Committee. The efforts of the Joint Committee in supporting the development of the "Nautilus" nuclear submarine and a nuclear Navy against some determined opposition are now well-known history.

In the past several years, the efforts of the Joint Committee to initiate various policies and projects has not only involved informal methods, but has also taken on more of a public and formal character by means of public hearings and debate, followed by legislative action in some cases. This has been particularly evident in regard to the peaceful uses of atomic energy, but it also has been applied to certain military projects as well.

With regard to so-called "classified projects," the Joint Committee in July 1959 held the first public hearings ever conducted on the status and prospects of the aircraft nuclear propulsion (ANP) program. As a result of Joint Committee efforts this project has been kept alive over the years despite various attempts of the budgetary planners in the Defense Department to bury it. In

² Henry M. Jackson, "Congress and the Atom," *The Annals*, Vol. 290 (November 1953), pp. 76, 78.

a report following these hearings, the full Committee endorsed efforts to get a prototype in the air, and recommended that, if the delay continued, Congress might want to consider placing responsibility during this developmental phase in the AEC rather than the Defense Department.

Recent programs sponsored

In 1958 the first public hearings on nuclear propulsion for outer space were held, and efforts by the Joint Committee were continued to accelerate the AEC's nuclear rocket project ("Rover") and auxiliary power sources for satellites program ("SNAP"). In 1959 the first experimental reactors for both projects went into operation successfully. At this juncture the question facing the AEC and Joint Committee would seem to be: How large and at what pace should this nuclear outer space propulsion effort be conducted?

Perhaps the most controversial problem which the Joint Committee has considered in recent years, other than the fallout question, is the matter of atomic power development. Since 1948 and 1949 when the Joint Committee first became interested in the peacetime potential of atomic power, the Committee has sponsored various studies and reports on the need to expand or accelerate the program, and has initiated various efforts to accomplish these objectives.

In 1953 the Joint Committee, under the leadership of Representatives Carl Durham and Sterling Cole, saved the AEC's experimental reactor projects from substantial cuts by the executive branch, and sponsored a five-year experimental reactor program. In 1954, the Joint Committee sponsored the Cole-Hickenlooper bill to amend the 1946 Act to provide, among other things, for greater private participation in atomic power development. In 1956 the Joint

Committee passed, without a dissenting vote, the proposed Atomic Power Acceleration Amendment of 1956, which was the Committee's version of the original Gore-Holifield bill. This bill, which was passed by the Senate and narrowly defeated in the House, would have authorized \$400 million for the development of prototype demonstration power reactors to be built by the government at AEC sites with the electricity absorbed in connection with operations at the site.

Since 1956, the Joint Committee has focused its efforts in the atomic power development field to adding projects in the annual AEC Authorization Bill. In 1957, among other things, it added a project for a gas-cooled reactor prototype, which was cut down in conference to a design study. In 1958, the Joint Committee authorized the gas-cooled project as well as a plutonium production reactor which would be convertible to electric power production, and various design studies. In 1959, the Committee added three reactor prototype projects to the AEC Authorization Bill, as well as the enlargement of the Shippingport reactor, and several design studies.

Friction with the AEC

The history of the atomic power program has not been entirely harmonious. In 1954 there were differences within the Committee and with the AEC. Again in 1956 and 1957, the AEC and the minority party in Congress opposed the Joint Committee's efforts. In late 1957 and 1958, the Joint Committee and AEC attempted to work out a mutually acceptable compromise. Although much progress was made, AEC came out with a separate statement in June 1958, and a Joint Committee staff report was issued in August 1958. Both statements attempted to provide a compromise be-

tween a program composed solely of wholly government owned projects or wholly privately sponsored projects.

During the fall of 1958 the new AEC Chairman, John McCone, appointed an Ad Hoc Committee which provided a report in January 1959 which supported most of the recommendations of the Joint Committee staff report. As of this writing relative peace prevails, with AEC proceeding with projects initiated by the Joint Committee, such as the gas-cooled prototype. The Commission is also assuming a more positive direction of the program, including a statement to undertake the development of a ten-year atomic power program, steps long advocated by the Joint Committee.

Basic research projects

A further example of the Joint Committee's creative efforts is in the field of basic research facilities. The story begins when the Joint Committee's Subcommittee on Research and Development held nine days of public hearings in February of 1958 on the AEC basic research program in the physical sciences.³ In due course the Subcommittee adopted a unanimous report recommending among other things additional facilities for basic research, and increased operating expenditures in the range of 50 to 150 per cent for research activities.

Following this consideration of basic research, some Committee members became concerned when the AEC authorization request for fiscal year 1959 provided for only two small facility projects totaling about \$1,000,000. Under its authority to be kept fully informed, the Committee obtained the information

³ Some fifty of the nation's leading scientists presented testimony on their methods and results. A record of some 800 pages of testimony on the latest data in the fields of chemistry, metallurgy, physics, and controlled thermonuclear reactions was amassed.

that the AEC Division of Research had originally recommended fifteen new facility projects totaling approximately \$45,000,000. These projects included new and improved particle accelerators, "hot" laboratories, and research reactors. The full Committee passed substantially all of these projects in the AEC Authorization Bill.

Following enactment of the AEC authorization legislation, the Joint Committee Chairman wrote to the Chairman of the House Appropriations Committee calling attention not only to the desirability of providing funds for the basic research projects added by the Joint Committee, but also to the need for funds held up on prior year projects by the Bureau of the Budget. The letter also pointed to the need for additional operating funds. The resulting AEC Appropriation Act for 1959 provided for all funds for prior year projects and half the projects added by the Joint Committee, with the stipulation in the House Appropriations Committee report that cancellations and unused funds on other projects might be used for the remainder.

Upon enactment of the AEC appropriation law for fiscal year 1959, the Joint Committee's Subcommittees on Research and Development and on Legislation announced an investigation of the Commission's research program to discover what bottlenecks, if any, there were to the prompt undertaking of the research and development projects which had been authorized. This was an attempt to forestall the delaying of funds by the Bureau of Budget, an agency which previously had held up some projects for as long as three years and some entirely. Fortunately this red-tape inquiry, together with the new AEC management, produced a fine result, namely that all authorized basic research projects were funded and that work was actually undertaken with reasonable

promptness. Such are the somewhat peculiar ways of getting jobs done in the federal government!

The Joint Committee has also been concerned with less understood research needs in the atomic energy field, particularly in relation to radiation hazards. In 1957, for example, following its extensive hearings the Committee urged greater research on the problems of radioactive fallout from weapons tests. In its subsequent report of August 1959, based on hearings held in May, the Committee pointed out that although some progress had been made, the program was still not getting the high-level attention or support which was required. The Committee's reports in 1959 on its extensive hearings on radioactive waste disposal and radiation hazards to employees also called attention to the need for more research on these hazards.⁴

AUTHORITY, METHODS, AND APPROACH

The sources of the Joint Committee's authority in the field of atomic energy are both formal in the statutory sense, and practical in the sense of the realities of government.

Reference has already been made to the Joint Committee's principal statutory sources of authority, namely, acting as a joint unit for both houses of Congress, its right to be currently informed, and its enlarged legislative responsibilities. Also of importance have been the statutory requirements of Joint Committee review of important domestic atomic power development arrangements, as well as international arrangements for co-operation with foreign governments covering the peaceful development of atomic energy and military uses.

From a practical standpoint the success achieved by the Joint Committee

⁴ These radiation hearings, except for employee hazards, have been conducted by the Special Subcommittee on Radiation, Representative Chet Holifield, Chairman.

over the years has resulted from the continuity in membership of many of its leading members, and its efforts to keep the United States in the forefront of atomic energy development. The tenure of many of its senior members goes back to the original Joint Committee appointments in 1946, and several other members number eight or ten years of service. This is in contrast with the Atomic Energy Commission which currently has four new Commissioners and a new General Manager.

The Joint Committee has exercised its powers vigorously, buttressed by a faith in the importance of atomic energy, and assisted from its inception by an able and devoted staff. The Joint Committee staff comprises a total of approximately twenty employees, including seven or eight professional employees. The Committee and staff utilize extensively the services of the Library of Congress, and the General Accounting Office, organizations which are responsible primarily to Congress. For example, the Library of Congress, at the request of the Joint Committee, prepared in 1956 a report on Soviet manpower and education which foreshadowed the current popular concern with Russian advances. The General Accounting Office, in response to a Joint Committee request, has reviewed the financial and contractual arrangements of each atomic power development arrangement submitted to the Joint Committee for review.

The Joint Committee has also utilized consultants and expert panels to a considerable extent to supplement its own staff and to obtain the benefit of outside advice.⁵

⁵ In the development of the Committee's staff report in 1958 on the expanded atomic power program, the following representative panel of reactor and industrial experts participated: Dr. Henry DeWolf Smyth, Chairman, Board of Scientific and Engineering Research, Princeton University; Dr. Chauncey Starr,

Most informational hearings held by the Joint Committee in the past few years have been planned with the assistance of an ad hoc steering committee of outside experts who advise on the scope and outline of the subject matter of the hearing and on possible expert witnesses. The Joint Committee normally obtains an outside expert consultant to assist on the technical aspects of the hearing and report. In addition, the assistance of the AEC and Defense Department staff is used considerably, particularly in checking factual statements in reports and otherwise obtaining technical information.

Informal approach

Sometimes the Joint Committee has dispensed with formal hearings and used informal seminars where it is believed that less formal proceedings would facilitate frank exchange of information and ideas. This technique was instituted in the development of legislation on power reactor insurance and indemnity, and was carried over into consideration of the atomic power program itself. In these seminars, leaders and technical representatives of the atomic equipment companies, the private and public utilities, engineering and construction companies, and various atomic laboratories, have participated.⁶

President, American Nuclear Society, and Vice President, Atomics International; Mr. Titus LeClair, Manager of Research and Development, Commonwealth Edison Company, Chicago, Illinois; Mr. James Grahl, Director, Atomic Energy Service, American Public Power Association; and Dr. W. H. Zinn, President of General Nuclear Engineering Corporation.

⁶ Perhaps it was this technique which led an authoritative atomic industry publication to state: "JCAE's assumption of leadership has been quiet, imaginative and efficient, though not unchallenged. From the first, the move has been marked by a deliberate effort to consult the industry's executives and the reactor experts in both industry and government." See Roundup: "Power Shifting Away from

It will be noted that a primary means used by the Joint Committee in keeping informed is by direct contact with technical representatives of the various atomic laboratories and industrial concerns. These Washington discussions are supplemented by field trips to the various domestic atomic energy installations. Perhaps the most interesting field trip of the Committee in the last session of Congress occurred on April 11, 1959, when the full Committee held an official meeting aboard the nuclear submarine "Skipjack" to receive a report from Admiral Rickover on this most advanced type of underwater atomic propulsion. It was during this trip that the Skipjack achieved new records of depth and speed.

Joint Committee members have also participated as Congressional Advisors at a number of international atomic conferences, such as at the Geneva scientific conferences in 1955 and 1958, and the conferences of the International Atomic Energy Agency (IAEA) in 1957, 1958, and 1959.

The Joint Committee's approach or philosophy with respect to nuclear research and development has been that of informed laymen with a vast respect for working scientists and engineers and an abiding faith in the potentials of atomic energy in peacetime.

Encouragement and improvement

The Joint Committee's main tools have been the great reservoir of experience and familiarity with atomic programs described above, together with a considerable amount of common sense and ability to utilize and sift advice and information from many sources. Generally speaking, the Joint Committee's role is not to substitute its judgment for that of the AEC or Defense Depart-

ment, but rather more to encourage the government to recognize the facts and situations, and sometimes to fill gaps in programs or policies which should be filled. Rarely does the Joint Committee recommend against an AEC request.

It is true that the Joint Committee on occasion does add projects and strongly urge certain policies. This has usually occurred where the AEC or Defense Department has been restricted by budgetary ceilings, or where, as in the atomic power field, AEC was unduly tied to the policy abstraction of private development.⁷

The general philosophy of development followed by the Joint Committee has been one of encouraging orderly improvement in the art. This has caused the Committee to question the construction of atomic reactors for the so-called "Peace Ship" in 1955, and for a Puerto Rico power station in 1957, which would have been virtual carbon copies of existing reactors, rather than improvements. Generally speaking, the Committee has favored diversified and parallel approaches on the important research and development programs, believing that both small improvements and large break-throughs are important in the field of technology. In this connection the Committee has followed a policy of "live and let live" whereby various competing project directors have been encouraged and supported.

The Joint Committee's philosophy in the field of basic research is that facilities and personnel must be augmented in order to keep the United States in a position of leadership in the Western world and in competition with the So-

⁷ For example, the Joint Committee, in its gap-filling role and based on good technical advice and the British experience, insisted on AEC sponsoring a gas-cooled prototype reactor. AEC, after initially opposing this type of technology and project, now admits that it is a field which must be explored by government and private development.

viets. The Committee in 1956 called attention to the need for an upgrade and an extension of our whole educational system, particularly in the field of mathematics. In 1958, as mentioned earlier, the Joint Committee substantially increased the authorization of facilities for basic research, particularly in the high energy field. The Joint Committee has also called attention to the need for increasing AEC operating expenditures to support the research carried on in the new and improved facilities.

General attitude of Congress

Congress by and large has accepted the legislative recommendation of the Joint Committee with respect to research and development. Occasionally in relation to atomic power development in recent years, the House has refused to agree on federal government construction of prototype demonstration plants. But even here, as a result of Joint Committee and AEC efforts, means of proceeding with such projects have been agreed to and authorized.

OTHER CONGRESSIONAL COMMITTEES

As the peaceful uses of atomic energy expand and the military uses broaden and are better understood, it is inevitable that other Committees of Congress will take more of an interest in atomic energy research and development. For example, the Disarmament Subcommittee of the Senate Foreign Policy Committee has evidenced an interest in research on weapons test detection.⁸

⁸ The House and Senate Committees on Outer Space and Astronautics have an obvious interest in nuclear rocket propulsion. The Maritime Committees of the House and Senate also have an evident interest in nuclear ship propulsion, regarding an atomic reactor as just another power plant. The Congressional Government Operations Committees have an interest in the organization and management of the atomic enterprise.

The Subcommittee has indicated, however, that it regards the Joint Committee as the "technical" committee in this field, and the Subcommittee is primarily interested in the policy implications of the detection problem.

One of the principal problems in the relationship between Congressional committees is the established practice of not communicating with one another, particularly in regard to classified information or matters discussed in executive session. This practice, in addition to normal jurisdictional interest, tends to encourage committees to find their own facts and information, rather than relying on the work of another committee. Duplication and time wasting of executive agencies and Congressional staff are the result.

IMPORT OF CONGRESSIONAL EXPERIENCE

Perhaps the most pervasive criticism which has been implicit in reviews of the Congressional role in atomic energy research and development, has been that Congress in acting through the Joint Committee majority "has been encroaching persistently on the domain that normally is reserved to the Executive."⁹ This criticism has largely been aimed in recent years at the Joint Committee's role in the atomic power development program. It is believed that the review of Joint Committee experience in this article indicates that the Joint Committee from its inception in 1946 has exercised a major policy function in all aspects of the atomic energy field. This role has been carried on without regard to which party had a Committee majority, with most of the Committee actions being unanimous or without dissent.

Whether the results of this active role of Congress in the field of atomic re-

⁹ See David F. Cavers, "Atomic Power: The Quest For a Program," *The George Washington Law Review*, Volume 27, No. 4 (April 1959), p. 470.

AEC on Reactor Plans; Joint Committee, Budget Disputing Leadership," *Nucleonics*, Vol. 16, No. 8 (August 1958), p. 22.

search and development have been good is not for the authors to determine.¹⁰ Suffice it to say that there has been no criticism of the fact that the United States now has additional and better nuclear weapons, more raw materials and fissionable materials, a growing nuclear Navy, and an expanding research and development program for the peacetime atom, all of which have been urged by the Joint Committee and supported by the Congress.

From this review of the Congressional experience in atomic energy research, perhaps the following conclusions may be drawn:

(1) The Joint Committee device has worked reasonably well over the thirteen years of its existence.¹¹ During this period, the Joint Committee's interests have broadened from considerations of the weapons program and security, to research and development on the peaceful uses, international co-operation, and declassification of information. Public hearings and published reports are an important part of its activity.

(2) The Joint Committee experience throughout its existence has shown that Congress can show initiative and exercise leadership even in a complex field.

(3) The Congressional experience in atomic energy does not support the idea of establishing a Joint Committee on Science and Technology to cover all scientific and technical matters coming before Congress. The present scope of activity of the Joint Committee on Atomic Energy is a heavy responsibility, and not much more could be added without overburdening the Committee and staff.¹²

¹⁰ For a detailed review and appraisal of the Joint Committee's activities and role up to 1956 see Morgan Thomas, *Atomic Energy and Congress* (Ann Arbor: The University of Michigan Press, 1956), pp. 139, 183-84, 229-41.

¹¹ This is not to say that other devices may not also be of great value. The Senate Committee on Labor and Public Welfare has done a fine job in the field of medical research.

¹² Notwithstanding the establishment in 1958 of the House Committee on Science and

A forward look

In conclusion, we believe it might properly be said that what was started as a device to permit a handful of members of the Congress to receive and evaluate the facts concerning a top secret endeavor and stand as guarantors to the Congress and the nation that things were all right has become a useful Congressional instrument at a time when the country requires less secrecy and more free discussion. Perhaps the biggest problem faced by the Joint Committee during this transitional period is that it may lose some of what Representative Mel Price, Chairman of its Subcommittee on Research and Development, calls "its adventurous spirit." But as the pendulum swings away from national secrecy to world co-operation, it is believed that there will be much in the field of research in which a contribution can be made, even in relation to co-operation on the other side of the Iron Curtain.

Plans of the Joint Committee for the current session of Congress include a series of hearings on "The Frontiers of Atomic Energy Research" and a report on a "Review of International Atomic Energy Policies and Programs." It is hoped that these hearings and reports, and others like them, will provide nourishment for the Joint Committee's spirit and will continue to make a contribution by Congress to science and technology.

Aeronautics and the Senate Committee on Aeronautical and Space Sciences, a majority of the committees of both Houses have continued to be concerned with aspects of scientific research and related subjects. See Report of the Committee on Government Operations, U. S. Senate, "Progress Report on Science Programs of the Federal Government" (Washington, D. C.: Government Printing Office, September 1958), pp. 58-67.

Research Planning and Control in the United States Department of Agriculture: The Experience of an Old and Well-established Research Agency

By BYRON T. SHAW

ABSTRACT: Our publicly supported agricultural research has been a joint responsibility of the Department of Agriculture and the state land-grant colleges since 1862. Methods evolved for its planning and control are based on voluntary co-operation between the states and Department agencies, with assistance from farmers, industry, and other groups. This system, nearly as complex and diverse as agriculture itself, has been very successful. Today it involves some 13,000 scientists at hundreds of locations throughout the country. It is financed by nearly \$238 million in public funds, about half from the states and half from the federal government. The work concerns all phases of production, marketing, utilization, and consumption of farm and forest products. It is organized generally around specific problems and includes about 14,700 projects. However, more than a fifth of the federal funds support basic studies. Advisory committees, composed of members who represent users of research results, aid extensively in planning. Control procedures, including thorough project review and co-ordination, permit a well-integrated and dynamic program. In the administration of this research, encouragement of creative contributions by individual scientists is a prime consideration.

Byron T. Shaw, Ph.D., Washington, D. C., is Administrator, Agricultural Research Service, United States Department of Agriculture (USDA). He has been the Department's research chief since 1952 following a term (1947-52) as assistant research administrator. Prior to joining the USDA in 1943 as head of soil management and irrigation research he taught at Ohio State University and the University of California. Dr. Shaw is the United States member of the Technical Advisory Council, Inter-American Institute of Agricultural Sciences and has served as chairman of the President's Interdepartmental Committee on Scientific Research and Development (1956-58). He is editor of the textbook *Soil Physical Conditions and Plant Growth*.

FOR nearly a century, agricultural research in the United States has been mainly a public effort, financed and conducted jointly by the federal and state governments. This research is largely responsible for the unparalleled efficiency and productivity of American agriculture.

In no other field of effort has state-federal co-operation been more effective. Our agricultural scientists have been outstandingly successful also in developing close working relations with farmers, farm organizations, marketing associations, industrial concerns, universities and research foundations, and other public and private groups.

The methods gradually evolved for planning and control of this highly complex, co-operative effort are based on the experience and thinking of hundreds of scientists, public administrators, and interested laymen in all sections of the country. They have continually faced the problem of meeting the scientific needs of our rapidly expanding agriculture on relatively limited budgets. Their efforts have resulted in one of the best planned and co-ordinated research programs in the world.

Publicly supported research in agriculture on a nation-wide scale began in this country in 1862, following enactment of two federal statutes creating the Department of Agriculture and the state land-grant colleges.

Subsequent acts passed by Congress established the state experiment stations and provided them with federal-grant funds, extended the scope of scientific work by the Department, and strengthened the bonds between federal-state research in agriculture and agricultural education.

Public institutions developed as a result of these laws have provided the leadership for our agricultural revolution.

ROAD TO ABUNDANCE

Farming technology in the 1860's had progressed little beyond that of Colonial days. Our fast expanding population was fed chiefly by more and more farmers working more and more acres. This trend, accompanied by a slow rise in farming efficiency, continued until the end of World War I.

Productive farm acreage tripled between 1860 and 1920, reaching a total of some 500 million acres cropland equivalent. Although important shifts in land use have since occurred, this total amount of cropland remains the basis of our agriculture today. Farm employment rose to an all-time peak of 13.6 million during the years 1910-16 and then began a steady decline.

Since 1920, advances in technology, rather than additional land and manpower, have been the key to our agricultural progress.

From 1920 to 1940, production of all farm products rose about one-fifth, while cropland stayed the same and farm employment dropped almost a fifth. But this was only the beginning.

In the twenty years since 1940 we have raised our total agricultural output by more than half. Farm employment has fallen by one-third. Farm output per man-hour has doubled.

Besides giving us a greater variety of higher quality farm products, agricultural research has developed more efficient methods for marketing and distributing these products to consumers. It has improved the diets of all our people, lightened the work of homemakers, and contributed in other ways to better family living.

The dark side of this picture of progress is well known. Farm production has been running ahead of demand. The burden of surpluses is felt by the entire economy. Prices received by

farmers have declined relative to prices of goods they must buy. As a result they have not shared equally with other segments of the population in the country's general prosperity.

THE RESEARCH JOB TODAY

Most of the phenomenal increase in farm output achieved in the last twenty years has been vitally necessary to meet the needs of a population that has grown by nearly 48 million people since 1940. Research owes no apology for its contribution to our bountiful harvests. But it does recognize a responsibility for doing something about the surpluses and the "cost-price squeeze" on farmers.

We are endeavoring to find new and wider uses for farm products, especially as industrial raw materials. We are seeking ways to help farmers make needed adjustments in production—away from commodities in surplus, and toward commodities for which demand is expanding, or can be expanded.

At the same time, we must continue to increase the quality of farm products and lower the cost of their production, further improve the efficiency of farm-product distribution, find ways to prevent soil deterioration and loss, and halt the waste of our water resources.

Looking ahead, we can expect a doubling of our present population in the next fifty years. For our people then to be as well fed as they should be, we must at least double our present crop output and more than double production of animal products. The job will have to be done on about the same acreage we have now, and with probably still fewer farm workers.

Federal-state responsibilities

In doing its share of this research job, the Department of Agriculture directs most of its efforts toward problems

of regional or national significance. The state agricultural experiment stations are free to investigate any problem of interest to the people of their states, but on matters of regional or national interest they usually work in co-operation with other states and the Department.

These stations conduct about three-fifths of the total federal-state research program. About 78 per cent of their work is currently supported by state funds and the remainder by federal grants.

Both state and federal research administrators endeavor to maintain voluntary working relationships that will avoid unnecessary duplication in their research and yet provide scientific answers to the most important problems, whether they are local, state, regional, or national in scope.

The Department and the experiment stations co-operate formally on more than half their research and informally on most of the rest. We are proud of this system and the way it operates. No other country has anything like it.

Size of the effort

The Department employs about 4,800 scientists, including specialists in practically all of the biological sciences, most of the physical sciences, and many of the social sciences. They work at more than 300 locations in all the states. The facilities at two-thirds of these locations are state owned, and the remainder are in federal establishments.

The state experiment stations have about 8,400 scientists, some of whom are engaged part time in teaching or extension work and part time in research. They work side by side with Department people at many of the research stations in each state.

Public funds appropriated for federal-state agricultural research have doubled since 1953. For the current fiscal year

they total about \$238 million. A little over half—\$124 million—is provided by the federal government and the remainder by the states.

The federal portion includes about \$92 million to be spent by Department of Agriculture scientists and \$32 million in federal grants to the state experiment stations. The state portion includes some funds provided to the experiment stations from private sources.

Since 1946, the Department has had authority from Congress to contract with outside groups for research, under its supervision, that can be done more rapidly, more effectively, or at less cost by other institutions, than in its own facilities. At present, we have more than 200 such contracts in force.

Under the Agricultural Trade, Development, and Assistance Act (Public Law 480), we recently began developing an extensive program of contract and grant research in foreign countries, financed by local currencies from the sale abroad of United States surplus farm commodities.

Industrial research in agriculture has also nearly doubled in the last half dozen years. It is supported today by an amount roughly equivalent to that for state-federal research. The work by industry is heavily concentrated in relatively few fields, mainly in processing and marketing, though substantial funds are spent also on agricultural chemicals and biologics and on farm equipment.

DEPARTMENT ORGANIZATION

During most of its history, research in the Department was a function of several tightly organized bureaus. Each bureau provided its own administrative services and presented its own budget estimates to Congress. Most of the bureaus were responsible not only for research, but also for certain regulatory activities that required research support, such as federal meat inspection and the

control or eradication of livestock and crop pests and diseases.

Since 1942 a series of changes has been made in the Department's research organization. These changes, reflecting the increased complexity of both agriculture and agricultural science, provided for the redirection and closer coordination of the Department's research efforts to meet changing national needs. In the process the old bureau structure has been abolished.

But the general principle of conducting research along with other activities in multifunctional institutions has been maintained, both in the Department and in the state colleges. The Agricultural Research Service and other Department agencies engaged in research continue to have regulatory and other responsibilities. Although similar regulatory activities in the states are largely a function of the state departments of agriculture, the land-grant colleges conduct teaching and extension work in addition to research.

The administrator of the Agricultural Research Service is delegated responsibility for the co-ordination of all the Department's research and for the administration of federal-grant funds to the state experiment stations.

Research activities of the Agricultural Research Service cover four broad areas:

1) Seven divisions, under a Deputy Administrator for Farm Research, work in the fields of livestock, poultry, and dairy husbandry; animal diseases and parasites; entomology; soil and water conservation; agricultural engineering; crops production; and farm economics.

2) Four divisions, under a Deputy Administrator for Utilization Research and Development, are concerned with expanding industrial and other uses for farm products.

3) Two divisions, under a Deputy Administrator for Experiment Stations, administer federal-grant funds to the states

and direct our territorial experiment stations.

4) The Institute of Home Economics, headed by a Director, conducts research in human nutrition, household economics, and clothing and housing.

Four other Department agencies are responsible for important additional phases of the total program. These include the marketing research and statistical functions of the Agricultural Marketing Service; research on forestry and forest products by the Forest Service; research aid to farmer co-operatives by the Farmer Co-operative Service; and foreign market development work by the Foreign Agricultural Service.

ADMINISTRATIVE METHODS

The diversity of American agriculture, the growing interdependence of all science, and the complexity of a research organization composed of some fifty autonomous state experiment stations, plus nation-wide activities by several Department agencies, make the planning and control of our state-federal research program a formidable undertaking.

Administrators of this research must insure that the important problems receive adequate attention; that shifts in economic and other conditions are properly reflected in the research program; that unnecessary duplication of work is avoided; and that the benefits expected from particular lines of work justify the effort devoted to them.

Choosing the best available ideas for incorporation in any research program is of course important. It is equally important to stimulate a flow of good ideas from which a choice can be made.

Accordingly, in our federal-state system we encourage both the inflow of ideas from outside and the generation and interchange of ideas at all points within the system.

Advisory committees

We make a continuing effort, formally and informally, to solicit comments on our research program from those best acquainted with the problems we are trying to solve. Valuable mechanisms for this purpose are the Department's Agricultural Research Policy Committee and the twenty-five advisory committees established under provisions of the Research and Marketing Act of 1946. Members of these committees represent the major segments of United States agriculture and the consuming public.

The Agricultural Research Policy Committee meets quarterly and advises the Department on policy matters and broad adjustments needed to maintain a dynamic research program.

Seventeen of the advisory committees are concerned with particular farm commodities, and the other eight offer counsel in various functional areas, such as food and nutrition, transportation, and economics. They meet annually to review current research and recommend adjustments, including termination of existing projects, expansion of current work, and initiation of new work.

The state experiment stations seek advice concerning their own research from similar advisory committees, composed of representatives of farmers, consumers, and other groups having agricultural interests in the various states.

The project system

Scientists at all levels of the federal-state research organization play an important part in the initiation and planning of research. They recognize problem areas where new facts are needed, and they can be counted upon to consider the usefulness and originality of projects they submit to their supervisors. The administrator's job is to determine in each case whether a pro-

posed project will contribute to solution of the most urgent research problems and fit into a well-balanced total program of research.

The administrator of the Agricultural Research Service provides for the examination and analysis of all Department research activities, current and contemplated; for review and approval of all proposed projects before they are initiated; for advice and consultation with agency heads on the planning of research; and for submission of reports and recommendations to the Secretary of Agriculture. He is assisted in this work by a Central Project Office and an Agricultural Research Council.

The Central Project Office is a control center in the review and approval of research proposals. It maintains records on about 2,800 Department line projects. Each proposed project is examined in this office in relation to the existing program and referred for comment to all agencies of the Department doing related work, including subject-matter specialists in the State Experiment Stations Division of the Agricultural Research Service, who consider it in relation to research at the state stations.

The Agricultural Research Council includes the deputy administrators for research in the Agricultural Research Service and in the Agricultural Marketing Service, the director of the Institute of Home Economics, the assistant chief for research of the Forest Service, and the administrators of the Foreign Agricultural Service and the Farmer Co-operative Service. It provides a forum for discussion of research problems of Department-wide concern.

Federal-state research

Relations between the states and the Department involve both the administration of federal-grant funds and a great volume of co-operative research which is formally documented by co-

operative agreements and memoranda of understanding.

The Department's role in the federal-grant research program of the state experiment stations is primarily one of service. We are charged with seeing that the funds are spent as intended by Congress, but we have a further responsibility for giving technical assistance. This includes comprehensive reviews of federal-grant research, participation in planning of regional research, and co-ordination of research effort among the states as well as between the states and the Department.

Before research projects using federal-grant funds can be initiated by a state station, they are reviewed in the State Experiment Stations Division. Division specialists make annual visits to each station to discuss the progress of the research with the scientists doing the work. At most of the stations, this annual review covers all state projects and is not limited to those receiving support from federal-grant funds.

The Division keeps detailed records on about 5,900 projects at the state experiment stations financed wholly or in part by federal funds. In addition, information is maintained on some 6,000 projects financed entirely by state funds.

These records, along with those on federal projects kept in the Central Project Office, provide background information on current work in progress against which all proposed new projects to be supported by federal funds are examined. This is the key to effective co-ordination and prevention of unnecessary duplication in the total effort.

In co-operative research on all problems of mutual interest, state and federal workers decide jointly what portion of the work each will undertake. To aid in co-operative planning, we make use of various devices that have proved useful over the years.

They include standing technical com-

mittees of state and federal scientists in major subject-matter areas, such as cereal crops, beef-cattle breeding, and other areas of general interest and importance. From time to time we also establish special research panels to plan an attack on emergency problems, such as new plant or animal diseases.

An important provision of the law on federal-grant funds is the authorization for co-operative regional research. It encourages joint planning and conduct of work on problems of broad regional significance by several state experiment stations and, frequently, one or more federal agencies. About 12 per cent of the research funds available to the state stations is devoted to regional projects. We maintain a variety of federal-state co-operative arrangements for this work.

Co-operation with industry

For the most part co-operation with industry is less formalized than state-federal co-operation. However, industrial research grants, endowments, and fellowships play an important part in co-operative industry-state research. Industry also co-operates extensively with the Department. Facilities, materials, and services made available by private concerns aid many phases of both federal and state research.

RESEARCH ENVIRONMENT

In developing our methods for the planning and control of research, we keep continually in mind the fact that successful research depends mainly on the ability of individual scientists. To generate those new ideas on which scientific progress depends, they must be talented and well-trained people, and they must have the freedom to use their imaginations.

Co-ordination, integration, and supervision of research are necessary. But we have to face the fact that a large element of self-direction is essential for

productive work by scientists. A research environment favorable to creative accomplishment by individual specialists must be provided.

A scientist should be able to conduct his research in an atmosphere of free inquiry, to publish his results freely, and to take advantage of free discussion with his colleagues.

One powerful incentive in scientific work is the opportunity to gain prestige and recognition. A liberal policy on attendance at scientific meetings and the holding of office in scientific organizations is therefore important.

In publishing their research results, scientists should be able to state their findings in their own words. Excessive review or editing of scientific papers, unrealistic security classifications, and too-rigid style requirements should be avoided. Accuracy of published papers is vital, but within the limits of accuracy and reasonable clarity, the individuality of the scientist as expressed in his reports should be maintained.

Pay is of course important to scientists, even if it is not the most powerful incentive for their work. We are making progress toward higher salaries for research work and better recognition of the value of research genius as distinguished from administrative ability.

The number of positions in the Agricultural Research Service in which senior researchers can work without administrative responsibilities has been increased. And our scientists now have opportunities in several positions to receive compensation fully equal to that of the agency's top administrators while continuing to pursue individual research.

Team research

We find that productive individual effort and the team approach can be effectively combined in a good research environment. Team research, though sometimes condemned as segmented,

69631

can help achieve co-ordinated effort, economy, and desired results.

Our co-operative relationships with the state experiment stations, as well as the diversity of our own work, call for a great variety of arrangements of this type. More and more team research is being done, because the nature of the problems to be solved demands it and because we have learned how to do it successfully.

BASIC RESEARCH

Our traditional "problem approach" in agricultural research has resulted in a strong emphasis on work aimed at finding practical answers to immediate questions. Such an emphasis is not inappropriate in a research effort supported by the public.

But many of our problems today, as well as those likely to arise in the future, call for more basic research. It is the only means we have for discovering the new scientific laws and principles that will enable us to deal more effectively with all problems.

Over the past dozen years, the proportion of the total effort in public agricultural research devoted to basic studies has risen from about 7 per cent to better than 22 per cent. In the Agricultural Research Service, we look forward eventually to putting at least 50 cents of every research dollar into the quest for new basic discoveries.

Most of our basic research will con-

tinue to be associated with problem solving. But we are increasing our efforts also in pioneering research—fundamental studies aimed at advancing basic knowledge without direct concern with practical problems.

We have established in the various divisions of the Agricultural Research Service during the past two years fifteen Pioneering Research Groups. Scientists chosen for this pioneering work have none of the supervisory or administrative duties usual in government positions.

They are free to seek answers to some of the basic mysteries of plant nutrition, physiology and virology, plant fibers and enzymes, seed proteins, the allergens of agricultural products, animal genetics, animal proteins, blood antigens, cellular metabolism, insect physiology and pathology, the chemistry of micro-organisms, and the economics of interfirm integration in farming.

Our pioneering researchers labor at the very frontier of knowledge. Many of our other scientists also are helping to advance that frontier. Their job, like that of the Western pioneers in the 1860's, calls for individual initiative. It puts a premium on co-operative enterprise. It demands a free environment.

The Department's experience of nearly a century teaches that in all our research planning and control we should strive to maintain the freedom of research, encourage co-operation, and stimulate the initiative of individual scientists.

Research Planning and Program Development in the National Institutes of Health: The Experience of a Relatively New and Growing Agency

By HERBERT H. ROSENBERG

ABSTRACT: Research planning and program development in the National Institutes of Health (NIH) have emerged over the past decade in a context of rising national interest, steadily expanding funds, shifting program emphasis, and constantly broadening scope of scientific inquiry. NIH basic philosophy seeks to maximize creative potential and regards research planning as a totality encompassing the limiting resources of manpower and facilities as well as conduct of research itself. Planning has evolved as a continuous, flexible, adaptive process in which administrators and scientists possess considerable discretion within a framework of goals and priorities established by Congressional action. It represents a balance between the spontaneous interests of individual scientists and organized effort designed to meet needs and opportunities vital to the nation's health. Responsibility for over-all planning has grown as expenditures have increased, program interests have enlarged, and NIH has become a more significant factor in support of university research and training of scientific manpower. The nature of the process requires further adaptation to deal more effectively with the problems of the future such as total impact of NIH programs upon an institution as a whole, strengthening the nation's research structure, and administering a co-operative research program on a world-wide scale.

Herbert H. Rosenberg, Ph.D., is Chief, Resources Analysis Section, Office of Research Planning, National Institutes of Health. He was Deputy Director of the Government Studies Section, National Science Foundation, 1954-1957, and prior to that, Director of the Washington Research Office of Syracuse University. Dr. Rosenberg has served as a consultant to the State of New York and the National Manpower Council on problems of research planning and manpower policy and is co-author of *Program Planning for Research and Development in the Navy* (1954) and author of various articles in professional journals. He taught public administration and planning at the University of Chicago and American University.

IN a growing agency,¹ the scope of planning constantly enlarges to meet program needs and opportunities in consonance with broadening interests and expanding responsibilities. As this development takes place in a research organization, new perspectives must be reconciled with the goal of maximizing the creative potential of scientific talent. The National Institutes of Health (NIH) confronts these problems as it grows within a context of rising national interest, steadily expanding funds, shifting program emphasis, and constantly broadening scope of scientific inquiry.

The past decade has crystallized the national interest in medical research. Extending beyond the support of science as an end in itself, the national interest recognizes that medical research deals

¹The views expressed are those of the author. They do not necessarily reflect the official views and positions of the National Institutes of Health, the Public Health Service, or the Department of Health, Education, and Welfare.

directly with the ultimate resources of the nation—the lives and health of the people. It emphasizes the contribution of medical research to economic capability. Better health and longer lives mean a larger, more productive labor force and reduction of individual and social costs of illness. Finally, medical research serves as a hopeful avenue toward peaceful coexistence between the free world and communist ideology.

The rapid but steady growth of the National Institutes of Health represents the development of a large-scale medical research program to promote the national interest. Facilitated by bipartisan support, NIH research appropriations have increased 20 to 30 per cent annually (Figure 1). This evenly paced growth pattern has expanded research funds more than thirty-fold since 1947, from \$8 million to \$285 million.

Concomitantly, program emphasis shifted from the infectious to the chronic and degenerative diseases. The scope of medical research broadened to em-

brace the creative energies of men from all fields of science. Increasingly, the study of biological processes utilizes the concepts and methods of the physical sciences. Behavioral scientists also devote their talents to medical research, especially as it touches mental health and related problems of individual and social well-being.

A "NEW" FEDERAL AGENCY EMERGES

Within this milieu, the National Institutes of Health has emerged as the federal agency with primary responsibility for medical and health related research. Beginning with a brief sketch of historical, organizational, and philosophical influences, this article describes NIH experience with research planning and program development in the light of past and present approaches and future problems.

Historical background

NIH is not exactly a "new" agency; its research tradition is deeply rooted in the Public Health Service established in 1798. The Hygienic Laboratory, opened by Dr. Joseph Kinyoun in 1887, preceded NIH as the Service's major research activity. This one-room laboratory expanded into a research organization with separate divisions of chemistry, bacteriology, pathology, zoology, and pharmacology. Its research interests broadened further in 1912 when the Public Health Service was specifically empowered to "study and investigate the disease of man." In 1930, the National Institute of Health was created and took over the functions of the Hygienic Laboratory; it moved from its five-acre site near 25th and E Streets, N.W., in Washington to the 305-acre campus at Bethesda eight years later.

New knowledge resulting from research coupled with public health measures drastically reduced the death toll from infectious diseases between 1900

and 1930. The challenge of the future loomed in the major killers—cancer and heart disease—and the cripples such as mental illness, metabolic and neurological diseases.

Recognizing that research offered the best hope of combating such diseases, the Congress established the National Cancer Institute in 1937. The statute, which served as a prototype for the creation of additional Institutes for other disease categories, empowered the Cancer Institute to conduct and coordinate research, make grants, and provide fellowships and training, and created a National Advisory Cancer Council. These actions marked a break with the past; they gave the National Institutes of Health a key role in the stimulation and support of research aimed at improving the health of the people.

Structure and functions

The National Institutes of Health is one of several bureaus of the Public Health Service within the Department of Health, Education, and Welfare. Its research programs are administered by seven National Institutes which cover the following categories: Cancer, Heart, Mental Health, Arthritis and Metabolic Diseases, Neurological Diseases and Blindness, Allergy and Infectious Diseases, and Dental Research. Each Institute receives a separate appropriation; each conducts intramural and extramural research and training programs. In addition, the Division of General Medical Sciences supports research and training not directly related to any specific disease and operates the Center for Aging Research.

The Director of NIH provides executive leadership, directs programs and co-ordinates the Institutes. In discharging this responsibility he is assisted by a Deputy Director, two Associate Directors—one for intramural research and one for training programs

FIG. 1.

—and three senior staff members in the areas of research planning, administration, and information.

This summary oversimplifies a multifaceted structure. In reality, NIH operates simultaneously in four different organizational contexts: (1) A bureau functioning as the principal research arm of the Public Health Service; (2) a national research institution at Bethesda carrying out what is perhaps the world's most comprehensive medical research program; (3) a major national agency whose policies and programs in support of research through grants and contracts have a far-reaching impact upon the scientific and academic communities. For example, during the past year NIH supported more than \$140 million in research grants covering about 10,000 projects in nearly 1,000 institutions; and (4) the federal agency responsible for continuing appraisal of research needs related to human health and disease as well as opportunities and resources required to meet those needs.

While the character and scope of research planning differ markedly for each of these organizational contexts, the basic philosophy remains constant.

Basic philosophy

Research planning at NIH seeks to maximize the creative potential of the limited supply of high-quality scientists. This basic philosophy encourages the scientist to follow his own curiosity in search of truth. It assumes that support of men and ideas in an environment conducive to creative effort enhances the probability of significant findings. This view has shaped the development of intramural research. In the extramural grant program, it has fostered terms and conditions of support that nourish free inquiry.

NIH also regards research planning as a totality which encompasses the limiting resources of manpower and facili-

ties as well as the conduct of research itself. This philosophy calls for a continuing appraisal of resources and requirements and the development of programs to: (1) assure an adequate supply and improve quality of scientists in all fields which are basic to medical research and (2) help provide the costly, complex research facilities required to advance the frontiers of knowledge.

WHO PLANS WHAT AND HOW

Planning at NIH has evolved as a continuous, flexible, adaptive process. It has to be because plans are influenced by the fusion of so many forces: Congressional interest and understanding, executive branch policies, values and views of the scientific community, attitudes and actions of lay groups concerned with specific diseases, recommendations of advisory groups, the vision and strength of NIH staff at all levels, and the leadership of three men who share administrative and political responsibility—the Director, NIH; the Surgeon General, Public Health Service; and the Secretary, Department of Health, Education, and Welfare. As a consequence, NIH research planning has developed as an integral part of the politico-administrative life of a growing organization, not as an isolated, autonomous study process.

In large measure, the Congress sets the goals by creating separate Institutes which focus upon specific diseases or health problems; it establishes priorities and allocates resources through the annual appropriation and accompanying reports. Within this framework, administrators and scientists possess considerable latitude for planning and program development. The problems they face vary substantially, however, for each of four major areas: intramural research, extramural grant support, target research, and over-all planning for the future.

Intramural research

The problems which NIH has experienced in its intramural research programs prevail in most large-scale research organizations.² First, NIH has sought to attract creative scientists, to give them adequate assistance and research facilities, and to provide an environment conducive to productive effort. The second set of problems involves the translation of statutory missions such as "to conduct . . . research . . . relating to the cause, prevention, and methods of diagnosis and treatment of heart disease . . ." into specific programs. Third and thorniest is the reconciliation between the freedom essential for productive inquiry and the planning, direction, and control which any large-scale organization must exercise to assure responsible performance. Problems such as these are not "solved"; they are worked at and lived with.

The Director and his staff play a role with respect to the level of effort, broad areas of investigation, and general direction. The degree to which the Director's office influences the substance of research fluctuates among institutes and over time.

Scientists determine the substance of the intramural research program within the constraints imposed by available funds, talent, space, and time. These decisions hinge upon judgments of research needs and opportunities, state of knowledge, and particularly the scientific interests and competence of the staff on hand.

The broad scope of "heart disease," "cancer," "mental health," and other fields confers ample discretion for the development of specific research pro-

² For an excellent, comprehensive discussion of NIH experience which is as pertinent today as when it was written, see W. H. Sebrell and C. V. Kidd, "Administration of Research in the National Institutes of Health," *Scientific Monthly*, Vol. LXXIV, No. 3 (March 1952).

grams and projects. Moreover, because history has demonstrated that fundamental inquiry accelerates understanding of basic disease processes, research is not narrowly confined to the diseases associated with each Institute.

At each successive layer, the scientific director, laboratory chief, section head, and so on, allocate resources and determine the degree of freedom for those beneath them. Freedom is not inherent in the individual's status as a scientist but is an earned right. NIH policy is to provide the degree of freedom consonant with the scientist's performance and promise. This evaluation is crucial because men, not projects, govern research productivity.

While informal peer judgments influence this appraisal, regularly scheduled promotion reviews furnish a more systematic evaluation of research accomplishments. In addition, an annual review of intramural research begins with the individual investigator, progresses through successive levels, and culminates in a document which serves as a springboard for the discussion of future and continuing research plans.

In addition to the assessment of men, another problem plagues most research organizations: How to identify changing needs, new opportunities, and shifts in scientific promise and how to modify research content accordingly? To provide a fresh and uncommitted appraisal, NIH utilizes boards of scientific counselors, drawn from the nation's top scientists. These groups review the intramural research program semiannually and make their recommendations for consideration by the Scientific and Institute Directors and the Director of NIH.

Extramural research

The National Institutes of Health invests eighty cents of its research dol-

lar in extramural research. Moreover, this investment has increased to the point where it now comprises a significant proportion of all federal research expenditures in academic institutions (Figure 2).

Despite this rapid but steady growth, the fundamental principles adopted in 1945-1946, when NIH agreed to take over the active contracts of the Office of Science Research and Development's Medical Research Committee, continue to govern extramural research planning and program development. These principles are: (1) support of the best men and most promising ideas will produce

the new knowledge required to combat disease and improve health; (2) the best men will seek support only if NIH gains and holds the respect of the scientific community; (3) support for the best men and ideas is most likely to emerge from open competition based upon scientific merit; (4) the judgment of one's scientific peers provides the wisest and fairest method for evaluating scientific merit, promise, and feasibility; and (5) terms and conditions that assure reasonable stability of support and foster freedom and flexibility for the investigator will facilitate productive inquiry.

The first step toward translating principles into action occurred in 1946 with the establishment of study sections organized around scientific disciplines, such as biochemistry and physiology, and problem areas, such as mental health and radiation. Composed of eminent scientists drawn from the scientific community, these study sections review all applications for research support in their particular discipline or problem area and assign priorities based upon scientific merit, promise, and feasibility.

The next level of review consists of eight twelve-member National Advisory Councils, each composed of six specialists in the appropriate medical field and six outstanding experts in fundamental science and public affairs. No grant may be made unless recommended for approval by a Council. The Councils also deliberate and advise on broad issues and policy questions.

Thus, with some significant exceptions, the substantive content of the extramural grant program is *not* planned. It emerges from the interaction of the research interests of qualified investigators and peer evaluation of scientific merit. Clearly, the scientific community plays the dominant role in shaping the content of the extramural grant program.

Target research

There are, however, significant exceptions where conscious planning supersedes purposeful nonplanning. The stimulus for conscious planning and direction may come from the scientific community, from NIH staff, from Congress, from health groups, and, most likely, from a combination of these sources. Conscious planning is essential to:

1. Nourish new fields of science. Study sections survey the status of research in their field to ascertain current emphasis and future needs. Biophysics is an excel-

lent case in point. The survey of this nascent field concerned with the relationship and interaction of matter and energy in life forms took several years, involved scientific leaders throughout the world, and resulted in specific recommendations to Congress, study sections, Councils, and NIH staff, and culminated in programs to stimulate research and expand the critical resource, trained manpower.

2. Identify and remedy gap areas. As the proportion of older persons in the population rises, the need for more intensive study of the physical, biological, and social aspects of the aging process becomes more acute. While several of the Institutes had long supported some research on various aspects of gerontology, NIH staff and Advisory Councils recognized the need for a concentrated, comprehensive approach. To provide a focus for such an approach, the Center for Aging Research was established in 1956. The program has grown since then, particularly through grants to non-federal research centers for long-term multidisciplinary studies.

At the opposite extreme of the life cycle, we find that more research is badly needed on the problems of perinatal morbidity and mortality. Because even a slight reduction in the mortality rate would yield substantial individual and social benefits. NIH has planned and initiated a nation-wide collaborative study of these problems.

3. Accelerate break-throughs. The evidence that virus can cause cancer in animals has been well established and scientists have developed vaccines that protect mice and chickens against virus-induced malignant tumors. Because scientists feel that the present state of knowledge seems ripe for a break-through, the Congress earmarked an additional \$4 million for research to determine whether viruses cause human tumors.

4. Evaluate intensively new methods of diagnosis or treatment. The primary illustration is the cancer chemotherapy contract program created by Congressional directive in the 1957 appropriation. It represents a highly organized program for screening and testing chemical therapeutic agents. It is altogether possible, however, that the scientists involved in this intensive effort may

stumble upon new knowledge of a fundamental character outside the target area.

In summary, because of these widely divergent approaches to the support of extramural research, the program represents a balance between: (1) the spontaneous interests of individual scientists and (2) organized effort designed to meet specific needs and opportunities considered sufficiently vital to the nation's health to warrant central planning and direction.

Stability versus flexibility

When research planning focuses upon policy rather than substantive content, the scientific community participates but does not control. NIH staff consults with study sections and Councils in planning for terms and conditions that nourish free, creative inquiry. Policies have encouraged grants for broader areas of investigation and for longer periods, three to seven years, thereby promoting greater stability and flexibility for the investigator.

These policies commit a substantial share of each year's program for a minimum of two years ahead. Rising research costs offset the apparent flexibility achieved by terminations and continuing evaluation. Consequently, program development must take place at the margin in terms of support for new men and ideas.

This fact is often overlooked in headlines publicizing NIH appropriations. However, NIH must plan for annual increments adequate to support a reasonable proportion of *new men and ideas* if the nation is to benefit from the constantly expanding supply of scientists seeking support for medical research.

Over-all planning

As research expenditures have expanded and program interests have

broadened, NIH responsibilities for over-all planning have grown with respect to the nation's total medical research effort. Ideally, over-all planning seeks to: (1) achieve desirable balances among competing objectives; (2) formulate long-range plans for future growth; (3) develop policies which will facilitate the attainment of these balances and plans; and (4) adjust and modify programs in consonance with this over-all framework, taking into account shifting scientific opportunities and health needs, changing economic and social conditions and pressures, and political realities.

In its over-all planning, NIH has become increasingly conscious of the dilemmas of balance. One of the early problems was to strike a desirable equilibrium between the intramural and extramural research programs. Another problem was to reconcile freedom for the investigator with specific disease missions. What relative emphasis should be given to today's research, construction of tomorrow's facilities, and training research scientists for the decade ahead? How should research funds be allocated between the advancement of new knowledge and the rapid translation of existing knowledge into practical application? How can NIH achieve a better balance between its research objectives and its broader responsibility for strengthening the nation's institutions dedicated to education, research, and medical care?

Questions such as these necessitate planning and continuous re-evaluation. The NIH experience has divined no magic solution to these complicated issues. It has, however, demonstrated the need for better long-range planning to provide a perspective for viewing these issues within a framework of probable future developments.

Long-range plans for the future growth of medical research rest upon assumptions which take into account a host of

variables such as population and economic growth, the prospect of substantial scientific achievements, the enlarging horizon of investigation and the penetrating depth of inquiry, the long lead-time required for training of manpower and construction of facilities, and the growing internationalization of the scientific community. The development of such assumptions requires a steady flow of relevant data and systematic analysis of all factors bearing upon the nation's resources and requirements for medical research. In 1957, the Resources Analysis Section was created to perform this function within the Office of Research Planning which has rendered staff assistance to the Director on policy-planning matters since its inception in 1949.

Long-range plans estimate the future level of medical research, approximate the resources required, and assess the feasibility of alternative courses of action designed to assure their availability. Because foundations, voluntary health agencies, unorganized private giving, corporations, and the states play such a vital role in the financing of medical research, these plans contain assumptions about the level of future support from nonfederal sources. This does not imply a parity formula for freezing the federal share in perpetuity. On the contrary, long-range plans assume that the federal share should be responsive to the rapidly changing needs of society and shifting scientific opportunities.

Long-range plans often connote fixed goals and a static situation between the present and the distant future. However, by a continuing appraisal of the situation as it exists rather than as it might have been, plans can be revised in the light of changing conditions. Such an appraisal necessarily calls for a look ahead at the problems that NIH

must meet in planning its programs for the future.

A LOOK AHEAD

Most of the problems of the next decade are already of immediate concern. These problems relate to the rate of growth and level of medical research expenditures, the challenges beyond the chronic diseases, the shifting policy focus from the individual investigator to the institution as a whole, the strengthening of the nation's research structure, increased emphasis upon co-operative research on an international scale, the financing of medical education and the quality of its product, and the adaptation of organization and management to cope with these problems.

The level of research expenditure

Many unpredictable factors will influence the future growth of medical research. However, assuming continuation of past trends, health research expenditures may again increase four-fold or more within a decade, reaching \$2.5 to \$3 billion by 1970. Achievement of such levels will demand substantial enlargement of resources, both manpower and facilities. Federal support seems essential to assure the availability of these resources needed to fulfill the national interest.

Beyond the chronic diseases

While the leading causes of death, heart disease and cancer, will continue to receive top priority, we can look for a steady broadening of research in many directions. A society geared to maximizing its potential in the continuing struggle for competitive coexistence will demand research in the etiology and prevention of accidents, the leading

cause of death during the first years of life. More research is also needed on those diseases that diminish individual and social productivity, for example, virus respiratory diseases. An increasingly urbanized, industrialized society will support more research on environmental health hazards. Fundamental research will receive increased support to gain greater knowledge and understanding of the basic biological, physical, and social structure of man.

The institution as a whole

The support of individual investigators on a project-by-project basis gradually accumulates into a research "program" for an academic institution, hospital, or research institute. The criterion of scientific merit is adequate for evaluating applications from individual investigators; it will not suffice when one considers the impact of an agency's grants upon an institution as a whole.

To meet this problem, NIH needs new and better ways for dealing with the institution as a whole. Why? Because NIH programs now constitute the primary source of research support at many institutions; because the cumulative impact may strain the institution's teaching capabilities, may weaken its control over its own destiny, may impose unforeseen financial burdens; because NIH desires to foster the more effective integration of research, education, and service; and because NIH aims to strengthen the resources, independence, and integrity of academic institutions, recognizing that a nation's research potential is relative to the quality of its educational system.

Consequently, NIH is actively exploring ways and means for dealing with the institution as a whole. One way would be to secure institutional participation in the policy and program planning process by expanding the advisory structure

which now provides representation for fields of science through the study sections and for national attitudes through the Councils. A complementary approach would use institutional research grants to furnish fluid funds and thereby better enable the institution to guide its own destiny.

Strengthening the nation's research structure

The NIH programs for support of research, training, and research facilities have greatly strengthened the nation's research structure. Looking ahead, one can see clearly the need to create regional biomathematical and electronics applications centers, environmental health research centers, germ-free life laboratories and similar, costly, specialized research resources becoming increasingly strategic for advanced biological investigation. A recent report of a good ad hoc advisory group to the Secretary of Health, Education, and Welfare recommended regional dispersal of such facilities so that they might serve many institutions and areas of inquiry.³ In this connection, the Congress has directed NIH to report upon the need for such facilities, including a thorough exploration of financial requirements.

The weaker institutions constitute another less dramatic but vital deficiency in the nation's research structure. The competition of excellence yields scant benefit to those who require substantial nourishment before their potential can be realized. Indeed, as in all walks of life, those with an advantage tend to increase it; faculty, funds, students, facilities all flow toward institutions with research reputations. More imaginative

³ *The Advancement of Medical Research and Education*, Final Report of the Secretary's Consultants on Medical Research and Education (June 27, 1958).

mechanisms and new criteria must be conceived to build up the marginal producers in our national research and intellectual structure.

International research programs

In his 1958 State of the Union Message, President Eisenhower called attention to the need for expanding medical research on an international scale. Legislation introduced by Senator Hill to establish a new Institute for International Health and Medical Research within the NIH framework passed the Senate on May 20, 1959, and is now being considered by the House. Follow-

ing the recent visit of Premier Khrushchev, the Ministry of Health of the Soviet Union and the United States Public Health Service signed an agreement expanding the medical exchange program between the two nations. These developments augur increased emphasis upon co-operative research on an international scale; when realized they will greatly expand both the resources and scope of medical research. Recognizing the shape of things to come, NIH is exploring the needs, the nature of the arrangements which will be required, and the diverse and complex problems which can be anticipated in the administration of a truly world-wide program.

What Federal Funds Mean to the Universities Today

By JOHN C. WEAVER

ABSTRACT: The accomplishments of higher education, regardless of their local significance, have been justifiably swept into the public consciousness as matters of grave national concern. As a result, federal aid to our universities and colleges has arrived, and clearly arrived to stay. Neither theoretically nor practically is there anything basically wrong with the concept of such federal aid; indeed, it has become prerequisite to the future growth and attainments of higher education. As things are presently constituted, federal aid is in a position to influence directly the conduct and development of higher education along two basic lines. One of these is through the powerful range of support flowing into our institutions under the multifarious arrangements of sponsored research; the other is through fellowship and loan aid to students, and other provisions of the National Defense Education Act. There can be little argument that our universities and colleges need this help, but it is bringing with it a whole new way of academic life, and there are a variety of influences calling for thoughtful caution and wary appraisal as the transforming tide rolls over our scholarly community.

John C. Weaver, Ph.D., Lincoln, Nebraska, is Dean of the Graduate College and Research Administrator at the University of Nebraska. A geographer by profession, he was for ten years on the faculty of the University of Minnesota, and before undertaking his present assignment in Nebraska served from 1955 to 1957 as Dean of Arts and Sciences at Kansas State University. He has taught at Harvard University and the University of Oregon and has held research positions on the staffs of the American Geographical Society of New York and of the U. S. Department of State in Washington. He is presently a member of the Advisory Committee for Title IV of the National Defense Education Act.

HOW did your legislature treat you this year?" Wherever men from state-supported universities gather, even as complete strangers, they need never resort to the weather as a subject for an opening conversational gambit. This is the question that will instantaneously provide a point of mutually absorbing and sympathetic contact. Indeed, among those who toil in the vineyards of public higher education, and rather particularly among those involved in the responsibilities of institutional administration, this "clutch" question and its associated implications reveal preoccupying apprehensions and virtually obsessive concerns.

An adequate understanding of this situation and the trend of its development calls for more than the usual analyses of such contributory factors to spiraling institutional operating costs as national inflationary pressures, mounting undergraduate and graduate enrollments, mushrooming research commitments, and necessary physical plant expansions. It demands more than an appreciation of the shortages of well-trained faculty and the frantic scramble for men that are causing universities to plead with their constituencies for higher and higher salaries in order that they can compete effectively with their sister universities around the nation for top-quality professorial services. And what heavily belabored state legislature has not in recent months heard the agonized assertion: "We must have a substantial increase in salary support if our university is to be able to recruit and hold a competent staff."

Perhaps most fundamental of all in the harassment and brow-furrowing consternation of legislator, benefactor, and educator alike is the direction of taxation that is inexorably increasing the concentration of both private and public resources in the federal treasury. Embattled state legislators, closer and

therefore understandably more sensitive to the taxpayer's woes, find their budgets creaking at every joint as competitive pressures for the locally available tax dollar grow in severity. At the same time, the great personal fortunes which initially endowed many of the nation's private institutions of higher learning can no longer form in the face of the powerful prescriptions of the federal income tax laws. Notwithstanding this confiscatory influence, the support of private institutions is being augmented, and increasingly so, by corporate and personal giving in escape of taxes. The need, however, far exceeds the available supply of such donations, in part because of such competition for funds as the establishment of foundations supporting many enterprises other than higher education.

GROWTH OF FEDERAL SUPPORT

If one were to pursue a gross oversimplification of a vastly complex problem, the accomplishments of higher education, regardless of their local significance, have justifiably elicited grave national concern among the people. There is ample precedent for pulling national needs under the sprawling federal fiscal tent on political, if not specific constitutional, grounds. Just as the trunk highway system is an economic burden that can no longer be dealt with at the exclusively state and local level, and just as the excellence of our major highways is recognized as serving far more than local demands, so likewise do the costs of achieving a healthy and necessarily massive growth of the facilities of higher education transcend both the available resources and interests of any single state or local community.

Such, then, are the factors that have been responsible for an enormous growth of federal support to the nation's public and private colleges and universities. In 1940, the federal government pro-

vided \$15,000,000 to the colleges and universities for research and development. Almost exclusively, this was traditional support to the agricultural experiment stations of the land-grant institutions. Less than two decades later, in the fiscal year ending June 30, 1958, federal agencies spent \$440,000,000 for research and development and training in a wide variety of public and private colleges and universities. Every year the total continues to rise. The National Defense Education Act of 1958 is adding many additional millions to the federal subsidy of higher education.

Federal aid to education is here, and clearly here to stay. Neither theoretically nor practically is there anything wrong with the basic concept of federal aid to higher education; indeed, it has become prerequisite to the future growth and attainments of higher education. The Northwest Ordinance and the Land-Grant Act long ago established the precedent, and education developed under their provisions has clearly demonstrated the efficacy of the practice.

There can be little argument that our institutions need this money. Indeed, its availability is adding great strength to our general operations. It is providing the direct support for a major proportion of the research of the faculty. This research is predominantly scholarly endeavor of a type which brings a fresh vitality to the classroom and offers opportunity essential to high staff morale. Federal funds also provide much of the expensive equipment and some of the physical facilities which a university presumably would have no other way of obtaining. Modern graduate education is hereby supported and strengthened in the form of assistantships and fellowships, as well as in the challenging and diverse staff research facilities in which the students can participate.

It is apparent that, as things are presently constituted, federal aid is in

a position to influence directly the conduct and future development of higher education in two basic ways: the powerful range of support flowing into our institutions under the multifarious arrangements of sponsored research, and the fellowship and loan aid to students, and other provisions of the National Defense Education Act.

INFLUENCES ON UNIVERSITY ACTIVITIES

The outside funds received by an institution in support of sponsored research bring influences that touch university activities, and particularly graduate education, at a number of significant points. This rapidly growing program at a level anywhere near the present, has only comparatively recently come in the back door to take up lodging in the academic household. At some institutions the magnitude of the involvement is colossal; in others it has not even been adequately measured. Significantly, however, almost everywhere, people find themselves somewhat uneasy in its sprawling presence.

Perhaps the prevailing state of apprehension derives in the first instance from the fact that the creature is so enormous, so subtle and persistent in movement and growth, that it is extremely difficult to get one's intellectual "hands" on it. One thing is sure. It has brought with it a whole new way of academic life, and although it is far too complex to permit the generalization that it is either "good" or bad," it has had a staggering impact and is bringing tremendous change. Deep concern undoubtedly also arises from a feeling of sheer helplessness in the face of inexorable forces that seem to be sweeping our institutions along in a transforming tide, over which no one has any measurable influence, let alone effective control.

Along with teaching and public service, research traditionally has been ac-

cepted as one of the three primary obligations of a university. Not only does this commitment grow out of the academic values inherent in research itself, but also from the fact that effective teaching and public service are indispensably grounded in research and creative scholarship. According to recent data from the National Science Foundation, two thirds of all research expenditures in our American institutions of higher learning this past year came from federal grants and contracts. The utter dependence of our universities on such governmental aid is now firmly established.

Despite all of the obvious advantages, however, this vast involvement in government-sponsored research is not a completely unalloyed blessing. There is reason for thoughtful caution and wary appraisal of the effects which it is having on the over-all academic effort. As a recent National Science Foundation study rightly emphasizes, we must remember that while the federal agencies have the research and development money to spend, and the universities are willing to accept it, and while both are seeking to operate in the public interest, each group operates in a different area of that interest, and each holds its own distinctive objectives, which in many instances are anything but identical, or even compatible. It is only common sense to be watchful when nonuniversity agencies, whose goals are of necessity not coincident with academically oriented ones, come into a position to influence such basic university functions as research and graduate education.

Certainly no attempt can be made here to explore all of the tangled and crisscrossing avenues of concern which lead out from this central problem, but a selection of them should be given brief mention. As every college administrator well knows, it costs money to accept money. One vital matter to consider,

as sponsored research grants mushroom in number and size, is how far is it feasible to let such developments go before the point is reached where further expansion is more expensive than institutional resources can afford? Accurate and trustworthy measuring sticks are difficult to find. In spite of all of the negotiations that have been carried on over recent years, a majority of universities still seem to feel that the indirect costs of government-sponsored research are not adequately covered by the variously computed overhead allowances which the institutions are permitted to charge.

Most universities are quick to concede that while sponsored research is putting a new and substantial drain on general operating funds, it has brought benefits which more than justify the over-all costs. Nonetheless, the size of the venture continues to increase, and inevitably a critical point must somewhere be attained at which any given institution will be compelled to concede that it has reached a degree of saturation beyond which it is unwise for it to go. The problem of weighing advantages against disadvantages and resources against costs is extremely difficult, simply because most institutions have not developed valid criteria. And added to this circumstance are the seemingly omnipresent motives of expansion and empire-building, which all too often lure various academic specialty enterprises to look with favor upon even the most rigid grants and contracts.

Disproportionate emphasis

Another point of general concern with sponsored research is the manner in which it tends to throw some segments of the academic enterprise out of balance with others. An educational institution is under obligation to maintain strength of scholarship in all of the intellectual fields it seeks to cover, the

social sciences and the humanities no less than the natural sciences. Because many of their objectives are particular and legitimately different from those of a university, government agencies have placed 95 per cent of the nearly half billion dollars of research money given to universities in the natural sciences. This presents the university with some fundamental problems in providing equality of opportunity and sound morale throughout its operations.

Significantly and fortunately, the men in the natural sciences are as worried about the "have not" areas in the academic scene as anyone. Adequate support of the social sciences and humanities, in the presence of this overwhelming subsidy of science and technology, is a troublesome and difficult matter. To be sure, the thoughtful distribution of research support from the internally derived funds of an institution can do something to alleviate this situation, but it is only a comparatively small number of the financially strongest schools that have sufficient available resources to achieve the proper balance. And all too clearly, unfortunate discrimination is a problem not only in the area of research opportunity, but in the adequacy of the support for teaching facilities and existent academic salary rates as well.

Unhappily, this growing state of imbalance is, at least potentially, even more severe than on the surface it appears to be. If, as is so widely claimed, the government research grants do not carry sufficient overhead to pay the costs incurred by the university in handling them, and the institution is therefore forced to dip into its basic operating funds to make up the difference, those areas which have no direct outside support stand to lose a second time around. It was in recognition of these very problems that the Canadian government made a major appropriation

designed to give compensatory aid to the nonscience divisions of their universities. One is strongly tempted to believe that our own federal Congress should give consideration to the same proposition.

It is this area of concern that likewise causes one to wince over the National Defense Education Act provision which largely restricts loan funds to undergraduate students who wish to pursue programs in science or technology. As the 1958 Parliament of Science conducted by the American Association for the Advancement of Science last March so rightly emphasized, "Efforts to advance science at the expense of other fields of learning (will) harm all fields of learning and the society they serve."

Direction of research activities

Aside from the types of financial problems already noted, there are a number of other questions raised by our sponsored-research activities. One issue centers around the effect of these funds on the faculty. A university is anxious to have a staff member pursue those basic lines of scholarly inquiry which are strictly of his own choosing. No academic administrative officer would think of telling a member of his faculty what specific program of research he should undertake. Yet, with money to offer in support of some lines of investigation and not in others, government agencies are in a position to wield a powerful and dangerous influence in "directing" the research activities of many of our scholars. The practice in some institutions of permitting extra salary compensation from research grants or contracts can place an especially unhealthy monetary lure before the staff. This may well result in specific research projects being selected for economic reasons rather than, as should be the case,

because of intrinsic intellectual or academic merit.

Not only do we have reason to take a dim view of the possibility of direction *per se*, but should we not also be watchful lest the immediate practical ends of those in a position to make grants of money do not too often divert many of our able scientists and technologists into routine programs of testing and development, when by inclination and ability these men are equipped to do, and by definition of the university idea should do, fundamental research? According to the National Science Foundation, the federal government devoted approximately three billion dollars to the support of research and development work of all types during the fiscal year 1958. Of this amount some 63 per cent is estimated to have been devoted to the conduct of development activities, 29 per cent to applied research, and a relatively small, remaining 8 per cent to basic research. Predominant among these over-all expenditures were applied research and development associated with products, systems, and processes related to defense or defense-oriented programs of specific practical concern.

Because differences of opinion are inevitable in defining the essential character and purpose of many projects, it is extremely difficult, if not patently impossible, to achieve an accurate breakdown of the \$440,000,000 of research and development funds spent in the colleges and universities during the fiscal year 1958. The National Science Foundation estimates, however, that probably not more than one third of the funds spent in the academic institutions could justifiably be categorized as basic research—study prompted by no more than scholarly curiosity—the pursuit of which generally has no immediately foreseeable practical utility. As two thirds of all academic research funds are now derived from these federal sources, the

de-emphasized position of the fundamental search for truth for its own intrinsic sake is an element in the scene that can be ignored or defended only at our great peril.

The institution of higher learning should always be held essentially inviolate as the primary bastion of pure scholarly inquiry. It is the place of the industrial or government laboratory or the private research institute to develop and apply the research. The initiative of the university and its faculties should be roving the far, creative, and theoretical horizons of knowledge, the frontiers where the new ideas and principles are born that two decades hence will be appearing on classroom blackboards. The business of the university is those fundamental truths upon which non-collegiate workers of another generation will base their developments and applications.

We must not permit the academic preoccupation with the attainment of such priceless insights to be overwhelmed or subverted by the restraining, inflexible demands of momentary expediency. The mandates of a handful of governmental agencies such as the National Science Foundation fortunately permit an increasingly effective and desirable weight to be thrown into these scales, but the essential incompatibility of the unique obligations of the academic community on the one hand, and the pressing needs of the federal agencies on the other, must be clearly seen for what it is, if we are not to do irreparable damage to our collegiate highroad of intellectual advance.

Institutional diversity

Truly, one of the greatest strengths of American higher education is the diverse character and behavior of the institutions that comprise the system. An even casual acquaintance with the universities and colleges of the United

States gives the observer a profound sense of the existence and critical significance of the essential uniqueness of the individual institutions. Each university has evolved its own peculiar personality. Each has developed by circumstances unique in place and time. Each bears the distinctive imprint of the men who have shaped its traditions, points of view, and goals, and the methods and customs designed to achieve them.

As one travels among the universities, one finds that certain common problems and aspirations reveal themselves with impressively consistent regularity. Generally applicable or widely accepted solutions are much harder to obtain. Indeed, it is clearly dangerous in the extreme to assume that a satisfactory solution hammered out within the personality of one institution will be wise or workable in another.

In any event, surely we stand to maximize our ultimate achievements by sustaining this highly diverse approach to our problems. Herein lies a basic resource of immeasurable value in accomplishing our common objectives. Whatever long-term effects federal aid may have, higher education must be watchful that its omnipresence shall never serve to routinize or standardize this diversity.

Effect on graduate students

In the relations of sponsored research to graduate education, there are a group of interrelated matters that must not be overlooked or minimized. Grants commonly carry provisions for research assistantships which can be made available to graduate students, usually on the basis of part-time employment. The positive values of these aids are obvious enough. In many instances, they represent the financial support which makes it possible for an able student to be in the graduate school. Beyond that, the

intimate involvement of such students in the research program of a mature scholar of the faculty has clearly discernible values for the person being trained for investigative work.

But there are negative forces in the situation, too. An essential ingredient of learning in research is experience in finding and delimiting a problem, and then in preparing an effective design for its solution. All too often, in aiding a faculty member with a broad, sponsored research commitment, students are permitted to satisfy their thesis requirements with work done as an assistant on a small segment of a large current project. This procedure, unfortunately, can rob the student of the independent selection of his own research problem. He may well have been drawn into a problem primarily because of the availability of financial support, and he may have had little or nothing to do with the definition of the problem and the basic approach to its solution. Graduate students, like staff, certainly should not be directed into specific lines of research activity solely by monetary inducement.

There is yet another element in this situation which is a matter of inevitable concern. At best, we have as a nation only a limited number of men of high-level creative talent in the sciences and technologic arts. Because a large proportion of these men are found on university faculties, the government and other nonacademic agencies are seeking to "job out" their ever increasing number of problems to the academic establishment. While faculty members are encouraged to engage in research, they also have their primary commitment to teaching and the training of the professionals who are desperately needed in enlarged numbers to meet the demands that lie ahead.

If the able research people of our universities become so encumbered with

specific project work that they are largely unavailable to students, no matter how important and urgent the investigation may seem to be, a real question of the long-run national interest is clearly involved. Many an outstanding teacher is failing to plant the invaluable seed for another generation of scholars, simply because some government agency believed his research services were indispensable to their immediate purposes. We must protect the basic educational resources of our institutions of higher learning from extensive internal decimation of this type. Whenever plans appear which will remove an outstanding professor from the classroom and seminar table, we have an obligation to take a long look at whether the research results will weigh as heavily in the scales of posterity as will the Ph.D. students he will train and who will carry his multiplied skills and insights into the future.

"NEW OR EXPANDED" PROGRAM

Perhaps the problem having the broadest and most significant implications among all of the matters affecting graduate education has to do with the scope of our institutional resources and the wise and efficient use of them. The National Defense Education Act of 1958 specifically and restrictively provides support for "new" graduate programs and the "expansion" of old ones. This action would appear to be based on what is almost certainly a wholly erroneous presumption concerning existing capacities to handle graduate students. There is abundant and persuasive evidence that the top fifty graduate schools of the country could as a group, with a reasonable distribution of enrollment, double the total number of graduate students, at present levels of instructional quality, without major expansions of either staff or physical equipment.

To be sure, the graduate schools of a

handful of outstanding institutions have reached or even exceeded the saturation point in some fields, but the universities with broadly established and soundly operated graduate programs in which there are actual shortages of well-qualified advanced students are far larger in number. Unquestionably we need to locate and recruit a much higher percentage of the intellectually capable people who can profit by postbaccalaureate work, but what sense does it make to confine federal fellowship aid to those students for whom a given university can claim to have devised a "new or expanded" program? Surely an overwhelming majority of the people who should be attracted into graduate work would profit most from following already established standard sequences. It is of transcendent importance that we distribute any expanding enrollment on a basis consistent with present, or only moderately extended, institutional capacities to train them.

The compelling need is the stabilization and strengthening of graduate efforts already in existence, rather than the more widespread promotion of new activities. And if federal aid is to be extended to graduate education, why should it be given only to the students? Urgent and defensible as fellowships for prospective graduate students are, the graduate schools themselves merit direct aid, and not just in the oblique manner of erratically distributed and unpredictable cost-of-education payments for students who may be attracted by "new or expanded programs." What validity can there be to the philosophy of increasing graduate enrollment, without simultaneous concern for the institutions that are to receive the students and which wish to raise the basic quality of their offerings?

There is a genuine need for substantial and continuing block grants to graduate schools which they may uti-

lize at their own discretion in the bolstering of staff, the extension of library and equipment facilities, and even the improvement of space. Present legislation being what it is, a university can neither provide a place for students receiving federal fellowships, nor can it become eligible for any aid itself, unless it is fortunate enough to have surplus internal funds with which genuinely to extend its over-all operations, or desperate enough to succumb to the temptation to establish "phonies" or "gimmicks" which can, on paper, pass the scrutiny of the appropriate authorities in Washington.

As the large and financially strong schools grow larger and need more staff, they draw the best individuals they can find away from the smaller and more modestly supported institutions. Not having the financial resources to hold their top people in this frantic competition for talent in a market of short supply, the academic strength of the less wealthy institutions grows steadily weaker and the number of graduate students they can attract progressively dwindles. The long-range result is all too easy to envision.

Surely the last thing the institution of traditionally good quality but modest resources should be encouraged to do in this sort of environment, is further to

extend its operations. Many, if indeed not most, schools need to bring all available resources to bear on maintaining quality in the areas they have already chosen to develop. The present federal legislation which calls upon a university to embrace additional operations, clearly invites a thinning out of existing resources and may result in ultimate modicrity, or worse, throughout the institution.

The already large and rich universities have a vital stake in the well-being of the smaller and less wealthy institutions. Many universities have an important role to play in the total national effort in graduate education, if only they can be given aid to accomplish their mission. We should, therefore, encourage them with material aid to remain, as they have sought in the past to be, strong in specialties of their own selection. Let us then ensure that their thoughtfully developed capabilities are fully utilized. Is this not wiser than to promote the indefinite expansion of a few famous graduate centers, or the costly creation of a new array of competing ones in colleges not now in the business at all? Many a respected graduate school and university is in a fight as urgent as survival itself. We cannot afford to let them lose the struggle.

The Role of the National Science Foundation

By ALAN T. WATERMAN

ABSTRACT: The National Science Foundation was established as an independent federal agency by Act of Congress in 1950. The general purpose of the Foundation is the support of basic research and education in the sciences. Its significance lies chiefly in the recognition by the federal government of the continuing need for the support of science as a peacetime measure, following the striking demonstrations of the applications of science to warfare.

The National Science Foundation is expected "to develop and encourage the pursuit of a national policy in support of the sciences." It holds the view that such policy must be developed with the co-operation of the scientific community, with due regard to governmental interests. Sound bases for policy development are laid by periodic surveys of research and development among colleges and universities, industry, government, and other research organizations. Recommendations combining national policy and the role of the federal government in the support of science are made to the President.

The major programs of the Foundation comprise support of basic research by grant, the award of fellowships, both pre- and postdoctoral, to senior scientists and science faculty, and support of student and teacher training.

Alan T. Waterman, Ph.D., Washington, D. C., is Director of the National Science Foundation. During World War II he served as Vice Chairman of Division D and Assistant to Member, National Defense Research Committee. From 1943 to 1944, he was Deputy Chief and in 1945 Chief of the Office of Field Service, Office of Scientific Research and Development. At the close of the war, Dr. Waterman went to the Office of Naval Research as Deputy Chief and Chief Scientist. He is a graduate of Princeton University. Dr. Waterman was for many years a member of the Department of Physics of Yale University.

THE role of the National Science Foundation in relation to government and science can best be understood when viewed against the general background of federal support of basic research.

Government support of research and development by contract with outside academic and other nonprofit institutions began during World War II as a result of the government's need for the quick solution of a wide variety of scientific and technical problems. It was initiated by the Office of Scientific Research and Development (OSRD). As the war drew to a close, the President sought from the Director of the OSRD, Vannevar Bush, suggestions as to how the techniques and research experience developed by the OSRD could be used for the national welfare in the days of peace ahead.

In his report to the President, *Science the Endless Frontier*, Dr. Bush strongly advocated the creation of a National Science Foundation, but five years of Congressional debate ensued before the National Science Foundation Act of 1950 was enacted into law.

ORIGINS

In the meantime, the notion of the government's contracting for the performance of research directed to the solution of specific problems expanded to include the support of so-called "basic research," that is research in which the principal motive is the advancement of scientific knowledge. Policies and procedures for the support of original and imaginative research in the colleges and universities were evolved by the Office of Naval Research, established by Congress in 1946, and a support program by means of grants was started by the United States Public Health Service in the field of medical research.

In 1947 the newly established Atomic

Energy Commission began a program of research support, and somewhat later the Army and the Air Force initiated similar programs.

These agencies adopted the practice of providing support to research projects at colleges and universities on the basis of proposals submitted by the interested scientists with the endorsement of their institutions. Projects were selected for support on the basis of the scientific merit of the problem proposed, the competence of the investigator, and relevance to the interests of the agency. As a general rule, the agency was aided in the selection process by expert consultants or advisory groups of scientists. Each agency provided support by the means available to it, for example, the military agencies by contract and the Public Health Service—later the National Institutes of Health—by grants. When the National Science Foundation began to operate in 1951, support of basic research by the federal government at nonprofit institutions was probably around \$75 million.

The Foundation was created by Congress in 1950 to meet the need for a federal agency to develop national policy in science, serve as a focal point for the support and encouragement of basic research which is carried on largely in the universities and for the training of young scientists. Its principal statutory functions included the following:

To develop and encourage the pursuit of a national policy for the promotion of basic research and education in the sciences.

To initiate and support basic scientific research and programs to strengthen scientific research potential in the mathematical, physical, medical, biological, engineering, and other sciences.

To appraise the impact of research upon industrial development and upon the general welfare.

To award scholarships and graduate fellowships in the mathematical, physical,

medical, biological, engineering, and other sciences.

To evaluate scientific research programs undertaken by agencies of the federal government, and to correlate the Foundation's scientific research programs with those undertaken by individuals and by public and private research groups.

To foster the interchange of scientific information among scientists in the United States and foreign countries.

In fulfilling these responsibilities, the Foundation has considered its first objective to be the strengthening and encouragement of basic research. After careful consideration, the decision was made to support such research in the same general manner as other agencies, that is, by the support of individual research projects in response to requests. A guiding principle has been to ensure that the Foundation's research programs have the endorsement of the nation's scientists, and to this end liberal use has been made of individual consultants and advisory panels.

POLICY FUNCTIONS

The number and variety of federal research programs prompted the Foundation to consider the responsibilities of the several federal agencies which support extramural research and development in the sciences; its primary recommendations were contained in an Executive Order of the President in 1954. The Foundation, the Order states:

shall . . . recommend to the President policies for the promotion and support of basic research and education in the sciences, including policies with respect to furnishing guidance toward defining the responsibilities of the Federal Government in the conduct and support of basic scientific research.

The Order further directs that the Foundation shall be increasingly responsible for the support of general-purpose basic research but recognizes, also, the importance and desirability of

other agencies conducting and supporting basic research in fields closely associated to their missions. The Foundation is not expected to have responsibility for the applied research and development programs of other agencies, and each agency is accountable for the scope and quality of its developmental effort.

The Foundation's mission with respect to research is primarily the support of a comprehensive program for basic research aimed at encouraging the research most significant to the advance of science in each field. The Foundation also encourages distribution of support—among small as well as large institutions, on a wide geographic basis, and with special attention to promising young investigators. It endeavors, also, to strike an optimum balance among the various fields of science.

Comprehensive surveys

As background data for its own research programs and for policy formulation concerning the role of the federal government in the support of science, the Foundation established a series of studies of the nature and extent of the national effort in research and development. A comprehensive survey was undertaken, for the years 1953–54, of the research and development effort at colleges and universities, industrial laboratories, foundations and other nonprofit institutions, nonprofit research institutes and commercial laboratories, and cooperative organizations. These studies were in addition to the Foundation's analyses of the support of research and development by federal agencies published annually in *Federal Funds for Science*. The whole series carries out the directive in the Executive Order "to make comprehensive studies and recommendations regarding the Nation's research effort and its resources for scientific activities. . . ."

The 1953–54 surveys are now being

repeated in order to measure again the national research and development effort in terms of dollars expended and numbers of persons employed, and to make comparisons with the earlier year. The results of present studies will be useful in discovering trends.

The most striking fact that has emerged from the Foundation studies is the magnitude of the total national research and development effort, which, according to preliminary estimates, is now more than \$12 billion annually. Also impressive is the rate of growth, which has more than doubled in half a dozen years.

As would be expected, colleges and universities have the most important role in the conduct of basic research. In terms of dollars, almost one-half of the nation's basic research is carried on in colleges and universities. However, educational and other nonprofit institutions are the source of only 19 per cent of the funds involved. The government supplies the largest percentage of funds, 48 per cent, with industry providing 33 per cent. In terms of scientific and engineering manpower, slightly over one-half of those engaged in basic research are employed at educational and other nonprofit institutions; about one-third are working in industry; and the remainder, about 15 per cent, in the federal government.

A question that concerns us is how the federal government's contribution to basic research can produce fruitful results without encroaching upon the traditional independence of institutions of higher learning. In the development of policies designed to achieve this end, the Foundation is expected to exert a role of leadership with respect to the government's over-all program of basic research support.

Thus we conceive the real significance of the Foundation to be measurable not only in terms of activities sup-

ported, important as these may be, but as judged by the course and direction of federal support of basic research and its effect upon progress of science in the country as a whole, both in basic research and in training.

RESEARCH SUPPORT

The Foundation is guided by the twenty-four member National Science Board, and the Director, all of whom are appointed by the President. The research support programs are administered by the Biological and Medical Sciences Division and the Mathematical, Physical and Engineering Sciences Division for the natural sciences, and by the Office of Social Sciences for the social sciences. Of the two methods available to the government for providing basic research support—the grant and the contract—the Foundation elected to use the grant because of the freedom and flexibility it allows the principal investigator and his institution in the utilization of funds awarded. Responsibility for the completion of work for which a grant has been made is shared by the institution and the principal investigator, and freedom in the research of the investigator is emphasized.

It should be noted, however, that the research contracts of the Office of Naval Research and the Atomic Energy Commission have been handled in such a way as to afford much the same leeway and flexibility as the grants administered by the Foundation and the National Institutes of Health.

The usefulness of the grant as a mechanism for the federal support of basic research in the universities prompted the Foundation to seek extension of the grant-making authority to other federal agencies. Furthermore, contracts for basic research entail troublesome administrative problems in the disposition of property and equipment acquired in connection with federally sponsored re-

search in colleges and universities to which the government retained title. As a result of the Foundation's efforts, the Eighty-fifth Congress passed Public Law 934, which extends the grant-making authority to appropriate federal agencies and permits them, also, in the case of basic research grants, to vest title to research equipment with the institution, provided such equipment is not needed for government purposes.

Continuity and stability are most important in the support of basic research. This can be achieved in two principal ways: one, by making the grant or contract for a term of years rather than for a single year and renewable; the other, by setting aside a revolving fund for the renewal of grants or contracts when their term expires, without reference to the annual appropriation. The average Foundation grant extends over a two- to three-year period, but a considerable number of grants are made for the five-year period. Several agencies lack authority to make a grant or contract for more than one year; it is hoped that steps may be taken to provide this authorization, thereby helping to provide needed stability in basic research.

Consistently the Foundation has urged, as a matter of federal policy, that in supporting research conducted in institutions of higher learning, agencies of the federal government, if requested, should reimburse these institutions for full indirect costs associated with the direct cost of research supported.

Loyalty issue

"Loyalty" in relation to the support of unclassified research was another issue that called for fundamental policy decision. The Foundation came face to face with the problem during the period of intense national preoccupation with loyalty and security, when the question was raised of federal support to scientists whose loyalty and security

were questioned, even though their research was unclassified. The matter was thoroughly discussed within the context of the grants program and a resolution submitted to the National Science Board.

As approved by the Board in November 1954, the policy is that the Foundation, in its appraisal of proposals for the support of unclassified research, will be guided by the judgment of scientists having a working knowledge of an individual's experience, competence, and integrity. It further states that the Foundation does not knowingly give or continue a grant in support of an avowed Communist or an individual convicted of sabotage or other crimes involved in the nation's security.

Subsequently a Special Committee of the National Academy of Sciences on Loyalty in Relation to Government Support of Unclassified Research considered the whole problem and made its report to the President. In releasing the report, the White House noted that its principles were essentially those which supported the policy of the National Science Foundation. The departments and agencies of the federal government were directed to follow practices consistent with the resolution contained in the report of the Academy's committee.

SUPPORT OF RESEARCH FACILITIES

The growing complexity of modern scientific apparatus has increased commensurately the need for major research facilities. Many of these are too costly for a single institution to procure or maintain without outside support. Examples are wind tunnels, high-energy accelerators and high-speed computing machines. Following World War II, such facilities began to be developed or provided principally by the military services, the National Advisory Committee for Aeronautics, and the Atomic Energy Commission. Gradually, how-

ever, the universities accumulated needs for such facilities to be used for basic research. The National Science Foundation made a study and report of federal policy in this area, entitled *Federal Financial Support of Physical Facilities and Major Equipment for the Conduct of Scientific Research*. It then initiated a program to provide universities with capital facilities for basic research purposes. In the case of nuclear reactors and large computing facilities, universities share the costs.

The Foundation has paid particular attention to astronomy, which, as a typical fundamental science, has had little support from agencies concerned primarily with the applications of science. Two national astronomical observatories are being built that will supplement the overworked facilities of private institutions. The Kitt Peak National Observatory in Arizona, being built and operated by the Association of Universities for Research in Astronomy, will provide an eighty-inch reflecting telescope equipped primarily for application of photoelectric techniques to astrophysical problems, and a unique solar telescope. At the National Radio Astronomy Observatory, a new intellectual center being established at Green Bank, West Virginia, by Associated Universities, Incorporated, an 85-foot radio telescope presently available and a 140-foot instrument under construction will make it possible for astronomers in the United States to have access to large instruments of high precision.

In the biological sciences, field stations have struggled, in the face of inadequate budgetary support, to maintain their position as research units in the universities and colleges. In 1955, the Foundation, acting upon the advice of special advisory groups, initiated a systematic support program for biological field stations and other specialized biological laboratories. Among such fa-

cilities assisted by the Foundation are the White Mountain High Altitude Research Laboratory of the University of California, a Prairie Research Station at the University of Missouri, the Marine Biological Laboratory at Woods Hole, and an international research center, the Naples Biological Station.

What began as a "specialized facility" support program has now been broadened to include the support of the development of graduate-level research laboratories in the natural and engineering sciences. Undertaken on a modest pilot basis in fiscal year 1960, the program is designed to help meet the urgent need of university research laboratories for the physical facilities required by modern scientific techniques and methods. The new program is on a fifty-fifty matching-funds basis.

EDUCATION IN THE SCIENCES

The Foundation has worked to acquire an understanding of the nature and magnitude of the problems that the nation faces in maintaining a supply of competent scientific manpower. The programs that have been developed have been based generally upon the following principles and assumptions:

(1) Quality is of primary importance: The education in the sciences programs has consistently emphasized quality. Selection of fellowship recipients, for example, is based on national competition where ability is the primary factor.

(2) The training of scientists, mathematicians, and engineers is the responsibility of the scientific and educational community: Scholars in all fields of learning have traditionally assumed responsibility for the replenishment of their numbers. The role of the National Science Foundation is one of providing a focal point for federal government concern in science education, and of making available necessary funds to the scientists and science teachers

through their institutions and their associations to accomplish the advances which they agree must be made.

(3) Science education in this era has dual responsibility: The character of our expanding technological society requires that every citizen have enough knowledge and understanding of the substance and the aims of science to enable him to make decisions intelligently. The Foundation's programs stress the importance of imparting adequate knowledge of science to nonscientists, through different kinds of emphasis at various levels in the educational system.

(4) Balance must be maintained between science and other fields of scholarship: Although the Foundation's first responsibility with respect to education in the sciences is to ensure that the necessary level of scientific work can be maintained through the training and support of scientists and engineers, it also feels a moral obligation to guard against overemphasis on science and imbalance in the utilization of our intellectual resources.

The Foundation's programs in education in the sciences are administered by the Division of Scientific Personnel and Education and fall in three principal categories: (1) support of students and advanced scholars in science, mathematics, and engineering, (2) training of science teachers in modern scientific theory and knowledge, (3) development and dissemination of modern and realistic subject-matter materials for instruction.

Fellowship program

A most urgent problem is the support of graduate students and advanced scholars. Those students whose capacity for research and teaching has been demonstrated and who have completed their basic studies should be pro-

vided means to continue their work. The predoctoral fellowship program was the first program established by the Foundation and has grown in accordance with evaluations of the relative need. Currently, the Foundation conducts five fellowship programs, exclusive of two additional fellowship programs designed primarily for teachers. These programs provide support for students ranging from first-year graduate students to postdoctoral scholars engaged in advanced study at the highest levels.

Additional significant numbers of graduate students receive support as research assistants through the Foundation's programs of basic research grants.

Direct Foundation support for individual students has been restricted to the graduate level. The evidence indicates that, with scholarships presently available, students in the upper ten per cent of the classes graduating from our secondary schools are generally able to obtain assistance toward financing a college education. The Foundation has not recommended the enactment of science scholarship legislation because it believes that a scholarship program should not be limited to science and engineering.

Teacher training program

Another important part of our program for education in the sciences involves in-service training of science and mathematics teachers at every level. Probably the best known is the support program for summer institutes conducted by participating colleges and universities. During the summer of 1959, 300 such institutes provided subject-matter training for about 15,000 high-school teachers of science and mathematics. Academic-year institutes enable teachers on leave of absence to take a full year of specially designed

study. Through the in-service institutes, teachers are able to increase their subject-matter knowledge by study at evening or Saturday classes. A new program of summer fellowships for high school science and mathematics teachers supports selected teachers in independent study in their fields of specialization.

Programs of the Foundation for college and university teachers range from postdoctoral and science-faculty fellowships, which provide support for study and research to summer institutes for college teachers and numerous kinds of short conferences and special field institutes. About 6,000 college and university teachers of science, mathematics, and engineering participated in last summer's programs and in the current academic-year programs.

Curricula and courses in mathematics and science have failed to keep pace with the rapid growth of scientific and technological knowledge during the past half-century. To meet this problem, the Foundation has provided support for comprehensive studies, under the aegis of colleges, universities, and professional societies. These efforts are co-operative, enlisting the aid of high-school teachers to ensure that the new materials are prepared in a way that will meet the needs of students.

Under this program, a fundamentally new approach to the teaching of high-school physics is being developed by the Physical Sciences Study Committee, with present headquarters at the Massachusetts Institute of Technology, in which many of the leading physicists of the country are involved. New materials prepared by this committee are being tried out in selected high schools. Another large-scale effort is being made by the School Mathematics Study Group, with headquarters at Yale University where new courses in mathematics for grades seven through twelve are being

developed. A program in biology for elementary, secondary, and college levels is in its beginning stages, and similar efforts are being planned for new course materials in chemistry and other fields.

The Foundation maintains liaison with other agencies of the federal government that have responsibilities in the field of education, particularly the United States Office of Education. The basic methods of approach used by the two agencies are essentially different, and the result has been re-enforcement and strengthening of the total effort.

The Office of Education operates generally through the state departments of education in co-operative enterprises. The National Science Foundation works very largely through the scientific community, dealing for the most part directly with colleges and universities and scientists and science-educators and working primarily with the subject matter of science. To ensure the necessary degree of co-operation, numerous conferences have been held between representatives of the two agencies and by staff members in the operating programs who have common interests. Each agency has an official liaison officer with the other.

CONCLUSION

The foregoing discussion does not cover the Foundation's entire program. Considerable activities in international science and in the dissemination and exchange of scientific information, for example, have not been touched upon. Since it was not possible, in a limited space, to give a comprehensive picture of operations, emphasis has been placed upon activities that have tended to establish policy with respect to the support and encouragement of basic research and education in the sciences by the federal government. Recently, the Foundation published a compilation of

some fifty recommended *Science Policies of a Government-wide or National Character*.

Despite the rate at which the federal research and development effort has grown, the government is now better than ever prepared to manage it effectively. Responsibility is assigned in this way: The National Science Foundation with its National Science Board has the primary responsibility for dealing with policy concerning federal support of basic research throughout the country. The Federal Council for Science and Technology, which reports to the President, deliberates on matters of policy-co-ordination and future planning among federal agencies and makes recommendations regarding federal programs. The President's Science Advisory Committee, comprising nongovernment scientists and engineers, considers important scientific and technical matters in relation to government policy, with special reference to national security. The presence in the White House of the Special Assistant to the

President for Science and Technology makes available to the President at all times advice and counsel on the wide range of scientific and technical affairs.

The past and present degree of strength and effectiveness of federal programs in research and development should not, however, give rise to complacency. It is clear that the potential of the country in science and technology is far from being realized. Both basic research and the education and training of scientists and engineers require a far greater degree of support throughout the country. In order to realize our full potential there must be widespread public recognition, understanding, and appreciation of the importance of intellectual and scholarly activity, and the pursuit of excellence in all fields of intellectual endeavor. Above all, there must develop a determination to accomplish these ends. Only by these means will the United States be capable of leadership and collaboration among the nations of the world in the vast new vistas that science is disclosing.

The Philosophy and Objectives of The National Defense Education Act

By ARTHUR S. FLEMMING

ABSTRACT: Considered in its historical context, the National Defense Education Act expresses a Congressional attitude that has characterized federal legislation in this field from the beginning of the Republic. The variety and scope of its concerns, the number and size of its grants, and its widespread public acceptance indicate that this Act will exert influences beyond and in addition to its specific defense intentions. The National Defense Education Act recognizes that education is a national unifying force, and it regards an educated citizenry as the country's most precious resource. Its ten Titles are designed to motivate the discovery of intelligent and talented young men and women and stimulate them to devote themselves to the sciences, foreign languages, technology, and in general to those intellectual pursuits that will enrich personal life, strengthen resistance to totalitarianism, and enhance the quality of American leadership on the international scene. The Act is also a contract that reasserts the partnership of federal and state governments in education, the former assisting with funds and counsel, the latter exercising full control over their own educational systems and programs.

Arthur S. Flemming, Washington, D. C., has been Secretary of Health, Education, and Welfare since August 1, 1958. From 1948 to 1958, he served as President of Ohio Wesleyan University. He was a member of the U. S. Civil Service Commission from 1939 to 1948. During this period he also served on a number of federal commissions and agencies concerned with government organization and war manpower problems. In 1951 he was appointed Assistant to the Director of the Office of Defense Mobilization and later served as Director. Upon completion of that assignment, he became a member of the Hoover Commission on government reorganization. He is currently a member of the President's Advisory Committee on Government Organization.

THE objectives of the National Defense Education Act have their source in a political philosophy that has consistently characterized federal aid to education from the beginning of our nation's history. This philosophy or, rather, this traditional principle, is based on two empirically derived premises. The first confines federal aid to specific programs devised to help the states solve those problems that bear upon national needs and that surpass the states' capabilities to resolve them unaided. The second asserts the sovereign right of the states to administer educational policies, devise curricula, select textbooks, educate and license teachers, supervise methods of instruction, and in general to maintain, manage, and direct the forms, substance, and tempo of their own systems of public education.

These premises have been constant factors in determining the objectives and scope of every act of Congress in aid of education from the Northwest Ordinance of 1787 to the National Defense Education Act of 1958.

THE GROWTH OF A TRADITION

In our country's formative years, total reliance on local autonomy in the management of schools was a practical necessity. Out of the self-contained and socially isolated nature of American communities in those early years, a unique and powerful sense of local responsibility for the schooling of children developed. Nevertheless, despite this strongly held conviction and the fear of the tyranny believed to be inherent in centralized government, the states accepted numerous grants of federal aid with no consequent loss of autonomy nor diminution of their control.

From the Revolution to the Civil War, the federal government encouraged and financially aided education in the states. It endowed higher and common schools

with lands and granted funds to supplement these endowments. On no occasion did the federal government seek to control public education in the states.

In 1862, under the Morrill Act, the federal government provided an eventual grant of eleven million acres of land for the endowment of at least one college in each state and territory that would provide much needed instruction in agriculture and the mechanic arts. The recipients of the Morrill Act's benefits, the so-called "land-grant colleges," have not experienced any difficulty in maintaining control of their academic programs. Moreover, the extensive public services rendered by these institutions are proof of the enduring value of federal-state co-operation.

This pattern of federal stimulation without federal domination characterized such subsequent legislation as the Smith-Hughes Act and the George-Barden Act, both of which helped the states to strengthen and extend vocational education. It determined the numerous legislative provisions for education during the depression years, the post-World War II provision of tuition and maintenance assistance to veterans under the "GI Bills," and programs in aid of federally affected areas. These were all manifestations not only of the national concern for education, but also of the federal government's recognition of the supremacy of state responsibility.

To guarantee the continuing separation of federal and state functions, the national government must constantly be on the alert to avoid jeopardizing the vital role of pluralism and thus of freedom and experimentation in education. Indeed, if it is to remain true to its proper purposes, the federal government must clearly define and delimit the scope of its educational role through unrelenting scrutiny of the letter and spirit of proposed legislation lest it be

interpreted as permitting trespass on state and local jurisdictional supremacies.

DEMANDS OF THE PRESENT

Present times and immediate circumstances have heightened the national concern for education. In the last half century our society has become an intricate network of diverse but related interests, each dependent on all others for effective functioning.

The obligations of world leadership, the increasing demands of industry and the armed forces for highly trained personnel, the requirements of foreign trade and international diplomacy for personnel having mastery of languages other than their own, and the increasing complexity of our economic and social arrangements have imposed on every school district and on every institution of higher learning insistent demands for a greater quantity and improved quality of educational opportunities and facilities to create an adequate national resource of well trained and intellectually enlightened young men and women.

To help solve these problems and to ease the fiscal burden carried by the states are prime purposes of federal aid to education. Accumulated experience over more than 170 years enables us to perceive that, properly utilized with due regard to state responsibility, federal funds can be useful in many ways to both the states and the nation. The National Defense Education Act of 1958 is an excellent illustration of this fact.

BACKGROUND OF THE LEGISLATION

Marion B. Folsom, then Secretary of Health, Education, and Welfare, appointed a committee to review the recommendations of the President's Committee on Education Beyond the High School and to draw up legislative proposals based upon them. Many of the

provisions of the National Defense Education Act had their source in those proposals.

After the bill was drawn, there still was doubt that it could win Congressional approval. The reception and fate of school-construction bills in the years immediately preceding did not provide an optimistic outlook.

Impact of Sputnik

When Sputnik rose into orbit, it aroused more than incredulous amazement; it was a blow to American pride. Yet, its advent had positive consequences. It awakened and spurred us into rigorous self-examination of our total educational system. This in turn provided an excellent climate for the consideration of the provisions of the proposed National Defense Education Act.

NATIONAL DEFENSE EDUCATION ACT

The National Defense Education Act of 1958 was passed by the Senate on August 22 and by the House of Representatives on August 23. It was signed into Public Law 85-864 by President Eisenhower on September 2.

The Act authorizes a billion dollars in federal aid for a dozen separate programs as described in its ten Titles.

The philosophy of the Act is exemplified in the Findings and Declaration of Policy of Section 101, Title I, which states in part:

The Congress hereby finds and declares that the security of the Nation requires the fullest development of the mental resources and technical skills of its young men and women. . . .

We must increase our efforts to identify and educate more of the talent of our Nation. This requires programs that will give assurance that no student of ability will be denied an opportunity for higher education because of financial need; will correct as rapidly as possible the existing imbalances

in our educational programs which have led to an insufficient proportion of our population educated in science, mathematics, and modern foreign languages and trained in technology.

Title I also emphatically prohibits federal control over the curriculum, program of instruction, administration, or personnel of an educational institution or school system.

Educational opportunities extended

The succeeding nine Titles of the Act are very closely dovetailed. Their relationship is made clear by considering the interlocking contents of the Titles rather than by recounting them in numerical sequence. Moreover, the fundamental significance of the National Defense Education Act as a whole is the more effectively understood if its Titles are reviewed in the context of their unifying purposes. For example, one of the most disturbing educational problems of the day emerges from conditions that force able young men and women to withdraw from high school before their secondary education is completed or to discontinue their education upon graduation from high school. Thus, every year about 200,000 gifted students are deprived of the rewarding disciplines of higher education for which they are eminently well qualified. In consequence, the nation suffers a loss of intellectual competence of incalculable magnitude.

The prevention of such personal and social deprivation is the fundamental objective of the National Defense Education Act. It is, therefore, enlightening to consider the Titles of the Act as having the following progression:

Find through strategically located testing programs especially gifted young people and guide them by means of competent counseling to adopt and to act upon educational plans suited to their interests and aptitudes.

Make it possible for them to enter and stay in college by providing liberal loan programs for students who otherwise would be unable to pay the costs of higher education.

Give them better and more easily accessible educational opportunities, improved quality of instruction in greater quantity, and adequate facilities.

Enrich for them the whole educational process by sensitizing administrative responsiveness to educational needs.

Ways and means

The Titles of the Act are designed to stimulate the achievement of these ends in the following specific and concrete ways:

Title V authorizes and assists in the establishment of testing programs to discover able students, guidance and counseling programs for the purpose of advising them to undertake courses of study best suited to their abilities, aptitudes, and skills, to encourage them to complete their secondary education, and to prepare themselves for admission to colleges and universities of their choice. To ensure the effectiveness of these programs, this Title recognizes the serious shortage of qualified testing and guidance personnel and provides for training institutes to meet demands for competent practitioners in this vital field.

Titles II and IV provide financial assistance to needy students, graduate or undergraduate, and fellowships to graduate students.

Title II authorizes the establishment of student loan funds, administered by the participating institutions, for the purpose of ensuring that worthy students will not be denied opportunity for higher education for lack of money. Loan funds have been allotted on the basis of the institution's particular needs and full-time enrollment. The institutions contribute one dollar for every

nine dollars of federal money. Students may borrow a maximum of \$5,000 over a five-year period, principal and interest to be repaid over a span of ten years, beginning one year after graduation.

Title IV is designed to foster an increased supply of well-trained college and university teachers by assisting in the expansion of facilities for their training, promoting a wider geographical distribution of such facilities, and granting 5,500 fellowships over a period of five years.

Titles III, VI, VII, and VIII have the objective of creating more and better educational opportunities and strengthening instruction.

Title VI has the specific aim of providing increased curricular opportunities for the study and mastery of the languages of those countries with which the United States has business or diplomatic relations. Title VIII is designed to aid the expansion of area vocational education programs to provide skilled technicians for occupations requiring scientific knowledge.

Title III authorizes financial assistance for strengthening science, mathematics, and modern foreign language instruction. Title VII is designed to stimulate research and experimentation for the sake of achieving a more effective utilization of television, radio, motion pictures, and related media as techniques of instruction.

Title X reinforces and complements the other objectives of the Act by encouraging the development of efficient methods of gathering and disseminating statistical and other data so that state education agencies will be able to provide reliable and current information and thus enhance the efficiency and effectiveness of program planning, administrative policy formation, and the provision of services. This Title also directs the Secretary of Health, Educa-

tion, and Welfare to develop policies and procedures to achieve the co-ordination which has been needed for so long between the several departments and agencies that conduct federal scholarship, fellowship, and other educational programs.

Although it reinforces the science and mathematics programs assisted by the Act, Title IX is not directly chargeable to the United States Office of Education. It authorizes the National Science Foundation to establish a Science Information Service and a Science Information Council. The latter will advise and consult with the former, and both will have one objective: providing the scientist with the information he needs, quickly and adequately, through indexing, abstracting, and translating materials from all domestic and foreign sources. Programs to develop better and faster methods of disseminating scientific information will also be undertaken.

ADMINISTRATION OF THE ACT

Except for Title IX, the fiscal, technical, and policy aspects of the National Defense Education Act are administered by the United States Office of Education of the Department of Health, Education, and Welfare. About three fourths of the appropriated funds will be distributed as grants to state educational agencies for strengthening instruction in elementary and secondary schools, testing and counseling, providing vocational education, and improving statistical services. The remainder will go to institutions of higher education for student loans, fellowships, institutes to train counselors, and foreign language centers; and to agencies, organizations, and individuals for research in the educational uses of television, radio, motion pictures, and related means of communication.

Before these funds can be made avail-

able, however, the Office of Education and the recipient states and institutions must meet certain prerequisites.

To this end, the Office of Education has drawn up regulations for the administration of details not specified in the Act but necessary to assure consistency and impartiality. The Office also has made changes in its organizational structure to meet the demands of new administrative duties.

The states must have authorization from their legislatures to receive and administer federal funds for the purposes of the National Defense Education Act. Moreover, except for the provisions of Title II, the states must match federal funds dollar for dollar. In order to do so, their legislatures must appropriate sufficient funds. In some states, however, local funds may be used for the purchase of equipment and facilities without state legislative action.

Each state is required to submit to the United States Commissioner of Education a four-year plan for using federal funds before it can become eligible as a recipient. No state, however, is irrevocably bound to its first outline; it may make such revisions as changing circumstances impose.

Institutions of higher education that wish to participate in the student loan program authorized by Title II are required to establish loan funds and contribute one tenth of the monies utilized. The participating colleges and universities administer their own programs. Under the provisions of Title IV, colleges and universities are required to establish new, or expand current, graduate programs.

The whole intent of the administrative aspects of the Act is to ensure an equitable distribution of available federal funds, to maintain standards of efficiency, and to assure proper expenditures of federal funds.

THE ACT'S ACCEPTANCE

Although it has been in force only a year, the National Defense Education Act has had enthusiastic acceptance.

Approximately 65 per cent of the nation's 2,000 institutions of higher education, representing 80 per cent of full-time college and university enrollment, are participating in the student loan program, as authorized by Title II of the Act. The federal share, in terms of funds actually appropriated and funds requested for fiscal year 1960, amounts to \$61.5 million. In addition to the federal contribution, the participating institutions provide one tenth of this amount, bringing the total to \$67.6 million.

The plans of fifty states and territories have been approved under Title III which authorizes the provision of funds on a fifty-fifty matching basis to strengthen instruction in science, mathematics, and modern foreign languages. Federal funds amounting to \$51.1 million have been certified for this purpose.

Title IV at present provides a maximum of 1,000 graduate fellowships. All of them were approved in fiscal year 1959. An additional 1,500 such fellowships have been requested and approved for fiscal year 1960.

Plans for the creation of state programs for guidance, counseling, and testing to identify and advise superior students, as authorized by Title V, have been approved for fifty states and territories, and \$8.65 million has been certified. This Title also provides for the establishment of guidance and counseling institutes. Fifty colleges and universities were given approval to establish such institutes in the summer of 1959. Funds for fiscal year 1959 made possible 4 academic-year institutes in 1959-60. Funds for fiscal year 1960 will make possible the creation of an additional 67

summer and 26 academic-year institutes.

Under the provisions of Title VI, contracts are being negotiated for the establishment of about 20 language and area centers and 12 summer language institutes and 4 academic-year institutes. Modern foreign language fellowships, also made possible by this Title, have been awarded to 171 graduate students. In addition, 20 research projects were started with fiscal year 1959 funds.

As authorized by Title VII, a total of 68 research grants and 14 contracts for research designed to develop more effective educational media and techniques have currently been approved.

Area vocational programs are being initiated, in response to the provisions of Title VIII, in fifty states and territories for the purpose of training students in technical skills essential to the national defense effort.

Forty-nine states have had their plans accepted under the terms of Title X for the purpose of improving the statistical services of state education agencies.

Of all the aspects of the Act, only the affidavit and loyalty oath requirements have evoked adverse reaction. Included without due consideration of the reactions they might provoke, these provisions, quite properly regarded as inadmissible by the academic community, have proved to be meaningless and discriminatory.

On May 4, 1959, the author addressed a letter to the chairman of the Senate Committee on Labor and Public Welfare urging an amendment of the National Defense Education Act that would repeal those provisions requiring affidavits of loyalty and allegiance.

The following reasons were expressed:

1. The Act's provisions make clear that, without the exaction of formal oaths, persons who belong to or support organizations dedicated to the violent overthrow of the government are not entitled to receive federal funds.

2. The formalities involved in signing affidavits and taking oaths do not deter or reveal disloyal persons. Generally, these persons are not scrupulous about the falsification of legal instruments.

3. The loyalty and allegiance requirements are discriminatory in that they single out educators and students for special treatment and in no sense ensure national security.

4. The argument that disloyal persons who sign the affidavit can be prosecuted for perjury introduces unnecessary legal skirmishing. If a person receiving assistance under this Act is identified as a violator of our internal security laws, he can be and should be prosecuted under pre-existing and current laws that are amply effective in dealing with treasonable and subversive offenders.

A LARGER MEANING

The variety and scope of the National Defense Education Act's provisions make them applicable to many of the most urgent educational needs of the day. Moreover, the Act's wide acceptance by parents, educators, students, and government leaders ensures its nation-wide utilization in solving problems that the states, communities, and private institutions could not attack separately and unassisted. Such adaptability and utilization strengthen the belief that this Act will have positive effects greatly surpassing its immediate defense intentions and thus enrich and reinforce the total educational process.

POLITICAL THEORY

HERBERT H. HYMAN. *Political Socialization: A Study in the Psychology of Political Behavior*. (A Report of the Bureau of Applied Social Research, Columbia University.) Pp. 175. Glencoe, Ill.: Free Press, 1959. \$4.00.

Fifty years ago Graham Wallas deplored the harmful separation of the study of politics from the study of psychology and hopefully observed "that there are already signs that it is coming to an end." One would have to conclude from an appraisal of what has happened in the intervening years that Professor Wallas' prediction was rather slow in materializing but that it has now clearly come to pass. Whether the union has been as fruitful as he confidently expected is a matter of conjecture.

Recent reviews of the literature in that amorphous area called political behavior reveal an extraordinary profusion of studies intended to illuminate some aspect of politics through the use of psychological concepts. They show a great deal of effort, a certain amount of ingenuity, and an overall impression of great scatter. As is true with so many fields in the so-called "behavioral sciences," the bits and pieces of theory with which researchers in the area are concerned are so weakly integrated that their studies do not ordinarily relate very strongly to each other. We still seem to

be exploring the terra incognita of political behavior rather than plotting the total topography.

In this book Professor Hyman undertakes to set himself at one remove from the search for new data and to seek out "the distinctive and systematic contribution that psychological analysis can make to the understanding of political behavior." He proposes to organize his examination of this contribution around three areas of inquiry, the areas of learning, motivation and emotion, and perceptual processes. The present monograph deals only with the first of these; it is presented as the first of a series which the author has in process.

Dr. Hyman was not confronted with an embarrassment of riches in his attempt to demonstrate the manner in which Americans learn their political attitudes and behavior patterns. Political socialization, as he points out, has been virtually ignored by psychologists. Systematic longitudinal studies of early politicization do not exist. Still, he has unearthed an impressive collection of research fragments which he has organized around his central theme with great skill.

Dr. Hyman does not attempt to apply a very refined set of categories to the evidence which he reviews; the diversity and lack of connectedness in the studies available to him preclude such a possibility. He has, however, made effective use of a

rather broad system of abstractions and has taken us a step forward in a research area which badly needs organization.

ANGUS CAMPBELL

Director, Survey Research Center
University of Michigan

SIDNEY HOOK. *Political Power and Personal Freedom: Critical Studies in Democracy, Communism, and Civil Rights*. Pp. xviii, 462. New York: Criterion Books, 1959. \$7.50.

Political Power and Personal Freedom is essentially a defense of what Professor Hook calls democratic socialism, which he defines in terms of three characteristics, more profitably reduced to two: first, an economy partially controlled and planned in the interests of political and cultural freedom and, secondly, an economy maintaining full employment, efficiently utilizing all its natural resources, and giving its population a decent standard of living (p. 366). In terms of these characteristics, one would have to say that most countries of the world from the United States to Thailand are, to the extent of their achievement, democratic-socialistic; the differences between them are essentially a matter of degree: to the extent to which their governments have legal control over small- and large-scale industry and services and to the extent to which they have achieved a developed economy.

Professor Hook's defense of democratic socialism—which seems to me his special name for the types of political economies found in the West—involves a sharp and thorough attack on Soviet communism. Soviet communism, he says, is opposed to all the great traditions of freedom in the West, and it can be recognized by three important characteristics. It believes that humanity's welfare depends upon the victory of the proletariat over the world; that the proletariat depend upon the dictatorship of the Communist party to achieve this; and that the Communist party's victory depends upon the dictatorship of its leaders. These three propositions logically involve the conclusion that communism must inevitably attempt to conquer the world by whatever means, fair or foul, and mostly foul, at its disposal. Accept this conclu-

sion and it logically follows, says Professor Hook, that peace or peaceful coexistence is impossible between the Soviets and the Western democracies. This hard opinion undergoes a subtle kind of softening in Chapter 32. Here Professor Hook suggests but does not directly admit that the Soviet countries may modify their dogmas by giving them a new, more libertarian interpretation. Hesitatingly Professor Hook implies that this might mean the practical possibility of peaceful coexistence between the West and the Soviet Union.

Of course, this book is more than a brilliant defense of democratic socialism; it ably covers a wide variety of topics from academic freedom to ritualistic liberalism. The most interesting of these discussions are the debates between Hook and Eastman and Hook and Bertrand Russell. The first debate deals with the possibility of democratic socialism; the second with East-West policy and human survival. Despite its liveliness and dialectical pyrotechnics, I think the first is largely a verbal dispute. The second reaches into issues that trouble thinking men everywhere such as how to prevent total nuclear warfare. Although to this "ritualistic liberal," Russell seems to have a more cogent argument, Professor Hook still makes a contribution in terms of the warnings and dangers of a policy like Russell's.

My main difficulty with Professor Hook's book is that, despite his brilliance both of invective and of dialectic, the book never seems to offer a practical policy for action against totalitarianism.

Typographically speaking, the book has a serious fault. For some reason unknown to me, pages 366–398 were omitted, and pages 335–365 reduplicated.

JEAN MEYNAUD. *Introduction à la Science Politique*. (Cahiers de la Fondation Nationale des Sciences Politiques, No. 100.) Pp. 369. Paris: Librairie Armand Colin, 1959. Fr. 1.300.

This book deserves recognition for more than one reason. It is the first full-scale exploration of contemporary political sci-

ence contributed by French scholarship. It is the work of an able man—academic director of the Ecole Pratique des Hautes Etudes, faculty member of both the Institute of Political Studies in Paris and of the University of Lausanne, and author of *Les Groupes de Pression en France* (1958). What is still more important, the present volume is not only a systematic exposition but also an incisive critique, distinguished by great resources of expression as well as of knowledge. Together with Maurice Duverger's new guide to the research techniques applied to politics, Meynaud's *Introduction à la Science Politique* will make it much harder in France to discount political science as a luxury-import from the United States.

The author begins with a survey of the different types of political analysis, proceeds to the question of a suitable theoretical framework, and then deals specifically with such matters as the object of political science, the focus of study, the sources of data, the range of measurement, and the treatment of variables. He singles out for special attention the place occupied by political science within the social sciences and particularly its relations with economics. A recurrent theme in all of this is the development of a "general theory." The concluding chapter sets forth the conditions which the author deems essential to furnish political analysis a truly scientific foundation.

It is remarkable how well the book succeeds in providing its readers with a cross-section of the methodological literature. For the most part, the footnotes bring together, as should be done more frequently, the best references of different national origin, especially French, British, and American; but the United States column is by far the longest. Although by no means uncritical, Professor Meynaud does not belittle the role that has fallen to American research. On the other hand, he is very sensitive to the possibility that political science may commit itself to the defense of a particular system of government or the values that underlie a particular culture. For both he cites examples in the United States, as he does also for the related tendency to look at the world abroad

through glasses different from those used for viewing the scene at home.

Thus it is not surprising that scientific advance and rejection of "moralism" (pp. 330 ff.) are here presented as necessarily linked—at least at the present stage, sternly characterized as the "age of hypothesis" (p. 34). One should add, however, that the author neither denies the formative influence of values nor stipulates for research an unattainable requirement of absolute neutrality toward them. Perhaps we must temper Professor Meynaud's zest for verification with the modest acknowledgment of a condition better than bankruptcy. After all, mankind is in possession, and has been for quite some time, of a considerable body of working knowledge to draw upon in the study as well as in the conduct of political affairs. In the utilization of this knowledge, it is true, great benefit flows from a continuous sharpening of our insights. The discipline of fresh hypothesis and the irreverent testing of commonplace are prime movers in the pursuit of truth. Professor Meynaud's admirable work will add significantly to the momentum which political science needs to become a science of politics.

Princeton University

BERNARD CRICK. *The American Science of Politics: Its Origins and Conditions*. Pp. xv, 252. Berkeley and Los Angeles: University of California Press, 1959. \$5.00.

CHARLES S. HYNEMAN. *The Study of Politics: The Present State of American Political Science*. Pp. xi, 232. Urbana: University of Illinois Press, 1959. \$4.50.

To introduce the authors of these two kindred volumes: Dr. Crick, an Englishman and an Assistant Lecturer on Government at the London School of Economics, wrote *The American Science of Politics* under a Rockefeller fellowship at the University of California. Dr. Hyneman, author of *The Study of Politics*, is Professor of Government at Indiana University.

Although Crick's style is heavier and less sprightly and his humor more subtle

than Hyneman's, and although Crick uses a largely chronological approach, while Hyneman deals topically with contemporary problems confronting political scientists, they are remarkably in agreement concerning the nature and solutions of current controversial issues within the profession. And each has done an excellent job within the brief compass of two-hundred-odd pages of text.

If there is a single theme central to both these books—and this reviewer believes that there is—it is that of modern attempts, by such groups as the "Chicago school," to develop a methodology, somewhat akin to the "scientific method" employed in the physical sciences, designed to make the social sciences "exact" and primarily quantitative disciplines. In the view of these groups, such immeasurable areas of political science as philosophy, ethics, morality, values and ends have little or no place in the legitimate activities of "scholars," since they cannot be validated by incontrovertible evidence.

Crick and Hyneman agree, however, that this restricted, descriptive approach is rather sterile and meaningless. For, as Crick points out, it tends to reduce political scientists to mere tabulators of largely irrelevant data and enables them to escape responsibility for value judgments and personal commitments with respect to social ends and means. Admittedly, adds Hyneman, because of the multiplicity of "variables" in human relations, political science may never reach the exactitude or provability of chemistry or physics. Hence, the political scientist must arrive at his "personal preferences" as to values, ends, and means primarily through speculation based upon incomplete empirical data, logical reasoning, and intuition. But, he cogently continues: "People cannot wait until science provides answers to their questions about how to use government to achieve a good life. They will act, and their acts will be shaped by the advice available to them. Thoughtful political scientists can provide better advice than other people on many things relating to government (p. 190).

Both authors also consider the relevance of fields impinging upon political science, such as psychology, sociology, economics,

anthropology, and geography, and the competence of political scientists to integrate them with what Hyneman defines as the knowledge of "that kind or part of government that speaks through law (pp. 26-27). Both maintain that these cognate areas are indeed relevant, and that political scientists must prepare themselves to deal with them, if maximum understanding of the process of government is to be attained. And although Hyneman expresses apprehension lest political scientists "tackle too much," at the expense of depth and quality, he concurs in Crick's condemnation of overspecialization which the "bureaucratic" American university forces upon ambitious faculty members.

Finally, these authors agree, the contemporary tendency to separate "theory" from the "policy sciences," or, in some cases, to scorn the "unscientific" former in favor of the "scientific" latter, has given rise to much controversy concerning the distinction between "power" and "authority." If the study of politics is to be practically useful, it must answer the vital question: "Power for what purpose?" Crick deplors the type of political science which "loses touch, by scorning history and philosophy, with its roots: the protestantism of conscience against mere power" (p. 227).

Obviously these two men are unfashionably willing to take stands on issues and to urge their colleagues to do likewise. To all of which this reviewer breathes an unscientific but fervent "Amen!"

AURIE N. DUNLAP

Associate Professor of
International Relations
Lehigh University

ALPHEUS THOMAS MASON and RICHARD H. LEACH. *In Quest of Freedom: American Political Thought and Practice*. Pp. viii, 568. Englewood Cliffs, N. J.: Prentice-Hall, 1959. \$9.25.

Under the title of *In Quest of Freedom* Professors Mason and Leach have presented a stimulating account of the main currents of American political theory from its background in England of the Puritan Revolution to current controversies over decisions of the Warren Court. The em-

phasis throughout is on the long debate over the rights of the individual versus the rights of property, but in the course of their exposition, the authors have occasion to discuss, among other things, diverse theories of the eighteenth-century British Empire, the assertion of American independence, the making of the Constitution and its interpretation by Hamilton and Jefferson and their schools, Jacksonian democracy, the controversy over slavery and the nature of the Union, the laissez-faire philosophy of the "Gilded Age," the reforming spirit of the "progressive" era, the Republican reaction of the 1920's, New Dealers and anti-New Dealers, the advocacy of "welfare capitalism" as an alternative to the welfare state, and the as yet unsolved problem of reconciling the freedom of the individual with the security of the state in troubled times like the present. The school desegregation issue is treated only briefly.

In a book whose leading author is a biographer of Justice Louis D. Brandeis and Chief Justice Harlan F. Stone, special interest attaches to the analysis of events of the last fifty years. Possibly the most interesting question which the authors raise and attempt to answer is: Why has a Supreme Court which since 1937 has given legislatures an increasingly free hand in narrowing the rights of property, at the same time swung toward more severe restraints upon the same legislatures when they have attempted to narrow or repress civil rights? An answer, which the authors clearly endorse, is found in a pronouncement of the late Justice Robert H. Jackson (quoted on page 556): "... the presumption of validity which attaches in general to legislative acts is frankly reversed in the case of interferences with free speech and free assembly, and for a perfectly cogent reason. Ordinarily, legislation whose basis in economic wisdom is uncertain can be redressed by the processes of the ballot box or the pressures of opinion. But when the channels of opinion or of peaceful persuasion are corrupted or clogged, these political correctives can no longer be relied on, and the democratic system is threatened at its most vital point. In that event the Court, by intervening, restores the proc-

esses of democratic government; it does not disrupt them."

The volume is for the most part admirably objective, though no one will mistake the authors' position on such questions as nationalism versus state rights or laissez-faire versus public regulation of property interests. The brief Index is less than adequate, and there are a few indications of hasty proofreading.

JULIUS W. PRATT

Professor of History, Emeritus
University of Buffalo

H. G. NICHOLAS. *The United Nations as a Political Institution*. Pp. 222. New York: Oxford University Press, 1959. \$3.40.

Candidly, the reviewer approached his task with some misgivings, as he has not forgiven the United Nations for what he conceives to have been its responsibility for the dismissal of General MacArthur and for the losses in the recent Korean conflict, the first instance in which American arms suffered actual defeat. Also, some recollection of the proceedings at San Francisco that launched the United Nations led to a search of the Index for any mention of Alger Hiss. Subsequent verbatim reading of the text confirmed the Index. He was not mentioned.

Careful reading, however, led to growing respect for the author, whose organization of highly technical material is excellent and who is doubtless justified in contending that an institution now in its second decade and embracing most nations of the world is not on trial, but should be examined without prejudice for what it is in theory and in practice. Moreover, since the work is institutional rather than historical, only incidental reference is made to achievements or to failures.

Frequent allusions suggest comparisons with the British Parliament. But governmental institutions in a homogeneous country after all have slight resemblance to the Parliament of Man. The United States, with fifty states, comes closer to the political pressures of over fifty nations. Even here the analogy is imperfect. Americans are fellow citizens. Only the most ad-

vanced "One Worlders" can ignore their national origin. So that the United Nations comes closer to a permanent conference of ambassadors. Here the author manifests an excellent comprehension of reality and at the same time great skill in demonstrating the niceties of constitution-building which insure autonomy to and, in some sense, parity with the Five Great Powers and their outnumbering juniors. International jealousies being what they are, the fashioners of the United Nations have demonstrated remarkable acumen.

The reader will be delighted by frequent evidences of literary skill. This the author possesses in good measure, though opportunities to utilize it are limited.

The United Nations as a Political Institution is essentially a work of erudition. Its value is enhanced by an Appendix which quotes in full the "Charter of the United Nations." There may never be a Gladstone to call that Charter the noblest document ever composed by the mind and pen of man. But Mr. Nicholas leaves no doubt of its significance in man's evolution as a political being.

LOUIS MARTIN SEARS

Washington, D. C.

STEPHEN S. GOODSPEED. *The Nature and Function of International Organization*. Pp. xi, 676. New York: Oxford University Press, 1958. \$7.25.

Dr. Goodspeed has written a useful text which provides a broad survey of contemporary international organizations, their objectives and activities. The approach is primarily descriptive, but there is a substantial amount of analytical material, particularly in summaries, conclusions, or appraisals at the end of chapters. The first part of the book deals with experiments in international organization antecedent to the United Nations, with special attention to the League of Nations and its activities in the field of security. This serves as a general and historical introduction to the United Nations, the principal subject of the volume. The emphasis is upon security matters, with chapters on pacific settlement, collective enforcement measures, and the regulation of armaments. Treatment

of the specialized agencies, with the exception of the World Health Organization, is so brief that the student will only be able to get the barest flavor of these international organizations from the material presented. The author may have felt himself limited with regard to the space he could give to them. In any event, the presentation would have been strengthened by devoting less attention to the details of organizational structure and more to the need for international organization in the various functional fields and to the activities of the agencies discussed. The volume also includes an examination of international regional organizations, with considerable attention devoted to the highly significant contemporary organizations in Europe like the Coal and Steel Community and the Common Market. The above matters by no means comprise all the subjects covered in this comprehensive survey of the field of international organization. The focus is broad throughout. There is no attempt to give detailed treatment to any subject.

The most important deficiency of this text is its dearth of conceptual analysis. Collective security aspects of the League of Nations and the United Nations constitute a major part of the book. Yet there is no real effort to present collective security as a concept in international relations and to consider the extent of its embodiment in the basic instruments and in the functioning of these organizations. It is true that concepts in international organization are far from being perfected—this is, of course, the case with regard to the whole field of international relations. Nevertheless, there have been considerable efforts directed toward concept formation in recent years, some of which could be presented profitably to an undergraduate student. Balance of power theory is nearly as essential to an understanding of contemporary international organization as collective security. How can the creation of the League of Nations or the United Nations be explained except with reference to balance of power in theory and practice? It is, of course, basic to an understanding of the North Atlantic Treaty Organization (NATO).

In his analysis of the recent Korean

crisis, the author makes the point that "the United Nations was utilized as a disguise for unilateral action by the United States whereby the policy of that nation was to be made the policy of the United Nations." The use of the collective security apparatus of an international organization as an instrument for the promotion of national interests, narrowly construed, has been a familiar practice of Great Power foreign policy in the past. But Mr. Truman makes it clear in his memoirs that the American response to the North Korean invasion of South Korea was made on the basis of a coincidence of national security and collective security interests. In the present stage of development of the international community, it is probably necessary for a Great Power to lead the international action against aggression. The difficulty, as Hans Kelsen has pointed out, is that there is no objective way of determining whether the Power is leading an international hue and cry, acting, in other words, for and in behalf of the international community as well as itself, or only mobilizing the organization for its own selfish purposes. Intent, therefore, is of prime importance.

HENDERSON B. BRADDICK

Assistant Professor of International Relations
Lehigh University

M. S. RAJAN. *United Nations and Domestic Jurisdiction*. Pp. xiii, 679. Bombay: Orient Longmans under the auspices of the Indian Council of World Affairs, 1958. RS 25.

With this pioneer study of a complex and controversial subject, M. S. Rajan, of the Indian Council of World Affairs, has made a substantial contribution to the study of international organization. One may differ, at times, with the author's interpretation and emphasis. Occasionally his language is vague or prolix. But the importance of his subject, his painstaking research and analysis, and the objectivity and thoroughness of his presentation make this volume a valuable addition to the literature of the field.

After a lengthy Introduction dealing with the development of the domestic jurisdic-

tion concept, the author takes up the drafting of Article 2, Section 7 of the United Nations Charter and its legal interpretation. There is much of interest and importance here. A more complete explanation of the content of the domestic jurisdiction article, its vaguenesses and ambiguities, would doubtless require, among other things, a fuller examination of American politics, with particular reference to the views of certain Senators and of the American delegation at San Francisco. The problem of getting the treaty through the Senate was a major preoccupation of the State Department. But with regard to this matter of American intent, we can thank the author for reproducing the following statement of Mr. Dulles at the Conference: "... future generations will thank us for what we do in adopting simple phrases and allowing them to evolve as the state of the world, the public opinion of the world, and the factual interdependence of the world, make it necessary and appropriate that it should evolve."

Problems involved in the legal interpretation of the domestic jurisdiction clause are examined in very considerable detail. More attention might have been devoted to the first part of the clause, however. This says that nothing in the Charter "shall authorize the United Nations to intervene" in matters essentially within the jurisdiction of states. The language does not forbid such intervention; it only states that the Charter does not empower the Organization to do so. The question arises, therefore, whether there may be inherent rights, privileges or powers possessed by the states of the international community according to general international law enabling them to intervene under certain circumstances in the domestic affairs of states. It may be noted that the Charter itself expressly recognizes one inherent and collective right: self defense.

The largest section of the book deals with United Nations practice regarding domestic jurisdiction. This the author interprets and evaluates. The evidence is overwhelming that United Nations organs consider themselves able to determine their own competency with regard to the disposition of matters involving domestic jurisdic-

THE ERA OF REFORM, 1830-1860

By HENRY STEELE COMMAGER

Carefully chosen and pungently introduced excerpts from some sixty documents reflect the passionate spirit of a reform era unlike any other in this country's history, a tempestuous age in which "every institution was called upon to show its credentials."

SOVIET FOREIGN POLICY

By GEORGE F. KENNAN

Derived from a series of lectures given by Dr. Kennan at Oxford, this book provides a clear, comprehensive picture of Russia's foreign policy from 1917 to the present.

EARLY CHRISTIANITY

By ROLAND H. BANTON

Professor Bainton traces, in narrative and documents, the history of Christianity during its first five hundred years. The documents range from the Annals of Tacitus to Justinian's "Laws Against the Pagans".

THE ROMANOV DYNASTY IN RUSSIAN HISTORY

By ANATOLE G. MAZOUR

Within the framework of the Romanov dynasty, Professor Mazour presents the social, economic, and political aspects of Russia's historical development from 1613 to 1917. Letters, memoirs, proclamations, and historical analyses augment the text.

THE STUDY OF POLITICS by Charles S. Hyneman

A great deal of debate has been touched off by this perceptive inquiry into the present state of American political science and the problems confronting members of the profession. It discusses such questions as: To what extent should political scientists engage in public affairs? What is the legitimate place of values in political science? What are the intellectual conflicts within American political science? 232 pages. \$4.50.

MEXICAN GOVERNMENT IN TRANSITION by Robert E. Scott

Here's the most comprehensive and up-to-date analysis in either English or Spanish of how the Mexican political system operates. It examines in detail Mexico's governmental structure, physical and social setting, people, political party system, electoral process, and presidency to describe how a stable and effective national political system has evolved to serve the needs of the new Mexico. 333 pages. \$5.75.

NATIONAL PARTY PLATFORMS, 1840-1956

compiled by Kirk H. Porter and Donald Bruce Johnson

This is the only complete collection of American political party platforms in existence. "This is an important and indispensable reference volume." — Malcolm Moos, *American Political Science Review*. "... an invaluable work for the study of American political development." — *History News*. 573 pages. \$10.00.

POLITICS IN THE UNITED NATIONS by Robert E. Riggs

Political maneuverings in and behind the scenes of the United Nations General Assembly are revealed and documented in this illuminating study of United States influence in the assembly. "Our knowledge of the complexity of international currents benefits from his analysis." — Robert A. Graham, *America*. 208 pages. \$4.50.

THE UNITED NATIONS TRUSTEESHIP SYSTEM

by James N. Murray, Jr.

"This is a solid contribution to knowledge about the trusteeship system. There is considerable data brought out by the author on various aspects of the functions of the new system which have not been presented before. Students of international organization will find the study very helpful." — J. Eugene Harley, *The Annals*. 283 pages. \$4.50.

diction issues. It is also evident that by and large, as Mr. Rajan states, "legal considerations were not of decisive importance to the issue of competence but that, on the other hand, political considerations were." This state of affairs is doubtless due to several factors: first, the lack of agreement on the interpretation of Article 2, Section 7 by the states signatory to the Charter; second, the failure to provide that problems of interpretation were to be resolved by the International Court; third, the fact that many of the most serious threats to international peace and security have arisen out of situations which, it can be argued, are within the domestic jurisdiction of a state; and fourth, the intense power struggles which have rent the international community into fragments during the last fifteen years.

The volume concludes with a note by Simone Dreyfus on French literature in the field of domestic jurisdiction and one on German sources by Gerhard Heuer.

HENDERSON B. BRADDICK
Assistant Professor of International
Relations
Lehigh University

SOCIOLOGY AND ANTHROPOLOGY

JULIA ABRAHAMSON. *A Neighborhood Finds Itself*. Pp. xiv, 370. New York: Harper & Brothers, 1959. \$5.00.

If what happened in the University of Chicago neighborhood has ever happened before, this book still verifies what few realize, that (1) cities need not destroy the characteristic human community; (2) something short of war can bring modern Americans to act together idealistically and effectively; and (3) nothing at the socio-cultural level can be called impossible or inevitable.

In 1949 Hyde Park was a proud middle-aged neighborhood fated to be engulfed by the expanding Negro ghetto that, due to an old pattern of residential segregation, was overcrowded and hence blighted. Those who were blind to the future did nothing; those who saw what was coming moved away and hastened its arrival. Only a very few both saw and denied the future.

Julia Abrahamson, a Quaker housewife, came to a meeting with forty neighbors; they learned what was going to happen. Eventually she became the resourceful executive of the Hyde Park-Kenwood Community Conference. This remarkable organization set as its goal a good rather than a white neighborhood and set in motion machinery and ideas that reversed the trend.

This is Mrs. Abrahamson's intimate story of the Conference with enough detail and analysis to provide guides for other communities with race problems compounding all those others of our cities. Any troubled citizen or community leader who wants sharply practical advice should read the book, an exciting adventure story that leads into details of the hard work that lie behind genius and history, and ends with a careful and useful Appraisal.

The history described is the more remarkable because impossible moral issues were frankly faced but left hanging while moral people acted. Those who gain by the saving of the community do not forget but cannot repay others who wished and worked as hard as they only to be squeezed out of it by the "redevelopment" that promises to save the neighborhood. Survivors in a lifeboat from which some jumped to keep it from foundering must live uneasily indeed if the selection of those forced overboard was not even based on principles clear to all. For a moral community requiring consensus, this should have been fatal.

Hyde Park succeeded in doing the improbable not only because an old community of well-to-do, well-educated, resourceful, and determined people wanted to continue to live in it, but because the liberal spirit was strong enough to convince people that their racial prejudices interfered with their interests, and because the action required was consonant with the democratic ideal to which all were publicly committed. It succeeded also because the need to compromise was accepted by enough uncompromising idealists to keep resolution from dying on the sharp horns of a thousand moral dilemmas.

It does not happen often; but what this book describes can happen anywhere and

anytime in any community or in the whole world.

SOL TAX

Professor of Anthropology
University of Chicago

RENÉE C. FOX. *Experiment Perilous: Physicians and Patients Facing the Unknown*. Pp. 262. Glencoe, Ill.: Free Press, 1959. \$5.00.

Experiment Perilous is a sociological study of the physicians and patients in a metabolic research ward. It is based on one of the early studies sponsored by the Bureau of Applied Social Research of Columbia University and the Commonwealth Fund. It deserves a considerable knowledge of two and possibly three professional "languages" for thorough appreciation: medical, sociological, and psychological. Nevertheless, the well-informed lay reader will understand most of it without recourse to a dictionary.

Depending on the background of the reviewer, the work may strike different notes. This reviewer has a medical background. He finds the study of the patients, many of whom were chronically ill with fatal or at least irreversible diseases, particularly illuminating. On the other hand, the studies of the attitudes and problems of the physician members of the research team seem less revealing, probably because personal experience has provided the reviewer with some earlier insight in this field. The objective approach of the student of sociology is nevertheless interesting to the physician. The author categorizes the problems of the research physician as problems of uncertainty, problems of therapeutic limitation, problems of reconciling clinical and research responsibilities, and problems of finding suitable motivated research subjects. She then proceeds to study "ways of coming to terms," among which she mentions membership in the group, a rather special brand of humor, the "game of chance," behavior of the group, and the rather intimate relationships built up between the doctors and their patients. She states, "However, it should be stated that on several occasions that we observed, the same patterns of behavior

which ordinarily served as ways of coming to terms made it harder for the physicians of the Group to carry out their clinical and research activities with detachment and efficiency. The instances of this sort we can cite seem to have resulted from the close relationship that existed between the Group and their patients. For example, when a patient died, the members of the Group were inclined to feel 'upset' or 'depressed' in a 'rather personal sort of way' . . ." (pp. 107-108). Possibly some physicians and patients would agree about the lack of detachment without agreeing that this impaired the group members' efficiency as physicians.

The book is illuminated by many quotes from interviews with patients or from their letters. These are of special significance because many of the patients on the metabolic research ward had extensive insight into their diseases and the unfavorable prognosis thereof. While most older adults know some of the adjustments that individuals make to impending death or continuing disability and practicing physicians are in daily contact with such problems, the cases described were characterized both by unusual understanding and a group situation. This combination is comparatively rare and of great interest. Both laymen and physicians will find insights in this interdisciplinary study.

RALF DAHRENDORF. *Class and Class Conflict in Industrial Society*. Translated by the author. Pp. xvi, 336. Stanford, Calif.: Stanford University Press, 1959. \$6.50.

This passionate and self-important book is, according to its author, a thoroughly revised English version of his *Soziale Klassen und Klassenkonflikt in der industriellen Gesellschaft*, published in Germany in 1957. The first of its two major parts is a lengthy exposition and critique, not particularly new, of the analysis of class and class conflict by Marx and some more re-

cent social thinkers, such as Nemchinov, Djilas, Schumpeter, Burnham, Croner, Renner, Geiger, Marshall, Schelsky, Drucker, and Mayo. The second part contains the author's own analysis of class and class conflict and his application of this analysis to what he calls "Post-Capitalist Society." The whole book is animated by the author's unquestioning conviction that "there is today a considerable need for reorienting sociological analysis to problems of change, conflict, and coercion in social structures, and especially in those of total societies."

Dahrendorf has rewritten his book to deal with the criticisms made against the earlier German version. Unfortunately, many fundamental errors and shortcomings are still present. For example, his allegation that Western social scientists have recently neglected change, conflict, and coercion is not supported by any evidence. Indeed, his book contains many references to analyses of these problems by Western social scientists. Until Dahrendorf tries to provide support for it, his allegation remains an expression of his values, not an empirical generalization. The author's abstract analysis of class and class conflict is still quite unsatisfactory. By class he seems to mean a broad and not precisely specified range of socially structured differences of interest within formally organized associations, from the nation-state to the myriad interest associations within nation-states. And by conflict he means a variegated set of social processes which may be distinguished from each other. "I am using the term 'conflict' in this study," says Dahrendorf, "for contests, competitions, disputes and tensions as well as for manifest clashes between social forces. All relations between sets of individuals that involve an incompatible difference of objective—in its most general form, a desire on the part of both contestants to attain what is available only to one, or only in part—are, in this sense, relations of social conflict." As one might expect from such inadequate conceptual equipment, Dahrendorf's discussion of conflict in "Post-Capitalist Society" does not add anything to the understanding of the main structures, cultural patterns, and basic processes of change in that type of society. His last two chapters, which are

about industrial and political "conflict," contain only familiar generalizations, some plausible, others not.

The impatient enthusiasm of a young scholar who thinks he has discovered something quite new and the ideological partisanship of one who feels that the social science community is utterly neglecting what he alone values as of the first importance can become high barriers to good work. In this case, it seems, they have prevented an obvious talent from making a contribution to social science knowledge.

ELTING E. MORISON (Ed.). *The American Style: Essays in Value and Performance*. A Report on the Dedham Conference on May 23-27, 1957. (American Project Series, Center for International Studies, Massachusetts Institute of Technology.) Pp. ix, 426. New York: Harper & Brothers, 1958. \$5.00.

The Center for International Studies at Massachusetts Institute of Technology is concerned with the study of various parts of the world from the standpoint of their relationship to the foreign policy of the United States. According to Max F. Millikan, its director, who wrote the Preface to this book, underlying these investigations was "the implicit premise widely held in this country that the difficulties with which we are confronted in our international relations spring primarily from the nature and evolution of the foreign countries with which we deal. . . ." It occurred to the staff of the Center that this assumption was lacking in dimension, that it should be broadened to include the nature and evolution of the United States as well, because all too often promise of American accomplishment in international affairs is forestalled by internal obstacles rather than external ones.

This thinking led to a conference of specialists in various aspects of American character and society at Dedham, Massachusetts, in May, 1957. The agenda of the conference, or more properly, the guiding framework and points of departure for those who wrote background papers, was a

series of "issues": theory versus practice in American values and performance, American concepts of administration, the meaning and content of individuality in an increasingly bureaucratized and specialized society, the manner in which the problem of evil is confronted in American society, and evolution of effective values within American society in the past twenty years.

The American Style resulted from the conference. It is divided into two parts, the first consisting of the six chapters which constituted the original work papers, and the second a group of formal commentaries, a selection of transcriptions of the informal discussion, and a summary description of "the course of the discussion" by the editor, Elting E. Morison.

It is in the second part that the excitement which the conference clearly generated among the participants shows through. Until this point is reached, the book has a miscellaneous quality stemming from differences in length, form, tone, point of view, and lack of connection among the individual chapters which is disturbing. This is felt in spite of the merit which they separately possess. For example, the opening chapter, "American Ethics and Public Policy" by Abraham Kaplan discusses critically the relationship between morality and power and the implementation of morality through political force in an essay of more than 100 pages, not a page of which is wasted. The second chapter, "Theory Versus Practice in American Values and Performance" by J. Robert Oppenheimer, about one-tenth its length, has the *déjà vu* quality of an endowed lecture in a mixed series designed for the thoughtful layman. Other chapters, in the order in which they appear, are "America's Administrative Response to Its World Problems" by George F. Kennan, "Have There Been Discernible Shifts in American Values During the Past Generation?" by Clyde Kluckhohn (for this reviewer, the most nourishing single contribution), "Individuality" by Henry A. Murray, and a final chapter, "The National Style" by W. W. Rostow, which establishes with notable success the relationships of the diverse themes and approaches of the preceding essays. Professor Rostow's ordering of the earlier discussion transforms

the record of what must have been an exhilarating conference into a book.

Contributors of commentary on the chapters are Elting E. Morison, David M. Potter, Richard M. Bissell, Jr., Richard Hofstadter, and David Riesman. I intend a double compliment when I say that the commentary is often as thoughtful and provocative as the original chapter upon which it is based.

W. LLOYD WARNER. *The Living and the Dead: A Study of the Symbolic Life of Americans*. (Yankee City Series, Vol. 5.) Pp. xii, 528. New Haven, Conn.: Yale University Press, 1959. \$7.50.

Nearly twenty years separate the publishing of the initial and this final volume of the Yankee City Series. Surely no other community study of this generation has had so much influence on sociologists in particular and on intellectuals in general as has this analysis of a small city on the North Shore of Massachusetts.

Part I of this book deals with the colorful career of Yankee City Mayor "Biggy" Muldoon. His successes and defeats are described in terms of kinship, class, and other symbols.

Part II is a study of the city's 1930 tercentenary celebration. This is perhaps the best part of the book. A great number of ceremonies, historical reconstructions, and other activities comprising the festival are analyzed with reference to the status and myths of the participating groups. In the symbolic representations of the past are indirectly expressed the social organization, aspirations, and anxieties of the present.

Part III turns to the symbolic meanings of Memorial Day, Abraham Lincoln, funeral rites, and the cult of the dead. In Part IV are discussed both sympathetically and analytically the symbols of Protestant and Catholic Christianity—its buildings, ceremonies, and social organization.

The last section on methods of studying social symbolism will appeal mainly to specialists. The other parts, although they seem unduly long and not always clearly

organized, should interest not only social scientists but also many laymen.

Such limitations in the *Yankee City* study stem largely from the one-place, one-time approach characteristic of American community studies. In a modern industrial society, however, many if not most of the decisive forces in a locality are manifestations or local variations of the structure and processes of the national society.

For the theoretical framework of his study of symbolism, Warner relies mainly on the generalizing, nonhistorical approach of such writers as Frazer, Durkheim, Robertson, Smith, Radcliffe-Brown, and Freud. "The influence of the moral order on the creation and maintenance of symbol systems [is emphasized], the influence of the human species as an (organic) animal organization is also stressed Most religious beliefs are fundamentally based on the simple realities and on the relations of family deities" (pp. 447, 506). In practice, however, Warner devotes much attention to class and economic factors as well as to moral and familial elements.

This book is a fitting conclusion to a monumental community study.

VANCE PACKARD. *The Status Seekers. An Exploration of Class Behavior in America and the Hidden Barriers That Affect You, Your Community, Your Future.* Pp. viii, 376. New York: David McKay Company, 1959. \$4.50.

That the author of *The Hidden Persuaders* should follow with another best seller was to be expected. The same spicy, subtly satirical earthiness carries the reader along on a wave of almost hypnotic persuasion. The author is again sad and frightened at the picture he delineates. His artful innuendos convey a feeling of impending disaster, of national failure. Unless something is done, the country will fall to the "status seekers," who in an era of abundance since 1940, are now allegedly located throughout the United States (p. 255). The lines are formed. Five social classes are definitely emerging. National

sclerosis has already begun to set in. To many who have enjoyed *The Hidden Persuaders*, however, this new book may come as a disappointment. So many positive factors are overlooked or ridiculed that one may complete its reading with a bad taste.

Since this is a short review, some questions will merely be mentioned here. For example, competent sociological studies of American classes go back at least as far as the turn of the century. Again, the five classes said to be forming now have already been in existence for a long time. Moreover, the author's use of statistics is sometimes rather cavalier, as in his citations concerning "a vast amount of brain power going to waste" (p. 347). Matters like these lead to the conclusion that as an unbiased analysis *The Status Seekers* is considerably lacking.

To this reviewer, despite such shortcomings, the chief difficulty with *The Status Seekers* lies in its apparent double frame of reference—one realistic and the other fanciful. The first benchmark accepts class distinctions as inevitable and suggests that, within this framework, "much can be done to promote contentment, mutual respect, and life satisfaction" (pp. 329-30).

Two ways to promote this end—by achieving better understanding and by discovering and encouraging real talent regardless of station—are then developed in two concluding chapters. But these are constantly marred by a repeated lapse into the other frame of reference or goal.

This goal is to show apparently how far we have deviated from the American Dream—the dream of a classless society. We can endure and prevail, the author concludes, only if we "really believe in our system" (does he mean the classless kind?) and are convinced that it "offers fairer rewards and opportunities for the fulfillment of human aspirations than any other."

The Founding Fathers did state that "all men are created free and equal," a dictum which has received many interpretations. The most realistic, perhaps, is that the early settlers and later arrivals in America were anxious to be free from the oppressive class distinctions that existed in Europe and England as a result of innumerable wars of conquest and enslavements of peo-

ple; they also wanted an equal chance to develop their talents. But this certainly was not and could not mean a classless society. People of various classes came over on the "Mayflower," and many others have come here since. Classes and groupings have continued to develop in America and within them most people are living wholesome and happy lives. If they seek to better themselves, is that something to be sad about? If in the period of affluence since 1940, they have bought many gadgets, is this to be viewed as frightening, except as the Park Avenue persuaders have coerced them into buying what they do not want or cannot afford?

As Clifton Fadiman sums it up, this new book is most provocative, whether the reader is a status seeker, has "thrown in the sponge," or is a status enjoyer. Most people in this country would seem to be status enjoyers. Through their neighborhood groups, their civic and service clubs, their churches, and various other associations and societies, much is being done for human welfare and understanding that could not otherwise be accomplished.

These are matters the author does not emphasize. There are, to be sure, hidden and blatant barriers to honest achievement in America. It is well that they be pointed out. The author does this excellently. His observations are always pithy, and they touch on many obscure matters. *The Status Seekers* is a book everyone should read. A better and more realistic title, however, would have been "Status Barriers: Hidden and Overt," with reference to classlessness omitted. Moreover, in economics classes go hand in hand with division of labor and specialization, and without these a society of abundance would be impossible.

JOSEPH MAYER

Head, Department of Economics
Western College for Women

ANSELM L. STRAUSS. *Mirrors and Masks: The Search for Identity.* Pp. 186. Glencoe, Ill.: Free Press, 1959. \$4.00.

This is a stimulating, but discursive essay on identity-formation motivated by the author's dissatisfaction with personality development theories. According to

Strauss, psychologists and psychiatrists have erred in underestimating the influence of social structure upon individual behavior, assuming an ingrained and early-formed personality structure, and neglecting the historical dimension in their theories and research. To develop a more fruitful perspective for viewing the traditional problems of social psychology, he combines the symbolic interactional and social organizational approaches. His primary concerns are the social processes from which identity emerges and the symbolic and cultural foundations of its structure. The author does not discuss the organization of identity which he considers of more central concern to psychiatry and psychology. Thus, the essay covers only one facet of identity and does not present a complete theory of personality development.

A basic theme of the essay is the importance of language for human action and identity, particularly "naming" as an act of placement or classification of the self and others. Identities are viewed as being perpetually indeterminate because of constantly changing social contexts. Yet some stability of identity does occur because continuities in the social structure provide, although not assure, continuities of personal experience. Incidentally, Strauss believes that if serious identity discontinuity does result it need not be necessarily hazardous, as usually assumed by sociologists, but may be creative. Throughout the book, interaction is viewed as a symbolic and developmental process, operating within the setting of group structure. Since groups have a past, historical, as well as autobiographical materials must be included in a study of personal identity.

Psychologists and psychiatrists should profit from Strauss' emphasis upon social organization and language in identity formation, while sociologists should find useful his attempt to integrate social psychology and social organization. However, the author's style and approach often obscure his significant contributions. Apparently, he believes that a theoretical essay need not be as rigorous and direct as a research report. Terms are seldom defined, including the key concept of identity. At times, his theoretical ideas become so abstruse

and divorced from empirical data that the reader not only has difficulty following them but may even question their soundness. Although Strauss defends his essay style, this reviewer feels its looseness and unevenness weaken an otherwise outstanding work.

JEROME K. MYERS

Associate Professor of Sociology
Yale University

GOTTFRIED EISERMANN (Ed.) in collaboration with Paul Honigsheim, Georges Gurvitch, Frederick Lenz, and J. Allan Beegle. *Die Lehre von der Gessellschaft: Ein Lehrbuch der Soziologie*. Pp. xi, 452. Stuttgart: Ferdinand Enke Verlag, 1958. DM 35.50.

Since the end of the last world war German publishers have tried steadily to overcome the lack of up-to-date sociological handbooks, readers, surveys, and teaching materials in general. The one before us wishes to serve a number of purposes: (1) to fill the gap between traditional German sociology and its international development since the coming of Nazism, (2) to inform interested readers—not necessarily members of the profession—of the present trends of thought, (3) to give to the student of sociology the opportunity to acquire “a general view of problems, and state results concerning his discipline and its different principal branches” (p. x).

Hence we find in the first chapter a “History of Sociology,” written by Paul Honigsheim and Gottfried Engelmann which, with the help of only brief indications, achieves a rather comprehensive view. The explanatory statements made in regard to Emile Durkheim and his school appear strange, particularly so in view of the fact that out of an abundant literature concerning these basic teachings quite a number of the most important ones have been overlooked. Written by the editor, G. Eisermann, the second chapter entitled “General or ‘Pure’ Sociology” presents a remarkably well constructed summary of the different schools of sociological thinking, more precise and much clearer in its definitions than many of the brief surveys which have appeared so far. The chapters “Sociology of Religion” and “Sociology of

Art, Music and Literature” have been compiled by Paul Honigsheim, whose special knowledge in these fields is well known. From the pen of Georges Gurvitch comes the articles on “Sociology of Law” and “Sociology of Knowledge.” Both might or might not be written specifically for this handbook. In any case, they do not seem to concur at all times with ideas expressed by the eminent French sociologist in his more recent publications. They excel, however, in their systematic way of expounding the development and the different tendencies of the two branches—underlining expressly the frequently proposed theorem of the author, that sociology can only develop properly, when able to collaborate intimately with philosophical doctrines in respect to perceptive knowledge.

Chapters on “Wirtschaftssoziologie” by F. Lenz, on “Soziologie der Politik” by G. Eisermann and on “Agrar und Stadtsoziologie” by J. A. Beegle and Paul Honigsheim complete this valuable contribution to the noteworthy enlivenment of sociological activities in present-day Germany. The fact that the book contains no Index may reduce its usefulness to students considerably.

ALPHONS SILBERMANN

Unesco Institut fuer
Sozialwissenschaften
Cologne, Germany

PHILIP M. HAUSER and OTIS DUDLEY DUNCAN (Eds.). *The Study of Population: An Inventory and Appraisal*. Pp. xvi, 864. Chicago: University of Chicago Press, 1959. \$15.00.

This monumental appraisal of the status of demography as a science was undertaken at the suggestion and with the financial support of the National Science Foundation as a necessary first step in the Foundation's new program of providing support for population research. In view of the formidable scope of the investigation, the directors commissioned by the Foundation decided to divide the labor by assembling a symposium of papers from twenty-seven individual scholars, in addition to the editors' own substantial contribution. The objectives of the project were “to provide a description and evaluation of the data, the

fund of knowledge, the theory, and the methods of demography and its various subfields; to examine its relationship to other scientific disciplines, and to indicate important circumstances bearing on the development of demography in various parts of the world. The successful achievement of these specific tasks would, it was hoped, provide a comprehensive picture of demography as a science and a profession as of mid-twentieth century.”

The volume is divided into four parts. In Part I, Demography as a Science, the editors themselves have attempted to assess the field by summarizing and evaluating the papers obtained from the contributors, although these papers do not constitute the sole basis for their comprehensive appraisal which runs to almost 120 pages. Part II opens with an historical review of demography on a world-wide scale and goes on to describe the development and current status of demography in a number of different countries selected to “provide representation both of areas where demographic research has a relatively long and distinguished history and of those in which promising beginnings in the development of demography and rapid initial progress have been made in recent years.” Part III, Elements of Demography, consists of a dozen papers in which the various substantive fields of demography are taken up, preceded by a comparative appraisal of demographic data available for population research. Here one finds analyses of fertility, mortality, migration, population distribution and composition, as well as other topics which form the core of contemporary demographic research and training. Finally, Part IV considers the relationship of demography to several other sciences with which it is closely interrelated. These include ecology, geography, physical anthropology, genetics, economics, and sociology.

The quality of the individual contributions varies but it is a pleasure to report that many of the chapters are excellent. This felicitous result was achieved not only by a judicious selection of contributors, many of whom rank as foremost experts in their fields of specialization, but also by the careful, detailed guidance provided by the editors. Unlike so many other sym-

posia which are woefully inadequate in organization and lack any over-all point of view, this volume greatly benefits from the fact that its editors have firm, outspoken views about the nature of demography and state their position clearly and unmistakably. On the other hand, this also accounts for some obvious defects of the undertaking. As the editors themselves frankly avow, their point of view embodies their personal biases and predilections. Although such frankness may be refreshing, it raises serious questions of scientific propriety. For example, is it justifiable in a symposium intended as “an inventory and appraisal” of the entire field to criticize editorially the psychosocial theories of fertility without at the same time inviting a single proponent of this currently influential “school” to state his point of view?

On the whole, however, the merits of this volume greatly outweigh its defects. For once it is possible to accept the claims made by the publisher on the book's cover without cavil: this book provides an encyclopedic summary of the field of demography, and as such it will serve as a standard reference work for years to come.

KURT B. MAYER

Chairman, Department of Sociology
and Anthropology
Brown University

ROBERT W. SMUTS. *Women and Work in America*. Pp. vi, 180. New York: Columbia University Press, 1959. \$4.50.

Here is a book on a highly significant topic: the increasing gainful employment of women, especially married women, outside of the home in the United States since 1890. The discussion is reliable, concise, and lucid. Four chapters, totaling 155 pages, discuss the changes in the work women do, the women who work, the demands and rewards of women's work, and underlying values and attitudes. The quality of the material is good, but still \$4.50 is a lot to pay for the quantity, 155 pages. The price may reflect the publisher's expectation of a small market.

This book is for the intelligent general reader, not the professional student of the family, for there is little here with which

the specialist will not already be familiar: the changes in women's occupations since 1890, mainly a relatively sharp decrease of work on farm, in factory, and household service, and a marked increase in clerical, sales, teaching, nursing, and nonhousehold service jobs. Even more striking is the increase in employment of wives and mothers. In 1890 almost all of the white working women were young, single, of immigrant stock or native farmers, working because of economic necessity. Today all types of women are well represented in the labor force; the young and the middle-aged, the poor and the not-poor, the single and the married—all except young mothers of preschool children and women over 65. As to working conditions, women now receive more pay for less work than in 1890, have more job security, and work under pleasanter circumstances. In 1890, employment for women was widely regarded as a threat to femininity, morality, and male supremacy. Today this concern has been greatly diminished as more recognition is accorded woman's right for self-realization.

All of this is quite familiar, but what makes Smuts' account distinctive is his use of literary, biographical, and other historical sources to illuminate and vivify the narrative. For the general reader this is perhaps the best brief account available of the changing occupational role of women in the United States since the beginning of the century.

This reviewer believes it would have sharpened the perspective of the book if the author had, as an extension of his historical viewpoint, included material on non-American working women. Highly instructive for us is the situation in other industrialized societies, such as the Netherlands where religion limits the number of married women workers. Also the book under review focuses on the causes rather than the consequences of changes in women's work, although the author acknowledges, in a brief reference near the close, that the consequences are momentous.

M. F. NIMKOFF

Professor and Chairman
Department of Sociology
Florida State University

HERBERT GARFINKEL. *When Negroes March. The March on Washington Movement in the Organizational Politics for FEPC.* Pp. 224. Glencoe, Ill.: Free Press, 1959. \$4.00.

In his efforts to improve his lot the Negro of the twentieth century has lent his support to a variety of programs, among them the vocational training approach of Booker T. Washington, the better-living-conditions goals of the National Urban League, the legal defense and court-case emphasis of the National Association for the Advancement of Colored People and, most recently, the technique of Ghandian resistance as given expression by Martin Luther King's Montgomery Improvement Association. Distinctive among these Negro-betterment programs was the dramatic March on Washington movement initiated in the spring of 1941 by A. Philip Randolph, president of the Brotherhood of Sleeping Car Porters.

As related by Professor Garfinkel of Dartmouth College the March on Washington was a last-ditch effort to focus attention on the plight of the urban Negro worker on the eve of America's entry into World War II. In 1941 the long-existent discriminatory practices in hiring, in on-the-job training, and in upgrading were more aggravating than ever to the Negro as he noted his country's eagerness to contrast the American creed of liberty and equality with the suppressions that characterized the fascist nations. Unable by conference-table methods to induce the Roosevelt administration to take effective action against employment bias, Randolph called for a national Negro March on Washington. This bold proposition could not be ignored. Faced with the possibility of an embarrassing large-scale demonstration in the nation's capital, President Roosevelt yielded, issuing on June 25, 1941, an order—Executive Order 8802—prohibiting discrimination in defense industries.

After this victory Randolph attempted to organize his March on Washington supporters into an ongoing organization. But his spirit of dedication and his great personal integrity were not equaled by his administrative ability; moreover, the March

on Washington movement faced the competition of the older Negro-betterment groups, some of whose leaders distrusted Randolph's more forthright "direct action" techniques. In a larger sense, however, the March on Washington movement was no failure inasmuch as it paved the way for "a steady increase in minority-group economic opportunities," and it established among Negroes a greater "collective self-reliance."

Skillfully organized, *When Negroes March* is a thoroughly documented, penetrating analysis of a remarkable mass movement which made use of political pressure techniques to achieve an economic goal. Hence this admirable study should be of interest to the social psychologist and the economist as well as to the political scientist and the historian of contemporary America.

BENJAMIN QUARLES

Professor of History
Morgan State College

CLEMENT E. VOSE. *Caucasians Only: The Supreme Court, the NAACP, and the Restrictive Covenant Cases.* Pp. xi, 296. Berkeley and Los Angeles: University of California Press, 1959. \$6.00.

"The court is a mirror, an excellent mirror, of which historians for some reason have little availed themselves, of the struggle of dominant forces outside the Court." This observation by Felix Frankfurter, which is used as the epigraph to *Caucasians Only*, very aptly describes the subject of this book. Mr. Vose heeds Mr. Frankfurter's advice, and we see, albeit darkly, as through a glass, the sordid struggle of particular interest groups to maintain what they regard as their best interests.

Mr. Vose focuses his attention minutely on particular court cases, both state and federal, in which the legality of residential restrictive covenants was tested. The result is a chronicle of a forty-years war between the segregating white society, represented in the field by white property-owners associations and real estate boards, and, on the other side, an aroused Negro citizenry, led by the National Association for the Advancement of Colored People (NAACP). The legal battle ended with

the momentous decisions of 1948 and 1953 when the United States Supreme Court ruled that the Fourteenth Amendment forbade the judicial enforcement of restrictive covenants. The nonlegal contest goes on, however, wherein white citizens seek through essentially illegal means to maintain the racial exclusiveness of their neighborhoods. Author Vose concentrates almost exclusively on the legal fracas, not on the "reconstruction" which is now underway in so many American communities.

One of the most provocative features of this book, though the theme is insufficiently emphasized, is the role of social science, and particularly sociology, in affecting the development of legal precedent and constitutional law. Although Vose discusses the various forces and variables affecting judicial decision, one wishes he had attempted a more systematic analysis of the interplay of these forces. Among the most important of these forces are public opinion and the research and thinking of scientists, particularly social and behavioral scientists. Which way do the currents of influence flow? Grossly oversimplifying the matter, we might ask, is the "order of opinions" scientific opinion to public opinion to judicial opinion? Or is it something else? Mr. Dooley, in his famous observation that Supreme Court decisions follow the latest election returns, seemed sure of the force of public opinion. In contrast to this view, Henry Steele Commager, quoted by Vose, was of the opinion that, by 1937, the sociological method of basing decision on sociological and economic findings had become "all but the official doctrine of the Court." Although there are many permutations according to which the threefold order of opinions may occur, there is a wealth of evidence which suggests that the order, scientific opinion to judicial opinion to public opinion, is becoming more and more common. It is not difficult to find numerous examples in which the courts, in the face of contrary wishes of particular groups, have outlawed various forms of discrimination, to base their decisions on the findings of the social and behavioral sciences.

The author not only demonstrates considerable legal acumen; he also reveals a

good measure of sociological insight. Like a good teacher he raises, without actually asking, many basic questions about social and legal processes in a democratic society. So many of these questions are evoked by this book that the fact that it is the most penetrating analysis of restrictive covenants seems almost incidental.

FRANK R. WESTIE

Associate Professor of Sociology
Indiana University

PAUL H. JACOBSON. *American Marriage and Divorce*. Pp. xviii, 188. New York: Rinehart & Company, 1959. \$12.00.

Students of the family have been painfully aware that the United States is the only major nation without a centralized method for the collection and publication of marriage and divorce statistics. Impeded by budgetary and other considerations the National Office of Vital Statistics (NOVS) has done a commendable job in compiling and publishing such data as are available; nevertheless, social scientists working in the family field have been severely handicapped because of informational gaps in statistics dealing with interracial marriage rates, migratory marriage and divorce, remarriage, children affected by divorce, occupational and educational differentials, and so forth. Jacobson has attempted to "fill in" some of the gaps, and by so doing has come up with one of the most valuable books ever written in the field of marriage and divorce.

American Marriage and Divorce is a classic in its field. The book is a mine of information, and in this respect is not likely to be surpassed in the foreseeable future. It must have taken Jacobson the better part of a decade to collect, tabulate, and organize his material, and he can take pride in the fact that the finished product represents a genuine contribution to the family literature.

In publishing its regular marriage and divorce statistics, NOVS must rely on data that are forwarded by the individual states. Since many of the latter have not had centralized reporting procedures, and since, over the years, statistical recording has varied a good deal from state to state, the NOVS "clearing house" has been able to

publish only fragmentary and relatively nondetailed information. Jacobson carried out the painstaking task of collecting not only centralized information but also of reaching down to the city, county, and local court level in order to collect and present statistical series not heretofore available.

The net result is a sorely needed compilation of facts dealing with the seasonal pattern of marriage, trends in the marriage and divorce rate, marital patterns by race, age, locale, and occupation, as well as geographic variations and urban-rural differences, marriage and divorce proceedings, alimony, custody of children, mortality and the duration of marriage, and a host of other factors that are of concern to family sociologists. Although not written within any theoretical framework, Jacobson's volume is more than a collection of statistical facts. The facts hang together, and the accompanying explanations have been clearly thought out by the author. In consequence, the book will appeal to both the statistical and nonstatistical-minded reader.

The book sells for twelve dollars, and doubtless there will be some who feel the price is too high. Viewed from this corner, the price is right. As a matter of faith, if you are willing to take the word of an old, experienced horse trader, the book is a bargain.

WILLIAM M. KEPHART

Associate Professor of Sociology
University of Pennsylvania

JEROME K. MYERS and BERTRAM H. ROBERTS. *Family and Class Dynamics in Mental Illness*. Pp. ix, 295. New York: John Wiley & Sons, 1959. \$6.95.

This volume is the second part of a research report on the relationship between social class and mental illness. The first part, *Social Class and Mental Illness* by Hollingshead and Redlich, demonstrated that the prevalence of mental illness, its diagnosis, and the kinds of psychiatric therapy were all associated with the patient's position in the class system. Relying on an epidemiological approach, with the use of mass data, no attempt was made in the first study to throw light on the question of how patients become mentally ill, nor

on the social and psycho-dynamic factors in the development of mental illness. These are the problems attacked in this study.

Specifically the research seeks to test two hypotheses: (1) social and psycho-dynamic factors in the development of psychiatric disorder are related to the patient's position in the class order; (2) mobility in the class structure is associated with the development of psychiatric disorder. These two propositions were tested through an intensive study of fifty patients, half schizophrenics and half psychoneurotics, carefully selected from two social levels, a lower middle and a lower working class. The research was carried out by a team of social scientists and psychiatrists in a New England metropolitan area, and covered a period of ten years.

The findings of the research completely support the first hypothesis. In part they also support the thesis that a significant factor in the development of illness is the tension associated with mobility in the class structure. This was found to be true in the middle but not in the lower class. Statistically, significant differences between middle and lower class patients were found in intrafamilial role relationships, in sex role development, in kind and intensities of community pressures, and in attitudes toward mental illness, as well as to therapy, and in development of symptoms. At each class level, external pressures and internal tensions were more severe and more frequent among schizophrenics than among neurotics. Among middle class patients, pressures clustered around two basic value systems, respectability and success. Out of these developed inner tensions arising out of conflicts between instinctual, especially sexual drives and moral values as represented by parents, especially mothers. In other cases they grew out of the failure to live up to the rigidly internalized values of middle class culture. Tensions associated with the strivings of the upwardly mobile, or fear of loss of status, once achieved, were marked correlates of mental breakdown in the middle class patient.

In the lower class the picture was quite different. Here the pressures of economic adversity and exclusion from participation in the life of the community were the

sources of the inner tensions. Lower class, much more than middle class patients, displayed a family history marked by absence of affection and warm interpersonal relations, and by conflict with and fear of parents. Excluded from community participation there was little internalization of conventional norms, hence fewer inhibitions and little guilt feeling over violation of convention. Constant conflict with teachers, social workers, police, employers, and the like, bred feelings of hostility but at the same time of rejection and self-worthlessness. In both cases intrafamilial and community pressures bore more heavily on the schizophrenic than on the neurotic. Both intensity and frequency of pressures were directly related to the severity of mental illness.

The authors repeatedly emphasize that they do not take the position that social class is the only or even the most important factor in mental illness. Psychiatric disorder is confined to no one class. Rather, membership in certain social classes exposes persons more frequently and more intensely to the kinds of pressures which are closely associated with the development of functional mental illness. At the same time most persons exposed to these same pressures do not succumb. But interpretation of the etiology of mental illness and its successful therapy can be achieved only in light of understanding the role of class background.

Family and Class Dynamics in Mental Illness is a worthy companion to the Hollingshead and Redlich volume. It should be read not only in academic circles but by psychiatrists, clinicians, social workers, and laymen who have an interest in the problems of mental health. It has important implications not only for the student of mental illness but for those interested in delinquency and crime as well as for other forms of deviant behavior. The book demonstrates again the importance of expanding the horizon of research in the mental health field to include the contribution of the social scientist as well as those whose orientation is purely psychiatric and clinical.

C. T. PIHLBLAD

Professor of Sociology

DERRICK SHERWIN BAILEY. *Sexual Relation in Christian Thought*. Pp. viii, 312. New York: Harper & Brothers, 1959. \$4.50.

Since Comte there has in general been no close meeting of minds between theologians and sociologists. The present book by an Anglican theologian does, however, command respect for its impressive scholarship. Sociologists who have written about historical aspects of the family from secondary sources could well be humbled by Dr. Bailey's command of Hebrew, Greek, and Latin documents interpreted in the light of Biblical criticism.

Chapters of the book cover primitive Christianity, the New Testament, the Patristic Age, the Mediaeval Western Church, the Reformation and seventeenth-century Anglicanism, the tradition today, and, finally, present a theology of sex. There is a lucid analysis of the Christian tradition concerning the relations between men and women as influenced by countless writers, many unknown to the average sociologist. The views of Jerome and Tertullian concerning lust and women are placed in perspective, but Dr. Bailey freely grants that the Christian tradition by virtue of antagonism to a pagan world and for other causes was deeply pervaded by hostility to genital sex expression and by androcentricity.

Much can be learned from this book concerning concepts and disputations over the ages which left significant residues in civil laws and church doctrines of the present day. Affinal relations, impediments, consent, consummation, sacrament, indissolubility of marriage, sacerdotal celibacy, digamy, and "syneisaktism" receive especially illuminating treatment.

It is only toward the end of the book that Dr. Bailey seems other than an objective, scholarly historian familiar both with ancient documents and modern biological and social science. The theologian finally emerges, influenced somewhat by Barth and Buber, lucid, aware of semantic pitfalls, eager and prepared to reason profoundly in a liberal tradition from certain assumptions. The unstated assumptions seem to be a Creator God, a divine Son, special creation of generic Man, and au-

thoritative revelation in Scriptures theologically interpreted. Man is seen as an image of God and as Mankind having equal masculine and feminine components. Man and woman are complementary in a richly variegated association, the potentialities of which are known only by experience free from preconceptions of culture and tradition.

Perhaps sociologists and theologians need not be on widely separate planes of human thought.

CLIFFORD KIRKPATRICK

Professor of Sociology
Indiana University

JOHN VINCENT BARRY. *Alexander Maconochie of Norfolk Island: A Study of a Pioneer in Penal Reform*. Pp. xxi, 277. New York: Oxford University Press, 1959. \$6.50.

In this book, Mr. Barry attempts to negate the prevailing legend of Maconochie's failure and to elevate him to his rightful place of distinction. Maconochie, of course, was the superintendent of the penal colony on Norfolk Island, over 900 miles east of Sydney, Australia, from 1840-44. Mr. Barry succeeds eminently in his mission.

Many in the United States have assumed that Maconochie had much to do with establishing the "ticket-of-leave" system, which has been considered a precursor of the parole system in America. No less authorities than Barnes and Teeters have labored under this erroneous impression as has the reviewer. From Barry's documentation, it seems clear that ticket-of-leave antedated Maconochie's advent to Van Diemen's Land in 1837 and his superintendency at Norfolk Island. Maconochie did use ticket-of-leave more constructively than heretofore.

The mark system was really the core idea of Maconochie's penal philosophy. Maconochie contended that "prisoners should be punished for the past but trained for the future." The offender would be incarcerated until he had performed a specified quantity of labor. This idea would make imprisonment a task rather than a time operation. In addition to the mark system whereby the prisoner earned marks by his labor, Maconochie introduced

on Norfolk Island the system of group responsibility: prisoners who had proved themselves ready were assigned to parties of six who were collectively responsible for the performance and misconduct of their members. This was hard to administer. Furthermore, Maconochie introduced several other progressive measures which sought to rehabilitate prisoners and create a good social climate for personal improvement.

From reports, it appears that Maconochie had a most favorable impact on the Norfolk penal colony and that after his removal it fell once again into a subhuman jungle. American penologists will also be interested to note that Maconochie had a rather direct influence on Sir Walter Crofton's development in approximately 1854 of the progressive stages system in the Irish prison system.

WALTER C. RECKLESS

Professor of Sociology
Ohio State University

L. S. PALMER. *Man's Journey Through Time: A First Step in Physical and Cultural Anthropochronology*. Pp. xv, 184. New York: Philosophical Library, 1959. No price.

Man and Culture are in a sense synonymous, yet "Man's cultural development has proceeded in a manner quite different from his physical development." Palmer aims to evaluate progress in each area. Three problems in the physical area at once arise: (1) the unit of evolutionary time; this is now solved by accepting a "Darwin" as a unit, that is, "when any dimension changes by 1/1,000 of its original value in 1,000 years"; anatomical indices were not developed with reference to measuring evolutionary change; no particular skeleton is available as a standard. Palmer adopts an "average modern European adult male." In the cultural area there is an obvious limitation to objects, largely stone, rather than concepts and values. Man, the toolmaking animal, is Palmer's over-all concern.

After developing mathematical formulas to equate physical and cultural rates with time, the author establishes four major criteria in each area. In the physical they are: I1, Nuchal Area Height Index; I2, Condylar Position Index; I3, Cranial Ca-

capacity; I4, Lower Dental Arcade Convergence Angle. I1 and I2 are related to erect posture, I3 to brain, I4 to speech. In the cultural they are: C1, The Number of Different Materials Used; C2, The Number of Different Occupations Engaged in; C3, The Speed With Which Man Moved by Mechanical Means; C4, Cultural "Grading of Man-Made Objects." C1, C2, and C3 relate to concrete objects and methods and are largely quantitative; C4 is qualitative.

The major inferences on the physical side suggest that erect posture, brain size, and speech developed in order. All graphs extrapolated to several million years ago come close to the values given for Proconsul. The rate of evolution is about one "Darwin," and for periods not exceeding 500,000 years the approximate equation $H = (100 - at)$ expresses the relation between "percentage humanity" and time (Table II and Fig. 53).

On the cultural side it is concluded, on the basis of graphing the data, that the similarity of the graphs demonstrates that the four criteria chosen measure "the same cultural factor." Further, the shape of the graphs betokens an accelerating developmental process that is currently in a terrific phase of acceleration (Tables III-IV and Fig. 54).

Dr. Palmer has brought together a lot of data and has developed a very useful evaluatory and discriminatory technique. I think we can all agree with his major objective of relating rate of development, physical or cultural, to time. We can argue an almost unsolvable problem, that is, the weighting of the criteria used. On the physical side are nuchal area, occipital condyles, cranial capacity, dental arch the best single measurements to evaluate fundamental evolutionary biological change? If so, which tells the most? If not, what others should be considered? The same questions may be asked of the cultural criteria which range from flint-tipped spear and bone needle in carved bone case to supersonic jet plane and radar-controlled automatically fired antiaircraft gun battery. Palmer's method equates and rates all of the criteria chosen in each area, to be sure, but the choosing of the traits is the moot point. Incidentally, by implica-

tion at least, cultural evolution is assumed. The book is clearly written, well illustrated, and excellently printed. It should be read, studied, and evaluated by all biologists and all anthropologists.

WILTON MARION KROGMAN
Graduate School of Medicine
University of Pennsylvania

EDWARD NORBECK. *Pineapple Town: Hawaii*. Pp. xii, 159. Berkeley and Los Angeles: University of California Press, 1959. \$4.00.

In this book an anthropologist examines Maunaloa, a pineapple plantation community on the island of Molokai.

After a sketch of the growth of Hawaii's comparatively young pineapple industry, built upon imported labor, mostly Asian, the author describes the scientific and highly mechanized operation of the Maunaloa "factory farm" and reports on the ethnic backgrounds, skills, and rewards of the corporation's employees. There follows a generalized portrait of the town, with attention to such factors as the racial and cultural composition of the residents, education, religion, languages used, town layout, housing, and community facilities.

Because the peoples of the community still "remain culturally as well as socially distinct," the Filipinos, Japanese, Haoles (Caucasians) and Cosmopolitans—persons of mixed national and cultural backgrounds—are next examined separately, with attention both to "old-country" attitudes and customs which have persisted within the first two groups and to forces which are gradually obliterating various of these survivals. Of prime importance in the latter connection is the corporation's pressure toward elimination of attitudes and habits inimical to efficient industry.

Though they are to some extent influenced by the racial and cultural affiliations of the individual, the author maintains that social classifications are very largely determined by occupational status. Though Haoles still have both top jobs and social prestige and are followed in rank by Japanese and then the Filipino majority, it is stressed that this ranking is based not solely on "race" but on cultural considerations which derive partly from corporate

needs and partly from social traditions uniquely Hawaiian. Opportunities for, and obstacles to, individual upward mobility are described in some detail. The non-Haoles chances for advancement have greatly increased in recent years.

The final chapter summarizes changes in community social relationships since the plantation's origin in the 1920's. These include trends away from paternalism and social solidarity by kinship and ethnic grouping toward impersonality in economic relations, individualism, and a class-structured society. They are viewed not solely as the results of a general diffusion of American culture, but as the unplanned "functional correlates of industrialization," which can be observed in other Hawaiian pineapple towns, and reflect similar tendencies in plantation owned communities in other areas of the world.

Readable and well organized, this book provides indubitably authentic, and sometimes most interesting detail on the lives and relationships of Maunaloa's residents. The chapters on "The Filipinos" and on "Community Social Relationships" are especially noteworthy. Photographs, maps, statistical tables, and an Index are provided.

THOMAS D. MURPHY
Professor of History
University of Hawaii

ARTHUR R. M. LOWER. *Canadians in the Making: A Social History of Canada*. Pp. xxiv, 475. New York: Longmans, Green & Company, 1959. \$7.50.

Perhaps every historian after a certain age becomes a philosopher. He reaches a time in life when he wants to reflect on history and leave to younger men the work of filling in the small, scattered gaps in historical knowledge. This, certainly, would appear to be true of the distinguished Canadian historian, A. R. M. Lower. The author of *Colony to Nation* might well have been expected to turn to a work of an even more general nature, a history of the Canadian people, and no historian had more earned the right. Only one with the breadth of historical knowledge and the insight of Professor Lower could have written *Canadians in the Making*. This is a

good book for the reason that nothing that Professor Lower writes can be anything but good.

Had a lesser historian, however, undertaken to write such a book the result might well have been disastrous. It would in no way please Professor Lower who reserves some of his most acid comments for references to sociology to suggest that to write the history of the Canadian people he needed to be more of a sociologist than he was. Professor Lower fancies himself as something of a philosopher of history, and *Canadians in the Making* opens on a note that suggests that there, in a sort of stage-theory of development, has been discovered the key which will give meaning to the history of the Canadian people. But as attention shifts from the early years of the growth of the Canadian nation to the more complex developments of the late nineteenth and early twentieth centuries, the stage-theory is fortunately forgotten and what might be described as a philosophical approach disappears. What develops in its stead is a sort of rambling commentary on Canadian life, the social class relations of the Canadian people, their style of architecture, their religious beliefs and ethical practices, their cultural achievements, and such. There is much good history crowded into even the later sections of the book, particularly history with a strong local flavor, but as the story of the Canadian people unfolds, and the guideposts directing historical analysis become more obscure, the temptation of the author to give free rein to the expression of his views about various things becomes irresistible. By the time Professor Lower has done, there remain few facets of Canadian life on which he has not passed judgment.

Those familiar with Professor Lower's earlier writings, and particularly his scattered articles and papers, will discover much in *Canadians in the Making* that they had read before. But there is a pungency about whatever he says that can scarcely fail to make what he writes interesting. Few sacred cows are left peacefully munching their hay after Lower has done with them. Never one to criticize his neighbor without subjecting himself to the same kind of searching analysis, Professor Lower

directs his most deadly barbs at that Canadian society of which he has been most a part. However, he says little that is unkind about his French-speaking Catholic compatriots. No one perhaps who was not intensely Canadian could have written *Canadians in the Making*. And it is only those few perhaps who are as deeply attached to their country as is Arthur Lower who will fully appreciate this book.

S. D. CLARK

Professor of Sociology
University of Toronto

DAVID L. MILLER. *Modern Science and Human Freedom*. Pp. xiii, 297. Austin: University of Texas Press, 1959. \$6.00.

This volume, seeking to resolve the oppositions between the deterministic postulates of science and man's freedom to set goals for himself and devise means to achieve his objectives, is in fact a complete philosophy of science. To prove his theses, Dr. Miller finds it necessary to investigate, in Part I, The Physical Bases of Science, and here problems of the place of Observables, Explanation, Laws, Cause, Valuation, and related scientific debatables, are dealt with—in the course of which Positivism fares badly. The discussion is clear and comprehensive.

In Part II, The Ethical Bases of Freedom are discussed. Problems concerning the nature of life, biological organization, evolution, the place of mind, and the like, are surveyed. The discussion, in Chapter XII, of problems in the social sciences is related to the concepts of freedom, institutions, and values, which then leads into the investigation of a possible science of norms, and here the previously hard-won conclusions are brought to a focus. In the formulation of his philosophy Dr. Miller was, and is, much influenced by the views of his former teacher, George H. Mead. Following this approach, Dr. Miller indicates, in terms of physiology and psychology, how human freedom emerges in a natural way as the culmination of evolutionary processes wherein the symbolic process and reflective thinking make possible planned behavior of individuals as members of society. The co-ordination of the symbolic

function with bodily behavior—as man acts on physical objects and social processes to create and transform ends (goals)—is the source of man's freedom.

This book appeals to me as an excellent survey and affirmation of a viewpoint. My major criticism of it relates to the limited manner in which the author states his problem: one of his aims (pp. 3, 4, 12, and *passim*) is to reconcile the Greek rational tradition, as the historic source of science, with the basic tenets of the Hebraic-Christian tradition which, the author believes, gives us our cultural components of freedom, responsibility, and the hope of improving the world through human effort and ethics. Surely this frame of reference is too narrow and limited for modern science and philosophy. Is not our task precisely that of rising above this traditional and obsolete antithesis to a higher plateau of thinking whereon we may discuss and settle problems on the level of a new world synthesis? Our coming civilization, if it comes at all, will not be merely "Western"—it will represent a planetary level of integration in which the Greek-Hebrew-Christian provincialisms will be transcended. Given his own context, the author has produced a useful and readable volume.

OLIVER L. REISER

Professor of Philosophy
University of Pittsburgh

ECONOMICS

MASSIMO SALVADORI. *The Economics of Freedom: American Capitalism Today*. Pp. xxii, 242. Garden City, N. Y.: Doubleday & Company, 1959. \$4.50.

Professor Salvadori's book is "written by a layman for laymen . . . on the assumption that . . . any citizen can acquire the knowledge necessary to an understanding of an economic system." This word "system" is central to the book's whole scheme of exposition. Our "people's capitalism" is a philosophical system, not circumscribed by naturalistic scientism, as were the doctrines of the classical economists, deductively constructing their dismal science.

Ours is a positive system based on the constructive use of individual liberty. He says, "Some Americans and a good many foreigners, baffled by the complexity, the apparent contradictions, and the variety of the American economy, maintain that there is not a system but simply something which has grown without direction and without purpose, which holds precariously together and which is likely to disintegrate in the near future. . . . Clearly they are wrong: we know intuitively that the system exists and we know empirically how it operates—there must therefore be something holding together the elements of which it is composed" (p. 31).

This system in its material aspect (Chapter 4) embraces the institutions of property, capital, free enterprise, and the market. In terms of "man as an economic agent" it embraces (Chapter 5) labor organization, business administration, and government guidance. The "driving forces" (Chapter 6) behind or within the system "that represent the core (one may say the soul) of our economic institutions" are individualism, rationalism, liberty, equality, respect for work, materialism—in its best sense, solidarity, and evolutionary revolutionism.

Out of all this unsystematic system we have, in Salvadori's estimation, achieved something that "as it is—with its innumerable defects, weaknesses, and dark spots, not as intellectuals, businessmen, labor economists, [and so forth] would like it to be—represents an improvement over all other economic systems past and present. . . . If Americans make a mess of their lives, as many do, it is of their own doing, not the responsibility of the economic system."

This book is an essay in persuasion and, as such, is a forceful and inspiring document. But to this reviewer it would seem that if the general reader is to understand the "system" of people's capitalism he must have more in the way of concrete exposition of its *modus operandi*—for instance, its credit structure, the nature of professional management of corporations and professional administration of unions and their federations, and the income redistributions characterized by individual

and corporation taxes and social security payments and business subsidies.

EDWIN G. NOURSE

Washington, D. C.

JOHN M. LETICHE. *Balance of Payments and Economic Growth*. Pp. xiii, 378. New York: Harper & Brothers, 1959. \$6.00.

One of the more interesting recent explanations of the dollar shortage links the strong payments position of the United States to greater rates of productivity growth in American import-competing industries than in foreign exporting industries. That this can serve as a partial explanation of Britain's postwar dollar shortage but definitely not as a general explanation of the difficulties faced in Western Europe is one of the fundamental points Professor Letiche makes in his new book. Recent hypotheses are examined by him with the aid of interwar and postwar data for the United States and Europe.

The relationship stressed by Professor Letiche is that between actual levels of output and full capacity levels of output. In his opinion, the United States is distinguished from other countries in its ability to generate excess capacity. This tendency, according to the argument, results in an excess of domestic production over domestic expenditure, which, in turn, is the export surplus. To the extent that the export surplus is not matched by an outflow of capital, that is, foreign investment, the rest of the world suffers from a dollar shortage. The weak link in this chain of reasoning, insufficiently supported in this book, is the assumption that excess capacity is associated with an excess of actual production over domestic demand.

Only the second part of the book is devoted to exploring the relationship between economic growth and the balance of payments. Part One is a critical appraisal of classical, Keynesian, and neo-Keynesian analyses of the process of adjustment to disturbances in the balance of payments. He rightly points out that adjustments usually involve many prices, employment, and incomes, but seems to go too far in rejecting traditional arguments couched in terms of elasticities of demand and supply

for exports, imports, and foreign exchange. In working out a "more general mechanism theory" Professor Letiche ignores recent work by economists wedding the elasticity arguments with income effects and essentially repeats much of the elasticity argument in different terminology.

The book attempts to reach the nontechnical reader, by minimizing the use of algebra and symbols. However, in so doing Professor Letiche runs the risk of not satisfying the technicians without communicating with the others; his long verbal accounts of the adjustment mechanism (for example, pp. 131–149) will be difficult for the uninitiated. The discussion of Part Two, however, should be of general interest to all concerned with the development of the present payments position in Britain, Western Europe, and the United States.

RONALD W. JONES

Assistant Professor of Economics
University of Rochester

RENDIGS FELS. *American Business Cycles 1865–1897*. Pp. 244. Chapel Hill: University of North Carolina Press, 1959. \$6.00.

In this useful study of business cycles in the United States from the end of the Civil War to the end of the century, Rendigs Fels helps fill a major gap. Save for unpublished dissertations and articles in journals, there has been no book dealing competently with the cycles from 1865 through 1897. Drawing on the work of the National Bureau of Economic Research, on contemporary accounts, as well as on various though not all available sources of information and analysis, Fels has managed to join in felicitous fashion empirical data and theoretical analysis which has illuminated both the nature of the cycles under study and business-cycle theory in general. In this regard his work is a helpful contribution to both the historian and the economist. Basically historical in its approach, the book leans heavily on the theoretical foundations of business-cycle theory.

The book is divided, roughly, into two parts: the first part deals mainly with the theoretical framework and tools to be used; the second part contains historical accounts and analysis of the particular cycles in

the period under review. After making his case for the historical approach rather than the inductive, deductive, or econometric, Fels painstakingly synthesizes a theoretical framework of eclectic quality, drawing mainly on Schumpeterian theory but including important additions from Hicks and R. A. Gordon. This framework is filled out by taking into account certain other significant elements in the business cycle: price and wage flexibility, long-wave depression, and the role of external events. The result is a set of theoretical benchmarks which help greatly to further understanding of each cycle and of the underlying forces which transcended the particular cycle.

In the second part of the book Fels goes through a historical analysis of the main aspects of the various cycles starting with 1865: the cycles of 1865-79, 1879-85, 1885-88, 1888-91, 1891-94, 1894-97. These analyses of the various cycles, the turning points of which generally are National Bureau dates except where occasionally the author critically modifies the month of peak or trough, include an explanation of the major forces shaping the particular cycle within the context of the author's modified Schumpeterian system where appropriate. The explanation in some instances departs widely from the Schumpeterian model in which case the author develops it in accord with Gordon's investment opportunity concept or brings in Hicksian concepts or a combination. Fels' explanations are often a happy intertwining of contemporary accounts and judgments with the most important statistical series which measure more concretely the dimensions of the fluctuation. In some instances he accepts uncritically the validity of contemporary judgments, and his notion that the depression of the eighteen nineties was intensified by net outflow of capital from the United States is subject to serious questioning. But on the whole the account is balanced and penetrating. Constantly referring causal relationships to his theoretical framework, the author succeeds in putting each cycle into a clearer focus.

As the author takes the measure of the cycles from 1865 to 1897 he concludes that "on the one hand drastic modifications need

be made in Schumpeter's theory, and on the other hand the model is exceedingly illuminating." Innovation, Juglars, and Kondratieffs all proved very useful concepts while Kitchins did not. Gordon's minor cycles were more useful than Schumpeter's Kitchins. Hicks' theory contributed least to the study of the cycles. Fels concludes further that the framework applicable to the 1865-97 period seems to hold valid for the 1945-58 period. Regardless of the validity of this, Fels' work does provide a solid historical and statistical study with much material enhancing our understanding of both economic history and business-cycle theory.

CHARLES HOFFMANN

Department of Economics
Queens College

DOUGLAS VICKERS. *Studies in the Theory of Money, 1690-1776*. Pp. ix. 313. Philadelphia: Chilton Company, 1959. \$6.50.

This book is based on a doctoral thesis presented at the University of London. It re-examines economic literature in this period to elucidate the theories presented on money, employment, and to some extent on interest and economic growth. Successive chapters deal with Locke, Barbon, North, Law, Berkeley, Vanderlint, Cantillon, Hume, and Steuart. In general, the view is taken that there was more "wholeness" in the ideas of the later mercantilist and transitional writers whom Vickers studies than often has been recognized. Vickers makes it appear that in substantial degree these men were macro-economists of modern type, concerned particularly with full employment. He marshals his evidence to build a good case and is to be congratulated on it.

It is generally conceded that mercantilism was a "macro" system so far as it was an economic system at all. The mercantilists professed to look at the economy in a broad way and expected the government to run it properly. From Misselden onward, the argument was presented that more money meant more employment. It was suggested frequently that banks should be chartered to give loans and issue money;

why buy specie from abroad with goods exports when paper would raise prices just as well? This is where later writers parted company with the earlier mercantilists.

Vickers has done good service in bringing to notice aspects of the literature in his field that have received relatively little attention in standard histories of economic thought. However, his book suffers in some degree from the limitations of its scope and, partly because of this, seems sometimes to overstate its case. The omission of reference to Misselden, who wrote before Vickers' period, makes some ideas dealt with appear more novel than they really were, and Vickers' concentration on analysis of the writings to the neglect of their background perhaps puts Berkeley in a somewhat different position than he ought to occupy. Berkeley, in the *Querist*, was concerned with Irish poverty, which was a different and more lasting condition than the trade depressions that interested some of the English writers who made comparable suggestions. Vickers' statements that Barbon's ultimate criterion of policy was employment, and Law's that of power through employment, are difficult to accept without reservation. Barbon's *Discourse of Trade* suggested consumers' goods as an objective and Law probably was as much concerned as earlier mercantilists with wealth and social stability.

EDMUND WHITTAKER

Professor of Economics
Colorado State University

W. PAUL STRASSMANN. *Risk and Technological Innovation: American Manufacturing Methods During the Nineteenth Century*. Pp. x, 249. Ithaca, N. Y.: Cornell University Press, 1959. \$4.00.

Inspired by the speculation of economists, especially Schumpeter and Veblen, on the impact of innovations on our economy, the author in this study makes an empirical examination of segments of American industry in the nineteenth century, endeavoring to determine the relationship among business enterprise, technological change, and the risks assumed by entrepreneurs in fostering the innovations that were undertaken. He studies the his-

tory of the production of iron and steel, textile machinery, machine tools, and electric power equipment to find out when innovations took place, the entrepreneurial problems and decisions that led to these developments, and the degree of risk encountered by the promoters of new manufacturing methods in these fields.

Strassmann defines innovation as the time when a first decision is made to alter the routine of production and funds are used to implement a new, untried technological change. His investigations disclose that innovators were more creative and less passive than Veblen thought them to be, but that they proceeded with a larger degree of caution as well as a more certain chance of success than would the speculating gamblers that Schumpeter described as innovators.

In the iron and steel industry, most early mill owners were not enthusiastic about experimenting with technological changes, and simply followed Europe's lead. After 1870, however, American entrepreneurs became less cautious and at last effected technical improvements. In the textile industry, Europe again took the lead. The expense of changing heavy machines made Americans overly cautious and limited most innovations to attachments and gradual increases in speed. The low risks in the machine tool field, because the cost of these tools was not great, permitted considerable innovation, but the number of innovating firms was small, most enterprisers preferring merely to copy. Caution and the experience necessary in the electric power industry limited the field to a very few firms, most of which, however, made many successful innovations.

To this reviewer, the book seemed disappointing. It closely resembles a Ph.D. thesis in format and confirms the oft-made observation that doctoral dissertations do not normally make good books. In addition, the constant references to the technical processes and equipment used in the industries studied makes it quite difficult for the average reader to follow the discussion. Finally, the limitation of the investigation to only four industries, all involved with heavy producers goods, makes the validity of the thesis questionable for any

generalizations to be applied to the entire economy.

SIDNEY I. SIMON

Associate Professor of Economics
Rutgers, The State University

CALVIN B. HOOVER. *The Economy, Liberty and the State*. Pp. 445. New York: Twentieth Century Fund, 1959. \$5.00.

The events of the first half of the twentieth century—two world wars, the rise of communism, important modifications in political and economic institutions in the countries of classical capitalism, fantastic technological and scientific advances—initiated a new period in the history of mankind.

Dr. Hoover has undertaken the task of presenting the development, during several recent decades, of countries with different socio-economic structures, and of showing how their development has affected personal freedoms. He discusses the possibility of the rebirth of freedom in the "peoples' democracies" and the possibility of maintaining freedom in the capitalist countries, under the assumption of uninterrupted evolution of their socio-economic structures.

The book consists of eleven chapters, excluding the Prologue and the two concluding chapters. The first chapter is entitled "Old-Style Capitalism," four chapters are devoted to the Soviet Union, one chapter discusses "The Nazi Totalitarian System," three chapters analyze the economic system of the United States and two chapters cover "The British Economic System" and "The Economic System of Western Europe."

In probing this theme, Dr. Hoover also discusses a number of other questions closely related to the freedom of the individual in countries with contrasting socio-economic structures.

Lack of space does not permit a more detailed description of the contents of this valuable book, saturated with quantitative data, examples, facts, and the author's personal observations. Dr. Hoover is a leading economist and an expert on Soviet practices. From the reviewer's point of view the most interesting chapters are de-

voted to the Soviet political and economic system. The author presents many ideas, facts, observations, illustrations, and comparisons pertaining to the Soviet economic system, which make the book valuable to a specialist and interesting to a layman.

It is important to note that the author sees the Soviet economy as it is in actuality, and not as we would wish to see it or as the Russians would like us to see it. Although the author knows well the shortcomings of the Soviet economic system, he was not lulled by these deficiencies into underestimating the Soviet potential. It cannot be said that Dr. Hoover did not see the forest for the trees. He stresses that "a Soviet rate of economic growth almost twice the past rate in the United States, if the writer's crude estimates were assumed to present reality, would represent a factor of great force in the present world conflict" (p. 164).

It is necessary to note an unfortunate inaccuracy in the book. Discussing the 1932-1933 famine in the Ukraine, the author writes: "Since the season turned out to be a poor crop year in the Ukraine, the harvest proved insufficient to maintain life. The peasants appealed for grain from the state grain reserves. Stalin said 'No!' Hundreds of thousands in the Ukraine died from starvation or diseases of malnutrition" (p. 73). Actually the situation was somewhat different. Famine was quite deliberately employed by the Soviet government as an instrument of national policy, as a last means of breaking the resistance of the peasantry to the new system where they are divorced from personal ownership of the land and obliged to work under the conditions which the state may dictate to them and deliver whatever the state may demand from them.

According to estimates of various authors, between three and five million people died of hunger in the Ukrainian Soviet Socialist Republic at that time. Famine, as a political tool, is the cruelest invention of the communist system.

Although Dr. Hoover's book will be especially useful for those who are working in the Soviet field, it is wholeheartedly recommended to all who are interested in

and take to heart the more disturbing problems of our times.

T. SOSNOVY

The Library of Congress

J. FRED RIPPY. *British Investments in Latin America, 1822-1949, A Case Study in the Operations of Private Enterprise in Retarded Regions*. Pp. xii, 249. Minneapolis: University of Minnesota Press, 1959. \$5.00.

Dr. J. Fred Rippy, who has dedicated many years to the study of Latin America, in the volume under review has presented an interesting and important survey of a special phase of the economic development of that region. It is in fact a case study in the operation of private enterprise in retarded regions. It considers from all possible angles the operations of the British investors in Latin America from the era of independence until 1949. The author has investigated carefully all the evidence available regarding the chronicle of private English investments in Latin America, and directs attention to the unequal economic progress among the various nations and peoples. Details of the size, nature, chronology, and rates of return of the British investments are presented.

The introductory chapter deals with recent problems in private international investment and details the crisis which has occurred in the British experience in Latin America. Then three parts are devoted to the various phases of the problems involved. Part one comprises a general survey of the British investments in Latin America. The various periods into which the investments fall are indicated, showing great activity at times and much reluctance at others. There are chapters devoted to a detailed analysis of investments at the end of 1913, British investments at their peak in 1928, and a decade of rapid contraction which closes the period covered to 1949.

Part two is devoted to a study of the British investments made in the various countries of Latin America. The importance and results are set forth. The amounts invested, the returns obtained by the investors, and the importance of the

development in each country are indicated. Part three comprises chapters dealing with the nature and results of certain British companies and the income from British overseas investment during a recent decade. It concludes with chapters on some British views of foreign investments and the view of the Latin American recipients.

Many statistical tables are included and the Appendices list the British gas companies in Latin America and the British investments in Latin American electric utilities. Thus it can be said that Dr. Rippy has made a valuable contribution to the study of certain aspects of the economic development of Latin America during the period of its independence. The volume should be read by all who desire to understand the course of events in the Latin American countries.

ROSCOE R. HILL

Washington, D. C.

Wages, Prices, Profits and Productivity. (Background Papers and the Final Report of the Fifteenth American Assembly, Arden House, Harrison Campus of Columbia University.) Pp. ix, 193. New York: American Assembly, Columbia University, 1959. No price.

The relationship among wages, prices, profits, and productivity was the subject for discussion at the Fifteenth American Assembly, Arden House, Harriman, New York, April 30 through May 3, 1959, under the auspices of Columbia University. Some sixty Americans from business, labor, government, agriculture, communications, and the clerical, legal, and military professions participated.

Special papers by a group of distinguished economists provided background material for the conference. Professor Charles A. Myers, Massachusetts Institute of Technology, edited the papers and contributed the Introduction titled "Central Issues in Wage Price Relationships." The papers, which constitute the major part of the present volume, include: "Patterns of Wages, Prices and Productivity," Professor Albert Rees, University of Chicago; "Productivity, Costs and Prices," Professor John W. Kendrick, George Washington University; "Underlying Factors in Post-

war inflation," Professor James S. Dusenberry, Harvard University; "The Impact of Unions on the Level of Wages," President Clark Kerr, University of California; "Wage Behavior and Inflation," Professor Lloyd G. Reynolds, Yale University; "Policy Problems," Professor John T. Dunlop, Harvard University.

Also included in the volume are an address by Secretary of Labor James P. Mitchell on "Productivity and the Consumer," an address by the late Professor Sumner H. Slichter of Harvard University on "Labor Costs and Prices," and the "Final Report of the Assembly."

Analysis of the relationships among wages, prices, profits, and productivity indicates the need for more complete data and more accurate measurement. Considerable attention is given to the relation of wages to inflation. While wages are seen as an important contributing cause, the consensus is that in addition to the upward push of wages and other costs it is essential to recognize the impact of the upward pull of demand resulting from such factors as the backlog of purchasing power, easy credit, heavy public expenditures, and increasing population.

Viewed as desirable national goals are: sustained economic growth, increased productivity, full employment, reasonable price stability, national security, industrial peace, and a higher standard of living. Illustrative of the means of attaining these goals are: appropriate monetary policy; free markets; reduction of tariffs and other impediments to international trade; vigorous enforcement of anti-trust laws; and an annual conference of labor, management, and government to examine the trend of wages, prices, profits, and productivity in relation to national objectives.

Comprising as it does a series of brilliant analyses of the diverse facets of inflation and the elements of sound public policy, this volume is a very important addition to contemporary economic literature.

RICHARD HARTSHORNE. *Perspective on the Nature of Geography*. (The Monograph Series of the Association of American Geographers.) Pp. 201. Chicago: Rand McNally & Company for the Association, 1959. \$5.00.

This book is both a summary and elaboration of Professor Hartshorne's previous methodological work entitled, *The Nature of Geography*, published during 1939 in the *Annals of the Association of American Geographers*. In 1946 the original monograph was reprinted in book form with minor additions and alterations by the author. American geographers were, and still are, given to frequent discussions of the nature and scope of their field. As the most comprehensive analysis of the subject in English, the monograph helped to give us perspective in the light of European concepts, particularly those of Ritter, Humboldt, Ratzel, and Hettner, and became the credo of the postwar generation of graduate students in Anglo-America.

Although the new book cannot replace the earlier work because it does not duplicate the exhaustive treatment contained therein, it expresses briefly and in a more affirmative manner a logical framework of geographic investigation and scholarship. It brings together references to subsequent writings in the English, French, and German languages, and takes cognizance of more recent thinking. In view of the present rapprochement between Russian and Western scholars and scientists, the paucity of references to the literature in Slavic languages and the lack of discussion of Russian geography might be considered a deficiency.

Consideration is given to ten basic questions, each of which forms a theme of a chapter: "What Is Meant by Geography as the Study of Areal Differentiation?" "What Is Meant by the 'Earth Surface'?" "Is the Integration of Heterogeneous Phenomena a Peculiarity of Geography?" "What Is the Measure of 'Significance' in Geography?" "Must We Distinguish between Human and Natural Factors?" "The Dualism of Physical and Human Geography," "Time and Genesis in Geography," "Is Geography Divided between 'System-

atic' and 'Regional' Geography?" "Does Geography Seek to Formulate Scientific Laws or to Describe Individual Cases?" and "The Place of Geography in a Classification of the Sciences."

In this, as in the earlier work, the author's endeavor is to report and document the concepts of the field found valid by others in Europe and America. Yet I detect a somewhat stronger expression of his personal views, particularly in regard to the place of genetic geomorphology (pp. 93-96), which is likely to arouse adverse criticism on both sides of the Atlantic. Anyone who seeks in this volume a set of final conclusions to end all arguments will be disappointed. No methodology should be considered complete.

Few will doubt, however, that many fundamental issues have been resolved and many illusions dispelled, including the notion that geography is an offshoot of geology despite the nurturing it received from geology in American colleges and universities during the early twentieth century. The value of Hartshorne's labor will be evident if it promotes general agreement among geographers and releases their energies for substantive studies built in an organized system.

JOHN E. BRUSH

Professor of Geography
Rutgers, The State University

F. ERNEST JOHNSON and J. EMORY ACKERMAN. *The Church as Employer, Money Raiser, and Investor*. (Series on the Economics and Ethics of Society.) Pp. xvi, 184. New York: Harper & Brothers, 1959. \$4.00.

Two competent authorities, clergymen skilled in social research techniques including questionnaires and statistical tabulations, present a reasonable although not exhaustive interpretation of the relation of American Protestant churches to the current economic picture. They ask: do religious groups live up to the accepted standards of corporate practice, and should they apply even stricter standards to themselves? Often the evaluation favors the churches; lags and inconsistencies seem due to inadequate funds or lack of acquaint-

ance with business and financial techniques.

Investigation reveals that some nine well-established denominations have higher salaries than do the smaller sects. Including allowances for house rent and car, three denominations average more than \$6,000; six others about one thousand dollars less. As a rule, the larger the community and plant, the higher the salary. Even the best averages are judged inadequate for the proper support of a family with children. Major agencies, like national denominational boards and the National Council of Churches, have better salary scales and fringe benefits. Pension systems, reinforced by social security, although insufficient are improving. The income of pastors is higher than that of directors of religious education, parish workers, office secretaries, and sextons, whose remuneration drops in that sequence.

The securing of funds, with or without the aid of professional money-raising organizations, is too commonly based upon excessive promises and directed toward givers motivated by forces other than purely dedicated stewardship. Ownership and investment practices approximate those of the business world, at times applied skillfully through the counsel and service of devoted laymen, but frequently based upon expediency rather than principle.

The authors consider that conditions are improving in regard to self-examination and effectiveness. They suggest further application of approved personnel practices such as job classification, racial integration, equal pay for women, and better provisions for illness, health, and vacations. They conclude with the caveat that the more the churches succeed in the realm of business and finance, the more they may take on the color of their secular environment. It would seem then to be the concern of sensitive Christians to lead rather than conform or follow, to strengthen the spiritual power of the churches, and to make their character and mission more visibly moral and socially beneficial.

AMERICAN GOVERNMENT AND HISTORY

MAX BELOFF. *The American Federal Government*. Pp. vii, 213. New York: Oxford University Press, 1959. \$4.50.

Professor Beloff set himself "in this book only a limited task: to give an account of the general principles of American government and of the manner in which it functions from the point of view of non-Americans, whose main concern is naturally with those aspects of American institutions and policies that affect the outside world." His viewpoint is necessarily that of the British subject, firmly committed to "responsible government" by a cabinet accountable to parliament. His critique of American government is couched in British terms. It might have started a debate about the relative merits of the two systems, if the late Harold J. Laski and Don K. Price had not pre-empted that field.

The book seems to have been meant as another in the series of European commentaries upon the United States, to which the contributions of De Tocqueville and Bryce have been the most distinguished ones. It impressed this reviewer more as a primer on American government for literate Britons. The core chapters deal with the Constitution, the President, the Administration, the Congress, and the parties. They do so at equal length, except for the Administration, to which more space and criticisms are offered. Mr. Beloff is especially unhappy about the Civil and Foreign Services. The latter "is forced in its recruitment to accept Congress' prejudices in favor of a spread by region, which may not necessarily correspond to the distribution of the universities and colleges most likely to turn out the best candidates." This overlooks the nationwide recruitment of students by these universities. And it is simply not true "that the highest posts are barred to the career man. . . ."

The conclusion favors constitutional reform. Of this, Mr. Beloff writes: "Where those relatively qualified to speak have been silent, it is not for the foreign student to make himself heard." Before the reader can applaud this thought, he continues:

"But he cannot help seeing the United States as the extreme case of the common fate of modern governments in being unable to cope effectively with the ever growing burden of day-to-day responsibilities, and in being forced to postpone or neglect important decisions of principle, including the shape of government itself." The merit of this book is directly related to the irrelevance of the conclusion to its core. However, on the whole, it presents an informed and balanced view of American federal government.

HERBERT JOHN SPIRO

Assistant Professor of Government
Harvard University

RICHARD F. FENNO, JR. *The President's Cabinet: An Analysis in the Period from Wilson to Eisenhower*. (Harvard Political Studies.) Pp. xii, 327. Cambridge, Mass.: Harvard University Press under the direction of the Department of Government, 1959. \$5.50.

Several approaches might be followed in studying as unmanageable and desultory an institution as the President's cabinet. A purely chronological one would be of interest to the historian, a purely analytical one to the political scientist. Mr. Fenno, in his study of that body from Wilson to Eisenhower, has managed to incorporate both with results of interest to both and by keeping his style relatively free from professional jargon has provided a study of value to anyone interested in American politics.

Beginning with a discussion of cabinets in general, "A cabinet originates in the universal need on the part of any single Chief Executive to consult with others and draw upon the advice of others in exercising his political power. It persists as an aid to intelligent and informed decision making," Mr. Fenno proceeds to analyze the appointment process, cabinet meetings, inter-cabinet and interdepartmental co-operation during and outside of formal meeting, the relation of the cabinet to the President, Congress, political parties, and pressure groups and concludes with a contemplative discussion of a series of proposals for and attempts at cabinet reform.

In all instances, he draws on examples over the last forty-five years for generalizations and conclusions.

And his conclusions are sane and perceptive. Generally they are that the cabinet is and ought to be an agency flexible enough to serve the best interests of the President in a variety of fashions. This, however, makes specific obligations vague, and Mr. Fenno makes clear that those obligations are not fixed or formal and can and have changed with individual Presidents and diverse cabinet personalities. Certain Presidents, for example, have expected their cabinets to serve as policy-making bodies. Harding felt his team of "best minds" could make up for his own inadequacies and chart an intelligent course for the nation. Hoover, on the other hand, made his own decisions, and Franklin Roosevelt used advice when it suited his general purposes and rejected it when it did not. But policy making is only one function. The cabinet is also a vital sounding board of public opinion, with different members responding to different sources of such opinion, and a popular member, popular that is with his particular "constituency," often serves admirably to draw support to the President. Here however lies a paradox. To be most useful the member must have non-Presidential "public" prestige, party following, legislative support, or roots of influence in his own department. And this means the member operates, not as part of the formal body but independently, and frequently means that he operates to get for his supporters the bigger piece of the pie before a fellow member moves in to do the same for his. In this sense the political help which the President receives comes not from the group but from individual members operating quite outside the group and often with ferocious individualism.

However, although Mr. Fenno discusses at length the problems of "departmentalism," he does not decry it too vigorously. On the contrary, he generally takes a dim view of proposals to formalize and institutionalize the cabinet and force it to work as a team. In this regard his discussion of the Eisenhower Secretariat approach is of interest. However, again, his analysis of

this experiment is properly detached. In some respects it has worked for Eisenhower, yet, as Mr. Fenno states: "one should remain reluctant to prescribe it or any other specific reform as the solution to the President's problems, lest a rigid prescription or an over-institutionalization of the means defeat the very ends of executive leadership."

In all, then, the cabinet is a vital part of American political life, not perfect nor even valuable in many instances but potentially very useful and well worth keeping in its "unreformed" status for just this reason.

PAUL L. MURPHY

Assistant Professor of History
University of Minnesota

LEWIS MAYERS. *Shall We Amend the Fifth Amendment?* Pp. x, 341. New York: Harper & Brothers, 1959. \$5.00.

Until the last decade, the Fifth Amendment to the federal Constitution was chiefly known for its double jeopardy and due process clauses. Buried in its verbiage was a fifteen-word phrase—"No person . . . shall be compelled in a criminal case to be a witness against himself"—about which most Americans then knew little or nothing. Yet today there is probably no constitutional provision that is more notorious than this so-called "privilege against self-incrimination."

Now Professor Lewis Mayers, long a fixture in the law department of New York's City College, has joined the growing ranks of the Fifth Amendment's detractors. This book, *Shall We Amend the Fifth Amendment?*, is the last of three significant recent books on the privilege. The first two, Dean Erwin Griswold's *The Fifth Amendment Today* and Professor Sidney Hook's *Common Sense and the Fifth Amendment*, were clearly inspired by the use or misuse of the privilege before congressional investigating committees and were mainly concerned with the inferences to be drawn from its invocation. Curiously enough, Professor Mayers' critical book, which is incomparably more comprehensive than its predecessors, not only defends the right of all witnesses except public officers to plead the Fifth Amend-

ment before these committees but even recommends its further liberalization. His opposition stems from what he considers its harmful effects insofar as law enforcement is concerned, an area in which legislative committees play little part.

His attack on the privilege is on two levels: its use by criminal suspects during preliminary interrogations by police, magistrates, and grand juries; and by nonimplicated witnesses in the trials themselves. In both cases, he advocates its outright abolition provided the prosecution is prohibited from offering the compelled testimony in evidence at any subsequent trial of the witness in question. He urges this approach to the abrogation of a constitutional right as a proper balance between the needs of law enforcement on the one hand and the individual's civil liberties on the other.

It is a constitutional necessity that even sacrosanct First Amendment rights must occasionally yield to compelling necessity. But Professor Mayers has not convinced me that lawlessness has reached the point where it can only be controlled by the destruction of fundamental rights. And the abolition of the privilege cannot be justified by the granting of a limited immunity which can never be as broad as the right it replaces. All he offers is the proposal that the compelled testimony cannot be used later against the witness. But there is nothing to prevent the prosecutor from utilizing the information gleaned from it to build a substantial case against the testifier. Mayers' suggestion is clearly unconstitutional, and as he somewhat querulously points out, today's Supreme Court would quickly invalidate any federal or state legislation incorporating his panacea.

It is not easy to sit still when Dave Beck stands on his constitutional rights and refuses to concede the paternity of his own son. Admittedly, it is exasperating, time-consuming, costly, and often even fruitless to force those responsible for the administration of justice to rely on secondary evidence because material witnesses sit smugly silent. But it is still better, even at the expense of some dead-end investigations or unfortunate acquittals, to retain these dif-

ferences in coloration that mark us from the totalitarian states. Jerome Frank saw this more clearly than Professor Mayers seems to when he wrote "Before we . . . sacrifice all our other values to effective law enforcement, we should reflect on the brutal consequences of the totalitarians' alleged efficiency in pursuing suspected criminals."

WILLIAM M. KUNSTLER

Associate Professor of Law
New York University Law School

RICHARD H. LEACH and REDDING S. SUGG, JR. *The Administration of Interstate Compacts*. Pp. vi, 256. Baton Rouge: Louisiana State University Press, 1959. \$4.50.

This book breaks new ground in the field of public administration, being the first comprehensive attempt at an appraisal of the organization, staffing, and practices of interstate compact agencies. It is the outgrowth of a project begun while the authors were staff members of the Southern Regional Education Board, an interstate compact agency established in 1949 and operating with notable success in the southern states from Maryland to Texas.

The authors have produced a well-written and readable book, without excessive details or extraneous matter. They have summarized the development of interstate agencies under the compact clause, discussed the relations of interstate compact agencies with state and federal governments, analyzed the powers and personnel of interstate bodies, and treated the staffing and operations of these bodies at some length. They have selected six interstate agencies—the Pecos River Commission, the Atlantic States Marine Fisheries Commission, the Ohio River Valley Water Sanitation Commission, the Waterfront Commission of New York Harbor, the Interstate Oil Compact Commission, and the Southern Regional Education Board—for special case studies. Finally, they have added some interesting conclusions and predictions about interstate compact agencies, and they have commented helpfully in a bibliographical note on available reports and other materials.

In discussing the development of interstate compact agencies, the authors point out that these agencies have been used to any extent during the past forty years only, more particularly since World War II, that they now provide "a new dimension for state power," and that "they permit the states to take continuing cooperative action in fields where they cannot act effectively or do not wish to act alone, fields which might fall by default to the federal power if not occupied through the initiative of the states." Of more than sixty interstate compact agencies established in recent years, thirty have set up administrative facilities to carry on their work and consequently are the ones which the authors have chosen to discuss. In all cases, these compact agencies are identified administratively with the states they represent rather than with the federal government.

While the idea of interstate compacts is as old as the federal constitution, the authors observe that the use of such compacts is still too new for any well-defined relationship to have developed between the states involved and the compact agencies themselves. But they think that the point has been reached where it is apparent now that the compact agencies can do new kinds of work hitherto inhibited to the states on account of "their adventitious physical and administrative boundaries." And the success of such agencies, they find, depends directly upon the ability and continuity of the staffs recruited by these agencies to carry on their work.

Sparked by the general attitude of the Eisenhower administration and the findings of the Kestnbaum Commission, there is currently renewed emphasis on the position and powers of the states in the federal union. So the authors conclude that "interstate compact agencies can play a tremendous role in the states' resumption of power."

A. E. BUCK

Norwalk, Connecticut

MRS. THEODORE ROOSEVELT, JR. *Day Before Yesterday: The Reminiscences of Mrs. Theodore Roosevelt, Jr.* Pp. 478. Garden City, N. Y.: Doubleday & Company, 1959. \$5.95.

Although Mrs. Theodore Roosevelt, Jr., nee Eleanor Alexander, has previously been largely unknown to students of the American scene, she should now gain her richly deserved place as one of America's great ladies of the twentieth century. This book, which is, first of all, a generous, unselfish autobiography, approaches the status of a biography of Theodore Roosevelt, Jr., the author's distinguished husband. Here for the first time are revealed many interesting anecdotes of the "off season" Roosevelts, as they are termed.

Theodore Roosevelt is mentioned, but this is not a book about him. Nor does it treat to any appreciable degree the life of Mrs. Theodore Roosevelt or of the author's well-known sister-in-law, Alice Roosevelt. Indeed, when the author ushers her in-laws into her fascinating narrative, it is the brothers of her husband who are introduced. Most of the information about Theodore Roosevelt, Jr.'s brothers is connected with their gallant records in military service during World War I. From her position as an employee of the Young Men's Christian Association (Y.M.C.A.) in France in 1917-1918, Mrs. Theodore Roosevelt, Jr. has told of a most unusual segment of her life.

This book gives the American public an excellent example of how partisan politics sometimes intervenes in war activity. Woodrow Wilson refused to permit Theodore Roosevelt to lead a division to France during World War I. That fact has been widely known but not so well known was the order issued during World War II, apparently by the Commander-in-Chief, Franklin Roosevelt, that in all reports of heroic feats performed by Theodore Roosevelt, Jr. or by his son, Quentin, the name of the Roosevelt in charge was to be deleted from all information sent to the United States. Although both father and son were recognized by foreign governments for meritorious service, not one word of this heroic military action was known in America. Only after Theodore Roosevelt died in France in July, 1944, was publicity given by his country to his distinguished military career during World War II. He was awarded the Congressional Medal of Honor posthumously.

THE PAPERS OF BENJAMIN FRANKLIN

Volume 1, 1706–1734

Leonard W. Labaree, Editor

Whitfield J. Bell, Jr., Associate Editor

This is the first volume to come from a great scholarly undertaking, the assembly and editing of Benjamin Franklin's complete writings and correspondence. Sponsored by the American Philosophical Society and Yale University, this new edition of forty volumes will be published over a period of fifteen years.

This first volume contains more than triple the amount of material in the Smyth edition for this period of Franklin's life, from his birth in 1706 to the end of 1734. This is the period reflecting the young Franklin of Boston and Philadelphia as an essayist, journalist, pamphleteer, and as a rising young printer.

Beautifully designed and printed, with full-color and half-tone illustrations. Genealogy, chronology, and index. Subscriptions are invited. \$7.50

Kindly mention THE ANNALS when writing to advertisers

Not all of the author's life, nor that of her husband, was consumed in military action. For several years Theodore was Governor of Puerto Rico and following that he was Governor General of the Philippine Islands. In both areas, the author reports the career of her husband as an efficient colonial administrator. She also weaves into her story much interesting material about herself and her children.

Another significant phase of Mrs. Roosevelt's life was spent in accompanying her husband to Asia on hunting trips for the Field Museum of Natural History. This accomplished lady proved herself to be an excellent rifle shot and a good companion on a safari.

From helping to organize the American Legion in 1919, Theodore entered politics. As Assistant Secretary of the Navy in 1921, he played a significant role in the Washington Disarmament Conference. Although Roosevelt was almost brushed by the Tea Pot Dome Scandal, he emerged without stain to run for governor of New York in 1924. Defeated by Al Smith, Theodore, assisted by his devoted wife, found another outlet for his boundless energy.

This well-written and informative book will be read with delight by many people. It records the life of a warm and wonderful family. At the same time, it evokes the history of the last half-century with great grace and charm.

GEORGE C. OSBORN

HARRY V. JAFFA. *Crisis of the House Divided: An Interpretation of the Issues in the Lincoln-Douglas Debates*. Pp. 451. Garden City, N. Y.: Doubleday & Company, 1959. \$6.50.

Professor Harry Jaffa, a political scientist, has written an important book about one of the great episodes in the history of the sectional controversy, the Lincoln-Douglas debates. To evaluate or even to discuss the book is a difficult task. It is a deeply thoughtful work and at times a tedious one. It is at once profoundly philosophical and ponderously pretentious.

It is also a very angry book. The author lashes out constantly against the views of such writers as Avery Craven, Richard Hofstadter, George Fort Milton, Allan Nevins, Charles W. Ramsdell, J. G. Randall, and T. Harry Williams. This is a distinguished list, but Professor Jaffa has every right to differ with these scholars; indeed, on many scores his criticisms are justified. But like so many writers who want to prove that everybody else is wrong, he sometimes gets carried away by the exuberance of his opinions and voices too extreme statements.

The principal targets of Professor Jaffa's thrusts are the so-called "revisionists" and particularly the leader of that school, J. G. Randall. In brief, the revisionist view was that the Civil War was not the product of slavery or of any fundamental cause, that it was artificial and brought about by a fanaticism, mainly Northern in origin, that ignored realities, and that it could have been avoided if the politicians had acted more responsibly. It so happens that I agree with many of Professor Jaffa's strictures on the revisionists. He has performed a service by calling attention, even if too bitterly, to their errors. But he does not see that the revisionists were influenced by the intellectual currents of their time, as all historians are, as he himself is influenced by certain concepts of our own day. He rightly finds more principle, more idealism, more consistency in the antislavery movement than previous writers—but he finds too much.

Professor Jaffa's thesis is too complex to explain in a short space. Briefly, he examines Lincoln's early thought, especially as expressed in the Lyceum and Temperance addresses, and finds therein a depth and duality not previously appreciated. In expounding Lincoln's arguments in the famous debates, he properly emphasizes Lincoln's devotion to the principle of equality, and he has some sensible things to say about the meaning of equality in the American ethic. This part of the book is excellent and should be read and pondered by every serious student, regardless of whether he agrees with the author's argument. It breaks new ground and opens a

new view of Lincoln's significance as a political thinker.

Of one of Professor Jaffa's criticisms of historical writing, I can speak with direct knowledge. He attacks me for saying that Lincoln held the Negro to be inferior and that the superior whites would always oppress the blacks. On the first point, he complains that I do not specify in what way Lincoln thought the Negro was inferior or how long the inferiority would last. Lincoln himself probably could not have defined his feelings on this issue exactly. On the second, Professor Jaffa argues that Lincoln said only that one race or the other would do the oppressing. It is obvious, I think, that Lincoln felt if any oppressing was done the whites would do it. Of course, he did not say, nor did I so report him, that one race would always oppress the other; he was talking about prospects in the foreseeable future. Professor Jaffa is correct in saying that Lincoln's racial ideas have been the subject of some "loose" scholarship. They may now become the victim of some dogmatic moralizing.

JOHN R. CUNEO. *Robert Rogers of the Rangers*. Pp. xii, 308. New York: Oxford University Press, 1959. \$6.00.

Few figures of any real importance in our eighteenth century have been so ignored by historians as has Robert Rogers of the Rangers. This does not mean to say that he is unknown. Kenneth Roberts' novel, with the resultant movie and television programs, have made "Rogers of the Rangers" almost a household word. The reputation of Robert Rogers has been swollen by legend and festered by prejudice. Until the present volume, however, there has been almost no attempt at serious and thorough research into the facts behind the legend.

That Robert Rogers deserves the attention of a serious and competent biographer cannot be challenged. Rogers volunteered to fight against the Indians at fourteen; at twenty-four he became a scout for Sir

William Johnson, on the shores of Lake George. There followed many gallant forays against the French and Indians; the dramatic destruction of the St. Francis Indians; the generally unsuccessful but glamorous expeditions into the West. Rogers won generous and powerful support in England, wrote and published volumes that were critically acclaimed, organized and commanded battalions of scouts and rangers, demonstrated the possession of military intelligence and insight of a high order, and married a beautiful and socially prominent girl.

Rogers also failed in business, contracted heavy debts, provoked the bitter animosity of such important men as Sir William Johnson and General Gage. Unjustly and maliciously accused of treason, he was acquitted only to find his career blasted. Years in debtors' prison were followed by permanent separation from his family, a lack of conviction during the American Revolution, and a final decade or more in England that was marked by debauchery and failure. As a gallant figure in the final English wars for possession of North America, as an untutored New Hampshire farm boy who demonstrated great courage, leadership, and military insight but almost no ability to adjust to civilian life, Rogers warrants attention, analysis, and understanding.

Mr. Cuneo, a Connecticut lawyer, has devoted many years and amazing perseverance to the difficult task of separating myth from fact and of identifying motives. His Chapter Notes are provocative and inspire confidence, and complete documentation, we are told, is available. His style is lucid and even brilliant, and his understanding of the complex Rogers and his frequently confused and complicated background, is unusual. Some scholars may feel that Mr. Cuneo has been too severe on Johnson and Gage; the fact remains that for the first time a brave and colorful soldier has found an adequate interpreter.

EUROPE

WILLIAM DIEBOLD, JR. *The Schuman Plan: A Study in Economic Cooperation 1950-1959*. Pp. xviii, 750. New York: Frederick A. Praeger for the Council on Foreign Relations, 1959. \$6.50.

An incredibly large literature has been produced on the European Coal and Steel Community (ECSC) since its formation in 1951. However, it is gratifying to say that the stout volume under notice is not just another addition to the studies. It is a major scholarly work on the ECSC during its period of transition to one of the institutions of the wider European economic integration—the European Economic Community.

The Coal and Steel Community derives from the Schuman Plan, proposed in May 1950, which had both a political objective and an economic purpose: to make war between France and Germany "not merely unthinkable, but materially impossible" by placing their entire production of coal and steel under a common organization open to other countries and developing a free trade market for these two basic economic sectors. It was established by the Treaty of April 18, 1951, that integrated the coal and steel industries of Belgium, France, the Federal Republic of Germany, Italy, Luxembourg, and the Netherlands. Mr. William Diebold, Jr., who is Director of Economic Studies at the Council on Foreign Relations, here presents the most substantial appraisal of the achievements of the ECSC and of the problems that it still faces that has so far appeared. The product of seven years of intensive research in documentary materials and interviews with leading Community officials and industrialists in Europe and the United States, it is likely to become the standard text on the subject in the English language.

In the four parts into which the book is divided Diebold discusses the background of the Schuman Plan and the developments that led to the ratification of the Treaty which came into force on July 25, 1952; examines the effort in the six member-countries to put the Treaty into practice by opening the common market for coal,

iron ore, steel, and scrap among them and the Community's experience with transportation rates, subsidies, taxes, prices, investments, cartels, and labor; analyzes the relationships of the ECSC with external areas and American interests and policies toward the Community; and offers an evaluation of the institution in terms of "its economic impact, what it has meant to each participating country and to outsiders, the character of the coal and steel economy that has emerged, the kind of entity the Community has turned out to be, its relation to other measures of European integration and the consequences of 'partial integration.'" In a final chapter on "The Future of the Community" he attempts to clarify some questions that the ECSC will have to face and "to post a few markers by which the future course of the Community may be gauged."

The picture of the Coal and Steel Community which emerges from Diebold's elaborate study is that of a vital, functioning organization which has effected major accomplishments but has achieved only partially the task of integration. The common market for coal and steel is a reality. The Community has abolished barriers to trade in coal and steel; has progressively eliminated aids and subsidies and ended discrimination in prices and transportation rates; has subjected cartels, mergers, and investments to international regulation; has borrowed in the money markets of Europe and America where its credit is firmly established; and has developed new relations with governments, employers, and labor. Although problems of production, technology, and stability in the two sectors await solution, "The Community is now a part of the political and social furniture of Western Europe, one of the realities of its coal and steel economy." It "has changed Europe simply by existing. By surviving through its transitional period the Community proved itself something more than a good idea, a new hope, the latest expression of an ideal to which many had long paid homage. That so old a dream should have taken on institutional form, with organization, procedures, a daily routine of problems and activities, is itself the main fact

about the Schuman Plan and a major statement about Europe of the 1950's."

ARTHUR LEON HORNIKER
Washington, D. C.

TIBOR MERAY. *Thirteen Days That Shook the Kremlin*. Translated by Howard L. Katzander. Pp. vi, 290. New York: Frederick A. Praeger, 1959. \$5.00.

Behind the dramatic cliché of the title there lies a serious and sober account of one of the most significant turning points of recent Central and Eastern European history. The subtitle of the book, "Imre Nagy and the Hungarian Revolution," must be closely considered by the interested reader since Meray's account is in reality a brilliant combination of the events of the short-lived Hungarian revolt of October-November 1956 and of a full-fledged biography of Mr. Nagy, Prime Minister of the country for those few exciting days.

Tibor Meray is obviously qualified for this delicate assignment. An outstanding writer and literary figure, he was once greatly favored by the communist regime of his native country, but later became a major protagonist in the revolution and finally was forced to flee to Paris where he is now living. His book is a microscopic—often far too detailed and technical for the nonspecialist reader—account of the bitter fighting within the ruling circles of the Hungarian Workers' party during the "New Course" period preceding the revolt. Imre Nagy emerges from these sordid and frightening struggles as an honest, serious, and sincere man, a lifelong communist with certain deep-seated convictions and scholarly interests. Unhappily he was also a clumsy tactician, an irresolute administrator, and a mediocre student of human nature. When forceful and aggressive leadership was required, Nagy missed the historical requirements of the moment, withdrew into himself, and by his irresolute bungling generally disappointed even his closest friends and collaborators.

Meray's book has several shrewd and significant "asides," in addition to presenting a plastic and reliable portrayal of Imre Nagy. He reports that the strong United Nations resolution against the deportations

of Hungarian youth had "succeeded in making an impression, the deportations having thereby been stopped" (p. 250). He also correctly stresses the steadily increasing influence of the Chinese Communist leadership in demanding a share of the decision-making process in the affairs of international communism. "The influence of Mao Tse-Tung and his friends had increased, their words carrying more and more weight" (p. 262 *et seq.*).

On the whole, although one might disagree with some of the author's editorial remarks and judgments of individual personalities on the Hungarian scene, he presents a valuable insight into Eastern European politics. This book will be indispensable for the student and the general reader alike.

ANDREW GYORGY
Professor of Political Science
Boston University

ISAAC DEUTSCHER. *The Prophet Unarmed, Trotsky: 1921-1929*. Pp. xii, 490. New York: Oxford University Press, 1959. \$9.50.

With the present volume Mr. Deutscher has passed the halfway mark in an ambitious effort to tell the story of the Bolshevik Revolution in biographical-ideological histories of its principal actors: Stalin, Trotsky, and Lenin. He has completed his life of Stalin in two volumes. For Trotsky he is taking three, of which this is the second. Lenin is yet to come.

The first Trotsky volume, *The Prophet Armed*, carried the story from the latter's birth to that moment in 1921 when, as Commissar of War, he had just brought the Civil War to a victorious conclusion. At that moment he was at the height of his power and glory. The present work shows the "Prophet" unarmed, thwarted in his efforts to turn his talents to economic and political reconstruction, stripped of his badges of glory, and covered with badges of infamy and dishonor. It ends in 1929, with the "Prophet" expelled by the Party he helped to bring to power, deported by the government of which he was a founder, exiled from the land in which he was born to the limbo of the West.

The tragedy is told with great literary skill, with complete mastery of the documentary sources, always limited to Bolshevik documents, acquaintance with the intricacies of Bolshevik controversy, a deep understanding of most of the major and minor personages involved, with the notable exception of Bukharin, and, of course, no understanding for non-Bolsheviks. Since Mr. Deutscher was once an organized Trotskyist and is still an ardent admirer of his protagonist, he has shown an uncommon knowledge of what goes on within Trotsky's spirit.

Sometimes his admiration of Trotsky leads to uncritical absurdities. Thus this arrogant, dictatorial, and authoritarian man is declared to have been "almost equally sensitive to the claims of authority and freedom." He was sensitive only to authority as long as he exercised it, and to freedom—strictly limited to Communists—when he was forced into opposition. So, too, Mr. Deutscher proclaims his hero to have been "Russia's chief intellectual inspirer and literary critic in the twenties," then admiringly cites some monstrously cruel and insensitive remarks on poets like Blok, Gippius, and Biely, and his preference for "the very last louse on the most uncouth of our bagman-speculators" to the intellectuals who neither glorify nor oppose the regime but seek refuge in "in inner immigration" of their own thoughts and private creation.

The most interesting feature of the present volume is its ambivalence towards Trotsky's tragedy. Mr. Deutscher's admiration serves him well as biographer, but the ideological prepossessions he shares with both Trotsky and Stalin and, of course, with Lenin make him steer the tragedy towards a "happy ending." Defeated, expropriated of his program, slandered, expelled, deported, in the next volume to be murdered, yet . . . "Trotsky was the authentic inspirer and prompter of the second revolution of which Stalin was to be the practical manager." Now, under Khrushchev, according to the author, Trotsky is beginning to come into his own, a sort of macabre resurrection. "I see him as the representative figure of pre-Stalinist communism and the precursor of post-

Stalinist communism." But the ruthless work of Trotsky's great and cruel antagonist was "the *sine qua non* for the ultimate fulfillment of the revolution's promise." It remains only to note that, for Deutscher, that promise includes not only a utopia in Russia but a winning of the world for the same blueprint, amended only by some touches derived from the benefit of hindsight and some traces of the utopian expectations of pre-Bolshevik Marxism.

BERTRAM D. WOLFE

Brooklyn, New York

STANLEY W. PAGE. *Lenin and World Revolution*. Pp. xviii, 252. New York: New York University Press, 1959. \$5.00.

Stanley Page's *Lenin and World Revolution* differs from most other studies of Lenin in the degree to which it emphasizes insatiable personal ambition as being the sole dominant motive of Lenin's whole political career. While this motive was rather unconvincingly disguised as political evangelism and care for the oppressed, it did not make him any less sincere a disciple of Karl Marx, whom indeed he closely resembled in the temporary use which he made of individuals, and whom he later disowned as soon as they started to endanger his determination to maintain supreme command.

Lenin's constant aspiration to international, rather than Russian, proletarian leadership, his seizure of power in 1917, his peculiar relations with Trotsky, his policy towards Germany during and after the Brest-Litovsk negotiations, his interest in stirring up the Asian countries, are all studied and revalued in the special light of Mr. Page's thesis.

There is a reasonable case for giving more encouragement to an approach which does not pander to the prevalent hero worship of temporary political success, built up by Lenin's admirers, still less to the myth that he embodied some inevitable forward movement of historical destiny. Lenin's concern for training chosen Asians to become anti-Western national socialists, under Russian control, is shown by his establishment in Moscow as early as 1920 of a so-called "Institute for Eastern Studies." These and other aspects of Lenin, referred

to in this book, have not always received the attention which they deserve.

RICHARD HARE

London University

EDGAR MCINNIS. *The Atlantic Triangle and the Cold War*. Pp. viii, 163. Toronto: University of Toronto Press under the auspices of the Canadian Institute of International Affairs, 1959. \$4.50.

Edgar McInnis has performed a remarkable service through his concisely and brilliantly written monograph, entitled: *The Atlantic Triangle and the Cold War*. According to the author, the Atlantic Triangle—United States, United Kingdom and Canada—is the "fundamental bone structure" of the western alliance, though he does not disparage the important roles played by France and West Germany.

Within the Atlantic Triangle, the United States must be the "leading and at times the decisive element," while both Britain and Canada recognize their "primary national interest is harmony" with the United States.

The author's thesis, very simply stated, is "to hold the line against the threat of aggression by force" and to "consolidate the unity of the non-communist world on a broad basis of social and economic advance." He is deeply concerned that the Atlantic Triangle has not, as yet, "evolved a global strategy" to effectively deal with "global interests."

McInnis, who is President of the Canadian Institute of International Affairs, advocates the basic requirement of military deterrence. Yet, he weakens another wise, sound military analysis by equivocation. On the one hand, he submits that "limited war remains a very real possibility," and, on the other side, declares that "both parties may be involved in a competition of increasing destructiveness whose end is unlimited war," thereby accepting the P. M. S. Blackett thesis.

Moreover, on the crucial German question, McInnis argues persuasively for the "continued presence of American troops" as a tangible assurance to our European Allies, and yet he suggests a policy of "disengagement" even to the point of acceptance of the Rapacki Plan.

In the economic arena, the author is on more solid ground, with the recommendation that the West must go beyond normal commercial contacts with the Afro-Asian nations and "become a major source of economic and technical aid." Yet, he is realist enough to advocate political strings by the West "as a lever to bring about the kind of [internal] changes that are needed if aid is to make the optimum contribution to economic and social improvement."

Several other pronouncements by McInnis lend interest to this authoritative little volume, such as the differences within the Atlantic Triangle over the Red China question and over the validity of the "northern tier" policy of the Bagdad Pact. All sober analysts, who are not fearful of facing the inevitable dilemmas that confront a coalition of nations, even though bound by a unity of purpose, should read this instructive monograph.

ALFRED J. HOTZ

Professor of Political Science
Western Reserve University

HENRY PELLING. *The British Communist Party: A Historical Profile*. Pp. viii, 204. New York: The Macmillan Company, 1959. \$3.75.

The British Communist party has known little but frustration and failure. In the late 1940's, Communist influence in some important British trade unions reached dangerous proportions, but it began to crumble as soon as the situation became generally recognized. Otherwise, the Communists' main achievements have been negative and unintentional: their existence provided an excuse for those who wanted to maintain the diplomatic isolation of the Soviet state in the 1920's; they also helped, by their clumsy attempts, to infiltrate the Labor party, to keep that party unshakably loyal to democratic practice and the parliamentary system even when, as in 1919-20, 1926, or 1931, there was some temptation to abandon these restraints.

Mr. Pelling's book is admirably straightforward and unpretentious. There is no attempt to inflate the feeble British party into something of universal importance. The author is well aware of the ironies, often grotesque, in which the party's his-

tory abounds. The vanguard of the proletariat achieved even the relative successes of the later 1930's only by enrolling a coterie of bourgeois intellectuals; as a party that was ever ready to sacrifice both principle and consistency for the sake of power it never managed to capture more than two parliamentary seats at a time. But Mr. Pelling wastes no time on preaching or polemic; the style throughout is economical and clear. Sometimes it is brilliantly succinct, as in the account of the Comintern's demise (pp. 121-124), or the paragraph about the self-deception of Communist intellectuals (p. 105).

A book of this size, written mainly from published sources and with an almost austere self-restraint, cannot answer all our questions about communism in Britain. To say that the party failed because "throughout the whole period, the British people have never been in a revolutionary mood" (p. 182), is perhaps not so much an explanation as it is a rephrasing of the central problem. But it would be unfair to charge Mr. Pelling with failing to provide the last word on his subject; this was plainly not his intention. *The British Communist Party: A Historical Profile* is a very useful book, the more so for being carefully and attractively produced at a comparatively sane price.

RICHARD W. LYMAN

Associate Professor of History
Stanford University

LORD BEVERIDGE. *A Defence of Free Learning*. Pp. xiv, 146. New York: Oxford University Press, 1959. \$2.90.

In March 1933, the author was in a Vienna cafe when the evening paper was brought in giving the names of a dozen leading German professors dismissed by the Nazi regime on racial or political grounds. He returned immediately to the London School of Economics, of which he was at that time director, to organize an effective answer to Hitler's attack on scholars. "On my way home from Vienna, I had my first intimation of what terror may mean to the individual when justice has become the will of a sadistic tyrant. There travelled with me a German professor slightly known to

me, not one of those already listed for dismissal but one who might be on a new list. He was in a state of panic all the way because in the next compartment was a youth, little more than a boy, whom he took for a Nazi agent, detailed to keep watch on him and hand him to the police. My friend's fears may have been imaginary, but his panic was real."

By May of that same year the Academic Assistance Council had come into being, because of the spontaneous and emphatic reaction in British universities to Hitler's racial policy. John Maynard Keynes was among the first to contribute. Under the stimulation and guidance of Lord Beveridge, the Council became something of a specialized labor exchange, always putting displaced scholars into contact with universities. Originally conceived as a temporary body to deal with a temporary persecution, the Council in 1938 became the more permanent Society for Protection of Science and Learning, as its founders realized that persecution, in one form or another and in one country or another, was here to stay. Lord Beveridge, now president of the Society, has written the story in *A Defence of Free Learning* of British efforts in the last twenty-five years to alleviate that persecution. The book is less dramatic than its subject would indicate, being largely an organizational history of the Council and its successor, the Society. However, it comes as a relief to find a dispassionate account of an explosive topic. The vast majority of books dealing with Nazi racism, understandably but regrettably, give vent to an intense emotionalism which obscures, paradoxically, the true extent of the horror and tragedy involved. Lord Beveridge and the others who actively took up the Nazi challenge by defending "free learning"—actively, since, as he once remarked, "protests butter no parsnips"—performed a remarkable service, both to England and to the free world. His brief account is worth reading, if only to serve as a timely reminder of the relative values of western and totalitarian societies.

KENNETH HOLLAND

President
Institute of International Education

LEO F. SOLT. *Saints in Arms: Puritanism and Democracy in Cromwell's Army*. (Studies in History, Economics and Political Science, XVIII.) Pp. 150. Stanford, Calif.: Stanford University Press, 1959. \$4.00.

This small book has a large and complex theme, the relationship of Puritan theology to democratic thought. For some time the students of English constitutional history have looked to the seventeenth century for the origins of democratic ideas, and especially to the religious radicals of Cromwell's army. This interpretation has rested on the analogical extension of equality in the church to equality in the state. Somewhat sceptical of this, Professor Solt has re-examined it in the light of the polemical tracts and sermons of the chaplains in Cromwell's New Model Army, whom he treats as the official educators of the troops in both religion and politics. He selects for his study especially the writings of William Dell, John Saltmarsh, and Hugh Peters.

The author subjects the polemical tracts and sermons of the chaplains to a careful logical analysis. His several chapters set forth the polarities of such religious and political ideas as liberty and authority, unity and uniformity, separatism and millenarianism, grace and nature. The key to understanding seventeenth-century political thought, the author thinks, is the argument whether government should be by "good men or good laws, whether by grace or nature" (p. 4). From the study of the chaplains' Antinomian theology, Professor Solt concludes that they believed "in government by the saints" (p. 69). He finds no suggestion of the social contract in their thought. Because the chaplains did not hold the doctrine of universal salvation, he concludes, they could not have believed in equality within the state; because they did not hold to a specific form of church government, they could not have developed a specific form of political government; because they held millenarian views, they therefore favored an authoritarian government by the saints (p. 72).

The analytical method of deducing political systems from theological premises has its difficulties. It is difficult, indeed,

to deduce a system of thought from the sermons and tracts of men who were not systematic thinkers. The analysis of meaning hardly explains the power of the sermons which instilled a fighting spirit into Cromwell's soldiers. It may be just as useful to view Puritan theological ideas as social symbols which produce group and class solidarity, or as myths which defy analysis but which stir men's emotions and move them to act. Although Professor Solt's study is useful in pointing out the complex relationship of political and religious ideas, it will hardly put an end to the perennial debate over the origins of democracy and over the character of Puritanism.

RAYMOND G. COWHERD

Associate Professor of History
Lehigh University

ARTHUR LAYTON FUNK. *Charles de Gaulle: The Crucial Years, 1943-1944*. Pp. xv, 336. Norman: University of Oklahoma Press, 1959. \$5.00.

The two event-filled years between the fall of France in June 1940 and the invasion of North Africa in November 1942 are recounted in this book as the setting for De Gaulle's emergence as a political figure. The "crucial years" 1943-44 are then analyzed in terms of their most significant events—successive chapters dealing with the Casablanca Conference, formation of the French Committee of National Liberation, its recognition by the Anglo-Americans, the Liberation of France, and the installation in Paris.

The account has merits. The prose is fluent; the story engages our interest. Even the plot is clear—no small accomplishment with so varied an array of characters and events to be brought into orderly sequence. The book is thus a useful addition to the conventional history of international relations. It will be read with pleasure and profit by all concerned with the critical role of France in the Allied coalition during World War II.

The other commitment taken by Mr. Funk, however, is less well met. He offers us international history as the matrix for biography. As biography, however, the

book is sterile. Once again we are shown De Gaulle as Churchill's "cross of Lorraine" and Roosevelt's "unwilling bride." But this familiar clash of public personalities is not illuminated by insights or data of any explanatory value. The goal of this book is, as I understand it, to explain De Gaulle's triumphant rise to French leadership despite the latent and manifest hostility of the Allied leaders. What in De Gaulle appealed so powerfully to Frenchmen while alienating others? What inspired popular trust in him among the peoples of the Allied coalition while generating deep distrust among their leaders?

For clarification these complex questions require investigation of the relationship between power and personality in contemporary political life. Had Mr. Funk dealt successfully with these questions, he would surely have enlarged our understanding of the political malaise from which the West still suffers today. The route which led the Allied coalition from a conservative military strategy in World War II to a defensive political posture in the postwar years would have been clarified.

But Mr. Funk shows neither the range of interests nor the array of skills needed for this task. The concepts and techniques of inquiry which have brought individual personality and political behavior into a single research focus in recent years lie outside his ken. Accordingly, he is content to conclude his labors with the banal comment:

"Between 1940 and 1945, De Gaulle developed enormously from the unknown specialist in tank warfare to the statesman coping with international and domestic affairs; but in spite of a considerable and often unacknowledged diplomatic skill, he never acquired that magnanimity, that breadth of view, or that sense of humor which might have altered the tragic course of his career and rendered his achievement far greater than it was."

But the profound questions underlying this "tragic course"—a great achievement undermined by its own intrinsic limitations—are never confronted.

DANIEL LERNER

Professor of Sociology
Massachusetts Institute of Technology

ALEXANDER L. GEORGE. *Propaganda Analysis: A Study of Inferences Made from Nazi Propaganda in World War II*. Pp. xxii, 287. Evanston, Ill.: Row, Peterson and Company, 1959. \$6.00.

Several wartime agencies as well as the intelligence divisions of the Armed Services concerned themselves with foreign and especially enemy propaganda during World War II, but none did so as comprehensively and intensively as the Foreign Broadcast Intelligence Service (FBIS) of the Federal Communications Commission (FCC). To the Analysis Division it intrusted the task of examining all broadcasts and available newspapers for indications not only of the policies and purposes behind propaganda but also of the military and other intentions of the governments in question. The resulting inferences were circularized to the interested offices.

While the author has not undertaken the probably futile task of studying their influence upon the conduct of the war, Dr. George, a junior official in the Analysis Division and presently a member of the staff of the Rand Corporation, has checked the inferences relating to Nazi Germany with the voluminous but incomplete historical evidence in captured documents, memoirs, and interviews to determine their accuracy. The difficulties incurred in this endeavor prevented a completely reliable result, but he believes that the analysts were successful in more than 80 percent of their inferences. This record of achievement constitutes, in his view, a sound basis for the formulation of a rational technique of propaganda analysis, itself in large part the product of inferences since the wartime analysts rarely explained the reasoning behind their conclusions. The case was first developed in reports to the Air Force whose funds financed this investigation, and the present study was accepted by the University of Chicago as a doctoral dissertation.

In its essentials, this highly rationalized technique of propaganda analysis, whose complexities are not always clarified for the layman by the author's abstruse terminology, largely centers on a detailed breakdown of "the logic of the situation," a concept which he accepts too readily as

having the unreserved approval of historians. The final result is doubtless an advance over wartime procedures, but that it goes far towards transforming what he calls "intuitive art into science" is less certain. Unlike other intelligence methods, the reliability of its results can only be determined much later and in some instances only after the enemy's complete defeat as in the case of Germany.

E. MALCOLM CARROLL

James B. Duke Professor, Emeritus
Duke University

EARL R. BECK. *The Death of the Prussian Republic: A Study of Reich-Prussian Relations, 1932-1934*. (Florida State University Studies, 31.) Pp. x, 283. Tallahassee: Florida State University, 1959. \$6.00.

In this most interesting volume, Earl R. Beck, of Florida State University, makes an extensive comparison of what he calls the two Prussias. The old Prussia, with its *Kadavergehorsam*, Uhlan, and Junkers, dominated the politics of the German nation from 1871 to 1919. This was the militaristic, autocratic, authoritarian Prussia, epitomized in the iron-and-blood Chancellor, Otto von Bismarck, and lauded by Hegel and the school of Prussian historiography.

But the second Prussia emerging in 1918, says Dr. Beck, was a republic, one of the eighteen states making up the Weimar Republic. The political leaders of this second Prussia—the Otto Brauns, the Heinrich Brünnings, the Carl Severings, the Wilhelm Marxs, the Joseph Wirths, and many others, sought zealously to transform democracy from vision into reality. These men, says the author, typify a tradition far more worthy of the name of Prussia than did Frederick William I, Bismarck, and von Hindenburg. They made the new Prussian government stable and efficient; they successfully countered communism on the left and Nazism on the right; they were the bulwark of the Weimar Republic.

This new Prussia died on July 20, 1932, when Chancellor Franz von Papen, utilizing the famed Article 48 of the Weimar Constitution, the clause which gave emer-

gency power to the President, deposed the legal government of Prussia and took over control as "Reich Commissioner." From this time the Prussian Republic slid to its doom. Hitler enveloped it in even tighter federal controls and eventually throttled it. What might have been a leading democratic European state, a state that might have played a most important role in European history, died.

The author concludes with this hope: "May a new generation of German historians, those who are now searching the past with open and critical eyes, seek more their ideal among the little men of the day than among those who towered over the time by ruthless will and autocratic actions. The old Prussia of 'blood and iron' is dead. The Republic of Prussia still lives as an experience and a tradition from which a new republic and the new states that compose it may well draw strength and pride" (p. 220).

The author tells the story of the death of the Prussian Republic by unraveling the complicated strands of politics and legal actions of the period. Readers will be impressed by his painstaking documentation and by the care he has taken to substantiate his main thesis. Others will feel that he has underestimated the capacity and staying power of his first Prussia, which by no means was obliterated by Versailles. Still others will disagree with the author's conclusion that republican Prussia was "a bastion of democracy." Neither the liberal nor the democratic tradition, in the Western rationalistic rather than the Prussian sense, was given a chance in Prussia since 1848 and in Germany since 1871. Even today there are many who are wondering what will happen in West Germany once the "strong, sure, authoritarian-democratic hand" of Adenauer is gone.

LOUIS L. SNYDER

Professor of History
College of the City of New York

JOACHIM REMAK. *Sarajevo: The Story of a Political Murder*. Pp. xv, 301. New York: Criterion Books, 1959. \$5.00.

Forty-five years after the assassination of the Austrian Archduke and his wife the

actual planners and their motives remain uncertain. For almost five decades suspicions have centered at one time or another upon the youthful assassins, Russia, Serbia, Austrian enemies of the Archduke, and countless other suspects, many simply products of hyperactive imaginations. This book, the latest recreation of the Sarajevo events, advances yet another point of view in an absorbing and adroitly written narrative that frequently takes on the air of the best in suspense fiction.

A history teacher at Lewis and Clark College in Oregon, Dr. Joachim Remak's thesis is that the entire conspiracy was planned and directed by Serbian Army Intelligence chief, Colonel Dragutin Dimitrijević, known also as "Apis," and his Black Hand society. Nikola Pašić, Serbia's prime minister, was aware of the plot and ultimately sent an "inadequate warning . . . neither formal nor specific" to Vienna's finance minister who promptly belittled and ignored it. Serbia, Dr. Remak argues, certainly believed it could benefit from the conspiracy and their politicians used the Black Hand whenever convenient or necessary to advance grandiose dreams of a Greater Serbia. As it happened, in 1914 Serbia's aims coincided with the ultranationalistic Black Hand, namely to destroy the Heir Presumptive because of his support of Trialism—transforming the Dual Monarchy into a Triple Monarchy, with the Empire's Serbs receiving autonomy—and the danger that presented to Serbian expansionists.

How valid are these conclusions? In the light of Dr. Remak's own reservations for in one footnote he concedes ". . . having considered all the fragmentary evidence that is available, it seemed plausible. . . . What cannot be claimed for it is that it is based on incontrovertible fact" and considering that no concrete primary evidence linking Apis and the Black Hand with the murders has ever been offered, it is difficult to accept this well-told tale as absolute truth. Since neither Apis nor the Black Hand were ever mentioned at the trial of the assassins, Apis' dubious final testament alluding to Sarajevo and implicating no one is hardly suitable supporting evidence. Moreover, it should be emphasized that by

1914, the Archduke had abandoned Trialism as unworkable. What, then, becomes of the motive?

One day Serbia's still closed diplomatic archives may reveal what really happened. Until then, while the definitive apportionment of responsibility will have to wait, it appears that a more accurate version would have Princip and his friends, aroused by Pan-Serbian nationalism, planning and committing the murders themselves with the encouragement but not the outright co-operation of Avis, the Black Hand, and the Serbian government.

MURRAY POLNER

Queens College

GIORGIO LOLLI and others. *Alcohol in Italian Culture: Food and Wine in Relation to Sobriety among Italians and Italian Americans*. (Monographs of the Yale Center of Alcohol Studies, No. 3.) Pp. xv, 140. Glencoe, Ill.: Free Press with the Publications Division, Yale Center of Alcohol Studies, 1959. \$4.00.

This excellent monograph is the third in a series: the first dealt with the Jews, a group distinctive for the absence of alcoholism, and the second with the "skid-row" type of chronic alcoholic. The present volume deals with Italian Americans in New Haven, Italians in Rome, and a stratified sample of Italy's entire population. The study concentrates on the place of liquids, particularly milk and alcoholic beverages, in the informants' diets from infancy through adulthood. It is made abundantly clear that the purposes, values, and social contexts of drinking in the Italian and Italian American cultures are markedly different from those of American society at large.

The discussion compounds sociological, psychiatric, and nutritional theory and data to show: (1) breast feeding is supported by Italian culture, being an almost universal practice considered both good and natural, (2) breast feeding minimizes the risk of an undifferentiated craving in adulthood for this physiological and psychological satisfaction which the alcoholic in American culture missed—or thinks he missed—in infancy, (3) alcoholic beverages, particu-

larly wines, are food for Italians, drunk mainly at meals or as a fortifying thirst-quencher during manual labor, (4) the drinking of alcoholic beverages on a full stomach, especially with the slowly absorbed carbohydrates of Italian cuisine, reduces the effects of alcohol on the central nervous system, (5) drinking among Italians does not have the purpose of inducing sociability or providing escape, (6) Italians generally drink alcoholic beverages in the bosom of the family, (7) drinking alcoholic beverages is supported by Italian culture, being an almost universal practice from childhood, and it is considered both beneficial and normal.

The authors' interpretative scheme leads to one important question. What is the dominant factor in Italian sobriety or the principal cause of widespread alcoholism in many other cultures? It would seem that breast feeding and familism, the two most striking features of Italian culture in the authors' analysis, are insufficient even though necessary conditions for sobriety. It is the reviewer's impression that several familistic cultures where breast feeding is general, such as rural Ireland and Poland, have a high incidence of inebriation. It is hoped that further cross-cultural comparisons in this series will seek to show specifically what it is in Italian nursing practices and family life which reduces alcoholism. However, the monograph admirably fulfills its purpose by narrowing the field of inquiry to this area, thus pointing the way for additive research which promises to be of great theoretical and practical importance.

JOHN S. McDONALD

New York City

CYRIL EUGENE SMITH. *The University of Toulouse in the Middle Ages: Its Origins and Growth to 1500 A.D.* Pp. vii, 244. Milwaukee, Wis.: Marquette University Press, 1958. \$7.00.

Professor Smith, in order to explain "obvious lacunae" in the present volume, which is devoted to a narrative of "the origin and external history of the university," states that he hopes to publish another volume on the constitutional and administrative history of the university. The wisdom of this organization may be questioned, for in the

present volume the failure to discuss the structure and function of the university is felt as a very obvious gap. The author touches on many subjects: the early history of Toulouse and previous educational activity in the region; the circumstances and personalities connected with the foundation of the university in 1229 to combat heresy, possibly the third instance of deliberate foundation rather than gradual growth in the Middle Ages; initial difficulties in a hostile land; the growth in personnel and privileges; relationships with monastic houses; the foundation of colleges, particularly numerous at Toulouse; the close ties with the Avignon papacy; conflicts with civic officials of Toulouse; conflicts with royal officials and relations with the monarchy; and the increasing litigation in and control by the *parlement* of Toulouse in the later fifteenth century.

Unfortunately, the organization by chronological narrative and the focus on external influences prevent the author from giving a coherent picture of the core of his study, the university itself. Institutions are elusive and complex historical subjects whose structure and function need careful description and analysis before the relevance and significance of many facts about the institution can become clear. The disadvantages of a chronological treatment are very apparent in the chapter on "The University and the *Parlement* of Toulouse, 1434-1500," where, interspersed among descriptions of relations with the *parlement* and paraphrases of litigation on diverse subjects, the author discusses royal visits to Toulouse, the requiem mass for Charles VII, university participation in the Council of Basel, the financial situation of the university, fire and plague, a disputed archiepiscopal election at Toulouse, the appearance of printing, abuse of letters of scholarship, the foundation of a college, and financial affairs of other colleges.

Although the book is little concerned with medieval education as such, does not focus on any central problem, and has no unifying thesis, it is rich in details about personalities connected with the university, sedulous in correcting mistakes in dating of other historians, and valuable for its description of many incidents in the univer-

sity's history. It is unlikely to be of interest to general readers wishing to understand the nature of a medieval university, but as a meticulous chronicle it will be useful for specialists.

GAVIN I. LANGMUIR

Assistant Professor of History
Stanford University

H. H. SCULLARD. *From the Gracchi to Nero: A History of Rome from 133 B.C. to A.D. 68*. Pp. xi, 450. New York: Frederick A. Praeger, 1959. \$6.00.

As the title indicates, this work by the well-known author of *A History of the Roman World from 753 to 146 B.C.* and *Scipio Africanus, Roman Politics: 220-150 B.C.*, covers a most critical period in Roman history in which the collapse of the Republic and the formation of the Principate or Empire took place. This is one of those historical epochs which evokes perennial interest, and consequently a fresh treatment of it is always welcome, particularly at this time, for many specialized studies written in recent years and some newly discovered source materials require evaluation or interpretation.

The author does not advance any one special cause for the breakdown of the Roman system of republican government. Rather, he wisely lets the sequence of events from the Gracchan attempts at reform to Caesar's victory in the civil wars speak for itself. As a result, we see that the responsibility rests upon the human factors involved, not upon economic or social forces. The "fall" of the Republic was not inevitable; it was the result of conflicting class and individual interests which could have been resolved, at least in their early stages, by statesmanlike and patriotic courses of action taken at various crises by the parties involved. As it turned out, however, the major share of blame falls upon the dominant faction in the senatorial oligarchy which adopted an attitude of no compromise whenever their traditional position of power and privilege seemed threatened by proposals for reasonable and necessary reforms. But their opponents cannot be held guiltless, especially when their personal ambitions led them into actions ne-

cessitating the overthrow of constitutional authority. After Caesar, some form of monarchy was inevitable, and it is to the credit of Augustus that he created one which, in spite of its potential weaknesses, revealed already under his immediate successors, served the needs of the Empire so long and so well.

Anyone reading this book will be struck by the author's realistic and judicious appraisal of the leading characters of the period. The Gracchi, Marius, Sulla, Pompey, Caesar, Antony, Augustus, and the Julio-Claudian emperors appear as intelligible human beings neither wholly evil nor wholly above criticism. Scholarly as it is, this work can be read with appreciation by all those interested in historical narratives and interpretations. Students of Roman history in particular will appreciate the Notes which offer useful discussions of the sources for each chapter and also select Bibliographies. There is a good Index and some useful maps.

Professor of History, Emeritus
University of Michigan

ASIA AND AFRICA

DAVID S. NIVISON and ARTHUR F. WRIGHT (Eds.). *Confucianism in Action*. Pp. xiv, 390. Stanford, Calif.: Stanford University Press, 1959. \$8.50.

Chinese and Japanese studies in the United States and Great Britain have come of age. A generation or so ago there were good monographs on the founders of Chinese thought in the classical period and on some of the principal spokesmen from the first to the seventeenth centuries, but there was little depth and no intimate picture of the chief institutions of government or of social life. Now, due to the awakened interest in our universities and to the support of foundations since World War II, there are a number of scholars, well trained in the languages and in their disciplines, working on neglected areas of eastern history, social, economic, intellectual, and other aspects.

Here we have a fine analysis of the rules

of Chinese clans based on a long series of genealogical records, which shows how the elders of the clans tried to force their members to behave. Here too is a study of a well-kept record of a charitable estate, founded in 1050 and continued to 1760, revealing the efforts of the founder and his successors to benefit the less fortunate members of his clan by establishing ancestral halls, charitable schools, and income-producing estates as well as a perspicacious study of the Chinese censorial system in government which did so much through remonstrance and surveillance of the entire bureaucratic machinery to preserve the best in the state—a system which grew out of both Confucian and legalist streams of thought. It is noteworthy that even the Mongol conqueror Kublai Khan who reigned from 1260 to 1294 was so imbued with the need of this arm of the government that he remarked: "The duties of the Censorate's officials lie in speaking out straightforwardly. If we should by chance commit improprieties, let them speak out vigorously, without concealment and without fearing others."

The classics of the Confucian school were long known to the Japanese and studied at Nara and elsewhere for a thousand years before Confucianism became in the 17th century "the strongest intellectual and ethical force in Japan." The teachers of this school of thought and their part in Japan prior to the restoration of imperial rule are given their rightful due in one essay, followed by an intimate picture of the tutor and chief advisor to the Meiji emperor from 1871 through 1890, a man who began his work when he was fifty-three and the young monarch eighteen, and who saw him nearly every day of those twenty years. So did Confucianism exert its power during the period when the influences of the west were nearly at their peak.

These remarks touch on only five of the dozen papers published herein, all of which are worth reading for their penetrating and realistic appraisal of a major way of life and thought in eastern Asia.

L. CARRINGTON GOODRICH

Dean Lung Professor of Chinese
Columbia University

R. P. DORE. *Land Reform in Japan*. Pp. xvii, 510. New York: Oxford University Press under the auspices of the Royal Institute of International Affairs, 1959. \$8.80.

At last we have a comprehensive, objective, well-documented, and interesting evaluation of the much-touted land reform brought about under the Allied occupation in Japan. Tenant-cultivated rice land was reduced from over 50 per cent to only 10 per cent, and now only 5 per cent of farm families rent more than 90 per cent of their land. No landlord may retain more than 1 *cho* (2.45 acres) of tenanted land. Thus, land is hardly an issue in Japanese politics any longer. That is, tenant-farmer movements of the prewar type, which are well treated in the book, find no strong *raison d'être* which is a loss to the Left. It is rather the small and ex-landlords who find sustenance for their discontent in the residual tenancy, and this is "the greatest single cause of dissension in Japanese villages today." The land reform was also incomplete in that it did little to do away with fragmentation of the land. Nevertheless, the conservative politicians have accepted the reform and give the discontents little encouragement, for the mass of votes come from the owner-cultivators who were formerly tenants.

Actually the book goes well beyond a narrow discussion of the land reform as such. It dissects the whole problem of tenancy in the development of Japanese agriculture and develops the implications of the land reform for the farm economy, the village social structure, and national politics today. By relieving the cultivators of the rent burden, by giving them responsibility for improving their own land, and by making the small and medium owner-cultivator more important politically, land reform can be counted high among the factors that have raised the standard of living of farmers in postwar Japan. Also, by reducing class divisions, land reform has paradoxically strengthened village solidarity, something usually denounced as "feudal" but which the author shows can also lead to progress. Finally, the solidarity of the agricultural population, encouraged by the land reforms, has caused

a congruence between conservative and socialist agricultural policies. Both appeal to the village as a whole. The socialists are trying to outbid the conservatives; they apparently seek in vain for a new departure.

The author, a sociologist and associate professor of Asian studies at the University of British Columbia, has a fine command of Japanese. He was thus able to detect and record the nuances of socio-political attitudes of respondents in the extensive conversations and interviews he conducted as well as make full use of Japanese research, sources, and statistics.

In the opinion of this reviewer, *Land Reform in Japan* will take its place among the classics in the field of studies of modern Japan. In addition, it will undoubtedly prove of great comparative importance for all who are interested in the "land question" in any industrializing society.

GEORGE O. TOTTEN

Assistant Professor of Government
Boston University

GEORGE ALEXANDER LENSEN. *The Russian Push Toward Japan: Russo-Japanese Relations, 1697-1875*. Pp. xv, 553. Princeton, N. J.: Princeton University Press, 1959. \$10.00.

This very large and solid volume by Professor Lensen of Florida State University is likely to prove the definitive work in English on Russo-Japanese relations between the earliest contacts and the border settlement of 1875, which assigned the whole of Sakhalin to Russia and all the Kuril Islands to Japan. It seems improbable that enough further material will be uncovered to induce other scholars to retrace in detail the whole of this story he has covered so fully and well.

As the title suggests, the subject is presented mostly from the Russian point of view rather than the Japanese. The author has described in some detail the Russian background of the relations with Japan and has ably exploited the accounts of the Russian naval officers, explorers, adventurers, and diplomats whose acts form the main line of the narrative. He has also made wide use of Japanese and other sources, though usually as supplementary

materials to the Russian. Those interested primarily in Japan will wish that he had given as much attention to the Japanese background as the Russian and had made a greater attempt to present the story from the Japanese point of view. As a consequence, the first two chapters of Professor John A. Harrison's *Japan's Northern Frontiers* (University of Florida Press, 1953) will still be useful as a look at this subject from the Japanese point of view, though Harrison's much briefer book is devoted primarily to the Japanese development of Hokkaido rather than to Russo-Japanese relations.

To call a book "definitive" may make it sound ponderous and dull. This is not true of Professor Lensen's volume. For all its length and detail, it makes fascinating reading. Such accounts as the flight of the prisoner Benyovszky from Kamchatka by way of Japan to the West, the mission of young Lieutenant Laxman, the imprisonment of Golovnin, the negotiations of Rikord and Takadaya, and the missionary work of Bishop Nikolai all make excellent stories, wholly aside from their broader historical significance. The author has told these stories well, letting the original records speak for themselves where possible. His balance and historical judgment seem sound, his writing is competent, and the volume is handsomely published with good maps and illustrations. One can only look forward with great expectation to Professor Lensen's promised second volume on Russo-Japanese relations since 1875.

EDWIN O. REISCHAUER

Professor of Far Eastern Languages
Harvard University

GEORGE MCTURNAN KAHIN (Ed.). *Governments and Politics of Southeast Asia*. Pp. xvii, 531. Ithaca, N. Y.: Cornell University Press, 1959. \$6.50.

This is a most welcome book for at last we have a single volume that provides a reliable introduction to the countries of Southeast Asia, and that can be strongly recommended to the student, the general reader, and all who have a professional interest in the region. Professor Kahin has worked out with his contributors a common framework within which they are able

to elaborate the distinctive features of each country and also point up the shared characteristics. The separate contributors follow a common outline in treating the six major countries of the region. Each country study begins with a brief historical résumé covering the pre-European period as well as colonial and postcolonial developments. With the advantage of this long-range perspective each author turns next to the contemporary scene and describes the outstanding social and economic characteristics of his country. The sections on the political process are divided between descriptions of the formal institutions of government and the informal patterns of behavior. The final sections are devoted to the major problems confronting each of the countries.

Southeast Asia is in such a state of flux that one cannot but feel sympathy for the authors and their problems of choice. They have sought to give a clear and precise picture of the ways in which the various governments of the region operate, and yet they are also aware of the fragile and ephemeral nature of most formal institutions in these developing societies. This situation calls for a judicious balance between general analysis and description of the current scene. The contributors have attempted to give more complete reports on the formal arrangements of government than are common in books on Asia, and in doing so they risk attributing excessive permanence to what are probably only temporary phases of institutional change. In the main, however, they have resisted the temptation of being unduly concerned with most recent developments. Possibly they have been less successful in weeding out accounts of developments which at an earlier time seemed significant, but which have not had lasting consequences. Here again is the problem of finding the appropriate perspective for viewing an erratically changing world.

The composite picture of Southeast Asia that emerges from the country studies is one of diversity and confusion on the surface and a few all-pervasive fundamental problems. Throughout the region there is a desperate need for economic growth, but such development is inhibited by a lack

of political unity. Governments can dominate the scene, for other groups are all so weak; but they lack the capacity to control and direct events. In spite of periods of high hope the basic theme of Southeast Asia is still that of a vicious circle of economic stagnation and political disunity. In countless ways this volume points to all the problems that must be overcome if the modernizing leaders of Southeast Asia are to realize their aspirations.

Although Professor Kahin is not the author of any of the chapters, his influence is to be noted throughout the book, and not just because of his editing skills and his respect for clean, precise prose. Even more, this book is a testament to the remarkable role that George McTurnan Kahin has played in training a generation of American scholars of Southeast Asia. This book is built out of the relationship between teacher and student, and it is rare for each to do so well by the other.

LUCIAN W. PYE

Associate Professor of Political Science
Massachusetts Institute of Technology

OLAF CAROE. *The Pathans: 550 B.C.-A.D. 1957*. Pp. xxii, 521. New York: St. Martins Press, 1959. \$12.50.

Sir Olaf Caroe was right in superimposing a portrait of a Pathan militiaman upon one of Alexander the Great on the cover of his book, just as it is right that most Western visitors should first meet the Pathans at Peshawar airport looking out toward the gaunt hills of the Khyber Pass, as the Pathan history and geography have played a very great part in molding their character. But Caroe was also right to devote a long, though difficult, first chapter to the semimythological genealogies of the Pathan tribes and subtribes. These genealogies form the basis of the folklore of the Pathans, and it is only through some understanding of these genealogies and this folklore as well as of the history and geography that one can hope to understand the Pathans and their attitude to the modern world. These attitudes are so different from those of the West that among the Westerners who have met them there must be very few who do not have strong feel-

ings either for or against the Pathans. It seems likely that even the misguided few who detest them will find Sir Olaf's account illuminating and fascinating; and what is more to the point, it should help them to mend their misguided views.

But it should not be only those who have or will have dealings with the Pathans themselves who will find this book useful. The Pathan homeland stretches across the mainland communications between India, the Middle East, and Central Asia. In telling the history of the Pathans, Sir Olaf necessarily sees the complicated history of all three regions from a Pathan viewpoint which though sometimes difficult should be illuminating for those concerned with any one of them. It is useful to be reminded that the Pathan contact with Europe stretches back at least as far as the Greeks. It is startling to realize that in the judgment of many of them the contact with Alexander is still of more importance than their more recent contact with the British, but by the end of this book the reader begins to understand this judgment.

It is extremely difficult for anyone to understand and explain the ideals and values of another people. Sir Olaf has succeeded admirably. One only wishes that similar books were available on all the many peoples of Asia. In the meantime anyone interested in the complexities and differences between the different cultures of South Asia would do well to read *The Pathans*.

T. F. WISE

Dominion Bureau of Statistics
Ottawa, Canada

SAUL ROSE. *Socialism in Southern Asia*. Pp. 278. New York: Oxford University Press under the auspices of the Royal Institute of International Affairs, 1959. \$4.50.

The importance of the author's subject lies, in part, in his conclusion that socialism is the "predominant ideology" in Southern Asia and that there are at least six national governments that describe themselves as "Socialist," these countries embracing the majority population of the region. Beyond this, his subject gains added significance from the fact that some form of demo-

cratic socialism is the only real alternative to communism or indigenous totalitarianism in South Asia, as the author implies but does not, unfortunately, develop in a comparative manner. By South Asia, he means South and Southeast Asia, from Pakistan to Indonesia, an area, he feels, in which socialist movements have "certain common features" not shared by others, such as Japan or Israel. Examples of such shared characteristics are the newly won independence of those nations, with the exception of Thailand and Nepal, an embryonic development in the womb of nationalist movements which is responsible for a special type of affinity between socialism and nationalism peculiar to South Asia, and common problems of economic development and national cohesion.

A central problem is to differentiate between competing socialisms in each country where all or most parties, those in and out of power, claim to be socialist. This is a problem not only for the scholar attempting to understand the politics of these countries but also from the practical standpoint, for the Asian Socialist Conference, which, as the self-constituted organization of Asian socialism, has the onerous task of selecting the true Socialist party in each country and rejecting the others. This difficulty also plagues the various national electorates who are asked to choose, as in India, for example, among the socialism of Nehru's Congress party, the Praja Socialist party, and the Communist party of India.

The author treats socialist parties descriptively on a country-by-country, brief survey basis, sandwiching them between valuable chapters on the first and second Asian Socialist Conferences held in 1953 and 1956, which have sometimes appeared as a potential rival to the established Socialist International based in Europe.

One must take issue with his assertion that differences between Asian and Western socialism can be reduced to mere questions of "tempo," over the rate of colonial liberation and industrialization and that the former is gradually moving in the direction of Western socialism. This conclusion must seem doubtful, even to the author, when, in a latter part of the book, he indicates the primary importance of the charis-

matic leader, points to the acute problem of the peasantry, and reveals recent Asian socialist doubts about the all-important role of the state as a means and a newly found appreciation of the need of decentralization and local autonomy.

Nevertheless, this is a valuable book for understanding of Asian and socialist politics.

THOMAS A. RUSCH

Assistant Professor of Government
Los Angeles State College

SYDNEY NETTLETON FISHER. *The Middle East: A History*. Pp. xiv, 650, xxxi. New York: Alfred A. Knopf, 1959. \$8.95, trade edition; \$6.75, text edition.

He who reviews a history of the Middle East is confronted with some of the difficulties of its author. The perplexities of this reviewer are augmented by reading Elizabeth Hardwick's "The Decline of Book Reviewing" in the October Harper's Magazine with her comment about reviews written by one "... who had written a book like it, or about the same country or the same period."

So complex are the problems of a historian who undertakes to write a one-volume history of the Middle East, that only carping critics would expect more than a competently written book useful for those who wish to increase their knowledge of the area. Such a book Professor Fisher has written. He has accomplished well his stated purpose of providing "... a brief account of the contemporary Middle East scene so that the beginning college student or general reader" can obtain a historical background for an understanding of its present-day problems.

Over half of the book is devoted to presenting such a background. The first chapter deals inadequately with the physical features of the area, the second briefly with pre-Islamic history. Byzantine Christian heritage is given little attention in both chapter two and chapter eleven. In striking contrast Fisher writes in considerable detail of Mohammed, the Koran, the spread of Islam and Moslem theology, and law and culture under Arab leadership.

The author's special interest is in the Turks whose history he traces in eight

chapters from the advent of the Seljuks to the end of the eighteenth century. He vividly describes the rise, the achievements, and the stagnation and subsequent decline of the Ottomans.

Part III entitled European Imperialism is not an analysis of the nature of European imperialism as it functioned throughout the Middle East and of its complex and multiform impact upon internal development in the Ottoman Empire. It is no easy task to weave into a meaningful pattern all the threads of Middle Eastern history from the reforms of Sultan Selim III and Napoleon's invasions of Egypt in the nineteenth century to the Young Turk Revolution and the rise of Arab nationalism.

The latter part of the book falls into two divisions: the first dealing with the period of World War I and its aftermath, and the second with World War II and developments up to 1958. Fourteen chapters are so crowded with factual data that there is little space for reading between the lines. The flood of events from 1914, which inundated and obliterated many of the old landmarks and fertilized the Middle East, are treated in a way which tends to overwhelm the reader.

WILLIAM YALE

Professor of History, Emeritus
University of New Hampshire
Lecturer in History
Boston University

WALTER Z. LAQUEUR. *The Soviet Union and the Middle East*. (Praeger Publications in Russian History and World Communism, No. 81.) Pp. x, 366. New York: Frederick A. Praeger, 1959. \$6.00.

In this volume, Mr. Laqueur, editor of *Soviet Survey* (London), and author of a number of works on the Middle East, traces the development of Soviet attitudes, policies, and interests in the Middle East from the period of the Bolshevik Revolution in 1917 to the present. Written under a research fellowship from the Harvard Russian Research Center and the Center for Middle Eastern Studies, the work is a welcome addition to our information and knowledge concerning that troubled area.

Essentially, Mr. Laqueur's volume is

divided into two parts, the first of which treats of the development of "the Soviet image of the Middle East as it grew and changed since 1917." The second is devoted to the "great break through," especially after the Soviet-Egyptian arms arrangement of September 1955, and discusses in some detail the development of policies during the critical and decisive years between 1954 and 1959. In the latter section the author discusses not only the arms arrangement, but the Suez conflict of 1956, the Syrian crisis of 1957, Soviet trade and aid in the Middle East, Soviet cultural policy, the development of Middle Eastern communism, and the evolution of Middle Eastern nationalism. In the end, the author believes there will be an inevitable conflict between Arab nationalism and communism. Three Appendices conclude the volume, dealing with (1) China and the Middle East, (2) Israel in the Soviet Mirror, (3) Iraq, Nasser, and the communists.

While the volume has perspective and balance, and is well written, the author *might* have provided his readers with a brief background of the Russian past in the Middle East, as necessary to any basic understanding of Soviet imperialism in that area. Secondly, there could have been a more ample treatment of Soviet policy and interest in connection with such specific Middle Eastern problems as those of Turkey and the Straits, Iran and oil, Palestine and Israel. While Mr. Laqueur has evidently used Soviet sources extensively, aside from his annotations, he provides no extended Bibliography and cites few of the detailed western studies which have been made of various aspects of Soviet policy in the Middle East—studies which would guide the student beyond the confines of this relatively brief volume. Mr. Laqueur's volume, however, represents only a beginning. It is now necessary to plunge more deeply into a most important and fascinating subject.

HARRY N. HOWARD

Beirut, Lebanon

ROM LANDAU. *Islam and the Arabs*. Pp. 298. New York: The Macmillan Company, 1959. \$4.95.

If an objectively minded American wants to know "What makes an Arab tick?" he can find a dispassionate answer in Rom Landau's book, *Islam and the Arabs*.

Current developments in the Arab World are understood primarily by the so-called "experts" in that area or by emotional national partisans. Mr. Landau's book makes it possible for the average American citizen to understand more thoroughly why issues and conflicts arise in the Near East and in North Africa.

Most people in the United States rely unwittingly upon "spot news" in their daily newspapers for their basic knowledge of international affairs—a rather tragic dependence upon a kind of reportorial coverage that overemphasizes assassinations, coup d'états, and violent upheavals. Too often "spot news" fails to provide a balanced interpretation concerning impacts that directly or indirectly brought about the current crises. Obviously, what has happened yesteryear influences what is happening today, and Mr. Landau's book provides the necessary background so essential in any fair-minded attempt to understand a foreign people whose culture and religion contrast sharply with those in the West.

In this concise and well-arranged history of the Arab peoples, the author emphasizes the extremely important role that the Islamic religion has played, and is still playing, in the social, economic, and political life of the Arab. Americans who sincerely want good will between the Arab world and the United States cannot impartially evaluate the political events now occurring in the Near East and in North Africa without first realizing what Islam means to the Arab. Mr. Landau's book fills such a need.

In a broad sense *Islam and the Arabs* can serve as a well-tempered study for anyone who goes to the Arab World in the diplomatic service, as an employee of an American corporation or simply as a tourist. In its thirteen chapters the book outlines the developments that led Mohammed to found a new monotheistic faith, the expansion of the Muslim empire under several dynasties, the impact of the Crusades, and the effect of Islamic institutions

on Europe through the Muslim conquest of Spain.

The significant role that Islam played in bringing philosophy, astronomy, mathematics, geography, medicine, and chemistry to Europe then living in darkness is neatly documented in succeeding chapters. Each chapter concludes with a detailed chronology that links the Muslim World with developments contemporary to events in the West. This is an excellent reference.

In the final chapter, "Problems of the Present Arab World," the author explains why Arabs in the present decade are "strongly anti-colonialist and therefore almost automatically anti-West" (p. 239). He also explains why the Arabs feel they were betrayed "by the West after World War I" and how this betrayal led to "the subsequent deterioration in the relations between the Arab World and the West" (p. 240).

From his long experience in Muslim-Arab affairs, Mr. Landau gives this piercing summary that every Westerner should remember whenever political crises in the Arab World seem to perplex him:

"To understand the trend of modern Arab thinking and Arab policies we must try to view the relevant problems not from our Western point of view, but from that of the Arabs themselves. For it is ultimately their point of view and not ours—however erroneous and prejudiced the former may appear to us to be—that decides their attitude towards the world and their decision to prefer one set of ideas to another" (p. 235).

JAMES BATAL

Lecturer in Journalism
American University in Beirut

WILLIAM R. BASCOM and MELVILLE J. HERSKOVITS (Eds.). *Continuity and Change in African Culture*. Pp. ix, 309. Chicago: University of Chicago Press, 1959. \$7.00.

The collection of papers in this volume, all prepared by professional anthropologists, is noteworthy for its demonstration of the magnitude and nature of the problem of cultural change in Africa, south of the Sahara.

One of the most momentous develop-

ments of our decade is the rapidity with which political change is taking place in Africa. Less than ten years ago, besides the Union of South Africa, three independent states existed in Africa—Egypt, Liberia, and Ethiopia. Since then Libya, Morocco, Tunisia, Guinea, and Ghana have become independent, while the former French West Africa and French Equatorial Africa have achieved a degree of autonomy in the French Community. Within the next year, Nigeria and Somalia will become independent, and there are indications that some of the members of the French Community and other African territories will shortly move towards complete independence. The independence snowball is rolling rapidly in Africa, and its momentum apparently will not be stayed until political independence and autonomy is attained by most of its people.

These climactic political changes are part of the process of transition from traditional and primitive society to modernism which is taking place in Africa under the impact of western civilization. It is no secret that the attainment of independence and self-government does not mean that the new African states have completed the transformation to modern society. Political independence, particularly when achieved rapidly as is the case in many of the African territories, hardly changes the people and their pattern of life overnight. It must be borne in mind that the changes resulting from western influences in Africa take place not only in the political realm, but also in other areas, such as marriage and the family, language, art, music, mode of life, and so forth. Not all of these changes are taking place at the same pace. Furthermore, traditional cultural patterns persist and affect the new political entities.

If we are to understand the peoples of Africa and the problems they face and create, particularly in their adjustment to modern political life, it may be stated axiomatically that we must pay close attention to the problem of cultural change in all its aspects. In this connection, the volume, *Continuity and Change in African Culture*, can serve a most useful purpose. Anthropologists and ethnologists will find much of interest in this volume from the

viewpoint of their discipline and its methodology. But over and above this, other social scientists and laymen seeking an understanding of what is happening in Africa by going behind the headlines will find this volume of inestimable value. For example, the title focuses attention on what is changing and what is not changing; where change is taking place and where it is not. Not all of Africa is changing at the same rate, nor is all of Africa accommodating readily to change. Some societies are resisting it. One of the main themes of the book, often overlooked by students, is that the current African scene is marked not only by change but also by cultural continuity and that the emerging African states synthesize western culture and traditional African patterns.

LETTERS TO THE EDITOR

September 30, 1959

Dear Sir:

I have read with some astonishment the review of my book, *The Spartacist Uprising*, by Professor Ralph Haswell Lutz. I am perfectly aware that neither my approach to the subject nor the conclusions reached will find the approval of everyone. However, I fail to see how any critical and open-minded reader of this book can come to the conclusion that it supports "the communist viewpoint of the German revolutionary movement of 1918-19" and "the line of polemics of the Communist parties." For example, Chapter 6 of the book entitled "The Revolution in Retrospect" contains a careful analysis of the communist interpretation of the German revolution and takes a very strong stand against the purposeful distortion made by the communist misinterpretation of historical facts. It is one of the author's main findings that the communist assertion that the showdown of forces between the left-wing radicals and those who wished to consolidate the political gains of the November revolution

was not the result of deliberate actions by the Social Democratic Provisional government but "was the out-growth of the tension which existed between the highly antagonistic camps within the socialist movement . . ." (p. 214).

In his review, Professor Lutz employs the rather unfortunate method of attempting to discredit a factual statement by claiming that the same statement was also made by communists. This is hardly an academic approach. On the strength of it anyone can be discredited who happens to cite statements of fact which are also recognized as such by the communist side. How can Professor Lutz, an experienced and respected historian, disparage the findings of the author by stating that he had used readily identifiable communist source materials? How else would Professor Lutz want one to characterize the communist position and buttress, as the author has done, an effective critical view?

Professor Robert G. L. Waite, in a review to be published by the *Journal of Modern History*, has no difficulties in understanding the author's position which is neither in support of the communist point of view that the Social Democratic Provisional government deliberately provoked a showdown in order to destroy physically the left-radicals nor the "right-wing" version which places all the blame for the events on a premeditated communist attempt to seize power at that time.

Had Professor Lutz read the book more carefully he might also have appreciated the reasons which led to the inclusion of the introductory chapters preceding *The Spartacist Uprising* proper. They serve to underpin the author's thesis that the January uprising was the upshot of tensions which had been in the making for a considerable period of time.

ERIC WALDMAN

Marquette University

October 26, 1959

Dear Sir:

I have seen Professor Waldman's letter and do not find in it any reason for changing my original statements and conclusions. My review was based upon a careful reading of the text including "The Revolution

in Retrospect," "Conclusions" and "Summary," which "modify points of view which are presented in the main chapters." The author commented on only two of the criticisms listed in the review.

The communist "view point of the revolutionary movement" was generally established by Lenin, Trotsky, Stalin, Radek, and a number of Soviet experts and social scientists who are partly listed in the scholarly, annotated Bibliography of T. I. Rainov (*Istoriik Marksist*, 1933, Nos. 5 and 6), which includes all viewpoints from monarchists to anarchists. Clemenceau, Lloyd George, Wilson, Hoover and a galaxy of experts and scholars at Versailles presented western viewpoints of this revolution, but none agreed with Lenin and his lieutenants. My considered opinion is that Professor Waldman's evaluations resemble generally the communist viewpoint until he modifies them in the last twenty four pages of his monograph.

Furthermore, "the line of polemics of the Communist parties" was fairly well drawn when the first so-called "anarchist Soviet Republic" was formed April 6, 1919, in Munich, which was then followed by the proclamation of a Communist state on direct instructions from Moscow.

The polemics of western statesmen, generals, and social scientists against the Socialist party were well known before the delivery of the Allied mantle note. The author's polemic again resembles that of the communist parties rather than those of the West. Professor Waldman should stress the difficulties of the majority Socialists, the historic ministerial mistakes and decisions of the Commissars, as well as Ebert's stubborn resistance to Allied demands and Reuters' propaganda.

I deny that in my review or elsewhere I attempt to discredit a factual statement by claiming that the same statement is also made by Communists. I have cited in documentary histories and narratives numbers of communist sources. The author's first citation to the admitted communist propaganda publication, *Illustrierte Geschichte* (p. 10), has nothing whatever to do with communism but is his authority for socialist and trade union membership figures. Why cite communist propaganda

when the best documentary sources are readily available? Professor Waldman has good reasons to quote from Lenin, Liebknecht, Luxemburg, Rosenberg, and other communist writers. To that I did not object.

The author states that "one of his main findings" is that the showdown of forces between the communists and the socialists was not as the communists assert, the result of deliberate action by the government (p. 214). But what communist social scientist makes the preposterous charge that it was? Moreover, who are the American economists and historians who support this "widespread assumption"? Liebknecht had accepted money, guns, and an alliance from Lenin, and with Pieck voted in the revolutionary committee for the overthrow of Ebert's government. Had the uprising succeeded, the armies of the victors would have occupied Potsdam-Berlin and the heartland of the Junkers. Professor Waldman should know and state forthrightly that the Allies would never have made peace with a Berlin Communist government which in January 1919 had far more than merely a majority of organized labor in the capital against it.

Yours truly,
RALPH H. LUTZ

HISTORICAL ATLAS

WILLIAM R. SHEPHERD

8th enlarged & revised edition

A most comprehensive one-volume historical atlas of the world. 226 pages of maps, some in 7 colors. Information on political, military and economic events, governments, etc. from 2100 B.C. to 1958.

"The great advantage of the *Historical Atlas* lies in its graphic presentation of intricate political organization. . . . It pinpoints and illustrates these changes of historical importance, furnishing the student a far sharper picture than the one text-reading alone could have given him. This work is thus the comprehensive and accurate aid for the study of history."—*Social Education*

FOREWORD

When Attorney-General Herbert Brownell, Jr., called the first Attorney-General's Conference on Court Congestion and Delay in 1956, he focused national attention on a problem that had been growing year by year since the end of the last war and was then approaching crisis proportions.

At the close of the war, the federal courts were abreast of their work, and court delay was nowhere a serious problem. New factors then clouded the scene. The moral aftermath of the war swelled criminal dockets everywhere. Population zoomed. Anchorage, Alaska, a village of a few thousand in the early 1940's, can now count nearly 100,000 and is still growing. Phoenix, Albuquerque and many cities have a similar story to tell. Business activity of all kinds has expanded on an unprecedented scale.

The judicial machine, organized by Constitutional directives and its manpower determined by legislative action, is not quickly adaptable to such changes, and it is a tribute to the hard work and devotion of the courts and their staffs that as much of the increased load has been absorbed. Today, most American courts are operating without delay, and most cases are heard and decided promptly. It is only in certain classes of cases, in certain courts, and certain localities that delay is a problem.

Although the number and the percentage of these courts and their cases is relatively small, their relative importance is great. The cases most affected—automobile accident damage suits—are in most instances a once-in-a-lifetime experience for the plaintiffs, with home, savings, and livelihood affected by the outcome. At the same time, those cases represent a large part of the business of an important segment of the business community—the insurance companies.

The obvious answer to more work is more judges, and their number has been increased, although by no means enough. While awaiting legislative action on bills for more judges, professional and community leaders concerned about court delays may find other things to do to increase both quantity and quality of the present judicial output.

More efficient calendar practices can avoid needless waste of judges' time. Encouragement of settlements can dispose of many cases without going to trial. Pre-trial conferences can shorten trial time. Use of auxiliary judges and quasi-judicial personnel can ensure that the judges' time is spent on the hard cases that need it most. Statistical reports and assignment systems, under an administrative officer, can put idle judges to work relieving the burdens of their overworked brethren. Simplification of procedure, modern discovery practices, impartial medical testimony—even adoption of a rule of law like comparative negligence—all have their place in increasing the productiveness of the courts of justice.

In the various chapters of this volume, one of a long series of ANNALS volumes devoted to various aspects of judicial administration, the background and present status of court congestion are reviewed, its causes examined in detail, and experience with the outstanding measures that have been invoked against it is described and explained.

It is the hope of the editor and of the authors who have co-operated to produce the volume that it will help its readers to understand the true nature and extent of court congestion and that in its chapters may be found the one or more ideas needed to correct the situation in each community where the monster of delay stands between American citizens and their legal rights.

GLENN R. WINTERS

Glenn R. Winters, LL.B., Chicago, Illinois, is Executive Director of the American Judicature Society and Editor of the Journal of the American Judicature Society. A graduate of the University of Michigan Law School, he is a member of the bar of Missouri and of Michigan, a member of the American Law Institute, and honorary member of various legal organizations. He is a member of the American Bar Association's House of Delegates and of various of the Association's committees, including the Special Committee on Court Congestion. His published writings include Selection of Judges in New York and in Other States (1943), Bar Association Organization and Activities (1954), and other monographs and articles in legal periodicals.

Historical Review

By JOHN ECKLER

ABSTRACT: The problem of congested dockets and delay of justice has been witnessed invariable times in past history. The real and ever present delay in the legal remedies afforded the people has permeated the public consciousness and has instilled an awareness of responsibility among the servants of the judiciary. Those ministering justice have instigated legislation in various states to accelerate the judicial process. Concern for the civic effects of delay in our courts and for the legal effects on our judicial system has fostered conferences, committee studies, and projects on congestion and delay in the administration of justice. A determined public, bar, and judiciary can implement positive programs and methods enabling the judges to grant speedier trials.—Ed.

John Eckler, A.B., J.D., Columbus, Ohio, is an attorney engaged in the active practice of law and a partner of the firm of Bricker, Evatt, Barton, Eckler & Niehoff. A graduate of Ohio Wesleyan University and the University of Chicago, Mr. Eckler is the Chairman of the American Bar Association's Special Committee on Court Congestion, and is a past president of the Columbus Ohio Bar Association and past chairman of the Board of Bar Examiners for the State of Ohio. He is the President-elect of the National Conference of Bar Examiners and a member of Phi Beta Kappa and Order of the Coif.

WITH and from the dawn of civilization, man has sought to establish and preserve his individual and property rights through systems of rules and laws. The early family and tribal rules, the Code of Hamurabi, the Justinian Code, the modern elaborate systems of constitutional, statutory, and judge-made law, all impose restraints on the conduct of individual members of their respective societies in order to secure for such societies, as a whole, the opportunity and right of adjusted and productive existence. Any such system, however, enjoins upon society the responsibility to assure that its members have a *just* and *ready* means of resolving their differences within such rules of conduct.

All but the most primitive systems of conduct provide a judiciary and courts as the means of resolving those differences. Modified only by the imperfections of the humans who have created and administered the courts, they have been *just* means of resolving differences. Unfortunately, however, all our courts have not been and are not now *ready* means of resolving differences. Fortunately, the imperative need to solve the problem of delay in the administration of justice resulting primarily from court congestion is engaging the attention of an increasing number of the members of the bench and bar and responsible laymen.

HISTORICAL AND LITERARY REFERENCES

The phenomenon of lagging justice is not the exclusive, though uncomfortable, possession of our immediate decade. Judge Ulysses S. Schwartz in his thoughtful opinion in *Gray v. Gray* suggests the temporal nature of the problem as evidenced in literature and song:

The law's delay in many lands and throughout history has been the theme of tragedy and comedy. Hamlet summarized the seven burdens of man and put the law's

delay fifth on his list. If the meter of his verse had permitted, he would perhaps have put it first. Dickens memorialized it in *Bleak House*, Chekhov, the Russian, and Moliere, the Frenchman, have written tragedies based on it. Gilbert and Sullivan have satirized it in song.¹

It is not without significance, as Judge Schwartz indicates, that in Act III, Scene 1 in the *Tragedy of Hamlet*, first published in 1604, Shakespeare has Hamlet, in his "to be, or not to be" soliloquy, give attention to the law's delay. The bad company that law's delay was keeping over 350 years ago is indicated by the following from Hamlet's musings:

There's the respect
That makes calamity of so long life;
For who would bear the whips and scorns
Of time,
Th' oppressor's wrong, the proud man's
contumely,
The pangs of dispriz'd love, the law's delay,
The insolence of office, and the spurns
That patient merit of th' unworthy takes,
When he himself might his quietus make
With a bare bodkin?

Messrs. Zeisel, Kalven, and Buchholz in a definitive analysis of the delay problems of the Supreme Court of New York County and their relation to the problems generally, recently published under the title, *Delay in the Court*,² have called attention to further historical and literary reference to the problem:

Goethe, after having received his doctor juris degree, practiced law for a while before the Reichskammer Court in Wetzlar, about which he writes in the twelfth chapter of his autobiography:

An immense mountain of swollen files lay there growing every year, since the seventeen assessors were not even able to handle the current workload. Twenty thousand cases had piled up, sixty could be disposed of every year,

¹ 6 Ill. App. 2d 571, 578-579, 128 N.E. 2d 602, 606 (1955).

² (Boston: Little, Brown and Company, 1959), pp. XXVII and 313.

while twice as many were added. It was not unusual for a case to remain on the docket for more than a hundred years. One, for instance, involving the city of Gelnhausen, began in 1459 and was in 1734 still waiting for the court's decision. A dispute between the city of Nuremberg and the electorate of Brandenburg had begun in 1526 and remained for ever undecided when in 1806 the court was dissolved. The piteous state of the court created the unique profession of "solicitors" whose sole job it was to secure preferments for their clients. This custom resulted eventually in the jailing of its leading practitioner and in the removal of three judges from the court because of bribery.

The effects of this delayed court on Goethe were profound and in the end salutary. It made him lose whatever taste he had for the law, gave him sufficient leisure (the court had 174 holidays annually) to fall into desperate love with Charlotte Buff, the heroine of *Werther*, the novel which was to catapult him firmly into world fame.

FOREMOST MEMBERS OF THE JUDICIARY

The problem of lagging justice has not escaped the attention of this nation's chief judicial officers. Chief Justice William Howard Taft observed:

If one were asked in what respect we have fallen furthest short of ideal conditions in our government, I think we would be justified in answering, in spite of the glaring defects of our system of municipal government, that it is our failure to secure expedition and thoroughness in the enforcement of public and private rights in our court.

In a recent series of speeches and articles, Chief Justice Warren has underlined not only the existence of the delay problem but has delineated its serious impact on our system of laws. In 1958 at the annual meeting of the American Bar Association the Chief Justice said:

. . . interminable and unjustifiable delays in our courts are today compromising the basic legal rights of countless thousands of Americans and, imperceptibly, corroding the very foundations of constitutional government in the United States. Today, be-

cause the legal remedies of many of our people can be realized only after they have swallowed with the passage of time, they are mere forms of justice. And, to the extent that this is so, there is created a disrespect for law at a time when everyone should be continually conscious of the fundamental principle that it is primarily the law and its adequate enforcement which makes individual liberty possible.³

PUBLIC AWARENESS OF DELAY

The extent of the delay problem and the urgency of its solution have, as might be expected, engaged the attention of the public. Articles and editorial comment have appeared in *The Christian Century*,⁴ *Life*,⁵ *This Week Magazine*,⁶ *The Rotarian*,⁷ *Saturday Evening Post*,⁸ *Time*,⁹ *Readers' Digest*,¹⁰ *U. S. News and World Report*,¹¹ and *Coronet*.¹² Many of our great daily newspapers have evidenced the general public's awareness of and concern over the delay problem. Two significant series dealing with court congestion have been published in the *Washington Post and Times Herald*¹³ and the *Cleveland Plain Dealer*,¹⁴ and editorial comments have recently appeared in the *New York Times*¹⁵ and *New York Herald Tribune*.¹⁶

As evidence of the fact that court congestion is not new in the law, Herbert Brownell, Jr., then Attorney-General of the United States, opening the first At-

torney-General's Conference on Court Congestion, turned back the legal clock 120 years. He reported that David Dudley Field speaking of the New York Courts in 1839 had said, "Speedy justice is a thing unknown; and any justice, without delays almost ruinous, is most rare." A half century ago, Roscoe Pound, Dean Emeritus of Harvard Law School, then a young lawyer from Nebraska directed the entire nation's attention to the difficulties in our judicial administration. His 1906 address, "The Causes of Popular Dissatisfactions with the Administrations of Justice," delivered to the annual meeting of the American Bar Association has served as a guide to judicial reform since that date.¹⁷ Fifty years later, the voice of this renowned scholar was again raised in the cause of more efficient judicial administration when he addressed the Chicago Bar Association.

It has been suggested that the problem of lagging justice is rather like Mark Twain's observation about the weather, that is that everybody talks about it, but that no one does anything about it. This, however, is not the fact.

PROGRAMS TO SPEED JUSTICE

The legislature of Massachusetts, faced with congested courts, adopted legislation in 1818 to establish the auditor system. This is considered an emergency procedure and is not invoked when calendars are current. In spite of its great age, the auditor system retains remarkable vitality. Recently, in 1934 and again in 1942 the system was employed to clear a congested docket, resulting in the disposition of some 47,000 cases. In 1956 the system was reinstated but limited to motor vehicle court cases. The following year it was made applicable on a selected basis to cases involving general liability.

¹⁷ 1906 ABA ANN. REP. pt. I, at 395-417.

The use of quasi-judicial personnel under legislative authority is provided in Pennsylvania. In 1958 the procedure was started in Philadelphia with some 6,200 cases being handled under Pennsylvania's compulsory arbitration procedures. It is reported that the program has been intensified where more than 1,000 cases a month are being handled in Philadelphia.

The Wayne County (Detroit) Michigan Circuit Court under the leadership of Judge Ira Jayne is credited with first establishing a pre-trial system in 1929. The more recently adopted Federal Rules of Civil Procedure provide for nonmandatory, pre-trial procedures. The system has been adopted by many state trial courts. A large segment of the bench and bar is convinced that increased and skilled use of pretrials will significantly reduce current court congestion.

The Judiciary Act was adopted by Congress in 1789, but "modern" court administration was not anticipated in the federal system until Congress authorized the Judicial Conference of Senior Circuit Judges in 1922. Finally in 1948 Congress provided for the administration of multi-judge courts.¹⁸ The administrative tools available and the invaluable statistics being compiled by Warren Olney, Director of the Administrative Office of the United States Courts, indicate that marked inroads should be made on congestion problems facing some federal courts.

It is generally conceded that a necessary ingredient to basic judicial reform is interest and support of lay groups. A classic example is the seventy-one year effort, from 1836 to 1907, primarily by enlightened laymen, which won in England the right effective repeals of criminal convictions.

¹⁸ See, Chief Justice Warren, *The Problem of Delay: A Task for Bench and Bar Alike*, 44 (No. 11) A.B.A.J. 1044.

The Committee for Modern Courts, organized in 1955, is primarily a group of civic-minded laymen organized to "stimulate and develop an understanding among citizens generally of the problems involved in the administration of Justice." This organization has been particularly active in New York and Illinois. Similar groups have supported most successful judicial reforms accomplished in the various states. Spectacular among such reform efforts was the simplification of the New Jersey court structure in 1948.

CONFERENCES AND COMMITTEE STUDIES

In the entire history of the troublesome problem of court congestion, probably the most forceful and concentrated attack on the problem was made by the two Attorney-General's Conferences on Court Congestion and Delay in Litigation during May 1956 and June 1958. Eminent judges, lawyers and laymen, meeting together, defined the problem and considered its solution. The printed proceedings of the Conferences are a valuable source for corrective legislation and modernized court rules. Continuing implementation of the Conferences' work is assured by the recently appointed Attorney-General's committee on Scope and Procedure, of which Whitney North Seymour, New York lawyer, is Chairman.

The organized bar, through the leadership of the American Bar Association, continually studies the issues of judicial reform. In 1938 the Association's House of Delegates adopted a series of resolutions proposed by its Section of Judicial Administration related to needed judicial reform. In the fall of 1958, President Ross Malone of the American Bar Association appointed a Special Committee on Court Congestion, which has been charged with the responsibility to deter-

mine and report those solutions to the delay problem which can be best implemented by practicing lawyers. The Committee's recent report, "Ten Cures for Court Congestion," contains a synthesis of such solutions.

Many state and local bar associations have committees working in conjunction with local courts on the delay problem. Recently there was organized the Conference of State Trial Judges, which should prove to be an extremely effective organization in the attack of the delay problem.

From its inception, the American Judicature Society has fostered judicial reform. Its scholarly and influential *Journal* has given thoughtful and effective attention to the problems of lagging justice. Since early 1957, the Project on Congestion in the Courts of the American Bar Foundation, in addition to its own continuing studies, has in its monthly publication, *Court Congestion*, printed references to and frequently digests of the literature in this area and comments on significant developments throughout the country.

The important work of these organizations is being supplemented by detailed research now being conducted by a number of current projects. Numbered among these are the Jury Project of the University of Chicago Law School, the Project for Effective Justice of Columbia University Law School, the Judicial Administration Project of the Institute of Legal Research, and the Joint Research Project in Court Calendar Congestion of Columbia University and the Association of the Bar of the City of New York.

Numerous state legislatures and the Judiciary Committee of the United States Senate are approaching the problem with a rolled-up-sleeves attitude. Pending and proposed legislation, designed to clear court calendars, is being

given intensive study and being readied for legislative action.

A DETERMINED WILL

In spite of the persistent history and current intensity of court congestion, the problem of lagging justice cannot be regarded as insoluble. Justice William J. Brennan, Jr. has suggested a warning sounded by his former associate when he said, "Arthur Vanderbilt once said that this job of improving judicial administration is no job for the short-winded."¹⁹ In specific reference to the problem of lagging justice, Chief Justice Warren has added, however, a note of encouragement by quoting the same source. The Chief Justice has said,

¹⁹ THE ATTORNEY-GENERAL'S CONFERENCE ON COURT CONGESTION AND DELAY IN LITIGATION PROCEEDINGS 109 (June 16 and 17, 1958).

"Arthur Vanderbilt never tired of saying that the problem of delay could be solved. 'The practical solutions of these problems,' he said, 'given a real determination to do so, is much simpler than most people suspect. It is not knowledge of ways and means that we lack; it is the will to put them into effect.'"²⁰

This strenuous activity to find and implement solutions to lagging justice suggests, without much measure of doubt, that there is a "will" to do the job. It is as clearly demonstrable that a solution must be found. William Gladstone is given credit with having first said, "Justice delayed is justice denied." Irrespective of the authorship of that frequently repeated aphorism, it is nonetheless patently true. It remains and is intensely the responsibility of society to assure justice by removal of delay.

The Situation in 1959*

By MILTON D. GREEN

ABSTRACT: Delay in the courts, although not a new complaint, has been the subject of much current discussion. Delay, as used in the present article, is the time interval between the point when a case is "at issue" and the trial. In the federal courts this period varies from 4.1 months to 39.1 months. In the state courts it varies from 1.0 month to 52.9 months. During the last seven years delay in the federal courts has increased, whereas delay in the state courts has decreased.

Milton D. Green, J.D., LL.M., J.S.D., New York City, is Visiting Professor of Law at New York University School of Law and Acting Director of the Institute of Judicial Administration. He has been Dean and Professor of Law at the School of Law, Washington University since 1953. He previously taught at the Universities of Colorado, Utah, and Washington (Seattle).

* The data was assembled and most of the charts and tables were prepared by Arnold B. Firestone, Research Assistant of the Institute.

THE law's delay is not a new disease of our social order. It is a chronic complaint. In recent years, however, it has been the subject of widespread comment in the press,¹ in popular magazines,² and law journals.³ The Chief Justice of the United States has repeatedly stressed the seriousness of the problem in his annual addresses to the American Law Institute. Last May, in an unprecedented action, he suggested to the Institute that it undertake a comprehensive study of certain aspects of the problem. The Judicial Conference of the United States, in its annual meetings, has struggled with the question. The Attorney-General of the United States has called national conferences on Court Congestion and Delay in Litigation. The American Bar Association has appointed a special committee on the subject, and it also publishes *Court Congestion*, a monthly newsletter, which digests recent articles, speeches, and projects.

With so much activity in the field one would expect that the nature and scope

³ Fannie J. Klein, *Congestion and Delay: A Selected Bibliography of Recent Materials* (Institute of Judicial Administration, May 1958). It lists 250 items, a majority of which are articles in law reviews and bar journals, and appears also in U. S. ATTORNEY-GENERAL'S CONFERENCE ON COURT CONGESTION AND DELAY IN LITIGATION PROCEEDINGS at 213-45 (June 16, 17, 1958).

of the problem would have been clearly defined. Is court congestion a general condition throughout the United States? Is the problem more acute in the state courts than it is in the federal courts? Is it getting better or worse? Contrary to what one might expect, accurate and comprehensive answers to these questions are not readily available.⁴ There are several reasons why this is so. In the first place there is no uniform method of keeping and reporting judicial statistics. This observation does not apply to the federal courts for which excellent statistics are available from the Administrative Office of the United States Courts. In the state courts, however, the situation is quite different. The administrative organization of the courts varies from state to state, as does the method of keeping records and reporting statistics. In the second place, the practices and procedures in the state courts may vary to such an extent that accurate comparison is difficult or impossible. In the third place, there is no general agreement upon the yardstick that shall be used for the measurement of delay.

DELAY DEFINED

In common parlance the term delay is used to signify abnormal lapse of time.

⁴ This statement should be qualified. Ever since the establishment of the Administrative Office of United States Courts (28 U.S.C. § 601) accurate statistics have been kept, and annual reports made on the business of the federal courts. Studies have been made of a few state courts in large metropolitan areas. H. Ziesel, H. Kalven, Jr., and B. Buchholz's *Delay in the Court* (Little, Brown, 1959) is a detailed study of the Supreme Court of New York County (Manhattan); *A Survey of Metropolitan Trial Courts—Los Angeles Area* (Haynes Foundation, Los Angeles, California, 1956); *Survey of Metropolitan Courts—Detroit Area* (Michigan Legal Studies, University of Michigan Law School, Ann Arbor, Michigan, 1950); and *Delay and Congestion in the Superior Court of Maricopa County, Arizona*

When we say a shipment of goods was delayed in transit we are not referring to the normal amount of time it would take to send the goods from one point to the other; we are referring to the extra, or abnormal time consumed. If there has been a delay—extension of the time which might reasonably be expected—it is chargeable to some cause. The cause may have been a flood or a fire or some other circumstances beyond the control of the carrier. On the other hand, the delay may have resulted from the negligence of someone or the inefficiency of the operation.

Delay in the administration of justice should likewise signify the extra or abnormal time which might reasonably be expected to bring a case to trial. Here again delay is chargeable to some cause. It could be due to the negligence of the party who has waited an unreasonable length of time before consulting a lawyer. Or it could be due to the negligence of the lawyer in failing to prosecute his client's case with reasonable diligence. Or it could be due to the inefficiency of the machinery of justice. Or it could be a combination. What we are concerned with, in the present article, is delay resulting from inefficiency in the administration of justice, or, in brief, court-caused delay.⁵

THE MEASUREMENT OF DELAY

Even choosing a yardstick to measure delay "turns out to be a complex and interesting matter," as the University of Chicago Law School study shows.⁶ The authors point out that the numerical size of the case backlog of a court is not a

(Institute of Judicial Administration, 1955). Other studies of individual courts have been done or are in progress.

⁵ The present study is restricted to civil actions in which the problem is most acute. Criminal cases are not included.

⁶ H. Zeisel, H. Kalven, Jr., and B. Buchholz, *Delay in the Court* (Boston: Little, Brown & Co., 1959), pp. 43-57.

reliable guide because such a small fraction of cases filed ever reaches the trial stage. Nor is the waiting time between the date the suit was filed and the date of trial a satisfactory measure due to the fact that much of the elapsed time may have been due to the voluntary action of the parties. The situation may be further complicated if the court establishes separate calendars for different types of cases and gives priority to certain categories.

For the purposes of the present article the yardstick which has been chosen to measure delay is the time interval (recorded in months, or fractions) between the date when the case is "at issue" and the date when it reaches trial. Without a detailed field study of all the state courts this seems to be a relatively fair way to measure court-caused delay. Theoretically a case is ready for trial when it is "at issue."⁷ Practically this may not be so. In some jurisdictions a case automatically goes on the trial calendar when it is "at issue," in others the attorneys must take the initiative of placing it there, and in still others it will not be placed upon the calendar until the parties have filed a certificate of readiness.⁸ Moreover, even after a case is on the trial calendar the parties may agree to voluntary post-

⁷ Considerable difficulty is encountered in ascribing a precise meaning to the term "at issue." It usually refers to the status of a case when final pleadings on both sides have been filed and preliminary motions have been disposed of. In some jurisdictions, however, the term is used in a different sense. For instance, in New Jersey a case is considered "at issue" when the first answering pleading is filed, whereas in New York a case is not considered "at issue" until the pleadings have been completed, all preliminary motions made and determined, and a certificate filed by the attorneys indicating that the case is ready for trial.

⁸ This point was demonstrated by a pilot study conducted by the Institute of Judicial Administration. See its *Calendar Status Study* (1957), pp. 11-13.

ponements which should not be charged to delay. Notwithstanding the infirmities inherent in choosing "at issue" as the starting point in computing delay, it is believed that it yields more accurate average results than if some other point were chosen, especially in view of the absence or dearth of reliable statistics on other possible starting points. The terminal point for measuring delay is the date the trial begins. It could, of course, be argued that by choosing this point, delay occurring during the course of the trial is left out of consideration. This is true, but to use the end of the trial as the terminal point would be impractical due to the fact that the length of a trial varies according to the type and complexity of the case. The simplicity or complexity of a case may have impacts on time intervals before the case is "at issue" and after it comes to trial, but should not appreciably affect the time interval between those two points.

Ideally, a case should be tried as soon as the parties are ready; hence any time interval between "at issue" and trial could be labeled delay. Practically, there is almost always some time interval which is regarded as necessary, inevitable, or normal.⁹ Without attempting to specify what this interval is, or should be, the present article will simply undertake to indicate the current condition of court congestion by reporting

⁹ What constitutes a "normal" time interval is, of course, a matter of opinion. The Judicial Conference of the United States has taken the position that six months is a "normal" interval from the filing of the case to trial. See its 1958 ANN. REP. 5, 72; also 1956 ANN. REP. 5. The Executive Committee of the Attorney-General's Conference on Court Congestion and Delay in Litigation also adopted this six-month period "as a guide in determining whether trial court calendars are current." Arthur T. Vanderbilt, *Improving the Administration of Justice—Two Decades of Development* (University of Cincinnati, 1957), p. 5.

the number of months elapsing between "at issue" and trial.

SOURCES OF DATA

The information about the federal courts was taken from the *Annual Report* of the Director of the Administrative Office of the United States Courts.¹⁰ This information may be regarded as official since the act of Congress establishing the office makes it the duty of the director to "examine the state of the dockets of the courts" and to submit an annual report of "the state of the business of the courts."¹¹ No such official source is available for the state courts. The information in regard to them was obtained from the Institute of Judicial Administration, a nonprofit corporation which was established in 1952.¹² Beginning in 1953, the Institute has published an annual *Calendar Status Study* of state trial courts of general jurisdiction. Until 1957 the study contained compilations of figures showing the average time required to obtain a trial in all cases, jury and nonjury, personal injury and otherwise. Since 1957, the figures are limited to personal injury jury cases.¹³ Information for the present article was obtained from the 1959 study.¹⁴

¹⁰ Submitted to the Chief Justice of the United States on September 2, 1959.

¹¹ 28 U.S. Code § 604.

¹² The Institute's offices are located at 40 Washington Square South, New York 12, New York.

¹³ The reason for the change is explained in the 1957 study: "Past studies included jury and nonjury cases, personal injury or otherwise. As a result of experience, as well as conferences and discussions with court administrators and others, we believe that personal injury cases are the principal source of calendar delays. Furthermore, we feel that time intervals in personal injury jury cases are often correlated with intervals in other cases and therefore furnish an index of calendar congestion in general."

¹⁴ This study reports on 99 trial courts of general jurisdiction located in 48 states and the District of Columbia. The study contains

The federal statistics measure delay in terms of median time intervals whereas the state court statistics use averages. This is unfortunate but unavoidable, since no other statistics for state courts on a nation-wide basis are available. It is not as serious, however, as it might appear at first blush. Valid comparisons between individual federal courts and between individual state courts can be made, because the method of computation within each system is uniform. It is only when comparisons are made between federal courts and state courts that the results are open to question. Even here the results are illuminating because medians tend to be slightly shorter than averages.¹⁵ This gives the federal courts the advantage, but in spite of it they make a poorer showing, as the subsequent analysis will demonstrate.

THE FEDERAL COURTS

There are eighty-six United States district courts, apportioned among ten judi-

the following cautionary statement: "In many jurisdictions the figures furnished are not based upon genuine statistical studies. Such studies are conducted in only a relatively few jurisdictions. Where they are, the Institute is happy to use the resulting figures. Where they are not, however, only estimates can be obtained. It is impossible for the Institute to look behind the figures reported by its sources. This would call for on-the-spot studies of almost a hundred courts, the cost of which would be beyond the resources of the Institute."

¹⁵ 1959 ADMINISTRATIVE OFFICE OF THE U. S. COURTS DIRECTOR'S REP. at II-24 states: "The median in general is shorter than the average in judicial time figures." The accuracy of this statement is demonstrated, in respect to the federal courts in Delaware, by THE OPERATIONS OF THE UNITED STATES COURTS FIELD STUDY (Cotter Report, 1959), p. 11, footnote 5. It is also verified by an analysis of delay in state trial courts in thirteen counties in New York, where, in every instance, median delay was shorter than average delay. 1959 JUDICIAL CONFERENCE OF THE STATE OF NEW YORK ANN. REP. 48.

cial circuits. They entered the year on July 1, 1958, with a backlog of 68,168 civil cases to which were added an additional 57,800 new filings during the course of the year.¹⁶ Approximately 45 per cent of the litigation occurs in twelve of these district courts, all of which are located in large metropolitan areas.¹⁷ Fifty-one of the district courts had fewer than 25 cases which terminated on jury trials during 1959, and as to those, statistics on delay are not available.¹⁸ Of the balance of 35 districts courts the period of delay varied from 4.1 months in Maryland to 39.1 months in the eastern district of New York (Brooklyn).¹⁹ Figure 1 indicates the amount of delay existing in each of these district courts for the year 1959.

If six months should be considered a normal period of delay between the time a case is "at issue" and the trial date, it would appear that thirty of the district courts are experiencing excessive delay in periods ranging from 0.3 month to 33.1 months.

In order to see how the situation in

¹⁶ 1959 U. S. DISTRICT COURTS ANN. REP. at I-1. Taken in isolation the work-load of the federal courts appears large. It should be remembered, however, that they are courts of limited jurisdiction. The great bulk of litigation is carried by the state courts. In fiscal year 1959 the number of new civil cases filed in the New York State Supreme Court was 59,073 more than the total filings of civil cases in all of the federal courts. (Information supplied by The Judicial Conference of the State of New York in letter dated October 19, 1959.)

¹⁷ 1959 ANN. REP. at I-25, 26, 27.

¹⁸ 1959 ANN. REP., Table C 6, footnote 1, which explains that "figures based on less than 25 cases are not considered statistically reliable."

¹⁹ These statistics and the ones immediately following are taken from the 1959 ANN. REP. Jury Tried Cases portion of Table C 6. Jury tried cases, rather than all cases, were selected in order to equate them with the state court statistics and thus secure a better basis of comparison.

Fig. 1. DELAY IN UNITED STATES DISTRICT COURTS, 1959

1959 compares with previous years, charts have been prepared for seven district courts located in large population areas. (See Fig. 2.) It will be seen that in the eastern district of New York (Brooklyn) the trend has been irregular but upward, increasing from 24.1 months in 1953 to 39.1 months in 1959. In the western district of Pennsylvania (Pittsburgh) there is also an upward trend, but a more regular rise, from 18.7 months in 1953 to 34.4 months in 1959. The eastern district of Pennsylvania (Philadelphia) shows a rather sharp increase, from 20.1 months in 1953 to 30.8 in 1956, but then a decline in 1957 and 1958 with a small rise in 1959 for a net rise of 3.1 months for the period. The southern district of New York (Manhattan) shows a marked improvement from 38.3 months in 1953 to 18.8 months in 1959. In the northern district of Illinois (Chicago) the irregular

trend has been upward from 11.9 to 14. In California the southern district (Los Angeles) shows a slight increase, while the northern district (San Francisco) shows a slight decrease.

Viewing the country as a whole, one will find that during this seven-year period delay in the United States district courts has increased from 7.5 months in 1953 to 11 months in 1959.

STATE COURTS

Seven years ago the Institute of Judicial Administration began its calendar status study of delay in state trial courts of general jurisdiction. Obviously it could not undertake a study of all such trial courts in the United States. It chose the principal trial courts in each of the forty-eight states. This year, in its published study, it has presented, in tabular form, not only the current pic-

Fig. 3. DELAY IN STATE COURTS: NEW YORK METROPOLITAN AREAS, 1953-59.

ture but the figures for previous years. Herewith reproduced is the table from the 1959 study. (See Appendix, Table 1.)

As in the case of the federal courts, charts have been prepared for courts in large population areas, corresponding as nearly as possible with the federal courts in the same areas.²⁰ Also, as in the case

²⁰ Complete correspondence is impossible. For this reason the four courts in the metropolitan area of New York City have been reproduced on one page.

of the federal courts there is very little uniformity of patterns or trends. For example, of the four courts in the area of metropolitan New York, during the period in question, two show a marked decrease in delay,²¹ one shows a moderate decrease,²² and one shows a slight increase.²³ (Fig. 3.)

²¹ Kings County, decrease of 32 months; New York, decrease of 19 months.

²² Bronx, decrease of 6 months.

²³ Queens, increase of 2 months.

Cook County, Illinois (Chicago) shows an increase of 20.3 months. Philadelphia County, Pennsylvania shows an increase of 16 months. Allegheny County, Pennsylvania (Pittsburgh) shows a decrease of 6 months. San Francisco County, California shows an increase of 6 months. And Los Angeles County, California shows an increase of 3 months. (Fig. 4.)

The individual differences which are reflected by these graphs have a tendency to offset each other. Nevertheless, viewing the country as a whole, a trend can be detected, and it is in the right direction. Over the seven-year period, there has been a modest improvement of 1.4 months.

The current condition of delay in the state courts for 1959 is shown in figure 5.

Fig. 4. DELAY IN STATE COURTS IN METROPOLITAN AREAS, 1953-59.

Upon the assumption that a time interval up to six months between "at issue" and trial is reasonable, or normal, then, of the ninety-nine courts covered by the study, forty-nine are subject to excessive delay.²⁴

FEDERAL AND STATE COURTS COMPARED

The greatest single instances of delay occur in the state courts. The two major state courts in Cook County, Illinois have average delays of 52.9 months and 50.3 months. Each exceeds the federal court showing the greatest delay,²⁵ one by 13.8 months and the other by 11.2 months. The other state court which exceeds the federal court exhibiting the greatest delay is the New York Supreme Court for Queen's County which shows a 4.9-month excess.

These special situations are not, however, typical of the general picture. During the seven-year period covered by the present study, the state courts make much the better record. In 1953 average delay in the state courts stood at 11.5 months, which was 4.0 months higher than average delay in the federal courts for the same period. But the state courts improved their average position by 1959, reducing the period of delay by 1.4 months. The federal courts, on the other hand, showed an average increase of delay of 3.5 months.

²⁴ The following are the states, together with the number of months which each exceeds the assumed norm of six:

Alabama	2.0
Arizona	6.5
California	
Los Angeles	9.0
San Francisco	8.0
Alameda	5.5
San Diego	11.0
Sacramento	7.0
Connecticut	
Hartford	14.3
New Haven	18.6
Bridgeport	18.4

This comparison is graphically illustrated in figure 6.

based on national averages. Table 2 is a specific breakdown of the situation as it exists in 1959, to illustrate the comparative position of state and federal courts in each of the states. (See Appendix.)

SUMMARY

Delay is measured by the time interval which elapses between the point when a case is "at issue" and the trial. In the federal courts this period varies from 4.1 months to 39.1 months. During the seven-year period from 1953 to 1959 the trend in individual federal

courts has varied, but on the whole there has been an increase of delay from 7.5 months to 11 months. In the state courts, where the delay varies from 1.0 month to 52.9 months, there has also been a variance in individual courts, but the over-all picture shows a decrease in delay from 11.5 months to 10.1 months. As of 1959, both the federal courts and the state courts are suffering from excessive delays in the trial of civil cases, but the state courts are showing more progress in solving the problem than are the federal courts.

Judicial Manpower Problems

By ROGER A. JOHNSEN

ABSTRACT: The overriding fact in any study of judicial manpower is that the American judiciary is undermanned. Therefore, it is increasingly important to use more efficiently the existing judicial manpower. Closer supervision of the number of days worked per trial-term and the number of hours worked per day may increase the amount of time spent in court by judges. Other suggested improvements include a more even distribution of the work-load through the use of the central case assignment system, fuller utilization of nonjudicial personnel not only for clerical matters but also for the hearing of routine motions where consent of counsel is obtained. Furthermore, to utilize fully the judicial manpower of America, a central authority in each court system should have the power to reassign judges to districts with overcrowded calendars. Lastly, certain courtroom measures could be taken to expedite the trial of cases and thereby to permit each judge to hear more cases per term. These measures are designed to use more fully the supply of judicial talent. They are not a cure for the shortage of judges which is now a problem in many of the courts in America.

Roger A. Johnsen, LL.B., Docteur-en-Droit, Chicago, Illinois, is a Research Attorney for the American Bar Foundation. He has in the past conducted studies on judicial administration and the court system. Mr. Johnsen is admitted to practice before the courts of Minnesota, and the Supreme Court of the United States. He is a member of the American Bar Association, the American Society of International Law and the Association of Attenders and Alumni of the Hague Academy of International Law.

THE proper use of judicial manpower is extremely important today as we face crowded dockets, congested calendars, and excessive delays. It will be the purpose of this chapter to discuss methods of assuring the maximum utilization of our judicial manpower.

The need for a more effective utilization of our judicial resources is evident. Since 1900 the business of the federal courts has almost quadrupled while the number of federal judges has little more than doubled; state courts seem to be similarly understaffed. Moreover, the cases coming before courts today are often more complex than those heard at the turn of the century. One only has to recall some of the recent antitrust litigation or the involved medical testimony in an automobile accident case to see the complicated questions which our courts are called on to resolve.

Looking to the future, it is certain that the load of our courts will continue to grow at a rapid rate. Current thinking on such matters as labor-management relations, civil rights, and related problems can only result in increased litigation, while on the national scene, Congress continues to add to the load of the federal courts as it passes new legislation. One of the more recent examples of this tendency is the Labor-Management Reporting and Disclosure Act of 1959 which, through Section 102, will probably bring many more cases before the federal district courts. The exploding birth rate and our continuing economic development as well as the spectacular advances in technology all point to an increased case-load for the judiciary. Add to this list problems world-wide in their scope which result from our position as the economic and military leader of the free world and the reader can imagine the weight of the work-load facing all levels of the American judiciary today.

THE CURRENT SHORTAGE OF JUDGES

The Chief Justice of the United States, the Honorable Earl A. Warren, described the current situation in the federal system in these words:

There is an immediate and most pressing need for additional judges. No new judgeships have been authorized for more than five years and, indeed, during that period we have lost three positions as a result of the expiration of judgeships created on a temporary basis. The last Congress had before it recommendations by the Judicial Conference for forty-five additional judgeships, many of which were contained in the Omnibus [Judgeship] Bill introduced as long ago as 1955.

This year, again, the Judicial Conference has recommended forty-three additional judgeships. These are not just requests from localities for more judges. They are recommendations of the Judicial Conference of the United States based upon serious study of statistics and conditions facing particular districts and circuits for which the additional judges have been recommended.

I regret to report that this legislation—so vital to the administration of justice in the Federal courts—has still not received the consideration of Congress.

In many places, this failure is throwing a burden on judges which they are not able to bear. If it were not for many of the retired judges who continue to serve so faithfully, we would, indeed, be in a terrible condition.¹

This then is the situation confronting the American judicial system.

Several remedies have been proposed. The most obvious of course is the creation of additional judgeships, as proposed in the omnibus judgeship bill. Of equal importance is the elimination of excessive delay in the nomination and the confirmation of new appointees. A

¹ Earl A. Warren, Chief Justice, Address before the American Law Institute, April 1959 Session.

recent report of the Administrative Office of the United States Courts states that the manpower lost in the federal courts because of these delays was the equivalent of the service rendered by approximately seventeen judges. Warren Olney, III, director of this office, states that last year approximately eleven years and ten months of judge-time were lost in the interval between the occurrence of a vacancy and the nomination to fill it. Five years and two months were lost from nomination to confirmation. The fact that this delay continues regardless of the party in power demonstrates that it may not be attributed to any political party's administration. The elaboration of a more efficient system of appointment would increase our judicial manpower without an actual increase in authorized judgeships.

A third remedy lies in the more efficient utilization of our existing judicial manpower. The absolute need for focusing attention on this measure is quite evident from the situations outlined above. This third remedy will be our major point of interest during the remaining portion of this chapter. This emphasis on the utilization of judicial manpower in no way reflects a lack of concern for the shortage of judges, nor should it be inferred from this chapter that fuller utilization of our judicial resources would be a complete substitute for the new personnel so urgently needed. In reality, improvement must be sought in both areas if the American courts are to operate without the pressure of excessive backlogs.

Judicial manpower is a rare and unique resource and should be treated as such. It is the result of intensive training, extensive learning, and introspective thinking. To waste it or to permit it to be wasted is as unthinkable as to squander any other unusual talent. On the following pages we shall con-

sider (1) methods of ensuring that this training will be at the disposal of the judicial system for the longest practical period of time during the year, and (2) those measures which will ensure that while it is at the disposal of the judicial system, it is neither squandered nor used inadvisedly.

LENGTH OF THE JUDICIAL TERM

Our first consideration is the length of the judicial term, or in other words, the number of days worked per year. A thorough study of hours worked by judges is to be found in *Delay in the Court*, by Messrs. Hans Zeisel, Harry Kalven, Jr., and Bernard Buchholz of the University of Chicago. Those portions of this chapter dealing with the New York and New Jersey courts rely heavily on their research. In the Supreme Court of New York County the sessions of the trial branches of the court commence after Labor Day and ordinarily terminate at the end of June. In 1957 there were 207 official trial days, after subtracting official holidays; this figure fell to 196 if one considered semiofficial court holidays.² The average number of trial days per judge was approximately 170 days for an over-all loss of potential trial time of 26.2 court days, or approximately 13.4 per cent of the total trial days available. The authors of *Delay in the Court* noted in passing that 36.1 per cent of the loss fell on Fridays.

The reasons for the loss of trial time are multiple. It would be erroneous to conclude that this loss could be eliminated completely. In some cases, religious holidays were involved while in other instances illnesses were a factor. In still other instances it might have been that there were no other cases ready to be heard. In any event the

² Zeisel, Kalven, and Buchholz, *Delay in the Court* (Boston: Little, Brown and Company, 1959), p. 173 et seq.

loss represents a significant amount of unused judicial manpower.

In neighboring New Jersey, the same authors found that the judges of that state average 14 more trial days per term than their brethren in New York.³ This represents an 8.2 per cent increase in the number of trial days per year.

Statistics furnished by the Honorable Louis H. Burke, presiding Judge of the Superior Court of Los Angeles County,⁴ indicate that the average judge of that court takes a vacation of approximately one calendar month, or 21 court days per year. Time off for illness averages about 6 days per year.

Since both the judiciary of New Jersey and the Superior Court of Los Angeles County are under close managerial supervision and judges are required to file time sheets, it would appear that this requirement is one of the most effective means of reducing the loss of trial days.

In the past, the New York court has tried a different approach: it has increased the number of trial days per year by establishing a summer session. In 1956 the summer session consisted of one calendar part and five trial parts, staffed by various members of the bench who worked two weeks more than the normal term. As a result of this effort, the backlog was reduced by 134 cases, or about one seventh of its total. Stated in other terms, they accomplished the equivalent of about 1.5 judge-years. The summer session was repeated on a reduced basis in 1957 but has not been employed since. This interesting experiment warrants further study and consideration by those interested in the fuller utilization of judicial manpower during the calendar year.

³ *Ibid.*, p. 177.

⁴ L. Burke, "Problems of Court Administration in a Metropolitan Court." Address before the National Conference on Judicial Selection and Court Administration, Edgewater Beach Hotel, Chicago, Illinois, November 23, 1959.

LENGTH OF THE TRIAL DAY

Let us now turn and consider the length of the judicial day. The authors of the New York study to which we have already referred found that the average New York court day, in those divisions under study, was 4.1 hours.⁵

This figure must be used with caution. It was derived from the records maintained by the courts' clerks of the number of hours required for the disposition of each case. The sum of the hours so recorded would be the total judge-hours per year. This figure when divided by the number of days worked gives the average number of hours per day. It must be remembered that this figure represents only the number of hours devoted to the disposition of cases and does not reflect time spent in chambers or in dealing with such administrative matters as might require attention.

It should be noted immediately that in many cases the 4.1-hour court day is determined by factors other than those under the control of the individual judge. For example, the termination of one case late in the day when another cannot be brought on for trial often causes a time loss of this type.

Since the average trial day is of less than a five-hour duration, it is easy to see the important results that could be achieved through lengthening the day by only thirty minutes. Although this might be accomplished by lengthening the duration of the judge's presence at court, it might also be accomplished through the process of freeing the judge of administrative details on which he may have to spend thirty minutes per day. One extra half-hour per day would permit the average judge to perform the equivalent of 20.7 more judge-days per year. Thus, he would have 12 per cent more judicial time at his disposal each

⁵ Zeisel, Kalven and Buchholz, *op. cit.*, p. 181.

year without lengthening the court term or resorting to summer sessions.⁶

There are basically two methods of securing this extra thirty minutes per day: (1) By freeing the judge of unnecessary administrative duties outside the court; and (2) by making certain that as rapidly as one case is terminated, the next is ready to be heard. We shall discuss both of these remedies in that order.

NONJUDICIAL ASSISTANTS

Initially, of course, there must be established a clear distinction between those duties calling for the use of judicial personnel and those which might be performed just as adequately by clerical or other nonjudicial employees. This principle is a bit more difficult of application than it might seem. Certainly the routine clerical matters are properly within the domain of the clerical personnel, and in most cases this principle is already applied. However, there are certain administrative functions which clearly require a decision by a judge and it would be unfortunate if, in our desire to free him from his administrative obligations, we strip him of the administrative authority necessary to accomplish his task.

The Superior Court of Los Angeles County has developed an interesting system of administration which gives due consideration to this dichotomy. The court has an administrative officer, who, subject to the approval of the presiding judge, is responsible for the appointment, management and discharge of all personnel, other than the commissioners who

⁶ Judge Burke, *op. cit.*, stated that judges of the Superior Court of Los Angeles County begin work at 9:00 A.M. and, with one short recess, continue until noon. Court reconvenes at 1:30 or 1:45 P.M. and adjourns at 4:00 or 4:15 P.M. A recent increase of one-half-hour trial time per day, included in the above figures, was the equivalent of adding five or six full-time judges to the court.

are directly appointed by the court. In addition, the administrator is directly responsible for the problems of recruitment, selection, and disciplinary action concerning employees, all budgetary matters, all record keeping, the gathering of statistical information, the making of special studies in the problems of administration, and the work of the jury commissioner.

On the other hand, the system recognizes that certain administrative tasks are best performed by a member of the judiciary. The Superior Court of Los Angeles County has a presiding judge who generally serves for a two-year period. His administrative responsibilities include such matters as the assignment of judges to various departments, divisions, and branches of the court and his responsibility extends to the operation of the master calendars of both the civil and criminal divisions.

Between these two fairly clearly defined areas lies an area containing questions not purely administrative but which do not necessarily warrant the close attention of a member of the bench. In Los Angeles, the call of the civil master and the hearing of motions of various kinds formerly required approximately two thirds of the time of the presiding judge. In 1958 the procedure was changed to permit a court commissioner to call the calendar and to hear the more ordinary motions such as consolidation, continuance, or change of venue. Under this system it is understood by counsel that the commissioner functions as a judge pro tempore. Should any counsel object to the procedure, he may request that the motion be heard by the presiding judge, in which case it is placed at the end of the calendar and is heard by the judge. Apparently, such requests are infrequent.

These are a few of the methods being considered by those wishing to make it possible for judges to devote more of

their time to the actual disposition of cases.

MOVING CASES TO JUDGES

As was pointed out earlier in this chapter, occasional gaps in the trial day appear with a resultant waste of the judge-time. This occurs, for example, when a case is terminated at 11:00 A.M. and it is not possible to schedule another case until 1:30 or 2:00 P.M. If this should occur several times in a month, it would have the effect of shortening trial time during that period by one judge-day.

It is frequently suggested that an even flow of cases could be attained more readily through a central assignment or master calendar system. Under this method judges do not maintain separate schedules of cases but rather each case is assigned to a central pool. When a judge disposes of one case he is immediately assigned another from the pool. Proponents of this system point out that litigants are free to have their cases heard in the first court available rather than forced to wait while the judge assigned to their case becomes involved in an unusually lengthy matter.⁷ The central assignment system is employed in Los Angeles and New Jersey as well as in several other state jurisdictions. In the criminal division of the Los Angeles Superior Court, each judge is assigned three cases a day. If at any time it should appear that for one reason or another one of the courts will

⁷ The central assignment or master calendar system has disadvantages as well as advantages. One of its most serious shortcomings is that it does not fix on each judge a personal responsibility to try a proportionate share of the court's case-load. For a very good discussion of both methods of case assignment, as well as many other problems in the field of judicial administration, see SENATE APPROPRIATIONS COMM. REP., FIELD STUDY OF THE OPERATION OF THE UNITED STATES COURTS (Washington, D. C.: United States Printing Office, April 1959), p. 22 *et seq.*

be unable to handle the three cases assigned for that date, the clerk of that court will call a member of the staff of the presiding judge to request the transfer of the excess cases for trial elsewhere. The staff member is in constant contact with all of the judges in the criminal division and usually is able to assign the excess cases to other courts for hearing that day. Through this procedure an even and steady flow is maintained through all of the judicial departments, thereby eliminating the one- or two-hour break during the judicial day.

MOVING JUDGES TO CASES

While it is apparent that in the larger courts, where many parallel departments or divisions exist, it often is fairly simple to transfer a matter from one division to another, the problem is not so readily resolved where great distances separate parallel courts in the same system. The problem is particularly acute on the federal level. Statistics for 1958 indicate that of the ninety-four federal district courts there were twenty-seven districts with less than one hundred private civil cases filed per judge, while twenty-two districts reported more than two hundred such cases filed per judge. The national average was one hundred sixty-seven.

Obviously in these circumstances the cases cannot seek out the judge but rather the judge must be transferred where the actions are commenced. Of course, there are often delays between the time when the need develops and the time when the transfer is finally made. A major factor restricting the wider use of transfers on the federal level has been the inadequate judicial expense allowance. Effective August 7, 1959, this allowance was increased from \$15 to \$25 per day.⁸

⁸ Pub. L. No. 138, 86th Cong., 1st Sess. (Aug. 7, 1959).

It would appear that similar situations of imbalance exist in the state court systems. According to figures compiled by the administrative assistant to the Supreme Court of Ohio, the 157 common pleas judges of that state have an average of 573 filings per judge. While forty-seven judges average only 275 filings per year, 17 judges, at the other extreme, average 695, with at least 760 dispositions per judge per year. One could conclude that the placing of all common pleas judges under the administrative control of the state's Chief Justice, who would have full power of assignment, would permit a more proportionate distribution of the work-load and at the same time provide for a fuller utilization of the judicial resources of the state. The reassignment order should be binding on the reassigned judge, not dependent on his personal wishes or desires. Clearly the lack of power to enforce assignments seriously handicaps the administration of the court system.

Certainly no article on the full use of our judicial manpower would be complete without reference to the unselfish services rendered by retired members of the judiciary who are recalled to alleviate a temporary shortage of judges. In 1958 there were four assignments of two retired Associate Justices of the Supreme Court to the Court of Claims; two assignments of a retired judge of the Court of Customs and Patent Appeals to the District of Columbia Circuit; and one assignment of a district judge of the Ninth Circuit to the Sixth Circuit Court of Appeals.

FULLER USE OF COURT TIME

We have until now concerned ourselves with methods designed to increase the number of judicial hours spent in court. It is also important to consider ways of assuring that the time spent by a judge in court will be devoted as much

as possible to those problems which require his attention. We will not consider in detail the various recommendations made by the many commentators concerned with this problem, for they are thoroughly discussed in other chapters of this publication. In brief, however, one may note that there is a growing tendency to reserve the use of judicial manpower to those matters which require the decision of a judge. The Pennsylvania arbitration system, which affects all civil suits where the value claimed is under \$1,000, demonstrates a desire manifested in some quarters to substitute arbitration panels where it is felt that substantial justice might be rendered without resort to the courts.

At least equally important is the growing use of the pre-trial hearing wherein the attorneys involved in a case meet with the judge, agree to proper stipulations and provide for the marking of evidence so that the case, once in court, will be tried more quickly. This measure is designed to reserve the use of the judge's in-court-time for the central issues of the case.

Although it has not been the subject of extensive comment, it would appear that additional trial time could be saved through the enlightened assistance of the judge's court aids. As has been pointed out by Judge A. Sherman Christenson, Judge of the United States District Court for the District of Utah, often the service of marshals or bailiffs is not fully utilized by the courts. The bailiff is expected only to maintain order, but he could just as well be entrusted with routine responsibilities which speed the trial. In the words of Judge Christenson:

His function may be more than to open court and then to sit and, perhaps, doze until time for recess, unless aroused by some unusual noise. It has been found helpful for him, as each prospective juror

takes his seat in the box, to call out the number of the juror corresponding to his seat for the benefit of court and counsel and to make sure that the seating is in that order. He well may escort each witness to the clerk's desk for swearing and direct him to face the clerk and raise his right hand; indicate that the witness take his place in the witness chair, and assist him, if necessary. We take much for granted, but the ordinary witness is acting an uneasy role on a strange stage.⁹

These then are the various methods by which our resources of judicial man-

⁹ A. S. Christenson, *Shortening Trials Without Sacrificing Essentials and Efficiency*, 9 OKLA. L. REV. 365, 367.

power may be conserved and at the same time utilized more effectively. We have considered ways of augmenting the number of hours at the judge's disposal, of limiting his nonjudicial responsibilities, and of assuring that he will be called on only for those matters which require the application of his judicial talent. Lastly, we have seen some of the methods by which the trial itself may be made a bit more efficient.

Truly, the full utilization of our existing judicial manpower is as important as is the creation of new judgeships. Both are key factors in any plan to alleviate the current congestion of our courts.

The Bar, The Court, and The Delay

By HARRY KALVEN, JR.

ABSTRACT: The trial bar has often been made the whipping boy for the court congestion problem. The trial bar is often blamed for contributing to the congestion of the courts by providing an insufficient number of trial lawyers and by deliberate delay tactics. An investigation of these charges reveals that while much civil trial work is indeed concentrated in a few law offices, this concentration is not big enough to cause congestion, if trial schedules are well laid out and adhered to. Nor need delaying tactics, while then affecting the individual case, increase congestion. If the courts assume a sufficiently firm policy of scheduling and refusals of last minute delays, the trial bar will be forced to respond by enlarging its ranks.

*Harry Kalven, Jr., LL.B., Chicago, Illinois, is Professor of Law at the University of Chicago, and for several years has been directing, in collaboration with Hans Zeisel and Fred Stradtbeck, its large scale study of the American jury system. He is the author with Walter Blum of *The Uneasy Case for Progressive Taxation* (1953); with Hans Zeisel and Bernard Buchholz of *Delay in the Court* (1959); and with Charles Gregory of *Cases and Materials in Torts* (1959).*

THE problem of court congestion is frequently approached from a misleading perspective. The approach is in terms of causes rather than remedies and it may prove misleading for at least two reasons. First, since delay comes gradually into any court system, the actual causes are likely to be buried in a history which is difficult to recapture. To write a sound history of the emergence of court congestion is almost certain to be more difficult than to remove the congestion. Second, the quest for causes is likely to be a quest for someone, or something to blame. And this proves to be a fruitless and divisive quest since there is no villain in the backlog. Perhaps no facet of the problem illustrates this view more vividly than do current complaints about the role of the trial lawyer. And the bar, always acutely and ineffectively worried about its public image, finds itself in congested urban centers with a serious public relations problem.

If, then, lawyers were to act or feel differently, or there were more of them, would there be less court congestion? A jumble of points are revealed when the bar's role in congestion is considered and we shall attempt briefly to sort them out and assess them.¹ As a matter of convenience the discussion will be divided loosely into two parts: first, a consideration of a variety of possible connections between the bar and delay which generally tend to evaporate on analysis; and second, a look at the one rather serious challenge to the bar—the consequences for court delay of the alleged small monopoly of trial lawyers.

THE BAR'S DILATORY STRATEGY

We begin with delay as a tactic. It is part of the popular image of the lawyer

¹ This article draws heavily upon the data and analysis in H. Zeisel, H. Kalven, Jr., and B. Buchholz, *Delay in the Court* (Boston: Little, Brown and Co., 1959), and particularly that in Chapter 17.

that he can exploit the red tape of legal procedure and, if he really wants to, to continue a case in court almost indefinitely. The tension between the desire for expediting the disposition of controversies on the one hand and the desire for full and fair examination of all sides of the controversy on the other is an old story in the development of procedure. The difference between seeing the law in terms of procedural safeguards or red tape may very well be determined by which side of the case one is on. But there is no doubt that dilatory strategy is possible and is used. The question is, what significance does it have for court congestion?

The answer is, I think, that it has very little significance. At the threshold there is the distinction between delay which affects only the particular case and delay which affects the system and hence all cases. What we mean primarily by the problem of court congestion is the problem of "system" delay, such that even though the parties are ready and anxious to try their case the court system cannot accommodate them promptly because there are other controversies waiting ahead of them for the court's time. The essential point is that continuances of the particular case will not affect other cases unless they serve to interrupt the continuous flow of trials and thus create gaps in the trial schedule of the court. If they create gaps they result in a waste of the court's most valuable resource, its own trial manpower, and the system as a whole suffers. But if there is no gap, the continuance raises issues only between the parties to that case; and, in fact, the cases waiting behind it to be tried are the beneficiaries of a small advancement to trial.² We know of no basis for con-

² The analogy to a group of people waiting in line to buy tickets may be helpful. If the continuance does not interrupt the flow of the line, its only effect is to remove one person and thus to improve *pro tanto* the position of

cluding that continuances which are the product of dilatory strategy loom large enough in any court to add appreciably to its delay by causing gaps in the trial schedule.³

We are left then with the impact of such tactics on the parties and the particular case. Admittedly there is some problem here, but it is not a new one and it can occur about as readily in a court system that is current as it can in one that is delayed.⁴ There is a legend that a leader of the New York bar began practice with the following motto on his wall: "If I am plaintiff nothing can stop me. If I am defendant nothing can move me." It is an apt reminder not only of the stake the lawyer has in timing but also of the safeguard that the adversary system, under the scrutiny of the trial judge,⁵ provides against serious abuse.

The bar and settlement

Another cluster of points concerns the trial bar's relation to settlement in a congested court. The first complaint is one frequently voiced by judges and plaintiff lawyers and it carries an air of hard-boiled insight into the crude facts

those waiting behind him. See Zeisel, Kalven and Buchholz, *op. cit.*, pp. 53, 193. It can thus be argued that a delayed court might well follow a liberal policy in granting continuances so long as both parties are agreeable. But judges have expressed concern whether such continuances may not be more in the interest of the lawyer than in the interest of his client. *Ibid.*, pp. 53-54.

³ The probable magnitude of scheduling gaps created by factors due to the lawyer in contrast to the judge is examined further in the discussion of the concentration of the trial bar, *infra*. The Bar's Concentrated Case-load.

⁴ Any system is likely to show some "overage" cases pending on its calendar, reflecting voluntary or half-voluntary adjournments. The court's statistics should be adjusted so as not to charge these cases against the court's efficiency. *Ibid.*, pp. 52-3.

⁵ The powers of the court to compel the case to proceed to trial are discussed *infra*. The Bar's Concentrated Case-load.

of legal life. It concerns the per diem arrangements under which some defendant counsel are paid by their institutional clients. One puzzling group of cases in any delayed court are those which start trial but are settled prior to verdict. Since in the end they do turn out to be amenable to settlement, it is tantalizing to speculate on what might have been done to move up their time of settlement so as to dispose of them without the necessity of using precious court trial time.⁶ The reason for these cases surviving to trial and only then yielding to settlement pressures are various, and an intensive study of this block of settlements would be most worthwhile. Our immediate point is that the per diem arrangement is said to provide one stimulus for defense counsel to delay settlement until they can be paid for a day of trial work. It is difficult to know how much there is to the point. The large institutional defendants deny it and argue with force that their scrutiny of settlement would disclose lawyers who were "feather bedding" this way. In any event in terms of the many forces contributing to delay this factor at worst cannot be a major one. But to whatever extent the bar does delay settlements on this ground it does add a cost to the whole system, and it engages in an unseemly practice.

A second point about the bar, the settlement process, and delay is one not frequently noted. A striking statistic for a delayed court is what we have called the attrition curve which plots the per cent of cases which remain on the calendar after any given number of months. At time zero all 100 per cent are on the calendar and they are gradually disposed of until none remain. Such a curve makes it obvious that in

⁶ For the New York court, for example, some 14 per cent of the cases were settled after trial had begun and required 31 per cent of the total court time. *Ibid.*, pp. 38-41, 107.

a delayed court the delay suffered by those cases which are disposed of prior to trial is substantially less on the average than for those which require trial and that for a considerable fraction it is dramatically less.⁷ The point then is that even in a delayed court there is considerable variation in the time at which cases destined ultimately for settlement are settled. And these constitute of course the majority of cases. What then is the bar's responsibility for accelerating the date of settlement of the case which will ultimately be settled? Certainly more prompt settlement of "setttable" cases would do much to soften the social hardships of delay. Without more detailed study of the whole settlement process we can do little more than raise the question. In a delayed court there are just a few occasions prior to trial when settlement is actively pursued; otherwise, the file lies dormant and there may be bargaining disadvantages in initiating another discussion. It is an important advantage both of pre-trial and of the New York certificate of readiness procedure that they create neutral occasions for renewing attention to the case and thus improve the chance of its being settled then rather than later, if it is destined for settlement. It may be that here, in the vast domain of cases destined for settlement, the lawyer has the most freedom to do something about the hardships of delay.

The bar's obligation

There is one further point about the lawyer and settlement. The basic fact about the economics of a congested calendar is that a case which is settled prior

⁷ Such an attrition curve is given for the New York court in Table 18, *Ibid.* Thus, at a time when the average age of all trial dispositions was thirty months, the average age of all dispositions of suits filed was twenty-one months and slightly over 40 per cent of all cases were disposed of within twelve months.

to trial takes only a small fraction of the time required to dispose of it through trial.⁸ Does the lawyer in a seriously delayed court system have any obligation to society to consider the general advantage if he were to yield a little and settle without trial? Does he have any obligation to weigh society's interest along with those of his client on the delicate scales he must use in deciding when to settle? Only for a moment does the affirmative answer have appeal. Even in a delayed court the lawyer on either side is entitled to—and is derelict if he does not—judge settlement solely in terms of the merits of his client's cause. Anything short of this exacts a subsidy from his client on behalf of a congested court. It is not the least of the evils of delay that it tends to foster the notion that settlement is always preferable to adjudication of a controversy. The bar undoubtedly has many obligations to assist in efforts to remove delay but among them is not an obligation to deny the propriety of litigation itself as a solution to controversy.

The bar's benefit

Another line of complaint goes to the bar's political role with respect to court delay. The point bluntly stated is that the bar in a delayed court system likes it that way. And the corollary is that without the momentum of the bar no serious reform of judicial administration will come about. The charge is not that the bar causes the delay but that it exploits it. What are the advantages for the trial lawyer in a delayed court?

The impact of a long waiting period⁹

⁸ Again using the New York figures as an example, only 15 per cent of the cases were tried through to verdict but required 53 per cent of the court's total time; and the 71 per cent of the cases which were settled prior to the start of trial took only 16 per cent of the court's time. Table 13, *Ibid.*

⁹ It is of course widely recognized that some waiting period is desirable to permit the case

on the preservation of evidence probably tends, on the average, to be offset between plaintiffs and defendants. And so in all likelihood does its impact on the evaluation of factual ambiguities such as whether a plaintiff is permanently disabled. But the impact on the bargaining and settlement position of the litigants, particularly in the all-important personal injury cases, may be quite another matter. "In almost every law suit," Justice Vanderbilt has written, "there is at least one party, generally the defendant, who is whole heartedly in favor of the law's delay."¹⁰ And the reason is not hard to find. The injured plaintiff is less able to endure the attrition of court delay than is the institutional defendant. In a delayed court the cases which are settled will be settled for less.¹¹ In fact it is just one more instance of the secondary evils flowing from calendar congestion that it tends to imbalance the justice of the settlement process.

Further this softening of claimants is not fully offset by the disadvantage that delay must then have for plaintiff counsel, for it permits them to build up a backlog of cases and thus a backlog of income as security for future years. On the other hand the institutional defendants argue that it is a diseconomy for them to have to keep open so long the contingent reserve set up for a claim; and plaintiff counsel argue that it is a burden on them to have to keep plaintiff's file open for so long, to have to

and the evidence to jell. Most estimates of such a minimum fall between six and ten months. *Ibid.*, pp. 51-52.

¹⁰ Arthur T. Vanderbilt, *The Challenge of Law Reform* (Princeton, N. J.: Princeton University Press, 1955), p. 77.

¹¹ Nevertheless unless the delay is extreme, it is doubtful that it affects the frequency as contrasted to the price of settlement. Hence the removal of delay will not in general tend to adversely affect the settlement ratio. Zeisel, Kalven and Buchholz, *Delay in the Court* (Boston: Little, Brown and Co., 1959), Ch. 10.

keep talking with him, comforting him, and so on.

Whatever the net balance of advantage and disadvantage to the lawyer and his client,¹² in the end, I think, the point tends to divert attention from more fruitful concerns. For at best it reminds us that court congestion is a curiously anemic public issue and that it creates no natural pressure groups. It may well be that more would be done about removing delay if the bar were goaded by its own self-interest to get rid of it. But in this sense to say that the bar is responsible for delay is really no more compelling than to assert it is responsible for juvenile delinquency or air pollution.

THE BAR'S CONCENTRATED CASE-LOAD

The points thus far examined do not in our view establish much of a case against the bar. There remains the point arising not from any conscious fostering or exploiting or tolerating of delay by the bar but from the economic concentration of trial lawyers. Is the scarcity of trial lawyers a significant factor in producing delay?

The popular version is that there may be enough judicial manpower but not enough trial lawyer manpower for the work-load at hand with the result that the courts from time to time stand empty waiting for the lawyers. If there were an extreme shortage of trial lawyers there is no doubt it would become a major bottleneck. If, for example, in a metropolitan court there were only five plaintiff and five defendant lawyers available, the limits of usable judicial manpower would literally be set by the number of cases these ten lawyers could

¹² In a court with substantial delay and a generous preference policy undoubtedly the impact of delay on the individual lawyer is further lessened since he is likely to have some power and freedom to get his important cases preferred for trial.

TABLE 1—CONCENTRATION OF PENDING CASES BY SIZE OF FIRM
(Attorney of Record)

FIRMS WITH CASES PENDING	REPRESENTING PLAINTIFF		REPRESENTING DEFENDANT	
	PER CENT OF FIRMS	HANDLE PER CENT OF CASES	PER CENT OF FIRMS	HANDLE PER CENT OF CASES
Over 1,000 cases			2.0	34.3
Over 500 cases	0.4	10.2	6.7	62.9
Over 100 cases	6.9	51.0	20.7	91.3
Over 20 cases	30.1	86.6	35.5	98.1

try in a year. Less drastic, and more plausible, assumptions will still yield a genuine problem however. If there are a small number of trial lawyers who have a large number of cases so that they frequently have conflicting trial commitments which require continuances, and if the granting of the continuances causes gaps in the trial schedule, then the concentration of the bar will have a genuine impact on delay.¹³ It is evident that the thesis involves several points of fact and we shall consider them in turn.

First, how great is the economic concentration of the trial bar? We have, for example, a set of figures for Chicago for 1958 showing the distribution among law firms of the jury cases pending in all state courts of unlimited civil jurisdiction. The concentration is striking. On the plaintiff side 6.9 per cent of the firms handle 51 per cent of all cases, and 6.7 per cent of the defendant firms have 62.9 per cent of the cases. A few plaintiff firms have over 500 cases pending and some 2 per cent of the defendant firms have over 1,000 cases pending.

Such economic concentration may be significant for a variety of reasons; it may invite inquiry as to how law business is recruited; it may suggest possibilities of "block" settlements of a num-

¹³ One of the most effective statements of the thesis ever made is that by Judge Ulysses S. Schwartz in *Gray v. Gray*, 61 Ill. App. 2d 571, 576, 128 N.E. 2d 602, 604-605 (1955).

ber of cases at one time; and it may indicate that there is a problem about the speed of settlement of those cases which are settled before trial. But whatever its significance for such issues, tracing its impact on court delay requires further analysis.

The bar's schedule-gaps

As we have already noted the economic concentration can affect court congestion only if it results in gaps in the trial schedule. Unfortunately only a detailed hourly time record for each trial part would show how frequently a scheduling gap results from conflicting lawyer dates, and such records are almost nowhere available.¹⁴ Judges often do mention this but because the gap appears to the judge a visible and irritating reason for delay, its frequency is likely to be exaggerated.

We can, however, approach the matter somewhat less directly. We were able for the New York Supreme Court to determine the degree to which the

¹⁴ For the New York court it was possible to set a rough outside limit. Taking New Jersey as a model yardstick we found that New York judges over a year worked 19 per cent less time on the trial bench. This relative loss of trial hours included however in addition to scheduling gaps other factors such as illness. Hence we concluded that for New York the maximum loss of judge time which the concentration of the trial bar could be causing was well under 19 per cent. Zeisel, Kalven and Buchholz, *Delay in the Court* (Boston: Little, Brown and Co., 1959), pp. 193-94.

trial of law cases in the court is actually concentrated. Table 2 shows the number of plaintiff lawyers who had personal injury cases reaching assignment during the five-month period from March through September 1957.

Table 2 indicates that the busiest 1 per cent of the plaintiff lawyers had 6.4 per cent of the cases, and that each lawyer in that group appeared on the average 2.1 times per month in the court during the observed period of five court months. The busiest 5 per cent which include the busiest 1 per cent tried 22.5 of the cases and appeared on the average of 1.6 times per month, and so forth. The concentration among defense counsel is, as would be expected, somewhat greater.¹⁵

Such figures then indicate that there is serious concentration of actual trial work. Some 10 per cent of the active bar handles 35 per cent of all trials. Yet the concentration falls well short of taxing the physical capacity of even the busiest lawyers. At its very peak it is 4.3 appearances per month for defense counsel and 2.1 appearances per month for plaintiff counsel; and for the busiest 10 per cent the average appearances per month are 2.1 and 1.2, respectively.

On this perspective the problem may seem to have evaporated. But a qualification must be added to explain why

¹⁵ See Table 83, *Ibid.*

the concentration of the bar is nevertheless a problem.¹⁶ What matters in the end is not the *average* ratio of lawyers to cases but rather the *chances* of conflicting trial commitments if cases are assigned to trial in a random sequence. The important fact here is that even a relatively low ratio of lawyers to cases can imply a very great chance of conflicting dates. Perhaps the simplest way to illustrate this is by recourse to an instructive statistical anecdote. If there are twenty-four people at a dinner party, what are the odds that at least two of them will have identical birthdays? Although there are 365 days to choose from, the odds surprisingly are better than even. The underlying theorem applies equally to the odds that a lawyer who averages two appearances per month, or four for the busiest defense attorneys, will run into a conflict of trial schedules. When the selection of trial dates is made without regard to a lawyer's previous commitments, the odds are several thousands to one that some conflicts will arise. Hence although the figures will vary from one

¹⁶ For the New York court there is an additional qualification. Our figures referred to only one of several courts which draw upon the bar in the metropolitan New York area, and there is reason to believe it was more successful than the courts with which it was competing in getting and holding busy trial lawyers. *Ibid.*, pp. 196-97.

TABLE 2—CONCENTRATION OF PLAINTIFF LAWYERS* IN PERSONAL INJURY TRIALS
IN THE NEW YORK COURT

CUMULATIVE PER CENT OF COUNSEL	NUMBER OF LAWYERS IN EACH GROUP	APPEARANCES IN COURT OVER 5-MONTH PERIOD		AVERAGE NUMBER OF APPEARANCES PER MONTH PER COUNSEL IN THIS GROUP
		(PER CENT)	(NUMBER)	
Busiest 1%	3	6.4	31	2.1
Busiest 5%	14	22.5	109	1.6
Busiest 10%	28	34.6	168	1.2
Remaining 90%	258	65.4	318	0.2
Total 100%	286	100.0	486	0.3

* This Table, unlike Table 1, refers to the individual lawyers who actually tried the case, irrespective of what firm they belonged to.

urban center to another, we can readily conclude that there is enough concentration to multiply greatly the danger of conflicts even though there is enough trial-bar manpower to try all cases without conflict on an ideally planned schedule.

Proposed remedies

In so far then as concentration of the bar is a factor contributing to delay, what remedies are available? A court might of course attempt to limit by direct rule the number of cases a given lawyer or law firm is permitted to handle. But this would seem a clumsy and impolitic solution.¹⁷ In any event two alternatives deserve serious consideration. First, changes in scheduling procedures might considerably reduce the chance of a gap. Although the practical details might prove troublesome, the essential point is simply that in scheduling the court recognize the concentration as a fact of life and seek to accommodate it, remembering that the existing conflicts arise because of random assignment as well as scarcity of lawyers.¹⁸

But ultimately the court has the power to compel lawyers to go to trial and thus to force them, if necessary, to turn some of their cases over to other lawyers or to add additional trial personnel to their own firm. In *Gray v. Gray*, the Illinois Appellate Court squarely faced the trial court's power to

¹⁷ Somewhat less directly the court may differentiate in granting continuances between counsel in terms of the number of cases they have pending. Thus the District of Columbia requires that no lawyer without the consent of his opponent may secure a postponement on the grounds of an engagement elsewhere if he is counsel of record in more than twenty-five cases in the court. See the remarks of Judge Laws, Attorney-General's Conference, 1956, pp. 37, 140.

¹⁸ See, for example, the interesting scheme reported by Judge Evans of the Bronx City Court in *Calendar Congestion—A New Approach*, 26 N. Y. S. B. Bull. 368 (1954).

deny a continuance when counsel for one of the parties is engaged elsewhere. The plaintiff had filed a complaint for divorce and the case was originally assigned for trial on October 29, 1954. Then, over the objection of opposing counsel, the case was continued four times on account of engagements of plaintiff's counsel and finally November 22 was set for the trial date. On that day the trial judge denied a motion for further continuance, sought on the ground that plaintiff's counsel was still active elsewhere, and ordered the case to go to trial. Counsel who had appeared on behalf of plaintiff's counsel to request the continuance refused to proceed on the ground that he was not prepared to try the case and the court thereupon dismissed the plaintiff's complaint for lack of prosecution. On appeal, the Illinois Appellate Court vigorously affirmed the power of the trial judge to take such action, saying it was the duty of the trial judge to do precisely what he had done.¹⁹ To the plain-

¹⁹ The English practice is in accord. I am much indebted to Professor J. A. Jolowicz of Trinity College, Cambridge, for the following comment in a recent letter to me: "It may interest you to know that the line taken in *Gray v. Gray* represents the general practice in this country. Counsel's convenience, as we call it, is never accepted as a reason for adjournment in the ordinary way, unless the barrister's other case happens to be in the House of Lords. Of course, sometimes the real excuse for an adjournment is that counsel is engaged elsewhere, but this is never the stated reason. One occasion I happened to be in court when a very young pupil sought an adjournment of one of his master's cases and simply said that his master was engaged elsewhere. The judge's reply was, 'Wrap it up a bit, Mr. Jones.'

"Of course it happens with us too that a member of the Bar may be required in two places at once, but the general rule is that he must return the brief in one of the cases, and he is supposed to do this as soon as the likelihood of a clash becomes evident. The English rule—one of etiquette alone—is put as follows in Boulton's *Conduct and Etiquette at the Bar*, p. 18:

tiff's argument that she had a constitutional right to select her own attorney and be represented by him in the trial of her case, Judge Ulysses Schwartz observed in a passage which merits quoting at length:²⁰

It is wrong in theory, in its premise, and in its conclusion. There is no constitutional, statutory or other provision which gives a party the right to choose a particular lawyer, without regard to whether that lawyer has the time to try the case or not. Such a doctrine would have results that would be disastrous. We cannot assume

'Briefs are as a rule delivered and accepted on the understanding that it is possible that a counsel may be prevented from attending the case. It is a paramount duty of a barrister not to embarrass his client and to allow sufficient time for another counsel to be engaged and to master the brief. A barrister is under a duty to give warning to his instructing solicitor as soon as there is any appreciable danger that he may not be able to attend to a brief and to return the brief if required. Only in the most exceptional cases should a brief for the defense of a person charged with a capital offense be returned when once accepted, and then only if sufficient time remains for another counsel to master the case.

'If counsel is instructed in a civil case which clashes with the defense of a prisoner in a criminal case, then he must return the brief in the civil case.'

"Of course it is sometimes the case that a barrister hangs on to two briefs too long, and then the result is that one of his cases will have to be handled by someone who has had little time to prepare, but at least our system does ensure that the engagements of counsel do little to cause delay. There is no reason why a firm of solicitors should not have several cases in court at the same time, each with different barristers, and it may be that there is here one of the advantages of a divided profession."

²⁰ 6 Ill. App. 2d 571, 580-81, 128 N.E. 2d 602, 606-7 (1955).

that there is only one lawyer who can properly represent the plaintiff in this divorce case. There are 11,000 lawyers in Cook County. The attorney for plaintiff is an able lawyer, well-known to the members of this court. His ability has attracted a large clientele. However, in times like these when litigation swamps the courts, it is the duty of lawyers to cooperate in the transaction of the business of the court. Therefore, as suggested by Mr. Justice Jackson,²¹ where business is tendered a lawyer to which he does not have time to attend, he should let it go to some other lawyer.

It is the duty of our profession to train younger men to take care of the legal needs of the community. This is done on a large scale in the medical profession. It is a matter to which trial lawyers in particular should give attention. We consider a baneful practice the custom which has grown in past years of a trial lawyer appearing alone, no matter how important the case may be, on the assumption that court or jury may be impressed by the lone advocate struggling to represent his client. The lawyer who represented plaintiff is a member of a large firm. We do not know the nature of his arrangement with his associates but the trial court had the right to assume that one of them would have come to his rescue in the emergency. If he has no such arrangement and has trained no one to assist him, the responsibility is his for his client's dilemma.

²¹ The court here refers to the following passage, quoted earlier in its own opinion at 578: "When more business becomes concentrated in one firm than it can handle, it has two obvious remedies: to put on more legal help, or let some of the business go to offices which have time to attend to it. I doubt if any court should be a party to encouraging the accumulation of more business in one law office than it can attend to in due time." Justice Jackson in *Knickerbocker Printing Corp. v. United States*, 75 Sup. Ct. 212 (1954).

The Jury and the Court Delay

By HANS ZEISEL

ABSTRACT: To save court time, and thereby reduce court congestion, it has been suggested that the civil jury be abolished. But the actual amount of time that could be saved is too small to warrant by itself such a move. So basic an heritage of our judicial system should be abolished only if we considered this to be an advisable step also in a nondelayed court system. Nor do the various proposals aimed at encouraging voluntary waiver of juries hold much promise. But while the number of jury trials should not be curtailed, much can be done to shorten them, through expeditious impaneling of jurors and especially through greater control of court proceedings by the judge. An innovation which promises considerable savings is to separate liability and damages in the jury trial and to try damages only if the jury finds liability. But whatever means are proposed to reduce court congestion and delay, none should be accepted unless it preserves the best in our legal system.—Ed.

*Hans Zeisel, Dr. jur., Dr. rer. pol., Chicago, Illinois, is Professor of Law and Sociology at the University of Chicago Law School where, together with Professor Harry Kalven, Jr. and others, he is engaged in the study of the American jury. Dr. Zeisel, prior to 1938, was a practicing member of the Vienna Bar. In this country, while holding a variety of posts as research director with business corporations, he was a lecturer in sociology at the Graduate Faculty of Columbia and the New School for Social Research. The first of the volumes projected to emerge from the American jury project, *Delay in the Court*, has appeared recently. He is also the author of *Say It With Figures* (1947, 1957) and co-author of *Marienthal* (1953, 1960).*

At a time when court congestion has become a local calamity and a national scandal, proposals for abolishing the jury in all personal injury cases or all negligence cases do not come as a surprise.¹ But such a move would cut so deeply into our legal tradition that it merits careful scrutiny.

ABOLITION OF THE CIVIL JURY

Since these proposals are made with the primary purpose of saving court time, the first question requiring an answer is, just how much court time abolishment of the jury would save. We must begin, of course, with the more basic question of how much longer it takes to try a case with a jury than without one. Until recently one could hear a great range of answers, but now it has been established with some confidence that it takes about 40 per cent less time to try a personal injury case without a jury than with a jury.² To arrive at the over-all savings for a particular court this figure must be applied to the number of jury trials that would be affected by the new rule. This computation has been made for one of the country's busiest trial courts, the Supreme Court of New York County, that is of Manhattan. If the jury were abolished there for personal injury trials, the court would save the equivalent of 1.6 judges annually. This substantial economy must be gauged, however, in its

context. These 1.6 judges would be saved in a court which has altogether some 26 judges, 19 of whom sit in the law division.³

Another way of putting into proper perspective this potential gain accrued from abolishing the jury is to compare it with another suggested remedy which would bring about a comparable saving of time. If each judge in the civil law division of the New York court were to curtail his summer vacation by two weeks—an experiment the court actually made in 1956—court time equivalent to 1.5 judges per year would be saved, almost exactly the amount that would be saved by removing personal injury trials from the jury.⁴

Abolishing the jury then is, relatively speaking, a small saving. To be sure, the New York court is not typical of most other courts. The proportion of contract cases among its law trials is much greater than anywhere else, because of the concentration of commerce in Manhattan. Nearly half of the New York court's trial time is spent on commercial cases. Moreover, for reasons which will occupy us presently, the number of cases tried already without jury is unusually high in the New York court. But even if such adjustments are made for other courts, the time saving to be expected from abolishing the jury is not large enough, on our view, to justify by itself abandoning so important a tradition of our legal system.

Juries' and judges' findings

The more thoughtful advocates of abolishment of the civil jury have seen this problem. They are making their point by suggesting that the ways juries and judges decide personal injury cases are not sufficiently different to warrant continuation of the costlier mode of trial by jury. If this were true, it would be

¹ See *The Symposium: Jury Trial on Trial*, 28 N.Y.S.B. Bull. 322 (1956), especially Justice David W. Peck's paper. The proposals aim variously at the abolishment of the jury in personal injury automobile negligence or all tort trials for personal injury or property damage. Proposals to transfer automobile negligence claims from the courts to a commission (as was done with workmen compensation claims) recently gained some ground in California, where the possibility is being investigated on the governor's suggestion.

² H. Zeisel, H. Kalven, B. Buchholz, *Delay in the Court* (Boston: Little, Brown and Company, 1959), Chap. 6, esp. p. 81.

³ *Ibid.*, Chap. 7, esp. p. 83.

⁴ *Ibid.*, p. 176 ff.

a point. As matters stand, however, juries do decide cases differently, which will come as no surprise to the many trial lawyers who have such clear preferences for one or the other mode of trial.

For some 4,000 civil jury trials, in which the presiding judges told us how they would have decided the case, had they sat without a jury, we were able to determine with precision the difference in verdict between these two modes of trial. Following are a few preliminary findings from our analysis of the personal injury cases which form the bulk of civil jury trials.⁵

THE JURY'S AND THE JUDGE'S FINDINGS IN PERSONAL INJURY CASES			
JUDGE WOULD HAVE FOUND:	JURY FOUND:		
	FOR PLAINTIFF	FOR DEFENDANT	
FOR PLAINTIFF	44%	10%	54%
FOR DEFENDANT	11%	35%	46%
55% 45% (TOTAL = 100%)			

Judge and jury agree in close to 80 per cent of the cases, and their disagreement is almost balanced. The jury finds in as many cases for the plaintiff where the judge would have found for the defendant as the other way around. But the cases in which judge and jury disagree can be differentiated from those in which they agree; they are not mere random deviations, but imply

⁵ These data are drawn from the Jury Project of the University of Chicago Law School, of which Professor Harry Kalven, Jr. is the director. The project, made possible by a grant from the Ford Foundation, has been engaged in a long-range study of the American jury system. We are now in the process of writing up the research in a series of volumes to be published by Little, Brown and Company. *Delay in the Court*, the first of the volumes, appeared in 1959 and had its origin in the alleged connection between civil jury trials and court delay.

a different standard of adjudication. Moreover, judge and jury disagree markedly on the awards they make even if they agree on liability. Case for case, jury awards are on the average some 20 per cent above what the judges would have given.

Suffice it then here to state, that if we abolished the jury in civil cases, we would change not only the form of our trials but for a great many of them also the substance of the verdict. Against a balance of such far reaching consequences, the time saving must look even less compelling.

In any event, these savings are not great enough, to suggest abolishment without a thorough investigation of the jury trial on its merits. There may be reasons for abolishing the jury in personal injury trials, but the saving in judge time it would bring about cannot be the decisive argument.

VOLUNTARY JURY WAIVER

If abolishment, then, is put aside, could one not try at least to encourage voluntary reduction of jury trials through jury waiver by counsel?

Across the country the jury in personal injury trials is waived in some 20 per cent of all trials. Could this percentage be increased and thereby the time required for trying these cases reduced?⁶

The best way to begin answering this question is to see what motivates the present jury waivers. These motives fall into two groups. In the first group of cases no difference in verdict is expected if the case be tried before a judge instead of a jury:

The case hinges on a question of law, the facts are undisputed . . . Insurance on the case is limited in relation to damages: even a judge verdict would exhaust available funds . . . The damages are at best

⁶ Zeisel, Kalven, Buchholz, *op. cit.*, Chap. 8, p. 87 ff.

so small that any difference between jury and judge is negligible.

In the second group of cases the expected difference between jury and judge verdict is implicitly acknowledged, but offsetting advantages are seen.

Special preferments

Thus, if a court wanted to increase the number of jury waivers, it would have to follow either or both of these ways: put some kind of differential tax on the jury trial (or premium on the judge trial) or make the difference between them negligible. The first way is being used with some success in the New York court. There, waiver of jury trial is rewarded with special preferment. A personal injury case for which the jury is waived receives immediate trial instead of having to wait through the normal delay interval. As a result the New York court has a greater proportion of jury waivers than any major court in the country.

The main trouble, of course, is that any such device, to succeed, must move both litigants at the same time. To waive jury trial effectively consent of both sides is needed. And this is a most difficult job, because if the plaintiff sees the balance of advantages in favor of a jury trial, the defendant—provided neither side misjudges the situation—will see his advantage in a bench trial; and vice versa. The New York scheme, to give preferment for jury waiver, succeeds to some extent because sometimes the plaintiff will waive the jury to obtain an early trial, and the defendant will forego the advantage of a later trial date for a trial without a jury in which he expects a better verdict. At one time the Appellate Division of the Manhattan Supreme Court had assurances from the major defendants, the insurance companies and the city of New York, that they would waive jury trial any time a plaintiff chose to waive it, and consent

to an early trial. This agreement seemed to work for a while but broke down when the city of New York declared that it preferred jury trial in all cases, and other defendants decided at least not to commit themselves. Whether this was done out of genuine preference for the jury, or only to gain the time offered on the delayed jury calendar was never explored.

However, even if they worked, devices that tax the jury trial and reward its waiver do not recommend themselves. They smack of punishing a litigant for exercising his constitutional right and of trying to abolish the jury by subterfuge.

There seems to remain the other route: to eliminate the difference between jury and judge trial and thus make it superfluous for either party to resort to the more cumbersome jury trial. One of the efforts to be watched with interest is the establishment of a special panel of judges in the Los Angeles courts who are to try personal injury cases for which the jury has been waived. The judges have been selected for this job because they have acquired the reputation for adjudicating very much like juries would do in their place.

Comparative negligence rule

Another, less direct, effort in this area is the proposal to substitute comparative negligence for the rule of contributory negligence.⁷ The proposal is based on the assumption that presently one of the major differences between judge and jury is their respective treatment of that

⁷ This common law rule, stated briefly, prevents a plaintiff from recovering damages if his own negligence has contributed to causing the damage, even if his share of the guilt was considerably smaller than that of the defendant. Comparative negligence permits recovery under these circumstances, but provides that the plaintiff damages be reduced by the percentage the plaintiff's negligence constitutes of the total negligence.

rule. It is alleged that the jury, unlike the judge, in spite of the judge's instruction, is likely to apply some sort of comparative negligence.

It is hard to see how such a change could increase jury waiver. The plaintiff, for much the same reason that made him prefer a jury under the contributory negligence rule, will prefer it also under the new rule; not only because of the expected difference in the evaluation of the damages, but also because the jury may take a more sympathetic view of the degree of the plaintiff's negligence and discount the award less. In addition, we are satisfied that a different handling of the contributory negligence rule is not one of the major differences between judge and jury verdicts.

Thus a change in the law from contributory to comparative negligence—whatever other merits it may have—is unlikely to change the disagreement balance between jury and judge verdicts. Such a change, therefore, cannot be expected to lead to an increase in the frequency of jury waivers. If anything, it should increase the work-load of the courts because it is bound to increase the number of claims raised. Under the contributory negligence rule, some claims with major contributory negligence had clearly so little chance before either jury or judge, that no defendant would take them seriously. Under comparative negligence they would become legitimate claims and could increase, therefore, the number of trials. Data from Wisconsin, a comparative negligence state, provide statistical support for this suspicion. Its ratio of damage claims to automobile accidents is considerably above the average.⁸ There is

⁸ *Delay in the Court*, p. 229, note 7. See there also the discussion of comparative negligence in Chapter 8 (esp. p. 90 ff.), and especially Justice Peck's proposal to permit stipulation of comparative negligence as reward for stipulating waiver of jury trial. The problem has also been investigated by Colum-

a third possible way in which the change-over could affect the work-load of the courts: it may affect the proportion of claims settled without trial. But how it would affect it is yet to be explored. We know nothing about it.

One thing is again clear. It would be a mistake to recommend abandoning the contributory negligence rule if reducing the work-load of the courts is the proposal's sole purpose.

ACCELERATE THE JURY TRIAL

But while we cannot do much and possibly should not do anything to curtail the use of jury trials, there are a number of moves which could save court time by shortening the jury trial as it now exists in most courts.

Expeditions New Jersey Trials

Merely by comparing jury trials in two states, in the Manhattan Supreme Court and in New Jersey, we found that there is considerable leeway in the amount of time a court cares to spend on the conduct of its trials. Our data strongly invite the conclusion that jury trials of personal injury cases are tried more expeditiously in New Jersey than in the New York court. In fact the difference is so substantial as to suggest that the length of jury trials of roughly comparable cases under different court systems may differ as much as the jury trial has been shown to differ from the bench trial.⁹

bia University's Project for Effective Justice. After Arkansas had temporarily changed to comparative negligence, the Project conducted an interesting survey among lawyers and judges which led to, among others, the following conclusion: "Introduction of comparative negligence . . . did not drastically alter the size or quality of the courts' burdens . . ." (Maurice Rosenberg, *Comparative Negligence in Arkansas*, 13 Ark. L.R. 89, 108 [1959]).

⁹ *Ibid.*, Chap. 9, p. 9 ff.

LENGTH OF PERSONAL INJURY TRIALS IN
NEW JERSEY AND NEW YORK
METROPOLITAN COURTS

	AVERAGE NUMBER OF WITNESSES	AVERAGE LENGTH OF JURY TRIAL
NEW YORK	8.1	17.4 hours
NEW JERSEY	7.8	9.5 hours
DIFFERENCE	.3 (-4%)	7.9 hours (-45%)

Although the average number of witnesses per trial is almost identical for New York and New Jersey, the New Jersey courts require 45 per cent less time to try a case than the New York court.

In an effort to further corroborate this difference in jury-trial length between New York and New Jersey we obtained a sample of four personal injury trial transcripts in roughly comparable cases from New York and five such transcripts from New Jersey and subjected them to a detailed content analysis.

COMPARING 9 TRIAL TRANSCRIPTS FROM
NEW YORK AND NEW JERSEY

	AVERAGE NUMBER OF TESTIMONY LINES PER TRANSCRIPT	AVERAGE NUMBER OF WIT- NESSES	NUMBER OF LINES PER WITNESS
NEW YORK	8,660	10.3	980
NEW JERSEY	7,280	12.6	580
DIFFERENCE			-40%

Also this second measurement of the court's efficiency yields a difference in the 40 per cent range.

Role of the trial judge

The causes of this difference are not entirely clear. Undoubtedly a great deal depends on the role of the trial judge, and his proper role in a jury trial has

long been a controversial and debated topic in America. Clearly, the judge can speed up a trial if he takes more vigorous charge of it, participates in the questioning himself, curtails repetitive testimony, and discourages purely formal objections. The extent of the trial judge's control may in turn depend also upon the degree to which such control is supported by appellate courts. Whether the trial judge is to remain a passive umpire, as in many American jurisdictions, or take full command of the trial, as in England, touches important values which go beyond the problem of removing delay. All that can be said with confidence is that the possibilities of accelerating the jury trial itself may have received too little attention. The questions raised by the relative brevity of the New Jersey trial should be an inviting and promising subject for further study.

There is one specific point at which higher judicial control could bring about considerable savings in some courts. It appears that jurisdictions vary considerably in the average time they require for the impaneling of the jury. Our studies have shown that where this procedure is time consuming, it is being used more for the indoctrination of the selected jurors than for the original purpose of selecting them.¹⁰

Separate liability and damage issues

A most promising, if radical, move to speed up jury trials has recently been made in the federal court for the Northern District of Illinois. The court put into action our suggestion¹¹ to separate also in jury trials the liability issue from the damage issue. To make this separation in bench trials is not an unknown

¹⁰ A study made by Professor Saul Mendlovitz as part of the University of Chicago Law School Jury Project.

¹¹ *Op. cit.*, pp. 99, 292. See Judge J. Miner's article *Court Congestion, A New Approach*, Dec. 1959 A.B.A.J.

practice, but it is seldom applied. Now, the Chicago court has encouraged its judges to make this separation also in jury trials. If the jury finds liability, the trial after a pause resumes and the same jury now hears the litigation of the damages. If the jury denies liability, the trial, of course, is over.

This move is bound to save at least 20 per cent of the court's trial time. Since the jury in 45 per cent of the cases finds for the defendant, damage litigation in these cases will be obviated. And if we assume that the discussion of damages usually consumes about half of the trial time, we arrive at a saving of the indicated order.

This separation may also bring about collateral savings. Once liability and damages are tried separately, either issue might be stipulated and only the other submitted to trial, moreover, once liability is affirmed, out of court settlement of the remaining damage issue might be facilitated. And instead of hoping or fearing that the jury might not be able to compromise liability and damages, the litigants themselves may prefer to do this—and settle the case.¹² In case of trial, there accrues also a clear procedural advantage in that the order of presentation of the evidence becomes more coherent. The customary sequence: plaintiff (liability, damages), defendant (liability, damages) is replaced by the more logical sequence: liability (plaintiff, defendant); damages (plaintiff, defendant).

It is significant that this move required no change in the law and can probably be followed in other jurisdictions.

Of all the time-saving remedies, the split trial should prove the most powerful. It can probably be introduced in

most courts without change of the law¹³ and it can stand the supreme test of all remedies: the procedure recommends itself as superior also in a nondelayed court.

PRÉCIS

What, then, can we say by way of summary about the jury and the delay problem?

First, that the abolition of the jury in civil cases, though it would save some court time, would not save enough time to permit this to become an overriding argument for its abolition. Second, none of the proposed devices to increase the voluntary waiver of jury trials, unless they amount to objectionable curtailment of the jury by subterfuge, holds much promise of being effective. Third, there is ample room for expediting the jury trial in its present form: by a general tightening of court control over the impaneling procedure and the presentation of evidence and by the specific measure of permitting separate trials for the issue of liability and the damage issue.

One general rule emerges with respect to any permanent reform designed to remedy court delay, be it abolishment of the jury, or the removal of automobile accident cases from the courts to a special commission, as recently aired by the governor of California. No reform should be initiated that would not recommend itself also in a nondelayed court. The reason is obvious. Once such a reform has accomplished its purpose and delay is cured, the reform stays with us in the now nondelayed courts. And we better make sure that the price for bringing our courts up to date is not a lowering in the quality of our judicial process.

¹³ The Chicago federal court introduced the practice by a Rule of Court. The Philadelphia federal court, I am informed, has been using the device sporadically for some time, without a special Rule; it considers the practice covered by Federal Rule 42(b).

A Proposed Automobile Accident Compensation Plan

By SAMUEL H. HOFSTADTER *

ABSTRACT: Automobile accidents have kept pace with the steadily rising highway use. In a real sense these are not caused by man but by the automobile itself. When the blow strikes, the complainant can obtain redress only by proving the operator careless. But if his own negligence contributed in any way, he may not be recompensed, whatever the fault of the operator. These rules are so harsh that juries circumvent them, trial of these cases is largely a matter of chance, the courts are jammed, justice is delayed, and many accident victims are denied reimbursement. Alternative theories predicated on fault are more sound but miss the heart of the problem. The solution lies in granting compensation on a prearranged schedule regardless of fault—as in workmen's compensation. If immediate adoption of such a plan is not possible, automobile cases should in the interim be assigned to special tribunals consisting of a judge, a layman and a physician, with apportionment of damages substituted for the rule of contributory negligence. In the era of the automobile, no victim of its thrust should be required to carry the burden of his pain and suffering alone.

*Samuel H. Hofstadter, LL.B., New York City, has been a Justice of the Supreme Court of New York since 1933. He was Special New York Assistant Attorney-General from 1922 to 1924; and was a member of the Legislature from 1924 to 1932, serving on Commission on Administration of Justice (1930-1932) and as Chairman of the Legislative Inquiry into the Affairs of the City of New York (1931-1932). Judge Hofstadter is author of *The Development of the Right of Privacy in New York* (1954) and of *The Fifth Amendment* (1955), as well as various articles in professional journals.*

* I am indebted to Jacob M. Dinnes of the New York Bar for assistance in arrangement and editing in the preparation of this article.

¹² An exact measure of the time saved by the split-trial rule will soon emerge from the experience of the Chicago court. There steps have been taken, with the co-operation of the University of Chicago Law School, to gauge the exact effect of the rule.

WHEN the automobile first appeared on the scene, it stirred the imagination as a marvel of the inventor's art; today it is a commonplace part of our daily life. Automobiles are everywhere; highways, thruways, and parkways have been and are being constantly built to facilitate their movement and their speed; practically every municipality in the country is grappling with the traffic and parking problem. In 1923 we had 15 million registered cars in the United States. By 1956 they had increased to 60 million. By 1970, they are expected to total 90 million! Nor does this growth in the number of automobiles on our roads tell the whole story. Not alone is the speed of which they are now capable substantially greater, but over the years the lawful speed limit has been progressively increased. This is the contemporary picture, of which the automobile accident is an integral part and inevitable concomitant.

Experience teaches that accidents have kept pace with the steadily rising highway use. Last year the New York Bureau of Motor Vehicles reported: "Motor vehicle accidents rose to a new high in this State during 1957. . . . Accidents involving personal injuries showed an alarming increase . . ." Because the use of the automobile is today so general, almost everyone, operator, passenger, pedestrian is exposed to its hazards. The Bureau observed that of the persons killed, 38 per cent were drivers, 26 per cent passengers, 35 per cent pedestrians, and 1 per cent bicyclists.

The late Dr. C. A. Kulp, Professor of Casualty Insurance, remarked: "The automobile liability hazard appears to be essentially quantitative. . . . The number of automobiles is controlling. Other factors mitigate or exaggerate hazards but they are essentially secondary." Dr. J. L. Malfetti of the Safety

Research Institute of Columbia University has just reported that drivers were responsible for 80 to 95 per cent of accidents, adding: "No driver, given cause enough, is immune to unsafe driving behavior." He cites as factors: highway hypnosis on dull stretches; losing the concept of speed and space when reducing speed from 60 to 25 miles an hour for an exit ramp; tension responses, and so forth.

Despite earnest safety campaigns, despite improved methods of testing and inspection, despite improved roads and highways, despite all the many other measures taken to reduce automobile accidents, they persist and are growing in ever increasing numbers. Thus, in the final analysis and in a real sense, the fault lies not with man, but with the automobile itself and its tremendous potential for mischief. Almost forty years ago, Cardozo referred to it as an instrument of danger to life and limb.

LIABILITY FOR DAMAGES

When the blow strikes, whether it causes death, bodily injury or property damage, redress can now be had only by resort to law on the basis of negligence. In layman's language, the word "negligence" may be changed to "fault." Unless the fault of the operator of the automobile caused the accident, the victim may not recover.

"Negligence is of a negative character. . . . the failure to conform to the standard of a normal man" in Professor Burdick's phrases.¹ But what is the standard of a normal man? When is the operator at fault? When does the fault cause the accident? The concept is so vague that ordinarily the answers are left to the sound judgment of a jury. Not infrequently, however, the judges take these issues from the jury, and, often disagreeing among themselves, de-

¹ William L. Burdick, *Law of Torts*, 4th Edition, Sec. 445.

cide the questions the way the majority of the highest court think proper. For instance:

A group of men, at 11:30 P.M., are travelling in three cars on Sunrise Highway in an easterly direction. Sunrise Highway is a street level, four lane road, two lanes going each way. The first and second cars are 100 to 200 yards apart; the third 75 feet behind the second. Near an intersection, a car going in the opposite direction suddenly swings left and stops in the outside (slow) easterly lane. The first car avoids him; the third stops in time; the second runs right into him. The second car had been going in the fast (inside) lane at 50 miles an hour, when 25 was proper. Passengers in both cars are hurt.

The jury found for the passengers against the driver of the second car. The appellate courts reversed, saying that the sudden unanticipated and unexplained dash across the highway of the car going in the opposite direction made the driver of the second car the helpless victim of an emergency.²

In a second case, tried by a judge without a jury, a car was going north on Taconic State Parkway, also a four lane concrete highway. It was raining and the road was slippery and wet. At the point of the accident, the road went downhill and curved to the east. Again the operator used the fast or outside northerly lane, but was traveling at 30 to 35 miles an hour. He skidded, crossed the white line, ran into cars going in the opposite direction and his passengers were hurt. The judges said he was not at fault and dismissed their claims for damages.³

Were these drivers at fault? Did their fault help cause the accidents? Opinions may differ. Certainly, the passengers

were not responsible for the accidents, yet they were denied reimbursement for their monetary losses as well as their pain and injury. Moreover, since they had guessed wrong when they brought their lawsuits, they suffered the additional expense of the litigation and the "costs" allowed the other side. This does not make sense!

EVOLUTION OF THE LAW

The cause of action for negligence did not exist in the early common law.⁴ In the sixteenth and seventeenth centuries, a person was liable for injuries caused by him, whether inflicted intentionally, negligently, or accidentally, if the occurrence fell within the forms of action then recognized.⁵ The cause of action for negligence evolved in England from the development of the so-called "action on the case" and the growth of the law of "proximate consequence." It spawned in the law of contractual, quasi contractual and proprietary relations applied to bailees other than innkeepers and common carriers. To such other bailees, the Roman rules of liability for negligence were applied.⁶ Extension of these principles to accidents not connected with public callings, bailments, or prescriptions began in 1676⁷ and developed thereafter. In 1809, an appendix was added that the claimant must also prove himself free from fault before recovery was permitted.⁸

THE AMERICAN THEORY

In the United States, the early rule of strict liability, that is, responsibility regardless of fault, was abandoned in

⁴ Palgraf v. L.I.R.R. Co. 248 N. Y. 339, 345.

⁵ William S. Holdsworth, *History of English Law* (Boston: Little, Brown and Co., 1956), pp. 446-53.

⁷ Mitchell v. Alestree, 1 Vent. 295.

⁸ Butterfield v. Forrester, 11 East 60, 61.

² Meyer v. Whisnant, 282 App. Div. 930, aff'd 307 N. Y. 369, 371.

³ Murphy v. Kittrinos, 6 App. Div. 2d 827;

aff'd 6 N. Y. 2d 849.

favor of the concept of liability only for fault in violation of a duty owed the claimant.⁹ To make matters worse for the victim, this was coupled to the presumption that every person performs his duty. Thus the burden of proving all the elements required by the courts is on the injured person. In short, the fact that an accident occurs or that injury is sustained does not establish the tort—the injured person must show not only that the driver was at fault but that his fault caused the accident. Even an affirmative wrongful act causing injury does not create liability if the victim is one to whom harm as a consequence of the act was not reasonably to be foreseen.¹⁰

The old rule of acting at one's peril survived in a sense, however, being inverted and transferred to the victim by adoption by our courts of the English concept of contributory negligence as an absolute bar against recovery.¹¹ Under this rule, if the injured person's own negligence or unskillfulness in any way conduced to bring about the injury complained of, he may not recover, whatever might have been the negligence of the defendant. "The law will not, in such a case," said the court, "attempt nicely to adjust the degree of blame to be assigned to the respective parties, and will not recognize any act as an injury to either, which they mutually contributed to produce."

The absurd lengths to which this may lead is illustrated by a case tried some years ago. Following a correct and adequate charge to the jury on the subject of negligence and contributory negligence, defendant's counsel requested an express charge that if the plaintiff was guilty of even 1 per cent negligence, he could not recover.

⁹ *Losee v. Buchanan*, 51 N. Y. 476.

¹⁰ *Palgraf v. L.I.R.R. Co.*, *supra*.

¹¹ *Munger v. Tonawanda R.R. Co.*, 4 N. Y. 356, 358.

Resenting the harshness of the rule, juries circumvent what someone has called "the judicial nonsense," and the plaintiff gets damages—based on "crude 'kangaroo' adjustments"—notwithstanding contributory negligence. The citizenry shrugs off its application, and testimony to circumvent the anticipated judge's charge is at times clearly contrived. Judges, aware of the "complete fantasy" of the rule are among its severest critics. It was branded "barbaric" by one of our most thoughtful and scholarly presiding justices.¹²

The result is that "a jury trial in the ordinary automobile accident case is largely a matter of chance. To a great extent, the verdict and the amount of damages depend on who secured the best or the most witnesses, or who has the best lawyer, on the personal prejudices of the jurors, on the so-called 'breaks of the trial,' and on the intangible human element. They do not depend on a scientific ascertainment of the facts."¹³ The ultimate consequence is irresponsibility, a deterioration of the judicial process, debasement of public morals, capricious results, staggering underwriting losses, and congested calendars.¹⁴

Conceived in a period of industrial change, capital found a ready ear for its plea for protection against depletion; and rooted in economic factors no longer in being, these concepts of liability and exoneration from liability have fed one upon the other, producing unreal distinctions and confusion. Their philosophy does not ring true; and their sequelae are not viable. They have been discarded or substantially modified in fields

where legislation was adopted;¹⁵ the concept of contributory negligence was never accepted in admiralty;¹⁶ and it has been bypassed where the doctrine of "last clear chance" was made applicable.¹⁷ Where these exceptions do not apply, however, we are confronted with a juridical problem of serious proportions which must be studied as a whole if long term solutions are to be found.

ALTERNATIVE THEORIES

Dean Pound tells us¹⁸ that the rule of exoneration for contributory negligence was based on the "Good Will" theory of liability—if plaintiff was also guilty of moral fault, he could not complain that defendant was blameworthy. His comment is cogent:

But, as Holmes has shown, negligence does not necessarily involve moral obliquity. . . . In connection with negligence we should not be thinking of the social interest in the general morals, but instead of the social interest in the general security. Moreover, there is nothing in the nature of things to require that in case of concurrent negligence the whole loss be thrown upon one of the parties exclusively.

The first step taken to ameliorate the harsh exonerating rule was the substitution of the doctrine of comparative

¹⁸ Roscoe Pound, *Jurisprudence* (St. Paul, Minn.: West Publishing Co., 1959), Vol. V, Chap. 32.

negligence, which apportions damages in accordance with each actor's degree of negligence. Based on Roman law and first embodied in the Continental Codes, it is gradually finding its way into common law jurisdictions both here and abroad.

But comparative negligence, though intrinsically a more equitable doctrine, is not a true solvent. Though more sound in theory, it cannot with any degree of certainty accomplish its intended purpose. So long as it is part of the concept of liability based on fault, unless fault can be measured precisely, it does not offer a just solution. The fact is that the effort of a jury, or, for that matter, of any other finder of fact, to determine the degree of fault allocable to each participant in an accident is a highly speculative adventure without possible exactitude in measure or result.

Moreover, it misses the heart of the problem. Fast moving objects of great weight, controlled by human beings with normal reactions and crowded highways make accidents a certainty. To be sure, the immediate occasion for an accident may be some carelessness, but the point is that such carelessness was inevitable, bearing in mind the nature of a motor vehicle, traffic and highway conditions and the needs, exigencies, and tensions generated by a complex society.

Legal rules reflecting earlier stimuli distort the present when dogmatically applied. An era of multimillion automobiles and the airplane, urbia and sub-urbia, heavy industry and wide diffusion of property, mechanized farms and an emancipated labor force over seventy million requires constant attention to the standards of liability flowing from its application. In the field of automobile accidents, fault as a basis of liability has outlived its usefulness and validity. Under modern conditions, the thesis that individual fault is a prerequisite to the right of indemnity for damage

due to an automobile accident is essentially unjust and unreal.

European experiment

Recognizing this fact, Europe has reverted to the standard of strict liability. In the 1890's French jurists applied this principle, under a revised interpretation of an article of the French Civil Code, to accidents caused by dangerous means of conveyance although no negligence could be proved. Eventually they extended the rule to automobiles. The German Code of 1907 imposed strict liability for motor accidents; followed later by similar liability for air accidents.

The application of strict liability—even tied to compulsory insurance—approaches the nub but does not reach it. For there remain the vexatious problem of assessment of the damage and its prolific offspring: the traffic jam in the courts.

Fundamental error

Neither a strict rule of liability nor insurance makes a bad driver good nor an unskilled one skillful; they are merely devices to assure a recovery and payment of that recovery. But the recovery must first be obtained before the insurer can be called upon to pay; and "how much" is an imponderable which often, after fruitless hours of negotiation, pre-trial conferences, discussions during the trial, and heroic effort by judge and counsel, is answered by the juries in as many different amounts as there are causes.

Their disagreement manifests the fundamental error in our present approach. Exact appraisal of personal injury is impossible—whether by judge or jury. At best, it is an approximation. At worst, it is based on the eloquence and experience of counsel, on sympathy and on emotion.

The inherent difficulties also reflect themselves in the pervading and prevailing evil of calendar congestion. In many courts delay is counted in years despite procedural expedients, free assignments of judges, rules of preference, and unceasing efforts to effect settlements.

The greater proportion of accident victims belong to the low-income group which can neither afford the burden of trial delay nor the cost of the accident itself. They are faced not so much with an outright denial of justice as with its circumvention by economic expediency. Society demands the automobile. It should provide an equitable method of meeting its cost. It is a common burden to be dealt with on a collective, not an individual basis.

THE PROPOSED PLAN

The solution will be found in a compensation plan. By such a plan, a system is contemplated analogous to that encompassed by the various state workmen's compensation acts. Underlying this legislation, long accepted in our states, was the recognition that accidents are an inevitable concomitant of modern industry and—as expressed by Lloyd George in a campaign slogan—"The cost of the product should bear the blood of the workman." The injured parties—except in those rare instances where the accident is caused by the deliberate willful act of the injured person—would be compensated, *regardless of fault*, as specified in a prearranged schedule of amounts for specific injuries, and payment would be made from a common fund set up for this purpose.

It is beyond the scope of this discussion to specify the details of such a plan; nor is it within the author's competency. The precise plan must await further study and the advice of specialists. It would, of course, include these

essentials: the accidents to be included and excluded, the benefits to be paid, and the method of determining coverage and assuring payment.

This suggestion is by no means wholly new. The idea was first projected by Arthur A. Ballentine, of this city, in 1916. It gained wide publicity in 1924, when specific proposals were embodied in bills introduced in the New York Legislature. In 1927, as a member of the Assembly, the author proposed legislation along these lines; as a member of the Senate in 1931, he introduced bills calling for a commission to study the problem. It was carefully re-examined in 1932 by the Columbia University Committee; the Committee's conclusions were embodied in a bill submitted to the New York Legislature in 1938 by the Joint Committee to Sponsor the Accident Compensation Plan. The conditions which commended a compensation system for automobile accidents in these earlier days are today far more acute and challenge prompt action.

Nor is it wholly untried. A modified form is now in effect in the Province of Saskatchewan, in Canada.

It is socially and economically sound. It is logically and juridically justifiable. It makes recovery more equitable and provides it speedily. It assures indemnification for loss regardless of fault. It spreads the burden; and, through "loss distribution," the group creating the risk carries the cost—a result that dilutes the financial weight on the individual and inures to the benefit of the whole community.

And as a collateral dividend, it will begin to clear the judicial channel of a roadblock so severe that former presiding Justice Peck of the Appellate Division of the Supreme Court of New York was moved to say, not too long ago, that if it is not removed "the grave prospect is that the courts will cease to be the accepted agency for the deter-

mination of litigation." Under such a program we will at least make provision to assure that though the highways may always be jammed with cars, the courts need not always be glutted with the cases that inevitably follow and are not always disposed of on an equitable and fair basis.

AN INTERIM PLAN

If ingrained conceptual habits of thought and loyalty, avowed and subconscious, make a compensation plan unlikely of adoption in the immediate future, I offer an interim—an alternative—proposal.

Until the public, bar and bench, and the insurance carriers will accept departure from present adversary practice, automobile accident cases should be assigned to special tribunals, consisting of a jurist, a layman, and a physician, with the principles of comparative negligence substituted for the rule of contributory negligence.

Under this alternative proposal, sole negligence as predicate of liability is modified but fault is continued as the ultimate basis of responsibility; and a collective, mixed judgment—as in the conventional jury trial—is retained as the method of adjudication and appraisal. Such a juridical forum can dispatch cases with a speed relatively equal to that of a court without a jury, yet meet the objection of those whose number must be legion who concur in G. K. Chesterton's doctrine: "I would trust twelve ordinary men, but I cannot trust one ordinary man."

Under this program, claimants would be thrice blessed: The assurance of recovery despite some fault of their own, adjudicated speedily, by a court of experienced mixed personnel. Defendants and their insurance carriers would likewise be benefited: While there may be a greater number of recoveries, inflated

verdicts will be less likely and the threat of bankruptcy to an underinsured car owner reduced substantially. At the same time, the fundamental characteristic of the jury trial—its multiple nature—will be retained in measurable degree.

The jurist will provide legal learning and experience; limiting the number to one will conserve judicial manpower. The leavening impact of lay thinking will be provided by the nonprofessional member. And the physician will provide that impartial medical guidance—not advocacy—which has already proved its great worth in the medical report office established some few years ago in our jurisdiction.

Midway between the present mode of adjudication and the proposed disposi-

tion by administrative boards, the alternate proposal, if successful, would mitigate the more pressing defects of our present rules and procedures.

For the sake of justice, we must face up squarely to our concept of liability for fault and revise it where modern conditions call for its modification. We should certainly be prepared to alter the apportionment of fault and, by allowing it in the front door, obviate the practice of subversion of the law at the back entrance. The United States of today is far different from that of the 1780's. In the era of the automobile—a potentially lethal agency—the victims of its thrust may not justifiably be left to carry the burden of their injuries alone.

Practice and Procedure

By CHARLES E. CLARK

ABSTRACT: In contrast to the hundred-year struggle for procedural reform in England the American movement for improved law administration has been professionally inspired and directed. Pleading, comprising the steps preparatory to the trial itself, by custom and precedent is an important preliminary stage of litigation where formalism has become rooted and reform is necessary. The first great reform of common law pleading was by the Field Code of 1848 in New York, which was copied in a majority of the states. Meanwhile federal practice lagged because of the statutory requirement of conformity to state practice. But with the adoption by the Supreme Court of the Federal Rules of Civil Procedure, as drafted by its Advisory Committee, the federal practice became the outstanding system in the country and a model for reform in a constantly increasing number of states. It has also stimulated the movement for rule-making authority in the courts and for an integrated court system efficiently operated. While much remains to be done, the intelligent steps already taken toward improved law administration show that current criticism of the courts is overdrawn and the title of this symposium, "Lagging Justice," not apt.

Charles E. Clark, LL.B., LL.D., New Haven, Conn., Chief Judge of the United States Court of Appeals, Second Circuit, from 1954 to 1959, has been a United States Circuit Judge since 1939. Before that he was Dean of the Yale Law School and Sterling Professor of Law at Yale. He served as Reporter to and member of the Supreme Court's Advisory Committee on Rules of Civil Procedure throughout its existence 1935-1955 and hence was the principal draftsman of the Federal Rules of Civil Procedure. He is a director of the American Judicature Society, and a fellow and now President-elect of the Institute of Judicial Administration. He has written several books on law, including the standard text, Code Pleading (2nd ed., 1947), and many law review articles.

IT IS a paradox, of a kind not uncommon in the law, that the one lawsuit probably best known to the layman was not an actual case at all. For *Jarndyce v. Jarndyce*, the lagging proceeding in chancery pilloried in *Bleak House*, was but a figment of Charles Dickens' fertile imagination. But it became the outstanding symbol of the law's delays and played a substantial role in sharpening the demand for law reform in England. So it was a notable feature of that one-hundred-year struggle, first sparked by Jeremy Bentham in 1776, that it was lay-inspired and largely lay-executed. The bench and the bar tended to resist change, and improvements in law administration had to be achieved over strong professional objection. In this country the cause of reform has fared somewhat better with the profession. The great nineteenth-century movement leading to the Field Code of 1848 in New York and code pleading throughout the country was in large degree the work of David Dudley Field, leader of the New York bar. And the outstanding reform of the present era, that embodied in the Federal Rules of Civil Procedure, was strictly professional in character. Since this development is itself a notable gain in operating efficiency in the courts and also affords a stimulus for other correlative advances, it is the chief subject matter of this paper.¹

¹ The legal literature on the historical developments here noted and on the recent federal reform is extensive. It is not thought desirable, however, to burden this article with detailed annotations. Interested readers may find these matters discussed, with extensive citation of authorities, in the author's *Code Pleading* (2nd ed., St. Paul, Minn.: West Publishing Company, 1947), particularly in Chapter 1 on the "History, Systems, and Functions of Pleading," in his article, *Two Decades of the Federal Civil Rules*, 58 COLUM. L. REV. 435 (April 1958), and in the article by Professor Charles Alan Wright, *Procedural Reform in the States*, 24 (No. 2) F.R.D. 85

THE REFORM OF PLEADING

Doubtless the lay reader is puzzled to know why reform of pleading—the steps whereby a case is brought to issue and hence only prepared for trial—looms so large, often beyond the actual trial itself, in any account of steps to be taken in the improvement of law administration. But this it does, as all reformers have to realize; and the reasons are not too hard to appreciate. They are both historical and practical. The rise of written pleadings in England can be discerned in the fifteenth and sixteenth centuries coincident with the development of the jury and as a response to the need felt to define the issues sharply for the lay jurors and to remove from them all questions of law. As red tape tends to settle into formal custom, so the written pleadings came to be more and more formalistic, and the strait jacket of procedure became even more a restricting influence. There was also the very practical need—still existent in perhaps more pressing form in modern court practice—of uncovering the matters really in dispute well in advance of the formal and portentous full-dress trial. This not only shortens the actual trial by focusing on the fighting points but even more renders the case subject to disposition without trial, either by some pre-trial action of the judge or perhaps more often by negotiation and settlement of the parties as they come to know and appraise the merits of their respective causes. At any rate such pre-trial disposition is an important, perhaps the most important, feature of litigation today; it is a rare

(Sept. 1959). For professional activity in the field see Arthur T. Vanderbilt, *Minimum Standards of Judicial Administration* (New York, 1949), a volume giving all developments listed state by state, and the A.B.A. pamphlets, *The Improvement of the Administration of Justice* (3rd ed., 1952), and *Justice Calling* (1958).

court where even a fifth of the cases actually go to trial and judgment. Hence this function of the court as a means of channeling litigation to settlement or prompt pre-trial disposition is so important that it must be carefully conserved and the litigatory procedures adapted to it, both to aid it directly and to avoid indirectly means of delay or obstruction by those so inclined.

Against this background, and with the professional and judicial propensity to be governed by precedents, it is not strange that procedure hardened and came to be unduly formalized, even to the extent of overlooking the parties' rights on the actual merits. Hence the movement for reform had necessarily to start with these overriding procedural barriers. This was true in both England and America. We have not occasion here for a full-length history of pleading formalism and its reform. Let it be said that by the nineteenth century pleading in the courts of common law had become unduly formalized, following what was technically known as "special" pleading; while practice in the quite separate courts of chancery was hopelessly bogged down in details presented not through the testimony of live witnesses, but through depositions, affidavits, and other written materials. The great change made by the Field Code, as adopted in New York in 1848, and thereafter copied in a majority of the states, was the merger of the courts of law and chancery and the union of law and equity. This was true also of the later English reform, the Judicature Act of 1873. A corollary was the greater freedom in stating the facts upon which the action was based, though the force of this reform was lost when the pleadings again became prolix. Almost a century under the Field Code—adopted as it was in a majority of the states—left the stage set for the modern reform embodied in the federal rules.

FEDERAL PRACTICE AND THE "CONFORMITY ACT"

Up to the time of the adoption of the federal rules, effective September 16, 1938, the federal practice had been anomalous. That was because of the attempt to follow the differing local procedures of the various states where the federal courts sat. Indeed the entire federal court structure had developed somewhat as a compromise. Strictly it was not necessary; the federal systems of Australia and Canada have found it sufficient that the provincial or state courts enforce also the federal law, capped only by a Supreme Court for the entire country. Our Constitution in Article III, Section 1, vests the judicial power of the United States only "in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish." But the framers of the Judiciary Act of 1789 thought the prestige of the infant country would be enhanced by a separate court establishment, and thus our far-flung federal court system was initiated.

For convenience and to lessen objections and animosities, the procedure at law in the national courts was set to follow that of the state where they convened. At first, this procedure was held in static conformity to the local practice beginning with the date of the statutory enactment; but this date was advanced from time to time by successive statutes until the famous Conformity Act of 1872 provided for continuing conformity "as near as may be" to the local practice where the federal court was held. Meanwhile the equity practice was governed by the court's uniform rules originally based on the English chancery practice—there being no well-developed chancery system in many of the colonies or states—and ultimately by the Equity Rules of 1912, achieving a reasonably

uniform and simplified procedure according to the standards of the day.

The confusion and conflicts resulting from this system were so great that federal practice became an activity only for specialists and an abomination for the profession generally. A comparatively small portion of the procedure, that of equity, was reasonably up to date; but the great bulk of the cases was subject to a separate dual procedure which was neither state practice nor uniform. True, the basic practice in any federal district court was supposedly that of the local state; but from the beginning there were various items affecting the bringing of suit and the service of process which were necessarily subject to federal law. This area of general practice superimposed on local procedure tended constantly to expand as Congress passed more and more remedial legislation covering diverse matters such as amendments or the pleading of equitable defenses in actions at law. Thus a practitioner accustomed to a local system of merged law and equity would find as he came into the federal court of his own locality not only the ancient separation, but also for the procedure as a whole a system which was not local but was a confusing mixture of local and general law. In addition admiralty followed its own course based upon English maritime procedure. Naturally there was no attempt at uniformity from district to district. And since a case would not stay confined in its own slot but would jump the artificial boundaries thus set up among actions, the indigenous and unique practice of each federal district was a major factor in delaying federal justice and even in denying it because of the technical barriers thus imposed.

REFORM OF FEDERAL PROCEDURE

This was a situation which obviously cried out for reform. Almost from its

inception in 1873 the American Bar Association took an interest in improved federal procedure; and from 1912 to 1933 it carried on a campaign through a special committee directed to this one objective. The plan supported by the Association was to confer complete rule-making power on the Supreme Court—a supplement to its existing power embodied in the draft of the Uniform Equity Rules—with the expectation that the Court, thus empowered, would modernize the practice. When the American Bar Association, disheartened by senatorial opposition, gave up the campaign, it was taken up vigorously by Attorney-General Homer Cummings, who secured the enactment on June 19, 1934, of the very bill which the Association had formerly sponsored. The Department of Justice then formulated plans to recommend a system of uniform rules at law to supplement the existing equity rules; but to many of us, including the writer, this seemed altogether too limited a reform. The Supreme Court accepted our point of view and in May 1935 announced its purpose to achieve the merger of law and equity as authorized by the Act and to appoint an Advisory Committee to assist it in the formulation of rules of practice.

Thus in June 1935, the Court announced the appointment of a Committee of fifteen with former Attorney-General William D. Mitchell as Chairman and the writer as Reporter and Committee member. On the Committee as named were the Presidents of the American Bar Association and the American Law Institute, eight other practitioners, and five law professors from the procedural field. The Reporter immediately organized a research staff, and drafts were being studied by the Committee as early as the fall of 1935. A Preliminary Draft was issued and widely distributed for the invited criticism of the bench and bar in May 1936. The

criticisms and suggestions received were carefully studied, and a modified and corrected draft was published in a Report of April 1937 with a *Final Report* to the Court in November 1937. The Court adopted the entire draft with the exception of two minor recommendations of limited scope. The eighty-six rules thus adopted were reported to Congress as required by the enabling statute and went into effect on September 16, 1938—three months after Congress adjourned.

CHARACTERISTICS OF THE FEDERAL RULES OF CIVIL PROCEDURE

The procedure adopted with such celerity was soundly based in part on accepted models from England, in part from advanced procedures here and there in the states, and in part from the unique blending and expansion of these various elements. Taken separately the various devices often appeared old and well tried; but combined into an ordered whole, they presented a system at once novel and the most advanced of its time. For my present purposes I shall classify the improvements as three basic advances and three notable, though perhaps less basic, changes, together with various improvements of detail too numerous to mention here. Obviously this classification is somewhat arbitrary; all the changes are important to those who have to deal daily with the practice. But I think this form of statement is illuminating to illustrate the improvements achieved.

Of the basic changes the first is of course the merger of law and equity. This, while long overdue, was not novel; it brought the federal system to the level of the better state practices. And the second was the manner of pleading the claim for relief and the happenings upon which it was founded. This, too, was not particularly original; it was the adaptation of the "general" pleading of

the common law to modern conditions pointedly illustrated by some important forms intended, as Rule 84 states, "to indicate the simplicity and brevity of statement which the rules contemplate." Thus the system quite properly walks between the confusing detail normal under the old "special" pleading and the code statement of "the facts constituting the cause of action" on the one hand and the vague indefiniteness of "fair notice"—the darling of some reformers—on the other. The third is both the natural corollary of the last point and the embodiment of the modern view against "surprise" as a procedural weapon or trial tactic, namely, the extensive pre-trial procedures for uncovering the merits at an early stage. These include the various deposition and discovery devices for ascertaining or taking the advance testimony of witnesses and parties, the summary-judgment motion for speedy disposition of a case found ready for early termination, and the pre-trial conference itself—a meeting before trial of lawyers and judge to settle the issues and admissions of things not questioned and generally to advance the case for trial only on essentials if, indeed, the more thorough knowledge thus obtained does not lead the parties to negotiate for a settlement.

Among the notable additional reforms must be included the free joinder of parties and of actions, the provisions for simple jury waiver by failure to make early claim for jury trial, and the wholly simplified method of taking appeals. All these improvements are so fully exploited in law texts, law review articles, and the cases themselves that documentation here is unnecessary. The literature is already vast.² Indeed some criti-

² See the references in note 1 *supra*. Professional texts for the practicing lawyer include William W. Barron and Alexander Holtzoff's *Federal Practice and Procedure* (St. Paul, Minn.: West Publishing Company, 1950-58),

cism occasionally stresses this sheer volume of materials, suggesting that the rules must contain some inherent difficulty if so many printed pages of exposition are necessary. But this is patently a misconstruction. The great bulk of the informed comment is wholly favorable and represents in large measure the desire of professionals to associate themselves with a going and successful enterprise. This was a feature noted from the beginning: the stimulus afforded, for example, to trial judges, who took pleasure and pride in what they could accomplish under the new procedure and wanted to write about it. Practically none of the comment is critical of the system as a whole; such criticism as appears now and then is directed to details or the need for clarification of particular rules, such as was undertaken from time to time by the former Advisory Committee. So the general success of the rules has been phenomenal. This is shown not only by their successful operation as disclosed in the reported cases and by the uniform chorus of praise, but also by their adoption in the states.

THE FEDERAL RULES IN THE STATES

As of this writing the federal rules have been adopted substantially in toto—except for very slight details forced by local exigencies—in Alaska, Arizona, Colorado, Delaware, District of Columbia, Hawaii, Idaho, Kentucky, Maine, Minnesota, Missouri, Nevada, New Jersey, New Mexico, North Dakota, Puerto Rico, Utah, Washington, West Virginia, and Wyoming. They have stimulated complete revisions largely, but not wholly, following their example in Flor-

already in 7 volumes, Moore's *Federal Practice* (Albany, N. Y.: Matthew Bender & Company, 1948-59), of which the second edition likewise requires 7 volumes, and the *Federal Rules Decisions* and the *Federal Rules Service*, which are continuing series of the reported cases on the Rules.

ida, Iowa, Maryland, Pennsylvania, and Texas, and somewhat more limited and partial steps in Alabama, Arkansas, California, Connecticut, Illinois, Louisiana, Nebraska, New York, South Dakota, and Vermont. Hardly a jurisdiction remains unaffected; for example, the famous Rule 16 on pre-trial conferences seems all pervasive. And there appears to be promising movement for reform gaining momentum in Michigan, Rhode Island, and South Carolina.³

Three more things should be noted about this movement. The first is the general pattern which now almost invariably follows that of the federal reform of a grant of rule-making authority to the highest court and its exercise with the aid of an advisory committee selected by the court for the purpose. With the responsibility for the over-all reform committed to the courts, rather than the legislatures, there is complete and informed action in contrast to the spotty response to special interests so unfortunate a feature of legislative activity in this specialized field. The courts can command expert help and are not to be expected to do the detailed work of drafting themselves. And the organization ensures continuous supervision and responsibility for keeping the tools of justice always bright.

A defect of the original federal system was a lack of provision for a continuing committee and for amendment of the rules. The Court met this gap by continuing its original committee and by approving amendments drafted in the same manner as were the original rules. But by 1955 the members of the original Advisory Committee had grown old in the service and its effective personnel had been reduced by illness and death. So at that time it was discharged with the thanks of the Court. Then there

³ The movement in each state is carefully and precisely described in Professor Wright's article cited in note 1 *supra*.

developed a strong demand for an express authorization, which had been lacking in the original statute, for a continuous study of procedure and the recommendation of changes as needed. This was achieved by a statute passed in 1958 which places the responsibility for such continuing study upon the Judicial Conference of the United States and charges that body with the obligation to report to the Court its recommendations for changes or additions "to promote simplicity in procedure, fairness in administration, the just determination of litigation, and the elimination of unjustifiable expense and delay."⁴ The Conference has determined that there shall be set up to carry out this task a standing Committee on Rules of Practice and Procedure and five advisory committees, on civil, criminal, bankruptcy, admiralty, and appellate procedure.⁵ Thus the continuing responsibility is clearly defined for the federal system which without doubt will continue to be a model to the states.

The second matter to be noted is the extension of rule making to procedures other than civil. It is true that in a court of general jurisdiction most of the court's time is taken up in the disposition of civil business which is both extensive in amount and time consuming in consideration. But as shown by the present planning for the federal system outlined above, there are other practices to which the new principles are properly applicable. The federal civil rules already cover appellate practice generally, and they are also applied in maritime cases by usual analogy and custom and in bankruptcy litigation so far as not inconsistent with the Bankruptcy Act. In criminal procedure the Court in 1941

⁴ P.L. 85-513, 72 Stat. 356, amending 28 U.S.C. § 331.

⁵ [Sept. 17-19, 1958] PROCEEDINGS OF THE JUDICIAL CONFERENCE OF THE U. S. ANN. REP. 6, 7.

appointed an Advisory Committee which recommended a set of rules adopted by the Court in 1944, effective in 1946. While not yet widely adopted in state practice, these rules appear to have been highly successful and comparably as useful in their area of operation as the civil rules. So there seems a wide field of potential usefulness for the modern federal principles in various new aspects of federal and state practice.⁶

The third matter to be noted is the stimulus to improvement in the entire court structure given impetus by the success of this reform. Now at least two thirds of the states are engaged in notable studies of their court organizations with a view of developing integrated organization under a single directing head—usually the State Chief Justice—and, with the help of such centralized control, of following businesslike methods in the dispatch of court affairs and the control of court finances. This movement, itself so vigorous and promising, has not yet had time to achieve success in wide areas. There has been notable improvement at the upper court level in New Jersey; but the most complete reform up to the present time, affecting all grades of judicial activity, has occurred in the Commonwealth of Puerto Rico.⁷ But most recently, Connecticut has established, to be effective in 1961, a major reform of its minor court system, involving police and traffic

⁶ Thus the civil rules have been adopted and are in successful operation in the Municipal Court for the District of Columbia.

⁷ Charles E. Clark and William D. Rogers, *The New Judiciary Act of Puerto Rico: A Definitive Court Reorganization*, 61 YALE L. J. 1147, 1165 (Nov. 1952); Sheldon D. Elliott, 'Our Faith in Justice': Puerto Rico Shows the Way to Better Courts, 42 A.B.A.J. 24 (Jan. 1956); William J. Brennan, Jr., *After Eight Years: New Jersey Judicial Reform*, 43 A.B.A.J. 499 (June 1957); Sheldon D. Elliott, *The Judiciary: Essential Elements of a Model Judiciary Article* (New York: Institute of Judicial Administration, April 20, 1959).

courts and the rural justices of the peace. The reform substitutes a centralized organization with career judges for the old outmoded and diffused organization. Undoubtedly the Connecticut Circuit Court Act will prove a model to other jurisdictions.⁸

INADEQUACY OF THE CONCEPT "LAGGING JUSTICE"

In my discussion the reader may sense a note of optimism concerning the status of law administration in this country which may seem at odds with much of the current complaints surrounding congested courts and delayed justice. But this is done deliberately as an accurate reflection of my own deep conviction that, in the area open to judicial and professional action, conditions are constantly improving and are brighter than they have been before. Nor can I think that the sharper criticisms currently directed toward the courts are altogether merited or indeed at times too well informed. Since I have spent a lifetime working for improvement in law administration, I cannot hold the courts beyond criticism and believe they can only benefit from constructive suggestions. The present extensive concern betokens a very worthwhile interest in the courts which may properly act as a goad and a stimulus to greater professional interest and efforts at improvement. I do have concern, however, lest the criticisms go so far as to suggest some crisis

⁸ Conn. P.A. 1959, Chap. 28. This follows in very substantial form the recommendations originally made by the Commission on State Government Organization appointed by Governor Bowles pursuant to legislative authorization in 1949. See 1950 COMM'N ON STATE GOVERNMENT ORGANIZATION REP. 62-66; Charles E. Clark, Final Report (Judicial Survey Unit No. 18), Dec. 1949; Charles E. Clark and Elias Clark, *Court Integration in Connecticut: A Case Study of Steps in Judicial Reform*, 59 YALE L. J. 1395 (Dec. 1950); Ernest McCormick, *The Struggle for Probate Court Reform*, 33 CONN. B. J. 267 (Sept. 1959).

requiring drastic measures of reform. For such an exigency is likely to suggest quick remedies of a gadget nature which may actually prejudice the somewhat slower approach of careful and expert study heretofore pursued.⁹ I am troubled, for this reason, by a recent rather hasty field study of the federal courts which is held to have revealed "Shocking Inefficiencies" in federal court administration;¹⁰ and I do not find the title of this symposium, "Lagging Justice," altogether realistic for the general purpose at hand.

For a proper approach to long-time improvements certain basic facts must be kept in mind. First, there are many, many courts in this country; and the caliber of judges, particularly as judicial administrators, varies greatly. In quite a few courts deliberation is a quality rather sought for than eschewed. Indeed a suggestion from the Administrative Office of the United States Courts that six months from the bringing of suit be considered as a normally desir-

⁹ An example in point is that of the English "summons for direction" as administered by the standing masters. This has proved an effective aid to the courts under the English practice with the concentration of cases in London, the outstanding ability of the masters thus available, the division of the profession making the responsible barristers alone in charge of litigation in the high courts, the comparative disuse of the jury, and the limited discovery which the masters somewhat extend. But it is hardly as useful here, and was rejected (for much more extensive discovery *inter alia*) upon adoption of the federal rules. See George Ragland, Jr., *Discovery before Trial* (Chicago: Callaghan and Company, 1932), pp. 227-40; Charles E. Clark, *The Evershed Report and English Procedural Reform*, 29 N.Y.U.L. Rev. 1046 (May 1954); Charles E. Clark, *Difficulties Encountered in a System of Masters*, 23 F.R.D. 569 (1959).

¹⁰ "Shocking" Inefficiencies Found in Federal Court Administration, 43 J. AM. JUD. Soc'y. 56 (Aug. 1959), a review of the "Field Study of the Operations of United States Courts" prepared for the Senate Appropriations Committee by Mr. Paul J. Cotter, staff member.

able time within which trial should have begun in the federal courts has met strenuous objection from the judges, who consider this too short a time for the parties properly to complete trial preparation or to explore the possibilities of settlement—the usual outcome, as we have seen, of the vast majority of the cases. Then it must be noted that really delaying congestion in the courts is found in only a comparatively few metropolitan areas in the country and in only certain of their calendars. Furthermore, the delay centers almost wholly about a modern phenomenon, namely, the vast number of negligence cases, usually arising out of automobile accidents, where the rather slow moving trial by jury is a constitutionally protected form of delay.¹¹ So serious is this problem that one must look in the not too distant future for some really worth-while solution, perhaps the adoption of the so-called "compensation principle."¹² This, be it noted, is a problem

¹¹ A late survey of calendars for personal injury jury cases shows that even for this burdensome litigation there are now only three courts (instead of ten or thirteen at earlier periods) showing delays in excess of twenty-five months, and these were located in Chicago and New York City. *State Trial Courts of General Jurisdiction: Calendar Status Study—1959* (New York: Institute of Judicial Administration, June 30, 1959).

¹² COMM. TO STUDY COMPENSATION FOR AUTOMOBILE ACCIDENTS, COLUMBIA UNIVERSITY COUNCIL FOR RESEARCH IN THE SOCIAL SCIENCES REP. (Philadelphia: International Printing Co., 1932); Fleming James, *The Columbia Study of Compensation for Automobile Accidents: An Unanswered Challenge*, 59 COLUM.

of general public policy, not merely one of judicial administration. Then, too, there is the phenomenon of an exploding population growing by leaps and bounds with which the increase by legislative action of court facilities, and particularly of judicial personnel, has lamentably failed to keep pace.¹³ Thus there are many serious problems which require the most determined and persistent consideration and which cannot be dismissed as obtruding solely because of judicial or even professional inefficiency. And judges for their part must accept an increasing burden of administration on top of the more congenial duties of adjudication.

Hence I would conclude that measurable steps have been taken in improving court administration, but there still remains a substantial task which offers an outstanding challenge to the judiciary and the bar. To the discharge of that responsibility it is to be hoped that this symposium will contribute effectively.

Pre-Trial Procedure

By ALFRED P. MURRAH

ABSTRACT: A departure from traditional procedural concepts was launched by the adoption of the Federal Rules of Civil Procedure. One of the major innovations instituted which diminishes the time required for litigation is the pre-trial conference. This conference between the adversary lawyers and the judge delimits the issues in an action, disposing of uncontested issues, fixing the essential points, and thus often preparing a case for settlement. Though a practical and effective procedure, the full rewards have yet to be reaped. The relative newness of the pre-trial conference and the unequal impact of the expanded litigation have limited its country-wide adoption. Pre-trial procedure recognizes the current conception of a lawsuit: one free from surprise, with all triable issues exposed prior to the courtroom.—Ed.

Alfred P. Murrah, LL.B., Oklahoma City, Oklahoma, is Chief Judge United States Court of Appeals, Tenth Circuit. A graduate of the University of Oklahoma Law School, Judge Murrah practiced law in Oklahoma until appointed to the United States District Court for the state of Oklahoma in 1937. In 1940 he was appointed to United States Court of Appeals. He has served as past Chairman of the American Bar Association, Section of Judicial Administration; member, Board of Directors American Judicature Society; Chairman, Committee on Pre-Trial, Judicial Conference of the United States; and Chairman, Advisory Council of Judges of the National Probation and Parole Association.

THE years since World War II have been years of growth and prosperity for our nation. Research has opened to business new and expanding markets that transcend even those created by the expansion in our population, and the automobile and superhighways have opened new vistas of travel.

These changing patterns of American life have not been without significance to the courts of the land. The fiercely competitive struggles for new markets are finding their way into the judicial forum through antitrust proceedings, stockholders suits, patent cases, and contract actions. The automobile, combined with widespread insurance coverage, has deluged the courts with personal injury tort litigation. The slowness of the courts and the legal profession generally to adjust to these changes and to the increased case-loads in the courts has led to the condition which prompts the title of this symposium "Lagging Justice."

Of course the term "lagging justice" is not applicable to every court. The impact of new litigation has been borne primarily by the large metropolitan courts of general jurisdiction, both state and federal. And even among the metropolitan courts, there are those which have quickly adjusted to the trend and developed new techniques and procedures for dealing with an ever increasing volume of cases. Though the courts are daily fashioning new rules of substantive law to govern the conduct of society and the ever changing forms of business transactions in the manner in which they conduct their own judicial business, many courts have been regrettably reluctant to depart from traditional procedural concepts.

EMBRYONIC PRE-TRIAL PROCEDURE

Just prior to World War II, however, giant strides in improving judicial procedure were made. These culminated in

1938 in the adoption of the Federal Rules of Civil Procedure, a set of rules that emerged from the ideas and techniques pioneered by leaders of the bench and bar. One such technique included in the Rules of Civil Procedure has proven most helpful in the judicial control and management of court dockets. It is the pre-trial conference.

The modern concept of the pre-trial conference was developed in the courtroom of Judge Ira W. Jayne of the Circuit Court of Wayne County, Detroit, Michigan. In experimenting with a docket of mechanics' lien cases in 1929, Judge Jayne discovered that he could dispose of considerably more cases and manage his business more effectively by calling the lawyers to an informal conference in each case prior to trial. Informal conferences, he found, could dispose of uncontested issues and eliminate waste-motions at trial. Furthermore, the reluctance of the parties and of the attorneys to deal specifically with the issues in their case frequently vanished, and out-of-court disposition of the lawsuit ensued. In this respect the policy of the law to encourage the amicable solution of controversies between litigants was fostered.

Conferences between court and counsel before trial undoubtedly had been used by judges prior to 1929, but under the leadership of Judge Jayne these conferences were systematized and made a regular feature of court practice for the first time in Anglo-American jurisprudence.

From Detroit the pre-trial conference, as it was known, spread to Boston and to Cleveland, and then in 1938 it became not just a part of, but a fundamental cornerstone of, the Federal Rules of Civil Procedure.

The Federal Rules liberalize considerably the way in which litigants procure the facts essential to the prosecution of their lawsuits. New discovery proce-

dures enable a party freely to examine his adversary by way of oral deposition on any question surrounding the case. Or he may elect to conduct such examination by written question or interrogatory to which his adversary must respond fully and completely. Witnesses may be examined in almost the same way. Documents relating to the lawsuit may be ordered produced and the injured party may be compelled to undergo a physical examination.

These discovery rules were designed to eliminate surprise insofar as possible as an element in the outcome of a lawsuit and to ensure that cases will be decided on their merits. They do just that. However, a lawsuit after thorough discovery frequently does not look the same. Legal and factual issues appearing in the original pleading papers filed with the court may have evaporated, and other issues may have taken their place. At this point it is the pre-trial conference that is designed to give unity to the case and prepare it for trial.

PRE-TRIAL PROCEDURE: FORMULATING ISSUES

Rule 16, Federal Rules of Civil Procedure, is simply drawn. It provides as follows:

In any action, the court may in its discretion direct the attorneys for the parties to appear before it for a conference to consider

- (1) The simplification of the issues;
- (2) The necessity or desirability of amendments to the pleadings;
- (3) The possibility of obtaining admissions of fact and of documents which will avoid unnecessary proof;
- (4) The limitation of the number of expert witnesses;
- (5) The advisability of a preliminary reference of issues to a master for findings to be used as evidence when the trial is to be by jury;
- (6) Such other matters as may aid in the disposition of the action.

The court shall make an order which recites the action taken at the conference, the amendments allowed to the pleadings, and the agreements made by the parties as to any of the matters considered, and which limits the issues for trial to those not disposed of by admissions or agreements of counsel; and such order when entered controls the subsequent course of the action, unless modified at the trial to prevent manifest injustice.

The pre-trial conference catalytically links discovery with the trial of a civil action. As stated above, pleading papers may have become obsolete, and it is through the pre-trial conference that the court first finds out what the case is all about. What use the court makes of this opportunity to see that the discovery procedures have been completed, to distill the issues, and to crystallize them for trial depends on the skill and understanding of the individual judge.

CIVIL CASES: LIMITED PRACTICE

The simplicity of the federal rule and of similar state rules and their utility in preparing a case for trial are almost self-evident. After twenty-one years of the use of the rule, few lawyers or judges are ever heard to deny its efficacy and practicality. Yet today the pre-trial conference is used in all civil cases by only 50 per cent of the federal judges and by even fewer state judges. Just a few years ago, the percentage was even less.

No complete answer is possible, but part of it can be explained historically. The rules of discovery and the pre-trial conference were entirely new to federal judges in 1938, and a complete transition understandably was delayed. The burden of litigation then was not as heavy, and dockets, for the most part, were not congested.

Actually, there was very little time from the adoption of the Rules before the advent of World War II for them

to become established. The new Rules and the pre-trial conference held promise of a more efficient conduct of a large volume of court business, but wartime controls and limitations on travel brought a decrease in litigation and there was little opportunity for the new procedures to become firmly rooted. This was true both in the federal courts and in the state courts which have been gradually absorbing features of the new Federal Rules into state practice.

Then came the great tide of postwar litigation. In their struggle to keep pace with this tide, many courts either lacked the time or the interest to delve into what new procedural techniques might be helpful. The accident of war and the changing patterns of litigation, it seemed, had suppressed development of widespread knowledge of the Federal Rules and of the use of the pre-trial conference. The tools were there, but skill in their use was lacking.

But there were men of vision who knew and understood the utility of the Rules. Pre-trial procedures were introduced and tested in many jurisdictions by such men as Chief Judge Bolitha J. Laws of Washington, D. C.; Judge James Alger Fee of Portland, Oregon; Judge Arthur F. Lederle of Detroit, Michigan; Judge Ira W. Jayne of Detroit, Michigan; and recently, Judge Clarence Kincaid of Los Angeles, California. In 1945 the Judicial Conference of the United States established a standing committee on pre-trial procedure, and in 1950 a book by Harry D. Nims of the New York Bar, entitled *Pre-trial*, was published under the auspices of the Section of Judicial Administration of the American Bar Association. Under the leadership of the late Chief Justice Arthur T. Vanderbilt of New Jersey, the pre-trial conference was made compulsory in New Jersey. California has recently followed suit. Each chief justice of the United States since Chief

Justice Taft has urged a wider and more efficient use of pre-trial devices.

The pre-trial conference has already proven to be an important device in the administration of justice, but experience with it has not been the same in every jurisdiction. However, it is fair to say that where it has not been productive certain fundamentals were not observed. For an effective pre-trial conference, it is essential that the discovery procedures intended to be used by the parties be completed prior to the pre-trial conference, and that counsel in the light of the discovery undertaken review their cases, preferably at a conference with opposing counsel, to re-evaluate the issues of fact and law they intend to litigate and to set aside the matters upon which they can agree. The court should likewise familiarize itself with the case file. No pre-trial conference can be successful without this preparation.

TRIAL WITHOUT SURPRISE

Many courts, both state and federal, have promulgated rules or orders, the effect of which is to require counsel to exhaust discovery and confer concerning the triable issues in the light of discovery. In this manner counsel comes to the pre-trial conference with knowledge not only of his own case, but his adversary's as well. Some courts have devised a pre-trial notice and check list in which counsel are informed of what is expected to be accomplished at the pre-trial conference. No lawyer, be he for the defendant or plaintiff, wants to go into court unprepared; no lawyer likes to be confronted with a surprise witness or surprise testimony; no lawyer who has any respect for the courts wants the judge to be confronted with a serious question of law upon which he might err if he were forced to make an immature decision.

Thus, we think it is in the interest of the administration of justice that each side of a lawsuit should have an opportunity to learn the adversary's contentions and prospective proof—his witnesses, lay and expert, and the law upon which he relies. It is only after learning of his adversary's case that a lawyer can fairly evaluate his own case in terms of money and properly advise his client as to settlement or other disposition. Pre-trial procedure is designed to bring about a fair and expeditious resolution of every lawsuit. A fair resolution means an open resolution; it means dealing with open hands without surprise or de-

ceit. A conscientious lawyer can recommend a sum of money to his client to settle his case only after positive proof of the possibilities of his adversary's contentions and facts upon which he may be able to sustain them.

Pre-trial procedure is in recognition of the concept that a lawsuit is a search for truth, not a game of chance. In the language of a famous lawyer, it affords the profession "a better chance to give a satisfactory answer to three questions uppermost in his client's mind, namely, what will it cost, how long will it take, and what are my chances of success?"

Impartial Medical Testimony

By BERNARD BOTEIN

ABSTRACT: An impartial medical testimony program provides in essence for the establishment of panels of outstanding, neutral experts in each of the branches of traumatic medicine. Whenever the medical claims of the contending parties in personal injury lawsuits seem irreconcilable, the court may designate a physician from the appropriate panel, who will report his findings to the judge and the respective attorneys and possibly testify if the case goes to trial. The program, in conception and operation, has a two-fold purpose. It is an important factor in the never ending campaign to reduce court congestion and delays, although far from a cure-all for that problem. It is also a very effective instrument in the pre-trial arsenal of measures designed to make a trial a fair and knowledgeable search for the truth. The impartial medical testimony program serves directly and indirectly to discourage the "battle of experts" in the courtroom, which often confuses lay jurors and judges, degrades the judicial process, and stigmatizes two great professions.

*Bernard Botein, LL.B., New York City, is Presiding Justice of the Appellate Division of the Supreme Court of the state of New York, First Department. While a practicing attorney, in 1936 and 1937, he conducted an accident fraud investigation by designation of the Board of Estimate of the city of New York, upon recommendation of the Association of the Bar of the city of New York. He was one of the founders of the Impartial Medical Testimony Project in New York County and is Chairman of the Committee on Impartial Medical Testimony of the Section of Judicial Administration of the American Bar Association. Judge Botein is co-author of *The Slum and Crime* (1935), and author of *Trial Judge* (1952), *The Prosecutor* (1956), and of numerous articles in law reviews and other publications.*

OTHER articles in this issue indicate that the key to the problem of court congestion and resultant delay lies in the handling of the enormous volume of personal injury cases that has engulfed our courts in the past few decades. Many judges are concerned about the skill, as well as the speed, with which these cases are processed. The Impartial Medical Testimony Project was conceived in order to improve the functioning of the courts in both respects.

There are two essential issues to be resolved in the settlement or trial of personal injury cases: (1) liability and (2) damages. The question of liability requires a determination of where the fault lies in the occurrence of an accident. A disputed set of facts on the liability question usually poses problems comfortably within the competency of jurors and judges to understand and decide. Our adversary method for the trial of cases and determination of disputed facts is generally an effective medium for eliciting the truth in a courtroom. The self-interest of the contending parties can be relied upon to cause them to present their proof as fully and effectively as possible.

This does not always hold true, however, with respect to the element of damages in personal injury cases, which is determined upon partisan medical reports or testimony usually involving highly technical and conjectural opinions. Damages for personal injuries are awarded on the basis of the amount of money sufficient to pay the claimant for his past and, if there are any, his future medical and hospital expenses, loss of earnings, and pain and suffering. Computation and assessment of such damages require knowledge of the nature and extent of the claimant's injuries, whether the defendant's negligence was the cause of the injuries, the probable duration of the injuries and, if still per-

sistent, whether they are permanent or may be cured. Expert diagnosis and prognosis are required and, thus, the opinions of doctors are the controlling factor. In this area the adversary techniques too often serve to compound confusion.

The basic premise upon which the system depends is that the arbiters of the facts, be they judges or jurors, possess sufficient insight and experience to resolve factual issues knowledgeably. But in our complex society, there are areas in which technical facts can be the subject of learned and conflicting testimony that defies the comprehension of either judge or jury. And in such a framework the adversary system often degenerates into pure guesswork.

The problem becomes at times unbearably frustrating to jurors and judges when conflicting medical testimony is so elusive and baffling that they can feel no confidence in the validity of any resolution they may reach. If both doctors appear to be honorable and competent men, the finder of the facts faces an almost insoluble dilemma.

THE BATTLE OF EXPERTS

The courtroom scene is further complicated by the fact that, in New York City at least, and in many other large cities, both sides rely to a large extent on testifying experts—doctors who examine the plaintiff not for treatment or diagnostic purposes, but only for the purposes of litigation. These men appear in court frequently, unlike the average treating physician, who usually loathes and dreads court appearances; and they have all developed effective courtroom manners.

There can be little quarrel ordinarily with the courtroom conduct or good faith of the general practitioner or specialist who actually treated the plaintiff. Allowances must be made for the fact that most civil trials take on the color-

tion of private fights, that partisanship is infectious and doctors are human in that regard. The most that can be said of treating physicians is that they will not give their patients the worst of testimony on a close medical question.

The testifying expert, hired by the lawyer and not the patient, is usually much more plausible and ingratiating than the treating physician, and he is almost always fully co-operative. So the courtroom expert is hired, and too often the trial lapses into a battle of opposing experts.

These battles of experts are degrading spectacles in a courtroom—degrading for the legal profession as well as the medical profession. The disgust and bewilderment they arouse in jurors and everyone touched by the court processes breed disrespect for our courts. Medical advocacy, guided by legal advocacy, becomes a marketable commodity. The overwhelming majority of honorable practitioners in both professions are undeservedly stigmatized by a small fringe of unscrupulous or undisciplined or careless lawyers and doctors. This condition is the joint responsibility of the organized groups in both professions.

IMPORT OF LIABILITY DECLINES

Whether or not juries have grown more indulgent in finding negligence upon the part of defendants and absence of contributory negligence upon the part of plaintiffs, or whatever the reason, the liability factor is rarely a bar to a settlement nowadays. In fact, in most claims the vigor with which defendants contest liability has dwindled almost to the vanishing point. Over 95 per cent of all claims are disposed of by some payment to the plaintiff, large or small—payments which tacitly concede some element of liability.

These figures as a general rule reflect the experience of courts in urban centers throughout the country. It must

be borne in mind that in the city of New York most personal injury claims are settled before they reach the courts. In settlement negotiations, plaintiffs and defendants do not quite proceed on an assumption of liability without fault; but it is nevertheless fair to say that the issue of liability emerges as a seriously disputed factor with much less frequency than the question of the damages suffered by the claimant. Damages to claimant have now become dispositive in the settlement of almost all personal injury cases.

Since almost 90 per cent of the civil cases in the city's courts are personal injury actions, some idea may be gained as to the dominance of this branch of litigation in the over-all court structure.

LAUNCHING OF THE PROJECT

In 1952, the Justices of the Supreme Court in the First Department, which comprises New York and Bronx Counties, decided the conditions would not cure themselves and would steadily worsen if affirmative action were not taken. Conferences were initiated among officials of the Association of the Bar of the city of New York, the New York County Lawyers Association, the Academy of Medicine, and the New York County Medical Society. A committee of judges and lawyers, headed by the former presiding Justice David W. Peck of the Appellate Division, presented, for elaboration and refinement, the basic idea of establishing a panel of neutral, outstanding medical experts. It was envisaged that they could be called on by judges to examine plaintiffs, report their findings, and if necessary testify, in cases where there was irreconcilable conflict between the doctors representing the contending parties. The medical profession responded enthusiastically and generously.

Two considerations animated the judges, doctors, and lawyers who col-

laborated in launching the plan. One was an abiding belief that a trial is not a test of wits nor a game of chance, but a sober, logical search for the truth. The Medical Panel Plan was designed as another weapon in the arsenal of pre-trial devices, specifically designed to substitute truth and light for the battles of experts which had so long bewildered courts and juries.

Second, the judges were concerned with the hampering, disorganizing impact of these practices upon the healthy and expeditious disposition of the courts' business. While very few personal injury claims end in the verdict of a jury, nevertheless the amounts awarded by juries are the yardstick by which the parties measure the value of a case in settlement negotiations.

Threading all the conferences was the conviction that two great professions, manned largely by honorable and dedicated practitioners, were being undeservedly stigmatized by an outlaw fringe; and that this condition must be ended or at least checked.

The operative rule

The Alfred P. Sloan Foundation and the Ford Motor Company Fund financed the establishment and operation of a Medical Panel System in the Supreme Court, New York County, as an experimental program for the year 1953. To implement this project the Appellate Division, First Department, promulgated the following Special Rule:

1. There is established in the Supreme Court for the County of New York an office to be known as the Medical Report Office, which shall be in charge of a deputy clerk of the Supreme Court.

2. In any personal injury case in which, prior to the trial thereof, a justice shall be of the opinion that an examination of the injured person and a report thereon by an impartial medical expert would be of material aid to the just determination of the

case, he may, after consultation with counsel for the respective parties, order such examination and report, without cost to the parties, through the Medical Report Office of the Supreme Court, New York County. The examination will be made by a member of a panel of examining physicians designated for their particular qualifications by the New York Academy of Medicine and New York County Medical Society. Copies of the report of the examining physician will be made available by the clerk of the Medical Report Office to all parties.

3. If the case proceeds to trial after such examination and report, either party may call the examining physician as a witness or the trial justice may, if he deems it desirable to do so, call the examining physician as a witness for the court, subject to questioning by any party, but without cost to any party.

Characteristics of experts

The Academy of Medicine and New York County Medical Society jointly and exclusively, without recommendations from lawyers or judges, established panels of leading specialists in sixteen fields of traumatic medicine, such as orthopedics, roentgenology, neurology, neuro-psychiatry, and so forth. To secure as neutral a body of experts as possible, the medical organizations excluded from the panels any physician who had been employed to any appreciable extent by insurance companies or plaintiffs' counsel in personal injury actions.

The fees of the experts for examinations, reports, and for their infrequent trial appearances are now paid out of the regular court budget and have been so paid since 1956. The panel experts are asked to fix their fees in the amounts they would charge patients in moderate circumstances. They have been most reasonable in the bills they have submitted. An annual appropriation of \$15,000 is made each year, which amount generally is entirely exhausted through the payment of fees of panel doctors. In this respect the New York

project differs from those in Baltimore and in the federal court in Philadelphia, where the fees are charged against the parties. It has been the view of the sponsors of the New York project that to assure the appearance as well as the reality of true impartiality and to avoid increasing the already high costs of litigation to the parties, it was essential that the costs should not be shifted to the litigants.

At this point it cannot be stressed too strongly that acceptance and the success of an impartial medical testimony program in a community depends upon the integrity and professional standing of the experts who man its panels. No such project can survive if bench and bar lack faith in the panel members.

THE PLAN IN OPERATION

The mechanics implementing the rule of court are designed to inconvenience all the participants as little as possible. The justice directs the examination, usually after conference with the respective attorneys. He endeavors to allow a time interval of at least two weeks, preferably three, until the resumed conference date, if the case is on the pre-trial calendar; or until an adjourned date if the case has reached the Day Calendar for trial.

The form as filled in by the judge describes the nature of the medical dispute and indicates the specialty of the panel expert who is to examine the plaintiff. This form is entrusted to the attorneys, who proceed to the Medical Report Office. In the attorneys' presence, the deputy clerk in charge, by a process of strict rotation, calls the panel expert whose name next appears on the specialty list. The clerk fixes a date for examination at the panel expert's office which is mutually convenient to doctor, plaintiff, and the respective lawyers. He also arranges to forward to the expert, in advance of his examination, copies of the reports of the plaintiff's and de-

fendant's physicians, as well as the hospital records, if any, so that he may be advised of the respective contentions of the parties. The lawyers for both sides are encouraged to attend at the examination.

The impartial expert examines the plaintiff as thoroughly and in much the same manner as he would examine a private patient. The plaintiff recounts his ailments and medical history and the expert uses such tests and laboratory procedures as he deems advisable. Of course, no treatment is contemplated—only an opinion embodying diagnosis and prognosis. After the examination, the expert mails at least three copies of his report to the Clerk of the Medical Report Office, who sends one to each attorney and the original to the justice. The expert also sends his bill to the office. It is preferable that the reports be distributed a few days before the adjourned date so that counsel and judge will be prepared to appraise and discuss their contents.

At the resumed conference the case is discussed again in the light of the impartial report. If the impartial expert's report has resolved the major points of controversy, the case may be settled. If not settled, the case is remanded to await trial in normal course. The judge passes upon the bill rendered by the impartial expert, and has the power to disapprove payment of any fee he considers unreasonable. Upon approval, the fee is paid from the Project funds.

Medical experts testify

If the settlement attempts fail and the case goes to trial, the impartial expert may be called to testify either by the judge or by one of the parties. In such event arrangements are made for his appearance informally, without subpoena, through the Medical Report Office—never through an attorney request-

ing his presence. When the impartial expert takes the stand, he is qualified just like any other expert, except that the auspices under which he was designated to examine the plaintiff are explained to the jury. If his appearance was requested by the attorney for one side, the opposing attorney may cross-examine him. Sometimes, particularly in nonjury cases, the parties may stipulate to receive the impartial expert's written report in evidence.

Many factors combine to make the pre-trial climate a favorable one, such as the absence of impending trial pressures, the presence of representatives qualified to discuss settlement, and the various pre-trial techniques. The pre-trial conference is held in an informal, relaxed atmosphere, several months before trial, and is conducive to the kind of unhurried judicial inquiry that will elicit whether a report from an impartial expert will be helpful.

When the project was in its experimental stage, references stemmed almost entirely from pre-trial conferences; but now only about half emanate from that source. As the judges have become more familiar with the workings of the panel and more assured of its advantages, they have used it in many more aspects of judicial duties. The Medical Expert Panel is being employed more and more on motions for preferences, motions to remove cases from the lower courts to the Supreme Court, compromise orders in infants' actions, and after nonjury trials.

ESTIMATE OF THE RESULTS

Up to the present time, about 800 cases have been assigned to the Medical Report Office, an average of a little over a hundred a year. From the outset it was realized that the job ahead was a qualitative, not a quantitative one. For example, the first eighty cases that were referred to the Medical Report Office at

the pre-trial stage were selected from 1,500 cases handled in pre-trial conferences. The importance of these relatively small blocks of cases, however, cannot be overemphasized; they certainly cannot be measured in mere numbers. They are the durable cases—not just any hundred personal injury cases out of the several thousand we dispose of in our court each year. The drain of this small number of medically irreconcilable cases on the court resources and the trial judge's time and energy is out of all proportion to their limited number. An inordinately large proportion of these cases do not permit of settlement and therefore go to trial. When we realize that suit is brought in approximately one third of the claims in the city of New York and that only 20 per cent of the claims are placed upon the calendars of the various courts; that less than 6 per cent of personal injury cases placed on the calendar ever go through to completed trial; when we reflect that at most a few hundred personal injury cases are tried to completion in the Supreme Court of the busiest county in New York State in any given year, we can appreciate how substantial an impediment these cases represent in the routing of court business. We can only guess at how many cases were settled because one side feared that referral to an impartial expert would disclose the falsity of its medical claim; or the ratio of cases in which puffing of injuries is discouraged by fear of possible disclosure; or the prophylactic effect of the possibility that their findings will be reviewed by the leaders of their profession has on the excesses of that small band of doctors I referred to earlier.

More precise measurement

As of June 30, 1959, there had been 769 referrals to the Medical Panel from both New York and Bronx Counties. Of these, 500 cases have been settled;

17 have been transferred for disposition by a lower court by consent of the parties; and 34 were virtually marked off the calendar. One hundred twenty-three of the cases that were referred nevertheless went to trial and in a number of them the impartial expert testified.

As might be expected, a major proportion of the referred cases involved injuries with few objective symptoms. About 40 per cent of the cases involved claims of postconcussion syndromes, and about 7 per cent concerned claims of back injuries. In about 29 per cent of all the references there were fracture claims. The panels utilized most often were orthopedics, neuro-psychiatry and roentgenology.

About 5 per cent of the cases required the services of more than one specialist. Sometimes the judge ordering the reference recognized the need and referred the case to two or more men. Sometimes a panel member would request the services of another specialist—very often an X-ray expert. There was some confusion at first, but now when a panel expert seeks the assistance of another expert he clears his request through the Medical Report Office.

It is difficult to determine with any assurance how often the impartial experts have sustained plaintiffs' claims and how often they have rejected or minimized them. For whatever the comparison is worth, the records show that after the impartial examinations, plaintiffs' claims are revised downward more frequently than defendants' offers are revised upward. However, in a significant number of cases the medical claims of the plaintiffs have been found to be thoroughly justified and in some cases, even understated. As a result of the impartial experts' reports, many cases have been settled at figures much higher than defendants offered before the reference, and in a few cases the panel experts discovered traumatic in-

juries that had been overlooked by the plaintiffs' doctors.

THE ROLE OF THE EXPERT

In some cases, particularly in the neuro-psychiatry areas, we find that the panel specialists are unable to resolve the medical conflict; they cannot say whether the plaintiff's claims are valid or unfounded. Even then, the reports, if definite enough on the inability to make findings, have an affirmative value. Both sides must give weight to a statement by a leading physician that neither party can establish its contentions with anything like medical certainty. The tendency is for both sides to pull in their claims from the goal posts toward the fifty-yard line.

There are certain areas of medicine in which the outstanding men are divided into two or more responsible but bitterly opposed schools of thought. There should be no referrals at all in such fields. Neither party should be required to run the risk that mere chance, something akin to the turn of a roulette wheel, will determine whether the case will draw an expert whose previous conditioning will render him hostile or friendly to his side. For example, because of divided medical opinion on the causation of cancer from trauma, we have eliminated the panel covering such cases. It is noteworthy that no case had ever been referred to this panel.

The reports with which we find major fault are those which are vague, rambling, and discursive. They tend to feed and encourage the claims of both sides and heighten confusion in conference or trial. Happily, there are few of that type.

There has been some debate about calling the panel expert as a witness at the trial. Some lawyers and judges seem to feel that the jury will be unduly swayed by the prestige and court im-

primatur of the independent expert. The criticism generally takes the form that the expert should not testify, but only report for conference purposes.

Of course, with such restrictions upon the use of the expert, the value of the Panel would be minimized, if not destroyed. Corrupt or careless doctors or lawyers would not have to fear exposure in court. Also, there would be no settlement leverage if the party affected unfavorably by the impartial expert's report did not apprehend that he would have to contend with his testimony should he go to trial.

Most important, the wholesome purpose of enlightening the jury through objective and competent medical testimony would be defeated; and the overwhelming majority of judges in our Department feel that the jury should not be shut off from this source of enlightenment.

There is no doubt that the expert enjoys a special standing in the eyes of the jury, but this is something he earned before he was appointed on the Panel. His professional pre-eminence and independence were well established. No special privileges or kudos are given the independent expert when he is called to the stand. He is exposed to full examination and cross-examination just as is any other witness. The jury is instructed that his testimony is not to be accepted or given any particular weight merely by reason of his identification. Certainly, a jury charged with the duty of making sense of the conflicting and confounding testimony of paid, partisan physicians can be entrusted with evaluating and weighing the testimony of the independent expert.

POTENTIALS OF THE PROGRAM

It may fairly be said that the Medical Expert Plan offers a significant contribution in the two areas that most con-

cerned those who launched it—in the improvement of medical fact-finding in accident cases and to some extent in relieving calendar congestion.

A Special Committee of the Association of the Bar of the city of New York, composed of judges, doctors, and lawyers, had the original pilot project in charge. The Committee rendered a report which was published in 1956 in book form by The Macmillan Company under the title *Impartial Medical Testimony*. This book will prove rewarding reading for anyone interested in a detailed treatment of the subject.

A Special Committee of the Section of Judicial Administration of the American Bar Association, in reporting on the subject of impartial medical testimony, recommended the establishment of impartial medical panels in centers of population having a volume of personal injury litigation. Its report was approved by the House of Delegates of the Bar Association in 1957, and the Association has now authorized the Section of Judicial Administration to advocate the general establishment of such offices.

The success of the experiment in New York, the endorsement of the idea by many segments of the organized bar and of the medical profession and the educational activities of the Special Committee of the Section of Judicial Administration of the American Bar Association have resulted in the growth of a considerable ground swell of interest in other urban communities. In Maryland there has been in operation for some time an impartial medical plan which differs from that of New York principally in that the charges of the panel experts are borne by the parties rather than by public funds. The Federal District Court in Philadelphia has also adopted such a system and the rule there has been upheld in the United States Court of Appeals for the Third

Circuit and in the Supreme Court of the United States.* Both in Maryland and in the Philadelphia Federal Court the plan is reportedly working with entire satisfaction. In California, Illinois, Minnesota, Massachusetts, and Ohio, both the medical profession and the legal profession are co-operating with the courts in projects looking toward the establishment of systems which would either follow the New York model exactly, or would adapt it to varying local

* *Hankinson v. Van Dusen et al.*, 3 L.Ed 2d 628.

conditions. In New Jersey the project is under study by an official committee of the Medical-Legal Society.

Thus, while it cannot be maintained that the program is in itself a panacea for all the problems of court congestion, it is generally found to have been of help in materially reducing its mischief. It is certainly regarded as an effective aid in promoting the more orderly, accurate, and efficient determination of the rights of the parties in the processing of the many personal injury cases that clog the dockets of our courts.

Decongestion Through Calendar Controls

By IRVING R. KAUFMAN

ABSTRACT: A dedicated group of judges in one of the busiest United States district courts in the country, the Southern District of New York, has analyzed its own enormous backlog problem with a success that merits the study of other courts in similar straits. A thorough survey of the cases then pending on the trial court calendars startlingly revealed that only a few cases were prepared for immediate trial. In the course of screening the nonjury cases, meetings between the judge and the lawyers and litigants generally resulted in pre-trial settlements. During the period in which these pre-trial conferences were held most of the calendar backlog was wiped out and docket currency restored. The results achieved, remarkable in themselves, point to several invaluable lessons about the nature of calendar congestion and the weapons with which it can be combatted. The experience of this district court, located in the business hub of New York with not only one of the largest dockets in the country but adjudicating some of the most complex and time-consuming cases, promises equivalent success for other congested areas where similar techniques are instituted.—Ed.

Irving R. Kaufman, LL.B., New York City, has been a United States District Judge, for the Southern District of New York, for over ten years. A graduate of Fordham University School of Law, Judge Kaufman has been interested in the problem of calendar congestion and its cure for many years, having written extensively on the subject. He is a member of both the Pre-Trial Committee and the Committee on the Administration of Criminal Law of the Judicial Conference of the United States.

BY June 30, 1955, the United States District Court for the Southern District of New York had reached a critical stage in its continuing effort to administer justice. Over the preceding years the number of new suits instituted in our court each year had been increasing at an alarming rate. Our civil calendars contained a total of 5,630 cases awaiting trial. Parties in jury personal injury and death actions were forced to wait an average of three and one-half years from the time their case was placed upon the calendar until it could be reached for trial. Other calendars were as much as two and two and one-half years behind. Such a long wait for the final adjudication of a controversy threatened seriously to impair the rights of litigants. It was, therefore, a situation which the judges of our court could no longer tolerate.

In 1955 a three-judge committee, composed of Judges Sylvester J. Ryan,¹ Archie O. Dawson and myself, was created to study ways and means of combatting and eliminating our calendar backlog. The task that lay before us was indeed formidable. The first step in the search for a solution was an analysis of the cause of our problem.

CAUSE OF THE LONG DELAY

One fact was immediately apparent. Our backlog was not the product of judicial lassitude. Our judges were producing to the maximum of their capabilities. This, despite the fact that a relatively high proportion of the judicial business in this court, located as it is in the heart of the nation's greatest financial and industrial center, consists of patent, copyright and trademark suits, stockholders' derivative actions, anti-trust proceedings, admiralty litigation and other matters which tend to be more complex and time-consuming than the

¹ Now Chief Judge of the Southern District Court, New York.

average. For example, statistics released by the Administrative Office of the United States Courts reveal that the Southern District of New York handles annually roughly one fourth of the national total of copyright cases, one third of government civil antitrust actions, one fifth of private antitrust suits, 35 per cent of the admiralty and maritime actions, and more than one half of all Jones Act suits involving injuries to seamen. Because of this high proportion of complex commercial litigation in our court, mere statistics comparing the size of our case-load with that of other courts do not fully reveal the disproportionately large share of federal judicial business handled annually in the Southern District of New York. And yet, even on a bare statistical basis our workload is far above the average. For example, in fiscal year 1958, the national average "Civil Caseload Per Judge" for the federal courts, based upon new cases filed, was 259 cases, whereas 374 new cases were filed per judge in the Southern District. From the foregoing it is apparent that each judge in our district carries a staggering burden of judicial business. Any attempts to increase that burden would not only endanger the health and welfare of the judges but would seriously jeopardize the rights of the litigants by undermining the quality of judicial craftsmanship.

Judge's work schedule

An examination of the average judge's work schedule will further reveal the reason for this conclusion. Judges normally "sit," that is, are engaged on the bench between the hours of 10:00 or 10:30 A.M. and 4:00 or 4:30 P.M. daily, with an hour out for lunch. This is the time when the judge is "on display" and the layman's knowledge of what judges do is often limited to the view gained at that time. However, before the judge ascends to the bench in

the morning and when the judge descends from the bench and returns to his chambers in the evening, he usually carries with him an accumulation of problems that must be solved during the remaining hours of the day and which, indeed, do carry over into his evenings and week ends. Evidentiary problems must be studied and researched; jury charges must be drawn; voluminous motions decided, opinions written, and so on, all during the judge's nonbench hours. More frequently than not, cases previously tried without a jury and marked "decision reserved" await the judge's determination and the writing of an opinion whenever the judge finds the opportunity. Almost inevitably, many of these matters overflow into the judge's so-called "summer vacation" and must await the close of the court year for determination. The summer months are precious to the judge, not only as an opportunity to set in order accumulated work before the onslaught of a new court year, but as a time to attend conferences and symposia on problems of judicial administration, attend committee meetings of the Judicial Conference, and to become up to date on his reading of other court opinions, legal periodicals, voluminous reports of the Administrative Office of the United States Courts, and so forth. Thus, between the pressures of ever-present reserved decision work, and the endeavor to improve their professional competence, it is not uncommon for conscientious judges in busy districts such as ours never truly to take a vacation, but to be engaged in the "business of judging" virtually twelve months of a year. Any solution based upon the imposition of an increased work-load on the judges, though it may have an appealing ring in newspaper articles, seeks in effect to find a thirteenth month in the judge's year. It is, therefore, quite obviously grounded upon an impossibility.

Though these facts make apparent the need for new judgeships in the Southern District of New York, this was a "solution" to which the committee did not address itself. The creation of new judgeships is a matter for Congressional action. Since our committee was created to suggest a solution based upon the best utilization of the materials at hand we turned our attention to the consideration of other possible approaches.

TRIAL COURT CALENDARS

As a start, we canvassed all of the 5,630 cases on our five civil calendars. For each case on the calendar, the attorneys were required to file a certificate with the calendar clerk of our court stating whether or not the case was ready to proceed to trial. The results of this poll startled us. Out of the 5,630 cases on the calendar only 799 certified that they were ready in all respects. It became apparent that the long delay between the time a case was placed on the calendar and the trial had caused many attorneys almost automatically to place every case on the calendars without waiting until their trial preparations were complete and with little regard being paid to the possibility or even probability of settlement. Thus our trial calendars did not present a true picture of the cases where litigants were ready and anxious for a trial. This meant that cases were often settled almost on the eve of trial or adjourned because of nonreadiness. The result was so-called "calendar breaks" which frequently caused judges in the most congested trial parts to remain idle until additional cases ready for trial could be summoned. Our poll made it apparent to us that to some degree at least our backlog was more specter than substance. We had pictured our calendar congestion problem as similar to a logjam on a river, where many logs accumulate along the river because they all

arrive at the same time at a narrow point through which they can go only one or two at a time. But if, in reality, the logs have not yet all arrived at the narrows, but are evenly spaced along various stages of the length of the river, then there is no logjam, though there may be the same number of logs in the river. So too, calendar congestion means a jam-up of cases which are all actually ready to be tried but can only be reached a few at a time. If, in fact, only a handful of cases are ready and the rest are still in various stages of preparation, then there would be no calendar congestion, though the court dockets might contain a great number of actions.

Pending cases reviewed

While the certificates filed by the attorneys were revealing, they did not provide us with all of the information needed. We wanted to know whether in certifying that their cases were ready to be tried, the attorneys meant that they were presently ready in all respects, or whether they were merely indicating their estimation that the case would be ready by the time it could be reached. We, therefore, determined that in order to gain an accurate picture of the present status of our calendars it was necessary for us to call in the attorneys on each case that had been marked "ready" and put this question to them: "Counselor, if you had the opportunity to try your case tomorrow, would you be ready to do so?" These calls could also provide us an opportunity to discuss with the attorneys the merits of their respective positions in order to determine whether the case might be disposed of without the necessity of a trial.

In October of 1955 Judge Ryan and I proceeded to call in these cases. I called in the cases on the three nonjury calendars of the court, while Judge Ryan was in control of the two jury

calendars. We each served a two-month term in this capacity as so-called "Part I Judge," after which we were succeeded by other judges of the court.

In the course of the nine-month court year from October 1955 through June 1956, our judges called everyone of the 5,630 cases pending on the calendars plus an additional 1,599 cases which were added to the calendars during the year. Of this total of 7,229 cases, 5,429 were terminated, largely as a result of the new screening procedure, eliminating a backlog representing over eight years of court time.

Nonjury calendars

Perhaps some insight into how this seeming miracle was accomplished can be gained if I tell you about my personal experience in calling the nonjury calendars.

In a two-month period, I called 1,856 cases, or three fourths of the then pending nonjury case-load. In the informal atmosphere prevailing at these screening conferences, I would encourage the attorneys really to reveal their claims and defenses. Each side would learn—often for the first time—the precise grounds on which the other party was actually basing its case. Excess claims and verbiage would be thrust aside, and the result was that one third of the cases called were settled. Thus, in those two months, pre-trial screening was responsible for 605 settlements in nonjury cases alone. Similar results were obtained by Judge Ryan in the jury part, and these achievements were continued by Part I judges throughout the year in a process which cleared not only our calendars, but those of the attorneys as well.

In numerous other actions which could not be settled, the issues were narrowed for trial, and vital stipulations were entered into. Where the parties to an action were not ready for trial, the case would be either marked off the

calendar subject to restoration, or adjourned to a later hearing in Part I, thus affording the ready case behind the non-ready cases a justified early trial. Sometimes if there were dilatory tactics on one side, and the other party was prepared, a case would be peremptorily marked ready for a set date.

Only when all parties to an action were completely prepared for trial and where settlement seemed to be completely out of the question would a case be placed upon the appropriate ready calendar.

Results achieved

This screening process bore fruit almost immediately. At the end of the first two months, the admiralty calendar, which had been two years behind, was current, as was the nonjury other than personal injury calendar, which had formerly accumulated a two and one-half year backlog, while the current status of the nonjury personal injury calendar was retained. I might add that this was a gratifying surprise to all of us, for when the new system was devised, we did not believe that the nonjury, nonpersonal injury calendars would lend themselves to disposition as effectively as the jury personal injury cases. As of June 30, 1956, all five civil calendars of the Southern District were current. This represented a fantastic achievement in case sorting.

Formerly the cases on our civil calendars ranged from the completely prepared to the absolutely unprepared—although, I must say, there were very few cases in the former category. The cases ranged from the necessary-to-be-tried to the never-to-be-tried, and from the one day case to the case which requires two months and longer. We screened them all and separated the wheat from the chaff to find out exactly what we were dealing with.

Indeed by January 2, 1956, most of

our calendars were current and we inaugurated a new rule designed to keep them that way. This rule requires that a notice of readiness for trial be filed along with the customary note of issue before any case can be placed upon a calendar of this court. That rule has dramatically cut the number of cases being added to our calendars—positive proof that attorneys were filing notes of issue prematurely. For example, in the three months before the rule was promulgated, we averaged 188 new cases per month. In the following three months, the average dropped to 56 cases per month, and that figure included many restorations of actions previously marked off calendar in Part I.

A further result of the Part I procedure was that we greatly reduced the problem of calendar breaks, and the judges were thus able to try a larger number of civil cases than ever before in our court's history. The trial judges worked with the calendar judges as a co-ordinated team which disposed of more business than has ever been disposed of in the Southern District. The judges of our court had a job to perform, and they did it with the utmost dispatch. The results could never have been attained without the enthusiasm and hard work of all the judges of this district.

JURY CALENDAR THREATENS

But amid this sunny picture, there were a few dark, threatening clouds hovering chiefly over our jury personal injury calendar. At the end of June 1956, there were over 630 jury personal injury cases which had been placed on the Ready Calendar awaiting trial. Since these cases had been through Assignment Conferences, we viewed them as a "hard core" of cases that must be tried. We were, therefore, fearful that another backlog was building up; that the cases which we removed from the calendar

last year would return as ready cases at a much quicker rate than we could dispose of them.

In October 1956, as the Civil Jury Part I judge assigned at the commencement of our term, I called these ready cases for another screening conference and for assignment to trial. The results were unexpectedly and overwhelmingly gratifying.

Before I get to these results, it would be well to review the background of the cases which were called. An action is not placed on the calendar until one party certifies that he is completely ready for trial; that all the necessary pre-trial examinations have been completed, and so forth, and that his adversary is ready or has had reasonable opportunity to be ready. The litigant must further certify, under our new Calendar Rule 5(b) (6), "that he has unsuccessfully approached the other party as to the possibility of settlement or the reason why he has not done so." When a party disputes the assertion that he has had reasonable time to complete his preparation and opposes the placing of the case on the calendar, a hearing is held before the Part I judge at which time inquiry may be made as to just what the issues in the case are, in order to discover whether more time is actually needed. To the extent that this results in the litigants unfolding their cases and discussing the merits of their claims and defenses, it resembles an informal pre-trial conference. To the extent that the relative weaknesses and strengths of their respective positions are revealed, settlement possibilities are enhanced. If the party's note of readiness and note of issue are accepted, the case is placed on the Permanent Calendar, shortly after which it is placed on the Reserve Calendar. The cases are then called, in the order in which they were placed on the calendar, to an Assignment Conference. The judge will

ask the attorneys, at that time, to further consider the possibility of settlement and he will offer his services to moderate a settlement conference if they believe that will make it more productive. At the conference the judge will encourage the lawyers to discuss their positions frankly and to make a concerted effort to settle the case. Where the parties request it, the judge will recommend a figure which he believes reasonable. If the parties cannot come to an agreement and if they signify their readiness for trial, they are placed on the Ready Calendar. In a great many instances, the attorneys seek adjournments or postponements for various reasons. In determining whether to grant the adjournment or mark the case off the calendar, the judge often suggests further settlement talks and again offers his assistance. Thus, before the case is placed on the Ready Calendar the attorneys usually have been before a number of judges, have discussed the basic problems with them, have rejected the possibility of settlement and, theoretically, are fully prepared and anxious to go to trial. Therefore, it was believed and assumed that the cases on the Ready Calendar represented a "hard core"—cases that must be tried.

Pre-trial settlement

Toward the end of the first year under our new calendar procedure, however, the judges began to notice that about 25 per cent of these actions were being settled by the judge assigned to try them. In order to avoid this wasteful consumption of precious trial time, it was felt that, despite the fact that these cases had undergone between one and three previous conferences, a final effort should be made to bring the parties together before they were assigned out for trial. This was called the Final Conference. The results were highly gratifying. With the period of time be-

tween placement on the Ready Calendar and call to a Final Conference to reconsider the weaknesses in their position and the strengths of their adversaries', and with the added anxieties accompanying the approach of trial, an exceptionally large number of lawyers decided to settle their cases at these Final Conferences.

Before the 1956 summer recess we started to build up a backlog of cases which had been through Final Conference but which were not reached for trial. The attorneys were told to be ready to go to trial the following October.

"Hard-core" cases settled at Final Conference

However, in view of our previous experience with "hard-core" cases, I decided, as Civil Jury Part I judge, to call these cases once again to a second Final Conference to see if there was any change in position over the summer, instead of simply assigning them to the judges in trial term. Of the 67 cases in the jury personal injury and death calendar, which had been through a previous Final Conference as well as at least one Assignment Conference, 38 were settled; 6 were adjourned to a future term; 4 were permanently discontinued or dismissed; 8 were found far from ready for trial and were marked off the calendar; and only 11 or about 16.5 per cent were really ready and willing to go to trial. Of the 11, one was settled at trial just before the judge was about to charge the jury. The number found ready for trial among the jury personal injury and death cases which had not been through a previous Final Conference but which had been through at least one Assignment Conference, was, of course, lower. Among jury cases other than personal injury or death the outcome was still more astounding. It was even more difficult to find cases

there which were ready for trial. During the six weeks in which the calendar was called, I screened a total of 1,107 cases of which only 120 or about 11 per cent signified a desire to go to trial. Of the 120, many were later settled in the trial part before actually going to trial and two were settled during trial.

The results of these six weeks indicated that our fears were premature. The backlog melted faster than the proverbial snowball in hell. During the October 1956 term, every case on the jury Ready and Reserve Calendars was screened, including cases which were first placed on the calendar the last day of October. During the last week of the term, cases on the Reserve Calendar were called for Assignment Conferences immediately after they reached that calendar. And there was one period when cases were assigned out for trial the day after they were placed on the Ready Calendar. Where there had been 630 cases on the jury personal injury Ready Calendar before that calendar was called for trial assignment, at the end of the term there were only about 18 cases which had to wait a few days for trial assignment. No case on the jury-other Ready Calendar was left waiting for trial assignment.

NATURE OF CALENDAR CONGESTION

During this period we not only wiped out our calendar backlog but we also learned some invaluable lessons about the nature of calendar congestion and the weapons which must be employed to combat it. We learned that congestion breeds more congestion, and, conversely, that the possibility of an early trial leads to speedy disposition of litigation, often without the need for a trial. It must be borne in mind that roughly 92 per cent of the actions instituted in our district are terminated without a trial. The great problem in calendar control is to keep the 92 per cent

from blocking the path to the courtroom of the remaining 8 per cent that must be tried. There are many cases which, for various reasons, will not be settled until the very eve of trial. Thus it is important in bringing about the early disposition of these cases that the trial calendars be clear so that the parties can feel the hot breath of a waiting trial part. In this manner, once congestion has been eliminated, the calendars help to maintain themselves in a current condition.

On the other hand, our experience has taught us that once the trial calendars begin to run several months behind, they no longer accurately reflect the status of the cases awaiting trial. In the months intervening between the conference and the time the case reaches the top of the calendar, the positions of the parties have often undergone a change. Further, as soon as an element of delay enters the trial calendars the attorneys once again begin placing cases on the calendars before they are truly ready; immediately the first ominous rumblings of the avalanche of calendar congestion can be heard. The only cure for such a condition is the rescreening process which I have already described.

COMPLEXITY AND QUANTITY

In the years since the introduction of our new calendar system, the number of cases commenced each year in our district has mounted at an accelerating rate. Since 1955 the annual number of new cases has increased over 55 per cent. In fiscal year 1959 alone, 6,561 new civil cases were commenced in the Southern District of New York. Had it not been for the increased efficiency resulting from the new calendar system, we would have been completely engulfed by this heavy influx of new business. So effective were our calendar procedures, however, that as of June 30, 1959, our five calendars contained a

total of 1,496 cases of which only 894 had been marked ready—this despite the fact the during most of the period that the new calendar system has been in operation, our district has been undermanned due to unfilled judicial vacancies.

These results would not have been possible but for an extraordinary effort on the part of all of the judges. During the 1959 court year, 334 cases were terminated per judge in the Southern District. This is almost 100 cases per judge more than the national average. But the mere fact that more cases were disposed of per judge in our district than in other districts does not reveal the full story. For "the problem of the complicated case" exists to a high degree in this district. Indeed, it has the largest number of "long and complicated cases" in the country.² More than one third of the government antitrust cases pending in the United States District courts are in the Southern District of New York. In addition, 117 private antitrust cases are presently pending in our district. Although precise figures are not available, it is believed that this represents approximately one half of the number pending throughout the country.

The long duration

These cases normally involve extensive pre-trial preparations not infrequently covering a period of several years. Often the trial of such cases lasts for many weeks in the course of which literally thousands of documents and other exhibits are introduced. As an illustration, an antitrust suit went to trial in the Southern District in which the pre-trial preparations alone consumed over two and one-half years of actual hearings. More than 100,000 pages of depo-

² April 1959 SENATE APPROPRIATIONS COMM. REP., FIELD STUDY OF THE OPERATIONS OF THE UNITED STATES COURTS 25, 54.

sitions were taken of approximately 173 witnesses. As many as 45,000 documents were marked as exhibits and over 700,000 pages of documents were produced. While it is true that not every case is so complex, most involve a great deal of pre-trial preparation in which the court is frequently called upon to hold hearings and decide many issues that arise between the parties. But such preparation before trial is only a part of the picture. Once it has been completed a judge is then called upon to devote his full time to the trial of the case. The full services of such a judge are often lost to the court for a period of many months. Some years ago, for example, an antitrust case was begun in the Southern District which consumed the full time of the trial judge for over a year. During the course of the trial 40,000 pages of testimony were taken all of which had to be carefully weighed and considered by the judge. Complex conclusions of fact and of law had to be made upon the basis of this voluminous evidence. This is an extremely tedious and difficult process which continues to occupy the judge's time even after the actual trial has been completed. Litigation of this type constitutes a continual and severe drain upon the judicial manpower of the court from the moment of its inception, over a period of years in some cases, until judgment is rendered.

The antitrust cases are not the only ones which consume an extraordinarily large amount of judicial time. Patent, copyright, admiralty, and other commercial cases also often fall into this category. For example, the limitation of liability proceedings involving the *S.S. Andrea Dorea* and the *MV/Stockholm* are reported statistically as two cases. However, they actually represent many separate suits, one for each claim. In these two cases, there were approximately 3,500 claims filed, many of which involved settlement of infants' and de-

ceased persons' claims. Much time of the Court³ was devoted to informal hearings in chambers, discussions, and the approval of papers. The two cases represent approximately 5,662 typewritten lines in the court's dockets. Over 100 claims were settled and orders of compromise passed upon by the court.

Criminal cases may also fall into the category of the protracted case. Two years ago I presided at a trial of eighteen alleged narcotics conspirators. The trial lasted over ten weeks. Before trial could be commenced, much time was devoted to conferences and other preliminary and preparatory work.

The few cases I have cited are but examples of the many similar cases that arise regularly in our district. Indicative of the volume of cases that are filed in the Southern District of New York is the fact that during the 1959 court year a total of 10,350 motions were on our motion calendars. The number of large cases has been increasing steadily as is indicated by the fact that the number of motions has increased over 32 per cent since 1957. At the time of the writing of this article the writer is once again engaged in the trial of a long and complex criminal trial involving twenty-two defendants, which is expected to last three months.

During the weeks or months that a judge is engaged in a single large case, he would have been able to dispose of many smaller cases on our calendars with less strain on his physical energy. When several of our judges are engaged in these large cases it has a crippling effect upon our calendars, for the so-called "run-of-the-mill" cases must wait for the judge in the "big" case to return to these cases.

Despite these obstacles, because of the energy and ability of Chief Judge Ryan and all the judges of our court,

³ Judge Lawrence E. Walsh, now Deputy Attorney-General of the United States.

we have somehow managed to keep our calendars in order.

CONTINUOUS EFFORT

While we have had a large measure of success up to the present time, we have not lost sight of the fact that only through continued study and experimentation with improved techniques can we hope to keep abreast of our mounting case-load. Most important among the projects now under consideration is the employment of several standing masters or quasi-judicial officers to undertake some pre-trial duties. It is my hope that the use of standing pre-trial masters will bring about earlier disposition of many actions and also release judges from many administrative functions for their more important work in the decisional phase of cases.

In 1955 when our three-judge com-

mittee began to seek solutions to our calendar problem, the obstacles that lay before us seemed virtually insurmountable. We had hoped to make improvements—perhaps at some long-distant future date finally to bring our calendars to the point where they would be current. What actually happened was that our problem burst like a balloon when analysis and study showed us where to thrust the needle. We know now that proper calendar controls can prevent congestion, even in the face of a case-load as heavy as ours. But we have also learned that where new filings are as heavy as they are in the Southern District of New York, backlogs snowball rapidly once they get a start. Thus, only through constant vigilance, through a process of screening and rescreening of our cases, can we remain current. We are determined to afford all litigants a speedy resolution of their controversies.

Judicial Statistics

By ORIN S. THIEL

ABSTRACT: Judicial statistics are used by both the sociologist and the court administrator. What will satisfy one may be very unsatisfactory to the other. As this issue of *THE ANNALS* is devoted to the problems of the courts, the discussion of statistics is centered around their use as a management tool for the court administrator. The history of federal judicial statistics is reviewed and a detailed description is given of the statistics that are now collected and published by the Administrative Office of the United States Courts. The problems that are faced by the statistician who prepares the statistics and their interpretation and use by court administrators conclude the article.

Orin S. Thiel, A.B., J.D., Washington, D. C., is Assistant Chief of the Division of Procedural Studies and Statistics. He has been with the Administrative Office of the United States Courts since 1941 and has held his present position in the organization since 1951. A graduate of the University of Chicago, Mr. Thiel is a member of the bar of Wisconsin.

THERE is no dearth of literature dealing with the subject of judicial statistics. The subject has received detailed attention from many experts. Depending on personal points of interest, the authors represent two fairly distinct groups. One group, the sociologists, wants judicial statistics presented in such a manner that it will help them to understand human behavior—criminal behavior, for example. As students of the social sciences they are interested in examining the judiciary and its functions as a segment of organized society. They rightly are disturbed by the lack of adequate statistics, especially at the state level, and the lack of comparability among the few statistical reporting systems that do exist. The other group, the professional managers of the courts, —the chief judges, the court administrators, and the bar which is interested in improving the administration of justice —looks for entirely different information in judicial statistics. To them judicial statistics are a matter of business, a tool to aid in good administration, the profit and loss statements and the balance sheets of a truly big business—the business of administering justice surely, quickly, and economically.

As this issue of *THE ANNALS* is devoted to the problem of congestion in the courts, this discussion of judicial statistics will be related to their use in the management of the affairs of the courts, rather than for their sociological implications.

If congestion is to be successfully attacked it first must be identified. And the more specifically the problems or bottlenecks are identified, the more likely adequate reforms will be applied. This is the role of statistics in the hands of the court administrator.

HISTORICAL BACKGROUND

The first published statistics concerning the federal courts appeared in the

ANNUAL REPORT of the Attorney-General for the calendar year 1871. Civil suits to which the United States was a party were classified in five divisions. Presentation of criminal statistics began at the same time. A few years later the Reports began to give some data on non-government cases in the federal courts, but only admiralty causes were separately classified.

Through the years there were some changes and amplifications in the method by which the Department of Justice presented the statistics. Beginning with 1922 the government civil and criminal cases were classified in ten divisions. The published tables set forth the number of civil cases or criminal proceedings which were pending at the beginning of a fiscal year, the number commenced and terminated during the year, and the number pending at the end of the year. Private civil cases which by then were a substantial part of the work of the district courts were unclassified in the statistical reports except for admiralty suits.

The statistical information that has just been described was published separately for each United States district court, each district requiring one printed page. Thus almost one-hundred pages were required to present these data each year.

By the early thirties it became apparent to court authorities and scholars that the statistical tables in the Annual Reports of the Attorney-General had, in their present form, outlived their usefulness and were ripe for a general overhauling and revision. The ten general nature of suit or offense classifications no longer reflected the types of cases actually being handled by the courts, and although a more detailed classification was available for all district courts combined, the individual district court statistical tables failed to reflect what was going on in these courts.

THE PUNCHED CARD SYSTEM

In 1935 a major change was made in the method of collecting the statistical data. Likewise, a major change also was made in the final presentation of the data in the Annual Reports. This change was adopted on the recommendation of a committee appointed by the National Commission on Law Observance and Enforcement (the Wickersham Commission). The committee's chairman was Professor Charles E. Clark, dean of the Yale Law School, and now chief judge of the United States Court of Appeals for the Second Circuit, and for the past fifteen years chairman of the Judicial Statistics Committee of the Judicial Conference of the United States. With him on the committee were two of his colleagues from the Yale Law School faculty—Professor William O. Douglas, now associate justice of the Supreme Court, and Professor Thurman Arnold, who afterward became a judge of the United States Court of Appeals for the District of Columbia Circuit.

The major change recommended by the committee was the adoption of an individual case-card system of reporting. This change was fundamental. Therefore, all of the reports were prepared from summary reports furnished by the clerks of the courts. This system of having the clerks prepare the reports while the headquarters office merely combined them had the inherent weakness of leaving to the discretion of almost one-hundred clerks the problem of classifying cases. In many instances this led to errors and inconsistencies. Too often clerks would not agree on the same classification category for identical kinds of cases, especially where the classification was on the borderline between two categories. To centralize responsibility for classification it was apparent that an individual case-card report giving only factual information would be highly

desirable. Classification could then be performed by a small, trained, and supervised group which would lend consistency and reliability to the final product.

Equally important was the content of the individual case cards recommended by the committee. Separate initial and final report cards were proposed. On the initial report, in addition to identifying information, the basis of jurisdiction was checked and a brief but complete description of the nature of suit or action was required. On the final report the clerk checked the nature of disposition of the case, the procedural steps through which the case had passed, and the nature of the judgment entered, if any. These cards are the prototype of the cards now being used by the Administrative Office of the United States Courts.

THE FEDERAL COURT SYSTEM

With the establishment of the Administrative Office of the United States Courts during the closing months of 1939 most of the statistical functions that had been performed by the Department of Justice were transferred to the new organization. By section 604 of Title 28, United States Code, the Director of the Administrative Office is charged with the duty of collecting judicial statistics and transmitting statistical data and reports as to the business of the courts to the chief judges of the circuits quarterly, and annually to the Judicial Conference of the United States, to Congress, and to the Attorney-General.

The statistical system of the Administrative Office is built around the punched card. Clerks of all federal circuit and district courts report monthly on separate cards information concerning each case commenced and each case terminated in their respective courts.

From the information so received,

quarterly and annual reports are prepared and published. The annual report is especially replete with textual comments and detailed tables concerning the work of the federal courts for the previous year. Besides the usual tables showing numerically the volume of business, detailed information is given concerning the kinds of cases that have been filed and those which remain pending, the type of court activity required to dispose of various kinds of cases, and the median time interval from filing to disposition, from filing to trial, and from issue to trial in cases disposed of where a trial had commenced.

More detailed information concerning the statistical methods employed in the Administrative Office of the United States Courts is given in Appendix I.

Committee of judges advise

Often some form of judicial supervision over the collection and publication of statistical data is desirable. Throughout most of the years that the Administrative Office of the United States Courts has been functioning, it has had the benefit of the advice and experience of a Committee on Judicial Statistics, appointed by the Chief Justice on authorization of the Judicial Conference of the United States. Until recently the chairman of this committee has been Chief Judge Charles E. Clark of the United States Court of Appeals for the Second Circuit, whose interest in judicial statistics has been life-long. The present chairman is Chief Judge Harvey M. Johnson of the United States Court of Appeals for the Eighth Circuit. The other members of the Committee are prominent judges known for their active interest in judicial statistics and court administration. They are: Chief Judge John Biggs, Jr., Court of Appeals for the Third Circuit; Chief Judge Richard H. Chambers, Court of Appeals for the Ninth Circuit; Judge Arthur F.

Lederle, Eastern District of Michigan; Chief Judge Royce H. Savage, Northern District of Oklahoma; Judge Leonard P. Walsh, District of Columbia; and Judge Harry C. Westover, Southern District of California. The collaboration of this Committee with the statistical organization produces two desirable results: First, the work is reviewed by the Committee and suggestions are made from the viewpoint of judges who are vitally interested in having statistics reflect as nearly as possible the status of the work of the courts; second, the judicial approval given to the work by the Committee encourages other judges to utilize more fully the services offered. Furthermore, the Committee makes recommendations directly to the Judicial Conference of the United States on such matters as the creation of additional judgeships, based on information collected and presented to it by the Administrative Office.

THE STATE COURT SYSTEMS

The establishment of state administrative offices for courts has been a highlight in the postwar progress of bringing business-like administration to the judiciary. Approximately half of the states now have statutory offices headed by court administrators, executives or coordinators. While there is little uniformity in the particular duties assigned the various officers, the collection of judicial statistics is one of the more common responsibilities imposed. In a number of states where administrative offices have not been created, judicial councils still perform the function of collecting and publishing court statistics.

At the present time around thirty-five states collect judicial statistics. This is a remarkable increase in number—as recently as 1955 fewer than twenty state organizations collected statistics.

But the statistics in their present state leave much to be desired. They suffer

from a number of serious defects. Some jurisdictions collect statistics, but do not publish them. And a number of administrators, either because of lack of funds to employ qualified personnel or for other reasons, collect only the most sketchy statistical information. This obviously makes it impossible to rely on any uniformity when comparing statistics of the various jurisdictions.

This is not to say that adequate statistics are an unknown quantity in the states. A number do a splendid job in the field, such as California, Michigan, New Jersey and New York, just to mention a few. A sample of the form of the quarterly report on judicial business made by the clerks of the circuit courts in Michigan to the Court Administrator appears as Appendix C of the report entitled *Court Administration—1959*, published by the Institute of Judicial Administration of New York City, which furnishes research assistance to the National Conference of Court Administrators. In the Michigan report the statistics show with respect to criminal actions, civil law suits, and chancery actions the flow of cases during the quarter, the age of the median case which was tried, the number of pending cases over two years old, the number of trials in which juries were empaneled and the number of days spent by juries, and the aggregate number of days or half-days in which court was in actual session.

All indications are that there will be a steady improvement in state court statistics. Because of their value to administrators in avoiding congestion and laying the foundation for the assignment of judges, their development appears assured.

JUDICIAL STATISTICS PROBLEMS

Scholars in the social sciences are all too aware of the difficulties that are inherent in attempts to assign definitive values to certain types of social activi-

ties. Judicial statistics, in their attempt to measure legal activities, are not free from these difficulties. There is more involved than the counting of cases, the posting of tables, and the drawing of charts.

Before any data are collected, the judicial statistician is faced with the troublesome problem of selecting and defining the unit of counting or reporting. As far as the reporting of civil litigation is concerned, the case is the usual unit. In criminal proceedings a number of choices are available—the defendant, the offense, and the case or indictment. As a unit of work-load in civil litigation the case is notorious for its unreliability.

Yet, despite the lack of blacks and whites and the tremendous area covered by the various grays inherent in the case unit, the count of civil actions by the case is effective when used with caution and discretion. It is when its limitations are forgotten that difficulties arise. The case count achieves greater reliability when limited to a single judicial system; it exhibits its greatest weakness when comparisons are attempted of statistical reports from diverse judicial systems. Within a single judicial system a certain amount of "averaging out" will occur among the component parts of a statistical report, especially as numbers grow larger.

Aids to the administrator

There are a number of aids to the user of judicial statistics that are based on a case unit which will help him to avoid pitfalls. It is imperative when a table is examined showing the number of cases filed during a period or pending at the end of a period that a table showing the natures of suit of these cases also be examined. This will give the reader some insight of the values he should assign to the numerical data appearing in the case-count table. The

casual user of judicial statistical tables will, of course, have much more difficulty than the experienced reader. One of the reasons why judicial statistics are often criticized is a failure to understand what is being presented and its limitations. The apparent inability to understand judicial statistical reports or to make any effort to learn about them by those who would profit the most from their use is discouraging. Whether he is aware of it or not, the administrator experienced in the use of judicial statistics subconsciously makes allowances for many of their shortcomings. He always remembers that certain districts are unusual because they have many cases of certain kinds that are not filed in volume in other districts; he remembers that one district may require that each tract of land being condemned in an eminent domain proceeding be filed as a separate case, while in another district one-hundred tracts may be filed as one case. He remembers that seaport districts will have many admiralty cases which will not appear in the inland districts. As his familiarity with his courts grows, his ability to use their statistics with increased reliability will grow. To the uninitiated, these statistics may be deceptive and unreliable; to the administrator in his battle against court congestion, they are indispensable weapons.

In order to eliminate some of the bias present in statistical tables where the case is used as a measure of the work-load, studies have been made for the purpose of establishing index figures which could be applied to various kinds of civil cases. This would make it possible to portray more accurately the burden factor of cases and to present statistically a weighted case-load table. With the help of a number of judges the Administrative Office of the United States Courts has conducted studies to determine the amount of time required by them to dispose of different kinds of

cases. The index figure does not indicate how much time one particular case will require. But when the index figure is applied to a number of cases, a reasonably accurate picture is given of the time that will be required to dispose of them. This information is of great value when determining the amount of congestion present in a court's pending case-load. The studies showed that civil cases between private parties in the federal courts took three times longer for their disposition than civil cases to which the United States was a party.¹

THE COURTS USING STATISTICS

There are a number of ways in which statistics will point out where effort should be expended to expedite the work of the courts. A few will be discussed here.

A very important function of statistical reports is to call to the attention of an administrator the areas where congestion exists. It would be more desirable to have the statistics point out those areas where congestion is beginning to exist so that remedial steps can be taken before the delays become chronic. It is usually not difficult to detect areas of congestion. To confirm the fact of congestion in a district, one can start with a statistical table showing the number of cases commenced and terminated over a period of years and the number pending at the end of each year. An increase in filings, a decrease in terminations, or both, showing an increase in the pending case-load, if substantial, require further investigation.

The currency of dockets

Next, a table showing the kinds of suit in pending cases and the length of

¹ THE ADMINISTRATIVE OFFICE OF THE U. S. COURTS, DIRECTOR'S REP. FOR THE FISCAL YEAR 1956, at 173-193.

time they have been pending on the docket should be examined. This may disclose a number of possibilities. If an unusually large number of cases of a particular kind are pending, the increased load may not indicate congestion, but rather an unusual situation in the district out of which a number of identical and companion cases arose. In the next step, the number of cases pending in each nature of suit should be considered, bearing in mind the probable amount of time and effort that will be required of the court to dispose of each, in order to ascertain whether a greater than usual number of hard-core cases are pending. Old cases should be especially scrutinized. Where a number are pending in the same nature of suit, it may be advisable to examine the original, initial docket report cards. Names of parties and unusual descriptions of kinds of actions often contain clues explaining why cases have not been terminated.

The column showing the number of cases terminated each year should be examined. If the increase in cases pending is due to progressively fewer cases being terminated, the reasons for this decrease should be searched for and established. Perhaps there have been vacancies of long duration in some of the judgeships; perhaps long illnesses have kept judges from their work. A glance at monthly trial and pre-trial report tables may show whether an extremely long antitrust, patent, or criminal trial has taken all of a judge's time to the detriment of other cases.

The length of time it takes a court to reach the trial stage in a civil case has always been a good indication of the currency of its dockets. Throughout its history the Administrative Office of the United States Courts has computed and published tables showing the median time intervals from filing to disposition and from issue to trial for cases which

were terminated during a given fiscal year after having reached the trial stage. The information contained in these tables is made an integral part of every report dealing with the docket conditions in the district courts. Showing the minimum number of months, which in some districts has been as much as four years, that half of the litigants have had to wait to get their cases tried and disposed of, is a forceful way to impress the evils of congestion and to begin taking corrective measures.

Personal survey interviews

In many instances full knowledge of the operations of a court, the condition of its dockets, and the reason for any congestion which exists can only be secured through a personal survey conducted by a qualified person. Such surveys have been made from time to time in the past by the staff of the Administrative Office of the United States Courts and a program for even more intensive and more frequent inspections is now under way in the federal courts. Talking with judges and their supporting personnel and with the clerk and his staff will often confirm or disprove tentative conclusions which were based upon the examination of the statistical material. In any court where congestion exists, the causes can be fairly well established from an inspection of sufficient statistical data and a personal inspection of the court.

State court administrators may find it difficult to find time for such surveys, but the importance of visiting the large courts cannot be overestimated. Exceedingly competent reports on docket conditions are made annually by some clerks of court in the federal system and a recent report by the Chief Judge of the Southern District of New York is a model of a thorough analysis of docket conditions, nature of the case-load, calendar operations, and court

needs of the largest district court in the federal system.²

Remedial steps indicated

The reasons for congestion often suggest what remedial steps must be taken. If a definite shortage of judge-power appears to be of a permanent nature, the creation of additional judgeships is an obvious remedy. In this process judicial statistics will play a most important part because Congressional committees considering requests for additional judgeships invariably want these demands adequately documented with factual information, that is, with statistics. If the shortage of judge-power is due to illness or long trials, temporary help from other courts may be the solution. Or, if the court is one of limited jurisdiction, as the federal courts are, a narrowing of their jurisdiction will reduce case-loads and possibly congestion. This is what happened when the Act of July 25, 1958 increased the jurisdictional amount required in diversity of citizenship cases from over \$3,000 to over \$10,000. The effects of such legislation were statistically examined when it was proposed and after it became effective. For the fiscal year 1959, in which the Act was effective, there was a decrease, during the last eleven months, of 17 per cent in the number of all civil cases filed in those districts with exclusive federal jurisdiction. Private civil cases commenced decreased 23 per cent. Cases filed in the diversity of citizenship category dropped almost 33 per cent. However, the effect on the pending civil case-load has been comparatively small.

It may be that a study of the statistical material of a district indicates little use of pre-trial conferences and other procedures of time-saving value. Per-

haps calendaring practices are obsolete and need revising. Throughout a thorough statistical survey of a court, a number of clues for improvement will reach the eye of the experienced administrator.

Temporary judge transfers

If there is a congested court which needs temporary help, the problem arises where this help can be secured. Again the court statistics are examined. But instead of looking for signs of congestion, the administrator will look for signs of currency and excess judge-power. Courts which can furnish help exist in the federal system, and their judges in the past have furnished a very considerable amount of assistance to districts with congested dockets. For example, in the fiscal year 1959, visiting judges served 3,559 days in other districts, including 499 days in the Eastern District of New York, 68 in the Southern District of New York, and 92 in the Eastern District of Pennsylvania.

In the state systems very great inequities between the case-loads of judges have existed in the past and the transfer of judges to the metropolitan areas has been regularly employed. With the recent creation of administrative offices in a number of states, these transfers are increasingly made on the basis of the knowledge gained from the collection and analysis of judicial statistics on comparative case-loads.

Jury expenses

In addition to the state of the dockets, the administrator will be interested in having the courts operated efficiently and economically. Again he will need the information obtainable through statistics. A good example in this area is the control of jury costs. Unless statistical records are kept of the number of jurors who are paid after being summoned to report, and the number thereof

² Report by Chief Judge Sylvester J. Ryan to Chief Judge Charles E. Clark of the United States Court of Appeals for the Second Circuit for the fiscal year ending June 30, 1959.

who are actually used to fill the jury box, the waste of money and of the time of jurors can reach surprising proportions. The Administrative Office for a number of years has collected monthly statistics on the number of jurors summoned and paid, the number thereof serving or challenged, and the number in reserve (not used). The publishing of data on excessive costs of jurors has resulted in tighter administrative control in many districts and the general improvement of the system by substituting more efficient jury pools for individual jury panels in multiple-judge districts.

An example of an excellent use of the punched-card system as an instrument of administrative control is the litigation-reporting system now in use in the Department of Justice. It is designed to give the Department up-to-date information on what steps are being taken by the United States attorneys to dispose of actions pending in their files. This, obviously, is information sorely needed by top-level management, for it permits the Attorney-General to review systematically all pending actions and to check on the currency of the field offices. A short description of this system is given in Appendix II.

Statistical reporting is imperative for any modern court system. Without it the judges and administrators are in the dark concerning their inventory of cases, the time it takes to dispose of them, and the causes, if any, of delay. The postwar establishment of many state administrative offices will undoubtedly hasten the development of more effective state judicial statistics.

APPENDIX I

The following is a short description of the statistical procedure used in the Administrative Office of the United States Courts. For the sake of brevity only the method used in processing civil

statistics will be described here. All district court clerks are supplied with blank initial and final civil docket report cards. These are unpunched IBM cards. Both cards provide for the entry of an established district, office, and docket code number. The docket number is entered on both cards as well as the names of the parties. The dates of filing and termination are likewise entered on the proper cards. On the initial docket card the clerk also reports whether the case is an original action, removed from a state court, remanded from an appellate court, reopened, or transferred from some other United States district court. The nature of suit or action is also briefly but completely described. Cards representing cases that are brought under the diversity of citizenship jurisdiction of the district courts also show the residence of the parties. The final civil docket report card shows the manner in which the case was disposed of, the procedural progress made by the case, the dates and length of the trial, if there was a trial, the results of any motions made for a summary judgment, the nature and amount of judgment, if one was entered, and the name of the judge disposing of the case.

The initial civil docket report card when received by the Administrative Office is checked for consistency, the nature of suit is reduced to a numerical code number, and the entire card is then punched. When all cards have been punched and verified, it is possible to make a number of important statistical tabulations easily and quickly on electric accounting machines. Among the more important of these are the tabulations showing the number of cases filed in a given period in each district and throughout the country as a whole by their natures of suit or action. Entering this information in a comparative table which shows this information for two consecutive periods immediately in-

dicates where changes in types of litigation are occurring.

By punching an initial civil docket report, it is possible to maintain a current file of pending civil actions, adding for each month new cases commenced and extracting those cases that have been terminated. Thus, at the end of any given period it is possible to list all cases pending in a district in docket number order or in nature of suit order. A very effective table is a tabulation of cases pending which have been arranged in nature of suit order showing the number of cases in each suit according to the time which has elapsed since the date of filing.

The final civil docket report card received by the Administrative Office contains sufficient information so that the time and effort required by the courts to dispose of cases can be fairly well gauged. Currently, the Administrative Office is publishing a table annually showing the type of disposition of civil cases by nature of suit. It is divided into three rough parts: those cases terminated by a judgment which was contested on the merits; those cases terminated without a contest or by the consent of the parties; and finally those cases which are transferred to another district, remanded to state courts, or consolidated with other actions. While this table is published for all districts as a whole, the Administrative Office records contain the same information in tables by district and they can be produced for each court, or even for each judge.

Other reports are received by the Administrative Office which will be mentioned briefly because of their importance in determining the degree of efficiency with which the courts are operating.

A report is received monthly listing every trial that has been commenced, showing the days consumed in trial, and

the judge presiding. A similar report, showing only jury trials commenced, is devised primarily to show the number of jurors summoned and used.

Initial and final report cards also are received for all district court criminal proceedings, showing the offenses charged and the type of disposition of the charges against the individual defendants. Probation officers report the number of individuals they place on and remove from their records each month as probationers, parolees, mandatory releasees, and military parolees, and the number of investigations they make. All bankruptcy petitions filed and concluded are reported monthly. Cases filed and terminated in the eleven United States courts of appeals also are reported monthly.

APPENDIX II

The basic tools of the Department of Justice litigation-reporting system are few and easily described. For example, a two-part, snap-out form measuring 10½ by 8 inches is used to report an initial civil claim. The first sheet of this form is printed on heavy stock and becomes the master record in the United States Attorney's office. The second, or carbon sheet, is mailed to the Department of Justice for use in preparing a punched-card record of the claim or action. The carbons are mailed the same day they are prepared. The top half of the form provides for the entry of all pertinent data in the claim, including such items as the names of the parties opposing the United States and their attorneys, the nature of the cause of action, the agency involved, and the amount claimed. All entries except names are entered in numeric code form, to expedite processing at headquarters. The bottom half and reverse side of the form provide space for entering all subsequent actions or proceedings and the dates they occurred. A detailed numeric

action code is used to report this progress.

When the carbon copy is received by the Department in Washington a docket card is punched. This card remains with the Department as its record of a pending claim. A mark-sense card is duplicated from the docket card and is returned at once to the proper United States Attorney's office where it is placed in his file of pending matters. Whenever any change in status of the claim or case occurs, an entry is made on the 10½ by 8 inch master-record form, the punched card for the action is pulled and the nature of the change of status is entered on the card in numeric code by means of the mark-sensing feature. This card is then transmitted to Washington, where it is automatically punched. If the change of status did not close the case or claim, a new dupli-

cate mark-sense punched card is sent to the field office to report the next subsequent change. This marking and punching of change of status cards continues as long as the case or claim remains open.

The Department's file is brought up to date monthly by adding new matters, making the necessary status changes, and eliminating closed claims and actions. Machine lists are then prepared for use by the staff in Washington and also by each United States Attorney, who is furnished a copy. For the larger offices matters are listed separately for each assistant attorney. When this monthly report of pending matters is run, the accounting machine automatically flags any matter when the date on which the last change occurred indicates that the claim is now in a delinquent status.

Court Administration: Housekeeping for the Judiciary

By LELAND L. TOLMAN

ABSTRACT: There is a growing popular and professional interest in court administration which has resulted in the establishment in some twenty-five American judicial systems of governmental agencies or officers concerned with the mechanics of running the courts. This is a hopeful sign, because though it will not be a panacea for congestion or delay in the courts, it will greatly help the courts to make their proceedings, facilities, personnel, and financing more efficient, and better enable them to meet the demands of the complex and voluminous litigation of modern society. The administrative machinery considered best for adoption in most states and which has been the pattern in those jurisdictions that have been most effective in this field is the Model Act of 1948, proposed by the Commissioners of Uniform State Laws. It is basically similar to the New Jersey law adopted as part of its constitutional reform of 1947, and provides for a centralized administrative control of all state courts and judges by the chief justice under supreme court rules of administration and with assistance from an administrative director and his staff acting under the direction of the chief justice.

Leland L. Tolman, Ph.B., J.D., New York City, is the Deputy Administrator for the Judicial Conference of the State of New York in the First Judicial Department, comprising the counties of New York and Bronx in New York City. Until 1955, when he assumed his present position, he was Chief of Business Administration in the Administrative Office of the United States Courts. He has served with the United States Supreme Court Advisory Committees on Rules of Civil and Criminal Procedure, and as an attorney in the Anti-Trust Division of the Department of Justice. In addition he was secretary of the Council of the American Bar Association's Section of Judicial Administration for four years and is now a council member.

THE congested calendars of metropolitan trial courts throughout the country and the consequent delay in those courts in the disposition of cases have been the springboard for a heightened interest in the housekeeping problems of the judiciary both among members of the legal profession and other groups concerned with the public welfare. This has led to establishment in a number of the states and cities of new offices and techniques for the administration of the courts. A recent issue of *State Government News*, a monthly publication of the Council of State Governments, which is concerned entirely with the governmental activities of the states, devoted two of its eight pages to reports from the states of news items in the field of court administration.¹

This mounting interest in the methods of conduct of court business is a hopeful sign of the times. The better administration of justice surely requires the use of modern management techniques in the operation of the routine day to day business of the courts. And there is no doubt that the provision of modernized machinery that will bring sound administration to the procedures of the judicial establishment can do much to help in the elimination of the law's delay.

ADMINISTRATION AND DELAY

Although there is much to be accomplished by an improved and efficient court administration, it must not be thought that the need is keyed solely to calendar congestion and delay. Mr. Justice Brennan, of the Supreme Court

¹ *State Government News*, Vol. 2, September 1959, pp. 4 and 5, discussing developments in Alaska, Illinois, Nebraska, New Hampshire, Washington, and the National Conferences of Chief Justices and Court Administrative Officers convened in Miami, Florida, for their respective annual meetings.

of the United States, has observed that "... chronic calendar congestion is usually a sign of bad judicial administration. But, definitely, it is not true that the absence of calendar congestion is the sign of good judicial administration."² And, the mere existence of a generally approved system of court administration is not, on the other hand, a guarantee against calendar congestion or a cure for it. In the federal courts, where the attention given to court administration in the past twenty-odd years has been more devoted and intelligent than in any court system in the world, there has been at the same time a chronic and growing complaint that the calendars in many districts are unduly congested and the disposition of cases is increasingly delayed.³ And even in New Jersey, where the court system is highly efficient, the number of pending cases increased last year to such a degree that the Chief Justice, who heads the state's administrative system, emphasized the urgent need for remedial action at the annual meeting of all the judges with representatives of the Bar in May of 1959.⁴

Other factors discussed in other articles in this publication are at least as responsible as any lack of administration for the long standing difficulties in the federal courts and the temporary reversals in New Jersey. The very word "congestion" is a hard one to define in this context. It is extremely unlikely that it exists in all parts of any court system. The mere fact that there are

² William J. Brennan, *Modernizing the Courts*, (New York: Institute of Judicial Administration, 1957), p. 2.

³ ADMINISTRATIVE OFFICE OF THE U. S. COURTS ANN. REPORTS, 1949 through 1959; April 1959 U. S. SENATE APPROPRIATIONS COMM. REP., FIELD STUDY OF THE OPERATION OF THE UNITED STATES COURTS.

⁴ No. 28 AMERICAN BAR FOUNDATION, COURT CONGESTION 3-4 (Nov. 1959); JUDICIAL CONFERENCE OF NEW JERSEY, ELEVENTH ANN. PROCEEDINGS (May 8-9, 1959).

many cases on the calendars is not in itself bad. It is only when cases do not advance through the courts rapidly and in an orderly way that there is "congestion." Similarly, court "delay" generally exists to an extreme degree only in big cities. It is almost impossible and sometimes inappropriate for the courts to attempt to cure "delay" when it is caused by the wishes and acts of litigants and lawyers for both parties in the case. But these two conditions—"congestion" and "delay"—are certainly evils that strong administration in the judicial system would strive mightily to correct—to the extent that courts can correct them.

The broad power for administrative officers freely to assign judges from one court or area of the state to another will make it possible to use the help of judges who are not fully occupied in courts where dockets are light in the busy metropolitan courts where calendars are heavy and many cases cannot reach trial for years. The power given the court administrator to assist the judges in devising methods for the processing of cases will make it possible for the courts to act quickly and effectively to meet conditions causing delay or congestion in particular parts of the system and, like other organizations that handle a large volume of business, to experiment with new procedures, many of which are described elsewhere in this issue, that may expedite the disposition of cases generally.

COURT'S ADMINISTRATIVE NEEDS

To be sure, courts, old and settled as they are, have never operated without administration. The means for this were simpler when society was less complex, as they were for all the social functions. But the judicial establishment, like those that serve other fundamental social and economic needs of

community life, such as education, employment, communication, and distribution, has changed and grown in this second half of the twentieth century, so that administrative techniques adequate for a hundred years ago are more or less useless in our times. The courts of any modern city are so huge and complex that they can hardly function without provision for the central collection and analysis of current and accurate judicial statistics, the planned assignment of judges, the orderly and regular calendaring of cases, and the constant development and inauguration of new case processing procedures, not to mention the ordinary housekeeping functions of budgeting, purchasing, staffing, and building maintenance for an operation costing millions of dollars yearly. Indeed, it takes a surprising amount of ingenuity and it is a rather remarkable fact that in some states and municipalities the institution of justice does not collapse completely with the archaic and decentralized administrative machinery that must be made to serve the essential operational purpose.

The ancient and simple local administrative techniques are just not enough for modern justice. There must be a more or less centralized control, under the direction of the judiciary, capable of giving over-all administrative help in the administration of the courts. Such an institution will provide for a court system the services that come from the central executive offices of a large business. They will develop and supervise the functioning of personnel policies, the budgeting, purchasing and accounting procedures, and record keeping for the courts. They will assist the judges to devise procedures for the channeling of new cases through the various steps of the judicial process to the ultimate trial and disposition in a prompt and efficient way. They will install and operate accurate statistical systems that will

give current and meaningful inventories of pending litigation and reflect the magnitude and speed with which the incoming cases are being entered on the calendar and the outgoing cases terminated. Thus, judges can be promptly assigned by the appropriate official to courtrooms where they are most needed, and procedures can be geared to meet the changing conditions of court calendars.

PATTERN FOR CENTRAL OFFICES OF COURT ADMINISTRATION

The present interest in providing machinery for organized central administration of the courts has been directed primarily to plans patterned somewhat along the lines of the federal Judicial Conferences, Councils, and Administrative Office, which are described elsewhere in this issue, or a more centralized modification of that design, as in New Jersey under the constitutional reform of 1947. There the ultimate administrative responsibility rests with the Chief Justice of the State Supreme Court, under rules of administration formulated by the Supreme Court; and staff assistance in the performance of these administrative duties is provided through an Administrative Director of the Courts and his office, working under the supervision of the Chief Justice. In general, this pattern is considered more suitable in the states than the federal plan, although in some jurisdictions the federal design has been strongly recommended.

In New York, for example, for almost one hundred years the state has been divided into four more or less autonomous judicial departments, two in the metropolitan area of New York City, and two in the more rural upstate areas. In this respect, its structure corresponds somewhat to the judicial circuits which have long featured the organization of the federal judicial system and which now underly its administrative machinery.

In New York, also, each department has its own intermediate appellate court, each of which traditionally exercises a degree of administrative control over the trial courts within its appellate jurisdiction. Thus, it corresponds again with the federal judicial circuits and their courts of appeal which, as circuit councils, are the principal executive organ in the administrative structure. Like the Supreme Court of the United States, New York's highest court (called the "Court of Appeals"), has never actively exercised direct powers of judicial administration over the lower courts and judges except when questions of an administrative nature necessarily arise in litigation coming before it in the usual way. Thus as in the federal system, a Judicial Conference of representative judges of various courts appeared to be preferable to New York's highest court or its chief judge as the central administrative organ. In view of all these similarities, it seemed wise in New York to urge the development of an administrative structure for the courts following generally the lines of the federal pattern and this is the structural basis of the Judicial Conference of the State of New York, established in 1955, which will serve as a framework for the administrative powers to be vested in the courts under the pending amendment to the judicial article of the New York State Constitution.⁵

⁵ See, for example, NEW YORK TEMPORARY COMM. ON THE COURTS REPORTS, PRELIMINARY REP. (1954); REP. LEG. DOC. NO. 45, pp. 11 ff. (1955); LEG. DOC. NO. 18, pp. 7, 47 (1956); LEG. DOC. NO. 6(a), pp. 17, 52 (1957); NO. 1, LEG. DOC. NO. 36, p. 13 (1958); ASSOC. OF THE BAR OF THE CITY OF NEW YORK, *Bad Housekeeping*, pp. 17-19, 150-159 (1955); Arthur T. Vanderbilt, *The Challenge of Law Reform*, (Princeton, N. J.: Princeton University Press, 1955), pp. 121 ff.; PROPOSED CONSTITUTIONAL AMENDMENT RELATING TO THE COURT SYSTEM (S. Print, No. 4319); McKinney, 1959 *Session Laws of New York*, pp. LXI ff.

Aside from limited areas of adaptability such as these, there has been criticism that the federal plan is not sufficiently strong administratively.⁶ Indeed, no less an authority than the Chief Justice of the United States is reported to have said only a few weeks ago, in an address before the Federal Bar Association:⁷

It is certain that the Federal judiciary will simply be unable to keep pace with the great forward strides in the economic and social growth of our country with the acceleration and complexity of scientific progress as long as it lacks an adequate number of judges, lacks simplified procedures, and improved administration.

THE MODEL ACT

So it has seemed preferable in most jurisdictions where there has been a movement to strengthen the administration of the state courts to follow in general the New Jersey pattern. The most widely known version of this is embodied in "The Model Act to Provide for an Administrator for the State Courts," prepared and approved by the National Conference of Commissioners on Uniform State Laws in 1948.⁸ That proposal is framed to fit the needs of a court system of smaller dimensions than those of New York State or of the United States Courts. It is designed to weld all of the courts of the system into a single administrative unit, with strong centralized direction centering in the highest judicial officer. This object is easier to achieve if it is accompanied

⁶ April 1959 U. S. SENATE APPROPRIATIONS COMM. REP., FIELD STUDY OF THE OPERATIONS OF THE UNITED STATES COURTS 2-5, 10-11, 14 ff.

⁷ No. 28 AMERICAN BAR FOUNDATION, COURT CONGESTION 3.

⁸ "Model Court Administrator Act," *Uniform Laws Annotated*, (Brooklyn, N. Y.: Edward Thompson Co., 1957), Vol. 9, p. 253 ff.

by and made a part of a modern and unified court structure, as it was in New Jersey and Puerto Rico and, most recently, in Alaska and Hawaii. But such a system can be extremely useful even without a wholesale reorganization of the courts. In Maryland and Michigan it was adapted to the existing court structure, seemingly with great success. And this year in Illinois, after the failure on popular referendum of proposals for extensive modernization by constitutional change of the plan for organization of the courts, an administrative structure with an administrator and, for the Chicago metropolitan area, a deputy administrator, under the control of the State Supreme Court has now been inaugurated by legislation, with strong expectation that it will achieve much in the way of improving court management and reducing delay, particularly in Chicago, where that problem is so severe.

The objectives of such an office of administration are well stated in the prefatory note published by the National Conference of Commissioners on Uniform State Laws with the Model Act of 1948.

There should be a responsible head to aid in directing the business affairs of the courts but without any power of supervision over the judicial function vested in the courts. The judiciary should be more closely integrated in order that the business end of the judiciary may be operated in a more efficient manner. In most states there are probably a sufficient number of judges to handle all of the judicial business promptly; but there may be congested dockets in some districts while in others the judges are idle. How many judges are needed in a county or district; is the judicial manpower so used that the services of all the judges is being fully utilized; are some judges overloaded and unable to keep their dockets current? An administrator could ascertain the facts and suggest the appropriate remedy. Efficient modes of

procedure may be in operation in some districts while outmoded methods prevail in others. To minimize delay the courts must be so manned, equipped, and organized that they may handle the maximum load promptly and efficiently.

POWERS OF AN ADMINISTRATOR

The powers of the administrators, in the jurisdictions where they exist, are various. Under the Model Act (1) the administrator is to examine the administrative methods and system employed in the offices of the clerks and other adjuncts of the courts; (2) he is to examine the state of the dockets and determine the need for assistance in any court; (3) he is to recommend to the chief justice the assignment of judges to courts in need of assistance and follow his directions in arranging assignments as needed. Here the Model Act presents an alternative which permits the administrator on his own initiative to assign judges. The proposed alternative has not been adopted in any state, probably because it is generally considered that this power involves questions of policy that should remain in the hands of judicial rather than administrative officers; (4) he is to collect and compile statistics and make reports on the transactions of judicial business and transmit them to the courts for appropriate action; (5) he is to prepare and submit court budgets. The Model Act limits this to state appropriations. It should probably be broadened to cover local appropriations as well, since in many states the courts are, in varying degrees, locally financed; (6) he is to draw requisitions for the expenditure of state appropriated funds; (7) he is to collect statistics and report on the expenditures of state and local money appropriated for the courts; (8) he is to obtain reports from clerks of court on cases delayed beyond specified periods of time;

(9) he is to act as secretary of the judicial council or conference of judges, if the state has such an institution; (10) he is to formulate and submit to the chief justice or highest court, recommendations of policies which he believes will improve the judicial system; and (11) he is to attend to any other matter assigned to him by the highest court or chief justice.

To make it feasible for him to exercise these powers, it is specified in the Model Act that judges, clerks, and all other officers, state and local, must comply with his requests for information relating to the business transacted by the courts and public moneys expended for the maintenance of the judicial system. The Act also provides for an annual conference of judges and lawyers to consider and advise on matters of court administration.

Exercise of powers

Offices established in the states after this pattern exhibit great variation in the extent to which their enumerated powers are exercised.⁹ Also, many of them have additional powers either conferred upon them by the judges under the general authority to do whatever is required or by specific enumeration in the basic act. Thus, most of the offices devote a great part of their time to the handling of complaints about the activities of particular judges or court officials and otherwise concern themselves with

⁹ The following jurisdictions have offices of court administration: Alaska, California (Los Angeles), Colorado, Connecticut, Idaho, Illinois, Iowa, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Missouri, New Jersey, New Mexico, New York, North Carolina, Ohio, Oregon, Puerto Rico, Rhode Island, Virginia, Washington, Wisconsin, The District of Columbia, the United States Courts, and, soon, Hawaii. For details of their powers see Institute of Judicial Administration, *Court Administration*, (New York, 1959), 1959 symposium.

public relations. Some of them—but none so extensively as in the federal system—maintain specialized personnel offices, fix salaries, set standards of employment, and in general perform civil service functions for the courts. Others devote much time to the preparation and consideration of rules of practice and procedure for the assistance of legislative, executive, or judicial bodies or for bar associations, judicial councils, or conferences. In at least two states the court administrator arranges the editing, printing, and publication of the decisions and opinions of the courts. Most of them spend a great amount of time in work as liaison officers for the judiciary in its relations with the legislative and executive branches of state government or with the federal government or other state governments. All of them are at the beck and call of the judges for any administrative or research job that may be assigned to them. They investigate particular courts and talk with judges, lawyers, public officials, and court employees regarding the manifold and changing problems of their daily work with and in the courts.

THE MODEL ACT REVIEWED

In 1958, the National Conference of Court Administrative Officers received and considered a careful report of a special committee appointed by it to study the provisions of the Model Act in the light of the ten years that had elapsed since its publication and the experience of conference members. The National Conference includes in its membership thirty-four officials concerned in one way or another with the administration of the court systems of twenty-two states (including Alaska), the Administrative Office of the United States Courts, the District of Columbia, and Puerto Rico. The report of its committee, which was approved by the con-

ferencees, recommended no change in the Model Act. It was the general view of the conference that each state must plan its own enactment to suit its own needs, and that the Model Act in its present form was as good a start for this as any. The conference directed, however, that the suggestions, comments, and criticisms regarding the Act collected by the committee be distributed generally for the information and help of those concerned with drafting legislation for the establishment of offices of court administration in particular jurisdictions.¹⁰

To illustrate somewhat the use of management techniques in the operation of courts, it may be helpful to say something here about the New York court structure and to mention one or two of the administrative problems in New York City.

THE NEW YORK COURTS

New York's courts have been variously described. Most of the descriptions have been uncomplimentary. It has been said that the first thing to notice about them is that they do not comprise a court system at all. Certainly they are not integrated to any substantial extent, and their operation lacks centralized administrative control to a marked degree. But they constitute one of the major operations of government in the state. In New York City alone, their total cost today is now probably close to \$40,000,000 a year. In recent years they have been a center of attention and great efforts have been made to better their methods of operation.

Organizationally, there are in New York City three tiers of courts dealing

¹⁰ COUNCIL OF STATE GOVERNMENTS SECOND REP., COMM. ON THE REVISION OF THE MODEL ACT TO PROVIDE FOR AN ADMINISTRATOR FOR THE STATE COURTS (Chicago, 1958).

exclusively with civil litigation and three separate tiers which are concerned solely with enforcement of the criminal law. In addition, there are two specialized courts which do not fall clearly within either category; the Surrogate's Court, handling primarily the administration of decedents' estates and the Court of Domestic Relations, concerned primarily with problems of juvenile delinquency and marital support.

The courts for the settlement of civil disputes begin with the Municipal Court of the City of New York, which has jurisdiction of small claims and of suits where amounts up to \$3,000 are involved. Next in the scale is the City Court of the City of New York, which handles civil cases where the amount claimed is not more than \$6,000. At the top is the Supreme Court, theoretically possessing jurisdiction over all kinds of cases.

Each of these courts is handling a tremendous amount of litigation and each of them handles its own cases in its own way, without regard to the calendar arrangements of other courts. Thus, a single lawyer may find himself faced with a call to try a case in several different tribunals at the same time, while other lawyers, eager to have their cases tried in one court may find that they are unable to do so because their opponents, although willing, are tied up by the call of another.

EFFECTIVE CALENDAR SYSTEM

The two courts of intermediate appeal in New York City, called the "Appellate Divisions," have between them a certain amount of general supervisory and investigatory power over all of the courts of the city. This they exercise themselves, directly in some instances, through their review of decisions and their rule-making power in others, and through Departmental Committees of

Court Administration, which are a part of the structure of the over-all Judicial Conference of the State of New York. The administrative authority, however, is not extensive and generally not positive, but rather co-ordinating and advisory.

Laying aside ordinary administrative problems of management such as the qualification, employment, and compensation of personnel; the provision for adequate plant and structure; the installation of suitable record-keeping procedures and systems; and the general supervision of as large an organization as the New York court system, the most pressing problem of administration in the civil courts is the method by which cases are channeled through them from the time of their inception until they are ultimately terminated by settlement or judgment. This "calendar system" is truly the heart of the court process. For the orderly handling of litigation in such a tremendous volume would be impossible if the system should break down, and it is the cause of much of the complaint of "delay." The problem is particularly complicated because its solution does not lie solely within the courts' own organization. The judicial process, by its very nature, must necessarily involve a good measure of elasticity for the negotiation of adverse points of view before it is possible to perform the ultimate act of entering a judgment which will dispose of the dispute with legal finality. Indeed, the tradition of advocacy requires that the courts should not interfere unduly with the formulation by the adversaries of their respective contentions and the development of the issues between them. But good court administration does require that when a case is brought to the court's attention, the channels should be clear so that if both parties are ready for trial the case can be advanced to disposition at as early a date as possi-

ble. And the courts have a duty to see to it that neither party prevents adjudication simply by stalling for time. Difficulty in meeting these obligations arises because cases are often brought to court before they have been made ready for trial or before the parties even know their relative strengths or weaknesses. Thus, it has been almost impossible for the court to distinguish among the cases on its calendars: which of them are really ripe for adjudication and which are in court merely to preserve a place on the calendar or to achieve bargaining position so that they can be tried when they are ready if they have not been disposed of amicably before then.

"Notice of readiness"

The New York courts, under the administrative leadership of their Appellate Division judges, Judicial Conference, and Departmental Committees, have recently adopted a number of devices to assist in making this distinction. First of all, they now require that no case be placed on the calendar until it is actually at issue. This they do by predicated the filing of the case upon a so-called "notice of readiness." In the notice, the person bringing the case on for trial must state that the dispute is in all respects ready for trial, that all pre-trial maneuvers, such as the taking of depositions, have been completed or that they will not be necessary, that the possibilities of amicable settlement of the dispute without trial have been explored between the parties, or, if they have not been explored, the reasons why that has not been done must be stated. When this is filed the opponent, if he challenges any statements of the readiness certificate, has an opportunity to ask the court to keep the case off the calendar upon showing to the calendar judge the respects in which his case is not ready.

Other pre-trial procedures

Another device for the sorting out of personal injury litigation and the formulation of the true issues has been pre-trial procedure. This practice involves the examination of the case shortly after it is placed on the calendar, at an informal conference in a judge's offices. If the first of these pre-trial conferences does not dispose of the case, it will probably be called up for a second conference of the same character a year or so later. This brings about the disposition of many cases without trial.

Another device that is used to sift and solidify the trial calendars, recently established in New York County, is a Medical Report Office, authoritatively described in some detail in another article in this issue. It has been found that very often after the impartial expert's examination the case is settled without trial on the basis of the expert's report and so the case is removed from the calendar.

Supreme Court calendars

Although the jurisdiction of the various New York City civil courts is based on differences of amount claimed, lawyers have a tendency to bring their litigation in the court allowing the highest amount, that is, the Supreme Court, rather than in the city or municipal courts. This has resulted in overloading the calendars of the Supreme Court, while the lower courts are relatively less occupied. And, in spite of repeated requests the State Legislature has refused to give the Court authority to transfer cases which could adequately be handled in the lower courts. To meet this problem, the New York City Supreme Court has devised calendar preference rules which require that when a case is placed on the calendar it be accompanied by affidavits, showing exactly the

extent of damages claimed and the details on which the claim is based. These are examined by a justice of the Court and if it is found that the amount recoverable is below \$6,000, that is, is within the jurisdiction of the city or municipal courts, the case is classified as nonpreferred. This means that it will not be tried in the Supreme Court until all other cases which involve larger amounts have been disposed of and, in effect, that the Court may never be able to consider it. The alternative to having the case remain in this limbo is for the parties to agree to transfer it to the lower court. Thus the Supreme Court calendars are continuously weeded out to distinguish those cases that cannot be tried elsewhere from those that could as well be handled in a lower court and to give privileged treatment to those that cannot be handled in any other tribunal.

There are a number of other administrative "gadgets" that have been devised in the New York City courts to help achieve efficient calendar management. Without these, the courts would have been completely incapable of handling the onrush of personal injury litigation with which they have been deluged during the past decade. Of course, none of the gadgets in itself is a panacea. The basic administrative problem here is to devise various means of screening cases at an earlier stage so that those requiring prompt trial can have it. The judges and officials charged with the duty of administering the New York City courts are always looking for other ways to bring this about.

SUCCESS OF VARIOUS ADMINISTRATIVE REFORMS

The degree of efficiency of the various recent state reforms in court administration cannot be quantitatively assessed.

For all "administration," by its very nature, depends largely upon subjective elements. The qualifications, energy, imagination, and interest of the administrator and the judge or judges who direct his work are of primary importance. Also, problems of court management differ in quality and degree among the states. The urgency of devising means to correct extreme delay in the disposition of cases in a heavily populated metropolitan area is not a problem for the court administrator in the more rural jurisdictions. He may be more concerned with the physical difficulties of transporting judges, jurors, and litigants over long distances, or with finding adequate facilities for holding court in the smaller towns, or securing for judges and other court personnel a living wage from economy-minded local officials. But, broadly speaking, it seems clear that the new devices have been a help in solving many of the daily problems of running the courts and have increased the efficiency of their operation. The success of the New Jersey system, and its older counterpart in the federal courts, and the improved condition of court dockets in some parts of New York State since the establishment of its Judicial Conference, are evidence of success. And, above all, the greater awareness of the problems of the courts, and the consequent increase in effort to solve them on the part of responsible judges, are intangible advances that brighten the prospect for more concrete future improvement.

For while court administration will not assure that justice will no longer lag, it will enable us to know when, where, and the extent to which delay occurs and thereby help show the way towards a speedier achievement of justice. Until the establishment of the Judicial Conference of the United States in 1922, there was no means in any

American court system to become thus informed. Today, thanks to the growth of the modern concept of judicial administration, there are in America at least twenty-five jurisdictions where the state of the dockets and calendars can be thoroughly known,¹¹ and there is more and more awareness throughout the na-

¹¹ See footnote 8, *supra*.

tion's court system of the need for knowledge concerning the facts of litigation. Delay cannot be truly measured—let alone cured—without such knowledge and to this extent, at least, an administrative organization is an indispensable prerequisite for the planning and installation of the means to put an end to the lagging of justice.

Arbitrators, Auditors, Referees, Pro-Tem Judges

By WALTER E. ALESSANDRONI

ABSTRACT: Congested judicial dockets have created the need for utilization of substitutes for judges. Legislative enactments which provide for appeal to a court satisfy the Constitutional guarantee of trial by jury. Various procedures are currently in use. The English system employs masters to prepare cases for trial; in Pennsylvania masters take testimony and make recommendations in divorce cases; in federal court bankruptcy matters and in state court Workmen's Compensation matters referees hear testimony and make awards. The decision of all of these judicial substitutes are subject to court review. The Massachusetts Auditor system utilizes with notable success lawyers to preside over cases in place of a judge. And in Pennsylvania Compulsory Arbitration or trial by lawyer panel has made dramatic progress in cutting judicial backlogs. More extensive use of these techniques seems to hold one of the keys to the problem of the congested court calendar.

Walter E. Alessandroni, LL.B., LL.D., Philadelphia, Pennsylvania is United States Attorney, Eastern District of Pennsylvania. He served as Chancellor of the Philadelphia Bar Association in 1958 and 1959. Mr. Alessandroni graduated from the University of Pennsylvania and Villanova University and was the recipient in 1959 of the Pennsylvania Bar Association Award for Conspicuous Service in the Improvement of the Administration of Justice. In addition he is a member of the House of Delegates and Committee on Court Congestion, the American Bar Association.

IT HAS long been recognized by judges and lawyers that one of the most satisfactory methods of coping with overburdened and congested dockets is to provide the courts with personnel who act in place of the judge under the general supervision of the court.

The authority for this kind of arrangement is generally found in acts adopted by state legislatures or Congress. These statutory enactments are usually implemented by more detailed rules adopted by the various courts and provide for appeal to the courts by the litigant who is dissatisfied with the conclusions reached by the arbitrator, auditor, referee, commissioner, or master, as they are variously called. As the matters in litigation are usually of a nature in which trial by jury is guaranteed by a state or the United States Constitution, it is mandatory that appeal to a court be provided for in the legislative enactment. Without such a provision the act would be unconstitutional and therefore void.

It has long been recognized that the courts have inherent powers to appoint "assistants" to preliminarily find certain facts, leaving matters dealing with law and the final conclusion or judgment to the judge. These "substitutes" for judges do not decree, but prepare materials upon which a decree may be made. In recent years the pressure of increased business in the courts has caused an awakening interest in the use of these inherent powers.

The use of quasi-judicial personnel has in various forms long been a part of our judicial system as it has in England from whom we have fashioned our own system of justice. As a matter of fact, the ability of the English courts to act more promptly in the disposition of cases can be traced in some measure to their use of quasi-judicial personnel.

The right to trial by jury is so deeply

rooted in our historical concept of justice that efforts to utilize procedures which do not provide litigants with its use immediately provoke strong objection, even though the right to trial by jury is only temporarily withheld pending a hearing before or action by quasi-judicial personnel. It is this historic attitude on the part of the average citizen backed up by most lawyers and judges, who see in such procedures a concept alien to all their training and ideals, that has prevented progress in this field. The right to have disputes settled in a courtroom with its dignified and formal proceedings, before an all-wise judge learned in the law and before a jury of one's peers is a concept for which free men have always fought. To depart from such a procedure even slightly is to provoke strong opposition.

EXTRA-COURTROOM PROCEDURES

Against such a backdrop it is no small wonder that a number of procedures for the full or partial settlement of controversies outside the courtroom have sprung up carrying with them general approval by the bench, bar, and public. The reason is obvious. They were born of necessity from the minds of lawyers and legislators who were forced to find other methods if there was to be even a semblance of democracy's claim to fair and speedy justice. Litigants deprived of a reasonably prompt trial made known their discontent to legislators, and judges and lawyers weighted down by sheer numbers of cases gave consent.

In spite of the effectiveness and general acceptance of these remedial procedures any suggestions for enlarging their use brings almost universal opposition from most segments of the bar. On the other hand, it is of interest to note that there have been few, if any, recommendations that the existing pro-

cedures be discontinued. The failure to demand retrenchment would seem to mean that there is greater approval of the various procedures than most lawyers and judges are willing to admit openly.

The jury system with all its faults is still the best procedure evolved by man to administer justice, settle disputes, and end controversies. However, this "ideal" in "all" litigation is today impossible. To argue the contrary is unforgivable wishful thinking. The normal trial process cannot hope to solve the problems of large backlogs. It is too technical, expensive, and slow moving except where court calendars are current.

No one who has studied the situation seriously doubts the need for more judges but the future demands on the courts resulting from an upsurging economy and the atomic era make it clear that we cannot afford the cost of the number of judges which will be necessary to meet our needs if we are to have them in sufficient numbers to produce impartial and speedy justice. Every new judge means extra courtrooms, offices, clerks, stenographers, and court officers. When the total cost is added up the cost of a judge's salary is not the largest item of expense. In New York City the "total" cost to maintain one judge is in excess of \$100,000 a year.

More study and evaluation must be made, therefore, of the successful procedures already adopted for many forms of litigation and pioneering efforts must be made in related methods if we are to meet the challenge. It is the purpose of this chapter to review briefly some of these procedures.

SOLUTIONS IN ENGLAND

The right to trial by jury in England in all but a limited class of civil actions was abolished over a quarter of a cen-

tury ago and made discretionary with the court, thus speeding the trial of cases. It is estimated that a jury trial costs as much as \$750 per day.

By the use of court personnel called masters the English system has improved the efficiency of its courts. The function of the master is to prepare the case for trial. He sits to hear preliminary matters and makes such orders "as are best adopted to secure the just, expeditious and economical disposal of the action." He simplifies the issues and obtains maximum agreement on facts and exhibits.

Contrast this informal, expeditious procedure with our own which provides for various pre-trial motions to be made in a formal way with detailed written statements being presented to the court for approval and sometimes placed on a list for argument in open court at a later date. It is not uncommon for a number of different judges to pass on these various motions, consuming a great deal of time. To illustrate the enormity of this problem, the New York Supreme Court annually decides on as many as 47,000 motions, of which 10,000 are for a bill of particulars.

Other court personnel could hear these interlocutory motions, call the calendar list, conduct pre-trial conferences leading to possible settlement and do all those things which will simplify the issues both as to fact and law. Especially does this seem worthy when it is realized that all but a handful of cases will be settled before trial anyway.

The problems in some of the federal district courts have grown so large, especially in connection with protracted or especially long cases that special masters have been appointed for the limited purpose of supervising pre-trial preparations. In the Southern District of New York, for example, there are 100 private antitrust cases pending and 20 government antitrust actions plus many other

cases of a protracted nature. Even if the judges forgot about the 5000 other cases normally filed each year in the district, they could not dispose of the pre-trial burdens of these long and difficult cases for some time to come. And even after this is accomplished the cases still must be tried.

To emphasize the enormity of the problem reference is made to an antitrust case assigned to a special master in which there were 100,000 pages of depositions from 173 witnesses, 45,000 documents as exhibits, and over 700,000 pages of documents produced. The master conducted hearings on 350 days over a three year period. Only on three occasions were the master's rulings asked to be reviewed and each time the master was sustained.

Here again is a procedure that has long been possible and, in fact, was used in patent and antitrust cases because of their complexity. The system fell into disuse when judges and lawyers opposed its operation. Necessity brings it back with some startling results, although it is clear that the cases in which a special master is used must be carefully selected.

MASTERS IN DIVORCE

In a number of counties in Pennsylvania the courts appoint masters to hear testimony in divorce cases. In Philadelphia, where 3,500 to 4,000 divorce cases are filed each year, it is not difficult to imagine what would happen if each case were heard by a judge. The plain fact is that they would have little time for anything else.

The judge to whom a divorce matter is assigned appoints a lawyer to take testimony from the parties and their witnesses. A court stenographer is present at the hearing which takes place in the master's private office. The master is paid for his services from costs which the plaintiff deposits with the court, re-

sulting in tremendous savings to the taxpayer.

After the hearing the master files a written report with the court containing specific conclusions and recommendations. Either party has an absolute right to be heard by the court before a final decision is made approving or rejecting the master's recommendations. A dissatisfied party may then appeal to the next higher court. Here we have full protection of the rights of the parties but a speedier and more efficient system that does not overburden the courts. In operation for a number of years no one has seriously questioned its merits.

REFEREES IN BANKRUPTCY

One of the most successful examples of a procedure which takes place outside the courtroom by the employment of an alter ego to the judge is in bankruptcy proceedings in the federal courts. A "substitute" or "deputy judge," called a referee, has been authorized to hear bankruptcy matters for over sixty years, showing that the use of court personnel other than a judge is not an innovation.

So marked has been their success that in 1938 they were authorized to grant or deny discharges, an authority only vested in a federal district court judge before that time. The determinations of a referee, of course, are subject to review by a judge but so well has the system operated that very few orders handed down by a referee are reviewed by a judge.

Bankruptcy proceedings by their nature are particularly susceptible to "trial" by a referee rather than by a judge because the hearing concerns itself with many detailed matters, some of which are technical and others routine. The informality of the hearing expedites the proceedings, saving time and money.

REFEREES IN WORKMEN'S COMPENSATION

Generally a person can sue for damages caused by another only when the person causing the injury was at fault. Workmen's Compensation, however, is predicated on the theory of liability without fault and is found in the limited area of employer-employee relationship. By statute, an employer generally is responsible for injuries sustained by his employee injured while at work even though not the fault of the employer.

If these matters were conducted by a judge and jury most employees would be deceased before their rights could be determined. For example, in one year in New York, 207,927 Workmen's Compensation claims were filed and 564,829 hearings were held.

Referees hold hearings in these matters at which the claimant, his lawyer (he need not have one), and witnesses testify. The findings of the referee, in the form of an award, are final unless one of the parties desires to appeal. Here again the action of the person sitting in place of a judge is reviewable by a judge.

ARBITRATION

So discouraging has the use of the judicial process become even for the business man who wins his case eventually but not before he loses his business by delay in court, that more and more are turning to arbitration as the forum for settling disputes. Here again we do not have an innovation as arbitration is really an older way of settling differences between people, antedating the judicial process with its public courts.

Recently it has made great strides and is now used extensively in labor and commercial disputes and in many other types of civil controversy. More lawyers every year are writing into con-

tracts they prepare provisions to settle disagreements by arbitration. It is the "agreement" of the parties to resort to arbitration that makes it possible. The mutual agreement confers the jurisdiction, fixes the power of the arbitrators, and establishes the scope of the arbitration.

A number of organizations have grown up to provide the machinery for operating arbitration. The best known is the American Arbitration Association which now has a list of some 33,000 panel members, qualified in every field of endeavor, who are available to act as arbitrators. For a nominal fee the Association will arrange all the details to carry out an arbitration agreement.

PRO-TEM JUDGES

A successful "temporary" expedient has been the appointment of pro-tem judges by the courts. Where there is statutory and constitutional authority the appointment of special judges for the relief of the docket of a particular court has had beneficial results, especially where the problem is an inherited backlog. It has the advantage of decreasing the long-range costs of the operation of the courts where the problem is one that is not necessarily continuing. It provides a flexible, efficient method of providing judicial manpower in emergencies.

When coupled with the right of the highest court to temporarily assign judges from counties not having a full time work-load to counties with a serious backlog many of the normal problems presented by court congestion can be met. It will probably come as a surprise to most laymen that reassignment of judges is not done as a matter of course. In Tennessee, a statute provides that where all the cases cannot be disposed of at a regular term the chief justice may designate a retired or other

judge to assist, and the local bar may elect one of its members to hear and try cases.

It must be admitted, however, that our judicial administrative system is not easily geared to incorporating into it judges who do not have some rather permanent tenure of office; but under the special circumstances outlined here they can be of real value where the need is for a limited time only and not too likely to reoccur.

MASSACHUSETTS AUDITOR SYSTEM

One of the most dramatic procedures to effectively strike at the backlog of untried cases has been the Massachusetts auditor system. This system is not a permanent part of the judicial administration in that state, however, but is an emergency procedure invoked only when the court calendar is running behind. The success of this operation is apparent when it is noted that between 1934 and 1942 it disposed of some 47,000 cases. So successful were the results that only 2 per cent of these cases were appealed.

Subsequent use of the procedure was invoked in 1956 when a special attack was made on the backlog of untried motor vehicle cases. This was followed in the next year by making the activity applicable to matters involving negligence generally.

The system is simple: A lawyer, called an auditor, is appointed by the court to preside over the trial of a case. At the present time some eighty lawyers are serving in this capacity and are paid at the rate of nine dollars an hour. The auditor hears the evidence, determines its truth, makes written findings of the facts and reports them to the court. The trial can be said to be similar to a trial before a judge without a jury. The findings of the auditor must be approved by a judge. A party who feels aggrieved

has the right of appeal to a judge and jury, thus preserving his basic rights.

The authority for appointment of auditors in Massachusetts goes back to a statutory enactment of 1817. Even before this date the common law provided for appointment of auditors in connection with business transactions where detailed figures were involved. Appointment of auditors was infrequent however and not in general usage in these early days. It is difficult to understand why this procedure so successful in recent years has not been adopted in other states confronted with similar problems.

PENNSYLVANIA COMPULSORY ARBITRATION

I have left to last a discussion of the Pennsylvania Compulsory Arbitration system because I thought it would lend emphasis to my opinion that it is the most effective procedure yet devised for helping to meet the problem of "lagging justice." It can be argued that my own close personal association with this plan in Pennsylvania and in particular in Philadelphia does not make me an unprejudiced reviewer of its workings and accomplishments. To this, I only reply: the facts speak for themselves and prove conclusively that it is the most effective tool yet devised for reducing congested court calendars and speeding up justice.

There have been thousands of words written on the subject of "lagging justice," the timely and appropriate subject of this edition of *THE ANNALS*, and hundreds of theories and recommendations have poured forth from the minds and pens of distinguished legal scholars, practitioners, and judges. This final comment in this chapter however is neither theory nor mere recommendation but a story of actual accomplishment that has successfully met its objective: elimination of the backlog so that the

trial of civil cases is now current. It is a story of what can be accomplished when men of good will and dedication work together. It is a story of judges and lawyers and public officials determined to put an end to the unconscionable delays of two years or more of cases reaching trial in the Municipal Court of Philadelphia.

At the outset it should be noted that the title of Compulsory Arbitration may be misleading. The procedure is not a bargaining by the parties with the help of an arbitrator. In fact, a mere explanatory title would have been "Trial by Lawyer Panel." Voluntary arbitration, although fallen into disuse, has been on the statute books in Pennsylvania since 1836. When the present novel plan was advanced it was deemed easiest to amend the existing statute on voluntary arbitration rather than draft a new one: hence the name Compulsory Arbitration.

Procedure

The procedure is simple. By court rule, on authority of the state act, all civil cases, excepting those involving title to real estate, when the amount in controversy is \$2,000 or less *must* first be submitted to a panel of three lawyers sitting as judge and jury. The lawyers are selected by the court clerk from an alphabetical list of attorneys who volunteer to serve. The first named acts as chairman and a majority vote controls the decision. A fee of \$25 to each lawyer and \$10 extra to the chairman is paid by the county. The chairman sends out the notices, arranges all the details, and holds the meeting in his private office.

All parties, their counsel and witnesses are present at the hearing which proceeds in much the same manner as if before a judge and jury but with less formality and greater dispatch. No

stenographer is present. After all the evidence has been presented the panel of three lawyers, after the parties have left, confer and generally reach a decision at that time. Their determination is recorded on a simple one page form called an "award" and when filed with the clerk of court has the same effect as the verdict of a jury or a judgment rendered by a court.

Either party has an absolute right to appeal and have his case heard by a judge and jury and the new trial is *de novo*. This means that the second trial before a judge and jury takes place as if the hearing before the lawyer panel had never been held. No reference to the first hearing or the testimony given can be referred to, thus preserving unhampered the Constitutional right of trial by jury.

To discourage appeals without merit the party appealing must pay to the county the fees of the arbitrators, and this cost is not reimbursable even if the party appealing is successful. Litigants and their counsel have been so satisfied with the decisions of these lawyer panels however that only about 2 per cent of the cases processed have been appealed, and in most of the appeals taken the verdicts of the juries have been the same as the decisions of the lawyer panels. Where no appeal is taken it should be noted that there is no participation by a judge at any point and the decision is a final one. This differs from other procedures which require court approval of the findings of a master or some similarly titled official.

Phenomenal success

The plan, found constitutional by the Pennsylvania and United States Supreme Courts, has been in effect in all but a few counties in Pennsylvania for some six years with universal and startling success. In Philadelphia the re-

sults have been phenomenal. When the bar association asked for volunteers, 2,500 lawyers responded immediately. Many of the ablest Philadelphia lawyers are serving at a sacrifice of time. This enthusiastic co-operation of the members of the bar who serve on the panels for a relatively nominal fee has been of paramount importance in the successful outcome of this novel experiment.

During the first year 9,000 cases were processed. With the experience gained the plan can now easily process 1,000 cases a month or approximately 50 a day and the waiting time has been reduced from in excess of two years to three months. Parenthetically, it is interesting to note that it would take a judge and jury sixty years to process the cases handled by Compulsory Arbitration in the first year.

Dubious trust unwarranted

When a public hearing was had by Philadelphia's city council on the question of appropriation of funds to finance the plan, a number of interesting questions were raised:

Wasn't this a deprivation of the right of trial by jury? Why hadn't other states adopted such a plan? Could it be proved in advance that justice would be more efficiently dispensed at a cost that would in the long run be less expensive? With only the use of lawyers who volunteered, and on a rotating basis, wouldn't most of the panels be composed of young men without experience who could afford to take the time for such a small fee? Wouldn't many of the panels be composed of the least competent? Why shouldn't the litigants pay the arbitrators' fees? Wasn't it unfair to make the appealing party reimburse the county for arbitrators' fees when he was successful on appeal? Wouldn't lawyers without judicial responsibility tend to favor their lawyer friends, especially when the arbitrators might be appearing later be-

fore the lawyers who were then acting as counsel for the plaintiff and defendant?

Answers were made to these inquiries and now, after operation of almost two years in Philadelphia, it can be proved conclusively that the replies given then have all been substantiated and that the procedure has met the highest hopes of its proponents.

What can be said of the other counties in Pennsylvania? A survey of the courts of the several counties have found the following advantages: claims under \$2,000 have been permanently removed from the trial lists; calendar congestion has been relieved to a point where the backlog of other civil cases has been reduced over 50 per cent; the trial of cases has been speeded so that awards are rendered in about two months from the filing of suit; the time has been shortened between suit and trial of cases not under arbitration; judges find more time for other litigation; a smaller number of civil juries are empaneled; it has eliminated all motions for new trial; it has postponed the need for additional judges in some counties; substantial savings have resulted from reduction in the number of jury trials; because less costly and speedier, it is worthwhile to file small claims; no waiting for cases to be heard as matters are fixed for a time certain; informality of proceedings puts litigants, witnesses, and counsel at ease; matters over \$2,000 have been "voluntarily" referred to arbitration because of the obvious advantages; lawyers have gained experience in the problems of judges and juries.

Lesson to be learned

The Compulsory Arbitration plan for civil cases has now successfully run the gamut from small rural counties in Pennsylvania to the state's largest metropolitan center. None of the dire predictions listed as possible causes of fail-

ure have come to pass. The plan has been tested under varying conditions and there appears to be no reason why it cannot be made to operate with the same effectiveness in most sections of the country if the bench and bar are determined that it shall work.

If this be true it follows that every effort should be made in other states to take advantage of the lessons learned from Compulsory Arbitration in Pennsylvania. Hampering tradition should

not act as a deterrent to the use of new techniques in the administration of justice so long as the fundamental rights of the litigants are safeguarded. If we are to find solutions to the problems of lagging justice, lawyers and judges especially must be ever alert to study, research, and evaluate new ideas and new methods to meet the crushing burdens which our expanding economy and increased population are placing on the courts.

The Two Faces of Janus: Delay in Metropolitan Trial Courts

By MAXINE BOORD VIRTUE

ABSTRACT: Recent studies show that metropolitan trial courts have far larger case-loads than other courts. These loads differ in substance from those of nonmetropolitan courts, being disproportionately weighted with special types of cases, such as criminal, mental, alcoholic, traffic, domestic relations cases, and litigation otherwise related to the special behavior of metropolitan populations. Metropolitan court systems usually are complex, overlapping, and not adjusted to the geographic area to be served. Because of the special structural patterns of metropolitan courts, and the special conditions under which they operate, delay in disposing of cases is especially and predominantly a metropolitan court problem. In these courts, ever increasing pressure to speed up the tempo of justice is balanced by the need to avoid perfunctory routine disposition, so as to defeat the very purpose of seeking justice. To overcome both aspects of this leering monster—delay and perfunctory routine—is the special problem of metropolitan courts.

Maxine Boord Virtue, LL.B., Ypsilanti, Michigan, is an Assistant Attorney-General of Michigan, currently engaged in preparing for the University of Michigan Law School and the Section of Judicial Administration, American Bar Association, a final monograph to conclude the inquiry launched by the Section in 1947 into the problems of metropolitan trial courts. Mrs. Virtue is a graduate of the School of Law, Yale University. In addition to the original Detroit study cited herein, other books by the author include: Basic Structure of Children's Services in Michigan (1952); Judge Medina Speaks (Editor, 1954); Family Cases in Court (1956).*

* The material in this article is taken from the monograph now nearing completion.

FOR the last decade the staff and membership of the Section of Judicial Administration of the American Bar Association have been working with local leaders of bench and bar, and with scholars in various fields, to isolate and analyze the special problems of metropolitan trial courts. Conclusions from this series of inquiries are now being placed in final form. Special metropolitan court problems are thought to occur both in the structure and in the operation of metropolitan courts. As a consequence of these special problems, delay is likely to result both from the structural patterns characteristic of the metropolitan court system, and from the special conditions under which metropolitan courts must operate.

Therefore, delay is especially and predominantly a metropolitan court problem. Although not confined exclusively to metropolitan courts, delay is virtually always found there. It is more difficult to deal with there than elsewhere, because of the complicated nature of the metropolitan court system, the complex mechanisms necessary to move cases through the system, and because of the great numbers of cases handled in metropolitan areas. In such an environment the causes of delay are harder to find and eradicate than in a simple one-judge court with a small case-load, such as may serve smaller communities.

Then, too, in a metropolitan court system the problem of achieving prompt disposition of cases is further complicated by the other face of Janus: in the densely populated case-load of the metropolitan court, there is a special danger that some of the cases will be completed too fast, so that perfunctory, routine disposition will be made of some problems that should receive more prolonged or more specialized attention in order to achieve a just disposition. This danger is most feared in the personal problem cases, where too-prompt disposition

of a criminal sexual psychopath, a divorce, an adoption, a juvenile case may sow the wind that will later reap a whirlwind of community depredation and personal tragedy. It is true that the metropolis is likely to have more specialized facilities for assisting the court to arrive at a proper evaluation of such personal problem cases. On the other hand, the much larger case-load of the metropolitan court and the bewildering complexity of its departments as related to complex noncourt agencies, also concerned with such cases, combine to make it harder for the metropolitan judge to be sure of quickly assembling and consulting the sources from which that solution can be reached which will best protect the community and dispose of the litigation.

Thus, delay is a two-faced specter which confronts the judge of the metropolitan trial court whichever way he turns: from one side leers the danger of delaying disposition until the problem is insoluble; from the other, the danger of hurrying too quickly to a disposition which will result in further conflict and litigation.

METROPOLITAN COMMUNITIES

As Hawley and others have pointed out, the metropolitan community, embracing cities, villages, and other local governmental units within a radius of thirty-five or more miles from the mother city, has assumed a dominant position in the settlement pattern of the United States. In 1950, the 168 metropolitan areas contained 56 per cent of the nation's population. By 1956, the total population had increased 9.8 per cent; within the metropolitan areas the growth rate was 14.8 per cent, while outside, it was only 3.4 per cent.¹

¹ Amos Hawley, *The Changing Shape of Metropolitan America: Deconcentration since 1920* (Glencoe, Illinois: The Free Press, 1955). 1 et seq. Department of Commerce, Bureau

More than half our population is living in metropolitan areas, and the trend appears to be continuing strongly.

Moreover, the metropolitan area acts as a magnet for industrial, social, and other activities of people in the surrounding territory. Therefore, we expect to find, and we do find, that metropolitan courts have to deal not only with the litigation of the inhabitants of the metropolitan area, but also with the many cases caused by some aspect of the movement in and out of the central city, or some conflict in the complex of relationships between in-dwellers and out-dwellers. Where a choice of tribunals is possible, litigants appear to prefer the metropolitan court, since as a function of the metropolitan community it shares the magnetizing power and prestige of the metropolis.

GOVERNMENTAL COMPLICATIONS

Exaggerated proliferation of overlapping governmental units is a concomitant of virtually all metropolitan areas. Congestion and mobility of population, two characterizing factors of metropolitan communities, combine with other forces to push the real community beyond the original legal boundaries of the mother city and thus create pressures which result in the improvised and haphazard creation of special governmental units to meet the needs as they occur.²

This haphazard complexity of governmental units is in and of itself a breeder of litigation in metropolitan courts, adding to its already huge case-load. For example, the struggles of cities to annex

of the Census, *Current Population Reports, Series P-20, No. 71, "Civilian Population, by Metropolitan and Urban-Rural Residence: 1950 and 1956."*

² See, generally, *Council of State Governments, States and Metropolitan Problems* (Chicago, 1956), p. 15. *The Annals*, Vol. 314 (Nov. 1957), especially "Metropolitan Organization," by Luther Gulick, 53 et seq.

suburban territory and the resistance of such territory to inclusion in the city are currently a major source of litigation in all metropolitan areas—a function of their growth and change. Many metropolitan areas, indeed, now involve several states, and a few involve two countries.

The way in which this governmental complexity is reflected in the condition of the courts' load of litigation may be suggested by current efforts, as reported in the New York press, to develop a tristate legal tribunal capable of dealing with litigation arising out of waterfront labor problems.

Many of these overlapping governmental units, which occur in metropolitan areas, have the power to develop independent judicial tribunals, with competing or conflicting jurisdiction; moreover, they are not integrated to the needs of the metropolitan area. Thus, in 1932, Lepawsky found 556 autonomous courts in the Chicago metropolitan region, and 205 in Cook County alone. This writer found 145 judicial tribunals in the Detroit Metropolitan District in a study conducted in 1948–1950. And even in California, which has unified its court system, a recent study in Los Angeles has brought out the fact that unification of the major trial court, the Superior Court, is hampered administratively by rapid proliferation of separate branch courts, and that the multiplication of separate municipal courts in Los Angeles County is creating a problem.³

DISTRIBUTION OF POPULATION

Presently, the impact of governmental multiplicity upon delay in metropolitan courts is further compounded by the dis-

³ James G. Holbrook, *Survey of the Metropolitan Trial Courts: Los Angeles Area* (Los Angeles, California: University of Southern California Press, 1956), pp. 36–37. This study is one of the series conducted for the Section of Judicial Administration.

tribution of the population within the metropolitan area: typically, the shift is towards the suburbs: "centrifugal drift," as population students call it. This tendency has accelerated in the decade since the Detroit study, which shows high growth rates shifting from the centers towards the outlying parts of metropolitan areas, and the population of satellite portions of such areas rapidly increasing.

Thus, to the problem of a multiplicity of overlying and overlapping governmental units within a given metropolitan area is now added the problem of scatter—a vast deconcentration towards the periphery into satellite settlements, occurring along with and as a major thrust of a continued vigorous over-all rate of growth of metropolitan areas as a whole.

Another characteristic of metropolitan population is density—in Detroit, for example, the population per square mile in 1950 was 13,249; in Boston, 16,767; in New York, 25,046; in Chicago, 17,450.⁴ Hawley reports that in some sectors of our largest cities, the density factor surpasses 100,000.⁵

As Professor Holbrook points out in commenting on the density of Los Angeles, "multi-million dollar lawsuits are commonplace and murder trials are daily occurrences which attract no attention unless a green orchid was found on the corpse."⁶

MOBILITY

The great mobility of metropolitan populations merits closer examination in terms of its bearing upon delay-producing conditions in metropolitan courts. Numerous kinds and levels of migration occur continually to and from the core

of the metropolitan area. These tidal waves of human movement are basic to the existence of the metropolis and set the unique tone and tempo of its life. "Each great capital sits like a spider in the midst of its transportation web."⁷

More than elsewhere, the residents of metropolitan communities are made up of recent migrants, many from outside the state, many from outside the country. The attraction of the large metropolitan area upon long-range migrants is one of its strongest characterizing attributes. This means that in the core-city, there will be more foreign born and negro population, less native-born white population. And, in turn, this comparative ethnic heterogeneity expresses itself, in terms of court problems, in class and race tension, in increased criminality, and in all sorts of personal problem litigation arising out of failure of migrants from different ethnic and culture groups to adjust to the demands of the new community. For example, the 1944 race riots on Belle Isle, in Detroit, are said by local court and police personnel to have been the result of a clash between native-born Detroit negroes, moving about the city with considerable self-confidence, and recent migrants brought in to work in the automobile plants from rural white settlements in southern and border-southern states. Similar incidents could be adduced concerning Mexicans in the Texas and California metropolitan cities, concerning Puerto Rican migrants in New York, and so on. The point here is that the ever present, large-scale mobility and congestion in any metropolitan city make such clashes an integral part of the city's life, and thus are

⁷ Wilfred Owen, *The Metropolitan Transportation Problem* (Washington, D. C.: Brookings Institute, 1956), citing Holden, *City of London, a Record of Destruction and Survival*.

⁶ Holbrook, *op. cit.*, note 3 *supra*, p. 11.

present as permanent elements of its law enforcement and court administration problem.

The daily commuter

Another aspect of the mobility factor, as it clogs the dockets of the metropolitan trial courts, is the daily commuter traffic. The large central cities continue to grow, and with them, their transportation problems. Improved transportation has also rendered these central cities accessible in a day to an ever widening circle of satellite city-dwellers. Thus, the problem now is not only how to move, but how to find room to move, and how to find a place to stop.⁸ Half of all motor travel is concentrated in the United States in central cities of metropolitan areas, and more than half of all persons entering and leaving metropolitan areas with populations of over 250,000 are moving by automobile, Owen reports.⁹

Consider, then, the commuter: the New Yorker in the five o'clock subway rush, the Angeleno caught in a vast rush-hour traffic jam on the Freeway. These are not occasional traumatic experiences, they are part of the daily rhythm of life of a substantial majority of our population. As Hawley points out, the entire tempo of life is quicker in the metropolitan city, relationships more transitory and enervating. It represents the extreme in modern life. Its nerve centers are the points of most feverish activity.

By bringing into instantaneous focus the opportunities, the risks, and the tragedies of life, man's behavior is made to resemble that of an animal treated to a rapid succession of electric shocks. It is not surprising that the incidence of mental disorder is highest in metropolitan centers.¹⁰

⁸ *Ibid.*, pp. 2, 3.

⁹ *Ibid.*, p. 33.

¹⁰ Amos Hawley, *Human Ecology*, note 5 *supra*, pp. 306-7.

We find "mobility," then, which is a metropolitan characteristic, expressing itself in the metropolitan court's case-load in several ways: not only in a tremendous load of traffic, property damage, and personal injury cases, but also in a wide variety of cases, such as mental cases, arising out of human reaction to the repeated shocks of the metropolitan environment. It is important to note that many such cases cannot be adequately dealt with by the metropolitan court by application of the adversary process for a single day. Rather, many such require expert diagnosis, and some knowledgeable supervision over a period of months or years in order to rehabilitate or readjust the human being who has come into the case-load of the metropolitan court as a result of "battle fatigue" suffered in the daily routine of metropolitan life.

LITIGATION-PRONE POPULATION

The ingredients of the total human aggregate in the core-city of a metropolitan area differ, and differ in certain specific ways, from those of the aggregate of a nonmetropolitan area. As has been mentioned, there are more foreign born and nonwhite in the metropolitan area. It is also known that the percentages of single, widowed, and divorced persons are directly related to the size of the place.¹¹ Further, the phenomenon of "centrifugal drift" marks the consistent strong movement of stable family groups to withdraw from the central core of the metropolis, seeking the greenbelts of suburbia to bring up their children.

This means progressive deterioration of neighborhoods near the heart of the central city, the progression of which from single-family dwellings to boarding houses to blighted area to slum has been traced and diagrammed in a number

¹¹ Otis Dudley Duncan, *Social Characteristics of Urban and Rural Communities* (New York, N. Y.: Wiley, 1956), p. 33.

energy and hard work, honesty, confidence in the future, skills and knowledge, inventiveness, ambition and drive, and several others. Many of these qualities, essential to growth, fall into the category of "variables" which plague the mathematical economist. They call for value judgments which cannot be quantified and fed into the computing machine, however useful such computers may be in the planning of certain aspects of economic and social development.

To bring such qualities as initiative, self-reliance, and the will to improvement to the fore, and to achieve voluntary commitment in the less-developed countries, individually and as peoples, to the development effort, it is essential that they be given a share in its planning. Considering the complexities, national planning has to be largely left to the expert, subject to final approval by parliaments or other representative bodies. However, broad participation in planning can be achieved on the local level, which gives special significance to the various community-development programs which are dealt with elsewhere in this volume.

By contrast, the totalitarian approach, rather than taking into account the human element in planning, the more intangible variables, tries to minimize or even eliminate them. In order to have its econometric conclusions come true, this approach bends human nature, it regiments the individual, it deprives him of his liberties, it tells him where to go and what to do. In one word, it tends to turn the individual himself into a machine, to reduce him to the stature of a robot. Whole generations are sacrificed to future targets. Totalitarian planning of this type loses sight of the central purpose of economic development, which is the freeing of the individual, not only from poverty and disease, but from ruthless encroach-

that of 41,000 families receiving help from 109 tax-supported and voluntary health and welfare agencies in the area, a "small, hard knot" of 6,500, about six per cent of the families, accounted for more than half of the total case-load served by these agencies. It is these same families that wind endlessly in and out of the metropolitan courts, often in contact with four or five courts at once.¹³ Their presence, in the metropolitan case-load, tends to slow the already clogged dockets to an even slower pace.

Here we should insert a "caveat" against the other face of Janus. Persons coming from areas known to contribute more than their share of certain kinds of litigation—such as, juvenile delinquency—are subject to what sociologists describe as "categorical risk." That is, a boy coming before a juvenile court, if a member of a certain minority group living in a certain area, has—to be blunt about it—two strikes on him.

This means that the court, under tremendous pressure to move the heavy case-load faster, also encounters here the vital problem of assuring a fair hearing and an appropriate disposition to each individual defendant. To do this and do it properly takes time—the more categorical risk, the more time.

METROPOLITAN CONDITIONS REFLECTED IN COURT PROBLEMS

When we talk about a "metropolitan community," as referring to the behavior of all persons found within a geographic area, we are of course talking about not just one community but an infinity of communities. Thus, within any metropolitan area there are many people whose lives and movements are guided from a metropolitan center other than

¹³ Maxine Boord Virtue, *Survey of Metropolitan Courts: Detroit Area* (Ann Arbor, Michigan: University of Michigan Press, 1950), p. 233 et seq.

the one in which these people happen to have legal residence. For example, air line personnel literally commute to international capitals; those in communications, entertainment, and the top echelons of the industrial, academic, and governmental worlds commute to Washington, New York, and abroad.

Likewise, within the territorial limits of one metropolitan area, there are an infinite number of lesser communities marked out by business, educational, aesthetic, and cultural categories: the Polish community, the neighborhood community in the dormitory suburb, the beatnik crowd, the union brotherhood, the faculty community of the local university, the dwellers in the world of music, and so on. Each of these has its regular orbit, which governs the movement of those tuned to it, within and as a part of the vast series of movements which make up the rhythms of the metropolitan community as such.

Clearly, we can't have a court for each of these "real," or cultural, communities, nor can we have a single gigantic metropolitan court for each metropolitan area as a whole. The physical distances alone would prohibit such a "supercourt" as the latter, and even if distance is left out of account, such a tribunal would be too unwieldy to cope with case-loads which move and change in many unpredictable ways. Two factors only are fully predictable: growth, and continuous change.

SIZE AND DELAY

A correlation between size of population and extent of court calendar delay has been shown to exist. See, for example, the current (1958) report of the Institute of Judicial Administration on *The State of the Calendars of State Trial Courts*, at page ii, with respect to personal injury jury cases. At page iii: "Only six courts appear on this year's list of jurisdictions having delay of over

twenty-five months, and all 11 are situated in counties with populations of over 500,000:"

MULTIPLICITY OF COURTS

Multiplicity of governmental units, as has been pointed out above, is found in courts as in other metropolitan units of government. Confusion, overlap, and conflict of jurisdiction among these courts is the inevitable accompaniment. As one of the Detroit reporters once expressed it, there is "one court for the corned beef, one for the cabbage": one court for the divorcing parents, another for the child suffering from the effects of that divorce; one court for the rapist, another for the victim, and so on.

The disadvantages of court multiplicity, then, are first and most obvious, jurisdictional conflict and confusion. This is aggravated by the great size of the case-load, by the large numbers of persons attempting to deal at any time with any given unit in the case-load, and, in personal problem cases, by the presence of a multiplicity of social agencies also concerned with the problems which have resulted in litigation, and by each agency's determination to solve the problem independently.

Administratively, then, we expect to find, and we do find, that delay and confusion result from the coexistence of many courts with wholly or partly duplicating jurisdiction. See, for example, the docket check of the Circuit and Superior courts of Cook County conducted by this writer for the metropolitan court studies of the Section of Judicial Administration.¹⁴

¹⁴ COMMITTEE ON METROPOLITAN TRIAL COURTS, *PROGRESS REP.*, p. 26 et seq. (June 1953). In February 1953, a check of the printed calendar of the Superior Court showed 350 cases filed in 1945, and 342 cases filed in 1946, still undisposed of. The average docket life of a group of cases checked in this court was 32.6 months, the median case had a docket life of 36 months. In the Circuit

Multiplicity of courts has been regarded since 1913,¹⁵ and earlier, by students of judicial administration as one of the signal causes of delay, and as a shocking waste of judicial power in large cities. The delay, and the waste, is increasing rapidly with the surge of population into metropolitan areas.

A recent study has described the process of growth of competing and duplicating courts which has accompanied the urbanization of our people. The authors list relief from congested calendars, need for better disposition of special types of cases, and far-reaching social change, as causes contributing to still further development of multiple courts within metropolitan areas.¹⁶

SIZE OF CASE-LOAD

The most direct reflection of the population grouping known as "metropolitanization," as it affects the delay problem in metropolitan courts, is, of course, the sheer, overwhelming size of the case-loads in metropolitan courts. To convey some idea of the awesome size of this load, the writer's worknotes, taken in 1947 for the original Detroit study, contain the record of an attempt made to estimate the full work-load for the entire system of courts in the Detroit metropolitan area. A difficult task, for almost nowhere can be found proper statistical reports of the work of all trial courts in a metropolitan area, so integrated as to provide this simple information.

Court, a check of a small group of cases showed over-all average docket life of 24 months; the median case had a docket life of 26 months.

¹⁵ Roscoe Pound, *Administration of Justice in the Modern City*, 26 HARV. L. REV. 302, 313 (Feb. 1913).

¹⁶ Council of State Governments, *Trial Courts of General Jurisdiction in the 48 States*, (Chicago, Illinois: William L. Frederick and Sidney Spector, 1951), p. 2 et seq.

The total case-load disposed of in 1947 by trial courts convening in Detroit was 677,879 cases. This figure we know to be low, since it omits from the case-load of the juvenile division of the Probate Court several hundred adoption cases referred to that division for investigation. Also omitted are Recorder's Court condemnation cases and ordinance cases disposed of by that court's Traffic and Ordinance Division, since no figures were available. These figures include only cases disposed of in the immediate Detroit area, excluding the other two counties which are included in the Census Bureau's definition of the Detroit metropolitan area as it was defined for 1950.

According to the figures of the Michigan State Court Administrator for 1956, the Detroit area has a total case-load almost four times as large as that of any circuit outside the metropolitan area. Total cases commenced in all circuit courts in Michigan, as reported by the State Court Administrator for 1956, were 59,341. Of these 19,979 were filed in the Circuit Court of Wayne County; 6,311 in the felony division of Detroit Recorder's Court—city cases at circuit court level; 2,878 in Macomb County; 5,779 in Oakland County—a total of 34,947 for the entire Detroit metropolitan area, or far more than half the total for the entire state.

Professor Holbrook reports¹⁷ that in the fiscal year 1953-1954, more than 100,000 cases were filed in the Los Angeles Superior Court (general trial jurisdiction), and 1,154,401 in the Los Angeles Municipal Court that same year. In 1954, a total of 221,398 cases were filed in all the California superior courts; the total filings in that year in Los Angeles alone were 108,968—almost half the total for the entire state. This relationship is more impressive when one

¹⁷ Holbrook, *op. cit.*, note 3 *supra*, p. 12, and Table 2, p. 14.

recalls that there are several major metropolitan areas in California, the San Francisco area, in addition to Los Angeles.

Further multiplication of statistics would not further advance the point: the case-loads of courts in the large central cities of metropolitan areas are of such tremendous size as to confront courts convening in those areas with conditions quite unlike those anywhere outside such areas. This characteristic condition—gigantic case-loads—makes itself felt in the form of delay, and also in the form of many complex structural, administrative, quantitative, and qualitative problems—all of which also bear upon the problem of delay.

SPECIAL TYPES OF CASES

Is the metropolitan case-load not only bigger, but also different? Some difference in substance, in social texture, can be seen if only by reason of the fact that the bigger the case-load, necessarily the smaller each unit in it must be in relation to the whole. This fact alone indicates the importance, in considering delay, of looking hard at the special difficulties experienced by the metropolitan court in performing its judicial function adequately under conditions in which the aggregate case-load is so large as to render the individual case all but invisibly small.

This point aside, however, there is another way of looking at the difference in substance of the metropolitan case-load. Numerous studies have established the tendency of certain types of cases to predominate in metropolitan areas, and particularly in the central cities. Among these are criminal, domestic relations, traffic, mental, and certain other

cases coming into court by reason of the special conditions governing behavior of persons in metropolitan areas.

In the attempt to provide special facilities for dealing with the social problems in these special types of cases, the metropolitan court finds itself confronted with the danger of transformation into a general rehabilitative clinic for personal problems, on the one hand, and, on the other, with the danger of sacrificing the rights of litigants to the increasing pressure to speed up.

To go too far in either direction is to sacrifice the vital force of the judicial function as such. Our studies indicate that judges in metropolitan trial courts are well aware of the danger leering from either side and are confronting their unique problems with courage and sagacity, though the size of their case-loads and the complexity of their problems appear to be increasing.

CONCLUSION

Many students of judicial administration have emphasized the difficulties experienced by metropolitan trial courts in seeing to it that the enormous case-loads are handled expeditiously, yet with something more than perfunctory routine. It is essential that they do see to it, for our legal system since Magna Charta has rested upon the guarantee that every man, regardless of his rank, wealth or station, shall have ready access to the judicial process, and to justice at its hands. "To no one will we sell, to no one will we refuse or delay, right or justice."

So says Magna Charta.

If metropolitan courts find this ideal difficult to achieve, they also know it to be worth the striving.

The State Court Systems

By WILLIAM M. TRUMBULL

ABSTRACT: Largely by historical accident, each of our states has a veritable maze of separate courts, each with its particular powers directly or indirectly derived from the state constitution. This atomized hierarchy of courts prevents efficient administration of justice, creates issues for litigation extraneous to the merits of the case, involves successive trials and successive appeals before final decision, and contributes in other ways to congestion and delay. England modernized its court structure in 1875, but in the United States it was not till the close of the first half of this century that Missouri, New Jersey, and California led the way of constitutional reform. The movement has gained considerable momentum during the past five years. Simplification of the court structure, central administrative authority, and procedural reform must be accompanied by measures designed to assure the quality and independence of the judiciary. Adversary election of judges in thirty-six states is a major obstacle. Here, also, Missouri led the way with a plan combining the best features of the appointive and elective methods. A handful of states have adopted variations of the plan, and arduous campaigns for its adoption have been, and will again be, conducted elsewhere.

William M. Trumbull, M.A., J.D., Chicago, Illinois, is Professor of Law at Northwestern University Law School. He is a graduate of Stanford University, the University of Chicago, Northwestern University, and is a member of the Bar of Illinois. From 1951 to 1958 he was a member of the Joint Committee on Judicial Article of the Illinois State and Chicago Bar Associations and currently is secretary and a member of the Board of Managers of The Chicago Bar Association.

TWO important aspects of the state court systems, namely, the extent of central administrative supervision of the courts and their personnel and the use of procedural devices calculated to increase efficiency in the adjudication of cases, are dealt with in various other parts of this volume. The present chapter, therefore, is largely confined to the court structure itself and to measures bearing upon the quality and independence of the judiciary. In considering these matters, while one may properly be impressed either by the diversity obtaining among the several states or by those features which most of the states have in common, it is the latter which may more readily be described and more significantly related to the problem of delay in the administration of justice.

CONCEPT OF A COURT AND ITS JURISDICTION

A word may first be in order as to what is meant by a court. Surely a court is something distinct from the judicial and other personnel who staff it, for they are constantly changing, and it may function through personnel acting separately, but simultaneously on various matters; likewise, it is distinct from a courtroom or courthouse, for not only may it share these with other courts, but it may sit in different places both at the same and at different times. A court in our system of law is an agency of the government whose primary function is to decide specific controversies—known as cases—between specific parties, one of whom may be the government itself, by determining the facts in dispute and applying to them the appropriate provisions or principles of law. Sometimes in construing provisions of constitutions or statutes and in molding generalized principles to specific facts, courts are in a sense making law, but this they do only inter-

stitially in a system in which legislative and judicial powers are basically separate. Since every state court derives its powers—called its jurisdiction—directly or indirectly from the constitution of the state, it is limited to that particular territorial area, to those particular types or classes of cases, and to those particular functions of decision entrusted to it.

Classification of cases

An obvious classification of cases is that between prosecution for violations of the criminal law and all other controversies, the latter being known as civil cases. Subclassifications may be less obvious: among criminal cases, according to the penalty in the event the accused is convicted, the maximum authorized fine, the place or maximum authorized period of detention, or whether a death sentence may be imposed; among civil cases, according to the amount involved measured in dollars; or by the complexity of the subject matter, as where title to real estate is at issue; or on a basis influenced by the historical accident which conferred matrimonial cases and the probate of decedents' estates on the ecclesiastical rather than the royal courts; or according to the historical division between cases at *law*, such as to obtain damages for breach of contract or the infliction of an injury to person or property, as to which the right to trial by jury has been preserved, and cases in *equity*, such as to compel the conveyance of real estate, enforce a trust or enjoin irreparable injury, for which there has in general never been a right to trial by jury.

Classification by function

The basic classification of the functions of decision is between the initial *trial*, at which witnesses testify and other evidence is produced and the law

applied to the facts as found, and the *appeal*, at which the whole or some part of the initial process is reviewed by a higher tribunal and the original decision affirmed or reversed, with the possibility that because of errors committed in the process a new trial may be ordered. A subclassification of appellate functions exists when provision is made for a succession of appeals through a hierarchy of tribunals.

By superimposing the classification of trial and appellate functions upon the classification and subclassifications of cases and territorial limitations, a very substantial number of different combinations is attained. Now, of course, provision could be made for a single court whose powers or jurisdiction would, by internal division of labor among its judicial personnel, extend throughout the territorial sovereignty to every conceivable type or class of case and to both trial and appellate functions of decision. This has never been done anywhere, though it was approximated in the British Judicature Act of 1873, which was modified two years later before going into effect. At the opposite extreme, provision could be made for a distinct and separate court for each type or class of case and for the trial and appellate function in its decision. This, too, has never been done anywhere, though a situation approximating it existed in the mother country at the time of the first English settlements on this continent. The constitutions of our several states today, intermediate between the theoretical extremes, create systems of a greater or lesser number of distinct courts, each with its own jurisdiction. These we are now ready to examine.¹

¹ American Bar Association, *The Judicial Articles of the Forty-Nine States*, compiled for Committee on Model Judicial Article, Section of Judicial Administration. (Chicago, Illinois, 1959). These constitutions and that of Hawaii may also be found in the annotated statutes of the several states.

STATE COURT STRUCTURE

For the humblest functions at the trial level all but a handful of the states still provide inferior courts, properly so called, presided over by part-time justices of the peace, selected in and for townships, precincts, county districts, and occasionally the county at large. They have power to try minor misdemeanors, perform preliminary functions in the prosecution of more serious crimes, and to hear and decide civil cases of the supposedly simpler sorts and involving limited amounts, usually not to exceed two or three hundred dollars. In general, these officials are not required to be trained in the law or to make a record of the testimony and other evidence; they are provided with no courtroom or clerk; they are compensated by fees and costs assessed against the parties, with the result that the justice or magistrate has a financial interest in the outcome of cases he is to decide; and as a consequence of these facts, upon appeal the case is tried all over again before another court, making it necessary for the witnesses to appear once more and repeat their testimony.

While only a half-dozen states have abolished the justice of the peace, it is little wonder that elsewhere this crude system is in the larger towns and cities supplemented or replaced by tribunals ranging in nature from those presided over by police magistrates, who may be provided with a fixed place for holding court and even a small salary, to municipal and city courts more or less worthy of the name, but usually with part-time judges and very limited jurisdiction. The needs of the largest metropolitan centers have been sought to be met by a proliferation of separate courts, each with its special functions. In New York City, for example, in addition to the trial courts existing throughout the state, there are special tribunals known, re-

spectively, as the City Court, the Municipal Court, the Court of General Sessions, the Court of Special Sessions, and the Court of Domestic Relations; and in Baltimore, there are special tribunals known, respectively, as the Superior Court, the Court of Common Pleas, the City Court, the Criminal Court, and the Supreme Bench. Some of the courts just named are dignified, expert, and important tribunals and by no means typical of the small municipal substitute for the justice of the peace.

Other trial courts

In addition to the systems of local courts just described, nearly all of the states have in each county a court variously known as the county, probate, orphans', or surrogate court, whose primary function is the administration of the estates of decedents, incompetents, and minors. In most instances these county courts also have jurisdiction in minor criminal cases and in civil suits, more extensive than that of the justice of the peace, but still quite limited in scope. Less frequently, where such jurisdiction is not combined with probate powers, it is vested in a separate county-wide court. In a few instances these courts are empowered to try appeals from justices of the peace, but that function is more generally reserved for the next level of trial courts to be described. While the various county courts make records of their own proceedings, which could be reviewed on appeal, in most states an appeal in certain classes of these cases involves taking the evidence again in a completely new trial in a higher court.

We have now reached the level of trial courts of plenary or general jurisdiction, known usually as district, circuit, or superior courts, in a few instances as the court of common pleas and in New York as the supreme court. These courts are usually organized by

districts composed of two or more counties; but isolated exceptions to this are to be found in certain of the metropolitan counties; and in eight states—Arizona, California, Montana, Nevada, Ohio, Utah, Washington and Wyoming—every county constitutes a separate district. In Pennsylvania and two or three metropolitan counties elsewhere the criminal court is separate, though staffed by the same judges. In Alabama, Delaware, Mississippi, and Tennessee equity powers, derived historically from the Lord Chancellor in England, are exercised by separate courts. The prevailing pattern, however, is that of single courts of plenary jurisdiction at the trial level organized by districts and holding terms of court in each of the counties comprising the district. As indicated above, these courts usually try appeals from justices of the peace and police magistrates and to some extent from the various municipal and county courts.

Appellate courts

At the apex of the state judicial systems are the appellate courts proper—tribunals consisting of three or more judges who sit together to decide appeals from the trial courts last described, and in some instances appeals directly from county and municipal courts, on the basis of the record made of trial proceedings. In fifteen states the appellate courts themselves consist of two levels, an intermediate court of appeal and the court of last resort, usually but not always known as the supreme court. In three of the fifteen, Maryland, New Jersey and New York, the intermediate appellate tribunal is a division of the main trial court; in the others it is a completely separate court, though in one or two instances it is staffed by judges of the main trial court. In eleven states, including four of the fifteen which have intermediate appellate courts, the su-

preme court is authorized to sit in divisions, with a possibility of final review by the whole court in certain instances. This leaves twenty-eight states in which the sole appellate court proper is the supreme court (by whatever name known) convening as a whole.

COURT STRUCTURE AND DELAY

The complex patterns of multiple separate courts constituting the judicial systems of the several states become intelligible only in the historical perspective of the circumstances under which they and their antecedents were developed over the centuries. For present purposes we do not need—and space will not permit us—to unravel the tangled strands which would lead us to an understanding of this development. The reasons, as hinted above in the discussion of the concept of a court and its jurisdiction, lie in the exigencies of more primitive social and economic conditions, in feudal politics, in the medieval division of functions between church and state, in the chancellor's intervention to relieve hardships of the law under the last of the Tudors and the first of the Stuarts, in the adaptations of the English system to suit the needs of a new and larger country, and finally in the pressure to create additional and specialized tribunals to administer justice in the metropolitan centers of a mechanized age. In short, the typical state court system of today was not anyone's plan or ideal; haphazard development has made it what it is.²

Court administration hampered

Probably the greatest evil of the fragmented court structure existing in most of our states is the obstacle which it presents to any attempt at coherent administration of justice in the system as

² Arthur T. Vanderbilt, *The Challenge of Law Reform*. (Princeton, New Jersey, 1955), pp. 36-39.

a whole. The judicial department, the third great branch in our tripartite division of government, is such in name only; in reality, it usually consists of scores of separate courts, each a sovereignty in the exercise of its particular powers and functions, with no one responsible for the functioning of the department as a whole. This is all the more true because most of the judges are locally elected in the great majority of the states and tend, realistically, to regard themselves, subject to the oath of office, as answerable only to their constituents. Even in the seventeen states in which the constitution more or less explicitly confers control and administrative authority on the chief justice, the highest court, or a judicial conference or council, atomized court structure hampers administration. The result is inefficient use of judicial and clerical personnel, with consequent delay and expense.³ Further discussion of this, however, would carry us beyond the scope of this paper. Other evils are presently germane, of which those not requiring technical explanation follow.⁴

Other evils

One is the retrial of cases on appeal from inferior courts. This waste of time of litigants, witnesses, counsel, jurors, and judges is unnecessary where a competent tribunal is provided in the first instance and a record made of the proceedings for review on appeal.

Another evil of fragmentation both on the trial and the appellate level is the opportunity afforded for litigating the question as to whether the case was tried in the proper court or was reviewed in the proper court. No degree of art or

³ Arthur T. Vanderbilt, *The Essentials of a Sound Judicial System*, 48 NW. U. L. REV. 3-6 (March-April 1953).

⁴ William M. Trumbull, *Why Lawyers Should Support the Judicial Amendment*, 46 ILL. B. J. 4-8, 12-13 (Feb. 1958).

skill in drawing constitutional and statutory provisions will altogether prevent such questions from arising, as long as provision is made for separate courts, each with its distinct and limited jurisdiction. Time spent litigating such issues merely creates expense and delays final disposition of the case on its merits.

The prevailing system, under which the main trial court is organized in districts and sits infrequently in the less populous counties, results in delay in adjudication of important cases beyond the jurisdiction of the county and other local courts.

Provision for successive appeals of the same case is no more necessary than, and is as productive of delay as, provision for successive trials. Justice requires no more than one trial followed by the right to one appeal, each before a competent tribunal. The existence of a hierarchy of separate courts, however, invites provision for the right to successive appeals, and where the right exists a losing litigant often will avail himself of it if he can afford to do so.

Finally, atomized courts are a major cause of delay and inefficiency in dealing with problems of the family, domestic relations, and the custody and protection of children. In no other field does fragmented justice, with social services similarly fragmented, result in greater human waste, as well as delay in the merely temporal sense.⁵

IMPROVING COURT STRUCTURES

Mention has already been made of the British Judicature Act of 1873, which would have completely unified the courts. Even after the modification of the plan in 1875, all the main courts, trial and appellate, had been consolidated into one court with appropriate branches or departments, excluding only

⁵ Paul W. Alexander, *Family Court of the Future*, 36 J. AM. JUD. SOC'Y. 38-46 (Aug. 1952).

the inferior local courts at the bottom and the House of Lords at the top. None of our states has gone this far, though there is general agreement in principle as to the ideal of a unified court system.⁶ While the simplicity of our federal court structure may be due in part to the narrower range of matters for which those courts are responsible, the unified trial court of Puerto Rico and the simplicity of the court structures of Alaska and Hawaii, our newest states, are without question grounds for encouragement. They cannot be explained away on the basis of federal influence, for many of our states with hopelessly complex court systems were once federal territories.

Missouri in its constitution of 1945 replaced justices of the peace and other inferior tribunals by a magistrate court in each county. New Jersey by constitutional amendment in 1948 abolished a dozen or more courts, including justices of the peace, and though county and municipal courts were not consolidated into the main trial court, the experience of that state has demonstrated how much may be accomplished by effective provision for administrative authority coupled with a reasonable degree of unification of the court system. California amended its constitution in 1950 to simplify the court structure by eliminating justices of the peace and three other types of inferior courts. As a result, in the city of Los Angeles, for instance, there are but two courts, the municipal court and the Superior Court of Los Angeles County, into which other pre-existing county courts were merged.⁷

A long step toward simplification was taken by Delaware in 1951. In Minnesota justice of the peace courts were

⁶ Roscoe Pound, *Organization of Courts*. (Boston, 1940), pp. 273-294.

⁷ Illinois Legislative Council, *Judicial Articles of the State Constitutions*. File No. 1-559. (Springfield, Illinois), pp. 2-4.

abolished and other improvements of court structure effected by constitutional amendment in 1956. During the same years measures directed toward similar ends were pressed in a number of other states, but failed to obtain the legislative approval prerequisite to submission to a vote of the people.⁸

Recent developments

Finally, in 1957 the Illinois General Assembly by two-thirds vote of each house approved a resolution for constitutional amendment which, in addition to other improvements in the judicial system, would have consolidated all the trial courts into one, to be organized in such branches and divisions and to sit at such places as the due administration of justice might require. After an arduous campaign in which the leaders of both major political parties, the organized bar, and countless civic, women's, and professional organizations gave their full support, the proposal was submitted to the electorate in the general election in 1958 and, according to the official canvass, received 1,589,655 favorable votes and 893,503 opposed, thus failing by a few thousand to obtain either a two-thirds majority on the question or a simple majority of all votes cast at the election. At the time of this writing an election contest is pending in the Illinois courts.

In 1959, by legislation not requiring constitutional amendment, Tennessee all but completed the replacement of justices of the peace by courts of record having salaried judges trained in the law; Connecticut adopted even more comprehensive legislation to the same end; Wisconsin simplified its county and municipal court structure and placed

justices of the peace on a salaried basis; and Illinois took action to decimate the number of justices of the peace and to place the remainder on salary, effective in 1961. Finally, preliminary legislative approval was given to proposed constitutional amendments in Iowa and New York which would greatly simplify the court structure in those two states. Plainly, the movement has gained momentum.⁹

QUALITY AND INDEPENDENCE OF THE JUDICIARY

The efficiency of the courts and the prospects for reducing delay in the administration of justice depend ultimately, though less directly and immediately, upon measures affecting the quality and independence of the judiciary. The objectives which a modern court structure and machinery for business-like administration would make possible can be realized only through the men and women serving as judges. The initial facet of this problem is the manner of selecting the judiciary. Following is a summary of the methods of selection applicable to the major courts in the several states.¹⁰

The original states knew two methods of selecting judges. The first, appointment by the executive by, and with, the advice and consent of the senate or council, which was incorporated into the Constitution of the United States applicable to federal judges, has continued in effect in Delaware, Maine, Massachusetts, New Hampshire, and New Jersey, and has been adopted by Hawaii. Under a variation in Connecticut the governor nominates, and both houses of the General Assembly act on the appointment. The second method was selection by the

legislature, and this has continued in effect in Rhode Island, South Carolina, Vermont, and Virginia. Before the middle of the last century a radically new method, selection by the voters in adversary elections, found favor and swept most of the southern and in turn all the midwestern and western states. Judges are so elected today in thirty-six states, which are all the states not specifically named in this, and the following, paragraph.

American Bar Association Plan

Variations of a fourth method, a composite of the appointive and elective methods and known as the American Bar Association Plan, are now in force in three states. Missouri by constitutional amendment in 1940 provided for a state-wide, nonpartisan judicial commission, consisting one-half of lawyers chosen by the members of the bar and one-half of nonlawyers chosen by the governor and presided over by the chief justice, to submit nominations to the governor for appointment to the supreme court and the courts of appeals. Similar commissions were provided for the nomination of circuit judges in circuits coming under the plan. Each judge so appointed serves a short probationary term, after which he must submit his name to the voters, without party designation and without opposition, on the sole question as to whether he shall be returned to office for a full term. Thereafter he has the same right at the end of each term.¹¹ Alaska has adopted this system, except that nominations are submitted by the Judicial Council, which has additional duties but is constituted in the manner of Missouri commissions. In California the gover-

nor appoints with the approval of a Commission on Qualifications, consisting of the attorney-general and judges representing the various courts; but from that point on the plan is substantially the same as in Missouri and Alaska. In California, as in Missouri, the plan applies to the supreme court and district courts of appeals but with respect to local judges only in counties electing to come under the plan. Kansas in 1958 adopted a variation of the plan limited to judges of the supreme court.

Tenure and retirement

Another major aspect of the problem of assuring an able and independent judiciary is tenure in office. In Massachusetts judges of the major courts serve during good behavior—for life, subject to impeachment—just as federal judges do; and the same is true in New Hampshire, except that there is a fixed age of retirement. In New Jersey the initial appointment is for seven years, but upon reappointment judges of the major courts have life tenure. In all the other states there are fixed terms which, with the notable exceptions of Louisiana, Maryland, New York, Pennsylvania, and West Virginia, are shorter where judges are elected by the voters.

A third major aspect of the problem of maintaining a judiciary of high calibre relates to procedures for removal of judges for cause and their retirement by reason of mental or physical disability. The greater their security of tenure in office, the more important this facet of the problem becomes. In the great majority of the states, judges of the highest courts may be removed or retired from office only by impeachment brought by the lower house of the legislature and tried by the senate, or by a vote of a specified majority of each house. Such cumbersome and onerous

procedures are seldom invoked. In a small minority of the states a judge is automatically removed upon conviction of crime. The constitutions of Maryland, Missouri, New Hampshire, and Wisconsin provide for a fixed age of retirement; and in Alaska, Florida, Hawaii, Massachusetts, Missouri, New Jersey, and New York provision is made for a special tribunal with authority to remove for cause or retire for disability or both.

EVALUATION OF METHODS OF SELECTION AND TENURE

The philosophical principles of democracy which dictate popular election of the executive and legislative branches of government conflict with the principle of the separation of powers when applied to the judiciary. As noted at the outset of this chapter, the essential function of the courts is to determine the facts in any controversy and then decide it in accordance with the law. An undertaking to do exactly that is the only platform on which any self-respecting candidate for the bench could run. Now it is true that someone must assess his qualifications of legal ability, temperament, and character, but of these the first is beyond the competence of the electorate, and as to the latter two the voters at large are unlikely to be informed except under unusual circumstances or in the smallest communities. At best, therefore, adversary elections of judges degenerate into mere popularity contests.

Unfortunately, the methods of nominating and electing judges in thirty-six of our states are subject to even more serious objections. Faithful service in partisan politics tends to be a prerequisite to nomination. The expense of campaigning further limits the field to the wealthy or to those willing and able to borrow funds. Political as well as

financial debts are incurred. A lawyer who has abandoned his practice to serve a relatively short term of office is under pressure to remain in the good graces of those having the power to nominate or reject him for another term. Finally, in the eighteen states in which judges run on party tickets and also in the eighteen states employing a nonpartisan ballot, whenever a candidate's party affiliation is well known, his election or re-election may be affected more by popular reaction to national party platforms, the personalities of candidates for other offices, and other extraneous influences than by the voters' appraisal of the relative qualifications of the adversaries running for judicial office. When this factor is sought to be minimized by providing for separate judicial elections, the small turnout of voters enhances the power of the organized vote. The very consideration of these things discourages many well-qualified lawyers from seeking or even accepting nomination to the bench.¹²

It is well known that political considerations influence the appointment of federal judges, but life tenure gives them independence. The combination appointive-elective plans, whether in the Missouri, California, or Alaska form, are designed to minimize political influences in initial selection and give reasonable security of tenure, without sacrificing altogether an element of popular control which may operate as a safety valve in the event of wilful abuse or honest mistake on the part of the persons to whom the powers of nomination are entrusted.

Reform difficult

During the past decade the organized bar and civic groups in a large number

¹² Evan Haynes, *Selection and Tenure of Judges* (New York, 1940), pp. 247-259 (bibliography).

of states have been promoting constitutional amendments to put the American Bar Association plan into effect.¹³ Political obstacles have proved very great indeed, and experience indicates that only through a gradual process of education of the public, in the course of repeated efforts, can the goal be reached. The most recent victory came in 1958 with the adoption of the plan for

the selection of supreme court judges in Kansas. Preliminary legislative approval has been obtained in Iowa and Nevada. With perseverance measures calculated to improve the quality and assure the independence of the judiciary, as well as measures to modernize the organization of the state court systems, can and will be adopted.¹⁴

The Problem of Congestion and Delay in the Federal Courts

By HENRY P. CHANDLER

ABSTRACT: In order to co-ordinate the work of the federal courts there was created in 1922 the Judicial Conference of the United States. In 1939 a law provided for a director of an administrative office to serve as executive assistant to the Conference and for judicial councils of the circuits consisting of the judges of the courts of appeals to exercise local supervision. The district judges have been given the assistance of law clerks; pre-trial conferences to reduce and simplify the issues before trial and incidentally to conduce to settlements have been promoted; and the judicial output of the individual judges has increased. But serious congestion and delay remain in some courts. For firmer administration the Judicial Conference should be authorized to prescribe administrative practices instead of merely to make suggestions; the chairmen of the judicial councils should have administrative assistants; and chief judges of courts should be appointed instead of succeeding by length of service. The paramount need is for more judges to cope with the present volume of litigation. The Congress is under a clear duty to provide for them.

Henry P. Chandler, A.B., J.D., Springfield, Illinois, was Director of the Administrative Office of the United States Courts from 1939 to 1956, when he retired. In 1957 at the instance of the territorial government of Hawaii, he made a study of the administration of the territorial courts and recommended legislation which with minor changes was enacted by the last territorial legislature and is now a law of the new state. Until September 1960 he is serving as the first court administrator of Illinois by appointment of the Illinois Supreme Court. He has written various articles for professional journals on court administration and on probation as a method of correction.

THE serious delays in the federal courts occur in the district or trial courts. This is natural because an overwhelming proportion of cases begun in those courts never reach appeal. In 1959,¹ 187,201 suits were brought in the federal district courts, but only 3,754 in the United States courts of appeals, and only 1,639 in the United States Supreme Court during its October 1957 term, the latest year for which figures are presently published.²

JUDICIAL CONFERENCE OF THE UNITED STATES³

When William Howard Taft became Chief Justice of the United States in 1921, he brought his great influence to bear toward making the federal courts more efficient. He had been thinking of the problem ever since he left the presidency in 1913. He was attracted by the English court system which he said provided for "executive control vested in a council of judges to direct business and economize judicial force."⁴ In 1921 there was a large accumulation of cases in the district courts resulting from the increase of business after the First World War and Prohibition. In order to handle it Congress provided by law for twenty-four additional district judges in specified districts. Upon Chief Justice Taft's recommendation, the Congress authorized the assignment of any district judges by the Chief Justice to courts of other circuits with the consent of the senior circuit judge of their own

circuit. It also adopted a recommendation that there be created a council consisting of the Chief Justice and the senior circuit judges, then nine, to meet annually and "agree informally as to where the judges were needed and whence they can be had."⁵ Thus on September 14, 1922, the Judicial Conference of the United States was created.⁶

PROGRESS: 1922-1939

Chief Justice Taft had a strong incentive, due to his advocacy of the provision for temporary assignment of judges among circuits, to arrange for full use of this practice. The Judicial Conference had tried ever since to do so, and these efforts have by no means been ineffectual. Over the years many judges have been so assigned, particularly to the Southern District of New York in Manhattan.

In principle there is good reason for much larger use of the practice. In 1959 over one third of the districts had incoming case-loads at least one fourth less than the national average of 215 civil cases per judge.⁷ But there are practical obstacles to assignment between circuits.

Members of the Conference, desiring to make a good record for currency in their own circuits, are reluctant to part even temporarily with their judges. Another difficulty was explained by Circuit Judge Walter H. Sanborn of Minnesota in 1921:

We have found from experience that these cases where work is needed will not be tried by non-resident judges, because . . . the lawyers being unacquainted with the ability, learning, character, and wisdom of the

judges sent into their districts, continue their cases until the resident judge . . . can hear them.⁸

Consequently, the assignment of judges from outside is not a substitute for enough resident judges.

In its first meetings in 1922 and 1923 the Conference took steps to bring about the removal from the dockets of cases which while nominally pending were really "dead," so that the judges could concentrate on the "live" cases. To this end it recommended periodic calls of the calendars and the dismissal of cases in which action had not been taken within a year.⁹ The Conference has always taken the view that while a client's lawyer has the primary responsibility for the prompt handling of his case, the court is under some obligation to see that it is fulfilled.

Chief Justice Taft and his successors have stimulated the members to spur lagging judges in their circuits. This has applied especially to holding cases a long time under advisement without decision. As Chief Justice Hughes said to the Conference in 1934,

I am entirely in favor of dealing very carefully and tactfully with a judicial officer, and not unnecessarily offending him, but after all, he has a duty and we have, in a sense, a responsibility for the general administration of justice in the Federal courts. . . . That is what we are here for.¹⁰

THE LEGISLATION OF 1939

In many ways the Judicial Conference exerted a beneficial influence between 1922 and 1939. But opinion grew that it was not enough. Former Attorney-General Homer Cummings pointed out that it was the only administrative

agency in the federal judicial system except the individual courts, and it met only once a year for a few days.¹¹

The business matters of the courts were then being handled by the Department of Justice under the attorney-general who procured the appropriations for their maintenance and controlled their expenditure. The Judicial Conference, reflecting the attitude of the judges, disliked this arrangement. Attorney-General Cummings recognized that it was anomalous for the courts to have to look for their financial support to the attorney for the United States government, their principal litigant. He proposed that provision be made for an administrative officer chosen by the judicial branch to whom the business functions would be transferred and who would also collect statistics and information concerning the work of the courts, and endeavor in proper ways to bring about improvements in their practices. The American Bar Association under its dynamic president, the late Arthur T. Vanderbilt, supported his proposal enthusiastically, and in 1938 a bill was introduced.¹²

The proposed administrative officer would have acted as a kind of agent for the Chief Justice. In the words of Chief Justice Hughes this would have made him almost personally responsible for what went on in the various courts which might be subject to correction.¹³ To this the members of the Supreme Court were opposed. The objection was overcome by the acceptance of a suggestion of the Chief Justice to put the burden of supervising the individual courts on judicial councils, consisting of

the judges of the courts of appeals of the circuits acting in an administrative capacity. In that form a law was enacted August 7, 1939.¹⁴

The statute provided for a Director of the Administrative Office of the United States Courts, to be appointed, subject to removal, by the Supreme Court, but to operate "under the supervision and direction" of the Judicial Conference. In addition to his duties in relation to the business and fiscal matters of the federal courts—except the Supreme Court—federal probation, and the offices of the referees in bankruptcy, he has a part in the following procedures designed to increase the efficiency of the courts.

1. He renders minutely detailed annual and quarterly reports of information and statistics concerning the judicial business, showing both nationally and for each court whether they are gaining or falling behind, and where there is delay, the causes of it.

2. The judicial councils are under a mandate in the statute to take such action on the quarterly reports "as may be necessary"; also to "make all necessary orders for the effective and expeditious administration of the courts" within their circuits and the district judges are obligated to comply.

3. The law provides for a judicial conference in each circuit to be held annually and attended by all the federal judges of the circuit and representatives of the bar to be selected according to rules of the court of appeals. In these conferences the problems of the federal courts can be candidly faced by circuit and district judges consulting together with the bar and often public-spirited laymen.

4. The Director and his staff act as a secretariat for the Judicial Conference and its committees, also for the judicial councils. This permits preparation for meetings, following up recommendations and taking steps to have them carried out, and

¹⁴ 53 U. S. Stat., 1223.

continuity of action that before was not possible.

ACCOMPLISHMENTS, 1939-1956

The usefulness of the Administrative Office to the Judicial Conference was demonstrated at its meeting in January 1940, two months after the beginning of the Office. While the Conference had been trying to end excessive delays of judges, the effort had not been systematized. The Conference now authorized the Administrative Office to inquire of all district judges the number of cases, motions, or other matters held under advisement more than 30 but less than 60 days, and the titles, dates of submission, and any explanation desired of cases held more than 60 days.¹⁵ The effect was prompt. The number of cases and motions so held dropped from 298 to 190 between February and August of 1940.¹⁶

On February 17, 1936 a law provided that a district judge might appoint a law clerk if his need was certified by the senior circuit judge of the circuit.¹⁷ But in the years immediately following, it was unavailing because there was no appropriation for such aid. In time the persistent recommendations of the Conference brought about the needed appropriations. Beginning in 1940 with provision for only two law clerks for district judges in each circuit, the limitations were gradually lifted until in 1945 they were removed altogether. Now every district judge who wishes a law clerk can have one.¹⁸ In conducting trials and hearing motions the district judges are called on to decide quickly numerous

questions of law, and the help of law clerks has substantially increased their producing power.

Pre-trial conferences

The simplification of practice in the federal courts by the Federal Rules of Civil and Criminal Procedure has helped to expedite the court processes. Particularly the Judicial Conference has repeatedly recommended holding pre-trial conferences authorized by Civil Rule 16. These conferences are informal consultations of counsel with the judge for the purpose of surveying the case, and reducing the issues to be tried to the heart of the controversy. Although settlement is not a stated purpose it often results and when it does it frees the time of the court for other cases.

Circuit Judge Alfred P. Murrah of Oklahoma, who since 1947 has been chairman of the Committee of the Conference on pre-trial procedure, has been a flaming evangelist for it. In every way that ingenuity could devise and enthusiasm prompt he has promoted it. With two districts omitted—in which pre-trial procedures are not strictly comparable to those in other districts—14,088 pre-trials were reported by the clerks of the courts in 1959.¹⁹

Some federal judges who have a notable record for production use pre-trial only in selected cases in which they think that it will have a definite advantage. Also a recent study, *Delay in the Court*, by Hans Zeisel, Harry Kalven, Jr., and Bernard Buchholz, which relates particularly to the Supreme Court (the trial court) of New York County but is of general application, comments that "On the basis of the evidence available we are not yet prepared to say that pre-trial is effective enough in this respect [promoting settlement] to over-

¹⁹ 1959 ADMINISTRATIVE OFFICE OF THE U. S. COURTS REP. at II-38.

come the offsetting loss of direct judge trial time."²⁰

Nevertheless the pre-trial conference in civil cases has reason to support it aside from being conducive to settlements. The reduction of the controversy to its essentials can generally be better attained in a quiet conference with the judge than in the strife of trial. The elimination of distracting matters in advance is especially desirable where there is a jury. The jurors' time is saved and there is no flagging in their attention.

The federal courts have also tried to bring about the fullest use of all means of discovering pertinent information in advance of the trial. Whether or not the cumulative effect of these practices or increased efforts of the judges or all together are the cause, the judicial output of the individual district judges has risen significantly in the last two decades. The number of civil cases terminated on the average per judge was 236 in 1959 compared with 169 in 1941, an increase of 40 per cent.²¹

New judgeships

From the beginning the Judicial Conference has worked unremittingly for additions to the judicial force. Before 1939 it had to look to the attorney-general for support of its recommendations in Congress. Now they are submitted by the director of the Administrative Office, and accompanied by a detailed analysis of the business of the courts concerned, the number of cases collectively and per judge, and their rise and fall. The studies take account of local conditions such as an unusual proportion of long cases and illness of judges or judicial vacancies.

²⁰ (Boston: Little, Brown and Co., 1959), p. 12.

²¹ 1959 ADMINISTRATIVE OFFICE OF THE U. S. COURTS, DIRECTOR'S REP. at I-2.

The most powerful support of the recommendations of the Conference comes from its own members and judges of the courts involved. For many years Chief Judge John Biggs Jr. of the Third Circuit has testified at all hearings on legislation of this nature, and his explanations have been able and persuasive. In the latter years he has been supported by Circuit Judge Charles E. Clark of the Second Circuit, chairman of the Committee on Judicial Statistics, which has carefully reviewed all the recommendations of new judgeships before they have gone to the Conference. This has also been done by the Committee on Court Administration under Judge Biggs as chairman.

In a decade the Congress has made two principal additions to the number of district judgeships. In 1949 it provided for twenty-one,²² and in 1954 for twenty-nine.²³ Since 1954 no new federal judgeships have been authorized. This has put a heavy strain on the district courts and is the largest factor in the delay there.

RECENT DEVELOPMENTS

In the last three years the membership of the Judicial Conference has been doubled from twelve to twenty-four and changed in nature. In 1956 the Chief Judge of the Court of Claims was made a member²⁴ and in 1957 provision was made for the representation of the district judges of each of the eleven circuits by a member to be chosen for a three-year term by all the judges of the circuit, circuit and district, assembled in their judicial conference.²⁵

Agitation for representation of the district judges began early in the last decade. It was truly said that the most

numerous and difficult problems of administration arose in the district courts. The participation of the district judges in the national body has begun well. Under the effective use of the committee system and the skillful guidance of the Chief Justice as chairman, the Conference requires no longer for its meetings than formerly. It is benefited by the first-hand knowledge of conditions in the district courts which its members from those courts supply, and its recommendations are more persuasive to the district judges because their representatives have had a part in shaping them.

A law which took effect on August 7, 1959 prescribed a maximum age limit of seventy years for chief judges of the United States courts of appeals and the United States district courts.²⁶ A chief judge reaching that age retains his powers as judge but ceases to be the head of the court. The effective administration of a court with a number of judges calls for vigor that often declines with age. The new law protects against lagging on that account although naturally it cannot guarantee that the chief judge will possess administrative talent.

On October 31, 1956, I retired as Director of the Administrative Office, and on January 7, 1958, Warren Olney III, who had been Assistant Attorney-General and head of the Criminal Division of the Department of Justice from 1953 until 1957, succeeded me. Under him the Administrative Office has undertaken to increase its personnel in an effort to render larger service, particularly in studying more closely the causes of congestion and delay and suggesting to the courts means of overcoming them. The extent to which it can do this will naturally be limited by its appropri-

²⁶ 72 U. S. Stat. 497. The law excepts from its operation any district judge holding the position of chief judge of a district with only two judges at the time of its enactment, as long as he continues to hold the position,

tions. But the appropriation for the fiscal year 1960 is \$159,000 more than the one for 1959 and aside from other purposes will permit an expansion of the present efficient staff of the Division of Procedural Studies and Statistics.

District court experiment

In the spring of 1959 the Administrative Office carried out a notable project in the District Court for the Eastern District of New York in Brooklyn. The congestion of the civil calendars in that court approached paralysis and was the subject of especially severe criticism in a report to the Senate Appropriations Committee by Paul J. Cotter, a member of its staff.²⁷ On the invitation of Chief Judge Mortimer W. Byers of the court, Mr. Olney arranged for the assignment to the district by Chief Justice Warren of fifteen district judges from other circuits, proficient in pre-trial techniques, to make a concerted attack on the backlog, leaving the resident five judges to handle their regular schedules.

The visiting judges held pre-trials and trials. Every case assigned to them was first pre-tried and the attorneys were required to complete in advance all preparatory steps such as discovery and the taking of depositions. By this course 681 out of 1,050 cases assigned were disposed of in twelve weeks. The greater number of the dispositions were by settlement, but there were 57 complete trials, including 33 jury cases, and trials were begun in 15 other cases which were settled during the process.²⁸ On June 30th there were 573 less cases on the civil docket than the year before, and the court's prospect for dealing with its

civil litigation was more hopeful than at any previous time in years.²⁹

SUGGESTED IMPROVEMENTS

The question arises what may be done to improve further the working of the district courts. I should say that the principal needs are firmer direction of administration and an adequate body of judges. Given sound organization and qualified personnel necessary improvements in practice will follow.

I recommend the following measures—without excluding others—which it seems to me would be beneficial and with concentrated effort might be secured.

First: Enlarge the power of the Judicial Conference, which is only to submit "suggestions," so that it can "make rules" governing the administration of the courts after the pattern of New Jersey.³⁰ The judicial councils can make orders binding on the courts within their circuits. But it is anomalous that the national body should be weak and the regional bodies in theory strong. The reason for the difference is probably that the conception of judicial administration has progressed from the "mild annual observation"³¹ thought of by Chief Justice Taft, in the seventeen years between 1922 and 1939. Now the time has come to attune the earlier provision to the present conception.

As Chief Justice Hughes said to the Judicial Conference in 1939, "The problems that concern more than one circuit . . . must be dealt with by this Conference."³² Plainly the general policies of administration, like the Rules of Civil and Criminal Procedure, should be uni-

form and determined upon a national basis. The Judicial Conference is the body to do this. The judicial councils would be strengthened in enforcing salutary practices if they rested on the authority rather than the recommendations of the national body.

Second: Give to the chief judges of all circuits except any in which the administrative problems are light the assistance of an administrative officer. Circuit Judge Warren E. Burger of the District of Columbia has criticized the judicial councils for not making sufficient use of their large powers.³³ May the trouble not be in part that they have not had the personnel to do this effectively?

With a larger staff the Administrative Office plans to give more help. But centralized assistance from Washington can hardly be a complete answer. A judicial council and its chairman who undertake to direct actively the administration of their courts will need the support locally of an executive assistant chosen by and responsible to them. Such an officer would be constantly at hand for consultation and assigned tasks, and his usefulness would be enhanced by his acquaintance not only with the judges but with the bar and people of the circuit.

Third: Provide for the appointment of the chief judges of the circuits and of the districts with more than one judge instead of succession by seniority of service. A high proportion of the cases brought in all district courts are disposed of in one way or another without contest. Efficient administration calls for segregating at an early stage the cases that will not be tried and procuring their disposition without delay, and setting aside those that present problems for hearing as expeditiously as con-

ditions will permit. This, and procuring harmonious team work among the judges require skillful management. Many judges with excellent qualities do not have the talent for it. It is a matter of pure chance whether the judge longest in service will have it.

It seems to me that the best arrangement would be to have chief judges, like the Chief Justice, appointed by the President with the advice and consent of the Senate. I realize that there can be no certainty that the President would require administrative ability of his appointees. But at least his attention and that of the public would be called to the importance of such a qualification. Furthermore the attorney-general, by whose advice the President in any administration is guided in judicial appointments, will appreciate the need for prompt action of the courts not only in the general public interest, but for the disposition of cases of the government. The course recommended would be almost bound to result in a higher proportion of effective chief judges than the present random arrangement.

IMPORTANCE OF THE JUDGES

When all is done that can be to give stronger direction to the administration of the federal courts, their accomplishment will depend mainly on how well the judges do their work in the individual courts, as has always been the case. Most observers agree; I think, that the general level of judicial competency in the federal courts today is high. But the number of judges, especially district judges, is seriously inadequate. The number of civil cases filed annually in the district courts with exclusively federal jurisdiction increased 50 per cent between 1941 and 1959 but the increase in the number of judges was only 26 per cent.³⁴

³³ Address before the Southern Regional Meeting of the American Bar Association, Feb. 21, 1958, 22 F.R.D. 71, 77, 82.

³⁴ 1959 ADMINISTRATIVE OFFICE OF THE U. S. COURTS REP. at II-15.

Undoubtedly the methods of handling cases in the district courts can be further improved. But it cannot reasonably be expected that by the most efficient practices those courts can make up for the present deficiency in judge power. Year by year the Judicial Conference has asked for legislation to grant additional judgeships. At its session last March it recommended forty-three, four circuit and thirty-nine district.⁸⁵ As Chief Justice Warren has said, these recommendations are "based upon serious study of the statistics and conditions facing the particular districts and circuits."⁸⁶ They have the unqualified support of the attorney-general and the American Bar Association.

All thus far to no avail. The Senate Committee on the Judiciary, in the last days of the 1959 session of the present Congress, reported a bill for twenty-five additional judgeships, three circuit and twenty-two district. But there it stopped.

To "establish justice" is still one of the fundamental purposes for which governments are established as it was in the days of the adoption of the Constitution. The United States is not doing its duty towards its citizens while it allows federal justice to continue as

⁸⁵ March 1939 JUDICIAL CONFERENCE REP. 5-6.

⁸⁶ Address at the Annual Meeting of the American Law Institute, May 20, 1959.

tardy as it is today. An adequate number of judges are indispensable for correcting this lag, and only the Congress can provide for them.

It is recognized that the attitude of the present Congress is not unique. Congress, whether the majority has been of one political party or the other, has generally been reluctant to create judgeships for a President of the opposite party to fill. The last Congress in the administration of President Wilson is an instance. This does not lessen the baneful effects upon the people of undermanned courts.

The American Bar Association, at its last annual meeting, urged the President to adopt the principle that, "The number of judges in our federal courts from each of the two major political parties should be approximately equal." Attorney-General William P. Rogers reported at the time of the meeting that the President had authorized him to say that if the needed new judgeships were created he would fill them on that basis. It is much to be hoped that this assurance may open the door to action by the Congress at its present session. In the longer view it would be fortunate if the policy might become a precedent for succeeding administrations of whatever party. Nothing could do more to improve the prospect of maintaining the federal courts at requisite judicial strength.

Delay in State Appellate Courts of Last Resort

By JOHN R. DETHMERS

ABSTRACT: Delays in appeals occur first in filing them, second in preparing and submitting them for decision, third in the courts' consideration and disposition of them. The first may be met by court rule requiring filing within specified number of days after decision in trial court. Delays in submission, due to procrastination of lawyers, decrease upon adoption of a rule providing for dismissal of appeals, automatically or on a court's own motion, when not submitted promptly. Some delays in hearing appeals are due, as are delays in deciding them, to the courts' inability or failure to keep up with workloads. Suggested means of increasing productiveness of judges include change in methods of judicial selection and improved compensation and facilities to attract the ablest lawyers to the bench. Among proposals for meeting today's increased case-loads are elimination of requirement that highest courts write opinions in every case decided, enlarging court membership, divisional sittings of the courts, placing restrictions on right of appeal, furnishing courts with legally trained clerks or commissioners, or establishment of intermediate courts of appeal. Advantages and disadvantages are found in each. The object of proposals is not only to expedite appellate operation but to improve the quality of the product.

John R. Dethmers, LL.B., honorary J.D. and LL.D., Lansing, Michigan, is Chief Justice of the Supreme Court of Michigan, assuming that bench in 1946. He was Chairman of the National Conference of State Chief Justices, 1957-58, is a Vice-President of the American Judicature Society, and a Vice-Chairman of the American Bar Association, Section of Judicial Administration. He was largely responsible for the creation of and is Chairman of the Michigan Judicial Conference. He has actively led this and other organizations and programs and devised measures designed to improve the administration of justice.

POPULATION growth, economic development, and other factors, combining to congest antiquated judicial structures at the trial level, could not have been expected to leave the states' appellate courts of last resort untouched. Authoritative information is not readily available on the extent of the law's delays there. Assuming that it presents a minor portion of the over-all problem of lagging justice, its elimination is, nonetheless, an essential part of the entire program of making the judicial process more prompt and efficient.

THREE STAGES OF DELAY

Delays may occur at three stages in appeals: First, during the period between entry of judgment in the trial court and the filing of an appeal; second, after filing and up to the time the appeal is submitted to the appellate court for decision; and, third, following submission, the time taken by the appellate court for decision and disposition of the case.

LIMITED AVAILABLE STATISTICS

A survey and report on appellate courts, prepared by the Institute of Judicial Administration in 1957, indicates that, in the state courts of last resort responding to questionnaires—about twenty-nine on most questions—the estimated average time lapse between judgment in the trial court and filing the appeal is two and one-half months, between filing and submitting the appeal for decision, six months, and between submission and final court disposition, one and six-tenths months. This would make a total of ten months from date of judgment in the lower court until disposition of the appeal in the appellate court. Some wishful thinking or minimizing guesswork may be reflected in these estimates. Also, it may be conjectured that answers from the almost twenty states not responding to ques-

tionnaires would boost the national average very substantially over the above figures.

DELAY IN FILING APPEAL

The first stage may be controlled readily, as it is in many states, by court rule or statute requiring appeals to be filed within a limited number of days after entry of judgment. This should work an injustice on no one, so long as the method for filing an appeal is simplified by rule or statute, and provided that liberal provisions are made for the appellate court's granting of leave to file a delayed appeal in order to avoid undue hardship or a miscarriage of justice, when the delay is shown not to be due to the culpable negligence of the appealing party or his counsel. This is the least difficult part of the problem to solve. It perhaps affords an opportunity for cutting from one to two months from the above estimated average time now consumed at this stage.

DELAY IN SUBMITTING APPEAL

Delays in the second stage, after appeal taken and before submission, may be due, first, to dilatoriness on the part of lawyers in preparing the appeal and, thereafter, to inability or failure of the court to hear the case as soon as counsel are prepared to submit it to the court for decision. These two successive phases of the second stage are best discussed separately.

PROCRASTINATION OF LAWYERS AFTER APPEAL

With respect to the first phase, too many of the states' courts of last resort have considered the delays of lawyers in submitting their appeals a matter of concern for the opposite parties only, not for the court. Rules or statutes provide for the time within which successive steps, such as filing of records and briefs, and so on, must be com-

pleted by the appellant and likewise those required of the appellee. Failure of appellant to comply usually makes him vulnerable to a motion by appellee to dismiss the appeal, which the court may or may not grant, depending on the circumstances of the particular case. Too often the penalties provided for a party's noncompliance with the time requirements governing his part of the preparation of the appeal have been imposed only as the opposing party has invoked them. Thus the courts have left it up to the parties to determine when their appeals finally are to be submitted to the court for decision. Such indifference by the court and the reluctance of counsel to press one another combine to create a good-fellow sort of atmosphere, in which the rights of litigants and, ultimately, the public's confidence in our judicial system come in last for consideration.

COURT RESPONSIBILITY FOR ACCELERATION

More recently, the courts have come to realize that whether the delays be caused by court or counsel is of small moment to the parties, or to the public whose distress at the law's delays, wherever the blame may rest, results in diminishing esteem for courts and the administration of justice. In consequence, rules are being adopted calling for dismissal of appeals, automatically or on the court's own motion, except upon good cause shown to the contrary, when they are not completed and submitted within specified time limits. This takes away from parties and counsel exclusive responsibility for prompt submission of appeals and makes it a matter of concern, as well, for the court itself. Here is a progressive step which, coupled with greater firmness on the part of the courts in considering requests of counsel for time extensions, is calculated

to correct one of the real sore spots of delay in appellate practice.

LAGGING COURTS

We come now to what is styled above as the second phase of the second stage in appeals, namely, delay which results from the court's failure or inability to hear and consider appeals as soon as counsel are ready to submit them.¹ Because this involves solely the functioning of the appellate court itself, as does, also, the matter of delay during the third stage, after submission and until decision, these two are combined for discussion. Here we are confronted with the fact that many of the courts of last resort simply cannot or, at least, do not keep up with their work-loads. Let us consider some of the causes and possible corrective measures.

SELECTION OF JUDGES

To begin with, it may as well be recognized that judges differ in capacity, learning, skill, industry, efficiency, and productiveness. Some do their work not only thoroughly but quickly, others more slowly. Some turn out a great deal of work, others much less. This may be a matter of comparative abilities or of differences in disposition and inclination. Some have judicial temperament, some have not. Some are ideally suited to the judicial task, some are not. All these individual factors affect, inescapably, the efficiency and dispatch with which the whole court disposes of its business. The problem is, in part, one of judicial selection and tenure. A judge has been defined as a lawyer who knew a governor. The implication is obvious. In all the states partisan poli-

¹ In many, perhaps most, of the state courts of last resort the appeals are taken up and heard by the court as soon as they are ready for submission.

tics can be and often is a factor in judicial selection, whether elective or appointive. A reasonable and warranted expectation of a rise in average judicial caliber is to be found in adoption of the American Bar Association plan, or so-called "Missouri plan," of judicial selection and tenure on the basis of qualifications alone. It is designed to remove politics from judges and judges from politics. It is likely to produce better appointments in the first instance and permits the appointee to be a better, more independent judge after he assumes the bench. Under such plan, when a judicial vacancy is to be filled, a nonpartisan or bipartisan commission, composed of lay members appointed by the governor, judicial members selected by fellow judges and lawyer members chosen by the bar, after considering the qualifications of eligible lawyers, recommend to the governor the three they deem best qualified. He appoints one. At stated intervals, equal to usual terms of judicial office, the appointee submits his record to the electorate who vote on the question whether he shall or shall not be retained in office for another term. If a majority votes "yes" he stays, if not he steps aside and a new appointment is made as above outlined. There are no opposing candidates at the elections and, hence, no occasion for rival campaign histrionics and promises. The judge goes to the people solely on his record.

Adoption of something like the Missouri plan in the states calls for constitutional amendment. Invariably, it is opposed by politicians desirous of maintaining patronage or control over the courts. Equally lacking in enthusiasm for it are those lawyers, aspiring to the bench, who sense that under this system the call may go only to those who are more highly qualified than they. Solution is to be found only in an informed

and aroused public, determined to correct the situation.

COMPENSATION OF JUDGES

A related problem is the deterrent to aspirations for the bench, on the part of the more skillful and successful lawyers, inhering in inadequate compensation, retirement benefits, and working facilities, together with political involvements distasteful to them. To attract the ablest and best men it is essential that, even though some sacrifices be involved, they at least may be relieved of unnecessary financial worries while on the bench and assured of equipment, facilities, and assistants equivalent to those commonly enjoyed in up-to-date law offices. These are lacking in many of the courts. Here, too, the people and public opinion, ultimately, must come to the rescue of our courts, if they are to be elevated to the highest possible level of efficiency and competence.

INCREASE IN CASE-LOADS

There can be no doubt, however, that the chief cause for the current congestion in many of the state courts of last resort, is that their organization, structure, methods, functions, and facilities are geared to the customs and needs of an earlier day when they were set up, and these do not permit meeting the demands of the vastly increased number of cases appealed to them today. Under existing requirements and with the means at hand, no matter how able and hard-working the judges, the mountain of work to be accomplished is insurmountable. What is to be done?

DUAL FUNCTION OF HIGHEST COURTS

State appellate courts of last resort, where no intermediate appellate courts exist, have an exclusive dual function: first, to correct errors of the lower courts and cause justice in accord with law to

be done between the parties in the individual case, and, second, "to give authoritative expression to the developing body of the law and to see that justice is administered uniformly throughout the state."² The first is pretty well understood by the public to be the work of a reviewing court. That purpose could be served, in many cases, by that court's mere announcement of a decision for appellant or appellee, without accompaniment of a formal written opinion. With respect to the second function, however, usually arising in cases of first impression, involving some question of constitutional interpretation, of statutory construction, or of great public importance, and significant to more than the immediate parties to the suit, an opinion of the court, stating the facts of the case, the applicable law and the court's reasons for its decisions, is imperative. The nature and existence of this second appellate court function and the need for a formal opinion in that connection is not so generally understood by the lay public. All this becomes obvious, however, as soon as it is realized that in determining the rights of litigants, courts often find no statutory or constitutional provision covering the situation and, so, are compelled to have recourse to common law doctrines, equitable principles, analogical reasoning, previous decisions, and plain common sense in order to reach a decision in the case. All this is incorporated into the court's written opinion, which is published and thereafter stands as a precedent, controlling of rights in like situations and controversies in the future.³ These decisions and opinions, as precedents, make up a part of the body

of the law as well as do statutes enacted by the legislature and, in fact, compose the major portion of it. They guide lower courts in future cases, lawyers in advising clients, and members of the public in concluding what are their rights and duties, and determining their courses of action accordingly. This considered, it is clear that courts must write painstaking, concise, and accurate opinions in such cases, carefully developing, declaring and applying what they deem to be the principles and law in point.

WRITTEN OPINIONS

We see, then, that in cases where the courts' function is largely of the first type, written opinions are not overly necessary for the public good or for any other reason, but that they are in cases calling in play the courts' second function. Now the study of the facts and record of a case, the legal research, and all the other work attendant on the writing of a court opinion take up the greater part of the time and energies of a member of an appellate court and, of course, he must give like study to the cases in which his brothers write and to their opinions as well. One means, then, of lightening the work-load and, thus, of quickening the flow of cases through such courts to point of decision, would be to limit the writing of full-dress opinions to cases of the latter type only, leaving the others to be disposed of by mere entry of an order affirming or reversing the lower court or, at most, by filing of a brief memorandum opinion. Statistics are available which demonstrate that courts of last resort in states where that practice is followed are able to dispose of cases much more rapidly and in considerably larger numbers than is true of courts in states in which formal opinions are written in every case submitted to the court for

² Study prepared by the Institute of Judicial Administration on "Intermediate Appellate Courts," 2-U29, 1954.

³ Of course, opinions construing constitutional or statutory provisions and declaring rights and duties thereunder are also published and stand as precedents too.

decision. Unfortunately this solution, in states where not employed, is not available to their courts because of constitutional or statutory requirements that full opinions be written, filed, and published in all of the cases decided by the court. Here again, an informed and interested public may help by initiating and supporting moves to eliminate such constitutional or statutory shackles, leaving it to the courts' discretion to determine which cases merit written opinions.

SHORTER OPINIONS

With respect to time consumed in preparation of opinions, lawyers will perhaps suggest that judges could afford themselves some relief by producing shorter opinions and sticking, as they should in the interests of accurate pronouncements of the law, to writing succinctly and exclusively on the issue in need of decision, without further gratuitous offerings. Time of the court is wasted and the door thrown open to needless error in the development and exposition of the law, when judges write one word more than that which is necessary to decide the case. In writing opinions, they must rigorously resist, as some of them do not, the temptation to indulge a sense of humor or a taste for general literature. In the current effort to find additional aids and means to facilitate the flow of litigation through the courts, here is a "do it yourself" prescription for the appellate judges.

ENLARGING THE COURT

A remedy for overloaded dockets in reviewing courts, frequently resorted to in the states through the decades, has been adding to the number of judges, as a means of increasing the court's working capacity. The membership of the United States Supreme Court was increased in 1837 from seven to nine, no doubt for that purpose. Many states

had only three-man courts at one time. Today twenty-one have seven-man courts, nineteen have five or fewer, a very few have nine and equally few three. Enlargement of the court may still be a feasible solution in some states. It may be true, however, that the courts with the smaller numbers are the ones least in need of increase. On the other hand, the courts most overloaded with work, in states with large metropolitan areas, are likely to be the ones already having larger memberships, and increasing their size would give rise to the problem of diminishing returns. Experience of the states seems to be that seven, or certainly not more than nine judges, is about the limit on the number which can effectively deliberate and decide cases together. The time-saving advantage of increasing court membership is that it reduces the number of opinions each judge must write. It does not lessen the work of each judge necessary for the study of records and briefs, legal research, and examination of opinions in cases in which the other members write. This he must do, of course, in order to decide whether he agrees and will sign such opinions or write dissents. Enlarging a court does not decrease the amount of time required for listening to oral arguments of counsel and for conference, consultation, and discussion by the judges. In fact, increase of numbers increases the man-hours thus consumed and, perhaps, the number of court hours as well, because of resultant increase in number of questions addressed to counsel from the bench and more arguments and discussion by the larger number of judges in conference. Enlargement of court membership is, therefore, not necessarily 100 per cent gain.

DIVISIONAL SITTING

Another method designed to increase the working capacity of reviewing courts is to permit them to sit in divisions.

Thus, for example, with a six- or seven-judge court, three might sit in a division, hear the oral arguments, study records and briefs and decide a case, with no involvement or work on that case for the other members of the court who, meanwhile, would be doing the same thing with a different case. While this does not decrease the number of opinions to be written by each judge, at least none is required to listen to as many arguments of counsel or participate in the discussions and consideration of as many cases as when all cases are heard by the entire court. The latter gain is offset somewhat by the usual provision, with respect to courts having divisional sittings, that when a dissent occurs in a division, the case shall be reheard by the entire court. This would occasion two hearings of such case. Also, a usual requirement is that all cases involving construction of the state or federal constitution or some question of great public importance or, in some states, involving the overruling of a previous decision, shall be heard in the first instance by the full court. This materially diminishes the number of cases left for hearing by a division only. Criticisms raised against the system by some, but disputed by others, are that it tends to increase the number of applications for rehearings, that it presents the possibility of conflicting decisions by the different divisions, and that it results in two supreme courts in a state instead of one, with lawyers given an opening to select the one of their choice when the divisions are of a permanent character, as some are. The latter may be avoided by a rotating divisional scheme. A valid objection would seem to be that a state's court of last resort is charged with an obligation to see that justice is done in the state's entire judicial system, to exercise superintending control over lower courts, and to give

guidance and direction to orderly development of law in the state, and see that it is uniformly interpreted and applied throughout the state. That is not the work of a half, or even two separate halves, of a court, but a challenging responsibility of a whole court. It seems more in keeping with American tradition and thinking that the matters presented to courts of last resort, many of transcendent importance to the people, call for the composite judgment of more than a division of such court.

RIGHT OF REVIEW RESTRICTED

Restricting the right to an appeal will serve to reduce the number of cases coming before an appellate court and thus help to solve its problem of overwork and congestion. Some indirect methods of restriction are the following: increasing the costs of appeal, as by requiring payment of a large appeal fee to the clerk of the court, making the appellate process more complex or difficult, decreasing the time within which an appeal may be taken, or permitting the party prevailing on the appeal to tax and collect from the losing party his actual costs of appeal rather than mere nominal costs as is the custom and general rule in this country as distinguished from England. Direct restrictions may consist of fixing and increasing the minimum amount which must be involved in a suit to permit an appeal as of right, or prohibiting appeals as of right in specific types of cases or from anything but final orders, judgments, or decrees.

The mentioned indirect restrictions—except for the one fixing a reasonable limit on the time within which an appeal may be filed, which limit already exists quite generally in the states—run counter to every trend and program in this country for improving the administration of justice by making litigation as

simple, inexpensive, and nontechnical a means as possible for arriving at truth and justice, equally available to rich or poor, schooled or unschooled, or from whatever walk of life parties may come. This alone is compatible with the democratic system under which we profess to live.

As for the direct restrictions, the one limiting appeals to cases involving more than a specified amount may work a hardship on those who can ill afford it with cases involving small amounts, but, at the same time, it may be a boon in saving them from becoming obligated for heavy appeal expenses in matters which are not worth it. Restricting appeals as of right to final orders and judgments saves the appellate court the time and litigants the expense of having cases come to the appellate court twice, that is, both before and after the trial below is completed. On the other hand, an appellate court decision on some controlling question at an early stage of what might become a protracted trial below sometimes could end the lawsuit at that point with savings of time to the trial court and money for the litigants.

In discussing restrictions, so far, we have been talking of appeals taken as a matter of right, as distinguished from appeals permitted by the appellate court upon application for leave to do so. Restricting the number of instances in which appeals may be taken as of right and increasing those in which leave must first be obtained from the appellate court is a very effective means of reducing the number of cases finally to be heard on appeal. Obviously, some time of the court must be given to consideration of whether the application for leave to appeal shall be granted, but the time demands upon the court on that account are far less than those involved upon formal hearing and decision of the case on appeal, whether taken as of right or on leave granted.

The entire question of the desirability of decreasing appellate court case-loads, by any of the restrictive means, must be measured by the modern American concept of justice and due process, namely that every person is equally entitled not only to a fair trial in the lower court, but also, because every judge can and does make mistakes, to at least one appeal, as of right, to another court for the purpose of securing correction of those mistakes. By that standard, restrictions on the right to appeal, without leave, do not fare well. Restrictions there will be, however, if no other relief is afforded some of the courts.

AIDS TO APPELLATE COURTS

Previously we have mentioned that the assurance of necessary aids is essential to attracting able lawyers to the bench. It is equally so in order to enable the court to carry its work-load. The difficulty is that these cost money. The battle of the budget is ever with the state. The membership and staff of attachés of the court are relatively small in number compared with the divisions of the executive branch of government and without lobbying significance. At times courts declare legislative enactments unconstitutional, thereby scarcely endearing themselves to the legislature. The result of all this is that courts usually come in last in legislative determinations of where increased expenditures of the insufficient number of tax dollars shall go. Once again, as before suggested, only the interest and insistence of the public in seeing the courts adequately provided for will induce the legislatures to meet the need.

THE COURTS' ATTACHÉS

Included in the field of aids are law clerks, furnished the judges in some states. Unfortunately, the compensa-

tion permitted and the requirements of the statutes providing for them are usually such that the positions are held only by recent graduates of law schools, with no practical experience, and their tenure is limited to short periods. This materially impairs the value of their services to the judges. Their work varies, but usually includes study of records and briefs in the cases and reports thereon to the justices, legal research, and supplying the judges with memoranda on the law, critical analysis for the judge employing them of the opinions written by the other judges, and so on. This provides a sort of filtering process, saving some time for the judge. In some states the courts have the services of commissioners. These are trained and experienced lawyers, with qualifications comparable to those of the judges. They may study, report on, and make recommendations to the court on motions and applications. In some states they join in hearing cases, draft tentative opinions, and submit them to the court for possible adoption. This can be a real time-saving arrangement for the judges. A problem, of course, is that lawyers, litigants, and the public want the decisions to be those of the judges of the court and not of attachés. There is too much suspicion now among lawyers that decisions are being made and opinions written for the judges by law clerks and assistants. This does not make for public confidence in the courts. It is not easy to draw the line between what may properly be done by court aids, who are nonjudicial officers, and what is a strictly judicial function to be performed by judges only. If the commissioners' function approximates or becomes that of the judges themselves, the result, obviously, is nothing other in character than an enlargement of the membership of the court, with the attendant involvements previously considered. An inexpensive variation of this

system is to call in trial judges, temporarily, for such assistance. Inasmuch as the trial courts of the larger states are as overloaded as their appellate courts, the judicial manpower of the trial courts usually could be utilized to better advantage by assignment where needed on the trial level. The shortage there is even greater than in the reviewing courts.

INTERMEDIATE APPELLATE COURTS

There remains for consideration, as a remedy for congested courts of last resort, the establishment of intermediate courts of appeal in states needing but not having them. They are functioning in thirteen states now. Depending on the size of the state and the amount of litigation in its courts, such intermediate court might be a single court with state-wide jurisdiction, or there might be two or more such courts, each in a definite district in the state, or one larger court might sit in rotating divisions in the several parts of the state. Under proper organization, rules, and practice this could relieve the court of last resort and save it largely for the most important appellate work of guiding the development of the law, leaving to the intermediate courts the less significant correction of trial court errors, and matters affecting little more than the rights of the immediate parties to a controversy.

Objections raised to the trilevel judicial system of trial courts, intermediate appellate courts and a court of last resort, are, (1) expense to the state of maintaining an additional court or courts, (2) occasions for controversy over the question of jurisdiction between the intermediate and highest courts of appeal, and (3) the additional cost of time and money to litigants of a double appeal, first to the intermediate court and then to the highest appellate court.

The question whether the results would justify the additional expense to the state is, again, one for the public to decide. The basis for jurisdictional conflicts or uncertainty between the two appellate courts, the resolution of which might occasion additional litigation, cost, and waste of time, is the common provision that certain types of cases may be appealed from the trial court directly to the court of last resort while others must go first to the intermediate court. There appears to be a lack of any sound basis upon which the jurisdiction of the two courts can be divided between them, thus creating a problem first, of how to word the statute governing the subject and, second, of judicially construing it. Hence the objection that only additional litigation, cost, and delay would result.

A suggested solution is that all appeals shall be taken in the first instance, as of right and without leave, to the intermediate court. At this point, we hear the next criticism, of double appeals. That there would be instances of double appeal is inescapable. Particularly is this true if appeals may be taken as of right from the intermediate to the final court. The best handling of this part of the problem would seem to be, then, to permit such appeals only on leave granted by the highest court. Merits and advantages of these suggested procedures for operating a trilevel court system, aside from relieving dockets in the highest court, would be that thus every party is assured of at least one appeal for correction of what he deems to be errors in the trial court, and the court of last resort would be freed, by the exercise of its discretion in allowing appeals there, to select only cases where dissents in the intermediate court or conflicting decisions of its different divisions leave uncertainties as to the law which need correction or harmonizing by the highest court in the

interests of certainty and uniformity in the state, or where questions of constitutional construction, statutory interpretation, or others of great public importance are presented, all giving occasion for the exercise of that court's highest function of guiding the development and giving direction to the growth and trend of the law.

CONCLUSION

A cautionary concluding thought is indicated. We have dwelt on what may be done to expedite business in the state courts of last resort. We should not be confused or misled into thinking that speed alone, or quantity rather than quality, is the ultimate desideratum in appellate work. The above proposals are offered not alone to solve the problem of lagging justice, but also as a means for securing more time for appellate judges, so that they may be enabled to do better work on all the cases before the court. Criticisms of appellate court decisions sometimes are that they rest on one-man opinions. If the judges are too busy, they may be driven to concentrating on the cases assigned to them for opinion writing, accepting, more or less as of course and without the necessary study and scrutiny, the decisions and opinions of their brothers in the other cases. This makes for one-man decisions, one-man opinions. There is no object in swapping what may be the erroneous decision of a trial judge for what may well be the equally erroneous decision of one appellate judge. What the parties and public want and are entitled to have, on appeal, is the composite judgment of the entire group of wise, skilled, and trained men, possessed of judicial temperament, who have been selected to sit on the court of last resort. In turn, the latter must not be placed on a beltline production basis. With great constitutional and other

questions to be decided, affecting the fundamental rights and duties of all the people and, possibly, the destiny of the nation, the judges must study, meditate, deliberate, consult, confer, and reach decisions in an unhurried atmosphere of calmness and serenity. This alone can insure the best prospects for avoidance of error and preservation of the liberties of our people and America's free institutions, of which the courts are the final guardians.

Acknowledgments for information and suggestions are due to the Research Study on the Organization and Operation of Courts of Review, made for the Judicial Council of Michigan, in 1933, by Edward O. Curran, Research Associate, and Edson R. Sunderland, Professor of Law and Legal Research, both at the University of Michigan Law School, and also to the report on Judicial Administration at the Appellate Level, prepared for the Supreme Court of Michigan in 1957 by Charles W. Joiner, Professor of Law at the University of Michigan Law School and Chairman of the Joint Committee on Michigan Procedural Revision.

Report of the Board of Directors to the Members of The American Academy of Political and Social Science for the Year 1959

(Presented by the President to the Annual Business Meeting of the Members,
held at the Academy Offices, 3937 Chestnut Street, Philadelphia,
8 February 1960.)

MEMBERSHIP

ON 31 December 1959 there were 13,422 members of the Academy, which may be compared with 13,254 for the previous year. The figure for 31 December 1957 was 12,919. These are only modest gains, but we are encouraged by them, considering the difficulties recently experienced by serious journals. We are pleased to report that our publication continues to have the largest circulation among scholarly journals in the field of the social sciences other than foreign affairs.

FINANCES

The total income from the 1959 operations of the Academy was \$120,576. "Operations" in this report does not include changes in the value of securities, or gains or losses from the sale of them, or changes in the value of inventory, real estate, or equipment. Total expenses amounted to \$118,482. With

money contributed by Senator Joseph S. Clark for the Leadership project—the cost of which we have been absorbing in our operations—and from money we had in our checking account, we purchased \$14,107 worth of securities. We did not convert any securities into cash during the year. The Academy still "owes" the Leadership project approximately \$3,000, but we expect to absorb this in 1960 or subsequent operations.

The totals in the Operations Report do not agree with those in the Auditor's Report. They should not agree, because the Auditor's Report reflects the depreciation of building and equipment, whereas our Operations Report does not deal with these matters. The loss through depreciation of our building and equipment—\$5,470—is compensated for by an enhanced inventory of salable magazines. The two reports have been completely reconciled in a conference between the Auditor and your President.

FINANCIAL STATEMENT ON 1959 OPERATIONS * AS OF DECEMBER 31, 1959

PUBLICATIONS

During 1959, the six volumes of THE ANNALS dealt with the following subjects:

January	<i>Contemporary China and the Chinese</i> , edited by Howard L. Boorman, Director, Research Project on Men and Politics in Modern China, Columbia University.
March	<i>Prevention of Juvenile Delinquency</i> , edited by Helen L. Witmer, Director, Division of Research, Children's Bureau, U. S. Department of Health, Education, and Welfare.
May	<i>Partnership for Progress: International, Technical Co-operation</i> , edited by Richard W. Gable, Associate Professor, School of Public Administration, University of Southern California.
July	<i>Resolving the Russian-American Deadlock</i> , edited by James C. Charlesworth, President of this Academy.
September	<i>American Civilization and Its Leadership Needs, 1960-1990</i> , also edited by Dr. Charlesworth.
November	<i>Inflation</i> , edited by Dr. Alfred G. Buehler, Professor of Public Finance, University of Pennsylvania.

Also, the Academy published 4,000 copies of a special brochure on *American Civilization and Its Leadership Needs, 1960-1990*, which was essentially a reprint of the September ANNALS, but which contained an introductory article written by Senator Clark and Dr. Charlesworth. As this report is being written, these brochures are being distributed free to 1,000 college and university presidents and to key persons in legislatures, personnel agencies, foundations, departments of education, et al.

The publication program for 1960 includes, in addition to the January volume on *Perspective on Government and*

Sciences, edited by Norman Wengert, Professor of Public Administration, University of Maryland, the following volumes:

March	<i>Lagging Justice</i> , edited by Glenn R. Winters, Executive Director, American Judicature Society.
May	<i>International Co-operation for Social Welfare: A New Reality</i> , edited by Hertha Kraus, Professor of Social Work Administration, Bryn Mawr College.
July	<i>Whither American Foreign Policy?</i> , edited by Dr. Charlesworth.
September	<i>United States Agriculture: Policy, Politics, and the Public Interest</i> , edited by Charles M. Hardin, Professor of Political Science, University of Chicago.
November	<i>Religion in American Society</i> , edited by Richard D. Lambert, Associate Professor of Sociology, University of Pennsylvania, and Assistant Editor of THE ANNALS.

(Not all of these are definitive titles.)

During 1959 the book department of THE ANNALS published 427 reviews. This represents an increase of 22 reviews over the number published in 1958. The majority of these reviews, 308, were written by college and university professors and lecturers. Presidents and deans of colleges contributed 13 reviews, and members of private and university-sponsored research organizations, 50 reviews. Government and United Nations officials, both active and retired, were responsible for 17 reviews; editors and journals contributed 4. The remaining 35 reviews were by individuals with no particular affiliation. Foreign reviews were from Canada, Venezuela, Great Britain, Germany, Uganda, Israel, Lebanon, India, and Ceylon. Three hundred and seventy-nine books were listed in the "Other Books" section. One hundred and thirty-two requests

were granted to reprint material from THE ANNALS. This represents an increase of 18 over 1958. Fifty-two of these were to professors and other authors for use in books under preparation, and 19 for classroom and adult education programs. Twenty-two requests were granted to various departments of the government, including 12 from the armed forces. Four requests from companies to reprint articles for training programs were granted, as well as requests made by independent organizations to incorporate articles from our volumes in their programs. Of special interest were the translations of the March 1957 volume on *Current Issues in International Labor Relations* and the January 1959 volume on *Contemporary China and the Chinese* into Japanese, as well as the utilization of "Continuing Education for National Survival," by C. Scott Fletcher in the September 1959 volume, by the Voice of America.

MEETINGS

The 1959 Spring Meeting, organized around the theme "Resolving the Russian-American Deadlock," was well attended, both from the standpoint of numbers and from that of attentive participation. The audiences, the largest to date, overtaxed the facilities of the Warwick Hotel, and we are accordingly taking the 1960 meeting to a larger establishment.

The subject of the 1960 Spring Meeting will be "Whither American Foreign

Policy?" We hope to have about five spokesmen of the Department of State, as well as some senators and ambassadors. Our main reliance, however, will continue to be on scholars and writers. We expect the tone of the meeting to be exposition and analysis, rather than criticism and contumely.

OFFICERS AND STAFF

No changes were made in directors or officers during 1959. Our Editor, Dr. Thorsten Sellin, was granted a leave of absence for the period from September 1959 to June 1960, to enable him to join the faculty of Cambridge University, England, for the academic year, and Dr. Richard D. Lambert was designated as Acting as well as Assistant Editor. Dr. Lambert also was granted a brief leave, for a scholarly sojourn in South Asia.

Respectfully submitted,

THE BOARD OF DIRECTORS

James C. Charlesworth, *President*
 Stephen B. Sweeney, *First Vice-President*
 Norman D. Palmer, *Secretary*
 M. Albert Linton, *Treasurer*
 Lewis M. Stevens, *Counsel*
 Thorsten Sellin, *Editor*

AMERICAN HISTORY AND GOVERNMENT

EMMET JOHN HUGHES. *America the Victible*. Pp. 306. Garden City, N. Y.: Doubleday & Company, 1959. \$3.95.

The chief significance of this trenchant critique of recent United States foreign policy is that it was written by a man who was formerly one of President Eisenhower's ablest speech-writers. Much of what Mr. Hughes says has been expressed by other critics—though few have stated their misgivings with such eloquence—but this is the first strongly dissenting voice raised from within the circle of men who have worked for the Eisenhower Administration.

From this observation it must not be inferred that Mr. Hughes' often devastating strictures apply only to the conduct of foreign relations under the present Administration. His criticism applies with equal force to its Democratic predecessor and, above all, to the attitude toward foreign policy problems on the part of the American people as a whole.

Mr. Hughes is at his best when he dissects the myths, the legends, and the false slogans upon which so large a part of United States postwar policy has been based. Of particular interest in this connection is the author's powerful indictment of the superficiality, the sham, and the distortion which characterized the Republican campaign oratory of 1952.

A second distinguishing feature of this very readable book is its remarkable lack of personal animus—remarkable, that is, in view of the circumstances. The author must, at times, have found it trying to write speeches for a President so strongly under the influence of a Secretary of State with whose ideas Mr. Hughes was often out of sympathy. Yet the author's work is not only singularly devoid of personal criticism but distinguished by compassionate understanding of the sincerity and devotion of those overburdened public servants with whose policies and pronouncements he violently disagreed.

The last section of the book, which deals with the author's ideas and precepts for the future, is eloquent but, to this reviewer, disappointing. One would like to know what so able a critic of past policy would recommend with respect to the great questions which must be faced in the immediate future. What, for example, should be the American attitude toward the proposals for total universal disarmament? What precisely should be the American policy toward China or with respect to Germany?

Instead of answering such questions, the author lapses into a sort of sermon, reminiscent of the "government by preachment" so often practiced by President Eisenhower. It is a moving sermon, even though its eloquence is somewhat diminished by the fact that the author's skill as a wordsmith occasionally leads him to excursions into somewhat purplish prose. This, however, does

not detract from the great merit of the work which is its relentless exposure of the delusions which have been fundamental to postwar American policy.

America the Vincible, as the title suggests, is a much-needed warning—a warning which we shall disregard at our peril.

JAMES P. Warburg

New York City

JOHN W. SPANIER. *The Truman-MacArthur Controversy and the Korean War*. Pp. xii, 311. Cambridge, Mass.: Belknap Press of Harvard University Press, 1959. \$6.50.

It is sad that a doctor's thesis shows through the simple usefulness of a necessary and competent book. This study was needed: for nothing blurs as quickly as the details of an official battle royal, the echoes of which grow more confused without dying away, since few have the patience to arrange the facts and recover the issues.

This book is a meticulous assembling of these facts and a careful identification of the basic issues. More than this, the context of the controversy, the contributions of the political environment to it, the accidents of events and opinions are cautiously added to the picture. There emerges, consequently, a clear clash of character, with no doubt left as to which was the stronger and the more able to exalt the office and subdue the man. And this emerges naturally from the evidence, for the presentation is eminently judicious.

The usefulness of the book lies in an arrangement of its material that leaves the items in their natural relationship of cause and effect, action and reaction. And the moral—not, incidentally, the conclusion that the author draws—follows emphatically: the office of President, patiently managed with a sincere conviction of its value, will always rope and tie the bucking bronco.

At this point the doctorate manner appears. There must be a thesis to be demonstrated. In this case it is that the American concept of a military instrument as something that is employed only on its own professional terms cannot be applied

to limited war without straining the concept of civilian control.

This thesis is asserted, but the story does not demonstrate its validity. The thesis is not labored in the sense of distorting the facts, but it is insisted on to the extent of producing some oddly irrelevant commentaries. In truth, the events of the story cannot be generalized as a President "X" and a General "Y" relationship. It is far too plainly the story of President Truman and General MacArthur: the General with his past behind him and a possible future ahead of him, given to defining rather than accepting a role; the President, with qualities that were initially unknown but that turned out to be those of courage and a high sense of the requirements of his office. The rest is merely the familiar record of the possibilities for maneuver that are inherent in the American political system.

It is a pity that so well designed and well executed a study should have had so inapplicable a thesis imposed on it by the exigencies of graduate work. In spite of this, however, the book makes its contribution, for the irrelevant bit of academic machinery can be easily side-stepped.

Haverford College

DONALD R. MCCOY. *Angry Voices: Left-of-Center Politics in the New Deal Era*. Pp. 224. Lawrence: University of Kansas Press, 1958. \$4.00.

This is a brief, but well-documented, account of the churning unrest of the late nineteen-twenties and early nineteen-thirties of this century. The great depression had not only caused hardship, it had raised questions in many minds concerning the viability of the economy and the fundamental justice of society. In such situations there are always competing leaders who seize the opportunity to further their careers as well as those who are genuinely stirred by the conditions about them.

The state of the economy at this time was especially aggravating because of the apparently causeless paralysis. It was en-

tirely unreasonable, yet it persisted. It lasted longer than other disturbances of a similar sort had in the past and refused to respond to the ordinary orthodox remedies. It finally affected so many people in so many different ways that government at every level was, however reluctantly, forced to accept more or less responsibility. It was the comparative reluctance of the Hoover Administration and its unwillingness to accept any suggestion for drastic attack that caused the Republicans to lose the country's confidence.

In the obvious decline of Republican strength, there was bound to be a competition for its inheritance. That competition showed itself within the Democratic party; and Franklin D. Roosevelt had a severe struggle to gain the nomination in 1932 and only did gain it by belaboring Hoover and promising progressive changes. However, the Democrats were not successful, either, in conquering the depression; it was somewhat improved by forced inflation and "make-work" measures; but the situation in 1936 was not spectacularly better than that in 1932. But the psychological situation was revolutionized. Especially the relief of unemployment and the other reform efforts showed a willingness to try and a concern for welfare which were in contrast with the former Republican indifference, and Roosevelt was nominated and elected again without difficulty.

But the other aspiring leaders were not convinced at any time that the Democratic success was sufficient to foreclose other contenders, and there continued to be agitation, some of it wordily violent. With the Democrats in control of the electorate, there was actually not much chance of political success; but several minor parties did organize and present a certain challenge. What was more important, several leaders, of whom Huey P. Long was the most successful as a demagogue, did make political advances and did reach positions of some influence.

This agitation from the left undoubtedly had its uses for Roosevelt in his more moderate intentions of reform. He had to contend with extreme conservatism in his own party much of the time, and the leftist agitators tended to offset this. Mr. McCoy's

book is a useful account of the various movements and personalities involved in this interesting interlude.

R. G. TUGWELL

Professor of Political Science,
Emeritus
University of Chicago

MARIO EINAUDI. *The Roosevelt Revolution*. Pp. x, 372. New York: Harcourt, Brace and Company, 1959. \$5.95.

The author has written several books previous to this one, all of which were on European subjects. Unfortunately, *The Roosevelt Revolution* will add little to his reputation as a scholar. Not only have no new facts nor interpretations been unearthed, but the very subject of the book has been presented with vague terms and with confused materials. The study lacks coherence and unity. In fact, the book consists of a group of essays under such titles as "Europe's Image of America," "Reflections on Tocqueville," "The Great Depression," and "Electricity and Freedom." One further grave fault in this book is that numerous, long quotations fill, or almost fill, page after page. Paraphrasing would have greatly improved the narrative.

Professor Mario Einaudi is an Italian immigrant who has sought to understand American political institutions. That, to a degree, he has failed is evidenced by the fact that he repeatedly tries to connect the Roosevelt revolution with European state socialism and especially with Russia's type of extreme socialism. Quotations from Lenin are intermixed with those from New Deal spokesmen.

Several of Mr. Einaudi's conclusions about the actual provisions of significant New Deal laws and, more especially, about the impact of New Deal social legislation on the American economy seem to be erroneous. For example, he states (p. 280) that corporations today must share their profits equally with the federal government through corporate income taxes. No mention is made of the universal practice of business passing on to the consumer in the form of higher prices the total productive cost, including taxes. A second illustration will suffice. In discussing the application of the Securities Exchange Act the author

apparently thinks that the requirement of full publicity concerning stocks before marketing will prevent another depression. Most of the stocks traded on the Wall Street market in 1929 which proved to be extremely insecure investments could still be marketed legally today.

By no means do all of the author's conclusions prove fallacious. He is on sound ground when he says that a lack of purchasing power among the people who would have liked to buy homes was a real contributory factor to the depression of 1929 and after. Equally logical is the mention of the unsound, and economically bad, distribution of American income in the causation of the last major depression. However, when the author writes of Franklin Roosevelt's re-establishing "the sense of Community" he never quite explains to the reader's satisfaction just what he means by the phrase.

Many Americans, including Professor Einaudi, have lavished praise upon the Tennessee Valley Authority (TVA). The writer does not show the recent trend in TVA of constructing plants to generate steam power and of the system's increasing dependence upon this source for its operating income and profits. Certainly, this was not in the original planning for TVA. Moreover, the Holding Company Act of 1935 abolished the holding companies only in the area of public utilities not in other segments of our complex economy. This type of corporate organization is not uncommon today.

The author has dealt with his adopted country with sympathy and admiration. Unfortunately he was not as successful in interpretation, in coherence of treatment, in unity of presentation as this reviewer hoped he would be.

GEORGE C. OSBORN

Professor of Social Sciences
University of Florida

JOHN C. CALHOUN. *The Papers of John C. Calhoun*. (Volume I, 1801-1817.) Edited by Robert L. Meriwether. Pp. xlii, 469. Columbia: University of South Carolina Press, 1959. \$10.00.

The first volume of the Calhoun papers covers the most attractive period of his life—the years when he was young, hope-

ful, and dominated by a fine spirit of nationalism. Here are his college letters which present him as an idealistic young man, very serious and hard-working. His letters and speeches do not reveal any sense of humor or any interests in literature or art. At Litchfield, Connecticut, he studied law in Judge Tappan Reeve's famous school, but he disliked law and compelled himself to study it intensely out of a sense of duty. His great ambition was to attain honor which, in the Old South, was most available in the field of politics: money was never important to him. From 1810 to 1817 he was one of the most promising young members of the House of Representatives. He was an ardent War Hawk in 1812, motivated by a sense of outrage at Great Britain's practice of impressment of American sailors and denial of the right to travel the seas freely—not by expansionist feeling or economic considerations as some writers have maintained.

Calhoun's nationalism permeates his letters and speeches of this period. He was a bold advocate of measures strengthening the national government, such as the maintenance of an adequate army, the establishment of a national bank, a moderate tariff to protect infant industries, and a broad system of internal improvements with federal encouragement. At this time he was quite willing to interpret the Constitution liberally and to use the implied powers of Congress. All of these measures indicate a progressive spirit, but Professor Meriwether in his Preface rightly evaluates Calhoun as essentially a conservative even in these early years. Perhaps this is the clue to the remarkable changes in Calhoun after 1830, although the editor attributes his later policies, so different from his early nationalism, to his reaction to "an immediate peril."

One looks in vain in this volume to find evidence that changes the traditional picture of the Carolina statesman. There is very little personal material in it, chiefly the letters from New England and his remarkable correspondence with Floride Bonneau Calhoun, who became his mother-in-law. His speeches of this period are pithy, logical, and free from the rhetoric characteristic of the oratory of his day. They

represent fundamentally an appeal to the mind and moral sense rather than to the emotions or imagination. The editor has written an excellent short Preface and good critical Notes to the documents that contribute much to the understanding of them.

CLEMENT EATON

Professor of History
University of Kentucky

ALPHEUS S. WILLIAMS. *From the Cannon's Mouth*. Edited by Milo M. Quaife. Pp. x, 405. Detroit, Mich.: Wayne State University Press and the Detroit Historical Society, 1959. \$7.50.

General Alpheus S. Williams, whose letters to his two daughters make up this book, was born in Connecticut and educated in the law at Yale. After traveling extensively in America and Europe, he settled in Detroit in 1836 where he soon became one of the growing town's most important citizens. In 1847 he departed for Mexico as lieutenant colonel of the Michigan regiment but arrived too late to engage in any battles. After the firing on Fort Sumter in 1861 he was appointed brigadier general of state troops, and soon thereafter, Lincoln gave him a like rank in the United States volunteers. Strangely enough, or probably not so strange in the light of the all too prevalent methods used for advancement in the army, he remained in this rank throughout the war despite his military ability and effectiveness as a leader of troops. For a short time he was in command of a corps.

In his letters he shows his disappointment at receiving no advancement, and he amply comments on the reasons. He did not toady to the war correspondents who had much to do with the promotion of their pets. Referring to the Battle of Chancellorsville, he commented, "I have seen in the illustrated newspapers and in the *Herald* diagrams and drawings of furious onslaughts made by troops which never fired a gun" (p. 179).

General Williams was not a pessimist, and he did not let his disappointments and what he disagreed with sour his disposition or warp his judgment. But at times he was caustic in his comments on the way the war was being run. As for General

Sickles, he "would beat a Napoleon in winning glory not earned." He was "a hero without an heroic deed! Literally made by scribblers." Then, "People at home are fancying this war is waged for the Union and for a stable and united government, but it is a mistake. It is carried on exclusively to make heroes of charlatans and braggarts!"

General Williams fought with the Army of the Potomac from First Manassas through Gettysburg after which he was sent with General Hooker to the West where his activities were mostly concerned with guarding Sherman's railroad lines of communications in Tennessee until the campaign against Atlanta and the March to the Sea took place. General Williams participated in this campaign and marched up through the Carolinas and on to the Grand Review in Washington.

These letters are a valuable addition to the growing literature of the Civil War and are far better than the common run of such books because Williams was a close observer of both military affairs and of the country through which he passed, and he was able to express himself in an excellent narrative style. By no means least in the outstanding qualities of this book is the skill and scholarship with which Milo M. Quaife edited these letters. Also to be noted are the distinguished format of the book and the clarity of the illustrations.

E. MERTON COULTER

Regents Professor Emeritus of
History
University of Georgia

LOUIS D. RUBIN, JR. (Ed.). *Teach the Freeman: The Correspondence of Rutherford B. Hayes and the Slater Fund for Negro Education, 1881-1893*. Vols. I & II. Pp. lv, 236; 302. Baton Rouge: Louisiana State University Press, 1959. \$10.00 per set.

Rutherford B. Hayes, nineteenth President of the United States, is best remembered as the victor over Samuel J. Tilden in the disputed election of 1876. Little attention has been paid to Hayes the humanitarian. Consequently, this correspondence, selected from the collection in the Hayes Library in Fremont, Ohio, is valu-

able for what it reveals of the former President's humane activities during the first decade of operation of the John F. Slater Fund for the Education of Freedmen.

As a trustee of the Peabody Education Fund, Hayes was already interested in promoting education in the South when he was asked to assist Slater, a Connecticut industrialist, in the endowment of a foundation to advance Negro education. When the Slater Fund was formally established in 1882, Hayes became president of a distinguished board of trustees, a position he held until his death in 1893. Hayes' correspondence in connection with the Fund discloses his skill in working with others to promote a social cause in which he had a sincere interest. He was the cement which bound the trustees together and the link between the board and the agent who worked with the Negro institutions assisted by the Fund.

The Peabody Fund, which promoted universal public education in the South, served as a model, but, unlike the older foundation, the Slater Fund's purpose was "the uplifting of the lately emancipated population of the Southern States, and their posterity, by conferring upon them the blessings of Christian education" (I, xx). The Fund especially encouraged industrial training of the Negro to help prepare him to become a useful and respected citizen. Both funds continued to operate until 1937 when they merged with the Anna T. Jeanes Fund and the Virginia Randolph Fund to form the Southern Education Association.

In his Introduction the editor evaluates the early work of the Slater Fund in terms of the times and the conditions under which it functioned; the correspondence is placed in its larger context, and many of the persons mentioned therein are introduced. Notes are few and brief and are restricted to identifying persons and places. An Index facilitates use of the letters. This correspondence is a contribution to the history of Negro education as well as a portrait of Hayes' service on behalf of the Negro following his retirement from public life. The Louisiana State University Press has done an outstanding job in the

production of these volumes—the design is notable and invites the eye.

FRANK J. KLINGBERG

JAMES MONROE. *The Autobiography of James Monroe*. Edited by Stuart Gerry Brown with the assistance of Donald G. Baker. Pp. xi, 236. Syracuse, N. Y.: Syracuse University Press, 1959. \$6.00.

Revisionists of the traditional Federalist interpretation of the early history of the United States will welcome this volume. It makes generally available for the first time the two long fragments of Monroe's unfinished autobiography.

These fragments were written in Monroe's old age in the hope that Congress would realize more fully his services to his country and would, therefore, relieve his financial embarrassment by an appropriation. They are the work of a man who had lost some of the partisan bitterness which inflamed the public mind when he was the American minister to France. The change in his mood becomes evident when his earlier writings are compared with his autobiography.

After he was recalled from Paris, Monroe had written a bitter political pamphlet entitled *View of the Conduct of the Executive* in which he enumerated the ways the Federalists had mishandled relations with France. One mistake, he alleged, had been their failure to inform him of the contents of Jay's Treaty with Great Britain until after it had been ratified by the Senate. B. W. Bond pointed out many years ago in "The Monroe Mission to France" (Johns Hopkins University Studies in the Political and Social Sciences, Volume 25) that Washington justifiably objected to this censure. In a calmer mood, Monroe wrote in his autobiography that he should not have been informed of the contents of the treaty because he had promised to let the French government know what they were when he received the information. He had believed in frankness in diplomacy.

On some of the other points, however, Monroe was as unyielding in 1830 as he

PUBLIC ADMINISTRATION

JOHN M. PFIFFNER, *University of Southern California*

ROBERT V. PRESTHUS, *Cornell University*

This standard textbook provides a clear and interesting account of the field of administration at all levels of government. It effectively integrates the descriptive-institutional materials of administrative science and the behavioral analyses of administration in action.

A Realistic Approach and Appraisal

The nature of public bureaucracy is analyzed, as is the political environment and its attendant pressures on the administrator. In discussing the traditional technical aspects of administration—organization, finance, and personnel—emphasis is placed on both formal content and the realities of the administrative process. Examples from all jurisdictions are included to illustrate contemporary practice.

Reflects Current Advances in Administrative Practice

Throughout, the authors have emphasized those areas that seem most important in understanding the rapid advances being made in this field. Unusually full coverage is given to decision making and the impact of the data-processing revolution in administrative fact-finding and planning. The analysis of the new human relations approach in administrative leadership incorporates many of the insights and findings of recent research in group behavior, individual motivation, and leadership dynamics. 4th Ed., 1960. 11 tables, charts; 609 pp. \$7

Kindly mention THE ANNALS when writing to advertisers

had been in 1797. Jay's Treaty was the true cause of the strain in French-American relations, not any misconduct on his part as the American minister to France. He still would have saved Tom Paine from the guillotine even though his conduct in the matter should again be made a cause of his dismissal as minister. He continued to deny that he had engaged in financial speculations while he was in France. Bitterly, he still insisted that Secretary of State Pickering had mistreated him and that he should have been given an official explanation of the causes of his dismissal.

No mention is made of the Hamilton-Reynolds affair or a letter he wrote to Logan for the Republican press—an incident important in the decision to recall Monroe according to the Carroll and Ashworth volume of Freeman's *George Washington*. But Monroe was sharply critical when senators revealed the contents of Jay's Treaty to the press before it became known through official channels.

The autobiography also covers the generally neglected part of Monroe in the Louisiana Purchase and his Spanish mission of 1804–1805, concluding with its failure.

The editor and his assistant, Donald G. Baker, have provided an excellent Introduction, appropriate illustrations, a serviceable chronological Table, illuminating Notes, and a good Index.

ROBERT LEROY HILLDRUP

Professor of History
Mary Washington College

MARCUS CUNLIFFE. *The Nation Takes Shape, 1789–1837*. Pp. vii, 222. Chicago: University of Chicago Press, 1959. \$3.50.

This is one of the volumes in the University of Chicago's History of American Civilization series, edited by Daniel J. Boorstin. Chronologically, it is the second in the series, following Edmund S. Morgan's *The Birth of the Republic: 1763–1789*.

The Nation Takes Shape is another illustration of the phenomenon that some of the best writings about America have been by foreigners. While Marcus Cunliffe is no Bryce or Tocqueville or even Brogan, he

is still in the tradition of those non-Americans who write about the United States with a freshness of insight and a cool sympathy that native historians often lack. Senior lecturer in American civilization at the University of Manchester, Cunliffe has a special competence in his chosen field. In addition, he has what more and more Americans seem to lose, namely, a respect for style and a gift for phrasing. While properly sober in his presentation of data, he is capable of casual aphorisms and even offhanded wit. Thus he remarks that "matter-of-factness was on occasion more valuable than intellectual discourse"; that "expediency was not an inherent vice"; and that the West and South were not well provided with "colleges, hospitals, jails, and other signs of high civilization."

Cunliffe's basic thesis is that American institutions and attitudes, "the American character," were set during the early days of the Republic and that, in their main outlines, they have remained the same. He traces the important political and intellectual developments of America's first four decades and sees the pervasive—and determining—characteristic of the United States as "an amazingly unformed and unfettered society."

The book is admirably readable, filled with relevant information, and pleasantly free of hackneyed emotions or procrustean theses. Cunliffe writes history as it should be written—cleanly and with a due respect for underlying ideas.

SAUL K. PADOVER

Professor of Political Science
New School for Social Research

R. R. PALMER. *The Age of the Democratic Revolution: A Political History of Europe and America, 1760–1800: The Challenge*. Pp. ix, 534. Princeton, N. J.: Princeton University Press, 1959. \$7.50.

The merit of this excellent book, the first of a projected two-volume study, lies in its highly successful exploitation of the idea of an "Atlantic Civilization" in the eighteenth century. It is the author's contention that a single "Great Democratic Revolution" against "entrenched aristocracy" swept

western culture between 1760 and 1800. The revolution, he asserts, was essentially democratic, not so much within the twentieth-century meaning of the word, but rather in that it was characterized by a new feeling of equality, a revolt against older forms of social stratification, and an attack on the possession of government "by any established, privileged, closed, or self-recruiting group of men."

A principle thesis of the author is that the American Revolution was the most important single event in precipitating the revolutionary era. This was not so much because the American upheaval was profoundly radical, for it had an essentially conservative constitutional character while the political ideas it propagated—natural law, natural rights, and human equality—were commonplace notions in contemporary European thought. Rather the significance of the American Revolution, apart from its inspirational example, lay in its successful assertion of the principle that the people were the ultimate foundation of all lawful public power, together with the resort to the constitutional convention as a device for putting popular sovereignty into practical operation.

As a consequence, the American Revolution precipitated a kind of "spiritual flight from the Old Regime." A rash of quasi-democratic revolutionary movements spread across Europe in the 1780's: the Association movement in Britain, the Dutch patriotic revolt against the House of Orange, the Genevese uprising against the city's ruling oligarchy, and the unsuccessful attempt to establish a "United States of Belgium" in 1789 with a constitution modeled on the Articles of Confederation. All these movements failed, in part because they lacked adequate mass support, but in part also because they did not understand the American idea of popular legitimacy; hence they fell victims to resurgent constitutional aristocracy.

But in France, the National Assembly in 1789 with the Abbé Sieyès as its principal theorist seized immediately upon the American idea of the people as the constituent power. Thereby, the French Revolutionists came into possession of an instru-

ment for destroying constituted aristocratic authority too strong to be denied.

ALFRED H. KELLY

Professor and Chairman,
Department of History
Wayne State University

RICHARD L. PERRY (Ed.), under the supervision of JOHN C. COOPER. *Sources of Our Liberties: Documentary Origins of Individual Liberties in the United States Constitution and Bill of Rights*. Pp. xxii, 456. New York: New York University Press for the American Bar Foundation, 1959. Distributed by Associated College Presses. \$5.00.

This is a documentary collection illustrating the foundations for constitutional guarantees of individual liberties in the United States. It was conceived by the committee on American citizenship of the American Bar Association as a means of informing the average man and woman about "the solid foundation on which the structure of our individual liberties has long stood." Given such a prospective readership and such an editorial purpose—and confined within such a relatively concise volume—the documentary material of necessity had to be highly selective, and its value as a reference tool for specialists is correspondingly limited.

In spite of this, the editor has managed exceedingly well with his material, ranging from the Magna Charta to the Bill of Rights. His introductions for each of the thirty-two documents, his annotations to the text, and his short list of references after each selection make the volume an excellent introduction to the study of personal freedoms within the Anglo-American legal system. In view of the fact that earlier documentary histories on this subject have long been out of print, the American Bar Foundation has performed a laudable public service in bringing out a new and up-to-date version.

As mentioned above, there are inevitable gaps in the selections—demonstrated early in the book by an interval of more than three centuries, 1297–1606, between the Confirmatio Cartarum of Edward I and the first charter of the Virginia Company. The

closing of the sequence with the first ten amendments to the Constitution of the United States in 1791, also, leaves the layman with the feeling that nothing new in the way of civil guarantees has been added since then.

The bulk of the documents are of the seventeenth century, and the author misses a good opportunity to emphasize the points of similarity and difference between English and colonial political thought for this era. However, he does document the complementary nature of the materials he has selected, and this is perhaps all that should be asked of a basic source book. From the so-called "great charter" of Virginia in 1618, and the Mayflower Compact of 1620, to the Bill of Rights in 1689, the milestones in the development of personal liberty and of the modern English constitution are carefully indicated. From the resolves of the Stamp Act Congress (1765) to the Bill of Rights, the rudiments of American constitutional development are also set forth.

For beginning students and the general public, this is an excellent introductory volume.

WILLIAM F. SWINDLER

The College of William and Mary

LOREN P. BETH. *The American Theory of Church and State*. Pp. vii, 183. Gainesville: University of Florida Press, 1958. \$4.50.

The author of this book explains his purpose with the observation that "those of us who agree with the Jeffersonian tradition have no reasoned philosophical basis for our position, for the writer of the Act for Religious Freedom [1785] and our modern court justices seem to have arrived at the concept almost intuitively." He concludes with the not excessively modest assertion that he has provided "the first completely reasoned theory of . . . 'partial separation' which has been produced in America since the time of Madison and Jefferson." Unfortunately, however, only thirty pages of the book are devoted to this "modern theory." The remaining five chapters provide a conventional historical account of the English background, the American colonial situation to 1775, the Revolution and

Constitution, the period of "testing" the principle between 1800 and 1958, and the major areas of contemporary conflict. Any brief survey of so vast a subject is necessarily cramped; and this one is not redeemed by extraordinary accuracy, brilliant generalization, or originality of interpretation, while the author's own deprecation of historical methods when used by the Court in its decision-making (pp. 87–89) tends to undermine the reader's confidence in so long an historical prologue.

Professor Beth's positive but lamentably brief case for "partial separation" is based first of all on a classification and reasoned dismissal of the seven other possible types of church-state relationship: Pure Theocracy, Total Separation, Mixed Theocracy, Total Identification, Total Conflict, Erastianism, and Totalitarianism. He then argues, as have J. N. Figgis, R. M. MacIver, and others, for a "pluralistic" understanding of the democratic state in which the "state" is by no means considered to be the only social organization of importance. He sees the churches, for example, as providing a major means for persons to exercise moral choice, and he recognizes the unfortunate way in which collective terms such as "church" and "state" veil the problem of personal liberty just as the institutions in actuality often limit that liberty. He holds that a policy of maximized separation, as defended by Jefferson and defined, for example, by the Supreme Court in the McCollum decision against "released time," frees the state of alien tasks, favors or hinders no groups, strengthens the churches, and brings to individuals as much religious liberty as is compatible with the general welfare. He recognizes, nevertheless, that "partial separation" will not eliminate conflict but only minimize it, since all people do not hold the same views of the "general welfare" nor, for that matter, do they agree on the meaning of democracy. Because the state is the only social organization to which everyone belongs, it must assume an adjudicatory role when conflict arises.

Professor Beth's argument is vitiated by a tendency to ignore the social and intellectual role of religious institutions and ideas and by a very narrow conception of

religion; but his position provides a valuable and persuasive basis for further discussion of a crucial American issue.

SYDNEY E. AHLSTROM

Assistant Professor of History
Yale University

ELEANOR FLEXNER. *Century of Struggle: The Woman's Rights Movement in the United States*. Pp. xiv, 384. Cambridge, Mass.: Belknap Press of Harvard University Press, 1959. \$6.00.

This author's purpose is to tell the full story of the woman's rights movement not only as a narrative of personalities and events but also as a mounting force of ideas and experiences involving many men as well as women, many states, many parties, many political and economic and historical circumstances. Its thesis holds that "the opportunity for complete human development could not and should not have been withheld from one half of the nation because opportunity inevitably brought with it new problems, for the extension of greater participation (and responsibility) to additional sections of the population is the essence of democratic growth" (p. vii).

This account of the suffrage movement is therefore interwoven in every decade with the activities of the growing numbers of women workers and their efforts for better hours, wages, and working conditions, as well as the classic struggles of women to enter institutions for higher education and the professions. The history of American social thought and the cultural lag between the leaders and the proletariat are not understood until such discrete but related histories are treated as one.

The devious and dishonest maneuverings of the "bosses" and the brewers are better known than the flagrant and pompous campaigns of the national party leaders, Lodge of Massachusetts, Wadsworth of New York, Reed of Missouri, Borah of Idaho, and the southern senators. The women who carried the movement from one decade to another are seen not so much as inspired and dedicated as forward-looking and intelligent, and above all as well trained and experienced. When they were anything less than hard-working and efficient, they merely aroused their opponents and lost their

cause. That there would be two national societies to promote the cause, working by quite different methods and from deeply opposing social ideologies, the conservative and the radical, this author takes for granted, as did the leaders themselves. This bifurcation of interests was inevitable in a period of intense economic development during which forces polarized in the midst of widespread unrest, and in the meantime victories would also continue to be won by each until one or the other became dominant.

The outstanding qualities of the book are the flexibility and elegance of the writing, the variety and scope of the evidence, the vividness of the detail, and the gathering force of the drama which builds up firmly to its final climax and unwinds briefly in the concluding chapter. Men as well as women have much to gain from the retelling of this revealing chapter of our nation's history.

KATE HEVNER MUELLER

Professor of Education
Indiana University

ROBERT H. REID. *American Degree Mills: A Study of Their Operations and of Existing and Potential Ways To Control Them*. Pp. xii, 99. Washington, D. C.: American Council on Education, 1959. \$1.00.

Mr. Reid undertook this study in an effort to increase the prestige of American higher education abroad, to ascertain the scope and significance of diploma mill activities, and to explore some of the possible solutions to the problem. Degree mills are defined as institutions purporting to be colleges or universities which confer "quick-way" degrees, usually by mail order, upon payment of a fee of \$150.00 or more. The traffic involves bogus bachelor's as well as master's and doctor's degrees. It is estimated that such institutions operate a \$75,000,000 business affecting 75,000 students annually. The study indicates that there may be as many as two hundred unethical institutions granting such unearned degrees in thirty-seven states and involving nationals in at least forty-two foreign countries.

In an effort to find ways in which to

curb the activities of such fraudulent institutions, the author examined the efforts of selected voluntary organizations, federal agencies, and state governments. Twenty-two national professional organizations were canvassed. The replies revealed limited knowledge of specific activities, some misinformation, and numerous limitations on the possibility of definite control over degree mills (p. 15). Efforts of voluntary organizations have been sporadic and have had little long-range effect.

The study lists the following federal agencies as those most directly involved in exposing deceptive educational institutions: United States Office of Education, Department of State, Department of Justice, Veterans Administration, Post Office, and Federal Trade Commission. The author reveals that the files of these agencies contain extensive records, some dating back more than seventy-five years, describing federal effort to cope with the problem. He observes that federal agencies are not directly responsible for the control and supervision of education. As a consequence authority and effort have too often been ineffective and frustrating. This lack of authority is the basic factor in the whole diploma mill problem (p. 19).

Reid feels that the efforts of voluntary and federal agencies to control the activities of fraudulent institutions are unnecessarily hampered by the lack of responsible state authority. "It cannot be said that most States exercise even the minimum degree of control for the maintenance of educational quality among private degree-granting institutions" (p. 62). He traces the major weaknesses to inadequate statutes providing for granting of charters or rights of incorporation, along with what he describes as a widespread absence of specific minimum educational standards, and a total lack of uniformity in state laws.

The study results in two conclusions which are stated as recommendations. "Basic is the need for concerted action by the States leading to the adoption of uniform legislation which sets minimum standards for the licensing and operating of all higher education—with special control of degree-granting privileges" (p. 77). The suggestion is made that the Council

of State Governments is the appropriate agency to undertake this assignment and that the California law might serve as a model. Assuming that satisfactory state legislation will be enacted, the author sees the need for supplementary federal legislation to plug the "loopholes in interstate and international control." He therefore recommends a full Congressional hearing looking toward federal legislation.

This report is a valuable addition to the literature of a long-standing and vexing problem confronting American higher education. It should stimulate renewed efforts to find effective measures to cope with the problem.

United States Office of Education

LYMAN A. GLENNY. *Autonomy of Public Colleges: The Challenge of Coordination*. (Carnegie Series in American Education.) Pp. xviii, 325. New York: McGraw-Hill Book Company, 1959. \$5.95.

Public higher education has refinements of problem areas which are usually neglected by all but the insiders. This book lucidly calls needed attention to these areas. Behind the scenes there are administrative tensions which need examination and new solutions demanded for the difficulties revealed.

The issue is the co-ordination of policy and practice among the educational units which compose a state's system of university and collegiate institutions. What should be the over-all policy body; what sort of administrative staff should it entail; what autonomies should remain vested in the individual institutions; how can quality, planning, economy, and fluidity of purpose be assured throughout the operation of a state system?

These are not easy questions. And the right answers—if there are some general principles to be accepted—have admittedly not yet been discovered. Diversity in practice among states is as prevalent here as in other phases of our pluralistic educational provisions. Much depends, it would

appear, upon the quality of leadership at the level of the administrative officer, the chancellor, executive director, or whatever of the state system. There must be a professional contribution of insight, of research, and of educational philosophy in the area of long-time planning in relation to future needs and sound educational provisions which can be placed persuasively before what should be an over-all trustee body chosen on nonpolitical grounds.

Much also depends upon the fiscal relation of the system to the state budgetary or other responsible state financial agency. It has certainly proved true that the authority of the exchequer can become the authority over policy and important internal college decisions. The need for a principle of relating agreed budgets to internal flexibility of allocation is clearly urgent. One detail here is that the so-called "line budget" should clearly be abandoned, and limitations should be imposed on budgetary or legislative committees' preaudit of needed expenditures. Another confusion arises from the lack of uniform agreement on personnel practices regarding salaries, promotions, tenure, and the like.

What of the control of educational policy which may well be eroded from autonomous judgments and may make the decisions actually reached stem from non-educational considerations?

It is all of these issues, deriving from actual experience, to which this book calls attention. Its conclusions, as far as they go, are sound and valuable. The author does make it clear that pioneering and constructive thought is now due in these mooted areas. Perhaps one of the functions of a new National Commission on Higher Education appointed from top educators, which has been proposed in several quarters, would be to move into this area with recommendations for consideration of the presently diversified state policies.

ROBERT J. ALEXANDER. *The Bolivian National Revolution*. Pp. xviii, 302. New Brunswick, N. J.: Rutgers University Press, 1958. \$7.50.

With *The Peron Era* and *Communism in Latin America* Robert J. Alexander has, some time ago, established himself not only as one of the ablest but also as one of the most reliable and detached reporters of the Latin-American scene. His work, more perhaps than anybody else's, has forced the revision of many a prejudice that previously blurred the vision of North American commentators. In his latest volume, *The Bolivian National Revolution*, he declares himself not so detached, as his sympathies are clearly on the side of the revolutionaries. Yet, his objectivity is little affected by this. He withholds neither criticism from Bolivia's new leaders nor sympathy and understanding from their antagonists.

With his customary exhaustive precision which, paradoxically, makes also for excellent reading, Alexander covers every aspect of the revolution of 1952 which, along with the Mexican and Cuban revolutions of 1910 and 1959 respectively, ranks as the most significant event of modern Latin America. There were numerous Bolivian revolutions prior to 1952. But most of these were in the nature of mere coups d'état resulting in little except turnovers in the ranks of those exercising but not actually holding power. The system itself had always remained unchanged: semifeudal; superimposed on two unassimilated and even largely unassociated national groups, one Spanish, one Indian; and operating for the benefit of an elite composed of Army, landowners, tin barons and, until the middle of the nineteenth century, the Church.

The revolution of 1952, led by Victor Paz Estenssoro and Hernán Siles, changed not only the government but the system. It was not a bloody affair, and its purpose was not vengeance. It lasted barely three days. Led by Movimiento Nacionalista Revolucionario (MNR) and enjoying for once wide, popular support, it was able to sweep aside not merely a group of military leaders but the entire army which, for so long, had successfully maintained itself as the center of political power while otherwise doing little except losing "every war in which it was engaged, including the last one with Paraguay."

The ensuing policy measures reflect the magnitude of Bolivia's change. The army

was first abolished and then reorganized as a tool less of military than of educational, economic, and technological policy, functioning both as a corps of engineers and a school for Indians. Agricultural reforms brought large-scale distribution of land. The great tin corporations were nationalized with compensations still to be negotiated, a vital condition for restoring Bolivia's credit standing. Other natural resources were opened for exploitation, particularly oil and iron ore. Highways were built to establish for the first time a modern market economy. Small private industry was encouraged and diversified to free the country from its excessive dependence on outsiders. And a great deal of social legislation was adopted to ensure the Indian masses a more equal share in the anticipated benefits.

That so vast a program in so underdeveloped a country should run into difficulties was inevitable. It was opposed by the forces of the past: defeated colonels, expropriated tin barons, frustrated labor leaders, feudal business men who failed to be stimulated by the profit motive to make their firms more efficient. It was opposed by those who thought of themselves as the wave of the future: two kinds of communist parties, two kinds of Trotskyite parties, and several kinds of rightist parties which, as in France, sound the more to the left the more right they stand. It was opposed by its own sheer magnitude which has made Bolivia temporarily more dependent on foreign assistance than she was under the regime whose overthrow was partly explained on the ground that it kept the country excessively dependent on foreigners. And finally, reforms of this kind could not but be suspect of communist inspiration—a suspicion which may serve Poland well but hardly a country whose total deficits in recent years are taken care of by the United States. However, as Alexander amply shows, there seems no danger of this in the Bolivian Revolution. For, "the Communists," he writes, "have been most successful in those nations without a strong national revolutionary party or some other party with a mass appeal, capable of meeting them on their own grounds and

among the groups from whom they especially draw support."

Alexander gives the first complete picture of the continuing Bolivian Revolution and, beyond this, of Latin-American issues and trends in general. The book is soberly written, thoroughly documented and, what is particularly appreciated during a period when a country enters into a new epoch, full of excellent excerpts from basic writings and programs such as will delight the student of sources as well as permit the reader to make his conclusions independent of the author's judgment. In all, this is an authoritative contribution to the political literature on Latin America. One would have welcomed, however, a few additional maps illustrating geopolitical, ethnic, climatic, and economic factors of a country as yet so unknown and seemingly remote even to many Bolivians.

EUROPEAN HISTORY AND GOVERNMENT

DANIEL H. THOMAS and LYNN M. CASE (Eds.). *Guide to the Diplomatic Archives of Western Europe*. Pp. xii, 389. Philadelphia: University of Pennsylvania Press, 1959. \$7.50.

Research workers in many fields will extend a welcome to this volume prepared in honor of Dr. William E. Lingelbach, for many years Professor of European History at the University of Pennsylvania. Several attempts have been made since the war to provide an up-to-date guide to record repositories, notably R. H. Bautier's "Bibliographie selective des guides d'archives" in *The Journal of Documentation*, Vol. 9 (1953) and in the fifth volume of the journal *Archivum* (1955), which is entirely devoted to a directory of the record offices in all countries. By confining their scope to the diplomatic archives of Western Europe the editors have contrived to produce a work, which on its rather narrower

front, far surpasses in scale and usefulness its predecessors in the field. The historical introductions to each section, in particular, are very valuable since all too often a faulty understanding of the mode of growth of an archive can seriously mislead a researcher as to the nature of the materials which he may find there. Several of these introductions, that to the section on Belgium, for example, are readable essays in their own right. There follows in each case a description of the organization and classification of the records which used in conjunction with the bibliographies concluding most sections will enormously lighten the burden of scholars who are planning a visit to a foreign record office. Much useful information is added of a severely practical kind, such as conditions of access, hours of opening, arrangements for securing reproductions, and even some helpful suggestions on accommodation.

It is quite natural that in a volume prepared by a large number of contributors there should be some divergences of scale, presentation, and method. The section on the archives of Spain by Dr. Lino G. Canedo seems to be worthy of special praise for its lucid exposition of a complicated subject on which explicit information is not at all easy to secure. Parts of the section on Great Britain appear to be rather thin and not quite up to date: it was a pity, for example, that the great and comparatively recent accessions of Cambridge University Library in this field should have passed unrecorded, especially the papers of the Prime Minister, Stanley Baldwin, and the political and ambassadorial archives of the First Marquess of Crewe and the First Baron Hardinge of Penshurst, as well as the enormously extensive records of the great mercantile house of Jardine Matheson of great importance for the study of the opening up of China in the nineteenth century: and one would have also expected to find a reference to the Milner papers, vital to historians of South Africa, preserved at New College, Oxford. It may well be argued, however, that the space saved has been more usefully employed in recording the holdings of less accessible and familiar repositories further afield. It is hoped that this rather insular,

not to say parochial, criticism will not mask this reviewer's enthusiasm for the project and its execution upon which the editors are to be warmly congratulated.

A. N. L. MUNBY

Cambridge

MICHAEL CURTIS. *Three Against the Third Republic: Sorel, Barrès, and Maurras*. Pp. 313. Princeton, N. J.: Princeton University Press, 1959. \$6.00.

Three Against the Third Republic is a study of the extremist critique of the governmental institutions and ideology of France at the start of our century. It draws this critique from the works of three men: Maurice Barrès, provincial aesthete, contemptuous of Paris and parliament and yet fascinated with them; Charles Maurras, terrible polemicist and rabble-rouser for aristocracy and the spiritual oneness of France; and Georges Sorel, technocrat and ex-engineer, who beginning at forty-five gave his full time to prophesying the end of politics. Barrès and Maurras sought a strengthening of the state, Sorel the reverse; egalitarianism and popular sovereignty were, though, loathsome to all three.

The author's choice of men is a good one, but his method is not. He rehearses their charges against the regime under successive heads: democracy, the Revolution, decadence, and so forth. The result is a dreary catalogue of their contentions complete with double entries. No full or credible picture of them emerges. Worse, much of their indictment gets lost in piecemeal paraphrase, and then to refute them is easy—and unconvincing. Nonetheless the author does sometimes refute them aptly, as when he opposes Sorel's praise of social violence to his stress on "juridical principles" or on industrial output, or when he points out the absurdity of Maurras' regarding France as more French in the seventeenth century than in the nineteenth and seeking national unity and strength through decentralization; not, however, when he calls Barrès paradoxical for mixing naturalistic sociology with the aesthetics of "individual sensitivity."

The book also has lesser faults. The

introductory chapters lack clear focus and rules of relevance. There is much showy scholarship throughout. Some refutations are merely counteraffirmations, and some quarrels are largely quarrels over words, for example, the one over "state" and "nation." But most irritating are the inadequately identified persons, institutions, and events. Knowing allusions abound. Writes Henri Peyre, "The author feels French history." He also understands it, but unfortunately he does not take the requisite pains to let his reader in on its secrets. One must come to him pre-equipped. The pity is the greater for his being an accomplished stylist, one able to make himself delightfully clear, as when he says of Barrès that he "preached discipline, sacrifice, and austerity, but not for himself," of Maurras that he raised "prejudice to the level of a science," and of Sorel, prolific and inconstant author, that "all his writings were rough drafts for a book he never wrote."

RUDOLPH BINION

Assistant Professor in History
Columbia University

KARL W. DEUTSCH and LEWIS J. EDINGER. *Germany Rejoins the Powers: Mass Opinion, Interest Groups, and Elites in Contemporary German Foreign Policy*. Pp. xvi, 320. Stanford, Calif.: Stanford University Press, 1959. \$6.50.

This is a notable study of the basic situations and conditions at work in the making of contemporary German policy. It examines the seven popular views about predominant influences shaping foreign policy and considers the relationship of mass opinion with the influence of governmental institutions, private organizations, informal interest groups, and elites. The authors seek to determine what basic political images, values, and beliefs influence German decisions, especially those which shape foreign policy. After a scholarly scrutiny of the inventories of public opinion polls, they accept the reliability of competently conducted polls "within reasonably well known limits of accuracy."

The Chancellor's power and responsibility for determining public policy and the roles of governmental institutions and elites are

presented with remarkable thoroughness. These include members of parties behind the political parties, leaders of trade unions, the key employers, the directors of farm associations, the spokesmen of the major churches, effective leaders of the press, periodicals, radio, and television, and the university rectors with pervasive influence.

The authors analyze the aims of foreign policy-makers, the influences of mass opinion, internal civil and military elite groups, and the pressures of the principal foreign powers and certain smaller states. A detailed review of the system in operation considers the recovery of German influence through the European Coal and Steel Community (ECSC), the North Atlantic Treaty Organization (NATO), the Paris agreements, the reparations settlement with Israel, the attempted negotiations with Russia, and the economic miracle of the 1950's. Meanwhile the patterns of influence in the foreign policy process are undergoing dramatic changes (pp. 204-216). In a brilliant concluding chapter the authors consider nine possible roles for the Republic in the early 1960's.

The first criticism of this study is the number of disparate chapters. The definition of an "elite" is too succinct for the general reader. The elite inventories are not examined for a critical evaluation of the conductors of one of the controversial public opinion polls. The present weight of the great historians and their historical philosophies is omitted from "Historical Memories and Present Aspirations."

This book reflects the superior quality of the scholarship of Professors Deutsch and Edinger and the adequacy of their source materials. They possess a profound knowledge of this important subject and give full credit to their German colleagues who have pioneered in elite and poll research. The authors show how able scholars doing research work involving several fields are capable of constructing an impressive synthesis. Their study should be read by all social scientists concerned with contemporary Germany and by general readers interested in the German problem.

RALPH HASWELL LUTZ

Professor of History, Emeritus
Stanford University

WOLFGANG HIRSCH-WEBER. *Gewerkschaftler in der Politik: Von der Massenstreikdebatte zum Kampf um das Mitbestimmungsrecht*. (Writings of the Institute for Political Knowledge, Vol. 13.) Pp. xv, 170. Köln: Westdeutscher Verlag, 1959. DM 18.50.

Thirteenth in a series of monographs and books to be produced by the Institute for Political Science of the Free University of Berlin, this study competently summarizes the pre-World War II history of German labor unions and offers a rather detailed account of the maneuverings, strategies, and struggles leading up to the enactment of the codetermination laws of 1951 and 1952. The term "codetermination" refers to postwar arrangements providing labor union representation on the supervisory boards and in the day-to-day management of German industrial enterprises. The author of the present study bases his prewar history entirely upon published sources. For the story of the developments since World War II he relies both upon published sources and upon union documents and interviews with officials of the German Federation of Labor. An Appendix presents some useful statistics on historical trends in union membership in Germany.

A study of this sort is welcome, especially insofar as it reveals some hitherto unknown details and insofar as it indicates a growing interest of some German political scientists in empirical study of political process and in the politically significant activities of private groups. On the whole, however, the book must be set down as a rather pedestrian work which tells us less than American scholars have already done about the significance of codetermination. Herbert Spiro, for example, has more cogently analyzed the relation of the codetermination issue to German politics and social relations. William McPherson has far more systematically explored its meaning for the rank and file worker. Edwin Beal has more imaginatively placed codetermination in the perspective of history and ideology.

Hirsch-Weber sees codetermination and the 1919 general strike against the Kapp Putsch as the prime historical examples of German union militancy in behalf of workers' ideals, in contrast to the ignominious

appeasing posture of the labor movement when Hitler came to power in 1933. Because the institution of codetermination involved a rather extended struggle, a lot of fervent rhetoric, and the threat of political strikes, it can stand superficially as a symbol of labor militancy against business interests. In the years since it was introduced, however, it has served to knit unions more closely into the economic and social fabric, thus proving itself a highly conservative institution and one with relatively few economic advantages for workers. Hirsch-Weber would doubtless have seen it in clearer perspective if he had examined its history since 1952. Codetermination may be more significant as a facet of the feverish program of postwar German economic and military reconstruction than as a symbol of militant pursuit of labor's democratic ideals.

Professor of Political Science
University of Illinois

NORBERT MUHLEN. *The Incredible Krupps: The Rise, Fall, and Comeback of Germany's Industrial Family*. Pp. xi, 308. New York: Henry Holt and Company, 1959. \$5.00.

There is much of interest for everyone in this scholarly, exciting book. In fact it is as incredible as the Krupps themselves. Norbert Muhlen has written with objectivity and sparkle about the 150-year life span of the Krupps and has managed in the process to inform and entertain us while exposing Europe's most controversial family, a family whose known roots go back to 1587.

From the "penniless refugee," Arndt Krupp, who made a fortune out of the tragedy of the Black Plague, to the present-day Alfred, who has rebuilt the Krupp dynasty, there are greed, determination, industrial genius, singleness of purpose, international intrigue, human frailty, and political nepotism in the Krupp men. There is also the industrial matriarchy of "Big Bertha" Krupp in an age when women had not yet publicly announced their superiority over men.

In this reflection of ourselves in the successful family biography of Krupp, there

COLUMBIA UNIVERSITY PRESS
2960 BROADWAY, NEW YORK 27

is evidence of no love or warmth of self-sacrifice. Asthmatic, rheumatic "Little Fritz," son of "steel-tough" Alfred, made a halfhearted attempt at marriage for love, but the eight-years delayed nuptials to Marga Von Ende are explained by Muhlen: "No deep affection, let alone passion, bound Fritz to Marga or vice versa."

In the late sixteenth century Arndt converted a general store into great real estate holdings . . . "This Black Plague . . . Esseners believed the end of the world had come . . . offered their lands to the first buyer . . . Arndt Krupp bought all the real estate . . . at prices far below value . . ." In 1707, George Krupp, Essen's richest man, used his job of town clerk to such general and family advantage that he was tried after indictment on twelve counts . . . "he did not pay any of the taxes which he imposed on his fellow citizens, he gave no accounting of the town's financing, he hid the account books at his home, he appropriated building materials . . . rather than deny his guilt he tried to explain it away with a show of arrogance . . . in the end the judge found most charges true . . ."

Two hundred and forty years later in 1947, a fifth generation Krupp, Alfred, being tried before the American Military Tribunals at Nuremberg, Germany . . . "considered himself an innocent victim of old slanders against his family and his trade . . ."

Alfred Krupp of the mid-nineteenth century stole England's secrets of casting steel. Then he returned to astound them and the world with the first cast steel cannon. The Kings of Cannons have always sold arms of war to friend and foe. . . . "If it will improve business they are free to bash in each other's heads. As far as I am concerned I am satisfied . . ." wrote a Krupp from Paris in 1839. Fritz Krupp was a different Krupp. His homosexual cavorting on the Isle of Capri finally brought censure from Kaiser Wilhelm and world scorn.

The one thread binding five generations of Krupps is that of an inbred conviction that "Business is Business." No moral, political, or human considerations have been allowed to interfere with the production of goods, whether for war or peace, or to pre-

vent their free sale on world markets. Perhaps this is what Krupp manager and super salesman Berthold Beitz meant in 1959 when, having being attacked by Chancellor Adenauer for Krupp's growing business with the Soviet Union, he said, "I am a businessman, I do not understand politics. . . . Let Adenauer have his politics and let us do our business. . . . Private industry works without political considerations, while governments change. . . ."

As Norbert Muhlen so clearly shows, this incredible Krupp family has not yet learned its historic lesson, although it has recovered its industrial power. Today's head, Alfred, who was formerly incarcerated for war crimes, will pass on to his young son, Arndt, one of the world's six greatest fortunes. Perhaps young Arndt will continue to make for the world only the present instruments of peace for that is the direction of present-day West Germany, and as Norbert Muhlen ends his brilliant book "as Germany goes so goes Krupp."

FRANK L. HOWLEY

Vice President

New York University

JOSEF KORBEL. *The Communist Subversion of Czechoslovakia, 1938-1948: The Failure of Coexistence.* Pp. xii, 258. Princeton, N. J.: Princeton University Press, 1959. \$5.00.

The fall of democratic government in postwar Czechoslovakia still defies definitive treatment because important materials remain unavailable. But there is no dearth of writings which purport to reconstruct and analyze the developments leading to the 1948 crisis. The author of this latest contribution was an adviser to Jan Masaryk at one time and represented his country in Belgrade when the Communists took control.

Following a truncated introduction of Czechoslovak life and politics before 1938, the author documents the changing party lines of the Communists from the time of Munich until the Soviet Union joined the West against Germany. The account will not surprise readers already familiar with the litmus characteristics of native Communists when Moscow speaks. With the wartime alliance in effect, Communists as-

sumed "the guise of patriots" without lessening their determination to overthrow the bourgeois system in postwar Czechoslovakia.

Considerable attention is also given to the actions and views of Benes and other political victims of Communist duplicity. Benes' desire to escape the fate of Polish and Yugoslav governments-in-exile, his conviction that close ties with the Soviet Union were necessary, and his optimism, following the 1943 negotiations in Moscow, that democratic and Communist interests could coexist are appropriately noted. Benes' abstention from political haggling and democratic disunity were elements in the 1945 formation of a coalition government that strengthened the Communist position.

The increasingly illegal and demagogic activities of the Communists after liberation are recapitulated by various examples, but this "infiltration in width and depth" is not systematically investigated. The governmental crisis that brought Communist victory is treated at greater length.

This book does illustrate that Communist success was not an abrupt operation, but a culmination of infiltration and increasing pressures. It does not, however, come to grips with the relative collapse of the democratic opposition. Nor is the author consistent in his interpretations of Benes' position. He describes Benes' awareness of Communist dangers and elsewhere emphasizes that fundamental to Gottwald's victory was the naive assumption shared by Benes with others that Communists were Czechoslovakians first and that they respected democratic processes.

These and lesser shortcomings have resulted from the generalized treatment given to important problems. The book contains some unpublished documentation and personal records that are not revelational: they serve as corroborating evidence of earlier accounts. Written somewhat dispassionately, this work is useful as a summary, but it makes no major contribution to existing information.

W. K. JORDAN. *Philanthropy in England 1480-1660: A Study of the Changing Pattern of English Social Aspirations*. Pp. 410. New York: Russell Sage Foundation, 1959. \$6.00.

Oftener than not college presidents who enter administration through the professional door find themselves forced to give up teaching, as well as research and writing in their former fields of interest. Happily W. K. Jordan, until recently the president of Radcliffe College, is an exception. He not only teaches a course in the Harvard Graduate School, but for some years has been engaged in a significant research project that now reaches the publication stage. The author describes his book as "the first of a series of volumes dealing with the changing pattern of man's aspirations" in a period in which he "began to move out into a new and unexplored terrain of social responsibility."

The most fully recognized manifestation of this movement hitherto has been the great body of social legislation passed under the first Elizabeth. Professor Jordan evaluates this program of "irreversible social gain" with great cogency. But the "mechanisms of relief" under which the state was ready after 1957 to enter if the need arose were intended, he thinks, more as "a system of co-insurance" to be used only if and when the resources of the community broke down. It is his contention that, broadly speaking, the burden of social responsibility throughout the period in question was borne by private charity.

A study of private charity then would presumably show the way in which the burden was met. But Professor Jordan's quest goes deeper still than that. A man's benefactions, he believes, mirror his own nature and aspirations. Hence a large-scale study of the private giving of all classes may be expected to furnish a key to those aspirations and the way in which they changed in an age that perceptibly moved from primarily religious preoccupations to secular concerns.

With this as his basic assumption, Professor Jordan has carried forward a task that matches in magnitude the bold and imaginative idea on which it was conceived.

Two urban centers and nine representative English counties are the laboratory and thousands of extant wills of all classes involved, the chief source for the study. The author is well aware of pitfalls. A whole section on Frailties of the Method warns, while at the same time it disarms and reassures the reader. The resultant data throw new light on differences of class as well as differences within class; and on local variables. The curve they plot shows a shift from primarily religious to secular giving that ranges all the way from bequests for public buildings and the founding of schools, to providing apprenticeships for apt young tradesmen and marriage subsidies for worthy young women. In general, the author sees an ever-widening sensitivity to human suffering and a turn from parochialism to a more national outlook. The three remaining volumes will deal more particularly with specific localities. Not everyone may agree with the author's basic assumption or with every detail of his interpretation. But the data alone are of tremendous significance, and will in the future furnish grist for many mills. I confess to thinking the book one of the most impressive pieces of historical scholarship that has come my way for a long time.

MILDRED CAMPBELL

Professor of History
Vassar College

ASHER LEE (Ed.). *The Soviet Air and Rocket Forces*. Pp. 311. New York: Frederick A. Praeger, 1959. \$7.50.

This timely and informative volume is edited by Asher Lee, an internationally known British expert on military aviation. He has written three previous books: one was on airpower in general and the other two treated of the German Air Force and the Soviet Air Force in particular. The nineteen chapters of the volume reviewed were written by experts who cover in broad strokes the history of the Soviet Air Force from the Russian Revolution to 1958. Also, there is an evaluation of Soviet air strength, about 20,000 combat planes.

Most of the chapters give technical information but should successfully hold the

lay reader's interest. "The Training of Personnel," "The German Legacy," and "Politics in the Soviet Airforce" have considerable background value. Much validity is derived from the writings of experts: Hanson Baldwin, Air Chief Marshal Sir Phillip Joubert; and among twelve well-informed contributors should be mentioned the ex-Soviet officers, Boris Kuban, and George Schatunowski, the Soviet aviator who was shot down three times in the Second World War. Asher Lee writes three terse chapters including a final chapter on "The Future of Soviet Air Power."

The information in these chapters came from many sources. Even though the Soviet Union is better constituted than nearly any other power to preserve strict military security, in the last nine or ten years, there were many major "breaks" from which new information was derived: Soviet-made planes were shot down in the Korean War; there was an unexpected display of new jet fighters, bombers, and transport planes at Soviet Air Force Days; information came from the "Institute of USSR," which contains hundreds of ex-Soviet citizens who were in the Red Armed Forces; and most important valuable information was secured from a "steady stream" of refugees—pilots, radio operators, and mechanics, who, although they came from Poland, Hungary, and Czechoslovakia, were all trained to use Soviet aircraft and equipment. Much of value has also been obtained from the German aircraft engineers who for a considerable time were engaged in Soviet laboratories, test facilities, and electronic factories. These bits from engineers and the competent, well-informed operators and technicians, when pieced together by experts, give a fairly complete general picture.

In short, Lee's book is a good up-to-date survey of present Soviet airpower, its historic background, its problems, and its possible future. There are twelve illustrations of aircraft and rockets; also concise biographical sketches of the twelve contributors.

ASIA AND AFRICA

K. A. NILAKANTA SASTRI (Ed.). *A Comprehensive History of India. Volume II, Mauryas and Satavahanas 325 B.C.-A.D. 300.* Pp. xx, 918. Bombay: Orient Longmans under the auspices of the Indian History Congress and the Bhāratiya Itihas Parishad, 1957. 90/-.

Thirty-eight years ago there appeared the first volume of the Cambridge History of India, a volume which gave promise of initiating for India a type of reference work which has proved of constant use in the study of western history. Alas, the promise of this co-operative endeavor has remained unfulfilled. The second volume of the Cambridge History, which was to have portrayed the history of India from the time of Christ to the Moslem invasion, never appeared, while volumes three to six, dealing with the Moslem and British periods, were disappointing, showing neither the mastery of fact nor the interpretative ability characteristic of the other series of Cambridge histories.

There appears, therefore, to be some reason for initiating a new series of co-operative histories of India. To this may be added the natural desire of a new nation to produce its history as written by its own scholars. One such attempt, *The Bhāratiya Itihāsa Samiti's History and Culture of the Indian People* (London: George Allen & Unwin, 1951-), is now in its fifth volume with seven more to follow. The work under review is the first volume to appear of a second attempt. If the work of which it forms part reaches completion it will be the second volume of another twelve-volume history.

A Comprehensive History of India, Volume II is not without merit. The chapters on South India by K. A. Nilakanta Sastri are painstaking and accurate and are based on this scholar's long years of productive research in this field. J. N. Banerjea, the well-known numismatist, furnishes competent chapters on the four great invasions of India in the period between the Maurya and Gupta dynasties: those of the Bactrian Greeks, the Parthians, Scythians, and Kushans. Dr. U. N.

Ghoshal writes two chapters on post-Mauryan economic conditions and social life which, even though poorly organized, still furnish valuable material for an understanding of ancient India. I find only one contribution in the volume which deserves condemnation—unfortunately, the first chapter of the book. Its lack of judgment and excess of rhetoric are not characteristic of the rest. King Nanda is made a conqueror of the Deccan on the basis of legends recorded in Mysore 1500 years after his death. Candragupta's minister is said to have instilled in this prince a desire "to free the fatherland," whereupon Candragupta organized "national resistance against alien domination." Justin, thinking of Rome, might use such terms. But the fact that no Indian document of Candragupta's time knows even the words for nation or fatherland should make us wary of following his example.

The question still arises in my mind whether volumes of co-operative endeavor like the one under review are the best way to present ancient Indian history. On the basis of the three series so far begun: The Cambridge History, The Bhāratiya Itihāsa Samiti's, and the present work, I must answer no. This answer may appear ungrateful, but is not so intended. I am impressed by the labor that has gone into these works, but I am equally impressed by the differences between the history of ancient India and that of ancient Europe or the Near East.

For vast stretches of Indian political history we have practically no facts at all. The evidence for the Sunga kings, for example, consists in a few coin names, a few references from uncollated editions of Purāṇas, four or five sentences from Patañjali, and a musical comedy written by Kālidāsa more than 500 years after the dynasty had ceased to exist. All this evidence has been known for many years, and I see no point in rehearsing it at length, trying to draw it out to the size of a chapter. The best form of reference for such facts is the briefest, such as we were given in de la Vallée Poussin's excellent volumes, *l'Inde aux Temps des Mauryas* (Paris 1930) and *Dynasties et Histoire de l'Inde depuis*

Kaniska jusqu'aux invasions Musulmans (Paris 1935) or in the recent manual edited by Renou and Filiozat, *l'Inde classique, Manuel des Études Indiennes*. 2 vols. (Paris: Payot, 1947 and 1953). On the other hand, the documentary evidence for the history of Indian religion, philosophy, and literature is immense, and it can be best treated not by cutting it down to the size of political history but by fuller treatment in special monographs of which several of the contributors to the volume under review have shown themselves eminently capable.

The sources for the ancient history of India at the present time are too disparate to be spun out and cut short into the fashion of European history. Such at any rate is my opinion of the present state of these sources. The future may bring facts to light which will change this.

MICHAEL BRECHER. *Nehru, A Political Biography*. Pp. xvi, 682. New York: Oxford University Press, 1959. \$8.50.

This biography is an important book for many reasons. First, its subject has attained a unique place in history, becoming a man apart, widely misunderstood both by adulators offering uncritical admiration and denigrators whose response is no less automatic and inadequate. New light on such a man is always welcome, and the author was fortunate in having access to previously unpublished source materials. This book gains importance also from its scope; the author has set himself the ambitious task of surveying "the still unfinished Asian Revolution . . . in its Indian setting," utilizing the life of Nehru as "the binding thread" (p. vii). The publishers have done well by the book which is illustrated with 3 maps, 35 photographs, a select Bibliography, including a list of persons interviewed, and an excellent Index. As a narrative of events, this "political biography" deserves high praise for careful scholarship. As interpretation the book bears the stamp of courage and honesty throughout, although to this reviewer it

seems lacking both in depth and subtlety of perception.

In pondering my differences with the author, it appears to me that they stem mainly from what in my opinion is a too ready acquiescence in the views of a minority segment of the Indian opposition which has seriously affected his assessment of the present condition and future prospects of the Congress party and also his evaluation of the Gandhi-Nehru relationship. The question of the Congress party ranges so widely as to require far more space for elucidation than is at my disposal, but a few points concerning the Gandhi-Nehru relationship seem worth noting.

It would appear that Gandhi's "archaic ideas about economic policy" (p. 170) so repel Brecher as to lead him to overlook certain genuinely revolutionary aspects of Gandhi's leadership and to characterize him as a "mediaevalist" (p. 619). This is a not uncommon failing among contemporary analysts; what makes this book different is that Brecher's unusual candor and courage have forced him to pursue his convictions wherever they lead with the result that he virtually apologizes for Nehru's attachment to Gandhi, explaining it away as one example of a lifelong habit of dependence upon strong-willed older men arising out of Nehru's childhood relationship with his father. Were space available, I believe it could be demonstrated that Nehru, on the contrary, exhibited an independence, both in relation to his father and, later, to Gandhi most unusual in the Indian cultural context. If my interpretation is correct, the most enduring tie between Nehru and Gandhi lay in the deep concern they shared with respect to the building of true courage and manhood in the Indian people. Herein lay Gandhi's genius, as also his fundamental claim to Nehru's allegiance. After all, Nehru had little more sympathy than Brecher for Gandhi's economic ideas, and was only after long years of intellectual struggle convinced of the efficacy of Gandhian tactics. In the end, however, Nehru concluded that when measured by results achieved, Gandhi was "the greatest revolutionary of our country, of the present age, and of the previous age" (Jawaharlal Nehru, *Towards a New Revolution*, Youth

Congress Series No. 2. New Delhi, 1956, pp. 13-14). Brecher has not yet explicitly grappled with this aspect of the Gandhi-Nehru relationship. I here suggest that far from exhibiting infantile dependence, Nehru, precisely because of his long years of unsentimental and searching analysis of Gandhi and his role in history, has emerged as the least time-bound of contemporary leaders, the giant among men which Brecher has indeed perceived him to be.

MARGARET W. FISHER

Lecturer in Political Science
University of California
Berkeley

VERA MICHELES DEAN. *New Patterns of Democracy in India*. Pp. viii, 226. Cambridge, Mass.: Harvard University Press, 1959. \$4.75.

The subtitle of this little book might easily have been that of the television commentary on President Eisenhower's recent good will trip abroad—"Journey into Understanding." The only surprise is that seemingly expressed by the author at the exciting history of India, the grandeur of her early civilization, and the religious toleration of her famous rulers. At least half the book is devoted to a rather sketchy review of these cultural aspects. Although written in the clear and concise style the author has long used in her excellent Foreign Policy Association pamphlets, the book adds little if anything startlingly new to our understanding of events in the sub-continent. The chapter on "New Economic Patterns" is the best. It discusses the government's Five Year Plans endeavoring to integrate land reform supplemented by Bhavé's "land gift" movement, the drive for planned parenthood, the efforts to increase agricultural production by the use of newer techniques, and the mobilization of peasant financial resources through a rural credit system. Mrs. Dean also points out that, without resort to force or violence, India is trying to provide on a modest scale measures of social welfare regarded as essential by Western nations of the twentieth century within the framework of an economy, with a few exceptions, presently at an approximately fifteenth-century level of development.

The main thesis is concerned with the wooing of India by the United States and the Soviet Union. There is an attempt to prove that the Indian philosophy of accepting "this and that" will continue to be effective and that it may not be necessary to make a divisive choice of "this or that." If such a choice is ever forced, since the Congress Party is devoted to democracy as developed in India, the probability is that the temptations of totalitarianism will be resisted. This conclusion is probably correct and certainly welcome. However, this reviewer feels that just as the strong Chinese family system did not act as a formidable deterrent to communism, it is unlikely, as stated, that Indian emphasis on individual contemplativeness, on the necessity of the individual choosing actions for which he must assume responsibility, and on self-improvement if he is to achieve eventual liberation from his mortal lot will be a great deterrent to his acceptance of a Communist regime dictating the acts of every human being (p. 203). This will be especially unlikely if population growth continues, and living standards remain deplorable and show no improvement.

There are minor errors in the spelling of Chinese and Indian names (pp. 6 and 183), and there is evidence of hasty proof reading (p. 77), but this does not make the book any less welcome to those desiring a good, quick survey of current Indian problems.

ALBERT E. KANE

Bureau of Indian Affairs

S. L. POPLAI (Ed.). *National Politics and 1957 Elections in India*. Pp. iii, 173. Delhi: Metropolitan Book Company under the auspices of the Diwan Chand Indian Information Center in co-operation with the Indian Council on World Affairs, 1957. Distributed by the Institute of Pacific Relations. \$2.00.

The first and second general elections in India have understandably been a source of pride among Indians and an object of interest among informed Americans. But there has been relatively little research on the Indian electoral process among either Indian or American scholars. Methods of candidate selection, techniques of party campaigning, procedures of polling, pat-

terns of voting behavior—these and other aspects of the process merit further study which would contribute heavily to our comprehension of Indian politics and comparative politics in general.

For such study this source-book is of some utility. Published before the second general elections, it is devoted primarily to a compilation of the election manifestos and special campaign statements of the four main parties: the Indian National Congress, the Praja Socialist party, the Communist party of India, and the Bharatiya Jana Sangh. In addition to these documents it includes a short Bibliography of Indian periodical articles on the pre-election situation, a brief survey of the results of by-elections between the first and second general elections, and a note on the formal procedures of candidate selection within the main parties. Finally, it contains a forty-six-page survey of parties and issues from 1952 to 1957 by Sirir Gupta, one of the most capable of young Indian political commentators. By and large, this volume complements an earlier American monograph by Margaret W. Fisher and Joan V. Bondurant, *The Indian Experience with Democratic Elections*.

The value and limitations of the volume are well defined in its Foreword, contributed by the Director of the Indian Institute of Public Administration, V. K. N. Menon. He observes that such a compilation is valuable to scholars of a country lacking certain basic research materials. But he acknowledges that it is not enough to record the professed policies of parties or the formal rules of the electoral system, and he states the hope that this volume will be "a starting point towards a deeper and more intimate study of our party characteristics and processes."

GENE D. OVERSTREET

T. H. SILCOCK. *The Commonwealth Economy in Southeast Asia*. (Duke University Commonwealth-Studies Center Publication No. 10.) Pp. xvii, 259. Durham, N. C.: Duke University Press, 1959. \$4.00.

T. H. Silcock, professor of economics of the University of Malaya, a long-time resident of Singapore, and member of several postwar commissions appointed to investigate economic and political problems of the Federation of Malaya and Singapore, was a natural choice when the Commonwealth-Studies Center of Duke University looked for a lecturer to present the economic problems of Southeast Asia to an American audience. Frequent references to American interests in Southeast Asia and suggestions as to what the United States might do in the area reflect the author's efforts to relate the Commonwealth in Southeast Asia to the United States.

The study encompasses not only the Federation of Malaya and Singapore, but also Hong Kong, North Borneo, Sarawak, and Brunei, a highly diverse group of territories which has in common only the political ties with the British Commonwealth.

The core of the study consists of three chapters entitled "Basic Pattern," "Commonwealth Impact," and "Assessment and Suggestions," which are based on the lectures delivered at Duke University. To these the author has added a chapter on the relationship between Malaya and the European Free Trade Area. A final chapter deals with "The Determinants of Economic Development."

Silcock very skillfully sets the stage by means of a brief description of the economy of the various territories, underlining the salient economic characteristics and bringing out similarities and differences. This is followed by a discussion of the economic impact of the British system of economic development leading a territory from the status of a colony or a protectorate to independence and membership in the Commonwealth. Silcock stresses the absence of a general uniform policy and points out that the successful economic developments in British Southeast Asia have almost all resulted from *ad hoc* political solutions of local problems.

The chapter "Assessment and Suggestions" is especially valuable, despite its brevity, since it deals with the basic development needs of Southeast Asia under such headings as: the basic political requirements; transport; agriculture and fish-

ing industry; industrialization; currency and credit; cultural change and economic development; and finally, research and outside assistance. Many of the observations made in this chapter clearly show Silcock's great familiarity with the local problems of both Malaya and Singapore.

In his final chapter Silcock examines those determinants of economic development which are of special importance in Southeast Asia. He discusses, for example, the problem of capital formation and the need for new enterprise but expresses doubts about the usual argument that the chief requirement for the growth of new enterprises is low taxation. In his opinion, low taxation will hamper the development of a high level of technical education or prevent the building up of adequate transport and power systems without which local enterprises cannot flourish. He also maintains that "it is far more important to build up local enterprise and local capital formation than to create a generally favorable investment climate for the international capitalist" (pp. 190-191).

The author relates capital formation to population growth. He is gloomy about the prospect for a rise in standards of living based on capital formation in Southeast Asia and stresses the importance of avoiding an undue raising of the people's expectations (p. 195).

The little volume contains an annotated reading list of no less than thirty-four pages which will prove invaluable to anyone who is looking for further elaboration on problems which could only be mentioned in passing or were treated rather briefly.

KARL J. PELZER

Professor of Geography
Yale University

ROBERT S. ELEGANT. *The Dragon's Seed: Peking and the Overseas Chinese*. Pp. 319. New York: St. Martin's Press, 1959. \$4.95.

The time is ripe for the appearance of his honest, journalistic appraisal of the overseas Chinese. Most past books on the subject have been sociological surveys, historical analyses, or statistical compilations; now readers can profit from the objective craftsmanship of a working newspaperman.

Mr. Elegant, though only in his early thirties, is equipped by extended Far Eastern experience to interpret the current emotional and political pressures on the Chinese of Southeast Asia and the ominously successful efforts of the Peking government to draw the expatriates into a web of obedience to Maoism. The fact that the author is unencumbered by the paraphernalia of traditional academic research permits him the luxuries of daring speculation, broad generalization, and the vitalization of characters. There are of course hazards as well as benefits in this sort of approach, and the present volume is not without errors and inadequacies.

Elegant is at his weakest when he stumbles into the quagmire of history. It is patently untrue that early colonial Spaniards and Dutchmen were compelled by immediate reasons of self-preservation to massacre the Chinese communities under their flags. It is equally unsound to imply that polygamy and concubinage disappeared in China two centuries ago. Despite the author's counterclaim, the Chinese of nineteenth-century Indonesia had neither the protection of nor access to the European criminal courts. The record establishes that even the last imperial Chinese government came to be vigorously interested in its overseas subjects, though Elegant states that such interest came only after the 1911 republican revolution. The most disturbing of the author's historical inaccuracies is found in his repeated statement that officially directed "millennia of imperialistic tradition" supported the growth of Chinese colonies abroad. It is wrong to equate the tributary system of dynastic times with the expansionism of today. It is similarly incorrect to write that Chinese have always emigrated under the sponsorship of their home governments. Perhaps Elegant does not know that emigration was long a capital offense under Chinese law.

Though the bulk of this book is on Singapore and Malaya and on the relatively wealthy Chinese there, it is possible by extension to make the story relevant to the rest of Southeast Asia. Elegant's reporting skill is demonstrated with particular brilliance in his chapters on the commercial empire and on the pernicious virulence of

Pan-Turkism and Islam in Russia

By **SERGE A. ZENKOVSKY**. This first history of Russia's second largest cultural and linguistic minority examines the early history of the Russian Turks, their nineteenth century cultural revival and the events of the critical first two decades of this century, when secular political ideas began to affect the traditional Islamic patterns. \$6.75

Reform in Sung China

WANG AN-SHIH (1021-1086) AND HIS NEW POLICIES

By **JAMES T. C. LIU**. The study provides new material about Wang An-shih and the strikingly modern "new policies" he introduced into the nearly model state of the 11th-century Northern Sung period. Stressing the development of political theories and institutions, it shows where Wang stood among the diverse strands of Confucian thought and his techniques of government. \$3.50

Studies on the Population of China, 1368-1953

By **PING-TI HO**. In this exhaustive study and interpretation of China's population, Dr. Ho "has put all future workers on this subject in his debt," says John K. Fairbank. Through an intimate knowledge of his subject, and long research, the author has succeeded in clearing up much of the confusion which has always attended interpreting China's multitudes on a historical basis. \$6.00

Predicting Delinquency and Crime

By **SHELDON and ELEANOR GLUECK**. Introduction by Chief Justice Earl Warren. Can potential and probable delinquents be detected at an early age? The results of the author's ten years of research shows that it can—and in this book they present an entire battery of predictive tables for use by school administrators, clinicians, and workers in crime preventive programs. One of the forecasting devices included was hailed by New York's Mayor Robert F. Wagner as "a significant contribution both for the preventive and treatment aspects of this important social problem." \$6.50

the Communist-dominated schools of the overseas Chinese. Toward the end the presentation seems first to grow repetitious and then confused. There is no apparent justification for the insertion of an already familiar description of life in Communist China. Presumably the author has not been in that country, and his readers have access to the flood of travelogues on which his account must be based. Elegant's closing call for a solution of the overseas Chinese problem is commendable, but he is no better prepared than anybody else to promise salvation to twelve to fifteen million insecure people.

A final, mild reproach is necessary. The title of this book is too elaborately contrived to escape derision. It is almost as unpalatable as the author's heading of a chapter on Singapore's night life—"Confucius in the Cabarets."

LEA E. WILLIAMS

Assistant Professor of Political

Science

Brown University

RICHARD K. BEARDSLEY, JOHN W. HALL and ROBERT E. WARD. *Village Japan*. Pp. xv, 498. Chicago: University of Chicago Press, 1959. \$8.75.

This reviewer has had the unusual experience of reading and reviewing this study of rural Japan both before and after publication. It would be interesting to compare his reactions to it both prior to publication and upon reading the published volume. In January 1958, he wrote to a prospective publisher: "This is one of the best village studies I have seen, certainly the best I've seen on Post-war Japan. . . . An attempt is made here to view rural Japan through a single village and to attempt an analysis of the characteristics of rural Japan from several methodological points of view. There is, thus, a considerable balance to the book's contents, unlike most village studies which tend to be primarily ethnological or cultural anthropological, and often deficient in background and perspective. This strength is reflected in the high quality of the three major authors, anthropologist, historian, and political scientist, respectively."

Happily, this initial reaction to an as yet

unpublished manuscript has been substantiated by the finished volume, an extremely handsome product, well illustrated, and remarkably well written, with a marked integrity of organization and substance. This integrity is all the more remarkable since not only do the authors represent their own separate disciplines, but they were assisted in the early preparation of their study by a geographer, J. D. Eyre, and an economist, C. F. Remer, and they had the advice and co-operation of other social scientists associated with the University of Michigan Center at Okayama, Japan. The effective presentation of a world in microcosm that is the village under study demands a special kind of talent, one held in abundance by the authors. In short, this is the authoritative study of a modern Japanese village done with a remarkable sophistication concerning contemporary social science and in a degree of detail that makes it a basic handbook of data concerning rural Japan. The authors are careful to point out that Niiike, their village, is not "typical" of all of rural Japan, but they present their materials in a way that invariably casts light on all Japanese villages wherever they may be.

It is possible, of course, even in a brief review, to criticize some aspects of organization, presentation, or fact, but this would be quibbling. For example, though in general the maps are adequate, Figure 4 unfortunately uses the "hairy caterpillar" type of terrain presentation that was old fashioned forty years ago. However, graphics, including photographs, perspective drawings, and other sketches, are very well done and add substantially to the value of the text. A Glossary and detailed Index also are commendable.

Niiike is presented as an ecological, geographical, economic, and social unit, internally organized to satisfy the wants and aspirations of its inhabitants and in continuous interaction with its settlement peers and with communities higher in the settlement hierarchy in Japan. It is shown to be a unit of social and areal organization in constant change, with roots deep in the past, but influenced by current changes in the Japanese regional and national scene and in evolution toward an as yet dimly perceived variant upon contemporary

themes. New and revealing light is cast on aspects of social organization, political change, man-land relationships, which could only have been generated out of intensive and long-lasting field study. The authors appreciate the fact that as observers they also acted to a degree as participants in village life and no doubt influenced its course of change, but they argue that this should not invalidate most of their observations and conclusions.

Since the field portion of the present study was completed in the mid-1950's Niiike has become an experimental village, the subject of an experiment in mechanization and modernization, sponsored by the Asia Foundation. The new Niiike may, or may not, become very different from the old, but it will provide an almost unique opportunity for a "before and after" study in induced economic change. Although examination of this change is being undertaken by Japanese scholars, it is to be hoped that the authors or their students will not let this opportunity slip by to observe and appraise Niiike's changing character and use their findings to test and modify such models of economic and cultural change as at present exist.

ROBERT C. BONE, JR. *The Dynamics of the Western New Guinea (Irian Barat) Problem.* (Monograph Series.) Pp. x, 170. Ithaca, N. Y.: Cornell University Modern Indonesia Project, 1959. \$1.50.

GERALD S. MARYANOV. *Decentralization in Indonesia as a Political Problem.* Pp. vii, 118. Ithaca, N. Y.: Department of Far Eastern Studies, Cornell University Modern Indonesia Project, 1958. \$1.50.

These two reports add substantially to the reference library which the Modern Indonesia Project is issuing on contemporary problems in Indonesia. The monographs, translations, and papers produced are a continual aid to the area specialist and have made a significant contribution to the study of this young republic. The Interim Report Series, in which these two studies appear, is designed to fill the

gap between general articles and detailed, weighty monographs; as such it has proved an excellent method of circulating the results of research speedily yet in a scholarly form. The papers in this series are thus rather specialized accounts often tentative in nature; but they fill a useful function and must be judged on their own merits.

The two reports under review illustrate the widely differing approaches and products included as interim reports. Both suffer from an over-reliance on quotations at the expense of analysis, yet such a tendency is almost to be expected considering the nature of the reports and the intricacies of politics in Indonesia. Dr. Bone's study of the frustrating problem of Western New Guinea carefully documents the origins of the quarrel between The Netherlands and the Republic of Indonesia, then traces the entanglement of the issue in the internal politics of both countries, and follows it into the arena of international affairs. He has wisely begun his report with a survey of the developmental potentialities of the island stating facts which swiftly puncture any ideas that the controversy concerns economic advantage. Rather the whole question has become enmeshed in national pride and the glorification of a "mission" so that any solution grows more and more distant. This study of the problem is clearly a draft for a more finished version that has already been announced for publication. The final product will undoubtedly condense many of the unnecessarily long quotations while providing the author with an opportunity to bring his material up to date and to deal more fully with the 1957-58 exodus of Dutch citizens from Indonesia as a result of the West Irian campaign which followed the defeat of the Indonesian resolution in the United Nations.

Dr. Maryanov's report, while also too liberally seasoned with quotations, is a discursive account concerning the meaning of the concept of decentralization to national political party leaders in Indonesia as evidenced by their speeches in Parliament. This is an illusive subject, particularly in a country characterized by complexities and vaguenesses. No one is more aware of the difficulties inherent in his topic than Maryanov himself, but repetitious apologies

for the work throughout the paper tend to detract from the merit of the material presented. Maryanov shows how the ideas of democratizing local government were incorporated in the concept of decentralization by most politicians; that this identification of two separate questions only further muddled already confusing demands is not sufficiently stressed, however. Recent events in Indonesia, as a result of the return to the 1945 Constitution, have not led to increased decentralization but to a curtailment of democracy at the lower levels. The basic disagreements over the powers and roles of the regional councils and the regional heads, which Maryanov amply illustrates, begged for the legal clarification which has been given them under the most recent regulations. The very inconclusiveness of Maryanov's paper indicates the obscurity of the problem; it is to be hoped that he too will write more fully on this fascinating subject at some early date.

IRENE TINKER

Berkeley, California

KEMAL H. KARPAT. *Turkey's Politics: The Transition to a Multi-Party System.* Pp. xiii, 522. Princeton, N. J.: Princeton University Press, 1959. \$7.50.

Turkey's reputation as the first Muslim and "Eastern" country to achieve national independence and an advanced stage of democratic government had received popular acceptance in the West not long before reports of her economic difficulties and of her present Prime Minister's apparent abuse of populist and liberal principles raised doubts whether her success were real or illusory. Professor Karpas's history of developments and analysis of the political situation in his country will reassure most readers, although his presentation is so fair and so comprehensive that doubters could quote him to their own comfort.

Karpas utilizes Turkish and foreign sources—both wherever available—on each point covered. His Part I, tracing reform efforts from Ottoman beginnings to World War II, conceivably is the best brief history of this period in any language. Then he proceeds to elucidate the problems and

processes of completing what Turkey's first President, Atatürk, had begun: the transition from personal and party dictatorship, which had replaced the Sultanate, to the dynamism of a truly multiparty system. Without coloring shortcomings and backslidings of Atatürk's successors, our author gives full and due credit to İnönü, the second President, for his leadership in insisting upon unrigged elections in 1950 and for fostering reasonableness after his People's party, consequently, had been reduced to the role of Opposition. Although Premier Menderes receives possibly better marks for his previctory policies than for performance in office, to the Demokrat parti is credited economic reformation essential to progressing democracy. For the stabilization of democracy in Turkey, Karpas attributes importance both to American aid, encouraging consonance with American principles, and to acute awareness of the Communist alternative.

This reviewer wishes the author had described how isolation of villages from Ottoman administrative centers necessitated local self-government which conditioned the peasants for national suffrage. Other criticisms are so minor as to be carping. Acquaintance with the data and analyses presented by Karpas is essential to all students of Turkish history and affairs, of the Near East, and of nationalism. They may also perceive Turkish democracy's community of dilemmas and distress with those of governments and societies of older states, for example, the United States. They will appreciate Karpas as an able political scientist, competent to hold positions of Cabinet rank; and may hope that his expatriation is exceedingly temporary, for Turkey's sake, as well as for his future contributions to our knowledge.

DONALD E. WEBSTER

Research Lecturer
Blaisdell Institute
Claremont

NEVILL BARBOUR (Ed.). *A Survey of North West Africa (The Maghrib).* Pp. xi, 406. New York: Oxford University Press under the auspices of the Royal Institute of International Affairs, 1959. \$5.60.

As indicated by the title, this book is a general survey of the *Maghrib*, or North Africa, though the term *Maghrib* has been broadened in this instance to include certain territories now claimed by Morocco but which ordinarily are regarded as belonging to sub-Saharan Africa. The area covered, therefore, includes not only Morocco, Algeria, Tunisia, and Libya, but also Spanish West Africa and Mauretania.

Though many subjects are touched—such as geography, demography, social and economic conditions—most of the space in this book is devoted to political history. Historical events, however, are interpreted in a way that betrays an excessive concern with contemporary politics. The results, while not always illuminating, are sometimes amusing. To cite but one example: in the early part of the book (pp. 10-14) there is a discussion of the roles of two Numidian kings, Massinissa and his grandson Jugurtha, both well known to students of ancient history. Massinissa, it may be briefly recalled, fought as Rome's ally in the war against Carthage, and Jugurtha later unsuccessfully defied Rome's military power. In this book one reads that "we may be sure . . . that a certain nationalist sentiment lay behind the activities of the Numidian kings Massinissa and Jugurtha" (p. 14). This is a startling statement. One would have thought, at least until now, that nationalism was a relatively modern phenomenon. But even more startling is the statement that follows, since one then learns that the part played by nationalism in ancient Numidia "is not brought out in our historical sources; being entirely Roman, these credit the Numidian kings with no motive other than personal ambition."

To the advanced student of North African affairs, who may be looking for special material to be used in a particular research project, this book has little to offer. The factual information it contains is of a general and fairly elementary nature so that he is more than likely to be already acquainted with it. Such a student will do well to turn to other sources, Arabic, French, Spanish, and Italian. The beginner, on the other hand, particularly if his command of foreign languages is poor, will

find it quite useful as an introduction. Other works in English may go more deeply into certain aspects of that complex world which is the *Maghrib*, but none can be found today which is as comprehensive, as simply written, and as up to date as this one.

ECONOMICS

HUGH G. J. AITKEN (Ed.). *The State and Economic Growth*. Papers of a Conference Held on October 11-13, 1956, under the Auspices of the Committee on Economic Growth. Pp. x, 389. New York: Social Science Research Council, 1959. \$3.75.

Ten of the thirteen papers in this volume are historical studies of the role played by the state in economic growth in various countries and at various times. The countries studied are the United States, Australia, Canada, Russia, Manchuria, Germany, France, Switzerland, Turkey, and the countries of Eastern Europe. The periods vary widely, covering different segments of the nineteenth and twentieth centuries. The unit of observation for most of the studies is the nation, but the papers concerned with France and Germany have a smaller focus. In addition to the country studies, the volume contains two papers of a theoretical nature and a final essay of summary and interpretation.

The intention of those who organized the volume was to make a series of parallel analyses of the state's role in economic development in different times and circumstances by methods which would permit comparisons to be made and conclusions of general applicability to be drawn. The desired results were not achieved. As Professor Kuznets says in a brief Foreword, "The conference that gave rise to the present volume resulted from prolonged discussion within the committee (on Economic Growth) regarding the feasibility of establishing an adequate basis for empirical

study of the influence of the state on economic growth. It will be evident from the contents of the volume that this basis is not yet established."

Indeed, it could be argued that the main contribution of the book is negative. Most students of economic development would guess that there is much to be learned by using a common approach to the historical analysis of growth in different countries. The lesson of this book is that to do this successfully will require a stronger analytical framework than that used here.

Countries were selected for study in the present case because they were thought to represent widely varying types according to three criteria: "Whether economic growth had been principally expansionist, through exploitation of unutilized resources, or intrinsic, through more intensive utilization of resources already in use; whether the economy was essentially self-contained and hence dominant, or highly dependent on foreign markets and resources and hence non-dominant or satellitic; and whether economic growth was autonomous as a result of decisions by private agencies in pursuit of private goals, or induced as a result of decisions by the same agencies that made political decisions." The authors of the various papers for the most part tried to apply this schema in their studies. The result was to demonstrate, as Professor Spengler says in his summary essay, that the schema "has little predictive and only limited explanatory value."

It would be wrong to conclude, however, that the book has only negative usefulness. Several of the papers, notably those by Butlin on Australia, Aitken on Canada, and Burgin on Switzerland, offer much valuable information and a number of stimulating ideas. And two of the papers seem to this reviewer to be very good indeed and to point the way toward more effective future research on the significance of state action in promoting economic progress. The first of these is E. P. Reubens' study of economic development in Manchuria, 1860-1940. Reubens explicitly discards the schema mentioned earlier and substitutes what he calls a "process model" as the theoretical foundation for his study. On the evidence of its application here, one

would hope that this model will be tested further. The second is a short piece by W. N. Parker contrasting the very different responses in France and Germany to similar economic opportunities in ore mining in the late nineteenth century—incidentally, the only attempt at straightforward comparison in the book. Parker's paper seems to this nonexpert reviewer to be a model of the comparative method: the focus of the comparison is sharp and clear, the limits to the meaning of the conclusions are carefully stressed, and the results are highly illuminating.

DAVID E. BELL

Lecturer on Economics
Harvard University

ROLF SANNWALD and JACQUES STOHLER. *Economic Integration: Theoretical Assumptions and Consequences of European Unification*. Translated from the Swiss edition. Pp. xvi, 260. Princeton, N. J.: Princeton University Press, 1959. \$5.00.

The authors advance the following political and economic reasons for an integration of Europe: avoiding internal conflicts, assuming membership in the club of the World Powers, and getting rid of the economic stagnation which has plagued Europe since 1913. They are convinced that the European economy would become more efficient if it followed the example of the United States. The larger economic unit would help in securing more specialization, mass production, an increased disposition to innovate, a higher rate of business mortality and consequent mergers under the impact of market forces, less dependence on foreign trade, and a reduction in the distortions caused by the economic instability of trading partners.

Given these aims and assumptions the next question is: Why integration and not free trade? Why not follow people like Röpke and advocate a complete return to free trade as practiced before 1914? The authors choose economic integration for two reasons. First, the abstract and quite vulnerable principle of free trade will not convince the European countries of the necessity for closer co-operation. Second, mere scrapping of protectionism in inter-

national trade will not bring Europe back to the old-time type of free trade because of the increased participation of governments in economic life. The results of freeing trade depend to a large extent on internal economic measures. Hence, Sannwald and Stohler call for the co-ordination and unification of economic and social policies along with the removal of artificial barriers to the operation of free trade. This position implies the rejection of the concept of free trade area as insufficient to achieve the desired goals.

The analytical part of the book is devoted to a discussion of currency and stabilization policies, fiscal policy, and factor mobility. The approach is taxonomic. There is no new substantial contribution to economic analysis; the authors offer a useful and orderly presentation of theory drawn from various sources. As an indication of the sources which were utilized, the Index contains 27 references to Meade, 9 to Tinbergen, 8 to Viner, and 6 to Keynes. The authors feel that the choice of monetary and fiscal policies must satisfy the requirements of internal balance, of external balance between the members of the union and their external balance vis-à-vis the rest of the world. They feel, after Meade, that the method of variable exchange rates is the most suitable, especially if there were to be a European monetary fund. Common currency, they argue cogently, would require very close links between the banking systems of member countries as well as the existence of a common authority dealing with the stabilization of the economies of member countries, and these conditions would be difficult to bring about.

The chapter on fiscal policy explains the difficulties due to the fact that in various countries taxes on production are levied on its different stages. Besides, by shifting the tax incidence from a production to a consumption basis the governments can affect the intra-union trade. The authors suggest that under the conditions prevailing in Western Europe the proper solution is to adjust taxes at the stages on which they are levied and not to unify the tax systems.

As to factor mobility, they agree that, in

theory, mobility is not necessary to make optimum use of resources. As, however, many assumptions usually made in the theoretical models do not obtain in practice, free trade should be supplemented by some factor mobility. This mobility must be limited on practical grounds; it may be in conflict with the policies for stabilization; it may be caused by the differences in the policies for income redistribution which do not necessarily reflect the incentives based on optimal allocation of resources.

The authors have marshaled theoretical contributions of many writers to show that to secure free trade between modern advanced societies it is necessary to co-ordinate monetary, fiscal, wage, and price policies. The final problem is how to make sure that for the sake of freer international trade we shall not have to accept as permanent the powerful instruments of governmental and intergovernmental intervention developed and perfected in the creative period of economic union.

STANISLAW WASOWSKI

Assistant Professor of Economics
Georgetown University

CHARLTON OGBURN. *Economic Plan and Action: Recent American Developments*. Pp. xiii, 287. New York: Harper & Brothers, 1959. \$4.75.

The book is useful as a summary of reports issued by the National Planning Association. It is designed to support and spread the views of certain of its officers and employees concerning leading public policy issues, 1937-1957: Foreign aid, full employment, labor relations, farm aid, education, and so forth.

In general, it favors consumer spending, "growth" and larger incomes for the masses including "supplementary incomes," central government control resting on international requirements, creeping inflation, "democracy," and progressive taxation (pp. 161-162).

To me, the best points of the book seem to be: (1) Classification of different kinds of "foreign aid"; (2) list of weaknesses of such foreign aid, particularly to the underdeveloped countries (31 f., 193); importance of supranational trade groups, as in Western Europe and underdeveloped areas;

bases for effective collective bargaining; and the concept of "corporate managers" who are conscious of responsibility to corporations as "permanent institutions" (p. 152).

The chief shortcomings seem to be: (1) There is no discussion of labor monopoly as a factor affecting labor leader attitudes in collective bargaining. The treatment of organized labor is largely influenced by James B. Carey and C. S. Golden. (2) There is no discussion of population growth as a problem needing control, outside of Asia and some backward areas. (3) There is little if any discussion of credit problems or of currency inflation as affecting confidence in the dollar.

In fact, the "recency" of the work is clouded by the passing in 1954 of "dollar shortages" and of our favorable balance of international payments.

Beneath the rather unsatisfying or inconclusive treatment, I think, lies a confused and conflicting philosophy of values. The advocacy of materialistic means conflicts with idealistic ends. The basis of most of the planning in the book is materialistic. It centers in "economic development" or material growth. It emphasizes "natural resources." It pays no attention to innate differences among individuals at least in the United States. It relies on the "free play of self reliant individuals" (p. 165).

But many references are made to "moral purposes," "moral missions," and "moral inspirations." Even "spiritual problems" are mentioned. Institutions are emphasized in some cases. Innate differences among individuals are held to be important in underdeveloped countries. In general, the author relies heavily upon government leadership and control perhaps guided by certain social planners.

This confusion appears in the mixing of economic values and political values: "Economic growth" and "national security" are said to go together and involve large-scale organization in both.

Other questions suggested are: How can one rely so much on government, and at the same time point out the inefficiency and blunders of government (pp. 25, 27, and 33)? How can one argue (p. 252) that high incomes and prosperity are in

general a preventive of communism, after one has said (p. 32) that in underdeveloped countries this is not so?

LEWIS H. HANEY

Port Washington, New York

A. J. YOUNGSON. *Possibilities of Economic Progress*. Pp. x, 325. New York: Cambridge University Press, 1959. \$6.00.

The author of this timely book pursues three roads of analysis: the theoretical, the historical, and the political.

The first part offers a fragmentary philosophy of the subject. The author wrestles with the elusive idea of economic progress and tries—of course, in vain—to define it in contradistinction to economic expansion and economic growth and to statistical concepts such as increase in aggregate real income, total real output, gross national product, and net national income. He dips also into the abyss of causality by indicating the causal factors to be looked for by the empirical researcher. In spite of his philosophical, economic, and statistical scruples, he eventually settles on identifying economic progress with measurable material improvements and therefrom concludes that investment or, more specifically, net investment (p. 53) is an appropriate index of economic progress. Apparently he is captivated by the argument that the investment approach concentrates on what is "most manageable" and, within limits, measurable (p. 64). The limitations of such a pragmatic view are too well known to need further elaboration.

Some results of the theoretical inquiry are tested in the second or historical part which concentrates on one aspect of the crucial phenomenon: the acceleration of economic progress. To prove, disprove, or modify his basic conceptions, the author examines so-called "historical episodes" in four nations at significant stages of their development: Great Britain, 1750-1800; Sweden, 1850-80; Denmark, 1865-1900; and the Southern United States, 1929-54. The wisdom of this selection is doubtful. Can we generalize from such unique social and economic trends as prevailed during England's Industrial Revolution or from those during the struggle of the United

States with the Great Depression and the problems of World War II and its aftermath? Can we regard the experience of the two neighboring countries Sweden and Denmark as representative?

The inadequacy of the four case studies may finally explain why the third and last part of the book leads to another anticlimax. Here the author admits that the "lessons of history" cannot be applied by the economist. This task must be left to the administrator and the politician. Giving advice is "a matter of personal judgment" (p. 308).

Despite its shortcomings, however, the book is worth reading. Though it fails to give what its title suggests, a truly general view of the possibilities of economic progress, and though its conclusions are relativistic and tentative, it will be welcomed by all readers who value carefully assembled factual information and a synopsis of the intellectual hurdles still to be surmounted.

FRITZ KARL MANN

Professor of Economics, Emeritus
American University

JAMES S. DUESENBERRY. *Business Cycles and Economic Growth*. Pp. xi, 341. New York: McGraw-Hill Book Company, 1958. \$6.50.

Duesenberry lacks, he says disarmingly, the strength of mind to ignore the complications of reality. He also has a taste for prolonged chains of reasoning. Hence this book diverges both from the abstractions of Harrod and Hicks and the statistics of Burns and Mitchell. Obstinate and persistently, Duesenberry tries to put the realities and the theories side by side. Often this gives an exciting sense of discovery. It also blurs the simple lines of abstract theory: cycles are not left in a form that can be readily visualized.

Duesenberry criticizes the multiplier-accelerator theories of the cycle—Hicks, Goodwin, Harrod, Kaldor—as exaggerating both the rate of growth that can be obtained by the interaction of income, investment, and capital stock, and the instability of the income movements resulting from that interaction. He also criticizes Han-

sen's theory as exaggerating the importance of autonomous investment and underestimating the importance of the interactions of income, investment, and capital stocks (Ch. 3). He thinks that reasoning and fact coincide in indicating that depressions are of two sharply different kinds. One kind occurs when the structure of the economy is such that demand tends to fall behind the growth of output. The other results from no chronic deficiency of the system, but only because adverse shocks strike the economy: monetary crises, speculative collapses, trade shifts, and the like. If income falls below a certain level, a point of unstable equilibrium (p. 206), recovery will not come when the shock is past but only after a long period of capital decumulation or a favorable change in the economic structure. There is evidence (Ch. 12) that the United States economy was in 1929 more vulnerable to shock than it had been earlier in the nineteenth century.

In a book where there is so much original thinking, it is no serious criticism to note that there are patches where presentation and/or ideas seem confused (pp. 154, 261, 168, 208). The reasoning is often inherently involved: this is a book for the graduate student well advanced in his training, and it will be stimulating to the specialist—it is not, as the editor says, for adult education or for the informed general reader. It is too hard and too detailed. The analysis is usually government-held and constant which makes it more abstract than it might be. Would it not be as reasonable an assumption, as many advanced for the private economy, to make the government's lagged propensity to spend or to tax a function of income?

Duesenberry's continued amalgam of theory and fact is something new. Much of his treatment seems to interpret our cycle experience better than it has been before. The presentation is attractively modest. No serious future treatment of cycles can fail to take the ideas he expresses here into account.

THEODORE MORGAN

Professor of Economics
University of Wisconsin

EDGAR LAWRENCE SMITH. *Common Stocks and Business Cycles*. Pp. 226. New York: The William-Frederick Press, 1959. \$10.00.

In 1924 Mr. Smith published his *Common Stocks as Long-Term Investments*; in 1939 his *Tides in the Affairs of Men*. In this book he strives to meet the criticisms of those volumes and makes visual comparisons to date of assorted series of recurring changes in sunspots, rainfall, temperature, mass psychology, pig iron production, and selected common stock averages, mostly since 1871, but with a glance backward as far as John Law's banking and stock adventures in 1720. His preliminary statement of his solar-economic theory runs as follows: "(1) All changes in quantity, content, and angle of solar radiation [emanation] reaching the earth's atmosphere cause relative changes in this atmosphere, and hence in the environment of man; (2) A preponderance of these atmospheric changes are recorded proportionately in changing types of weather, over shorter and longer periods, on a world-wide basis, and are recorded in relative weather data at widely separated weather stations; (3) The activities, health, and mental outlook of populations are affected by changes in environmental conditions, and these effects are measureable in records of man's behavior, notably in certain basic economic areas; (4) Because of these relationships, at different points on the earth's surface it is possible to find weather data that can be used as an index of probable human response to total environmental change" (p. 133).

His use of statistics and logic is bold. Thus, for example, without aid of net correlation coefficient or mathematical estimates of error, he finds similar graphical fluctuations in "(1) the rate of change in average rainfall at Bern, Switzerland, and (2) the change in the rate of change in the average New York bank clearings and debits one year later" (p. 117). In this way he compares "(1) New York weather data (measured by monthly deviations in barometric range), (2) physical change in a number of people in Chicago, hence change probably in many others, if not in

all the more sensitive and emotional individuals involved, (3) psychological change or change in attitude toward the same or similar economic premises and (4) consequent changes in the price level of representative stocks on the New York Stock exchange" (p. 104).

Curves on stock prices plotted by decade show ten-year cycles which when compared since 1871, he contends, show that in years ending in 5 stock prices are consistently strong, also years ending in 8 and part of 9. Prices of stocks in years ending in 2, 4, and 6 tend to be firm; those in years ending in 1 and 3 are weak, and in 7 and 0 weakest. Moreover he finds a long-term 89½ year swing, as witness the breaking in France and England of the Mississippi and South Sea bubbles in September 1720, followed 89 years and 4 months later, in February 1809, by the collapse of bank stocks in Boston, and on its heels the closing of the United States Bank; at the center of each being a distrust in the central bank.

Mr. Smith concedes that it is worth emphasizing that no single approach should be the basis for important investment decisions including timing of transactions. He calls for "as many confirmatory studies as possible," electro-magnetic, meteorological, pathological, psychological, and economic.

One can emphatically agree with Mr. Smith, however, that "it is not surprising that economists still reject the evidence" (p. 104).

THEODORE J. KREPS

Professor of Business Economics
Graduate School of Business
Stanford University

SOCIOLOGY AND PSYCHOLOGY

WINSTON EHRMANN. *Premarital Dating Behavior*. Pp. xvii, 316. New York: Henry Holt and Company, 1959. \$6.00.

This admirable study is both honest and modest. Honest because it confesses all the procedural errors made and makes no attempt to give the illusion that there was an elegant design from the beginning.

Modest because it makes no great pretensions; it recognizes that the time, 1947-1953, the place, University of Florida, and the circumstances, the changeover to co-education, under which the data were collected, influenced the results. And anyone who has ever confronted the literally yards of figures that an IBM machine spawns can only be awed by the skill with which the author has mastered his materials. He must have wrestled manfully with his data, long and weary hours, to have emerged so completely in control. There is no endless procession of tables—these are available from the publishers in a separate *Supplement*—but rather meaningful summaries of complex data that the reader can digest as part of the text.

One major contribution of this study—though Ehrmann warns us of its limitations (pp. 278-279)—is the six-stage scale of intimacy which ranges from no physical contact or only holding hands to sexual intercourse. Now that he has given us this scale it seems remarkable no one has arrived at it sooner. It is superior to the old categories of light and heavy petting and illuminates the fact that the critical point in erotic play is between "hugging and kissing" and fondling of the covered breast and not, as he had anticipated, between fondling the covered and the bare breast. Young women seem to recognize or intuit that they are in control only until the genital responses are touched off by the breast-trigger; then, they flash the red light.

After detailed and comprehensive comparisons of male and female sexual behavior, codes, and cultures, Ehrmann feels that his most important empirical finding was the fact that female sexuality was primarily and profoundly related to being in love and to going steady whereas the same was not true of males (p. 269). He feels his most single theoretical contribution is the definition and analysis of sexual attitudes and behavior in terms of (1) his scale, (2) sex codes, and (3) standards of conduct. Omission of any one may, he points out, give fallacious results. He hopes his findings may make a contribution to programs for sex education, although he warns against the mistaken notion that sci-

entific data can solve problems of sexuality. He makes a plea for a tolerant and permissive attitude toward research on sexual behavior.

The compassion of the author shows throughout. Here is a man who has not only scientific curiosity about young people but also deep understanding of their problems. I believe him when he states his conviction that the young people he questioned and interviewed were completely candid with him. Why wouldn't they be? They probably got from him a great deal more than he got from them. In any event, clinicians, teachers, and students of American society will find this a valuable contribution to their thinking.

There is an Introduction by Margaret Mead and a Postscript on "The Sociological Significance of this Research" by Clifford Kirkpatrick.

JESSIE BERNARD

Visiting Professor
Princeton University

MICHAEL ARGYLE. *Religious Behavior*. Pp. xii, 196. Glencoe, Ill.: Free Press, 1959. \$5.00.

The author describes his work as a "study in social psychology of religion in Britain and America since 1900" (p. xi). He has collected a considerable amount of empirical data dealing with such aspects of religious behavior as age, sex differences, personality, as well as the relationship between religion and mental disorder, the impact of religion on sex and marriage, and theories of religious behavior and beliefs. Because of the great breadth of the subject material and the relative brevity of volume, it is probably most useful as a reference.

Some findings should interest the clergy such as the statement that religious conversions occur most frequently in adolescence and that some persons are converted a number of times. The gradual conversion is more permanent than the sudden, violent one. Adolescents show grave concern over sin, heaven, hell, science versus religion, and what happens after death.

Another conclusion based on studies is that Protestants in the United States are more likely to vote republican than Catholics even when social class is held constant.

However, voting in the 1952 presidential election may raise some questions about the present validity of this statement. Furthermore, urban-rural differences are important. Urbanites are more likely to be democrats than republicans, and most Catholics are urban dwellers. This factor was not mentioned.

His summary of findings on racial and ethnic prejudice will interest social scientists. Regular and devout church members are less likely to be prejudiced than non-religious persons, but Catholics, it is stated, are most prejudiced, followed by Protestants. The author also reports that neuroses among Jews are two and a half times as frequent as among Catholics and Protestants. Since it is just about impossible to get any accurate statistics on the incidence of neuroses, this finding should be viewed with caution. It may well be true on the basis of diagnoses, but how many undiagnosed neurotics exist is anyone's guess.

Some of the studies on which the author's data are based go back thirty or more years. These indicate the need for replication of such research in the nineteen sixties. Neither has the author been very critical of the studies he has assembled. As pointed out above, the major value of this book will be as a reference to many studies made on religious behavior in the United States and England since the opening of the twentieth century. But for a careful evaluation of methodology, sampling and validity of the studies, the reader will still find it advisable to consult the original research.

MAURICE HALBWACHS. *The Psychology of Social Class*. Translated by Claire Delavenay. Pp. xvii, 142. Glencoe, Ill.: Free Press, 1959. \$4.00.

Maurice Halbwachs, renowned French sociologist, died in 1945 at Buchenwald, a tragic victim of the Nazi holocaust. One would like to report that the contents of this small volume published first in Brussels in 1938 and later in 1955 in a posthumous Paris edition, prior to the present American edition, will augment his reputation. Regrettably, this reviewer must de-

clare a contrary opinion. The substance of the work is a series of "thin" essays on social-psychological tendencies alleged to be characteristic of four major occupational groups indigenous to Western civilization: peasants, "entrepreneurs and bourgeoisie," industrial workers, and what Halbwachs refers to as the "lower middle or intermediate" class composed of the subgroups of "artisans and small tradesmen," clerical workers in private industry, and "the lower grades of the civil service." Some historical trends are discussed. Documentation is sporadic and plausible but unsupported generalizations abound. Some approach banality. For instance, peasants are emotionally attached to their land, entrepreneurs are individualistic and competitive, lower civil servants are bureaucratic, dominated by routine, and status conscious, and so on. The specialist in social stratification will find little or nothing new in this volume, and others are advised to seek elsewhere for a more effective discussion of the topics considered. In short, it is difficult to understand why Halbwachs published these essays, or why they were later reissued.

A touching tribute to the author and his life and work by Georges Friedmann, originally published in 1946, has been inserted as a Foreword, and a Bibliography of Halbwachs' writings is appended.

AUGUST B. HOLLINGSHEAD and FREDRICK C. REDLICH. *Social Class and Mental Illness: A Community Study*. Pp. ix, 442. New York: John Wiley & Sons, 1958. \$7.50.

The purpose of the study reported in this volume was to determine the relationship between mental illness and social class, and the bearing that the social status of a mentally ill person has on the kind and amount of treatment he receives for his illness. The data of the study are from the greater New Haven community. Most of the analysis presented bears on the prevalence of mental illness in the community during the period June 1, 1950 to December 1, 1950. Thus, the rates com-

puted reflect not only new cases developing during the period but old cases still under treatment during the period. Some incidence rates, new cases appearing during the period, are presented, but the number of new cases in the higher social class levels is so small that conclusions based on them need to be made with great caution. This is unfortunate because it means that the problem of greatest importance, the extent to which class membership generates mental illness, cannot be answered satisfactorily with the data of the study.

However, the data clearly permit the conclusion that the prevalence of mental illness is *inversely* related to class position, that is, the lower the class the higher the prevalence. For the psychoses, the prevalence is much greater in the lower classes than in the middle and upper classes. To a marked extent the greater prevalence of psychoses in the lower classes is due to the fact that they tend to remain in treatment or custodial care for much longer periods than do higher status patients. But even when this factor is taken into account, the contention that psychoses rates are higher for persons of lower social status than for those of higher status is supported by the data. When the neuroses are considered separately, the prevalence of treated neuroses is higher for the upper than the lower classes. However, this may only be a reflection of the fact that a higher proportion of upper-class than lower-class neurotics ordinarily seek treatment.

On the second purpose of the study, it is clear from the data that there is a close relationship between the patient's social class and the treatment he receives. In general, upper-class patients receive psychotherapeutic treatment while lower-class patients are treated by means of organic therapies. Moreover, lower-class psychotic patients tend to remain in treatment or custodial care for much longer periods than do patients of higher status. The need for more effective treatment of lower-class patients is thought by the authors to be one of the serious challenges facing psychiatry today.

Despite methodological limitations of the study, this book provides the most comprehensive knowledge about the relationship

between social class and mental illness yet available. It merits the careful attention of all practitioners in the field of mental health as well as students of social behavior.

WILLIAM H. SEWELL

Behavioral Sciences
Stanford, California

DONALD J. BOGUE. *The Population of the United States*. Pp. xix, 873. Glencoe, Ill.: Free Press, 1959. \$17.50.

This is perhaps the most comprehensive book ever written on population problems and trends in the United States. Some attention is given to earlier periods, but the chief emphasis is on trends since 1940. This concentration on recent changes has advantages, but the book appears on the eve of the 1960 census, and its value as a current reference will soon be greatly reduced.

After discussing the growth and distribution of the population, the author describes various types of composition: color, nativity, sex, age, occupation, industry, income, and religion. He devotes several chapters to the components of population change, fertility, mortality, and migration, and concludes the book with brief descriptions of the demography of Alaska and Hawaii and a discussion of the implications of future population trends. The chapter on fertility, contributed by Wilson H. Grabill, is the only one not written by Bogue.

Having used some of the materials in this book in his classes at the University of Chicago, the author apparently tries in part to meet the needs of teachers and professional demographers. However, the author emphasizes that an important purpose of this book is to tell the intelligent layman about the practical importance and varied ramifications of population trends. Having rubbed elbows with regional and city planners, the author has the gift of putting technical things into the business man's language, and he uses it.

Being a sociologist as well as a demographer, the author is perhaps most deeply concerned about the impact of demographic changes on social problems. To city fathers and social workers he may give some en-

lightenment but not satisfaction when he says "the nation can look forward to a 50 per cent increase in the number of juvenile delinquents in the twelve years from 1958 to 1970, simply on the basis of the increased number of children who will be living at the ages when delinquency occurs. Actually the great urbanization movement that has brought many thousands of Negro youngsters into a strange and disorganizing environment may result in an even greater increase" (p. 787).

In a volume the size of the present one, some errors, typographical or otherwise, are almost inevitable. The couples in the Indianapolis Study were erroneously described as having been married between 1920 and 1929 instead of 1927 and 1929 (p. 312). Of much more consequence is an error in the "billion" column of a set of world population figures. Thus, in a small table (p. 788), the estimated world population for 1950 appears as 1,497 million instead of 2,497 million. A regrettable error in the other direction is the appearance of the term "millions" instead of the correct term "thousands" at the head of the columns of a table giving projected populations for 1960 and 1970 for the United States and other countries (p. 790).

In view of the recent public interest in population and birth control, the author's efforts to write for the laymen may bear fruit. In the reviewer's judgment, however, the book will find its main use and value in college libraries and classrooms rather than the meeting places of book clubs or on the desks of the organization men.

RONALD FREEDMAN, PASCAL K. WHELPTON, and ARTHUR A. CAMPBELL. *Family Planning, Sterility and Population Growth*. Pp. xi, 515. New York: McGraw-Hill Book Company, 1959. \$9.50.

The research so lucidly reported in this book is a major substantive contribution to our knowledge of the social-demographic characteristics of the American population. A national probability sample, 2,713 married white women aged 18 to 39, was surveyed in 1955 with a variety of objectives.

Ultimately, one purpose is to improve population forecasts by securing American women's own estimates of their future fertility. In one sense this protects the authors. Should their forecasts be in error the responsibility lies with the respondents' deviations from expected behavior. The data on expected fertility are artfully woven into the "component-cohort" technique of projection and, at the end of the report, estimates of the population by age and sex are provided for the rest of this century.

Even should these forecasts go awry, the other equally important accomplishments of this research will survive. One primary objective was to secure estimates of parameters not previously known on a nationwide basis, relating to such characteristics as sterility, fertility rates by religion, the practice of contraception including methods used, attitudes toward family planning, and fertility-planning success. It is inevitable that this book will be the authoritative source of such bound-to-be quoted findings as: one third of all American couples have fecundity impairments; one tenth cannot have children in the future; voluntary childlessness has all but vanished from the American scene; fertility planning is widespread, and so forth.

In addition to the population forecasts of practical importance and the point estimates of scientific interest produced by this research, the reader is also led through a limited but detailed analysis of differential fertility. The upshot of the analysis is a corroboration of other research: Americans are becoming increasingly homogeneous in their fertility behavior as well as in other respects. Traditional factors such as socioeconomic and rural-urban factors no longer differentiate fertility as they once did. Aside from participation of women in the labor force, only religious affiliation seems to make a difference. But even here, the higher fertility of Catholics is a relative consideration. The large majority of all wives expect two, three, or four children. The implication for understanding the post-war "baby boom" that is still very much with us is that a rise in completed family size to an estimated completed average of 3.0 children for women born during 1931-35 is being accomplished by shifts within

the 2 to 4 range as well as the diminution of smaller sized families but not by a return to the large families of earlier years. Some evidence is mounting, however, that five-child families are becoming more prevalent and within a few more years the proportions with six children will probably also increase. If this happens the definition of "large" families may be problematic.

The authors also include a very sophisticated analysis of the effects on period rates of shifts in the patterns of child-spacing. On the whole, this volume embodies the most refined empirical techniques of population forecasting.

Professors Freedman, Whelpton, and Campbell are to be heartily congratulated for their work. It is good news indeed to learn that another survey of a similar sample will be conducted in 1960, five years after the first.

ELI GINZBERG and others. *The Ineffective Soldier, Vol. I: The Lost Divisions. Lessons for Management and the Nation.* Pp. xx, 225. New York: Columbia University Press, 1959. \$6.00.

ELI GINZBERG and others. *The Ineffective Soldier, Vol. II: Breakdown and Recovery. Lessons for Management and the Nation.* Pp. xvii, 284. New York: Columbia University Press, 1959. \$6.00.

ELI GINZBERG and others. *The Ineffective Soldier, Vol. III: Patterns of Performance. Lessons for Management and the Nation.* Pp. xix, 340. New York: Columbia University Press, 1959. \$6.00.

These three volumes comprise a comprehensive review and evaluation of the manpower selection and assignment procedures of the ground and air forces during World War II. They are the final reports of the "Conservation of Human Resources" project established at Columbia University under the directorship of Dr. Eli Ginzberg and represent the results of an elaborate research program carried out from 1950 to 1958 by a team of specialists representing psychiatry, personnel research, social psychology, history, and statistics.

While the study covers ground well known to specialists, it is of importance because it supplies definitive documentation. The major conclusion is that psychiatric screening did not operate effectively to meet the personnel requirements of the armed forces in World War II. The armed forces sought to develop a procedure which would eliminate ineffective soldiers and thereby facilitate the efficiency of combat units. Screening for ineffective soldiers, those who suffered psychological disabilities, illiteracy, and general inaptitude, employed the stringent criterion that all recruits should be potentially combat soldiers. In addition, the manpower planners operated as if the sources of manpower were unlimited and only later in the war modified their requirements.

As a result, many persons were excluded from military service, even though there would have been suitable occupational specialties for them within the military establishment. The screening system was defective because of shortages of trained personnel, pressure of the crisis, and lack of clarity of standards. With the exception of screening psychotics, the psychological standards were unable to distinguish between those who would and those who would not perform effectively in combat.

The authors seek to demonstrate that such screening procedures have inherent limitations for the military establishment and for industrial organizations. They argue that the effectiveness of a soldier is a function of his psychological predispositions, environmental stress, and the practices of management. Since psychological screening only measures one dimension, and this incompletely, it is at best a partial approach. Instead, they emphasize the need for training, placement, and organizational practices which will maximize the effectiveness of borderline personnel. This study is another example, and clearly the most comprehensive, in the growing body of literature which seeks to place psychiatric and psychological testing in its proper perspective as a device of administrative management.

ROBERT K. MERTON, GEORGE G. READER and PATRICIA L. KENDALL (Eds.). *The Student-Physician: Introductory Studies in the Sociology of Medical Education*. (A report from the Bureau of Applied Social Research, Columbia University.) Pp. xii, 360. Cambridge, Mass.: Harvard University Press for The Commonwealth Fund, 1957. No price.

One of the outstanding developments in Western civilization is the rise of medicine to the stature of a major social institution. Psychoanalysis and wonder drugs, victories over infant mortality, the continuously publicized fight against cancer, regular check-ups, and general concern with nutrition have increased the status of the physicians far beyond the status of the lawyers, ministers, and teachers. The specific ways in which physicians feel, think, and act, therefore, have become attributes of one of the most interesting subcultures in our society.

The book under review is a preliminary report on a research program which is examining the ways in which medical schools in this country change the viewpoint of their students toward self, the profession of medicine, and toward other persons in society, altering their views from those held by laymen interested in becoming doctors to those of certified physicians. In accordance with the book's character as a preliminary report, those parts which set the framework of the research program in theoretical and historical terms are much more rewarding to the reader than the individual chapters reporting on various facets of the concrete research program. Merton's introductory chapter entitled "Some Preliminaries to a Sociology of Medical Education" is an important contribution which all interested in medicine as a social institution should read. This chapter clarifies the essential position of the study to the effect that "learning and performance vary not only as the individual qualities of students vary, but also as their social environments vary, with their distinctive climates of value and their distinctive organization of relations among students, between students and faculty, and between students and patients" (p. 63).

For persons more specifically interested in medical education, Reader's report on

"The Cornell Comprehensive Care and Teaching Program" will prove equally interesting. He describes a shift in medical education away from emphasis on medical knowledge as such to an approach in which "the patient as a person is considered the appropriate focus of medical care and teaching," and in which "the student is recognized as coequal in many respects with the teacher in the learning process" (p. 93).

The remainder of the book, approximately 250 pages, seems to be intended for researcher and scholars in the sociology of the professions and is devoted to reports on such phenomena as "The Decision to Study Medicine," "Some Comparisons of Entrants to Medical and Law School," "Tendencies Toward Specialization in Medical Training," "The Development of a Professional Self-Image," "Preferences for Types of Patients," "Training for Uncertainty," and two reports on specific research problems encountered in "assessing an educational innovation." These reports vary in quality and appeal to interest. They are, however, of importance from a methodological point of view and deserve the attention of the research specialist. Although it does not promise more than it keeps, and in spite of some significant contributions, unfortunately the book leaves the reader with a definite sense of dissatisfaction. It starts with the roar of two basic papers and ends in the whimper of yet unfinished research. Probably the reports to follow will correct this impression.

OTTO POLLAK

Professor of Sociology
University of Pennsylvania

ALFRED J. KAHN (Ed.). *Issues in American Social Work*. Pp. xii, 354. New York: Columbia University Press, 1959. \$5.00.

The twelve contributors to this book of essays are intellectuals in social-work teaching, planning, and practice. They are authors of books and are recognized authorities. Nevertheless, most of them display the usual social-work reliance on "authority" in the form of footnotes to arrays of articles which in their turn, this reviewer seems to recall, footnoted much the same literature. Still, these essays will interest

social work leaders and can be read by graduate students in the field with profit. Although similar in most respects to articles in *Social Casework*, *Social Service Review*, and *Social Work*, these essays more often peal a discordant note of discontent over the graveyard of old themes.

The adequacy of the social work profession to accomplish its tasks comes sharply into question when one reads the following evaluations: While only a social-work master's degree has been needed for membership in the field's national association, says one writer, "the majority of persons in social work positions were thereby [1955] shut out of membership." Henry J. Meyer of the University of Michigan charges that "the knowledge base for social work has hardly been identified," nor are there "clear descriptions of the technical competence that social workers may possess." Furthermore, "it seems likely, but it is not yet demonstrated, that trained social workers have greater skill in counseling, in working with groups and with communities, than persons of equivalent experience but less training." Moreover, "what social workers do has not yet been objectively described." Alfred Kadushin judges that there has been no systematic attempt to validate the part of the knowledge base of this field that comes from social work itself. "Facts" have derived from reiteration. He wants intensified research activity. Bertram M. Beck desires social work to be an agent of social change and a force. Unfortunately, "goals must be defined before we know how they may be attained."

In spite of these presumably educated judgments, the editor wants social work's function in the modern world broadened to include service to the normal as well as to the disadvantaged, thus planning the better life for all, while retaining a concern with pathology and social disorganization. Nathan E. Cohen finds the latter an attribute of our communities which needs to be "reversed." Dr. Kahn counts on social work to humanize our superurban society and do many other things. "How much of this is possible?" he asks.

It is strange, Samuel Mencher says, that with all our leisure the field of social welfare "has not moved toward enriching

rather than restricting the possibilities for voluntary effort." He hopes that volunteers will appear to serve government agencies with dedication. The need for this derives from his conviction that public demand for impartial and impersonal service finds its ultimate fulfillment in a democratic society through government services. Private bodies, it is alleged, are identified with particular elements or interests in a community and cannot give the public "classless justice" (p. 226). This generalization about such groups as American National Red Cross, Salvation Army, Catholic Social Service, and both Jewish and Protestant bodies oppresses this reviewer. Certainly it leaves much to be desired. *Grass Roots Private Welfare* (New York University Press, 1958) convincingly conveys a contrary orientation. Mencher's essay is on the whole, however, a knowledgeable one.

Dr. Kahn judges that "there are needs to be met, services to be created, vital functions to be filled," and he finds evidence that social work can meet "the challenge." One wishes these hardworking and dedicated people well. At the same time, it is reassuring that educators, physicians, attorneys, ministers, talented volunteers, and experts in many fields continue to shoulder partial responsibility for the welfare of American society.

VAUGHN D. BORNET

The RAND Corporation
Santa Monica, California

DAVID DRESSLER. *Practice and Theory of Probation and Parole*. Pp. ix, 252. New York: Columbia University Press, 1959. \$6.00.

A 1951 book by Dr. Dressler entitled *Probation and Parole* set the stage for the volume under review. It is, however, not conceived of as a second edition but as a new book. The earlier volume "... was intended as a rationale of the field and not as a textbook. . . . [present volume] is not a rewrite of the earlier book. It is planned as a text for college courses in probation and parole" (Preface, p. vii).

The author's explanation tells a good part of the story. Despite general similarity of format, style, and page length, the 1959

volume really is a new book. There are 17 chapters in all, not counting the Preface and an extensive 12-page Index. Valuable materials and sensible points of view are presented in a number of chapters carrying self-explanatory titles such as, "Etiological Factors in Delinquency and Crime," "Investigation in Probation and Parole," "The Helping Process," "Ways of Helping," "Newer Directions in Treatment," and so on. Designed as a textbook, the book under review gives more attention than its predecessor did to the historical origins and vicissitudes in the development of probation and parole as operational procedures. Examples and illustrations in the form of anecdotal case-history material constitute a principal methodological device and are relied on for substantiation of assertions made more often than systematic examination of data from the more important scientific research studies having some bearing on the field.

Dr. Dressler writes from the standpoint of a social worker, not that of a sociologist, or of a research criminologist. No attention is given to the large areas of criminality that flow from the conflict of interests in the community at large. Similarly, the role of politics and of politicians in the operation of parole and probation practice is largely ignored. Disenchanted negative aspects of these practices and their implications tend to be overlooked or rationalized as due to inadequate support and poor public relations.

The discussion seeks rather to stress the positive, constructive aspects of probation and parole as "helping services." In view of this approach, the book tends to take on more the character of a field manual seeking to bolster the morale of "in-service" agents rather than the character of customary textbook presentation of materials on all major issues, pro and con, as a basis for serious thought on the part of interested students. The emphasis, presumably, flows from the author's many years of experience as agent or supervisor directly involved with field problems in this area of correctional work.

In a field often characterized by doctrinaire interpretations, Dr. Dressler's sensible, well-grounded, middle-of-the-road,

position should be welcomed by practitioners and laymen alike. His book is a valuable addition to the literature in the field.

GEORGE B. VOLD

Professor of Sociology
University of Minnesota

JOHN FAYERWEATHER. *The Executive Overseas: Administrative Attitudes and Relationships in a Foreign Culture*. Pp. xi, 195. Syracuse, N. Y.: Syracuse University Press, 1959. \$4.00.

Driven by the needs of American world interests, students of business and economics are undertaking the analysis of complex cultures, a task anthropologists have tried to avoid. It means that literature on national character and personality types is being created by men who in this field are amateurs rather than by the most experienced professionals. But, as illustrated by John Fayerweather's book, this new literature is valuable and provocative, perhaps sufficiently so to set anthropologists to work checking the hypotheses.

Professor Fayerweather collected data on attitudes and behavior from forty-five interviews with local and United States executives in Mexico and tested the resulting hypotheses by an intimate four-month study of six United States and ten Mexican executives. Checks were made on some comparable data from India and Europe to note similarities and differences. Professor Fayerweather's considerable experience with foreign cultures made him an unusually acute observer.

The research points to two polar types of personality: the individualistic and the group-oriented. A man of the individualistic type in pursuing activities deemed essential to his success "walls himself off as much as possible from those around him." He sees his subordinates and peers as dangerous competitors, his superiors as men whose favor must be won by pleasing them. The group-oriented type has a feeling of union with those around him. His satisfactions are to a considerable extent achieved "in being part of a team." He expects to argue freely and equally with superiors. Mexican executives, and those of other less developed countries, tend to have personalities of the individualistic

type, United States executives to be group-oriented.

The book is a skillful analysis of why the individualistic type has come to prevail in Mexican culture, and how group-oriented executives should deal with this type. There is also good discussion of how differing value systems affect behavior. For example, while Mexicans are not opposed to following plans, being on time, or observing other aspects of industrial discipline, they put a higher value on the expression of personal inclinations and the maintenance of personal relationships. Consequently a mandatory plan may be ignored in favor of some more personally appealing course of action.

For what it purports to be I have no criticisms worth noting in a brief review of this well-developed study. I merely want to warn the reader that while Professor Fayerweather writes with a persuasive confidence that makes his observations seem reasonable and true, more specialized study of personality by psychologists may make the present conceptual schemes seem crude and inaccurate. As Professor Fayerweather admits almost no one is a pure type, and whether his are the most useful polarities for analytical purposes is not certain. Similarly whether short-run changes in adult environment can do much to alter basic personality types needs further proof. But in the meantime psychologists and anthropologists as well as business men should read this small book.

THOMAS C. COCHRAN

Professor of History
University of Pennsylvania

PATRICK MCCAULEY and EDWARD D. BALL (Eds.). *Southern Schools: Progress and Problems*. Pp. viii, 174. Nashville, Tenn.: Southern Education Reporting Service, 1959. \$4.75.

The problems of desegregation in the public schools of seventeen Southern and border states have provoked one of the most bitter controversies of this era. Acts of violence in some cities have understandably provided headlines for newspapers in the United States and most other parts of the world. This report focuses attention upon "other important developments: not

sensational, fast-breaking headlines but nonetheless dramatic" (p. vii). Like other reports of the Southern Education Reporting Service, this one does not go into the pros and cons of desegregation. This reviewer regrets that it does not discuss recent federal court decisions. The first section, written for the layman by veteran newspaper men, analyzes Population, Enrollment and Attendance, Expenditures, Personnel, Transportation, Buildings and Equipment, and Special Services. The second section consists of seventy-seven statistical tables for the scholar and educator, gathered and analyzed by competent educators. The project was financed by the Fund for the Advancement of Education.

The Introduction, "Great Leap Forward," indicates the optimistic theme. This leap is "transforming all the old patterns, raising scholastic and physical standards, rewarding teachers, erecting new buildings, equipping them with libraries, lunchrooms and laboratories of the latest design, experimenting with advanced techniques in teaching, and most important, finding the money for still more such projects" (p. 1). One reason for this transformation is the belief of some Southerners that, if Negro schools were made really equal to white schools, some Negroes would bring less legal pressure to bear in favor of desegregation. On the other hand, even if segregated schools are frequently more expensive than desegregated schools, many white Southerners consider the additional expenditure well spent. The problem is aggravated by the fact that, while the South has a larger proportion of its population to educate than does the rest of the nation, it has less money with which to educate the students. But at the beginning of this century 85 per cent of Negroes were concentrated in the eleven states of the Confederacy as well as Kentucky and the Oklahoma territory. By 1950 the proportion in the same area had dropped to 62.5 per cent, and it is estimated that the next census will find less than 60 per cent still living in the traditionally Southern states. This reviewer, however, agrees with some competent demographers that migration of Negroes from the South is decelerating. Even if this is not true, desegregation will probably long

remain one of the nation's most difficult problems.

JOSEPH S. ROUCEK (Ed.). *Contemporary Sociology*. Pp. xii, 1209. New York: Philosophical Library, 1958. \$12.00.

Judged by the prolificacy of commentary evoked, no period of sociology has attracted so much attention as the post-World War II era. *Contemporary Sociology* joins the series of summaries, analyses, syntheses, and assessments which include, within the last four years, such endeavors as *Sociology in the United States of America* (ed. by Zetterberg), *Modern Sociological Theory in Continuity and Change* (ed. by Becker and Boskoff), *Review of Sociology: Analysis of a Decade* (ed. by Gittler), and *Sociology Today: Problems and Prospects* (ed. by Merton, Broom, and Cottrell). Both the short span of time from the publication of the earliest to the latest one and the paucity of cross-references suggest strongly that each volume was planned, and its papers contributed in virtual ignorance of the others. These independent interpretations should afford an unusual opportunity for comparative study of the degree of consensus on the state of recent sociology.

With 1,176 text pages and 59 chapters by 44 American and 18 foreign contributors, *Contemporary Sociology* is conspicuously the largest of the five treatises. Between Zimmerman's first chapter on trends in the discipline and Sorokin's last on physicalist and mechanistic approaches are the two basic sections of the work.

The first part is essentially an analysis of American sociology in terms of specific fields and methods. It contains chapters on community by Owen, personality by S. Riemer, institutions by Hanson, family by Zimmerman, social control by K. Wolff, social organization and disorganization by Lenn, methodology and research by Tiryakian, criminology by S. Koenig, race and intergroup relations by H. Smythe, political sociology by F. Gross, population by H. Doby, historical sociology by Barnes, social psychology by Frumkin, sociology of knowledge by L. Chall, urban sociology by

Ravitz, human ecology and human geography by G. Theodorson, rural sociology by J. Beegle and C. Loomis, educational sociology by P. Smith, social psychiatry by Nehnevajsa, sociology of symbols, language, and semantics by C. R. Jones, bureaucracy and professions by R. Stone, economic organization by Grigsby and Linden, social stratification by Lenski, religion by C. Hunt, public opinion and propaganda by J. Ford, military sociology by P. Walter, sociological aspects of psychological warfare by R. Sorensen, sociometry by Nehnevajsa, statistics by R. Francis, typology by J. McKinney and C. Loomis, role theory and sociodrama by J. Moreno and L. Zeleny, sociology and anthropology by Voget, sociology and social work by P. Smith, and sociology and American Catholics by Mundy.

The second part presents synthetic views of sociological developments in a variety of national or regional settings abroad. It involves chapters on Great Britain by MacRae, France by Cuvillier, the Low Countries by Gadourek, Scandinavia by Boalt Carlsson, and Öste, Germany by König, Austria by Knoll, Spain by Arboreya, Portugal by Machado, Switzerland by Girod, Italy by Pellizzi, Latin America by Williamson, Russia, the Ukraine and Satellite Europe by Roucek, Japan by Chikazawa and H. Smythe, China by M. Fried, India by Saran, Indonesia and Southeast Asia by van der Kroef, Middle East by L. Armstrong, Israel by Bar-Joseph and Weintraub, Africa by C. Williams, South Africa by Pauw, and Canada by Elkin.

POLITICAL AND SOCIAL PHILOSOPHY

RICHARD LAPIERRE. *The Freudian Ethic*. Pp. x, 299. New York: Duell, Sloan and Pearce, 1959. \$5.00.

We stand thoroughly in need of a good sociological study of the impact of psychoanalysis on contemporary American cul-

ture; this book, however, is nothing of the sort. It is, in fact, an ill-tempered and ill-informed pamphleteering broadside.

One finds it hard to believe that someone who claims seriously to have studied Freud's work can write that "he was in all respects antagonistic to society" or that "the Freudian theory of man assures us that no one can really be expected to be socially responsible" or that "to Freud . . . men of enterprise are neither villains nor heroes—they are neurotics." Such passages, and they abound, cannot be said to be part of scholarly discourse.

Professor LaPierre distorts the past and caricatures the present. He lacks a sense of historical scholarship when he writes that medieval men of finance were "invariably Jews" or that the Church "had for long discouraged all enterprises except those undertaken under religious auspices (e.g., the building of cathedrals was sanctioned, whereas the construction of roads, harbors, etc., was not)." He caricatures the present when he writes that "organized labor . . . has given, to a considerable extent, organizational expression to such class qualities as irresponsibility, lack of enterprise, and lack of personal self-reliance."

The author's thesis is simple indeed: The Reformation gave birth to the emergence of a new ethic of enterprise, the enterprising bourgeoisie was responsible for the dynamism of Western and in particular of American society. This ethic is now being challenged by the "Freudian ethic" which is characterized by the absence of constraints and inhibitions, a "lack of any rigorous system of personal-social values and sentiments, and complete absence of any sense of obligation toward others." The "ethic of negation" undermines the sturdy virtues of the entrepreneurs. It threatens, in fact, to lead to the gradual euthanasia of the entrepreneurs and hence to utter depravity and decadence. The Freudian ethic insidiously destroys the fabric of American society and is largely responsible for such nonprotestant institutions as "the permissive home," "the progressive school," "the adjustment motif," "the condonation of crime," and the "political maternalism" of the welfare state. It is also, in a somewhat obscure manner,

held responsible for the decline in the age of first marriage, the rise in the birth rate, and the increase in divorce. "Should the upward trends of the past twenty years continue, the United States would be completely socialized by 1975."

It is, of course, anyone's privilege to look at the contemporary world with a jaundiced eye, but LaPierre's resentment-laden assault upon a psychological school brings to mind Gogol's injunction: "Don't break the mirror if the mug is ugly."

LEWIS A. COSER

Associate Professor of Sociology
Brandeis University

KARL L. POPPER. *The Logic of Scientific Discovery*. Pp. 479. New York: Basic Books, 1959. \$7.50.

This is the author's translation of his *Logik der Forschung*, published in 1934. A well-known and respected contribution to logic and the philosophy of science, it has stimulated many scholars to either vigorous support or heated dissent. Many consider Popper's ideas to be counter to the main stream of logical analysis, and he has initiated additional debates with his claims to Socratic midwifery. Those who know *The Open Society and Its Enemies* or *The Poverty of Historicism* will be gratified to have the logical foundations of Popper's theses available in English. The original text is unaltered but contains many new Appendices; and a new book, *Postscript: After Twenty Years*, is in press with the author's more recent reflections.

Popper's main contentions are these. First, that modern logicians are fallaciously neo-Baconian in their alleged attempt to convert the formalization of scientific language into an *organon* of scientific discovery. To formalize the statements in a scientific theory so that the path from observations to overarching hypothetical construct is syntactically delineated is, for him, the road away from empiricism and into "metaphysics," "essentialism," "post-rationalism"—and in social philosophy, "historicism." To maintain, for example, that quantum mechanics is in the last analysis only a particularly knotty problem for rational linguistic reconstruction is a prime example of such procrustean projects. He

levels this charge most especially at Rudolf Carnap.

Secondly, Popper rejects Carnap's belief that there are two kinds of probability—relative frequency in the long run and probability as the "degree of confirmation" or weight of evidence adduced to confirm an hypothesis. The latter, Popper insists, is mere neorationalism, not empiricism. What we need, he says, is not a mathematically inspired quasi calculation of "weights," but a straightforwardly observational criterion of "falsifiability." No number of supporting instances will exhaust the chances of finding an exception to a given generalization, but one such exception is sufficient to falsify and to disqualify any hypothesis which depended upon the falsified proposition.

Popper's third contention is that this criterion of "falsifiability" is the "principle of demarcation" between genuine science and pseudo or nonscience in both physical and social sciences. He has frequently emphasized that he was led to formulate this rubric while trying to evaluate the theories of Freud, Marx, and others. And, he has indeed applied it mercilessly to expose the "conventionalist stratagems" that have been used to "save" certain physical and social theories; especially the gambit of explaining exceptional instances by integrating them at presumably higher levels of explanation.

Having thus dismissed a large portion of the method of inference, Popper offers his own formalization to establish criteria for "confirmability" and "corroboration" instead of confirmation and verification. But notwithstanding the intellectual discipline and boldness which he exhibits, these ideas are not original with him. Although a "falsifiability" criterion was not explicitly stated by Hume, it is implicit in his views and in many subsequent writings on the "testability" of scientific theories. In construing the idea of "testability" so narrowly as to eliminate all formulations of "falsifiability" earlier and less formalized than his own, Popper has done justice neither to the logic nor the history of science. Even "degree of confirmation" depends upon tests which in practice can always result in falsification. This can be found, for

example, in Herschel (*Natural Philosophy* [1845], p. 10); Cohen (*Reason and Nature* [1931], Ch. 3), and in Cohen and Nagel's elementary text [1934]. Mach's view of scientific laws as "Einschränkungen der Möglichkeiten" is in the same general family. The "falsifiability" criterion itself is stated by Peirce (*Papers*, 7.182 and 7.206). The general view of scientific explanation to which Popper has contributed and which is best known, probably, through the work of Hempel, is also found unformalized in *Reason and Nature* and in F. H. Bradley's *Principles of Logic*, a work much respected by Cohen. Many of Popper's Appendices deal with these points, and a number of them are cluttered with elaborate chronological reconstructions of conversations, correspondence, and discussions (as an example, pp. 311-317), meant to corroborate his originality.

Popper does concede (pp. 206-207 and 206n) that he now sees some arguments as "rationally arguable" even though not falsifiable and still "metaphysical." Does this concession shift the demarcation line between pseudo and real science? Or draw two lines? Into what provinces will he now put historical explanation, macro-economics (especially welfare economics), and both historical and analytical sociology? Now, a triage criterion for theories is valuable when confronting a genuine ideology—any ideology. A characteristic of ideologies is the labyrinthine rationalization of "confirming" instances, according to pre-conceptions of relevancy and of what constitutes a social fact. Ideologists as different as Burke and Marx attack others' "perspectives," these criteria of relevance and factuality, with "confirmations" and "falsifications." And, indeed, overly soft theories are suspect. But it is also to be recalled that conservatives from Burke to Buckley have insisted that mere mortal man's myopia precludes the perspective required for any general descriptive theories of society, let alone any normative decisions allegedly warranted by them. Popper does not explicitly claim a necessary connection between his own logic of science and a social philosophy; but his insistence on a documented history of "stubbornness"—a commendable precaution—is hardly

conducive to creativity; it is rather, a modern sophisticated warrant for the social status quo, not totally incompatible with Popper's other writings on such issues.

SAMUEL E. GLUCK

Department of Philosophy
Rutgers, The State University

CONWAY ZIRKLE. *Evolution, Marxian Biology, and the Social Scene*. Pp. 527. Philadelphia: University of Pennsylvania Press, 1959. \$7.50.

The present volume is unique among the books of the Darwin year. Professor Zirkle, who, in addition to botanical studies, has written numerous works on historical aspects of evolution and genetics, is also the author of *Death of a Science in Russia*. The latter deals at length with the Lysenko affair and its implications for science and society. This study continues the analysis on a larger canvas and in a larger sphere. To indicate "the extent to which Marxian biology has infected our culture and our learned specialties," Professor Zirkle has selected English and American literature together with sociology as typical. "Marxian quackery," the more insidious since specialism has driven a wedge in knowledge, has become socially pernicious because of the growth of population genetics and its increasing complexity. The rate of distortion, now intensified, threatens individual integrity and the future of society.

The ascription of a special variety of "quackery" to Marx and to the founders of communism is not convincing. Marx and Engels were frequently unclear, and their unclarity was confounded by their double role as social theorists and political propagandists. Followers of the Red Prussian, however famous for perfecting the art of the "official line," are notorious for a highly pragmatic use of history including their own. David Joravsky (*Journal of the History of Ideas*, XX, January, 1959, pp. 85-104) suggests that the data are much more complicated than Zirkle's interpretation indicates.

By endowing the communist line with a constancy it may not possess, Zirkle is able to establish connections between the "Marxian syndrome" and distortions of

social theory. The existence of distortions, conscious and unconscious, is not at issue. But the history of what is confusedly called Social Darwinism in America, for example, has a conservative side. Carnegie and Sumner have nothing to do with Marx and his colleagues. And it is hard to see how Lester F. Ward and James Harvey Robinson, two representatives of the "radical" wing, were in any sense affiliated to Marxian dogma. Like conclusions do not inexorably stem from the same premises. When they are assumed to do so, the result is likely to be confusion by intellectual association. The chapters which trace the history of evolutionary theory and genetic developments are excellent summaries; those dealing with social theory and literary expression are not.

BERT JAMES LOEWENBERG

KARIN DOVRING. *Road of Propaganda: The Semantics of Biased Communication*. Pp. 158. New York: Philosophical Library, 1959. \$4.75.

Road of Propaganda: The Semantics of Biased Communication by Karin Dovring professes to analyze systematically the uses and abuses of propaganda in mass communications. It is the work of a Swedish scholar who is now Visiting Professor at the International University of Social Studies, Pro Deo, Rome.

The book contains an Introduction by Harold D. Lasswell, Professor of Law and Political Science at Yale University, whose work in the field of propaganda analysis is well known.

Dr. Lasswell lauds Dr. Dovring's book and says it is an important step towards according the recognition it deserves to a technique of modern social sciences.

I cannot agree with him. "Gobbledygook" is often referred to as the bane of social science. The obfuscation social scientists practice in their works is a great hindrance, hazard, and handicap to public recognition or understanding of this important field.

This book caps the climax. It combines the worse features of obfuscatory "gobbledygook" with an apparent complete lack

Princeton UNIVERSITY PRESS

Political Realism and the Crisis of World Politics

By Kenneth W. Thompson

In the past fifty years, Americans have witnessed the emergence of an approach to international politics known as "political realism," whose leading proponents currently include such thinkers as Reinhold Niebuhr, Hans J. Morgenthau, Paul H. Nitze, George F. Kennan, Walter Lippmann, and James Reston. In this book, Kenneth W. Thompson traces the principles supported by these and other political realists and applies them to fundamental problems in world politics and foreign policy. He leads up to the ultimate problem, the conditions for peace in our era, and makes practical suggestions for a realistic approach that will tend to bring this goal closer. 268 pages. \$5

The Eclipse of Community

By Maurice R. Stein

A solid book that shows how American community life has changed during the past few decades and gives a clear picture of those factors which affect ordinary people in the daily round of community living today. The author examines three classic community studies written during the past half century to show the main trends in American community development. He then formulates his own theory which can be used to relate different kinds of community studies to one another, and applies this theory to specific types of communities: slums, Bohemias, suburbia, Southern towns, and military communities. "The best critical and theoretical introduction I have seen to the study of the American community in all its ramifications. . . . A pattern-breaking as well as pattern-making study."—Max Lerner. 328 pages. \$6

The Wage-Price Issue

A Theoretical Analysis

By William G. Bowen

This first thorough and systematic analysis of the theoretical aspects of the wage-price issue shows how the various facets of this issue fit together, provides a critical appraisal of existing studies, suggests areas where additional research is needed, and aids in the consideration of public policies. It considers what "type" of inflation is at the root of the wage-price issue and discusses in detail one particular model of the inflationary process—the familiar "dilemma model." The book explores the questions raised by this model in the areas of wage determination, cost and price determination, and monetary policy; and comments generally on the problems of affixing the "responsibility" for inflation and "solving" the wage-price issue. 464 pages. Illustrated. \$8.50

Value in Social Theory

A Selection of Essays on Methodology

By **GUNNAR MYRDAL**

Author of *An American Dilemma*, etc.

Edited by PAUL STREETEN. An outstanding observer clarifies the philosophical and political foundations of social research. Among the questions he asks: How is knowledge of social facts possible? Can we be simultaneously objective, practical, and idealistic? Dr. Myrdal's answers to these questions will stimulate, challenge, and enlighten.

A Century of Higher Education For American Women

By **MABEL NEWCOMER**

Emeritus Professor of Economics, Vassar College

The struggle of women during the past century for equal educational opportunities, and more important, what they have done and should do with those opportunities, is the subject of this book. Miss Newcomer explores various critical questions: How should women's education be financed? Why don't more women go to college today? An eminent scholar and educator, Miss Newcomer brings knowledge and humor to her pungent criticisms and suggestions.

of knowledge of the first elements in writing English. The combination of the two is deflationary on a reader who tries with all good will to master its contents.

Here are some representative sentences typical of many others. What do they mean?

"When testing is possible confidence in recommendations increases, and people become more receptive even to new ones." "As we have already said the appeals to public attention must be counted first before the interests can be seen." "The use of community values for purposes of influence can be exemplified anew in the case of the communicator facing his mass public."

The book has a Table of Contents which lists chapter headings as "The Communication Process," "Attention," "Interest," "Influence or Understanding?," "Afterthought." But nowhere has the author or publisher been able to translate these headings into meanings comprehensible to the reader.

Some years ago a member of the Institute of Semantics came to see me and asked me to comment on a pamphlet explaining semantics to the public. I returned it with a short note saying that I could not understand a word of it.

EDWARD L. BERNAYS

New York City

LILLIAN PARKER WALLACE and WILLIAM C. ASKEW (Eds.). *Power, Public Opinion, and Diplomacy: Essays in Honor of Eber Malcolm Carroll by His Former Students*. Pp. xiv, 421. Durham, N. C.: Duke University Press, 1959. \$8.75.

The eleven essays in this volume, written "to illuminate certain aspects of the history of the nineteenth and twentieth centuries" (p. v), were inspired by the desire of the contributors to express their gratitude for the guidance and inspiration furnished them while working for their doctorates by E. Malcolm Carroll, now Emeritus Professor of History at Duke University.

Except for the final essay, "Two Constants in Russian Foreign Policy," the writers employ the method of meticulous

and methodical historical research to reveal the foreign policy goals and maneuverings of European statesmen occupying high office or seeking to attain it at the expense of their rivals at home and their enemies abroad. Thus the actions, interactions, and motivations of strong political personalities playing for high stakes in a sharply competitive international struggle for power and prestige, are the chief concerns of the essayists.

The principal dramatis personae in the first essay are Pope Pius IX and Lord Palmerston. The Pope, "absolute ruler of the oldest institution in Europe," and the British Foreign Secretary, "the representative in international affairs of Europe's oldest national government," became estranged after Pius abandoned liberalism and constitutional government. Palmerston then ceased his efforts to have Protestant England draw closer to the Holy See and prophesied that the papacy eventually would disintegrate. However, since being divested of the temporal power, it has been able to "recover its spiritual ascendancy and carry its religious leadership to heights not hitherto reached" (p. 46).

Succeeding essays, with their minute probings of the political scene, make further contributions to a detailed understanding of European political alignments and rivalries in the decades before World War I and to the troubled aftermath from which World War II was to emerge.

The final essay offers the thesis that the prime factors which have determined Russian foreign policy "from the reign of the first prince of Muscovy to the present time are . . . geography and the Russian character" (p. 343). These "two constants" account for the "extreme consistency" of Russian policy through the centuries, whatever the regime. Russian rulers, chronically suspicious of and hostile to the West, asserted a "historic mission" to unite all the Russian people in one sovereign state. In the process they gathered in many non-Russians as well. Likewise under communism the Russian Empire has been further enlarged, and Russian domination extended through the medium of the so-called "people's democracies" (p. 344). Now the "mission" is to preserve communist doc-

trines from corruption and disseminate them throughout the world.

FRANK M. RUSSELL

Professor of Political Science, Emeritus
University of California
Berkeley

JAMES COLLINS. *God in Modern Philosophy*. Pp. xii, 476. Chicago: Henry Regnery Company, 1959. \$6.50.

This is a study of men who have tried to answer the question: How can we know God if such knowledge is possible? And if it is not possible, can belief in God be defended? The survey begins with Cusanus, Calvin, and Bruno. Cusanus and Calvin have little confidence in the natural powers of the human mind to gain knowledge of God. So they point instead to faith and revelation. Bruno rejects revelation and Christian faith, claiming to know God as cosmic unity.

These answers to the question are so unsatisfactory that they lead to the skepticism of Montaigne, Charron, Gassendi, and Huett. Some welcome skepticism regarding all knowledge because faith is then free to accept belief without hindrance from the claims of knowledge.

When the idea of God is thus released from claims to prior systems of knowledge it is appropriated by Descartes, Spinoza, and Leibnitz to complete and give cogency to the comprehensive philosophical system developed by each. This use of the idea of God brings on the criticism of the empiricists, Bacon, Hobbes, Locke, and Hume. These thinkers reduce belief in God to a probability defended for its moral, political, and other practical uses. For Hume even this moral utility is lacking. This led Bayle, Holbach, and Diderot to reject all belief in God but they were opposed by the natural theology of Wolff, Voltaire, and Rousseau, although these three were very much opposed to one another in the way they defended belief in God.

All this was very unsatisfactory to Kant and Hegel who came forth to "prove" by comprehensive systems that belief in God is justified, Kant by pointing to what is necessary to render the moral imperative reasonable, Hegel by identifying God with the dialectical movement by which the Ab-

solute realizes itself in human consciousness.

Kant provided no knowledge of God, only justified the belief; while Hegel's absolute swallowed up the concrete individual and all actual existence into the absolute so that the concrete individual and all actual things became unreal when taken in their own right. This led Feurbach, Marx, and Nietzsche to atheism and induced Kierkegaard to repudiate all attempts to know God by intellectual inquiry, even while he defended belief in God with passion.

The author of this book thinks that none of the ways to God examined by him is convincing; but he claims there is a reliable way to know God even though it has not yet been fully developed. Throughout the volume he hints at what this better way might be but does not carry it far enough to show the outline of it.

HENRY NELSON WIEMAN

Visiting Professor of Philosophy
University of Southern Illinois
Professor Emeritus
University of Chicago

PHILIP C. JESSUP and HOWARD J. TAUBENFELD. *Controls for Outer Space and the Antarctic Analogy*. Pp. xi, 379. New York: Columbia University Press, 1959. \$6.00.

I mean it as a compliment—this is a scholarly Jules Verne. Under one cover we have Outer Space and the Antarctic Analogy. Without having been to either place, one can still feel—and I think "feel" is the right word for this forward-looking book—that the subject is urgently important and that the treatment is solid but imaginative.

Essentially this is an exploration of the problems and opportunities of international control. As the authors state, the book is concerned with a choice of alternatives: will there be in these areas the ageless national power struggles or an international solution? Perhaps the key paragraph in the book is: "Regardless of the nature of the activity involved, the record makes it clear that some form of international organization may readily be created and utilized when there is a conviction that it would serve a useful purpose. This is the

central point which must be kept in mind as one comes to look at the future of Antarctica and of outer space" (p. 116).

Will states so decide? The authors almost make one think that such will happen.

Something of a hero emerges—the co-operating scientist. And the well-known political scientists state, "It is difficult to assert dogmatically that national security would be prejudiced by seeking to secure international agreement on the future of outer space" (p. 221).

Indeed, after reviewing joint actions in history, including the International Geophysical Year, the authors are optimistic, in conclusion: "The experiences reviewed in this book show that through a long stretch of history states have evolved a variety of devices for co-operative and administrative activities whenever it seemed to them desirable to have a joint rather than a single nation regime. . . . The need and the incentive have never been greater than now. Steadily the trend on the face of the earth has been toward organized multinational action in the common interest. There will be no reversal of that trend as man moves on into outer space" (p. 282).

But before we relax into this comfort, or to the "comforting air" of "limited war," perhaps we should recall that some pages earlier (p. 269) the authors have written: ". . . Functionalism can be highly productive; it can never be what it is sometimes apparently intended to be, a substitute for a workable political solution."

President
Wagner College

REINHOLD NIEBUHR. *The Structure of Nations and Empires: A Study of the Recurring Patterns and Problems of the Political Order in Relation to the Unique Problems of the Nuclear Age*. Pp. xi, 306. New York: Charles Scribner's Sons, 1959. \$5.00.

Dr. Niebuhr's new book is the serious work of a man rightly perturbed by the overwhelming political problems of the nuclear age and rightly skeptical of all the fashionable panaceas for them. It is

marred by a number of errors of fact, historical and contemporary, some trivial, some, for example, an overestimate of the role of "aid" in Soviet penetration in the under-developed countries rather more serious. But none affect the basic argument.

We must, he tells us, give up believing that our age is unique except in the terror of the weapons at its disposal. History has always known of empires that have sought to justify themselves by an assumption of unique virtue; and much of the core of the book treats of this phenomenon as it has shown itself in the ancient world, in medieval Europe, Byzantine and Western, and in the Islamic world. It is in the last of these that Dr. Niebuhr sees the nearest approach to the secular utopianism of modern Soviet communism. Medieval western Europe perhaps illustrates the fundamental dilemma facing man who has to take note of both the absolute and the contingent. Either he may regard them as wholly disparate and thereby fall into the view that what happens in the earthly realm does not matter, as with some of the early Fathers and again in a different way with Luther. Or he may believe that the secular power can itself be wholly the instrument of righteousness and end up by obliterating the difference between the two realms.

But the failures of the medieval Empire and Papacy illustrate another important fact, the strength of the organic elements in human societies that contribute to the making of nations. What Dr. Niebuhr has to say about nationalism in its different forms is well worth saying; but his main point is that we in the West must also cease to regard our ways and views as the only possible ones, accept both the fact that we have overrated the importance of conscious contrivance in politics—a typically American error as the author sees it—and that we may have less to offer the uncommitted world than we believe. In other words, if we are to make anything of competitive coexistence with the Russians which nothing short of universal destruction can relieve us of—unless and until the Soviet system evolves internally into something else—it must be on a basis of greater modesty.

Some may say that Dr. Niebuhr is too modest on the West's behalf and too oblivious of the positive values of transcending our nationalisms not through imperialism or artificial devices for "collective security" but through the building of international communities intermediate between the nation-state and mankind as a whole. But anyone who wishes to argue in this way must think as deeply about the problems of authority and consent in many different settings as Dr. Niebuhr has.

dexed in the *Reader's Guide to Periodical Lit-
erature*.

FOREWORD

This volume of THE ANNALS * was planned to inform interested readers about the current expansion of an area in international co-operation, as yet little known, and quite often seen in a rather limited perspective. American and international agencies have often solicited financial contributions so that they might provide help for victims of war, persecution, famine, and other catastrophes. We have thus become familiar with international relief activities designed to meet the minimum necessities for sheer survival. In a deeply disturbed world, harboring many pockets of intense human suffering, the need for such aid created by local emergency conditions and special pressures still exists.

In recent years, however, extending beyond this limited concept and traditional administration of international aid, there has developed an increasingly vigorous and inspired international movement—a beginning of concerted social action toward new long-range goals: a higher level of human welfare, a lesser degree of human wastage.

Across cultural, economic, and political boundaries, we have started to build a new pattern of sustained interaction, involving many levels of government, many types of agencies both national and international, and focusing on major social problems as they affect the common man. Thus, in an era of great instability and serious tensions, we also witness the slow unfolding of a new ethic of mutual aid expressed in a truly international exploration of policies and the development of programs which may eventually produce a higher level of living, more human satisfactions, and greater human opportunity everywhere.

Many different channels and relationships have been built to translate such novel objectives into operational programs. A wide range of methods and techniques are being tested: Civic participation technical competence; development of leadership on the grass roots level at every level in co-operative undertakings; fitting national and international resources to each country's priorities and social objectives.

The articles in this volume were designed to provide a balanced introduction to this complex, challenging field, which is still at an early stage of development. Inevitably, limitations of time and space have only allowed a very condensed presentation of much important material; they have also caused the omission of some helpful illustrative data that cover other approaches, as well as other areas of the world.

We are most grateful to the highly qualified authors who contributed so generously of their experiences, their insights, and expectations to this volume.

The American people, with a superb tradition of faith in the value and dignity of every human being, should be ready to accept social development as an independent goal—with all its policy, educational, and professional implications—and should be prepared to recognize the recent direction in the social field as a matter of deep national and international concern.

It is rightly demanded of us to provide effective contributions and an increasingly strong foundation of encouragement and moral support for this broadening area

of world-wide peaceful interaction, with its rich potential for human growth, greater productivity, and greater mutual trust.

HERTHA KRAUS

Hertha Kraus, Ph.D., Bryn Mawr, Pennsylvania, is Associate Professor of Social Work and Social Research at Bryn Mawr College. She is the author of various monographs and articles on international aid, and has served as consultant for the State Department, Social Security Board, Russell Sage Foundation, and the American Friends Service Committee.

* Concerned with strengthening public awareness of the role of social welfare programs in the international field, the Committee on International Social Welfare of the Philadelphia Area Chapter of the National Association of Social Workers took the initiative in crystalizing this venture. The special editor would also like to acknowledge the encouragement and support, and many helpful suggestions, provided by a number of knowledgeable individuals consulted in the process of planning.

The Challenge of World-wide Social Conditions*

By JULIA J. HENDERSON

ABSTRACT: In the fifteen years since World War II, the international community has seen marked progress in prolonging life, providing education for children, and in increasing the world food supply. Progress in the struggle against poverty and bad housing is much less notable, and the achievements in lessening social tensions, in increasing human dignity, and other qualitative aspects of the standard of living are not measurable by the rough indicators we have at our disposal. The attempt to reach a new synthesis in the economic and social aspects of the development of less-developed countries, the widespread approval of governmental planning for social as well as economic development, the growth of public responsibility for welfare of the total population, and the attention given to rural as well as urban development are cited as important postwar developments in the philosophy and methods of international co-operation. The concern about extending assistance in ways which stimulate active participation of the people is a hopeful response to the world social situation. Finally, the importance of basing assistance on mutual respect—with every country acting both as donor and recipient—is stressed in this co-operation.

Julia J. Henderson, Ph.D., New York City, has been Director of the Bureau of Social Affairs of the United Nations since 1951. A graduate of the Universities of Illinois and Minnesota, Dr. Henderson has taught political science at Wellesley College and has held various positions with the United States government. Prior to her present appointment she has served as organization advisor and chief of the financial policy division of the United Nations.

* This article is based upon the relevant findings of the research staff of the United Nations Bureau of Social Affairs and the specialized agencies which co-operate in the preparation of the series of reports on the World Social Situation. It is also a brief presentation of Miss Henderson's own reflections on these findings so far as a program of international action is concerned. These views are stated on her own responsibility and not that of the United Nations Secretariat.

SEVEN years ago the United Nations set forth the challenge of world-wide social conditions in the following terms:

... more than half the population of the world is still living at levels which deny them a reasonable freedom from preventable disease; a diet adequate to physical well-being; a dwelling that meets basic human needs; the education necessary for improvement and development; and conditions of work that are technically efficient, economically rewarding and socially satisfactory.¹

THE POSTWAR PROBLEM

This picture represented the world, as we found it, at a point midway between the holocaust of World War II and the present day. The cost of the war in terms of broken families, orphans, homeless people, refugees, the physically and mentally handicapped, bad health, lost education, was still acutely felt in Europe, but the forces of recovery were at work. Millions of skilled and semi-skilled workers were back in the factories and on the farms, social institutions were being rebuilt, and natural resources remained in abundance in many parts of Europe. Thus when outside capital was forthcoming, economic recovery was achieved with relative speed. This is not to say that important social problems do not remain unsolved fifteen years after World War II but the basic question of economic security for the family is no longer a major problem in most of Europe or in North America.

The chronic problems of poverty, illiteracy, and ill-health in the economically less-developed countries have yielded much more slowly to widespread efforts to improve conditions. The lesser achievements result not only from the immensity of the areas and populations

¹ *The Preliminary Report on the World Social Situation* (United Nations, New York, 1952), p. 4.

affected but also from the deep-rooted social character of these problems. Nevertheless, United Nations surveys and special studies made by the specialized agencies as well as by national institutions show that considerable headway has been made during the last decade in achieving higher standards of health and of education in these regions. The battle against poverty has not gained as much ground. Poor housing and many forms of social disorganization remain serious problems in both industrial and nonindustrial countries, in some countries even appearing to increase in light of demographic trends.

The pages which follow will attempt to provide some perspective for judging the major social problems of our time and the efforts made by international, bilateral, national, and voluntary groups to "promote social progress and better standards of life in larger freedom."² It must be recognized at the outset that the statistical evidence which can be adduced to support generalization about the various components in the standards of living is still very scanty and unreliable in large parts of the world and that our judgments must often rest, therefore, on the testimony of national governments and of informed observers in the social field. It is difficult enough to measure in quantitative terms the rise in levels of health or nutrition. It is problematical to what extent an increase of school-age children in school measures a real advance in levels of education. The levels of real wages on a comparative basis are still more elusive.³ The problems of nonmaterial factors in

² Preamble to the *Charter of the United Nations*.

³ These problems of definition and measurement of standards and levels of living have been elaborated by a series of expert committees convened by the United Nations and the specialized agencies. See *Definition and Measurement of Standards and Levels of Living* (United Nations, New York, 1953).

the social situation such as human freedom remain completely in the qualitative realm. The United Nations Commission on Human Rights and its Subcommittee on the Prevention of Discrimination and Protection of Minorities keep these questions under review, not only through governmental reports covering the implementation of basic human rights through legislation and law enforcement but also through the reports of special rapporteurs on such subjects as discrimination in education and in religion.⁴ The status of women, which has an important bearing on the social situation around the world, also receives special scrutiny in terms of legislation for extending political and property rights and in terms of the opportunities of women and girls for education and employment.

No assessment of world social conditions—whether we speak of material or nonmaterial aspects of our lives—can be isolated from the basic demographic facts of our time. The rate of population growth may spell the difference between victory or defeat in our struggle to raise the levels of living in the economically underdeveloped regions and to protect and promote human freedom.

THE WORLD DEMOGRAPHIC SITUATION

The "population explosion" is now so widely discussed in America, in Europe, and among the leaders in most Asian countries that it is not necessary to belabor the question in this article. Quite apart from the fact that 2.5 billion people lived on the planet in 1950 and that present rates of growth would add

another 2 billion by 1980,⁵ a number of features in the demographic situation demand special attention by economists, social scientists, and planners. These are the geographic distribution of the world's population in relation to its natural resources, the age structure of the population, and the rate of urbanization.

With all the reservations which must be made on demographic statistics in large parts of the world, it can be reasonably estimated that one half of the world's population lives in monsoon Asia.⁶ Within this region, the concentration of population in countries already facing tremendous problems of poverty, illiteracy, and ill health, presents the most serious challenge to national and international economic and social policies and programs. All available estimates indicate that the share of the world's population living in this region will continue to rise.⁷ There is, of course, much discussion concerning the probable effects of increased industrialization on fertility rates in these countries but the action taken thus far has not stemmed the flood tide.

Asia is not the only region of the world destined to have its share of the world's population enlarged; in the course of the century in which we live, the population of Latin America is likely to grow tenfold. The rate of growth in Africa will be accelerated but its share in the total will change only slightly. If present trends prevail, there will be a continuing decline in the relative importance of Europe—including the Soviet Union—even though European population will double within the century. The proportions for Northern America and Oceania which rose until

⁴ See the *Human Rights Yearbook* of the United Nations and the reports of Mr. Charles Ammoun "Study of Discrimination in Education" (E/CN.4/Sub.2/181/Rev.1) and of Mr. A. Krishnaswami "Study of Discrimination in the Matter of Religious Rights and Practices" (E/CN.4/Sub.2/200).

⁵ *The Future Growth of World Population* (United Nations, New York, 1958).

⁶ *Ibid.*

⁷ *The Population of South-East Asia* (United Nations, 1958).

the middle of the century, are likely to fall off in the second half of the century.⁸ These facts are of crucial importance to the whole world and, in particular, to those directly concerned with development of natural resources, agricultural productivity, and industrialization.

Age distribution

Of even greater short-run importance to social planners than the over-all increase in the size of the population and its concentration in underdeveloped regions, is the age distribution of the population. With the success of health measures in reducing infant mortality and lengthening the life span, the percentage of the population in so-called "dependency" status is also growing in the countries which can least afford the burden of more food, clothing, shelter, and education. The continuing high birth rates together with the falling mortality rates have resulted in ratios estimated at 40 per cent of the total population in the age groups under fifteen, while the range of this ratio in European countries is 20-30 per cent. The effect of this situation on the problem of education is illustrated by the fact that if the Brazilians, the Muslims of Algeria, or the Chinese in Taiwan could reduce their ratio of school-age children per one-hundred workers to the level of the United Kingdom, the outlay on education per child could be doubled without increasing the share of national income devoted to education.⁹ The picture of dependency at the other end of the scale is not so clear since a vast majority of economically active males in Asia, Africa, and most of Latin America are still engaged in agriculture. In these countries, papers prepared for the last

⁸ *The Future Growth of World Population*, op. cit.

⁹ *Report on the World Social Situation* (New York, 1957), p. 26.

World Population Conference showed that 78.5 per cent of the male population of sixty-five and over was still economically active, while only 40 per cent of males in this age group in the industrialized countries was still active.¹⁰ The family structure in the economically less-developed countries as well as the economic organization makes it difficult to define dependency. While the expectation of life at birth is rising in these regions and the death rates are declining at a faster rate than the decline in the industrialized countries, the percentage of the population over sixty years of age is still between 3.5 per cent and 7.7 per cent in Asia while it ranges from 10.1 to 15.7 per cent in Europe and 12.2 per cent in the United States.¹¹

Urbanization

The third demographic factor of utmost importance for international cooperation in social welfare is the movement from rural to urban centers of population—the phenomenon known to demographers and other social scientists as "urbanization."¹² The additional billions of people on our planet are being concentrated to an increasing degree in our large cities. In 1950 there were some 900 metropolitan cities with more than 100,000 inhabitants whose total population had reached over 300 million; cities of more than 20,000 contained at the same date more than 500 million people or one fifth of the world's total population. Every eleventh person

¹⁰ "Age Structure and Labour Supply," *Proceedings of the World Population Conference*, Papers: Vol. III (E/Cnf.13/415), pp. 571-592.

¹¹ *Report on the World Social Situation* (New York, 1957), p. 23.

¹² United Nations findings on "Social Problems of Urbanization in Economically Under-Developed Areas" were published as Part II of the *Report on the World Social Situation* (New York, 1957), and were summarized by the author in an article prepared for *The Annals*, Vol. 314, November 1957, pp. 147-155.

in Africa, every eighth in Asia, every fifth in Central America, every fourth in South America, every third European, and almost every second person in North America was living in 1950 in a city of over 20,000 people.¹³ These regional averages hide wide variations among countries of each region. For example, in Latin America, the urban population varied in 1950 from 5 per cent in Haiti to 48 per cent in Argentina, from 8 per cent in Pakistan to 42 per cent in Japan, from 13 per cent in Yugoslavia to 69 per cent in England and Wales. Nevertheless the common and significant fact from a social point of view is the continuing movement of population to the cities and the rate of the growth of cities. While the rate of urbanization appears to have slowed down in England, France, and the United States since 1930, the rate was greatly accelerated in other countries. In the Soviet Union, for example, while the total population increased only 34 per cent in the period 1926-1955, the population in cities of 100,000 or more increased more than four times. The latest—1959—census in the Soviet Union indicates that more than 47 per cent of the population is now living in urban settlements of 3,000 and over.¹⁴ A number of countries in the less-developed regions such as India and the Federation of Malaya appear to be at the beginning of a period of acceleration of the rate of urbanization. Some of the implications of this movement for health, housing, and social welfare of the world's population will be elaborated in later articles in this volume. At this point, it suffices to say that

¹³ Philip M. Hauser, *Implications of Population Trends for Regional and Urban Planning in Asia* (Tokyo, 1958), prepared for the United Nations Seminar on Regional Planning.

¹⁴ *Preliminary Results of the 1959 All-Union Population Census* (census taken 15 January 1959), Communication of the Central Statistical Administration of the Council of Ministers of the Soviet Union.

the analyses of family structure, age structure, racial composition, and a multitude of other social, economic, and psychological facts about our present-day cities are essential contributions made by the social scientist to the practitioners in the social field. It is here we can economize our limited professional resources.

FAMILY INCOME

The most basic information about the "social condition" of the hundreds of millions of families living in cities or in rural areas concerns the income available to the family to satisfy its needs. Paradoxically it is the most difficult data to obtain because of the complexity of elements entering into such calculations. In the first place, a large part of the world's population is still living on subsistence agriculture, and calculations of money equivalents are not meaningful. Secondly, the prices of consumer goods which have fluctuated violently since the prewar period are as important as wage levels in determining the real wage levels. Thirdly, the number of working members of the family obviously has a tremendous impact on the family level of living, but the wide variations throughout the world in the pattern of working women, child labor, and the contribution of unmarried members of the household make cross-country comparisons mostly unrealistic. Finally, the amount of "social income" such as social insurance, family allowances, free medical care, and free education is highly significant in some countries and insignificant in others. It is little wonder that the countries reporting wage data to the International Labour Office on a regular basis are largely the industrialized countries.¹⁵

Nevertheless, after examining consumer price data and wage data for the

¹⁵ *Report on the World Social Situation* (New York, 1957), p. 106.

period 1939-1954 for twenty countries, the International Labour Office was able to conclude that "real wages in four-fifths of the countries surveyed increased by 10% or more." The median increase was approximately 26 per cent. Even though new inflationary pressures developed in many countries in the period after 1955, there appeared to be some further gains in real wages, even without reference to extensions of social benefits. In the Soviet Union substantial increases in real wages resulted mainly from reductions in consumer prices, increases in social security benefits, and increases in minimum wage levels. To a greater or lesser extent, the same trends were noted in other Eastern European countries. Increases in agricultural wages are also reported by most European countries, including the Soviet Union.¹⁶

The real income of families living on subsistence agriculture may also have shown some gains in recent years if conclusions can be drawn from the impressive increases in food production in this period. The serious food shortages of the early postwar period came to an end but the Food and Agriculture Organization reported in 1957 that "there is little indication that some of the longer-term fundamental problems of world food and agriculture have come appreciably nearer to solution. Food consumption per capita in many less developed countries covering a large part of the world's population still remains below pre-war levels . . ."¹⁷

There exist many other inequities in the distribution of the basic elements of subsistence both between and within countries. The varying increases in national income in the less-developed countries has been accompanied by a growing unevenness in the distribution of this income within the population. In some

¹⁶ *Ibid.*, p. 107-109.

¹⁷ *Ibid.*, p. 49.

cases, too, an over-all increase in national income has indicated only that part of the labor force has shifted from rural employment to nominally higher paid urban employment. This shift may not mean a higher level in actual consumption.

In this balance sheet on the family income, however, two further positive factors should be taken into account: first, family incomes have been augmented on a wider scale than ever before through the gradual extension of the scope of social security systems in terms of the risks covered, the new groups of beneficiaries, and the higher levels of benefits. Income from social security has been rising in relation to national income and in terms of per capita annual expenses for social security benefits. Measures have been taken in many industrialized countries to provide increases to meet rises in the cost of living as well as to improve the general level of pensions and of family allowances.¹⁸ The second positive factor is the continuing growth of the labor force, with unemployment held within modest bounds in most countries. However, it cannot be said that either of these factors is important in the less-developed regions where social security schemes still cover a very small percentage of the labor force and where wide-scale underemployment rather than unemployment is the root of continuing poverty.

HEALTH CONDITIONS¹⁹

In no aspect of our lives have more dramatic changes been introduced since 1946 than in the health of the world's

¹⁸ *International Survey of Programmes of Social Development* (United Nations, 1959), Chap. VII.

¹⁹ *Report on the World Social Situation* (New York, 1957), Chap. III. See also the *World Health Survey* (WHO, Geneva, 1959), for a country by country analysis of health conditions.

population. The best testimonials to the success of scientific advances in medicine and to planned and sustained efforts of national and international health authorities are the facts quoted above on the growth of population, the reduction of infant and general mortality, and the rising expectation of life at birth.

This is not to say that important problems do not remain to be solved in the health field—problems of great magnitude and great variety from region to region. Among the infective and parasitic diseases, while malaria, yaws, and syphilis have been brought under control in vast areas of the world, bilharziasis still affected 150,000,000 peoples in the middle of this decade and filariasis another 250,000,000. It is estimated that trachoma and infectious conjunctivitis affected no less than 400,000,000—sometimes whole villages in North Africa and as many as 78 per cent of rural school children in selected villages in India. Leprosy and sleeping sickness remain important health problems, especially in Africa although real progress has been achieved through new methods of treatment and public health measures of prevention and detection. Death rates from tuberculosis have continued to fall although this does not always mean that the prevalence of the disease has decreased. A number of surveys of the disease are under way in Asia and Africa; in some of these countries pulmonary tuberculosis seems to be less common in rural and more common in industrial areas. Virus diseases such as influenza continue to be widely reported but specific control measures are now available for some forms of virus infections. Considerable progress has been made against poliomyelitis which began to appear for the first time in recent years in economically underdeveloped areas. Pneumonia remains among the diseases causing the greatest number

of deaths even in the developed countries where antibiotics are widely used.

Most of these infectious diseases, however, are health problems today primarily in the economically less-developed regions. In the industrialized countries, the chronic degenerative and malignant diseases have become the important causes of mortality and morbidity. Heart disease is now the most frequent cause of death in Northern America, most of Europe, and among the more prosperous segments of the population in other parts of the world. The increased incidence of cancer, especially lung cancer, has caused growing concern.²⁰ The variations between mortality rates between the sexes as well as among industrial countries is now the subject of extensive research on the causes of cancer. Mortality from accidents, particularly motor accidents, has reached alarming proportions in the developed countries. It now appears that in these countries more children, especially boys, die from accidents than from all infective and parasitic diseases.²¹

A positive concept

The state of health throughout the world is not, of course, to be measured only in terms of mortality and morbidity rates nor even in terms of the prevention of specific diseases. The promotion of a positive concept of health, involving the general protection of the individual against sickness and the promotion of a general state of well-being, has been a major objective of the World Health Organization and is now accepted by almost all national health administrations. It is in this area that the ob-

²⁰ In November 1959, the General Assembly of the United Nations adopted a resolution establishing international prizes for cancer research. (Res. 1398 (XIV) 30 November 1959.)

²¹ "Mortality from Accidents," World Health Organization, *Epidemiological and Vital Statistics Report*, Vol. 9, No. 1, 1956.

jectives of health and social welfare specialists are most closely bound together.

The healthy development of children takes the foremost place in most countries dedicated to a positive concept of health. The growth of maternal and child health services and their extension to rural areas, under the stimulation of the United Nations Children's Fund-World Health Organization programs, has contributed materially to an improvement in the health of children. Much greater attention to nutrition problems around the world is required to ensure continued progress in child health; the diet of children in most of the underdeveloped areas is still deficient in animal protein. Research into ways and means of using locally available sources of protein for child-feeding is being carried out in Africa, Central America, and India through national and regional institutions with the assistance of the Food and Agriculture Organization and the United Nations Children's Fund.

Environmental sanitation is a problem which is not limited to economically developed or underdeveloped countries. In the developed group, continuing supervision of water supplies, sewage collection and disposal, and food hygiene programs have greatly reduced transmission of disease. The problems of air and water pollution, toxic effects of insecticides, food additives, and atomic radiation are growing in scope with our technological progress and our rapid urbanization. While the less-developed countries are also suffering the environmental sanitation problems of overcrowded and unplanned cities, the principal problems still lie in the improvement of water supply, excreta disposal, and control of insects for the rural population.

Finally, the state of mental health must be noted even though its assess-

ment on a world-wide basis is far beyond our existing knowledge—or our space in this article. We are informed that in some of the economically developed countries nearly half of the existing hospital beds are occupied by the mentally ill. To what extent this situation is related to the problems of old age, to psychological stresses and strains, to the attitudes of family and community toward mental illness, and even to the availability of mental health services no one is yet prepared to say. Because many studies have indicated that the causes of mental illness often occur in early childhood and that the normal development of the child in relation to his parents, his family, and his society is of vital importance, mental health activities are being given increasing attention by both health and welfare departments.

The availability of health services to the whole population is also an important element in the world health situation. The quality of service largely depends on adequate numbers of trained personnel and secondarily on physical facilities, equipment, and medical supplies. The wide variations between countries in number of physicians and hospital beds in relation to population are set out in the most recent *Report on the World Social Situation* (1957). These calculations show, for example, that while Israel had one physician for every 400 in her population, the Soviet Union one for every 600, and the United States one for every 760, Ethiopia had one physician for 210,000 and Afghanistan, Liberia, and Cambodia one for every 90,000. The number of hospital beds available also show tremendous variation, but since these beds as well as fully trained doctors are often concentrated in urban areas, the data are only significant if studied in conjunction with the availability of rural health centers and of auxiliary health personnel.

Extensive programs for training such auxiliary or "para-medical" personnel have brought health services within the reach of millions of people in recent years.

EDUCATION²²

The goal of creating a healthy and literate society has been accepted by all governments, and for many of the non-self-governing and newly independent countries it has become a major preoccupation in their political response to popular demand and in their public expenditure. In Ghana, for example, school enrollments increased from 183,283 to 578,249, that is, 315.5 per cent in the ten years, 1946–1956, immediately preceding independence and in French Equatorial Africa from 35,986 to 149,166, that is, 414.5 per cent in the same period. Throughout the world, a tremendous expansion of primary education has taken place, in particular, to reach the goal of universal, free, and compulsory education or to cope with the rising tide of school-age children. At some point between 1950 and 1955, the United Nations Economic and Social Council estimated that we crossed the half-way mark in school enrollments—that 300,000,000 children between the ages of five and fourteen were in school out of a total population of 550,000,000 in that age group. This represented a gain of 18 per cent between the years 1950 and 1954.

As in other factors in the world social situation, however, the progress is very uneven indeed. About seventy-five countries with more than 60 per cent of the world's population are still some dis-

tance from the goal of universal education. In twenty relatively small countries, mostly in Africa, less than 20 per cent of school-age children are in school despite considerable effort. In a few countries the number of children who do not receive any schooling is increasing because the child population is rising faster than school facilities. Nevertheless, analysis of the available statistics shows that most of the less-developed countries have made significant progress in raising their enrollment ratios since 1950.

During the same period, secondary school enrollment has increased, on the whole, faster than primary school enrollment in countries at all levels of development—in some cases because of legal measures to prolong compulsory education but in many instances simply because of a de facto lengthening of school life. In many countries this has led to a serious re-examination of the aims, form, and content of secondary education. The broad trend indicates a tendency to blur the distinction between "academic" and "vocational" education. This has taken place in countries as widely different as India, Sweden, and the Soviet Union, where Mr. Khrushchev introduced a great debate on secondary education by his speech in September 1958 "Concerning the strengthening of the ties between school and life and the future development of the system of public education." The demand for more technical school graduates has also been rising markedly as countries increased the tempo of their development programs and has received considerable attention from educators and administrators.

For all types of school education, both the industrialized countries and the economically underdeveloped countries are facing serious problems of teacher-shortage, heavy investment in school buildings, and adequate supplies of teaching

²² These facts are drawn from three main sources: *The Report on the World Social Situation* (1957); the *International Survey of Programmes of Social Development* (1959) and the *Report on Education in Non-Self-Governing Territories* (document A/4131), (July 1959). The relevant chapters have in each case been prepared by UNESCO.

materials. In addition, many countries without enforced compulsory schooling for a fixed period are confronted with problems of wastage and retardation. In India, for example, a study by the Ministry of Education showed that of every one-hundred pupils in class I in 1949-1950 only forty-three were studying in class IV in 1952-1953. In Africa, the Middle East, and Asia, this problem is especially acute among girls. In the view of all educational authorities, this situation represents an intolerable waste of scarce educational resources. In many cases, however, it does not only represent a voluntary withdrawal from school but also results from rural primary school programs which offer four years of schooling or even less. These difficulties are obviously not only budgetary problems for governments but also are closely interlocked with poverty and with the social values of the family and the community.

While primary, secondary, and technical education have received most of the funds available for education in recent years, the problem of reducing the widespread adult illiteracy has also required attention by governments seeking to raise their economic levels and their standards of living. At the mid-point in this decade, nearly one third of all countries still had less than 20 per cent literacy. Slightly more than half had estimated literacy rates of 50 per cent or more. Out-of-school education programs have been undertaken in a fairly large number of less-developed countries under the aegis of fundamental education or community development programs. The use of radio, public libraries, and museums and new attempts to provide reading materials for new literates have all been expended during the past several years. In the industrial countries, the broadening of adult education and the use of educational television to meet new technological needs of our

civilization have been noteworthy developments.

Finally one must look beyond the immediate problems of combatting illiteracy and extending education to all children of school-age to the smaller but equally vital question of providing higher education. The number of university students has been growing so rapidly throughout the world that the facilities in all countries are strained. There is no end in sight of the trend for a higher proportion of students to seek admission to universities as secondary education expands, job requirements become higher, and the increase in child population after the war arrives at university age. New universities are being established in many countries and old ones expanded. The variations from country to country are, of course, tremendous. In most of the African countries and territories, less than 20 students per 100,000 population are enrolled in institutions of higher education, while in India it was 147 per 100,000 in 1953, in the Soviet Union the number was 613 per 100,000 in 1955 and in the United States it was 1,816 in the same year. It is natural that the demand for educated leadership will drive the numbers of applications upward at a fast rate. The number of institutions will have to be expanded more rapidly or the access drastically limited.

HOUSING ²³

The limited successes which nations have achieved in the fields of health, education, nutrition, wages, and social security for the most part cannot be said to extend to housing. The stand-

²³ The summary of the world situation in housing is kept to an absolute minimum in this article in view of the special article in this issue on mutual aid for low-cost housing (see p. 107). See also the *Report on the World Social Situation* (1957), pp. 131-134 and the *International Survey of Programmes of Social Development* (1959), Chap. IV.

ards of housing have deteriorated in many countries for a multitude of reasons. These include the rapid increase in population, the augmented rate of urbanization, the higher investment required for urban housing, and the relatively low priority most governments attach to the problem. In particular the supply of housing available to low-income groups continues to be inadequate, even critical in some countries, exacting a heavy toll in terms of human health and happiness.

In the free-enterprise countries, the gap between the cost of dwellings that meet modern standards and the amount that low-income families can afford to pay continues to widen. In the centrally planned economies, the supply of public housing, although improving in recent years, barely keeps pace with natural population increase and migration to the cities.

For every traveller, the pattern of the urban peripheral slum, with its shacks of mud, tar-paper, and bits of wood, has now become commonplace. The dilapidated "old city" with its densely occupied tenements side by side with a modern commercial, administrative, and upper-class residential center is almost taken for granted. The condition of rural dwellings in much of the world is not so much remarked. There is a dearth of precise knowledge and there persists the romantic notion that housing is not so important as long as one has clean air and plenty of space. Unfortunately this picture usually overlooks the squalid huts huddled in villages with little or no ventilation, with one room for cooking, sleeping, and living during months of rain and torrid heat or bitter cold.

In this decade, housing has become a political problem in developed and underdeveloped countries alike. Most governments have assumed some degree of responsibility for housing, often be-

ginning with housing for their civil servants. In many developing countries, industries have been required by law to provide housing for their workers. Everywhere governments have found the financial burden of providing housing so great that private building is encouraged and in many areas ancient traditions of mutual aid and co-operation in house-building are being combined with technical aid to provide more housing.

GROUPS IN NEED OF SPECIAL CARE ²⁴

In addition to the basic problems which must be faced in raising the standards of living of whole populations and even of depressed areas within otherwise prosperous industrial countries, there exist in every country a series of special social problems which cannot be automatically "cured" by application of drugs, education, increased productivity of agriculture and industry, or even of outside capital. These are the social problems of the orphan, the handicapped, the refugee, the adult offender, or the juvenile delinquent. There has been little effort so far to measure the size of these groups in global terms since definitions vary substantially from country to country but as services to cope with each of these problems have expanded a clearer understanding of their scope and nature has emerged in many countries.

Children deprived of normal home life were, of course, a high priority problem in the Western consciousness after World War II but the extent to which the problem continues as a result of such political upheavals as the partition of India and Pakistan and events in Korea, Indo-China, and Hungary will be reflected in the succeeding ar-

²⁴ Information on these problems is included in Part II of the 1957 edition of the *Report on the World Social Situation* and in Chapter VIII of the 1959 edition of the *International Survey of Programmes of Social Development*.

ticle on refugees. Unfortunately it cannot even be limited to these man-made catastrophes but must also be related to the world-wide rural-urban migrations, to changes in family structure, and to continuing high birth rates in the face of poverty and bad housing.

The impact of these broad social and economic changes on the life of children is still ill-defined in many parts of the world. We know, for example, that African "urbanization" frequently means that the father goes to the city leaving his wife and children in the village where they may continue to be a part of an "extended" family. He may return to visit them frequently, eventually bring them to the city, or establish a new family in the city. Only a relatively small number of the children find their way into institutions. In Latin America, where the female population of the cities is greater than the male population, different problems predominate and considerable numbers of children born out of wedlock are to be found in institutions since their mothers must work. In many Asian and Middle-East countries it is still common to count many children in "orphanages" who have one or both parents whose willingness—and even eagerness—to place their child in an institution is the opposite face of their poverty, their large family, and their overcrowded housing. In a recent visit to a Central Asian Republic of the Union of Soviet Socialist Republics, I found great pressure for the expansion of boarding schools ostensibly to improve the quality of education but obviously also as relief for the working mother with a large family and one- or two-room apartment.

Other tens of thousands of children with or without normal family attachments are "living by their wits" in the streets of our cities today. It is they who are the subject of mounting national and international concern about

juvenile delinquency.²⁵ The General Assembly of the United Nations has recently emphasized the widespread character of the problem of violence by youth "gangs" as well as the mounting rate of more traditional forms of juvenile delinquency by adopting a resolution urging increasing attention by the United Nations.²⁶

The problem of the physically handicapped, in spite of significant scientific and technical advances in rehabilitation, continues to be in most countries unable to provide minimum economic and social security for their citizens an aggravated and pitiful problem of beggary and human misery. The demonstration centers for modern rehabilitation which have been established in many Asian, Middle Eastern, and Latin-American countries since the war touch only a fraction of the men, women, and children who need special care to enable them to fulfill a useful role in society. The training centers for rehabilitation personnel and the expansion of prosthetic shops able to produce low-cost and effective prostheses offer our best hope for the future.

The question of aging populations, especially in the industrial countries, has been noted above in connection with demographic trends. Although the extension of social security and public assistance schemes in many countries has relieved to some extent the basic problem of subsistence, continuing inflation creates much hardship and anxiety among the aging in the developed countries. The problems of chronic disease and mental health for this group have far outstripped the resources of most communities, even in relatively rich countries. In the economically less-developed countries, where the aged in the

²⁵ *International Review of Criminal Policy*, No. 7-8 (United Nations, 1955).

²⁶ *Juvenile Delinquency* (A/Res./1394 (XIV)).

rural areas continue to find their place in the extended family, the strains produced by urbanization as well as a growing proportion of aged population will in all likelihood increase the scope of the problem considerably in our lifetime.²⁷

CONCLUSIONS

What then is the challenge presented to those of us who have a concern for social welfare on an international scale? Basically it has not changed since 1945 or 1952—in broadest terms, we seek (1) to raise the material standards of living for half the world's population; (2) to assist those groups in need of special care without losing sight of the place of such programs in the total social and economic action of the world community; (3) to give assistance in such ways which will increase the sense of fulfillment of the individual, develop a sense of responsibility in the community, and help to build a strong and developing economy; and (4) to achieve an international co-operation based on mutual aid and mutual respect employing all agencies, national and international, public and private, which have a contribution to make to the achievement of these goals.

There have been some notable developments both in our philosophy and our methods for attacking the social problems of the world over the past fifteen years. Most of these will be discussed in the articles which follow. It may be worthy of special note in this introductory chapter that we have increased considerably our understanding of the interrelationship of economic and social factors in raising standards of living and are perhaps reaching for a new synthesis in the work of social scientists, health

²⁷ *The Aging of Populations and its Economic and Social Implications* (United Nations, 1956).

workers, educators, welfare personnel, economists, and engineers. The attention to planning at all levels in both social and economic fields has grown continuously in the years since the war and has accelerated this search for a new synthesis in the development process. The spread of the idea of public responsibility for the welfare of the whole population, including groups in need of special care, has reflected itself in the demands made on international and bilateral agencies for help in planning, organizing, and administering governmental programs in the social field. The emphasis on developing rural areas, virtually unknown in prewar international efforts, has introduced a concept of "balance" in national development which has had a significant impact on international policies and programs.

Our concern about the manner in which we give assistance in the social welfare field reflects itself in many ways but perhaps most clearly in the community development program. Essentially we are advocating a policy which does not extend technical services to a passive population but which enlists their active participation, educates and organizes them, and creates the local institutions fundamental for continuing growth and adaptation to changing circumstances. We believe that this approach not only produces—or creates the potential for producing—a higher standard of living but develops the qualities in the people and the community which offers the best bulwark for freedom. Another way in which this concern for methods is evident is the growing attention in all international technical assistance to the training of local personnel. Not only the fellowship programs which touch a few thousands each year but also the multiplicity of efforts to train administrators, teachers, technicians, volunteer leaders through the creation and

strengthening of national and local institutions are indicative of this emphasis. Moreover these efforts show the common acceptance of the principle that the object of all assistance is to increase the capacity of the less developed countries and communities to help themselves.

Finally, the challenge of world-wide social conditions is manifestly the challenge to international co-operation itself. In the highly interdependent world which modern communications, economics, and technology have created for us, no nation or community is able to solve its social problems in isolation. It is fundamental not only to "coexistence" but also to co-operation that assistance should be based on genuine mutual re-

spect. It is not the function of international co-operation to export western culture to the "underdeveloped" countries. While western medicine and agricultural and industrial techniques may be welcome everywhere, western ways of life are not always so acceptable. If western countries could find the humility to ask advice on certain problems of family stability, juvenile delinquency, welfare of the aging, or integration of minority groups, it would make a considerable contribution to the climate of international co-operation. The challenge will only be met when we are willing and able to utilize all our resources, wherever they may be located, in the war against poverty, illiteracy, disease, and servitude.

The Refugee Problem: Joint Responsibility

By ELFAN REES

ABSTRACT: The refugee, a victim of political events, a man uprooted from his homestead and country, finds himself in a strange land where he is homeless, often stateless, and poverty-stricken. The refugee in Hong Kong, for example, who faces this predicament can find his fellow exiles dispersed globally in such countries as The Republic of Korea, India, Syria, West Germany, and Finland. The dimensions of the refugee problem in the postwar era estimated to include at least forty million persons are indeed frightening. Yet the enormity of the figure cannot describe the individual misery and human tragedy that have befallen these people. Moreover, neither the end of political upheavals nor the concomitant movement of peoples—the unabated dynamism of the refugee problem—are in sight. This situation demands global recognition. The United Nations is concerned with the problem but has been able to give support and succor only on a limited basis. The neighboring nations, who have been obliged to bear the brunt of the immediate crises, must not be left alone to alleviate the misery of these millions.—Ed.

*Elfan Rees, Geneva, Switzerland, is the Representative in Europe of the Commission of the Churches on International Affairs and an Advisor on refugee affairs to the World Council of Churches. He is also Chairman of the Executive Committee of the International Committee for World Refugee Year. Dr. Rees has been President of the Standing Conference of Voluntary Agencies working for Refugees and closely associated from the beginning with the Office of the United Nations High Commissioner for Refugees and with the United Nations Relief and Works Agency for Palestine Refugees. He is the author of *We Strangers and Afraid* (1959).*

IT can be argued as to whether homelessness or hunger most epitomize the greatest single human tragedy of our age. Such an argument is however unprofitable because both homelessness and hunger so challenge the conscience of nations and the peace of the world that both must be regarded as endemic diseases of this century whose eradication will only be possible by international co-operation on a much more massive scale than has hitherto been achieved.

THE HOMELESS MAN

The essence of homelessness—the problem of the refugee—lies in its dimensions and its dynamism.

It is one of the tragedies of the refugee problem that so much of it is the consequence of, and incidental to, world-shaking events whose progress and dangers preoccupy the public mind to the exclusion of all thought for, and often any recognition of, their human consequences. We were rightly perturbed by events in Hungary, in Suez, and in Egypt in 1956, but generally overlook the fact that, as a result, 20,000 refugees from Egypt sought asylum in Europe and Israel, and 11,000 Hungarian refugees still await a solution to their problem. We are concerned about the reunification of Germany but reckon little that, while this seems indefinitely delayed, 25,000 refugees per month have fled the Soviet zone to seek asylum in West Germany. Since 1949 no less than 2,189,225 people have become refugees in this way. The official figure of flight in 1959 is 160,000. An annual and continuing problem of equal dimension to the Hungarian refugee crisis gets less than half its public attention. We are anxious about events in North Africa but scarcely aware that at least 200,000 Algerians have sought asylum in Tunisia and Morocco. Any recent year seems to add almost another million to the world refugee total. Nor

has the tide been stemmed. The year 1959 brought its continuing exodus from East Germany and Algiers while new flights erupted—as they constantly do in this age of exile—in quite unexpected places. There is flight from Tibet.

All over the Indian borderland including Kalimpong, Darjeeling and Sikkim the Tibetan refugees will come to about 10,000 men, women and children. Among these there will not be more than 500 people who can subsist on their own earnings, some 800 or a thousand can live for one year on their own resources; again, about five to 800 can be taken to survive on whatever they have collected while coming from Tibet and the remaining six to 7,000 people are just living on nothing.¹

Other explosions follow with the frequency of atomic tests.

Ghana is facing a mounting problem in the thousands of Ghanaian refugees who have been arriving from the French Ivory Coast since the "anti-foreign" riots there in October. Unofficial estimates were that 5,000 Ghanaians of Ewe tribe origin had now arrived in Ghana as refugees, and others were still coming by air and sea. This was apart from the thousands of citizens of Togoland and Dahomey who also fled from the Ivory Coast.²

South Africa enters the refugee orbit.

The Indonesian government also has provided relief for some 7,500 persons who recently fled from rebel-infested areas in North Sumatra.³ A conservative estimate places the number of Tamil refugees from Northern Ceylon at 20,000. They are now in and around Jaffna, being very well cared for by their government. So the disease is also in Asia.

The forty-year exile

No attempt is being made in this survey to indicate refugee problems that

¹ From a personal letter to the author.

² *The Times* (London), January 10, 1959.

³ This was due to rebel action which began in December 1957.

antedate World War II. At the same time there are problems which persist in raising their ugly heads as if to emphasize that the "Century of the Homeless Man" did not begin in mid-century.

The Greek government recently appointed a committee to draft a bill providing for the early housing of 30,000 persons who came to Greece as refugees from Asia Minor in 1922–1923 and are still living in camps or hovels after having been in Greece for thirty-seven years.

Since 1918 thousands of Assyrians have lived as refugees in Iraq and Syria, while there is a colony of some 5,000 in Lebanon. Recent events in the Near East have made their precarious position more acute.

The painful and intricate question of eligibility deserves special attention. It must be remembered that in all Eastern territories, the mere possession of a certificate of naturalization does not convey to its holder many tangible advantages. Thus, an Assyrian or, for all it matters, a Russian refugee who had become naturalized in Iran, Iraq or Lebanon remains for all practical purposes an underprivileged stranger: he may, perhaps, find work more easily than his stateless fellow-exile, but in illness or in the case of an accident he will get no help from the State, nor any support when he gets old. Social services in the East still remain totally undeveloped, so that the care of the sick and the aged remains the concern of the local clan and family, obviously barred to a stranger.⁴

It is small wonder that men's minds lose track of the immensity and the tragic dynamism of the refugee problem.

The minimum and maximum

Refugee statistics are a pitfall for even the most wary. There is a vast margin of error, for counting heads in a crisis is always difficult; moreover,

⁴ From a private report.

statistical procedures vary across the world from the scientific to mere guesswork. It is probably wise to assume that even the most conservative estimates are inflated. Indigent natives seeking the meager benefits of refugee status misrepresent themselves; governments anxious for maximum international assistance are not guiltless of inflation; and voluntary agencies desperately seeking support for their programs sometimes exaggerate, not indeed their needs, but the dimensions of their problem.

The validity of statistics will also vary considerably according to the definition of a refugee that is accepted and applied. The United Nations purist, faithful to somewhat narrow and restrictive definitions, will obviously arrive at a smaller total than the humanitarian whose concern and compassion is for uprooted people everywhere. It is not proposed here to indulge in yet another dialogue on definition. The member governments of the United Nations, in arriving at their definitions, were clearly concerned to contain to a minimum the numbers who might, by definition, have a claim to international protection and assistance. The German Federal Republic must obviously apply quite other criteria in deciding who is a refugee.

For the purposes of this study we shall regard as a refugee anyone who has been uprooted from his home, has crossed a frontier—artificial or traditional—and looks for protection and sustenance to a government or authority other than his former one. By this definition and mindful of the pitfall of statistics it is certain that at least 40,000,000 persons have become refugees since 1945. How many of them continue in their plight in 1960, for how many of them a solution to their problem remains elusive, is a much more difficult issue to decide. A review of the present situation by areas is prob-

ably the only way to arrive at a reasonably accurate appraisal.

THE FAR EAST

In 1953 there were 9,000,000 homeless people in the Republic of Korea but not all of them were refugees from north of the 38th parallel. Many were war-time displaced persons who were slow in returning to their original homes. Time and vast reconstruction programs have had their effect but it is officially reported that there are still 3,000,000 persons who are unsettled refugees in the Republic.

When Vietnam suffered the fate of Korea and was also bifurcated in the interests of coexistence, 900,000 refugees, mostly of Roman Catholic faith, fled south of the 17th parallel. The "Economic Survey for Asia and the Far East" for 1956 reports on this:

The arrival in southern Viet-Nam of about 900,000 refugees had brought crucial problems to a country with a total population of 11 million. By 1956, however, a substantial number of refugees had been resettled and, while many problems were still to be solved in this respect, they were no longer of such a magnitude as to threaten the stability of the country's economy. (The resettlement) was facilitated by favourable factors, such as French and United States aid, the existence of uncultivated land and the industrious nature of the northern Viet-Nameese who were able to adjust to new circumstances. Good use was made of these favourable factors. The refugees were distributed in 325 villages, of which 300 were under the charge of the Commissariat for Refugees. Three categories were established. In the villages of Category A, which number approximately 100 and include more than one-third of the refugees, a programme of activities has been implemented and the financial help to the village has gradually been withdrawn. In this category, it is estimated 60 are already totally self-sufficient. The villages in Category B have a programme of activities but it is still in a transitory stage. Cate-

gory C includes about 50 villages in areas in which security has been recently restored.⁵

The establishment of the separate states of India and Pakistan in 1947 was followed by one of the largest migrations our era has known. It is estimated that 8,500,000 Hindus and Sikhs left Pakistan for India and that 6,500,000 Moslems fled from India into Pakistan. These refugees, like the German expellees, were granted full rights of citizenship in their new countries. This and the fact that the widespread poverty of both countries tends to minimize the difference between a refugee and a native, obscure, at least in part, the full magnitude and nature of this particular problem. It remains true however that over 5,000,000 of these refugees remain landless and homeless and are accordingly persons lacking any permanent solution as yet.

The dual refugee problem

Hong Kong is the focal point of two refugee problems quite different in character but equal in tragedy. Ten-thousand Europeans in China are registered with the Office of the United Nations High Commissioner as refugees in need of protection and assistance—neither of which can be extended to them *in situ*. The Shanghai branch of the High Commissioner's Office had to be closed down in May 1956 at the request of the Chinese People's Republic. Most of this group are refugees from the Russian Revolution of 1917 or their children; others are refugees from Nazi persecution. Evicted from their homes, denied the right to work—and often lacking the strength—they are among the most needy and most pitiable refugees in the world.

The problem of saving their lives by

⁵ United Nations Sales No. 1957.II.F.1 (United Nations, Hong Kong and London, 1957), pp. 169, 170.

resettlement has been primarily one of securing exit permits for them from China to Hong Kong, whence they have been moved by the Intergovernmental Committee for European Migration (ICEM) to countries of resettlement. After a disheartening period of financial crisis the prospects of a successful operation have materially improved. Even though ICEM has special funds large enough to move 3,400, visas are now available for 7,000. The unresolved problems are, more money for ICEM, more exit permits from China and, given these, some 3,000 more visas.

For reasons that are discussed below, the government in Hong Kong cannot admit indefinite numbers of these refugees without the assurance of their onward movement. There is a real danger that the Chinese People's Republic may be able to score a propaganda victory by showing when the free-world's opportunity to act comes that the five-year concern for these refugees was empty hypocrisy.

Hong Kong has its own intractable refugee problem. Out of a total population in the Colony of 2,500,000 more than one million are officially classified as refugees from mainland China. According to percentage figures, this is the second highest incidence of refugees in a local community in the whole world. They present the Colony with massive problems of housing, health and fire risks, unemployment, and, on occasions, political instability. Despite heroic efforts and quite disproportionate expenditures by the government in Hong Kong the majority of these refugees still live in appalling squalor and overcrowding in hillside shanties or rooftop huts.

It is estimated that 110,000 refugees are living in tin-and-hessian huts on the roofs of buildings. Four tenement huts destroyed in a recent fire in the Kowloon mainland area were housing 111 men, 116 women and

139 children, with 146 others in 20 squatters huts on the roofs.⁶

The situation is complicated by the decision of the government not to distinguish, in need and available services, between the refugees and the native poor of the Colony. It is true that many of the less-poor refugees have exacerbated the lot of the poorer natives by buying their homes and displacing them. The nondiscriminatory decision of government is, therefore, understandable and almost inevitable, but it seriously complicates the issue of international aid in a refugee situation. It should be added that, were it not for border control between the Colony and the mainland, the local refugee problem would be even more intolerable than it is.

Hong Kong has lived up to the highest traditions of the right of asylum but quite obviously has been limited by its absorptive capacity. Here is the first instance in our global survey where frontier control reduces the actual potential of the refugee problem. As we examine Europe we shall see that, even in this age, there are more refugees in intent than there are in fact. This then is the situation in Asia and the Far East. It is a tale of some 21,532,500 persons who have become refugees in a decade. In India about one person in forty-two is a refugee, in Vietnam one in twelve, in Pakistan one in eleven, in Korea one in three, and in Hong Kong nearly two in seven.

THE MIDDLE EAST

The refugee problem in the Middle East is more widely known, though not necessarily appreciated, because it impinges much more sharply on current political issues than does that of the Far East. The latest official count gives a figure of over one million Arab refugees from Palestine who are officially

⁶ *The Times* (London), March 10, 1957.

registered with the United Nations Relief and Works Agency for Palestine Refugees (UNRWA). By definition an Arab refugee from Palestine is a person whose normal residence was Palestine for a minimum of two years preceding the outbreak of the conflict of 1948 and who, as a result of the conflict, has lost both his home and his means of livelihood.

There is a continuing controversy about these figures which need not engage us here. Three facts are clear. The total quoted does not represent the number of Arabs who fled Palestine in 1948. The reported excess of births over deaths among the Arab refugees is 30,000 each year. There are therefore some 250,000 children under eight years of age who were born refugees. There are undoubtedly many hundreds of persons in Jordan registered as refugees who have no title to that status but this figure may well be balanced by others, especially children, who are eligible but not recognized. So long as the Jordanian government persists in its refusal to revise the rolls, this muddle will persist.

The Arab refugees are to be found today, as indeed they have been for over ten years, in Syria, in Lebanon, in Jordan, and in the Gaza Strip in Egypt. In Syria they amount to 2.4 per cent of the local population, in Lebanon to 7.4 and in Jordan 56.3.⁷ It will be seen that in the Hashemite Kingdom of Jordan the refugees outnumber the local population—the political consequences of this are almost daily evident in world events. In the Gaza Strip—some thirty miles long and five miles wide—no less than 230,000 refugees and 80,000 natives are completely marooned.

The Arab refugees have endured ten years of angry exile. Their situation has

⁷ It should be noted that many persons remain on the refugee rolls even though they have been granted Jordanian citizenship.

been so stagnant that being a refugee has become an institution if not a privilege. The UNRWA ration card is the only form of security they know. Indeed it is oftentimes, notably in Gaza, a form of security superior to that which is available to the nonrefugee Arab. It is well known that the ration card is very tangible currency and security in the Middle East. This particular refugee problem is so charged with political overtones that the underlying human tragedy of so many wasted lives, of so much frustration, bitterness, and hatred is far too often overlooked.

There is another aspect of the Middle East refugee problem that is also frequently ignored. It is necessary to remember that concurrently with the perpetuation of the Arab refugee problem more than 400,000 Jews have been forced to leave their homes in Iraq, Yemen, and North Africa. They have not been counted as refugees because they were readily and immediately received as new immigrants into Israel. Nevertheless they were forced to leave their traditional homes against their will and to abandon, in the process, all that they possessed.

EUROPE

In the decade under review no less than 15,000,000 refugees and displaced persons have crowded into Western Europe. By far the greatest single group of these are the German expellees and refugees. From the German provinces east of the Oder-Neisse line, from the Sudetenland, Poland, and other Eastern European states no less than 18,000,000 Germans were expelled from their homes after the Second World War. Millions died in the horrible process, millions more disappeared but some 13,000,000 survived and arrived as penniless refugees, 4,000,000 in the Soviet zone of Germany and 9,000,000 in the Federal Republic. They constitute in fact 17

per cent of the population of the Federal Republic. In great measure the German authorities have been alone in their efforts to deal with the problem.

Little has been said and less is known in the world-at-large about this massive crime against humanity. The World Council of Churches at its Hamburg conference in 1948 sought to break the conspiracy of silence that shrouded this tragedy, but with only partial success. It may well be that it has been the deliberate policy of guilty men to ignore and forget the enormous consequences of their criminal foolishness. In this case the United States and the United Kingdom must bear a great burden of the guilt. It was the victorious powers that, by Article XII of the Potsdam Agreement, authorized the mass expulsion and expropriation, and it was they who, by default, failed to ensure the fulfillment of their own requirement that it "should be effected in an orderly and humane manner." Small wonder that Albert Schweitzer was moved to write: "This is the worst violation of historic truths and of the rights of man: when the right to their homeland is denied to certain human beings so that they are forced to leave their homesteads."⁸

As though this were not burden enough, no less than 2,900,000 German citizens resident in the Soviet zone, the so-called "German Democratic Republic," have abandoned everything and sought asylum in the West; and the flow is mounting rather than diminishing. Nor is this the end of the tale in Europe. Ideas of expulsion, particularly when it also involves expropriation, are not slow to seize hold. Six-hundred thousand "Volksdeutsche," whose ancestors peopled and cultivated the Danube basin for five centuries, have had to seek asy-

⁸ Quoted in, *After Ten Years: A European Problem—Still No Solution* (Frankfurt am Main: Wirtschaftsdienst Verlag und Druckerei G.M.B.H., 1957), p. 5.

lums in Austria. Three hundred and fifty thousand Bulgarians of Turkish ethnic origin were expelled to Turkey. Four hundred thousand Karelians have similarly found asylum in Finland since the Karelian Peninsula was ceded to the Soviet Union by the 1947 peace treaty. All these groups have one characteristic in common. They have sought asylum from, and thrown themselves upon, the mercy of, their own kind. They are strangers but not among a strange people. Community of language, faith, culture, and social organization provides a cushion that both minimizes the shock of exile and increases the chances of assimilation.

Unhappily this is not true of all refugees in Europe. Nothing tempers the cold wind of exile for the ultimate refugees—those who come within the mandate of the United Nations High Commissioner. Leaving home and hearth of their own decision, withal compelled by fear, risking their lives en route, they reject, as they go, any right to the protection of their government and so arrive, defenseless and helpless, in a strange country with a strange language and other customs, the bewildered guests of embarrassed hosts who have no obligations toward them other than those dictated by common humanity. They are indeed "the men who came to dinner."

THE ULTIMATE REFUGEES

There have been slightly more than one million of these ultimate refugees in 1959. Most of them are in Europe although there are small pockets of them in the Middle East and, as we have seen, 15,000 in China. Some of the refugee problems we have examined would have been orderly exchanges of population, if they had been more humanely and more pacifically organized; others could have been planned migra-

tions. Here is one-way traffic from nationality into statelessness.

It was never intended by the authors of the Atlantic Charter that men in our time should have to choose between "Freedom from Want" and "Freedom from Fear." The choice is being made every day and those who make it become refugees. In the main they knock at the doors of those free countries contiguous to the "iron curtain"; thus to Austria, Germany, Greece, and Italy they have come and keep on coming. It would be indefensible to make these countries by reason of accidents of geography alone responsible for this tragic burden of people. This has been recognized, if somewhat narrowly, by the United Nations and, by its action, these refugees, and only these, are the wards of the High Commissioner: his Office is responsible for their protection and for the search for a permanent solution to their problem.

FORTY-MILLION DISPOSSESSED

In our survey from east to west we have noted the creation, since 1945, of more than 40,000,000 refugees. Current events always seem to add to their number. There is evidence that the refugee problem is both dynamic and endemic in our times.

This migratory movement is not yet finished. It is also not restricted to Europe alone. A dispersion zone reaches in a vast half circle around Communist dominated North Asia and East Europe, from Korea over China and Indochina, over the Near East with its refugee distress resulting from the Arab-Jewish conflict, through all of East-Mid-Europe up to Finland that has succeeded in solving its refugee problem

in an exemplary way. Who can say how many people in this dispersion zone—who were forced to flee or were deported or resettled—have fallen into dire poverty or have perished in it.⁹

It is not without its significance that whereas the General Assembly of the United Nations has declared a World Refugee Year, the Food and Agriculture Organization is contemplating a Freedom from Hunger Campaign. The latter agency has recognized in advance the long-term nature of its task. The United Nations has been singularly obtuse in thinking that the refugee problem could be solved by "crash programs" and time-limited agencies. Even now there are too many governments and too many people who imagine that World Refugee Year is the panacea to all these ills.

The numbers involved in this tragedy and the problems arising are too many and too complex for quick solutions; thus a long-term task is inevitable. Nevertheless if, in a year of special endeavor, we cannot solve the refugee problem, we can solve the problems of more refugees than is possible in the disquieting indifference of an ordinary year. There will inevitably be a depressing aftermath—the tragedy of the disappointed refugee who is even more disillusioned than before. That will be the long-term task.

Curiously enough, it was Lenin, in exile in Switzerland, who said, "A refugee is a man who votes with his feet." There is a bigger pedestrian poll today than ever before. They vote for freedom. We ignore their vote at our peril.

National Efforts in the Field of Social Development

By GEORGE F. DAVIDSON

ABSTRACT: First, a working definition, or description, of social development is attempted in order to distinguish it from economic or community development. Next, reference is made to factors which have created the tremendous postwar upsurge of interest in social development, particularly in the United Nations and its related agencies. This leads to consideration of problems faced by national governments, particularly in newly independent, underdeveloped countries, as they attempt to meet their responsibilities—often written into their constitutions—in the field of social development. Each country faces the difficult problem of priorities. Some, like India, frankly recognize the necessity of giving priority to economic and industrial development. Others, like Pakistan and the Philippines, attempt, not always successfully, to strike a balance between economic and social development. In still others, certain kinds of social development programs—for example, in health or education—may actually be a precondition of successful economic development. Seldom can less-developed countries give high priority in their social development plans to social security or insurance programs. The article concludes that each nation must resolve the problem of priorities for itself: international or bilateral advice, technical assistance or even financial aid cannot substitute for national effort in the field of social development.

George F. Davidson, Ph.D., L.L.D., Ottawa, Canada, is Deputy Minister of National Welfare for Canada, a position he has held since 1944. He presides, since 1955, as Chairman of the National Joint Council of the Public Service of Canada and, since 1956, as President of the International Conference of Social Work. Dr. Davidson's active career in social work has included tenure as President of the United Nations Economic and Social Council (1958), Chairman of the Social, Humanitarian, and Cultural Committee, United Nations General Assembly (1953), and President of the Canadian Conference of Social Work (1953-1954). He is a graduate of the University of British Columbia and of Harvard University.

THE word "development" shines like a freshly minted coin in the currency of international discussion. Like all currency and coinage, it appears in several denominations—economic development, community development, and social development. Much is also said and written these days in international meeting places concerning "balanced" or "integrated" economic and social development. More and more the conviction is growing that economic development and social development are really not separate coins at all but opposite sides of the same coin. For the purposes of this paper, it will perhaps be useful at the outset if an attempt is made to examine at least one of the faces of this coin and to indicate what is meant by the use of the expression "social development."

SOCIAL DEVELOPMENT DEFINED

Social development connotes, first and foremost, movement and progress—a dynamic process of evolution and growth—directed towards the achievement of desirable social goals. In its broadest sense, it may be described as including every action, governmental or voluntary, which contributes to building up the structure, both infrastructure and superstructure, of social policies and programs which alone can assure the maintenance and improvement of family and community levels of living and lead to social progress.

Broken down into its component parts, social development embraces everything that is done in the field of health—both preventive and curative—education, labor standards and employment practices, housing, nutrition, child and family welfare, and protection from economic insecurity, whether through provision of help "in kind" or through income maintenance payments of various kinds provided on a taxation or insurance basis. In each of these fields, as

the structure of our society becomes increasingly complex, and this applies to countries in all stages of development, a variety of institutional facilities and community services is required. These facilities and services may take the form of physical institutions, such as schools, hospitals, universities, clinics, child welfare institutions, and housing projects or agencies, such as departments of government, employment exchanges, family and child welfare agencies, and community centers. The social benefits derived from these programs may vary in form from teaching, health care, vocational training to the protection of wage levels and working conditions as provided by standard-setting legislation. They may also take the more tangible form of actual care and maintenance in an institution, or cash income payments provided through social insurance or social security laws. These as well as many other components form the concept of social development which national governments, international agencies, and community groups at all levels of society are endeavoring to promote and strengthen in the interests of individual family and community betterment.

THE UPSURGE OF INTEREST

The postwar years have witnessed an unprecedented upsurge of interest and activity in the field of social development. Laying aside the instruments of war, governments, old and new alike, have turned their attention either to the rebuilding of standards of economic and social well-being which had been gravely undermined or even shattered by the war, or, in the case of newly independent states, to the creation of a new, ambitious and much-improved living standard for their people, impatiently waiting to taste the benefits of their new-found freedom. The most authoritative and detailed accounts of these many national initiatives in the direction

of social progress are to be found in the two International Surveys of Programmes of Social Development published by the United Nations Bureau of Social Affairs and covering generally the period 1945 to the present time.

Perhaps one of the most significant indications of the importance attached to social progress by states and peoples in the modern world is found in the number of national governments which have actually included the concept of social action or social progress, and the state's responsibility for promoting it, in their respective constitutional instruments. Constitutional provisions are not, of course, self-implementing; indeed, it is a well-known fact that some of the most flowery and far-reaching constitutional provisions in the social field are honored more in the breach than in the observance. Nevertheless, it is important to note that more than fifty states in the postwar years have made formal provision for the inclusion within their constitutional instruments of sections outlining, frequently in fairly specific terms, the national government's responsibility for achieving social well-being for its people. This is a most impressive record of progress compared to the number of states taking similar action in any earlier comparable period. Significant is the increasingly widespread acceptance by the modern state, as one of its natural and proper functions, that it should actively develop, promote, and implement policies designed to improve living standards for the masses of the people. This is indeed a far cry from the "laissez faire" concept of the role of government which was prevalent almost universally up to the turn of the century and which was still widely held to be the proper function of government even as recently as the decades between the wars.

It is interesting to speculate as to the reasons for this dramatic upsurge of

interest on the part of governments in the strengthening of social standards within their respective national communities. It has been noted on various occasions that, paradoxical though it may seem, interest in social progress and reform rises to new heights in periods of war. As a result, the years following a major conflict witness, not infrequently, a major forward movement in the social field. This phenomenon has occurred on at least two occasions in the present century. Certainly the decade following the close of World War II has produced an unprecedented wave of comprehensive social plans and programs in both the developed and the less-developed countries. This trend has been accentuated by the emergence in the postwar years of a world-wide United Nations Organization created in the belief, expressed implicitly in its structure and in its Charter, that the deep-seated roots of world unrest are just as likely to be economic and social as political or military in character.

International agencies

The United Nations is, of course, only one of many international organizations created in the postwar years to reflect the concern of governments and peoples everywhere with social problems and to provide a focal point for constructive national and international action. The four major specialized agencies, the International Labour Organisation, the World Health Organization, the Food and Agriculture Organization, the United Nations Educational, Scientific and Cultural Organization; concentrate most of their effort and attention on problems of social development. Other examples are furnished by the United Nations Children's Fund, and the Office of the High Commissioner for Refugees and its predecessor organizations. In part—and certainly in their origins—each of these organizations was created

in response to a clearly felt need, worldwide in its extent, for some stimulus to greater action in the field of labor standards, health, food production and nutrition, education, child welfare, or refugees. Once created in response to these felt needs, each of these organizations has itself, by its activities, contributed much to the awakening of still greater interest in the problems of and opportunities for social development arising in its particular field. These international agencies, by their leadership, stimulus, and support, provide substantial reinforcement to the efforts which are being made everywhere by national governments to develop and improve their social policies and programs. International assistance thereby helps the national governments achieve their ultimate goal: the improvement of the social and living standards of their people.

It is, of course, axiomatic that international leadership and action, however well conceived, can only be effective in most of these social fields as a reinforcement and support of efforts made at the national level. International effort can never replace national effort; indeed, experience is showing with increasing regularity that only as clear-headed and conscientious effort in the development of social policies and programs is made at the national level does international leadership, guidance, and assistance become meaningful. Let us examine, therefore, some of the main problems faced at the national level as governments and peoples endeavor by their own domestic initiative and effort to advance their standards of social well-being.

THE PROBLEM OF PRIORITIES

The issues present themselves in most dramatic and uncompromising fashion in the case of the underdeveloped countries, many of whose peoples are still seething

in the ferment of a new-found freedom, recently and hardly won and precariously maintained. The problems faced by a newly independent people, struggling to emerge overnight in all the complex paraphernalia of a twentieth-century state, are understandably overwhelming. So much has to be started from the very beginning. Low levels of productivity condemn the masses of the population to a poverty that is almost endemic in its effect and character. The debilitating effects of poverty are compounded by low health standards and widespread disease and epidemics. Without a healthier, better-fed, more vigorous working force, the infant nation's productivity and economic strength will always remain low. Even if it becomes possible through improving health standards to develop a strong, healthy, alert, and vigorous population, there is still the problem of converting an ignorant, illiterate, and often primitive populace into an intelligent, well-trained, modern working force capable of working, producing, and living with meaning and purpose in a modern, industrial world.

The social economists term this struggle in the underdeveloped nations the vicious circle of poverty, disease, and ignorance. Educators may prefer to designate ignorance as the "original sin," giving rise to the other two; medical and health workers would undoubtedly give disease the place of honor at the head of the list. It really matters very little which of these social blights comes first and which two follow after. What struggling nations desperately need to know is: How to break the vicious circle? Where to start? What problem deserves priority of attention? Should social reform, crying out for attention, receive first priority? If so, where to begin? With health? With education? Nutrition? Housing? Or should economic growth and productivity receive prior

emphasis, leaving social progress to a later stage when at least a marginal economic surplus exists which can be converted into social gains?

These questions illustrate the terrible problem of priorities faced by all nations, but more particularly by the less-developed countries as they endeavor to surmount the problems of social development in their respective jurisdictions. The stark fact is that, for the most part, social gains can come only from economic surplus, making possible some social redistribution of the nation's wealth through services or other benefits in cash or kind. In the case of nations whose populations are, almost without exception, living at the poverty level or below, the possibility of taxing surplus wealth to provide social benefits are almost nonexistent. For this reason, in many of the less-developed countries, the hard decision has been taken to give priority to projects concerned primarily with economic development, leaving to a later date the hope that, when economic improvement has made itself manifest, some portion of the nation's newly created and acquired wealth can be converted into social gains through carefully selected social development projects.

INDIA

In India, for example, the government has resolved, even more than in most countries, to proceed on lines of strict austerity and to give a clear priority to economic and industrial development projects, in the conviction that this is, in fact, the surest and quickest way to achieve a real and lasting improvement in the standard of living of its people. Since India's development plan requires that most additions to the nation's annual output go into industrial expansion and not into the production of more consumer goods, it has been necessary to limit severely the new services pro-

vided in the social field to specially vulnerable groups or those in need of special assistance. In Nehru's own words, "this generation of Indians is sentenced to hard labour."

Consistent with this attitude and policy, the first five-year plan for India, covering the period 1951 to 1956, devoted almost one third of its total outlay to irrigation and river control projects, one quarter to the expansion and modernization of transportation and communications, one fifth to agriculture and community development, and one tenth to industrial development, including cottage and decentralized industries. Only after these requirements had been taken care of did the plan include provision of a modest share—something less than one fifth of total projected expenditures under the plan—for social development in all its forms, including health, education, housing, rehabilitation of refugees, aid to the unemployed and other groups in special need, and so on.

Chester Bowles, in his vivid account entitled "An Ambassador Reports," gives a striking illustration of India's policy in action. He relates how, in 1952, the Indian government cut out nearly \$100 million in food subsidies, designed to hold down food prices, in order to speed up the building of a number of great river valley developments. Queried about this in Parliament, the government spokesman stated simply: "We must take some bread from the people today so that tomorrow there will be electric power, expanding industry and an end to India's age old poverty."

Social programs

Despite its openly avowed policy of giving priority to economic over social development, the Indian government has none the less embarked upon a number of basic and fundamental social development projects which, in their dimensions, stagger the imagination. In the health

field, for example, India's first five-year plan laid out a carefully conceived program involving a concerted effort to improve community water supplies and sanitation; massive malaria control and other preventive health measures; special health programs for the rural population and, in particular, mothers and children; and an intensified program for the education and training of medical and other health personnel. The second five-year plan continued to stress the development of adequate numbers of professional and technical personnel, the improvement of environmental sanitation, the control of communicable diseases, and the expansion of institutional facilities of all kinds required in the health field.

One example will suffice to depict the magnitude of the problems faced, and the heroic scale on which solutions were being sought. At the beginning of the first five-year plan, malaria was taking the lives of well over a million persons annually: well over 100 million of the Indian population were malaria sufferers. The debilitating effect of this on the health and productivity of the working population is literally incalculable. The first five-year plan set as its objective the reduction of the number of malaria sufferers from 100 million to one million or less. The program of spraying with DDT, begun with the help of United States funds under the first five-year plan, was continued under the second plan, with the result that malaria is now in the process of being brought under control for the first time in the history of the Indian subcontinent. And this has been undertaken during a period in which the government of India has avowedly been devoting its major efforts to projects in the economic, rather than the social field!

One other example, taken from the field of education, will serve to indicate the scale on which these social develop-

ment projects in the less-developed parts of the world have to be undertaken if trained men and women are to be made available to meet the requirements of accelerated economic and industrial growth. Literacy, like health, is one of the keys to success in any effort to achieve major economic and industrial progress. Indeed, as Professor Hla Myint has stated, in a paper presented to the Ninth International Conference of Social Work, "basic expenditure on health and education emerges as the key to the problem. It is, in fact, a *pre-condition* to economic development."

OTHER COUNTRIES

Recognizing this, the government of the Philippines, in its five-year plan of social development (1958-1963), proposed to allocate 30 per cent of its national budget to education. The government of Pakistan, in formulating its five-year plan for economic and social development (1955-1960), recorded its conviction that "of all the social services that go to build up the people, education is the most important"; and in conformity with this principle, it set out to provide increased facilities for technical training and education and to add one million additional children to its primary and secondary schools. As for India, which had in 1951 some 26 million children in primary, secondary, technical, and vocational schools, the first five-year plan's objective was to increase this number to 36 million; while outside the schools, India has set as its goal the wiping out of illiteracy among 250 million of its people over a period stretching out to 1972. As Chester Bowles has pointed out, the Soviet Union under a dictatorship taught 100 million of its people to read and write within the decade 1925 to 1935: if India succeeds in her much vaster undertaking in a comparatively shorter period of time,

it will represent one of the historic and unforgettable victories for free and democratic government in Asia and indeed in the entire world.

Not all countries, of course, have weighted their development planning as heavily on the side of economic and industrial growth as has India. Other countries have striven from the outset to achieve more of a balance or proportion between the amounts of national wealth devoted to the furtherance of economic development and investments for social purposes. For example, the government of the Philippines, in its three-year program of Economic and Social Development, has prescribed as a basic principle that the yearly increases in national income shall go partly to increase capital formation and partly to increase the consumption standards of the people. Pakistan likewise, in its five-year plan for Economic and Social Development already mentioned, has set out "to develop the resources of the country as rapidly as possible so as to promote the welfare of the people, provide adequate standards, social services, secure social justice and equality of opportunity, and the widest and most equitable distribution of income and property."

Competition for resources

While one of the objectives of the Pakistan plan is to make steady progress in providing social services—housing, education, health, and social welfare—the tragic finding of actual experience with the plan has been that resources for these purposes have been sharply limited because of the competing need for investments in productive sectors of industry and agriculture on which the possibility of further social gains depends. In fact, the close of the five-year period for which the plan was made finds even its relatively modest social goals in large part unfulfilled.

The illustrations given from the experience of three Asian countries—India, Pakistan, and the Philippines—are broadly typical of the experience of most underdeveloped countries, in Asia, Latin America, Africa, and the Middle East, as they endeavor to provide some help from their meager resources for programs of social development. Time and again national governments find that laudable social goals which they have set for themselves, and which they have frequently enshrined as an obligation of the state in their constitutions, cannot be achieved without a dangerous diversion of resources sorely needed in building up the economic strength of the state itself. This has led, in many instances, to the over-simplified conclusion that all social development programs are unproductive and a net burden on the economy of the state, and that all economic development projects, by contrast, create and add to national wealth. The fallacy of this is now becoming increasingly apparent as nations learn that splendid hydroelectric projects, or cement plants, or giant factories, or mechanized equipment do not all automatically or speedily create a flow of new wealth throughout the national economy. Some of these economic development projects have proven to be strangely unproductive, particularly when there has been failure to develop, along with physical plant and capital assets, a trained and healthy labor force that will make it possible to operate and utilize these modern physical assets for the interest of the total community.

COMBINED OBJECTIVES

More and more, in the light of experience with economic and social development in the postwar years, individual nations are beginning to concentrate their efforts on types of projects which have combined economic and social objectives. Increasingly, efforts are being

made to avoid the arbitrary grouping of projects into "economic" and "social" classifications. As the "United Nations Report on a Co-ordinated Policy regarding Family Levels of Living" points out, such a classification "tends to assume quite unjustifiably that social problems can be solved only by social measures and economic problems only by economic measures." Attention is now being concentrated on projects with a social purpose which in themselves contribute to the possibilities of higher productivity; and this involves, of course, a choice between a wide variety of social and economic projects—a choice in favor of land reform and accelerated food production, for example, or large-scale health measures such as malaria eradication, or educational projects such as vocational training—all of which have a fundamental social purpose, but also produce significant economic results as well.

SOCIAL INSURANCE PLANS

As a corollary to this, it follows, of course, that certain types of social expenditure are given a correspondingly low priority, precisely because in themselves they make relatively little contribution to productivity. Many, if not most of our typically western social security or social insurance measures fall in this category. Income maintenance programs, involving the redistribution of income through insurance, means-test or similar programs have great social significance in the highly industrialized western countries where wages and productivity are relatively high, and where taxation of income and wealth of the majority can be resorted to in order to protect the living standards of a minority who fall below the danger line. But in countries such as India, where three quarters of the people already live in poverty, with most of them close to the hunger line,

western-type social insurance or security measures can have little meaning, because they are simply not workable. This is why the United Nations Group of Experts on Family Levels of Living stressed that systems of generalized insurance belong to a relatively advanced stage of development and gave as an order of priority for underdeveloped countries, first of all the organization of social services, secondly benefits in kind, and finally cash benefits. While there are always dangers inherent in any attempt to generalize, this is probably a reasonable rule of thumb for most countries to follow, especially the less-developed ones, in their efforts to develop higher levels of social well-being for their people.

NATIONAL EFFORT AND DECISION

What, then, are the lessons to be drawn from the varied experiences of nations both new and old as they embark upon efforts to promote their national social development? Probably the only safe conclusion to be drawn is that each nation must develop its own pattern and set its own pace for social development in the light of its particular circumstances. In some countries the basic infrastructure of facilities and services in fields such as health and education may be sufficiently advanced to justify the expectation that economic development projects can be successfully undertaken. These projects will yield in time returns on the human and material investment made, which can later be converted into social gains for the people. In other countries, the first and fundamental attack may have to be directed to the development—through intensified health and education programs—of the human resources themselves before there can be any real hope of substantial success in promoting economic development. In still a third type of society—already

fairly well advanced in terms of economic and social development—the approach to further progress may be in the direction of developing a comprehensive network of social welfare and social insurance measures, geared to the needs of an industrial wage-earning economy in which income maintenance emerges as a major socioeconomic problem.

In each of these situations, international agencies or more fortunate nations stand ready and willing to provide technical assistance, expert advice and, in many instances, significant, if not sub-

stantial, financial help. But while this help from other sources may be both invaluable and indispensable, it does not, and can never provide, the foundation on which the national structure of social development is erected. The design, the foundation, and the main outlines of such a structure must reflect the cultural patterns, the value judgments, and the aspirations of the nation itself. In the final analysis, there can be no substitute for national effort, national sacrifice, and national determination in promoting and in achieving national social development.

Intergovernmental Channels: Activities in the Social Field*

By MARTHA BRANSCOMBE

ABSTRACT: While the principle of intergovernmental co-operation in the field of social welfare was well established prior to World War II, the current widespread activity and proliferation of channels have developed in direct response to the postwar social upheavals and the rising tide of newly independent nations. Present intergovernmental co-operation is conducted through a multifarious network of international organs. There are those linked to the United Nations as well as a more diffuse group of intergovernmental organs with an independent existence. The Economic and Social Council, an organ of the United Nations, which bears the main responsibility for United Nations social policy is also the co-ordinator of the specialized agencies' social welfare programs. In addition to the complex structure of intergovernmental organizations, their efforts encompass all facets of the social field. In such an enormous undertaking the major problem is the co-ordination of these activities and the channels through which they move.—Ed.

*Martha Branscombe, Ph.D., New York City, has been Chief of the Social Service Division, Bureau of Social Affairs, United Nations, since 1954. She formerly served, among other affiliations, as Chief of the Child Welfare Branch of the United Nations Relief and Rehabilitation Agency (UNRRA); European Representative of the United States Committee for the Care of European Children; Director, Elizabeth McCormick Memorial Fund; and Assistant Chief of the United States Children's Bureau. A graduate of the University of Chicago, Dr. Branscombe is the author of numerous professional articles and the book, *The Courts and the Poor Law in New York State, 1784-1929* (1943).*

*The views and opinions expressed in this article are those of the author and do not necessarily represent those of the United Nations.

IT is no longer news that "our world of today is more than ever before one world." Nevertheless, it remains notable in the history of man that the vast social upheavals through which we are passing have brought about wider recognition and increasing knowledge of the social conditions and needs of the world's population and an unprecedented expansion in the conception of the social responsibility of the international society as regards such needs.

The principle of intergovernmental co-operation in the social field was well established by the end of the First World War, but the greatest increases in co-operative activities and in the channels and resources for this purpose have come during the past decade. Not only has there been a vast extension in the range of social matters in which governments have recognized a common interest, but changes have occurred in the kind of action considered appropriate for international bodies. This is an important factor in the vitality of intergovernmental co-operation in the social field.

Too often the facts and the significance of the advances in the collective efforts of people and governments to achieve social goals continue to go unnoticed or to be inadequately recognized. Most often they are overshadowed by the more spectacular activities concerning the maintenance of international peace and establishment of a system of collective security. Frequently also they are minimized or obscured by the assumption that international co-operation for social welfare is inseparable from the political realm and therefore it will not increase to any large degree until fundamental political agreement is reached. It will not be contested that the success or failure of intergovernmental undertakings for these purposes condition progress toward a better way of life for all peoples. But it is also notable that

the Charter of the United Nations recognizes that peace and security require conditions of economic and social stability.

Whatever may be the merits on either side of these debatable issues, the most critical appraisers of the experience to date seem in general agreement that regardless of important limitations the greatest successes of intergovernmental collaboration have been those directed towards social welfare. Nevertheless it is still extremely difficult to evaluate precisely the distinctive contributions of intergovernmental co-operation to observable national social advancements, or to forecast the inherent possibilities of this approach to the basic social goals of improving the conditions of all peoples suffering from poverty, disease, ignorance, or injustice. These uncertainties, however, cannot blur the fact that the consequences of intergovernmental co-operation are today affecting in varying degrees the way the everyday life of hundreds of millions of people is carried on at "the grass roots of the world."

Since the creation of the United Nations in 1945, all intergovernmental efforts in this field have been carried on in a new environment through a network of permanent mechanisms that both express the increased interdependence of nations and their general accord in promoting co-operative programs in the social field. As a consequence, the activities in this field have reached an unprecedented scale and the system of intergovernmental organization has become extremely complex.

Although there are many basic similarities, the variations among the intergovernmental bodies operating today are so numerous that it is impossible in this limited space to describe them in detail. It may be useful, however, to review briefly a few of the major developments in the structure through which intergovernmental co-operation is carried out,

and to examine some of the more significant activities being undertaken and the interrelationship of these programs. Finally, reference to some of the current trends may serve as indicators of the potentialities for future advancement toward the humanitarian ideal of combining common interests and efforts to improve the life of people everywhere.

EARLIER DEVELOPMENTS

It may broaden perspective on more recent developments to recall that it was not until the nineteenth century, and particularly after 1850, that co-operation in nonpolitical and technical fields emerged as a new type of organized intergovernmental effort. Activities in such fields were initiated largely as a consequence of the needs and problems arising from a rapidly growing industrial society and were stimulated by the awakening of a new social consciousness. By the early part of the twentieth century, intergovernmental agencies had been created and new forms of international activity had been started in such diverse technical fields as science, art, communications and transit, health, morals, economics, and finance.

Although the League of Nations was created primarily to promote international political co-operation, it was entrusted under the Covenant and the peace treaties with certain responsibilities in the social field which laid the foundations for later departures from the traditional notions of intergovernmental co-operation. The League's activities were carried out through a number of auxiliary agencies and semi-autonomous organizations established to supplement the central machinery. Significant among these bodies were the semiautonomous World Health Organization, the High Commissioner for Refugees, the committees on Intellectual Co-operation, Traffic in Women and Children, Child Welfare, Social Questions,

Nutrition and the several bodies dealing with regulation and control of narcotic drugs. The International Labour Organisation which was actually created under Part XIII of the Treaty of Versailles was an integral part of the "League System," though it maintained an independent status, thus establishing a precedent for the present specialized agencies. The titles of these bodies are generally indicative of the technical fields in which activities were undertaken.

As regards the nature of its activities, the League's work was carried out during a period when intergovernmental co-operation took the form mainly of conferences and various types of legal instruments designed to deal with problems transcending national boundaries, the protection of particular groups, or matters primarily of national jurisdiction which were of common concern to a number of countries. Consequently, while the League's social program included other important activities such as studies, information services, publication of technical journals and reports, its efforts were primarily concentrated on abstract and legalistic approaches to questions of a protective or regulatory nature.

In spite of its limited responsibilities, the League's social activities were gradually expanded,¹ including to some extent the provision of technical services directed to individual countries. Although its activities in the social field were overshadowed by its political concerns, the

¹ A special committee, headed by S. P. Bruce, former Prime Minister of Australia, was appointed by the Council in 1938 to make recommendations regarding the reorganization of the League's activities in the economic and social fields. The Bruce Committee Report, entitled "The Development of International Cooperation in Economic and Social Affairs," was published in the Special Supplement to the Monthly Summary of the League of Nations, Geneva (August 1939).

clearest indication of the far-reaching impact of its work lies in the fact that these activities were subsequently continued in greatly expanded form by the United Nations and the specialized agencies.

During the Second World War and the period following cessation of hostilities, the concept of international social action was notably extended. The United Nations Relief and Rehabilitation Administration (UNRRA) assumed responsibility for the operation of emergency services and assistance on an unprecedented scale. It went far beyond the activities of the League or any previous intergovernmental or nongovernmental organization in supplying equipment and technical advice to war-devastated countries for the restoration of their social welfare institutions. When UNRRA terminated its operations, certain of its services were also transferred to the United Nations and the specialized agencies and formed the basis for the first United Nations experiments in technical assistance to governments.

CURRENT INTERGOVERNMENTAL CO-OPERATION

The developments cited indicate that far-reaching changes in earlier concepts of the role of intergovernmental bodies in the social field had gradually taken place by the time the San Francisco Conference convened in 1945. The great extension since 1945 has resulted largely from the broad formulation of international social responsibility enunciated in the Charter of the United Nations and in the constitutions of the specialized agencies that had already been formed or were in the planning stages when the Conference convened. Today, the formidable task of implementing the expanded concepts of international social policy and action is carried out through an intricate network of intergovernmental channels. Structurally,

these consist of the social welfare system of the United Nations including the specialized agencies and a number of other intergovernmental organizations which have no organic relationship with the United Nations.

It will be possible only to sketch briefly the United Nations system and to mention among the numerous intergovernmental organizations a few which will illustrate the nature and variety of channels through which intergovernmental co-operation in the social field is navigating.

THE UNITED NATIONS SOCIAL WELFARE SYSTEM

One of the primary purposes of the United Nations as set forth in Article 1 of the Charter is "to achieve international co-operation in solving problems of an economic, cultural, social, or humanitarian character . . ." The mandate to attain this purpose lies in Article 55 which empowers the United Nations to promote "higher standards of living, full employment, and conditions of economic and social progress and development; solutions of international economic, social, health and related problems; and international cultural and educational co-operation," together with respect for human rights and fundamental freedom.

The responsibility for the discharge of the functions implicit in this mandate is vested in the General Assembly and under its authority is entrusted to the Economic and Social Council (ECOSOC). With its array of subsidiary units, ECOSOC is in fact the hub of the United Nations social welfare system. In addition, this social welfare system includes a number of special bodies of the United Nations which have together with the specialized agencies wide responsibilities in the social field that are brought into relationship with the United Nations as provided for by the Charter.

The Economic and Social Council

Among the multiplicity of its functions, ECOSOC has, broadly speaking, a dual role in the social field. On the one hand, it has the direct responsibility for initiating and carrying out the social program of the United Nations itself, and on the other, for co-ordinating the activities of the specialized agencies in the social field.²

In performing its responsibilities, ECOSOC is assisted by functional and regional economic commissions and standing committees. The functional commissions cover various technical fields; they include the Social and Population Commissions, the Commissions on Statistics, the Status of Women, Narcotic Drugs, and Human Rights. More recently the terms of reference of three of ECOSOC's four regional commissions were broadened to include promotion of social development and particularly, consideration of the social aspects of economic development. This extension of the functions of the regional commissions, which has significant implications for future activities in the social field, was initiated in 1958, when the Economic Commission for Africa (ECA) was first created; in 1959, the functions of the economic commissions for Asia and the Far East (ECAFE) and for Latin America (ECLA) were similarly expanded.

Special bodies

Besides ECOSOC, the United Nations has created a number of special bodies or organs within its framework which function independently, but report to ECOSOC or through it to the Assembly. The major ones undertaking social programs perform primarily operational functions, and include: the United Nations Children's Fund (UNICEF), the

² Articles 57, 63, 64 of the Charter.

Technical Assistance Board, the Administrative Committee on Co-ordination (ACC), Office of the High Commissioner for Refugees, the Permanent Central Opium Board, and the Special Fund. From time to time special bodies are established on a temporary basis to deal with emergencies or particular problems, such as the United Nations Relief and Work Agency for the Palestinian Refugees in the Middle East (UNRWA).

The specialized agencies

In contrast to the League of Nations, the United Nations in its Charter recognized the principle of establishing by intergovernmental agreement functional or specialized agencies having broad responsibilities in various technical fields outside the framework of the United Nations itself. Provision was made, however, for such agencies to be brought into relationship with the United Nations by agreements negotiated with each agency, and responsibility for overall co-ordination of this system was given to the United Nations.

The specialized agencies which constitute an important part of the United Nations social welfare system are: the Food and Agriculture Organization (FAO), the International Labour Organisation (ILO), the United Nations Educational, Scientific and Cultural Organization (UNESCO), and the World Health Organization (WHO). The major areas of responsibility in the social field vested in these agencies are evident from their respective titles.

Each of the specialized agencies has its own constitution, membership, organizational structure, budget, and program, and each functions independently. Hence they differ in many significant respects, although they have many common characteristics. Among their similarities are the embodiment within their constitutions of social welfare objectives

and responsibilities resembling those of the United Nations; the general pattern of organization; and the performance of multiple functions within their respective technical fields of a research, informational, educational, and advisory nature aimed at establishing and improving national programs and standards, including provision for direct technical services and assistance to governments desiring them.

ECOSOC endeavors not only to avoid overlapping or duplication among the specialized agencies that might result from the broad statements of responsibility in their constitutions, but also to promote their close working relationships. Furthermore, in developing the social program of the United Nations itself, ECOSOC undertakes only those activities in the social field relevant to the formulation of over-all international social policy and those not encompassed by the specialized agencies. In addition to its own co-ordination machinery, ECOSOC is assisted in co-ordinating the programs of technical co-operation by the Technical Assistance Board consisting of representatives of the United Nations and the specialized agencies. Various arrangements are also made directly between and among the component members of the United Nations system for bilateral and multilateral co-operation in planning and operation of programs of common interest. Nevertheless, the similarities and the differences among these autonomous agencies, coupled with those of ECOSOC and its subsidiary bodies which also have some of the characteristics of a specialized agency emphasize the importance and at the same time the difficulties inherent in the task of co-ordination within the United Nations system itself.

OTHER INTERGOVERNMENTAL BODIES

Besides the United Nations system, there are today over thirty other inter-

governmental bodies directly or indirectly concerned with activities in the social field.³ A large number of these existed before the United Nations was created and from time to time new bodies are established with no organic relationship to the United Nations system. Nevertheless, many of these organizations co-operate in various ways with the United Nations and the specialized agencies, and in some instances there are formal arrangements for close relationships, such as those between the WHO and the Pan American Sanitary Bureau, whereby the latter became the regional office for WHO in the Americas. On the other hand, as between and among these various intergovernmental organizations, there are with few exceptions limited or no arrangements for systematic collaboration.

These autonomous bodies vary widely in their objectives, membership, the nature and scope of their activities in the social field, as well as in the patterns of organization and methods of operation. The geographical areas served by these organizations may be constitutionally limited or not depending largely upon the objectives and membership, but generally, their activities are not operative on a world-wide basis. Nevertheless, many of them have features in common and some resemble in certain respects the United Nations and the specialized agencies.

For purposes of illustration, these bodies might perhaps be broadly classified into two groups: first those of a specialized nature performing functions related exclusively or primarily to the social field; and secondly, those having broader objectives covering multiple fields which include certain responsibilities

³ *Yearbook of International Organizations, 1958-59*. Published by the Union of International Associations in collaboration with the United Nations (7th ed.; Brussels, Palais d'Egmont. 1958).

ties in the social field or closely related activities.

Such broad classification obviously is not definitive of the activities of these bodies, but a listing of a few in each group will suggest the range of social matters being dealt with by separate intergovernmental bodies. Among those that might be included in the first group are the Inter-Governmental Committee for European Migration, the Inter-African Labour Institute, the Inter-American Conference on Social Security, the International Bureau of Education, and the International Relief Union.

As regards the second group, the most notable examples are the regional bodies, such as the Organization of American States, the Council of Europe, the League of Arab States, the Caribbean Commission, the Colombo Plan Council for Technical Co-operation in South and Southeast Asia, the Commission for Technical Co-operation in Africa South of the Sahara, and the South Pacific Commission. The social activities of these bodies constitute one aspect of their comprehensive programs which in some cases include larger problems of interstate policy. However significant the differences may be, certain of the social welfare objectives and activities of many of these regional bodies are identical and generally aimed at raising the levels of living. A number of these organizations have been created since 1945, and although their membership is not always based upon geographical contiguity, they reflect a strong tendency toward regionalism.

One of the best examples of a regional system of co-operation and one of the oldest in origin is the Organization of American States. Its broad social welfare objectives are carried out primarily through two of its technical councils and a number of specialized organizations. The Inter-American Economic and Social Council and the Inter-American

Cultural Council act as the co-ordinating bodies for all official inter-American activities in the social field and at the same time undertake their own programs to promote social welfare including technical assistance to member states. Among its specialized agencies concerned with social activities are the Pan American Sanitary Bureau (PASB), the American International Institute for the Protection of Childhood, and the Inter-American Indian Institute.

CO-ORDINATION OF INTERGOVERNMENTAL ORGANIZATIONS

This brief sketch will not merely suffice to indicate the extent and complexity of the channels for intergovernmental co-operation in the social field but will also make obvious that there exists no systematic arrangement for an over-all review of the programs and policies of this whole network of organizations, nor machinery to bring about the concerted effort and teamwork required to fulfill their various purposes more effectively. However, the differences in the objectives and other characteristics of many of the bodies outside of the United Nations reflect the interest of member governments in a pluralistic approach to international co-operation which would make it difficult to bring about a unified system. Furthermore, there are formidable obstacles to achieving such co-ordination without giving greater power to a central authority than most governments today consider sound or acceptable.

As regards the United Nations system alone, reference has been made to certain of the difficulties even though the responsibility and machinery for co-ordination have received continuous attention. In this connection, a recent study which includes an analysis of this problem points out that "It is generally acknowledged that ECOSOC has had

very partial success in its co-ordinating function. This situation is in large measure due to the limits of its authority."⁴ This same study concludes, however, that it would be highly advantageous if those organizations concerned with social and essentially scientific and technical matters "were made less dependent on the associated governments for their composition and direction, and thus became more truly representative of the nascent international community."⁵ Regardless of the wisdom of this proposition, this problem is of such significance for current international co-operation in the social field that intensive efforts should continue to be directed toward improvements having immediate practical effects, as well as towards longer range solutions.

DEVELOPMENTS IN INTERGOVERNMENTAL CO-OPERATION

The actual growth in international social programs during the past fifteen years attests a new sense of the need for positive international action to explore common interests and cope with common problems arising within a world that is rapidly becoming more interdependent. In this respect, the most significant recent developments in intergovernmental action are related to the rapid social and economic changes associated with the widespread impact of modern technology and the extensive political changes affecting a large part of the world's population.

As the urgent problems and needs for emergency relief and rehabilitation following in the wake of the Second World War subsided, the attention of the con-

temporary world was claimed by the mounting expectations and demands for a better life that were reverberating from the newly independent countries and the economically less-developed areas in which the larger part of the world's population eke out their lives under conditions of survival elsewhere described. Moreover, these are the areas of most rapid population growth. This challenge to the world community became a paramount force in shaping international social policy and the inspiration for new and more dynamic approaches to human advancement.

Obviously, the tremendous efforts required to cope with the social needs and problems of improving the levels of living are primarily the responsibility of the individual countries, and intergovernmental action cannot replace national responsibility. Nevertheless, there is no doubt that the call for intergovernmental social action is becoming more insistent and the opportunities for such action are increasing.

Developed in response to the prevailing common interest of their member states, the social programs of many intergovernmental organizations are today closely related, in terms of their particular responsibilities, to the preoccupation of most of the world with social and economic development. Consequently, a labyrinth of co-operative enterprises under various intergovernmental auspices spreads over the face of the earth, touching to some degree almost every facet of social well-being, though clearly the current activities and resources do not match the dimensions of the task.

CURRENT TREND IN INTERGOVERNMENTAL PROGRAMS

The marked trend in this decade towards greater government responsibility for the promotion of social welfare and

⁴ Robert M. MacIver, *The Nations and the United Nations*. Prepared for the Carnegie Endowment for International Peace. (New York: Manhattan Publishing Company, 1959), p. 122.

⁵ *Ibid.*, pp. 130-131.

the consequential growth of new organizational structures for dealing with these matters is observable in countries throughout the world. This is closely associated in some respects with the general trend towards government responsibility for comprehensive national planning and programming for economic and social development that is evident in varying degrees in the major regions of the world. These trends have both increased the opportunities for international social action and are significantly influencing current trends in the programs of intergovernmental organizations.

Illustrations of certain of the trends in the program of the United Nations itself⁶ resulting from an expanding social policy and shifts of emphasis may be indicative of some of the general trends in other intergovernmental programs.⁷ While these are identifiable in

⁶ The United Nations program in the social field as distinguished from those of other components of its social welfare system currently encompasses activities in the following technical areas: community development; social aspects of housing, building and environmental planning; population; social services including family and child welfare, youth welfare, social assistance and related economic measures not covered under social security as dealt with by ILO, planning, organization and administration of social services, training of social welfare personnel, rehabilitation of the handicapped exclusive of medical, vocational and placement aspects, and services for groups requiring special care such as the aged, and social aspects of migration; social defense including treatment and prevention of crime and delinquency and prostitution; social statistics including census. Human rights and status of women are also encompassed within the United Nations program but because they involve additional factors, they are not specifically dealt with in this article.

⁷ In accordance with the General Assembly Resolution 1094 (XI) and subsequent action by ECOSOC including Resolution 694 D (XXVI), an appraisal of the over-all development, the future scope, and trends of the whole program of the United Nations and the specialized agencies in the economic, social, and

the general aspects of the programs of all the United Nations system and will be seen in certain of the interrelationships, there are, of course, other important trends too numerous to elaborate which are distinctly related to the respective functional fields included in the United Nations program and those of health, nutrition, education, home economics, labor, and other related areas of social welfare encompassed by the programs of the specialized agencies, as well as of other intergovernmental organizations.

Changes in emphasis

Since 1950, the United Nations has progressively evolved a broad framework of international social policy which gives overriding priority to assisting governments, particularly in the economically less-advanced countries, in their own efforts to improve the levels of living of their peoples. In line with this emphasis, the program of the United Nations has increasingly stressed activities, in the areas where it is responsible, related to questions of broad social policy, community development, the strengthening of national and local planning, organization and administration of social programs particularly for family and child welfare, and the training of personnel at all educational levels required for social programs.

human rights fields is now in process. A report covering the work of the United Nations was submitted by the Secretary-General to ECOSOC at its twenty-eighth session in 1959 (E/3260/Add.1), and separate appraisals have been prepared by the specialized agencies concerned. A special committee was appointed by ECOSOC to collate the separate appraisals and prepare a consolidated report showing the extent to which the programs responded to basic needs and the interrelations of the activities of the participating organizations in meeting these needs. Unfortunately, as this article is written, the findings are not available, but will be reported to ECOSOC at its summer session in 1960.

In addition, programs based upon newer concepts of international action have begun to take shape involving coordinated efforts by the United Nations system aimed at long-range programs to promote rural community development; to improve the methods and promote programs in the field of low-cost housing and related community facilities. Similarly, through interagency collaboration, explorations are underway at the international level to ascertain the most effective programs and measures for meeting the social problems arising from rapid urbanization.

Another recent trend of far-reaching import is the increased recognition of the social aspects of economic development, which lays emphasis upon the social measures required to accelerate effective economic growth and, at the same time, to cope with the social problems that arise as a consequence of economic development and sometimes impede economic change. These considerations have focused attention upon the prerequisites of development and the problems of achieving a satisfactory balance and integration of national economic and social development programs.

These activities are carried out with the assistance of the Secretariat of the United Nations and through a network of regional commissions and offices, and at the national level with the assistance of resident representatives of technical assistance, country officers, and other field personnel. While many of the forms of action used have traditionally characterized the work of intergovernmental organizations, the shift in emphasis to social development brought with it a parallel shift to the use largely of practical methods of operation. At an earlier period, as previously indicated, the activities of intergovernmental organizations were pri-

marily of a legal character, and while legal instruments, such as conventions and regulations, continue to be used for setting international standards or for devising controls for such matters as narcotic drugs, there has generally been a strong tendency for the international organizations to apply methods more suitable for practical assistance to countries. In this connection, the programs of technical co-operation represent the outstanding form of international action developed since the Second World War, and they have become the major instrument for carrying out the United Nations activities in the social as well as other fields.

Surveys and statistical aids

The idea that social programming should be accompanied by social research is not new, and accordingly, the statistical, research, and related activities of the United Nations have increasingly been redirected to provide the essential information and tools for the formulation and implementation of development programs. Thus the statistical work is aimed not merely at establishment of international statistical standards for data most universally in demand, but more particularly at helping to build up national statistical services essential for planning and program development. Important in this respect is the regular publication of statistical yearbooks, such as the United Nations Statistical Yearbook, the Demographic Yearbook, and a Monthly Statistical Bulletin covering a variety of economic and social subjects needed for national and international planning. A "compendium of social statistics" is to be published in 1961 which may become a regular publication every four years, which indicates the increasing developments in this field.

Social surveys, research, and reports

are undertaken as a basis for the formulation of international social policy, to provide guidance for technical assistance programs and to help governments in the formulation of national policies and plans and in program implementation. Among the most important of these are the comprehensive surveys of world social conditions and of programs of social development which are prepared at four-year intervals in co-operation with the specialized agencies. Furthermore, such surveys bring to light new problems calling for international consideration. For example, the second survey on world social conditions revealed the problem of rapid urbanization as a universal phenomenon, and as a result extensive studies of this problem were undertaken.

These social surveys are supplemented by studies designed to assist governments in appraising the current levels of living and measuring the changes taking place; by the studies now in process which are intended to help new countries struggling to decide what proportion of their budgets should be invested in health, education, and other social welfare activities as compared with the amounts to be invested in industrial, agricultural, and other development programs; and by a series of studies relating to the social adjustments required to bring about a greater degree of industrial development. They are also supplemented by the work of expert groups convened to study and advise on questions of social policy, such as a co-ordinated policy for improving family levels of living, or on various methods of dealing with social questions based on the experience of different countries.

In addition to the diffusion and exchange of information through publications, clearing-house functions, conferences, expert committees, and seminars, various forms of technical assistance for the use of such information may be

given directly to individual governments or through regional projects.

Although the United Nations gives highest priority to assisting newly developing countries, this is not its only objective, nor are the more highly industrialized countries excluded. On the contrary, all of the activities in the social field, including some aspects of technical assistance, have continued to be universal. Moreover, those activities of highest priority involve consideration of fundamental questions of social policy, social needs and problems, scientific and technical matters of common interest to most countries regardless of the stage of development. A permanent intergovernmental mechanism is thus provided to explore these matters and to resolve other common problems associated with new day-by-day relationships among governments, as well as to facilitate mutual exchanges essential to understanding the "fast-moving current of change" that links all human needs and problems and for vital participation in the global flow of human affairs.

Response to human needs

Whatever may be the limitations and shortcomings of the responsibilities, structures, interrelationships, and programs of intergovernmental organizations undertaking activities in the social field at this moment in time, the rapid development of these bodies and the expanding conception of the nature and scope of their social activities during the past decade have come about in response to the growing awareness of the magnitude and significance of unmet human needs and the widening recognition that the whole human community shares a common interest and responsibility for helping to meet them. Moreover, while it is clear that no miracle can be expected and that there are countless obstacles to be surmounted, the

opportunities for intergovernmental co-operation are increasing. The compelling challenge to governments and peoples is to perceive the meaning of the explosive pace of change resulting from new knowledge and technology lest the human situation become subordinate and to prove that mankind can advance at the required pace toward social progress

and development through intelligent foresight in charting the course of common efforts and wise insight into human motivation and common human values. The time may already have arrived when international co-operation in this field may be equally as crucial for peace and security as any other instrumentality yet devised.

Bilateral Channels: Activities in the Social Field

By CHARLES I. SCHOTTLAND

ABSTRACT: Since World War II, "social" programs have expanded rapidly throughout the world and there has been increasing recognition that in the economic development of less-advanced nations, social development must keep pace if nations are to avoid social dislocations frequently associated with industrial and urban expansion. Bilateral programs have not given adequate attention to the social aspects of economic development. The United States has made its largest contribution in the social field in the area of technical assistance to "community development," a movement with broad political, social, and economic implications which is spreading throughout the world and is aimed at improving village life. The International Co-operation Administration (ICA) has also engaged in training of personnel and direct service in the social field but has instructed that social programs must contribute to economic development. Other countries have likewise engaged in bilateral programs in the social field, but, as in the United States program, they have minimized activities in the social field as compared to economic development programs. Increased attention to social factors can minimize the social problems associated with rapid economic development and industrialization and this is urged for future United States programs since the United States has the largest bilateral program in the world.

Charles I. Schottland, Waltham, Massachusetts, is Dean and Professor of Social Welfare of The Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University. He was formerly Commissioner of Social Security, Department of Health, Education, and Welfare, has served as Principal Advisor to the United States delegation to the Social Commission of the United Nations, and was a member of the United Nations Committee of Social Service Experts appointed by the United Nations Secretary-General in 1959. He was chief of a delegation of American Social Security Experts who visited the Soviet Union to study their system, and is currently President of the National Conference on Social Welfare.

ONE of the most distinctive developments in governments throughout the world since World War II has been the growth of public social services and related social programs. In the decade 1945 to 1955, forty-five countries adopted new constitutions or constitutional amendments establishing basic responsibilities for governments in social welfare matters. Such programs as social insurance have become so large and important that in some countries the benefits paid out exceed all other non-military governmental expenditures combined—expenditures often supported by taxes ranging from 5 to 45 per cent of payroll.¹ Probably no other period in history has been marked by such worldwide interest in social action directed towards raising the levels of living as the one immediately following World War II. Social security, social assistance, and other social service programs were newly established in many countries and existing programs were expanded.²

In recognition of the rapid growth of such programs, the United Nations appointed A Group of Experts to report on "The Development of National Social Service Programmes." This committee, composed of experts from nine countries, reported that "in this period of rapid change which differs only in degree from country to country, the social implications should be clearly recognized. It is commonly accepted that the effective development of a country requires a balanced approach from both the economic and social aspects . . ."³

¹ ICA ICATO Circular A. July 24, 1959. In Bolivia, private employers allocated 60 per cent of payroll for Social Security. *Time*, March 2, 1959. p. 25.

² *International Survey of Programmes of Social Development*. (United Nations: New York, 1959), p. 3.

³ Report by A Group of Experts appointed by the Secretary-General of the United Nations. *The Development of National Social Service Programmes*. (March 9, 1959), p. 8.

This report, which was vigorously debated by the Social Commission of the United Nations, met with general approbation by the various national representatives, approbation which reflected the growing recognition of the importance of "social" factors in the life of the people of their respective countries and the growth in their own governmental social services.

In view of these developments it is disappointing to note how little attention has been given to the "social" field and related social services in the extensive bilateral programs of material aid and technical assistance of many countries. This article will indicate some of the bilateral activities in the social field and venture some suggestions for the United States program.

The different programs that can be classified as "social" cover a wide range and variety of activities including programs related to health, education, housing, agriculture, labor conditions, social security, social services, community development, and many others. They have in common mainly their emphasis on programs which promote human welfare.⁴ Because of the wide range of services, our discussion will be merely indicative of the "social" programs rather than complete.

THE BACKGROUND

Bilateral programs are not new. Governments have frequently, in the past, extended assistance to other nations in connection with natural disasters, famine, epidemics, and other catastrophic events. Also, since the turn of the century, the foreign "advisor" has been an integral part of the developing history of several nations, particularly in South Asia and the Far and Middle East. The current descendants of these ancestral predecessors, namely, present bilateral programs, have been frequently de-

⁴ *International Survey, op. cit.*, p. 3.

scribed and need not be detailed here.⁵

But bilateral programs today are based on factors which were absent in past efforts of one nation to help another. The cold war has impelled nations, both free nations and Iron Curtain nations, to use bilateral programs to buy friends and influence governments. Added to this, the world has witnessed in the thirteen years since World War II a transition of 750 million people in twenty-one nations from a colonial to an independent status. This political upheaval has been occurring at a time when the population explosion has resulted in doubling the world's population in a single generation.⁶ This population, in addition to its growth in numbers, has been changing from a rural to an urban population and the economy in which the people live has been changing from an agricultural to an industrial economy, from a barter economy to a money wage economy.

These changes have been dramatic, sudden, and frequently have been accompanied by increased want in many areas of the world. Changing from an agricultural to an industrial economy, with such change frequently accelerated by foreign aid, has brought in its train a variety of social problems—slums, delinquency, family disorganization, unemployment, migration—the whole panorama of social problems familiar to the industrialized nations.

How have bilateral programs recognized these social problems and what have they done to assist in their solution? Has the emphasis on material aid and economic assistance excluded effort in the social field? The answer to these questions is not entirely clear. Certainly there has been a growing awareness of such social problems by

nations having bilateral programs. Just as certainly this awareness has not resulted in the kind of major activity in the social field demanded by the situation.

THE UNITED STATES PROGRAM

In President Truman's inaugural address on January 20, 1949, the President emphasized the need for raising the living standards in underdeveloped countries through aid and technical assistance. To provide such assistance, a variety of programs under different administrative mechanisms has been in operation since Congress established the program ten years ago. The history and present organization is beyond the scope of this discussion. Suffice it to say that over one hundred billion dollars have been spent for material aid and technical assistance by the current foreign aid programs and their predecessors.

Under the general co-ordination of the Department of State, three agencies administer the United States Mutual Security Program. The Department of Defense administers military aid, the Development Loan Fund extends long-term loans for economic development, and the International Co-operation Administration (ICA) carries on the economic and technical assistance programs. About two thirds of the funds allocated to ICA have been used in four general areas:⁷

1. Agriculture, Forestry, and Fishing. ICA is today aiding fifty-five countries to improve diets and food supplies, establish farm credit agencies, agricultural extension services, farm organizations and farm youth clubs, and introduce better farming production and marketing methods.

2. Education. More than three hundred universities, colleges, and technical schools in forty-one countries are being aided in

⁷ Department of State Publication 6803, Economic Co-operation Series 51, Released April 1959.

⁵ For a comprehensive picture of United States and other bilateral programs see *The Annals*, Vol. 323, May, 1959.

⁶ *America*, March 28, 1959, p. 736.

their development through eighty ICA contracts with American universities. ICA has helped to train hundreds of thousands of school teachers and in some countries up to 80 per cent of all teachers.

3. Industry. The governments of less-developed nations have frequently looked to industrial development as the answer to their economic problems. ICA has aided in industrial development both in the public and private fields and has brought foreign personnel to the United States for observation and training.

4. Health and Sanitation. ICA has co-operated in the training of public health workers, including physicians, sanitary engineers, and nurses, in forty countries.

The primary aim of the United States program has been economic development. Of some 6,000 technical assistance personnel overseas in fifty-eight countries in March, 1958, the vast majority have been engaged, directly or indirectly, in economic development programs. About twelve persons were in the social services, but several hundred were in the broader "social fields."

The lack of greater attention to the social field stems partly from basic legislation and partly from the fact that the responsible officials have either not understood the importance of balancing social and economic developments or else have deliberately decided to concentrate on economic development in the hope that the social dislocations and problems inherent in such rapid development would not be as serious as past experience indicates they are.

The main activities of the United States in bilateral programs in the social field are administered by the International Co-operation Administration pursuant to the 1954 Mutual Security law which authorizes the President to furnish assistance through bilateral "technical cooperation programs." The bill provided that "such activities shall be limited to economic, engineering, medical, educational, labor, agricultural, for-

estry, fishery, mineral and fiscal surveys, demonstration, training, and similar projects that serve the purpose of promoting the development of economic resources, productive capacities, and trade of economically underdeveloped areas, and training in public administration . . ."⁸ Although attempts were made to include "social services" or some similar language in the list of activities, this was not done and social services and other social programs must be related to "promoting economic resources, productive capacities . . . and training in public administration." Although such programs are definitely related in this way, they have been organized only on a small scale.

Some "social" programs of ICA have been placed administratively in ICA's Community Development Division. This Division has primary responsibility for ICA's participation in community development programs and also has the functional responsibility for the social services.

Community development

The largest social program of ICA is "community development." Community development is a term which has come into international usage to "denote the processes by which the efforts of the people themselves are united with those of governmental authorities, to improve the economic, social and cultural conditions of communities, to integrate these communities into the life of the nation, and to enable them to contribute fully to national progress."⁹ Although community development takes many forms depending upon the particular country, the idea of building strong local communities able to help themselves, build

⁸ Mutual Security Act, 1954. Title III, Section 302.

⁹ *International Survey of Programmes of Social Development* (United Nations, 1959), p. 156.

their own institutions, establish a link with their national government, and take advantage of available technical services has spread rapidly throughout the world.

It is sometimes difficult for Americans reared in urban, industrial surroundings to realize that 80 per cent of the people in underdeveloped countries live in villages which are outside of the commercial economies and for the most part are not tied to transportation and communications systems. For example, in the Caspian area of Iran, which is a flat fertile plain lending itself to the easy development of roads, only about eight out of one-hundred villages can be reached by jeep.¹⁰

Community development has attempted to terminate this isolation and bring together the local indigenous as well as national and foreign technical assistance resources to improve village life. The dramatic development of such programs in South Asia, Africa, the Middle East, and Far East—with many countries having national ministries concerned with community development—has been stimulated by technical assistance from bilateral and multilateral agencies. The United States' bilateral program of technical assistance in this area has been significant. Instructions sent to United States ICA Operations Missions have emphasized the importance of community development, known in some countries under different names, such as Village Development or Community Education. Guidelines for United States participation and assistance were sent to United States Operations Missions in sixty-one countries on October 27, 1956.¹¹ These guidelines were based on the experience gained in twenty-three

countries where ICA specialists were assisting in furthering community development activities. The guidelines also reflected discussions held in Bangkok in March, 1956, with sixty-five representatives from twenty-two United States Operations Missions.

These guidelines have accelerated United States assistance in Community Development and along with later guides and materials have stressed:

(1) The aims of community development as set forth above.

(2) The importance of assimilating ICA activities with the plans of the host countries without utilizing programs preconceived by United States technicians.

(3) Maximum use of existing governmental agencies.

(4) Within ICA rural programs, the establishment of a community development advisor to co-operate with other United States specialists in such fields as education, agriculture, health, industry, and the social services and to relate ICA programs to host village programs. Such a community development advisor serves as the point of contact with national governments and is liaison with other bilateral, multilateral, and private organizations in the field.

States aided

The results and accomplishments of community development have been extensive and important and United States assistance has been helpful. For example, in India, community development activities are being carried out in 272,756 villages encompassing a population of 150,000,000 people. Over 34,000 workers have been trained for this program. Some of the physical achievements are impressive. Twenty-two thousand new schools have been started, 65,000 miles of road constructed, 53,000 new "co-operatives" were launched, and over 5,500,000 acres brought under irrigation or reclaimed. The Ford Foundation has contributed

approximately \$10,000,000 chiefly for the establishment of training centers.

In the Philippines, the program launched by President Magsaysay in 1955 emphasized self-help financial grants and in 1958 almost 6,000 self-help projects were under way. United States funds are being used to train community development workers and technicians of various kinds and to support self-help projects. In 1958 the Philippine contribution was about 60 per cent as great as that of the United States but is expected to exceed the United States contributions in 1960.

In Pakistan, the community development program began in July 1953. The United States has furnished technicians, supplies, equipment, and advisors.

In addition to the programs in India, the Philippines, and Pakistan, the United States has assisted similar programs in Chile, Korea, Laos, Thailand, Iran, Jordan, Nepal, Ghana, Libya, Egypt, Brazil, Panama, and British Guiana. Also, many ICA activities in other countries have contributed to community development programs.

Several United States universities have developed curricula to train foreign personnel for community development. Perhaps the largest programs are represented by training facilities at Cornell University, Michigan State University, and the University of Kentucky, but a number of other universities have contributed also. An excellent program of interdisciplinary training has been planned by the University of California at Berkeley. In addition ICA has developed a variety of field observations for foreign personnel including field trips to Puerto Rico and Jamaica. The United States Departments of Agriculture and of Health, Education, and Welfare have provided technical consultation to such foreign personnel.

Although much more remains to be done in community development insofar

as United States activities are concerned, there is little question that United States participation has enriched and stimulated the community development programs of many countries. Also United States participation in the community development activities of the United Nations, Organization of American States, and other multilateral bodies has assisted in promoting international programs in this field.

Surplus commodities

With famine stalking many areas of the world, the distribution of United States surplus commodities has been significant. The Mutual Security Program has financed the purchase and export of some six billion dollars worth of surplus foods. In addition, agricultural products, other than surpluses, have been distributed throughout the world.

Since 1950, surplus foodstuffs have also been distributed through American voluntary agencies. Thirty-two private groups have been operating in twenty-four countries and are now expanding into fourteen more. The cost of shipping and distributing the foodstuffs is shared by the United States government, recipient governments, and the voluntary agencies. In 1954, such foodstuffs were made available to intergovernmental agencies.

Social services

Although United States technical assistance programs in the social services have been limited and inadequate in relation either to the needs or to total expenditures, there is evidence of increasing interest in this area. Voluntary agencies, church groups, officials of the Department of Health, Education, and Welfare, and representatives of the less-developed countries themselves have stressed the importance of such social services to the countries assisted.

¹⁰ *ICA Work in Community Development*. (ICA, Washington, D. C., April 1959), p. 2.

¹¹ *The Community Development Guidelines*, ICA, Sent to ICA Operations Missions, October 27, 1956.

The Community Development Division has issued guidelines and instructions,¹² assigned social service personnel to various missions, assisted in training foreign personnel, provided short-term consultation, and attempted to relate the social services to other ICA technical programs and to community development. It has also acted as liaison for ICA with the United Nations, Organization of American States, and voluntary organizations with respect to programs in the social service field.

The Community Development Division has been assisted and reinforced by the Social Security Administration of the Department of Health, Education, and Welfare. Under an agreement entered into in April 1954 and since revised, the Social Security Administration assists in recruiting social service specialists, training of foreign personnel, handling and arranging field observations by foreign visitors, developing literature and materials for United States personnel in the field as well as for foreign governments, and, in general, bringing to the ICA the experience and knowledge of the social services in this country.

ICA instructions have emphasized that technical assistance in the social services must be tied to the increase in standards of living, economic advancement, increase of food production, and such activities as "uneconomical migration" to the cities. This emphasis has undoubtedly hindered the most effective use of United States personnel since many of the social services in child welfare, delinquency, and family disorganization do not appear to be inexperienced to be directly related to economic development. However, ICA and its predecessor agencies have recognized "a

¹² Among the more significant are: ICATO Circular A. *Training for Social Welfare Personnel*. July 24, 1959; Chapter 3100 of the ICA Manual "Social Services," effective November 15, 1957.

relationship between the social and economic aspects of economic development" and priority has been given to those programs "most essential to sound economic development."

Social service activities of ICA have been most significant in two areas—(1) Training and (2) Direct service of United States technical assistance personnel.

Training

Co-operation between the United States and other countries in the training of social welfare personnel has a long history. Antedating World War II, with the United States Children's Bureau promoting such training in Latin America, it was accelerated in 1941 as a measure of national defense.

Since that time, training schools for social workers have developed all over the world and more than 450 have been established. There are sixty-five in the United States.

Training programs of ICA encompass the training of foreign personnel in the United States and the training of personnel in their own countries. With reference to training in this country, the Social Security Administration has developed a comprehensive program utilized by ICA and other agencies. Training usually consists of (a) nine months of academic study in a professional school of social work with field training in selected American social service agencies and three months observation in varied communities; or (b) six months observation or internship in selected agencies; or (c) training within the Social Security Administration; or (d) a combination of the above programs of shorter duration which are developed for key officials. Arrangements are also made for participation in seminars, institutes, and conferences of various kinds. During the fiscal year

1959, the Social Security Administration planned training programs or conducted training sessions for 987 persons from 72 countries. Six hundred fourteen of these came through ICA—many of them with primary interests in other fields¹³ and the remainder through the United Nations, World Health Organization, and other agencies. Those trained have included top government policy advisors in the social services of their respective countries, social work educators and teachers, family and child welfare workers, community organization specialists, social workers for industry, housing projects, and schools, social insurance specialists, and research specialists in social welfare.

Perhaps the most significant training project of ICA was the contract with the Council on Social Work Education¹⁴ for the development of social work education in India. This contract grew out of a series of requests made by a number of individual schools of social work in India to the Indian government for United States technical assistance in the various special fields of social work education. The ICA withheld approval of these requests because it felt that service to a single school did not justify ICA expenditures. Finally, the requests were combined into one over-all project which was accepted by the government of India and ICA.

The original contract was for a three-year period which ended June 30, 1959 and has been renewed for a two and a

¹³ Department of Health, Education, and Welfare, Social Security Administration, International Service. *Annual Summary*, 1959, p. 5.

¹⁴ The Council was organized in 1949. Its participants include the United States and Canadian schools of social work and various governmental and voluntary agencies and the National Association of Social Workers. It promotes standards of social work education, develops curriculum materials, provides consultation to schools, engages in recruitment programs, and in general is the leadership body in United States social work education.

half-year extension. During the first three years, consultation was provided to six Indian schools of social work, five Indian educators undertook a year of study in the United States, and books and other educational supplies were provided to the Indian schools. Under the new contract, consultation will continue to four Indian schools, four Indian faculty members will come to the United States for a year of study, and additional educational materials will be provided.¹⁵

Direct service activities

Social workers and a variety of other technicians give direct service to governments in the social service and related fields although these activities have decreased in recent years. Indicative of such direct services has been the assignment of:

An ICA child welfare specialist to El Salvador.

A consultant to Israel "to assist in establishing and improving organizations and procedures for the administration of the National Insurance Law of Israel."

A worker in relief and refugee programs in Tunisia.

A social work consultant for community development in Panama.

A community organization worker in Chile.

A medical social worker in Peru to advise on establishing a medical social work unit in a hospital.

Short-term consultants such as a community organization advisor on housing for three months work in Costa Rica; a community development advisor in Panama; and a consultant to the school of social work in Guatemala.

Exchanges

A variety of exchange programs and visits have proved a valuable part of

¹⁵ Letter from President of Council on Social Work Education to members. No. 20, July 25, 1959. See also Dr. Witte's article in this volume, p. 123.

the bilateral programs in the social field. As part of the Department of State's International Education Exchange Service, travel grants were made available in 1959 by the Department of State for the study of social welfare developments in six Latin-American countries. An exchange of social security specialists was arranged with the Soviet Union during 1958.

OTHER BILATERAL PROGRAMS

Most of the industrialized countries of the world, and even some of the less-developed ones, have been engaged in technical assistance programs as part of the growing desire of countries to help each other either from humanitarian or political motives or a combination of both. For the most part, these programs have been confined to economic aid or technical assistance for economic development, and little assistance has been rendered in the social field.

The industrialized countries

An exception is Great Britain which has developed a comprehensive bilateral program to stimulate economic and colonial development.¹⁶ This program has included considerable activity in the social field. It was undertaken primarily for two reasons: (1) The growing demand of Great Britain's colonial population—about 60 million—for improved social services, and (2) the need to expand production of food and raw materials throughout the British Empire. The program is based on a "partnership" concept between Great Britain and the respective local officials, and the plans are developed jointly.

Great Britain's program was put into effect by a series of Colonial Development and Welfare acts. The first act was passed in 1929. The Colonial Office

¹⁶ W. R. Sharp, *International Technical Assistance*. (Chicago: Public Administration Service, 1952), p. 14.

provides staff experts, information, and advice to colonial authorities.

Activities in the social field are numerous and varied. Research institutes have been established such as one in Uganda (April 1950) for the study of East African social and economic problems and the planning and co-ordination of research in anthropology, education, government, labor, social services, and related fields. A variety of scholarships for training of foreign social workers, community development specialists, and others in the social field have been available, and many such persons have been trained in Great Britain in connection with a huge training program for all fields in which as many as twelve thousand students were in various universities. Considerable technical assistance has been given to Middle East countries. Since many of the colonies or former colonies are leaders in the new community development programs—such as India, Pakistan, Ghana, Nigeria—Great Britain has made a significant contribution in this area in training and in the development of techniques, philosophy, and literature of community development.

The Dominions have also developed bilateral programs. Australia has an extensive program of economic aid, primarily to its overseas territories in Oceania. However, it has sent considerable equipment to India. Its technical assistance to its territories has included assistance in housing, sanitation, education, labor conditions, and village or community development.

For its size, Canada has a large program of economic assistance to less-developed areas and although emphasizing the economic aspects, its technical assistance personnel has been involved in a variety of social programs. Since the inception of the different technical co-operation schemes, some two-hundred trainees have come to Canada for training

in health and welfare work. The majority have come under the Colombo plan. A number of Canadians have served as health and welfare experts in the Middle East and Asia under the auspices of multilateral organizations.

Smaller countries have also organized assistance to their neighbors. Israel, itself the recipient of technical assistance, has provided specialists particularly to Africa.¹⁷ Israeli specialists have been sent to Ghana to advise on trade union organization, co-operatives, and resettlement. Similar specialists have been sent to other areas such as Burma. Exchange programs have been increasing. But Israel, in common with other countries, has emphasized the economic aspects of technical assistance and has done little to export its social achievements such as social security, the excellent social work programs, and the new social services.

In June 1952, the Norwegian Storting appropriated funds to establish a "Foundation for Assistance to Underdeveloped Countries" and Norway has extended various types of economic aid. Technical assistance and equipment have been sent to India to assist in developing India's fishing industry and limited technical assistance has been offered in health and maternity programs. However, little has been done in the social field although Norway has much to offer in technical know-how in housing, co-operatives, programs for the aged, and the social insurances.

Sweden, likewise, has done little to export its knowledge and achievements in the social field. Its bilateral programs have generally been limited to such projects as the one in Pakistan, initiated in 1955 for equipping and staffing a technical school in Karachi to train for such occupations as carpenters and

¹⁷ Arnold Rivkin, "Israel and the Afro-Asian World." *Foreign Affairs*, (April 1954), p. 3.

tailors. A similar institute was established in Addis Ababa.

France has a current program also emphasizing economic assistance but including aid and specialist assistance in housing, hospitals, refugees, and relief particularly in its African territories.

Belgium has done considerable work in the Congo in organizing schools, hospitals, and a variety of social services.

Germany has been increasing its bilateral programs. By the end of 1956, over 300 students from underdeveloped countries were studying in West Germany through scholarships awarded by the German government, and in the period 1954–1956, 111 experts were sent to less-developed countries, including some who represented the social field in areas of housing and health programs.

The less-developed countries

The less-developed countries have frequently helped each other through technical assistance. For example in 1957, Ghana sent a team of professional community development workers to the Western Region of Nigeria to advise on community development programs.¹⁸

The Soviet sphere

Little information is available about the bilateral programs of the Iron Curtain countries in the social field. The Soviet Union is developing an extensive program of economic assistance.¹⁹ Its technical assistance activities are patterned after those of the United States.²⁰ In the social field it would appear that its efforts have been very limited. Exchange visits and study groups have

¹⁸ ICA, *Community Development Review*, Vol. 4, No. 2 (June 1959).

¹⁹ Waldemark Nielse and Zoran S. Hodjera, "Sino-Soviet Bloc Assistance—Another Bilateral Approach." *The Annals*, May 1959. pp. 40–49.

²⁰ Michael T. Florinsky, "Russian-American Rivalry in Foreign Aid." *Current History* (September 1957), p. 153.

been encouraged in education, health, medical care, social security, and other social fields, and many scholarships for study in the Soviet Union have included study in various "social" areas. Czechoslovakia has been active in inviting officials of less-developed countries for observance and study of its social security program. China has begun technical assistance programs primarily in the economic field such as assisting in the organization of a textile factory in Burma and other such programs in Cambodia, Ceylon, and Nepal.

The foregoing discussion on bilateral programs is incomplete but nevertheless indicates the limited extent of social programs in the expanding bilateral activities.

MULTILATERAL AGENCIES

Another article in this issue will deal with multilateral agencies.²¹ However, note should be taken of the increasing difficulty of separating bilateral and multilateral programs. For example, there has been a growing tendency for the United States to deal with technical assistance on a co-operative basis through multilateral and regional arrangements. Regional arrangements in Africa, the Caribbean, and South Pacific, aimed at the advancement and economic development of nations in the region, have been the channel for utilizing resources of the bilateral programs. This has been true particularly of the Colombo Plan and the Organization of American States.

Organization of American States

The Organization of the American States (OAS) has developed an extensive program in the social field with the support of its member nations and with the United States, which furnishes two thirds of the funds, making available

personnel for work in member countries. The OAS social program is well developed.²² "Social Welfare and Community Development Programs" are a section under the OAS "Division of Labor and Social Affairs." OAS official policy indicates that "there must be simultaneous and coordinated economic and social development."

Colombo Plan

Of the many regional arrangements for technical assistance and economic development the Colombo Plan is the best known. Actually it is not an organization itself. It developed as a result of a meeting of Britain's Commonwealth Ministers in Ceylon in January, 1950. This meeting laid the groundwork for bilateral programs to raise living standards in South and Southeast Asia through the Colombo Plan for Co-operative Economic Development in Southeast Asia.

The small secretariat of the Colombo Plan in Ceylon has as its principal function the expediting of bilateral negotiations. When a country desires a foreign specialist, the request is routed through the Colombo secretariat to the government having such a specialist available.

Although emphasizing economic development, considerable attention has been given, both by the countries assisted and those providing assistance, to the social field. This has been particularly true with reference to training. For every expert sent to Colombo Plan countries, seven persons have been trained, whereas the United Nations ratio has been 0.9 trainees to one expert and the United States ratio about 1.3 trainees to one expert.²³ Many of the trainees have been trained in housing, health, medical care, community development, and re-

²² See Martha Branscombe. Article herein.

²³ Rowland Egger, "Financing Technical Assistance." *The Annals*, May 1959, p. 85.

lated programs. Also, plans of Colombo nations have emphasized the close relationship between social and economic development.

CONCLUSION AND COMMENTS

The "social" aspects of bilateral programs have not received the attention which multilateral agencies and less-developed countries themselves have considered appropriate. The wealthy nations extending technical assistance and material aid are still too complacent about want prevailing in the world and the fact that the situation is not being improved. Thus, the per cent of the world's population which is undernourished has risen from 38.6 per cent before the war to 59.5 per cent at the present time.²⁴ The problem of hunger is tied to related social problems of slums, delinquency, migration, disease, and family disorganization.

Eventually, the programs of economic development should alleviate the problem of hunger but economic growth may well accentuate social conflicts.²⁵ Perhaps one of history's most severe indictments of bilateral and multilateral programs alike will be that rapid economic development of the less-developed nations caused social stagnation and accentuated and developed serious social problems.

The less-developed nations themselves are beginning to understand this. They are not satisfied with slow progress in the social field, and foreign trainees and visitors to the United States have emphasized this frequently. As one foreign official put it, "Aiding a farmer to produce more while industrial development causes his children to leave home and go to the city is not very helpful."

The United States in particular has a

²⁴ *America*, April 26, 1959, p. 141.

²⁵ Oscar Gass, "The United States and the Poorest Peoples." *Commentary* (February 1959), p. 103.

unique opportunity to make important contributions to the social field. Its bilateral programs are large and significant and have been a major factor in the economic progress of many nations. This progress has been responsible for some of these countries choosing the democratic rather than the communist way and, therefore, has been in our own national interest. But our humanitarian interests in bilateral programs demand assistance which enables people to use their capacities to the fullest and to achieve a happier and sounder life. Overemphasis on economic objectives can thwart this goal. Economic development cannot be isolated from social development and the social consequences flowing from economic advancement.

For a relatively insignificant expenditure, many of the social problems arising in the developing economies of the countries receiving technical assistance can be avoided. These technical assistance programs are regarded all over the world as a test of United States sincerity in foreign affairs.²⁶ It does not help our position if slums and delinquency follow industrialization, or unplanned migration disrupts families. Suggested for consideration as an accelerated program for the United States in the social field are the following steps:

First, a clear acknowledgment by ICA and other appropriate United States agencies, similar to the statement of the Organization of American States, that "there must be simultaneous and coordinated economic and social development."²⁷ Such clear-cut recognition of the significance of social development is

²⁶ *America*, February 16, 1957, p. 543.

²⁷ This is official United States policy also in spite of limited programs. See statement by Christopher H. Phillips, United States representative to the United Nations Economic and Social Council, July 14, 1959 that "Neither economic nor social development can be mutually exclusive."

²¹ See Martha Branscombe. Article herein.

particularly important today since there has been in many instances a slowing down or stagnation of social programs in many less-developed countries in the past five or six years.²⁸

Second, the creation of a Social Affairs Division or other appropriate unit in ICA to bring to bear on our technical assistance programs the best skills, knowledge, and thinking in the social field. It is believed that this emphasis is consistent with the present law and legislative objectives.

Third, the placement in each major United States Overseas Mission of a person expert in the social services and social insurances.²⁹

Fourth, acceleration of training programs in the social field—both in the United States for foreign officials as well as the development of training facilities in beneficiary countries.

Fifth, a closer working relationship between ICA, the universities, and other

federal and voluntary agencies in the social field, particularly the Social Security Administration, thus enabling ICA to obtain the advantage of specialist assistance in recruiting, training, and policy formulation.

Sixth, increasing co-operation and relationships with intergovernmental, multilateral, and regional agencies in the social field. In many countries a dozen or more separate assistance programs are in operation. The United States program, usually the largest, can take the lead in bringing about needed co-ordination through established channels.

These suggestions could, if adopted, have an important impact upon the people of the less-developed countries. After all, the real issues of the cold war will be determined by people. And the people of the less-developed countries will develop attitudes based on their personal situations and problems. If economic assistance complicates or increases their personal problems, its purpose, both political and humanitarian, will not be achieved. If a parallel development of social and economic programs can achieve a rise in the standard of living without the social disruptions evident in some areas, the assistance of the United States will be hailed as a great contribution to human progress.

Voluntary Agencies and Foundations in International Aid

By LEWIS M. HOSKINS

ABSTRACT: American voluntary agencies perform on behalf of their constituencies—the American public—extensive overseas operations in many countries throughout the world. They bring medical, educational, agricultural, relief, and refugee services to disadvantaged people wherever they have an opportunity to share their concerns and competence. They co-ordinate their activities and co-operate with governmental agencies through informal arrangements such as councils and more formal agreements such as subcontracts. Their voluntary and independent characteristics permit a maximum of experimentation and close contact with the people with whom they work and share. In so doing they help translate American humanitarian ideals in practical ways. They also bring to communities in the United States firsthand insight of the aspirations and problems of other peoples. This relationship helps the needed communication and understanding in an interdependent world. Foundations have grown in number and scope to supplement the work of the traditional voluntary agencies. Some carry on their own programs; others prefer to work through existing organizations.

²⁸ *International Survey of Programmes of Social Development*. (United Nations, New York, 1959), p. 3.

²⁹ For a discussion of the contributions of American social workers to such programs as community development see: Charles I. Schottland, "Community Development—A Challenge to Social Workers," *Community Organization 1958*, published for the National Conference on Social Welfare by the Columbia University Press, pp. 3-17.

Lewis M. Hoskins, Ph.D., Richmond, Indiana, is Professor of History at Earlham College, Richmond. A graduate of Pacific College, Haverford College, and the University of Michigan, Dr. Hoskins has taught in this country and abroad. For three years he served with the Friends Ambulance Unit in China. From 1950 to 1959 he was Executive Secretary of the American Friends Service Committee.

THE publication of *The Ugly American*¹ has accelerated the debate in responsible governmental and community circles on how to represent the best of American ideals and motivation abroad where even our most altruistic actions are misunderstood and suspected. Sincere attempts to help others less fortunate do not produce the kind of friendships which we desire and which the world needs. Is the representative of the United States who is living and serving abroad inadequate to his task? If so, why? How can we help remedy the situation?

This issue has received earnest consideration by a segment of the American community that has a long record of work overseas; namely, the voluntary agencies. While no specific attack has been made on the quality of the persons sent abroad by the religious and other voluntary groups that render foreign service, their own motivation has made them self-critical and well aware of the role played by Americans abroad. These agencies are constantly seeking to improve their programs and the quality of their representatives. In the selection of personnel they lay special emphasis on motivation, and it must be admitted that few, if any, have funds to attract workers by financial incentives. But religious or idealistic motivation must be supplemented by adequate training and firm organizational support. Relations with the people whom they seek to serve are facilitated by relatively good communication: language, simple living, congenial contact with counterpart indigenous groups, absence of ulterior or political motive and the like.

¹ William J. Lederer and Eugene Burdick, *The Ugly American* (New York: Norton, 1958). In leading magazines and newspapers and on the floor of Congress earnest discussion has intensified on the issues raised by the authors. This has been essentially salutary in increasing public concern for the maintenance of high standards.

Who are these "voluntary agencies"? Possibly in no country in the world is there a greater and healthier development of free associations of citizens to achieve social improvements than in the United States. This is particularly true of the groups organized to meet relief and welfare needs of people overseas. Our own governmental and community leaders have come to appreciate these unofficial efforts as a significant supplement to official programs. Working as they do without reference to race, creed, caste, geography, or political involvement, these agencies elicit the support of a large portion of our country's citizens. It has been estimated that the membership and supporters of the agencies operating overseas include at least 100,000,000 people. It is impossible to estimate the number of individuals whom these serve, but certainly the beneficiaries must total several hundred million. A true "people to people" relationship is established through material assistance and personal contact, the recipients of which have through the years expressed their appreciation by tokens and letters to donors and above all by helping the people of the United States to understand world affairs.

THE CHARACTER OF A VOLUNTARY AGENCY

In this country a voluntary agency is a nonprofit organization established and governed by a group of private citizens for a stated philanthropic purpose. It is supported by voluntary contributions. Many agencies are designed to meet welfare needs at home. We are here concerned only with those devoted to overseas assistance. In the field, American agencies come into contact and co-operate with similar agencies from other countries; these too are beyond the scope of this examination. Many United States organizations are religiously motivated; some aim to serve

their own counterparts abroad, while others carry on their efforts on a non-sectarian line. America's religious denominations have a long history of missionary service overseas. Originally sent with a primary concern for evangelization, they early began teaching, healing, and helping the people in many ways. In time the medical, educational, and agricultural missions were flourishing all over the world. It is this phase of their work that concerns us here.

Many United States agencies are secular in origin; some represent nationality groups; others a mixture of constituencies. All stem from a vital aspect of the American cultural tradition in which helping one's neighbor was an essential ingredient of the frontier and of an expanding nation. Most Americans come from another land and have old world traditions and associations which make them sympathetic to less-fortunate peoples elsewhere and hospitable to refugees seeking new opportunities. The American people as a whole are not traditionally bureaucratic. They respect action on individual initiative and prefer to help others to help themselves. Belief in the worth of individuals is an integral part of their confidence in the democratic ideal.

Three other efforts, not discussed here, properly belong in a broad review of American nonofficial aid programs. The first is the American Red Cross which has a Congressional Charter. It carries out extensive relief in this country and abroad where it co-operates with the international League of Red Cross Societies. Another is the increasingly significant role of the American universities in supplying specific training as well as technical assistance abroad.²

RELATIONS WITH THE UNITED NATIONS

A third area of great significance must be omitted here because of lack of space.

² *The Annals*, Vol. 323 (May 1959).

American voluntary agencies have developed fruitful relationships with a number of intergovernmental agencies such as United Nations Relief and Reconstruction Agency (UNRRA), International Refugee Organization (IRO), United Nations High Commissioner for Refugees (UNHCR), United Nations Korean Reconstruction Agency (UNKRA), and United Nations Works Relief Agency for Palestine Refugees (UNWRA). Of special note was the experience of American groups working with the UNHCR for European refugees stimulated by a grant from an American Foundation. The "crash" program for Hungarian refugees was in part possible because of this pattern of co-operation.

The major expansion in American programs abroad has occurred since World War I and more particularly during and after World War II, when compassion for the suffering brought on by war precipitated the formation of a host of American organizations. Herbert Hoover's huge food relief in Belgium and the other European countries was supplemented by that of numerous private groups that distributed food, clothing, and medical supplies throughout Europe, even in the former enemy countries.³ Many agencies focused on the children, whose innocent suffering elicited sympathy both because of their immediate plight and because hostile attitudes were being engendered. With the outbreak of the Second World War, American philanthropy again responded with instinctive generosity. The burgeoning of organizations and the complications of governmental and intergovernmental relationships during the period of neutrality brought the United States government into the picture as never before.

³ See Herbert Hoover's new book: *An American Epic: The Relief of Belgium and Northern France 1914-30*, (Chicago: Henry Regnery Co., 1959).

Regulation and control seemed imperative at home and in the field.

WAR RELIEF CONTROL BOARD

It was then that Secretary of State Cordell Hull recommended to President Franklin D. Roosevelt (March 3, 1941) that an authority be created to protect the public from exploitation and to make sure that funds and supplies were used for the purposes for which they were collected. President Roosevelt responded by appointing a special committee⁴ to study problems involved in foreign war relief and to make recommendations for supervision. By the time the United States became involved in the war, some problems were acute, and widespread satisfaction was expressed by responsible agencies at the appointment (July 25, 1942) of the President's War Relief Control Board composed mainly of the former committee. The Board was empowered to license and regulate solicitation for war-relief charities, domestic and foreign, by agencies other than the American Red Cross and the churches. Its efforts helped to reduce overhead, maintain standards, and minimize confusion arising in the public mind from overlapping appeals.⁵

Faithful to America's democratic and civilian tradition the War Relief Board was terminated on May 14, 1946, immediately after the cessation of hostilities. But just then the liberation of war-torn countries brought opportunity for full-scale work by American groups. The religious and European nationality groups rapidly increased their efforts. There was a great outpouring of gifts through organizations and individual

⁴ Joseph E. Davies was chairman with Charles P. Taft and Frederick P. Kappel members.

⁵ This story is well told by Arthur C. Ringland in "The Organization of Voluntary Foreign Aid, 1939-53," Department of State Bulletin, Washington, March 15, 1954.

contributions of food packages.⁶ Governments, military authorities and private agencies co-operated closely in setting up a mammoth operation for food relief, rehabilitation, and the reorganization of local welfare services. Shortly afterwards, similar opportunities challenged American agencies in the Orient. In all this the need for continued governmental oversight remained. The War Relief Board was replaced in 1946 by the Advisory Committee on Voluntary Foreign Aid. This was made up of distinguished private citizens and was serviced by the Office of the Assistant Secretary for Economic Affairs of the Department of State.⁷

ADVISORY COMMITTEE ON VOLUNTARY FOREIGN AID

Over sixty voluntary agencies accepted the Advisory Committee's invitation to register and submit quarterly reports. Both the executive and legislative departments of the government recognized the need for a close relationship between the official and voluntary postwar relief efforts. The Congress, at a time when it was making provision for food, medical supplies, clothing, feed, fertilizers, pesticides, and seed, authorized up to five million dollars to defray the cost of ocean transport for supplies privately donated which were deemed essential to supplement the official program. The government freight has continued to date, including shipments of agricultural surpluses donated to the voluntary agencies under Public Law 480, Title III. The role of the Advisory Committee has also continued, although it is now administratively attached to the International Co-operation Administration.

⁶ At this time CARE (Co-operative Agencies for Remittances to Europe) was organized by various voluntary organizations.

⁷ Ringland, *op. cit.*

FOUNDATIONS

A recent and characteristically American phenomenon in world-wide philanthropy is the development of foundation activities abroad. Of the many hundred foundations or trust funds in the United States, the majority limit their charitable activities to programs in our country, but there is an increasing interest among some larger foundations in programs relating to America's long-range interest in peace and human welfare among peoples across the seas. Tax laws in this country have encouraged the development of these foundations. Though often set up by an individual family, the scope of their programs and objectives equals the span of American concern for human welfare. Often the individual wealth and initiative available to foundations are dedicated to encouraging research and the development of potential leaders here and in other countries. Self-help activities abroad also exert a special appeal and often receive assistance. Annual reports of the stewardship of funds of the larger foundations are published by their Boards of Directors, usually composed of well-known citizens. Many of these directors feel keenly their responsibility and the opportunity to use these relatively free funds as venture capital to stimulate progress toward new frontiers in education, science, medicine, and welfare. "Pump priming" and "multipliers" are favorite phrases among foundation executives. They select, according to these criteria, among the thousands of suggested projects the few which they feel most merit their assistance.

Some of the larger foundations have developed distinctive programs with full-time staff.⁸ More provide subventions

⁸ Well-known examples of larger operating foundations include the Ford Foundation, the Rockefeller Foundation, the Rockefeller Brothers Fund, the Carnegie Corporation, the Dan-

to existing educational or voluntary organizations to increase programs already under way or to inaugurate new ones. For example, they have enormously supplemented the resources and effectiveness of the American voluntary organizations. This has been accomplished without appreciably weakening the independent policy and operation of the agencies. In a few cases only have voluntary agencies permitted themselves to be warped or overextended through foundation subsidies. The normal withdrawal of such support after a period of years has occasionally embarrassed an agency whose constituency is unable to continue the program at the higher level of activity. The elaborate applications required by most foundations have had a salutary effect on program planning by the voluntary agencies. Some observers have expressed their regret at the tendency of large foundations to be overcautious in their granting policy. On the whole, the increasing role of foundations in areas formerly dominated by the voluntary agencies has been both stimulating and creative, and the manifold service endeavors of foundations merit special review.

SCOPE OF VOLUNTARY ACTIVITY

At present the 55 voluntary agencies, supported on a nation-wide basis primarily by contributions of their own constituencies, operate relief, welfare, and self-help activities in 103 countries and areas in all parts of the world.⁹

forth Foundation, and others. The Near East Foundation, despite its name is more properly a voluntary agency and not a fund-dispensing foundation in the usual sense.

⁹ A list of agencies registered with the Advisory Committee of Voluntary Foreign Aid can be secured by writing its executive director, International Co-operation Administration, Washington 25, D. C. For general information on voluntary agencies write Director, American Council of Voluntary Agencies for Foreign Service, 20 West 40th Street, New York.

They distribute food and clothing, medical supplies and equipment; they operate hospitals and mobile clinics, schools and training programs; and they carry out agricultural extension work and community development. In order that their efforts will not have proved transient, they strive in their assistance to develop local leadership in true self-help manner. Every year the American voluntary agencies generate an average of over a quarter of a billion dollars for overseas programs. This represents cash expenditures as well as the money value of supplies distributed. To operate and supervise these foreign service programs the agencies normally maintain an American staff of about 800 workers abroad. In addition they employ thousands of indigenous personnel. Beyond that they enjoy the services of many volunteers, often members of counterpart organizations located in the foreign countries in which they work. They operate in these areas usually by specific invitation and with the co-operation of host governments. Home offices provide supervisory and planning personnel, while policy is usually determined by a Board of Directors composed of private citizens with broad background experience. Careful records are kept and reports made to constituent groups and to the general public. This is indispensable to assure future support.

REFUGEES

A specialized area of service in which many American voluntary agencies are vitally involved is that of refugee assistance: relief and welfare services, movement, and resettlement. In this "century of the uprooted" when millions have been made homeless through circumstances beyond their control or remedy, American voluntary agencies have responded with characteristic warmth and understanding. They are uniquely equipped to

supplement the basic services that must be supplied by governments—such as documents, funds for transportation, and so on. The agencies have trained staff abroad; at the same time they have members across America ready to prepare a welcome for newcomers.¹⁰ In the past decade voluntary agencies have helped over 600,000 persons displaced by wars' aftermath, natural calamities, or political oppression to become established, mostly in the United States. This essentially human response to human need is a work of rescue that has not only saved the lives of individuals and families but has also been of service to the economies of overpopulated and devastated countries. In addition there has been an incalculable contribution to American leadership and economic life through the importation of talent and purchasing power. Voluntary agencies carry on a persistent year-round effort to facilitate the resettlement of refugees from Europe and Asia in the New World or Australia. During recent months they have exerted special efforts to make the current "World Refugee Year" a success. Although always co-operating closely with governmental and intergovernmental efforts, their service is personalized in warm and human ways which are difficult or impossible for official efforts alone.

MATERIAL AIDS

It is evident that in war's aftermath huge shipments of various goods are required to bring the level of life back towards normal. It is not always appreciated that such assistance may be re-

¹⁰ Particularly noteworthy are agencies representing America's three major faiths: National Catholic Welfare Conference, Church World Service, Hebrew Immigrant Aid Society/Jewish Joint Distribution Committee. There are other smaller agencies that conduct significant refugee programs in over-all co-operation with these.

quired for many years in areas of poverty and bare subsistence. The government has recognized our responsibility and opportunity to share our bounty. "Democracy begins somewhere above 1700 calories per day." Since 1947 a sizeable portion of our agricultural surpluses has been distributed abroad through the American voluntary agencies. The law not only releases the surpluses, but provides subsidies for moving them from the United States to foreign countries whose governments assure customs free entry and other facilities through agreements with the United States government or the voluntary agencies. Supervision is through the Advisory Committee referred to above with close consultation of officials in the Department of Agriculture and the Food and Agriculture Office of the International Co-operation Administration. Overseas distribution must be supervised by American representatives of the voluntary agencies, although it is usually carried out through indigenous counterpart agencies.¹¹ Care is taken to see that the supplies actually reach needy individuals and that the local economy is not adversely affected. It seems likely that world consumption will be increased because of increased aspirations. In the end this will benefit Americans as producers rather than depress our workers.¹²

¹¹ A manual to guide voluntary agency representatives handling surpluses abroad has been prepared by the Surplus Commodities Policy Committee of the American Council of Voluntary Agencies (March 1959). The historical development of the use of surpluses and the present legal requirements are detailed therein. It is a good illustration of co-operative effort among agencies and between agencies and the government.

¹² An especially imaginative program of material aids is the Brethren's "Heifer Project" under whose auspices thousands of heifers, goats, and poultry have been shipped to needy areas to rejuvenate animal husbandry and raise standards of food consumption.

TECHNICAL ASSISTANCE

Although "community development" and "technical assistance" are terms recently in vogue, the concepts they represent are not new to American voluntary agencies. To villages of Asia, Africa, and Latin America, trained technicians from the United States have gone for years to bring know-how, experience, and encouragement to the local people. Education and training programs have been at the heart of most of these efforts. Goals of a co-operative community spirit have been traditional. The current phrase to describe these programs is "self-help." National governments have recently recognized their responsibilities more fully and, like India, have set up "Five Year Plans" in which community development for thousands of villages is an integral part. Supplementing official programs are the smaller, pilot and experimental efforts of voluntary agencies. These are closely co-ordinated with the plans of the government involved. There is also co-operation in various areas with the extensive programs of the United Nations agencies.¹³

¹³ In a report by a group of experts appointed by the Secretary-General of the United Nations to the Twelfth Session of the Social Commission entitled "The Scope and Development of National Social Service Programmes" (February 1959) stress is placed on a rounded approach to economic and social problems both in industrialized and in underdeveloped nations. Properly they emphasize the importance of social services in areas of rapid economic change to insure maximum social stability and the preservation of such values as family life. Members of the United Nations Secretariat, in commenting on their report, pointed out the significant role nongovernmental organizations could play in this field. See "Scope and Development of National Social Service Programmes," reported by the Secretary-General, March 1959. For a description of voluntary activities in technical assistance the reader is referred to Edwin A. Bock, *Fifty Years of Technical Assistance* (Chicago:

The technique of exchange or foreign study is important to the development of local leadership. Many voluntary agencies have experimented with this field, supplementing official programs.¹⁴

CO-ORDINATION

These varied examples illustrate the scope of the major efforts of voluntary agencies in their humanitarian endeavors abroad. But organizational variety and versatility as well as resourcefulness have produced over the years many other imaginative projects designed to meet specific human needs in practical ways. The experience gained by individual agencies is shared in their joint discussions. In the United States the chief agency for co-ordination and maintenance of standards is the American Council of Voluntary Agencies for Foreign Service, 20 West 40th Street, New York City. About forty member agencies participate in its various subcommittees, such as the Migration and Refugee Problems Committee or the Committee on Korea. Policy guidance is provided by an executive committee of officers and representatives of the member agencies. The experience gained by the individual groups is pooled, then shared, when appropriate, with government and international agencies and policy-making officials.

Public Administration Clearing House, 1954); American Council of Voluntary Agencies, *The Role of Voluntary Agencies in Technical Assistance* (New York, 1953); W. N. Collison, editor, *Directory of American Voluntary and Non-profit Agencies Interested in Technical Assistance*, American Council of Voluntary Agencies (2nd ed., New York: Technical Assistance Information Clearing House, 1958). Also see *The Annals*, *supra*, note 2.

¹⁴ The 4-H Farm Youth Exchange, Brethren's hospitality on American farms for Polish farmers, the international School Affiliation Service of the Quakers, the aid to foreign students studying in American colleges and universities given by the Institute of International Education are examples of voluntary exchange programs.

In recent years field co-ordination has been expedited by co-operative inter-agency groups such as the Council of Relief Agencies Licensed to Operate in Germany (CRALOG); Licensed Agencies for Relief in Asia (LARA); and the Advisory Council for Relief Efforts in Egypt. In addition there have been informal councils in the capitals of some foreign nations where American agencies are working—Rome, Delhi, Seoul, Vienna, and so on. These devices help to assure adequate co-ordination among agencies and between the agencies and the government programs. They can also facilitate relations with host governments and specialized agencies of the United Nations.

RELATIONS WITH GOVERNMENTS

Both joint and individual relations exist between the various voluntary agencies and their own governments. All share a general belief in the importance of their independence and freedom of action. Some insist more strongly than others on complete separation from official programs. Some gladly support and co-operate to the extent of accepting government contracts and funds for overseas refugee or technical assistance programs. Others refrain from forming any formal ties. A letter recently issued by the American Council to field staff dealing with government surpluses and accompanying a manual on distribution procedures probably reflects the opinions of most agencies:

... freedom of action [is] the highest and crowning prerogative of the voluntary agency. . . . The voluntary agency must be able to act with discretion; it is expected to use wise judgment in all its actions and to have proper discernment in its own conduct. In order to function most effectively, it needs the freedom to act on its own judgment and responsibility. Moreover, because it is designed as a channel through which people may serve people, the choice

of those it will serve must be determined primarily by need, not by the political objectives of any government or the selfishness of any individual. This independent spirit is at the very heart of voluntarism. At the same time, it is in the best interests of all responsible people that the voluntary agency be registered with government. This is a protection for the legitimate agency and tends to eliminate those which are not qualified to serve according to their declared intent. The voluntary agency has a special kind of function in rendering services which government and other private sources are not able to provide. The ideal is a partnership concept in which the work of the voluntary agency and other private sources complement the work of government in the service of mankind.¹⁵

As early as 1950 the administrators of the Point Four program in Washington were considering the use of private voluntary agencies. The acting administrator, Capus M. Waynick, recommended in October 1950 that the government (a) arrange for release of staff of private groups as employees or consultants on United States technical co-operation projects, (b) assist and advise private groups in conducting their programs, (c) enlist participation of private agencies to increase public understanding of the Point Four program at home and abroad, and (d) contract specific projects or functions to be carried out by private groups or award grants for support of approved activities. In April 1951 a memorandum directed attention to voluntary agency experience, personnel, and acceptance in the countries in which they had programs. Their rich resources of dedicated personnel were recognized.

The government followed three prin-

¹⁵ "Letter to a Colleague," American Council of Voluntary Agencies, New York, March 1959. (Accompanying "Manual on U. S. Government Agricultural Commodities" of same date.)

ciples in making early contracts with agencies: (1) Their program should be nonsectarian, (2) they should have the confidence and respect of the host government and the people, (3) they should have sound administrative experience. Before 1952 supplemental principles were added: (1) the host government should desire and request the services of an American voluntary agency, (2) the agency should do no proselytizing, (3) the agency should demonstrate its capacity to relate to local mores and social customs, (4) the agency should encourage self-improvement of the people in training indigenous leaders wherever possible, (5) the agency should relate its activities to the total Point Four program when under contract. These are the general policies still followed by the government in its partnership with voluntary agencies.

One agency so cherished its unqualified independence that it withdrew from an eminently satisfactory relationship with the United States government when officials felt it necessary under Congressional prodding to require security checks of all agency personnel. The loss of government funds forced some retrenchment. It was necessary to seek replacement of income from the general public so that its technical assistance project could continue in India without incident or controversy.¹⁶ Other agencies have withdrawn from efforts to formulate contracts with the International Co-operation Administration because of delays, red tape, and indirect restraints on freedom. On the whole, however, amicable relationships have been worked out despite inherent differences of organization and philosophy between the private and public sectors.

Despite the size and significance of the total efforts of American voluntary

¹⁶ The American Friends Service Committee, Philadelphia.

agencies, they are small in comparison with governmental and intergovernmental programs. Their role is pioneering, experimenting, and filling in gaps which the larger, official agencies may overlook. Among the special contributions which the voluntary agencies seek to make in international welfare programs are the following:

SPECIAL FUNCTIONS

1. They provide a channel for the direct expression of personal concern of people in more-privileged areas for the welfare of people in less-favored nations. Representatives of some private agencies live in remote villages, working directly with the local people, helping them find answers to some of their problems such as food production, disease, indebtedness. This can create a sense of brotherhood and a basis for international understanding in the Americans as well as in those with whom they work. The recipients of this aid can come to realize that these services are provided out of sympathy and not for personal or national ambition. It is worth noticing that while Communist nations may provide competent technicians in their official aid programs throughout the world, they have been unable to supply truly voluntary representatives. The Americans returning from overseas assignments provide sources of insight and widening vision for their home communities. People develop ways of participating in voluntary and official aid programs abroad as they become personally involved in the destinies of people in foreign parts.¹⁷

¹⁷ An example of a spontaneous response to human need was the Hiroshima Maidens project inaugurated by Norman Cousins of the *Saturday Review*. Various church groups offered hospitality. Doctors and hospitals furnished medical services. With a note of penance implicit, this project brought rich overtones of goodwill and international understanding.

2. In the less-developed countries there has rarely been real self-government. Governments have usually been authoritative, operating from the top down. There is no clear channel for the people's voice to pass upward to top government officials, even if the people had an inclination to speak. Since many projects for the improvement of agriculture and health involve radical changes in the social values and customs of a people, government officials coming into the village as innovators may meet resistance because there is a fear that cherished values will be destroyed. Government reforms, however sound, may appear at first to work hardships on the people or on portions of them. In such situations, a nongovernmental organization may play a very useful role. It can serve as a channel of communication between the people and the government, interpreting the one to the other and helping each side to modify its attitudes and actions when it fully understands the other side. Furthermore, it can support and encourage villagers to bring their problems to the attention of the government in appropriate ways. Experience has proved that some easing of communications is possible even though the nongovernmental agency is an outside group, if there is no ulterior motive, no personal stake in the matter.

3. All countries need honest, able leadership. Even more important than technical training in administration and government is integrity and the ability to resist the graft and bribery that are customary in many parts of the world. Many voluntary agencies are tackling this difficult task through intensive training programs for leadership at various levels. Some are developing multipurpose village workers who go out from a training center to serve in several villages. Agencies continually seek to inject a moral dimension and sense

of responsibility into their practical projects.¹⁸

4. Closely related to better leadership is a new spirit of confidence and expectation. One agency¹⁹ states that it "seeks to develop local groups or hosts in whom the technical knowledge brought in by the outside workers can live and grow and continue beyond the period of foreign influence. These self-help, competent, and confident local groups are our major objective . . ." Another agency reported that a village elder remarked with satisfaction on a new project his village was undertaking. "You see, my friend, we now have the courage to do some of the things we never dreamed we could do before." From little changes of attitude great progress may result.

5. Besides facilitating communication between local people and their governmental representatives the nongovernmental organization can frequently show villagers how to secure facilities and services of their own government which they heretofore had never tapped.

6. Voluntary agencies can attempt to meet needs which official bodies cannot or are not yet willing to meet. They can get programs under way quickly and flexibly since they are not limited by legal or political complications.

7. Nongovernmental organizations, because of their experience on over-all policies, are in a position to criticize their own or other governments that tend to violate good principles of social welfare or human values generally.

¹⁸ The Unitarian Service Committee has stressed medical and social work, exchanges, and training. The Near East Foundation experiments in village education and local-teacher training. Others have tried internships and on-the-job training. For an example of village-worker training see *Social and Technical Assistance in India: an Interim Report*, American Friends Service Committee, Philadelphia, 1956.

¹⁹ International Voluntary Service.

Some American agencies have expressed profound regret that the original high principles of President Truman's Point Four have been de-emphasized in favor of stress on technical assistance as a weapon against communism. They tend to feel that a positive program based purely on compassionate concern and humanitarian principles best serves the national and the international interest.

8. As suggested earlier, voluntary agencies are uniquely fitted for experiment. They are able to take calculated risks, trying schemes which may fail or prove sound for larger and for official programs to adopt.

9. Economic progress in less-developed areas of the world is complicated and must be carried out in ways appropriate to complex local circumstances. Anthropologists are helping official and private workers to learn the relationship of popular attitudes to what westerners regard as "progress." Social stability is often precarious and changes may prove upsetting. The voluntary agencies are especially concerned to comprehend subtle, spiritual factors. Can we avoid importing crass materialism that squeezes out rich spiritual values as we try to bring higher standards of living?

EVALUATION

The voluntary agencies are conscious of their inadequacies and shortcomings. They constantly review and evaluate their own programs, seeking ways to improve their operations. They do this self-evaluation because of their sense of responsibility to their constituents and their obligation to do the best possible job. They realize that they have not always been able to reach down to the lowest level of people in areas where they work, and that it is the moderately well-off individuals who may seem to profit most from their assistance, crushing down the very poorest to an even

lower state. They realize that too often their efforts atrophy or die when they withdraw: local leadership has not been adequately trained to carry on, local circumstances have not been adequately prepared for continued growth. They are concerned that their material assistance may be divisive or become a dole if there is not sufficient effort on the part of the people to raise their production levels commensurate with their new

demands. And they realize that they do not portray to their own satisfaction the image of America with its diversity, its freedom, its moral and spiritual values. Nevertheless, by reflection and examination, the agencies constantly seek to raise the level and quality of their performance, so as better to represent the best of America in the overseas activities made possible by the generosity of Americans.

UNICEF in Central America

By ALICE C. SHAFFER

ABSTRACT: Central America has been one of the pioneer areas for the United Nations Children's Fund assisted programs. When the United Nations Children's Fund, under a broadened mandate from the United Nations, shifted the emphasis of its aid from emergency to long term and from war-torn countries to those economically less developed, Central American governments immediately requested its assistance to strengthen and extend services to children and mothers. As one of the first areas in the world to aim at the eradication of malaria and to have engaged in an intensive campaign against malnutrition on a regional basis, the Central American experiences in these fields have become known, watched, and studied by people from many countries. Against this background, international and bilateral organizations are working together with governments as they broaden the scope and the extent of their programs. Ten years of co-operative action have highlighted the need for training of personnel, both professional and auxiliary. This period has also made clear the value of more integrated programs with wider collaboration both within the ministries of government and between the international organizations.

Alice C. Shaffer, M.A., Guatemala City, Guatemala, for the past ten years has been Chief of the UNICEF Area Office for Central America, with headquarters in Guatemala. Originally the Area Office served Mexico, Central America, and the Caribbean. From 1942 to 1944 she represented the United States Children's Bureau as Child Welfare Consultant to Paraguay, Costa Rica, and Cuba. From 1944 to 1947 Miss Shaffer was Chief of the Social Branch in the Division of International Labor, Social, and Health Affairs, U. S. Department of State, Washington, D. C. A graduate of the School of Social Service Administration, University of Chicago, she is the author of the History and Administration of the Indiana Poor Law.

THE United Nations Children's Fund (UNICEF), through its Executive Board, has allocated \$7,244,500 for programs in the Central America area during the past ten years, at the request of the governments of British Honduras, Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama.

UNICEF, established by the United Nations General Assembly in December 1946 to help child victims of aggression, took over that aspect of the United Nations Relief and Rehabilitation Agency's function when the agency was liquidated.

As recovery took place in Europe, there was an increasing demand that UNICEF turn to the needs of children in other parts of the world, particularly in the economically less-developed countries. Accordingly, in October 1953, UNICEF was continued indefinitely by the United Nations General Assembly as an integral part of the United Nations. At that time the name of the organization was changed from the United Nations International Children's Emergency Fund to its present name, but retained the symbol UNICEF.

It was recognized that in many parts of the world, apart from the devastations of war, the health and life expectancy of children were threatened by conditions which, as one Latin-American described it, were due to "chronic emergencies."

In line with the directive of the United Nations General Assembly, that UNICEF should shift the emphasis of its aid from emergency programs to those of long-term benefit to children, the door to other than war-torn countries was opened and governments soon sought UNICEF's co-operation in various programs.

As early as 1948, when the Ninth Pan American Child Congress met in Venezuela, it requested the American International Institute for the Protection of Childhood "to explore the ways in which

the experience of the United Nations International Children's Emergency Fund, the Food and Agriculture Organization and the Pan American Sanitary Bureau may serve to encourage intensified effort to raise the standards of child nutrition in all the American Republics, and to extend and improve child feeding programs adequately related to health and social services for mothers and children and the education of parents in the principles of child feeding and child care."

TEN YEARS OF ACTION

In the course of the first field visits to British Honduras, Central America, and Panama, in order to study the needs of children and explore ways in which UNICEF might assist governments, they called attention to the malnutrition existing in the area, and the fact that children were the principal victims. Without exception, British Honduras, the five Central American countries, and Panama requested UNICEF to assist in school feeding programs.

Likewise, these governments at the same time asked for UNICEF aid in malaria control programs. By November 1949 the UNICEF Executive Board had before it the governments' requests for child feeding and malaria control, and the first allocations for these programs were approved by the Board at that session.

Ten years have passed since these programs were inaugurated and it is significant to note that to date the two major UNICEF-assisted programs in Central America continue to be the fight against malaria and malnutrition.

It should be made quite clear, however, that these programs have not remained static. A brief comment on the present concept and goals may serve to illustrate the extent to which development has taken place over a ten-year period.

For example, malaria control programs have now been converted into full-scale eradication campaigns to eliminate the local transmission of the disease. This, as will be seen later, is very different from programs designed to control malaria.

In the field of the nutrition programs, the focus from the beginning has been toward assisting governments in their efforts to find effective ways to meet their local dietary deficiencies and to improve nutrition generally. There has been a gradual intensification by governments of education in nutrition, the development of local sources of animal and vegetable protein, increased efforts to extend the feeding programs to the more vulnerable group of preschool-age children, pregnant women, and nursing mothers, and the training of personnel at all levels. A most recent development is UNICEF's assistance to a children's nutrition program, where education is fostered through school gardens.

Under its charter, UNICEF was to help children, which was of course considered to include help to pregnant women and nursing mothers.

General public health

But health services benefiting children and mothers had to be considered also in relation to the general public health organization. In the case of providing insecticides for insect-borne diseases it is not always technically possible to separate benefits to children from those to all ages in the community; for some diseases it is necessary to heal adults as well as children in order to prevent reinfection. While children and mothers have been the principal recipients in programs assisted by UNICEF, they are not the sole beneficiaries of such international aid.

Health programs to fight diseases affecting children, such as mass campaigns against tuberculosis, venereal disease,

trachoma, and yaws, have been approved by the Executive Board as appropriate for UNICEF aid. Similarly, environmental sanitation has also been approved. Its direct bearing on the morbidity and mortality of children, the Executive Board recognized, makes it basic to all maternal and child health work.

During the ten-year period in which UNICEF has assisted the governments of Central America and Panama, aid to maternal and child health services has been extended to British Honduras, Guatemala, El Salvador, Honduras, and Panama, with assistance in environmental sanitation having been given to Guatemala, Honduras, Nicaragua, and Panama. Mass campaigns against tuberculosis have been carried out in British Honduras, Guatemala, El Salvador, Honduras, and Costa Rica.

Most of the Central American governments, with technical advice from the World Health Organization (WHO), are developing a long-term national public health plan to be implemented progressively. The timing will depend on the availability of trained professional and auxiliary personnel, adequate budgetary provision to cover the expanding services, and the gradual reorganization of the public health structure. Adequate supervision and co-ordination of work at all levels necessitates such a reorganization.

In the light of these developments some governments have requested UNICEF to extend aid to those aspects which relate more specifically to the basic maternal and child welfare services.

For example, such a program recommendation for Honduras was presented to the UNICEF Executive Board at its meeting held in September 1959; an allocation of \$97,000 for this project was approved. Under this two-year program UNICEF will provide equipment and drugs for a district health

center, five main centers, and six subcenters; well-drilling rig, piping, pumps, and transport for environmental sanitation work; stipends for six and one-half months' training of seventy-five health auxiliaries, seventy-five sanitary inspectors; and transport to assist in the expansion and strengthening of the basic maternal and child welfare services during the first two years of the government's National Health Plan.

BASIC CRITERIA AND RELATIONSHIPS

UNICEF assistance to governments usually raises a number of questions in view of the work concurrently administered by the United Nations' specialized agencies and the bilateral aid programs.

In order to clarify how UNICEF operates it may be helpful at this point to recall a few basic points:

1) UNICEF is the only United Nations organization concerned exclusively with children.

2) UNICEF may assist governments through the provision of essential imported supplies and equipment, as well as by contributing to the local costs of training, in the form of stipends for instructors and trainees.

3) UNICEF-aided programs must have the technical approval of the appropriate United Nations Specialized Agency before a government request and recommendation is presented to the UNICEF Executive Board for the approval of an allocation.

4) UNICEF assistance involves a co-operative venture in which the funds it contributes find their counterpart in local funds, facilities, services, supplies, personnel, or other resources made available by the beneficiary country for the purpose of the project. This system has become known as the "matching principle" and any assistance given by UNICEF is in a sense doubled and in many cases more than doubled.

5) For every assisting program, a comprehensive Plan of Operations is prepared defining the scope of the program, its basic objectives, both immediate and long term, and the timing of action to be taken. The phasing of the program is outlined in detail and the commitments of the government and each participating agency are specifically enumerated.

6) UNICEF co-operates jointly with the World Health Organization and the Food and Agriculture Organization in two policy-making committees. The two committees recommend general principles to be followed in the organizations' respective spheres of competence: for example, the Food and Agriculture Organization-UNICEF Joint Policy Committee recommends policy governing the assistance tendered to governments for the improvement of the nutrition of mothers and children.

7) The UNICEF Executive Board has approved a procedure for formalizing and strengthening the closer contacts which have gradually grown up in recent years between the UNICEF Secretariat and the Bureau of Social Affairs. On the one hand this makes it possible for the Bureau to keep UNICEF informed of social data and trends; on the other hand UNICEF may be able to assist governments in such projects as community development. The Bureau has a special responsibility in these projects and UNICEF is interested in providing aid for basic maternal and child welfare services.

8) Some of the government programs receiving UNICEF assistance are given technical guidance by experts provided through the United Nations Technical Assistance Board. There are, therefore, periodic reviews between these agencies in the field, insofar as there are common program interests and needs. Regular contacts with these experts are

maintained both in connection with program planning and development.

Policy and procedures do not alone relate to governments and various United Nations Organizations. It is necessary that they take into consideration several regional organizations serving the area, such as the Pan American Health Organization (PAHO), the Institute of Nutrition for Central America and Panama (INCAP), the Central American Institute for Technological and Industrial Investigations (ICAITI), the Economic Commission for Latin America (ECLA), and the Organization of Central American States (ODECA).

9) There are over fifty international nongovernmental organizations with the status of observers in relation to UNICEF's world-wide activities. Many of these organizations seek direct ways to aid the ongoing UNICEF-assisted programs. At the same time, while voluntary organizations within these countries may have similar desires, they are not always affiliated with an international group and very often they are attempting to build up their own organization's resources, both human and material. The majority of civic organizations have had limited experience in dealing with these types of programs, whether on a local, national, or international basis. To avoid loss and assure effective use of this potential call for creative thinking and action by all concerned, because many well-conceived programs may fail if they are not properly staffed and supported. Public funds are not always adequate to provide sufficient paid personnel; and in the rural areas this problem is even more acute. Also some of the nongovernmental agencies may have members who, with good orientation, could assist trained personnel as volunteers. The services in which all are interested could thereby be extended.

All of the organizations in this large network have an important role to play: They can assist governments in their battle to break the circle of poverty, disease, and ignorance. In addition to the possibilities and limitations which arise out of each agency's basic function, organization, and methods of operation, there is another set of conditions which must be taken into account in planning, implementing, and evaluating joint programs. To illustrate the other factors an agency must consider in its program planning, the child-malnutrition problem will be briefly examined.

FACTORS AFFECTING PROGRAM DEVELOPMENT

When the Central American countries asked for assistance to cope with the malnutrition of their children, feeding programs were developed principally through the schools. At that time, they offered the best opportunity and, in some countries, almost the only opportunity to reach regularly some groups of children, especially those in rural areas. It is recognized, nevertheless, that in some Central American countries where less than 50 per cent of the school-age children are in school, the percentage of children benefiting from a school feeding program is extremely limited, even if all schools were reached, leaving aside the more vulnerable group of infants and preschool children. In view of the lack of health centers, particularly in the rural areas, it is presently still very difficult in most of these countries to reach any considerable number of preschool-age children.

The Central American governments, recognizing the general nutritional deficiency, established the Institute of Nutrition for Central America and Panama in 1949. Over the years the studies this organization has made have

shown that the Central American diet is deficient in high quality protein and Vitamin A. As investigations pointed to the more serious nutritional conditions of infants and children of pre-school age, every effort was made by governments to give priority to these categories.

The development of the UNICEF-assisted feeding programs in Central America has inevitably differed somewhat from country to country. While basic imported supplies, such as powdered skim milk, utilized in the program were the same, the individual objectives, needs, and conditions of the countries, as well as the available personnel had to be taken into consideration at each step of development. The relevant factors included among others: the general economy, transport and communications, public health services, general educational level, social organization, concentration of population, the organization of government administrative services, the racial, cultural, and language background of the people, the co-operation between public and private agencies, a country's recognition of its own needs and the extent to which it is trying to meet them, available personnel, and attitudes towards international agencies and their ability to be of practical assistance.

PRACTICAL APPROACHES

During one of the early discussions in a Ministry of Foreign Relations, international aid, as it existed in the past, was described to the UNICEF representative. He was told how seldom it was implemented within the country in such a way that it touched the fathers, mothers, and children directly. The government representative then suggested, "If the United Nations through its various agencies can do something practical which will indicate

to parents that the United Nations cares about their children, perhaps this is one of the most important messages it has to give to our people at this time."

If, in spite of all the efforts of governments and international agencies, programs do not reach the parents and children, especially in the more remote rural areas, perhaps this is due, in part, to the methods being used. One of the more interesting experiences in connection with the nutrition education-school garden programs in Guatemala is to see the response of the village people in seventy-two communities where the school gardens have been started and where mothers' clubs have been organized as a central point in which education in nutrition can be shared. Likewise, men and women of the community have been carefully selected and given a simple training in order to help them to encourage their families, friends, neighbors, and the community-at-large to participate in these related activities. It leaves no doubt that too often there is a very real underestimation of the potential of village folk, both with reference to their interest in their own problems and their desire and ability to help themselves.

Recognizing the interrelated interests and responsibilities of the Ministry of Public Health, Ministry of Agriculture, and Ministry of Education in such programs, the international agencies—the Food and Agriculture Organization (FAO), World Health Organization (WHO), United Nations Bureau of Social Affairs and UNICEF—are planning with governments integrated programs of this type, and it is expected that this development will be a general one in the future.

UNICEF, together with the FAO, has helped five Central American countries in developing milk drying plants as a means of government self-help

toward the continuance of nutrition programs initiated with international assistance and the importation of surplus supplies. The effect on milk production has been striking, once the plant is in operation. Appropriate approaches are being sought in relation to the related problems of production, marketing, consumption, and the health aspects involved.

INTERAGENCY COLLABORATION

In spite of the seeming complexity of international co-operation in practical programs for the welfare of children, there has gradually evolved a working pattern which has made possible the fullest collaboration between the governments and all interested agencies.

The programs are government programs: it is the government which requests and invites the United Nations' agencies and sometimes bilateral organizations, as well, to participate in a given project in accordance with their possible fields of assistance, whether technical or material.

MALARIA ERADICATION

The Central American governments, in concentrating upon the eradication of malaria, are given technical guidance by experts of the Pan American Health Organization which serves as the Regional Office for WHO in the Americas. For these programs UNICEF has contributed a large share of the supplies including insecticides, transport, sprayers, and some laboratory equipment. In some countries the administration of this program is carried on by the co-operative service of public health of the International Co-operation Administration (ICA). Close co-ordination and the sharing of information between the government and all participating agencies is required and equally important is the acceptance by all of the basic theory of eradication and the scientific

techniques required in order to achieve the goal.

In a report on Malaria Eradication prepared by the Director-General of the World Health Organization at the request of the UNICEF Executive Board, an appraisal of present programs was given as a basis for a review by UNICEF of its financial support for these programs. In explaining the theory of eradication, the report states that "the eradication of malaria depends on the elimination of local transmission of the disease by methods directed against the anophaline vectors. As a result of such elimination of transmission, the human reservoir of malaria parasites gradually empties itself, since the infection is self-limiting in time. The latter process can be speeded up by attack on the malaria parasite through the action of specific drugs. The consequent reduction of the reservoir of infection makes possible the final eradication of malaria. In some exceptional conditions where the insecticide alone is unable to interrupt transmission, there might be need for a simultaneous attack on the vector and on the parasite."

The female mosquitoes after each blood-meal and before the subsequent egg-laying rest on the walls and other internal surfaces of houses or shelters in which they feed. The method used, therefore, to interrupt the transmission of malaria is the systematic application of residual insecticides until human dwellings are totally covered, and if necessary the process is extended to animal dwellings.

During the early malaria control program in Central America the plan envisaged the spraying of all houses in the malarious area with DDT every six months. At the beginning of the eradication program six of the countries in this area changed over to the use of dieldrin once a year; however, in view

of the resistance which the mosquitoes built up to the dieldrin, it was necessary to revise the plans in five countries, again using DDT.

As DDT is sprayed twice a year, this has meant a considerable increase in cost to the governments concerned and to the participating agencies, including UNICEF.

The development of resistance to dieldrin has in some cases delayed matters. There is no doubt, however, in the opinion of WHO, as to the feasibility of achieving eradication eventually.

UNICEF originally committed itself to assist governments in their malaria eradication programs for four years, that is, the time the attack phase was expected to last. In view of the development of resistance in Central America, it is now clear that in many cases this attack phase will have to be extended. At its session in September 1959 the UNICEF Executive Board agreed to extend assistance beyond the original four years with the rider that the commitment will never be for more than one year at a time after which the matter will be again considered.

It is virtually impossible to show progress towards eradication without detailed epidemiological knowledge of the country. Moreover, from one single remaining focus of malaria the disease may spread all over again. The evaluation services of the malaria programs are therefore of paramount importance. Encouraged and supervised by trained program staff, thousands of voluntary collaborators—school teachers, shopkeepers, policemen, missionaries—throughout countries take blood-slides from any and all recent or actual fever cases. The slides are examined centrally and the results, apart from enabling those sick of malaria to be treated with antimalaria drugs, enable a detailed map to be drawn up of the epidemiological situation of the coun-

try. Over the months the pins begin to concentrate more and more in isolated spots, leaving ever wider areas clear of pins and of malaria. But the disease will not be eradicated until all pins have been removed and have remained so for at least three years.

TRENDS FOR THE FUTURE

Turning to future program possibilities, mention should be made of two additional fields of action under consideration by the UNICEF Administration and the Executive Board: assistance to primary education and assistance to social services for children with particular reference to institutions, day-care centers, and other methods of care to children outside their own homes.

At the meeting of the UNICEF Executive Board in March 1958 the United States Delegation, noting that UNICEF's aid up to that time had been directed almost exclusively toward improving the health of mothers and children, raised the question as to whether it might not be appropriate to consider ways in which UNICEF programs could be extended more directly in the area of social services.

One year later, in response to this request, a recommendation was submitted to the Executive Board, for its approval, which outlined the ways such social services could be assisted by UNICEF. This was approved unanimously by the thirty members of the Board. In view of this new field, a number of Central American countries, already in the process of strengthening their social services with the technical guidance of the United Nations Bureau of Social Affairs, expect at a later date to request UNICEF aid in this field. This new focus will undoubtedly effect a greater understanding of children's total needs. UNICEF, in partnership with the other United Nations organi-

zations, looks forward to making a contribution that will help children to have a better intellectual and emotional growth as well as improved health and nutrition. These new programs are only in their beginning stages, but in Central America, governments are already aware of and interested in this possible development. In the years to come, UNICEF aid will indeed be broadened, taking into account the whole needs of a child and the general improvement of family and community levels of living.

CONCLUSIONS

In a geographic area, in which the total population in 1960 is estimated at 12,000,000, with 5,136,000 under 14 years of age, it would appear that international aid will continue to be needed, not only along the basic lines developed during the past ten years, but in new fields of action as well.

In view of the matching principle and the obligations it represents, it is logical to suppose that a single ministry may reach its saturation point in relation to international aid, even though there is need for further assistance. The more integrated approach, which calls for several ministries to participate, should have a wholesome effect on the pro-

grams as such and make it possible for their extension.

Anticipating the eradication of malaria, large sums of money now going into these campaigns, both from the budgets of the governments and from international agencies, should eventually be freed for use in other programs.

With the rapid increase of population, greater emphasis will have to be placed on increased food production even to maintain the present inadequate level of nutrition. In a number of countries, half the children of school age are not attending school in spite of compulsory education laws. A large percentage of the children who do attend have the benefit of only three or four grades of primary schooling.

Lack of essential social services, inadequate and insufficient housing, and child labor, affect very seriously the life of children in Central America.

So far the general pattern of assistance, as it has gradually evolved, has been initially to aid governments in programs which had the most urgent character. The governments have turned to longer term planning which, insofar as the UNICEF aid is concerned, puts increasing emphasis on ways to assist in the training of personnel in various fields of service and at different levels.

Social Development in the United Kingdom African Territories

By WILFRED H. CHINN

ABSTRACT: Social development in British African territories has consciously been undertaken by governments only since the end of World War II. Initially it took the form of remedial methods to deal with social problems accentuated by the war. The work of government social welfare departments and voluntary agencies assisted by international aid could not, however, be confined to the provision of remedial services. The underlying social ills had to be attacked as well. Social welfare workers were among the pioneers in community-development work in several territories in Africa; their work originally begun in the towns now reaches more and more into the outlying areas. This is particularly true in the case of Ghana, Uganda, and Tanganyika. In most African territories, social welfare and community development are administered through a single Ministry of Social Development so that remedial and constructive measures are correlated.

Wilfred H. Chinn, C.M.G., London, England, is Adviser on Social Welfare to the United Kingdom Secretary of State for the Colonies. After probation and settlement work in the United Kingdom he served in the Mandatory Government in Palestine 1935-1947, where he was Director of the Department of Social Welfare. He has traveled extensively and has visited all the British African territories. He has served as alternate United Kingdom delegate on the United Nations Social Commission and as adviser on the United Nations Committee on Information from Nonselves-governing territories and as United Kingdom representative on many international conferences on social affairs.

THE report of the Ashridge Conference on Social Development in British Overseas Territories, which was convened by the Colonial Office in 1954, defined social development as "... nothing less than the whole process of change and advancement in a territory considered in terms of the well-being of society and the individual." The report went on to say that social development is not just the sum total of development activities carried out by those agencies usually grouped under the heading "Social Services," but that it covers and informs the economic, social, political, and cultural fields.

PHILOSOPHIC CONCEPT

Social development in this sense is a concept which, in a democratic society, can only grow in conditions which allow free expression of individual aspirations and which provide scope for social action in associations of various kinds. For the older democratic countries these conditions are axiomatic; their social and political institutions are based on the abilities of their peoples to adapt thought and action to changing conditions. But adaptation and adjustment to change are not made automatically through political institutions. Political institutions give expression and force to the ideas and philosophy inspired by individuals and groups and formalize practical voluntary experiments in social development. In other words "the well-being of the individual and society" depends primarily on the efforts which the individual himself is prepared to make, the scope of his activities in his community, and the influence brought to bear on public opinion and governments.

HISTORICAL BACKGROUND

However, these efforts also need encouragement and stimulation. This is

particularly true in Africa where economic development and social change have been recent and rapid. Development during what might be called the Colonial period was dependent on and furthered the interests of outside commercial enterprise. Until comparatively recently only a small section of any overseas community was directly affected by these trading contacts with the outside world. The establishment of industrial plants, mining concerns, and plantation farming changed the situation. Europeans settled in the healthier areas, towns were built, and labor was required to work for wages in districts far from the tribal home.

Government had to provide services for the growing towns; regulations had to be made to govern conditions of labor, health services provided, and education extended to meet ever increasing demands for a growing variety of skills. All this was expensive, and ways and means had to be found to raise money from a people unused to a money economy. This meant increased production of cash crops from peasant farmers, and agricultural departments were set up to help and advise the farmers. Taxes had to be collected, and new forms of political organizations were introduced to replace or modify the former policy of indirect rule. And so the original concept of Colonial development began to change. Although still mainly economic in character, development was directed to the improvement of conditions in the territories: to strengthening the economy and expanding the social services.

EFFECT ON TRADITIONAL SOCIETY

These changes seriously affected traditional ways of life; tribal laws and customs everywhere show signs of breaking down and in certain areas this process is well advanced. It is, however, important to realize that change

is inevitable; it can and should be directed, but any attempt to prevent it—to return to what is often nostalgically thought of as a happy state of nature—is doomed to failure.

This aspect of change might be considered as the result of a clash of cultures which could be directed and controlled through educational methods and the growth of political responsibility. But in recent years new and much more revolutionary processes have been at work in British territories—namely, rapid economic development and the policy of hastening the advance of overseas territories towards full self-government within the Commonwealth.

EFFECT OF ECONOMIC EXPANSION

The recent origin of this economic growth is not generally realized. Africa is now experiencing an industrial revolution, telescoped into about one tenth of the time occupied by the European industrial revolution. At the same time its people are having to absorb an entirely new culture and have no natural background of tradition and custom suitable for a form of civilization based on western technology. In the west there was not only more time to adjust to changing conditions but the adjustment was made within a social and political setting which allowed for adaptation and the development of a sense of personal and public responsibility. Even so, the western countries made quite a sad mess of many aspects of industrialization. Some of the mistakes made are being repeated in Africa where their effect is even more devastating to the social structure.

FUNCTION OF SOCIAL DEVELOPMENT

It is therefore necessary to think of social development in a functional sense by which certain measures and skills can be made available to communities and individuals in order to

achieve not only desirable social ends but to help to adapt traditional law and custom to the new and as yet not clearly discernable form of society resulting from the rapid change.

At this stage, there is a need for a distinctive social development organization whose activities might be grouped under three heads:

(1) to prepare the ground for and to supplement the work of the technical departments of government, and through group activities and communal effort to concentrate attention on the human aspects of development;

(2) provide constructive measures to build a sense of community and as far as possible to prevent disruption and its consequent social problems;

(3) provide remedial measures to deal with problems as they arise and initiate services to help those individuals who are unable or unwilling to fit into the changing pattern of society, or who fall by the wayside.

These three aspects of social development receive their practical application under the headings of Community Development and Social Welfare.

COMMUNITY DEVELOPMENT

The term community development was adopted at the Cambridge Summer Conference on African Administration in 1948 to describe a method of approach to local administration which aimed at developing the initiative of the individual and the community in schemes for promoting their own betterment. It has been defined as "a movement designed to promote better living for the whole community with the active participation and on the initiative of the community." The principles of community development were, of course, not new in 1948 when the term was first used. What is new is the concept of community development as a movement, the principles and methods

of which are universal in their application. Even so, community development is often used to describe differing methods of approach and there is not as yet, and by the nature of the subject there may never be, a precise definition applicable in all circumstances. There is also considerable divergence in methods used to stimulate initiative in the community from what may be called the "authoritarian" approach through an outside agency to complete reliance on the wishes of the people—their "felt needs." All these methods may use the principles of community development but, as T. R. Batten points out, they may not all equally apply to every situation and in every community.

Different communities have different needs and the same community has different needs at different times. It is in finding and meeting these needs that agency aims and methods should be related, and it is by success in doing so rather than by adhering to fixed principles or dogma that community agencies must justify what they do.¹

The differences in method and application can be seen in British African territories, but recent trends place the emphasis more on the word "community" than on the word "development"; development of communities rather than for or even by communities.

In helping people to adapt themselves to a changing form of society it is essential to find effective ways of stimulating, helping, and teaching them to adopt new methods and to learn new skills; to help them to adapt their way of life to changes they accept or have imposed upon them; and to ensure that the sense of community is not destroyed.

An additional and extremely impor-

¹ T. R. Batten, *Communities and their Development: an introductory study with special reference to the tropics* (London: Oxford University Press, 1957).

tant aspect of community development is the part it can play in building new communities. It was first used in the rural areas where the bulk of the African people live. Not enough attention either in research or experimentation has been given to the constructive side of social development in towns, mining areas, and plantations. In nearly all cases these conglomerations of people are of forced growth and recent origin.² They present a problem of creating communities out of often widely differing ethnic and religious groups. Community development can help to foster means by which the individual in a new and strange environment can discover a sense of belonging, new loyalties can be created, and a forceful public opinion developed.

It is thus through the application of community development methods that the first two requirements of a social development program can be met. It was suggested that these were to prepare the people to accept and use intelligently the services available to them and to ensure that development took fully into account the human aspect; and to build a sense of community and mitigate the social ills arising from economic development.

SOCIAL WELFARE

The third requirement was to provide measures to deal with social problems as they arise: problems such as delinquency, destitution, the care of children, the handicapped, and the aged.

There is a close relationship between social welfare and community development. Social welfare is not only concerned with remedial action but it also has an important constructive contribution to make by applying group work methods in both urban and rural areas. Community associations and centers,

² Gutkind and Southall, *Townsmen in the Making*.

boys' and girls' clubs and associations generally, the organization of sports and athletics, all of which come under the general head of welfare, are essential elements in social development.

PRINCIPLES OF SOCIAL DEVELOPMENT

Broadly speaking, the main principles of social development are:

(1) the need to relate social development policy to the particular circumstances of the particular territory;

(2) interdepartmental co-operation, so devised as to provide a unified approach to the policy;

(3) community development as a component of social development to be integrated at all levels with the wider political and economic plans for the territory, and in particular with the development of local government. In addition, it is essential that the people themselves should be associated with the planning and execution of community development programs at every possible stage and at all levels.³

In the social welfare field statutory provision has been made in all African territories for the treatment of juvenile delinquency, the establishment of probation services, and measures are in hand for legislation to deal with the problem of children deprived of a normal home life. It is the policy of all African governments to make full use of voluntary social welfare organizations.

In many countries public social services originated in the efforts of charitable individuals and voluntary societies, but in Africa there is not time to await the gradual evolution of public services through voluntary action which has been typical in western societies. Governments often have to initiate services to deal with social problems

³ *Community Development, A Handbook* (Her Majesty's Stationery Office, 1958).

and to safeguard the individual well in advance of public opinion as expressed in voluntary effort. But as public social services increase, opportunities for voluntary action are presented, and it is considered of the utmost importance that voluntary societies should be encouraged; they are the pioneers of social progress through their freedom both to enter new fields and, most important in Africa, to adapt the traditional social services to modern needs.

SOCIAL DEVELOPMENT IN PRACTICE

During the past ten years a great deal has been said and written on the theory and practice of social development and particularly the place of community development in programs of social development. As is inevitable on a subject of such magnitude and importance, a variety of viewpoints have emerged. Recently, however, there has been some evidence that opinions on fundamentals are drawing closer together. It is, for example, now agreed by most authorities that community development, which tended to have a materialistic bias through concentration on small self-help economic projects, also has a cultural, social, and spiritual significance, and provides a useful stepping stone to democratic self-government as it is understood in the western world.

IMPORTANCE OF FAMILY UNIT

It has now been realized that all these things can only be successfully achieved through the improvement and strengthening of the most fundamental unit of society—the family. This sounds fairly obvious, but the place of the family in African society is not quite so easy to understand, and its significance and influence in the social structure is very different from that of the conventional western type family. The traditional African family is part

of a larger structure. Each member has clearly defined rights and duties, determined by tribal law and custom. In many places this traditional family pattern is breaking up, particularly in urban areas, and it is clear that unless a new and acceptable form of family life emerges, there can be little hope for social development. A conference was recently convened by the United Kingdom Colonial Office to consider "The Place of the Family in Social Development"—the report of which will be available shortly. The conference was quite clear in its conclusions that the family must be the unit through which social development should operate, and that means must be found to preserve, strengthen, and adapt the rights and duties common to the African extended family in and to the changing conditions of today. In other words, social development must be "family centered." The family should be both the recipient of social development services and the unit through which social development operates in the wider community.

In practical terms this means a shift of emphasis from concentration on individual members of a family group—for example, child welfare, women's clubs, community projects involving the man—to a co-ordinated approach reaching the whole family and leading to its complete involvement in community affairs. The techniques of this approach have yet to be worked out but there is no doubt that greater emphasis will need to be placed on home economics.

SOCIAL DEVELOPMENT PROGRAMS

Examples of social development in practice in British African territories are bound to be selective. As was indicated above, there is no common pattern of administration although there are certain commonly accepted principles.

The following examples from actual programs of social development have been selected to illustrate the scope and variety of the schemes in operation.

An encouraging feature of social development in Africa is the increasing interest and assistance given by international agencies and by the International Co-operation Administration of the United States. UNICEF is contributing generously to the Women's Club movement in East Africa. The Home Economics Division of the Food and Agriculture Organization gives valuable advice and assistance.

One of the first projects of the newly created United Nations Economic Commission for Africa was to convene a conference on Community Development, and the Commission has also recently strengthened its Social Service Section.

UGANDA

Social development in Uganda is the responsibility of the Minister of Social Development who includes in his portfolio community development, social welfare and the probation service, and the Division of African Housing. The staff of the Ministry of Social Development consists of a Permanent Secretary who is the principal adviser to the Minister, and two Deputy Secretaries who are responsible for the Social Development and Housing divisions respectively. The Deputy Secretary for Social Development has on his staff a Principal Welfare Officer responsible for urban social welfare and the probation service, and an adviser on women's work. The country is divided into four provinces and sixteen administrative districts. At district level there is an establishment of two community development officers, a man and a woman, and a staff of male and female assistants.

Emphasis is placed on the devolution

of responsibility, and local development plans are formulated and executed by the district team which includes in its membership the officers of the technical departments of government working in the districts, including the community development officer. The district team holds frequent meetings, approves local community development schemes, and technical assistance for the schemes is always forthcoming from the professional officers.

Since high priority is given to leadership training, each district in Uganda has a rural training center controlled by the community development officer and available on request to other professional officers of the district team.

The community development program is a very wide one. It includes literacy classes for adults and the establishment of a literature and library service, training in citizenship, the stimulation and supervision of village self-help schemes, the organization of men's and women's clubs, and assisting the technical departments in their extension work. Urban social welfare and the operation of the probation system is under the direction of the Principal Welfare Officer. Apart from the Probation and After-care services, which cover the greater part of the Protectorate, urban social welfare is undertaken mainly by voluntary organizations most of which are aided by grants from the government. This aid often takes the form of providing staff and facilities for training leaders. Co-ordination of voluntary effort is achieved through the Uganda National Council of Social Service—a body which represents every Protectorate-wide voluntary organization. Government has made institutional provision for young offenders. Welfare committees serviced by social welfare staff have been set up in the major towns. These commit-

tees are composed of members elected by voluntary agencies and government officers nominated by the ministries concerned.

WOMEN'S GROUPS

Uganda was a pioneer in realizing that social progress depended very largely on the attitude of the women. Women in the rural areas were encouraged to form groups where they could share common interests, learn new skills, and discuss what needed to be done to improve their homes. Groups formed throughout one district and were soon organized as clubs, each with its own elected officers. There are now nearly 900 established women's clubs which have graduated from programs mainly concerned with literacy, sewing, and cooking to courses in home economics. Thus, a more complete process of education has begun and action is directed to a greater extent towards raising standards of living, including the improvement of the material amenities of the home. Cultural activities and "fun and games" are not neglected, and music and drama are a feature of most clubs. Men's clubs, which both supplement and co-operate with the work of the women's groups, have also been formed. Closely linked with the instruction given in the clubs are schemes for home improvement, organized by groups of ten families who work in turn on each others' homes and compounds in order to improve the physical amenities of the home, to make simple furniture, and undertake services to ensure a clean and sanitary compound. This type of collective home improvement is very popular and thousands of homes have improved beyond all expectations as the result of teaching in the clubs and voluntary effort. The continued suc-

cess of the club movement depends on trained leadership and this is supplied through courses of three months' duration held at the rural training centers for women voluntary leaders. The more advanced leaders are sent to a central training establishment for further training.

SELF-HELP SCHEMES

Village self-help schemes usually develop from group work based on literacy classes or are inspired by the leadership training courses held for both men and women at the rural training centers. At the local level, it is usual for a group of people to discuss with a member of the community development staff what they feel needs to be done to improve village life, and with the community development officer's assistance, they then assess their ability to meet the needs. An agreed scheme is submitted to the district team, and if approved, help is given in the form of the more expensive materials or skilled labor from community development funds administered locally. Some very large improvement schemes have been undertaken but in the main, the schemes are small, affecting the immediate community. The main purpose of these projects is to develop self-reliant communities and not to do public works cheaply.

An important feature of the work of the Ministry is co-operation with professional and technical departments of government in their extension work. Teaching aids are provided for health work and for agricultural extension services. Community development staff urge their groups to seek the advice of the technical officers and to put into practice the lessons taught by their officers. In addition community development officers co-operate with technical officers in production drives, health campaigns, pest control and so forth.

KENYA

In Kenya social welfare and kindred work is divided between two ministries, and the municipalities of Nairobi, Mombassa, and Nakuru have their own welfare departments. The Ministry of Community Development is responsible, in addition to community development and informal adult education, for the probation service and institutions for the training of young offenders. The Ministry of Health and Local Government is responsible for European welfare services, public assistance, the care of destitute children and the handicapped, and for liaison with voluntary welfare organizations.

The organization and practice of community development is similar to that of Uganda—the important differences being apparent in their local government structures. Community development officers, both men and women, are appointed to the districts, some of whose salaries are provided from United States International Co-operation Administration funds.

WOMEN'S CLUBS

One of the most interesting features of community development in Kenya is, as in Uganda, the establishment of women's clubs. Started in 1951, the clubs attracted members mainly through interest in sewing. They used voluntary helpers, but as trained leaders became available the practice of planned programs was introduced. The clubs multiplied so rapidly that in 1955 the movement known as Maendeleo ya Wanawake (Progress of Women) had enough affiliated members to receive official recognition as a registered society. There are now some 800 clubs with a paid-up membership of 40,000 and an additional 18,000 women who attend meetings without having paid membership fees. The clubs are open to all women over

the age of sixteen, and a recent development has been the formation of Junior Maendeleo groups, supervised by senior members of the registered clubs.

In all areas where there are active clubs, the general standard of cleanliness, both in the home and in the person has risen considerably, the improved health and cleanliness of the children of club members being particularly noticeable. The community spirit engendered by active participation in group activities has shown itself in the practical and valuable assistance given by club members in many of the areas affected by the Mau Mau emergency.

The movement has aroused interest in the men as well as the women of Kenya and in many areas the chiefs and headmen have voted monies towards club buildings and training centers, have given land for buildings and games' pitches, and paid their own local leaders.

YOUTH CLUBS

A recent and significant development in Kenya is the growth of clubs for boys and youths who are unemployed or underemployed. The problem of the landless and semieducated boy is a serious one in many territories. Kenya is tackling the problem through community development techniques, whereby young people organize groups for the purpose of learning crafts and better agriculture and at the same time develop a sense of community and public service. They are encouraged by the adult members of the community who often make gifts of land, money, and materials for club premises and agricultural training.

EAST AFRICA

The three East African territories, Uganda, Kenya, and Tanganyika, are concentrating on similar group activities for men, women, and young people.

The intention of all these groups is to extend into new forms of society those communal services which were an essential part of traditional societies and to introduce new ideas and skills designed to prepare the people to play their part in building the new society.

WEST AFRICA

In West Africa, Ghana provides an example of a nationally organized and centrally directed department dealing with most aspects of social development, both at the policy-making level and in the field. In this respect it has a more advanced and comprehensive form of social development administration than other African countries. It was a pioneer in developing community development techniques suitable for West African conditions and its influence on neighboring territories has been great. Ghana is an independent country so cannot be quoted here as a representative of social development in United Kingdom African territories. A description of the history and methods of social development in Ghana can be found in a book written by the Director of the Department of Community Development and Social Welfare.⁴

EASTERN NIGERIA

Mr. I. C. Jackson has described Social Development in Eastern Nigeria in his book *Advance in Africa*.⁵ This shows the different emphasis placed on community development in a country with established village communities and townships and where the social structure and status of women are different from that in East Africa. Community development took the form of projects communally undertaken, mainly to improve

⁴ Peter du Sautoy, *Community Development in Ghana* (London: Oxford University Press, 1958).

⁵ I. C. Jackson, *Advance in Africa* (London: Oxford University Press, 1956).

economic standards. It originated in the pioneer efforts of Mr. E. R. Chadwick who worked in the Udi Division and whose methods paved the way for the modern conception of community development. The story has been vividly presented in the film "Daybreak in Udi."

Reference has been made above to training programs for people actively engaged in social development work, whether as Community Development officers, social workers, or local leaders.

Training has been found essential at all levels and has been given considerable support by co-operating international and national agencies. There is also need for much more social research, the evaluation of existing programs, and the encouragement of nongovernmental organizations in experimental schemes.

Social development has many tasks ahead. At the present time it is perhaps the most important aspect of development in Africa, and it requires all the understanding and help it can get.

Pakistan: Co-operative Ventures in Social Welfare*

By VICTOR D. CARLSON

ABSTRACT: The creation of the state of Pakistan, following in the wake of the bloody partition, the mass migrations, as well as the resultant concentration of people, culminated in a situation where the human needs could only be fulfilled through organized and planned social welfare. Industrialization was the apparent need for a largely agricultural country. But the Muslim population with its inbred tradition of social justice and equality reinforced the stress on social welfare. There emerged, therefore, a policy that demanded a balance between economic and social planning. Social work begun by volunteers was shaped by government efforts. International assistance was requested and personnel was secured to institute the needy training of local persons. Among the varied projects which developed, perhaps the most noteworthy was the emergence of the Village-Aid Programs and the Urban Community Development Programs. The simultaneous activity of the government and the voluntary agencies facilitated rapid and dramatic progress in the planning and organization of welfare services.—Ed.

Victor D. Carlson, M.A., New Delhi, India, is Regional Social Affairs Officer for The Division of Social Affairs of the United Nations Economic Commission for Asia and the Far East. He was for four years, until 1959, United Nations Social Welfare Advisor to the government of Pakistan and simultaneously leader of a team of United Nations Technical Assistance experts. He served for twelve years (1943-1955) as Regional Representative for the Bureau of Public Assistance, United States Department of Health, Education, and Welfare. A graduate of Willamette University and the University of Chicago School of Social Service Administration, Mr. Carlson is the author of Social Welfare in Pakistan, a report to the Government.

* The opinions expressed in this article are those of the author, and do not necessarily reflect the position of the United Nations.

PAKISTAN, twelve years old, is, legally, a young country. Culturally, it is very old, dating back 3,000 years B.C. to the early civilizations of the Indus Valley in the West and to the ancient and varying cultures of the riverine country leading to the mouths of the Ganges in the East.

The nation came into being in June, 1947, when Lord Cyril Radcliffe, as Chairman of the Boundary Commission, painfully drew lines across a map to divide the great territory of India into two areas. Ironically, the division, based, roughly, on geographical location of Muslim majorities, resulted in Pakistan's becoming two separate units, twelve hundred miles apart.

Although the large country of India separates the two units, both West Pakistan and East Pakistan are bound together by the shared struggle for equality and freedom, based on a common religion, Islam.

Under the Islamic constitution adopted in 1956, the two provinces were given equal rights and powers in a central government, with Karachi as its capital. It is now planned to move the capital north to the vicinity of Rawalpindi.

PARTITION DISRUPTS POPULATION

For decades, prior to the division and simultaneous freedom from British rule, the Muslims, a minority group, had struggled against the majority Hindus and the Sikhs. The best efforts of such great leaders as Mohammed Ali Jinnah, Mahatma Gandhi, and Pandit Nehru to find a solution to this communal strife, short of partition, came to naught.

The leaders had planned for a peaceful partition, and Quaid-i-Azam, as Jinnah was fondly called, appealed to the Muslim people for an orderly resettlement. But, the passions and hatreds, so long smoldering, could not be suppressed. The heartbreaking, terrible

chaos of partition is now history, but the scars remain. Hindus left houses, shops, and farms and fled to Indian territory, while Muslims, fourteen millions of them, sacrificed their belongings in India to flee to Pakistani territory. About fifty-thousand persons poured into the new country every day, once the mass migration started. Massacres cost a million lives, and probably thrice that were maimed.

The people of Pakistan promptly rallied to establish mass feeding programs and to set up temporary, make-shift housing. With meagre resources, government officials and volunteers worked together to start the machinery of resettlement and rehabilitation.

Pakistan now finds itself a nation of 84 million people, sixth largest in the world. The first and only census, taken in 1951, showed 75,700,000 and the rate of increase is estimated by the Pakistan Planning Commission at 1.4 per cent. Sixty per cent live in East Pakistan, which is less than a third as large as the West Province. Hence, the density of population there is appalling, that is, 777 per square mile. This density is even more vivid when related to cultivable land—11,666 persons per square mile. Overall, the small area of Pakistan—365,000 square miles—makes it the country of fifth highest density, with 225 persons per square mile, although great stretches of West Pakistan, purely desert, are scantily populated, given over to nomadic camel and sheep grazing peoples.

The economy of Pakistan is traditionally and essentially agricultural. Ninety per cent of the people live in villages and depend upon agriculture for their livelihood. The average per capita income, though difficult to establish accurately, is Rs. 249, or roughly \$50 per year, one of the lowest in the world. Large estates prevail in West Pakistan, hence most agriculturists own

no land. They work for Zamindars—large landowners—with the common problems of low yield per acre, and land lying fallow because taxes are based on produce, not land. Enactment of the State Acquisition and Tenancy Act of 1951 modified the situation in East Pakistan, as the government has proceeded to acquire land from the Zamindars, for compensation, and to redistribute it in smaller lots. And, in early 1959, the new governmental regime in Karachi, adopted a land-redistribution plan for West Pakistan, which is presently being executed. It is believed that these land reforms will remove some major obstacles to the greatly needed increase in food production.

MOVE TOWARD INDUSTRIALIZATION

The portions of undivided India which became Pakistan contained practically no industry; rather, they were known as the "bread basket" of India. The national efforts toward industrial development are dramatic, textile mills, sugar factories, cement factories, hydro-electric plants are being set up with government funds, private enterprise, and foreign capital. The accompanying urbanization, as the villagers move to the cities and the cities continue to overflow with unsettled refugees, creates acute social problems.

Most of the persons coming to Pakistan in 1947–1949 were agriculturists and craftsmen, while the Hindus and the Sikhs who crossed over to India were, in great part, townsmen who had engaged in business or in the professions of law, medicine, teaching, and governmental services.

Thus, there was a void of technical skills which could not be quickly filled. Many services such as schools, health clinics, dispensaries, hospitals, and welfare institutions were badly crippled in

their operations, or entirely abandoned.

The great increase in population converging on the towns and the cities strained, almost to the breaking point, the essential community services, such as water supplies, electricity, and sewage disposal.

Cities like Karachi, Dacca, Khulna, and others grew tremendously. Housing or developed plots were provided to about half a million persons, but many thousands remain improperly housed to this day.

The early social programs were, thus, necessarily those of mass approach, and little specialized attention could be given to individual needs.

PATTERNS OF SOCIAL WELFARE

There were, however, certain normal patterns of social welfare in prepartitioned India, which had carried over into the new country.

In terms of services, the care of orphaned children was probably the oldest field. Charity schools and orphanages were established as early as the eighteenth century. While the extensive reliance on large and archaic orphanages is now decried in Pakistan, it must be realized that the 1951 census showed nearly two million fatherless children who required some plan of care. Considerably later came the development of some services for the physically handicapped, such as the deaf and dumb and the blind.

Charitable hospital facilities were part of an early welfare movement.

Individual philanthropy had been a distinct tradition. The giving of alms and the care and feeding of the destitute had been considered acts of religious merit. During times of famine, free kitchens were set up and religious buildings used to shelter the homeless.

The greatest resource for the needy, of course, had been the extended family,

where the aged, the disabled, the chronically ill, and others were looked after by the family. Community councils also sometimes took responsibility for persons in need, and the government provided relief work and gratuitous relief in times of disaster. There had not, however, been, nor is there now, any organized method of regularly providing social assistance to needy persons.

Training for social work was relatively new in the subcontinent. The first graduate school of social work was established in 1936—the Sir Dorabji Tata School, in Bombay. The handful of graduates of the Tata School who migrated to Pakistan were influential in gaining recognition of the need for social work training in Pakistan.

IDEALISM AND MODERN CONCEPTS

It was evident from the beginning of its existence as a separate nation, that Pakistan was committed to base its conscious social welfare development on traditional idealism affected by some modern concepts. As a secular state based upon Islam, a religion characterized by concern for social justice and equality, it was appropriately recognized that economic development to be effective required parallel social planning. In order to accomplish the ideal of a welfare state, drastic reforms were necessary to assure that the benefits of a meagre economy were made increasingly available to the common man. To this end, internal and external resources in kind, monies, and manpower had to be mobilized, organized, co-ordinated and used to best advantage. Pakistan's social welfare movement has evolved around these efforts of its leaders to achieve a balance in economic and social development. It is to be noted that there have been drastic fluctuations between progress and regression with respect to these idealistic goals. As in

most new countries, greed and lack of scruples of some of the leaders have, at periods, deterred the advance.

The heroic and unselfish work of volunteers during the emergency of partition resulted in the formation of organizations such as the All-Pakistan Womens Association, Anjumans, Medical Relief Societies, and Maternal and Child Welfare Societies. There was, concurrently, a growing recognition on the part of various departments of government, especially health, education, interior, labor, and refugee rehabilitation, that some professional guidance would be helpful in planning for welfare services. Material aid in the form of relief in kind or individual care seemed of secondary importance to the mobilization and training of national personnel for planning and executing mass welfare programs.

INTERNATIONAL AID REQUESTED

In 1951, the first request was made by the government to the United Nations Technical Assistance Administration for an international adviser. Miss Elmina Lucke of the United States, whom many in Pakistan know well and remember affectionately, arrived early in 1952. With her advice, the government decided that the best progress could be made in combatting social problems facing the country by training social workers who could assist with leadership responsibilities. It proposed, therefore, to set up short-term training courses and requested additional advisory and teaching help from the United Nations. Technical experts from Sweden, Australia, the United States, and Egypt were provided, bringing into the advisory and teaching team a variety of backgrounds and experiences. Their counterparts, or national team members, were drawn from appropriate ministries having to do with some

aspect of welfare services. This team of international and national persons conducted a number of courses, in both West and East Pakistan, in an effort to create a nucleus of understanding personnel who could aid the government departments and voluntary agencies in co-ordinated planning for improved social services.

In devising the type of training most needed in Pakistan, the advisors had first to become acquainted with the factors that would affect training and programming. This was not easy, as the classic approach of survey, analysis, planning, and then implementation was considered impossible in the emergency.

The little band of international and national teachers had scarcely an office roof over their heads, let alone a classroom. For Karachi, the new capital, had until recently been a small, clean, sleepy fishing town and harbor on the Arabian Sea at the edge of the Sind desert, of no more than 200,000 souls, including the surrounding villages. Suddenly, it had become a teeming mass of nearly two million. Space in a government building, reference books, typewriters, or even desks and chairs were in scant supply for the new movement. So a colorful shamiana (tent) was erected in a hot, dusty compound where students gathered for classes and learned their practice by "field work" in the nearby, crowded refugee camps. Teaching staff garnered from allied fields, supervisors, international advisors, and students worked and learned together. These hectic and trying early efforts produced, under stress, some excellent workers. Their efforts resulted in the setting up of what was called the Government of Pakistan-United Nations Social Welfare Project.

When Miss Lucke left Pakistan, she was succeeded as general advisor for a brief period by Dr. Karl de Jongh of the Netherlands. Late in 1955, I ar-

rived in Pakistan to serve as General Social Welfare advisor and Team Leader and had the privilege of working within the country for almost four years. As the need for special advisory skills evidenced itself, the government continued to request and receive the services of international advisors and placed them where they were most needed to help develop schools of social work, to advise on urban community development projects, and to counsel on social work in medical institutions. A total of sixteen different United Nations experts from six different countries have served Pakistan in these areas.

NATIONAL WELFARE STRUCTURE EMERGES

The period 1955-1959, was one of great activity in the government and among the voluntary agencies.

National and Provincial Councils of Social Welfare were created by the government early in 1956 to make grants-in-aid to, and confer with, voluntary agencies. Their interpretive activities, along with those of the All Pakistan Womens Association and other agencies, finally led, in 1958, to the creation of a Central Ministry of Health and Social Welfare. For the first time, the term "Social Welfare" was included as a ministerial subject in the central government. In addition to welfare services, the new ministry includes Rural-village agricultural and industrial development—and Urban Community Development and health and labor welfare.

This significant step was the culmination of a rapid series of experimental ministerial changes all within a few months of 1958, affecting the social welfare programs. There is now evidence of real stability.

The period also saw the creation and advancement of National Voluntary Welfare agencies.

As in the history of the development of welfare services in all countries, Pakistan had dedicated leaders: at most international conferences concerned with some phase of welfare—be it children, prevention of crime and treatment of offenders, labor welfare, women's rights, or the handicapped—Pakistan had been ably represented. It was, then, almost inevitable that a national conference of social work was inaugurated in November 1955, with three affiliated branches in West Pakistan, East Pakistan and the Karachi federal area, to hold annual forums for discussion and planning. They have served to help define the areas and priorities of "welfare services" as well as to bring into a more understanding and active relationship the allied fields of education, labor, health, and religious institutions.

Later came the Pakistan Child Welfare Council to focus the country's attention on its children and their needs.

The organizational developments placed the government and the voluntary agencies in a better position to deal with the continuing problems of poverty, ill health, lack of sanitation, poor dietary habits, inadequate educational facilities, insufficient housing; and also to deal with the problems of adjustment resulting largely from population movement and modification of the traditional agrarian pattern.

Dozens of small voluntary institutions were in existence. Many had been founded by philanthropists of other than Islamic background. When they left the country, many of them were temporarily deserted or converted into shelters for refugees. But the traditions of charity and concern for welfare, inculcated into the religion and culture of the Muslims, made the restoration of these institutions only a question of time. The co-ordinated help from, and shared experience of, available interna-

tional resources served to hasten the process.

RELiance ON COMMUNITY DEVELOPMENT

The country has relied heavily on community-development programs. The Village-Aid program has steadily expanded until today some 16,000 villages are being served. Its primary emphasis has been on increasing agricultural production and income for villagers, but direct social improvements have also received attention.

The Urban Community Development Program, which now serves large cities in East and West Pakistan, came into being, through the leadership of the early social work trainees, to deal with the urgent problems of urbanization. From the beginning, it has been primarily concerned with the social aspects of community improvement. Emphasis has been on the development of initiative and leadership of people within a community; on encouraging a recognition of community needs; and on stimulating self-help efforts to meet them.

Although the projects are still few and the benefiting population proportionately small, they have served many purposes. On an experimental and demonstration basis, techniques appropriate to community development in Pakistan have been studied and tested. The projects have provided a laboratory for the initial training of Pakistani social workers. They have become the proving grounds for theories and practical methods of arousing the communities' awareness of their own potentials for meeting their basic needs. Many voluntary workers and leaders have been developed under the guidance of the community development organizers. They form a nucleus of leaders for a further

increase in the numbers of voluntary groups to work with government organizers in other localities. More emphasis is now being placed by the program on vocational content, through craft production and cottage industries.

Recently, the value of these efforts, has been recognized by United Nations Children's Fund which, this year, will commence helping with transport, sewing machines, carpentry tools for boys clubs, and equipment for leadership training in centers for women.

The National and Provincial Councils of Social Welfare, created by the government in 1956, have provided grants-in-aid to many voluntary agencies which meet specified criteria. Emphasis has been placed on developing competent leadership and trained staff in the agencies so that existing social services are improved.

A small program of demonstrating social work techniques in medical institutions has continued to make gains although specialization is still not possible in Pakistan because of the paucity of trained personnel and funds.

TRAINING EMPHASIZED

The country has continued its early emphasis on training. Out of the experimentation in the early, short-term courses has come the opening of two graduate professional schools of social work offering a two-year curriculum: The University of Punjab Government School of Social Work in Lahore, West Pakistan, started four years ago, and the new College of Social Welfare, also a research center, to be affiliated with the University of Dacca in East Pakistan.

In the process of developing the social work programs, many international agencies have played a part.

Obviously, their contribution has been relatively minor, compared with the work of the people of Pakistan,

themselves. Nevertheless, the aid has been meaningful.

While the United Nations has sent most of the international advisors requested by the government, many other agencies have contributed.

The Asia Foundation has provided some support for the schools of social work, including payment of salaries for national and international faculty members, student stipends, transport, and improved office facilities. It has aided Pakistanis to travel between the two provinces and Karachi to attend conferences and welfare seminars and to attend various International Conferences of Social Work.

It has also encouraged programs in the social sciences and humanities, stimulated social research, and supplied text books.

AGENCIES OF THE UNITED STATES ASSIST

The agencies of the United States government have been helpful. Through the Washington State College affiliation with the University of Punjab, the International Co-operation Administration has for three years provided an international professor to the Department of Social Work and has contributed library furnishings, books, and other equipment. The United States Educational Fund—Fullbright program—has provided an exchange social work instructor to the same institution.

The Ford Foundation, which is concerned with assisting Pakistan in the establishment of a broad range of new training institutions for advance of individual capacity and opportunity, has included, through its Harvard University contract, international sociological advisors to the Pakistan Planning Commission.¹

¹ See George F. Gant: "The Ford Foundation Program in Pakistan," *The Annals*, Vol. 323, May 1959.

Two international voluntary groups which have aided greatly with short-term training for welfare workers have been the Society of Friends through its Center in Dacca; and the World Assembly of Youth, which has operated the Training for Leadership Centre called Aloka, in Ceylon.

Leaders and workers in the YMCA, YWCA, Red Cross, Girl Guides, and Boy Scouts, from the internationally affiliated national agencies, have contributed to teaching at all levels within Pakistan. And other agencies such as United Nations Children's Fund, World Health Organization, International Labour Organisation, United Nations Economic and Social Council, Food and Agriculture Organization, Co-operative Agencies for Remittances to Everywhere (CARE), Church World Services, Catholic Relief Services, Worlds Veterans Service, the International Child Welfare Union and the International Conference of Social Work have given important supporting services in welfare and allied fields.

FELLOWSHIPS ABROAD PROVIDED

The provision of fellowships and scholarships for training Pakistanis abroad has developed concurrently with the establishment of local training facilities. The United Nations, the United States programs, the Asia Foundation, and the Ford Foundation have all contributed much in this area. In addition, Australia, Canada, and the United Kingdom, acting under the Colombo Plan have given opportunities in their countries for training and observation in Medical Social Work, Treatment of Juvenile Delinquency, Urban Community Development, Probation, and other areas. The governments of Sweden, the Netherlands, and Yugoslavia have offered scholarships.

Some 100 persons from Pakistan have now had full two-year graduate

training in social work either abroad or from the University of Punjab in Pakistan. In addition, 250 to 300 persons have had part-time training in the social services.

Many of those trained in social work have been staff members of various departments and ministries of the central and provincial governments who have returned to their posts better qualified to carry out the welfare aspects of their work, for example, railway labor services, refugee rehabilitation, health, village-aid, and education.

Proper utilization of trained persons has become the key question of the moment. A few of the trainees are not now engaged in work for which the training has qualified them. Others are in marginal situations. The schools, the government, and the voluntary agencies will need to determine what posts should be staffed by fully trained workers and what posts by lesser trained people. Real efforts will be necessary to see that they are placed accordingly.

INDIGENOUS TRAINING MATERIALS NEEDED

There will also need to be continuing activity at the two schools of social work and elsewhere to develop indigenous training materials, such as, among other things, field work process recordings to be contributed by the teaching staff, other practitioners, and students in the field. Only through the development and use of good local teaching materials can training be fully appropriate and effective. There is always the danger that western patterns will be adopted rather than adapted which could prove fatal to social work as a profession and to effective programs of service.

Special attention will also be necessary to the continuous re-evaluation and revision of the curricula of the

schools appropriate to the changing needs of urban and rural community development, labor welfare services, modernization of institutional care, the development of services for children, and other services.

A third element of significance is that of student selection. It is important for Pakistan that the early graduates of their schools be persons of good personal attributes, who, after training, can serve as the leaders, planners, teachers, supervisors, and interpreters of social needs, and who can devise better methods for dealing with them.

The professional workers will never replace the volunteers. But volunteers will also need some training in understanding human behavior and how to deal effectively with people. As more teaching staff becomes available they can be used in the expansion of short-term training courses for volunteers and for persons working in related fields of social welfare.

RURAL SERVICES IMPORTANT

As in most countries, the initial development of social services in Pakistan has been concentrated in and near the cities, where rapid industrialization gives rise to social distress. But the continued deprivation of the rural population, still some 90 per cent of the total, cannot be justified. This is being given cognizance by national and

international departments and agencies. The vitality, both economic and moral, of the country will need to come from the rural population.

After several years of trial and error in rural-welfare planning especially through Village-aid, it is recognized that the break-through of the hard crust of superstition, age-old methods, and customs must come with improved understanding of human nature, group work methods, and community organization.

RAPID AND DRAMATIC PROGRESS

In conclusion, it appears that Pakistan has made rapid and dramatic progress in its planning and organization for welfare services. As has been the experience in many countries, the impact of national emergency or shock has given impetus to existing human concern. A common religion, upon which the new country was based, professing equality and humane treatment for all provided the mandate for universal social welfare. Many adverse factors have yet to be overcome before desperately needed welfare services can reach the millions in need. Economic, political, and cultural barriers to rapid advances in education, health, and related amenities will require years of effort to overcome. But the zeal, dedication and practicality of the present leadership augur well for continued progress.

New Resources for Rehabilitation and Health

By HOWARD A. RUSK AND DONALD V. WILSON

ABSTRACT: During the past few years many new resources have been created to improve the health and welfare of all the people of the world. These new resources include international governmental organizations such as the World Health Organization, United Nations, International Labour Organisation, and the United Nations Children's Fund (UNICEF). International voluntary organizations, multilateral and bilateral, are setting new standards. Increased educational opportunities and the development of professional associations are other important new resources. The realization by most of the people of the world that better health, rehabilitation, and welfare services are possible and the demand for such services are also to be regarded as new resources. Most important is the changing attitudes of individuals and communities toward physical handicaps and illness. These new attitudes are the primary new resource for future work in the health and welfare field.

Howard A. Rusk, M.D., New York City, is the Director of the Institute of Physical Medicine and Rehabilitation, Bellevue Medical Center, New York University. He is also Associate Editor of the New York Times and President of the World Rehabilitation Fund.

Donald V. Wilson, M.A., LL.B., New York City, is the Secretary-General of the International Society for the Welfare of Cripples. He serves as Secretary for the International Federation of Social Workers, and also as Chairman of the International Social Welfare Committee, National Association of Social Workers.

A SWEDISH physical therapist, a young doctor from England, and a Danish prosthetics technician are working on the same team at the Hospital das Clinicas in Sao Paulo, Brazil to develop a comprehensive rehabilitation program. Their services are made possible by the United Nations and the World Health Organization. They had the help of an expert from Canada provided by the International Labour Organisation and a consultant in services for the blind from the United States. In the same city the Association for the Aid of Crippled Children is developing its program with the assistance of an experienced administrator of crippled children's services from the United States. These programs serve not only the disabled people of Sao Paulo and Brazil, but also serve as a demonstration and pilot project and set an example for nearby countries.

On the other side of the world, in Bombay, India, a similar project has been underway for several years, resulting in the establishment of the All India Institute for Physical Medicine and Rehabilitation. An experienced administrator from the United States was provided by the United Nations; the occupational therapist comes from Belgium; the physical therapist is a young Englishman; and the expert in employment of the handicapped is a Norwegian with extensive international experience.

In both Brazil and India, as well as in many other places, professional persons of several nationalities are working together with local persons under the auspices of international organizations. The primary goal in such projects is to provide more adequate services for the handicapped. An important by-product is to enable individuals of diverse nationalities to learn to work together.

Such projects have common characteristics: the advice and information are

provided by professional persons from other countries; the success, however, depends on the support and understanding to be found in the local community and the ability of local professional personnel to secure the education and training necessary to carry them forward.

INTERNATIONAL CO-OPERATION

The expanded programs of a large number of international organizations, both voluntary and governmental, are a new resource available today to all countries of the world who wish to create and improve health and rehabilitation services for the handicapped. International co-operation in this broad field is not new but what is new is the increased utilization of international assistance.

The mere existence of international rehabilitation programs helps to create a world-wide moral standard which recognizes the importance of the individual even though he is severely handicapped. In the local community, both professional and lay leaders now have a strong ally in such international agencies when they wish to take action to make a better life possible for the crippled children and adults in their community. The experiences of persons in other countries with similar interests and community problems are readily available to them through these international agencies.

UNITED NATIONS AND SPECIALIZED AGENCIES

Many international governmental organizations are engaged to some degree in rehabilitation programs: the United Nations; World Health Organization (WHO); International Labour Organisation (ILO); and the United Nations Children's Fund (UNICEF).

The co-ordinated program of the United Nations for the rehabilitation of the physically handicapped has evolved

over a period of years. The United Nations and several of the specialized agencies recognized very early the urgent need to do something about the problem of physical disability and rehabilitation. These problems were among the first to be given special attention by the Economic and Social Council when the activities of the United Nations in the field of social welfare were initiated. At its first session in 1946, the General Assembly of the United Nations, on the recommendation of the Council, established the Advisory Social Welfare Services and specifically included the handicapped as an area in which expert advice, demonstration, and technical equipment should be made available to the various governments.

The present program of the United Nations was authorized by a resolution adopted in 1950 by the Economic and Social Council which provides for co-operative efforts on the part of the United Nations and other governmental and voluntary international organizations. The Secretary-General of the United Nations was requested "to plan jointly with the specialized agencies and in consultation with the interested nongovernmental organizations, a well-co-ordinated programme for the rehabilitation of physically handicapped persons."

A recent survey of the rehabilitation program of the United Nations indicates that some form of aid had, over a two-year period, been provided to more than fifty countries. A substantial number of fellowships were provided to enable persons engaged in work for the disabled to study rehabilitation programs in countries other than their own. Experts were provided as consultants to national governments to plan future programs. Much of the work was done in co-operation with international voluntary organizations.

The best practical results of the co-ordinated program for rehabilitation have been obtained within the United Nations technical assistance program. Many of the technical assistance projects in rehabilitation have been undertaken jointly by the United Nations, the ILO and WHO with, in certain cases, nongovernmental organizations co-operating. Joint projects have been, or are being, carried out in a number of countries: in Asia—Burma, India, and Indonesia—the Middle East—Egypt—Europe—Yugoslavia—and Latin America—Brazil and Guatemala. Joint short-term and advisory missions have, in addition, visited Austria, Italy, Spain, Bolivia, Mexico, Paraguay, and Chile. In other cases advisory missions or projects carried out by one agency have been reinforced through subsequent action undertaken by other agencies, for example, in Ceylon, Greece, Philippines, and Turkey.

A number of seminars, study groups, and conferences have been organized jointly by the United Nations and the specialized agencies. The United Nations and the specialized agencies have also supported meetings held by some nongovernmental organizations by providing directing staff, contributing experts to present papers on specific topics, or granting fellowships to participants coming from other countries.

WORLD HEALTH ORGANIZATION

The desire to improve the health standards of all peoples of the world, and the widespread awareness that such improvement is possible, are relatively new developments. No longer are poor health, high infant death rates, and disease accepted as inevitable. The people of the world now know that better health is possible for them and their children, and they demand improvement. Particularly in countries which

have become independent in recent years we find a desire and determination to improve health programs.

The best known "new resource" to improve the health of all people is the World Health Organization (WHO), established in 1946. The membership of the Organization now includes practically all nations. "The attainment by all peoples of the highest possible level of health" is the objective of WHO as stated in its constitution. In the preamble health is defined as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity."

In carrying out these objectives WHO has, therefore, given the highest priority to programs that prevent sickness. Such priorities are essential since the total annual budget of WHO is less than fourteen million dollars, or less than what is spent for health and medical programs in many of the larger cities of the world. The program for the eradication of malaria is probably the best known example of the work WHO performs in the prevention of disease.

Although WHO gives priority to the preventive aspects of medicine, the phases of definitive treatment and rehabilitation are not ignored entirely. Many diseases and injuries which result in disability are preventable, but of course preventive programs do not eliminate entirely the need for curative treatment and rehabilitation. Early treatment, when disease and injuries do occur, is an effective means of preventing permanent disability. Accidents in the street, in the house, and at work continue to increase and result in permanent disability unless prompt and good medical care followed by rehabilitation are provided. Although vaccine is now available to prevent poliomyelitis, thousands of children and adults each year will continue to become per-

manently disabled unless medical care is provided during the infectious period and is followed by a rehabilitation program.

CHILDREN'S FUND

The programs of the WHO have been supplemented and extended by the United Nations Children's Fund (UNICEF) which has made large contributions for programs to prevent and treat physical disability.

UNICEF has extended aid to tens of millions of children in more than one hundred nations and territories of the world. Mass programs against tuberculosis, yaws, trachoma, and malaria have been conducted. Maternal and child health centers, particularly in remote areas, have been created. UNICEF has also provided supplies and equipment to aid the development of services for handicapped children. Grants made during the past year will aid such programs in Poland, Thailand, Japan, and Pakistan.

INTERNATIONAL LABOUR ORGANISATION

An important phase of rehabilitation is to provide vocational opportunities for the handicapped, an area in which the International Labour Organisation (ILO) has provided world-wide leadership. In 1955 the General Conference of the ILO unanimously adopted a recommendation (Number 99) concerning vocational rehabilitation of the disabled. It provides that the disabled should not as a result of their disability be discriminated against in respect to their rehabilitation or subsequent employment. Principles and methods applicable to the vocational guidance, training, and placement of the disabled are set forth.

It is significant that this recommendation was drafted by a group representing labor, employers, and governments of more than sixty countries and that it was adopted unanimously. There

were, however, decided differences of opinion as to how the employment of the disabled should be encouraged. In some countries, but not in North America, a fixed percentage or quota of all employees must be classified as disabled. After considerable debate it was agreed that the ILO recommendation should provide that "wherever appropriate in the national circumstances, and consistent with national policy, the employment of disabled persons should be promoted by the engagement by employers of a percentage of disabled persons under such arrangements as will avoid the displacement of non-disabled workers." The reserving of certain designated occupations for the disabled and arranging that seriously disabled persons be given preference in certain occupations were also approved.

In several countries, such as Poland, the employment of the disabled has been increased by the creation of co-operatives by and for disabled persons. Such employment was endorsed by the ILO recommendation when "appropriate in the national circumstances and consistent with national policy."

The development of co-operatives for the disabled in Poland is an interesting example of how the problem can be met when there are large numbers of handicapped persons in the community and no employment opportunities. In Warsaw at the end of the war, and actually before the fighting ended, a group of disabled persons started to produce soap, dental powder, and similar items for the troops. This group eventually organized as a co-operative and other disabled groups established additional co-operatives. In 1949 the Union of Co-operatives for Invalids was created. On the tenth anniversary of the Union there was a total of 363 co-operatives in Poland employing over fifty thousand handicapped persons. Some employees are not classified as

handicapped but more than 80 per cent are disabled. A variety of goods are produced including shoes, clothing, and books. The object of such a program is to provide work for the handicapped. Only in recent years has much thought been given to other phases of rehabilitation; it is to be expected that medical restoration and educational and vocational training programs will be developed.

Sheltered employment has been developed in many countries to provide work opportunities for the handicapped. Such services aim to rehabilitate the individual by providing needed medical, social, and vocational services to enable him to work in the open market. For the seriously handicapped sheltered employment frequently becomes the permanent job rather than a step to a "regular" job. These programs must be subsidized by the community in some way: by adjustment of taxes as is done in the United States for philanthropies; by charitable contributions; or by special arrangements made by industry or private individuals.

When there are a large number of handicapped in the community and few employment opportunities, sheltered work for the disabled is most important. In countries where unemployment is not a serious problem more effort is expended to provide medical rehabilitation, vocational training, and placement in regular industry. The problems of sheltered employment for the handicapped were considered at a seminar on this subject held at The Hague, Netherlands, in 1959 under the auspices of the International Society for the Welfare of Cripples.

Many important rehabilitation programs begin as efforts to provide employment for the handicapped. Subsequently, medical, social, and other services are added. Conversely, many rehabilitation services begin with a

medical program. How the service begins, by providing either medical care or employment, is not so important as how it expands to provide all the services needed for the individual's complete rehabilitation.

HEALTH FOR PEACE

Research, with the resulting growth in knowledge about prevention, treatment, and rehabilitation, has increased greatly in recent years but has not been utilized to the maximum. More research and, equally important, wider dissemination of the results of previous research are needed. Many of the major medical advances in the past were not the work of any one country but a combination of effort.

The proposed International Health and Medical Research Act, which has been approved by the Senate of the United States, will make possible an important increase in health and rehabilitation research throughout the world. The proposed law, known popularly as the "Health for Peace Bill," will create within the National Institutes of Health of the Department of Health, Education, and Welfare a new National Institute of International Medical Research, with an annual appropriation of \$50,000,000.

These funds will be used to encourage and support research and the exchange of information on research, the training of research personnel, and the improvement of research facilities throughout the world. Grants to support such activities, including basic research and research in rehabilitation, would be authorized. Such grants could be made to foreign and American universities and research organizations and to voluntary and inter-governmental agencies such as the World Health Organization.

A National Advisory Council for

International Medical Research, composed of voluntary—nongovernmental—leaders, would establish policies, make recommendations, and approve grants and loans. Existing agencies specializing in heart, cancer, arthritis, metabolic and neurological diseases, blindness, and vocational rehabilitation would evaluate for the Advisory Council specific projects within their particular areas of competence.

The proposed program would not replace support by the United States of the current multilateral programs of international health organizations, such as the World Health Organization and United Nations Children's Fund, or any of the bilateral activities conducted through the International Co-operation Administration. Nor would it supplant the research programs being conducted in the United States through the National Institutes of Health. These programs would be enhanced and would provide additional means for uniting science throughout the world in an expanded global attack on disease and disability. An emphasis on the international implications of research, in health and rehabilitation, is the important factor to be added to existing programs by the proposed legislation.

VOLUNTARY ORGANIZATIONS

A large number of international voluntary organizations include services to handicapped children and adults in their total program. More than thirty such organizations are members of the World Conference of Organizations Interested in the Handicapped. The varieties of interest in services for the handicapped are indicated by the names of some of the organizations that are members: World Association of Girl Guides and Girl Scouts; International Confederation of Free Trade Unions; International Conference of Social

Work; World Veterans Federation; World Council for the Welfare of the Blind; and the World Federation for the Deaf.

In addition to these multilateral international organizations, there are many international bilateral agencies with programs for the handicapped. For many years the American Foundation for Overseas Blind has maintained an extensive program in many countries for the blind. The World Rehabilitation Fund is another example of an agency of the United States assisting programs for the handicapped on an international basis. A large number of fellowships have been provided by the Fund to enable rehabilitation personnel to study in countries other than their own, and rehabilitation programs and organizations have been assisted by the Fund.

EDUCATION AND TRAINING OF PERSONNEL

Competent personnel is the greatest existing need in health and rehabilitation programs. Improvement in both quality and quantity of professionally trained persons is urgent. Education and training cannot, however, be separated from the total program, for such training is largely wasted unless, upon completion, the individual has a place to work and the equipment and supplies required to work effectively.

Two types of programs are needed: to create and expand educational programs within a particular country and to make it possible for more professional persons to secure professional education and experience in another country.

Educational facilities to train doctors have developed quite well in all countries in comparison to other professions. For example, all countries have medical schools and a basic medical education is available at least to the best-qualified

young people. Advanced medical study, required in rehabilitation programs, is often not available, and the doctor who wishes to specialize must go out of his home country to secure that advanced study. Many doctors go to North America or Europe for graduate work in orthopedic surgery, physical medicine, neurology, and pediatrics. As these specialties develop within a country, there is, of course, less need for formal study abroad, but more need for the experienced doctor to keep abreast of new developments. Travel, observation, and participation in advanced seminars and world congresses supplement the doctor's efforts to keep up to date through reading, films, and consultation with experts who visit his country.

THE PROFESSIONS

A mere listing of all the professions participating in rehabilitation programs indicates to some extent the nature of the program. In the medical phase alone we find the doctor, nurse, medical social worker, occupational and physical therapist, speech specialist, and prosthetic technician.

The development of professional groups throughout the world is undoubtedly an outstanding phenomenon of current times. The traditional professions of law, theology, military, and medicine are being challenged and supplemented by newer groups.

In addition to the advances made in professional education, the professional associations are also important. The membership qualifications of these associations are a great force to bring about an improvement in the quality of services to the individual client.

The development of training facilities for social workers has been outstanding and currently there is less need for study opportunities abroad. The proper role of the social worker in

rehabilitation requires further investigation. The best-defined role is within the medical phase of rehabilitation in which the specialties of medical and psychiatric social work have developed. The role of the social worker in rehabilitation outside the hospital and institution is not so clearly defined. The social worker undoubtedly has a great deal more to contribute than is currently the case in agencies, both voluntary and governmental, engaged in organization of community resources for rehabilitation programs. In the vocational phase, the social worker is frequently called upon to provide services in vocational guidance, counseling, and placement.

EDUCATIONAL PROGRAMS

Many rehabilitation services, particularly for children and youths, are undertaken originally as schools for blind, deaf, or crippled. The primary purpose of such a program is education but in time medical services are added. Usually social service is provided at a later date, mainly as a means to maintain relations with the families of the children. As children become older, vocational training and job placement become a part of the school program.

In some countries programs for handicapped children are undertaken under the sponsorship of educational authorities. Subsequently medical, social, and vocational services are added to the program so that rehabilitation is possible in one "school." Whether the school program should be expanded to include medical care or whether a health agency should provide it is a question constantly debated.

Rehabilitation programs can begin in medical agencies, such as hospitals, or in social welfare institutions, in schools, or as a service to provide work for the handicapped. All four types of agencies—medical, social, educational,

and vocational—administer rehabilitation services. It is not important where the service begins or who is responsible for administration. What is important is that each individual receives all the services that can be utilized to bring about his maximum rehabilitation.

SOCIAL ASPECTS

Medical care alone is not sufficient to meet the needs of individuals who become ill or disabled. We now understand more clearly than ever that curative treatment is only one phase of the total service required.

The individual who is sick or disabled presents many problems which cannot be solved without the co-operation of many professional disciplines. The importance of rehabilitation as a part of medical care has been emphasized by designating it as the "third phase of medicine."

Within the field of medicine the importance of rehabilitation has been recognized. Preventive medicine is now given equal place with definitive treatment and is an accepted phase of medical programs. The medical phase of rehabilitation—the third phase of medicine—is now well understood. Integration with other aspects of rehabilitation—social, educational, and vocational—needs further consideration.

AN EXAMPLE

Indonesia presents a striking example of how patience and hard work, combined with aid from international agencies, can overcome centuries of false beliefs and superstitions about crippled children and adults. The Surakarta Rehabilitation Center was established at Solo, a city in central Java, following the Indonesian war for independence. In 1946 the area of hostilities in midwest Java circled the city, making it a beleaguered terminus for countless disabled evacuees. Their spe-

cial surgical and after-care programs required the establishment of a special medical and rehabilitation service.

To solve the problem of providing artificial limbs to the large number of war amputees, a young surgeon worked co-operatively with an engineer. They began in a small garage which was a part of the general hospital. Although materials and experience were limited they were able to manufacture artificial limbs by using scraps of domestic wood and leather, valve springs from damaged motor cars, and aluminum from wrecked planes.

After a year or two of experience some financial help was provided by the Ministry of Health. The number of war amputees coming to the center from all parts of the country increased rapidly, however, and further expansion was necessary. It was realized that the provision of an artificial limb would not by itself be sufficient to restore the amputees to productive life. A simple vocational training program was undertaken by utilizing nearby unused buildings.

Subsequently, at the request of the Indonesian government an expert was provided by the United Nations. An over-all plan for developing nation-wide rehabilitation programs was drawn up which served as the basis for aid in various forms provided by a large number of international organizations, both voluntary and governmental.

The program for the war disabled was the stimulus for creating a separate service for crippled children under the auspices of the Indonesian Society for the Care of Crippled Children. It was realized that the work in adult rehabilitation was already taxing the rehabilitation center, and steps were taken to alert the entire community to the problem of children crippled by congenital defects, war injuries, cerebral palsy, and polio. Women volunteers played the

major role in bringing about an understanding of existing problems and in expanding services.

A new crippled children's center was established in Solo in 1954 with dormitory facilities for fifty-two children between the ages of three and thirteen. A nursery and primary school were included as well as facilities for physical therapy.

The work of the Indonesian Society for Crippled Children did not end, however, with the creation of a single center. Subsequently branches of the Society were established in other cities throughout Java and additional rehabilitation services were created. International contacts were maintained while services were being established, and in 1954 the Indonesian Society became a member organization of the International Society for the Welfare of Cripples.

Rehabilitation experts from several nations served for a time in Solo—from England, Australia, the United States, and the Philippines. In the fall of 1957 a Seminar on Rehabilitation of the Physically Handicapped for Participants from Asia and the Far East was held in Solo and brought together individuals from the following nations: Burma, Ceylon, Republic of China, Hong Kong, India, Indonesia, Japan, South Korea, Laos, Pakistan, Philippines, Thailand, and Vietnam.

The experiences of the Solo Center have been exported to other countries in many different ways: through visitors to Solo; films and publications; and trips abroad by various members of the staff of the Center.

CHANGING ATTITUDES

The most important "new resource" throughout the world is the changing attitude toward the possibility of rehabilitation for crippled children and

adults. In many communities of the world having a handicapped child was, and in many places still is, a mark of disgrace.

The crippled have been handicapped as much by the attitude of society as by their physical limitations. The tendency to set apart the person who is physically different because of a conspicuous physical defect is being replaced by a realization that the crippled individual is first a person and only secondarily a handicapped one. He must, therefore, be treated as a whole person with physical, mental, social, and emotional needs. The recognition of this fact has led to the development of the concept of an integrated pattern of medical, social, educational, and vocational services which has been the most important advance in reducing the problem of disability in recent years. Physical capacity, or incapacity, is a relative matter; no one remains physically perfect, few are totally disabled.

This change of attitude usually comes

about in the community when voluntary agencies establish a service for the handicapped. Members of the family of a crippled child or adult must accept him as a person with special problems who can, with proper help, serve as a contributing member of society.

Most important of all is the attitude of the individual toward his disability. He reflects to a great degree the attitudes met in his community and family, but if he is fortunate he will evolve a personal philosophy that, although he is handicapped by deformity, old age, or chronic illness, he has an obligation to make his maximum contribution to society.

International activities in rehabilitation mean far more when the countless millions of hopeless, helpless people throughout the world return to lives of dignity and productivity. With dynamic leadership international rehabilitation programs contribute another step toward the international understanding that is essential to world peace.

Mutual Aid in Low-cost Housing

By ERNEST WEISSMANN

ABSTRACT: The United Nations—long active in facilitating international co-operation in the housing field—will carry out, from 1961 to 1965, a world-wide program whose central theme is the mobilization of individual and group efforts for the improvement of housing for lower-income groups. According to estimates for the world made around 1950, as many as 150 million families in the industrially less-advanced areas required more adequate homes and better physical surroundings. In the industrially advanced countries, there was a housing deficit of roughly 30 million units. At the mid-point of this century, characterized by the greatest technological advances in man's history, there was indeed no country without a housing problem. While marked strides had been made in health, education, and nutrition, no comparable advance could be reported in housing. With very few exceptions the supply of housing for most families is in fact deteriorating, especially in the less-developed countries. Practical experiences clearly indicate that self-help and mutual aid combined with economic co-operation could contribute towards alleviating the extreme shortage of housing for many income groups and the utter lack of adequate community facilities in most parts of the world.

Ernest Weissmann, New York City, is Assistant Director of the Bureau of Social Affairs, United Nations, where he has been in charge of the United Nations housing, building, and planning program since 1951. Previously, he was Director of the Industry and Materials Division, United Nations Economic Commission for Europe, Geneva (1948-1950). Mr. Weissmann also served as Special Consultant, representing Yugoslavia, for the planning and design of the United Nations Permanent Headquarters, New York (April-December 1947) and as a Director of the Industrial Rehabilitation Division, United Nations Relief and Rehabilitation Administration, Washington, from 1944 to 1947.

THE current explosive growth of cities is creating grave economic and social imbalances and physical decay. The expected growth of the world's population will necessarily cause a progressive concentration of people in cities, and industrialization will have to provide the means of livelihood for them. Provision of housing and essential community services and facilities, in the right place and at the right time, will play a crucial role in this development. This problem is, however, difficult to resolve because of the serious gap between the cost of house construction—economic rent—and the ability of low income families to pay for it—social rent. Three major approaches may help to bridge this gap. A temporary adjustment of housing standards to conform more closely with the economic potential of a country is one way. Another is the steady improvement of the building industry, leading to a substantial reduction of the cost of housing. A third promising means has been the mobilization of the future householder's own contribution in labor through self-help and mutual aid or through appropriate co-operative and other nonprofit arrangements for savings, actual and potential.

HOUSING AND GENERAL DEVELOPMENT

Technological progress in the sphere of construction, transport, and utilities has been multiplying in recent decades, but it has not been applied at a significant rate in metropolitan areas. Grave economic and social imbalances are direct consequences of this gap, and its outward physical symptoms are bad housing and poor community services, choked-up city traffic with excessive travel time to work; and filth, squalor, and disease. Gang activity, juvenile delinquency, crime, and vice are among the more conspicuous aspects of the physical decay and disorganization of

urban economies. While these conditions affect an ever growing number of people already established in cities, they mostly involve newcomers, many of whom belong to the lower income group. These newcomers usually become slum dwellers and squatters and therefore fail to be accepted by their new community and its institutions.

Economic development programs have tended to intensify rural-urban migration when sufficient attention was not paid to corresponding agricultural development. In these cases, living conditions in the villages continued to deteriorate, a growing number of rural people drifted into towns, and large numbers of urban inhabitants as well as the rural people generally remained untouched by their country's economic progress. In some instances, methods known as community development were combined with agricultural extension to increase the food production and thereby remedy this situation. In other instances cottage and small-scale industries established simultaneously have been able to produce needed consumer goods which otherwise would not have been manufactured for many years. Thus, the resources of the people have been mobilized to contribute substantially to general development; and their more extensive participation has been effective in the setting of goals and in determining the direction and pace of development at the local level.

The current trend in urbanization is uncertain, for in all parts of the world more people already live in cities and industrial centers than can be supported by employment in industries. The levels of living of the migrant population are therefore shrinking, not only in terms of physical surroundings and social environment, but also from the point of view of family income. In town and country, economic and social measures are therefore being tested

which are aimed at discouraging the transplantation of rural poverty into the urban environment, and attempts are being made to guide internal migration so that it facilitates rather than impedes development. To achieve this, development plans on a regional scale are conceived to strengthen the economic base of existing cities and to create alternative centers of attraction for internal migration by decentralizing new industry.¹

Economic limitations

In the context of such broad development policies, co-ordinated planning of housing and essential community services and facilities can play a crucial role. The problem is difficult to solve because there exists a serious gap between the cost of acceptable housing accommodations—the “economic rent”—and the amount that families are able and willing to pay for them—the “social rent.” Progressive concentration of people in the urban and industrial areas; the scarcity of resources available for housing; rising cost of building; and a growing shortage of suitable urban land are responsible for this negative trend. While the share of the family budget spent for housing varies considerably,² the fact is that lower income families in most countries find it more and more difficult to obtain adequate accommodation without jeopardizing other essential needs.³

“Housing” constitutes the physical

environment in which the society's basic unit, the family, must develop; its improvement represents a concrete and visible expression of a rise in the general level of living. Housing, from the family's perspective, however, is not “shelter” alone but comprises a number of services, facilities, and utilities which link the individual and the family to the group and the community.

Attempts by governments of the developing countries to provide better housing and the means of livelihood for the millions of people added every year to the world's population⁴ are often thwarted by the very limited resources available. These circumstances suggest the need for economy, and imagination to meet enormous requirements with small outlays. Action by central and local authorities in a significant number of countries is therefore closely co-ordinated with their economic possibilities: resources to be made available for housing are being assessed in the light of their potential contribution not solely to social betterment, but also to employment and labor productivity, to over-all economic growth, and to a more balanced economic and social development. At the same time, new resources which have not been fully utilized are being sought for housing programs.

Promising remedies

Governments find it necessary to subsidize housing for a rapidly growing number of families, but in view of the considerable outlay of public funds involved they find it also necessary to take a second look at housing standards established by law or custom. As a matter of principle, housing standards

⁴ According to various estimates the current yearly addition amounts to some 50 million persons. By 1975 it will reach the yearly figure of 77 million and at the end of the century 126 million.

must grow out of the social setting and the economic potential of a given area. They should normally aim at establishing guiding principles and required levels of performance with respect to health, safety, and convenience, rather than at fixing specific sizes, construction methods, or materials to be used. A periodic review of such standards is necessary, however, so that they can be raised as soon as this becomes possible. When resources are scarce, emphasis should be laid on adequate utilities and community facilities and services—including transport between residence and place of work—rather than on providing well-equipped houses in an otherwise poor environment. Such a temporary adjustment in which permissible levels conform more closely with the current economic situation of a country is one way used to bridge the gap between the economic and the social rent.

Another avenue being explored by governments is the improvement of the productivity of the building industry which may lead to a substantial reduction of cost and enable more families to pay for their own housing. The development of a highly productive industry is important not only for housing and community improvement but also for investment programs in industry, agriculture, transportation, and power in the developing countries. A review of economic development programs will show that the building industry alone absorbs a larger share of investment funds than any other field.⁵

Finally, a more general mobilization of the future householder's own contribution in labor, cash, or potential savings is a highly promising way of dealing at least in part with the housing problem.⁶ In most countries the mere

⁵ For structures of different types including, for example, housing, harbors and dams, and hydroelectric schemes.

⁶ Finland, Israel, the People's Republic of China, Iceland, and Chile exemplify such poli-

establishment of adequate savings and credit and loan facilities has created a sufficient incentive for mobilizing additional financial resources for housing. In a number of countries with strong inflationary trends a new device has been utilized to increase the volume of private savings by means of an "index clause" which provides, in addition to the normal interest rate, an allowance for any rise in prices as reflected in the fluctuations of a specified index, such as cost of construction or of some basic building material.⁷

MOBILIZATION OF THE PEOPLE'S RESOURCES

To help alleviate this situation, the United Nations will sponsor, from 1961 to 1965, a world-wide program of international action, the central theme of which will be the mobilization of individual and group efforts for the improvement of housing conditions. It is hoped that a concerted effort of the people directly concerned and their governments, with the use of science and technology, can perhaps break through the apparently insurmountable problems of planning, organization, financing, execution, and management created by the current housing crisis.

No government has sufficient resources to provide all the housing and community facilities needed, but the people concerned can contribute their own share. They can contribute labor and skills, their individual savings, and the materials they can produce from local sources. In this way, effective group effort and assistance from public

cies. See *International Survey of Programmes of Social Development* (United Nations, Sales Publications No. 1959, IV, 2), Chap. IV, "Housing," p. 38.

⁷ In many countries the custom still exists of levying contributions in labor for various types of public and communal works in lieu of taxes. In some cases they are convertible into cash payments.

authority can be combined for practical action. It must however be stressed that housing programs involving co-operatives, self-help, and mutual aid will make a substantial contribution to national development only if methods are found which will diminish the now common reliance on exceptional people and exceptional circumstances.

All societies have traditionally used self-help and mutual aid for the building of homes and community facilities. Organized versions of these methods are now being applied with equal enthusiasm in villages and small towns throughout the world as part of community development projects: in Scandinavian cities under the "egnahem"—own home—program; in schemes for squatters' resettlement and slum clearance organized by many municipalities; in the new industrial communities of the Soviet Union under the leadership of labor unions; and in North America by enthusiasts of the do-it-yourself movement. The motivating force may vary, but the general principle is the same. The people concerned contribute their own labor to reduce the necessary capital outlay for the construction of their homes and the facilities needed in their communities. Or alternatively, construction labor needed which may be in short supply is being mobilized in this way.⁸

In Africa, Asia, and Latin America self-help and mutual aid have often been a means for improving the physical environment and health conditions in response to a growing social awareness and eagerness among the people to learn and to improve living conditions. A variety of techniques were

⁸ For a description of some of these schemes see *Housing and Town and Country Planning*: Bulletin No. 6, "Housing in the Tropics" (United Nations, New York, Sales Publication No. 1952, IV, 2); and *International Survey of Programmes of Social Development*, *op. cit.*, Chap. IX.

used to bring the people from "darkness to light." In Nigeria, Haiti, and India, pilot projects were designed to experiment with various approaches before they were applied more generally. The cultural missions in Mexico used as their main vehicle a suitable system of education. Village reconstruction projects in Egypt were using the fundamental education method. The "labor week" in Jammu and Kashmir was designed to encourage in young people a sense of the dignity of labor and their capacity to work together. In addition the community centers in many African and Caribbean areas have demonstrated in a practical way what rural families can do for themselves.

Rural programs

In Ceylon, Indonesia, Jamaica, and the Philippines, self-help schemes have been developed in connection with broad rural resettlement programs, and in Puerto Rico self-help and mutual aid have been applied also in urban resettlement and slum clearance projects. These latter included the transfer of families from slums or squatters' camps to new, well laid-out communities, with a grant of land supplied with basic utilities. In Greece a technique was developed whereby thousands of homes were built cheaply and quickly, despite the postwar shortage of building materials and skilled labor. The original "material-in-aid" plan in that country gradually evolved into a program whereby entire villages were organized for the purpose of housebuilding and whole families participated in building their own homes.

Millions of people have been made homeless due to wartime and postwar economic, social, and political dislocations. Self-help and mutual aid have made possible the resettlement of some of these people in new communities. The new satellite town at Faridabad in

India, for instance, proved that forty-thousand ordinary people could erect homes for themselves, largely with their own labor. In about two years a whole new town was built and the cash outlay per house was at the same time drastically reduced. As many as five-hundred dwellings a month were produced without using elaborate mechanized devices. Due to the steady influx of immigrants into Israel some one hundred thousand people were at one time sheltered in tent colonies, shacks, and abandoned army camps. As a solution to the restiveness of the people compelled to live under extremely bad conditions and to the waste of potentially productive labor, the work village or "maabarot" plan was developed. Under this scheme the immigrants worked in teams building their own permanent homes. In most cases they have also built the factory in which they have eventually been employed.

A self-help program of great promise has been developed in Ghana. There, home ownership has such appeal for people that many of them invest their savings in concrete blocks in the hope of building a house for their families. The government therefore started in 1956 a Roof Loan Scheme under which families who have built their houses up to the roof level are provided, on credit, with roofing materials and doors and windows.⁹ The program is administered through Village Housing Societies which select the applicants from their members on the basis of need and trustworthiness and undertake responsibility for the collection of payments on loans. The loans are interest-free and repayable in four years. The scheme has gained wide acceptance and the revolv-

⁹ A similar scheme was introduced earlier in Burma which involved light roofing for rural dwellings and other structures mainly built with bamboo and belonging to individual families or the community.

ing fund established by the government for its financing is now being increased. At the same time the scheme is also being gradually introduced into urban areas.

The rehabilitation of areas stricken by disasters such as earthquakes, floods, or hurricanes has offered other opportunities for effective co-operation. The National Reconstruction Board in Lebanon which was established in 1956 following an earthquake is a good example. Its operations were financed by a special tax on imported items, an entertainment tax and a postal tax. Some 300 villages affected by earthquake were rebuilt. Along with contractor-built houses, the Board also experimented with self-help. Because of the lack of confidence in this method, participants were initially offered wages for work on their own homes, but the Board was able to cut down the number of houses built in this way. Instead, families willing to rebuild their homes on the old sites were provided with materials purchased in bulk and distributed at a greatly reduced cost to the consumer. To facilitate the operation a system of "regional" depots was established together with smaller local stores for one or more villages depending on their size. The Board provided supervision and skilled labor, and a team composed of an engineer, two supervisors, and two foremen was made responsible for the work in a group of villages. The success of the scheme which involved repair of 13,000 homes in the first year and rebuilding of an additional 9,000 houses in a period of two years can be ascribed to a good preparation of the materials supply line and good planning of operations.

Urban housing schemes

Many experiments with self-help and mutual aid in a number of cities are beginning to yield basic information on

their applicability to urban conditions.¹⁰ The urban housing scheme known as "egnahem" is a particularly novel program conducted in Stockholm, Sweden, by a special municipal department. The city supplies the building components, provides technical advice, and negotiates contracts for skilled labor—such as plumbing. The neighborhood is planned as an urban residential unit with all needed facilities and services. House construction is financed by a single government loan at 3.5 per cent for forty years. This scheme has combined co-operative efforts at saving through industrial prefabrication of structural and other elements of the house with self-help labor of the householder, his family, and their friends.

In the city and region of Gorki in the Soviet Union another approach was taken. Participants were paid full wages by the enterprise concerned, with the government subsidizing any difference that there might be between wages in the factory and the wages earned by the householder as a temporary construction worker. Industrial communities in the Gorki Region have pledged to build by the use of self-help some 700,000 square meters of "net" dwelling area between 1957 and 1960.¹¹ This amounts to 60 per cent of the state plan for that area. The impact of this initiative is evident from the fact that representatives from forty-two territories, regions, and cities of the Soviet Union and from many central organizations joined in a conference to study the self-help experience of Gorki. These housing projects are financed through a fund formed in each enterprise by deductions of 1 to 6 per

¹⁰ For information on housing co-operatives see *Housing, Building and Planning*, No. 10, "Housing through Non-Profit Organizations" (United Nations, New York, Sales Publication No. 1956, IV, 7).

¹¹ Not counting walls, halls, kitchens and bathrooms or closet or storage areas.

cent of anticipated productivity and savings due to lower production costs. Higher deductions, from 20 to 50 per cent, are obtained from production in excess of that anticipated. Large enterprises use the "assembly line method" in house building under the supervision of qualified technical personnel. Local building materials are used as far as possible, including industrial waste products.

In a number of cities, from Morocco and Tunisia to the Belgian Congo, Indonesia and Poland, self-help and mutual aid have been applied with varied success; but projects combining the contribution of the people's own labor with the technical skills and equipment provided by public or private construction enterprises, in other words self-help combined with contractor-built cores of houses, have proved to be most productive. In France and Sweden, savings in cash through contributed labor have been estimated at about 10 per cent, and savings in the cost of building materials through bulk purchase accounted for another reduction of 20 to 30 per cent. In less-developed countries, where construction is generally simpler and therefore relies more readily on unskilled labor, savings amounting to as much as 60 per cent have been reported in certain cases.

THE CONTRIBUTION OF SELF-HELP AND MUTUAL AID

Undoubtedly programs such as those described above can make a significant contribution toward improving housing and community services for the lower income families, particularly if they are executed as part of a national housing policy and if they are supported by appropriate planning. But it must be recognized that such projects require large supplies of resources to be invested in land, materials, equipment, and in organization and technical ad-

vice. There is much practical experience already available in many countries on self-help and mutual aid in rural areas. This will enable the United Nations, its specialized agencies, and international professional organizations¹²—in conjunction with agricultural extension and community development—to undertake demonstration projects as guides for national policies and programs for the improvement of rural housing. The application of self-help and mutual aid in urban slums and squatters' colonies, however, needs further study. Well-planned pilot projects established within the framework of broader plans for slum clearance, urban renewal, and metropolitan and regional development may provide opportunity for such exploration.

While self-help, mutual aid, and co-operatives can clearly make a highly significant contribution to rural and urban housing, it must be recognized that they will be truly effective only if certain basic principles are observed:

(1) Unskilled labor can be economically used only for work that does not require specific skills; it is uneconomical from the national viewpoint to acquire the necessary skills if they are to be used only once.

(2) In order to utilize the latent potential of capital formation inherent in self-help, mutual aid, and co-operation, sufficient initial capital, technical personnel, administrative ability, and organizing skill must also be available.

(3) Housing and community improvement programs using self-help and mutual aid must as a matter of national policy always be made part of general

housing programs, rural or urban; they must also be part of a general improvement of rural life or broad programs for urban development.

(4) Self-help housing projects must not become the "poorer" sections of a community—its "ghetto"; provision of adequate facilities and services must be achieved through suitable community planning on a broad scale.

(5) The householder's labor should be combined with an economically justifiable application of machines to ensure an adequate measure of productivity making the effort worth while beyond the mere fact of employing the underemployed for the sake of having them occupied.

(6) The use of unskilled labor through self-help and mutual aid has definite limitations. It therefore cannot be a substitute for a highly productive building industry which ultimately must be enabled to deal with the increasing problem of urban development and reconstruction to accommodate the expected population growth, to eliminate substandard housing, and to do justice to the continuing rise in legitimate expectations of any people.

Finally, there is a need to take full advantage of new technology in order to rejuvenate the existing cities, to prepare them to receive the growing millions of new urban dwellers, and to create alternative foci of attraction by judicious development of transport and location of industry. Faster transit and new modes of transportation, for example; abandonment, if necessary, of the dream of individual homes in their present form and ownership pattern; and creation of contemporary counterparts in taller buildings and less ground coverage—all of which might return nature, beauty, efficiency, and sanity to our cities. In our times, it is the city that must progress, or the nations will perish.

A Mass Attack on a Basic Problem: A Child Nutrition Project in Latin America

By ELISABETH SHIRLEY ENOCHS

ABSTRACT: In 1958 and 1959, the Inter-American Children's Institute of Montevideo, Uruguay, and the Unitarian Service Committee of the United States cosponsored four Symposia on Child Nutrition in Latin America with the co-operation of Specialized Organizations of the United Nations, the Organization of American States, and the International Co-operation Administration. Each sponsor appointed a team of experts, contributed by universities and governmental agencies, to conduct the symposia. The Williams-Waterman Fund helped to provide travel grants for three participants from each South American country. Different professions—medicine, agriculture, social work, education, anthropology, and so on—were represented. The multidisciplinary approach—new to the Latin Americans—proved effective in dealing with a multifaceted problem which has top priority in Latin America because of its serious effects on the general population, particularly children, and because it is recognized as a deterrent to economic development and productivity.

Elisabeth Shirley Enochs, Washington, D. C., is Chief of International Technical Missions, in the International Service, Office of the Commissioner of Social Security. Previously she was for ten years Director of the International Co-operation Division of the Children's Bureau. She has served as Representative of the United States in the Directing Council of the Inter-American Children's Institute and is now Honorary President of the Council. By designation of the Department of State, she serves as Technical Advisor on Social Questions to the United States Delegation to the Inter-American Economic and Social Council, Organization of American States.

WHEN the VIII Pan American Child Congress met in Washington in 1942—in war time—the founder and director of the National Institute of Nutrition in Argentina, Dr. Pedro Escudero, presented a paper in which he stated that “Latin America has been living a tragedy of hunger since the days of the Conquest.”

Since the war, progress has been made in studying the problem, particularly in the Central American countries where an Institute of Nutrition was established in 1946 by the five Central American Republics with the help of the W. K. Kellogg Foundation and the Pan American Sanitary Bureau, under whose auspices it now functions.

In 1950, when the Inter-American Economic and Social Council held its first Extraordinary Session to establish the Technical Co-operation Program of the Organization of American States, it listed nutrition as one of the major problems requiring attention.

Not until 1958, however, was a mass attack launched on this basic problem through what might be termed community organization on an international scale. The purpose of this article is to describe what has been recognized as a unique experiment in the mobilization of international and national agencies and representatives of many different professions for a war on hunger.

BACKGROUND

It is particularly fitting that this project should have resulted from the meeting, in Panama, July 22, 1956, of the Presidents of all the American Republics, since this meeting was part of a commemorative celebration of the First Pan American Conference called by Simon Bolivar in 1826. President Eisenhower attended this meeting and proposed that each President designate a representative to form a committee

which would have the task of strengthening inter-American relations and improving the welfare of the American peoples. Dr. Milton S. Eisenhower, the President's brother, was designated as his representative and chaired the Committee of Presidential Representatives (CPR) which held several meetings in Washington and drew up a number of recommendations.

In preparation for the first of these meetings, the Secretary-General of the Organization of American States, Dr. José A. Mora, addressed a message to each of the Inter-American Specialized Organizations asking them to report upon the major problems in their respective spheres of operations in order to provide the CPR with a comprehensive picture of conditions in the Western Hemisphere.

The Inter-American System includes three organizations directly concerned with one or more phases of the nutrition problem, namely, the Pan American Sanitary Bureau (PASB), the Inter-American Institute of Agricultural Sciences, and the Inter-American Children's Institute. All three have special competence in one or more of the technical aspects of the problem. All have co-operative relationships with the specialized agencies of the United Nations. The PASB is the regional office of the World Health Organization. The Inter-American Institute of Agricultural Sciences and the Children's Institute have worked co-operatively with the Food and Agriculture Organization. Co-operating relationships exist also with the United Nations Children's Fund (UNICEF). Other inter-American agencies, such as the Inter-American Indian Institute, have studied specific phases of the problem, such as food superstitions and taboos. However, the combined resources of these agencies had never been used for a comprehensive and co-ordinated attack on a prob-

lem of mutual concern to all of them, such as the problem of nutrition.

Malnutrition

The report sent to the Secretary-General by the Inter-American Children's Institute listed malnutrition as the problem with top priority in the field of child welfare. The report from the Pan American Sanitary Bureau placed it second only to the world-wide problem of malaria. “While a variety of nutritional problems . . . adversely affect the health of the population in some areas of Latin America,” said the PASB, “the greatest single problem is recognized to be malnutrition due to lack of suitable protein.” The report stated that consumption of animal and milk protein in Latin America is much less—25 grams per capita per day of animal protein and 65 grams per capita per day of total protein—than in Canada and the United States—61 grams of animal and 90 of total protein. The PASB agreed with the Children's Institute that the problem affects the population as a whole. It asserted that its effect is particularly severe in childhood and is directly responsible for a portion of the high infant and early childhood mortality in many Latin-American countries, and is found in all Latin-American countries with the exception of Argentina and Uruguay. In fact, the PASB report indicated, it has now been established that the condition described by Latin-American pediatricians as “*Síndrome Pluricarenal de la Infancia*”—multiple deficiency syndrome of childhood—is identical with Kwashiorkor, the protein-deficiency disease found by the World Health Organization (WHO) and the Food and Agricultural Organization (FAO) consultants to be so widespread in Africa. It has come as a shock to many people in Europe and in America to learn that

malnutrition among children is so widespread in Latin America and as severe as that found in many famine areas of Africa and the Far East.

The Committee of Presidential Representatives agreed that malnutrition in vast areas of Latin America affects economic development and is highly detrimental to the general welfare of the population. In Recommendation Number 17 the Committee urged the Organization of American States (OAS) to bring about a co-ordinated approach to activities in this field through the appropriate organizations; to support the work of the international organizations concerned with it; and, through its expanded technical co-operation program, to help individual governments requesting assistance in matters pertaining to food and nutrition.

It was while the problem was being dealt with at this high level that the Unitarian Service Committee, which had been actively promoting co-operative projects in the fields of health and social welfare, decided to explore the possibility of carrying out a project in Latin America. Mr. Wilmer Froistad, a social worker—community organization specialist—came to Washington as the representative of the Committee to consult with a member of the staff of the International Service, Office of the Commissioner of Social Security, Department of Health, Education, and Welfare, who had had long association with the other American Republics. The consultations resulted in a decision to join forces with the Inter-American Children's Institute in conducting a series of symposia on child nutrition in South America. It was agreed not to involve the Central American countries where the Institute of Nutrition of Central America and Panama (INCAP) is actively engaged in nutrition work. The choice was a logical one. Here was a problem with which the whole conti-

nent was concerned. Here was an inter-American organization—the Inter-American Children's Institute—with contacts in every American country through which a project might be developed. And here was a group in the United States—the Unitarian Service Committee—willing to help and to mobilize resources which were not available to the Institute.

PREPARATIONS

In its report to the Secretary-General of the OAS, the Pan American Sanitary Bureau recognized that international and national programs in the field of nutrition need the co-operation of agencies in the field of agriculture as well as in the field of health. "At the international level," they said, "this means co-operation with the FAO and with UNICEF, as well as with the Inter-American Institute of Agricultural Sciences and the Inter-American Children's Institute."

As for the latter agency, it has always recognized the interdisciplinary approach to problems affecting child life, and its structure provides for research and advisory services in the fields of health, education, legislation, and the social services.

From the beginning, therefore, it was evident that the approach must be interdisciplinary and that other agencies would naturally be interested in co-operating. From the moment the project was presented to them, the Pan American Sanitary Bureau, the Inter-American Institute of Agricultural Sciences, the FAO, and the International Co-operation Administration (ICA) offered their co-operation in both planning and execution. The Inter-American Statistical Institute and the Inter-American Commission of Women also indicated their interest in participating, the former by sending its Vice-President

to one of the symposia and the latter by sending a special message and report.

The regional office of FAO for the Western Hemisphere is located in Santiago, Chile, and as the nutrition adviser, a Frenchman, Dr. Henri Teulon, had just been assigned and was "making contact" with his region, he offered to assist in the planning and to help the Inter-American Children's Institute in the selection of three experts from each of the South American countries who would participate in the meetings on travel grants made available by the Institute.

In correspondence between the Unitarian Service Committee (USC) and Institute headquarters in Montevideo it was agreed that each of the sponsoring agencies would supply a team of experts representing different professional fields to conduct the symposia. The Medical School of the University of Cali in Colombia offered its facilities for the first of the two meetings planned, and the Bolivian Pediatric Society agreed to be host to the second meeting in La Paz with co-operation from the Bolivian Social Security Institute.

Advance planning had to be carried on through conferences between USC representatives and staff of those agencies having offices in the United States or who providentially happened to visit New York or Washington during the preparatory period, and through correspondence with the Institute headquarters in Montevideo and the FAO Regional Office in Santiago, Chile. This triangular arrangement presented many difficulties, as did the short period actually available for preparations. The meeting in Cali had to be held during the week of February 17, 1958, during a vacation period. All participants agreed that more time for advance planning would have been desirable.

Symposium members

The Director-General of the Inter-American Children's Institute, Dr. Victor Escardó y Anaya, appointed as Team Leader the head of the Institute's Technical Department, Dr. Maria Luisa Saldún de Rodriguez, who is also Associate Professor of Pediatrics at the Medical School of the University of Montevideo. Each leader selected the members of his or her team.

The Unitarian Service Committee appointed as Team Leader Dr. Samuel Z. Levine, Professor of Pediatrics, from the New York Hospital-Cornell Medical Center. Executive responsibility during the preparatory period was carried by Mr. Wilmer Froistad of the USC, who also served as a team member representing the field of social work.

The personal interest of Dr. Milton S. Eisenhower, President of the Johns Hopkins University, enabled the USC to secure the participation of Dr. Ernest L. Stebbins, Director of the School of Hygiene and Public Health of that University. The University of California contributed the services of Dr. Ruth L. Huenemann, Associate Professor of Public Health Nutrition, and a co-operative arrangement between the Social Security Administration and the Pan American Union enabled the writer to participate as a representative of the field of social welfare.

A distinguished anthropologist, Dr. Isabel Kelly, was made available by the International Co-operation Administration.

Members of the team designated by the Institute included Dr. Arturo Baeza Goñi, Professor of Pediatrics of the University of Chile; Dr. Carlos Collazos Chiriboga, Director of the National Nutrition Institute of Peru; and Dr. Walter Santos, Executive Director of the Co-ordinating Council on Food Supply of Brazil. The Inter-American

Institute of Agricultural Sciences contributed the services of Dr. Jorge Ramsay, an Agricultural Extension agent, and Mrs. Ines de Ramsay, who is both an extension agent and a home economist. The representative of the Pan American Sanitary Bureau was Dr. Carlos Perez, Assistant Director of the Institute of Nutrition of Central America and Panama. FAO made an invaluable contribution in the person of Dr. Henri Teulon, and the International Co-operation Administration contributed the services of biochemists, health educators, home economists, and public health nurses from the missions in the various countries in which these symposia were held.

As mentioned earlier, each country was invited to send three experts—representing different professional fields—to attend the symposia. Through the interest of Dr. Henry Sebrell, the Williams-Waterman Fund made a financial contribution to the project which helped to defray international travel costs for these participants whose maintenance while in Colombia or Bolivia was paid by the Medical School of the University of Cali and the Bolivian Pediatric Society, respectively. A few governments sent extra trainees at their own expense.

DEVELOPMENT OF THE SYMPOSIA

The first symposium opened in Cali, Colombia on February 17. Participating countries were Colombia, Ecuador, Peru, and Venezuela, represented by pediatricians, nutritionists, and social workers.

It was symptomatic of some of the basic relationships then existing between Latin America and the United States that the first meeting of the two teams to plan the opening session was held in an atmosphere of tension. As soon as it became evident that the group of experts from the "Colossus of the

North" was not going to "throw its weight around," the tension disappeared. When the meeting in Cali adjourned Dr. Saldún de Rodríguez reported to the Institute in Montevideo that "she had never imagined that it would be possible to work in such an atmosphere of complete companionship."

Discussions covered nutritional needs of pregnant and lactating women; problems of the weaning period; nutritional requirements during the preschool period; minimum requirements of the school-age child and the adolescent; the feeding of children in hospitals and child-caring institutions; problems involved in increasing the production of essential foods; improvement of community food habits in the South American countries; social welfare programs contributing to improvement of family nutrition; and the responsibility of departments of public health and of public school systems to improve nutrition.

The interdisciplinary character of the meetings was a new experience for participants and proved successful in focusing on the need for more co-operation among professional groups as well as the national and international agencies concerned with this multifaceted problem.

There were difficult moments, of course. Technical experts do not always agree about technical matters. National pride expresses itself in various ways. Some experts credited the distribution of dry skim milk by the United Children's Fund (UNICEF), Co-operative for American Remittances to Everywhere (CARE), and other agencies through which surplus foods are made available to other countries under U. S. Public Law 480, with saving the lives of thousands of children. Others expressed the feeling that these children are receiving crumbs from the rich man's table. Occasionally someone would say: "We cannot forever have two Americas, a rich America and a poor America."

There was much discussion of community development techniques through which people in local communities can help to improve and increase their own food supply. The need for more team work between different groups of experts was stressed over and over again. The Director of a national nutrition institute pointed out that many people are confused because they get conflicting advice from experts in different fields. He told of mothers receiving one type of advice from the maternal and child health center, while her school-age children come home with different advice and the home economist comes in with instructions and demonstrations that differ from any of the others. One symposium was fascinated when a home economist told how women in a remote rural area had been taught to can corn in coca cola bottles only to have an anthropologist say that a study in that same area had shown that over the centuries people had been conserving food less laboriously in ways that retained a higher nutritional value.

While pediatricians were discussing some of the causes of infants' diarrhea, social workers suggested that one reason why infants developed it is the extreme poverty and lack of fuel in many homes. If the mothers boil the milk, or the water used to mix powdered milk, as they are instructed in the Mother and Child Health Center, they have no fuel left to cook for the rest of the family. Too often these families do not possess a single spoon. Older children coming home from school dip their hands into the powdered milk because they prefer to eat it rather than drink it. Home economists had called attention to the latter practice, indicating that it is all right for children to eat powdered milk since it is one way of providing them with the protein and calcium they need. The anthropologists discussed food taboos and superstitions and everybody

agreed on the importance of education at all levels and through all professions.

The need for economic development as a basis for more general social welfare was recognized but some of the experts pointed out that national plans for economic development often focus on production for export without consideration of certain basic human needs. Nutrition experts, for instance, felt that they should have a voice in national councils dealing with food production to provide for consideration of national nutrition needs.

Attention was paid to emergency and short-range programs as well as to long-range planning for work in such fields as environmental sanitation. The lack of such sanitation is one cause of intestinal parasites, and the consequent anemia contributes to poor nutrition of people in many areas.

Interest aroused

Although only two symposia were planned for 1958, four were actually held. The interest engendered was so great that the governments of Argentina and Brazil spontaneously decided to organize national meetings to be attended by experts from every province and state in those two countries in order to take advantage of the participation of the two teams. This extension had not been foreseen and since the USC team included faculty members from some of our well-known universities whose presidents had generously given them leave in the middle of the academic year, not all of them were able to remain through the two extra meetings.

En route from Colombia to Bolivia, stops were made in Peru and Chile where special programs were arranged by local authorities to enable the team members to report on the first symposium. The impact of the symposia was thus greatly extended.

The interest aroused was not confined

to professional circles. The Presidents of Bolivia and Brazil asked to meet the visiting teams and receive direct reports of the meetings in which various officials of cabinet rank participated.

Each symposium lasted a full week. One of the few complaints was the lack of time for field visits. But the discussions painted a vivid picture of the seriousness of the nutrition problem in the countries visited. Stories were told of parents who sell their children in order to have fewer mouths to feed, or who drug them to keep them from crying of hunger. Reports from hospitals revealed that near-starvation of children is responsible for a host of other problems, and school teachers emphasized the effect of undernourishment on the school attendance and student performance. Social workers described heroic measures to improve the economic status of families. Nurses, health educators and home economists stressed the need for educational programs couched in terms that people of various cultural levels can readily accept.

While it was agreed that the symposia would adopt no resolutions, they did arrive at certain findings or conclusions which, after review by the Institute, have been widely circulated in both Spanish and English. A major conclusion was that the problem of nutrition, particularly child nutrition, is so great that it must be dramatized and that each American country must be urged to consider its solution a goal of honor.

EVALUATION OF RESULTS

A meeting was held at the headquarters of the Institute in Montevideo to evaluate results. There was complete agreement with Dr. Levine's statement that these symposia had introduced to Latin America a new method of dealing with a basic problem of concern to different professional groups.

Dr. Stebbins described the experiment as "unique in that a very considerable number of national and international agencies participated in discussion of one of the most important problems in Latin America." He described the experience to be most encouraging for the future possibilities of international co-operation, and stated that it was one of the most interesting and valuable international co-operative ventures that he had had the privilege to participate in. The Latin-American experts repeatedly stressed the fact that the project had been carried out, and the discussions conducted, "on a plane of complete equality." There was a consensus that no small part of the success of the project was due to the fact that the Unitarian Service Committee did not go to Latin America with a project of its own but offered its co-operation to an agency that had identified a serious problem but lacked means of dealing with it without assistance. There was enthusiastic agreement that two more symposia should be held in 1959. These were successfully conducted in Quito, Ecuador, and Asuncion, Paraguay, in February and March of that year with some of the same team members.

In each country visited, the symposia received an extraordinary amount of publicity through press, radio, and television. The Inter-American Children's Institute has published comprehensive reports in its quarterly bulletin. Journals of pediatric societies are still commenting on the meetings and proposing new steps to deal with the problem.

When the New York Times on January 30, 1959, carried a report on President Eisenhower's message to Congress urging a "Food for Peace" policy, participants in the symposia were impressed by the statement that there was a plan "to dramatize food as an instrument for building a durable peace."

Several Latin-American countries have now applied to the Interdepartmental Committee on Nutrition for National Defense—established early in 1955 by the United States Departments of Defense; State; Agriculture; and Health, Education, and Welfare, plus the International Co-operation Administration and, later, the Atomic Energy Commission—for co-operation and technical assistance in conducting national nutrition surveys. Dr. Arnold Schaefer, Executive Secretary of the Committee, has suggested that these requests may not be completely unrelated to the symposia since the requesting authorities in the countries concerned include many persons who participated directly in the meetings.

It is noteworthy that these symposia gave members of a newly emerging profession in Latin America—the profession of social work—their first opportunity to participate on a plane of equality with representatives of other professions in meetings of this international character.

New light was thrown on some of the social aspects of economic development. Many of the Latin-American participants declared that "this multi-disciplinary approach has opened a new world for us," and agreed with Dr. Stebbins "that it set a pattern that might be followed, with certain modifications, for future international programs on various subjects."

In the broader area of inter-American relationships there is no question but that these symposia contributed greatly to intercountry co-operation and also to mutual respect and understanding. As mentioned above, the first meeting opened in an atmosphere of tension. In a final meeting one of the Latin-American participants enthusiastically described these symposia as a "miracle of love."

Developing Professional Leadership for Social Programs

By ERNEST F. WITTE

ABSTRACT: The insistent demand in less-advanced areas of the world for improved living standards is dependent upon effecting social changes in the habits and living patterns of the people in these areas. Such changes can only be brought about in an orderly way through the development of competent, informed, indigenous leaders. Among the personnel so urgently needed to initiate and carry on programs of social change are social workers to function at all levels of activity within these countries. As this need has become recognized, a growing world-wide effort to provide such leadership, carried on by many international and national, governmental and voluntary agencies, has emerged. These organizations have developed a great variety of methods to help less-developed countries acquire a nucleus of trained social workers to initiate and carry forward social welfare programs which will ultimately result in better, more secure, and more satisfying lives for the majority of their people. The need for social work personnel is great, and the time available for preparing them is limited. There is much to be learned from past and current experience on how to do this job most effectively.

Ernest F. Witte, Ph.D., New York City, has been Executive Director of the Council on Social Work Education since 1953. Among other positions in the field of social work, he has served as Chief of the Division of Technical Training, Bureau of Public Assistance of the Federal Security Agency, and Chief of Social Service for the Veterans Administration for the Pacific Coast states. A graduate of the University of Nebraska and the University of Chicago, Dr. Witte served as Director of two schools of social work, first at the University of Nebraska where he organized the school and later at the University of Washington.

THE progress of much of the world toward better living standards, greater self-sufficiency, and a more rewarding life is greatly handicapped by a shortage of technically qualified personnel to provide the needed professional leadership, especially in the less-developed nations of the world. *The Ugly American*¹ helped to dramatize for the United States the importance of the change agent sent abroad to help bring about social and other changes. One of the principal ingredients of success in achieving social change is training of indigenous personnel to carry on the program.

The social change involved in every kind of development program calls for social welfare personnel. Change in any lasting sense depends upon the persons who constitute the society and the degree to which their resistance to change has been overcome by their acceptance of the need for it. It depends as well on the provisions made to ameliorate the ill effects for some persons and groups which are bound to accompany any fundamental social change. In these aspects of development programs the major contribution of social workers may be expected, since their professional focus is on the effective social functioning of people.

WORLD NEED FOR TRAINED WELFARE PERSONNEL

As Louis Miniclier has pointed out in an International Co-operation Administration circular on this subject:

A United Nations survey shows that between 1945 and 1955, forty-five countries adopted new constitutions or constitutional amendments, creating basic responsibilities for governments in the matter of social welfare. One result has been the creation, even in the less-developed countries, of

ministries or other public agencies charged with the planning and administration of social welfare programs.

Since programs are not self-administering, schools of social work have sprung up all over the globe to train staff needed for these new agencies. The philosophy and ideology permeating such training are of vital importance since social workers come in direct contact with a greater cross-section of the population than almost any other type of professional worker.

The training of social workers is considered today as an integral part of a country's effort to promote political stability, increase economic productivity, and provide for the national defense. It is no longer solely intended to improve the professional know-how of persons working in traditional humanitarian fields. Social workers are found today not only in ministries of health and welfare but in ministries of agriculture, justice, education, national defense, and many other public agencies. They are employed as counselors in factories and on farms; in schools and in courts; in prisons and reformatories; in hospitals, health centers and dispensaries; in housing agencies and a variety of other institutions.²

A further clarifying comment on the nature of the problem is set forth in a United Nations report:

The experts have repeatedly stressed that 'the effective development of a country requires a balanced approach from both the economic and social aspects' . . . and, accordingly, that 'the planning of any development policy should give due consideration to the human resources on which such development depends and in whose interest it should operate'. . . . Policies dealing with the social aspects of over-all development should be designed to both 'prevent individual maladjustment and social disruption' which might result from economic change,

² ICA Manual Order 3100, ICATO circular A-353, May 28, 1958, entitled *Training for Social Welfare Personnel*. For a list of the schools referred to by Mr. Miniclier see International Association of Schools of Social Work, *Directory of Members and Constitution* (New York, January 1957).

¹ Eugene Burdick and William J. Lederer, *The Ugly American* (New York: Norton, 1958).

and 'ensure that economic development contributes to the welfare of the population'. . . .³

With wide attention increasingly focused upon the need to improve living conditions in the less well-developed areas of the world, a remarkable world effort to train needed social work personnel has been initiated. Many of these efforts, under many different auspices, have been improvised and hasty; in others more careful and longer time plans have been devised. It is generally agreed that professional education in a school of social work provides the best preparation for many of the functions in developing social programs. This article will not describe in detail the characteristics of social work education, as the subject has been covered in a series of studies published by the United Nations.⁴ Instead, an attempt will be

³ United Nations Economic and Social Council, Social Commission Twelfth Session, *Scope and Development of National Social Service Programmes*, Report by the Secretary-General 30 March 1959, p. 7. A recent comment by Dr. Branko Kesic, Professor of Hygiene and Social Medicine, School of Public Health in Zagreb, as quoted in *The New York Times*, October 18, 1959, bears on this aspect of development. He pointed out that industrialization had certain side effects that he had noted in Yugoslavia and which the nation had an obligation to deal with. He said these included: alcoholism, mental disorders, deficient nutrition, and juvenile delinquency. For a thoughtful, concise and cogent report on the contributions of social service to programs of economic and social development, attention is called to: United Nations Economic and Social Council, *The Development of National Social Service Programmes*, Report by a Group of Experts appointed by the Secretary-General of the United Nations, New York, March 9, 1959, especially Chapter II and Summary of Conclusions.

⁴ United Nations, Department of Social Affairs, *Training for Social Work, An International Survey* (1950); Bureau of Social Affairs, *Training for Social Work, Second International Survey* (1955); Department of Economic and Social Affairs, *Training for Social Work, Third International Survey* (1958).

made to describe efforts and methods less well-known and designed to increase the supply of professional and technical leadership at all levels to deal with the growing complex of problems involved. The examples cited were selected primarily because they illustrate significant principles or aspects of a complex and difficult task.

MAGNITUDE OF THE NEED

Unfortunately, there has been no study or careful estimate of the over-all personnel needed to provide perspective on the scope of the problem. There are estimates in some countries and for some programs which, if compiled, might be helpful. In India, for example, the first five-year plan required the training of some 84,000 persons in all categories of positions for its community development program,⁵ including: project executive officers, block development officers, village-level workers, social education organizers, doctors, nurses, veterinary personnel, stockmen, teachers, agricultural graduates, co-operative inspectors, compounders, sanitary inspectors, lady health visitors, midwives, overseers, arts and crafts supervisors, mechanics, engineers, and others. In the second five-year plan the number of trained personnel needed for the community development program in India was reported as likely to exceed 350,000 persons. Community development, it should be noted, is only one program of many in India's efforts to improve the economic and social well-being of her people.

A recent report on the Colombo Plan indicates that some "10,000 Asians have been trained [as part of the Plan] in everything from farming to medicine to

⁵ Gibson, Masters, Witte, *Report on Community Development Programs in India, Iran, Egypt and Gold Coast* (Washington, D. C.: International Co-operation Administration, December 1955), p. 22.

engineering and social work. . . . The United States has trained another 6,000 Asians under its own separate programs."⁶

These examples help to convey the size and complexity of the problem involved. Further evidence is abundantly available from the documents of the United Nations, many of them based upon official reports of member nations. One such recent report notes that

. . . The implementation of comprehensive plans requires appropriate administrative organization and qualified personnel. The training requirements implicit in designing programmes to prevent or resolve social problems arising in connexion with the economic development of less developed countries are urgent. Problems relating to the training of social welfare personnel are therefore given continuing priority in the programme of the United Nations.⁷

The degree of success achieved in dealing with the shortage will determine in large part the progress that can be made in effecting social change in the countries concerned.

METHODS EMPLOYED TO TRAIN PERSONNEL

Methods utilized and agencies engaged in efforts to increase and raise the standard of professional and technical

leadership in the welfare field are too numerous to review here.⁸ Some of the methods, such as exchange programs, provision of technical aid, and the establishment of special educational institutions,⁹ are better known than are institutes, conferences, seminars, demonstrations, short-time advisory services, planned observation tours, and educational materials and supplies.¹⁰ Some of these devices may serve a single country, but frequently are made to serve more than one by being organized on a regional basis. Methods employed will vary with the general objectives, and whether these are designed to show immediate or more long-range results.¹¹ Unfortunately, political, social, and economic expediency introduces pressures on these programs, both in the countries providing the aid and in those receiving it, and irrespective of auspices. Training programs ill conceived through a need to show quick results may be disastrous to their objectives and economically wasteful by

⁸ The most comprehensive listing of such organizations may be found in *The Yearbook of International Organizations* (7th ed.; Brussels: Union of International Associations, 1958).

¹⁰ For a good discussion of the use of these methods see: United Nations Department of Social Affairs, *International Advisory Social Welfare Services* (New York, 1949).

¹¹ For an interesting summary of various training programs and the personnel for which training was provided in community development in specified countries see: Jean Ogden, *Conference Summary Community Development Africa*, March 17-20, 1958, Tripoli, Libya (Washington, D. C.: International Co-operation Administration), Chap. V, "Training for Community Development." Particular attention is called to the training for voluntary village leadership in Ghana which is included in this report.

duplicating institutions already in existence instead of modifying them to serve the new needs.¹²

SOCIAL WORK EDUCATION FOR KOREA

An example of fundamental, long-range effort to develop technical leadership and knowledge is the assistance given to Korea by the American-Korean Foundation and the Unitarian Service Committee, with additional financial help from the United States Department of State. It illustrates the time involved, the complications frequently encountered, and the need to co-ordinate the efforts of a number of organizations.

Following the devastating events in Korea, the task of reconstruction was initiated by the United Nations Korean Reconstruction Agency, whose program was started in late 1952.¹² The need for social as well as economic reconstruction was acute, and it was clear that Korean personnel must be equipped to give the continuing leadership required. In 1954 the American-Korean Foundation and the Unitarian Service Committee sent a social work educator from the United States to Seoul to assess the need with Korean educators and to recommend the best way to assure a supply of social welfare personnel.

As his proposals were modified and carried out, three Koreans were brought to the United States by the American-Korean Foundation and the Unitarian Service Committee, and enrolled in a graduate school of social work for the basic two-year course. Funds were made available to the Seoul National University by the Unitarian Service Committee to help establish a Department of Social Work, but when the three Koreans returned to Seoul for that

¹² For a brief summary of its program and accomplishments see: United Nations, *Annual Report of the Secretary-General on the Work of the Organization* 16 June 1957-15 June 1958, pp. 27-28.

purpose upon completion of their studies, they learned that the University lacked the additional funds required and the needed legislative authorization to establish the Department.

Further consultation by representatives of the Unitarian Service Committee with the Ministry of Education and the University led to a plan to develop a program for social work education within the Department of Sociology. The number of undergraduates to be admitted was limited to ten students in any one year. This plan was also voided by the failure of the applicants for undergraduate study to meet the standards for admission to the University. Again consultation was provided by the Unitarian Service Committee and arrangements were made for it to underwrite the cost of a beginning graduate program of social work education, utilizing the part-time services of the three Koreans who had completed their professional education in the United States.

By March 1959 the program had become well established. Necessary legislation had been passed providing for an independent Department of Social Work, with earmarked funds to become available in 1960. The funds provided by the Unitarian Service Committee to help keep the program going until 1960 had been more than matched by the University from its meager budget. The representative of the Committee reports that the sacrifices made by the University officials left no doubt that they were really supporting the program and that previous opposition from some quarters had disappeared. The question of the availability of suitable students seemed answered when some 117 applications were received for the ten students to be admitted. The applicants had good academic rating, and the first class selected showed real promise. There have already been substantial indications that employment

opportunities will be available to these graduates when they complete their education, so that they can make their contribution readily in bringing about social change and progress.¹³

This Korean example illustrates a number of problems which appear to be fairly common in the effort to develop qualified personnel. Among these are the chronic lack of adequate resources and the need to find alternative ways of moving forward, that is, of being prepared to start with less than the situation seems to demand; the difficulty of breaking traditions in order to introduce the new; the slow pace in developing the resources required to get the program started; the persistence required if the obstacles facing change are to be overcome; the help which the outside change agent contributes—which may be required over long periods—in moving the program ahead.

PRINCIPLES OF CO-OPERATION

There is growing recognition of the need for a balanced social and economic program of development in less-developed countries supported by appropriate education of all the people concerned. Technical consultants can make substantial contributions toward achieving such a balanced development or impede it according to their understanding and action.¹⁴

In this connection one of the most interesting attempts to develop leadership personnel is the work of the Near East Foundation in the training of women for work in the villages of Iran. This undertaking is extremely important because of its potential, long-range, social significance and because it

¹³ Unitarian Service Committee, "Report on Program in Korea," October 24, 1959 (mimeographed).

¹⁴ For further discussion of this subject see: Council on Social Work Education, *Interprofessional Training Goals for Technical Assistance Personnel Abroad* (New York, 1959).

illustrates the broad personnel base on which social progress must ultimately rest. It was recognized that unless and until some change could be effected in the traditional status of the village women, little real progress could be made to improve the health or living standards of village families.

It was not until 1951 that a home economist from the United States was placed on the Foundation staff in Iran. She initiated, after much exploration, a pilot demonstration project for women in a geographic area where the Foundation had been working since 1946. Her first efforts were directed toward winning the confidence of village men, in order that they might permit the women to participate in any of the planned activities. Considerable time and effort went into the task of recruiting young Iranian women who were willing to learn and to teach literacy, sewing, and, as opportunity offered, something on child care to the village women.

Three years after the demonstration started there had been developed an adult out-of-school program for women which included literacy, the raising of dooryard gardens, raising and cooking vegetables, drying food for future use, sewing, health education, and the care of children.

In 1953 officials of the Near East Foundation had discussed with their Iranian consultant when he thought it would be possible to establish a demonstration boarding school for Iranian girls, as had previously been done for boys. It was agreed that circumstances appeared to favor such a development at the time.

School for girls

Accordingly, a boarding school to train girls to carry on these and other services was established by the Foundation in 1954, called Galeh Nou. The first such school in Iran, it eventually

provided special training programs for teachers, for village-level community-development workers, and for home economists. Planning for the school and its operation was carried on in close co-operation with the Ministries of Education, Interior, and Agriculture.

In 1958 the Near East Foundation turned over operation of the school to the Ministry of Education, maintaining only an advisory relationship to it. The Ministry has more recently asked the Foundation to establish a number of additional schools with funds provided by the Ministry. This arrangement has several distinct advantages including: (a) greater flexibility as to admission standards, employment qualifications of teachers, curriculum requirements, and so on; (b) avoidance by the Ministry of direct political responsibility, should the undertaking not succeed, but permitting credit to be taken if it does; and (c) removing the operation during its formative period from pressures for conformity with the past.

The Iranian woman selected to head the Galeh Nou School was subsequently made the national director of the home economics extension service of the Ministry of Agriculture.

Village-level activity

From the beginning, the Near East Foundation has insisted on keeping this training program close to the culture of the village. Girls selected for training have not been required to have more than a sixth-grade education, even though there has been pressure to raise this requirement to the ninth grade. There are few village girls having a ninth-grade education; those who do are not so apt to want to work in the village; and finally, the Foundation believes that the training program it has developed is not beyond the ability of the sixth-grade graduate at this stage

of development. Only one girl in five is enrolled in a village school, in part because many parents do not want girls to study with male teachers after they have completed the second grade. The Foundation has resisted the temptation and pressures to establish more elaborate and fancier buildings and equipment at the school because this might widen the gulf between the girls trained as change agents and the villagers. In the same way it has continued to insist on a fairly generic and fundamental curriculum for all trainees, of fairly short duration—twelve months for teachers, nine months for community development workers, and six months for home economists—with provision for refresher courses from time to time and for competent supervision of their work in the field.

Operative principles

Although they may seem obvious, certain aspects of this training effort merit special mention: the close partnership which the outside agent—the Near East Foundation—established with government officials responsible for the work at all stages and levels of activity; the care exercised in the selection of Iranian personnel and their on-the-job supervision for the assumption of responsibility and continuing leadership; the early involvement and steady increase in the financial participation of the host government; the willingness of the outside agent to relinquish control to the indigenous authority when this seemed appropriate; the continued participation in the substantial developmental period after relinquishment of control, through the retention of an advisory function. These factors seem so basic in any enterprise of this nature as to be considered "principles."

One of three pioneers in Iranian women's work, Mrs. Ezzat Agheoli, national director of the home economics

extension service in the Ministry of Agriculture, is quoted in a Near East Foundation field agent's report (July 1959) as having learned from her work on this project these three things:

- (1) Do not start programs too high or too big, start where the people are.
- (2) You must live in a village and be considered one of them to be an effective worker for village people.
- (3) Start a program with available personnel and give them job training if qualified personnel is not available.

It is impossible in so brief a report to convey any idea of the problems confronted in initiating and carrying forward a project of this type. Great patience, a sense of objectivity, and dedication are all important in the personnel responsible if the frustrations, the delays, and the slow progress are not to overwhelm the effort to develop the indigenous leadership which any fundamental social change requires.

TECHNICAL ASSISTANCE FOR IN-SERVICE TRAINING

The direct use of technical assistance to strengthen welfare manpower resources of a country through in-service training is illustrated by a United Nations undertaking in Pakistan.¹⁵ It

¹⁵ See also: Morris E. Opler, *Social Aspects of Technical Assistance in Operation* (Paris: UNESCO, 1954). This report of a conference jointly sponsored by the United Nations and UNESCO presents the various phases of the technical assistance program. The report (p. 38) notes: "Of the many criteria for selecting technical assistance projects, the educational possibilities seemed to the conferees to be one of the most important. . . ." United Nations Technical Assistance Programme, *Social Welfare Project* Prepared for the Government of Pakistan by Elmina R. Lucke, 1955. United Nations Technical Assistance Programme, *Social Work Education in Pakistan* Prepared for the government of Pakistan by Arthur S. Livingston 17 July 1958. American Council of Voluntary Agencies for Foreign Service, *The Role of Voluntary Agencies in Technical Assistance* (New York, May 1953). This volume

illustrates also utilization of the cultural heritage of a country to buttress the effort to train the personnel and create the instruments needed for social change.

Despite generally favorable circumstances, obstacles were encountered, many of them common in ventures of this nature. An exceedingly serious one in this project had to do with its timing, which required the social welfare team to establish a training program before it had made even a beginning inventory of the knowledge and understanding that would be required for social work practice in Pakistan.¹⁶

While this is disturbing and perhaps more costly to the country than a more orderly procedure, few countries offer ideal circumstances. Progress, if there is to be any, may be made by getting a start of some kind, even though much of what is done may later have to be modified. The opportunities for learning from mistakes are likely to be more valuable, particularly in less-developed countries, than withholding action pending a more nearly ideal set of circumstances. This is not to say, of course, that as much careful advanced planning ought not to be done as the complex factors to be dealt with will permit.

Many details of planning the technical assistance program may be factors of importance in the final outcome achieved. Some of these are brought out in another United Nations technical project providing help to the government of Thailand, indicating that it would have been more effective had one advisor been provided for a longer period, instead of the two who were requested for a period of less than a year.

discusses the role of voluntary agencies in providing technical assistance.

¹⁶ Based upon information provided by individuals participating in the program and the United Nations Secretariat.

The timing was poor in that the advisors arrived when the second term of the school year was under way and had to leave as the first term of the succeeding academic year was ending. Most unfortunate of all was the fact that the Administrative Officer of the Social Work Training Institute was out of the country during most of the period the advisors were there. During most of the period no interpreter was available to the advisors.¹⁷

TEACHING MATERIALS

A major handicap to the development of welfare personnel, particularly in the less well-developed countries, is the lack of indigenous teaching materials. Heavy reliance is placed on the literature of the country with which the outside consultant is most familiar, and personnel in the countries being helped generally have to fall back upon its use, even though it may not be in their language. In the early stages, the shortage of indigenous teaching materials seems almost inevitable, but it need not and should not remain so for any extended period. Every encouragement, including funds if needed, should be given to the development of teaching materials based upon work in the country itself. Furthermore, efforts should be made to help the country reproduce the more fundamental reference works of the profession in the language most familiar to the personnel of the host country.

Recent activities in Europe under the auspices of the International Association of Schools of Social Work have demonstrated the value of regional co-operation in the production of teaching materials. Initially, the project was directed toward selection from participating countries of a limited number of case records for use in regional seminars. Their usefulness led to organiza-

¹⁷ *Ibid.*

tion of a pool of European teaching records, and various national committees have been organized to increase the supply and quality of such indigenous teaching records.

The Unitarian Service Committee is currently assisting the two schools of social work in Athens, Greece, by financing the translation into Greek of basic concepts of social work as discussed in a recent seminar given in Greece. This will be the first professional social work literature to come out of a Greek experience. Also in process is the trial translation into Greek of two books, *The Art of Interviewing* by Annette Garrett and *Social Group Work Principles and Practice* by Wilson and Ryland.¹⁸

SOCIAL WORK EDUCATIONAL HELP FOR INDIA

Methods to develop personnel are often determined by the particular circumstances of a given area, as illustrated by the variations in programs to help India and Korea develop indigenous educational resources for training social workers. Korea had no educational institutions offering training in social work, whereas India had a number of well-developed schools of social work already functioning. Following an assessment of their needs made with them over an extended period of time by the social work attaché of the United States Embassy,¹⁹ the Technical Co-operation Mission in India, in co-

¹⁸ Unitarian Service Committee, "Proposal for the Continuation of Program of Assistance in Social Welfare in Greece 1959 and 1960," September 1958 (mimeographed). Attention is called to a recent publication prepared by the Committee on International Education of the Council on Social Work Education as an aid to other countries, entitled *Selected Bibliography of North American Social Welfare Literature* (New York, October 1958).

¹⁹ She later became a member of the staff of the United States Technical Co-operation Mission to India.

operation with the Ministry of Education and the schools concerned, enlisted the Council on Social Work Education to provide the consultation requested by the Indian schools.

The Council selected educational consultants from United States and Canadian sources who: (a) had special knowledge of the educational area required by the Indian schools to which they were going; (b) were especially aware that the consultant's contribution needed to be adapted by the Indian school to the economic, cultural, and social circumstances, needs, and objectives of Indian education; and (c) were secure enough in their knowledge of social work education to be objectively flexible and to realize the two-way learning relationship essential to the success of their assignment.

Experience has demonstrated that, where help is extended in the form of consultation, two-years time of a given consultant appears to be the minimum required, at least in the initial period, if any substantial and lasting contribution is to be made. The consultant must become sufficiently acquainted with indigenous conditions to develop the required confidence of his counterparts, to help institute changes, and to be available for assistance and advice until those with whom he is working are comfortable in their knowledge and acceptance of him. Returns from the original investment will often be greatly enhanced by providing the technical help over a longer period than two years.

PROGRAM CAUTIONS

It cannot be stressed too often that the major time of an educational consultant sent to help a less-developed country should be spent in strengthening indigenous teaching personnel and in aiding the development of indigenous teaching materials and institutions.

Unless care is exercised, there is a tendency to use the consultant to teach regular or special classes, disregarding the long-run benefits that can be achieved when he concentrates on improving the permanent program. In this connection it may be noted that every technician who goes abroad is or ought to be primarily a teacher. Too often he is so involved in getting specific things accomplished that he neglects his primary task of teaching counterpart personnel the *why* as well as the *how* of what is to be done.

One of the pitfalls to guard against in using the nationals and/or the institutions of one country to help train the personnel of another is imposition of the social programs and services with which the nationals of the helping country are most familiar. This is a most difficult problem to deal with even at the conscious level. The same problem often requires a great readjustment of students returning home after training in other countries. Upon their return, they may find the lack of resources more noticeable and frustrating; or be unable to utilize their new knowledge within the framework of the existing culture, structure, and program; or feel a notable lack of enthusiasm on the part of their colleagues to accept the newly acquired knowledge.

Avoidance of another pitfall is illustrated by a volunteer program of help named "Operation Brotherhood," in which eighty-five Filipino doctors, nurses, social workers, nutritionists, and agriculturists are working in eight areas throughout Laos. The purpose of the project "... is to start a series of small pilot projects that, with our training and encouragement, the people can develop and sustain themselves. ... We are not in Laos to give away gifts."²⁰

²⁰ *The New York Times*, November 22, 1959.

This statement of the project director emphasizes the need for a sincere desire for help on the part of the receiving country. In some instances, technical assistance has been tolerated or even forced on the receiving nation as a condition for getting funds or goods, or sometimes to develop or retain the good will of the helping country.²¹ The climate created by the host government for change has a marked bearing upon the potential contribution by outside technicians, and the importance of economic aspects is sometimes overemphasized to the detriment of other factors.²²

INTERNATIONAL CO-OPERATION ADMINISTRATION

A unique development of the International Co-operation Administration (ICA) of the United States in its substantial help to less-developed nations for the training of personnel has been its financing of contracts with United States educational institutions, both public and private, under which they agree to provide technical help within a defined area.

Although social work has no official home within the structure of ICA—a curious phenomenon in view of the fact that the ultimate aim of its whole program is to improve the welfare of people—the Community Development Division, whose work has much in common with social work, has utilized social workers as appropriate in community

²¹ An interesting commentary on this aspect of unilateral assistance has been made recently by Henry Cabot Lodge who is reported in *The New York Times* for January 12, 1960, p. 6: "... They look for help to the United Nations and other international agencies and do not want help that they suspect is offered for selfish motives ... He added that this underscored the importance of pressing a 'vigorous multilateral program which cannot be suspected of any ulterior motives.'"

²² See also: *Report on Community Development Programs in India, Iran, Egypt and Gold Coast*, op. cit., espec. pp. 9-10.

development and in the training of welfare personnel.²³ We may hope for a greater use of social workers in developing the training facilities and the competent training staff for preparing personnel to effect social change and improve living conditions. Such change is absolutely essential to a rise in living standards for the general population, a rise which does not automatically result as the national output is increased by economic development.²⁴

The ICA has utilized many methods of help to other countries, including study observation tours, student exchange programs,²⁵ supplying of advisors and consultants, the organiza-

²³ In this connection see: ICA Manual Order May 28, 1958, "Training for Social Welfare Personnel," op. cit. This is an excellent statement setting forth the role which social work might be expected to undertake in relation to the technical assistance and providing information on United States facilities for training in this professional field. A good reference on facilities in the United States for training of social workers from other countries is United States Department of Health, Education, and Welfare, *Training Programs in Social Welfare for International Social Workers*, International Technical Co-operation Series No. 5 (Washington, D. C., 1959). The most comprehensive listing of resources available to students everywhere for study in other countries may be found in UNESCO, *Study Abroad*, Vol. XI, 1959-60 (Paris, 1959).

²⁴ *Interprofessional Training Goals for Technical Assistance Personnel Abroad*, op. cit.

²⁵ In the first quarter of 1959-60 there were some 1,620 foreign nationals in the United States for study in various fields of welfare, most of whom were under the sponsorship of the International Co-operation Administration, the United Nations, and the World Health Organization. There were, of course, many other foreign students under voluntary and private auspices. See Department of Health, Education, and Welfare, Social Security Administration, International Service "Quarterly Report July 1 to September 30, 1959," mimeographed. For a more detailed statement of U. S. training programs see Department of Health, Education, and Welfare, *Training Programs in Social Welfare for International Social Workers*, op. cit.

tion of seminars, institutes, and short courses, the supplying of educational materials and equipment, and financial help in supporting needed institutions for the training of welfare and related personnel.²⁶

During the period 1941 through 1959, the Social Security Administration of the United States Department of Health, Education, and Welfare recruited for overseas service in Technical Co-operation Administration programs some 84 welfare experts for service in 28 different countries.²⁷ Of these, some 43 had as all or part of their assignment the provision of help on social work education. Figures are not available on the number of experts sent abroad in various welfare programs through other organizations, including those holding contracts from ICA. They must total a substantial number and many of them have been engaged in the training of personnel.

UNITED NATIONS TRAINING SEMINAR

Seminars, workshops, and institutes, many of them organized on a regional basis, appear to be useful training devices and may serve a variety of purposes, including: sharing of experiences of program officials at many levels from different areas, stimulation of interest in existing or new programs, and development of improved technical competence. Their common purpose is to improve the effectiveness of the personnel responsible for welfare planning and

²⁶ For more comprehensive information on the activities of the Community Development Division of the United States International Co-operation Administration see various issues of *Community Development Review*, a quarterly publication of the Community Development Division, Office of Public Services, International Co-operation Administration.

²⁷ Not including experts assigned to social insurance programs or staff members of the Department who may have made survey trips abroad. The above figures were supplied by the Department upon request.

services in the participating countries.

One example, the first of its kind in Asia, was the Far East Seminar on Training for Community Development and Social Work, held in Lahore, West Pakistan, December 9-20, 1957, under the auspices of the Technical Assistance Administration of the United Nations.²⁸ Wide use was made of specialist personnel from the host country, Pakistan, and participating countries in staffing the seminar.

It is difficult to determine the net value of such a seminar. The report on this one discusses its accomplishments briefly and states among other things:

... The greatest value of any international seminar or training course lies in its impact on the improvement in the home countries of participants following stimulation and inspiration received at the seminar

Both groups realized that their common objective is to accelerate change in the attitudes of people and to contribute to the process of making people more resourceful, more independent in their thinking and more concerned with the welfare of their fellow men and their communities. Their recommendations and suggestions were quite realistic and related to conditions in the region. There was a feeling that the participants learned a lot from the seminar and a strongly expressed desire to improve training upon return home.

²⁸ United Nations Technical Assistance Programme, *United Nations Asia and the Far East Seminar on Training for Community Development and Social Work*, June 30, 1959. For more information on this subject see the following excellent publications: United Nations Department of Economic and Social Affairs, *Study Kit on Training for Community Development*, 1957; and Jean Ogden, *Conference Summary Community Development Africa*, March 17-20, 1958, Tripoli, Libya, *op. cit.*, especially Chap. V, "Training for Community Development." For an excellent example of training material prepared by the United Nations see *Study Kit on Training for Community Development*, *supra*.

This feeling was expressed even by the delegations of countries which at the present lead in the community development programme and social work in Asia.²⁹

It is perhaps significant that the better understanding of urban community development resulting from the seminar held in Lahore was mentioned in a later report made to the government of Pakistan by a United Nations advisor.³⁰

The United Nations recognized early that competent personnel was a major factor in the efforts of less-developed countries to improve the welfare of their nationals. Accordingly, it has taken the leadership not only in sending welfare experts to requesting countries but in encouraging its more-developed member states to do likewise. It recognizes that efforts so far have been inadequate to meet the known need, but during the period 1947 through 1958 the United Nations provided 543 welfare experts to 61 countries and 2,028 fellowships to individuals for study outside their own country.³¹

Extensive use has been made of programs which permit personnel from one country to visit, observe and/or study in another. Educational exchange programs are used to develop and raise the standards of welfare personnel at all levels and are sponsored by governments, voluntary bodies, and the United Nations. Countries where few or no persons have heretofore been equipped by professional education are now likely to have a nucleus of personnel qualified to take leadership in developing the welfare services so urgently required, not only to contribute to needed social

progress but to mitigate the human hardships entailed in the economic changes which are being induced.³²

EVALUATION

That much is being done by a variety of governmental and voluntary international and national organizations, utilizing many different methods, to meet the acute need for more qualified social welfare manpower is clear. Less clear, however, is the degree of progress being made. Such an assessment requires more knowledge about the extent of the need, more evaluation of the results of past efforts, and a careful analysis of the methods employed. Review of many United Nations and United States reports on a variety of projects indicates that great value would come from a careful study of such documents and use of the information thus gained to chart future programs of technical assistance for training welfare personnel. Certainly there is widespread interest in a more planful effort to meet the welfare personnel needs of the less well-advanced areas of the world. Fortunately, United Nations personnel is aware increasingly of the need for more penetrating evaluation of the help extended to its members in their efforts to improve the living conditions of their people.³³ Its current studies of methods used to train needed manpower should contribute much to a more informed approach.

Needed also is much more integration

³² For an earlier report on the need for, uses of, and resources for the international exchange of social welfare personnel for training, see United Nations Department of Social Affairs, *International Exchange of Social Welfare Personnel* (1949).

³³ See United Nations Economic and Social Council, *Programme Appraisal, 1959-1964, Work of the United Nations in the Economic, Social, Human Rights and Related Fields*, 29 May 1959, especially Chapters X, XI, XII, XIII, and XIV.

of the training programs for personnel in all the economic and social programs of development and assistance, since changes in the activities and living situations of people are implicit in them, whether the major focus of the program be on agricultural economics, public health, education, public administration, or social welfare.³⁴ Although

³⁴ For further discussion of this and related problems see United Nations Social Commission, *Report of the Twelfth Session* (27 April-15 May 1959), Economic and Social Council Official Records: Twenty-Eighth Session Supplement No. 11, espec. p. 7—paragraphs 40, 41, 42; p. 10—paragraphs 63, 65; p. 11—paragraphs 69, 70, 71.

the complexity, size, and scope of the social as well as economic problems with which the world is confronted preclude any tidy and orderly integrated approach to their resolution, more effort toward integration in training is needed if the required manpower is to be trained purposefully with a reasonable degree of effectiveness and efficiency and to include the common goal of social change. All the evidence indicates the importance of providing the social work personnel required in the less-developed areas of the world where the scope of the need is exceeded only by the pressure of its immediacy.

Foundations of International Aid

By JANE M. HOEY

ABSTRACT: The newly developing countries desire not only political independence but also economic progress for their people—a progress which they can see, and are now aware of, in the rest of the world. The role of the developed countries is to extend aid to the needy. Moral foundations underlie the donor's contributions, but they are more than that, they are the means for acquiring support for international aid in the donor's country. The United States must assume the leadership among the free nations in granting aid; she must accept this role because of her economic achievements and technological advantages. Donators of such aid should take cognizance of the complementary character and interrelatedness of economic and social development. For economic development, however much it is sought, is not an end in itself, rather the aim is the well-being and happiness of the individual. Such a goal necessitates economic aid accompanied by social aid. Social welfare can also be a vehicle to achieve peace, inasmuch as people-to-people relationships generate brotherly love—the only lasting foundation for peace.—Ed.

*Jane W. Hoey, New York City, is President of the William J. Kerby Foundation, Vice-President of the Catholic International Union for Social Service, Board member, International Conference of Social Work, Council on Social Work Education and National Social Welfare Assembly. Formerly she served as Director of Social Research, National Tuberculosis Association (1954-1957), Director of Public Assistance, Social Security Administration, Department of Health, Education, and Welfare (1936-1954), and United States alternate delegate to the Social Commission of the United Nations. A graduate of Trinity College, Columbia University, and the New York School of Social Work, Columbia University, Miss Hoey has contributed sections to *Democracy, Should It Survive?* and *New Directions in Social Work*.*

THE people in the newly developing countries are aroused and no longer willing to accept their low status and levels of living. Most of the adult population, even in countries without mass media of communication, know now, by word of mouth, that millions of people in more prosperous nations have high standards of living, while in their own countries they cannot get even enough food and other basic essentials of life, and land ownership and wealth are concentrated in a small percentage of the population.

Nationalist feelings are strong and political independence in many instances has been relatively easy to secure. Now, however, governments face great pressure from their people to raise their levels of living. They see economic progress being made under dictatorship in some countries. They do not want the control and suppression of people that this involves but they have had no experience in democratic processes. They cannot be expected to see the advantages of a democracy unless these are pointed out and demonstrated. International aid from the free nations for economic and social development would provide an opportunity to do this.

MORAL LEADERSHIP

Strong moral leadership is required to unite the free nations and to obtain their agreement to expand international aid and to extend it to these countries for a longer period of time. The spiritual and social foundations of such assistance also need to be emphasized.

To secure the funds required, the people and leaders of the Western world must be convinced that sharing resources with the economically deprived is a moral, ethical, and social responsibility, especially of prosperous nations, business corporations, groups, and indi-

viduals. Sacrifice to meet this great emergency will be necessary.

Religious motivation can bring favorable response from large numbers of people in the free nations for support of public foreign aid and programs of international voluntary agencies. It can also help recipients to reject philosophies contrary to theirs and to resist efforts to restrain and repress them. International and national religious leaders in the West should be asked to unite in support of increased foreign aid and to interpret, at home and abroad, the spiritual basis of democracy, respect for the dignity and human rights of every person.

The United States is a logical choice of the free nations to assume the responsibility of moral leadership. The established reputation of Americans for idealism, generosity based chiefly on religious motivation, and their unwavering faith in democracy has qualified the United States in the past for moral world leadership.

Today Americans are challenged to prove that they have the moral courage and strength to continue this leadership. Questions have been raised because of a general attitude of complacency, frequently associated with prosperity, and evidence, widely publicized, of the disintegration of family life, disregard of ethical standards in some large business organizations, and continued denial of certain human rights in some areas. Europeans, likewise prosperous, and with similar problems, are also faced with the necessity of testing their moral fiber in this crisis situation. The free nations, with United States leadership, can make clear their desire to relieve human suffering and their belief in social justice, by joint determination of the amount and character of international aid required by the less-developed countries and by their assumption of this responsibility

on an equitable basis. At the same time they need to demonstrate increasingly their respect for human rights at home and in the administration of international aid.

There is no question of the ability of the industrialized free nations to meet this obligation. In "The Challenge of the Sixties" Barbara Ward wrote, "Of the fundamental fact there is no longer any doubt. The free nations are immensely, unprecedentedly rich. The momentous question is: What do we do with our wealth?" She suggests that "For the West, the decade that lies ahead will compel a choice between constructive use of wealth and a complacency that may prove fatal."¹

OBJECTIVES

People are the focus of international aid. Its primary purpose is to give constructive help to the needy in less-developed countries so that they may become self-sustaining, able to defend themselves against aggression and tyranny, and have an opportunity for cultural, social, and spiritual development. Increased production through industrialization, soil conservation, better methods of farming, and the like are obviously necessary to make available food and other goods required by expanding populations. But these are means of assisting people and are not ends in themselves. Confusion and misunderstandings have arisen as to the self-interest of donor nations when international aid has been used to achieve goals other than the improvement in human well-being.

If people are to be the beneficiaries of aid, the interrelatedness and complementary character of economic and social development should be recognized in practice as well as theory, and joint planning and action should be under-

taken. That this has not happened to any extent in international aid programs was clearly pointed out, with regret, by Christopher H. Phillips, United States Representative to the last session of the United Nations Economic and Social Council in a discussion of the World Social Situation.²

"Social development is frequently treated as a separate entity, entirely distinct from economic development.

"... We tend, I fear, to attach greater importance to economic progress, on the basis that somehow social adjustments and improvements will automatically follow.

"... The ultimate objective of economic development is not bigger and better factories and power plants, per se, nor the achievement of ever higher production statistics. Rather the basic goal is higher levels of living, increased and more secure incomes, better education and better health for all the peoples of the world—in sum, the well-being and happiness of the individual."

Mr. Phillips also added the encouraging statement that "The United States feels strongly, however, that the time has come for us to recognize the interdependence of social and economic policies and planning."

To fulfill this function would require a team of experts from economic and social fields, in the United Nations, in national governments providing and receiving international aid, and in local communities of recipient countries where programs in these fields are planned and in operation. Experts in the social field should logically represent the "helping professions"—social work, health, and education. Their responsibility would be to focus attention on human needs, to suggest programs for meeting these, and ways of preventing increase of social problems caused by rapid industrialization and unplanned urbanization.

¹ *New York Times Magazine*, December 27, 1959.

² United States Information Service News Release, July 14, 1959.

Social workers, especially those with training and experience in public welfare, group work, and community organization, could make significant contributions to such teams if they were given the opportunity to participate. Their training is aimed at making them sensitive to, and understanding of, total human needs, human motivation, and concern about human rights. It also increases awareness of the economic and social forces that adversely affect people and emphasizes the importance of co-operating with citizen groups in social action programs.

PEOPLE-TO-PEOPLE RELATIONSHIP

To build firm foundations of international aid, a people-to-people relationship between donor and recipient countries is most important and should receive continuing encouragement. Cultural exchange programs and international conferences focused on human problems have not only brought new knowledge to participants but have provided an opportunity to make new friends and learn about the cultures of other countries.

Out of a people-to-people relationship can grow mutual respect and friendship based on brotherly love. This is a goal to which international aid programs could make a notable contribution. It is an important means of promoting world peace.

The question is constantly asked in underdeveloped countries: "Do Americans and Europeans really care about us, as people? Or are they only interested in stopping the spread of communism and preserving their way of life?" It is time that this question was answered by the United States and other governments of the free nations and by individuals and groups with friends in these countries.

One effective answer would be a clear statement by the United States and

other free nations of their belief in and respect for human rights and of the efforts they have made and will continue to make to help people in all nations secure and protect such rights. It is also necessary to demonstrate, in their own countries, that real progress is being made to remove obstacles to the exercise of these rights by all their people.

To be successful any assistance program should be based on understanding of the nature of man, his human needs and human rights. This was undoubtedly one reason for the United Nations in 1948 adopting a "Declaration of Human Rights to make men and women everywhere aware of the rights to which they are entitled and that each may respect the rights of others." This statement was intended as a guide to nations and organizations and the staff of the United Nations and its specialized agencies in their administration of services to people.

Most of the rights included in the Declaration are not new. They are based on the teachings of Christ, and religious leaders have been promoting their recognition for at least 2,000 years. Yet, denial of certain human rights occurs daily in many communities in every country. Currently racial tensions are high in many parts of the world including the West.

Twelve years have elapsed since the publication of the United Nations Declaration of Human Rights. A reinterpretation of some of the principles in terms of the current situation might be helpful.

HUMAN NEEDS AND HUMAN RIGHTS⁸

(1) Basic human needs and human rights are universal and unchangeable.

⁸ The following statements are based on the author's personal beliefs but may, in general, also represent the convictions of social workers.

They are not altered by race, color or nationality, by personal characteristics or wealth, by heredity or by environment.

(2) The nature of man determines his human needs. They are the same for every person. In addition to the necessities of life, such as food, clothing, housing, and medical care, these include opportunities for intellectual, cultural, social, and spiritual development and also the need for protection, love, and respect from family and society.

(3) Human rights come from the Creator of mankind. They do not originate in the State. Governments have an obligation to secure and protect them.

(4) As children of God, the Father of mankind, all men are brothers and deserve mutual love and respect. This is the core of religion and inspires the self-discipline necessary to establish this relationship with all people. Love of humanity also stimulates acceptance of the concept of the brotherhood of man and brotherly love.

(5) The right to life requires having tangible means by which to live, such as earnings from employment or continuing income from other sources, to secure the essentials of life for the needy and those whose employment ceases or is interrupted for any reason.

(6) Every person has a right to live under a government established and maintained by the will of the citizens, and one that assures:

- a. Respect for the dignity and human rights of every person;
- b. Freedom, especially religious and political, and of choice as to a way of life and location of residence;
- c. Free enlistment of people in co-operative enterprises for economic, cultural, spiritual, and social development.

RESPONSIBILITIES

Since every right has corresponding responsibilities, it is assumed that every individual, able to do so, will be self-sustaining, will support his family, and that both parents will give care and training to their children. These obligations will also include contributions through taxes and voluntary payments for protection of families against destitution, illness, and other hazards of life and for the provision of health, education, and social welfare services and facilities.

Governments have responsibility for developing the most effective means of assuring continuing income to workers and their dependents when they are unemployed, sick, retired, or die and leave family dependents. Many of the free nations have, through a combination of social insurance and public assistance, guaranteed that no person need go without the necessities of life.⁴

REVIEW OF PROGRAM

If people in the less-developed countries are to receive maximum benefits from international aid, then it is important to review the programs, methods of work, and policies, at regular intervals, and adjust them to meet current needs. All programs should be focused on improving conditions and standards of living for people, and methods of

⁴ While great progress has been made in recent years in the United States in this direction, there is still a major hazard of life for all people, sickness, that is not covered by social insurance, and public assistance is not yet available to any needy person. Also, some minority groups are still denied political rights in certain sections of the country and are discriminated against in employment, education, and housing in a number of areas.

The people in the underdeveloped countries would be encouraged by a demonstration in the United States that human needs were met and human rights respected for all citizens.

work should be in line with this objective.

Efforts should be made to prevent an increase in social problems. Numerous illustrations can be cited to show what happens when industries are located in urban areas with no planning, for example, in respect to the housing of workers' families. Large numbers of men leave their homes and families in distant rural areas to seek employment in cities wholly unprepared to employ, feed, or house most of them. Disruption of family life and support is inevitable in most cases. An increase in alcoholism, divorce, delinquency, and other social problems usually follows.

Qualifications of personnel employed in the administration of international aid should also be evaluated from time to time. In addition to technical and professional education and experience and personal qualifications, an inquiry should be made of every new and old employee in the program as to his attitude toward people of different cultures, races, and religions. Persons with prejudices toward any group are unsuitable for employment in a foreign aid program.

The United States could set an example for other countries by developing interprofessional training for its employees in technical assistance and foreign service.

These programs require professionals and not amateurs. They require every bit of technical knowledge the Western world has collected, they require the rational approach, the efficient use of resources, both material and human, and the careful evaluation of what works and what does not work in the interest of greater productivity in the years ahead. . . . Professionals, trained exclusively in the Western sense of practitioners, are no match for the challenge awaiting them in the programs overseas unless they are reoriented to different goals, different techniques, and an ability to get along with people whose language

and culture they do not at first understand. They need to perceive themselves as change-agents, not because they are interested in change for its own sake, but because changes are already occurring and in need of direction toward humanitarian ends. Nor is one training period sufficient. The task calls for continuous learning of new skills, the development of greater empathy, and a profounder knowledge on which to base day-by-day decisions.⁵

It is recognized that social workers as well as other professional and technical personnel require additional training in order to orient themselves to cultures, languages, and customs unfamiliar to them. But they have knowledge and skill in motivating people, in being "change agents," that is not now being used to any extent since so few are employed in the technical assistance program and none in foreign service.

Persons should be selected for the administration of international aid who are concerned with improvement in human well-being and able to focus their policies, programs, and methods on this paramount objective.

OUTLOOK

The outlook for the future is encouraging if recognition is given in United States practice to co-ordinated and integrated planning for economic and social development. To do this an increase would be necessary in the numbers of persons employed from the "helping professions" including social work. They should be included as members of teams at all levels in the administration of international aid. An enlargement of service programs, utilizing community development techniques, would be a most effective way of training people in democracy.

Goals for the future include assump-

⁵ Council on Social Work Education, *Interprofessional Training Goals for Technical Assistance Personnel Abroad* (New York, 1959), p. 63.

tion by the United States of leadership in uniting the free nations to provide the material aid and technical assistance required by the less-developed countries for as long as it is needed. Also, it is hoped that assurance can be given to the people of these countries that Americans and other people in the

Western world offer them such aid on the basis of friendship and brotherly love. Like a gift from person-to-person, aid from nation-to-nation is most appreciated when the motivations of donors are known to be affection and unselfish concern for the well-being and happiness of the recipients.

Social Development and Foreign Policy

By WALTER M. KOTSCHNIG *

ABSTRACT: The contemporary realization of the importance of international progress in the economic and social fields, and particularly the development of the less-developed countries, has added a new dimension to foreign policy and resulted in vast foreign aid programs. Chief factors in this development are the unprecedented acceleration in population growth occurring primarily in the less-developed countries least able to sustain it, the "revolution of rising expectations," and Communist penetration. In addition to an increase in financial and technical assistance to the less-developed countries, the free world, building on strength, must emphasize that the purpose of economic development is a social objective and that the methods used to promote development cannot be divorced from the overriding social objective without destroying the objective itself. Development planning should aim at balanced economic and social growth and stress economic programs with an early social impact in terms of improved levels of living, and social programs designed to further economic growth.

Walter M. Kotschnig, Ph.D., LL.D., Washington, D. C., is Director of the Office of International Economic and Social Affairs, the United States Department of State and, since 1948, the Deputy United States Representative on the United Nations Economic and Social Council. He served on United States Delegations to the Dumbarton Oaks Conference, the 1945 San Francisco Conference, the United Nations General Assembly, and to sessions of the United Nations Economic Commissions for Asia and the Far East, for Latin America, and for Africa; also to UNESCO and the International Labour Organization. Dr. Kotschnig is the author of *Unemployment in the Learned Professions* (1937); *Slaves Need No Leaders* (1943); and co-author of *The University in a Changing World* (1932) and *The United Nations and Promotion of the General Welfare* (1957).

* The views set forth in this article are his own and do not necessarily reflect those of the Department of State.

OVER the last generation a new dimension has been added to American foreign policy. It stems from a new realization of the importance of international economic and social matters, a new interest in their bearing on the strengthening of free world societies and institutions, and the establishment of firm foundations on which to build a lasting peace. The preoccupation with economic and social aspects of international relations has led to the development of vast foreign aid programs carried forward bilaterally by such agencies as the International Co-operation Administration and multilaterally through the United Nations, specialized agencies, and other inter-governmental bodies. It has brought into the ranks of those who conduct our foreign relations and represent us abroad a new breed of men and women—economists and social workers, educators and doctors, productivity experts and engineers; and not a few diplomats in overalls—county agents from Kentucky and South Dakota working in remote villages in India or Iran, in Thailand and in Peru; or technicians helping to develop dams, develop airports, or build new industries.

Each year, all these new activities, these new aspects of our foreign policy, are brought under close public scrutiny as Congress debates our foreign aid programs, and our participation in the United Nations and the specialized agencies such as the World Health Organization, the Food and Agriculture Organization, United Nations Educational, Scientific, and Cultural Organization, and the International Labour Organisation. There is much talk of so-called "give-away programs," of "boon-doggies" and unnecessary frills. And there is frequently an inclination to urge a contraction of activities which to many appear to be only remotely, if at all, related to the vital interests

of the American people, and their desire to go their own way in peace.

Such negative attitudes, rejected year after year by large majorities in Congress, are not responsive to the needs of an enlightened foreign policy, for the simple reason that they are not responsive to the aspirations and interests of the peoples whose friendship and co-operation we are seeking. Pacts and alliances and the build-up of military strength are necessary and will continue to be essential to deter aggression and immediate threats to the peace. But these traditional instruments of foreign policy do not go to the roots of the problems which beset the world today. They help to maintain a precarious peace; they do not, by themselves, build a secure and lasting peace. They are not enough in an age of high-tension ideological and revolutionary turmoil in large parts of the world.

STRAINS AND STRESSES

Other contributions to this volume have enlarged on the basic needs and some of the tidal forces which explain the strains and stresses within the contemporary world. Briefly stated they can be summarized under four headings.

(1) There is first of all the unprecedented acceleration in population growth. In 1830 mankind reached a world total of approximately one billion individuals. It took just another century to reach a second billion. It is taking a little over thirty years to reach the third billion. The world's population at present is close to 2.9 billion. Forecasts by the United Nations demographers indicate that, with continued medical progress, the world total will pass the fourth, fifth, and possibly the sixth billion mark by the end of the century. In other words, we can anticipate the doubling of the present world population within the brief span of forty years. Most of this growth is

taking place in Africa, the Middle East, Asia, and Latin America. In those regions it is not due to an increase in the birth rate, which has remained relatively stable, and in some cases is even slightly declining, but to a spectacular fall in death rates.

One example will illustrate the point. In 1946, a vigorous public health campaign was launched in Ceylon with the co-operation of the World Health Organization. The program was largely designed to control malaria through the residual spraying of DDT. The death rate responded immediately, and declined in one year from 19.8 deaths per 1,000 population in 1946 to 14.0 in 1947. Since then Ceylon's death rate has continued its remarkable downward trend, falling to 10.1 in 1957. The expectation of life at birth at present is approximately 50 per cent higher than it was only twelve years ago. As a result of the rapid decline in the death rate, the annual rate of natural increase in the Ceylonese population rose from 1.9 in 1946 to 2.6 in 1957.

Similar rates of increases could be quoted for other countries, in some of which the population appears to be increasing by 3 or more per cent per year compared with percentage increases of well below 2 or even 1.5 per cent in the more highly developed countries of Europe and North America. This calls for a final set of figures: in 1950, about 66 per cent of the world's people lived in the less-developed countries; this percentage may rise to 70 per cent in 1975 and more than 75 per cent by the year 2000.

(2) These less-developed countries with the highest increases in population are the very countries least able to sustain such growth. In thirty-eight of the underdeveloped countries with a total of 1,360,000,000 people, the gross national product per head was, according to recent figures, less than \$100. It

was less than \$200 per head in another twenty-seven countries and territories with a total population of 140,000,000. This is another way of saying that these people are living at bare subsistence levels.

World production of food has, in recent years, exceeded the growth of population. However, the actual level of per capita production has increased more slowly and remains much lower in the economically less-developed regions. Thus, the four regions of Latin America, the Far East, and Africa, with about two thirds of the world population, accounted in 1954-1958 for only about one third of the agricultural production of the world—excluding mainland China. The rate of annual increase in agricultural production is presently slowing down in many parts of the Far East, and in Africa is now estimated to have fallen behind population growth.¹ These are the regions of the world where the specter of malnutrition and the threat of famine conditions are ever present.

(3) The time of fatalistic acceptance of such conditions on the part of the people is largely passed. It has been swept away by the famous "revolution of rising expectations" of which so much has been said in recent years. It is a revolution born of the poverty and misery of the masses, and their growing realization that in this scientific age they need not be poor and miserable. Under the impact of their contacts with more highly developed countries and the growing effectiveness of mass media of information and propaganda, fatalism has given way to restiveness, and resignation to expectation.

The situation is particularly acute in those countries which have only re-

¹ See Food and Agriculture Organization, *The State of Food and Agriculture, 1959*, p. 15.

cently gained their independence or are about to emerge as independent states. Close to nine hundred million people have found national independence in the last forty years, most of them since the end of the Second World War. The process which began in the Middle East and in Asia is presently repeating itself at an accelerated rate in Africa. Many of the newly independent countries which have modeled their Constitutions in the image of the great Constitutional documents of the West, are exposed to serious dangers from within and from without. They lack administrative experience, their political institutions tend to be unstable, and in the underdeveloped state in which they find themselves their economic situation is precarious. Under these conditions governments are vulnerable to subversion and their countries are among the chief targets of attempts at Communist penetration.

(4) Benefiting from all this ferment, the Communist leaders of Soviet Russia and of Communist China are making a determined attempt to bring the underdeveloped countries into their fold. Communist propaganda uses every means at its disposal to convince the peoples of the underdeveloped countries that their salvation is to be found along the road of Communism. Every effort is made to emphasize the achievements of Communism in the development of heavy industries, power, and transportation, which are indeed impressive. The present rate of annual increase in gross national product in the Soviet Union is above 6 per cent compared with less than 4 per cent in the United States. Communist attempts at penetration build on the fascination of governments and peoples in the underdeveloped countries with heavy industry as the basis of all development. They use the lack of capital in the underdeveloped countries, and the little margin they

have for savings, to deride private investment, particularly investment from abroad. They give free rein to their imagination in depicting Western economies as built on exploitation, while taking great care to leave the underdeveloped countries ignorant of the terrific price paid in human lives and human liberty for the economic achievements of the Communist world. In recent years this propaganda has been buttressed by Soviet and Chinese experts, scholarships, supplies, grants, and low-interest loans.

CRUCIAL CHOICES

Taken together, these four points bring into sharp focus the explosive conditions prevailing throughout large parts of the world. Barbara Ward in "The Interplay of East and West" summarized the situation succinctly when she stated that "the choice now is to modernize or perish." Indeed, the choice lies between economic and social development at a rate higher than the world has ever known before, or violent revolution, disintegration of democratic government, substandard levels of living and famine, and wars of despair. The governments in the underdeveloped countries know this, and their peoples dimly perceive it.

But there is yet another crucial choice to be made, namely between economic and social development in the image of modern Russia or Communist China, and development in the spirit of the free world and as part of it. On the one hand, it is to choose the complete control of the State over the individual and all his activities, the collectivization of agriculture, the forced development of heavy industries, and the regimentation of labor. The alternative is to choose self-help, individual initiative, private as well as public financing, and balanced economic and social development with due regard to

the interest and needs of the consumer.

Much has recently been said about "competitive coexistence." It is a useful concept provided it is not taken to mean that the danger of armed conflict has been eliminated or that some of the most crucial political issues can be shelved, such as the problem of Berlin, of German unification, or aggressive moves on the part of Communist regimes in Asia and the Far East. Unless a measure of effective, that is, internationally controlled disarmament can be achieved, which of course would be highly desirable, the military guards of the free world cannot be lowered.

With these reservations "competitive coexistence" may well become the keynote in international relations during the next few decades. In this competition the less-developed countries will play a major role. The outcome of the future will, to an alarming degree, depend on their choice between totalitarianism and the way of life of the free. And that choice, in turn, will depend to a considerable extent on the ability of the free world and, above all, of the United States, to demonstrate that free world objectives and methods will serve the hard-pressed countries of the less-developed regions better than the blandishments of Communism.

BUILDING ON STRENGTH

It stands to reason that in this competition the free world must build on strength, its own strength. There are those who hold that free world financial aid to the less-developed countries must be substantially increased. This point is well taken and it is to be hoped that during the years to come much more substantial support will be forthcoming from the highly developed countries, particularly some of the major European states which, thanks to their own efforts, and with earlier Marshall aid,

are presently experiencing a high and welcome level of prosperity.

Yet, however important reliance on the financial resources and the productive capacity of the highly developed free countries of the West and East is by itself, it is not enough. In sheer volume Communist aid to some of the most "sensitive" countries of the world is exceeding that offered by free world countries. The rate of growth of gross national product in the Soviet Union, as pointed out earlier, and in mainland China—even after discounting the blatantly false propaganda claims of the Communist Chinese regime—is presently higher than in the United States or in the major countries of Western Europe and in Japan. Soviet engineers and technicians, flushed with victory in their battle for industrialization of some of the more backward areas of their own country, are in an advantageous position to adjust to conditions of life and work in less-developed countries similarly situated.

Fortunately, there is another element essential to economic and social growth, namely, freedom, and here free world strength is beyond contest, unless the totalitarian regimes are willing to give up the very objectives and methods which they have imposed upon their own people and are trying to impose upon the rest of the world. Freedom—not freedom as a vague abstract notion, but freedom from oppression and want in a democratic society—is one contribution which the Soviet leaders have failed to make to the welfare of their own people, and which for that very reason they cannot make to the welfare of the less-developed countries.

Not enough has been made of the unique strength of that freedom. There has been a tendency, even in this country, to assume that the ultimate objectives of economic development are steel mills per se, bigger and better dams per

se, bigger and better space satellites. It is essential that this technological and economic approach be made meaningful by the recognition that the purpose of all economic development is the well-being of the individual, the satisfaction of his wants, his growth in dignity and freedom. The accent must be placed on the well-being of the individual not of the anonymous "masses," a term much used by Communist planners. The very term "the masses" is a denial of the dignity of the individual and his ability to develop according to his gifts and aspirations.

Thus, in word and deed it must be made clear that the very purpose of economic development is a social objective. The very acceptance of this principle means social progress, for it rejects utterly any form of subservience of man to man, of the individual to the all-powerful State. It means the end of slavery, political, economic, or otherwise.
