"Here are five ways

BOAC Air Cargo can
help your business!"

- ★ *Fast* BOAC jetliners slash transit time by hours.
- ★ *Direct* BOAC city-to-city freighting cuts out time-wasting journeys to and from docks.
- ★ *Simple* (cheap) packaging is all that's needed with careful BOAC handling.
- ★ *Safe*, efficient BOAC freighting means lower insurance costs, wider coverage.
- ★ *Experienced* BOAC staff give all goods individual attention all the way.

We deliver your goods in hours, instead of days or weeks! And that's only one of the things you gain. Speed alone may not be enough for you—but BOAC Air Cargo gives more and more successful businessmen these extra advantages...advantages that can help and benefit your business!

Ask for details now—from your Forwarding Agent or BOAC offices at:

The Eastern Economist

JULY 7, 1961.

India and ECM: The Hour of Decision

THE visit of Mr. Peter Thorneycroft, a senior representative of the United Kingdom, in connection with the European Common Market, brings to us effectively the hour of decision on the European Common Market. This has been generally recognised and the Federation of Indian Chambers of Commerce and Industry have come out with a timely assessment of the disadvantages of British participation on our current trade. The Press has been quick to take the same line and the public has been led to believe that the first-round effects of Britain's possible entry into the Common Market will be very damaging to Indian trade. The fact that the leading elements in our exports to the United Kingdom, predominantly tea, and next, cotton textiles and jute, will come under pressure, has been read in isolation. The fact that once we jump the initial hurdle of higher duties on our imports into the U.K. we are in a vastly expanded market, of which the U.K. is only a small part, has passed unnoticed. Therein lies the danger of a static assessment of the operation set in train by the Treaty of Rome. This is a continuous and on the whole, a future, rather than a present, challenge. The question for India to consider is whether or not in the longer term her trade will be better if the United Kingdom is a portion of this market or if it is outside it. In *The Eastern Economist's* view, apart from a transitional stage in which many of our current markets will be disturbed, notably that for tea and cotton textiles, India will reap the benefits of enhanced trade via the United Kingdom, if Britain should join the Common Market.

On the face of it, the initial hurdles are grave. Of India's total export of tea in 1960 worth Rs. 120.06 crores, Rs. 75.40 crores went to the U.K. If in place of duty free treatment, the Common Market rate is 18 per cent for loose tea and 23 per cent for packaged tea, obviously prices in the United Kingdom would rise by this amount. Since, at the same time, it is likely that real incomes will be held for at least a year in the U.K. by the fact that real wages are likely to decline in competition—reports say that the trade unions have agreed to a 5 per cent cut—it is extremely unlikely that the market for tea in the U.K. can be maintained. On the other hand, it is probably a mistake to suppose that, because prices are up and incomes down, the whole of the impact will fall on tea. It is part of a customary ritual in the U.K. to drink tea at stated times, and while there may be some resistance, there is no indication that fluctu-

ations of tea prices have had proportionate effect on tea consumption in the United Kingdom. It is probably true in somewhat different terms and perhaps with less certainty that this applies to jute cloth and to cotton textiles. Here, however, we must be prepared for a setback of a somewhat different order because there is no built-in customary use of Indian textiles or Indian hessian as there is of tea. All in all, one would expect a decline in the U.K. market in terms of the consumption of Indian goods.

The error that has constantly made us to confine the discussion to the U.K. on which undoubtedly, on balance, we will be losers, has made us oblivious of the larger issues. The essence of the European Common Market opportunity is different. Firstly, it is the most rapidly growing market in the world. Between 1950 and 1958, national income at constant prices of the European Economic Community rose by 53 per cent, as against all Europe which rose by 42 per cent while that of the United States rose by only 26 per cent and that of the U.K. merely by 22 per cent. If we look in terms of real per capita income, the figures are somewhat similar to West Germany, Italy and France which are well ahead of the U.K. and the United States. It is this basic factor of growth (reflected also substantially in industrial production and productivity) which is the most vital factor in India's future prospects which has been unduly ignored by both the Federation and by current Press assessments. Getting into the European Common Market via the U.K. might well be one of the most important shots in the arm that Indian exports will receive over the next decade. It is clearly necessary that we should get into this market and build in it since it is likely to be the greatest market in the world, once the U.K. has joined it, as it is extremely probable that it will. Within two decades from now the European Common Market might well be equal to the United States market and the Commonwealth markets combined. Mere safeguards to protect existing trade in this direction might well be a bar to participation in the market. Secondly, while higher prices will have to be paid for Indian goods in the United Kingdom, it is to be remembered that, once these added duties are paid, Indian processed material can move duty free subject to the clauses of the Treaty of Rome, into the vast potential of the European Common Market. In other words, what we lose on the swings we may gain on the roundabouts.

The mere fact that this market exists does not imply, of course, it is ours for the asking. Indian salesmanship has been notoriously weak in both Western and Eastern Europe, particularly in the latter. Those who have recently seen these parts of the world can well realise the shocking inadequacy of Indian export promotion in these areas. Surely it has not been appreciated that this is the greatest potential market in the world and, indeed, for certain commodities already.

It is right that India should place before Mr.

India and East Africa

THE news from Kenya this week should mean for India much more than seems to have been currently recognised. The decision to constitute a common services organisation is an obvious preliminary to a federal entity which will soon include Kenya, Tanganyika and Uganda. Those who have recently been in Kenya have now — after many excursions and alarms of the last six months — taken the view that the political odds are in favour of Kenya's reaching independence within six months as part of a federal unit in which it will have an equal partnership with Tanganyika and Uganda. The great fears that the European settler population of 60,000 in Kenya would weigh against an easy transition, such as is forthcoming in Tanganyika with its small settler population, would appear now to need modification. A large number of the English settlers are still recalcitrant, but the die seems to have been cast in favour of a pattern of self-government which will bring peace to Kenya on very much the same terms that Tanganyika has envisaged. Whether it will bring equal statesmanship on the African side and whether Jomo Kenyatta's release, which is expected, will contribute to tolerance and understanding of the European point of view may be another matter. But, at least, one should recognise that a new entity of considerable importance to India is likely to emerge.

For a long period East African markets have not been adequately studied or nursed by Indian exporters. Even in Kenya the best known export efforts have been half-hearted. While imperial preferences last, imports from the Commonwealth have been based largely on preferential treatment. Should an African federation decide to raise import duties against Indian goods, the need for manufacture inside the new federation's territories will become important. Are Indian settlers

Thorneycroft its own fears and press for as many safeguards as are possible. But too much has already taken place in the realm of discussion for the United Kingdom now to hold back on joining the European Market. The die is not yet cast, but it is almost certain to be thrown on the side of entry. It is much more important, instead of our resisting an inevitable event, that we should plan our thinking spaciously to secure every advantage that it presents. That, and no other, is the challenge of this hour of decision.

in the federation aware of the opportunities that this will present? Conversely, if the opportunities are not likely to be as great, because of preference given to African manufacturing interests — which can only emerge slowly — do Indian traders in Kenya consider investment in the Indian Union not a practical possibility? Both ways, whether to stay and develop under the federation's new perspective political alignments or to transfer capital to the Indian Union, are currently in animated suspense. Several Indian traders have looked upon Zanzibar as a possible additional opportunity for investment, but recent riots there have belied their hopes. All in all, what is required is that the sights of business men in India and the Indian business men in the new likely federation of East Africa should be raised to the development of trade between India and the new territories organised under African leadership. There is room for development of our markets in these territories which are making good progress and there is room for Indian investment from these territories in the Indian Union. There is need for much more organised thinking on the pattern of development and perhaps the Ministry of Commerce and Industry should send a powerful delegation to these territories to report on the most likely pattern of development in the very near future.

This development must take account of the instability of the Central African Federation. It is now more than likely that Nyasaland, rejecting Sir Roy Welensky's rigid proposals, will in time join an East African federation. When Zanzibar joins, a population of something over 40 million people and a rich agricultural area may make early investment very profitable. This is the time for imagination on both sides of the Arabian Sea.

Oil: Why Two Standards?

MR. K. D. Malaviya's statement at an informal meeting with the Press on Tuesday that the Government had decided to put the Koyali refinery, proposed to be set up to process Cambay, Ankleshwar and Kalol crude, under the charge of the Oil and Natural Gas Commission instead of under the control of the Indian Refineries Limited has not attracted the notice it deserved. In view of the practice followed by the Union Ministry of Oil in the recent past in seeking collaboration from foreign interests for prospecting of oil in the country on the condition that refining of crude will be separated from prospecting, the statement of Mr. Malaviya is of wide import.

Setting up of the Koyali refinery by the ONGC, of course, may not, on the face of it, be in conflict with the Government's declared policy of reserving all future oil refining rights for the public sector only; the ONGC is a public sector undertaking and its statute provides for combina-

tion of exploration and refining operations. But the reasons put forth by Mr. Malaviya for taking this decision are astonishing indeed. The ONGC, according to Mr. Malaviya, by setting up this refinery will be able to offset its losses on oil exploration. Exploration and marketing of crude by itself is a fairly profitable proposition; this was the basis on which the Government of India negotiated the recent agreement with the Burmah Oil Company. Why a different standard should be applied in the case of the ONGC is something which passes one's comprehension.

The insistence of the Oil and Natural Gas Commission on having the refining rights for the crude discovered by it is obviously an indication of the fact that the ONGC's operations are not upto the required standard of efficiency. The ONGC has been singularly lucky in striking oil at Sibsagar, Cambay, Ankleshwar and Kalol without much expenditure. At some places oil has

been struck by it even at the first attempt at drilling. But if with all this luck, it cannot make both ends meet — not to speak of its making any profit on oil prospecting — there should be something grievously wrong with its working. The proposed reorganisation of the ONGC with a view to giving to it greater autonomy, and its integration with the other public sector undertakings dealing with oil is a step in the right direction and should help in effecting appreciable economy in its expenses. But there is obviously need for injecting greater efficiency into its operations.

The combining of exploration and refining rights in the case of the ONGC will undoubtedly weaken Mr. Malaviya's hands in negotiating further deals with foreign oil companies for exploration of oil in India. Separation of prospecting rights from the refining and marketing privileges has stood in the way of greater inflow of foreign capital into this country for the development of the oil industry. Will Mr. Malaviya extend the treatment accorded to the ONGC to the private sector as well?

The Kuwait Imbroglio

GENERAL KASSEM'S announcement of June 25 affirming a subordinate status for Kuwait as an integral part of Iraq was the product of a brainstorm rather than a brainwave. This description may sound harsh, but it reveals the tragic reality of the situation. Not only was the world taken aback by his fantastic move but his cabinet ministers too, including, notably, Dr. Hasham Jawad, his Foreign Minister. Dr. Jawad's sober influence has always produced a moderating effect on General Kassem's policies. It is incredible that he would have been a consenting party to the General's new-found claim, if he had been consulted. His reported resignation on the Kuwait issue (and its withdrawal under pressure) cannot be discounted as fictions of imagination. Iraq's novel claim has been flatly contradicted by her own conduct in the very recent past. Only on June 13 last she gave her unqualified support to the admission of Kuwait as a full-fledged member of the International Labour Organisation. Two years ago in 1959 she voted for Kuwait's membership of the International Telecommunications Union.

Throughout the six decades that the treaty of 1899 between Britain and Kuwait has been in operation, Kuwait's position as a separate entity has never been challenged, it has been expressly recognised and her participation in her own right with the status of a member in a host of international organizations has been accepted by fellow members not excluding Iraq. General Kassem has now rescued a map of the Ottoman Empire from the dusty archives showing Kuwait as a part of the Basra province. It is on the basis of this shred that he is asserting his claim. But this pretension cannot cover up his real ambition to annex the sheikhdom for no other reason than its enormous resources of oil; the leading Arab countries in particular and the non-Communist world at large reacted promptly to Iraq's threat of annexation and unequivocally recognized the sovereign status of Kuwait. But however hollow General Kassem's pretensions may be, they cannot for that reason be regarded as devoid of a potential for creating an international crisis. At the Security Council's meeting on Sunday last, the Soviet representative picked up a deliberate phraseology in designating Kuwait as the "Kuwait area". The

It is indeed heartening to know that Mr. Malaviya after his recent tour of Europe has realised the imperativeness of moving faster towards developing the oil industry in the country. Imports of petroleum products in future are going to be a heavy drain on India's foreign exchange resources. The sooner this drain is stopped — or at least reduced to the bare minimum — the better will it be from the long-term interests of the country. Having become more conscious of this fact, will Mr. Malaviya now bestow second thoughts on the question of allowing expansion of the private sector refineries? Even after setting up the three public sector refineries and effecting their proposed "marginal" expansion, there will remain a substantial gap between the country's refining capacity and the requirements during the Third Plan period. This gap can be filled to some extent by allowing the private sector refineries to expand, especially when they themselves will be arranging for all the foreign exchange required. The point that a more rapid rate of growth is required and that growth tends in democratic societies to be the greatest of all levellers has still to be appreciated in this Ministry.

prospect of extending the cold war where oil overflows in profusion could hardly be allowed to go by default.

The swift action taken by Britain in dispatching her troops by sea and air in response to the Sheikh's appeal is nothing more than the discharge of an obligation cast on her by the agreement of June 19 to protect Kuwait against external aggression. There was no escape from it, when a real threat of attack, backed by massing of armed forces in the Basra province, made precipitate action by Iraq imminent. But the British troops were deployed along the frontier with such promptitude that an effective deterrent has been built up against any rash military move by General Kassem. The defence which has now been erected will be indispensable until the threat of attack disappears. That is the plain justification of the presence of the British troops and Sir Patrick Dean's categorical assurance to the Security Council that his country's forces would not be kept on Kuwaiti soil longer than the existence of the threat of aggression should suffice to set the point at rest. In this decision the Sheikh of Kuwait's voice must, of course, prevail. While the defensive forces were being deployed, Britain issued appeals to the Arab countries in the first instance and others including India to exercise their influence and use their good offices in persuading Iraq to settle the dispute peacefully. At the Security Council's meeting Dr. Pachachi, Iraq's representative, denied any intention on the part of his Government to impose a solution on Kuwait by military action. If the warlike posture is abandoned by Iraq, the tension that has been raised to such a high pitch can be eased.

It is inside the Arab League that the Kuwait imbroglio has created a crisis of the highest order. Kuwait cannot be expected to sign her death warrant and in the result a face-saving formula for Iraq remains the only alternative. At its meeting of July 4 the Arab League postponed consideration of Kuwait's application for membership by eight days. The Secretary-General, Mr. Abdel Khalek's mediatory mission in Kuwait and Baghdad is expected to create a climate for conciliatory talks and in the intervening span Arab diplomacy will meet one of its severest tests.

A DELHI DIARY

RIVAL CITIES!

HOW happy could I be with either, were the other far away! Only, on this occasion the source of attraction is not sweetly feminine, but the compelling memory of two great cities, Berlin and Warsaw. I have still, after nearly three weeks, got them indelibly in mind—the powerful terminals of an air journey, which is memorable like no other. A fortnight ago I said a word or two about Berlin from where I set out. Here it is only necessary to say that this seems to be the most fateful city in the world. The Fall of Berlin effectively ended World War II. A change in the status of Berlin may well be a precedent for World War III. Few of us living far away from this tragic, yet proud, and almost incredibly divided city, can appreciate the extent of the danger that any change in its current status implies. Those of us who have been recently in West Berlin know how passionate is the belief of the West Berliners in their own way of life. In some respects, it is an artificial way of life. The Berlin Hilton Hotel, for example, with its splendid show and extraordinary comfort at what must be deemed a moderate price (judged by the great hotels of the world) is maintained, in part, by the city authorities, who meet losses but do not, for some abstruse reason, take profits. In turn the deficit on Berlin is borne by West Germany, and over the years—including those of the airlift—Germany has cost the Free World on an average a billion dollars a year. This is not, in terms of politics—or at least Cold War politics—a prodigious sum. But it is a measure of the price that is placed by the Free World on this city—gay and yet depressing, brave and yet uncertain, deeply human in its tragedy, yet in many respects artificial and unreal.

IN SPITE OF FREEDOM

Not the least of the signs of the unreality is the extraordinary difference between the current rate of wages in West Berlin and East Berlin. I take a single instance, of which I have personal experience, in two restaurants singled out as being about the best in West and East Berlin. A waiter in West Berlin would make, with his tips, at least seven hundred marks a month; a waitress in East Berlin at a large restaurant told me that she was earning only 310 marks which with (low) tips might come to 500 marks. In theory the marks are equal; in practice, as I have mentioned before, the West German mark exchanges in West Berlin for 4.87 East German marks. How do the differences remain? Amidst the great buildings that are coming up in West Berlin and the massive but plain edifices of Stalin Allee in East Berlin, one has a picture of tragedy awaiting a great day of judgment. When will it come? All I can say at the present time is that knowing how passionately their way of life is held by Berliners, I would never (as a Berliner!) agree to assign my future to East Germany. Therein lies peril. For if an irresistible force meets an immovable object, how great will be the nuclear detonation?

WARSAW

I leave Berlin with hesitation to throw myself into a tribute to another city, in some respects greater in its power to rise again from disaster than any city in the world. I refer to Warsaw, built again with great beauty and with an investment in human and spiritual resources which surely can have no equal in the world. I know of no area damaged by war which has accomplished a similar resurrection. The terrible marks can still be seen here and there, and sometimes the memories are kept alive as in that powerful memorial in the Ghetto with the facade of the Gestapo office still standing. But it is not to that almost incredible period of insanity that Warsaw owes her unique claim to fame.

Resistance and death can be supremely heroic things, but they are not necessarily as abiding as the romantics would have us believe. The new Poland, of which Warsaw is a great symbol, is a superb reflection not merely of survival; it is a symbol of the amazing capacity—artistic, architectural, economic and industrial—of the Polish nation. Here, if ever, is the Phoenix, the bird that can never die, because it rises from its ashes to live again with almost all its pristine purity!

THE NEW POLAND

In the new Poland, the buildings, and all that buildings connote, occupy a special place. I was told by an economist—one guess is as good as another!—that between one-third and a half of Poland's saving in the last decade must have been committed to a building of some kind or another. But for the demands for building, industrial progress, which is already making such a splendid showing, would have gone faster. The conclusion that I draw is now that the building programme is declining somewhat and the rate of accumulation remains 20 per cent, that industrial production will receive a new shot in the arm. This is what might be called the law of conservation of energy in Poland's new plan. The greatness of Poland is that its passion for building, and even for industry, is tempered by superb perspective in her cultural life. A very large number of people have been drawn into the arts. There are sixteen theatres in Warsaw alone and the Palace of Culture donated by the Russians contains exhibitions of books which show how eminently book-minded the Poles remain. Men and women are to be found in almost equal number in medicine and in architecture and music. The great parks and theatres are always full. So indeed, as I discovered, was a little Royal Theatre, set in the old Royal Park, built some centuries ago, where now Sheridan's School for Scandal is playing (in mediaeval costumes) to full audiences of 500 only.

THE AFFLUENT SOCIETY?

Greatly daring, I claim that here women are increasingly well-dressed and that perfume on the streets is as noticeable as in Paris, though the names are not those of Chanel or Carmen or Christian Dior. A powerful flavour of affluence is entering the Warsaw scene. After the years this is in no way resented in spite of the extreme passion for equality which Polish planning has decreed. An eminent economist mentioned to me that this very passion for equality had produced not a little resentment. I prophesy that some little inequality will enter the Polish State with the new affluence one sees making its way slowly, but surely, in all directions!

Affluence in Warsaw does not, however, mean an absence of dedication to the major objectives to which the Polish nation is committed. I remember well that Professor Oscar Lange, the great economist, who presides over the Council of States on economic affairs, told me he would have to go to Poznan to see some of the new machines being produced in his country for export, for if he does not see them in the Poznan Fair he would see them nowhere. He added that Poland's plan is directed, indeed, to raising the standard of living of the people, but its first priority was not employment, although that was desired, but investment in the export industries to solve, once and for all, the current payments problem. With what I saw in performance at Poznan and single-mindedness in Warsaw, I can think of no nation, except Yugoslavia, which fights the balance of payments problem with the same certainty of success. How one can wish and wish that India had the same philosophy and the same single-minded dedication!

ARGUS.

THE WEEK'S NOTES

A Great Leader

SIR PURUSHOTAMDAS THAKURDAS

THE PASSING on Tuesday night at the age of 83 of Sir Purushotamdas Thakurdas marks the end of a great chapter in India's commercial history. There was no figure which more symbolised the link between the old and the new systems, between the strings of Indian nationalism expressing itself in economic terms and the dead philosophy of the ancient regime. In a great sense, he represented in one committee after another—and particularly on the Royal Commission on Banking—more India than himself. A trenchant critic, he had the wisdom often to hold his fire. He could combine supreme tact and friendliness with firm negotiation. Curiously, not all these qualities were appreciated after Independence came. He seemed to lose more and more touch with Delhi, and, in one or two cases, an open rupture unfortunately occurred. All this, however, did not prevent, while life lasted, a great dedication to duty. Ailing and sometimes in severe pain, Sir Purushotamdas dragged himself both to company meetings and to his office work. It was part of his life that he should not surrender to death even when its victory was near.

Chambers of Commerce throughout India should feel the loss of this elder statesman keenly; there is no one who has done more for their creation and their independence. Almost every institution in Bombay has at some time benefited from his mature wisdom and generosity. And India will mourn the loss of a great leader of her commercial community, independent, courageous and patriotic in the finest sense, to the core of his being.

Assam

A HAPPY UNDERSTANDING

IT IS a matter for gratification that the leaders of the Sangram Parishad in the Cachar district have eventually found their way to the happy understanding with the Home Minister. This attitude has a powerful element of the unexpected in view of the fact that the Sangram Parishad had declared its opposition to the Shastri formula and its determination to continue its struggle by peaceful means to win recognition of the status of a parallel official language for Bengali in the entire Assam State. It is true that it had suspended the agitational approach to create the right type of atmosphere for conciliatory talks, but the subsequent utterances of some of its responsible leaders gave an impression that the suspension was declared with serious mental reservations. The credit for removing this attitude of scepticism should go in the first instance to Dr. B. C. Roy. He must have had a strenuous time in convincing the leaders of the Sangram Parishad that acceptance of the Shastri formula was essential for a return to normalcy. In this frontier province any indulgence in extremist claims in respect of language was certain to create a potential danger of civil strife, which was in the interest neither of the Bengalis nor the Assamese nor of India as a whole. As a result of the understanding reached by the Bengali leaders in Cachar, the Shastri Formula is to be given an unqualified trial and the demand for recognition of Bengali as a second official language of Assam is to be relinquished.

It is one of the vital conditions of the Shastri formula that the Government of India's memorandum of 1954 on the provision of safeguards to linguistic

minorities should be scrupulously observed not only in letter but in spirit. Much of the psychology of fear and suspicion which has been generated among the Bengali speaking population of Assam since the tragic riots of last year is based on the apprehension of unequal and discriminating treatment. It is possible to argue that in some measure a minority's psychology of fear is more self-imagined than real, but in the case of the Bengali residents of Assam, large-scale evacuation has given a substantial basis for the fear. Even now the grievances against unequal treatment in the matter of employment are voiced and the State Government certainly owes a duty to itself to investigate them sympathetically and provide the essential correctives. It is for the majority to show a spirit of generous attitudes, but before this can be shown in Assam tangible indications may have to be provided that the earlier chapter of intolerance is now a matter of the past. Hailakandi is a bitter and unfortunate reminder that the Assam Government and the Congress Party in Assam will have to undertake deliberate and sustained efforts to establish the atmosphere of goodwill and amity. In the organized attack at Hailakandi the presence of illegal entrants from Pakistan was a fact, although its magnitude has been exaggerated and an unfortunate attempt has been made to give a communal twist to this aspect. The Assam Government needs to take effective measures to put a stop to these infiltrations on a continuous and substantial scale. It is to be trusted that this latest phase in the language dispute will be a prelude to the return of permanent goodwill and understanding in this problem State.

THE CHALLENGE OF SEPARATISM

IF THE settlement with the Sangram Parishad in the Cachar district has enabled the Centre to cross one major hurdle in re-establishing accord and peace in Assam, this is by no means the end of the regrettable chapter of internal strife in this tormented border State. The hill districts constitute a major linguistic area where the grievances of the tribal residents and their fears of domination by the linguistic majority from the plains are yet to be resolved. There has been not the slightest lack of effort on the part of the Centre, and in particular on the part of the Prime Minister and the Home Minister, in going the farthest limit of accommodation. In spite of this the so-called All-Party Hill Leaders' Conference has chosen to stick to an attitude of intransigence. The conference has rejected both the safeguards provided in the Shastri formula and the Prime Minister's offer of the Scottish pattern of administration of a hill state for these districts. The conference has passed the extreme resolution that unless the Assam Official Language Act is repealed or a separate hill state is created, it will not stop its agitation and would even start a campaign of non-co-operation with the Government. This resolution sounds as pompous as it is extremist. But apprehensions need not be entertained that the hill districts are really on the brink of separation from the plains. The all-party character of the conference is in itself open to genuine doubt and it may even be questioned whether the leaders of the conference do really command the necessary following to give a concrete substance to their threats.

This is not in the least to suggest that a campaign of repression is the answer to these extremist demands. Repression has never succeeded in solving any controversial issues and repression is the one thing which the Government of India will scrupulously eschew. It is necessary to understand the spirit of accommodation and fair-mindedness which inspires both the Shastri

formula in its application to the hill districts and the Scottish pattern of internal autonomy proposed by the Prime Minister. In terms of the Shastri formula the linguistic grievance is to be eliminated by the provision that English, and not Assamese, should be the language for communication between the State Government and the local authorities of the hill districts until English is replaced by Hindi. In so far as the media of education and the use of language for inter-hill-district communications are concerned, the Shastri formula gives a complete latitude to the people of the districts to substitute any of their own languages in place of English or Hindi. Concession could not be stretched longer than this. It is difficult to understand how the demand for the repeal of the Assam Official Language Act can hold water in the face of this just offer.

The Prime Minister's formula of the pattern of the Scottish administration is even more generous and accommodating. It is calculated to remove even the slightest suspicion of any unfair treatment or imposition of decisions by the majority. A committee consisting of the members selected from the representatives of the hill districts in the Legislative Assembly is to be authorised to scrutinise legislation relating to the tribal people of the hill areas and the decisions taken by the committee are to have a binding effect as a rule. Thus it is that the committee becomes a legislature of greater competence than the State Legislative Assembly on local issues. In cases of differences of opinion between the State Government and the Committee, arbitration by the Governor is to be final. Grants for development made either by the Centre or the State for outlay are to be entrusted, to the extent of the allocation for the hill districts, to a special committee representing these districts and it is to be armed with a special secretariat as its administrative adjunct. The power of expenditure is thus to be delegated to the accredited representatives of the people and any responsibility for its use is to rest on their shoulders. This provision as well as the legislative provision are calculated to create a full sense of confidence about self-determination. Fortunately, there exist large sections of the hill population which are inclined to work out the Shastri formula in respect of the language issue and the Prime Minister's formula for legislation. It is for them now to show where the All-Party Hill Leaders' Conference really stands.

Vietnam

SIX YEARS OF PROGRESS

TODAY, JULY 7, Vietnam crosses the sixth milestone and starts her onward journey on the seventh mile. These six years have been crowded with considerable activity on the economic front. Prior to that, for full nine years, war and Communist strife had shaken the fabric of the normal economic life of the country and a huge backlog of rehabilitation accumulated on the eve of independence. But under the confident and far-sighted leadership of President Ngo Dinh Diem, Vietnam applied herself to the task of reconstruction and development with a determination to race ahead. But that was by no means easy. The partition of the country has deprived Vietnam of the rich mineral and industrial resources and left her with agriculture as her staple resource. President Ngo Dinh Diem combined in his personality the vision of a great national leader with the objectivity of a practical administrator. It was this rare combination which was mainly responsible for his pragmatic approach to the problems crying for solution.

Agriculture naturally demanded the highest priority in the developmental task and the conventional crops

received preference in the allocation of outlay. The production of paddy was stepped up during the last five years by 150 per cent, but exports which had been depressed and stagnating were increased from \$371,000 in 1956 to \$670,000 in 1960. Rubber came for prior attention and its output was increased to 78,000 tons in 1960 with an area of 100,000 hectares under cultivation. Between 1954 and 1959, exports of rubber rose sharply from \$24.2 million to \$46.9 million. New crops, kenaf and cotton, to mention the only two staple ones, were introduced to supplement the income from the traditional commercial crops. It speaks for the comprehensive view which Vietnam takes of the development of her economy that diversification was sought in the direction of industrial expansion. In this sphere notable mention ought to be made of the expansion of light industry at a rate which enabled her to create an exportable surplus of electrical bulbs.

In an era of economic expansion in the underdeveloped countries, with its conspicuous feature of the widening the gap of external payments, Vietnam found it feasible to reduce her trade deficit from \$208 million in 1957 to \$140 million in 1960. This had its impact on the overall payments gap. American assistance no longer remained the prop of the sustenance of the economy and it was scaled down from \$320 million in 1955 to \$135 million in 1961. The pattern of American aid was changed in a marked degree from emphasis on military equipment and stores as well as consumer goods to the main accent on supply of capital equipment. Once the reconstruction of the economy was over, President Ngo Dinh Diem found it practicable to give a concrete shape to a key sector of the economic policy. The policy on private investment was announced three years ago on a basis of non-discrimination and extension of equal incentives to the indigenous as well as the foreign investor. Private investment in new industries or in the expansion of existing industries rose to \$71.5 million last year out of which 45 per cent was indigenous and 55 per cent foreign. Along with France, Japan, the United States and West Germany, India ranks as one of the external investors in Vietnam. Social services received their due share in this crowded programme of expansion.

The World Abroad

NEW IDEAS ABOUT GROWTH

By

ODYSSEUS

IN THE PAST THREE WEEKS, I outlined Professor P. T. Bauer's constructive criticisms of Indian planning. Lest any think that the Professor is a crank, I propose now to try to show that, far from being alone in his attitude, he is but one among several leading economists who are advancing the frontiers of economic thought.

All over the world since World War II men of good will have been anxious to speed the advance of the under-developed countries. The trouble has been that too many planners have misapplied, in a period of over-employment and rising prices, a theory that Keynes designed to create employment by investment in years of depression, deflation, and chronic unemployment. Keynes himself foresaw this possibility. Professor Colin Clark in his first class, 60 pages booklet entitled "Growth-manship" (Institute of Economic Affairs, 66A Eaton Square, London, S.W. 1. Price 5sh.) quotes Keynes as saying to him in 1930: "I predict that by 1950 Treasury officials all over the world will be talking about savings and investment, by which time that issue will have ceased to matter; it will be quite different questions which will be important by then."

Colin Clark points out that economics as a whole is concerned with growth, that the agents of production (or growth) are land, labour, capital (or investment), and enterprise, that all these factors are of equal importance, and that investment does not take absolute precedence over the others. The prominence given to investment has arisen because the immediate post-war period was one of shortage in savings and capital. But the truth is not that capital alone creates growth, but that capital is created during growth.

KEYNES'S SHORT TERM AIM

Keynes propounded more investment as a short-term solution for the European unemployment problem of the 1930's. If his ideas had been applied then, unemployment would have been mitigated. His primary aim was to get masses back to work. Because he was not formulating a long-term view he did not think much about the kind of employment created, or the capacity or growth of the labour force.

Roy Harrod and E. D. Domar helped to build a general theory out of Keynes's short-term solution. They pointed out that capital investment, which Keynes advocated to create employment, also increased production and promoted growth. With this concept they linked some complicated ideas about the "multiplier" (whereby investment outlay increases spending power beyond the original amount), and the "accelerator" (whereby a rise in consumption expenditure induces fresh investment). The interactions of the multiplier and accelerator today loom large in standard courses for students of economics, but Colin Clark points out that already in the 1950's it had begun to seem doubtful whether the old-fashioned ten-year trade cycle was still a relevant idea. It seemed to be replaced by a shorter, less violent cycle, in which stock fluctuations, rather than investments in fixed capital, played the major part. Harrod and Domar then re-orientated their theories towards the problem of attaining and maintaining steady growth with full employment, rather than towards an analysis of fluctuations. They reasoned that every unit of investment must yield a regular addition to national output in the future, dependent

upon a "capital-output ratio." Capital investment was itself held to depend on the level of income, and its changes. The expansion of the labour force was expected to be slow and predictable.

On these assumptions, conditions for sustained economic growth were laid down, and the rate of growth calculated under various conditions. Everything, however, turned on the capital-output ratio, a dubious working concept now promoted to the status of a general economic law.

In the 1940's, valid estimates of the quantity of capital began to appear for the first time. The quantity employed per unit of labour, it was known, was tending to rise. But up to the 1940's, it had been assumed that the quantity per unit of output was also tending to rise. As, however, valid measurements of capital stock began to come in, they revealed that the amount of capital required per unit of output tended to remain constant. Detailed studies in various countries showed that while industrial techniques had changed beyond recognition, the ratio of capital (measured in current replacement values) to output had changed little.

Measured at current replacement value, the capital-output ratio has, in fact varied between 4 and 2½ in various countries, i.e., between four and two and a half units of capital correspond to about one unit per annum of national product.

Colin Clark stresses that although the capital-output ratio may be an accurate description of conditions at any one moment, it is not true if we add three units (or whatever the particular ratio is) to the stock of capital, output will necessarily be raised by one unit per annum. It may be raised by more, or by less. (In technical terms, the marginal capital-output ratio does not necessarily equal the average capital-output ratio, and, in fact, should probably be expected to differ from it).

TAKE-OFF THEORY CHALLENGED

Colin Clark cites these facts to show how firmly the idea of capital as the key to growth is embedded in today's popular economic thinking. He rebuts the proposition that the simple concept that more physical capital, whether accumulated in the American or the Soviet way, will solve all problems.

What about developing countries? Many have adopted W. W. Rostow's assumptions that economic growth is determined by the rate of investment, and that fulfilment of three conditions will ensure a "take-off", namely, (1) the rate of savings must be stepped up, probably doubled; (2) there must be people willing and able to invest; (3) there must be some mechanism whereby investible funds are transferred from savers to entrepreneurs.

Let us consider these three conditions against the background of "take-off." First, says Colin Clark, no convincing figures have been produced from any industrialised country which show that the rate of savings did, in fact, double at about the reputed take-off period. And, anyway, the mere fact of a change in the rate of saving (even granted conditions 2 and 3) is not in itself a guarantee that industrialisation will automatically follow.

The first question is: If people do not wish to save is it either practicable, or desirable, for the government of a democratic, non-totalitarian country to compel

people by taxation persistently to save much larger amounts than they would have been willing to save voluntarily? This is only justifiable if the country's long-term aim is the achievement of complete Socialism and the total elimination of private enterprise. Too great questions of principle are involved here to launch out on a discussion of them at the tail-end of an article, and we must reserve this for a future date.

Professor A. O. Hirschman has, however, a pertinent comment in his "Strategy of Economic Development" (New Haven, 1958): The ability to invest is acquired and increased primarily by practice and the amount of practice required depends in fact upon the size of the modern sector of the economy. In other words, an economy secretes abilities, skills, and attitudes needed for further development roughly in proportion to the size of the sector where these abilities are already acquired and where these attitudes are being inculcated.

This explains why growth may be self-continuing and cumulative, but Colin Clark observes that it does not explain a take-off. In an under-developed economy, the ability to invest is limited; it increases only through growth. As the ability to invest is essential to release Rostow's take-off, and to break the vicious circle of poverty, there is here a flaw in the logic of the argument.

Colin Clark submits that Rostow's third condition is also suspect. If, in a stagnant, pre-take-off economy, entrepreneurs do the saving all is well. But this would seem rarely to be true. What is needed is either a close liaison between saver and investor, which is unlikely, or else some sort of capital market. But developed capital markets do not exist in under-developed economies.

What, then, did happen historically? It would seem that the upper classes changed their attitudes towards industry, or were replaced, or that the government stepped in. The changing of attitudes is a slow process and it only happens when a certain amount of growth has already occurred and the upper classes see that they have something to gain by joining in rather than by standing aloof.

As for government intervention, there is a definite limit to what a government can do if it is trying to act against, and to break down, a traditional social structure. This was illustrated by the Soviet government's experience in trying to discipline the peasants in the twenty years after 1917. (In New Delhi's experience any more encouraging?) The milder and more cautious intervention by the Japanese Emperor in the earlier stages of Japan's development produced much more successful economic results.

Colin Clark suggests that since the conditions necessary to achieve Rostow's take-off can only be satisfied after a long period of time, and after an appreciable amount of already attained development, we must conclude that, while the idea of a take-off has some historical validity (though not as Rostow describes it), the concept is too vague to be of much help in dealing with the present problems of the under-developed countries.

I am conscious, as my space ends, that the ideas outlined here are so contrary to the prevailing fashion of economic thought that they are likely to arouse bewilderment rather than acceptance. I hope that their elaboration in future articles may make them clearer.

One who did not waver...

Jamshedpur's latest blast furnace needed a 'big bell'—a 20-ton component requiring highly skilled casting and machining. A difficult operation even if the right machine tools were available, but in 1958 they were not, and import seemed the only solution to all but one determined and resourceful young engineer, N. P. Naik.

Working on this problem in his leisure hours, Naik gradually crystallised his ideas into mathematical formulae and blue-prints. He developed, at the same time, a new machine tool to do the job by remodelling a small boring machine, stage by stage. Then started the casting and intricate machining, until, in a short time, Naik and his colleagues succeeded in producing a

'big bell', fully meeting the technical specifications to the last detail. As a tribute to Naik's fine endeavour, Tata Steel gave him an award of Rs. 10,000, the highest made under a ten-year old scheme to encourage initiative from the shop floor.

Men like Naik are carrying forward a fine Jamshedpur tradition, recalling Jamsetji Tata's exhortation: "Let the Indian learn to do things for himself."

The European Scene

A REAL LEAP FORWARD

From Our Special West European Correspondent

PARIS, July 2.

WITH the usual delay of six months, the Italian economic ministries tabled their reports on the "miracle year", 1960, this month and at the same time the final figures on industrial production during the first quarter of this year became available. So late?, the impatient will ask. Better late than false — and almost all the spot indicators of industrial activity issued in the West today are false, i.e. they have to be seriously revised when full information becomes available with the inevitable delay of several months. There is nothing Chinese about this; far from inventing leaps forward that will not survive the statistics, the quick index numbers have lately been under-estimating economic expansion in Europe. The fact is that, despite advances in the art of economic diagnosis, it remains true (as we read in our economics textbooks) that no one really knows what is going on in a free economy until it is so late that the impatient are no longer interested. Yet the figures just issued in Rome will interest anybody who wants to know what a genuine leap forward looks like.

At the end of March this year, the Italian industrial production index stood at 207.4, which was 10 per cent above a year before. More important, since the base-year is 1953, it means that industrial production had been doubled in seven years. Industrial production in 1953 was already 65 per cent above 1938, the best year of Italian fascism. Activity has increased not only in manufacturing industry but in agriculture, commerce and other services, so the movement of revenues has been as follows:

	Net National Income (In thousand million Present-day Lira)	Income Per Capita (Present-day Lira)
1911 ..	5,500	150,000
1938 ..	8,000	250,000
1945 ..	4,000	125,000
1950 ..	8,000	250,000
1960 ..	17,000	340,000

Real income per head has tripled since 1861, but half of that increase was achieved in the short period, 1951-1960. Connecting these dates with the salient events of Italian history, we can say that the Risorgimento, the great movement of unification and liberation led by the liberal bourgeoisie, achieved a modest improvement which was not much exceeded by fascism in its reign of more than 20 years — and the collapse of fascism left the Italians poorer than they were at the beginning of the century. From the bottom of the abyss in 1945, the effort of post-war reconstruction backed with generous American aid had equalled fascism's best by 1950. From the following year, there began a leap forward that still shows no sign of falter-

ing. This was a period of technological progress, structural reform and industrialisation throughout which, far from relying on protection (which had been the policy of the first nationalists) or on autarchy (the policy of fascism), Italian industry was integrated into the free-trade channels of the West and accepted the competition of the Common Market.

We cannot ascribe these results to any one "system" because the Christian Democrats inherited from Mussolini a very mixed economy, with a substantial public sector, which they proceeded to administer in accordance with a rather dogmatic, sound-money liberalism, allowing free reign to private enterprise, with no national planning but a good deal of bureaucracy, with powerful private monopolies and equally powerful state monopolies. He would be an agile polemist who could extract from this a testimonial for any of the conflicting doctrines of political economy. The fact stands that this mongrel system has done more for the Italians than the liberals and the fascists rolled together, and that it has at least begun to make an impression on the country's basic social problems; unemployment and the unbalance between North and South.

Writing here a year ago on Italian economic progress, I pointed out that those two problems were so far untouched by a decade of rapid growth, and I suggested pessimistic conclusions to Indian planners about the quantity of investment that was necessary to reduce unemployment and equalise regional disproportions. In the intervening year — the "miracle year" — the Italian boom has suddenly bitten into these two hard cores of the country's ills. There are, of course, no miracles in economic life; what had happened was that a long period of massive investment bore fruit all at once. This tendency of economic advance to describe steps-and-stairs rather than a smooth curve is familiar, but just in case anyone imagines that it has anything to do with the notorious theory of the "take-off", I should emphasise that Italian experience tells against that myth in every particular. If aeronautical metaphor is really any use, one would have to say that Italy has "taken off" three or four times in her history, and has promptly belly-landed; she has been hovering uncertainly over the airport for a decade and only now seems to be set on free flight.

The turn of the tide on the employment front was probably the most important event in 1960. While 405,000 people found work for the first time, 31,000 people left the land to take up urban jobs; this total of 436,000 went into industry (296,000) and into tertiary employment (140,000). Not only was the normal increment in the active population absorbed, but the number of unemployed was actually reduced. Italy can now claim to have full employment in the sense that all qualified labour is at work. This only makes more urgent, of course, the task of qualifying for employment the unskilled (and often unlettered) mass, while behind the unemployment problem looms more clearly the question of the vast under-employment of the rural population. The terrible problem of Italy's idle millions is by no means resolved yet but the country is past the stage where no amount of economic advance seemed to make any difference to it.

Similarly with regard to the North-South division of the country, which really split it into two distinct

economies, a decade-long boom seemed only to have widened the gap between the industrialised North and the poor Mezzogiorno. But figures now in hand show that, as well as becoming richer in absolute terms, the South began to catch up during 1960. There is a long way to go yet, and this result has been achieved only after ten years of constantly increasing investment under the Vannoni Plan for the development of the South. From here on, progress will be faster because the direction of investment is changing: more capital is going to manufacturing industry in the South and less to public works. Indeed, the same phenomenon is to be noted for Italy as a whole: less money for the "infrastructure" such as public utilities and housing, and more for secondary industry and tertiary services. No doubt, this explains a good deal of last year's so-called miracle: previous costly investment in the infrastructure began to mature and funds flowed to activities such as manufacturing and services, which generate more revenues and provide more employment. Thus, in 1960 total investment increased by 16.5 per cent over 1959, but investment in industry rose by almost 23 per cent. Investment in housing, which had been 20 per cent of the total a decade ago, fell to 4 per cent of the total.

Admittedly, the country had several advantages to begin with, notably the transport network it inherited from Mussolini. Italy has not had to rebuild her rail system, and a series of recent train accidents has re-

called that rolling stock has scarcely been modernised since before the war when, as the fascists boasted, Il Duce made the trains run on time. To make up these arrears, Rome last week decreed a 15 per cent jump in rail fares. As for roads, the long (and still vigorous) motor car boom has only just brought the country to the point where it must undertake the construction of motorways ("autostrade"), which will be financed by tolls. Given the nation's present prosperity, this modernisation of the transport infrastructure can fairly easily be paid for by actual users, without the need for expensive and temporarily unprofitable works such as India must undertake.

Since it is a dogma in many Indian circles that progress of the sort the Italians have achieved cannot occur without price-inflation, it is well worth emphasising that since 1953 (in which period, I repeat, industrial production has been more than doubled) Italian prices have in fact fallen. Taking 1953 prices as 100, the general index of wholesale prices in March this year was 99.2, for consumer goods it was 97.8 and for industrial raw materials it was 98.2; for capital goods, after reaching a peak of 105.8 in 1957, it has been falling ever since and is now 103.6. I am not just choosing a favourable month to make this point: all these index numbers have been virtually stable, month in and month out, since 1958. This is the proof that production, national income and per capita revenues can all "leap forward" while prices fall back.

A TRIBUTE TO QUALITY & FASHION

PRIVILEGE IN THE CLOTH CAP

By WILLIAM REES-MOGG

IN all the Western European countries a new class of businessmen has grown up since the war, a class which almost amounts to a new bourgeoisie. In the continental countries the destruction of the old bourgeoisie by the events of war, and the rapid growth of the recovery and post-recovery period, has pushed a large number of the members of this new class into obviously dominating positions. In Britain things have been rather different.

Neither the war nor the period of Labour Government significantly weakened the influence of the people who were accustomed to run British affairs. High taxation shifted the balance in favour of the well-established businessmen, as against the professional classes. Professional men paid the same or higher rates of taxation on their incomes, without being able to accumulate capital sums.

In the 1950's, however, the new group of businessmen began to emerge. They were people who started without any advantages or special influence. They had built up their own businesses from small beginnings, sometimes to be really large concerns, but much more often to be substantial but not very large. Some of the businesses make £3,000 to £5,000 a year, and some £30,000 to £50,000, but very, very few make more. On the other hand, these are businesses which have been built up mainly or entirely since the war.

This group is particularly interesting from a political point of view. It presents problems for both major political parties. For the Conservatives the problem is that this group is both active and, on the whole, right-wing.

Certainly these new men feel no need to apologise for their own success. They feel that it is much to their credit to have made their way in a world of high taxation. They have an aggressive attitude to political problems, similar to their approach to business.

Above all, they lack the sense of guilt which is always attached to unearned privilege, and which has an acutely debilitating effect on the political actions of those who suffer from it.

The Conservative Party does not always know what to make of these men. Their attitudes are strong in

the constituencies, but much less strong in Parliament, and least strong of all in the Cabinet. Their vigour, the roughness of their approach, does not consort with the predominant tone of the Party. Neither their policies nor the way they pursue them are felt to be sympathetic. So far they are represented in the Cabinet only by Mr. Marples, though they have rather more impact on the backbenches.

The difficulties of the Conservative Party are, however, relatively minor. They present a much more serious threat to the Labour Party, and particularly to the effectiveness of a Labour Government if one were to be formed.

Even in the period of the last Labour Government it was obvious that this group, or what was then potentially this group, was highly effective in fighting the Labour Party. It was effective because it could not be accused of being upper-class privilege; if it was privilege at all it was privilege with a working accent; it was privilege in a cloth cap.

A further Labour Government would expect to have much more difficulty. For one thing just as the business atmosphere of the 1950's helped to create this group, so would one expect Labour policies to cut back their profits. These businessmen are not engaged in the main central activities of the economy, but in the main are filling in the gaps left by big concerns. They are particularly common in housing and road transport, both of which would probably come under closer control.

In terms of economic interest there would, therefore, be every prospect of a frontal conflict. Equally there would be every prospect of a major psychological conflict. Simply because this group represents a new and emerging class it does not feel any doubt about its right to expand its influence. Where the large businesses might accept a major extension of control—if grudgingly—these small businessmen would not.

It is very doubtful whether the Labour Party has recognised how great this social change of the last ten years has been. A buoyant modern economy has a momentum of its own which can only with difficulty be deflected by political action.

The Canadian Economy

SOLID FOUNDATION LAID

CANADA'S economy rests on a solid foundation, though economic trends in 1960 were less uniformly expansive than in the previous year. Higher export values, together with slightly lower imports, provided an element of expansion in the economy, while additional stimulus was supplied by the continuing rise in public and institutional investment and a further moderate growth in consumer purchases. Though capital expenditures on plant and equipment were on a large scale, they did not impose additional demands on the productive resources of the economy.

The annual levels of production, employment and incomes achieved new peaks moderately above those of 1959. Canada's Gross National Product recorded a further advance last year of about three per cent. Although prices were slightly higher on the average, the total output of the economy was larger than ever before. Total personal income rose by about three per cent, and real earnings on a per capita basis remained at the unprecedented level achieved during the previous year. Employment continued upward, and was higher on the average by 100,000 persons. The growth in job opportunities did not fully keep pace with the unusually rapid rise in labour supply, however, and jobless persons comprised seven per cent of the labour force, compared with six per cent in 1959.

Total capital outlays in the past year, both private and public, amounted to \$8,200 million. While this level of capital investment was slightly lower than the \$8,400 million figure recorded in 1959, it contributed 23 per cent of the Gross National Product and indicated an unusually strong pace of capital expansion by any standards. Large-scale programmes were under way in a wide range of industries, including primary iron and steel, nickel, pulp and paper, oil refining, rubber products, chemicals, electric power and air transportation.

Capital expenditure in 1961 for all sectors of the economy are estimated at \$8,336 million, which represents a continuation of the high and relatively stable level of capital spending realized in recent years. Of this figure, expenditures for new construction should be \$5,689 million, or four per cent more than in 1960. Both housebuilding activity and non-residential construction will share in this larger programme. Planned outlays for new machinery and equipment are moderately below the levels of last year, and call for outlays of \$2,647 million.

Expenditures for social capital purposes, including health and educational facilities and all types of government improvements, are expected to be about eleven per cent higher this year. New hospital construction, in particular, will be sharply expanded. Estimates from business firms suggest a moderate reduction in their capital spending this year. The reduction is largely concentrated in the transportation industry. Larger outlays by the natural gas industry are offset by reductions in certain other industries, notably iron and steel.

Among equipment producers, the farm implement industry was adversely affected last year by declining sales in the United States market. Producers of electrical and industrial equipment held their own against imports, however, and, with the support of additional export orders, the trend of total shipments was maintained.

Consumer-based industries benefited from a moderate rise in incomes, but in some instances faced intensified competition from imports. The share of the Canadian automobile market held by European-type cars edged a little further upward in 1960 to approximately 28 per cent of all vehicles sold in this country. Despite the continuing popularity of foreign cars however, production of motor vehicles in Canada rose by eight per cent. Higher sales abroad, as well as in the domestic market, contributed to a larger output in the automobile industry. Activity in the clothing trades was little changed, even though a larger share of the market for certain types of clothing was captured by imports. The output of synthetic textiles was maintained last year, but that of cottons and woollens was lower. Footwear production also declined.

Despite the continuation of divergent trends in various industries, general activity followed a firm course in the latter part of 1960. Nevertheless, conditions of ample supply and keen competition continued to retard the absorption of new productive resources.

CANADA'S FOREIGN TRADE

Canada's merchandise trade last year was characterized by a further growth in the value of her exports and a slight decline in the value of her imports. This divergence in trend reduced the deficit on merchandise trade to Can. \$97 million, which is the lowest figure since 1954. Export prices remained stable, while import prices increased slightly. The value of Canada's foreign trade, in 1960, compared with that in the previous years, is as follows:

CANADA'S FOREIGN TRADE

	(Million)	
	1959	1960
Exports*	\$5,140	\$5,395
Imports	5,509	5,492
Balance of Trade	369	97

*Including re-exports.

An outstanding feature of Canada's export trade in 1960 was the increase in sales to overseas countries, shipments to which were approximately one-fifth of the total. Substantial advances were achieved in sales to the three largest overseas market areas, namely the United Kingdom, Western Europe and Japan. Most of this rise consisted of shipments of forest and mineral products, including pulp and paper, lumber, base metals, iron and steel, asbestos and chemicals. In addition, widespread increases were noted for various types of highly processed and manufactured goods. Rising incomes and consumer levels, together with the progressive dismantling of import restrictions throughout the trading world, opened up new market opportunities for this type of export. Despite the continuing world surplus, Canada's sales of wheat in commercial markets held up well. However, of the major agricultural exports, that of oil seeds was the only one to show a significant rise last year.

The proportion of Canada's exports to the United States declined from 61.9 per cent in 1959 to 56.3 per cent in 1960. Over the same period, the proportion

going to Commonwealth countries rose from 20.8 per cent to 23.3 per cent, and to all other overseas countries, from 17.3 per cent to 20.4 per cent.

Meanwhile imports into Canada held about stable in aggregate, and changed little in either commodity or geographical composition. Machinery and equipment, together with manufactured consumer items, made up nearly one-half of Canada's total imports last year, followed by forest, mineral and chemical products. The proportion of imports from the United States held steady at 67.3 per cent for both 1959 and 1960. That originating in Commonwealth countries increased from 15.0 per cent to 15.8 per cent, and from other overseas countries declined from 17.6 per cent to 17.0 per cent.

Higher exports and slightly lower imports last year reduced Canada's merchandise deficit from \$369 million in 1959 to \$97 million last year. This substantial decline in the merchandise imbalance more than offset a continuing rise in the invisible deficit, and resulted in a reduction in the overall deficit on current international transactions. The current account deficit was covered in large part by a further inflow of long-term capital. The premium on the Canadian dollar declined during the past year, and was within one per cent of par with the United States dollar at the end of December. The lower premium, compared with the preceding year, enabled Canadian producers to compete more successfully in foreign markets.

EXPORT TRADE PROMOTION CONFERENCE

Although Canada is the fourth trading nation in the world, it is appreciated that every effort must be made to sustain interest in Canadian products throughout the world, and to explore avenues that may result in the development of new sales opportunities. To this end, an Export Trade Promotion Conference was held in Ottawa last December, and 110 trade commissioners from sixty-three posts in forty-nine countries were summoned home for interviews with representatives of Canadian firms. More than 1,300 businessmen sought 10,500 interviews with these officers, and obtained a wealth of information that might assist them in selling their wares abroad.

Many of the firms sending representatives to Ottawa had not previously considered the export field as a possible outlet for their products, owing to the difficulties

they thought existed. More than twenty per cent of those requesting interviews were in this class. Many of them are now enthusiastic about prospects. A good proportion of the companies concerned have been created since the Second World War, and are producing items never before manufactured in Canada.

Trade Commissioners returned to their posts impressed with the knowledge that a rejuvenated commercial community is prepared to take advantage of their services in securing agents to handle new lines or old lines that were either discontinued or never before offered in some markets of the world. They urged Canadian businessmen to travel abroad, where they would be warmly welcomed and learn much about the fine characteristics of prospective purchasers of their merchandise, and their particular requirements. They were convinced that new friendships would be created between satisfied buyers and sellers, which would tend to create a better understanding between Canada and the countries concerned.

While most Canadian businessmen at the Conference were primarily interested in exploring sales opportunities, they realized that trade is a two-way street, and that Canada must be prepared to buy the products of other lands. It is probable that greater diversification will result from the outward-looking consciousness created by the trade conference and reflected in the pages of newspapers, magazines and trade publications all across the country.

In commenting on the conference, the Hon. George Hees, Minister of Trade and Commerce, said: "We, in the Department of Trade and Commerce, are prepared to render all possible assistance to those businessmen who wish to sell their wares to people in all parts of the world, no matter what may be their race or their language. The reputation of Canada, as a progressive, peace-loving country, stands high, both in the larger and smaller nations, some of which have only recently achieved nationhood. But, the products we are able to sell are not as widely known as they should be. That is primarily the task of the individual producer in a free-enterprise economy, such as ours, but our trade commissioners will provide the necessary introductions and will work alongside the exporter and his agent, provided both are genuinely interested in pushing sales for their goods."

WORLDGRAM

India.

U.S. Donated Milk Plant at Trivandrum: Mr. V. V. Giri, Governor of Kerala, recently opened a modern milk processing and bottling plant at Trivandrum. The plant is a gift of the U.S. Government made through the U.S. Technical Co-operation Mission in India to the Trivandrum District Co-operative Milk Supply Union. With a capacity to pasteurise and bottle 1,200 gallons a day, the plant is the first major milk processing unit to be installed in the State. It is estimated to cost Rs. 4,50,000. Efficient and hygienic handling of the milk is ensured through the different stages of processing. From the reception platform, the milk moves in large cans to the weighing stand by automatic conveyor, and then the cans are tipped into the pipe system leading to a 1,000 gallon storage tank. The cans, meanwhile, are collected and fed into an automatic can washer. The milk goes to the pasteuriser and cream separator. The pasteurised milk goes to the bottling unit, and the cream is passed on to another unit where a butter churner and a ghee boiler convert it to these products.

United Kingdom

Record Sales of British Electronic Equipment: Total home and overseas sales of British electronic capital goods last year were worth more than £57,000,000 — some £4,500,000 up on 1959, says the Electronic Engineering Association in an announcement in London. Exports, at £29,000,000 showed an increase of £4,384,000 over 1959, and accounted for more than half the total sales. In the four years 1957-60 sales of British electronic capital goods have risen by more than a third, and exports have increased by nearly a half. The rising sales of electronic computers — worth more than £8,000,000 last year — reflect their growing and widespread use. Since 1957, the electronic-computer industry has more than doubled its total sales, and almost trebled its exports, which last year were worth £2,301,000.

High Speed Packaging Machine: A cartoning machine designed to meet the needs of manufacturers of powders, soap flakes, cereals, garden fertilizers and other granular products will be among a score of machines to be shown by a U.K. engineering group at the International Packaging Exhibition to be held at Olympia, London, in September. The machine erects, glues, fills and seals cartons at speeds of up to 55 per minute. Special attachments such as automatic weighers, volumetric fillers and vibratory conveyors can be fitted, if required. Also on show will be machines for wrapping bakery products, sweets and cigarettes. For the sugar confectionery trade there will be a machine which provides a twist or sachet wrap for various types of sweets of irregular shape. Output of double and twist wraps is up to 450 a minute and sachet wraps 350 a minute. The machine can use cellulose film with or without under strip, wax paper or foil. All that is required for alteration of sweet sizes is a change of one feed plate.

Another machine for the confectionery trade is for the high speed foiling of soft-centred chocolates of varying shapes. It is fitted with an automatic belt in-

feed so that it can take chocolate direct from an enrober belt, thus avoiding handling. The cigarette packing machine is designed to assemble, fill and deliver the slide and shell type of cigarette packet. The cigarettes can be packed with or without an interior wrapper. A vane type cigarette feed is used with a gentle oscillating movement which enables the cigarettes to be counted and fed without damage. The model can be built to produce any size of packet to hold up to 25 cigarettes.

Howard and Bullough's Modernisation Scheme: One of Britain's leading textile machinery manufacturing companies, which has been exporting its products to India since the 1880's, has recently completed a £7,00,000 modernisation scheme embracing every department in its main works. The firm, Howard and Bullough Ltd. of Accrington, Lancashire, which is well over 100 years old and is now a member of Textile Machinery Makers — the largest group of its kind in the world — launched this ambitious programme at its main works 2½ years ago. The reconstruction, planned by the firm's own drawing office, was carried out in five phases without any loss to production time.

France

Franco-Swiss Trade: Swiss exports to France totalled 51.6 million Swiss francs in April. This is an increase of 7.4 million Swiss francs compared with April 1960 and represents 7.7 per cent of total Swiss exports. During the same period, French sales to Switzerland totalled 119.1 million Swiss francs compared with 92.4 million Swiss francs in April 1960. This represents 13.1 per cent of total Swiss imports. For the first four months of 1961, Swiss exports to France exceeded the figures recorded until now with 213.7 million Swiss francs (177.8 million Swiss francs in 1960). French imports into Switzerland totalled 472 million Swiss francs for the first four months of 1961 compared with 354.9 million Swiss francs for the first four months of 1960.

Ghana

New Fishing Industry: A string of 13 new fishing industries will go into operation in Ghana shortly as a result of the agreement signed between Ghana and the Soviet Union in Accra. The agreement provides for the selection of construction sites as well as the preparation of a memorandum for projecting a complex of fishing enterprises. A number of Russian technicians are expected to be engaged in the running of the enterprises. This is the second technical assistance agreement signed between Ghana and the Soviet Union.

Yugoslavia

New Ore Dressing Plant: A new ore-dressing plant was put into operation in Majdanpek, thus completing the second stage of reconstruction work in the Bor, East Yugoslav mining area, which will be ranked among the foremost world copper producers. The production process key points in this plant are followed up on television screens in a control booth com-

pletely outfitted for supervising copper deposits which have been originally estimated at 190,000,000 tons. However, recent prospecting raised this amount to 300,000,000 tons, sufficient for an estimated fifty-year exploitation. The new ore-dressing plant at Majdanpek, with an annual 25,000 tons output, is the major industrial project to have been put into operation in Yugoslavia this year. However, the capacity of the Bor smelting plants is to be expanded for another 25,000 tons by 1965. A sulphuric acid plant has been recently set up in Bor area.

Canada

Oral Polio Vaccine for India: In response to an appeal from the Director-General for Health Services for India, a shipment of 50,000 doses of Oral Polio Vaccine arrived by air from Canada in Bombay recently. It is part of a gift of 1,00,000 doses being made to the Government of India by Connaught Medical Research Laboratories, the well-known research institute in Canada associated with the University of Toronto. The vaccine is being put to immediate use in the State of Andhra Pradesh to complete a children's immunization programme begun several weeks ago to meet a threatened outbreak of polio in that area. Connaught Medical Research Laboratories, who are supplying this urgently required vaccine were closely associated with the programme which developed the now famous Salk Vaccine only a few years ago. They also produced a wide range of other vaccines and serums for the prevention of such diseases as diphtheria, rabies, small pox, typhoid fever and tetanus. Yet their most enduring claim to fame is the discovery of insulin for the treatment of diabetes.

Italy

Starfighter Production Agreement: Lockheed's California Division has reported signing of agreements with Italian Government and Industry officials establishing a super starfighter production programme in Italy. Italy last spring first revealed selection of the all-weather, multi-mission F-104 to re-equip its aerial defence force. Hundreds of the 1,500 m.p.h. fighters already are scheduled for production by manufacturers in Germany, the Netherlands and Belgium. The unprecedented project involves integrated production in all the four countries. Additional super-starfighters are scheduled for production in the United States, Canada and Japan. Although plans call for Italy to co-ordinate its manufacturing capabilities with the other European participants, a final assembly line is contemplated at the Fiat factory in Turin. Particularly close production co-ordination will exist between Italy and Belgium. Other Italian firms, besides Fiat, programmed to take part in the international production project are Aeronautica Macchi in Milan; Aefer in Naples; and Alfa Romeo, scheduled to participate in production of the F-104's J-79 engine in Milan under a General Electric Company license, probably with Fiat.

Norway

Import Surplus Up: According to figures issued by the Central Bureau of Statistics on Norwegian foreign trade in April 1961, the value of imports amounted to 841 million kroner (just over £42 million) and that of exports to 481 million kroner (just over £24 million). The figures for April last year were 764 and 488 million

kroner. (£38,200,000 and £24,400,000) respectively. The surplus of import of goods, excluding ships, was 361 million kroner (£18,050,000) in April this year, compared with 276 million kroner (£13,800,000) in April 1960.

*

Foreign Investment Establishes 120 New Companies:

It is reported that nearly 120 new companies were established through direct investment from abroad. The total capital of these companies amounts to 46.1 million kroner, equivalent to about £2,305,000, of which 27.7 million kroner (or £1,385,000) was invested by foreign shareholders. In addition, the foreign sources have contributed capital in other ways or granted loans which probably by far exceed the amount invested in shares. It is clear from these figures that businessmen abroad are interested in promoting industrial activity in Norway.

Mexico

Trade with Indonesia: Mexico may be able to expand its export trade with the Republic of Indonesia through the sale of two new product groups, steel pipes and paper and printed matter. There is also the possibility that the sales of cotton yarn and textiles to that market will increase to 400 million pesos in 1961. The above trade prospects are the result of the recent visit to Mexico of the President of Indonesia. 1960 exports of Mexican cotton yarn and cloth to Indonesia were of the value of 300 million pesos. One fact to be kept in mind in this respect is that the Indonesian market for foreign cotton textiles may dwindle to nothing in a year or two since important textile manufacturing installations are currently going up in the republic. If the steel pipe sales materialise, Mexico will very probably provide appropriate technical assistance to Indonesia.

Belgium

Exports of Linen Fabrics: Total production of linen fabrics in Belgium for the 12 months of 1960 amounted to 7,454 tons, as compared with 6,701 tons in 1959, an increase of 11.2 per cent. On the other hand, exports of Belgian linen fabrics during the same year came to 5,211 tons, as against 4,788 tons in 1959, an increase of 8.8 per cent. Of these totals, exports to the U.S.A. amounted to 3,670 tons, an increase of 6 per cent over 1959 (3,469 tons). This figure of 3,670 tons represents a hitherto unattained record.

World Bank

Loan for PICIC in Pakistan: The World Bank has made a loan equivalent to \$15 million to the Pakistan Industrial Credit and Investment Corporation Limited, (PICIC). Like two other Bank loans to PICIC aggregating \$14.2 million, this loan will be used to meet foreign exchange requirements of industrial enterprises financed by the Corporation. The Bank loan has no fixed schedule for payment and no fixed interest charge. Each part of the loan committed for a particular project will be repaid by semi-annual instalments according to a schedule to be determined at the time of the commitment. Interest will be applied to each portion of the loan at the Bank's current rate, when such portion is committed for one of PICIC's projects. The loan is guaranteed by the Government of Pakistan.

Busy hands laying down rail tracks of steel, steel lines penetrating into the heart of the wilderness, steel bringing civilization to the doorsteps of isolated villages and homes without number. In this land with its 410 million people and vast distances, there is need for swifter and more efficient transport, be it by road or rail. And transport needs steel — from bicycle to aeroplane every modern vehicle is shaped from STEEL. Soon, even the remotest outpost on this great subcontinent will be a part of the national network of transport. Soon all these benefits will be ours, as there is a little more steel for us. Towards this end, IISCO is working — for more steel to help you and you and you — in serving you we help the Nation and that is our privilege.

STEEL IS BETTER TRANSPORT FOR YOU

NEWS IN BRIEF

INDIAN

Smokeless domestic fuel can be obtained from Neyveli lignite according to pilot plant studies carried out by the Lignite Project authorities.

The sugar mill machinery industry may now be considered to have been successfully established. It has achieved spectacular progress during the last five years and it has now reached a stage where it is now possible to meet the requirements of complete sugar factories for the whole country.

The National Shipping Board will review, at its next meeting to be held in Bombay on July 7, the general shipping tonnage position as well as the question of acquisition of additional ships for the coastal and overseas trade, particularly in view of the need for transporting an additional one million tons of coal on the coast and about eight million tons of foodgrains from the U.S.A.

Government is giving pig iron and steel at concessional prices for manufacture of goods which are exported. To ensure that only manufactured articles, and not merely pig iron or steel with a little processing, are exported Government have prescribed that the minimum value in the case of iron articles should be Rs. 400 per ton and the minimum value of steel articles Rs. 800 per ton.

Enormous potentialities for the cultivation of geranium, an important oil-bearing plant are indicated in a study carried out by the Essential Oils Research Committee of the Council of Scientific and Industrial Research.

The Tata Engineering and Locomotive Company Ltd. has been granted consent to the issue of 50,000, 5 per cent per annum debentures of Rs. 1,000 each, repayable on six months notice on or after 1st October, 1970, at the option of the company, but not later than September 30, 1975. The consent is valid for 12 months.

With the introduction of the three-monthly contract in bullion from June 26, in the Bombay Bullion Association, the Forward Markets Commission has relaxed the special margins payable by longs both in respect of gold and silver.

The President has given assent to the Lahaul and Spiti (State Aid to Industries) Regulation, 1961. The inhabitants of these areas will now be able to enjoy facilities provided under the Act in the shape of loans, subsidies, grants in aid etc. which are available to the people of all other parts of the State.

Under the First Plan, 14 national laboratories were established by the Council of Scientific and Industrial Research; under the Second Plan, nine more institutions have been established.

Provident Fund benefits were provided to 3.49 lakhs colliery workers during 1959-60 in Assam, West Bengal, Bihar, Madhya Pradesh, Orissa, Maharashtra, Gujarat, Andhra Pradesh and Rajasthan.

The Indian Standards Institution has prepared two draft standards prescribing methods for detection and estimation of damage to jute fabrics, jute yarn and cordages due to micro-organisms.

FOREIGN

Australia's wool exports dropped by £A51,300,000 in the first 11 months of the financial year, according to official figures released recently. The most significant fall was in exports to the U.K. Japan was again the best buyer.

Kaiser Aluminium and Chemical Corporation and a group of investors in Venezuela have organised a new company, Alumina Nacional S.A. (AL NASA) to establish the first aluminium foil production facilities in Venezuela.

Russia is to build more atomic-powered ships for peaceful purposes. The new programme would profit from experience gained with the Icebreaker Lenin (16,000 tons), which in 100 days of working at full capacity used only about six ounces of uranium.

A major expansion programme to cost £5 million over the next two years is to be carried out by Dunlop Japan at its Kobe and Nagoya factories. The plans include modernisation of existing works and the construction of new plant and buildings.

It is reported Ghana has banned the export of all Ghanaian produce to the Republic of South Africa and South-West Africa.

It is reported that the forthcoming \$25 million Argentine Government loan issue in Europe will be in the form of 12-year bonds at 6.5 per cent, not 7.5 per cent as had previously been believed.

The World Bank, with the participation of two private banks, has made a \$1½ million loan to British Guinea to provide the British Guinea Credit Corporation with additional resources for its lending programme, forestry, animal husbandry and fishing. The loan is for eight years and bears interest at 5½ per cent annually.

Construction work is about to begin on Israel's second crude oil refinery to be located at Eilat, the Finance Minister, Mr. Levo Eshkol, announced recently.

It is reported the U.S. will be associated with the British mission to the West Indies which is to discuss projects of special urgency.

The State-owned West German Railways are borrowing DM 100 million from the European Investment Bank—a specialised agency of the Common Market Organisation—to finance the electrification of a north-south trunk route.

Although world production of refined copper rose by 25,195 tons in May, stocks at the end of the month showed a decline of 18,075 tons.

The Norwegian Storting (Parliament) recently approved Norway's Kr. 69 million subsidy to the Scandinavian Airlines System for its refinancing scheme.

Special Article

DIFFERENTIALS IN ECONOMIC GROWTH: 1956-1976

THE Rockefeller Panel Reports highlighting the prospects for the U.S. over the next ten to fifteen years have now been published in one volume under the title "Prospect for America". The basic purpose of these reports was "to define the major problems and opportunities that will challenge the United States" and "to clarify the national purposes and objectives that must inspire and direct the meeting of such great challenges". The reports also attempted "to develop a framework of concepts and principles on which national policies and decisions can be soundly based."

More than one hundred distinguished Americans were requested to submit papers relating to these pressing problems and amongst the contributors may be named Mr. Chester Bowles, Mr. Arthur F. Burns, Mr. Dean Rusk and a number of other outstanding scholars. There were in all six panels which dealt with the following problems:

1. The Mid-Century Challenge of U.S. Foreign Policy
2. International Security: The Military Aspect
3. Foreign Economic Policy for the Twentieth Century
4. The Challenge to America: Its Economic and Social Aspects.
5. The Pursuit of Excellence: Education and the Future of America
6. The Power of the Democratic Idea

A report of major interest is the one dealing with the Foreign Economic Policy, with special reference to provocative statistical projections in economic growth upto 1976. In this report, an attempt has been made to project the population of the industrialised free world, the less industrialised free world and the communist countries to 1976 along with their growth in gross national product and per capita gross national product for 1956, 1966 and 1976. The results of their findings are set out in the table below.

The most striking fact brought out in this table is that the gap in the per capita gross national product between the industrialised free countries at 1159 dollars and the Communist countries at 312 dollars in 1956 is likely to widen in 1966 and 1976 instead of showing any signs of closing. While the difference between the per head G.N.P. of the industrialised free countries and the Communist countries was of the order of 847 dollars in 1956, it is estimated to increase to 1222 dollars per head in 1966 and to 1754 dollars per

head in 1976. It thus disproves the much publicised assertions of the Communist countries that they would soon overtake the industrialised free countries.

In terms of total gross national product as well, the Communist countries do not fare better. In 1956, the total gross national product of the Communist countries was about 38 per cent of the gross national product of the industrialised free world countries. According to the forecasts made by the panel, the gross national product of the Communist countries is likely to remain unchanged at 38 per cent of the industrialised free countries by 1976. These forecasts are based on an average rate of growth of 4.5 per cent per annum in the Communist countries and a similar rate for the free world industrial countries.

In the Communist countries, only the USSR has risen in the past at an average rate of 6 per cent per annum, but the satellites are estimated to have grown at not more than 3 per cent and Red China at not more than 2 per cent per annum giving an average of 4.5 per cent per annum for the entire bloc. The degree of variation in economic growth between the USA and the other industrialised nations in the free world is not very wide. Whereas the United States of America rose steadily at the rate of 4 per cent per annum, the other free world countries rose in the past at 5 per cent per annum. On the basis of these figures, it has been estimated that the free world industrialised countries will rise at an average rate of 4.5 per cent.

The fact that the report was published in 1958 and had based all its forecasts on the year 1956 does not alter the argument even when the trends during the last 4 years are taken into consideration. The fresh data in regard to population and rate of economic growth in all these countries has been utilised by the Research Section of "The Eastern Economist" so as to make fresh estimates of economic growth in these three regions during the last decade and new forecasts have been spelt out. It has been observed that in the case of the free world industrialised countries, there has been witnessed some slowing down in the case of the United States of America in particular; the overall rate of growth turned out to be 3.3 per cent per annum between 1950 to 1959 instead of the 4 per cent assumed in the calculations of the Panel. There is not much change in the case of other countries. Amongst the Communist countries China has proclaimed a rate of growth of 12 per cent per annum but because of the frequent violent revisions in its figures of agricultural output, in particular, some doubt has been cast on the

Area	Population (Mill.)			Total GNP (\$billions)			Per Capita GNP (dollars)		
	1956	1966	1976	1956	1966	1976	1956	1966	1976
Industrialised Free Countries	640	696	761	742	1152	1789	1159	1655	2351
Less Industrialised Free Countries	1132	1278	1451	134	172	220	118	135	152
Communist bloc	910	1018	1148	284	441	685	312	433	597

ASSUMPTIONS: GNP grows 4.5 per cent in the free world industrial countries, 2.5 per cent in less industrialised Free countries; and 4.5 per cent in the Communist bloc.

accuracy of their publicised figures and, therefore, much reliance cannot be placed on them. The new set of forecasts which emerged out of these revised considerations are set out in the table alongside. It will be seen that the argument in regard to the widening gap in the living standard between the Communist countries and the industrialised free countries of the world still stands and there seems to be no possibility of the Communist countries overtaking the industrialised free countries of the world by 1976 in terms of the standard of living.

While the less industrialised free countries of the world also are likely to improve their standard of living substantially by 1976, the hiatus between the industrialised and the less industrialised countries tends to widen at a much faster rate than the gap between the Communist and the industrialised free countries. Even when massive international capital is injected into the economies of these under-developed countries both through private and public agencies, it is not possible to accelerate the rate of growth in these areas which may come anywhere near the rates attained by the advanced nations. As the report states "these economies cannot be turned upside down overnight without creating stresses and strains. Any attempt to raise the rate of investment in the less developed areas by massive international loans or grants would very likely prove disruptive if attempted in too brief a period". Thus, the urgency of accelerating the processes of economic growth in the underdeveloped countries is stressed but it is believed that because of inherent difficulties, the rate of growth cannot be propelled so as to match the level prevailing in the advanced countries.

**THE
BUSINESS WORLD****Oilseeds Can Make It Too**

By CROESUS

ALTHOUGH reasonably higher targets have been set for agricultural products generally, in the Third Five-Year Plan, the oilseeds have been given only a slight increase of just two lakh tons over the Second Plan target of 95 lakh tons. Needless to say, the Third Plan target appreciably falls short of the target of 115 lakh tons proposed by the Bombay Oil Seeds and Oils Exchange Ltd. It is not that the B.O.O.E. is not aware of the absence of any fresh land that could be brought under cultivation for the purpose. But even while realising this, as Mr. Kilachand Ramdas, the President, observed in the course of his speech at its 34th General Body Meeting of that body last week, the association has felt it necessary to reiterate that, although there is not much scope to bring new land under the plough, the production of oilseeds could be increased by intensive cultivation as well as by scientific farming. What scope there is for doing so becomes obvious if note is taken of the fact that the per acre yield of oilseeds in this country is very much below that of other countries. Thus, our yield per acre stood at 645 lbs. in 1959-60 while in China it was 1401 lbs., in Brazil 1,137 lbs., in Nigeria 1,003 lbs. and in the USA 1,002 lbs.

There will always be serious differences of view on the question whether oilseeds deserve so much attention, especially vis-a-vis foodgrains. But even the protagonists of more foodgrains cannot object to more oilseeds being raised so long as the latter do not encroach upon the area under the former i.e. foodgrains. As any keen student of Indian agriculture knows, the conflict between food crops and cash crops is more a bogey than a reality, although interested parties may present the case in their own way to create such an impression. It is a pity that, in the bargain cash crops do not appear to be receiving a fair deal and this at a time when India needs to export as much as possible of every commodity that she can raise to rectify her balance of payments position.

True, the timely offer of aid by the Aid

India Club and the World Bank has enabled us to hope that we shall steer through our foreign exchange difficulties, but this cannot, and ought not, be a permanent 'dues ex machina'. Any long-term solution of our balance of payments difficulties must be found only in an all-out export drive. Given the chance, oilseeds could make their contribution, a sizeable contribution at that, even as other commodities have been able to make through their respective export promotion councils. Possibly, the absence of such a body in the case of oilseeds explains why the export position of oilseeds, oils and oilcakes has more or less remained static in recent years. Mr. Ramdas had ample justification, therefore, to characterise it as unfortunate that despite its repeated requests, the oilseeds interests had not succeeded in having an export promotion council of their own. The establishment of such a council will undoubtedly be of great use not only for detailed discussions of the trade's problems and constructive suggestions for their solution but also for a studied and concerted drive for promoting exports of oilseeds.

As in the matter of setting up an export promotion council for oilseeds and oils, the Government has yet to evolve a consistent policy towards exports of groundnut oil and salad oils. As Mr. Ramdas disclosed, the Government's experiments—by inviting tenders for export of groundnut oil and salad oils or making it obligatory on the importers of cassia, mace, cinnamon etc. to export groundnut oil against their imports—have not been successful. Similarly, the recent incentive scheme in regard to the export of cottonseed cake and vanaspathi were offered only to the manufacturers. According to Mr. Ramdas, this should be given to the exporters also. In the same context, the B.O.O.E. President further suggested that the Government of India also should adopt the methods followed by the advanced countries such as Japan and West Germany, namely relief in income-tax and super-tax on profits earned from export trade, foreign exchange retention scheme etc.

Business Notes**Industrial Finance****STATE FINANCE CORPORATION**

WITH THE rising tempo of industrialisation in the country there is an urgent need for institutional agencies to provide immediate as well as long term finance to industrial units — especially in less industrialised parts of the country. In fact, the commercial banks have been increasingly advancing money to industrial undertakings and between 1950 and 1960 the advances of the scheduled banks have increased by Rs. 650 crores, out of which Rs. 381 crores on account of industry. In 1950, scheduled bank advances to industry constituted nearly 32 per cent of the total. This percentage has

increased to 47.4 by the middle of 1960. The requirement of finance for industry increased at such a rapid speed that more similar institutions like Industrial Finance Corporation of India and Industrial Credit and Investment Corporation of India Ltd. have come into existence. The role played by the State Finance Corporations is peculiar in the sense that being in direct touch with the respective regions they can look into various industrial avenues to be exploited profitably.

Annual reports of three Finance Corporations in Mysore, Madhya Pradesh and Maharashtra States reveal that these Corporations are increasingly widening their spheres of activity. Increasing number of applications is being received and generally the Corpora-

tions examine the schemes in details on their respective merits and weigh the possibilities of success or failure on the basis of data submitted by the applicants. The corporations also take reasonable amount of risk because the purpose of their being constituted is to promote rapid industrialisation. Mr. Purushottam Kanji of the Bombay State Financial Corporation, for instance, indicated that if the Corporations were to adopt the same lines as the ones which make profits they would have failed in the very purpose for which they have been constituted. The Corporations, he added, should support and, if necessary, stand by the industrial units in times of need without fear of reproach.

The loans sanctioned by the Bombay State Financial Corporation during the financial year ended March 31, 1961 add up to Rs. 176.2 lakhs to 126 applicants. Of these 28 applications were sanctioned for new projects proposed to be taken up by existing concerns, 37 applications for setting up of new concerns and 61 applications for completing the programmes for expansion. Special care was taken by the Corporation to give credit to small scale producers.

Ever since May 1, 1960 when Bombay State was divided into Gujarat and Maharashtra, a new Corporation was constituted for Gujarat and the Bombay State Finance Corporation has been dealing with new applications from Maharashtra region only. There are certain parts of the State where adequate facilities for industrial undertakings did not exist. The Corporation has given special preference to the producers from these parts. It seems enough care has been taken to give loans to a diverse number of industries. The recipients include the manufacturers of chemicals, metal products, electrical machinery, textiles, engineering goods, paper and paper products, basic metals, food manufactures, rubber products and transport equipment.

The Madhya Pradesh Financial Corporation received 54 applications during the financial year ended March 31, 1961. Out of these and 18 brought forward from the previous year, 32 applications for a loan of Rs. 37.48 lakhs were sanctioned. Compared to the previous year, it was a fairly good record. Total loans sanctioned since the inception of the Corporation till the end of the year under review came to nearly Rs. 124.3 lakhs. Looking to the special needs of the small industries and medium industries, which are coming up, the Corporation decided to reduce the minimum amount of loan from Rs. 20,000 to Rs. 10,000. In this way units with small capital and modest schemes could approach the Corporation.

The Mysore State Finance Corporation received 60 applications for financial assistance of the order of Rs. 86.5 lakhs. The Corporation dealt with 91 applications including those pending from the previous year and sanctioned loans to 21 applicants to the extent of Rs. 43.5 lakhs. The chairman has indicated that the applicants did not furnish full information which resulted in unnecessary delay. The corporation has therefore printed a brochure for the guidance of the applicants. The industries which benefited by loan received from the Corporation include textiles, tile factories, metal engineering works etc. It seems that these Corporations are doing a major work by encouraging small and medium scale units engaged in a variety of industries.

Trade

AUSTRALIA'S FLOATING FAIR

THE EXPERIENCE of India's first floating fair, even after all the elaborate preparations that preceded it, cannot be said to have been very happy. But this does not mean that the idea has nothing to commend itself. Indeed, after seeing the floating fair that the Australian

Trade Mission has brought to India, one's faith in floating fairs as an effective means of fostering trade relations ought to be revived, if not increased. Also the way in which the floating fair was organised on board the M. V. Straat Banka, which was not after all a very huge vessel, should be an eye-opener to those in our country who may be contemplating a similar venture again in future.

The Australian floating fair certainly evoked considerable interest, thanks to the elaborate advance arrangements made by the representatives in India of the Australian Government. Besides carrying many exhibits, the M. V. Straat Banka had on board a number of leading industrialists who wanted to establish—and, according to reports, succeeded in establishing—preliminary contacts with Indian businessmen and explore opportunities of promoting trade with Australia. According to Mr. A. P. Whittington, Leader of the Trade Mission, the primary object of the Mission was to “further even more strongly two-way trade, and weld the bonds of friendship and cultural understanding which already exist between Australia and its northern neighbours.” At the same time, the Mission must have wanted to give a concrete demonstration, through the floating fair, of the extent to which Australia has advanced industrially and could help India and other countries of South-East Asia in their respective programmes of national development by supplying raw materials as well as heavy electrical and agricultural equipment.

The several exhibits—there were 115 of them—on the ship reflected the wide range of Australian primary and secondary industries, and included a number of interesting items from a carton-filling machine for liquids to power line switch-gear with live line testing and operating equipment. Our country has been exporting to Australia mainly hessian and other allied products, while, in return, we are importing wheat, pulses, milk and wool tops, among others. Mr. Whittington stated that our exports to Australia exceed our imports from that country by 50 per cent which has created an imbalance in trade, an imbalance which Australia is naturally anxious to rectify not only by increasing its traditional exports to India but also by seeking avenues for other items. Along with this, he said, his country wanted to collaborate with India in the pharmaceutical, chemical and processing building material fields, as also in the textile field, if possible. It is to be hoped that the visit of the Australian Trade Mission ship has not only created a tremendous amount of goodwill, but has also helped in laying the foundation stone for increased trade between the two countries, as was claimed by the Leader of the Trade Mission and the Union Minister for Commerce, Mr. Nityanand Kanungo, who specially came down to Bombay to welcome the Trade Mission.

New Issues

UNITED WIRE ROPES' OFFER

THE UNITED WIRE ROPES LTD. proposes to raise fresh capital to the tune of Rs. 54,08,000. The Company has an authorised capital of Rs. 1,00,00,000, of which capital worth Rs. 55,42,000 has already been issued and subscribed. Of the new issue, shares worth Rs. 17,08,000 will be taken up by the promoters, directors, their friends and associates, and capital worth Rs. 10 lakhs has been agreed to be subscribed by the Life Insurance Corporation. The remaining capital of Rs. 27,50,000 is being offered, at par, for public subscription in the form of 22,500 ordinary shares of Rs. 100 each and 5,000, 9.5 per cent cumulative redeemable preference shares, also of Rs. 100 each. The preference shares will be free of company's income-tax, but subject to deduction of taxes at source at the prescribed rates. The subscription list

opens on July 17 and will close on July 24 or earlier at the discretion of the company, but not before July 19.

The United Wire Ropes Ltd. was incorporated in October last for carrying on various business activities, particularly the manufacture of steel wires and wire ropes (both black and galvanized). The company proposes to locate its plant at Thana near Bombay. The initial capacity of the plant will be 3,600 tons per annum. The total capital outlay to set up the factory and the working capital required to run it are estimated to require Rs. 97 lakhs. The capital outlay and the working capital is proposed to be drawn from the following sources: Rs. 45 lakhs from equity capital; Rs. 10 lakhs from preference capital; Rs. 30 lakhs — the foreign exchange component — through loan from the Industrial Credit and Investment Corporation of India; Rs. 12 lakhs through loans from the company's bankers and from other unspecified sources.

Technical collaboration for this project has been secured from Messrs. Lepage Consulting Engineers of Antwerp (Belgium) who will also train the company's technicians both in Europe and in India. A sum of Rs. 688,475 will be paid to the technical consultants for their services. Seventy per cent of this remuneration will be invested by the technical collaborators in the equity capital of the Indian company.

In the developing Indian economy, the company's products should have a ready market. The share offer can be expected to evoke good response from the public.

SHRI VALLABH GLASS

THE SUBSCRIPTION list of Shri Vallabh Glass's Rs. 37.25 lakhs equity issue, offered to public at par, which opened on July 5, will close on July 15 or earlier at the discretion of the directors of the company, but not before July 8. The entire issue has been underwritten by the Central Bank of India and the Bank of Baroda. The company proposes to manufacture wired and sheet glass which is not at present manufactured in the country. The plant for this purpose will be set up at Anand in Gujarat and will be the first of its kind in India. At present the company is processing the famous tuff toughened safety glass which is widely used by the automobile manufacturers, bus body builders, and State transport and P.W.D. vehicles. The capacity of the Andheri plant which will consume a substantial part of the sheet glass production of the proposed Anand plant is also to be increased three-fold.

For the supply of machinery and technical know-how the company has entered into negotiations with Messrs. Induicofen and Maschinen G.M.B.H. Garmisch Partenkirchen, West Germany. It has been agreed that this foreign firm will assist the company in the manufacture of sheet glass and wired glass and design the lay-out of the plant. It has also been agreed that the theoretical and practical training of qualified persons of the company with regard to the manufacture of glass will also be arranged by this firm.

So far as foreign exchange for the import of machinery and capital equipment is concerned, the Industrial Credit and Investment Corporation of India has agreed in principle, subject to the approval of the International Bank for Reconstruction and Development, to lend to the company an amount in the foreign currencies to the extent of Rs. 37,19,000. The demand for sheet glass will obviously be considerable during the Third Plan period. The company hopes to meet fully Western India's demand where the plant has been set up.

Insurance

PROBLEMS FACING GENERAL INSURANCE

MR. AMBALAL KILACHAND, who in the absence of Mr. Tulsidas Kilachand presided over the 18th annual general meeting of the shareholders of the New Great

Insurance Company, pinpointed some of the problems faced by the general insurance industry. He expressed dissatisfaction with various regulations governing the industry and called for a wholesale review of the present Insurance Act. He pleaded for the removal of certain provisions in the Act such as restrictions on payment of commission and wanted it to be replaced by a simplified legislation more or less on the pattern of the U.K. legislation. Mr. Ambalal also urged re-examination of the Section 40C of the Act and Rule 17E of the Insurance Rules pertaining to the quantum of allowable expenses which were fixed over 10 years ago when cost of living was very much lower. The formula governing the expenditure to be allowed should be made more flexible, he said.

Dealing with the Insurance Amendment Act, Mr. Ambalal reiterated that as the main object for which the amending Act was passed was to conserve and earn foreign exchange and to make good to the companies the reduction in reciprocity, the India Reinsurance Corporation and the Indian Guarantee and General Insurance Company should concentrate mostly on brining to the Indian market an increasing volume of profitable business from abroad.

Dwelling upon the working of the company in 1960, Mr. Ambalal stated that the company earned a gross direct premium of Rs. 48,14,879 from fire business, Rs. 37,24,835 from miscellaneous insurance and Rs. 38,20,963 from marine business. The net premiums received were Rs. 42,24,023, Rs. 31,99,405 and Rs. 19,50,504 respectively. After providing for all expenses and making suitable allocation to the reserve fund, the net amount remaining to the credit of the Profit and Loss Account was Rs. 32,076.

Travancore Cements

THE PROBLEM OF COSTS

THE FACT that the cement industry was facing a problem of increasing costs was highlighted by Mr. C. S. Loganathan, Chairman of the Travancore Cements Limited, in his speech delivered at the annual general meeting of the Company recently. One major factor contributing to higher costs was the costlier coal transported by steamers because the entire requirements of coal by rail were not available to the Company. During 1960, the Chairman added, due to serious problem posed by the unsatisfactory coal supply position, the Company was forced to operate for more than half the time with furnace oil. If the entire requirements of coal by rail could be available and thereby the Company could avoid the use of fuel oil and sea-borne coal, he pointed out, there could have been an additional profit of Rs. 2 lakhs for the Company.

Another important factor that effected the cost of cement was the rising cost of packing materials. While the cost of naked cement was usually revised once in three years, the cost of packing payable to the producers was revised once in three months, based on the actual cost of gunnies. The Chairman pointed out that when the price of gunnies shot up by 60 per cent from the fourth quarter of 1960, the Government found it impossible to accommodate the increase within the then existing destination price and it was not possible for the industry also to run without an enhanced packing allowance. Although the Government permitted the producers to use second-hand bags upto the middle of 1961, the Company had to bear higher cost than permitted by the Government because the producers did not have sufficient supply of second-hand bags. The Company has, however, submitted all the facts to the Tariff Commission in respect of cost of production and it is quite likely that the prices will be revised so that cement companies find it worthwhile to expand their production capacity.

FROM THE CAPITAL'S CORRIDORS

OIL IN THE PUBLIC SECTOR

MR. K.D. Malaviya, the Union Minister for Oil, disclosed here on Tuesday that his Ministry was drawing up plans for the reorganisation of the Oil and Natural Gas Commission with a view to give it greater autonomy and to run it on sound business lines. The Commission, he added, had already some autonomy by virtue of its being a statutory body, but further measures were needed in this direction to make it more efficient and expeditious in its operations. A bill to amend the ONGC statute is likely to be brought before Parliament during its Monsoon Session starting on August 7.

Mr. Malaviya also disclosed that there were plans to integrate the operations of all the public sector undertakings dealing with oil, namely, the Oil and Natural Gas Commission, the Indian Refineries Ltd., the Indian Oil Company Ltd., etc. Details of this integration programme have not yet been finalised. Probably, there will be an apex body at the helm of affairs of all the various oil-managing units in the public sector. A beginning towards this end has already been made with the nomination of the Chairman of the Indian Refineries Ltd., as a member of the ONGC. The integration of the various public sector oil undertakings, it is felt, will not only result in appreciable economy in expenditure, but also step up the pace of development of the oil industry in the country.

Mr. Malaviya also dwelt upon the prospects of building up petro-chemical industries in India. He expressed the opinion that petro-chemical industries should be set up as a large, concentrated complex which could utilise all the by-products from oil at one place and not in small stray units. The public sector, the Minister added, will have to play a dominant role in the development of petro-chemical industries, but the private sector will also have its due share in the building up of the overall complex. The development of the petro-chemical industries in the public sector is envisaged to be integrated with the exploration, refining and distribution of oil.

Mr. Malaviya described his recent tour of the Continent as a "useful one". But he was reticent to say anything about the outcome of his negotiations with the ENI and the French Petroleum Institute for collaboration in India's oil exploration programme. He said he had first to report to the Prime Minister. Only after he had done so, he could say anything on this subject. He, however, indicated that there was every likelihood of an ENI team visiting India in the near future.

A French expert is also expected here shortly to explain to the Government of India and to exchange views with it on building up of a large petro-chemical industry complex in this country.

The 2-million ton refinery to be set up at Koyali, about 10 miles from Baroda, to process the Cambay, Ankleshwar and Kalol crude, the Minister stated, will be under the charge of the ONGC and not under the control of the Indian Refineries Ltd., which will look after only the Nunmati and Barauni refineries. This decision, he explained, had been taken due to the insistence of the Oil and Natural Gas Commission to own the refinery so that it could meet its losses in oil exploration from refining operations.

THE THIRD PLAN

The Third Five-Year Plan has reached the printing stage. It is expected to be published early in August.

Few chapters in the final draft have undergone so many changes in their content and presentation as the chapter on "Objectives of the Plan". This chapter, it is understood, has been re-written by the Prime Minister himself and sets forth not only the objectives which are to be achieved under this Plan, but also the various safeguards which have to be taken while achieving these aims.

Agriculture, the chapter says, has necessarily to be given the first priority. But the growth of the industrial sector has also to be fostered at a rate faster than hitherto. The interdependence of agriculture and industry is greatly stressed in the chapter. Public sector, it says, has to be expanded further particularly in the fields of heavy, machine-making and other industries of basic and strategic importance. State trading is envisaged to be resorted to on an increasing scale in consonance with the requirements of the economy.

Though large areas of development are assigned to the private sector, care will be taken to see that the expansion in the private sector does not lead to concentration of economic power in a few hands. The tendency towards concentration of economic power in the hands of a smaller number of individuals and business houses is envisaged to be encountered in various ways. The more important among them are: (1) Extension of the public sector into fields requiring the establishment of large-scale units and heavy investments; (2) opening up of opportunities for new entrants in the industrial field; (3) Development of small-scale and medium-scale industries on co-operative lines; and (4) Effective exercise of Government's powers of control and regulation—directly through the Industries (Development and Regulation) Act and indirectly through changes in fiscal policy.

In a growing economy, it is pointed out in the chapter, high incomes quite frequently are due to accrual of capital gains, to trading and speculative profits and to pre-requisites of one kind or another which are permitted by law. The tax system is proposed to be tightened up to enable the State to have its due share in capital gains and trading profits.

I.F.C.'S WORKING

Mr. K. R. K. Menon, on the eve of his relinquishing the office of the Chairman of the Industrial Finance Corporation, disclosed at a press conference here last week that the Corporation had under "active consideration" two proposals in regard to its lending operations. The first proposal related to conversion of a part or whole of the loans granted by the Corporation to the various industrial undertakings into share capital of the loanee companies. A decision on this is expected to be taken in about a month's time.

The second proposal which the Industrial Finance Corporation has under consideration is that, in future, besides charging the normal rate of interest, the I.F.C. may ask for some share in profits of the loanee companies. Such a participatory scheme, Mr. Menon explained, was prevalent in various underdeveloped countries, such as Brazil and Chile, and even in some advanced countries, notably the United Kingdom. A decision on this proposal is likely to be taken before September.

Mr. Menon also told the press conference that the Corporation had approached the Government of India to allow it to raise its capital by Rs. 2 crores—from Rs. 5 crores to Rs. 7 crores. The Government of India,

it is understood, has acceded to this request. The Corporation has an authorised capital of Rs. 10 crores.

To provide foreign exchange to the loanee companies, the Corporation, Mr. Menon disclosed, has approached the Development Loan Fund for a fresh loan of \$20 million. The D.L.F.'s first loan of \$10 million has been practically used up. The interest to be paid by the Industrial Finance Corporation to the Development Loan Fund on this fresh loan will be the same as on the previous one i.e. 5 per cent per annum. The Corporation, however, will be charging on the loans granted by it out of the D.L.F. funds an interest at the rate of 8½ per cent.

Reviewing the working of the Corporation during the year ended June 30, 1961, Mr. Menon said that the Corporation had made tremendous progress during the course of this year; it had sanctioned loans totalling Rs. 21.21 crores, given deferred payment guarantees to the tune of Rs. 13.29 crores and underwritten share capitals of various industrial units to the extent of Rs. 2.33 crores. Compared to the previous year's figures of Rs. 17.92 crores, Rs. 7.87 crores and Rs. 25 lakhs respectively, the 1960-61 figures undoubtedly represent a sizeable improvement.

The Corporation during the year just ended received 76 applications for loans, 14 applications for deferred payment guarantees and 28 applications for underwriting. Of these, 57 applications for loans, 9 applications for deferred payment guarantees and 12 applications for underwriting were approved by the Corporation. During the year 1959-60, the Corporation had received 38 applications for loans, 7 applications for deferred payment guarantees and 14 applications for underwriting. Of these, 29 applications for loans, 6 applications for deferred payment guarantees and 2 applications for underwriting had been approved.

The total loans given by the Corporation since its inception in 1948 upto June 30, 1961, amounted to Rs. 105.82 crores. Deferred payments guarantees given by the Corporation during all these years amount to Rs. 25.47 crores and underwriting to Rs. 4.20 crores.

Mr. Menon said the repayment of the loans advanced by the I.F.C. had been remarkably prompt. The default ratio had gone down progressively and was now very small.

The loans sanctioned by the I.F.C. during the year 1960-61 were distributed amongst the various industries in the following manner:

(Rs. crores)	
Industry	Amount
Co-operative sugar factories	4.65
Paper	3.50
Ceramics and Glass (including refractories and brick making)	2.42
Chemicals	1.49
Cotton textiles	2.16
Mechanical engineering	0.82
Electrical engineering	0.55
Metallurgical (non-ferrous metals)	1.30
Mining	0.20
Iron and steel	0.60
Plywood	0.81
Hotel	0.19
Miscellaneous	2.52
TOTAL	21.21

I.D.A. LOAN FOR ROADS DEVELOPMENT

The \$60 million credit extended by the International Development Association for development of roads in India will eliminate some of the major deficiencies in the national highways system. All the works for which this loan is to be utilised are located in the Gangetic plain in north India and in the coastal areas around Calcutta and Bombay where the density of population is the highest and which account for 40 per cent of the country's total vehicular registration.

The programme includes the following projects:

Calcutta Region: The congested approaches from the two main roads into Calcutta are to be completely relocated outside the thickly populated suburban areas. A new access is to be opened from their points of junction at Joypurbeel to Vivekananda Bridge into Calcutta and supplementary works are to be undertaken to provide improved connections between Calcutta and the neighbouring industrial centres. A new highway will be built to serve the coastal areas of West Bengal which upto now have been without road connections with Calcutta, and to link Calcutta with the rapidly growing industrial centres of Jamshedpur and Ranchi. A new road is also to be built from Calcutta to Cuttack in Orissa State. This road will fill in the missing link with the east coast highway running south from Calcutta through Madras. It will cross the under-developed areas where one of the retarding factors has been the absence of adequate trunk roads.

(2) Bihar Region: A bridge is envisaged to be constructed over the Sone river. This bridge will fill in the one remaining gap in the grand trunk road which runs from Calcutta westwards all the way across northern India. In north Bihar, the works to be completed during the Third Plan period include two new roads under construction in a densely populated area which, until a bridge was built over the Ganges two years ago, was entirely cut off from direct communications southward to the rest of the country.

(3) Bombay Region: Two roads are to be built in and around Bombay to relieve serious traffic congestion. One of them will be an expressway running east out of the city and the other will provide a new connection north along the coast towards Ahmedabad, opening in the immediate vicinity of Bombay a new area for industrial and agricultural development. In view of the traffic congestion in downtown Bombay, a small part of the I.D.A. credit is envisaged to be utilised for conducting a study into this problem by foreign consultants.

The Joypurbeel-Vivekananda access road into Calcutta and the eastern expressway at Bombay will be four-lane highways. All the other roads will be two-lane.

U.S. ASSISTANCE FOR POWER PROJECTS

Professor John Kenneth Galbraith, the U.S. Ambassador in India, after his first visit to the Bhakra Dam, has stated that the United States will increase its assistance for India's power projects included in the Third Five-Year Plan. The U.S.A. has upto now given assistance totalling \$486.6 million (Rs. 231.6 crores) for development of power resources in this country. This sum includes both dollar and rupee loans as well as grants.

Eight projects, with a total installed capacity of about 1.2 million KW., are being financed entirely by the United States. There are another 13 projects, having a total installed capacity of over 1.6 million KW., which are being partly financed by the U.S.A. The

former category includes the thermal power projects of Chandrapura, Durgapur, Barauni and Talcher and the hydro-electric projects of Barapani and Saravathi (Stage II). The latter category includes the thermal power project of Delhi and the hydro-electric power projects of Rihand, Chambal and Hirakud.

INDO-ITALIAN ECONOMIC CO-OPERATION

The Nityanand Kanungo Mission, which recently visited Italy, has made a very useful report to the Government of India. The Mission has found two major difficulties in the way of large-scale Indo-Italian collaboration for the development of chemical, engineering and machine-making industries in India. There was, the Mission says, a continuous imbalance in trade between the two countries, which, in the absence of any suitable alternative long-term arrangements, presented a serious impediment to greater economic co-operation. *Pari-passu*, India has not yet made any serious attempt to create the requisite climate for sympathetic understanding of the Indian economic situation by the Italians.

The Indian Mission, however, made it clear that situated as India was vis-a-vis foreign exchange resources, it would be next to impossible to continue even the existing level of imports from Italy, unless some long-term arrangements were made. Italians were equally candid. While the legislation for deferred payment facilities, at present under discussion by the Italian Parliament, could slightly ease the situation, there was little possibility of Italy extending any long-term credit to India.

So far as private investments were concerned, it was difficult for Italy to break away from certain countries of Europe, Latin America and North Africa. There could, however, be some investment by the war-created and State-controlled IRI. This is a Government controlled organisation. During the depression and banking crisis in Italy during the 1930s, the Government extended financial assistance to several industrial and banking units, which were in difficulties and whose stability was essential to the economy. This was achieved by State participation in the capital structure of the individual units, the extent of participation ranging from dominant majority to minority. The structure of the companies and internal management were not altered. Connected units of industries were brought together under different groups, for purposes of financial guidance. There are several such group companies. Finsider (Fin indicating financial) controls the State steel units, which account for a substantial portion of steel production in Italy. Finmeccanica, dealing with mechanical industries (which includes the Alfa Romeo automobile factory); Finelctrica, dealing with electrical industries; and Fincantieri, dealing with shipyards are among the others which include also certain non-industrial groups, such as Finmare, dealing with shipping; Alitalia Airways; telephones; and radio and television. These group companies are, in turn, under a single holding company, the Institute for Industrial Reconstruction (IRI), which deals directly with the banking companies in which it has interest. The ENI group, dealing with oil, gas and petrochemicals, and the State Railways are outside the IRI. Governmental guidance is secured by the Ministry of State participation.

The Mission made a specific request to the Director-General of Foreign Trade and the officials of the Italian Government to use their good offices to induce IRI and its subsidiaries to consider possibilities of collaboration and investment in India. The fields in which the IRI group of industries are engaged, such as heavy machinery, electrical machinery, machine tools, marine

engines, compressors, etc., are exactly those having particular significance to India's developing economy, whether in the public or in the private sector. The Mission is of the view that the matter should be further pursued at Governmental level.

AGGRESSIVE SALESMANSHIP WANTED

An important step for encouraging greater collaboration and investment is the need to finalise the double taxation relief agreement with Italy at an early date, it is urged.

On the trade side, the Mission has recommended the establishment of joint bureaux at important centres like Milan, Rome, Bombay and Calcutta, with the co-operation of the respective Federations of Industry and Commerce of Italy and India. The Mission, in this connection, repeatedly heard from Italian importers and institutions that, apart from the question of price and quality, Indian exports to Italy did not pick up mainly because Indian exporters had not shown the necessary degree of aggressiveness as compared to other countries. This was particularly mentioned in regard to tea. The Mission was told that to the extent that Italy imported tea, Ceylon tea found a better market in Italy mainly because of the better publicity and salesmanship.

Another point made by some Italian importers is that the supply of certain commodities from India had been on somewhat sporadic basis, and was not on a sustained and adequate scale. The Mission also gained the impression that there was scope for Italian industry purchasing semi-finished items from India such as castings etc., especially where there was also collaboration between the Italian and Indian parties. Here again, much would depend on the initiative that the Indian exporter was prepared to take in regard to the survey of the market and specific needs of the consumer.

Italians showed a sort of weakness for barter and link deals and the Mission, in its report, has suggested that such deals should not be ruled out of consideration by the Government.

MANUFACTURE OF TRACTORS

Production of agricultural tractors and attached implements, which was of the order of about Rs. 10 lakhs in 1960, is expected to go up to Rs. 20 crores by 1965-66. The demand for agricultural tractors by the end of the Third Plan is estimated at 10,000 numbers—3,000 numbers of 12/18 DBHP, 5,500 numbers of 20/30 DBHP and 1,500 numbers of 35 DBHP and above. Four firms have been licensed to undertake the manufacture of these tractors. They are:

Company	Licensed Capacity
1. Messrs. Goodearth & Co., New Delhi.	2,000 Nos. (for tractors in the 12/18 and 20/30 DBHP range).
2. Messrs. Tractors & Bulldozers (P) Ltd., Baroda.	1,000 Nos. (for tractors in 35 DBHP range).
3. Messrs. India Tractors & Implement Co. (P) Ltd., Madras.	3,500 Nos. (for tractors in 20/30 DBHP and 35 DBHP & above range).
4. Messrs. Mahindra & Mahindra Ltd., Bombay.	3,500 Nos. (for all three ranges).
Total	10,000 Nos.

These firms have also been approved for the manufacture of matching implements. It is considered desirable that the attached implements should be manufactured by the tractor manufacturing concerns themselves.

Messrs. Goodearth and Company have already gone into production and are turning out about 50 tractors

a month in the 26/27 DBHP range. They have also started manufacturing attached implements. Messrs. Tractors and Bulldozers are expected to go into production very shortly. Messrs. India Tractors and Implements Company are taking steps to import their plant and machinery at an early date. The manufacturing programme of Messrs. Mahindra and Mahindra has been slightly delayed because their collaboration arrangements with Messrs. David Brown, of U.K., have fallen through. They have now finalised collaboration arrangements with a Czech firm. This arrangement has been agreed to in principle by the Government of India. All these four firms are expected to be operating their factories to full capacity by 1965-66, by which time 100 per cent of components would be produced indigenously.

Manufacture of tractor-driven agricultural implements has also been started by Messrs. Marshall Sons and Company (India) Ltd., Calcutta. They have been licensed to produce 200 ploughs and 400 cultivators. In 1959, this firm manufactured 40 ploughs, 54 harrows and 112 cultivators. In 1960 its production was 60 ploughs, 100 harrows and 72 cultivators.

Three other firms have been licensed to manufacture tillers (also called walking tractors). They are:

Company	Annual Capacity (Nos.)
Messrs. East Asiatic Co. (I) Ltd., Bombay	24,000
Messrs. Testeels Ltd., Bombay	1,200/6,000
Messrs. Engineering Developments (P) Ltd., Calcutta	1,200

All these firms are expected to achieve an indigenous content of 50 per cent of the value of the tractor equipment during the very first year of their operation.

JOINT STEAMER COMPANIES

The Government of India, on the recommendation of the Inland Water Transport Freight Rates Enquiry Committee, set up in March last to look into the problem of whether any increase in freight rates charged by the India General Navigation and Railway Company and the Rivers Steam Navigation Company, popularly known as the Joint Steamer Companies, for the traffic other than foodgrains, carried by them to and from Assam was justified and if so to what extent and how the increase in freight rates should be distributed amongst the various traffic items, has allowed the two companies a 5 per cent increase in their freight rates in force prior to March 15, 1961. The Committee had also recommended that the increase in freight rates proposed by it should not be applied to tea traffic from Cachar and foodgrains traffic. This suggestion too has been accepted by the Government. The increased freight rates take effect from July 1, 1961.

The case for increase in freight rates of the Joint Steamer Companies was based on the fact that the freight rates charged by them prior to March 15, 1961, did not enable them to set apart out of their earnings enough resources for their rehabilitation programme. Owing to their fleet becoming obsolete, the two companies had worked out in 1959 plans for the replacement of all their overaged vessels by new vessels in a period of 10 years from 1961 to 1970. This rehabilitation programme involved construction of 24 self-propelled main-line carriers, 3 main-line tugs, 22 main-line barges, 7 Cachar feeder tugs, 28 Cachar feeder barges and 8 harbour tugs and was expected to cost Rs. 10.6 crores, of which a sum of Rs. 4.5 crores was to be secured from external sources and the balance from internal resources, primarily from the savings the companies expected to effect in their working cost on account of repairs and fuel. This rehabilitation programme also envisaged increasing of the companies' one-way annual capacity of carriage from about 5,46,000 tons to 6,54,000 tons. For

one reason or the other, the companies could not get financial help from outside sources. After protracted discussions between the Government of India and the representatives of the companies, a modified scheme of rehabilitation was drawn up which involved construction of 14 new self-propelled carriers and 6 harbour tugs during the five years from 1960 to 1964 at a total cost of Rs. 5.66 crores. Out of this, a sum of Rs. 2 crores was to be advanced by the Government as a loan to the companies. The balance was to be arranged by the companies from their own resources. This modified scheme (it did not include any expansion in the existing carrying capacity of the two companies) was accepted by the Union Government which agreed to provide a loan of Rs. 2 crores for the execution of the plan. In order to find adequate resources from their own sphere, the two companies in March last raised their freight rates for the transport of all commodities, other than foodgrains and Cachar tea, by the river route from Calcutta to Assam by 10 per cent. This increase was objected to by the State Government and the Assam Chamber of Commerce. On the intervention of the Government of India, the companies curtailed the increase to 6 per cent over the rates prevailing before March 15, 1961.

The Enquiry Committee found that there was a good deal of justification for some increase in the freight rates charged by the Joint Steamer Companies to enable them to find funds for their modified rehabilitation programme. The increase in freight rates suggested by the Committee and accepted by the Government is expected to yield nearly Rs. 9 lakhs per year for the two companies' rehabilitation programme. The Committee thinks that 5 per cent increase in the freight rates in force prior to March 15, 1961, is "reasonable and by no means excessive having regard to all the features of the case".

IBRD & IDA LOANS

Following the recent meeting of the Aid-India Club, a number of negotiations for loans are in progress with the World Bank and the International Development Association. A mission has left for Washington to negotiate a loan of \$20 million to cover the foreign exchange requirements of the coal industry in the private sector, during the first two years of the Third Plan. The five-year requirements of this industry are placed at \$56 million.

This will be the first loan of its kind. The Government of India will be the guarantor of the loan and will also set up the machinery for its allocation to various colliery-owners in the private sector.

Another loan of \$20 million is being negotiated for the development of Calcutta port. Negotiations are also in progress with the International Development Association for loans to finance the tube-well projects in U.P., medium-sized irrigation projects in Gujarat, and Orissa and a drainage project in Gujarat.

The World Bank is also showing great interest in the development of hydro-electric power in India. One expert is already working with the D.V.A. and another is expected to study the Koyana project.

BRIEFS

Despite acquisition of several new vessels during the quarter January-March, 1961, the strength of India's shipping fleet was only 8,85,850 GRT on March 31, 1961—14,150 GRT short of the Second Plan target.

*

One of West Germany's leading chemical companies—BASF (Badische Anilin and Sodafabrik)—has acquired 50 per cent interest in R.A. Cole, a Bombay firm. The Indian concern will produce plastics for the domestic market under West German technical management. The deal has already been approved by the Union Government.

COMPANY AFFAIRS

THE BURMAH OIL

Sales through the subsidiary and associated companies of the Burmah Oil Company Limited in India were some 7 per cent higher during 1960 as compared to the previous year. This trend is likely to continue because the total demand in 1960 for petroleum products was of the order of 7 million tons and in the course of next six years it is likely to be doubled.

The Chairman, Mr. W. E. Eadie, referred to the new price formula for petroleum products which reduced the margin allowed to the oil companies. In the latter half of 1960, the Government of India established an Oil Price Enquiry Committee which was conducting an exhaustive investigation and was expected to report shortly. He was of the opinion that the desire to see national petroleum reserves discovered and developed expeditiously was quite natural in countries like India. The greater the number of operators exploring for such reserves the greater the chances of success. He pointed out that the Government of India would encourage interested operators - national and foreign - and offer attractive concessional terms and as far as possible provide an assurance of a fair selling price for the commodity and its products.

He indicated that production operations continued in the Assam Oil Company's Digboi field. In the Jharkatiya, Huglijan and Moran areas extension and development drilling has again been successful. 25 wells were drilled, 19 of them being completed as oil wells, 3 as gas wells and 3 were abandoned as dry holes.

Construction of the first stage of the pipeline, belonging to Oil India Pvt. Ltd., from the oil fields to Gauhati, a distance of 260 miles, was started towards the end of 1960 and the target date for completion is the end of October 1961. Construction of the second stage, from Gauhati to Barauni, a distance of 460 miles, is due to start in 1961 and the target date for the completion of this section is the end of March 1961. The Burmah Oil Company (Pipe Lines) Limited is superintending the design and construction of this pipeline.

BAGALKOT CEMENT

The Company has been granted, by the Government of India, a licence to increase its production capacity from the existing 2 lakh tons per year to 4 lakh tons per year. The Directors do not feel justified in implementing the additional capacity when its existing capacity is not being fully utilised. The Company has, therefore, informed the Government that the Company as to defer its decision regarding implementation of additional capacity until the coal situation has eased and the Company is in a position to receive its supply of electric power from Sharavathi Power Project which is due towards the end of 1963.

Production of clinker and cement in the Bagalkot Cement Company Limited, during 1960, was 134,645 tons and 134,901 tons, respectively. The Directors have reported that the increased capacity during the eight months of 1960 could not be fully utilized on account of shortage of coal. Despatches of cement for the year as recorded at 132,231 tons. Sale proceeds for 1960 were higher at Rs. 1.01 crores against Rs. 74.05 lakhs during the previous year. After meeting all expenses of operation and management, the Company revealed gross profit of Rs. 21.93 lakhs.

Although the second kiln was put into operation in May 1960 and worked only partially during the

year, mainly due to shortage of coal, the Directors have provided for full depreciation for the original plant and machinery and for the Company's hundred per cent capacity expansion effected in the year 1960. The total depreciation provided, according to Income-tax Rules for the original plant as also for hundred per cent expansion during the period of its operation, amounted to Rs. 20,59,467, the balance of Rs. 1,33,584 being surplus for the year.

PREMIER FERTILISERS LIMITED

The First Annual Meeting of the members of the Premier Fertilizers Ltd. was held at Madras on 19th June, 1961. Mr. M. Ct. Muthiah, Chairman, reviewed the progress made during the period ended 31st December, 1960 and in the course of his speech observed that the contract for the civil work had been finalised and that the actual execution will start in the next few days. In the meantime arrangement for other services like water and power supply are being attended to. According to the latest information received, one shipment consisting of two instalments of machinery due has been despatched from Germany and it is expected that the same may be received in the course of a month or so. The indigenous items ordered are also getting ready and it is expected that the schedule regarding the erection of the machinery and the target fixed for the commencement of production sometime in January 1962 could be adhered to.

LEATHER EXPORT PROMOTION COUNCIL

SCHEME FOR ENROLMENT OF EXPORTERS

In order to maintain and develop the goodwill among the foreign importers about Hides and Skins, Leathers, Leather Goods and allied items which they import from our country and to maintain healthy trade relationships, it has been decided by the Government of India, Ministry of Commerce and Industry, to introduce a Scheme for Enrolment of Exporters. The Government have authorised this Council to operate the same.

Producers and exporters of (1) skins and hides of all types (2) tanned leathers (vegetable and chrome tanned and finished leathers) (3) manufactures of all types including boots and shoes made wholly or partly from leather (4) bye-products of the tanning industry such as fleshings, tannery wool, hair etc. (5) products of allied industries including tanning materials, in our Country are advised to register themselves under this scheme with this Council before 31st July, 1961.

Attention is invited to para 6 of Appendix 23 of the Current Red Book wherein the exporters are advised to enrol themselves with the respective Councils as early as possible.

Application forms and other details can be obtained from:

They won't dispense with Carrier at Sandoz (India) Ltd., Kolshet

Perfectionists, those medicine manufacturers! With them, everything has to be just so. Like the quality of their pharmaceuticals, for instance. Or the way their drugs are made. Won't tolerate dust or impurities. Insist on stable temperatures in their labs. That's why they can't do without people like us—air conditioning people.

Drug manufacturers all over India give their climate control jobs to us. Rely on our wonderful Carrier equipment. On the expert way Voltas design, install and service every project. Though we hate to admit it—we're flattered when our perfectionist friends say: "Carrier and Voltas are the people who know air conditioning best".

Other pharmaceutical concerns air conditioned by us:

Burroughs Wellcome & Co. (India) Private Ltd., Bombay
British Drug Houses (India) Private Ltd., Bombay
Dey's Medical Stores Private Ltd., Calcutta
Ciba Pharma Private Ltd., Bombay
Glaxo Laboratories (India) Private Ltd., Bombay
Lederle Laboratories (India) Private Ltd., Bulsar
Roche Products Ltd., Bombay
Sigma Laboratories, Bombay

Fabrications to specifications

Under licences
from Messrs Fives-Lille-Cail,
France, who built the largest sugar and cement
plants in the world and have supplied Soviet Russia
in 1959 a five thousand ton daily capacity cement plant, we
manufacture machinery and equip complete sugar and cement plants.

We also manufacture and supply complete sulphuric acid and super
phosphate plants. We have secured orders for five complete sugar
plants, of one thousand tons daily sugar cane crushing capacity.

COMMODITY NEWS AND NOTES

REGULATING PRICES OF WOOL PRODUCTS

Unsatisfactory conditions of price and supply of wool yarns have recently led to protests by dependent processors.

The Hand Knitting Wool Processors of Delhi, who dye and package knitting wool, claim that deliveries of undyed yarn from the spinners are totally inadequate, and that prices asked are in excess of the voluntarily controlled rates. This difficult position has arisen, they say, because more spinners have started marketing their own branded knitting wool, thus starving the hand-knitting wool processors of their usual supplies.

On 6th June this Delhi association observed a hartal and as a protest marched to Udyog Bhawan where their representatives met the Union Minister for Industries, Mr. Manubhai Shah.

The Small Scale Woollen Manufacturers' Association of Amritsar have also complained vigorously that most spinning mills are ignoring the voluntary price regulation scheme. They report that many of their member units may be forced to close down if the present shortage of yarn becomes worse.

The shawl weavers of Kashmir have complained to the Textile Commissioner that they are not getting worsted yarn at the fixed rates. The shawl manufacturers have been using worsted yarn instead of pashmina since the decline of trade with Tibet after the Chinese occupation.

Spinners' Viewpoint

The Textile Manufacturers' Association, Amritsar and some of the Bombay spinning mills have urged the Government to agree to a revision of the voluntarily controlled prices of worsted yarn as world rates for wool tops have gone up considerably since they were first set. Furthermore, while imports are now less in quantity (licences being on a value basis) overhead expenses remain the same.

Shoddy Yarn

The Textile Manufacturers' Association have also requested the Government to examine the claims of weaving units and to ensure for them a satisfactory supply of shoddy yarn. They suggest that it be based on actual production over a standard period.

Meanwhile an Amritsar spinner complains that hosiery yarns are accumulating with him, as the Ludhiana Hosiery Industry Federation has delayed issuing delivery permits to its members.

FLOOR PRICES OF COTTON INCREASED

The Government of India have been considering the question of fixing floor and ceiling prices for cotton for the September 1961—August 1962 cotton season. In the context of general economic conditions and in view of the necessity to increase cotton production, it has been decided to increase the floor price for Jarilla 25/32 inch from Rs. 139 to Rs. 168-57 per quintal (100 Kilograms), corresponding to an increase from Rs. 495 to Rs. 600 per candy by the old rate. The floor prices of other varieties of cotton will be increased correspondingly. The Government of India have decided to keep the ceiling prices of all varieties of cotton at the existing levels.

PRODUCTION OF CRYOLITE FOR STEEL AND OTHER INDUSTRIES

The National Metallurgical Laboratory, Jamshedpur, has undertaken investigations for the manufacture of cryolite which is one of the essential minerals required by the steel, ceramic and aluminium industries. Cryolite is not found in India and is imported from Denmark and Greenland. The annual imports total about 7,500 tons. The National Metallurgical Laboratory is investigating the possibility of producing cryolite

from low-grade fluorspar containing a high percentage of silica. Fluorspar of this type is available in Rajasthan, Madhya Pradesh and Bombay. High-grade cryolite can be obtained by the interaction of metallurgical-grade-fluorspar with sulphuric acid and boric acid through the intermediate formation of fluoboric acid and subsequent precipitation of cryolite by the interaction of fluoboric acid with hydrated alumina and sodium carbonate. In the process, boric acid can be re-generated and re-used. High-grade gypsum is also obtained as a by-product.

IRON ORE PRODUCTION IN INDIA

The production of iron ore during April 1961 was 944,000 metric tons, according to the Indian Bureau of Mines. This brings the total output during January-April 1961 to 3,838,000 metric tons which was higher by about 8 per cent compared to the output during the corresponding period of the preceding year. Orissa was the leading producing State with an output of 321,000 metric tons followed by Bihar with 264,000 metric tons. The production from Madhya Pradesh, Mysore and Maharashtra was 169,000, 122,000 and 45,000 metric tons, respectively. During the month, despatches for consumption in the iron and steel plants totalled 678,000 metric tons while despatches for export totalled 184,000 metric tons.

RESEARCH ON CHEWING AND CIGARETTE TOBACCO

Two research stations are likely to be set up, one in Gujarat and the other in Madras, for carrying out research on tobacco. The decision to recommend the setting up of these research stations by the two State Governments was taken by the Agricultural Research Sub-Committee of the Indian Central Tobacco Committee which met in Madras recently. The Committee approved the technical programme of work of its Central Tobacco Research Institute and research stations and Schemes. The station proposed to be set up at Vijapur in Gujarat will conduct research on cigarette tobacco, and the other at Bhavanisagar, in Coimbatore district, research on chewing tobacco.

SUGAR PRODUCTION

According to the Indian Sugar Mills' Association the sugar production during the month of May, 1961, was 2,06,000 Tons as against 76,000 Tons during the corresponding period last season. This brings the total production for the Season 1960-61 upto 31-5-61 at 29,06,000 Tons as against 23,99,000 Tons produced last season by this date. The off-take of sugar from factories during the month of May, 1961, was 1,76,000 Tons as against 1,87,000 Tons during the corresponding period last season. The total despatches including despatches for exports upto 31-5-61 were 12,34,000 Tons as against 11,30,000 Tons by the same date last Season. The total closing stock of sugar with factories on the 31st May, 1961, was 22,13,000 Tons as against 14,11,000 Tons on the same date last Season.

Company Meeting

THE INDIA SUGARS AND REFINERIES LTD.

Speech delivered by Shri Rajeshwara Patel, M. P., Officiating Chairman, at the Twentyseventh Annual General Meeting of the Company held at the Factory on Thursday the 29th June, 1961.

Gentlemen,

In the absence of our Chairman I am asked to perform the pleasant duty of welcoming you all to this Twenty-seventh Annual General Meeting of the Company. In deference to the wishes of the shareholders expressed in this behalf, the registered office of the Company was transferred to this place and thus after an interregnum of five years the Annual General Meeting is again being held in Hospet.

2. The Directors' Report and the audited accounts for the year ended 30-9-1960 have been with you for sometime now, and, with your permission, I shall take them as read.

3. From the accounts you must have noticed that though our sugar recovery was much better during the year under review, the net profits are less by Rs. 1,43,487 and you would naturally like me to say a word about it. The main reason for this fall in the net profit is the payment of bonus amount to the cane growers under the SISMA formula. The amount paid under this formula for the year under review is Rs. 12,32,836 as against Rs. 6,26,221 for the previous year. This alone makes a difference of Rs. 6,06,615. Then we have also made increased provision for depreciation during the year; the increase being approximately Rs. 1,06,000. If you make an allowance for these two items, you will find the working results for the year under review are better than that of the previous year. Out of the net profits also we had to provide a sum of Rs. 2.92 lakhs for taxation as against a sum of Rs. 50,000 only for the previous year.

4. In spite of these factors and slight reduction in the net profits, your Directors have recommended a higher dividend of 14 per cent to the shareholders for this period. This 14 per cent dividend is payable subject to deduction of 30 per cent tax on your personal account which sum will be adjusted at the time of your personal assessment. Those of you who have obtained the exemption certificates from the income-tax authorities will no doubt receive this dividend without any deduction.

5. In the Directors' Report a reference has been made to the late starting of the current season. The crushing of cane still continues and is expected to be completed by the first week of next month. Due to late starting and delayed crushing, the sugar recovery is bound to be low and that in turn is sure to affect the overall working results of the Company. The factory started late because the cane growers were not prepared to supply cane to the factory till the question of cane bonus under SISMA formula was settled. That settlement became possible only after the intervention of State and the Central Governments. Valuable time was lost in these negotiations and as a result, all interests concerned stand to suffer. I am sure you would all approve the action of the Management in accepting all the cane honouring their moral obligation even if technically they were in a position to reject some of this cane.

6. Another difficulty which your Company is presently facing is about the sales and stock lifting of sugar. As you know, the sales are controlled by the Central and State Governments and the permit holders do not lift stocks in time. Sometimes the permit expires and even when a fresh permit is issued the stocks are still not lifted. This has naturally created working difficulties and some bottle-necks. Fortunately, till now we have been able to carry on without any

dislocation of work. So while I do not want to draw any pessimistic picture of the current year, I consider it my duty to be frank with you and to take you in confidence by apprising you of the exact position obtaining.

7. The production of sugar in the country was phenomenal last year and it is likely to go still higher up during the current year. The efforts of the Government and the Sugar Mill Association to export sugar have succeeded only partially. The main hurdle in our export is, as you all know, our high cost of production. Even though the Government is prepared to export it at a much sacrificed price yet we cannot make our sales very competitive or sufficiently attractive in the world market. Perhaps you will be surprised to know that a bag of sugar which costs you and me about Rs. 115 here in this country where it is produced, we are prepared to sell it to the foreign purchasers for less than Rs. 35 only.

8. The redeeming feature, however, is that this year the Government has announced that the loss on export of sugar will be borne fully by them and the factories would not be called upon to pay any percentage thereof. Your Directors sincerely hope that the Government would be able to export all the surplus sugar on this basis. This export besides earning foreign exchange, for our country would give much needed relief to the sugar industry.

9. Another important point which we have already mentioned in our Directors' Report is the Central Wage Board Award for the Sugar Industry which came to be implemented from 1st November last year. Your Directors have since taken necessary steps to implement it and it is estimated that this will increase the annual wage bill of your Company by more than a lakh of rupees.

10. I would now say a word about our Subsidiary Company, the Salar Jung Sugar Mills Ltd. I am very happy to be able to inform you that this Company has achieved record crushing this year. It has crushed more than 1,20,000 tons and has produced about 1,08,000 bags of sugar. It has been a thrilling performance when one compares the same with its production only a few years back viz., in the year ending 30-6-1956 when the total production was less than 21,000 bags. It is not only a question of emotional thrill but financially also the Company has been fully rehabilitated. Your Directors hope that within not too distant a future, the losses of this Company would be completely written off and that this Subsidiary Company would soon become a perpetual source of steady revenue to your Company.

11. Last year on a similar occasion, our Chairman made a reference to the expansion scheme and you would perhaps expect me to let you know as to where the matter stands at present. Our application with the Government is still pending but in the meantime your Directors are negotiating an agreement with cane growers, their co-operative societies and their leaders in this area under which if your factory is assured of certain minimum supply of cane every year, we would not press application for expansion. It is the wish of those people to start a Co-operative Sugar Factory of their own. In the larger interests of the factory and to maintain harmonious relations between the cane growers and our factory, we have agreed not to expand the present capacity provided our minimum quantity is assured to us and that an agreement to this effect is finally approved by the State as well as the Central Government. Actually the agreement is under draft

by the lawyers and when it is finalised further action would be taken in the matter.

12. In your Directors' Report we have mentioned that two of your Directors, Sarvashri M. R. Morarka and Madanlal Somani are retiring by rotation under Article 105 of the Company and are eligible for re-election. Since then we have received an intimation that Sri M. R. Morarka is not seeking re-election. Hence you have to re-elect only Sri Madanlal Somani.

13. Before I conclude I must express my heart-

felt thanks on behalf of all of you and the Board, to our Managing Agents, to our Staff, to our Workers and to the Cane Growers and Merchants for their industry and hard work without which these results would not have been achieved.

14. Gentlemen, I now formally move the adoption of Directors' Report and audited accounts for the year ended 30-9-1960.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

RESERVE BANK OF INDIA

Applications are invited for the following posts in the Bank:

(A) POSTS AND SCALES OF PAY

(i) Banking Officer: Rs. 375-55-815 E.B. 55-925-60-1045.

(ii) Probationary Assistants: Rs. 250-25-450 E.B. 25-650.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates will be eligible to draw local pay, house allowance and dearness allowance at the rates prescribed by the Bank from time to time.

(B) QUALIFICATIONS:

(i) Banking Officers:

(a) Applicants should have a minimum of five years' commercial banking experience out of which not less than three years should be in a responsible position. Preference will be given to applicants with high academic qualifications who have made a special study of Economics, Banking, Commerce or Accountancy, or

(b) They should be Chartered Accountants with a minimum standing of 5 years.

Preference will be given to those who have passed the examinations of the English or Indian Institute of Bankers.

(ii) Probationary Assistants: Applicants should have a good academic record and a first or high second class Master's degree of a recognised Indian or foreign University with Economics, Banking, Commerce or Accountancy as a special subject and should also have some proficiency in drafting. Educational qualifications may be slightly relaxed in the case of candidates who have passed the Institute of Bankers' examinations and/or possess practical banking experience in a supervisory capacity in a commercial bank.

Candidates who have applied for these posts in response to previous advertisements issued in 1960 need not apply again.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

(C) AGE LIMITS AS ON 1ST JULY 1961:

(i) Banking Officers: Candidates should not ordinarily be over 35 years of age but the age limit may be slightly relaxed in the case of candidates with exceptionally good experience of value to the Bank.

(ii) Probationary Assistants: Between 21 and 25 years.

In the case of (ii) the maximum age limit is relaxable but not beyond 30 years in the case of:

(i) candidates possessing special qualifications and experience of value to the

(ii) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;

(iii) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges; and

(iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees and should clearly indicate the post for which they have applied.

3. Applicants for the posts of Banking Officers and Probationary Assistants must remit with their applications a fee of Rs. 7.50 for each post by cheque or bank draft on a Scheduled Bank payable at Bombay or by Postal Order. The application fee is in no case refundable. Bonafide refugee candidates not in employment applying through Employment Exchanges are exempted from payment of application fees while in the case of candidates belonging to Scheduled Castes/Tribes, the fee will be reduced to one-fourth.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Lucknow, Trivandrum and Patna accompanied by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post Graduate degree examinations and two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before 22nd July, 1961.

5. Candidates should also indicate in their applications whether they had applied previously for a similar post in the Reserve Bank and if so with what result.

6. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected, at the time of their appointment in the Bank's service.

7. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

8. Selected candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

9. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

10. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

11. Canvassing will be regarded as a disqualifi-

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS. APPLICATIONS FOR SHARES ARE INVITED ON THE BASIS OF PROSPECTUS.

A copy of the Prospectus together with the documents required to be attached thereto by Section 60 of the Companies Act, 1956 has been duly filed with the Registrar of Companies, Maharashtra for registration.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence has been obtained from the Central Government for the establishment of this new industrial undertaking for the manufacture of steel wire ropes (black and galvanized) with a rated capacity of 3630 tons per annum (working on two-shift basis).

An application will be made to the Stock Exchange, Bombay for permission to deal in the shares now offered and in due course for an official quotation.

UNITED WIRE ROPES LIMITED

(Incorporated on 19th October, 1960 under the Companies Act, 1956).

AUTHORISED CAPITAL:	1,00,000
Shares of Rs. 100 each	Rs. 1,00,00,000

UNDERWRITING COMMISSION

The underwriters will each be paid an underwriting commission of 2½ per cent on the face value of all the shares underwritten by them respectively besides brokerage of 1 per cent on shares allotted on application bearing their stamp.

BROKERAGE

Brokerage at the rate of 1 per cent will be paid on all allotments made in respect of applications bearing the stamp of a Bank or a recognised Broker. Broker-

age on the same basis is payable to the Underwriters in addition to the underwriting commission on all allotments in respect of applications made or procured by them and bearing their rubber stamp.

OBJECTS OF THE COMPANY

The Company was incorporated on the 19th October, 1960 for carrying on all or any of the objects and purposes mentioned in the Memorandum of Association including in particular to manufacture steel wires and wire ropes (both black and galvanized).

COMMENCEMENT OF BUSINESS

The Company has obtained a Certificate to Commence Business bearing No. 11851 dated 22nd December, 1960 from the Registrar of Companies, Maharashtra.

PROSPECTS

Steel wire ropes are a specialised product and are used by various industries such as mines and mining, shipping, engineering, ropeways, oil exploration, lifts, cranes and for other haulage purposes. The major portion of India's domestic requirement of wire ropes is at present met through imports with the resultant continuous drain on the country's foreign exchange. With the increasing tempo of industrialisation envisaged in the successive Five-Year Plans the demand for wire ropes is likely to increase considerably in the near future. According to estimates of the Planning Commission the country's demand for wire ropes at the end of the Second Plan will be about 25,000 tons a year which is expected to rise to approximately 40,000 tons per year at the end of the Third Plan. This ever increasing demand leaves a wide gap between the supply and demand and thus assures this proposed factory a good market for its products which will eventually assist the country's foreign exchange position.

The Company's plant will be most up-to-date in design and technique of production of steel wires and wire ropes of the best quality and will have an initial capacity of 3600 tons per annum. At a nominal additional capital cost it is also proposed to manufacture High Tensile Steel wire for use in prestressed concrete construction and an application has already been made to the Government of India for issue of a Licence for an annual production capacity of 2100 tons.

ESTIMATE OF PROFITS

On the basis of the existing prices the Directors are of the opinion that, in the absence of any unforeseen circumstances, the Company should be in a position to pay reasonable dividends on Equity Shares.

TAX BENEFITS

The Company will enjoy the special benefits under the Indian Income-tax Act, 1922 as regards development rebate, in addition, as a new industrial undertaking, it will enjoy exemption from Income-tax for profits upto 6 per cent on the capital employed for the first five years of the Company's operation.

Shareholders of the Company would also be exempt from Wealth-tax on their holdings for a period of five years under the Wealth-tax Act and may also be exempt from tax on such dividend paid from the Company's profit exempted from tax under Section 15C of the Indian Income-tax Act.

FOREIGN COLLABORATION

With the approval of the Government of India the Company has entered into a (1) Technical Services

Agreement and (2) Assistance to the Management Contract with Messrs. **Lepage Consulting Engineers of Antwerp (Belgium)** who have been working as specialist consultants in the field of wires and wire ropes for over 20 years. Under the Technical Services Agreement the consultants will provide all technical know-how, layout and other engineering and the plant will be erected under their supervision. They will advise the Company in respect of machinery, raw materials and staff necessary for operation of the plant and will train the Company's technicians in Europe and India. This Agreement expires when the plant is installed and the quantity and quality of products are proved. For these services the consultants will be paid a remuneration of **£23,520**.

The Assistance to the Management Contract comes into force immediately after the expiry of the technical Services Agreement. As per the Contract Messrs. Lepage Consulting Engineers will provide their experts to look after the various processes of manufacture at the Company's plant for a period of 5 years from the start-up. For these services called "technical assistance in the management of the plant", the consultants will be paid at the rate of Rs. 75,000 per year.

Thus the Company has been assured of continuous availability of technical know-how and assistance in the production of wire ropes. A beneficial feature of the collaboration agreements with Messrs. Lepage Consulting Engineers is that about 70 per cent (Rs. 4,85,000) of the payments to be made to them as stated above will be invested by them in the equity capital of the Company.

LOCATION

The factory is to be located at Thana, near Bombay, where all facilities like transport, power, water, etc. are adequately available.

START OF PRODUCTION

The plant is expected to go into production late in the year 1962.

CAPITAL OUTLAY AND SOURCES

Capital outlay and working capital:

The estimate of requirements is as follows:

(a) Land, buildings, roads, etc.	Rs. 11,00,000
(b) Plant and machinery, imported and indigenous, including import duty, transport to site and erection charges	Rs. 56,85,000
(c) Cost of technical services and know-how	Rs. 3,15,000
(d) Pre-operating expenses	Rs. 4,15,000
(e) Preliminary Expenses including Underwriting Commission, Brokerage, and Issue Expenses	Rs. 2,45,000
(f) Working capital	Rs. 19,40,000

Total Rs. 97,00,000

The above requirements will be met from the following sources:

(a) Equity Capital	Rs. 45,00,000
(b) Preference Capital	Rs. 10,00,000
(c) Foreign exchange loan from the Industrial Credit and Investment Corporation of India Ltd.	Rs. 30,00,000
(d) Loan from Company's Bankers and from other sources	Rs. 12,00,000

TOTAL **Rs. 97,00,000**

LOAN IN FOREIGN CURRENCIES FOR IMPORT OF MACHINERY

The Industrial Credit and Investment Corporation of India Ltd., Bombay have agreed in principle, subject to the approval of the International Bank for Reconstruction and Development, to lend to the Company an amount in foreign currencies equivalent to U.S. \$630,000 (approximately Rs. 30 lakhs) to pay for the cost of imported machinery and capital equipment. The loan will bear interest at 7½ per cent per annum and is repayable in 15 half-yearly instalments commencing from November 1963 and ending in November, 1970. The loan will be secured by a first legal mortgage of the Company's present and future assets subject to the hypothecation of moveables to secure bank borrowings for working capital. So long as the loan or any part thereof is outstanding ICICI shall be entitled to appoint a Director who shall not be liable to retire by rotation nor shall be required to hold qualification shares.

PAYMENT TO PROMOTERS

No payment is to be made to Messrs. C. H. Gandhi & Sons, Promoters of the Company, except for the re-

imbursement of the actual out-of-pocket expenses incurred by them and no profit or benefit has been given to any other person as promoter of the Company.

MANAGING AGENTS

The Government of India by their letter No. 9(5)-C.III/60 dated 2nd June, 1961 have given their approval to the appointment of Messrs. C. H. Gandhi & Sons Private Limited as the Managing Agents of the Company for a period of 10 years from 2nd June, 1961.

MINIMUM SUBSCRIPTION

The minimum subscription in respect of the public issue on which the Directors will proceed to allot is Rs. 27,50,000. Subscription of the amount is assured as the entire public issue has been underwritten.

REDEMPTION OF PREFERENCE SHARES

The Redeemable Cumulative Preference Shares of the face value of Rs. 10 lakhs being issued under this Prospectus shall be redeemed by the Company at par at the expiry of 10 years from the date of issue.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON THE 17TH JULY, 1961 AND WILL CLOSE AT THE CLOSING OF BANKING HOURS ON THE 24TH JULY, 1961 OR EARLIER BUT NOT BEFORE THE 19TH JULY, 1961.

Steam...

Industry's greatest power

SINCE 1782, when the first Rotative Steam Engine enabled the use of steam power to motivate machinery, steam has played an ever increasing part in industry throughout the world.

Not only is steam today's most important source of power for the civilised world, but it must remain so for many years to come. Even atomic power is yet in its infancy and can only be applied as an alternative source of heat. Steam is indeed the real power of industry.

While this is but an outline of the extensive and continually growing part that steam plays in power generation and industry throughout the world, it indicates quite clearly the unparalleled importance of steam power in the industrial growth of India... and, therefore, the urgent need to manufacture vital steam-raising plant in this country to meet the demands of expanding industry.

This is one of the needs which has led to the formation of a new and powerful industrial group, ACC-Vickers-Babcock Limited (AVB). The vast technical knowledge and extensive practical experience available to it will enable the new company to make an important contribution to Indian industry—and help Indian engineers overcome some of the difficulties which have faced them for so long.

The new AVB plant is nearing completion on a 700-acre site at Durgapur. The workshops, designed on modern lines, will have built into the structure electric overhead travelling cranes with 70 tons lifting capacity. All workshops have been designed to allow for progressive expansion so that it will be possible to lift 200 tons without making structural alterations. Up-to-date machine tools are being installed. When completed, they will include a 3000 ton hydraulic press capable of bending steel plates up to 5" thick for use in the manufacture of high pressure boiler drums, and pressure vessels required for the fertiliser, chemicals and oil refining industries. The new plant will make it possible to manufacture steam-raising equipment in the high pressure range—for the first time in India.

ACC-VICKERS-BABCOCK LTD. offers the industrialist his best chance to ensure a fully integrated installation comprising the boiler plant itself and a wide range of equipment from the fuel handling and preparation plant to the ash plant and dust disposal installation.

Besides, the industrialist has the confidence that he will get after-sales service of the highest quality from AVB!

...a Powerful Partnership for Progress

ACC-VICKERS-BABCOCK LTD.

REGISTERED OFFICE OF THE COMPANY
TAKTAWALA HOUSE,
GANDHI ROAD, AHMEDABAD.

CONSENT

The letters giving the consent in writing of the Auditors, Bankers, Brokers and Solicitors to the Company to act in their respective capacities have been obtained, and the same are filed with the Registrar of Companies, Gujarat, Ahmedabad. None of them have withdrawn their consent so given.

OBJECTS AND HISTORY OF THE COMPANY

The Company was incorporated as a private limited company on 24th December, 1957 to carry on all or any of the object of purposes, mentioned in the Memorandum of Association and more particularly to carry on the business as manufacturers and dealers in sheet, wired and figured glasses, glass building blocks and all sort of glass and glasswares. The Company was promoted by Messrs. Tribhovandas Maneklal Taktawala, who are in the business of import and distribution of glass since last 70 years. The Company had installed a plant at Andheri, Bombay and commenced production on 1st April, 1959.

The Company is being managed by Managing Directors, Shri J. A. Taktawala and Shri M. J. Taktawala since 13-2-1958, who are connected with glass business since 20 years and have considerable experience in the line.

The present capacity of the plant of the Company at Andheri is of processing of about 1,00,000 sq. ft. of sheet and plate toughened glass per month and about 50,000 sq. ft. of mirrors per month. The plant has also the capacity of processing per month 10,000 pieces of sight glasses and 10,000 pieces of protector glasses used in ship and furnaces.

At present the company is processing the famous "Tufex" brand toughened safety glass which are widely used by the Automobile Manufacturers, Bus Body Builders, State Transport, P.W.D. vehicles etc. The Government has granted Import Licences for the value of Rs. 1,95,000 for the import of machinery for the manufacture of laminated safety glasses and for the import of machinery of the value of Rs. 1,96,000 for

the manufacture of bent toughened glasses. This will increase the activities of the present works of the Company situated at Andheri.

SCOPE OF THE INDUSTRY

The Tariff Commission has estimated the total demand of sheet glasses in the country at about 110 million sq. ft. in 1960. The present production is round about 85 million sq. ft. The present production and demand has already increased owing to expansion in building programme and there will be sufficient demand for sheet glass. At present, all plants in India which are engaged in manufacturing activity similar to that of the Company are situated near about Calcutta. There is no similar plant in Western India. The cost of transport of their finished products is about 20 per cent of their sale price. Western India is an important market for the consumption of items which the Company proposes to manufacture. During the period of Second Five-Year Plan, the demand of glass has also been increased at a rate faster than envisaged either by the Tariff Commission or Planning Commission. During the period of Third Five-Year Plan it is estimated that the demand will be considerably higher than the present installed capacity in the country and the Company believes that there is adequate market for the type of sheet glasses proposed to be manufactured by the Company. Furthermore, Company proposes to manufacture wired and figured glass which most probably at present are not being manufactured in India. The type of glasses are at present imported from abroad. This project will perhaps be the first of its kind simultaneously making sheet glass and wired glasses in India.

SITE

Keeping in view the availability of power, water, raw materials, labour, transport facilities etc. arrangements have been made to obtain by way of purchase about 1 lakh sq. yards or more of land near about Anand.

MACHINERY AND TECHNICAL COLLABORATION

The Company has finalised negotiations to supply the machinery and technical know-how with Messrs. Industrieofen & Maschinen G.M.B.H. Garmisch Partenkirchen West Germany, who has wide experience in glass technology, and has designed similar plants all

over the world, which to the Company's information are functioning satisfactorily.

The said foreign firm has agreed in principle to assist the Company in the manufacture of sheet glass and wired glass, and in designing the layout of the plants and will render necessary assistance in technical know-how, to enable the Company to work its plant satisfactorily. Moreover, the said foreign firm, has agreed to arrange for the theoretical and practical training of qualified persons of the Company with regard to the manufacture of glass.

FOREIGN EXCHANGE REQUIREMENTS

The Industrial Credit and Investment Corporation of India Ltd., Bombay have agreed in principle subject to the approval of the International Bank of Reconstruction and Development to lend to the Company an amount in foreign currencies equivalent to U.S. \$7,81,000 (about Rs. 37,19,000) to pay for the cost of imported machinery and capital equipment.

CAPITAL OUTLAY

The capital estimated to be required to commence production will be as follows:-

(1) Land, building and power installation	Rs. 35,00,000
(2) Complete cost of plant and machinery including designing engineering fees, transport and erection	Rs. 55,00,000
(3) Working capital	Rs. 23,00,000
(4) Expenses of issue	Rs. 2,00,000
	Rs. 1,15,00,000

THE SUBSCRIPTION LIST WILL OPEN AT COMMENCEMENT OF BANKING HOURS ON 5-7-1961 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 15-7-1961 OR EARLIER AT THE DISCRETION OF DIRECTORS BUT NOT EARLIER THAN 8-7-1961.

DIVIDEND

In respect of the first two periods, no dividend was paid by the Company. Interim dividend has been paid at the rate of 6 per cent (subject to deduction of tax) on 4,030 Equity Shares, in respect of the profits of the year ending 31st March, 1961. The final dividend at the rate of 9 per cent (subject to deduction of tax) on the Equity Shares has been proposed in respect of the year ended 31st March, 1961. The above dividends have been paid and proposed respectively out of the profits of the Company for the year ending 31st March, 1961.

INSPECTION OF DOCUMENTS

Copies of prospectus and documents mentioned therein are open for inspection at the Registered Office of the Company during office hours till the subscription list is closed.

*The figures for 1960 are not strictly comparable with those of earlier years; till 1959 only accounts with deposits of Rs. 500 and over were classified against various items and all accounts with deposits of below Rs. 500 were grouped together and shown as "unclassified accounts." From 1960 such accounts (below Rs. 500) under Demand and Time Deposits were required to be classified as in the case of other accounts against various items. The items will, therefore include all accounts in 1960.

**Includes in addition the deposits of business concerns owned and/or managed by government; the relevant figures for the previous years are not available.

§Transport, communications, gas, electricity etc.

†Accounts of less than Rs. 500.

‡Included under item (a).

†Including 'Business deposits'.

¶In 1951, the "Unclassified accounts" (i.e. accounts of less than Rs. 500) have been classified under "Personal" and "Others".

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

- PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
- STORES ORGANISATION • CONSUMABLE STORES CONTROL
- RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
- TRANSPORTATION METHODS • MECHANICAL HANDLING
- PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
- WORK STUDY • BUDGETARY CONTROLS
- VALUATION OF PLANT & BUILDINGS
- DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

- METHOD AND WORK STUDY • PRODUCTIVITY INDICES
- TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
- JOB EVALUATION • WAGE STRUCTURES
- PERSONNEL RECORDS • LABOUR POLICIES
- HUMAN RELATIONS • COMMUNICATION
- REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

- MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
- CLERICAL PROCEDURE • MANAGEMENT CONTROLS
- WORK MEASUREMENT • BUDGET FORECASTS
- LAYOUT, COMMUNICATIONS AND EQUIPMENT

JULY 14, 1961.

The New Foreign Exchange Crisis

INDIA'S foreign exchange crises have changed from becoming hardy annuals to appear unhappily at more frequent intervals. The Reserve Bank's statement for the week ending June 30 has raised again the question of how critical India's current balance of payments position really is. Foreign exchange securities are down to an all-time-low of Rs. 103.01 crores and balances held abroad to Rs. 10.78 crores. It is understood that in the last ten days there have been further withdrawals and it is not impossible that before the Independence Day the figure will be below Rs. 100 crores in all. To those who have not acquired repose in the assimilation of statistics, these figures might look alarming. On the other hand one should look upon the effort of the last six months in terms of underwriting our foreign exchange problems as one of the most successful of our accomplishments. Apart from the spectacular results of the Aid-India Club meeting there is good ground for believing that now oscillations of India's sterling balances are merely a marginal indication of our capacity to fulfil the Plan. It would be too much to say that external finance is no longer a major problem, but it is literally true that it has ceased to be the one requiring the highest priority. Implementation in terms of managerial skills and organisation have now attained first place with a reasonable assurance that India's major foreign exchange needs will be underwritten with only the inevitable administrative delays.

While this broad perspective remains that India's foreign exchange crisis is manageable, no complacency is permissible in terms of the use of the foreign exchange which India already has. Many Ministries of the Government of India still consider that pet schemes which are not foreign exchange earners or long-term contributors to the infrastructure of the economy can go on unscathed. This is as much an error in perspective as pessimism on India's balance of payments over the long haul. What is required is a new determination to tighten our belts in respect of everything which can be cut out of our foreign exchange budget while at the same time, recognising that an escape from recurrent crises means a strengthening of the productive apparatus which in itself is dependent on essential imports. There has been both wisdom and generosity in the Aid-India Club meeting's assessment — largely helped by the understanding in the United States — that development and maintenance imports must, to some extent, march together. However, no one should make the mistake of supposing that non-development and non-maintenance imports have any place in priority at the present time.

It would be foolish to deny that there exist at the present time many areas seemingly unknown to the authorities where foreign exchange is being lost by procedural or ideological prejudices which have no relation to the current severity of our foreign exchange difficulties. In a

Special Article in the issue next week (July 21) a case study of one particular commodity, namely, the lubricating oils, will be presented in order to show how, by failing to buy in bulk, India might be losing something in the region of half a crore of rupees each year by the mere dispersal of licences which have to be operated by non-bulk purchases by a large number of persons. Whatever the arguments in favour of dispersal — and *The Eastern Economist* has always been in favour of decentralisation wherever practicable — this must never be carried to the point where our foreign exchange crisis is made more difficult by such dispersal. No doubt, the Ramaswami Mudaliar Committee which is to report at the end of the year will indicate the area over which procedural changes can save foreign exchange, but there is no reason, why where proved cases come to light they should not be corrected without delay.

Quite apart from procedural matters, there are other opportunities raised which have not been fully recognised. There seem to be a very significant number of schemes under negotiation both in the public and private sectors where a gap in the foreign exchange is sought to be covered by loan in Western European or North American currencies when they could conceivably be covered by rupees by using the facilities offered by rupee payment by many countries in Eastern Europe and by Yugoslavia. What, in effect, is implied is that the rupee component of a particular project negotiated with the West can be extended by sub-contracting not only inside the Indian Union, but also in those rupee receiving countries, which are prepared to take Indian currency even though a small fraction, even over 10 per cent, might have to be paid in part in foreign exchange. An understanding has been reached in these terms with Yugoslavia and those who are acquainted with Yugoslavia's great capacity at the present time in the heavy industry field to help India out must wonder why we have not attempted a greater degree of sub-contracting in that country. Similar arrangements seem to be possible in Poland and in Czechoslovakia. Triangular, or even multi-lateral arrangements to sub-contract in rupees where a hard foreign exchange payment would otherwise be inevitable might well prove to be a major source of foreign exchange saving. It is certain that this will require much technical discussion and much knowledge of the capacity of the partners in an enterprise to work together on the basis of complete partnership and confidence. *The Eastern Economist* is certain, however, that there is a great measure of such co-operation which can immediately be fruitful, and should be sought with vigour and urgency.

If a close scrutiny is undertaken of areas of unnecessary expenditure as a result of faulty procedure, and areas of saving by intelligent sub-contracting of orders with rupee payment coun-

tries, one might argue that a further cushion can be placed under our current sterling balances. While there is no need for great alarm, this is the

time for ordered decision on a long range policy for saving foreign exchange at points where substantial leakage is visible even to the naked eye.

The Wage Board for Coffee

THE announcement of July 7 of the personnel and terms of reference of the Wage Board for Coffee could not have been more ill-timed. For about two years now the coffee plantation industry is in the doldrums. It may be reasonably argued that alternations of booms and recessions are cyclical features of any industry. But precisely for this reason the indecent haste shown in appointing the Wage Board at a most inopportune time ought to have been avoided. For two successive years the industry is confronted with the stark reality of accumulations of enormous stocks which can find a market neither at home nor abroad. This cannot be considered, by any stretch of reasoning, a situation conducive to making a fair assessment of a liberal structure of wages. While the industry is in dire need of an assessment of relief which it is entitled to receive, it is offered a gift of an enquiry into fresh burdens.

Exports have proved to be the very crux of the rapid expansion of the coffee industry in the post-war era and, therefore, of consolidating its position. Between 1953 and 1959 (the year before the recession), exports of coffee increased nearly five-fold from 3,339 tons to 16,241 tons. Domestic consumption during this period recorded an increase of less than a half from 20,235 tons to 29,619 tons. In percentage as well as absolute terms, it was the volume of exports which gave a boost to production pushing it to 45,860 tons in 1958-59. In the global perspective, India's share in coffee exports may look small at 2 per cent, but it is based on the high quality of supply and, in normal conditions prevailing in the world market, it operates as a stabiliser for the developing industry. In 1959 with exports ranging at 14,408 tons the residual output was of the order of 34,972 tons, but in 1960-61 the phenomenal volume of output at 63,300 tons, in spite of some improvement in exports at 16,459 tons, has created the staggering problem of clearance of the quantity of 46,841 tons much of which is just not disposable. The major producing countries of Latin America are offering tough and organized competition with the powerful instrument of the International Coffee Agreement that they recently forged. The priority problem is to devise ways and means to provide relief to the industry, not to raise the wage structure, particularly when labour in the last year had no grievances on the score of wages and bonus.

Food Exports?

IMMEDIATELY on his return to New Delhi after a six-week world tour, the Union Food and Agriculture Minister, Mr. S. K. Patil, has done well in correcting the erroneous impression created by a news despatch from London last week. Mr. Patil was reported to have said there that India was in a position to export food and that it would not be advisable for her to have a bigger food output because in that event she would be saddled with the same problems of over-production that today beset so many other countries in the world. At a Press Conference held here on Wednesday, Mr. Patil stated categorically that no exports of wheat and rice from the country were envisaged. A large output in one year did not warrant export of foodstuffs. The situation had to be watched at least for another ten years or so.

The index numbers (with base 1949 = 100) for the different indicators of the coffee industry make highly instructive comparisons. The rise of the index for the area under cultivation to 106 in 1959, in telling contrast with the index number of production in the same year at 263, brings out conspicuously the strategic role of intensive and scientific methods of cultivation sustained by substantial outlays. The economies of large-scale production have not been translated into diminishing costs per unit inasmuch as the index for costs reveals a rise to 175 in 1959. The corresponding index number of price has stayed low at 118. Taxation and wages have been in the forefront of the factors which have inflated costs.

The results of these diverse and conflicting trends in the industry's main indicators are best summed up in the profit ratio. The best testimony available is that of the official estimates. The Reserve Bank's analysis of the balance sheets of 750 companies for 1951-55 and of 1,001 companies for 1955-59 (which includes the coffee industry in the category of "other plantations" barring tea) discloses the average profits of coffee plantations for these two periods to be declining. Gross profits as a percentage of total capital employed decreased from 15.9 to 15.4, as a percentage of gross sales they recorded a larger drop from 39.8 to 36.4, whereas profits after tax as a percentage of net worth fell sharply from 14.0 to 11.4. The margin for plough back for development is progressively shrinking.

The foregoing analysis must not be misconstrued as an argument against a rational wage structure. The industry has not grudged better wage scales and it stands committed to the policy of gradual improvement to obviate dislocations. The terms of reference specifically call upon the Board to give full weight to two important factors — developmental requirements of the industry and the principle of payment by results. The precedent of the Wage Board for the Textile Industry shows that nominal attention is paid to them and considerations of retroactive higher wages override everything else. If this error is repeated by the Coffee Wage Board, it will bear full responsibility for hastening the saturation point in the production of coffee and in the industry's employment potential.

Not to speak of effecting foodgrains exports at the present juncture when India is importing nearly five million tons of grains from abroad every year, even to talk in terms of exporting foodgrains is inadvisable. The rate of development of Indian agriculture under the Second Five-Year Plan, despite the fact that foodgrains output during the past three years has been maintained around 75 million tons and production in the agricultural year 1961-62 is expected to go up to 80 million tons, is not something with which we can remain contented. With population growing at the fast rate of over 2 per cent per annum, the agrarian economy of India being still a big gamble in rain despite the massive investment that has gone into this vital field during the past 10 years and the urgency to raise the standard of living of the people, there is hardly any scope for complacency on the food front.

At the 1960-61 foodgrains output of 78.5 million tons, per capita availability of indigenous foodgrains on the basis of the latest population census figures comes to 15.1 ozs. a day — approximately the same as in the pre-World War II days. In the meantime, intake of protective food has progressively gone down. This is a factor that cannot be ignored when we talk about achieving self-sufficiency in food. Taking into consideration the caloric and protein content of an average Indian's food, India's attaining self-sufficiency in food is yet a far cry.

The need of the hour is to redouble our efforts if the goal of self-sufficiency in food on the basis of the minimum caloric and protein content requirements is to be achieved by the end of Third Five-Year Plan. India would be requiring at least 102 million tons of foodgrains per year by 1965-66 if a modest advance is to be made in the prevailing nutrition standards by providing 17.4 ozs. of cereals and 3.5 ozs. of pulses per adult unit per day. This means an annual increase in foodgrains output at the rate of 6 per cent as against nearly 3.5 per cent achieved under the Second Plan. The task is stupendous indeed.

With little scope for increasing the area under food crops in view of the imperative of stepping up the output of raw materials required to meet the demands of industrialisation, the need for raising yields per acre in the country, which today are amongst the lowest in the world, can hardly be over-emphasised. While there is every reason for fostering the use of improved seeds,

The Czech Credit

THE announcement last week by Mr. V. Pacl, Economic Counsellor of the Embassy of the Czechoslovak Socialist Republic in India, regarding the long-term credit of about Rs. 17 crores extended by Messrs. Technoexport of Prague — in addition to the Czechoslovak Government's long-term credit of Rs. 23 crores — has been received with great satisfaction in New Delhi and has further strengthened the bonds between the two countries. It is true that India's foreign exchange requirements for the Third Plan exceed 3,000 crores of rupees and the total credit of Rs. 40 crores from Czechoslovakia may look small in relation to the total need, but the importance lies in the particular types of industrial units which the Czechoslovak Government and Messrs. Technoexport have agreed to set up.

Of the four projects being set up with Czechoslovak assistance, the most important is the Foundry Forge Plant in Ranchi which will be the biggest engineering project of its kind in Asia and will produce medium and heavy castings and forgings and, which will mainly be used as semi-products in Heavy Machine Building Plant and Heavy Machine Tool Plant. The second plant, namely, the Heavy Machine Tool Plant will produce different types of heavy machine tools such as lathes, double housing planning machines, horizontal boring machines, boring and turning mill, portal milling machines, radial drilling machines and grinding machines. The Heavy Power Equipment Plant will be the third engineering works to be established in collaboration with Messrs. CKD of Prague, Czechoslovakia. This plant will produce steam turbines and alternators. It will also produce condensate extraction pumps, cooling pumps, water-jet air pumps and feed pumps. The High Pressure Boiler Plant will be the fourth important engineering factory which will produce high pressure boilers.

In order to lessen the pressure on India's for-

farm implements, fertilizers and for extension of irrigation facilities, one important factor that has not been given serious consideration as yet in the changed circumstances is the provision of price support at least for the major food crops. The liberalisation of restrictions on inter-State movement of foodgrains and improvement in the holding capacity of the peasantry has helped to some extent in ensuring a fair return to the agriculturist for his efforts. But in view of the gradually improving food situation, there is a strong case for guaranteeing minimum prices to the farmer for his products. The return may be gradually reduced to bring down food prices in the country, thereby helping the industrial sector to push down its production costs.

The need for continuing food imports for at least a number of years to supplement the indigenous production and to build up a buffer stock also cannot be over-stressed. The deal that India last year entered into with the United States for the supply of 17 million tons of foodgrains under PL 480 during the first four years of the Third Plan has been an important factor in keeping food prices within bounds; it has proved to be deterrent to the trade's indulging in any nefarious activities when there have emerged terrible transport bottlenecks. The difficult foreign exchange situation and increasing indigenous output may warrant curtailing of imports of food on commercial account, but care has to be taken that reduction in imports does not remove this powerful deterrent to any undue rise in food prices.

In addition to these four projects, the Czechoslovak Government has offered as a gift to India essential equipment and technical assistance for the establishment of the Central Machine Institute.

It has been possible for Czechoslovakia to render assistance of this order to the Indian Union because of the speedy growth of the Czechoslovak economy in recent years. It may be mentioned that Czechoslovakia has an area of not more than 40,000 square miles and a population of less than 14 millions. The economy, however, has been racing ahead in a dynamic manner with yearly average growth in gross national product at nearly 8 per cent. Forty per cent of the investment during the Second Plan was allocated for the development of industry while agriculture claimed only 16 per cent. It is this extreme emphasis on industrial development which has made Czechoslovakia not only self-sufficient in its own requirements of machinery but has also created capacity to export on easy credit terms to the developing countries.

On per capita basis, the output of cement, steel, coal, electric power in Czechoslovakia is far ahead of many advanced countries of Europe. In all these four major industrial elements, Czechoslovakia has scored over France on per head basis. Its output of coal on per head basis is ahead of even West Germany, while its production of steel on per capita basis is very nearly that of West Germany. Similarly, in cement production Czechoslovakia is slightly above the United States of America on per head basis.

The Third Five-Year Plan in Czechoslovakia which started early this year, because of its extremely heavy emphasis on investment in industry, is likely to accelerate the growth of its economy. Whereas during the period 1956-60 the investments in machinery were around 36 per cent of the total gross national income, during the Third Plan the investment is to be raised to 41 per cent.

A DELHI DIARY

OF CHIEF MINISTERS AND ELECTIONS

GREATLY resisting the temptation to be embroiled in election politics, I am keeping my sights still fixed on my experiences abroad. I should, however, mention in passing the strange controversies which are taking place everywhere in regard to what is called the ten-year rule, that is, the decree of Congress President (not shared by the Prime Minister) that normally those Congressmen who have served ten years in legislatures should be good enough to stay out for the benefit of new aspirants to office. At the Finance Minister's residence this week Dr. Jivraj Mehta has apparently agreed to cease to be Chief Minister, but is staying on to contest a seat in the legislature. Thus have Congress rivalries found a new formula by which the new and the old can march together without open faction. While I record with some satisfaction the settlement with Gandhian non-violence of this particular election dispute, there are threatening rumours from a group of astrologers gathered at Calcutta that there will be no election at all in February, 1962. The configuration of the planets—or is it the stars?—in February, 1962 is such, they say, that a tremendous calamity will occur which will have dire repercussions on the Indian Union. Apparently, a seminar—or the orthodox equivalent thereof which is a Parishad—has been called to determine whether the aforesaid configuration is scientifically accurate and the consequences thereof are astrologically sound! If so, the astrological predictions are in conformity with the great guessing game, all of which I have no doubt will be of great interest to those who are looking forward to their political futures with more than usual zest.

YUGOSLAVIA REVISITED

However, as I was saying, my eyes are still abroad—particularly on Yugoslavia which I have visited again after two years. One can look upon the Yugoslavian scene with many eyes. Those who are frankly political-minded (I am not of these) are interested in the great Neutral Nations Conference to be held in Belgrade in September; all I know is that India has added many nations to the Conference. My interest is elsewhere. There are the great political and economic changes of the last two years which are both for the eyes to see and for the statistics to describe. The statistics, I might say, are for the most part up to the end of 1960, published in a handbook which is made available within three months of the completion of the year. May I suggest for the Indian Government that here imitation would be the sincerest form of flattery?

Yugoslav statistics can tell you magnificent stories of the manner in which one of the greatest miracles of economic growth has been accomplished in five years. Yugoslavia's national income went up last year by 13 per cent and if it continues (as is planned) for about a decade at an average rate of growth of 10 per cent per year, it will secure in the fifteen years from 1955 the highest rate of growth that the world has ever seen. Here too, are illustrations of the axiom that growth is the greatest of all destroyers of inequality. Workers of all kinds in Yugoslavia are the main beneficiaries. Their money earnings between 1958 and 1960 are up by a little less than 50 per cent in manufacturing and 30 per cent in agriculture. In the economy as a whole a better balance has been struck with manufacturing containing half the number of workers employed. Agricultural production, in spite of the fact that the agricultural population has been constantly declining in terms of percentage of the total working population, has risen well over 50 per cent since 1956. Agricultural exports in 1960 at nearly 40,000 million dinars against agricultural imports of only 23,063 million dinars helped Yugo-

slavia's serious balance of payment problem. Thus agriculture has become a powerful dynamic element in the Yugoslavian State. On the other hand, it would be a mistake to suppose that industry is in any way lagging although it gives rise to an adverse balance of payments. So far as we in India are concerned, Yugoslav heavy industry and power stations are more germane to our Plan and, therefore, more to be studied. I failed, after much trial and error, to count correctly the number of Yugoslav enterprises in this field. Their name is Legion. Their top managers are typical captains of industry. Most extraordinary of all, their competition with one another is intense, particularly at home!

THE INDUSTRIAL RENAISSANCE

I saw it in Ljubljana in Slovenia, in Zagreb in Croatia and, last but not least, in Sarajevo, in what used to be the backward province of Bosnia and Herzegovina. Many of my readers may remember that it was in Sarajevo that a famous prince of Austria was assassinated, thus (as recorded in the text books) producing the World War I. I can claim to have seen on a pavement in Sarajevo the fatal footprints engraved upon the stone; footprints of a historic past. But the new Sarajevo has moved far beyond from 1914. It is now a great industrial centre dominated by many factories. It maintains its one-time Turkish character and still contains 90 mosques and has a 60 per cent Muslim population. But the fact is that Bosnia, the backward province of Yugoslavia, has raced ahead; in terms of its national income it has moved faster than any other province of Yugoslavia. Its national income has practically doubled in five years. It is true the cost of living has risen, but only by about 20 per cent. The province has now emerged from the typically underdeveloped category and can bear comparison with a moderately developed province. A distinguished Yugoslavian economist told me that he thought that Bosnia has been taken over the hump, the hump being that very difficult and intractable area where the national income has to work itself up from between 100 to 300 dollars per capita. I do not take any responsibility for any predictions based upon these "take-off" statistics which are going increasingly out of fashion, but I will commit the whole of my (dubious!) reputation to the point that Bosnia and Herzegovina have taken off!

GENTLEMEN: THE MANAGER

When I was looking at the Yugoslav miracle in its earlier incarnation two years ago, I was inclined to concentrate, more particularly, on technological change rather than on the great incentive unloosed by the far-reaching decentralisation and workers' participation in management. But on this particular occasion I am inclined to rate the capacity of Yugoslav managers, whom I saw—perhaps a hundred in all—as the topmost instrument in Yugoslavia's splendid progress. I was happy to be able to see again the brilliant young manager of the great Estate farm outside Belgrade called Pancevacki Rit. On the face of it the visible changes have not been great, but there is a stately new slaughter house and a new milk pasteurisation plant. Belgrade now receives half of its milk supply and, I believe, nearly all its meat from this one farm. Production has nearly doubled in some sectors of the economy in a matter of two years. The Italian wheat which was first acclimatised here is now being exported to Italy! In its home farm it has given yields as much as 2½ tons per acre. Why, I wonder, have we not tested it on a great scale in this country where our average yields are less than one third of a ton?

ARGUS.

THE WEEK'S NOTES

Legislators' Tenure

THE GUJARAT CONTROVERSY

IT IS a misnomer to call the Gujarat Pradesh Congress Committee's resolution on the ten-year rule as "retirement of legislators" to make room for new blood. No retirement from legislative life at the end of ten years is contemplated, nor is the rule being applied uniformly to all without distinction, nor are the distinctions sought to be made based on any declared principles. The rule in question specifically sets a limit of ten years to a legislator's tenure in a particular legislature, but allows him the choice to try for the Party ticket to contest an election to the other legislature. A member who has served two terms of five years each in the Gujarat Legislative Assembly (including its predecessor, the Bombay Legislative Assembly) may not be permitted to seek re-election to the Legislative Assembly, but he is competent to stand for election to Parliament where he can have a tenure for two terms, and vice versa. Thus, in effect, the actual limit prescribed for retirement is twenty years and not ten years. There is a lot of local politics (not free from intrigue, as Dr. Jivraj Mehta maintains) in this ten-year rule.

Limited exceptions have been made in favour of a few leaders, but the significant fact is that Dr. Jivraj Mehta, the Chief Minister of the State, is not one of them. A healthy convention could have been laid if the Chief Minister had also been exempted from the rule. When Congress passed legislation in America to limit the maximum presidential tenure to two terms only during Mr. Truman's regime, a specific clause was inserted in the Act to explain that the legislation was not intended to convey any personal imputation and a reservation was made entitling President Truman to stand for a third term. The absence of such a healthy convention speaks for a major motive behind the ten-year rule. If this rule is enforced, according to one estimate, 9 out of 14 ministers in the State would be disqualified from contesting election to the Legislative Assembly. The next cabinet would inevitably consist of a majority of new comers. The High Command and the State Congress Parties have been generally averse to admitting fresh men in the ministries and building a second line of leadership. In this sense the trend in Gujarat is to be welcomed. But there is no virtue in having new blood for its own sake and that too on an extensive scale. A great risk would be run in sacrificing tried talent where it continues to retain vigour for administration. Sir Winston Churchill in Britain and Mr. Mackenzie King in Canada, who enjoyed long terms as Prime Ministers, are notable examples of statesmen shouldering great burdens for long years without impairment of their faculties. In any case, it would be perverse to apply the ten-year rule with rigidity.

The Gujarat Pradesh Election Committee is presumably not clear in its own mind how to implement the resolution and to what extent its rigidity should be softened. The centre of controversy at the moment is Dr. Jivraj Mehta. According to Press reports (whose authenticity it is difficult to vouchsafe for the reason that all the meetings of the Gujarat leaders over this controversy were held behind closed doors), Mr. Morarji Desai has counselled Dr. Jivraj Mehta not to seek re-election to the Legislative Assembly as an act of self-denying ordinance. But the reports also have it that Dr. Mehta is contemplating a contest at the election to continue as an ordinary member of the Assembly, apparently to challenge the manoeuvres of his opponents. It would be embarrassing for the Pradesh Election Committee to decline to entertain the application of the Chief Minister, but at the same time the PCC will be embarrassed to find its ten-year rule openly flouted.

The Election Committee is due to meet in August. The forecast may be ventured that the controversial rule will be watered down in its implementation.

The Floods

AFTER THE DEVASTATION

IF THE early arrival of the monsoon this year was hailed as an omen of relief from the preceding oppressive period of shortage of water and power supplies, the suddenness with which the principal rivers in several parts of the country were inundated have raised problems of serious dimensions. The Cauvery, Periyar, Pamba in the South, the Narmada in Madhya Pradesh and the Mahanadi in Orissa, to mention the main rivers which were subject to excessive floods, have taken the riparian populations completely unawares. The sudden impact of the floods and the unpreparedness of the local authorities and the local populations to take preliminary measures have heightened the severity of the destruction. Various estimates of the damage caused by the floods are being made and a figure somewhere near Rs. 100 crores for all parts of the country affected so far is also mentioned as a possibility. To say that these estimates will perhaps prove to be inflated owing to the proximity of the calamity is not to minimise the magnitude of the destruction caused and the hardships inflicted on the population. What the Government can spend by way of relief must be generously supplemented by public contributions. In this context an unhappy fact which needs to be underscored is that the Prime Minister's National Relief Fund, from which assistance to flood-stricken areas is promptly available, has been very much depleted. This is all the more a reason for an appeal to the public to discharge its moral obligation.

The problem of immediate relief apart, attention needs to be riveted in all seriousness on certain aspects of the flood policy of the Government. It was only by a singular stroke of good luck that the Hirakud dam was saved from imminent danger. The question needs to be investigated in earnest whether the safety margins, for which allowances have been made in the major dams, are really adequate and whether they do not add to the serious risk of floods spreading in the neighbouring areas as soon as waters are discharged to save them. At least in the case of Hirakud, competent technical opinion does not hold it to be adequate and one criticism is that low margins have been allowed on financial considerations. The flooded rivers have receded and the danger in Kerala (where it was grave), Mysore and Madhya Pradesh is now over. Madras is also emerging practically out of it. So also relief to Orissa is expected in a matter of a few days even in the Cuttack and Puri districts. It is now two years that the Flood Control Committee reported on an appropriate flood policy to hold potential damage within the minimum limits. The numerous measures which it has urged, such as reforestation of catchment areas and construction of dams and embankments as well as drainage along the banks of rivers may have little novelty in them, but they are certainly the most effective ways to minimise the havoc which floods work at frequent intervals.

South-West Africa

A DRAMATIC DEADLOCK

THE PROJECTED visit of the United Nations Commission on South-West Africa to that country has taken a dramatic turn. Even from the start it was assumed that the Government of the Republic of the Union of South Africa would not allow entry to the Commission since it persists in treating South-West Africa as constitutionally an integral part of that country. It

had expressed its opposition to the appointment of the Commission and its decision not to permit it to enter the country. This opposition notwithstanding, the United Nations is under an obligation to explore all reasonable means to investigate the conditions of African nationals in South-West Africa which it cannot recognise as a part of the Union of South Africa.

The best way to do this in this perplexing situation was to ask the Commission to visit Bechuanaland, which has always extended an open asylum to Africans compelled to flee from South-West Africa under pressure of the repressive policies pursued by the Government of the Union of South Africa. Bechuanaland is receiving, in rapid stages, progressive reforms and this treatment of the African races has incensed the protagonists of apartheid for fear of its reaction in their own country. The South African Government has threatened to absorb the adjoining British protectorates even as it has sucked the mandated territory of South-West Africa in defiance of law, public morality and the demand of the United Nations to place it under its trusteeship. Against this background, the permission granted by the British Government to the Commission to visit Bechuanaland was an act of faith and courage and the Commission could have collected ample evidence from the evacuees from South-West Africa who have sought asylum in Bechuanaland. How to tackle the problem of the illegal integration of South-West Africa in the Republic of the Union of South Africa is a long term problem whose solution will not be easy. It is a separate issue.

But in the baffling circumstances the Commission's Chairman, Prof. Rodriguez Fabregat of Uruguay, acted rather impetuously in announcing the determination of the Commission to enter South-West Africa no matter whether illegally. The South African Government had already declared its intention to arrest the members of the Commission immediately on their entry and now Mr. Eric Louw has issued a warning to Mr. Hammarström that the Commission's entry would be treated as an act of aggression. In the face of these complications, the British Government had perhaps no alternative but to withdraw the permission previously granted to the Commission to operate in Bechuanaland. The impasse can be broken even now by the Commission affirming its intention to collect all relevant information in Bechuanaland without using the Protectorate as a base for forcing an entry in South-West Africa.

Shipping

DRIFTING POLICY

MR. G. L. MEHTA'S frank observations in his presidential speech at the National Shipping Board's recent meeting should move the Government to re-assess its attitude to the Board and in particular to its authoritative status. Two years ago in April 1959, when the Board was inaugurated, the Prime Minister described it as the "highest policy-making body" in the sphere of shipping. Mr. S. K. Patil, then Minister for Transport and Communications, gave a solemn assurance on the occasion that the National Shipping Board's policy decisions would be treated normally as binding on the Government and they would not be departed from unless exceptional reasons warranted such a course. Mr. Patil had undoubtedly a sincere intention to give the Board the same status and authority which is enjoyed by its counterparts in the other maritime countries. After scrutinising Mr. Mehta's objective survey of the Board's activities, one wonders whether the Government has learnt to draw a real line of demarcation between a top-level policy-making body and an advisory committee.

Immediately after its inception the National Shipping Board was requested by the Government to formulate an appropriate target for shipping in the Third

Five-Year Plan. The Board's special committee made the basic recommendation that, on a conservative estimate, a target of an annual addition of 100,000 GRT should be the minimum to be aimed at, and it would involve a cost of about Rs. 118 crores. This target of 500,000 GRT for the Plan period was pruned to 200,000 GRT with an outlay of Rs. 55 crores. It is difficult to accept the plea of shortage of funds because resources are being allocated to projects of low priority in disregard of the fact that the outlay on shipping would be recouped in less than a decade and considerable expenditure of foreign exchange on freight would be permanently saved for the nation's economy. Incidentally, it is a sad commentary on the Government's solicitude for adequate statistics for planning that no one should know authoritatively how much India is paying by way of freight charges to foreign shipping. Mr. Mehta has rightly put his finger on this grave flaw and urged that compilation and up-to-date maintenance of vital statistics of shipping and of the classification of the cargoes carried in national and foreign bottoms should be taken in hand at least from now on.

A new threat is in the offing for the shipping companies operating the distant overseas trades. The public sector corporations, which were hitherto operating relatively unremunerative routes are now to be diverted to the routes already being served by the private companies. Certainly the public sector companies must earn a net profit in this commercial undertaking, but that is no justification for duplicating the operations and involving both in losses. Co-ordination must be devised and the two must work as complementary to each other or function on separate routes.

South Korea

COUP WITHIN A COUP

HARDLY HAD General Chang Do Yung kept in his hands the uneasy reins of power for forty-eight days, since the coup d'état organised by the military junta to overthrow Prime Minister John M. Chang, had he to yield to the pressure of his recalcitrant colleagues who aspired to rise to the top of power. But General Chang's enforced resignation, which he tendered on July 3, did not mark the end of his troubles. Within six days, on July 9, was flashed the news that General Chang and forty-four of the military officers, who were known for lending support to him, had tried to commit murders of their compeers in the Supreme Council for National Reconstruction, comprising the men in control of the junta responsible for the coup of May 16. The house arrest of General Chang and clapping of forty-four other officers in jail on July 9 complete the story of this coup within a coup.

The internal pattern of the organisations responsible for bringing about military coups and seizures of power, which has been in evidence in several countries, has manifested itself in South Korea also. It would appear that General Chang was chosen as the leader for the coup of May 16 more for the prestige which his name would lend to the military take-over than for his personal faith in the justification for overthrowing the cabinet of Mr. John M. Chang. Reports were not slow in leaking out that the Supreme Council was a divided house and it was an uneasy peace which it was managing to maintain. It may be that the support which General Chang subsequently received from General Macgruder weakened rather than strengthened his hands and gave the chance to his aspiring right-hand man, General Pak Chung Hi. The charges levelled against General Chang do not reveal any substantial ground for difference of opinion as to the manner in which the junta should conduct the government. Whether the new group which has jumped to power can control the situation and how long are matters on which hardly a few would express any confident views.

ADVENTURES INTO TUBELESS TIMES

I, Time Master Tubophile...that's my name... Chairman, Tube Time Inc., am venturing into the tubeless times on my tubular time machine. Journey fraught with some danger but more hardships...hardships unimagined even by the imaginative Wells (he with the Martian mania)...for Wells, a scientific man, couldn't conceive of a time without tubes. But tubeless times there have been (I, Time Master Tubophile, Chairman, Tube Time Inc., should know) and 'tis to these unhappy tubeless times I go in my time machine, so I can tell you of the hardships of a life without tubes.

Look for the next instalment.

WHY BE ASHAMED OF CASTE?

By ODYSSEUS

WE ARE DISCUSSING some widespread popular misconceptions about growth.

In his stimulating 60 page booklet "Growthmanship" (Institute of Economic Affairs, 66A Eaton Sq. London. S.W.1. Price 5sh.), Colin Clark asks us to remember that "economic growth" in a country may not produce the goods which people want. Consider, for example, today's high unemployment in the USA, and the under-utilisation of capacity in some industries, such as steel and textiles, about which the Americans are rightly worried. Is a policy of "accelerated economic growth" the answer? But market research shows that if US families received a general increase in their buying power, they would buy little, if any, more steel or textiles. They want more holidays, swimming pools, books, music, education, and many other services that could not be quickly made available. US unemployment is not now of a kind that would be cured by a general increase of demand. It is a more stubborn, structural unemployment, with a large body of men (particularly coloured folk) who have insufficient education to adapt to the requirements of 1961 and to meet the competition of younger workers. Any attempt to force the pace of economic growth in these conditions would, as soon as some 2 per cent of slack had been taken up, lead to labour shortages in some industries, side by side with persistent unemployment in others.

Should the US government launch out on a Soviet-type Five-Year Plan? Should US planners decide what should be produced and ignore American consumers' choices? This would mean some "direction of labour", a euphemism for depriving poorer and weaker citizens of their freedom.

GROWTH IN THE USSR

The USSR maintained a high rate of growth between 1948 and 1953, and the Soviets have spread the idea that this high rate of growth has since been kept up. But Colin Clark points out that the real Soviet rate of growth has in fact been lower than that of most industrial countries, as has also the long-period rate of growth, which can be ascertained by comparing the 1956 figures with those of 1940, 1928, and 1913. Here are the Soviet figures:

	Capital, excluding land, residences, consumer durables	Net national product at market prices	Labour input billions of manhours per year	Capital-output ratio
\$billions 1950 purchasing power				
1928*	(48.9	155.0)		
1940)	34.4(a)	(79.9	205.1)	1.11(b)
1940)	not known	(78.4	199.7)	not known
1948)	54.5(a)	(78.4	199.7)	1.98(b)
1953)	53.6(a)	(105.9	214.9)	3.95(b)
1956)	(119.5	229.8)		

* Adjusted to present boundaries.

(b) Increases in capital per unit of output between these years.

The immediate post-war years witnessed universal shortages, when everything that could be produced was valuable. But as production becomes normal, marketing problems arise, even in the USSR, whose planned production was wasteful. Shortly before Bulganin was retired to private life, he publicly pointed out the waste that arose because every tractor plant was required to make all its components, and stressed the great savings that could be secured by specialisation and trading between plants.

Many economists today hesitate to lay down to what extent, in quantitative terms, capital is responsible for economic growth. First, they observe that the use of a capital-output ratio as a forecasting tool is no more reliable than, say, a labour-output ratio, or, for that matter, a land-output ratio. And yet popular writings attribute exceptional importance to it.

The agents of production are land, labour, capital, and organisation. The only justification for some pre-occupation with capital is that investment can be more readily subjected to some measures of control, or encouragement, than can labour—if we hold the freedom and dignity of the individual to be important.

Professors Bauer and Yamey noted in their "Economics of Under-developed Countries" (Cambridge Univ. Press and Nisbet, 1957) that economic growth results from a combination of social, cultural, political, and economic changes, which, in turn, bring about other changes. This has taken place in dissimilar circumstances in the UK, the USA, Canada, Japan, the USSR, South Africa, and Nigeria. "Economists," say these Professors "have no special insight enabling them to reduce these different historical experiences into straightforward casual relationships between simple economic magnitudes." At most they claim that economic growth has been accompanied, inter alia, by a heightened spirit of enterprise, by capital formation, by improvement in techniques of production and in the economic qualities and productive capacities of workers and managers. But they do not think it possible to isolate any one of these as the inevitable prime cause of change and growth.

In many underdeveloped countries there exists a traditional social structure, which has imbued the masses with ideas which are difficult to reconcile with the aptitudes needed to transform a traditional economy into a modern one, based on the specialisation of labour, the habit of thinking for tomorrow and therefore saving, the mechanics of investment and capital formation, and the production of goods for sale for profit in a cash market.

IGNORANT SCORN

Unfortunately, the ignorant scorn with which many previous colonial rulers often regarded such natural historical developments as caste have made the intellectual leaders of many underdeveloped countries sensitive to any discussion of traditional systems and even to assert that they no longer exist.

A more constructive attitude, it seems to me, is to realise, first, that there is nothing to be ashamed of in

any traditional social system. All such systems were evolved in the course of history to solve contemporary problems. In Europe, for example, the feudal system was evolved to meet the situation created by the disintegration of the Roman Empire. Feudal baronies were focal points of law and order, and protection for the weak, in a sea of anarchy. The system was not perfect. No system is. It was widely abused. All systems are. But without it, the lives of the masses would have been completely intolerable.

Gradually kings asserted their unifying authority over the separate units constituted by the feudal baronies, and, as national states emerged, the feudal system increasingly lost its social justification, until eventually those features of it which survived stood in the way of further evolution and progress. Feudalism was incompatible with savings, investment, and an exchange economy. Progressive minded people therefore attacked it, so that today (especially among Socialists) "feudalism" has become a term of abuse.

I would hate to see a revival of feudalism (which would smash the system of private enterprise which this column cherishes), but my sense of history will not allow me to scorn the feudal system. It performed a vital social function in its day.

As with feudalism, so with India's caste and joint family systems. In centuries gone by, caste enabled India to preserve her cultural heritage in the face of a series of foreign invasions, and the joint family system made life tolerable for poverty-stricken people, living in a war-torn mofussil. As with feudalism, caste had its disadvantages and the joint family system its imperfections. Foreigners, ignorant of Indian history, may scorn caste if they will. I see nothing of which to be ashamed in it.

The point, as I see it, is that today progressive people seek to substitute new social concepts, which are incompatible with the ideals of caste.

It does not seem to me constructive either to be embarrassed about the widespread persistence of the old social structure, or to revile it, still less to pretend that such customs as the veneration of the cow, the reluctance to slaughter cattle, and the hindrances to the mobility of labour caused by caste, do not exist. We need not fear to admit, first, that many of the old ways are incompatible with the new economy that we are seeking to build, and, secondly, that whether or not ordinary men and women are conservatives politically, they are conservatives socially, so that it is probable that several generations must live and die before many attitudes inimical to an exchange economy finally pass away.

The trouble (again as I see it) is that, faced with the persistence in the mofussil of caste, of the reluctance to slaughter useless cattle, and so on, our political leaders have fallen back on investment as the one infallible panacea to solve all problems. I suggest that, far from being indignant with people like Professors Bauer and Colin Clark, we ought to be grateful to them for reminding us that investment is but one factor in growth, and that if, at the same time as we invest, we do not strive to educate the masses in modern economic attitudes—a euphemism for telling them about the profit motive!—and in the skills of technology and management, steel plants and other spectacular capital investments will not be as productive of output and incomes as they are in Europe and America. Yet this simple idea is largely ignored in most discussions of Indian planning.

If I were a New Delhi planner, I would concentrate on the advancement of agriculture and of education. Historically, agriculture has provided the surpluses out of which the West has developed its industries, and education has enabled those industries to be manned, directed, and expanded.

[This is the second in a short series of articles debating some popular misconceptions about investment as a factor in economic growth.—Ed.]

No liveried footmen or blazing chandeliers remain to proclaim the grandeur and gaiety that once pervaded the large red brick mansion that still stands in Calcutta's Hastings Street and which Warren Hastings, India's first Governor-General, built for his charming wife as her town house. For many years this fine residence was the scene of glittering assemblies and balls, the entrée to which was considered a high social privilege.

In 1827, No. 7 was acquired for the purpose of its business by the old established engineering firm of Burn & Company which occupied it for almost a century. By reason of its expanding business, Burn & Company found this historic building with its cobbled carriage drive and spacious rooms too small, and in 1925, the Company was forced to sever its link with this house of memories and moved to larger premises in Clive Street, where it joined hands with Martin & Co.

Today, the activities of Martin Burn Ltd. cover a wide range of engineering interests including those brought to it by the renowned firm of Burn & Company all of which are vital to the rapid development of India's industrialisation.

*The European Scene***EURATOM AND NUCLEAR ELECTRICITY**

From Our Special West European Correspondent

PARIS, July 8.

WHILE India is going ahead with her atomic energy programme, expert opinion on this side of the world (as has often been recalled here) has been sceptical about the economic utility at the present moment of investment in nuclear power generation. A decision taken this week in Brussels by Euratom (the atomic energy agency of the Six of the Common Market) marks a break with this scepticism: Euratom will contribute, to the tune of \$19 million initially, to three industrial projects for the atomic generation of electricity. Two are Italian: an enriched uranium reactor of 150 megawatts constructed by the Societa Elettronucleare Nazionale, and a natural uranium reactor of 200 megawatts built by SIMEA, an atomic energy agency that operates in the poor and power-hungry South. The third is Franco-Belgian: an enriched uranium reactor of 210 megawatts being built by a private firm in the Ardennes. The decision to make this commitment was taken by the six-power Council of Ministers against determined French opposition, and is all the more significant for that. It was one of the first genuinely super-national actions of European unity; the majority overruled an important member-Government—and it happens that, in the nuclear sphere, France is the giant of the community, having atomic resources, knowledge and projects equal to those of the rest put together.

The president of Euratom, M. Etienne Hirsch, who had to present the case for investment in atomic power projects, is French and so there was a typically "supra-national" debate, with the French expert clashing with France's Minister for Scientific Research, who demanded more work on research before Euratom ventured into the industrial power field. The Minister took his stand on a financial technicality: the aid for power reactors would have to come out of the research budget of \$215 million for the five years ending 1962. This would, he claimed, upset the agency's research programme and make no contribution to scientific research. But the real point at issue was whether the time had yet come to put money into schemes to generate electricity from the atom, or whether this was still so uneconomic that the experimental stage should be prolonged until the profitability of atomic power was established. Political considerations were not absent, of course: on both sides there was an urgent desire to keep the Common Market independent, in the nuclear field, of the Americans and the British. The French Government was peeved that the reactors chosen for support were all of Anglo-Saxon origin, for it would have preferred to see Euratom put its money into a purely Continental project, probably French. The others replied that unless the Six moved quickly into the industrial power field, even if at first with Anglo-Saxon designs, they would eventually become dependent on the USA and Britain.

Up to now, the Continentals have done little in the matter of building atomic power houses. They wrote an ambitious programme several years ago when energy from all sources was scarce, but when the oil and coal glut set in they let this drop. The present position is

this. In West Germany, one small reactor is functioning at Kehl and a second is being built at Julich. In Belgium, a small reactor will soon begin working at Mol and two are being completed in Italy, at Latina and Garigliano. Two reactors are being built at Chinon, on the Loire, by the French electricity monopoly, while the three reactors at Marcoule, which provide the material for France's atom bombs, produce a small quantity of power only incidentally (their combined power is 60 megawatts). This is all that remains of the panic-plan drawn up at a time when the experts were prophesying a grave energy deficit in West Europe for the decade 1960-70; as long as the present power surplus lasts, there will be little interest in big, costly and necessarily hazardous experiments in industrial power generation.

M. Hirsch, however, justifies Euratom's support for the three projects chosen this week in these terms: "It is true that there is at present no shortage of energy in Europe, but you must remember two things. During a period of shortage, people will be ready to pay any price for atomic energy; on the contrary, during a period of abundance the deciding factor is the price of that energy. The problem is to know at what moment nuclear energy will become cheaper than classic energy. At the present moment, everyone believes that nuclear energy will be competitive about 1970. At that date electricity producers will want to construct nuclear power stations and all at once there will be an enormous demand. So our industries must learn, right now, how to build power-stations to meet that demand, for otherwise they will be wiped out by American and British competition. Naturally, this period of apprenticeship for really big works will require, in the immediate, certain sacrifices, because today electricity from nuclear sources costs 25 or 30 per cent more. But that is only temporary. That is why we want to stimulate, financially and technically, the construction of atomic power-houses".

In other words, Euratom's entry into the power-generation field is purely experimental, except that it is a question of applied experiments instead of the pure research experiment to which Paris sought to limit it. It is in no sense the case that Euratom or anybody else here believes that the time has come to build the power sources of tomorrow, for no one would pretend to know exactly on what techniques these will be based. If Euratom can afford to toy with some pretty substantial applied experiments such as the three reactors named, that is because its research resources are very considerable: this week's decision will commit no more than 15 per cent of its total research budget. Thus, however encouraging Euratom's decision may be to the apostles of nuclear power generation, it is not to be compared with the policy of a nation that is desperately short of capital and chooses to invest in atomic power houses as part of its plan for industrialisation.

Euratom's activities represent, admittedly, only a fraction of the work being done in the Common Market for the development of atomic energy. Its total budget,

while much larger than that of West Germany, Italy and Benelux, is merely half the size of French outlays on comparable tasks, while the French programme includes a military sector that is twice as big again. So one could not draw conclusions about European scepticism on the future of atomic energy from its limited activities alone. The French are far from inactive in exploring the industrial exploitation of the atom and, in view of their manifest superiority in the six-nation region, they tend to seek to reduce Euratom to the minor role of carrying out jobs that are complementary to their national programme. The other five react badly to this and are inclined to gestures of independence, signifying their refusal to make Euratom a mere camp-follower. This week's decision to finance atomic power houses following British and American designs was as much one of these gestures as a reasoned wager on the industrial future of the atom. The unbalance within Euratom, due to the large disproportion between the nuclear capabilities of France and her neighbours, would be remedied if ever Britain were to join, as the Continentals would expect her to in the event of her joining the Common Market. This would not only strengthen Euratom, and indeed make it perhaps the world's most competent atomic energy authority by pooling British, French, German and Italian talent, but would enable it to write a more balanced programme, reflecting better European estimations of the economic future of nuclear power.

When all these reservations are made, however, the fact stands that Euratom accurately summarises the balance of expert European opinion when it regards atomic power as still very much in the experimental stage and when it interprets its recent incursion into the industrial power field as simply a more elaborate applied experiment that leaves the future open. By far

the greater part of its work, while always having industrial application in view, is still remote from firm investment projects such as are written into national plans. One of its most interesting lines of work—admitted to be of much greater importance than the financing of atomic power stations—concerns studies on the domestication of thermonuclear fusion, that is on the possible peaceful use of the Hydrogen bomb. This requires long and costly research, which the Continentals are anxious to carry out on their own account without waiting for the Americans and British. For that purpose, Euratom is co-operating with the Max Planck Institute of Munich, the French Atomic Energy Commissariat and the National Nuclear Energy Institute in Rome. The results of this effort will not be known for some years, and possible industrial applications lie even further in the future—but when they come, they will be considerably more rewarding than premature investment in atomic stations of the types conceived today.

Similarly, it is exploring the possibilities of a new type of reactor in its "Orgel" research project: reactors using natural uranium as fuel, heavy water as "moderator" and an organic liquid for cooling. It attaches great importance to an assignment it has farmed out to a Dutch institute, which it supports with men and money, and which aims to find the applications of the atom in agriculture. Altogether, Euratom has signed 115 such contracts with private and governmental institutes for joint research, and it has 75 more ready for signing; several of these relate to atomic propulsion for ships. The decision it took this week (and then against the advice of its best-informed member) to put money into atomic generators is to be set in this context of support for all sorts of practical research, and not as sudden conversion to the view that the age of economic atomic power has arrived.

Bank vaults are always made of steel...
because steel is so dependable!

symbol of security!

THE UNITED STEEL COS. (INDIA) PRIVATE LTD.

Bombay • Calcutta • Madras

Through the years Steel has come to be considered the symbol of security... not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries... the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability... Steel that she can hold up to the world as a symbol of her security.

THE GREAT RED SPLIT

By WILLIAM REES-MOGG

ONE of the most important news discoveries for many years was published recently by Mr. Isaac Deutscher, the authority on Soviet affairs, in "The Sunday Times". He published a remarkable document containing an attack on Chinese policy which had been sent to the headquarters of a number of foreign Communist parties by Mr. Khrushchev's office in Moscow.

The document accuses the Chinese of breaking the agreement reached by the Communist assembly in Moscow last November; it accuses them of trying to take over international Communism from Russian leadership, and of conducting subversive intrigues against Moscow. Even more important, it accuses China of advocating preventive war, and of being obsessed with the problem of Formosa.

There have, of course, been disagreements and clashes between Russian and Chinese communism before. Stalin never wanted Mao Tse Tung to achieve power in China, much on the principle that made Richelieu in the thirty years war prefer a Protestant and divided Germany to a united Catholic one. At the time of the Khrushchev-Malenkov power conflict Chinese support for Khrushchev had an important bearing on the outcome.

Further conflicts led up to the agreement of last November. None of these conflicts, however, seemed to pass the point at which the dispute became irreconcilable. There is after all a vital difference between the character of Russian relationships with Poland and with Yugoslavia, though both have been involved in disputes. In the case of Yugoslavia the breach was final, and that now seems to be the case with China as well.

It appears from the character and language of Mr. Deutscher's report that this breach is likely to become even more serious. If this is so then a political event has occurred of such importance that its ultimate consequences can only begin to be guessed. This is a situation which is likely to be of dominating importance in the international affairs of the 1960's.

It has already affected the economic situation of China. Two bad harvests have made China more than ever dependent on outside assistance; the political conflict has already led to a substantial reduction in Russian aid. In the competition to demonstrate that Communism is the best way to develop a non-industrial country this cut in Russian aid could be very important.

The Russo-Chinese conflict has also had an important influence on Berlin. One of the factors in the Berlin situation seems to be that Mr. Khrushchev needs to prove, to invest an American phrase, that he is not "soft on Capitalism". Another factor is that Berlin is a crisis that Russia can control, and had indeed in the last two years moved from warm to hot and back again according to the fluctuations of tactical convenience. The other crisis points, those in the Far East, might get out of control because China would not stop when Mr. Khrushchev gave the word. The East Germans have no choice.

The quarrel with China makes the whole Russian position look much less satisfactory than it often seems to the rest of the world. The European Red Empire is becoming increasingly precarious. The palpable success and high prosperity of Western Europe stands in contrast to the depressing conditions of the satellite countries. In East Germany, where border is open, this has led to a vast exodus of population, which start-

ed as a refugee movement (leaving Communism) and has now become an emigration movement (seeking the prosperity of Capitalism). There is no Communist government in Eastern Europe, possibly excepting Bulgaria, which is backed by real popular support, in sharp distinction to the support for Communism in the imperial motherland of Russia herself.

To the West, therefore, Russia has a rickety and feeble empire which accords no more than the morose and feeble support of careerist satellite governments. To the East there is the menace of an independent China, now actively seeking to seize control of international Communism out of Russia's hands. For lack of financial resources China is likely to fail, but the threat is a serious one none the less.

This change is in one sense immensely hopeful, and in another considerably alarming. The split in the Communist camp does make it very much more unlikely that people will in the end mistake Communism for the wave of the future. The fact that the Communist world, behind a facade of unity, is divided by deep hostilities, is likely to reassure those who find the non-Communist world hides its united preference for free political institutions behind a facade of bickering.

The worrying point is that a strong and secure Russia is an influence for peace. It is insecurity which makes statesmen and nations behave unreasonably. If the world has passed the apogee of Communist power, the period of declension may include many anxious passages.

Encouragement of Research in Industries: The Government of India have appointed a 19-member Committee headed by Prof. M. S. Thacker, Director-General, Scientific and Industrial Research, to consider and recommend to Government measures to be taken to encourage the development of research in industries as well as the promotion of consultancy firms. The Committee has been asked to submit its recommendations to the Government within a period of 6 months. The terms of reference of the Committee will be to consider and recommend measures to be adopted to promote research activity by industrial undertakings and measures by which the growth of consultancy firms could be encouraged.

Production of Menthol and Peppermint Oil: A scheme for the cultivation of 'Mentha arvensis' used in the production of Menthol and Peppermint Oil, in collaboration with the Council of Scientific and Industrial Research, has been sanctioned by the Government of Jammu & Kashmir. The scheme envisages the cultivation of about 2,000 acres of land in Jammu under the guidance and with the help of the Central Indian Medicinal Plants Organization of the Council of Scientific and Industrial Research. The value of the Menthol and Peppermint Oil to be produced is estimated at Rs. 30 lakhs and would result in a corresponding saving of foreign exchange. The over-all expenditure during the Third Plan on cultivation of 2,000 acres of 'Mentha arvensis' is expected to be about Rs. 43 lakhs.

India's Foreign Trade in Merchandise in May, 1961: The provisional figures of India's foreign trade in merchandise by all routes—sea, air and land—on private and Government accounts during May, 1961, according to information available in the Department of Commercial Intelligence and Statistics, Calcutta, are given below:

Exports	Rs. 56.73 lakhs
Re-exports	Rs. 39 lakhs
Imports	Rs. 85.57 lakhs
Balance of Trade	Rs. —28.45 lakhs

Trade with Tibet, Bhutan and Sikkim, and the trade arising in the Andaman and Nicobar and the Laccadive, Minicoy and Amindivi Islands is not included. In the case of Nepal, air-borne trade alone is covered. The value of certain consignments of private merchandise under reference to the customs for verification and of Government stores awaiting adjustments is also excluded.

Table I below brings together the provisional figures for May 1961, along with similar figures for April 1961, May 1960 and the revised figures for May 1960:

Foreign trade in merchandise	INDIA'S FOREIGN TRADE DURING MAY, 1961, APRIL, 1961 AND MAY, 1960 (In lakhs of rupees)			
	For the month of		Provisional	Revised
	May, 1961	April, 1961		
Exports	56.73	53.36	49.81	47.88
Re-exports	39	48	93	1.94
Imports	85.57	85.90	82.77	98.48
Balance of trade in merchandise	—29.45	—32.06	—32.03	—48.66

The cumulative totals for the two months April and May, 1961, are shown along with the corresponding figures for 1960 in table II below:

TABLE II.

INDIA'S FOREIGN TRADE DURING THE TWO MONTHS APRIL AND MAY, 1961 AND APRIL AND MAY, 1960

(In lakhs of rupees)

Foreign trade in merchandise	Cumulative totals for two months April & May		
	1961 Provisional	1960 Provisional	1960 Revised
Exports	110.09	97.93	94.08
Re-exports	87	1.39	2.37
Imports	171.47	164.77	197.28
Balance of trade in merchandise	—60.51	—65.45	—100.83

United States

Loans to Indian Firms: The U.S. Government has announced approval of loans totalling Rs. 47.5 lakhs to three joint Indo-American private ventures in the fields of manufacture of shock absorbers, air-conditioning equipments and automobile and bicycle tyres and tubes. The loans are being made from the Cooley Amendment Fund, to which is credited a part of the rupees generated by the sale of agricultural commodities supplied to India under U.S. Public Law 480. The U.S. Export-Import Bank administers the Cooley Amendment Fund whose principal object is to facilitate the investment of American capital in India and other countries receiving commodities under U.S. Public Law 480. The biggest of the loans announced is to Carrier Air-Conditioning and Refrigeration Private Ltd. which has been formed by the U.S. firm of Carrier Corporation and the Indian firms of Voltas and J. Stone & Co. (India) Private Ltd. The company is establishing a plant outside Bombay to produce refrigeration and air-conditioning equipment. It has been given a loan of Rs. 37.5 lakhs. Madras Rubber Factory Ltd. is the recipient of a rupees 5 lakh loan to help in building a factory for the manufacture of automobile, truck and bicycle tyres and tubes. Mansfield Rubber Co. of Ohio, United States, is collaborating in the new factory for furnishing machinery and know-how. Another loan of Rs. 5 lakhs goes to Gabriel India Private Ltd. which is the joint venture between D. C. Anand and Associates and the Gabriel Company of Cleveland, Ohio. A new factory planned to be erected at Mulund near Bombay will produce 1,20,000 automobile shock absorber units per year. So far 13 loans totalling Rs. 11.5 crores has been granted to joint Indo-American ventures from the Cooley Amendment Fund.

Pfizer's 1960 Grants: Grants of more than \$1 million (over five million rupees) were made for scientific research and medical education last year by

Pfizer and the Pfizer Foundation, the 112-year-old pharmaceutical and chemical company announced recently. Included in the overall total of \$1,053,951 (Rs. 50,37,885) was the sum of \$171,715 (Rs. 8,20,798) earmarked by Pfizer's overseas organisations to support research and education outside the United States. Grants-in-aid to universities, medical schools, pharmacy and agricultural colleges constituted the largest allocation, approximately \$662,000 (Rs. 31,64,360). Providing assistance in such areas as chemistry, biochemistry, microbiology and agricultural science, these contributions supported a broad range of investigations, including cardiovascular research, inquiries into analgesia narcotics and drug addiction, the effect of essential amino acids on breeding hens and a study of the effects of ultrasonic radiation on crystal growth. In addition, \$220,000 (Rs. 10,51,600) was received by resident physicians and hospital and pharmacy interns under a continuing programme designed to aid resident interns in completing their education. Also included were graduate fellowships to students seeking advanced scientific degrees. Contributions by the Pfizer Foundation in 1960 also supported medical and pharmaceutical education as well as emergency and relief organisations, and health and philanthropic groups in countries where Pfizer maintains plants, laboratories and offices. The grants total announced by Pfizer does not include various emergency drug shipments made throughout 1960. Among other donations were a company contribution of approximately \$200,000 (Rs. 9,56,000) to MEDICO (Medical International Co-operation Organization) in 1960 for use at hospitals established by the late Dr. Thomas A. Dooley in Laos, and at other medical centres in Asia, Africa and the Caribbean plus an additional \$50,000 (Rs. 2,39,000) drug consignment to help equip the hospital ship operated by Project HOPE in South-East Asia.

Radio Transmitter Powered by Human Voice: A radio transmitter that is powered entirely by the human voice has been patented by an American electronics engineer. George W. Bryan Jr., the inventor, says that the transistorized device changes the physical energy of the voice's sound waves into electrical energy of sufficient strength to broadcast the speaker's words. Experimental models have transmitted for distances upto 100 yards (30 meters), and with further refinement it is expected that the range will be increased to one to two miles (1.6 to 3.2 kilometers).

United Kingdom

Aid for Tube Making Factory in India: The Commonwealth Development Finance Company is to provide a loan of £1,75,000 for the manufacture of non-ferrous tubes pipes, rods, and sections in India. The loan will provide the foreign exchange requirements for a factory being erected in Bombay by Kamani Tubes Private Ltd., in collaboration with Yorkshire Imperial Metals Ltd., an associate of Imperial Chemical Industries, which has arranged the procurement of plant in the United Kingdom, and will assist in the early period of running, under a ten year technical collaboration agreement. A spokesman of Yorkshire Imperial Metals said in an interview in Leeds that his firm's part in the scheme was largely one of supplying know-how. They also hope to provide assistance from time to time by means of short visits to India by technicians from Leeds.

Fall in Sterling Area Reserves: The British Treasury announced on July 4, that the gold and convertible currency reserve of the sterling area fell by £47 million last month to stand at £990 million on June 30.

Two special payments totalling £7 million contributed to the fall. These included a sum of £4 million paid to the European Payments Union.

Mongolia

Economic and Social Progress: In a speech delivered recently at a press get-together Mr. Mangalyn Dugersuren, Ambassador of the Mongolian People's Republic in India, revealed that Mongolia has at present some 25 heads of cattle per capita which is the highest figure in the world. Along with the traditional animal husbandry, land cultivation has been developed successfully, specially during the recent years. The country now produces 268 kilogramme of foodgrains per capita and by the end of the Third Five-Year Plan which commences this year the figure will rise to 502 kg. The newly born industry is growing rapidly. Recently more than ten big industrial enterprises and other important projects were commissioned. In 1965, it will be producing 55 per cent of the gross national output. Illiteracy among adults has been eliminated. All children of school going age are covered by schooling. Free and compulsory education has been introduced; four year course in rural areas and 7-year course in urban places. Now arrangements have been made to go over to 7-year education throughout the country. As to the number of students of higher educational establishments per 10,000 persons of the population, Mongolia is considerably ahead of Japan, Italy, West Germany and many other countries. Free medicine has made a good progress. According to 1960 data, the Mongolian People's Republic has one physician and 9 hospital beds per 1100 an 1000 persons respectively.

Australia

Computers for Complex Tasks: A leading Australian manufacturer of electronic equipment recently used a unique method of demonstrating the practical workings of complex electronic circuit blocks and computer-type parts. An ordinary gaming machine was fitted with numbers instead of the usual symbols and visitors were allowed to operate the machine and observe the results for themselves. At the pull of a handle, the device produced at random any one of 256 different numerical figure combinations. The demonstration was staged by Philips Electrical Industries Pty. Ltd. of Australia at the Radio and Electronics Engineering Convention in Sydney. Its purpose was to illustrate simply the uses of electronic equipment to record random information and transmit it along any communication path. Similar systems are used in space exploration and for many industrial and commercial purposes.

World Bank

Loan for Calcutta Port: The Executive Directors of the World Bank have approved a loan equivalent to \$21 million to the Commissioners of the Port of Calcutta. The loan will help to finance dredges and other floating craft to maintain navigation on the Hoogley river approach to Calcutta, and equipment and works to improve the efficiency of the port. The loan will also finance the foreign exchange costs of a hydraulic study of the Hoogley river to help solve the problem of siltation in the river and to determine the feasibility of establishing a deep water satellite port farther down the river at Haldia to accommodate bulk cargo vessels. The loan is for a term of 25 years and bears interest at the rate of 5½ per cent per annum including the one per cent commission which is allocated to the Bank's special reserve. Amortisation will begin on May 15, 1966. The loan is guaranteed by India.

NEWS IN BRIEF

INDIAN

The State Trading Corporation of India has entered into an agreement with Jordan Phosphate Mines Co. S.A. Amman, Jordan. The agreement provides for the import of rock phosphate from Jordan against the export of tea, coffee, spices, footwear and leather goods, shellac, textiles, engineering equipment, cotton yarn and chemical and pharmaceutical products.

As a measure of export promotion the Government of India have decided to allow drawback of customs and central excise duty on exports of books printed on imported paper, hacksaw blades, fire-works and alumina ferric.

The Punjab State Government has decided to set up an industrial marketing and development corporation to arrange for the supply of essential and raw materials to small industrialists at reasonable prices.

A delegation of the State Trading Corporation will soon visit Russia, Poland, East Germany and Bulgaria for securing export orders for Agra shoes, according to the President of the Agra Shoe Manufacturers' Association.

The Palmulam Estates Private Limited, Nagercoil (Madras), has been granted consent for issue of further capital of Rs. 500,000 divided into 5,000 equity shares of Rs. 100 each to be issued as bonus shares on capitalization of reserves to a like extent in the ratio of one bonus share for one share held.

Trade between India and the U.K. over the first five months of 1961 had a gross value of £130,461,321 over £3,300,000 more than in the corresponding period of 1960.

The Union Exchequer received Rs. 5.08 crores by way of customs and excise duties on tobacco during March, against Rs. 4.84 crores in the corresponding month of last year.

Mr. S. K. Wankhede, the Finance Minister of Maharashtra opened recently a modern factory in Bhandup, Bombay, where prestressed concrete, the latest and most economic structural material, is to be produced.

An enumeration check to determine the extent of error in the population count has been completed throughout the country and the report will be available in the next few weeks.

Fish production in India during 1960 has been the highest ever recorded. Sea fish landings were about 8.8 lakh metric tons. Marketable surplus of inland catches, including estuarine tracts, was about 2.8 lakh tons.

The first refractory and foundry shop at the technical institute of the Rourkela Steel Plant was inaugurated recently. The shop fabricated entirely by semi-skilled trainees and artisans of the institute will impart training in refractory and machinery work.

The President has given assent to the Punjab Co-operative Societies Bill, 1961. The legislation seeks to simplify co-operative law and procedure with a view to removing bottlenecks in the way of development of co-operative movement in the country.

FOREIGN

With production of Canadian newsprint continuing at a high level, and output of other products also up, woodpulp output as well as domestic consumption and exports were all higher in May and also for the first five months of the year.

Kellag International Corporation, the London subsidiary of the M.W. Kellogg Company of New York has been awarded a contract to build an oil refinery in Denmark.

The United States hopes to reach some arrangement under which Japan may increase her textile exports to the U.S. though by less than 30 per cent increase requested by the Japanese.

Britain has asked the Hong Kong textile industry to accept an 11-month extension of the three-year voluntary limitation of exports to Britain, with certain modifications. The agreement was due to expire on January 31, next.

Sugar mills in Tucuman province, are liable for Government take-over or operation under a Bill approved by the provincial legislature.

The final Ministry of Labour figures in U.K. for mid-June confirm that there was a general drop in unemployment in most industries and services. There was a reduction of 11,900 in manufacturing industries.

Further details are announced of the aromatic chemicals plant to be built at Dinslaken, West Germany, by Standard Oil Company of California and British Petroleum Company.

Associated Electrical Industries has made an agreement with Facit Electronics AB, of Sweden, as a result of which the electronic apparatus division of A.E.I. has been appointed sole agent in the U.K. and Commonwealth (except Canada) for Facit Carousel memory, high-speed tape punch and high-speed reader.

The construction of a modern airport in the capital of Mongolia for receiving jet airliners has been completed by Mongolian and Soviet teams in 50 days. It is said to have been the shortest time ever known for the construction of this very complex structure which normally requires at least six months of assiduous work.

Fourteen students and two group leaders from the University of California, Los Angeles, arrived in Bombay on July 5 by TWA Super Jet. The college students, on their 1961 Project India mission, realise that this year's venture may take on Peace Corps overtones.

Special Article

POLISH SCIENCE AND THE ECONOMIC PROBLEMS OF UNDERDEVELOPED COUNTRIES

By DR. IGNACY SACHS

[Dr. Ignacy Sachs has studied in Brazil, Poland and India where he obtained his doctor's degree for his work "Patterns of the Public Sector in Underdeveloped Countries". He now holds a chair in International Economic Relations at the Warsaw Central School of Planning and Statistics.]

THE great growth of interest in the problems of socio-economic development on the part of Latin American, African and Asian countries is a phenomenon of world-wide significance. It results from the rising roles of these countries in modern political and economic life as well as from the conviction that the changes occurring there will have a far-reaching effect on the shape of the future world. There is therefore nothing strange in the fact that Polish scholars have been devoting themselves to the problems of development of the former colonial and dependent countries. The mere statement of the above fact would not justify an article on that theme. But I believe that the investigations conducted in Poland may serve to stimulate discussion in respect to their specific concepts and scope.

In many countries the problems of economic development of underdeveloped States continue to be treated within the framework of a paternalistic attitude, strongly savouring of conceptions which move mountains to give birth to a mouse. The idea is prevalent there that the scholars from the highly developed countries have to lend a helping hand to their "inexperienced" colleagues of the underdeveloped countries, and to present them with ready-made recipes. Such viewpoints, often unconscious and free of pre-meditation on the part of individual authors, have done much harm to the world of science. For they have endeavoured to, at all costs, squeeze all facts into European schemes and consequently recommended the repetition of European solutions even where they hardly apply. If we add that the idealization of the existing international division of labour — for reasons that are understandable but are not, however, without intent — strives to influence backward countries to reconcile themselves to their fate as raw material suppliers, then we get the none-too-glorious picture of the situation which prevailed up to recent times in economic thinking, a vital sector of the social science.

It is true that much has changed in this sector in the post-war period. A series of Western scholars, to mention here as examples Gunnar Myrdal, Francois Perroux, Alfred Sauvy, Maurice Dobb, Ragner Nurske, Paul Baran; and among Latin American economic writers, Raul Prebisch, applied themselves to scattering the mythical brew, and showed the true picture of the relations between the dominant and the reflected economies. There can be no doubt that the last word in this field belongs to the economists of the developing countries who are more familiar with the essence of the problems confronting their homelands and are, therefore, better equipped to submit them to scientific analysis. It is not without reason that Professor Witold Kula—one of the most eminent of Poland's historians of the young generation — declared in his "Historical Considerations" that the great changes occurring under our very eyes on the continents of Asia, Africa and Latin America should also induce a true revolution in our knowledge of these continents, and that a basic element of that revolution will be precisely the broad participation of their scholars in scientific work.

The view-point of Professor Kula is shared by all Polish scientists who are engaged with the problems of underdeveloped countries. Important methodo-

logical and organisational consequences flow from this fact.

Thus, we always strive in our activity to base ourselves as much as possible upon direct contact with the scholars and publications of the countries in the process of development. In so far as the direction of our analyses is concerned it mainly involves three sets of problems:

(1) Interpretation of the complicated processes of development occurring in the growing countries, (2) scientific analysis of the international division of labour, and on this background, the resulting perspective of development of trade and economic relations between the socialist countries and those in the course of development, as well as (3) elaboration of selected problems which have a direct significance for countries in the process of development, in close relation with our experiences and practice.

To the above three, undoubtedly extremely attractive groups of problems must be added studies on the role of the State in the process of economic development and the possibilities of planning under the conditions of expanding economies. A series of articles and larger works by the most eminent of Poland's economists — Professors Lange, Kalecki, Bobrowski and Zawadzki may be mentioned here — are devoted to these problems. A common feature of all their works is their attention to the institutional aspects of the problems and their emphasis that the bottleneck for development exists most often in the backward social structure; whereas under conditions of necessary reforms and proper economic policy material proportions may be liquidated. It is necessary to state at this point that there is a far-reaching difference between these views of Polish economists and those of a number of Latin American scholars regarding the principal sources of the economic ills of their continent, such as the lack of proper agrarian reform.

The researches conducted in this field by Polish scholars are moreover not limited to an analysis of the existing situation and developmental perspective of individual countries. Much attention is devoted to the theoretical and technical aspects of planning by underdeveloped economies. For years a special seminar devoted to these problems has been functioning regularly under the direction of Professors Kalecki, Bobrowski and Lange. Research workers from Warsaw University, the Central School of Planning and Statistics, the Polish Academy of Science as well as the planners from the Planning Commission and other institutions have been participating in the seminar. It considers the concrete problems of selected countries as well as meritorious problems of a general character; and from time to time there takes place a "chess match," i.e. a development plan of some abstract state is constructed on the basis of arbitrarily assumed starting point data. These "planning exercises" are the same kind of drills for the planners as are the traditional manoeuvres of staff school pupils. The seminar discussions are very lively in general, and it must be admitted that the majority of those who attend them are well-informed about the specific problems confronting countries in the process of economic development.

The seminar's connection with live problems is assured by the fact that a number of its directors and participants have had the privilege of being in practical touch with the problems of the developing countries. Thus, Prof. Lange has been consulted by the Governments of India and Ceylon on the economic plans of these countries. Several other countries have turned to him with similar questions. Prof. Kalecki spent some time in India and Cuba also as an economic consultant in 1960. Professors Bobrowski and Pajestka occupied themselves with planning in Iraq, where the latter spent a full year. Polish economists were also invited for long periods to Indonesia and the United Arab Republic; the list of underdeveloped countries where they delivered lectures and prepared reports is of course much greater.

It is not accidental that a number of best known works of Polish scholars on the question of underdeveloped countries appeared at the time of their trips there. I have in mind particularly Prof. Lange's treatise written in India and Prof. Kalecki's lectures on financing economic growth delivered during his stay in Mexico. These works found a wide echo abroad and were published in many periodicals, including "The Economic Review," "Sankhya" and "The Economic Weekly".

The modest information given above on our work on the question of planning by underdeveloped economies must be complemented by calling attention to the investigations conducted for the last few years of themes related, it is true, to socialist economies, but which appear to have a tremendous significance theoretically for countries launched on the course of economic development. I have in mind our work on the question of accelerated growth, conducted primarily by Prof. Kalecki. Their significance for countries which have begun the process of development flows from the fact that they exert an influence on growth acceleration, while the majority of the very numerous world publications today on the question of the theory of growth generally consider the conditions for steady growth.

It would be a mistake to think that the problems of the underdeveloped countries occupy only a narrow circle of the initiated. On the contrary, they are at present among the most "stylish" questions, which is shown by the veritable flood of articles and lectures. Not without an influence on this situation is the fact that for about a year the problem of Poland's foreign trade has been in the centre of public attention, and the perspective of an appreciable expansion of our trade exchange with the Latin American, African and Asian countries has constituted an important element in the discussion. We can also note an important increase of university graduating and doctoral theses on themes connected with problems of the underdeveloped countries. Warsaw University students have undertaken a contest for a treatise on underdeveloped countries, on which there will be held a special scientific session in the autumn of 1961. An inquiry conducted recently by the Polish Economic Society disclosed that some provincial centres and, for understandable reasons, particularly port cities as well as Poznan—seat of the great international trade fairs—and Cracow are striving to keep pace with Warsaw in this respect.

In the capital itself, besides Warsaw University and the Central School of Economic Planning and Statistics, there are engaged in the problems of underdeveloped countries the Economic Science Division of the Polish Academy of Science, the Polish Institute of International Affairs, the Economic Research Bureau of the State Planning Commission and on a more limited scale several other institutions. The problems of these countries have begun to interest not only economic institutions but also sociological and historical societies. Our sociologists and historians display a special preference for the exciting African problems.

Their research is still in the initial stages; whereas the Institute of Geography can boast of several years' work in the field of the economic-geography of the underdeveloped countries.

A few words must be said about publication. As already mentioned, the number of articles and essays appearing in our periodicals and scientific magazines as well as collections of material must be regarded as very satisfactory. But the number of books by Polish authors exclusively devoted to the problems of underdeveloped countries are still few. Publishers announce the appearance of several important works within a year. Intensive efforts have been made, however, in the field of translations. The Polish reader possesses today a fairly wide range of the works of foreign economists primarily in the form of selected texts. The collection published in 1958, entitled "Problems of the Development of Underdeveloped Countries" contains among others the contributions of Celso Furtado, Myrdal, V.K.R.V. Rao, Hoselitz, Singer and many other well-known scholars. The works of Josue de Castro, Gunnar Myrdal, J. Oser and others have been published. The State Economics Publishers have published a collection of several dozen articles on the social and economic problems of India. Indian scholars also figure in the authors' list. The contributions of Prime Minister Jawaharlal Nehru take the first place in the volume. The same publishing house has announced a similar volume for the next year dedicated to Latin American problems — figuring again to have the majority of the published contributions from the pens of the Latin American economists.

The launching of a special enterprise dedicated to the economic problems of countries beginning their process of development is now being considered. It will function in the Central School of Planning and Statistics but it will be composed also of representatives from the University and the Polish Academy of Science. In the near future an advanced course in planning for economists from developing countries will begin at the Central School of Planning and Statistics, with the support, however, of the scientists and planners of all central institutions.

Furthermore, the State Scientific Publishing House, the largest publishers in Poland specialising in scientific publication in Polish and foreign languages — has appointed a special editorial committee under the direction of Prof. Lange, to organize a cycle of correspondence symposia on themes connected with countries which have started on the course of economic development. The participants in the symposia should be primarily scholars of those countries. A number of eminent economists from Mexico, India, and other countries have been invited to co-operate in the project. The resulting works would be published in English and eventually also in French.

All the above mentioned projects — which are either in the phase of plans or in the first stage of realisation — indicate the growing interest in Poland in the problems of countries set on the course of economic development. They also reflect our desire that the knowledge of these questions should grow first of all on the basis of widest possible contacts with the scientific circles of those countries. We are persuaded that the deepening of such collaboration between us may bring a series of mutual benefits. I would like to once again emphasize the possibilities which are open for the planners of countries set on the course of economic development to assimilate Poland's experiences in the field of the methodology and techniques of planning in their broadest conception. Indian and Polish economists thus have a wide field of co-operation, and may accomplish much in the sphere of exchanging experiences and publications.

A Letter to the Editor

DIFFERENCES ON KUWAIT

Sir,

In the July 7, 1961, issue of your magazine the Editorial under the title 'The Kuwait Imbroglio' is an unfair assessment of the dispute. What is more regrettable is that you begin your article by using improper terms about the Prime Minister of a friendly country to India.

I hate to see you judging about conditions in Iraq from correspondents writing in some of the Indian papers and who carry ill-feelings for their own ends against Iraq and particularly against Maj.-Gen. Abdul Karim Qassim, instead of relying on wisdom and accuracy. If your article is meant to repeat the false reports carried by partial news agencies and correspondents, you have fallen a prey to such sources and the manipulators of such news have succeeded in impressing you, which is undoubtedly their aim.

I hardly find an excuse for a sober magazine like yours to jump to conclusions and deny the historical, geographical and ethnic evidences, and not "a mere map" as you have mentioned, in backing her just claim. I am sure that there are many cases known to everybody similar to Iraq, in which a claim is backed by historical, geographic, linguistic evidence and maps, etc.

What is more regrettable is that you have gone to the extent of justifying "the swift action taken by Britain in despatching her troops" to Kuwait, when

such a movement is but a disguise for imperialistic designs against Iraq and the Arab world and a mere show of force or a threat to those who voice freedom and justice. Regardless of the continued assertion that she will adopt peaceful means to back her claims and by not moving a single soldier to the frontiers in an attempt to attack Kuwait, Britain played an underhand game to convince the world that Iraq is planning an attack, thus justifying her landings.

I need not draw your attention to the contradictory statements of responsible Britishers about Iraqi military concentrations, which has been exposed to the world as a big lie.

Your remark on the British appeal to the Arab countries and others including India to exercise their influence and use their good offices in persuading Iraq to settle the dispute peacefully is irrelevant because there is no need for such advice, as Iraq has stated right from the beginning that she will pursue a peaceful solution for her claims.

Yours sincerely,
KAMAL R. BUTTI
Press Attache.

Embassy of the Republic of Iraq,
NEW DELHI-11.

† DAGGER BRAND DRILLS FOR LASTING PRECISION PERFORMANCE

BACKED BY YEARS OF TRADITION and rigid control at every stage of production
DAGGER BRAND DRILLS

(available in inch and metric sizes)
assure precision performance.

They are made of superior quality steel, specially heat-treated to ensure long life and manufactured in India's biggest and most modern factory for small tools.

THE INDIAN TOOL Mfrs. Ltd.

THE BUSINESS WORLD

A Patriarch Passes Away

By CROESUS

WHEN I heard of the sad demise of Sir Purushotamdas Thakurdas early last week, I suddenly remembered that long peroration of Burke (sic): "The venerable age of this great man, his merited rank, his superior eloquence and, lastly, his fall from power which, like death, canonises and sanctifies..." This was probably because, after having closely followed the career of this stalwart Indian business man from the battle of the ratios — that was when, as a student, I first heard of him — to his battle with the Forward Markets Commission, I have often said to myself that nothing could better sum up the life of the late Sir Purushotamdas than this peroration. There is not the slightest doubt that the passing away of this patriarch is a severe blow to the fast thinning ranks of the great Indian business men of the older generation to whose calibre, foresight, initiative and vision we owe what we claim today, with pardonable pride, as the achievements of private enterprise in India.

Sir Purushotamdas was great in a number of ways. In the first place, he was fully informed on any subject on which he chose to say something. And when he said anything, he said it clearly and with a courage of conviction that often overawed and overwhelmed his opponents. His inflexible stand on the 1sh. 4d. ratio for the rupee and the arguments that he advanced in that behalf were something that his British counterparts had not bargained for from the Indian side. Similarly, but for his valiant fight, it is a moot point whether the cotton trade of his country could have been wrested from the stranglehold of its foreign monopoly.

Secondly, his sphere of activities was as comprehensive as the Indian economy. In fact, there is no field of Indian economic activity, be it trade, agriculture, industry, transport, insurance, banking, or public finance, on which he has failed to leave his impress. I cannot think of any other Indian who has been on the board of directors of as many companies as Sir P. T. But in no single instance was it a case of his being merely a dummy director; he not only took an active part, but, in many cases, as the chairman, guided and gave the right direction to discussions on high policy matters. Verily was his a versatile personality.

Thirdly, he was correct in whatever he did. As Mr. Madanmohan Ruia observed at a meeting of the East Indian Cotton Association, held to mourn the death of Sir P. T., integrity was a hall-mark of his career from the beginning. No one could point an accusing finger towards him, in so far as his bona fides went. That is why, while the British honoured him with distinction after distinction, the Father of the Nation invariably took the counsel of Sir P. T., even as he always used to consult Mr. G. D. Birla, on all economic issues of importance.

Fourthly, he not only helped — with the help of his esteemed colleagues — build institutions to safeguard the interests of the business community, but also

assisted in founding institutions for the imparting of education in commercial subjects. The Indian Merchants' Chamber, Bombay, the Federation of Indian Chambers of Commerce and Industry, the East India Cotton Association and the Sydenham College of Commerce and Economics are among the many institutions which owe their origin, directly or indirectly, to him.

Fifthly, Sir P. T. was a discriminating philanthropist; he gave munificently but only to deserving causes or institutions, those favoured most by him being technical institutions, hospitals and educational institutions in rural areas. It will be no exaggeration to say that nearly all the educational facilities that Surat commands today are the fruits of one or other act of his munificence.

Sixthly, Sir P. T. was both well educated and highly cultured. He was a voracious reader and, as long as he could read, I can say without fear of contradiction, he never missed going in for reading a good book, and what is more, and this had appealed to me most, advising others to read it too.

The death of such a great and versatile personality must leave a vacuum that is very difficult, if not impossible to fill. Sir P. T.'s was a full, eventful and, but for a couple of incidents, unfailingly successful life. Many a time, I have felt that, had it not been for those two incidents — one in the life insurance field and the other in the cotton field — his would have been a 'lapse-less' ideal career for all to endeavour to emulate. But even in these two cases, we are too near, in the historical sense, to be dogmatic in our judgment, if only because Sir P. T.'s version was not available due to his severe illness. At least this happened, as I know, when the Forward Market Commission issued a long Press Note on the cotton crisis in 1955. I have with me a letter which he sent long afterwards, that is after he recovered somewhat, explaining the whole position which fully vindicates the stand he took. Among others, he strongly repudiated the suggestion that he treated the FMC with open hostility. "It would be recalled", he wrote to me, "that the control on forward trading was first imposed by the Congress Government after independence and a Cabinet Committee presided over by Shri Morarji Desai investigated the affairs of the Association and that Committee openly thanked me (Sir P. T.) for the co-operation that I gave to regularise control on Forward Trading in Cotton in Bombay."

Similarly, he categorically countered the official insinuation that coercion was needed by the Commission to enforce the margin system in October, 1954. In this context, he said: "The provisions regarding margin and the manner in which statements were to be submitted required detailed working and called for negotiations. The negotiations were conducted by the deputies nominated by the Board of East India Cotton Association. After the negotiations regarding the margin had gone through, the then Chairman of the Commission, Dr. Naidu, in a Press interview on Octo-

ber 5, 1954, publicly paid a tribute to the EICA President for personally handling the matter and the co-operative attitude in which the Board of the Association conducted the negotiations." Naturally enough, Sir P. T. had reasons to feel, as, in fact, he expressed to me, that "this charge against him of not co-operating in regard to margin system could only have been done out of sheer malice."

This is no occasion to rake up the past, but what I have recalled and recounted here is only intended to show what type of man Sir P. T. was. The India of today has need for men of such understanding, courage and integrity. And every Indian business man must bear in mind and follow the advice which Sir P. T. gave to the business community in February, 1955: "In the midst of circumstances creating a good deal of

avoidable misunderstanding, interested propaganda based on all sorts of 'isms' and struggle for political power between contending parties, it will be the duty of the leaders of the business community to work on such principles and to guide their policies in such a manner that not only will the commercial and industrial community of India be able to justify itself and its policies to the people of India, but also play a significant part in shaping the economic destiny of India."

We need more and more such well-meant and disinterested advice from men of stature like Sir P. T., alike to the officials and to the public. But this also presupposes a willingness to heed, which, unfortunately, does not seem to be there in the required measure.

Business Notes

ECM

EFFECT ON INDIAN TEXTILES

THE PROPOSED entry of the UK in the European Economic Community has caused much stir and concern among all the Commonwealth countries. India also, while not totally opposed to the UK joining the E.E.C., has, at the same time, expressed its grave concern that it might adversely affect her trade with the UK. If Britain were to join the E.E.C., countries like India, Pakistan and Hong Kong would be deprived of the 17½ per cent tariff advantage on cloth and 17½ per cent on yarn which they have so far enjoyed *vis-a-vis* non-Commonwealth countries. On the other hand, such would be converted into a more or less corresponding tariff advantage for the E.E.C. countries.

At present, India stands as the major exporter of cotton textiles and cotton yarn to Great Britain. Thus, in 1960, while the UK's total imports of cotton textiles amounted to 394 million sq. yards, as much as 231 million sq. yards were imported from India. In addition to this, Great Britain imported 9.2 million lbs. of Indian cotton yarn. It is important to note here that the volume of exports to the UK from the E.E.C. countries has been greatly increasing even with the present tariff disability of 17½ per cent on cloth *vis-a-vis* the Commonwealth countries. Thus, the exports of E.E.C. countries to the UK rose from 30 million sq. yards in 1958 to 77 million sq. yards in 1960.

Highlighting this point, Mr. Ramnath Podar, acting Chairman of the Indian Cotton Mills' Federation, has, in a Press statement, last week, noted that, with a potential competitor in the E.E.C. to her exports, it is any body's guess whether India would be able to maintain her market in the UK, without the existing tariff preferences. Even if the UK joins the E.E.C., he suggested, "the interests of the developing Commonwealth countries could best be preserved if those countries could consider the possibility of becoming something like the Associated Countries of the E.E.C." In support of this suggestion, Mr. Podar pointed out that such a status had been accorded to many sovereign African countries, some of which were formerly linked with the E.E.C. countries. If such is done, he opined, India would not only continue to enjoy the present advantages in the UK, but the markets of E.E.C. also would be available to her on a preferential basis.

If, for one reason or other, this scheme is not acceptable, Mr. Podar went on to say, the UK must preserve the links by making provisions for tariff-free imports on a quota basis for commodities which she has traditionally imported from the Commonwealth coun-

tries. This system too, he pointed out, was existing in the E.E.C. countries, i.e. between France and Belgium and their overseas territories. In short, he said, whatever may happen to the UK's position *vis-a-vis* the E.E.C. "the present existing Commonwealth preferences should remain unimpaired," and he did not mind how this was brought about.

SWITZERLAND'S ATTITUDE

THE NEWS that the United Kingdom is likely to join the European Common Market has set in motion cross-currents in the remaining six countries of the European Free Trade Area, of which the U.K. is a member. Recently, Mr. Whlen, President of the Swiss Confederation, stressed the significance of the Six and the Seven to join together to achieve a unified Europe. He, however, very clearly indicated that this unity could not be bought at the price of affecting their economic relations with the outside world.

It is true that an integrated Europe is likely to reinforce the economic inter-dependence of the European countries and thereby consolidate the ties which already unite them. As a sharp contrast, as Mr. Whlen indicated, the present separate existence of the Six and the Seven can be harmful by raising the 'walls' between them. One important argument advanced by him is that a combined Europe can always afford more capital, more technicians and more assistance of all kinds for the under-developed countries, because it will consequently put an end to the waste of economic resources and the expensive diversions of the investment which its division into two economic units implies.

Switzerland, nevertheless, cannot afford to pay much for the unity. Along with the remaining Six, Switzerland has preferred a free trade area in which it is not necessary for her to relinquish her freedom of action in the field of trade and tariff policy with regard to non-member countries. This freedom is especially useful within the framework of the GATT which allows for the greatest possible flexibility in tariff negotiations. Mr. Whlen, therefore, voiced the opinion held generally in Switzerland that the Seven are prepared to study with the Six the ways and means of an agreement for the setting up of a single European market with maximum internal cohesion and at the same time maximum flexibility towards the outer world, in order to ensure the greatest possible success for the common efforts for the expansion of world trade. This attitude appears to be quite reasonable because in this loose association the countries which are not willing to align their political status with the single unit can remain comparatively independent.

India and Nigeria

ECONOMIC AND COMMERCIAL CO-OPERATION

THE RECENT visit of the Nigerian Economic Mission to New Delhi is significant in the sense that it is bound to pave the way for further economic and commercial co-operation between India and Nigeria. Although the trade between the two countries is only nominal (Rs. 5.5 crores in 1960), it is expected that with the increasing progress of Nigeria, healthy trade relations between the two countries would be established on a permanent footing. While Nigeria can export to India non-ferrous metals, groundnut oil, palm oil etc., India in turn can meet the Nigerian needs by supplying light engineering goods, diesel engines, capital equipments and textiles. These, of course, will have to be competitive in price, quality and delivery. To maintain a foothold in textiles, however, special efforts will have to be made as competition in the Nigerian market from U.K., West Germany, Japan and China is very stiff. Besides, some of the Communist countries are offering drills, greys and bleached cloth at cheap rates.

It is underlined by the Indian Cotton Textile Delegation (leader M. Chinoobhai C. Javeri) which visited West Africa recently that if India wants to retain the market in West Africa, she will have to diversify its textile exports to that country. This, in other words, implies that only those textiles should be supplied which are in great demand there, like prints, fancy varieties and quality cloths. Since there is a good scope for expanding trade between the two countries, the possibility of entering into a bilateral trade agreement should be explored fully.

The table below gives India's exports to Nigeria and imports from that country in lakhs of rupees.

Year	Exports to Nigeria	Imports from Nigeria	Balance of Trade
1952	6.48	Nil	+6.48
1953	8.01	29	+7.72
1954	8.63	1.16	+7.47
1955	8.43	31	+8.12
1956	7.35	17	+7.18
1957	6.90	Nil	+6.90
1958	8.90	34	+6.56
1959	4.14	27	+3.87
1960	4.99	51	+4.48

Nigeria's economic problems at the moment are under-production in the agricultural field, a rapidly increasing population and lack of trained personnel, health services and educational facilities. The consensus of opinion is that India can help in this matter to a great extent. And it is a welcome sign that she has decided to train Nigerian technical personnel. A railway team has been sent for the reorganisation of railway system in the country. Similar teams in the field of irrigation and agriculture are likely to be sent. The services of experts in the field of oil industry may also be provided. All these are signs, no doubt, of happy collaboration, which is likely to extend further as the years go by.

India Sugars

THE PROBLEM OF COSTS

SUGAR PRODUCERS in India are experiencing the problem of rising costs. In this connection, Mr. Rajesh-

wara Patel, M.P., officiating Chairman of The India Sugars and Refineries Ltd., pointed out at the recent annual general meeting of the company's shareholders that the company had to pay bonus to cane-growers under the SISMA formula to the extent of double the amount paid last year. The company had also to make increased provision for depreciation and on this score alone an additional sum of over Rs. 1 lakh had to be separated. In addition to this, the labour costs too were rising. He added that the sugar industry Wage Board's award which came to be implemented from November 1, 1960, was likely to mean an annual increase in the wage bill to the extent of Rs. 1 lakh.

The net effect of these rising costs was evident when the prices at which the Indian sugar producers could supply the commodity in the foreign markets were compared to those at which certain other countries offered sugar in the same markets. The Chairman pointed out that a bag of sugar which costs the company about Rs. 115 in India, had to be offered to the foreign purchasers for less than Rs. 35. Like last year, sugar output this year was also expected to be phenomenal and the Government of India, in collaboration with the Sugar Mills Association, was trying to export as much sugar as possible. In this attempt the major hurdle that was being felt was on account of higher costs. The Chairman added, however, that this year the Government had offered to bear the loss on export of sugar and the producers would not be called upon to bear any portion of this loss. In view of this cost differential it was necessary that serious view was taken of the situation and necessary steps were formulated to increase the efficiency in the sugar industry.

Non-Ferrous Metals

PLEA FOR REDUCTION IN EXCISE DUTY

MR. VITHALDAS H. SHAH, President, All India Non-Ferrous Metalware Manufacturers' Association, in his speech which was read out by Mr. Chunilal B. Bhatt in his absence, at the fifteenth annual general meeting of the Association, underlined the hardships faced by the non-ferrous metals industry. Mr. Shah is of the opinion that the non-ferrous metals industry should be provided licences on the basis of its production during the period 1956 to 1959, if not on the basis of its installed capacity. According to him this will help the industry to produce more industrial items and to expand its activities in such a manner that would definitely save the much-needed foreign exchange.

His main grievance is against the excise duty introduced on aluminium in March 1960 and on copper and copper alloys and zinc in March 1961, which has been instrumental in raising the prices of aluminium, copper and brass utensils. The grievance of Mr. Shah is justified in the sense that these utensils are the essential requirements of the poor and middle class people who can ill-afford to switch over, partially at least, to stainless steel utensils which, due to insufficiency of raw material, command rather high prices. Under the circumstances, it is quite fair that some redress should be given to the utensil industry by exempting it from the payment of the excise duty on the raw material used by it. There is also logic in his statement that the brunt of protection should be placed on the other industries utilising aluminium as this metal is now being used in cables, conductors, transport, building, canning and packaging etc. All along, the protection given to the aluminium industry has fallen more or less on the shoulders of the utensil industry which caters to the essential wants of the poor man.

FROM THE CAPITAL'S CORRIDORS

FOREIGN EXCHANGE CRISIS

WITH the fall in sterling securities with the Reserve Bank to Rs. 113.79 crores on June 30, 1961, sterling assets of India have touched a new low. The Union Government, though it looks upon the problem with no sense of complacency, is, however, not alarmed at this deepening foreign exchange crisis. A spokesman of the Union Ministry of Finance at a Press Conference held here last week expressed the opinion that there was nothing to be scared about by this decline in foreign exchange reserves. The fall in foreign exchange reserves in the past few weeks, he said, had probably been due to quicker encashment of import licences and maturing of the deferred payment liabilities entered into under the Second Five-Year Plan.

The lack of alarm on the part of the Government on this decline in sterling assets of the Reserve Bank emanates from three factors: (1) export performance during the past six months; (2) fall in imports; and (3) massive aid promised by the Aid-India Club for the first two years of the Plan.

Compared to the first half of 1960, exports from India during the first half of 1961 have been better as is evident from the following table:

VALUE OF INDIA'S EXPORTS

(Rs. crores)

Month	Exports In 1960	Exports In 1961
January	61	61.7
February	52.8	56.2
March	52.7	57.7
April	49.0	54.5
May	38.4	49.5
June (upto 20th)	29.1	33.5

Exports during the whole of 1961 are expected to touch a new high.

Imports, on the other hand, as judged by the issuance of import licences during the period October 1960—March 1961 compared to the previous three half-years, have shown a steady decline. During the six months October 1960 to March 1961, import licences to the extent of only Rs. 360 crores were issued, as against to the tune of Rs. 470 crores during the six months from April to September 1960, to the extent of Rs. 483 crores during the six months October 1959—March 1960 and to the order of Rs. 381 crores during the period April to September 1959. Indigenous output of some essential agricultural raw materials is expected to be higher this year. The import bill, as compared to the previous year, therefore, is likely to be slightly smaller.

The \$2,250 million aid promised by the Aid-India Club for the first two years of the current Plan is expected to start flowing in early August. The tempo is likely to go up in October when aid from the United States starts coming in. From August onwards, therefore, foreign assets of the Reserve Bank are expected to show an upward trend.

In the meantime, under the 1957 amendment of the Reserve Bank of India Act, the sterling securities

held by the Reserve Bank as backing against currency can be drawn down to Rs. 82.24 crores. If necessity arises, further withdrawals from this reserve can be effected through an executive action.

MR. THORNEYCROFT'S VISIT

The visit of Mr. Peter Thorneycroft, Minister for Aviation in the British Government, to New Delhi this week is primarily concerned with his exchanging of views with the Government of India on Britain's joining the European Common Market.

The Government of India and the Indian mercantile community have been busy in the recent past calculating what impact Britain's joining the Common Market would have on India's foreign trade. According to both these sources, the U.K.'s joining the Common Market without adequate safeguards for her trade with the Commonwealth countries will mean a major set-back to India's export trade. It may upset India's development under the Third Five-Year Plan which assumes a tremendous concerted effort on the export front.

By joining the E.C.M., the United Kingdom, it is pointed out, will be obliged to adhere to the following two practices:

- (1) Abolition of tariffs on imports of all goods from the Common Market countries;
- (2) Adoption of a common external tariff against all third countries (including Commonwealth countries which so far have enjoyed a preferential treatment in their trade with Great Britain).

If Britain joins the European Common Market without any safeguards for her trade with the Commonwealth countries, India will suffer on two accounts. Firstly, Indian exports will have to face a tariff wall in the United Kingdom which is not there at present. Britain today generally imposes no quantitative restrictions on imports from Commonwealth countries and wherever there are such restrictions, e.g. on imports of cloth from India, Hong Kong and Pakistan, the ceilings fixed are quite liberal. Imports from Commonwealth countries into Britain are also mostly duty-free. In case Britain imposes import duties, imports from the Commonwealth countries are subject to lower duties.

Indian exports to the United Kingdom are also likely to suffer on account of competition from the Common Market countries from where imports would be on duty-free basis. Hitherto, imports into Britain from these countries have to face tariff wall.

India's objection to the United Kingdom's joining the European Common Market, however, is based more on moral grounds than on economic and political considerations. It is pointed out that it has been largely due to the awakening of social conscience in the western countries that they have started giving liberal aid to under-developed countries and have begun relaxing trade restrictions on imports from there. The set-back which India's trade will suffer as a result of Britain's joining the Common Market will be more serious than could be offset by prospects of increased aid from the enlarged Common Market, it is pointed out here.

According to official circles, association with the Common Market countries would be of dubious advan-

tage to the United Kingdom because any shrinkage in exports of the Commonwealth countries to Britain would weaken the sterling. The strength of the sterling, it is pointed out, depends not only on Britain's economic health, but also on the export earnings of the Commonwealth countries.

The official circles here also do not share the view that Britain is too weak to stand up to the competition from the ECM countries. Since Britain's joining the "Inner Six", according to some members of the European Common Market, is likely to add to the strength of the ECM, the U.K. while signing the Treaty of Rome, it is felt, should be in a position to obtain necessary safeguards for her trade with the Commonwealth countries.

The Government of India in its discussions with Mr. Thorneycroft is expected to stress the point that if Britain joins the ECM, India's total trade with her and the Common Market countries should not suffer any set-back.

Mr. Thorneycroft's talks with the Government of India on the issue of Britain's joining the Common Market are considered here as only exploratory. The issue is expected to be considered further at the meeting of the Commonwealth Finance Ministers scheduled to be held at Accra in September.

Formation of a common market among the Asian and African countries, it is felt here, is not a feasible proposition so long as there is considerable unemployment in these countries.

ENERGY OUTPUT

According to Planning Commission, the total production of energy in India during 1960-61 was approximately 165 million tons of coal equivalent. As much as 39 per cent of this energy was derived from commercial sources, namely, coal, oil and water, and remaining 61 per cent from non-commercial sources such as cattle dung, wood, charcoal, farm wastes etc. The following table gives the amount of energy produced from various commercial and non-commercial sources:

ENERGY PRODUCTION IN INDIA (1960-61)

(Million tons of coal equivalent)

Source	Percentage of Total		
	Total	Commercial	Non-Commercial
Coal	54.60	84.00	33.00
Water	9.50	14.60	5.80
Oil	0.90	1.40	0.60
Total (Commercial)	65.00	100.00	39.40
Cattle Dung	46.00		27.90
Fuel Wood	35.00		21.20
Agricultural Wastes	19.00		11.50
Total (Non-Commercial)	100.00		60.60
Total (All Sources)	165.00		100.00

The energy produced from dried cattle dung is primarily used for cooking and heating purposes in rural India. It is made use of in urban households as

well to some extent. The total amount of cattle dung available annually is estimated at 1,200 million tons (wet weight). Of this, 400 million tons are used as fuel and 215 million tons as manure. The balance is simply wasted. The 400 million tons of cattle dung used as fuel produces energy equivalent to nearly 46 million tons of coal.

Wood is used as fuel for domestic purposes, mainly in urban areas, and by some industries either directly or in the form of charcoal. The fuelwood consumption in the country is estimated to be of the order of 60 million tons, which in terms of energy would be equal to 35 million tons of coal.

As much as 84 per cent of the energy produced from commercial sources in 1960-61 was derived from coal, 14.6 per cent from water and 1.4 per cent from oil. No nuclear energy was produced during this year.

The average cost of production of electricity from coal, oil, water and nuclear materials is of the order of 3 nP., 25 nP., 1.2 nP. and 4 nP. per KWH respectively. The energy produced from commercial sources is mainly utilised for industrial purposes and partly for domestic uses.

The total output of electricity in 1961 is estimated to be of the order of 5.8 million KW. By 1966 the output is likely to be doubled. The following table gives the electricity generating capacity in the country based on the four commercial sources, namely, water, coal, oil and nuclear material:

ELECTRICITY OUTPUT IN INDIA

(Million KW)

Source	1951	1956	1961's (Estimate)	1966 (Planned)
Water	0.56	0.94	2.10	5.08
Coal	1.60	2.27	3.45	7.06
Oil	0.15	0.21	0.25	0.36
Nuclear	—	—	—	0.15
Total	2.31	3.42	5.80	12.65

Electricity consumption in India at present is about 45 KWH. per head of population. By 1965-66 the consumption is expected to increase to about 95 KWH. per head. Compared to other countries, consumption in India is extremely low. Against India's present per capita consumption of 45 KWH., per capita consumption in Japan in 1958 was 930 KWH. and in Italy 928 KWH. Per capita consumption in the more advanced countries is even higher.

The ultimate potential of water power in India is estimated to be about 41 million KW. It is distributed in the various parts of the country in the following manner:

HYDRO-ELECTRIC POTENTIAL OF INDIA

(Million KW)

River System	Potential
West-flowing South Indian rivers	4.35
East-flowing South Indian rivers	8.63
Central Indian rivers	4.29
Rivers of Ganga Basin	4.83
River of Indus Basin	6.58
Brahmaputra and others	12.49
Total	41.17

During the Third Plan period, additional electricity requirements of the country are to be mainly met from generation from water and coal. The increase in electricity output from oil is envisaged to be only small. A beginning is also being made for producing some electricity from nuclear materials.

GROWTH OF CORPORATE SECTOR UNDER SECOND PLAN

The total paid-up capital raised by the new companies floated during the Second Plan period was of

the order of Rs. 161.01 crores. Of this, capital raised by Government companies amounted to Rs. 75.71 crores and that raised by non-Government companies totalled Rs. 85.30 crores. The table below gives the break-up State-wise.

The net increase in the paid-up capital of all the companies, both old and new, during the Second Plan period has been to the tune of Rs. 700 crores. Of this, capital worth Rs. 432 crores is accounted for by Government companies and the rest by non-Government companies.

FOREIGN COLLABORATION WITH INDIAN INDUSTRIAL UNDERTAKINGS

A number of technical collaboration arrangements have recently been concluded between the Indian manufacturing companies and foreign firms.

The British firms are well to the fore in offering collaboration for the manufacture of mining machinery, carbon paper and stationery products, non-ferrous pipes and tubes, electric motors, sugar machinery, steam turbines, gears and geared motors, switchgears, starters

and fuses, power tillers, textile machinery, diamond drill bits, refractories, wire ropes, sports goods etc.

American collaboration has been forthcoming for the manufacture of synthetic rubber, polythelene, carbon black, aluminium and aluminium products, pulp and paper, synthetic resins, chemicals, electric lamps, syringes, glass, rubber belting, spun pipes, tube-well drills, tyre tube valves and textile finishes.

West German firms will be collaborating for the manufacture of chemicals, electrical insulations, H.T. and L.T. insulators, textile machinery, steel pipes and tubes, scientific instruments, photographic printing paper and refractories.

Japan is collaborating for setting up the first dye-stuff manufacturing plant in Eastern India near Calcutta. It will also be collaborating for the manufacture of steel wire, transistor radios, water and electric meters and cameras.

Swiss collaborators are active in the field of chemicals and plastics, chemical plant, electrical equipment, synthetic fibres, textile machinery, diesel engines and aluminium. Swedish firms have offered collaboration for the manufacture of primus burners, saws, ball and roller bearings and petrol/kerosene engines.

The West Bengal Government proposes to collaborate with Krebs of France for setting up a chemicals manufacturing factory at Durgapur. Some collaboration arrangements have also been negotiated or are under negotiation with Italy, Norway, Finland, Belgium, East Germany, Czechoslovakia, Poland and Hungary.

VILLIERS' PRODUCTS IN INDIA

Some of the products of Villiers Engineering Company of Wolverhampton, England, are proposed to be manufactured in India. Villiers are the world's biggest producers of bicycle freewheels; they have been in this business since 1904 and are producing today nearly 70 million freewheels per annum. They also manufacture air-cooled petrol and diesel engines for various agricultural and industrial uses. Their production of such engines is nearly two million units a year.

Under an agreement concluded recently, Enfield (India) Limited will be making Villiers' two-stroke motor-cycle and scooter engines at a factory set up at Tiruvottiyur, Madras. Messrs. Cycle Equipment (Private) Limited of Okhla, Delhi, will be manufacturing Villiers' freewheels.

A spokesman of the British company has disclosed that negotiations are going on with the Government of India for the grant of permission to Enfield (India) Limited for the manufacture of full range of Villiers agricultural and industrial engines.

TWYFORDS SANITARY-WARE

The Hindustan Twyford Limited is setting up a factory in Delhi for the manufacture of sanitary-ware and some other goods produced by the Twyford Limited of Stoke-on-Trent, Staffordshire, England. The factory is expected to go into production next year. The British firm will have 26 per cent interest in this factory and will provide technical know-how and training facilities for Indian nationals in Britain. The training programme is already underway.

TWO NEW WAGE BOARDS

The Government of India has set up two Central Wage Boards — one for the coffee plantation industry and the other for the rubber plantation industry. The two Wage Boards have a common Chairman, Mr. L. P. Dave. The two independent members on the two Boards are also the same, namely, Mr. T. Manaen, M.P., and Dr. R. Balakrishna. The employers' representatives on the Coffee Wage Board will be Mr. U. K. Lakshman Gowda and Mr. M. B. Cariappa. Mr. M. C. Narasimhan, M.L.A., and Mr. P. Vriddhagiri will represent the workers on this Wage Board. Mr. M. M. Varghese and Mr. C. H. S. London will be employers' representatives on the Rubber Industry Wage Board. The workers' representatives on this Board will be Mr. B. K. Nair and Mr. P. Ramalingam.

The terms of reference of the two Wage Boards are to work out wage structures for the two industries based on the principles of fair wages as set forth in the report of the Committee on Fair Wages, as far as practicable. In evolving the wage structures, the Wage Boards would, in addition to the considerations relating to fair wages, take into account the needs of the two industries in a developing economy, system of payment by results, special characteristics of the two industries in various regions and areas, categories of workers to be covered (according to the definition of workmen in the Industrial Disputes Act) and working hours in the two industries. Whenever applying the system of payment by results, the Wage Boards will keep in view the need for fixing a minimum (fall-back) wage and also the safeguards against over-work and undue speed.

The headquarters of the two Wage Boards will be at Calcutta.

PRODUCTION OF ALUMINIUM

The Government of India, apparently, is following a policy of drift so far as production of aluminium is concerned. Demand for aluminium is growing at a fast rate, especially because of short supplies of copper and tin for which aluminium is a good substitute. A number of offers are pending for collaboration from, at least, three well-known American firms—Reynolds, Keiser and Alcoa. There are understood to be available similar offers from French and German firms. Meetings are held to discuss the problem of expanding aluminium output for which raw material is available in abundance, but they are adjourned without reaching a decision. Demand for aluminium is expected to go up to 1.5 million tons by 1966. Production target by the end of the Third Plan has, however, been fixed at 87,500 tons.

BRIEFS

The Bank Deposits Insurance Scheme has reached the stage of preparation of a draft bill. No decision has yet been taken on the limit to which deposits will be insured.

The Government of India will not hesitate to take effective steps if the unhealthy speculation on the Indian stock exchanges does not stop, it is pointed out by official circles.

The West German company, Fischer and Tausche, of Husum has entered into partnership with the Associated Electrical and Mechanical Industries, New Delhi, for the erection of a condensator plant in Delhi. The plant will eventually employ 450 people.

COMPANY AFFAIRS

HINDUSTAN MACHINE TOOLS

Production of 1,002 machines at the Hindustan Machine Tools Ltd., during the year to March 31, 1961, represents an increase of 250 per cent over the Plan target of 400 machines and compares well with 702 machines produced during the previous year. The production was further diversified with the addition of 16 types of Cylindrical Grinding Machines in collaboration with Messrs. Officina Meccanica Olivetti of Italy. Thirty Grinding Machines were produced during the year for the first time and the first batch of two heavy duty Turret Lathes designed and manufactured by the Company in India was demonstrated for the first time to the Speaker of the Lok Sabha, on January 2, 1961. The Company entered into a technical collaboration agreement on March 16, 1961—the sixth in four years—with Messrs. Regie Nationale Des Usines Renault of France for the production of Special Purpose Machines in India. A further general technical collaboration agreement was also signed on March 6, 1961 with Messrs. Lixem, G.m.b.H., of the German Democratic Republic representing a consortium of all the State owned machine tool factories of the German Democratic Republic. During the year under review the company undertook the establishment of a watch factory with an initial capacity of 360,000 watches per annum in collaboration with the Citizen Watch Company of Japan.

The Government of India has approved the construction of two more machine tools factories each of 1,000 machines per annum capacity, in other parts of the country during the Third Plan period. The second machine tool factory in Bangalore designed to double the output to 2,000 machines valued at Rs. 7 crores per annum, the construction of which commenced on April 1, 1960 was completed ten months ahead of schedule in May 1961, i.e. in a record time of 14 months, against 7 years taken for the completion of the original factory. It is quite creditable that the second factory was built without any financial contribution from the Government or the shareholders and entirely with the internal financial resources built up by the company during its first five years of operation.

During the year to March 31, 1961, the company recorded a profit, before providing for depreciation and interest, of Rs. 1.28 crores as against last year's Rs. 82.27 lakhs. After making provisions for depreciations etc. the directors have recommended Rs. 1.95 lakhs to be transferred to development rebate reserve. The payment of 10 per cent dividend not subject to deduction of income tax will absorb Rs. 53.10 lakhs.

SELECTED SATGRAM COLLIERIES

Raisings of Selected Satgram Collieries Ltd. during the year to December 31, 1960 were 283,851 tons, nearly 23 per cent higher than the previous year's raisings. This, in a way, reflects the trend of coal output in the country which was nearly 10 per cent higher over the previous year. The company achieved this higher output by scientific planning and efficient execution. The sales too were higher which are reflected in trading results. The profit before taxation is Rs. 5.18 lakhs against Rs. 4.55 lakhs last year. After making usual provisions the directors have recommended a final dividend of Rs. 8 per ordinary share and pro rata Rs. 2.62 on newly issued ordinary shares.

The Chairman of the company has pointed out that the raisings in the collieries in 1960 were obtained by the development work which required a continuous dose of capital investment which in turn resulted in comparatively higher costs. In the new Satgram colliery, he adds, expectations were not fully realised owing to the Satgram seam being declared gassy by the De-

partment of Mines towards the end of the year. More expenditure, both of current and capital nature, had to be incurred in taking extra precautions as required by the Mines Act.

Towards the end of 1960 electricity had come to South Joyramdanga Colliery and higher output was recorded and the quality of coal was also upgraded. Similarly Manoharbahal seam had been fitted with required machinery and better quality of coal was being produced.

The Chairman was of the opinion that the most critical situation was likely to develop in the country due to acute transport shortage when the coal output increased in the coming year. Even now, he says, there is a severe shortage. As against the total daily requirement of 6,000 wagons of coal loading in Bengal-Bihar coal-fields, and 5,000 wagons committed by the railways, only 4,694 wagons on an average are loaded from January 1961 causing a shortfall and short supply of 1,306 and 306 wagons respectively. In view of the higher targets—97 million tons by the end of the Third Plan—fixed for the Third Plan, it is necessary that transport problem is given proper attention.

MANDYA NATIONAL PAPER

The factory of the Mandya National Paper Mills Ltd., with an original production capacity of 35 tons of paper a day, is under construction under the supervision of the engineers of the company's American collaborators, M/s. Parsons and Whittemore. The factory is expected to go into production towards the end of October. The company has drawn up expansion plans to double the production capacity, i.e. to 70 tons of paper per day. For this purpose, sanction and assistance from the relevant government departments and agencies have been obtained. Negotiations are also going on with M/s. Parsons and Whittemore for the purchase of extra machinery and technical collaboration.

COMMODITY NEWS AND NOTES

MONTHLY RELEASE OF SUGAR

The Government of India has decided to release 2 lakh tons of sugar in July. There will be no release for free sale from factories in Uttar Pradesh, Bihar and Punjab, except a small quantity which will be released to each factory for sale at the factory gate. Allotments of sugar to Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, West Bengal, Orissa, Madras, Kerala, Maharashtra, Gujarat, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to nominees of the State Governments. In the case of Punjab and Jammu & Kashmir, allotments will be made direct to the State Governments or to their nominees. Allotments to Delhi will continue to be made on the existing basis.

Allotments will be made at prices fixed under Notification No. GSR 1112/Ess.Com/Sugar dated September 15, 1960 and GSR 1/Ess.Com/Sugar dated January 2, 1961. The controlled ex-factory price for U.P. and North Bihar factories is Rs. 37.85 per maund and for factories in Punjab and South Bihar Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r. destination prices in respect of allotments made to Kanpur and Calcutta will be Rs. 38.60 and Rs. 39.85 per maund respectively for sugar of ISS D-29 grade.

EXPORT INCENTIVE SCHEME FOR MANGANESE ORE

As a measure of export promotion, it has been decided to provide incentive to exporters of manganese ore. Exporters of manganese ore are to be permitted to import mining equipment and machinery for improvement of their manganese mines to the extent of 5 per cent of the foreign exchange earned by them through the export of manganese ore in case of straight sales against cash. An additional import entitlement not exceeding 5 per cent (thus making a total of 10 per cent) will also be considered on merits in individual cases, where the Actual Users establish the need for it.

In the case of exports of manganese ore under barter also, import of machinery will be allowed to the extent indicated above, on condition that the value of the imports under the barter agreement is reduced to the extent of the machinery entitlements. Import licences will be issued by the Joint Chief Controllers of Imports and Exports at the Ports. Necessary applications may be sent to them with the requisite documents like shipping bills and bank certificates and also

a certificate from the Director of Indian Bureau of Mines about the essentiality of the equipment sought to be imported. Licences will generally be granted only once in a quarter on the basis of exports effected in the preceding quarter and will be subject to conditions applicable to Actual Users licences. Exporters may, however, if they choose, obtain licences once in six months against exports made in the preceding half year period.

PRODUCTION OF FERTILIZERS

Both the installed capacity and the actual output of nitrogenous fertilizers, it is learnt, has fallen far short of the Second Plan targets. The installed capacity (in terms of nitrogen) on March 31, 1961 (the close of the Second Plan) was 248,000 tons as against the target of 382,000 tons fixed for the Second Plan. The output achieved was 105,000 tons as against the target of 290,000 tons.

The shortfall in output, it is said, has been due partly to production difficulties at Sindri and partly owing to the delayed commissioning of the Nangal factory which has a capacity of 80,000 tons production per annum.

To cover the shortfall in production and to meet the expanding demand for fertilizers, the Government, has made increased provision for imports during the current year.

WOOL MARKETING COMMITTEE TO STUDY OVERSEAS INDUSTRIES

The Australian Government's committee of inquiry into wool marketing problems is to spend a period of about three months inspecting the wool industries of Great Britain, the Continent, United States of America, and Japan. The Secretary of the Graziers Association, Mr. Vernon Officer, told the committee that he thought that artificial attempts to prop up Australian wool prices could cause buyers to use more of the artificial fibres. This would be one of the positive dangers of a reserve price plan. Reserve prices could not guarantee stability or profit to wool growers. Skillfully handled they could moderate a downward trend of wool prices in a season. But they could not exert any influence over the general level of the prices. His association could not agree that any change in the present selling of wool, of which more than 90 per cent was bought by overseas countries, could guarantee a profit to producers. Steeply rising costs was the major factor against such a guarantee.

PROUD ACHIEVEMENT

The J. K. Organisation can legitimately be proud of the fact that it has been the first in various fields of industrial activity in India.

FIRST to manufacture *Calice Prints* in India—J. K. Cotton Spinning & Weaving Mills Co. Ltd., Kanpur.

FIRST to instal *Electric Furnace* for manufacturing steel in Northern India—J. K. Iron & Steel Co. Ltd., Kanpur.

FIRST to produce *Baling Hoops* for use by the Jute and Cotton Textile Industries in India—J. K. Iron & Steel Co. Ltd., Kanpur.

FIRST to manufacture hydraulically operated modern cane crushing mill for small-scale Khandasri sugar units—J. K. Iron & Steel Co. Ltd., Kanpur.

FIRST to produce *Aluminium virgin metal* from Indian Bauxite in India—Aluminium Corporation of India Ltd., Jaykaynagar.

FIRST to produce *Engineers' Files* in India—J. K. Engineers' Files, Bombay.

FIRST to establish *Plastic Industry* in Northern India—Plastic Products Ltd., Kanpur.

FIRST to produce *Heavy Chemicals* in Western India—Eastern Chemical Co. (India) Bombay.

FIRST in the world to produce on a commercial scale *Hydrosulphite of Soda* by Sodium Amalgam Process—J. K. Chemicals Ltd., Thana.

FIRST *Continuous process Rayon Plant* in India to produce *Vicose Rayon* and the first such factory in India to be built up in record time—J. K. Rayon, Kanpur.

FIRST *Nylon Plant* in India—Jaykaylon (under construction), Kera.

FIRST to manufacture *Portable Typewriters* in India—Blackwoods India Ltd., Calcutta.

FIRST *Woolen mill* in India to export woollen goods to Norway and Sweden—The Raymond Woollen Mills Ltd., Thana.

LARGEST *Jute Mill* in Northern India—J. K. Jute Mills Co. Ltd., Kanpur.

STRONG Medicine!

Cargo to the U. S. A. by AIR-INDIA JET

Fly your merchandise direct to New York by Boeing... the big Jet for big American markets — fast, fresh and frequently.

For streamlined distribution, for quicker turnover and larger profits, use AIR-INDIA.

10,000 lbs. capacity per flight with bulk discounts and special low rates for many commodities.

5 Boeing Flights to New York Every Week

The Eastern Economist

JULY 21, 1961.

President Ayub Khan in America

ON Tuesday, President Ayub Khan of Pakistan concluded his visit to the United States. It would be foolish to deny that he has recorded beyond expectations. He has been successful in obtaining additional military aid with the possibility of air-to-air missiles which hitherto have not been in use in the Asian Continent. There is a rumour that Shooting Star supersonic jet fighters will also be supplied; these are equipped with the Hound Dog missiles which direct themselves into planes, being attracted by heat generation. If only because this places technological superiority with the Pakistan air force, India would have ground for concern. Whatever the thinking of the new administration in Washington has been on the arrival of neutralism in South-East Asia, it is apparently in no mood to disrupt the permanent alliance it has with Pakistan in the military field. This should give us food for thought. The belief that the Kennedy administration was moving neutralist and dismantling the military arrangements round the Soviet Union is an error. The recognition of neutralism in Laos does not imply acceptance of what might be called the Indian view on military alliances. The present current in Washington seems to be greater liberalism towards neutralism, but at the same time greater assistance to old military allies.

If President Ayub Khan only made this clear he would be reflecting and not initiating American policy. But it would appear from the high tributes he has earned from American Congressmen and the particular tribute which has been given by the Vice-President, Mr. Lyndon Johnson, when he entertained President Ayub Khan at his home in Texas, that he has in fact influenced American policy as well as reflected it. If so, it is necessary that India should obtain clarification as to the extent of the influence and the extent of the reflection. In both cases it would appear that our understanding of American policy needs a new assessment. This is not primarily connected with Kashmir, on which it is obvious that while it forms part of the joint communique, the United States cannot bring undue pressure on India to alter her course. This does not imply that Kashmir is not negotiable, but currently it is not negotiable by the United States' pressure.

It is not unlikely that President Ayub Khan's success and his satisfaction are based on facts as well as on propaganda. The outspoken character of his utterances, notwithstanding their unpopularity in the Communist world, must commend the

President to American audiences, particularly on the eve of the crisis on Berlin; it cannot assist the United States to have an uncertain ally in Pakistan. Whether Indian comment is to the effect that he is an uncritical ally or that he has overdone his tirade against India, the fact remains that the United States and Pakistan in the Democratic administration remain very much as they were before. It is sincerely to be hoped that the guarantees given to India on the use by Pakistan of American arms still apply. In any case, the large economic aid underwritten by the Kennedy administration must not make India oblivious of the fact that her Defence expenditure cannot under any circumstances be reduced. This is a serious consequence of President Ayub Khan's visit, no less than of prior obligations the country faced in respect of the People's Republic of China.

It is also to be hoped that India's diplomatic efforts in the United States will be redoubled now that it is clear that the President of Pakistan has secured some substantial accommodation. It is necessary that the Indian Embassy in the United States under Mr. B. K. Nehru, who has to take charge at this critical time, should be adequate for the large task which he is called upon to undertake. He has been supremely successful as Commissioner-General for Economic Affairs, having in effect underwritten not merely the first two years of the Plan, but in principle, longer requirements. It is to be hoped that he will be equally successful in informing both the administration and the American people of the larger issues of Indo-Pakistan relations.

It is not only in the United States that President Ayub Khan seems to have scored some telling advantages. If current rumours in Delhi are correct, it would appear that the United Kingdom is not beyond suggesting that Pakistan should occupy a special place in its negotiations with the European Common Market. The rumour has appeared that it is possible that a special status as an associated territory, under the Treaty of Rome, might be found for Pakistan while that will not be attempted for India. It is obvious that if this should happen, India's tea exports would be greatly imperilled, particularly if Ceylon enjoys a like status. Possibly it is because of some assurance of this kind that President Ayub Khan has expressed himself so favourably on Britain's joining the European Common Market. Whether this is so, or not, an immediate clarification must be ob-

tained in respect of the United Kingdom's intention in regard to discriminatory treatment against India. Both in Washington and London it would appear that India's current diplomatic effort has

suffered a reverse, and Pakistan's corresponding success. It is necessary for the Ministry of External Affairs to ponder carefully over the implications of these reverses.

States' Finances

THE Reserve Bank's study of States' finances, contained in the June issue of its Bulletin, read against the backdrop of the discussions at the last two meetings of the National Development Council, presents a picture that can hardly evoke optimism about the States' role in the implementation of the Third Five-Year Plan. During the Third Plan period, the States are required to restrict their deficit on current revenues to Rs. 12 crores and to raise Rs. 149 crores from surpluses of public enterprises and another Rs. 610 crores from fresh taxes. In view of the clamour from various State Governments for stepping up of their outlays under the Plan, the tax effort on their part may have to be even more than stipulated. The States' budgets for the first year of the Plan, however, severely fall short of these targets. With total receipts estimated at Rs. 1021.37 crores, they have shown a deficit of Rs. 36 crores on revenue account. Another Rs. 29.9 crores is anticipated to be the deficit on capital account, bringing the total deficit, including Rs. 0.7 crores shortfall in miscellaneous receipts, for the current year to Rs. 66.6 crores. Fresh taxation has been proposed only to the tune of Rs. 17.3 crores, leaving an uncovered gap of Rs. 49.3 crores. In view of the experience of the past few years and the prospects of the Third Finance Commission reallocating the share of States in some of the Central taxation receipts and also stepping up of Central grants to some States, this gap in States' revenue and expenditure may not be of much significance. But if it has been manipulated either to influence the Finance Commission or to avoid adverse repercussions at the ballot box in the ensuing elections, it is something which can only be deplored.

The analysis of the expenditure of States makes very mixed reading. While it is encouraging to note that developmental expenditure, both on revenue and capital accounts, has increased by 80.94 per cent from Rs. 2,006.71 crores under the First Plan to Rs. 3,630.96 crores under the Second Plan, it is disconcerting to behold that the downward trend witnessed in non-developmental expenditure during the years 1951-52 to 1956-57 has been reversed. During the six years to 1956-57, non-developmental expenditure as percentage of the total expenditure went down from 43.00 per cent to 27.66 per cent. In 1957-58, it increased to 33.47 per cent, in 1958-59 to 34.68 per cent and in 1959-60 to 35.14 per cent. The revised estimates for 1960-61 put this expenditure at 32.46 per cent of the total. But when actuals are available next year, this percentage may be higher by two to three points. Increase in non-developmental expenditure, both on revenue and capital accounts, under the Second Plan has been of the order of 58.76 per cent, from Rs. 1,113.93 crores in the five years of the First Plan to Rs. 1,768.48 crores under the Second Plan. Of the absolute increase, expenditure on Civil Administration has gone up by Rs. 165.92 crores. Another disturbing fact that emerges from the study of non-developmental expenditure in the States during the past decade is that the cost of collection of States' taxes has also shown an upward trend. Under the First Plan this cost was 14.7 per cent of the total tax collections. Under the Second Plan it increased to 15.9 per

cent. There is obviously need to tighten up reins on this front.

The phenomenal increase in the permanent debt of the States over the past ten years is reflected in the increase in debt service charges. Under the two Plans, expenditure under this head has gone up from Rs. 64.46 crores to Rs. 265.90 crores. A more discomfiting fact in this connection, however, is the tendency of State Governments to go in for increased overdrafts on the Reserve Bank; there will be eleven States out of the fifteen in the Union which will have at the end of the current financial year a negative cash balance with the Reserve Bank to the tune of Rs. 60.9 crores, as against only five having a negative balance of Rs. 14.2 crores at the end of the last financial year. This increase in the overdraft of States on the Reserve Bank implies that State Governments this year would be going in for deficit financing to the tune of Rs. 46.7 crores, if the gap is not filled by revenue turning out to be better than anticipated. The Planning Commission has stipulated a ceiling of Rs. 26 crores deficit financing by the States during the entire Third Plan period. This calls for far greater financial discipline on the part of the States than they have practised under the Second Plan.

A word may be said about the new taxation that the State Governments have gone in for this year. Of the ten States which have proposed to raise additional taxation this year, only four have levied new taxes; others have made some changes in the existing rates of taxation. The pattern of taxation followed by the State Governments leaves much to be desired inasmuch as the one massive sector of population which in all appropriateness should share a greater burden of taxation is not being asked to do so. When State Governments are required to raise fresh taxes to the tune of Rs. 610 crores during the Third Plan period, it is imperative that they should broad-base their tax structure and raise the land revenue rates which were fixed decades ago at a time when general price level in the country was about 25 per cent of the present level. It is true that in some States land revenue has been enhanced through imposition of surcharge on it, but in view of nearly four-fold increase in the prices of agricultural commodities, it is only just that the agriculturist should be asked to shoulder his due share of the burdens of planning.

The buoyancy in States' finances during the Second Plan period—the total revenue receipts of the fifteen States during this period have nearly doubled from Rs. 2,227.4 crores during the five years of the First Plan to Rs. 4,012.7 crores during the Second Plan quinquennium—and raising of practically all the resources needed for the Second Plan—there was a shortfall of only 2 per cent in this regard—has been largely due to the bountiful transfer of Central revenue to the States under the Santhanam Commission's award. The States should not expect any great concessions from the new Finance Commission and instead of looking for the *manna* from New Delhi, should exercise greater financial discipline on themselves by way of greater tax effort and restraint on non-developmental expenditure.

Commonwealth or Europe?

By PAUL BAREAU,

Editor: *The Statist*, London.

THE debate on whether or not to join the Common Market is waxing fast and furious in Britain. It is now reaching a new pitch of intensity and is causing the most astonishing cleavages within the recognised political parties. To see Empire loyalties on the extreme right allied in this cause to the extreme left of the Labour Party and the arch protectionist, Lord Beaverbrook, embracing the out and out free traders who object to the Common Market because it will have a common tariff is to behold a confusion such as has never before swept over U.K.'s political scene.

The debate has, of course, been stimulated by the well-reported tours of the Commonwealth by three senior Ministers bent on expounding the British views on this subject of joining the Common Market and on obtaining from Commonwealth countries some indication of their attitude to U.K.'s possible membership of the E.C.M.

It is not altogether surprising that the answers obtained by the Ministers should on the whole have been negative, discouraging and defensive. The Commonwealth countries they visited were in fact being asked for their views about a move which is highly problematical, the results of which must lie in the dim mists of an unpredictable future which might well endanger the very solid advantages which they now enjoy in the British market. It is not at all surprising that in these circumstances they should in general have refused to exchange the bird they have in the hand for the two problematical birds in the European bush.

As viewed from London, it would seem that Mr. Peter Thorneycroft, who visited India, Pakistan and Ceylon, had the easiest of the three tasks and Mr. Duncan Sandys, whose route took him through New Zealand, Australia and Canada, had the toughest assignment. Mr. Hare in Africa apparently encountered some surprises; but the reaction from Ghana and Nigeria, and particularly from the former had overtones of the old colonialism and new African nationalism which had very little to do with the immediate subject at issue. Ghana, it is known, wants to create and perhaps lead a black African common market. Any suggestion that the overseas territories linked to European countries should in some way or other be associated with E.C.M. appears to Dr. Nkrumah and those who think like him, reek of dependence and is, therefore, anathema.

Beyond this emotionalism, however, there are some harsh and substantial facts that the new African Dominions must face. Among them is the protection which the overseas territories of the present members of the Common Market are about to enjoy in that extremely dynamic and expanding part of Europe and the detriment which this may well cause to the sale of non-Common Market tropical products to Europe. Nearly half of Ghana's cocoa is at present consumed in the Common Market. This is a reality to which Ghana should pay more attention than to her plans to form a common market in Africa.

The most difficult of the Commonwealth problems is undoubtedly that of the temperate zone Dominions whose farm products—butter, meat, cheese—are in large part consumed in Britain. This is a market to which they have unrestricted and duty-free access. These products, however, are also those which come from the highly protected farming communities of the Common Market. If Britain becomes part of this Common

Market and has to erect against the outside world the Common Market tariff, depending that on foodstuffs, it may deprive a country like New Zealand of virtually all its means of livelihood. This accounts for and explains the vehemence of the New Zealander and the Australian reaction to Britain's proposed membership of the E.C.M.

This, however, is a reaction against a completely unreal alternative. There could be no question of Britain joining the Common Market in such a way as to pass sentence of economic death on overseas countries whose whole economy is geared to the British market. No country in the Common Market itself would dream of asking this. What must be negotiated is a series of agreements dealing with the problem commodity by commodity and ensuring that if Britain joins the Common Market its imports of temperate zone foodstuffs from the Dominions will have some ceiling placed on them. This limit would be defined by what the U.K. had imported in the past. Up to this figure duty-free entry would be continued.

Beyond such considerations, countries like New Zealand, Australia and Canada will have been informed in no uncertain terms that if Britain were isolated from the Common Market, it might easily lose the prosperity and purchasing power which enables it to absorb these vast quantities of duty-free foodstuffs from the temperate zone Dominions. There is a real danger of destroying the *status quo* by trying to keep it. Commonwealth countries must seriously ask themselves whether they are serving their own interests best by barring Britain's entry into Europe in the hope of retaining their privileged position in the British market. Would it not be better to make an act of faith based on the reasoning that a Britain prospering as part of the Common Market and providing within that market a voice pleading for the interest of the Commonwealth than one isolated from the historic movement which is now irreversibly under way on the other side of the English Channel?

As far as India and the other Asian countries are concerned, the primary need is for more capital. That will be more readily forthcoming from a united than from a divided Europe. Their next need is to secure larger export markets in Britain and Europe for their primary and their manufactured goods. Here too the movement towards unification of Europe, provided the interests of the Commonwealth are looked after, would seem to be the best solution. A point of particular interest for India is the problem of exports of relatively low-cost manufactures to Europe. Their continued entry into the British market is by no means guaranteed as the recent treatment of textile imports from India shows. The Federation of British Industries in a recent statement on British Industry and Europe has stressed that it would like to have a joint European approach to the problem of low-cost Asian manufactures as part of any settlement with the Common Market. The F.B.I. points out: "British industry recognises that economic expansion in Asia and elsewhere is to its ultimate benefit, but it is carrying a disproportionate share of low-cost imports, particularly in certain sectors, and a spreading of this burden is now called for." Here is one more reason why India, in particular, should not take a negative and restrictive view of Britain's possible membership of the E.C.M.

A DELHI DIARY

MR. THORNEYCROFT IN DELHI

THE week in Delhi, like no other that I can remember, has been dominated by economics. Not, indeed, that the famous 'economic' man has been very much in evidence; the brand of economics that has been visible is that older science called political economy, with politics operating very much behind the scenes. The immediate display of the economic component is connected with the European Common Market, which has temporarily so far banished domestic politics from the scene that for a whole week I have heard nothing else but common market talk! Some of it, for the great majority of people in Delhi, was not so common and, indeed, for many of my journalist friends, the task of preparing their minds for the Battle of the 'Sixes' and 'Sevens', (and if Britain joins, the Sevens and the Sixes) involved not a little hard work and, on the whole, very little enlightenment. One can go through all the written work on the European Common Market and not feel very much wiser. This is the ideal setting for an expert to impose his view upon that amorphous thing called the journalistic opinion; it would seem, the experts, whether in the Government or in the Federation, have not been a little successful in the impress they have left on the newspaper mind. Almost everyone seemed to work himself up to a fever that a serious thrust into India's entrails was contemplated. I found "The Eastern Economist" a very lonely voice on the other side.

The alarm seems to be overdone. Arithmetic on the subject of what will happen five years, six years or ten years from now can be very misleading. Nothing was so effective as Mr. Thorneycroft's Press Conference in presenting what might be described as another background of the problem. Surprisingly to most of us, Mr. Thorneycroft came out quickly with his own very positive view. This was that there were, on balance, advantages in entering the Common Market. He admitted that while he had come down on one side the volume of controversy that existed and the complexity of the issues involved made such a decision extremely difficult. There were many 'ifs' and 'buts'; one such, of course, depended on that very dangerous word "safeguards", which could, in fact, be negotiated. In the real world, however, there were no permanent safeguards. Slyly (and, I thought, with a twinkle in his eye!) he pointed out that Indian nationals had once strongly opposed the Ottawa Agreement and Imperial Preferences; they are now very much in favour of their retention. This was no backwardness on their part; it was merely a natural response to a rapidly changing situation. The European Common Market was itself the expression of the forces of change. History was decreeing for a variety of reasons that large units with relative free trade within them were conditions of efficiency and even survival. With the North American Continent on the one hand and the Communist bloc on the other, Europe had to integrate or become a high cost area compelled to lose markets. The Treaty of Rome had done much for the Six; Britain—not withstanding the Commonwealth—was geographically in Europe. Was Geography greater than History? That could not be answered; but the European market could not be dropped that simply. To the question: Was not the Commonwealth a great trading area, he answered, "Of course". But (alas!) it was not a Free Trade Area. There were (as in India) tariffs which had to be jumped. The Commonwealth was not offering free trade; only asking for the retention of a formula a little out of the present current. All of which made us feel not so progressive. The expansion of world trade with an outward looking Europe would, perhaps, give us back all the privileges we might lose. Besides there would be

a transitional period—perhaps for five years—when we could get used to those cold North Sea winds!

THE WAVE OF THE FUTURE

Perhaps I am simple (I have been told so thrice this week!) but I believe that the eye of the (statistical) mind is not so good as the physical eye with which, in the mercy of Providence, all men have been endowed. Having recently returned from the European Common Market, I argue without statistics that it is better to be inside than outside it; having been recently in Britain, I would argue that Britain is trembling on the brink, but is almost certainly in. The only upset might have arisen if a General Election preceded the decision. I am told that the political prophets have decided in favour of an election only after entry, the consequences of which act of statesmanship I find it difficult to assess. All in all, Britain's current financial crisis seems happily staged to show that the Commonwealth (Bless her patriotic heart!) is not designed to protect Britain's balance of payments with British capital so anxious to leap into the Common Market. One way, therefore, to shut the door is to enter the market, and prevent duplication of plants by over-anxious British Big Business!

There is only one snag which I should record. There was no word given to us directly by Mr. Thorneycroft or anyone else that Pakistan and Ceylon might get in as "associated territories" with their old privileges while India ran the gauntlet alone or with Australia and Canada. I would take a very dim view of negotiations which split the Commonwealth arbitrarily on a country basis; surely the answer is to negotiate a (five-year) transitional period on the basis of the sensitive commodities—tea and cotton textiles first, please! But, for the moment, I keep asking myself how the centre of our fears was so long hidden from us while briefs and communiques abounded. Can it be that human nature, being fearful, keeps all its greatest fears to the end?

THE SWINGS AND THE ROUNDABOUTS

All of which brings me to that happy metaphor of swings and roundabouts and the cheerful manner in which they balance. On the swings of trade, it seems we shall be certainly down and, if it should happen that Ceylon gets away with 'associated territory' status, while we, being in the doubtful position of 'Big Brother' have to defend ourselves unaided, the loss on our tea exports can be very large. And this is all in foreign exchange. It is no consolation whatever to be told that, since Britain will lose her preference in Indian markets, we will have in rupees a larger revenue duty on machinery imported from Great Britain. It is obvious that the whole problem of India's competitive position in tea—and a Wage Board is now sitting, the consequences of which will certainly be to make us even less competitive than before!—depends on access to the British market being changed for all, and not for any portion of the Commonwealth. On the roundabouts, by which I mean payments, it is true that if Britain does invest less in Europe she will have more to invest in this country and also, if the European Common Market countries do not invest in Britain, they might invest more in the Indian Union. But who can pretend to add invisibles (which grow more invisible every day) to replace a stable element in our trade? All in all, one must argue that, unless payments can balance trading losses, Britain will find it very difficult to persuade the Indian Union that the Common Market is a good thing. I suggest very humbly that, while experts have been studying trade figures with excessive care, they might now devote themselves to Britain's potential surplus of payments out of which our trading losses can be reimbursed!

ARGUS.

THE WEEK'S NOTES

Laos

FIFTEEN POINTS FOR NEUTRALITY

NOVELTY IS by no means claimed by Mr. V. K. Krishna Menon as a special virtue of the 15-point proposal he has presented to safeguard neutrality for Laos. It need not be, for it is immaterial. The material consideration is the soundness of the proposal. Taken as a whole, it is so. The UK, one of the co-chairmen of the 14-nation conference on Laos, has expressed its first reaction in these terms and commended it for closer examination. But Mr. Krishna Menon's optimism would be shared not by many, when he forecasts that the three Princes who would meet soon (Phnom Penh in Cambodia is to be the venue) to deliberate on the formation of a provisional coalition government, would be able to set it up by the close of this month. Na Mon points to a different experience. Likewise, his assessment of the relative strength of the three groups assumes much. It is right to presume that Prince Boum Oum's voice would not be strong. But to think that Prince Souvanna Phouma will have the upper hand, while Prince Souphannouvong will lean heavily on him is to overlook the sanction behind the Pathet Lao and the accession of strength to it in the past few months.

This leads to the crux of the problem which is to give substance and reality to neutrality. From this angle the suggestions in the 15-point proposal which relate to foreign forces and supply of illicit arms acquire great importance. The proposal demands immediate evacuation of all foreign forces from the Laotian soil as soon as the Government of National Alliance is set up. There would be little difficulty in securing compliance with this demand as none of the foreign powers interested in Laos would openly incur the odium of flouting the accord on the coalition and persisting in flagrant intervention. But there is another potential means of intervention and subversion of neutrality. It is here that the 15-point proposal discloses its weakness. It charges the International Control Commission with the task of keeping strict vigilance on the inflow of illicit armaments and to make its prevention effective. The ICC can hardly prove a powerful machinery for this difficult assignment, granting that it is supplied with the paraphernalia for supervision. It has been frustrated and neutralised in functioning by the Pathet Lao. Under whose inspiration, it is not difficult to guess. In this respect the British proposal of a high-powered international agency to control the supply of arms to Laos seems more promising and reassuring.

Punjabi Suba

DEMOCRATIC DETERMINATION

MASTER TARA SINGH'S Press Conference of July 12 and his recent statements on other occasions are significant for laying bare the real complexion of the Akali demand for the creation of a Punjabi Suba. All along the Akali leader had been very scrupulous in adhering strictly to his contention that the demand for the Punjabi Suba is in essence a linguistic demand for setting up a Punjabi-speaking State and that it was gross misrepresentation to describe it as a communal demand for carving out a separate Sikh State. At the Press Conference he came out openly and asserted that the motive force for his demand was provided by the discrimination which is practised against the Sikhs. This is a vague charge which may be given a comprehensive connotation implying discrimination in the spheres of employment in the civil administration, enlistment in the armed forces, official contracts in

business and various forms of patronage. It is a serious enough charge like the one which he made in attributing to the Prime Minister a highly offensive generalisation regarding the Sikhs. When asked to substantiate his charge of discrimination with specific illustrations, he had none whatsoever to give. More important than the hollowness of the charge is the fact that the Akali leader spoke out his mind at a Press Conference, where he was presumed to be careful about what he said.

If the demand for a Punjabi Suba rests on a linguistic basis, the Akali Dal has yet to offer an explanation how it is that it lacks the support of even a fraction of the 45 per cent non-Sikh Punjabi speaking population in the territory which would form the Suba. Notwithstanding this fact, Master Tara Singh feels absolutely confident that not less than 80 per cent of the population would vote for the Punjabi Suba, if a referendum were taken. The constitution makes no provision for a referendum. But apart from this difficulty, if the Akali leader is so confident of an overwhelming vote of four-fifths, he can very well command it by an appeal to the electorate. Mr. Lal Bahadur Shastri's proposal to him to make the Punjabi Suba a straight election issue at the forthcoming general elections is a forthright offer, which provides the constitutional mode of a democratic determination of the question. His refusal to agree to it is incomprehensible. He would be doing a great service to his community and to the country if he puts his faith in the ballot box and desists from the extra-constitutional method of going on a fast, which carries grave potentialities of setting aflame an emotional conflagration.

Kerala Elections

"NO TRUCK" THESIS

THE KERALA PRADESH CONGRESS COMMITTEE and in particular its president, Mr. C. K. Govindan Nair, are at great pains to explain and convince the nation that they are observing in spirit the AICC's directive to have no truck with communal parties on any count. The test has been offered by the ensuing elections in the State to the local bodies.

The authoritative version of the "understanding" reached between the Congress Party, the Praja Socialist Party and the Muslim League is now available. The negotiating committees of the three parties finalised the understanding at Ernakulam on July 15 on the basis of which the three parties have agreed to adopt a common strategy at the election. The aim of the strategy is to defeat the Communist Party at any cost and the most potential way to do it is to avoid triangular contests to prevent splitting up of votes and to arrange straight contests instead. The three parties have arrived at the understanding on this very basis at Ernakulam. The next step is to work out constituency-wise the details of allocation of seats to the three parties and the selection of candidates in accordance with the local strength of the parties and the personal influence of the individual candidates. This task, no less important than the understanding, has been left to the district committees of the three parties.

The PSP has made a clean breast of the whole affair and admitted straightaway that its alliance with the Congress Party and the Muslim League continues. The Muslim League has reiterated the fact of its alliance with the PSP, but in deference to the Congress Party it has explained that the Congress and the League would go about the elections alone. How the Muslim League attempts to explain its behaviour is not relevant. The

relevant issue is the justification sought to be given by the Kerala Congress Committee. Mr. Nair has proclaimed that the Congress Party would have no truck and no joint platform with the Muslim League and this position had been thoroughly understood by the latter. True, there will be no joint platform and no truck with the League in the sense that the Congress Party may not address election meetings in support of the League candidates on a common platform and voters following the two Parties will not be given a lift to the polling booths in common trucks. Thus it is that the Durgapur directive of the AICC on "no truck" will be followed in the fullness of spirit.

Does the KPCC pretend that where the Muslim League candidates are put up (with its consent) in straight contests with the Communists, Congressmen voting at the elections will be asked to have no truck with the League candidates? The plain reality of the political situation in Kerala is that the overriding task of dislodging the Communist Party from its position as the strongest single party (though not the majority party) still remains to be accomplished. If politics, at times, makes strange bed-fellows, it is a matter of expediency. The Kerala understanding cannot be explained on any other reasoning.

Nuclear Test-Ban

ANOTHER DEADLOCK

THE NUCLEAR test-ban talks, which were in progress at Geneva, have been deadlocked once again. This is yet another impasse in a series since this initial key solution to the problem of general and total disarmament was taken up two and three quarters of years ago. But the submission of the memorandum by the US and the UK for reference of this subject to the UN General Assembly is the final indication of their view that the present deadlock cannot be resolved at the Big Three level. The memorandum stresses the point in quite unequivocal terms that "voluntary forbearance" by the US and the UK in this situation entails serious risks to their security. The implication is clear. Any credible evidence of nuclear tests being carried out by the USSR may force their hands not to be left behind. Already, President Kennedy's technical advisers are exerting pressure on him for resumption.

Effective international inspection and control of the tests constitutes the hard core of the problem. The draft treaty with its clear and forceful preamble, drawn up by the three parties, raised high hopes that the deliberations would be pursued with speed to a satisfactory conclusion. Nevertheless, Russia's conventional shifts uttered a caution against over-optimism and the apprehension proved to be true. The Western proposal for a really operative machinery for inspection and control was rejected by the USSR, its basic and unalterable contention being that operations for inspection inside Russia must be conducted under "the direction of a Soviet citizen." The Russian counter proposal was based on the new-found "troika" pattern for the executive council carrying out the day-to-day functions of control. With the rule of unanimity between the representatives of the East, West and the neutral countries, the built-in veto was, of course, implied in it. This did not mark the end of the Russian strategy to block the evolution of an effective and workable control machinery. Her further insistence on tying the issue of ban on nuclear tests with the larger problem of general disarmament was proof of obstructing the tenor of the negotiations on the nuclear ban. A treaty on the ban on nuclear tests is a crucial, preliminary measure to end the dangerous race for destructive potential and it is an elementary fact that general dis-

armament cannot be achieved in one sweep. In proposing such a highly impractical condition, Russia could not be unaware that the magnitude of the nuclear arms menace would be enhanced by more countries making progress in the manufacture of these arms. A treaty imposing the ban between the three big powers is the right approach to secure compliance of prospective entrants in the club. This hope has been deferred for the time being.

The Doctors' Dilemma

THE MENACE OF EVICTION

DOCTORS IN Delhi are in a predicament. At present this predicament is limited to about fifty of them, but it threatens to spread and assume alarming dimensions. The victims in this first batch find themselves tossed on the horns of a dilemma—whether to face the uncertainties of finding accommodation in the commercial localities for setting up their clinics or to compromise the issue of eviction (wherever practicable) with the landlords. In either case it is a matter of extra investment outlay on the profession which only a few of them can afford. A crusade of eviction has been launched against the doctors mostly in various localities of New Delhi. The Land and Development Office of the Delhi Administration has taken the initiative and private landlords have not been slow in following suit. The technical ground on which the campaign of large-scale eviction is launched is that doctors behave as unpardonable sinners in housing their clinics for commercial pursuit in residential premises. The Land and Development Office, as reports go, is issuing notices to these sinners for termination of their leases and renewals on payment of enhanced lease money which commercial use of premises requires. Private landlords have their own device. If hush money is paid, the matter ends—but not for all time necessarily. Hush money secures the landlord's neutrality for a limited period of time, so that the sword is kept dangling over the head.

The rationale of this law is not understandable. Residential and clinical accommodation in the same premises is almost a universal phenomenon and it can hardly be said to offend against public health, although a slight chance of its doing so may not be ruled out. Commercial premises in the capital city are getting scarcer and the real rents to be paid for them are reaching higher peaks. Besides, there are some localities where no plots are now available to erect buildings for commercial occupation. To bifurcate the clinic and the doctor's residence will work hardship on him and his patient, while in the case of the beginner there will be the hard prospect of starting practice in the new environment afresh. If law tends to be an ass, the remedy is to expunge this attribute by an appropriate amendment. The Ministry of Works, Housing and Supply would do well in entertaining the deputation of the Delhi Medical Association which is approaching it in a humanitarian spirit.

The local authorities (by whatever designation they may be called) can canalise their energy and zeal for public service in fruitful directions. Some tuberculosis hospitals are situated in congested localities of the capital city. Can nothing be done to shift them to safe distances? Mushroom repair and maintenance shops for mechanical vehicles are started at critical turning points on roads with heavy traffic and their number is multiplying with the growth of motor rickshaws and scooters, blocking the footpaths and endangering human safety, particularly that of urchins moving about while welding operations are on. It is these varieties of public nuisance against which the crusade of eviction ought to be launched.

HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR

H. R. C. CARTRIDGE FUSE-LINKS

Hermetically sealed construction—
Non-deteriorating—
ASTA certified for 35 MVA rupturing capacity—
Visible indication of operation—
Ratings up to 300 amps.

COMBINATION FUSE-SWITCHES

Ratings from 30 to 750 amps—
Rugged construction, fully shrouded and interlocked—
Type tested for 35 MVA rupturing capacity

COMBINATION FUSE-SWITCHBOARDS

Incorporating Combination Fuse-Switches upto 750 amps—
Robust and compact construction—
Readily modified and extended—
Type tested for 35 MVA rupturing capacity.

DISTRIBUTION FUSE-BOARDS

Robust, dust and moisture proof construction—
Type tested for 35 MVA rupturing capacity—
Ratings from 15 to 100 amps.

Flexibility of power distribution—
Can be installed without disturbing existing layout or production—
Avoids chasing of floors for ducting—
Approved by Fire Insurance Authorities.

"GROWTHMANSHIP"

By

ODYSSEUS

OF COURSE, you cannot have economic growth without investment. But, equally, investment without skilled labour, able management, and a social structure and customs compatible with saving, investment, and the free play of the (usually scorned) acquisitive instinct, will not produce real, solidly established, economic growth.

India's aim today is the achievement of a modern industrialised economy. In order to promote that, you need a climate of opinion favourable to it. As I pointed out here last week, many current attitudes of mind in the mofussil are incompatible with the advance of a modern exchange economy. There is no need to pretend that this is not so, still less to feel ashamed of it. All progress in all centuries has arisen out of conflict between established traditional ways and new ideas. The first task of any democratic government, anxious to promote change and growth, should be, then, to seek by all legitimate democratic means to spread the new ideas to create a climate of opinion favourable to its aims. Should not investment in people precede investment in plant? It was because nobody thought of doing this that there was no industrial revolution in classical Greece. Archimedes (287-212 B.C.), the Greek scientist, designed balanced cranes and compound pulleys and a suction screw for raising water, but, because the society in which he lived was indifferent to the profit motive and economic enterprise, his inventions led to nothing.

To transform traditionally-minded masses into modern "economic" men and women is admittedly a colossal task, that is likely to be achieved only over many years. It seems to me that too many leaders in underdeveloped countries shrink from so vast an undertaking and think that they can avoid it by ignoring the factors of labour, skill, and management, and by concentrating on investment.

CONSPICUOUS INVESTMENT

And in his booklet, "Growthmanship" (Institute of Economic Affairs, 66A Eaton Sq. London. S.W.1. Price 5sh.) from which I quoted last week, Colin Clark makes the shrewd point that much of the mistaken emphasis on investment is due to the desire of most planners (except those in France) to secure more and more power for the state and to enlarge the public sector at the expense of individual enterprise. The American iconoclast, Thorstein Veblen, criticised the rich for their enjoyment of "conspicuous waste", in spending on yachts, Ritz hotels, and so on. Today, public investment increasingly enables the politician and the bureaucrat to aggrandise their authority by economic showmanship and "conspicuous investment."

But public expenditure does not become productive investment merely by describing it as "investment." It can be misdirected, or wasted, or used inefficiently. If you don't believe me, please look at the article "Performance of the Public Sector Undertakings: 1958-60", in "The Eastern Economist" of June 9, which shows that the average gross profits earned on net fixed assets of twenty-one leading public enterprises was only 3.4 per cent, which is below the Bank rate. The article might, incidentally, have added that as the average annual rate of depreciation of the rupee between 1955-60 was 5.1

per cent, the Indian taxpayer did not get 3.4 per cent on his public investment but lost 1.7 per cent a year! It might also have pointed out that there is not only the direct waste on projects designed on insufficient information, or mismanaged by bureaucratic red tape, but there is the indirect waste flowing from the crushing burden of taxation on private enterprise from inflation and the whole incredible paraphernalia of government controls, permits, and licences, intended—if you please!—to promote investment and ensure that it is only used in the most productive channels! Lewis Carroll, with his Alice in Wonderland, was the merest amateur compared with planners.

Let us get this straight. The people who create wealth are not the planners who, according to "The Eastern Economist" of June 9, invested over Rs. 108 crores to get a return of minus 1.7 per cent, but the tens of thousands of entrepreneurs, great and small, in the industrial sector of private enterprise, and the millions in agriculture, who between them create the major part of India's real national income.

In a paper read before the British Institute of Management (which, I see, has opened a branch in New Delhi), Mr. J. A. C. Brown said that while he welcomed automation and electronic computers as valuable tools for economic progress, they could not displace good management and human judgment. He quoted freely from Professor Colin Clark, Dr. Barna, and others, to show that the lopsided pattern of investment in the UK had been at least partly responsible for the UK's chronic crises. Invested capital per worker has risen since 1937 in the UK by 70 per cent, compared with 25 per cent in the USA and 30 per cent in Germany, which suggests that capital has been wastefully allocated between alternative uses.

It is not only in India that nationalised industries have secured low returns on the capital invested. Between 1948-58, no less than Rs. 887 crores, or 26 per cent of total UK investment, has been in the nationalised industries, with the intention of securing a yield of around 5 per cent. I don't know what the actual yields have been. The Railways, for example, have piled up deficits. But even if 5 per cent has been attained, it will, with inflation averaging 3.9 per cent a year, have yielded the taxpayer only 1.1 per cent. And do not forget that the UK's nationalised industries contribute nothing to export earnings, which are gained entirely by private enterprise. The export industries have been starved of capital by the burden of taxation, and inflation, needed to bolster the nationalised industries. In other words, as Colin Clark says, "there has been plenty of 'investment', but how much effective growth?"

SENSE AND NONSENSE

I am told that the Government of India has called in a leading firm of British business consultants to advise it on the management of the Durgapur Steel Works. This makes sense. But I am also told that an appreciable number of established Indian owned private enterprises would like to do the same but cannot get the foreign exchange to pay for them. If true, this is nonsense. Why have a huge physical investment in plant and machinery if it is not being made to yield

its maximum contribution to the national income? Why authorise scarce foreign exchange to build a new plant and then grudge the small amount needed to pay for experienced advice on the best way to exploit it?

A proportion of the five-year plans' future allocations for physical plant could profitably be switched to investment in polishing up India's managerial skills by importing foreign business consultants, and also by sending picked executives, junior and senior, abroad for the sort of courses that are run by the British Institute of Management (80 Fetter Lane, London. E.C.4.)

The first people to be granted foreign exchange to call in business consultants should be the most successful of some of India's old established concerns. British experience has been that it is the successful, progressive firm which is readiest to use business consultants and best equipped to profit by their recommendations. Business consultants are not substitutes for competent managers: they enable them to get better results. The incompetents will not be able to carry out advice offered. On the other hand, many competent organisations do not take the trouble to avail themselves of the experience of business consultants. As Mr. Frank Rowe recently said in a talk given to the British Institute of Management in London: "I tell my own staff that if we are doing a job in the way we used to do it in ten years ago, we must be wrong. We ought to have learned something in ten years. In an organisation where everything is at least ten years old, there must have been a hiatus in progress."

Some industrialists seem to think that it is a reflection on their own competence to call in outside advice. But a trained outside observer can bring situations to

light that nobody inside a firm would believe existed. Pre-occupation with day-to-day routine allows important omissions or deficiencies to escape notice. An outside consultant comes to the job with independent status, uninfluenced by the history of the existing methods built up inside a firm, and unaffected by office jealousies. He has no axe of personal promotion to grind.

The outstanding success of Indians in industry and commerce in many overseas countries where private enterprise is given a chance, and where the ability to exploit economic opportunity is not frustrated by the survival of social structures that have served their purpose, should encourage India's political leaders to concentrate planning expenditure on education at all levels, on boldly and courageously fighting reactionary legislation which strengthen social customs that encourage the forces of inertia and discourage the profit motive that gets things moving.

In the past, faced with the vast numbers of India's population, the government has quailed before the problems of education because of the huge expenditure involved. But development expenditure on education (in the Second Plan) was between one third and two fifths of that on large and medium industries in the public sector, and on elementary education was about half the cost of the three public sector steel plants. How about reversing these proportions from now on? Why not cease from new industrial ventures for a while in order to consolidate the administration of those existing, and divert funds to education (elementary, technical, and managerial), and to roads (which are vital to social and economic advance)? This would, I believe, not only speed India's economic growth, but would also solve her balance of payments problem by one stroke of the pen!

COPIES—
SIMPLY
AND
QUICKLY
with

Kodak
DOCUMENT-COPYING EQUIPMENT

Whatever your copying problems, solve them the modern way—with 'Kodak' document-copying equipment. For instance, the 'Kodak' Document Copying Printer gives clear copies, which need no checking—in less than two minutes. So easy to operate, this new copying aid—now made in India—is considered the greatest invention since the typewriter!

Other 'Kodak' document-copying equipment include Verifax, Duostat, Recordak (Microfilming), Photostat and Statfile. We will be glad to help you choose the right equipment for your special needs.

Steam...

Industry's greatest power

SINCE 1782, when the first Rotative Steam Engine enabled the use of steam power to motivate machinery, steam has played an ever increasing part in industry throughout the world.

Not only is steam today's most important source of power for the civilised world, but it must remain so for many years to come. Even atomic power is yet in its infancy and can only be applied as an alternative source of heat. Steam is indeed the real power of industry.

While this is but an outline of the extensive and continually growing part that steam plays in power generation and industry throughout the world, it indicates quite clearly the unparalleled importance of steam power in the industrial growth of India...and, therefore, the urgent need to manufacture vital steam-raising plant in this country to meet the demands of expanding industry.

This is one of the needs which has led to the formation of a new and powerful industrial group, ACC-Vickers-Babcock Limited (AVB). The vast technical knowledge and extensive practical experience available to it will enable the new company to make an important contribution to Indian industry—and help Indian engineers overcome some of the difficulties which have faced them for so long.

The new AVB plant is nearing completion on a 700-acre site at Durgapur. The workshops, designed on modern lines, will have built into the structure electric overhead travelling cranes with 70 tons lifting capacity. All workshops have been designed to allow for progressive expansion so that it will be possible to lift 200 tons without making structural alterations. Up-to-date machine tools are being installed. When completed, they will include a 3000 ton hydraulic press capable of bending steel plates up to 5' thick for use in the manufacture of high pressure boiler drums, and pressure vessels required for the fertiliser, chemicals and oil refining industries. The new plant will make it possible to manufacture steam-raising equipment in the high pressure range—for the first time in India.

ACC-VICKERS-BABCOCK LTD. offers the industrialist his best chance to ensure a fully integrated installation comprising the boiler plant itself and a wide range of equipment from the fuel handling and preparation plant to the ash plant and dust disposal installation.

Besides, the industrialist has the confidence that he will get after-sales service of the highest quality from AVB!

...a Powerful Partnership for Progress

The European Scene

EURO-DOLLARS VERSUS TRIFFIN

From Our Special West European Correspondent

PARIS, July 14.

THE celebrities of monetary science have lately been taking potshots at the gold-exchange standard, the system of international payments whereby differences are settled (or as some people say, quite incorrectly, "whereby international trade is financed") in dollars and sterling as well as gold, held by the central banks as reserves. This has provoked European bankers to reply that many eminent critics do not seem to know how the international payments system works. Indeed, there appears to be some confusion, especially about the notion of "international liquidities" and their relation to the volume of world trade. On the one side, Professor Triffin and his pupils argue that the quantity of liquidities available for settling trade debts has become inadequate and will become more so in the years ahead: the amount of gold at hand for this purpose is limited by the mining industry, and the amount of dollars and sterling is limited by the dangers of persistent U.S. and British payments deficits, these being the only source of those currencies. On the other side, Mr. Jacques Rueff urges that dollars and sterling be removed from central reserves, without being replaced by the World Money that Triffin, following Keynes, proposes; thus international liquidities would be reduced to gold, or very nearly.

This is not just a difference in recipes, but a radical contradiction about the facts of our present situation. Triffin is saying that there is too little money (internationally acceptable counters) about for the settlement of trade debts, and the only safe way to make more is for a world authority such as the IMF to print a new money. Rueff is saying that, on the contrary, there is too much money about, because some of it is being counted twice over, and so the only safe way to continue is to manage with less. It is as though we found four men playing cards for chips, and one by-stander said, "You can't play much longer because you haven't enough chips, so someone should give you all more chips", whereas another by-stander said, "If you play this game properly, you can get along with fewer chips".

This is surely a question of fact, not doctrine. In monetary matters, where it is facts and not doctrines that are at issue, one consults bankers rather than economists. The bankers have begun to make their voice heard—mostly anonymously as is their tradition. Though none has endorsed Rueff's sensational prognosis for the gold-exchange standard nor advocated a return to the gold standard, they are unanimous in siding with him against Triffin on the question of the adequacy of international liquidities. A former director-general of the Bank for International Settlements has said, "In my opinion, Jacques Rueff has good reasons to dispute the so-called scarcity of international liquidities and to emphasise the dangers of measures which, by inflating them artificially, would only postpone dangerously the necessary remedies". Another banker has called the Triffin case a mere "slogan" and warned against "recourse to undesirable innovations which would rapidly lead either to monetary chaos or to the re-appearance of the worst sort of governmental controls". Less controversially but just as significantly, many big European banks have noted in their recent annual reports (I quote from that of the Credit Lyon-

nais) "the substantial role on exchange markets now played by currency-loans between European banks... operations which place large amounts of foreign currencies at the disposal of the European banking system".

This is something new. Or rather, it is a classic monetary mechanism that has only begun to work again in the last two years, since European currencies regained non-resident convertibility. After decades of non-convertibility, the emergence of a free, international, inter-bank market in foreign currencies looks unfamiliar, and it has been christened with barbarous names such as "Euro-dollars" and "Euro-sterling"; we are even threatened with "Americano-marks" for the near future. These all mean the same thing: because of convertibility, private exchange banks have begun doing an active business between themselves in their various holdings of foreign currencies. Non-American banks lend each other, for short periods, their dollar credits—and that is Euro-dollars. Non-British banks lend each other their sterling balances, and that is Euro-sterling. If American banks began trading in their German credits, we would have Americano-marks. The upshot is the same in each case: the volume of international liquidities remains the same but it circulates with increased velocity. The product of volume and velocity is the real level of international liquidity, and the bankers assure us that it is perfectly adequate to finance growing international trade.

Without going into the details of this mechanism, one can already see the flaw in Triffin's argument. He says that between 1950 and 1960 the value of world trade doubled, whereas central reserves increased by only one-third; he concludes that if world trade is to go on expanding, more and different reserves must be manufactured. Yet between those two dates, the European monetary system was revolutionised by the return to convertibility, which brought back into play the foreign funds of private banks. It is the rapid circulation of these funds, especially in the Euro-dollar market centred in London, that now finances world trade. Central bank reserves no longer finance world trade, as they did in the time of exchange controls and bilateral payments. Nowadays, they are really and truly reserves; they intervene only at the last moment to balance the exchange markets before those markets balance themselves by putting new values on currencies, i.e. they keep the fluctuations within agreed limits, instead of letting currencies "float".

It is impossible to say exactly how many Euro-dollars there are on the market. The estimate of \$500 million was made in 1959 but by the spring of this year expatriate American capital had probably tripled that sum, at least. The demand for Euro-dollars has grown similarly, because these foreign-exchange credits are easy to negotiate, they quite escape what remains of exchange controls and they cost less, often, than short-term capital in the national money markets. So business men all over the world may finance substantial operations (export-import, stock-building, distribution) through banks having representation in London. German, Italian, Canadian and Japanese banks are among the big dealers in Euro-dollars, as well as overseas subsidiaries of U.S. companies. The Euro-dollar market today constitutes the only fully international and completely free capital market; its role in financing

world trade is vital. It is no accident that it is centred in London. Minor business of the same sort goes on the Continent and the Common Market bankers would dearly love to wrest this work from the City, but they lack the human and technical material. The Radcliffe Report of 1958 was, it now appears, fully justified in saying that London could maintain her technical financial supremacy, no matter in what currency business was done: be it Euro-dollars, "Bancor" or any fancy World Money the Triffinites invent, London will no doubt handle the work as efficiently as when world trade was done in sterling.

International trade is not financed by gold or by official reserves of dollars and sterling, except very indirectly and in the last resort. It is financed by transfers from one bank account to another bank account, and it therefore depends on the velocity of circulation of certain widely acceptable currencies inside the network of private exchange banks and their correspondents around the world. For this purpose, ever since the return of convertibility, the Western banks and the London financial profession have been building up an efficient international money market where the volume of circulating liquidities is adequate to the growth in world trade. Thus when European bankers intervene in the controversy about the gold-exchange standard, it is to say firmly, "There is no problem about adapting international liquidities to the needs of trade. That adaptation is secured automatically by the mechanism of the market".

This is not to deny that the payments system is today faced with serious problems; and they are connected with the weakness of the dollar and sterling.

But the position is rather different, say the bankers, from the picture drawn by Triffin. According to him, the payments system can work smoothly only if there are so many dollars and so much sterling abroad that this deficit represents a threat for the American and British economies. On the contrary, the bankers say that the velocity of circulation of deposits such as Euro-dollars can keep the payments system working smoothly without any such dangerous increase in the volume of expatriate dollars. What the system requires is not any absolute quantity of dollars and sterling, but a pre-eminent confidence in those currencies—and that is lacking today, when a number of other (Continental) currencies command as much confidence. Efforts to substitute those other currencies for the two key-moneys in the work of financing world trade would probably not go very far, because other capitals lack the large and experienced money markets of London and New York. Still, it is urgent to restore full confidence in dollars and sterling—and if to do that requires making one or both temporarily scarcer, that will not worry the international money market unduly, however much it might upset certain other people. In a world of convertible currencies, the need to have adequate international liquidities does not prevent the USA and Britain from making their money scarcer and sounder; on the contrary it requires it. Nothing very drastic would be needed in the case of the dollar, think European bankers, who expect to see that currency strengthen as U.S. aid is brought back to what that country can afford. Something fairly drastic, however, might be needed to restore sterling: a vigorous economic reform in the U.K. We are back to classic monetary remedies, and a long way from plans for a World Money.

Economic Report from the U.S.

ECONOMIC RECOVERY

By GUY SIMS FITCH

WASHINGTON, July 12.

ECONOMIC recovery in the United States may be at the point where employment gains may be catching up with production increases. This conclusion can be drawn from an analysis of employment data recently released by the U.S. Department of Labour. Last month, employment in the United States rose by nearly two million to a record high of 68.7 million. Employment of adult men, the core of the labour force, increased by no less than 500,000. These employment gains represent a better than seasonal pick-up for this time of year. The fact that unemployment also rose in June—by 812,000 to a total of 5.6 million—can be attributed largely to the growth of the labour force during the month by 2.7 million persons. Nearly 2.5 million of these were in the 14-19 age group, many of them students looking for temporary summer work before returning to school. It should be borne in mind that the U.S. Government counts as officially unemployed anyone looking for work. Even so, the unemployment increase last month just about equalled the normal seasonal expectation. This, coupled with the better than seasonal rise in employment, brought the adjusted unemployment rate—the ratio of jobless to total labour force—down slightly to 6.8 per cent from May's 6.9 per cent. But it is in a detailed breakdown of these and related statistics that the most encouraging developments can be discerned. They are noticeable particularly in the case of factory work, which had been hardest hit in the recession that ended this past spring. Continuing a trend of recent months, factory employment again rose in June, this time by a sizeable 240,000 to a total of 16 million, or more than twice the normal seasonal increase.

Along with the employment gains have come new advances in workers' earnings. The average weekly earnings of factory workers rose to a record \$94.24 in June, an increase of \$1.34 over May and of \$2.64 over June 1960. This increase is attributable to two important factors: a rise in hourly pay, and a rise in working time. It is this latter point which may be especially significant. The average factory work week in June increased to 40.1 hours from May's 39.7 hours. This represents a gain of about one full hour since the beginning of this year, and has brought the work week back to about its pre-recession level. Since in most industries—largely on standards set by Federal legis-

lation—the basic work week is figured at 40 hours, any more time than that spent on the job is paid for at premium rates, usually figured at "time and a half." Thus, the Labour Department estimates that about one out of every ten dollars in the average factory worker's June pay cheques came from overtime work. This, in turn, has led the Department to conclude that employers may well be stepping up the rate at which they have been hiring new employees. This conclusion is based partly on the view that companies want to avoid the more costly over-time pay rates, partly on the anticipation that more workers will be needed to maintain industry's expanding production schedules. The fact that companies historically have tended to lengthen the work week before embarking on new hiring programmes has helped account for the customary lag between production and employment gains during the early stages of an economic upturn.

Promising as it appears, this situation still is not one that lends itself to unrestrained optimism. As the Labour Department points out, there still are well over 900,000 workers who have been idle for more than six months, of whom some 260,000 have been without jobs for a year or more. It is this "hard-core" unemployment problem, relatively small in the context of the many millions gainfully at work, to which the Federal Government is addressing much of its attention. Complicating its task is the fact that this type of unemployment is concentrated largely among those with limited education and training, for whom job opportunities have been dwindling in an industrial complex which is becoming more highly technical and automated with each passing year. Job openings are numerous as a glance at the help wanted columns of any major newspaper will reveal. They may, in fact, be as large as the number of unemployed. But they can hardly be filled by workers who do not have the requisite skills to qualify for them. This underscores the need for training programmes to fit such workers for useful employment, as Labour Department officials emphasize. It also points up the responsibilities faced by President Kennedy's special council on labour-management problems, which was set up earlier this year. The council has just designated economic growth and unemployment as one of its principal subjects for intensive study over the next few months, along with such others as automation, industrial relations, international competition, and sound wage and price policies.

Production of Iron and Steel: The production of iron and steel during June 1961 at the three steel plants of the Hindustan Steel Limited was as follows:

Bhilai Steel plant produced 78,610 tonnes of pig iron & 55,747 tonnes of steel ingots during June, 1961 as against 72,564 and 48,832 tonnes respectively during May, 1961. Production of pig iron for sale was 31,732 tonnes as against 33,026 tonnes in May, 1961. Saleable steel production rose from 27,869 tonnes to 43,091 tonnes in June, 1961. This consisted of 21,089 tonnes of finished steel and 22,002 tonnes of semi-finished products for sale as against 16,258 and 11,611 tonnes respectively in May 1961. Durgapur Steel Plant produced 55,750 tonnes of steel ingots during June, 1961, as against 54,042 tonnes and 24,421 tonnes respectively during May 1961. The production of saleable pig iron was 32,781 tonnes as against 28,239 tonnes in the previous month. Production of saleable steel amounted to 20,582 tonnes which consisted of 3,106 tonnes of finished steel and 17,476 tonnes of saleable semis. Rourkela Steel Plant produced 29,542 tonnes of pig iron and 22,808 tonnes of steel ingots during June, 1961. Production of saleable pig iron stood at 7,433 tonnes. Total saleable steel produced at the plant amounted to 10,160 tonnes consisting entirely of finished products.

United States

Electric Power from the Ocean: An American scientist has developed a device that can generate electric power from sea water and the sediments of the ocean bottom. The device, made by Dr. Frederick D. Sisler of the U.S. Geological Survey, is an "organic" fuel cell that produces electricity directly from decomposing organic matter. The electricity is generated by making bacteria "burn" the organic matter. Dr. Sisler's fuel cell is divided into two compartments. One contains sea water, organisms and bacteria; the other sea water and oxygen. An electrode is placed in each compartment, and the resulting energy, created by the "burning" organisms, is converted into electrical energy.

Light Weight Automobile Engine Developed: A United States engineering company has achieved a long-sought goal by developing an automobile engine that delivers one horsepower for each pound of its weight. The four-cylinder, 175-pound (79-kilogram) engine generates 175 horse-power. It has been possible to make such an engine by using an engine block assembly made of thin stainless steel sheet.

United Kingdom

Manufacture of Isocyanates: A multi-million pound sterling plant for the manufacture of isocyanates, will be built by the Du Pont Company (United Kingdom) Ltd. on its plant site at Maydown, near Londonderry, Northern Ireland. This new facility will supply "Hylene" foams for markets in the United Kingdom and for export to other countries in the Free Trade Area. Flexible urethane foams are used chiefly for furniture and automotive cushioning and inter-lining for clothing. Rigid foams are used primarily for insulation in refrigeration units, building panels, and other industrial

purposes. This facility, the second manufacturing unit to be built by the Du Pont Company (United Kingdom) Ltd., will be located adjacent to the company's neoprene synthetic rubber plant.

New Company to Make Metal and Diamond Dies in Bombay: A new company, Gannon Norton Metal and Diamond Dies Ltd., Bombay — a joint venture of Gannon Dunkerley & Co. Ltd., Bombay and Wire Drawing Dies (Manchester) Ltd. — has been formed to manufacture wire drawing dies of tungsten carbide and diamonds. Wire Drawing Dies is a subsidiary of the British firm Sir James Farmer Norton & Co. Ltd. Gannon Norton has erected at Mahul, Bombay, a plant designed to manufacture 150 diamond dies and 400 to 450 tungsten carbide dies (for wire drawing purposes) a month. Experimental and trial production started some time ago, and the new company is now in a position to start commercial production on a small scale. The plant is expected to manufacture dies for the value of about Rs. 7,20,000 a year, which — allowing for the essential import of certain parts — would help in the saving of foreign exchange to the extent of some Rs. 5,30,000 annually. Wire Drawing Dies has many years of experience in the manufacture of tungsten carbide and diamond dies. It has provided the plant and machinery for the Bombay factory, and will also supply the technical know-how.

Steel Exports: The British Iron and Steel Board announced on July 12, that the amount of steel exported in May this year was the highest since the War, except for October 1959. The May export figure was 2,93,000 tons and the rate for the first five months of the year was 2,24,000 tons a month, compared with 1,92,000 tons a month during 1959. Exports were increasing in spite of strong and growing competition from producers abroad.

Capital Contribution and Under-developed Lands: The British Minister of State for Foreign Affairs, Mr. Joseph Godber, told a United Nations Economic and Social Council meeting in Geneva, on July 11, that British contribution in public and private capital to under-developed countries was running at the rate of \$800 million a year. The increase added to the recent strain on Britain's external balance, however, and he warned that this strain now limits the extent to which "we can go on increasing the level of our assistance."

Kenya

Combating Food Shortages: The Kenya Government plans to meet a threatened serious food shortage in several districts during the next eight months. It is estimated that a total of 3 lakh bags of maize will be needed for issue in areas where the rains have failed and although a maize surplus is expected in Lyanza province, this will not meet the needs. Arrangements are, therefore, being made to import 28,000 bags of maize from Rhodesia. The Government is also considering the ways and means of obtaining further necessary food supplies for free distribution between now and the end of the year. Further approaches have been made to the United States and British Governments, and the outcome of these approaches is awaited.

Thailand

The New Six-Year Plan: Thailand's already spunky market is getting a very healthy shot in the arm. The new Six-Year Plan (October 1961 — September 1967), calling for Government expenditure of \$600 million will mean new and profitable sales opportunities for alert suppliers, particularly in construction, road building, electric and communications equipment, pumps etc. The planned opening of a permanent US trade centre in Bangkok will fit in with plans of those firms wanting to sell to this growing market. The Plan concentrates on typical Governmental projects: electric power, irrigation, highways and communications. Practically all the industry expenditures go for completion of the Yanhee Dam and other power projects that will increase electrical capacity from 138,000 KW now to 370,000 KW by the end of 1963. Like neighbouring Malaya's Five-Year Plan, the Government prefers to leave major manufacturing ventures to private investors. Obviously, the general growth of the purchasing power, the increased production and productivity of the agricultural sector, on which the Plan concentrates—a big chunk of the \$211 million for communications will go toward building 650 miles of new roads and most of the agricultural component will be spent to increase irrigated land by 1.2 million acres — will open new local manufacturing prospects and spur further growth of the market. The Plan's aims are moderate: raising the present annual increase in Gross National Product from 4 per cent to 5 per cent and raising annual growth of per capita income from 2 per cent to 3 per cent. Other specific targets for the end of 1963 are raising rubber production (now the country's top exchange earner) by 6 per cent, maize 100 per cent, fish 50 per cent, paper 400 per cent, gypsum and lignite 300 per cent, cement, gunny bags and tobacco 50 per cent, textiles 100 per cent, tin 40 per cent and sugar 8 per cent. A new method of financing has also been successfully pioneered in Thailand to help agents of US manufacturers of heavy equipment and durable goods. The US exporter agrees to repurchase the equipment sold to its agent if he is unable to sell it within 12 months. Against this repurchase guarantee — which the importer may or may not know about — a local bank will open an overdraft equal to the value of the goods imported. These funds are used to pay the manufacturer. The bank is repaid by the agent as the goods are sold during the year. This method of financing has an added value to the exporter since the local bank becomes somewhat more than normally interested in the agent's sales.

Canada

Facilities for Export Credit and Insurance: Canadian authorities are oiling up old and introducing new facilities for export credit and insurance. Coupled with the discount of the Canadian dollar vis-a-vis the U.S. dollar (now 3.5 per cent due to go to five per cent), this spells more profits for exports from firms that operate in Canada, more competition in the U.S. and third markets for those that don't. What is more, these Canadian agencies, whose vision of how to help Canadian export and employment does not suffer from Dr. Dillon's particular type of myopia, will not only finance or insure the exports of foreign-owned Canadian companies (whether wholly or partially owned); they will also deal — as does the U.K.'s Export Credit Guarantee Department — with foreign trading companies (whether or not Canadian owned), purchasing Canadian goods for resale. Main source for medium term export financing is the newly formed Export Fin-

ance Corporation of Canada Ltd. which started operations about a month ago. Canada's eight chartered banks are the stock-holders and have supplied the initial capital of C\$10 million based on an agreement with the Government. The Corporation is authorised to increase its capital to C\$ 50 million and borrow up to ten times that amount, for an ultimate C\$ 550 million for export financing.

Switzerland

Forty-second Lausanne National Fair: Switzerland's important Lausanne 42nd National Fair will be held from September 9 to 24, 1961. Some 2,362 exhibitors will be displaying their products in the 38 halls of the Palace of Beaulieu, one of the most modern and best equipped economic cultural centres in Europe, with 6 new permanent pavilions set aside for the remarkable exhibits of the agricultural sector and the youthful trade. The vitality of the Swiss economy is the fruit of a nicely struck balance between the forceful strength of the country's traditional activities and the youthful dynamism of its more recent industries. In this respect, the close interpenetration of the industry, trade, agriculture and craftwork is clearly shown in the synthesis of the national production achieved by the Lausanne Fair, which shares with the Basle Fair the honour of presenting to the foreign visitor a true picture of the activities of a whole people...

Although the Lausanne Fair remains primarily national in character, it none-the-less practises a certain liberalism by inviting each year a foreign country to take part officially with an exhibition of its own. This year Greece will be exhibiting its main resources in a pavilion organised by the Ministry of Trade and Industry in Athens, under the auspices of the Greek Embassy in Switzerland and in collaboration with various Greek national organisations in the fields of cotton, tobacco, tourism, etc.

The Lausanne Fair, which is a general trade fair, also organises, some specialised sectors and salons, including a Salon of Elegance and Luxury Industries, an Exhibition of Economic Housing, a Market-Gardening and Horticultural Exhibition, a Milk and Dairy Trade Sector, and the complete range of Switzerland's production of tractors and agricultural machinery in a special display extending over an area of more than 44,000 sq. ft. It also holds big shows and markets, for horses and small and large livestock, organized by the Cantonal Cattle-raising Federations. Considerable facilities, in particular in the form of reductions on certain Swiss and foreign rail and air fares, are granted to all visitors, who are advised to get into touch with Switzerland's official agencies in their country of residence or origin.

World Bank and IMF

Laos Becomes a Member: Laos has become a member of the International Monetary Fund and the International Bank for Reconstruction and Development. The quota of Laos in International Monetary Fund is \$7,500,000 and its subscription to the capital stock of the Bank is 100 shares with a total par value of \$10,000,000. Seventy-one nations are now members of the Fund, and 69 nations are members of the Bank. Admission of Laos has brought the total of members' quotas in the Fund to \$14,860,800,000 and the total subscribed capital of the Bank to \$20,103,100,000.

NEWS IN BRIEF

INDIAN

The Government of India have allotted an additional 20,000 tons of rice to Kerala, over and above the State's regular quota as a measure of flood relief.

During the year ended March 31, 1961, Birla Jute have made a profit of Rs. 133 lakhs, against Rs. 105 lakhs in the previous year.

Punjab registered an all-round increase in agricultural production during the Second Plan period. Foodgrains production increased by 33.30 per cent; cotton by 48.76 per cent; sugarcane by 40.30 per cent and oilseeds by 24.16 per cent.

The World Bank is assigning a team of experts to India in November to re-appraise the country's requirements in the context of the "Aid India" consortium meeting at which the World Bank pledged \$400 million for the first two years of the Third Five-Year Plan.

The Government of India permitted the issue of licences for import of one lakh bales of jute cuttings from Pakistan. Further licences will also be issued depending on the demand for such cuttings and estimated availability of the supply in Pakistan.

Official circles concede that the programme for the modernisation and rehabilitation of the Cotton, Jute and Woollen industries in the Third Plan is likely to be seriously hamstrung due to lack of adequate funds.

Mr. Shivaram Nair, seniormost Indian executive of J. Walter Thompson Company Private Ltd., Bombay, has been elected a Director of the Company at its 23rd Annual Meeting recently.

Investigations conducted at the Central Building Research Institute, Roorkee, indicate that Bhopal clay is suitable for producing a sintered type of lightweight aggregate. Lightweight aggregate is used in all types of concrete construction where weight reduction, thermal insulation and fire resistance are desired.

According to latest estimates, about 7 million KW. of electric power will be added by 1966 to the installed generating capacity in the country. The schemes completed during the Second Five-Year Plan raised the generating capacity by 2.3 million KW.

The Kosi Control Board which met recently decided that Rs. 16-crores Kosi barrage and its eastern canal system should be completed by 1963.

The outstanding balance of the 2½ per cent Government of India loan, 1961, and the 3 per cent Hyderabad loan 1951-61, is repayable at par on August 1, 1961 and no interest will accrue thereon from that date, says a Finance Ministry Press note.

FOREIGN

Daily average crude oil output in the U.S. in the week ended June 30 amounted to 6,653,000 barrels according to the American Petroleum Institute. This compares with 6,860,000 barrels daily in the preceding week.

Canadian exports of wheat and wheat flour in May totalled 45,890,228 bushels, an increase of 30,839,324 over the same month last year.

A series of new measures aimed at curbing internal demand in Norway to help reduce the growing pressure on imports, prices and labour, have been announced in a circular issued by the Bank of Norway.

Britain has paid Jordan £1 million as the second instalment of her grant-in-aid to cover Jordan Budgetary expenses totally £2 million. The first instalment of £1 million for 1961 was paid last May. A £500,000 loan for Jordan development products is to be advanced later this year.

The Netherlands has officially informed the member countries of the International Whaling Convention of its readiness to rejoin the International Whaling Commission subject to certain conditions.

Experiments that point to the successful continuous operation of the new Central Electricity Generating Board nuclear power stations, now under construction have been carried out by the U.K. Atomic Energy Authority at Calder Hall, the world's first nuclear power station of commercial size.

Iraq's request to ENI-AGIP, the Italian State Oil Corporation, for Italian petroleum-technicians to replace those of I.P.C. has now been repeated in a formal request by the Iraqi Government to the Italian Government.

Ghana's budget, introduced in Parliament recently imposes increased import duties on all consumer goods and initiates purchase tax on luxury goods.

Imperial Chemical Industries is to spend £7 million on an acrylic products plant at Rotterdam as the first stage of its investment within the Common Market. Construction is expected to begin this year.

New import regulations for the period from July 1 to the end of the year have been announced by the Pakistan Government. They are in the direction of further liberalisation and effective transfer of large number of items to "open general licence" from automatic licence.

It is reported, reciprocal organisations are to be set up in London and Budapest to promote Anglo-Hungarian trade.

Butyl Acetate

Check these qualities of "Union Carbide" Butyl Acetate and you will agree you cannot buy a more versatile medium-boiling solvent for nitrocellulose.

PERMITS FORMULATION OF HIGH
QUALITY LACQUERS WITH OUTSTANDING
VISCOSITY CHARACTERISTICS

ENSURES FREEDOM FROM MOISTURE BLUSH
NO ORANGE PEEL, SAG OR TACKINESS

Often considered a standard for solvent comparisons by the lacquer industry, "Union Carbide" Butyl Acetate is also widely used in the manufacture of dopes, artificial leather, photographic films, printing inks, adhesives and paper coatings, and as an extractant in antibiotic manufacture.

For your requirements of Butyl Acetate or for further information write to your nearest Union Carbide India Office.

FOREIGN EXCHANGE: LOSSES THROUGH IMPORT DISPERSAL?

A CASE STUDY FOR LUBRICATING OILS

AT a time when India's sterling balances have reached an all-time low of Rs. 103 crores, it is natural that there should be renewed agitation on the possibility that there might be a further cut on imports to sustain a precarious payments balance. The need for a constant scrutiny of every item in the import bill remains in spite of the IMF credit and the certainty that maintenance imports will now be included in the Aid-India allocations. Much of the scrutiny of the past has been concerned with a straight elimination of imported articles or, a reduction in volume. Very little has been done to examine foreign exchange losses which occur as a result of methods used to import given quantities, such as the dispersal of licences reducing bulk purchases and so on. There is no doubt that in particular cases the foreign exchange allocated to special items could go further if there were a clearer understanding as to the manner in which the trade operates under alternative importing procedures. A classic but, by no means, a unique case is provided by a study of the import licensing system for lubricants. This case study is presented in the hope that it will stimulate thinking in similar cases.

Upto the year 1957, lubricating oil import licences were issued almost lavishly. All importers had, in fact, more licence cover than they actually needed. Indeed, from 1955 to 1957 licence issues varied between 200 and 280 per cent of the quota for soft currency areas and 100 to 150 per cent for dollar areas. The quota itself was based on the best year's imports upto 1951-52, which itself could not be described as ungenerous. Since 1957-58, with the foreign exchange crisis dominant, the quota was reduced to 100 per cent in best year's imports upto 1957-58, and the manner in which the licences were utilised in 1959-60 is exhibited in the following table rounded conveniently in rupees lakhs.

ESTIMATED IMPORT FIGURES IN RS. LAKHS OF LUBRICATING OILS APRIL 1959 - MARCH 1960 (ROUNDED TO NEAREST LAKH)

	Lubricating Mineral Oils N.O.S.	Trans- Oil Oil	Greases & Petro- leum	Total
a. Burmah-Shell, Stanvac, Caltex	792	22	38	852
b. Gulf, Castrol	115	13	9	137
c. Other Established Importers	155	5	6	166
d. Sub Total = (b) + (c)	270	18	15	303
e. Actual users	7	—	0.09	7
f. Grand Total (a+b+c+e)	1069	40	53	1162

The result of the operation of the current system and the policy to disperse licences has been that importers, other than three major companies, received 26 per cent of the licences whereas their sales in terms of volume amount to not much more than 12 per cent of the total. It is believed that there are now 150

licences and licencees are either unable to use them in full (which means that they are selling them in part to the "bulk" importers) or when they use them wholly or partially they are importing at a higher cost because of the difference between "the bulk" import price and import in barrels or in packed form.

It would appear that the bulk imports of lubricating oils are at landed cost of Rs. 390 per ton while blended oil in barrels (inclusive of barrels) amounts to as much as Rs. 900 per ton. In respect of transformer oils, greases and certain specialised oils, they have to be imported packed. On the basis of certain calculations relating to the table above, one might assume that 80 per cent of non-bulk imports, that is, Rs. 216 lakhs, could have been utilised for the import of bulk if the importers concerned had the necessary facilities and organisation to handle trade on this basis. This would imply some blending facilities which the three major oil companies have; it would imply the availability of barrels which, until recently, were short; also import of some chemicals required in the blending process. Now, however, that 18 gauge sheets are available and barrels can be made locally, the argument on barrels has less force. All in all, one might assume that after making provision for the additional barrels imported, blending and chemical costs, non-bulk imports might be reckoned at Rs. 600 per ton. If these figures are applied to Rs. 216 lakhs at Rs. 390 per ton and Rs. 600 per ton respectively, it would appear that an additional quantity of 19,400 tons could have been imported for the same foreign exchange. Alternatively, if the same quantity of lubricants had to be imported "bulk" at Rs. 390 per ton, the saving would have been about Rs. 48 lakhs. It is true that there would be an additional cost on account of the chemicals for blending, but this is increasingly payable in rupees, and it is doubtful if the foreign exchange component is much more than Rs. 8 lakhs in all. In any case, therefore, there would appear to be a net advantage of Rs. 40 lakhs by bulk purchase with domestic blending and distribution in Indian barrels.

It is not contended that the major oil companies should be given the benefit of these savings if it is a major issue of policy that a foreign company with a right to expatriate its profit in foreign exchange should not acquire additional remittance opportunities. This does not in any way militate against the point that bulk purchases should be made and that the economies of foreign exchange, or alternatively, additional oil imports should be obtained by a modification of existing procedures.

Only a postscript need be added to these general considerations. It is to the effect that, notwithstanding the reduction in licences issued to them, the major oil companies have managed to import larger quantities of lubricants generally. This is because they have progressively developed bulk imports, permitting the import of much greater quantities for a given outlay in foreign exchange. For example, in 1956 Burmah-Shell imported 68 per cent (by quantity) in bulk; the corresponding figure for 1960 was 92. In terms of value, the figures were 45 per cent and 83 per cent. This implies that they have already contributed very largely to savings in foreign exchange in the direction indicated. There is, however, room for more.

THE BUSINESS WORLD

Coherent Policy for Cement

By CROESUS

THE public inquiry into the revision of cement prices that began on July 11, 1961, bids fair to yield more promising results, from the point of view of the industry, than the last inquiry, that is the one held in 1958. From the speeches of the Chairmen of cement companies that have followed the publication of the 1958 T.C. Report, it seems that the industry suffered grievously at the hands of the Tariff Commission in 1958. As if this were not enough, in accepting and implementing them, the Government made matters worse by not only delaying to give effect to the T.C.'s recommendations (instead of from 1-1-1958, effect was given only from 1-7-1958), but also by not implementing all the recommendations accepted by it, as, for instance, the "coal escalator clause". The Government also did the industry grave injustice by refusing to accept "stockists' rebate" as a legitimate incidence of distribution cost. No wonder then that, long before the date of expiry of the current ex-works prices of cement based on the 1958 T.C.'s recommendations—i.e. June 30, 1961—the cement producers began representing to the Government the need not for just a revision of prices but a complete reorientation of the approach to the problems of the cement industry. Indeed, those who have given the subject some thought go so far as to declare that there has so far been no coherent long-term policy as such for cement. It is just as well, therefore, that Mr. K. R. P. Ayyangar, the present Chairman of the Tariff Commission, believes that, according to the terms of reference, the Government wants the Commission "to make a comprehensive review of the industry and to make recommendations covering all aspects without limiting the scope of the present inquiry to the price factor alone." The spokesmen of the industry too have been stressing the need for such a policy.

What then should be the main objectives of a sound long-term policy? Although Mr. Ayyangar exhaustively analysed the progress of the cement industry in India during the last two price periods—1953-1958 and 1958 and since—and gave the entire background of the problems of the industry in his fairly long speech whilst opening the public inquiry, one was rather disappointed that there was nothing in it to indicate that the Tariff Commission is even now seized of the desirability and the urgency alike of a sound long-term policy for cement. The farthest that he can be said to have gone in this direction, if he did at all, is this: "We are conscious of the fact that the price which we are to recommend will have an important bearing on the attainment of the above target (the Planning Commission's target of 15 million tons capacity for cement by the end of 1965-66). But, in a planned economy, the price policy by itself will not achieve the desired results." One wishes Mr. Ayyangar had dwelt on this point at some length. Even as it is, it is noteworthy that the T.C. Chairman conceded the important bearing of price on the target to be achieved and felt that the price policy would have to be supplemented with something more, if the "desired results" are to be achieved.

Now, before venturing any views on what a sound cement policy ought to be, one must take note of the outstanding and persistent features of the present

cement situation. Briefly, these may be summed up as follows:

1. A continuing shortage of cement, in greater or lesser degree, for the past 10 years and more and the likelihood of its persisting indefinitely. [It has been estimated that the demand for cement has been increasing by 10 per cent (compound rate) every year and that, so far as one can foresee, this trend will continue for at least the next 10-15 years]. It may be noted here, incidentally, that there has been a steady increase in installed capacity all along, and yet the shortage of cement has been nowhere near disappearance.
2. A concomitant of the above, that is price control, again, for over 10 years, and the probability of its continuance and this, again, for an indefinite period;
3. The inevitable sequel to price control—control on distribution, rationing of cement—which too will probably go on almost for ever.

This is verily an abnormal state of affairs, at least in a democracy, and it must be ended soon. No one in his proper senses will want either an indefinite continuance of persisting cement shortage or its inevitable consequences—controls on price and distribution of cement. The fundamental objective of any sound cement policy must, therefore, be to encourage an adequate growth in installed capacity, "adequate growth" meaning a growth commensurate with the volume and tempo of the growth in demand for cement for at least the next 10-15 years. It has been estimated that the demand for cement in 1970-71 will be 216.72 lakh metric tonnes, which means that the installed capacity required to meet this demand—on the basis of a production efficiency of 95 per cent of installed capacity—will have to be about 230 lakh metric tonnes. By way of caution, one may as well add here that, merely by issuing licences, one will not achieve an expansion in capacity. There are other decisive factors besides. There is, for example, the vital role of the price factor which has yet to receive proper attention.

It is admitted on all hands that, in a free economy (this may be taken also to include a mixed economy such as ours), the function of price should be something more than to serve as a mere balancing mechanism, that is, to equate demand with supply; it should so stimulate expansion as not merely to catch up with the present shortage but to grow 'pari passu' with the steadily rising demand in the country. According to the spokesmen of the industry, any sound price-fixing policy should provide, among others, for the following specific objectives:

- (i) The price fixed must cover all costs at the levels presently established;
- (ii) It must also cover all prospective cost increases (say, upto the next price revision) to the extent that such increases can reasonably be foreseen and allow something over for contingencies to cover not merely unforeseen specific increases but also the foreseeable rise

in the general price level due to inflation, on the one hand, and to heavy anticipated indirect taxation, on the other; and

- (iii) The price fixed must allow for a profit element by way of return on capital employed, such return being conceived as a "net distributable return", after tax, and after meeting all costs. In other words, the level of the return must be such (a) that the existing units are assured of adequate resources for ploughing back for modernisation, rehabilitation and some expansion, (b) that it may be competitive with alternative avenues for investments available to the new investor (and to units in the industry itself in respect of the investment of their internal resources), and (c) that it may thereby encourage an adequate flow of additional resources into the industry—both into existing units and into new units—for the enormous expansion that is needed.

It may be argued that all this sounds excellent in so far as the industry is concerned, but it betrays a complete lack of concern for the consumer. This is an

age-old argument that tends to be dismissed by many as the customary "consumer canard". That may appear rather too cavalierish. But if it is left to the option of the consumer himself as to whether he would prefer an uneconomical price that can only hold out the eternal prospect of inadequate growth in installed capacity, shortage of supplies, price control, rationing, black marketing and so on, or a reasonably fair price that will induce more investment in the industry, steady expansion and adequate supplies at a given price anywhere in the country, he is certain to choose the latter. For what the consumer of cement in this country wants today is more cement for which he will readily and willingly pay even a price higher than the controlled price. In other words, the inhibiting factor is not so much the high price as the shortage of supplies. So long as the industry knows that, beyond a given level, consumer resistance is certain to manifest itself and so long as there is an autonomous statutory body which is not influenced by any political considerations in fixing prices, there is assured for the consumer a built-in safety valve, as it were, that may be expected to take care of either excessive cupidity on the part of the industry or any extra indulgence to the industry on the part of the Tariff Commission.

Business Notes

Investment Centre

GOOD START

THE INDIAN INVESTMENT CENTRE, inaugurated in February last by the Union Finance Minister, Mr. Morarji Desai, has got off to a good start. During its short existence, the Centre has already received as many as 35 enquiries, both from foreign and Indian entrepreneurs, on prospects of setting up new industries in this country. Twenty-five of these enquiries have already been processed by the Centre and 10 of them, from Indian entrepreneurs, have been forwarded to potential foreign collaborators for their personal and reaction. The Centre is a statutory organisation set up with the primary object of providing information to Indian and foreign entrepreneurs on Government of India's policies, laws, regulations and various other aspects relating to investment of foreign private capital in India.

It is, indeed, encouraging that some of the prominent U.S. entrepreneurs have addressed enquiries to the Centre seeking its assistance for finding suitable Indian partners for setting up in this country basic chemicals, construction equipment, industrial ceramics, steel tubes, electrical equipments, pharmaceuticals and drugs and food processing industries. These proposals are said to be receiving careful scrutiny by the Centre. In course of time, the Centre will suggest suitable Indian parties, both from amongst those already active in the industrial field—the Centre on the advice of the various Chambers of Commerce and Industry in the country has drawn up a panel of nearly 110 Indian industrialists—and new entrants from amongst those who are in the import and export business, for these collaboration arrangements.

Indian industrialists, of course, have addressed a larger number of enquiries to the Centre. They relate to seeking of the Centre's assistance in securing technical and financial collaboration from abroad for setting up industrial units to manufacture alloy and tool steel, cast iron pipes, steel tubes, malleable castings, industrial ceramic, water meters, paper and pulp, automobile tyres and tubes, fine chemicals, machine tools, hand tools, scientific glassware and plastics. The enquiries are from large-scale manufacturers as well as small industrialists.

The Centre is preparing brochures on "Basic Facts of the Indian Economy", "Objects and Functions of

Investment Centre" and "Starting an Industrial Enterprise in India" and booklets on 'Taxation', 'Exchange Control' and 'Company Law'. They are expected to be issued in the near future. The Centre is also making preparations for publishing a 'Monthly News Letter'. It will disseminate information on various aspects bearing on investment in the country.

The Centre is planning to open its own representations abroad, particularly in the United States, on the European Continent and in Japan. The office in New York is expected to be opened soon. The opening of these offices in the countries from where private foreign capital is expected to flow for investment in India will undoubtedly give a great fillip to the Centre's activities. The Centre's plans to start in due course the service of rendering advice to Indian investors requiring help in India itself in matters of raising financial resources, procurement of capital equipment and guidance on dealings with the Government is a step in the right direction and can go a long way in reducing the drain on foreign exchange resources. As the Centre's procedures are closely co-ordinated with the policies of the Government of India and the industrial targets and capacities laid down in the Third Plan, and since it has already set up an efficient and competent machinery for processing enquiries addressed to it, it is in an enviable position to render correct advice on setting up of new industrial units in the country.

Foreign Exchange

IDLE CAPACITY IN INDUSTRIES

A SUBSTANTIAL portion of the additional capacity to be created in several industries during the Third Plan period has been licensed, according to a press release recently issued by the Union Ministry of Commerce and Industry. As a result, the existing capacity, in many cases, has come to form only a small proportion of 20-50 per cent of the total licensed capacity. A major portion of the foreign exchange outlay on this additional capacity has been covered by foreign collaboration arrangements, but, even so, it should be noted that such is limited to capital equipment only, so that we are in a worse off position than before as regards foreign exchange for essential raw materials that have to be imported. As it is (that is, not taking the capacity scheduled to be licensed under the Third Plan), there is a large idle capacity in the existing industries,

ranging from some 25 to 60 per cent, mainly due to non-availability of raw materials and components, thanks to the drastic cuts in raw material imports. When the maximum utilization of even the existing capacities is thus rendered impossible, to license and bring in new projects will only lead to acute competition by the newly licensed units with the existing ones for the severely limited supply of maintenance imports (essential raw materials and components). This was the sensible view expressed by Mr. G. V. Puranik, Chairman of the All-India Manufacturers' Organisation, in his speech at the first quarterly meeting of the Central Committee of the Organisation, held at Coimbatore a few days ago. He further warned that the continuation of the indiscriminate "licensing of new industries and issue of licences without proper phasing" would give rise to a serious exchange crisis, as happened during the Second Plan period. "Maintenance imports of essential raw materials should, therefore, be given precedence over developmental imports of capital equipment", Mr. Purnaik emphasised.

Mr. Purnaik also dwelt on the subject of limited participation of the public in the share capital of selected State undertakings. It may be recalled that this proposal found favour with the Estimates Committee of Parliament as well as the Krishna Menon Committee on Public Undertakings. But it was rejected as undesirable by the Special Committee of Secretaries, headed by Mr. Vishnu Sahay. This probably explains why the Government of Maharashtra has chosen to achieve the same results in a slightly different way. Thus, it has taken the initiative in State participation in some private ventures. For this purpose, the Maharashtra Government has allotted a sum of Rs. 2.7 crores during the Third Plan period. A Study Group, appointed by the State Government in this connection, has made it clear that joint ventures such as these should have autonomy in regard to day-to-day working, purchases, appointments, promotions, etc. For some reason, however, the Madras Government, which too was very eager to go in for such joint ventures, has abandoned the idea. (It is alleged, the proposal has been dropped due to the opposition of the Planning Commission). Strongly deprecating this trend, the AIMO chairman made the pertinent point that public participation in State enterprises would give them "a real public character", which they cannot be said to possess save only in appellation now.

Planning

EVERY STATE A DEMOGRAPHIC ENTITY

A DECADE of planning in India has helped to bring about a substantial rise in industrial production (67.5 per cent) and agriculture (41 per cent), but, even so, the rate of economic growth has averaged only 3 per cent per annum, which is lower than the rate of growth in respect of many under-developed countries over the corresponding period. Many reasons have been attributed to this relatively slow growth, but the main impediment to a more rapid growth in India is undoubtedly the high rate of growth of our population. It may not be known to all that India has recorded a rise of 87.5 per cent in her population over the past 60 years. Thus, India's population, which was 235 million in 1901, rose to 436 million by 1961, thereby registering an increase of 201 million. As though this is not enough, there will be a 20 per cent increase in population within next 15 years, estimate the demographers. Thus, by 1976, we are told, India's population would be somewhere near 625 million! Such a "population explosion" is bound to be a scourge to all our national development.

Highlighting the magnitude of this problem, Dr. V. K. R. V. Rao, Director of the Institute of Economic Growth, pointed out, in his Convocation Address to the

Faculty of Demographic Training and Research Institute, Chembur, that although, in terms of planning, India was one State, and "we are concerned with the national rate of population growth", in reality, the different States of India "constitute demographic entities in themselves." Amplifying this thesis, he said: "With internal migration practically stable," with the reorganisation of India into linguistic States, and the rapid and alarming growth of the sub-continental sentiment in the country, the study of population growth should be conducted in States individually before an all-India policy could be evolved.

Referring in particular to the Kerala State, which has the highest natural rate of increase in population, Dr. Rao wondered how this State, in spite of its poverty and high rate of unemployment, a high degree of female education, as well as a social and economic system which is supposed to elevate the status of women, could have such a high rate of population growth. His own reading seems to be that there are some local factors that favour this rather abnormal growth. It is undoubtedly because of this that, while emphasising the apparent need to control the population in all States, Dr. Rao suggested that the programmes, priorities and policies require to be fitted to regional and State requirements so as correctly to diagnose the real causes of growth of population and effectively to regulate it.

Engineering

TELCO'S ALL ROUND PROGRESS

THE STATEMENT of Mr. J. R. D. Tata, Chairman, Tata Engineering & Locomotive Co. Ltd., for the year 1960-61 shows that the Company has made during this year all round progress in production, in sales and in profits. Gross profit of the Company in 1960-61 was Rs. 110.44 lakhs higher than in the previous year. After providing an additional Rs. 19.93 lakhs for depreciation, Rs. 30.84 lakhs for development rebate reserve, and Rs. 28.93 lakhs for taxation, the Directors have been able to recommend dividend on ordinary shares at the rate of Rs. 14.50 gross or Rs. 10.15 tax-free, subject to tax relief under Section 15C of the Income-tax Act — an increase of 16 per cent over the previous year. In order to ensure that the shareholders obtain the full benefit of such relief part of the dividend on ordinary shares will be paid out of the undistributed balance of 15C profit earned in previous years and the whole of such 15C profits earned in the year under report.

The bulk of these profits have come through the operations of the Automobile Division of the Company, the demand for whose vehicles has gone up to such an extent that it has been decided to expand capacity and to double the rate of output. Initial steps have already been taken to implement this expansion programme, estimated to cost Rs. 18 crores. The programme is intended to be completed in a period of about 3½ years during which production and the percentage of indigenous content will be progressively increased.

On the locomotives front, the Company has received orders to supply 65 locomotives a year on an average for the next five years to the Railway Board although now it is under no obligation to supply them, the 16-year agreement with the Railway Board having come to an end. The cheaper prices of the locomotives produced by the Company appear to have brought out this order. The Company's project for the manufacture of excavators and similar equipment under licence from Messrs. Hanischfeger of Milwaukee, U.S.A., is also faring well. But the most satisfactory aspect of the Company's working is that it is now producing to an increasing extent plant and equipment required for its own purposes. That not only reduces capital outlay but also saves a good deal of foreign exchange.

...the mighty roll of the drums seethes to the climax of a wild rhythm...and the dancing Wapis have danced their traditional Fish Dance, cleansing themselves of the anger of the Great Fish of the river.

BINNY's fabrics are shipped to this exciting land of New Guinea to help the people discover the wonderful new world of modern clothes.

BINNY's fabrics are exported to 49 other countries, too. Superb materials made only from cotton of the best quality and dyed with the fastest colours or so carefully bleached that the full strength of the cloth is preserved. Rigid Quality Control* ensures maximum durability and perfect finish.

Quality Control:
Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is laboratory testing to eliminate defects at every stage of production. That's why BINNY'S fabrics stay smart so long.

From palm leaves to TUSSORES

BINNY'S manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:
Shirting . Khaki Drills . Bleached & Dyed Drills
Towels . Anticrease Suitings . Tussorees
Unbleached Fabrics . Silk Saris etc. etc.

FROM THE CAPITAL'S CORRIDORS

THE INDIAN TAX STRUCTURE

SOME elucidation is now available on the changes effected in the tax structure by the Finance Act of 1961.

The changes effected by the Act in the super-tax rates for dividends received by companies are as follows:

(i) Dividends received by any company (Indian or foreign) from an Indian subsidiary company formed before April 1, 1961, will continue to be charged to super-tax at the rate of 10 per cent, but dividends received by any company (Indian or foreign) from an Indian subsidiary formed and registered on or after April 1, 1961, will be charged to super-tax at the rate of 20 per cent;

(ii) Dividends received from any Indian company (other than a subsidiary) formed and registered before April 1, 1959, will continue to be taxed to super-tax as before, i.e. at the rate of 20 per cent in the case of an Indian company in which the public are substantially interested and whose total income does not exceed Rs. 25,000; at the rate of 25 per cent in the case of any other Indian company and at the rate of 43 per cent in the case of a foreign company which has not made the prescribed arrangements for the declaration and payment of dividends in India;

(iii) Dividends received from an Indian company (other than a subsidiary) formed and registered on or after April 1, 1959, will be taxed to super-tax at the uniform rate of 20 per cent in the case of all companies.

ROYALTIES & BONUS ISSUES

The Finance Act, 1961, has also prescribed a reduced rate of super-tax in respect of royalties received by a foreign company (i.e. a company which has not made the prescribed arrangements for the declaration and payment of dividends in India) from an Indian concern in pursuance of an agreement made with it on or after April 1, 1961, and which has been approved by the Central Government. The reduced rate is 30 per cent so that such royalties will be taxable at the overall rate of 50 per cent (Income-tax 20 per cent, Super-tax 30 per cent). For royalties received (even after April 1, 1961) in pursuance of agreements made before April 1, 1961, whether with or without the approval of the Central Government, or in pursuance of agreements made on or after April 1, 1961, but which are not approved by the Central Government for this purpose, the aggregate rate of tax would continue to be 63 per cent (Income-tax 20 per cent, Super-tax 43 per cent) as before.

A suitable procedure for approving royalty agreements for the purposes of this provision is being evolved in consultation with the Ministry of Commerce and Industry. The reduced super-tax rate of 30 per cent would not be applied to any royalty income unless the Income-tax Officer is in receipt of the Government of India, Ministry of Finance (Department of Revenue)'s approval of the relevant royalty agreement.

The rate of super-tax payable by companies with reference to bonus issues has been reduced from 30 to 12½ per cent on the amount of such issues. This reduced rate will apply to bonus issues made during the previous year relevant to the assessment year 1961-62.

TAX DEDUCTION AT SOURCE

There is no change in the rates for deduction of tax at source during 1960-61 except that in the case of dividends and certain royalties payable to such foreign companies as do not declare their dividends in India, changes have been made for this purpose corresponding to the changes made in the effective rates of tax applicable to such companies for assessment. The proposed rates for deduction of tax at source during the financial

year 1961-62 in the case of such foreign companies are as follows:

RATES FOR DEDUCTION OF TAX AT SOURCE FROM INCOMES OF FOREIGN COMPANIES WHICH DO NOT DECLARE THEIR DIVIDENDS IN INDIA

(In percentage terms)

Source of Income	Income-tax	Super-tax	Total
1. On interest on any security of the Central Government issued or declared to be free of income-tax	—	43	43
2. On dividends from an Indian company referred to in section 56A of the Income-tax Act	20	—	20
3. On dividends from a subsidiary Indian company formed and registered before April 1, 1961	20	10	30
4. On dividends from a company (not being a subsidiary) formed and registered before April 1, 1959	20	43	63
5. On dividends from any other Indian company formed and registered on or after April 1, 1959, i.e.			
i) Any Indian company, other than a subsidiary, formed and registered on or after April 1, 1959; and	20	20	40
ii) A subsidiary Indian company formed and registered on or after April 1, 1961			
6. On royalties received from an Indian concern in pursuance of an agreement made with it on or after April 1, 1961, which has been approved by the Central Government	20	30	50
7. On any other income	20	43	63

SALARIES OF FOREIGN TECHNICIANS

At present, a foreign technician whose contract of service is approved by the Central Government before the commencement of his service in India, is exempt from tax on his income under the head "salaries" for the financial year of his arrival and the two subsequent financial years. Depending on the date of his arrival in India, the exemption may extend for a period varying from 24 to 36 months. The second proviso to section 4(3)(xiva) has been amended to secure that the exemption will be available in all cases for a uniform period not exceeding 36 months from the date of the arrival of the technician in India.

It has further been provided that if the technician continues to remain in employment in India after the said period of 36 months and the employer pays tax on the technician's income chargeable under the head "salaries" for a period not exceeding 24 months following the expiry of the said 36 months, such tax shall not be treated as the income of the technician. In the absence of such a provision, if the technician were to be paid a tax-free salary, i.e. if the tax on the salary of the technician were to be borne by the employer, it

would have had to be calculated on tax-on-tax basis. Now, the employer will have to pay only the tax on the salary itself and the tax so paid by the employer shall not be regarded as the income of the technician.

The benefits of both these concessions will apply to technicians whose contracts have been approved under the existing regulations. Thus, the benefit of the first concession will be available in the case of such technicians who are already serving in India in respect of the salary for such part of the period of the said 36 months as falls after March 31, 1960. For example, if such a technician came to India on October 1, 1957, his salary income upto March 31, 1960, only would have been exempt under the second provision to section 4(3)(xiva) before its amendment by the Finance Act, 1961. By virtue of the present amendment, the salary income from April 1, 1960, to September 30, 1960, also would become entitled to exemption. Similarly, the benefit of the exemption for the period of 24 months following the said period of 36 months will be available to those technicians who are already serving in India under contracts of service which have received the prior approval of the Central Government. No further approval of the Central Government (in the Ministry of Commerce and Industry) will be required for the availability of these two concessions provided, of course, the technician continues to serve under the same employer and under the same conditions of service as were initially approved by the Government.

DLF LOANS

Section 4(3)(xvi) of the Income-tax Act has been amended so as to extend the Development Loan Fund of U.S.A. the exemption now available in the case of the International Bank for Reconstruction and Development in respect of the interest on, or premium on the redemption of, any bonds issued by the Central Government under a loan agreement between the Central Government and the said Fund or by any industrial undertaking or financial corporation in India under a loan agreement with the said Fund which is guaranteed by the Central Government except where the holder of such a bond is a person resident in India.

DEFENCE SERVICES GRATUITY PROVISION

It has been provided that retiring gratuity payable to members of Defence Services received after the 1st day of June, 1953, under the New Pension Code applicable to them would be exempt from tax in the same manner as the payment of death-cum-retirement gratuity received by a Central Government servant under the Revised Pension Rules. The amendment has been given retrospective effect and, as such, if any such gratuity has already been taxed in the hands of any assessee, the relevant assessment would be revised under section 33A(1) and necessary refund allowed to the assessee on receipt of an application from him for this purpose. The time-limit under section 33A would be waived in such cases. The exemption applies only to such retiring gratuity as is paid to the Defence Services officers under the New Pension Code, which came into effect on June 1, 1953. Any retiring gratuity paid otherwise than under the New Pension Code would not be exempt from tax under this provision.

CONCESSIONAL RATE FOR RESIDENTIAL BUILDINGS

In order to encourage construction of residential buildings for persons in low-income brackets, a concession has been provided in respect of any new building the erection of which is begun and completed after April 1, 1961. In computing the income assessable under section 9 in respect of such a building, its annual value shall be reduced by a sum equal to the aggregate of:

- (a) in respect of each residential unit (comprised in the building) whose annual value does not

exceed Rs. 600, the amount of such annual value; and

- (b) in respect of each residential unit (comprised in the building) whose annual value exceeds Rs. 600, an amount of Rs. 600.

The exemption applies for a period of three years from the date of completion of the building. The following points are to be carefully noted:

(i) The concession will apply only to those buildings the erection of which is begun and completed after April 1, 1961. It will not apply at all to buildings the construction of which was completed before April 1, 1961 or the construction of which was initiated before April 1, 1961.

(ii) The reduction in the annual value is to be made for a period of three calendar years (i.e. 36 months) from the date of the completion of the building. This may fall for consideration in the four assessment years. Thus, if a building is completed on December 1, 1961, the annual value for the period December 1, 1961, to November 30, 1964, will have to be reduced in the manner provided and this will affect the calculation of annual value for the assessment years 1962-63, 1963-64, 1964-65 and 1965-66.

(iii) The reduction in the annual value of the property is to be made with reference to each residential unit comprised in the building. A portion of a building would be regarded as a separate residential unit if it is meant for being occupied by, and is rented separately to, a tenant. The Income-tax Officers would see that no unintended concession is allowed to the assessee through any attempt at an artificial division of a building into small units which cannot be regarded as separate and self-contained residential units in the sense referred to above.

This concession is subject to two limits. First, it has been provided that in no case the computation of income in respect of any residential unit should result in a loss. If it does, the loss will be ignored and the net income in respect thereof will be taken at nil. Secondly, it has been provided in the explanation to the new proviso that where the residential unit is in occupation of the owner of the property for the purposes of his own residence, the computation of the annual value of such a unit in the hands of the owner would be made in accordance with the first proviso to section 9(2) as if the newly added proviso did not exist, i.e., the method followed hitherto in respect of self-occupied houses would continue to apply and the concession provided by the new proviso will not be available in respect of such houses.

An amendment has been made to clause (vi) of section 10(2) to the effect that an initial depreciation allowance of an amount equal to 20 per cent of the actual cost shall be allowed in respect of the following types of buildings to an assessee in the computation of his business income for the previous year of erection of the building:

(i) Buildings newly erected after March 31, 1961 (i.e. whose construction is initiated and completed after March 31, 1961) by a person carrying on a business and used solely for the purpose of residence of person employed in the business and drawing remuneration not exceeding Rs. 200 per month; and

(ii) Buildings newly erected after March 31, 1961 (i.e., whose construction is initiated and completed after March 31, 1961) by a person carrying on a business and used solely or mainly for the welfare requirements of the said employees in the form of hospitals, canteens, schools, canteens, libraries, recreational centres, shelters, rest rooms and lunch rooms.

The initial depreciation so allowed will not be deducted for determining the written-down value for the purpose of allowing normal depreciation on such

buildings from year to year. However, such initial depreciation shall be taken into account for the purpose of determining the written-down value for other purposes of the Act, such as computing the terminal allowance or charge under section 10(2)(vii). It shall also be taken into account for computing the total depreciation allowed in respect of such buildings for the purpose of clause (c) of the proviso to section 10(2)(vi).

Buildings belonging to the owner of a business and used by him in order to house his employees are to be regarded as buildings used for the purpose of business where the occupation by the employer who carries on a business is subservient to and necessary for the performance of their duties. Before a building can be said to have been used for the purpose of business, and hence entitled to depreciation, it is necessary that the said condition should be fulfilled. However, in the case of buildings described under (i) and (ii) above, the Income-tax Officers would not insist on a strict compliance with this condition. Such buildings would be regarded as having been used for the purpose of business carried on by the assessee and, therefore:

(a) Income from such buildings would be computed under section 10 and not under section 9; the deductions admissible under section 9 (including the new concession referred to above) will not be applicable to such buildings; and

(ii) Depreciation according to the provisions of section 10(2)(vi)—(including the new allowance for initial depreciation referred to in the preceding paragraph) would be allowed in respect of such buildings.

The following further points are to be noted in this connection:

(i) Any part of a building even though newly erected after March 31, 1961, which is used for the purpose of residence of (a) persons not employed in the business, or (b) persons employed in the business but whose remuneration exceeds Rs. 200 per month, would not be regarded as used for the purpose of business unless in the case of (b) the condition referred to above is satisfied. Income from such parts of any building would be computed under section 9 and not under section 10.

(ii) Buildings which are used for welfare purposes need not be exclusively used for the welfare of business employees drawing a remuneration not exceeding Rs. 200 per month. The initial depreciation would be allowed even if they are mainly used for this purpose. But if a building is meant mainly for catering to the welfare needs of the employees drawing a remuneration of more than Rs. 200 per month (such as a club or rest house for the senior officers of the business), such a building will not be given the benefit of the new concession.

(iii) The term 'remuneration' would be regarded as comprised of the pay and salary, dearness allowance and fixed bonus or commission and exclusive of variable bonus or commission or any other benefit or perquisite.

(iv) This concession applies only to buildings used for the above-mentioned purposes by persons carrying on a business. It does not apply to persons carrying on a profession or vocation.

DEVELOPMENT REBATE

The rate of development rebate in respect of machinery or plant installed after March 31, 1961, has now been prescribed at 20 per cent of the actual cost, as against 25 per cent in respect of machinery or plant installed before April 1, 1961. There is, however, no change in respect of ships acquired by an assessee, the rate of development rebate in respect of which continues at 40 per cent of the actual cost.

A new clause (xic) has been added to section 10(2) of the Income-tax Act, 1961, to preserve the benefits of development rebate when plant and machinery is transferred in the course of the amalgamation of com-

panies and the succession to the business of a firm by a private limited company if certain conditions are satisfied. Corresponding amendments have also been made in the proviso to section 10(2)(vib) and section 35(ii), vide section 6(ii)(2) and section 9 of the Finance Act.

Under the existing proviso to section 10(2)(vib) read with section 35(11), development rebate already granted to an assessee is withdrawn in a case where the asset on which the rebate was allowed is sold or otherwise transferred by the assessee to any person other than the Government at any time before the expiry of ten years from the end of the previous year in which it was acquired or installed. Accordingly, where a company is amalgamated with another company or where a firm is converted into a private limited company, within the above period, the assets of the amalgamating company or of the firm would fall to be treated as having been sold or transferred to the successor company and any development rebate allowed to the former would stand to be withdrawn. Further, the successor company would not be entitled to set off against its profits any portion of the development rebate remaining unabsorbed in the hands of the amalgamated company or the firm due to paucity of profits.

The amendments referred to above provide that where an amalgamation of companies takes place, the development rebate already allowed to the amalgamating company or companies will not be withdrawn and any balance of development rebate still outstanding to the amalgamating company or companies on the date of amalgamation will be carried forward and allowed in the assessments of the successor company in accordance with Explanation I and II of section 10(2)(vib), subject to the restriction that the total period for which the balance of the development rebate shall be carried forward both in the hands of the successor and the predecessor shall not exceed the period of eight years as specified in Explanation I to section 10(2)(vib). Thus, for example, where a company is amalgamated with another company at the end of four years from the expiry of the previous year of the acquisition of a particular asset and the whole or a part of the development rebate in respect of the asset is still outstanding to it, the amalgamated company would be allowed to carry forward the outstanding rebate for a further period of four years only.

It has been provided that this benefit will be admissible only if the amalgamated company continues to comply with the obligations placed by the first proviso to section 10(2)(vib) on the amalgamating company had it continued to exist. Thus, the amalgamated company should continue to maintain the reserve as required by clause (b) of the proviso to section 10(2)(vib). Similarly, it should not sell or otherwise transfer the asset to any person other than Government at any time before the expiry of ten years from the end of the previous year in which it was acquired by the amalgamating company. If it violates any of these obligations, the provisions of section 35(11) will be attracted and it has been specifically provided that the tax resulting from the recomputation of the total income of the amalgamating company for the relevant previous year in which the development rebate was originally allowed, shall be payable by the amalgamated company. The rights, liabilities and obligations of the amalgamating company have thus been transferred to the amalgamated company in respect of the development rebate on the assets transferred to the latter in the course of amalgamation.

It should be noted:

(i) This concession does not apply to all situations where assets are transferred by one company to another, but only where an amalgamation or merger of companies takes place so that all the property, liabilities, and

shareholders of the former companies immediately before the amalgamation become respectively the property, liabilities, and shareholders of the successor company. For this purpose, the term 'amalgamation' has been specifically defined in the explanation to section 10(2)(vic)(i). The benefit of this concession would, however, be given also in a case where a wholly-owned subsidiary company is merged with its parent company if all the conditions other than that mentioned in clause (c) of the explanation to section 10(2)(vic)(i) are satisfied. Further, the definition covers only two types of cases: (a) where two companies (A) and (B) amalgamate to form a new company (C), and (b) where one company (X) amalgamates with another company (Y).

(ii) The definition excludes cases of mere acquisition of property of one company by another company pursuant to the purchase of such property by the other company or as a result of distribution of such property to the other company after the working up of the first company.

Section 10(2)(vic)(ii) of the Income-tax Act, newly introduced by section 6(iii) of the Finance Act, provides that the benefits which are allowed in the case of amalgamation of companies as mentioned above will also be allowed in the case where a firm is succeeded to by a private company in the business carried on by it and the firm sells or otherwise transfers any ship, machinery or plant to the company as a result of such succession, subject to the same conditions 'mutatis mutandis'.

It is to be noted that this concession in the case of succession to a firm will be available only where the firm is succeeded to by a private company (as defined in the Companies Act, 1956) and not where an individual transfers his business to a private or a public company or where a firm is succeeded to by a public company. Further, though the provision does not specifically mention so, the intention is that the benefit of this concession should be available only where all the shareholders of the company hold the shares in exactly or nearly the same ratio as the interest of the partners in the quondam firm. If this benefit is claimed in a case where this condition is satisfied, the facts of the case should be reported to the Board.

FINANCE CORPORATIONS

A new clause (xiva) has been added to section 10(2) to provide that a financial corporation which is engaged in providing long-term finance for industrial development in India, may claim as a deduction an amount, carried to any special reserve created by it, not exceeding 10 per cent of the total income as computed before making a deduction for such a reserve. The allowance is, however, subject to the restriction that where the aggregate of the amounts carried to such a reserve account from time to time exceeds the paid-up share capital of the corporation, no further deduction shall be allowed under this clause. For this purpose, any amount capitalised from reserves has to be excluded from the paid-up capital.

It has further been provided that only the financial corporations which are approved by the Central Government for this purpose will be allowed this concession. A list of such institutions will be issued in due course.

It will be noticed that, unlike the development rebate reserve, there are no restrictions placed on the manner in which such a reserve may be utilised by the corporation. If, however, the reserve is utilised for a purpose totally unconnected with the business of providing long-term industrial finance in India, the facts of the case should be brought to the notice of the Board. It is to be noted that it is not the amount standing to the credit of the reserve account at the end of the relevant previous year but the total amount carried to

such reserve account from year to year which will determine the question whether any further appropriations to the reserve account should be allowed as a deduction. A statement of the amounts carried (or appropriated) to such a reserve account from year to year should be maintained in the permanent record and when the aggregate of such amounts becomes equal to the paid-up capital (as at the end of the relevant year), no further appropriations to such a reserve account would be allowed as a deduction. Any amounts which may be written back from the reserve account to the Profit and Loss Appropriation Account or to any other account having the effect of reducing the amount standing to the credit of the reserve account at any point of time, would be ignored for this purpose.

ENTERTAINMENT EXPENSES

A proviso has been added to clause (xv) of section 10(2) prescribing certain limitations to the amount of entertainment expenses that may be allowed in the assessment of a company. The entertainment expenditure desired to be allowed as deduction will have first to satisfy the test that it is genuine business expenditure laid out or expended wholly and exclusively for the purpose of business. But even after the expenditure has passed this test, its admissibility is restricted to certain maximum limits mentioned in the new proviso to section 10(2) (xv). The maximum amount that can be allowed in a particular case depends on the amount of the profits and gains (computed in the manner laid down in section 10 but before allowing any development rebate or any entertainment expenses) of the business in connection with which expenditure has been incurred and not the total profits and gains assessable under section 10 in respect of all the business carried on by the assessee. The maximum allowance that can be made on account of entertainment expenses in excess of this amount should, therefore, in any case be added back to the company's assessable profits.

It will be seen that if the profits and gains of the company from the relevant business, computed in the manner indicated above, do not exceed Rs. 10,00,000 or the company has incurred a loss it is entitled to a deduction of one per cent of the amount of such profits or Rs. 5,000, whichever is higher. Thus a minimum limit has also been prescribed which will be operative where the profits, computed as aforesaid, are less than Rs. 5,00,000 or where there is a net loss, similarly computed. In such cases, the actual amount of entertainment expenditure incurred or Rs. 5,000, whichever is less, will be admissible as deduction. It is intended by the Central Board of Revenue that where the entertainment expenditure incurred and claimed by an assessee company does not exceed Rs. 5,000, the Income-tax Officer need not be meticulous about putting it to strict proof and such expenditure should be allowed after a broad check to ensure that expenditure totally unconnected with the business or patently inadmissible on other grounds is not claimed in the garb of entertainment expenditure.

It is difficult to lay down precisely in this context as to what expenses should be treated as covered by the term 'entertainment expenditure'. Each case will have to be decided on its own facts. Different expense accounts of the company would be carefully scrutinised to safeguard against any attempt to pass off entertainment expense through other accounts. It is, however, to be noted in this connection that where any entertainment allowance as such is paid to any employee of the company as a part of his remuneration, the amount of such allowances would not be included in the entertainment expenses for the purpose of the new proviso to section 10(2)(xv) if it is subjected to tax in the hands of the employee. Where instead of being paid an allowance as a part of his remuneration, an employee is allowed to operate an expense account for the purpose of entertainment of the customers of the company.

MORE PIPES
to meet the
nation's needs

With the addition of a second plant at the Kulti Works of The Indian Iron & Steel Co. Ltd., the production of spun iron pipes has increased from 60,000 to 150,000 tons per year. Besides helping to satisfy India's growing demands for large diameter pipe mains, the increased tonnage saves India many crores of rupees annually in foreign exchange. Employing latest techniques, the Kulti Works of IISCO is the first to produce 3" to 30" diameter spun iron pipes in the country.

the expenses through such an account would be included in the entertainment expenses of the company for this purpose.

It is further to be noted that while the law has been changed with regard to the admissibility of entertainment expenses in the cases of companies, no change has been made in the matter of allowance of such expenses in the hands of assesseees other than companies, in whose cases such expenses will continue to be allowed in the same manner as before.

The Income-tax Officers would maintain a record in respect of the cases in which entertainment expenses are disallowed by them under the new proviso to section 10(2)(xc). At the end of the current financial year, the Commissioners would send a consolidated report to the Central Board of Revenue in respect of their charges showing the number of such cases, the amount of such expenditure disallowed and the tax demand attributable thereto.

TAX HOLIDAY FOR HOTELS

Amendments have been made to section 150 of the Act to provide a tax holiday in respect of new hotels in the same manner as in the case of new industrial undertakings. The exemption will apply in respect of the profits of a hotel for five assessment years starting with the assessment for the previous year in which it starts functioning. The benefit of exemption under section 15C(4) in the hands of shareholders with regard to the dividends attributable to the exempt profits will also apply to the new sub-section (2A) of section 15C. These conditions are somewhat different from those applicable to industrial undertakings for the purpose of section 15C. Thus, whereas any other industrial undertaking need not necessarily be run and owned by a company, a hotel must be owned and run by a company registered in the taxable territories and with a paid-up capital of not less than Rs. 5,00,000. The condition that the hotel must be run in the premises owned by the company is also peculiar to hotels. A hotel has also to satisfy the condition regarding the number of type of guest rooms and the amenities that should be provided by it; these are to be prescribed having regard to the population and the tourist importance of the place in which the hotel is located. The rules for this purpose are being separately framed. The most important condition is that the hotel must be approved by the Central Government for this purpose. No exemption would be allowed either to the hotel or the shareholders unless the Central Government has accorded its approval of the hotel for this purpose.

An explanation has also been added to sub-section (4) of section 15C to the effect that rules may be prescribed by the Central Board of Revenue for the computation of the amount of dividend in respect of which tax is not payable by the shareholders under the said sub-section. The rules for this purpose are being separately framed and when finalised will apply to dividends distributed not only by an industrial undertaking but also by a hotel covered under section 15C.

CHARITABLE INSTITUTIONS

A new clause (iii) has been inserted in section 23A(1) to provide that where at least 75 per cent of the share capital of a company has been beneficially held throughout the relevant previous year by charitable institutions or funds the income of which is exempt under section 4(3)(i), the provisions of section 23A(i) will not be applied to such a company. In fact, till the financial year 1959-60, the provisions of section 23A(1) were not, in view of the existing clause (ii) of that section, applicable to the companies whose share capital was held mostly by charitable institutions or trusts, as in their cases the result of a distribution of a dividend or a larger dividend by the companies would have

been a net refund to the shareholders and, therefore, a loss to revenue. As under the new scheme of taxation of dividends, the question of grossing up the dividend and deeming the tax paid by the shareholder does not arise, clause (ii) became ineffective to safeguard the cases of such companies from the operation of section 23A. Hence, the present amendment. The amendment has been given retrospective effect from April 1, 1960, and, as such, if in the case of any such company an order under section 23A(1) has been passed in respect of the assessment year 1960-61, the same would be rectified under section 35 and necessary refund, if any, would be allowed to the company.

MR. THORNEYCROFT'S VISIT

The Government of India Ministers and officials in their talks with Mr. Peter Thorneycroft, who arrived here on July 12 on a three-day visit to ascertain the reaction of the Indian Government on Britain's joining the European Common Market, are said to have emphasised the points that Britain's entry into the ECM without securing safeguards for her trade with the Commonwealth countries would result in serious damage to be caused to India's export trade (the damage, according to official circles is likely to be of the order of 20 per cent) and that it would also lead to weakening of the Commonwealth ties. It was pointed out by them that principal exports of India were subject to high tariffs, internal taxes and quantitative restrictions of a discriminatory character in some of the countries of the ECM, while these products were being admitted duty-free and without restrictions to the United Kingdom. If the United Kingdom joined the European Economic Community without suitable provisions for her future trade with the Commonwealth, with special emphasis on the types of products which come from developing countries, India would find it extremely difficult to maintain her export trade which was a matter of vital concern for her since the earnings from her exports provided, as in the case of other developing countries, external resources for her economic development.

Mr. Peter Thorneycroft is said to have explained to the Government of India that although the British Government had reached no decision on the question as yet, it was concerned about the economic division of Europe which was emerging and, therefore, was examining carefully the problems that could arise if the United Kingdom decided to join the ECM. He is said to have drawn attention of the Government of India to the economic consequences of continued division and to the importance of maintaining and expanding European economy, both as a market for the products of developing countries and as a source of investment funds for them.

Addressing a Press Conference after the conclusion of his talks with the Government of India, Mr. Thorneycroft emphasised the point that during his talks with India, Pakistan and Ceylon, the dominant impression which he had gathered was that the decision on whether to join or not the European Economic Community rested with the British Government and the Commonwealth countries would not stand in the way of Britain's starting negotiations for her entry into the ECM.

About the argument that Britain's joining the ECM would weaken the Commonwealth links, Mr. Thorneycroft observed that all big changes had the possibility of weakening or strengthening an organisation. He recalled that when Ottawa Preferences were negotiated in early thirties, the present-day ruling party in India, then in opposition, was dead set against the Ottawa Agreement. Today, nearly 30 years later, it is now hugging the Ottawa Pact to its bosom.

The principal consideration before the United Kingdom which would influence her decision to join the European Economic Community, Mr. Thorneycroft

said, was whether Britain would be a bigger market and a stronger investor if she were to join the "Inner Six". He added that Britain was a part of Europe and this consideration could not be ruled out.

Mr. Thorneycroft indicated that Britain with its traditions of following liberal trade policies would try to persuade the present six members of the European Common Market to have liberal trade outlook towards the underdeveloped countries.

Mr. Thorneycroft has assured the Government that if negotiations for Britain's joining the European Common Market were embarked upon, the British Government would keep in the closest touch the Government of India in all matters affecting India's interest. It was agreed during the meeting which the Indian Ministers had with Mr. Thorneycroft that arrangement should be made for such consultations and for further discussions between the two Governments when the British Government takes a decision to join the European Economic Community.

CENTRAL LOANS

The Government of India has announced the issue of a further tranche of the existing 3½ per cent Bonds 1969 at Rs. 98.40 per Rs. 100 (nominal) repayable at par on July 1, 1969, and 4 per cent Loan 1981 at Rs. 98.50 per Rs. 100 (nominal) repayable at par on July 24, 1981. Subscriptions are to be in the form of cash/cheque or securities of 2½ per cent Loan 1961 or 3 per cent Hyderabad Loan 1951-61 (H.E.H. the Nizam's Government 3 per cent O. S. Rupee Loan 1360-70F).

The subscription lists open on July 24 and close on July 26, or earlier without notice as soon as the total subscriptions amount to Rs. 100 crores. The Government reserves the right to retain subscriptions upto 10 per cent in excess of the notified amount.

The securities of 2½ per cent Loan 1961 and 3 per cent Hyderabad Loan 1951-61 will be accepted for conversion at par. Interest on the securities tendered for conversion will be paid at the respective rates upto July 31, 1961. Interest on the securities to be issued will accrue from July 24, 1961. Interest on 3½ per cent Bonds 1969 will be paid on January 1, 1962, for the period July 24, 1961, to December 31, 1961, inclusive, and thereafter half-yearly on July 1 and January 1. In the case of the 4 per cent Loan 1981, interest will be paid half-yearly on January 24, and July 24. Interest on the new securities will be liable to tax under the Income-tax Act, 1922.

CREDIT FROM I.M.F.

The Reserve Bank of India will be receiving on August 1, 1961, a credit of \$250 million (Rs. 109.04 crores) from the International Monetary Fund. The credit will be available in six foreign currencies — \$110 million (Rs. 52.38 crores) in U.S. dollars, \$60 million (Rs. 28.57 crores) in pound-sterling, \$45 million (Rs. 21.43 crores) in D' marks, \$15 million (Rs. 7.14 crores) in French francs, \$15 million (Rs. 7.14 crores) in Italian lira and \$5 million (Rs. 2.38 crores) in Japanese yen. This is the first occasion when drawings from the IMF are being made by any member in yen.

India's share in the Fund amounts to \$600 million (Rs. 285.71 crores). Of this, \$77.5 million (Rs. 37.90 crores) has been paid in gold and the rest in Indian currency.

This is not the first time that India has sought assistance from the IMF to meet her short-term balance of payments deficit. In 1948-49, India drew \$100 million (Rs. 47.62 crores) from the Fund. This amount was repaid by April, 1956. In 1957, India made a straight drawal of \$127.5 million (Rs. 60.71 crores) from the Fund and another \$72.5 million (Rs. 34.59 crores) as "stand-by" credit. While the "stand-by" credit was fully repaid within three years ending June, 1960, the straight drawal of \$127.5 million was repaid to the extent of \$64.25 (Rs.

30.76 crores) on June 26 this year. The balance of \$63.25 million (Rs. 30.11 crores) is expected to be repaid in the near future.

JHARIA, RANEEGUNJE ROPEWAYS PROJECT

The completion of the Coal Board's aerial ropeways project in the Jharia and Raneegunje coalfields is likely to be delayed by a year. Originally, the project was scheduled to be completed by March, 1963. The delay, it is understood, is being caused by two factors, (1) the final alignment surveys in some areas could not be completed in time as alternative routes had to be selected, and (2) prospective tenderers had asked for an extension of time in the case of three ropeways. The Coal Board, it is learnt, has submitted for the approval of the Government revised time-schedule for the completion of the project.

The project envisages the construction of four cable ropeways in the Jharia coalfields and three similar ropeways in the Raneegunje area. Each of these seven ropeways will have a carrying capacity of 1.5 million tons of sand per annum. Sand will be extracted from the rivers Damodar and Ajoy and transported by means of these ropeways to central dumps. From there it will be subsequently distributed to the collieries for use in coal stowing.

STEPPING UP COAL OUTPUT

An agreement is expected to be signed shortly with the West German Government under which West Germany will place at the disposal of the National Coal Development Corporation the services of three experts who will advise the Government of India and the NCDC on setting up of coal washeries in selected areas and stepping up of coal output during the Third Plan period.

The Government of India has already entered into agreement with Poland and the United States for the development of the coal industry under the Third Plan. An agreement is envisaged to be signed in the near future with the United Kingdom as well for the same purpose.

For the development of the coal industry in the private sector, the World Bank is making available a sum of \$20 million.

MANUFACTURE OF TRACTORS

The Government of India, it is understood, is favourably inclined to grant permission to the Ghazialabad Engineering Company to manufacture 3,000 tractors per annum in the 35 H.P. range, in collaboration with Renaults of France. The company has plans to manufacture about 50 per cent of the components indigenously in the very first year of the start of production, nearly 86 per cent in the second year and 90 per cent in the third year. The balance 10 per cent components, considered to be proprietary parts, would have to be imported. The French collaborators have agreed to make the transmission unit for the Indian company during the second year of their collaboration.

The Chairman of Renaults, Mr. Pierre Dreyfus, is arriving here on a three-day visit on July 29. He is expected to meet the Prime Minister.

MANUFACTURE OF ASPHALT & FUEL OIL

The Government of India, it is learnt, will be shortly granting a licence to Duncan Brothers Limited, Calcutta, for the manufacture of 150,000 tons asphalt and 50,000 tons fuel oil per annum from crude to be imported from Kuwait through the American Independent Company in the form of vacuum feed-stock. Duncan Brothers will float a new Indian company with an issued capital of Rs. 1,25,00,000. The U.S. company will invest in the equity capital of the new Indian company to the extent of foreign exchange requirements of the undertaking, nearly Rs. 35,00,000.

GOVERNMENT OF INDIA

3½ per cent BONDS 1969 ISSUE PRICE Rs. 98.40 PER Rs. 100 (NOMINAL).
REPAYABLE ON 1ST JULY, 1969.

4 per cent LOAN 1981 ISSUE PRICE Rs. 98.50 PER Rs. 100 (NOMINAL).
REPAYABLE ON 24TH JULY, 1981.

Subscriptions to the above bonds and loan will be received simultaneously and will be limited to a total of Rs. 100 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of the 2½ per cent. Loan 1961 or 3 per cent. Hyderabad Loan 1951-61 which will be accepted for conversion at par.

Interest on the securities tendered for conversion will be paid upto 31st July, 1961 inclusive.

The new bonds and loan will bear interest from 24th July, 1961. Interest on the bonds will be paid on 1st January, 1962 for the period 24th July, 1961 to 31st December, 1961 and thereafter half-yearly on 1st July and 1st January. In case of the loan interest will be paid half-yearly on the 24th January and 24th July.

Subscription lists will open on 24th July, 1961 and close on 26th July, 1961 or earlier without notice.

Applications for the bonds and loan will be received at:-

- Offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi;
- Branches of the State Bank of Hyderabad conducting Government work, and those at Bhainsa, Jaggaypet, Mancheria, Nagarjunasagar and Sirpur Kagaznagar in Andhra Pradesh, Manwath, Purli-Vaijnath and Sailu in Maharashtra State and Shahabad in Mysore State;
- Branches of the State Bank of Mysore in the State of Mysore except those at Bangalore, Mangalore and Gulbarga; and
- Branches of the State Bank of India at Mangalore and at other places in India, except at the places specified in (a), (b) and (c) above.

A Letter to the Editor

INDIAN AIRLINES FARES

Dear Sir,

Comments have recently appeared in the press on the proposed increase of fares on IAC. Most of these have bracketed the proposal with the increased wage-bill since IAC's pay-scales were revised. What seems to have been generally ignored is the fact that the cost of operations and maintenance has been rising as well.

For years now the Corporation has been doing its best within the limitations of extraordinarily high fuel costs (possibly the highest paid by any airline) and a fare structure that is about the lowest in the world. Normal increases in expenditure can be, and are, offset by increasing revenues due to increased traffic, but even here IAC is faced by the limiting factor of the near-maximum capacity already offered. IAC's revenue-earning potential is now levelling off while unavoidable expenditure continues to rise.

Since 1957, the price of Aviation Turbine Fuel used by Viscounts and Friendships has gone up by about 4.5 per cent, and that of High Octane Gasoline consumed by piston-engined aircraft by nearly 17 per cent. The impact of the latter increase is very considerable as the IAC fleet is made up largely of piston-engined aircraft. Fuel alone accounts for nearly one-third of our total expenditure.

Aircraft and engine spares have also been going up in price. Items:

- Dakotas:** The main source of supply for Dakota spares has been the war surplus market in the U.S.A. The pool of unused spares manufactured years ago has almost dried up, and whatever is available sells at a higher price. In the last five years alone, Dakota spares have gone up by over 150 per cent on an average, with some regularly replaceable parts costing five times as much. As the spares position becomes

more difficult we are forced to buy newly manufactured parts, which cost a lot more.

- Viscounts:** Modern though the Viscount is, the prices of its engine and aircraft spares have gone up by varying degrees in the last four years. Aircraft spares now cost at least 18 per cent more, and vendor items (such as radio equipment) between 4 per cent and 50 per cent more. Engine spares which are changed at every overhaul have gone up by nearly 97 per cent.

To these must be added higher duties on some items, increased cost of freight and the increased incidence of Sales Taxes on local purchases.

Despite all these added costs, the fares and freight rates on IAC have been static since 1958, but for a few minor adjustments. Even with the proposed increases IAC will continue to offer fares that are lower than almost anywhere else in the world.

Yours faithfully,
P. C. LAL,
General Manager

Indian Airlines,
New Delhi,
July 12, 1961.

['The Eastern Economist' finds full justification for the increase in the Indian Airlines Corporation's fares. In a Leading Article in this journal dated December 23, 1960, we advocated an increase of 10 per cent in the fares charged for the Vickers Viscounts which is the same as announced last month. In another Leading Article in the issue of June 30, 1961, we stressed the point that there were important factors, besides the rising wage and salary bill, which necessitated the increases in fares. We are glad to publish the above clarification of these factors.—Ed.]

COMPANY AFFAIRS

KESORAM COTTON'S EXPANSION PROGRAMME

Kesoram Cotton Mills Ltd., which after sometime may be called Kesoram Industries and Cotton Mills Limited, has decided to broaden its sphere of activities and with that end in view the directors have decided to alter and enlarge the Memorandum of Association of the Company. After getting consent of the shareholders an application has been made by the Company to the High Court at Calcutta. The Court has approved of these alterations subject to the condition that the name of Company be changed to Kesoram Industries and Cotton Mills Ltd., necessary application for which has been made to the Central Government. The directors have proposed to issue four lakh shares of Rs. 10 each at par in proportion to one right share for four existing ordinary shares.

The textile section of the Company is being modernised and now has 75,040 spindles and 1991 looms. By the end of the current financial year, the rayon section will have 48 spindles with an installed capacity of about 11½ tons per day based on 120 deniers of yarn. The transparent paper section will have casting machines with an installed capacity of 7½ tons per day. The Directors are examining some other proposals too to diversify the activities of the Company. The Directors add that in spite of the efforts of the management, it has not been possible for the Company to obtain import licences for steel tubes project. In the meantime, in anticipation of the import licences provisional orders for machinery have already been placed by the Company. The Company has received permission for a plant to manufacture 30,000 tons of spun pipe per annum. The import licences for this project too are being awaited.

During the year under review the Company made a net profit of Rs. 81.81 lakhs after making a provision for depreciation, development rebate and contingency reserve etc. A sum of Rs. 51 lakhs has been transferred to general reserve. The Directors have decided to pay dividends on 16 lakh ordinary shares of Rs. 10 each at the rate of 12 per cent gross which comes to 8.4 per cent net. This will absorb Rs. 19.20 lakhs.

The Directors have pointed out that the cost of production which was already quite high further increased due to increased wages and other amenities of workers, higher prices of stores, fuel coal etc. In this connection they have pointed that the Company experienced a serious shortage of power supply as a result of break down in the generation stations of the Calcutta Electric Supply Corporation. The output of the Company suffered during the months of March, April and May this year. The position nevertheless is now more or less normal.

The spinning plant of Bharat Kala Bhandar Ltd., a 100 per cent subsidiary of the Company, is expected to go into production before the middle of 1962.

BENGAL PAPER

During 1960, the Bengal Paper Mills Company Ltd. worked quite smoothly and its output increased from

15,927 tons in 1959 to 18,105 tons during 1960. The Directors have reported that the expansion and modernisation scheme of the Company to increase its production to 100 tons per day is making satisfactory progress. During the year the Brown Stock Washing Plant was put into commission and in the current year a Re-causticizing Plant, a Water Clarification Plant and other machines also started functioning. These plants which have been installed at a cost of Rs. 36 lakhs approximately have resulted in reducing the loss in washing and better caustic recovery. Orders for a new paper machine of latest design have already been placed with Messrs. Walmsleys (Bury) Limited of England, shipment of which is expected to commence from the second half of 1962. Negotiations for the purchase of machinery from U.S.A. for which Import Licence has already been received, are also in advanced stage and orders will be finalised as soon as approval of the Development Loan Fund, U.S.A. is received to the Dollar Loan Application made through and sanctioned by the Industrial Finance Corporation of India. The Directors are considering to raise fresh capital for modernisation and expansion of the Company.

The profit for the year was Rs. 50.83 lakhs. After providing for depreciation and taxation, the Board of Directors transferred Rs. 10,000 to capital reserve, Rs. 4 lakhs to general reserve and Rs. 4.69 lakhs to development rebate reserve. Dividend proposed to be paid on ordinary shares at the rate of 32 per cent will absorb Rs. 14.4 lakhs.

HONGKONG BANK GROUP INTERIM DIVIDEND

The Hongkong and Shanghai Banking Corporation has declared an interim dividend of £5 a share on its paid-up capital of 3,161,845 shares (£4,940,383). This interim dividend is a distribution of £790,461 and is unchanged from that declared in July 1960. The Hongkong and Shanghai Banking Corporation is the parent Company in a group comprising the Mercantile Bank Ltd. and The British Bank of the Middle East.

UNITED WIRE ROPES

Besides the production of wire ropes (black and galvanised) with a rated capacity of 3,600 tons per annum, the United Wire Rope Limited has also a programme for the manufacture of 2,100 tons per annum of Stranded Wire and 3 mm Wire — special categories of high tensile steel wire — which are widely in use for prestressed concrete construction all over Europe and in some of the advanced Asian countries. The Company will be able not only to cater to the needs of the Indian market where the prestressed method of concrete construction is being increasingly adopted, but also hopes to export its product with the assistance of its collaborators, Messrs. Lepage Consulting Engineers of Antwerp, who are themselves established exporters of wires and allied products. The Company's collaborators have finalised plans for the machinery layout and details of furnace placed for machinery and capital equipment to be imported from the United Kingdom, France, West Germany and Belgium. It may be mentioned that each item of machinery selected for installation at the Company's factory is of the latest type.

Company Meeting

TATA ENGINEERING & LOCOMOTIVE CO., LTD.

STATEMENT OF THE CHAIRMAN, SHRI J.R.D. TATA

The following is the statement of Shri J. R. D. Tata, Chairman of Tata Engineering & Locomotive Co. Ltd. for the year 1960-61:

The year that has passed has been a good one for this Company. As shareholders will see from the attached Report and Accounts, we made all round progress in production, in sales and in profits.

2. The Company's performance in the past year has brought substantial benefits to many sectors of the economy. The rail and road transport industries were provided with Rs. 33 crores worth of Indian made transport equipment of the highest quality and performance; 13,000 men and women were provided direct employment and earned from us over Rs. 4 crores in wages and bonuses. The Company paid Rs. 7.7 crores in taxes and duties.

3. Ordinary shareholders, assuming they approve of the Directors' recommendation, will have received Rs. 1.16 crores as dividends and added Rs. 3.92 crores to their assets.

4. In addition to the above benefits, which can be expressed in money terms, we made intangible, but not less real, contributions to the nation's economic development: for instance, in the training and additional experience imparted to our staff at various levels, in the continued building up of the managerial and technological skills of our organisation: in the stimulus which our operations will have given to the development of ancillary industries and to road transport.

5. The results we have achieved and the manner in which we have conducted our affairs in the past year demonstrate what private enterprise, properly organised and financed and given the necessary scope for initiative, can do for the country in its plans of industrial development.

6. It should be noted that it took the Company some fifteen years of hard work to achieve its present stage of maturity and efficiency. There is a tendency in our country to believe that the establishment of new industries requires little more than the provision of the necessary buildings, plant and equipment, and to criticise the lack of immediate results. We have ourselves had our share of such criticism. Enterprises such as ours are not, however, made up merely of buildings and machines. There are the mere bones of industry; the flesh, muscles, blood and nerves essential to productive effort, which in industry are represented by materials and money, management and staff, take nearly as long to build up as it takes for a child to develop into a grown and productive human being. Productivity and efficiency can be achieved only step by step with sustained hard work, relentless attention to details and insistence on the highest standards of quality and performance. I trust that this important aspect of industrial growth will not be ignored in the implementation of the great plans of industrial development on which the country has embarked.

7. Now that the Company has reached maturity, by which I mean not only the ability to pay its way but also the capacity for self sustaining growth, I would like to thank the shareholders for their support and continued confidence during the ten weary years they waited for a dividend. When so much is so often said with so little understanding about the inadequacies of private enterprise and the inequities of the profit motive, I trust the record of this Company will not be overlooked nor the fact that its shareholders and management bore with patience this long period of waiting for some return on their investment of money and effort.

8. I would, on your behalf, also like to thank all those responsible for the Company's progress over these past fifteen years; our workers and staff at Jamshedpur and elsewhere for the skills and productivity they have acquired (I am glad that they are now getting tangible evidence of the value of the training and experience they have been given in the Company's employment and the opportunities available to them for advancement and higher standards of life); the supervisory staff, and particularly the higher echelons of management, for the unremitting and at times thankless work they have put in; our past General Managers who laid the foundations for the present progress of the Company; Mr. da Costa, our present General Manager; Mr. Stoehr, head of our Automobile Division, who has been mainly responsible for building up this Division to its present high state of efficiency and productivity; Mr. Broacha, head of our construction and engineering activities; and finally our technical associates, Messrs Daimler-Benz, Krauss-Maffei, Henricot, Harnischfeger, and Johnsons for their invaluable assistance in our various projects.

9. Our thanks are also due in no small measure to the Ministry of Commerce and Industry, particularly the Development Wing of the Ministry, for their realistic and constructive policies and sound decisions on the problems of the Automobile Industry.

10. Very much against his own wish, I must also mention my colleague, Mr. Moolgaokar, Director-in-Charge of the Company, who, through the dedicated application of his outstanding technical and managerial talents and an immense capacity for work, has contributed more than any other single person to the growth, efficiency and success of the Company.

PROFITS AND APPROPRIATIONS

11. As you will see from the Directors' Report and Accounts, the gross profits accruing from the past year's operations were Rs. 110.44 lakhs higher than in the previous year. After providing an additional Rs. 19.33 lakhs for depreciation, Rs. 30.84 lakhs for development rebate reserve, and Rs. 28.93 lakhs for taxation, the Directors were able to recommend an increase of 16 per cent over the previous year in the rate of distribution on ordinary shares which, if approved by you,

will be Rs. 14.50 gross or Rs. 10.15 tax-free per share, subject to tax relief under Section 15C of the Income Tax Act. In order to ensure that the shareholders obtain the full benefit of such relief, a part of the dividends on ordinary shares will be paid out of the undistributed balance of 15C profits earned in previous years and the whole of such 15C profits earned in the year under report. As a result of this treatment of appropriations and dividends, the tax on dividends borne by the shareholders will be reduced from 30 per cent to 21.9 per cent, subject to finalization by the Income Tax authorities.

AUTOMOBILE DIVISION

12. As in the past year, the operations of the Automobile Division produced the bulk of our revenues and profits. Tata-Mercedes-Benz vehicles have maintained and in fact further enhanced their leadership in the industry, and the demand for our vehicles continues greatly to exceed our capacity to produce them even after expanding our output to 1,000 units a month. I mentioned to you last year, that in order to meet this unsatisfied demand, we have decided to embark on a further scheme of expansion of our capacity intended to double once again our rate of output. I am glad to report that our proposals have been approved by the Government of India and that the necessary initial steps have already been taken to implement this important project which is estimated to cost about Rs. 18 crores, including its share of the expansion of capacity for castings, forging and other components. It is planned to complete the programme over a period of about three and a half years during which production and the percentage of indigenous content will be progressively increased each year.

13. In my statement last year, I discussed at some length the project for an economy car in regard to which we had put forward to Government proposals for the manufacture of the DKW-Junior under licence from Messrs. Auto-Union, an associate company of Messrs. Daimler-Benz. Nothing has come of this scheme nor is it likely to materialise in the future as the Government of India seem to have decided, on grounds which are yet to be justified publicly, to manufacture such a car themselves. It remains to be seen whether the public will in due course get from the Government project a good, durable and economical small car at a price anywhere near Rs. 5,000 or Rs. 5,500 as indicated by Government.

LOCOMOTIVES

14. On the expiry of the sixteen years agreement between the Railway Board and the Company in May, 1961, the Railway Board's obligation to place regular orders for locomotives on the Company, and the Company's obligation to supply them, have come to an end. Although this agreement caused headache to both sides and brought us hardly any profit, we may be grateful for the part it played in enabling the Company to come into existence and to create the initial industrial base from which we developed into other more profitable fields making possible our subsequent progress. We are grateful to the Railway Board for the support extended to us during the last sixteen years.

15. Although we are no longer obliged to supply locomotives to the Railway Board, we have readily agreed to meet their further requirements on an *ad hoc* basis and have received orders for the supply of about sixty-five locomotives a year on an average for the next five years, at a price which, while yielding us only a very small profit will enable the country to

secure its requirements of metre-gauge steam locomotives more cheaply than, we believe, the Railways could secure from any other source.

TATA-P & H EXCAVATORS

16. Since I reported to you last year, the project for the manufacture of excavators and similar equipment under licence from Messrs. Harnischfeger of Milwaukee, U.S.A., has got into its stride and is being energetically pursued. Subject to the availability of foreign exchange, the shortage of which, incidentally, was responsible for delaying the start of the project, we shall be in regular production of these heavy machines essential to the mining, heavy construction and other industries. An initial batch of twenty 2½ cubic yard power shovels has been put into production. Although, naturally, the number of units manufactured initially will be relatively small, I believe that the Tata-P & H power shovels, cranes and similar machines will establish for themselves the same high reputation for performance and quality as has characterised our Tata-Mercedes-Benz trucks and buses.

MANUFACTURE OF PLANT AND EQUIPMENT

17. An important activity of the Company which has grown considerably in the last year and which is not specifically reflected in the Directors' Report or Accounts, is the increasing extent to which we have been making plant and equipment for our own use. Amongst such items may be mentioned special machine tools, materials handling equipment, presses, furnaces, cranes, etc. This development is of great value, both to ourselves and to the country. It assists development of design talent, enables expansion activities to be better co-ordinated, and not only reduces capital expenditure but also saves a good deal of foreign exchange of which, as you know, there is a critical dearth today.

18. I have little further to add to the Directors' Report and the annexed Accounts which give a clear picture of our operations during the past year. We can, I think, view the future with sober confidence in our ability to surmount such obstacles and difficulties as we may find on our road to further growth and achievement. I can safely assure you that with the equipment, the financial and human resources, the knowledge and experience now at our disposal, and given reasonable freedom of initiative and action, we should do at least as well, if not better than any similarly placed enterprise in the country, and in the process satisfy some of the most vital needs of the country as well as the legitimate aspirations of the shareholders.

19. In closing, I wish on behalf of the Directors and yourselves, to refer to the great loss suffered by the Company, the industrial and business community, and the country as a whole by the death of Sir Purshotamdas Thakurdas on the 4th July, 1961. A man of outstanding intellect and ability and unrivalled experience of business and industry, Sir Purshotamdas has rendered valuable services to the Company of which he had been a Director since its inception.

20. The Directors have placed on record their sorrow at the passing of Sir Purshotamdas, and I am sure you will wish to join them in conveying our deepest condolences to Lady Thakurdas and other members of the family.

J. R. D. TATA
Chairman

BOMBAY, 6th July, 1961

COMMODITY NEWS AND NOTES

TRADING IN JUTE GOODS

With continued favourable weather conditions, the next season's jute crop is reported to have made very satisfactory progress, and consequently the prices of jute and jute goods have been gradually receding since May 1961 from the extremely high levels prevailing earlier this season. In view of the easier conditions ruling in the markets, and the prospects of an early return to normal price levels next season, the Forward Markets Commission recently concurred in the resumption of hedge trading in jute and jute goods with effect from June 15, 1961. As a further step in restoring normal trading conditions in the jute market the Forward Markets Commission has, with effect from June 13, 1961, withdrawn its orders issued in November 1960 imposing special margins on purchases of raw jute and certain standard constructions of jute goods on transferable specific delivery contracts. The Commission has also withdrawn the restrictions imposed in November 1960 on the number of transfers of pucca delivery orders issued against transferable specific delivery contracts in certain standard constructions of jute goods. The Commission has, however, directed the East India Jute and Hessian Exchange Ltd., Calcutta to continue in force the procedure of registration of transferable specific delivery contracts and the submission of trading returns in these contracts by members of the Exchange.

FOUR VARIETIES OF HYBRID MAIZE SELECTED FOR SEED PRODUCTION

Four varieties of hybrid maize have been selected for large-scale seed production as a result of research carried out under the Co-ordinated Maize Breeding Scheme of the Indian Council of Agricultural Research, New Delhi. These hybrids, which possess flint type of grain very similar to those of local varieties grown in India are likely to be readily acceptable to the maize growers and the consumers. Of these, the Ganga Hybrid Makka No. 1 has given a per acre yield of 2,141 pounds in large-scale sowings made in rabi 1960-61. This variety has been found adaptable in the maize-growing areas in the plains of the Punjab, U.P., Bihar and West Bengal. The Ganga Hybrid Makka No. 101, which has yielded, 3,288 pounds, has been found suitable for the maize-growing areas in the plains of the Punjab, U.P., Bihar, West Bengal and north Madhya Pradesh. With a yield per acre of 3,942 pounds, the Ranjit Hybrid Makka has been found suitable for Rajasthan, Gujarat and Maharashtra. The fourth variety, the Deccan Hybrid, has yielded 4,365 pounds per acre and the areas for its adaptation are Peninsular India, including Andhra Pradesh, Mysore and the southern parts of Madhya Pradesh. Intensive research is being carried out for the selection of a suitable hybrid for the Himalayan region.

STABILISATION FUNDS FOR BASIC PRODUCTS

Creation of a revolving fund to help stabilise prices of Latin American basic products, including coffee,

copper, sugar and tin, has been urged by a study group headed by Senor Earnesto Fernandez Hurtado, manager of the Bank of Mexico and Senor Feliz Ruiz of the Central Bank of Chile. The plan could be carried out over the next few years with a fund of about \$900 million, the group considers. The recommendations were contained in a report to the Inter-American Economic and Social Conference, opening in Uruguay on August 5. The group believes help could be expected from the U.S., Canada, Western Europe, Japan and other nations. Latin American countries would be expected to contribute to the fund when conditions were good. Money from the fund would be used on a loan basis.

U.S. MAIZE FORECAST

A major change in the monthly production forecasts of 1961 maize crop was announced recently by the U.S. Agriculture Department. From now on the estimates will only include maize to be harvested for grain. The change will eliminate estimates of silage and forage maize, which have been included in estimates of maize for all purposes in previous years. The change is being made, officials explain, because farmers and grain dealers are interested chiefly in grain that moves off the farm to market, or is placed under government loan.

COTTON AND WOOL HOSIERY FABRICS

The Government of India have decided to grant import entitlements against exports of mixed hosiery fabrics made out of cotton and wool to the extent of 15 per cent of the f.o.b. value of such exports. A public notice issued in this connection says that the entitlements will be valid for the import of coal tar dyes, textile chemicals etc, zip fasteners, elastic tapes and trimmings for the use in the making of hosiery fabrics, knitting machines for hosiery fabrics, their accessories and knitting needles, which are not indigenously available. Items like zip fasteners, elastic tapes, knitting machines and accessories and knitting needles will be licensed only to manufacturer-exporters of hosiery fabrics. It has been further laid down that in the case of zip fasteners, elastic tapes and trimmings for use in the making of hosiery fabrics, the value of import licences in respect of any one of these articles will be limited to 5 per cent of the entitlement value. Exporters and manufacturer-exporters of hosiery fabrics, importing coal tar dyes, textile chemicals etc., under this scheme will be required to sell the imported articles to any unit of the textile industry. The manufacturer-exporters of hosiery fabrics should in the first instance register themselves with the Textile Commissioner; only exports effected by registered manufacturer-exporters of hosiery fabrics will qualify for receiving import entitlements under the scheme. The licencing authority will be Joint Chief Controller of Imports and Exports, Bombay, on certification by the Textile Commissioner of the value of the import entitlement. Licences will be granted once in a quarter on the basis of exports effected in the preceding quarter.

WILL INDIA SUFFER IF BRITAIN JOINS THE COMMON MARKET?

UNDERTAKINGS LICENSED FOR MANUFACTURE OF SUGAR MILL MACHINERY AND EQUIPMENT
(As on March 1, 1961)

Name of Firm	Location of Unit	Item of Plant/machinery licensed for	Annual licensed/ approved capacity (Rs. lakhs)	Name of collaborator, if any
1. Walchandnagar Industries Ltd., Poona	Walchandnagar (Poona)	General items of sugar mill m/c milling plants	200.0	Skoda
		Gears & equipments)	160.0	
		2 Complete plants)	360.0	
2. Texmaco, Belgharia (W. Bengal)	Belgharia	Complete sugar mill plants except centrifugals	160.0	Stork Werkspoor, Holland
3. Indian Sugar & General Engg. Co. Ltd., Ambala	Yamunanagar	-do-	160.0	A.F. Craig, Glasgow.
4. Binny's Engg. Works Ltd., Madras	Madras	2 complete sugar mill plants except centrifugals	160.0	Mirrless Watson Co. Ltd., Glasgow.
5. K. C. P. Ltd., Madras	Madras	2 complete sugar plants	160.0	Fives Cail Ltd., France.
6. New India Development Corporation Ltd., Pimpri	Pimpri	2 complete plants including centrifugals		Buckau Wolf, West Germany.
7. Port Engg. Works, Calcutta	Calcutta	General items of sugar mill m/c like vacuum pans, evaporators, etc. & centrifugals	60.0	Watson Laidlaw, Glasgow.
8. Berry Bros., Calcutta	Calcutta	General items	50.0	
9. Saran Engg. Works, Marhowrah (Bihar)	Marhowrah	General items of sugar mill m/c	20.0	Nil
10. Arthur Butler & Co., Calcutta	Muzzafarpore (Bihar)	General item	30.0	Nil
11. R. R. Engg. Co., Bareilly (U.P.)	Bareilly	General item	3.0	Nil
12. Saharanpur Engg. Works, Saharanpur (U.P.)	Saharanpur	General item	5.0	Nil
13. Richardson & Cruddas, Bombay.	Saharanpur	General items	25.0	Nil
14. Garlick & Co., Bombay.	Byculla	General items of sugar mill machinery	10.0	
15. Rai Bahadur Lachman Das Sugar & General Mills Ltd., Lucknow.	Bombay	General items and vacuum filters	10.0	Dorr-Oliver, USA
16. Andhra Sugars Ltd., Tanuku (A.P.)	Jarwal Road	General items of sugar mill m/c	20.0	
17. Ramkola Sugar Mills Co. Ltd.			Against orders	
18. Ganesh Dass Ramgopal & Sons, Lucknow.	Tanuku	General items	5.0	
19. Rajkumar Mills Ltd., Indore.			Against orders	
20. Ravalgaon Sugar Firms Ltd., Maharashtra.	Ramkola	General items	10.0	
21. Vijay Steel & Genl. Mills Co. Ltd., Phagwara.			Against orders	
22. Chitram & Co., Madras.	Lucknow	General items of sugar mill m/c	1.0	
23. Trwani Engg. Works Ltd., New Delhi.	Indore	-do-	2.0	
24. W. H. Brady & Paral Co., Bombay.	Ravalgaon	General items of sugar mill m/c Sugar graders & surplus valves	10.0	
	Phagwara	Mostly castings	1.0	
	Madras	Mostly structural items	1.0	
	Naini (Allahabad)	Sugar mill plants, mill gears, engines and turbines and centrifugal	150.0	Booker's Engg. (Holdings) Ltd., London.
	Bombay	General items of sugar mill m/c	2.0	Nil

**SMARTNESS
THAT MATTERS...**

"Clothes make the man" says the age-old Proverb. They not only impart smartness but also give that air of self-confidence to a man which is so necessary in all walks of life.

DIGJAM
WOOLLENS

stand in the forefront of today's finest Woollens and run the gamut of good taste.

**Shree Digvijaya
Woollen Mills Ltd.,
Jamnagar**

DVMPS-55

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

THE SETTING UP AND TRAINING OF THE
CLIENT'S OWN INDUSTRIAL
ENGINEERING DEPARTMENT

MARKET RESEARCH

PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES

TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

IBCON PRIVATE LIMITED

2, FAIRLIE PLACE
CALCUTTA 1.

HEAD OFFICE: ADELPHI,

U.K., PAKISTAN, BURMA, IRAQ, CHILE, ARGENTINA,
BRAZIL, MEXICO, AUSTRALIA, HONG KONG.

OF THE

The Eastern Economist

JULY 28, 1961.

Accent on Accelerated Growth

THE Economic Survey of Europe in 1960 has lit a fire which will not be put out for many years. In a comprehensive review of the growth of European economies, it has found opportunities to point to the widening gap between the developing countries of Europe and the underdeveloped countries and even to outline a policy for correction. But the important lesson is really to be found in the juxtaposition of the growth patterns of what are described as industrial economies and underdeveloped economies in the non-Communist world, both in the World and European Surveys. One of these is so revealing that it deserves repetition in full. It is true the story from 1950 to 1959 is not complete and, for India at least, 1960

has given us a much more favourable figure. Nevertheless, even if our average rate of growth were raised to 4 per cent over the decade, India would still be at the bottom of this group, below Portugal and only surpassing Egypt and Argentina. It is right that Mr. S. P. Jain, President of the Indian Chamber, Calcutta, should have raised the question in a challenging form in his presidential address at the first quarterly general meeting last Friday. Mr. Jain asked the Federation of Indian Chambers of Commerce and Industry and the Planning Commission to address themselves to the challenge of our slow rate of economic growth. This is much more than a problem for businessmen and the Government; it

GROWTH PATTERNS IN OUTPUT, GROSS CAPITAL FORMATION AND NET SAVINGS, 1950 TO 1959

is a challenge directed to all thinking persons in an age in which economic growth has acquired, properly, topmost priority.

It is to be noted that the current debate is not related to the slow rate of growths of free economies against those propelled by the forces of Communist teaching. There is, in fact, quite a substantial amount in the Economic Commission for Europe's Economic Survey of Europe in 1960 which shows that the Communist countries are not doing so well as is currently believed in the Indian Union. Soviet agriculture has stagnated for two years and a Special Article in the current issue sets out the tables from which one can judge progress in the largest of the Communist countries. It is obvious, whatever might be happening in terms of Soviet Industry, that the rate of overall economic progress in the Soviet Union is not higher than in the free economies. However this may be, the fact remains that both in Eastern Europe and in Western Europe there are now operating both technological and human factors, which have changed entirely the pattern of slow and stately development and have made possible, in advanced economies, rates of development substantially higher than those reached over the long haul. Most European countries now anticipate levels of growth of between 5 and 7 per cent notwithstanding their current advanced position. The crisis in psychology, both in the U.S.A. and the U.K. today, is connected with the dissatisfaction widely prevalent in both countries at the fact that they have abandoned themselves over the last decade to rates of growth between 2 and 3 per cent. The challenge everywhere, therefore, is for a recognition that even a wide industrial base is no justification for a rate of rise less than 4 per cent. In the case of the underdeveloped countries, the figure should be between 7 and 8 per cent. This is both technologically and humanly possible elsewhere. Why, it should be asked, are we still at the bottom of the Free World list and powerless to raise our targets to the level of our needs?

A vast amount of literature outside the classic report of the Economic Survey of Europe in 1960 is now accumulating on the point that while economists have for many years been unable to place their finger on the essential characteristics of

growthmanship — to use Colin Clark's appropriate term — great growthmanship is patently visible in Europe today. Prof. Galbraith did well to point out that the growthmanship was by no means a matter of rule of thumb or, indeed, a list of principles. It was basically a matter of adapting experience changing over time to the changing circumstances of each country. Nevertheless, there is enough experience to suggest that India's Plans have been conceived too conservatively in the light of this experience of Europe in 1960. What are the insuperable bars for India in raising the rate of growth, saving, employment and, necessarily, external trade?

Currently the issue is not one of method as of conviction. What is needed at the present time is a recognition that we have erred in diffidence, even in the Third Plan. The example of Italy — well set out in the piece "A Real Leap Forward" by our West European Correspondent in the issue of July 7, 1961 — is as suggestive as any other. Italy is not enormously endowed with natural resources. She is not the first of the industrial nations technologically or in terms of skilled labour. Nevertheless, she has maintained over the last decade, at constant prices, per capita rate of advance of about 6 per cent per year. How has this come about? It has been by the application of known techniques in backward areas no less than in the industrial North. Again the whole subject of economic development, which has swayed violently with the fortunes of particular countries in particular years, is now seen in a new light. The Free World is again overtaking the Communist world. It is much more a matter of application of certain technologies in an ordered and predictable way. If the current sense of dissatisfaction with India's rate of growth exposed in the World Economic Survey and the Economic Survey for Europe in 1960 leads to a determination to revise the Plan and to impart a new dynamism into its implementation, no one need regret that the Plan, to be placed before Parliament on August 7, will have proved partially out of date before its presentation. There is no greater sign of dynamism than that we should decline at the outset to be kept within limits unworthy of our place in the contemporary world.

Blunder over Bizerta

NO two States and their heads could seemingly have had better friendly relations and understanding of each other than France and Tunisia and President de Gaulle and President Bourguiba. Ever since Tunisia achieved independence in 1955, relations between the two countries have been cordial, being based on full co-operation and a realisation of its uninterrupted continuance. This makes the battle of Bizerta all the more tragic. Undoubtedly errors have been committed over Bizerta by both States. It is quite obscure from all available reports what immediate provocation there was for President Bourguiba, consistently known for his great sense of moderation, to force the issue of the evacuation of the French navy and the supporting air and land forces from Bizerta. At any rate, he chose a most unfortunate moment for precipitating this issue.

The talks with the Algerians at Evian are being resumed after a long break and not a little diplomacy went between the two sides before resumption could be agreed upon. This was hardly the best time to insist upon an immediate settlement of the question of evacuation as France

could not be expected to agree to it, knowing full well that any such agreement would seriously impair her position in the negotiations at Evian. Mr. Bourguiba further complicated his position by pressing upon President de Gaulle the Tunisian claim over part of Sahara. This claim brings Tunisia into direct clash with Algeria which insists upon a package deal over Algerian independence and settlement of the Sahara issue. Actually the FLN has issued a warning to President Bourguiba that any settlement he would make with France in respect of sovereignty over any part of Sahara would not be binding upon the future Government of sovereign Algeria.

There is, of course, the error of French ways also to be taken into due account. Tunisian national pride was deeply injured and President Bourguiba was placed in an embarrassing position by the ruthless French bombing of the Sakiet Sidi Youssef area of Tunisia in pursuit of Algerian rebels, suspected to have sought refuge there, in 1958. Franco-Tunisian relations came under strain and it was in this year that active correspondence was started by President Bourguiba for

the evacuation of the French forces from Bizerta. This correspondence added to the bitterness of relations. France was in no hurry to expedite the solution of this question. Early in the second week of this month, President Bourguiba again addressed a letter to President de Gaulle asking for nothing more than acceptance of the principle of evacuation, but the French response was not in the least encouraging. If it is argued that forcing the issue of evacuation right on the eve of the resumption of the Algerian negotiations was ill-timed, it is arguable with equal force that it was a great error of judgment on the part of President de Gaulle not to accept such a mild proposal as acceptance of the principle of the evacuation which was indisputable. With the fund of goodwill and understanding between the two sides, the crucial question of the schedule of evacuation could have been held over until the Algerian tangle was resolved.

France's legal right to hold the Bizerta base could not be controverted, but, likewise, the sovereignty of Tunisia over the Bizerta base also could not be controverted. Knowing the highly sensitive nationalist feelings in Africa at this juncture, the least that was expected of France was to respect Tunisian sovereignty over the naval base. But the French authorities on the spot paid

scant regard to this right and their attitude was not rectified by the home government. President Bourguiba had a legitimate grievance over the extension of the runway at Bizerta without his consent, which meant an overt affront to Tunisian sovereignty. It was not only that. It aroused the suspicions about preparation to land air force in large numbers, if need be.

If the blockade clamped by Tunisia was a grave blunder committed by her, the ruthlessness with which bombardment and destruction of life were rained by France on Tunisia was a blunder of equal, if not greater, gravity. The reference of the issue to the Security Council is bound to take its normal course, but the wisest way for both the sides would be to come to an agreement on this thorny question of vacating the base. The argument of the sensitivity of the French navy is matched by the argument of the sensitivity of the nationalist feeling in Tunisia. A long view ought to be taken of this question inasmuch as retention of a base in the midst of a hostile surrounding would serve no purpose. On the contrary, it would complicate France's task of safeguarding her oil interests in Sahara, when the question of the transfer of sovereignty over it comes to be settled with African countries, as it is bound to be at some future time.

Double Standard

MR. SHANTILAL SHAH, Labour Minister of Maharashtra, urged the workers in a speech at Ujjain not to press for bonus as their right in the public sector undertakings. The reason given for this advice was that profits from the public sector undertakings were ploughed back for the good of the entire nation. While the performance of a majority of the public sector undertakings has been extremely poor in the recent years and naturally does not allow much margin of profit, the question of bonus, therefore, does not arise because 'bonus' in this country has been closely linked with the sudden and unexpected profits of a particular industry. The Labour Ministers at the Centre as well as the States are never tired of exhorting the industrialists in the private sector to treat bonus as a deferred wage and freely distribute bonus to the workers whether the balance sheets of the units warrant such a distribution or not. It appears that the Labour Ministers in this country have two different standards for application to workers in the public and the private sectors.

The results of the financial working of the industrial establishments, whether in the private sector or the public sector, are governed by the same principles of accounting. The gross profits are distributed between the State and the shareholders according to an agreed formula. The private sector establishments also continue to plough back a sizable portion of the profits. If capital formation had not taken place in the private sector, the present high level of industrial activity could not have been achieved. Where then lies the difference between the industrial establishments in the two sectors? Why should a double standard be applied in the allocation of emoluments? Why should bonus be made a compulsory item of cost in a substantial majority of the private sector industries irrespective of their margin of profit, while the public sector should be exempted from it?

There is a strong belief in this country that the public sector undertakings are being run with

inefficient management, particularly in financial matters. There seem to be some inherent weaknesses in these undertakings and their financial results have indicated that the capital invested in them has not so far yielded a return even equivalent to the modest yield on bank deposits by way of interest. In view of this stark reality, the question of bonus perhaps in these public sector establishments does not arise because there are small or no surpluses to be distributed or ploughed back. There is no justification for withholding the application of this criterion to industries in the private sector. It is the rank discrimination of the double standard which militates against equitable treatment to the private sector.

The Third Five-Year Plan has, however, envisaged that a sum of Rs. 450 crores would be available from the public sector establishments during the five-year period for reinvestment in the expansion of the undertakings. Is it to safeguard this probable surplus which might emerge during the next five years that the Government takes the precaution to forewarn labour against its erosion through bonus payments and the same reasoning would apply to private industries unless a double standard is to be blatantly resorted to. Labour Ministers need to search their hearts — or is it conscience?—and evolve a national labour policy in regard to bonus based on non-discrimination, in particular, and one which may encourage the growth of both the sectors without giving any preferential treatment to the one over the other.

Can it be gainsaid that the two sectors are the limbs of the same economy? If internal resources of industry are to constitute a vital source of development finance, as they must, when pressures of planned expansion tend to make capital resources scarcer, and fresh equity investment is to be encouraged, the profit margin must be adequate to allow both dividend distribution and retention for re-investment. Priority can be given to bonus only at the risk of these imperatives.

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose 'KORES', when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

A DELHI DIARY

THE HIGH ROAD OR THE LOW ROAD?

THE week has been full of personal interest. I shall, however, refer here only to the dominant one, because I am pressed by what might be described as historical forces, to speak of Alfred Marshall's "high theme of economic progress". The dominant personal note this week has been the President Dr. Rajendra Prasad. His severe illness has engendered concern on a scale which is small measure of the extent to which he has enshrined himself in the minds of the Indian people. Some of the bulletins being issued are, to say the least, unnecessarily detailed in anatomical detail and perhaps the panel of doctors might choose a little more discretion in describing alimentary details. But at least they have taken account of public concern which last Saturday mounted to a high pitch. Now that the President has been pronounced out of danger, there has been a feeling of grateful relief. It seems now clear that the President will have to go very slow; there is general expectation that he will complete his term of office as he was desperately anxious to do. I will make no comment on the next President of the Indian Union, bearing in mind the misfortunes of those journalists who were rash enough to make prophecies on the last occasion!

I must return hastily to the theme of economic progress which has erupted — I can find no better word — all over the country and which, I see, has strongly invaded "The Eastern Economist" this week. Not intending to give place to the Editor, who has pronounced this week on the "low" rate of Indian economic progress, I must proclaim that I have long entertained the view that India's Plans, adequate as they seem to us, have always receded to background when I have returned from abroad. I have said as much in Delhi Diaries recently — two on Poland and one on Yugoslavia. I must return to Yugoslavia today because I think it best illustrates what can be done by the right management and the appropriate environment to jump the blocks.

AM I A TITOIST?

I must tarry, however, on a word on personal explanation. One of my journalist friends, seeing my enthusiasm for Yugoslavia a fortnight ago, stopped me abruptly the other day and asked me if I was a Titoist. I was so taken aback that I could not realise how the confusion had arisen. People forget that one can admire the tremendous achievements of Yugoslavia in the last few years and not necessarily accept her entire political fabric. But the truth happens to be — if I might so boldly state it — that the Yugoslavs themselves are not Titoists in the sense that Marshal Tito's views dominate thinking in Yugoslavia. One of the most extraordinary things that I have found in Yugoslavia is that almost no one refers to the Marshal. He is a beloved figure and his picture is everywhere. But every enterprise operates entirely on its own, and Belgrade is almost irrelevant to its operation — I was about to say as much as public opinion is to policy making in this country. The idea that Belgrade operates like Delhi will naturally prevail in the Indian Union, but it is the opposite of the truth. The suggestion that Marshal Tito exercises as much power in detail as Jawaharlal Nehru does in this country is totally false. The substance of Yugoslavia's economic progress is, in fact, the decentralisation of administration in a form which puts to shame our high democratic principles. In theory we are a democratic country and Yugoslavia looks like a dictatorship. In practice economic freedom inside every enterprise is far greater in Yugoslavia than it will ever be in the Indian Union. After this odious comparison let me talk more particularly about what I consider to be the three basic elements

in Yugoslavia's recent economic progress, which, as I said a fortnight ago, is likely, if continued as in the Plan, to set up the highest rate of economic progress that the world will have seen over a period of a decade.

THE TROIKA

It is fashionable to talk about the Troika in political affairs. In Nikita Khrushchev's language, of course, the Troika is the new Trojan horse by which anti-Communists, Communists and neutrals are held together in an international commission which eventually leaves everything as it was. But there is a great deal to be said for an economic Troika in which the great components of modern productive efficiency are allowed full play. I call them, for want of better words, Technology, Management and Participation. In my own (humble) opinion they explain far more of the Yugoslavian production miracle than they would in any comparable case of rapid economic progress of other relatively underdeveloped areas. On the last occasion when I was in Yugoslavia, I thought of technology largely in agricultural terms — the careful choice of Italian wheat, after combing the whole world for varieties and then acclimatising seed to Yugoslavian conditions; the selection of British cattle and the rejection of cover when the numbers became so large that they could not be housed under comparable conditions in Yugoslavia; the subsequent adaptation of feeding and shelter so that milk yields were higher than in Britain. I could multiply instances of this kind in industry where innovation in Yugoslavia has been remarkably swift and capital-saving. These are, however, real triumphs not so much of technology by itself as of Management Plus. And I can repeat the point that I made two weeks ago that Yugoslavia has managed somehow or other to compress the span of experience in its younger managers so that a man rises quickly in capacity in five years, accomplishing what in India would take fifteen years. Another point, namely, that managers should not be allowed to grow stale on their jobs, or lose the original challenge which belonged to the revolution, is well appreciated in Yugoslavia. In India, largely as a result of our traditional forms of management — the civil service in the public sector, and the managing agencies in the private sector — the opportunities for a constant ferment are seldom there. Am I right in suggesting that this leads to staleness not often recognised? The longer experience may well (heresy?) be in the event dearly bought.

Finally, and this is unique in Yugoslavia, is the problem of decentralised management associated with "crashing" individual incentives. From January 1, this year there is a new pattern of distribution of a product of industry, one feature of which is that provision is made out of profits for social obligations and State taxation before the Federal provision of 15 per cent (only!) of profits is made. The essence of the Yugoslavian principle is that the workman participates freely in a decision in regard to allocations for bonus (or enhanced wages) as well as for ploughing back. He is really a portion of management to the extent that he is party to a decision as to what is to be taken out and what is to be ploughed back. Whereas some time ago I took the view that technology was the major element in Yugoslavia's success and a fortnight ago I was talking about managers more than about other factors, I should now correct my heresy and say that the Troika—technology, management and participation—must be worked as a single instrument for total success. If this is being a Titoist, let me proclaim, answering my friend, that I am a Titoist in economics. I have still my reservations on ownership of enterprises. On this I enjoy the delightful conveniences of a split personality!

ARGUS.

THE WEEK'S NOTES

Berlin

PRONOUNCEMENTS WITHOUT SOLUTION

THE WESTERN POWERS' notes presented to Russia on July 17, in reply to the Russian note of June 4 on the settlement of the Berlin issue, reiterate their determination not to be pushed from their rightful position and to defend it against any possible assault. They have reaffirmed the fact that they are in positions of control in Berlin by virtue of the solemn agreement to which the three Western allies and Russia are signatories. International agreements cannot be altered at the option of any single party and no change in the present status of Berlin can be made except by unanimous agreement between the four signatories. The position so firmly taken up by the Western powers is fully vindicated by their legal rights. But if international problems and cold war controversies could be solved by legal arguments and assertion of legal rights, many other issues, like the Berlin question, would have long ceased to be dangerous sources of trouble threatening to push the world to the brink of war. The Western pronouncements are tantamount to a determination not to be bullied by threats, but they do not provide a solution to the Berlin issue. On the contrary, they carry a serious risk of a likely lapse into a situation which may create the possibility of war. This applies to the posture taken by the U.S. and Lord Home has uttered a note of caution where the developments may lead to.

But if Russia concludes a separate treaty with East Germany as a sovereign State, there is nothing in law which can enable the Western powers to prevent her from doing so. On their part they would be right in refusing to recognise the sovereign status of East Germany and that is all. This is a trump card in Mr. Khrushchev's hand and he has threatened to use it before the end of the current year. The Western powers' insistence on self-determination to the German people in deciding the issue of the reunification of Germany is politically and morally right. But the Kremlin has no intention of agreeing to free elections in East Germany and risk its strangle-hold on this State of its creation.

Mr. Khrushchev has taken care not to use any expression indicating that he would block the West's access routes to Berlin. If he concludes a separate treaty with East Germany, Russia will vacate her position in favour of the latter and the Western allies will be faced with a situation where they will need to negotiate the question of the access routes with East Germany. It is problematic how far the agreement on the routes to Berlin concluded between the Western allies and Russia will be honoured by East Germany. If no alternative is possible (airlift is there, but not a permanent one), the West may need to deal with East Germany on a de facto basis, but it cannot be driven to de jure recognition. Such a tight corner strategy will harden Western attitude and Russia will be unable to impose the proposal of a free city of Berlin on the three co-signatories. The pronouncements made by the two sides lead to a blind alley, where they will again find a war of nerves.

Flood Enquiry

SIGNIFICANCE OF THE POONA PROBE

MR. Y. B. CHAVAN, the Chief Minister of Maharashtra, has taken a forthright and courageous attitude in acceding to the public demand in the State for a probe into the cause of the collapse of the Panshet and Khadakvasala dams. The controversy essentially centres round the tragedy of the Panshet dam. Three main

issues have been raised in demanding the enquiry — the failure of the administrative machinery to give a warning of the coming disaster to the public, the consequences of advancing the completion of the dam at Panshet one year ahead of the target date of 1962 and the technical propriety of constructing an earthen dam in preference to masonry construction. There is no ground for a judicial enquiry as the State PSP has demanded.

The real case for a thorough probe into Panshet rests on technical reasons. The issue is of an all-India significance concerning the conditions in which it is technically safe, sound and desirable to construct earthen dams on big scales since they are relatively recent in this country. As far back as 1957, when the plan for Panshet was being drawn up, the Deccan Agricultural Association sent a deputation, consisting, among other experts, of retired Chief Engineers of high repute of the former Bombay State and a former Chief Conservator of Forests, to urge upon the State Government to revise its decision to construct an earthen dam. The plea was based on two reasons. The Deccan terrain was eminently suited for masonry construction for which ample quantities of stone, lime and sand were locally available and earth of the requisite suitability was not easily obtainable. Technically again, the second reason is vitally important. Giant earthen dams are not unknown, but the view is strongly held abroad that local soil is preferably acceptable as it answers the requirements of a firm mixing agent, imparting strength and resistance to the foundation as well as the superstructure. The deputation's advice was not heeded, one of the reasons being economy of about one crore of rupees in expenditure.

In appointing a former judge of the Bombay High Court to constitute the one-man Commission of Enquiry, Mr. Chavan has unwittingly given a handle to the critics, clamouring for a judicial probe, that the Commission's assignment assumes that complexion. What is really needed is a thorough examination of the suitability, justification and, above all, techniques of earth dams in different conditions in the all-India context. The issue ought not to be limited to Panshet alone. A high ranking official of the Central Water and Power Commission has already collected preliminary data in the course of his personal investigation at Panshet which are being processed. These can be used with profit by the Commission. But in view of the comprehensive significance of the issue, it is advisable to appoint engineering and other technical experts on the Commission, including also a foreign expert or experts in the theory and practice of the construction of earthen dams. The Commission's personnel should be enlarged for this purpose.

Iran

AFTER FIFTEEN MONTHS

FIFTEEN MONTHS after the great political shake-up of May 5, 1960, Iran finds herself in a state of complete stagnation. Dr. Amini's choice as Prime Minister had raised high hopes that the country would be provided with a clean administration and progressive economic policies which would mark a firm beginning of a new order. But when the plain truth of the situation is realised that Dr. Amini has been in office, but not in power, much of the explanation of the perpetuation of the political and economic stagnation is offered. The preliminary step to economic reform — dissolution of the concentration of ownership of land in the hands of a few families for redistribution — has been blocked by the resistance of the feudal forces, whose influence

could not be assailed over the years, much less during Dr. Amini's fifteen months of office. The Prime Minister now finds, with a painful sense of helplessness, that corruption is difficult to root out as the campaign for its eradication would implicate many in high positions in the army. Dr. Amini has little hold over the army to take stern action against erring officers, nor can he claim any effective control over the security forces and the police. Even in the Cabinet and the civil administration, the Shah has planted his nominees in strategic posts. Dr. Amini, bereft of party support (for he has none of his own) or control over the armed forces and the administration, invokes sympathy which an honest and well-intentioned man would in fighting a forlorn battle.

The National Front, which derives strength from the intelligentsia with leftist leanings, held its soul in patience until about two months ago to give the Premier a fair chance, unembarrassed by pressures of far-reaching reforms here and now. But this tacit understanding has given way. The recent ban imposed on the National Front's projected spectacular demonstration for immediate and radical reforms marks the beginning of a reluctant phase of repression. Relaxation in political restrictions, like strict control of the Press, has set the temper of quite a substantial section of the public in favour of non-alignment which means repudiation of partnership in Cento. These vociferous advocates of neutrality ignore the plain fact that Cento is the real defence for Iran against a threat to her security from across the frontier with neighbouring Azerbaijan. Dr. Amini has reaffirmed the policy of the existing security pacts, as indeed he could not do otherwise. Meantime, the empty treasury which he took over fifteen months ago remains virtually in the same condition. Attempts are being made to fill it with credits from the World Bank and West Germany. The really effective flow can come from American aid. Possibly the Kennedy administration may need proof of political stability assured by economic reform. So the vicious circle moves and stagnation threatens to make the situation below the surface explosive.

Minor Irrigation

CAPACITY AND UTILISATION

THE RECENTLY released report of the Programme Evaluation Organisation of the Planning Commission on minor irrigation works has apparently erred on the side of recording optimistic conclusions about the effective or actually available capacity and it has drawn unconvincing inferences about the magnitude of the gap between the capacity and its utilisation. It states that about 54 per cent of the irrigation potential of the minor works in the sample areas surveyed remained unutilized in the kharif crop of 1959-60, while under-utilisation in the case of the rabi crop of the same season was lower at 31 per cent. Obviously this gulf between utilisation and the irrigation potential is based on the estimate of the culturable command areas of the minor works, particularly the wells. To assume that a certain command area can be supplied with water by a given number of works with reference to their existing capacity is not the same thing as to demonstrate that the potential is actually available for exploitation to the owners or occupants of land within the command area. Where the works are owned by private landholders, as happens in the case of an overwhelming majority of them, the occupants in the command area cannot claim, as of right, the benefit of the water, assuming that they are willing to pay reasonable rates for its use.

This concept of capacity as related to the command area is no doubt theoretically sound, but it seems to ignore the reality of the situation in regard to the pos-

sibilities of effective use based on access as a matter of right to the adjacent landholders. That this is so is corroborated by an important finding in the report which highlights the fact that as many as 80 per cent of the respondents complained of inadequacy of water. The non-utilization of water from the existing works and its inadequacy of such a high order cannot go together. The obvious inconsistency between these two findings merits full explanation. The report records the finding that in the villages covered by the sample about 29 per cent of the net cultivated area can be served by minor irrigation works. This indicates an encouraging prospect for stepping up food production with the help of minor irrigation. But if the estimate is based on the concept of the culturable command area unrelated to access as a matter of right to owners or occupants in the area, it loses some of its practical force.

Students' Strike

CLOSURE OF OSMANIA UNIVERSITY

THE DRASTIC action taken by the authorities of the Osmania University in closing the colleges affiliated to it in Hyderabad and Secunderabad and the concurrent action taken by the high school authorities to close down the schools, as a measure to deal with the strike of the students, deserve to be welcomed for several considerations. So far as the students of the high schools are concerned, they were in no way concerned with the supposed cause of the strike and they had no reason to thrust themselves into the picture. The strike arose out of the enhancement of the tuition fees for different courses ranging between 10 per cent and 25 per cent in the Osmania University. The students went on strike for over a week in protest against the enhancement of the fees, but on being disillusioned that the authorities could not be cowed down by direct action, they began to indulge in most objectionable acts of violence, causing damage to the university buildings and smashing street lights.

The Osmania University's case stands in a class by itself and the entire conduct of the students from the start right to the point of the closure is totally indefensible and it has hardly anything to do with the issues involved in the broader national problem of student indiscipline. This University receives higher grants than the two other universities in Andhra State — the Andhra University and the Venketeshwara University and, furthermore, the fees at Osmania are exceptionally low. The gap of deficit in the budget of the University is widening year after year. In this situation the increase was inevitable and fully justified. In absolute terms, it cannot be considered as high. The parties who are really affected are not the students but their guardians, who have not raised even a faint voice of protest. There are further considerations which weaken the students' "cause". About one-third of them in the university receive monetary help through grants of scholarship or subsidised residence in the hostels. Above all, the increased fees were to be applicable to new entrants. It should be clear that the students have been irresponsibly misguided by the so-called leaders of their unions or associations and this leadership appears to be extraneous to the student world. Dragging high school students of tender age even without the semblance of any pretext in this affair corroborates this suspicion. The university and schools, of course, cannot be closed indefinitely. The initiative for reopening should come from the guardians who ought to exercise authority over their wards. If this does not happen on a sufficient scale, the majority who wants to resume their education must be given police protection to attend the courses and in that event severe action would need to be taken against the intransigent elements.

GOOD WORK AT BAD GODESBERG

From Our Special West European Correspondent

PARIS, July 22.

SEVEN months late, the political summit conference of the Six of the Common Market was held this week in Bad Godesberg, and approved a modified version of the plans for greater unity that President de Gaulle proposed over a year ago. The long delay required before agreement could be reached, and the repeated postponement of the summit meeting, were due to determined opposition (notably in Holland but in other quarters too) to the methods President de Gaulle suggested for extending co-operation beyond the purely economic sphere of the Common Market and the Coal and Steel Pool. This opposition, which was based on considerations of principle, was overcome only in extremis, and because of the seriousness of the Berlin crisis. A display of European disunity at the present moment, everyone realised, could have disastrous consequences, by leading Moscow to believe that the European democracies were so divided that they would not oppose its designs on Berlin. The West Germans in particular were so anxious for a demonstration of solidarity that they would have rallied to almost any scheme for unity, even if it were not the sort of European unity they preferred.

So the decisive step that was taken this week toward Continental unification was taken under stress, and some might think that this limits its significance. This seems to be confirmed by a reading of the communique, which contains a generous salad of all the different conceptions of One Europe. Its main idea is that regular meetings of heads of government will be held to discuss all European problems, and continuity between these meetings will be assured by a permanent commission. This is clearly what remains (and it is the most important part) of President de Gaulle's project for a confederal union of governments, distinct from the larger Western alliance and distinct too from the supranational embryo government they have set up in the administrations of Euratom, the Common Market and the Coal and Steel Pool. Yet the communique contains numerous favourable references to those administrations, to the Western alliance and even to the European Parliamentary Assembly, all of which are to be associated with the move to political unity.

The various sects of the One Europe religion—the federalists, the integrationists, the confederalists—would be hard put to say which path the Six chose at Bad Godesberg. The major question of the immediate future, whether or not Britain is to join the Six, was left untouched although there was an invitation to "other European nations" to join provided they were prepared to "assume in all domains the same responsibilities and the same obligations". In sum, the Six seem to have pressed blindly ahead along the road that leads in the general direction of unity, too afraid to stop at this moment of international crisis to argue about the finer points of their association. Far from being reason for skepticism about the solidity of their union, I think that this attitude is the only reasonable and profitable one. A united Europe will be built, if ever, not because everyone is satisfied with the paper plans for it, but because, at moments of crisis, it becomes clear that there is no practical alternative to pursuing unification by whatever means are available at the time.

The crisis which, for the time being, is the main stimulant to union—the Soviet threat to Berlin—is no isolated accident but an aspect of the situation that makes European unification vitally necessary, a situation that is already at least 13 years old and which will persist for several decades yet. Russian designs on West Berlin are one stage in a process that began with the subjection of East Germany, will be continued, if possible, with the incorporation of West Germany into the Soviet sphere and completed very easily thereafter by the destruction of democracy elsewhere on the Continent. By turning on the heat at Berlin, Mr Khrushchev has not simply provided a pretext for the Europeans to sink their doctrinal differences for the sake of an urgent need for increased unity; he has reminded them of the permanent threat that makes their unity inevitable.

The dangerous phase of the Berlin crisis may well be past by the end of this year, but no matter what form the settlement takes the permanent Soviet threat to West Europe will have become clearer. If the Allies are evinced from West Berlin, the Communists will begin the next stage of their advance: the seduction of West Germany, offering German re-unification in exchange for defection from the Western connection. If the Allies are still in a free West Berlin, Soviet pressure will have been relaxed only temporarily after the calling of their present bluff. If, finally, some negotiated compromise is the upshot, the Communists will soon be exploring to find which aspect of the deal has left the West most exposed (e.g. a recognition de jure of the East German puppet regime). In the improbable but conceivable eventuality of a general Russo-American agreement (both super-powers, unnerved by their experience on the brink, might decide to withdraw to a safe distance), the Six would be left to repair by their own unity the loss of American protection on this side of the Atlantic. On any hypothesis, the Six will be condemned to stumble along the path to unity sometimes snatching a pretext for further cohesion from the imminence of a temporary danger, as they did this week by the Rhine. This, after all, is the way nations have been built in the past, and it will dismay only authors of neat plans for unification according to a juridical formula. The countries of Europe would not be uniting if they did not live in a dangerous world and in a dangerous world the best laid plans "gang at agley". Precisely the same considerations apply, incidentally to the prospect of Britain joining the Continent, a question that is being considered seriously only under the lash of a recent deterioration in Britain's economic situation. Britain will never join the Common Market in calm, orderly fashion because where there is calm and order the need for such a decision will not appear.

The international crisis was no stranger either to the two other items on the agenda at Bad Godesberg this week: the relations of the Common Market with Africa, Latin America and, by implication, with all the under-developed countries. The creation of the European trade association poses problems for these countries, which will become more acute if Britain joins the Six. In so far as these problems are purely commercial, they are probably not very serious—and certainly not as terrible as some statements in India imply.

where Britain's membership of the Common Market has been described as a disaster for all developing economies. But in the context of the permanent Soviet threat to the democracies, these problems have a more than commercial interest; they raise the question of the aid Europe must provide to the poorer free nations if her flanks are to be protected from Soviet penetration. One sometimes hears resentment expressed about this confusion of aid for development with the anti-Communist strategic calculation, and indeed a narrow-minded bargain (butter for bases) can have disappointing economic results as well as insecure defence gains. Yet it is better to be clear on the fact that, were it not for the menace of Communism, the well-fed Europeans would be much more complacent than they are about a situation where 80 per cent of the world's goods belong to 15 per cent of its population. Development assistance has always been connected, in a more or less broadminded and generous spirit, with ultimate strategic objectives and probably always will be. Certainly this explains why the Common Market's responsibilities towards economies were discussed this week at a meeting dominated by the imminent Berlin crisis.

The substantial political agreement achieved at this meeting sets in perspective the economic difficulties that have arisen in the implementation of the Common Market. As is known, France has refused to go faster with tariff disarmament in the sphere of manufactures unless something decisive is done about writing a joint agricultural policy before the end of this year. There is no question of paralysing the Common Market; the normal 10 per cent reduction in tariffs demanded by the Rome treaty will take place in any case at the end of 1961. The dispute is about whether a supplementary 10 per cent should be knocked off import duties at that date, and this is important because it

would mean that duties had been halved since the venture started and so the Six were bound by the treaty to undertake a whole series of measures, called the second phase. No satisfaction can be given France on the agricultural problem until after the coming West German elections, because any move toward a joint policy would mean that West German farmers would have to accept the entry of cheaper French foodstuffs. This is something that a government whose mandate is about to expire has neither the electoral courage nor the moral right to impose. Since, however, it is virtually certain that the next German government will be the same as the one that opted for greater European unity this week, a decision favourable to continued rapid economic integration seems assured.

Writing last week before the summit of the Six, an Italian paper described the European Community, in an unlovely metaphor, as a creature with the body of an adult but the head of a foetus, meaning that its economic unification had progressed rapidly but was not governed by a coherent political organ. Since the acceptance of French plans for regular governmental meetings entails the appearance of a sort of confederal government, the Community's head has taken on more human shape. It is well that this has happened while the British are still trying to make up their minds about their relations with the Six, for now they have a clearer conception of what association with Europe will mean. There is no room now for any illusions about patching up a trade arrangement with the Six, which would secure as many commercial advantages as possible, avoid as many commercial losses as possible, while leaving the rest of British policy unchanged. The question is now not whether to join the six-nation trade club, but whether to adhere to the political entity that is taking form.

Notes from West Germany

CLOSER CO-OPERATION BETWEEN EUROPE & AFRICA

By DR. GABRIELE WULKER

A DECISIVE CONFERENCE

AN important conference of world-wide bearing recently took place in Strassbourg, the seat of the European Council. For the first time Members of Parliaments of the Six Common Market countries and of 15 African States plus Madagascar convened to discuss the future co-operation between Europe and Africa. This six days conference was held in an atmosphere of full confidence and sincerity. There was no destructive tension between ideologies, races or power blocs which very often paralyse international meetings such as those of the United Nations. Africans and Europeans were seated in alphabetical order. The chair was held in rotation between Europe and Africa.

HOW DID THIS CONFERENCE COME ABOUT?

Among the six member States of the Common Market, France and Belgium owned colonies in Africa, which have been liberated recently. Even after their liberation, these former colonies are associated members of the Common Market, a status which will officially expire by the end of 1962.

In view of this deadline, it became imperative to lay new grounds for the future co-operation. Previous to this assembly in Strassbourg, German deputies of the Bundestag had repeatedly contacted the African Governments to arouse their interest. The 16 African Governments, represented by their top-men, who were entitled to make binding statements, expressed their opinion that political authority presupposed economic independence. Their countries lack financial resources; their technical development is just beginning; they have no modern civilisation. Ninety per cent of African economy is based on agriculture at a time when agricultural problems are a world-wide issue. The African States cannot solve those problems by their own. They came to Strassbourg to explore whether the assistance needed would be granted on the basis of partnership with equal rights.

The Africans, who had come to Strassbourg with the fear that a new form of colonialism might be inherent, eventually expressed their full conviction that they were faced with a new chance of extending their markets and a new way for technical and economic assistance. All delegates from Europe and Africa based their future co-operation on self-determination and solidarity to the benefit of both sides.

UNION IN AFRICA NECESSARY

The will to create a common African market was another positive outcome of this conference. Africa is split up into an English speaking part and a French-speaking part. It is a fact that Africa is represented by one Joint Office for Africa at the United Nations. Yet, serious political controversies between parties, trade unions and organisations so far shook the Continent and inhibited a common African policy. In Strassbourg agreement was reached among the French-speaking Africans to forget about the different political theories and rather to find ways and means of an economic co-operation within Africa. This can be considered as a milestone on the way to a common African market. One of the Congolese representatives declared: "Our association with Europe must in the future consider all African countries. We are in the stage of industrialisation. The new industries need a consumer market in order to cope with competition. All African States will strive for a common market."

RESULTS OF THE CONFERENCE

It was stressed at this conference that association does not mean dependency. On the contrary, the freedom of the African States and of Madagascar shall be

strengthened. It is presupposed that the one-sided concentration of these economies on one or two raw materials and their export to the former colonial powers has to be replaced by their free access to the world market. This process of change will require a long time and it requires co-operation with the old industrial powers. During this period of transition the African partners should receive similar aid as they did during the time of their colonial dependence.

In order to avoid deterioration of their economic position after independence, the associated States will receive the same tax preferences such as were laid down in the Rome Treaty for the Common Market countries. The conference finally unanimously recommended that a minimum export rate of African goods based on fixed prices should be guaranteed. The European States are to cover the costs for the storage of tropical goods. Proposals were made to create a research institute for Africa and Madagascar to promote the economic co-operation and to co-ordinate planning. A fund will be established to finance the economic and social projects and above all to improve the educational level. On this occasion the following statement was made: "A country which is rich in natural resources but lacks skilled labour will be bound to poverty."

The African States have a longer way ahead towards development than India has. Their industrialization and systems of education are in the first stage of development. Africa has now made the first steps towards independence after a long term of colonial dependence.

The situation is aggravated by the considerable forces of disruption within the various African States and between the States. The Strassbourg conference, based on mutual confidence, has certainly contributed to the economic and political appeasement within Africa and between Africa and Europe.

Location of Refinery in Gujarat: The Oil and Natural Gas Commission has selected Koyali for location of the two million tons refinery to be set up in Gujarat in the public sector. Situated at a distance of 10 miles from Baroda main town, Koyali village is near Bajwa railway station and is very close to Mahi-sagar river. The Commission has also decided to acquire 2,000 acres of land for the plant and the township. A Site Selection Committee appointed in November 1960 has recommended two areas for location of the refinery and suggested that a Technical Site Selection Committee should go into the details and finally pin-point the site. The Technical Site Selection Committee, with which were associated five Russian specialists, recommended three other sites in Gujarat area including Koyali. They, however, did not make a final suggestion because additional data for water supply and sewage disposal had to be collected and certain other tests had to be made. The final selection has been made on the basis of additional technical information supplied by the Government of Gujarat.

Two Loans Being Repaid at Par: The outstanding balance of the 2½ per cent Government of India Loan 1961 and the 3 per cent Hyderabad Loan 1951-61 (H.E.H. the Nizam's Government 3 per cent O.S. Rupee Loan 1360-70F) is repayable at par on August 1, 1961, and no interest will accrue thereon from that date. As August 1, 1961 is a holiday in the State of Maharashtra, the repayment will be effected on July 31, 1961 by the Paying Offices in Maharashtra State. At other places, however, repayment will be effected on August 1, 1961. As already announced, the holders may tender their securities for conversion into 3½ per cent Bonds 1969 and/or 4 per cent Loan 1981. To facilitate repayment on the due date, the securities may be tendered at the Public Debt Office Treasury or branch of the State Bank of India/State Bank of Hyderabad/State Bank of Mysore, at which they are encased/registered for payment of interest on or after July 24, 1961. Full details of the procedure for conversion of the securities or obtaining their discharge value can be obtained on application at any of the above offices.

United Kingdom

More Steel From Cheaper Process of Using Coal: Britain's National Coal Board is helping the steel industry in a plan to introduce a more economical method of using coal in blast furnaces, Lord Robins, Chairman of the Board has disclosed. The new process, never before tried in the United Kingdom, could eventually replace at least 30 per cent of the coke used in furnaces and would have the advantages both of being cheaper and of making possible an increased output of steel. Lord Robins, speaking at the annual dinner of the Society of the Chemical Industry, said the new technique was to be tried out at the Stanton Iron Works Nottingham, towards the end of the year. This process will mean the steel industry will use not more coal but less, "but we regard it as our public duty to get the best we possibly can from the indigenous material beneath our feet." Speaking of dramatic changes likely in the coal industry, he said that in a few years' time the industry would have reached the stage where the

coal could be mined without a single man being employed on the coalface. "It seems to me that this is a very sound development. When this comes about science will have made not only a great economic contribution, it will have made a very great human and social contribution as well".

Fuel Ash Helps Reclaim British Marshes for Pasture Land: Useless marshes have been successfully reclaimed to form rich pasture land in the United Kingdom by means of fuel ash from a power station. The cementing properties of pulverized fuel ash from power stations have already been established. The ash is used in a number of ways, including construction material for dams, highways, embankments, power station foundations, and as a "filler" for roads. One of the latest examples of its versatility is in Flintshire, Wales, where a fertile field has been created from the marshes by means of ash from the nearby Connah Quay power station, which produces some 70,000 tons of fine ash each year. A mixture of water and ash was directed into a lagoon. The water was drained away through filters into the river, and ash, when it reached the rim of the lagoon, was ready for levelling, sowing, and cultivation.

The first experimental 40 acres have been used for arable and grazing purposes with conspicuous success. Grass and clover have grown richly, and sheep and lambs have thrived on the pasturage. Now cattle are to be introduced. The ground has also yielded good root crops, though so far cereals have not come up to standard. By October, another 57 acres will be reclaimed for farmland, and a further 70 acres are planned. Apart from land contribution, the scheme, which may be extended to other low-lying ground in Britain near power stations, helps to relieve the ash-disposal problem.

Electronic Instrument to Check Floor Levels: Minute changes of level in the reinforced concrete floor of a joint Protone Synchrotron now being completed at the Rutherford High Energy Laboratory, of the National Institute of Research in Nuclear Science, Harwell were periodically registered by a unique British measuring instrument. The measurements have been taken over a period of a year on a specially sited concrete pad in a subterranean chamber beneath the Proton Synchrotron. The instrument used to measure the floor level is an electronic level indicator consisting of a pendulum co-operating with transducers which provide an electrical displacement signal. This signal is amplified to feed a centre-zero metre graduated in angle and gradient. With suitable mechanical adaptation, the instrument can be used to measure vertically or angles. Periodic measurements taken beneath Nimrod, weighing 7,000 tons, with the 'Talyvel' have indicated no great change in levels of the Nimrod foundations.

U.S.S.R.

Technological Institute for Burma: An Institute of Technology, a hospital and a hotel built by the joint

efforts of the Soviet Union and Burma were handed to the Burmese Government at a ceremony held in Rangoon recently. To help the Burmese to learn to handle the equipment, the Soviet Government has agreed to send them professors and teachers to work at the Institute for two years, and also 12 doctors to work at the hospital.

*

Building a New Radio Station in Iraq: A new radio station has been built in Iraq in conformity with the Soviet-Iraqi agreement on economic and technical co-operation. The stately three storey building of the Middle East's biggest broadcasting centre was put up in record time of one year and three months. Sixty Soviet specialists and 600 Iraqi workers did their best to commission the radio station for the national holiday of the Iraqi republic; also they had to work in a temperature of 40° centigrade, which prevailed in Iraq during the past few months. Soviet specialists have designed this station, assembled the modern equipment which was delivered from the Soviet Union and commissioned the broadcasting centre. In the course of construction, many unskilled Iraqi workers have acquired new trade with the help of Soviet specialists.

Yugoslavia

Trade Agreement with Britain: With reference to the completion of trade negotiations between Great Britain and Yugoslavia, the participants in these talks had the task of exploring the development of economic relations between the two countries and to examine prospects of further development of these relations in 1961-62. The development of economic relations, a foreign secretariat spokesman emphasized, has been appraised as favourable, for trade has been increasing from year to year. In future it is to be expected that it will continue to increase, which will be helped along on the one hand by Yugoslavia's greater potential in the manufacture of commodities which are in demand in the British market and on the other to a much greater participation of British industrial concerns in the delivery to Yugoslavia of complete industrial equipment, in which special mention should be made of the delivery of equipment for the ironworks at Skoplje. The favourable development is contributed to also by the foreign trade system in both the countries.

Australia

Ford (Australian) Expansion: An expansion programme to cost £15,500,000 has been announced by the Ford Motors Company of Australia. In expanding its plants and facilities, the company will spend £10 million in Geelong, almost £5 million in Melbourne and £7,00,000 in Sydney. The company's headquarters will be transferred during the next two years to a new building to be erected at Broadmeadows. These announcements were made by the Managing Director of the Ford Motor Company of Australia (Mr. John G. W. McIntyre) at a press conference in Melbourne. Among those present were the Prime Minister (Mr. Menzies), the Treasurer (Mr. Holt) and the Minister for Shipping and Transport (Mr. Opperman), whose Federal seat is Geelong. Making the announcement, Mr. McIntyre said, "This expansion programme is a matter of great significance to the company and to the country as a whole". Last month the Prime Minister, in a nation-wide talk, called

for confidence in the country's "unlimited future, and appealed to the public, industry and business generally to take a confident approach to the conditions applying today". Mr. McIntyre said, "We share the Prime Minister's confidence in Australia's future. We know that the country is sound and that it holds out rich and rewarding promises for the future".

Switzerland

Price Reductions in Synthetic Rubber: Du Pont de Nemours International S.A. has announced price reductions on two important types of Neoprene synthetic rubber. Effective August 1, 1961, the price of Neoprene WHV will be reduced by 2 cents per pound (4.4 cents per kilo). The price of Neoprene Latex 842-A will also be reduced by the same amount for tank car quantities. Dr. Russell A. Kurtz, Marketing Manager, said that the price reductions were made possible by improved manufacturing techniques. The lower prices are in keeping with the Du Pont Company's policy of passing on savings in manufacturing costs to its customers. Neoprene, the first commercially produced synthetic rubber, was introduced in 1932. This general purpose elastomer is used widely throughout the world because of its combination of physical properties, including excellent resistance to weather, ozone, heat, flame, abrasion, oils and chemicals.

OEEC

European Market Research: The European Productivity Agency of the OEEC is organising two conferences on European Market Research, to be held in Vienna from 27th to 29th September and from 2nd to 4th October, 1961. In recognition of the growing importance of marketing in industry since the war, the purpose of the conference is to study the advantages which a wider use of market research might offer to different branches of industry, and to discuss how small and medium-sized firms may best be helped with their marketing problems. From 27th to 29th September, leading European marketing experts will deal with "the Role of Trade Associations in the Study of European Markets." From 2nd to 4th October a second conference will be held also in Vienna, on "the Opportunities of Small and Medium-sized Firms in Export Markets." Requests for information regarding these two conferences and applications to attend may be addressed to the National Productivity Centres or to the secretariat of the European Productivity Agency of the OEEC, 3 rue Andre's Pascal Paris 16e.

United Nations

New Sources of Energy: Some 400 specialists and economic development officials from 61 countries have so far accepted invitations to attend the first UN conference on New Sources of Energy scheduled for 21-31 August in Rome. Their discussions will be based on 250 papers submitted by specialists of 30 countries and 20 general papers prepared by Conference Rapporteurs to incorporate basic points presented in each field. The main questions before the participants will include these: how can solar, wind and geothermal energy (from underground steam or hot water) best be put to work to raise living standards in underdeveloped areas? And how, for example, can they be used to light homes, cook meals, pump farm water, operate village industries, provide heat in cool climates, and refrigerate food in the tropics?

NEWS IN BRIEF

INDIAN

Coffee exports from India are steadily improving. During the first six months of the current year about 20,000 tons have been shipped out of 32,000 tons released for 1961.

The Tata Iron and Steel Company has announced a dividend of Rs. 6.80 and a bonus of 45 nP. per share net on ordinary shares. Last year the company had paid a dividend of Rs. 6.80 free of tax (gross dividend Rs. 9.72 per share) on ordinary shares.

It is reported there is no demand for Indian textiles barring rayon piecegoods in the Sudan. Prospects for textile exports are not bright in view of heavy stocks in the Sudanese market.

Storage schemes on the Beas in the Punjab to be built in consequence of the Indus Waters Treaty will constitute the largest single new project to be undertaken in the Third Plan.

A conference of bankers from Asia and outside has been proposed to be held in Bombay in mid-September 1962 to discuss questions relating to banking techniques, procedures and allied subjects. The proposal has been made by the Federation of Indian Chambers of Commerce and Industry.

The Union Government has granted a manufacturing licence to the Assam State Electricity Board for the establishment of a factory to manufacture electric meters during the current financial year at an estimated cost of Rs. 60 lakhs, of which, Rs. 20 lakhs will be in foreign exchange.

The Nepal Government has entered into an agreement with an Indian industrial firm to set up a modern textile mill in the country at a cost of Rs. 1.65 crores. The mill will go into production in 18 months to two years. It will produce about 20 million yards of cloth.

It is reported in India there are five major units manufacturing motor cars, trucks, scooters and their components.

The Government of India has appointed a special officer to study the economics of the proposed free trade zone at Kandla port.

The Central Government proposes to initiate legislation to make registration of births and deaths compulsory all over the country. The registration will have to be normally done within 72 hours and the law will provide for standard forms of birth and death registration available at the registration offices set up for the purpose.

Capsulation Services Private Limited, Bombay, which has a paid up capital of Rs. 2,52,000 in equity shares of Rs. 10 each, has been granted consent to issue bonus shares of the value of Rs. 2,52,000 in the ratio of one bonus share for every share held.

FOREIGN

Egypt is expanding her cotton acreage for the coming season. The Ministry of Agriculture announced that the area under cotton cultivation is 1,985,000 feddans, compared with 1,874,000 planted last year and 1,760,000 in 1959.

The Federal Rhodesian Government is to float a £3 million two-year local loan at the month end. The stock will be offered at par, carry interest of 5½ per cent and be redeemed in September, 1963.

Sweden's exports in May rose sharply to a record Kr. 1,275 million and because the rise in imports was modest, the result was a Kr. 42 million surplus on current trade.

The International Monetary Fund has agreed to provide the Government of El Salvador with the equivalent of \$11.25 million over the next 12 months.

The German wagon works, Link-Hoffmann-Busch, of Salz-gitter-Watenstadt, has secured an order from Pakistan Railways for 120 rail passenger carriages, two Pullman coaches and 12 motor rail coaches and trailers. The order is worth about DM 24 million.

Holland's foreign trade gap was larger in the first half of this year than during any six monthly period since the first half of 1957.

World production of crude copper fell by 5,752 tons to 311,129 in June and refined fell 11,052 tons to 307,459, according to the U.S. Copper Institute.

The Industriewerke Company is starting an assembly line for an amphibian car, in its Lubeck factory, reports Deutsche Korrespondenz. The first 25,000 are bound for the American market.

U.S. industrial output last month was running less than 1 per cent below its historic peak. Another strong rise in production carried the Federal Reserve Board index up by 2 points to 110, erasing almost all of the recession decline after only three months of vigorous recovery.

Motor Assemblies of Durban is to assemble Japanese trucks for the first time in South Africa starting next month. Another Durban company, Airco Engineering, is to manufacture pickup bodies for these vehicles and Firestone, of Port Elizabeth, will produce the tyres.

Zim Israel Navigation Company has announced that it is to float abroad an I£10 million share issue. Proceeds will be used to finance an expansion programme.

6 million kwts. more power before 1966

To provide light for every home in India... power for our ever-growing industries... the First and Second Five Year Plans have taken us towards the target of 30 million kwts. of installed generating capacity planned for 1975. And, during the Third Five Year Plan, another 6 million Kwts. are to be added to our output of electric power.

To produce this enormous amount of electricity Nature must be harnessed... huge dams must be built, generating stations erected...

In several such projects—as in so many other spheres—the new India is being built to last with ACC and Sankar brand cements.

THE STAGNATION IN SOVIET AGRICULTURE: 1927-1960

THE latest issue of the Economic Survey of Europe[§] is probably unique in the imaginative range of its coverage on the problems of economic growth both in Western and in Eastern Europe. There are collected in various portions of this Report tables of rates of growth which should end for a long time the futile debate on virtues of the various economic systems as distinguished from the brute facts—rates of growth which have been attained by particular countries at different times under systems as different as chalk from cheese. For the present, however, what seems to call for the greatest attention are the startling revelations on the failures of agriculture in the Soviet Union both over the long and the short periods. There have, indeed, been small stretches of progress. But students of Soviet agriculture will be confounded by the statistics in Chapter IV of the Report, particularly those relating to the Soviet Union.

One of the most depressing results of the survey is the long period assessment of Russia's agricultural production in the pre-war era and during the post-war period upto 1952. The Report gives (Table I) the percentage change in the volume of gross output from 1927-29 to 1937-39 (pre-war territory) at plus 2 per cent a year for all production, but minus 13 per cent for animal production. For the period 1940 to 1950-52 which covers the post-war territory, but includes the devastating effects of World War II, all production fell by 3 per cent while animal production was up by 9 per cent. Virtually, therefore, Russia's agricultural progress between 1927 and 1952 was small.

In the survey, an analysis of the recovery from 1950-52 onwards has also been made. But the inputs and output of Soviet agriculture show after 1956 no startling progress. The figures, in fact, are as follow:

TABLE I.

DEVELOPMENT OF SOVIET AGRICULTURE (1927-1952)

	Percentage changes in the volume of gross output	
	1927-29 to 1937-39 Pre-war territory	1940 to 1950-52 Post-war territory
	.. + 2	— 3
All Production	.. + 2	— 3
Animal Production	.. — 13	+ 9

TABLE II.

GROWTH OF OUTPUT AND OF INPUTS INTO SOVIET AGRICULTURE

(Index Numbers—Base 1950-52=100)

	1956	1957	1958	1959	1960
Total	141	144	159	159	163*

*Including state credits to collective farms for investment purposes, and excluding payments made in 1958 and 1959 for purchases of MTS machinery.

§ The Economic Survey of Europe in 1960, United Nations, Geneva, 1961.

The investment in Soviet agriculture is shown in Table III (on page 169) which indicates the massive use of resources directed to the purpose.

The question arises how effective these methods have been in turning back the stagnation of the earlier years. This is answered in Table 32 on page 49, Chapter IV, of the Report. The relevant part of this table is reproduced below (Table IV).

It is clear from this table that while agricultural

output in the Soviet Union rose by 10.7 per cent between 1957 and 1958, there was no rise in 1959 and the crop output in that year was 4.4 per cent below 1958. Again, actuals in 1960 showed an increase of 2 to 3 per cent over 1959. If one looks at the figures of 1958 to 1960 in a line, one recognizes that the Plan figure of 1965 (199) is far away from current performance which in a linear projection would only come to 145 and in accumulated projection to 167. This applies equally to crop output and to animal output both of which are running substantially lower than before 1958.

TABLE IV.

GROSS AGRICULTURAL OUTPUT OF SOVIET UNION, 1958 TO 1960,
AND PLANS FOR 1961 AND 1965

	1958 1959		1960		1961	1965†	1965 projection of past trend

of which: Crop output	14.6	-4.4	4*	6.9*	189*	141*	160*	
Animal output	4.6	6.3	-1*	9.4*	215*	154*	190*	

*Estimate.

†Cumulative annual percentage rate of growth (1959 to 1965).

** Includes extension of sown area.

The details of various crops to be found in Table 33, Chapter IV, of the Report (Table V alongside) show that the disease is wide-spread. As against 141.2 million tons in 1958, output of grains in 1959 was 125.9 million tons, and in 1960 132.7 million tons. The planned target of 167-180 million tons of grains output is thus far away. Current output of potatoes around 86 million tons is also only 60 per cent of the target for 1965. Similar results hold over most of the other fields. Meat output in 1960 was a little over half the level planned for 1965. Only in wool the progress is satisfactory. Possibly the target for eggs will also be attained.

Those who look upon Soviet planning efficiency with almost superstitious faith and assert that once targets are fixed, they will be accomplished, will do well to look again. No one need wonder whether or not the capacity of the Soviet Union in the field of agriculture has not been seriously overrated. It now transpires that Colin Clark's figures, often derided by Soviet authorities, have been closer to the truth than any others. It is almost certain that in terms of productivity, Western Europe, as shown by the figures in this Report, is far ahead of Eastern Europe. This would not necessarily imply that either the West or the East has established superiority over the other for all time, but it does suggest that in the agricultural field Soviet experience has not been invested with anything like the same success as has attended on its industry and scientific research.

TABLE V.

PRODUCTION OF MAIN AGRICULTURAL
COMMODITIES IN THE SOVIET UNION
1958 TO 1960 AND 1965 PLAN

Commodity/Unit	1958	1959	1960	1965 Plan†
Grains (Mil. Tons)	141.2	125.9	132.7	167-180
Potatoes (Mil. Tons)	86.5	86.6	84.0	147

Sunflower seed (Mil. Tons)	4.63	3.02	3.8	—
Meat (carcase weight) (Mil. Tons)	7.7	8.9	8.7	16*
Milk (Billion Litres)	58.7	61.7	61.5	100-105
Wool (Thousand Tons)	322	355	355	348
Eggs (Billion)	23	25	26.4	37

†1965 Plan figures are from the directives of October 1959.

*Target stated as "Not less than 16".

THE BUSINESS WORLD

Floods Demand First Things First

By CROESUS

WHEN it pours cats and dogs in Bombay, as it often happens during the monsoon season, the common comment one hears is: "there must be a big hole now in the sky". When flood waters gushed out like an avalanche to envelop a good bit of Poona the other day, many must have exclaimed: "the earth has given way to send its subterranean waters gushing up". Actually, however, it was not the earth (bless her, Mother Earth) that gave way, but the earthen dam of Panshet created by mere mortals. It is not my business here to go into any of those controversies now raging, such as whether the flood havoc was due to natural causes or it was man-made; whether the dam should not have been a stone masonry dam (as though stone masonry dams never give way!) and so on. But I consider it every one's business, first, to rush relief to the flood victims, especially the middle class families, and, secondly, to go into the causes of these recurrent floods in our country and devise proper and effective measures to prevent them at least in future.

it is a stupendous problem. And the most expeditious way of dealing with such a problem is to use prefabricated houses by indenting on the assistance of countries like the USA and Japan which have specialised in prefabricated houses. Such could be sought and obtained, if need be, through international agencies. But as this would necessarily take time, immediate efforts should be directed to collection of building materials, especially cement by requisitioning supplies, if need be, from the nearest cement factory. Also, wherever possible, local building materials and traditional methods known to the people before they became familiar with cement might be pressed into service. Incidentally, one cannot conceive of a more deserving claimant than this necessarily large-scale rehousing programme not only in Poona but wherever floods have wrought havoc in the country, for diversion of some of the accumulating P.L. 480 funds for which suitable uses are being explored.

The first task is no doubt being attended to with expedition, thanks to the spontaneous and almost country-wide public response to the appeal for funds for flood relief, but the presence of so many agencies—voluntary and no doubt well-meaning—although helpful in creating the required atmosphere, creates organisational problems. It is of the utmost importance, therefore, that, while not refusing the services and assistance in any form from any quarter, help to the flood victims is channelised through a single agency not only to ensure that there is no duplication (which is, after all, one form of wastage in these circumstances) but also to distribute relief among as many of the afflicted as possible, let alone prevent it being misused. I have said that help must go "especially to middle classes." Here is the explanation for it. These people have lost their all and are simply dazed. There are several instances of this ill-fated section of Poona's population still sitting on the site where once stood their humble dwellings with all their earthly belongings; all they can call their own today is their body and the clothes they were wearing before the floods came. This harrowing spectacle must be seen to be believed. I shudder even to imagine how many would survive the shock and would be able to retain their mental poise. Calamities such as these are known to unhinge the minds of many a weak-willed person.

It is something comforting to learn that efforts are being made simultaneously to provide both temporary 'kutchas' accommodation and more durable 'pucca' housing for as many as possible. According to preliminary estimates, some 4,000 houses have been washed out affecting about 85,000 people. This number is more likely to go up than go down, for it is not known how many of the houses still standing, which are seemingly all right, have been damaged beyond repair. Anyway

Medical aid comes next in importance only to food and, in such situations as the Poona floods, should have priority even over housing. This is fortunately being done and the Haffkine Institute has sent liberal supplies of anti-cholera vaccine. Several drug and medical firms also have donated large supplies of medicines and cod liver oil for the young and the invalid. More than supplies, which do not appear to be greatly lagging behind need, an army of medical personnel would seem to be needed to keep a round-the-clock watch both to prevent and arrest the outbreak of epidemics. One has not so far heard much about what the All-India Medical Council has been doing in this behalf, though the Red Cross and the Rotary are reported to be doing some valuable work. So much for the immediate task.

We have waited long enough, in all conscience, for a long-term solution to the hardy annual of floods in our country. Although there has been talk of every other river project being a so-called multi-purpose project with flood control as one of the invariable features, we do not appear to have achieved much for the immediate present. The Planning Commission is still blissfully planning for flood control in the years to come, as though we have not had enough disastrous floods in the years gone by, not to speak of the floods in recent weeks. As between prevention of floods and control of floods, the former must receive preferential attention. There may be some justification for not giving immediate attention to such elaborate—though eminently sensible—proposals as those of Sir C. P. Ramaswami Aiyar for cross-linking a number of rivers by a series of navigation-cum-irrigation channels, but there can be no justification whatsoever for not taking even such simple steps as periodical removal of silt from our river (and also tank) beds. Surprisingly enough, quite unsophisticated folk are able to ascribe the devastating floods in recent years to this criminal neglect. One lady

of 50 years who volunteered her opinion compared the number of steps (about 40-45) she had to go a few years ago with those she has to negotiate today (15-20) to reach the Cauvery river bed near Mysore and added that, if the river bed is allowed to rise at this rate, there would be more and more disastrous floods with larger and larger tracts of the country experiencing the effects thereof. I am told that, in Hardwar, the people on either banks of the River Ganges make it a point every year to desilt—or is it de-stone?—the river

bed so as to keep it as low as possible. Surely this could not have escaped the vigilance of our planners who treat us with chapter after chapter on minor and major irrigation works and multi-purpose river valley projects. It was fashionable, some years ago, to talk of the D.V.A. in season and out of season, I don't know with what precise profit. How I wish that our planners again indulged in that pastime, if that be the only way they can be made to draw their inspiration and act!

Business Notes

Sugar

ABORTIVE DEAL WITH PAKISTAN

THE CANCELLATION by Pakistan of her deal to import 25,000 tons of sugar from India at £23 per long ton is prone to be dismissed as an off-shoot of the present political estrangement between the two countries. Coming close on the heels of President Ayub's tirade against this country during his visit to the United States, this announcement by Pakistan can, indeed, be interpreted as such. But underneath the political overtones there lie some economic considerations that have apparently weighed with Pakistan in cancelling her contract with India. This raises an issue of wide import for us in the present day foreign exchange crisis.

The case history of this deal obviously cannot absolve the State Trading Corporation and the Indian Sugar Mills Association, the two agencies connected with the deal on India's side, from all the blame for the fiasco in which the deal has ended. It is, indeed, a sorry state of affairs that the Indian Sugar Mills Association, which started the negotiations in the first instance for exporting sugar to Pakistan, rushed into matters without weighing properly the issues involved. The original quotation which ISMA made was £28 per long ton of sugar, c. & f. Karachi. It was only at a later stage that it was realised that India could supply sugar to Pakistan much cheaper at £23 per long ton if supplies were effected over the land border at Attari. The acceptance of the Indian tender by the Pakistan Government should have cleared the way for sugar exports to that country. But the protracted negotiations that followed, both in Pakistan over the schedule for deliveries and on the question of payment in sterling and here between the Sugar Mills Association and the State Trading Corporation which came into the picture at a later stage when the question of bearing the loss on these exports arose, resulted in valuable loss of time which led to the State Trading Corporation submitting a revised delivery schedule to the Pakistan Government. Under this schedule, supplies were to be started on August 1, instead of on July 15, as promised earlier at the time of offering the tender. This gave a plausible excuse to the Pakistan Government which in a falling international market took advantage and negotiated a deal with Czechoslovakia for the purchase of Cuban sugar at £22. 15s. per ton c. & f. Karachi.

Whatever may have been the reason which prompted Pakistan to cancel this deal, the unimaginative handling on our part of the matter has made us lose a good opportunity of earning nearly Rs. 75 lakhs in foreign exchange. Further, it may mean the loss of Pakistan market for Indian sugar when efforts are

being made to find outlets for the huge surplus that we have in this commodity. This abortive deal should set the State Trading Corporation at thinking that if it is to make its mark in the foreign trade of India, it has got to be run strictly on commercial lines and with the same efficiency. The defects of the bureaucratic set-up of the State Trading Corporation which have been brought out in the Economist Intelligence Unit's report on STC's functioning, especially in regard to manganese ore exports, have been underlined by the muddle on sugar deal. It is time that some thought is bestowed on making the State Trading Corporation's functioning more efficient and businesslike.

NAPE

ECONOMY BY EFFICIENT PURCHASE

THE ECONOMY of every country depends, to a great extent, upon the efficiency with which simultaneous and uniform growth in all aspects of production is ensured. Among the many aspects of production, the one that does not appear to have received all the attention that is necessary is that of material purchases and management. The paramount importance of this aspect can be imagined if only one cares to take note of the several heavy construction works like multi-purpose dams, factories and buildings in hand which entail an investment of hundreds of crores of rupees. Out of the total investment of Rs. 10,500 crores in the Third Plan, for instance, the creation of physical assets like buildings, plants and equipment alone accounts for some Rs. 5,000 crores. If only a 5 per cent economy is effected through efficient purchasing techniques, it would mean an enormous saving of Rs. 250 crores. This point was appropriately emphasised by Dr. C. D. Deshmukh, while inaugurating the National Association of Purchasing Executives (NAPE) a few days ago in Bombay. In this connection, he also stressed the importance of standardisation and simplification of items for industrial use which have greatly helped improve purchasing operations in foreign countries. Factors, such as value analysis, market research and inventory management form the core of efficient purchasing, he said.

The Government of India, it may be noted, has set up two cadres of Central Service officers for dealing with purchase and inspection work—the Indian Supply Service and the Indian Inspection Service—which are expected to lead to a greater measure of efficiency and co-operation in the purchase of materials than hitherto. During the period April 1, 1960, to January 31, 1961, the Director-General of Supply and Disposals, which is the sole purchaser on behalf of the Central and the State Governments, as also on behalf of Government undertakings, purchased Rs. 151.5 crores worth of indigenous goods. It is estimated that something like 488 firms have been registered with the Directorate of

BIRDS are stepping up it

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

BIRD & COMPANY (PRIVATE) LIMITED
and
F.W. HEILGERS & COMPANY (PRIVATE) LIMITED
Chartered Bank Buildings, Calcutta-1

Supply and Disposals. Besides, we have the Indian Stores Department in London and the India Supply Mission in Washington. Since the NAPE is intended for the service of the private sector, Dr. Deshmukh welcomed its advent. The birth of NAPE, it is to be hoped, will usher in an era of efficient purchasing which will mean lower costs and, therefore, greater competitive ability. At a time when there are complaints from almost all quarters that the Indian costs of production in respect of many items exceed those of any other country in Europe, it is at once urgent and imperative that increased efficiency is instilled so as to bring down costs of production to the minimum levels feasible.

Textiles

RIISING COSTS AND THIRD PLAN TARGET

IT IS common knowledge that our cotton mill industry has been assigned a target of 5,800 million yards output during the Third Plan period, which is only 800 million yards more than the Second Plan target. What is not equally well known, however, is that, with its present unbalanced and inadequate machinery, the industry may not be able to fulfil even this modest target. Even so, it is noteworthy that the Millowners' Association, Bombay, in its report for the year 1960, released last week, has noted that the higher production in the textile industry could easily be achieved without establishing new units, provided the existing units are allowed to expand by installing additional spindleage and loomage and the maximum utilisation of the installed equipment and the introduction of third-shift working are permitted. Now, as between starting altogether new units and expanding the existing ones, the advantages of economy certainly lie with the latter. The total capital cost of expansion and machinery and technical staff required will any day be lower than that involved in starting wholly new units.

Another snag about achieving the textile target, according to the Report, is the inadequate cotton supply position which has been a source of constant concern to the textile industry for a considerable time. It is feared that, unless the supply position is stabilized, the achievement of the target can only be at the risk of higher costs of production. (Cotton production in the season 1960-61 has been estimated to be around 52 lakh bales, that is, even less than the Second Plan target of 54 lakh bales!) During the current season (1960-61), the textile industry has been forced to buy foreign cotton, which is mostly of the long-staple variety, and, therefore, not exactly suited to our mill industry, at a much higher price than domestic cotton. Left with no other choice, the Indian mill industry was forced to use imported cotton and to resort to spinning down in order to manufacture the kind of cloth and yarn for which the mills have been equipped. In the result, production of cloth was not only slowed down, but costs of production also went up appreciably.

In addition to higher prices paid for cotton, the industry was also called upon, last year, to increase the basic wage by Rs. 6 to Rs. 8 per month in different centres, thanks to the recommendations of the Central Wage Board, from 1st January, 1960. There will be a further increase of Rs. 2 per month in the basic wage of the worker this year. Thus, the total wage bill of the industry will be about Rs. 16 crores, which constitutes 25 to 32 per cent of the total costs of production. According to the Report, the higher prices of cotton, along with the increased wages, thus, has raised the cost of production by at least 50 per cent.

Paper

PROBLEMS OF IMPORTERS

IN ITS attempts to minimise imports of paper, the Government of India has practically squeezed out the established importers and has created a class of 'new importers' known as the actual users. It is true that a favourable attitude towards this class is justified for reasons of economy. But the established importers are quite within their right to protest when they say that the authorities, while issuing licences to the actual users, do not thoroughly ascertain whether an applicant can really be called an actual user within the definition prescribed in the Red Book; whether the stated requirements are essential in the real sense of the term; whether the quantities stated as "consumed or to be consumed" by the applicant are in fact intended for use by the applicant and whether there is any foolproof method for the authorities to ascertain if any of the stores supplied are sold away by backdoor in black market. Various instances have been quoted by the Paper Traders Association wherein several items of paper allowed only to the actual users are available for sale in the open market. This is a clear proof to the fact that actual users misuse their import licences. Perhaps some of them are able to manoeuvre import licences on less dependable evidence. When it is seen in the context that foreign exchange allocation for quotas of consumer goods (excluding foodgrains) during the period April-September, 1961, comes roughly to 9 per cent of the total import bill, and out of this allocation the actual users are able to share 4.8 per cent, the real plight of the established importers is revealed. In fact the value of actual users' licences for paper items is comparatively even more.

There are certain other factors too which make it necessary to give sufficient attention to the demands of Paper Traders Association. For instance, their demand that the validity period of the established importers' licences for paper and paperboard items be extended to 12 months is positively reasonable because the licences granted to them are sometimes for very small amounts and the importers have to club together two or three or more licences in order to make their orders acceptable to the foreign suppliers. This incidentally saves lot of money because at bigger orders they are comparatively in a better position to bargain. Their another demand that the minimum value of licences should be increased from Rs. 500 to Rs. 1,000 also seems quite reasonable because it is not economical to negotiate imports of small quantities.

Trade

EXPORT OF ENGINEERING GOODS

THE REPORT of the Trade Delegation that visited West Asian and West European countries to study the prospects for export of Indian engineering good recently released is quite a useful document. It not only indicates the existence of possibilities for export of a wide range of engineering products to Yugoslavia, United Kingdom, U.A.R., Spain, Lebanon, Italy, Iran and Greece, but also pin-points the handicaps which have been hampering the smooth flow of engineering goods to these countries. The Delegation was sponsored by the Engineering Export Promotion Council which carries on market research with a view to examining possibilities of export for Indian engineering goods. Besides giving its finding in respect of export prospects, the Delegation has provided in the appendices to its report two useful lists — one of importers in different countries and the other of firms interested in taking up Indian agencies for the countries concerned. Statements showing the imports of and the duties

levied on certain engineering goods in the U.K. and Italy enhance the usefulness of the report.

With a view to expanding the exports of engineering goods the Delegation has made a number of recommendations. It urges that bilateral trade agreements be signed as early as possible, with Syria, Spain and Iran. Efforts to have some special agreements with Italy, because certain special types of machine tools, machinery items and castings can be exported to that country in sufficiently large quantities are also highlighted in the report. Invitations to Ministers and Government officials from these countries and adequate publicity and propaganda are asked for to promote the exports of these goods. The main stress is, however, laid on personal contacts and servicing arrangements because Indian products have not so far achieved that fame when business could be expected on the basis of brands. It is a fact that a large number of items can find markets in these countries provided their possibilities are thoroughly studied, improvements made according to the local requirements and prompt deliveries assured.

The Delegation is of the opinion that export services offered by English Merchant Houses in England be fully utilised for export to West African and Latin American countries. Special efforts are also called for for promoting export of castings to Yugoslavia, U.K. and Iran as there exist vast opportunities for castings of all kinds in these countries. Countries in West Asia and Africa offer bright prospects for many items which have not so far figured much in India's export of engineering goods. These items include all types of railway stores, track and signalling materials, railway wagons, locomotives and components, steel and cast iron

machine castings, chassis, auto-engines, transmission line towers, irrigation equipment and heavier electrical goods. The Delegation considers that these items should be included in the Trade and Payments Agreements with these countries. Most of these recommendations are of far-reaching importance and need to be acted upon in right earnest.

General Insurance

UNITED INDIA'S YEAR OF PROGRESS

THE DIRECTORS of the United India Fire and General Insurance Company Limited have recommended a dividend of 12 per cent for the year 1960 which compares favourably with the last year's distribution of 10-2/3 per cent. This is a reflection of the general working of the company which increased substantially in both gross and net premiums especially in fire and miscellaneous departments. The gross premium in the fire department written during the year amounted to Rs. 31.77 lakhs as against Rs. 26.72 lakhs the previous year. In the miscellaneous department, the gross premium written was Rs. 21.00 lakhs as against Rs. 15.51 lakhs and in marine department the gross premium for the year amounted to Rs. 12.70 lakhs as against Rs. 12.39 lakhs the previous year. There was, however, an appreciable reduction in the net premium in the marine department which is explained by the cancellation of a foreign reinsurance arrangement which was not found profitable by the company. Maximum profit of over Rs. 2.4 lakhs was recorded by the fire department. The directors' report reveals that there was an appreciable increase in the value of equity shares held by the company which naturally strengthened their general position.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

- | | |
|--|----------|
| 1. India & the World and India in 1950 | Rs. 5/- |
| 2. A Social History of the Indian People & India in 1951 | Rs. 5/- |
| 3. India & the Free World and India in 1952 | Rs. 5/- |
| 4. India in Asia & India in 1953 | Rs. 5/- |
| 5. India in South East Asia and India in 1954 | Rs. 5/- |
| 6. India & the Communist World and India in 1955 | Rs. 5/- |
| 7. India in 1975, A Study of the next Twenty Years & India in 1956 | Rs. 7.50 |
| 8. India & the Middle East and India in 1958 | Rs. 7.50 |
| 9. India and Europe & India in 1959 | Rs. 10/- |
| 10. India & North America and India in 1960 | Rs. 10/- |

A Letter to the Editor**THE ORISSA ELECTIONS, 1961**

Dear Sir,

In your leading article "Stability for Orissa" in your Weekly of June 16, 1961, it is stated "The surprise is that the electorate gave an unequivocal verdict for stability. This is very likely a case of robust common-sense influencing judgment in the right direction after the experience of the futility of the coalition". May I point out that the analysis of the voting results does not bear out any such conclusion. It will be seen that out of the total electorate of 85,52,840 Congress received 12,68,828 or 14.8 per cent votes only. Only 36.5 per cent of the electorate voted and out of the valid votes cast the Congress votes work out at 43.3 per cent only while 56.7 per cent votes were for non-Congress parties. Even with this small percentage of the electorate voting, Congress candidates secured majority votes (over 50 per cent) in 46 seats only. In the other 36 seats Congress candidates won with minority votes due to division of votes because of multiple candidates contesting. Hence, the unexpected majority of the Congress is more accidental than due to any deliberate or conscious judgment and decision of the electorate. Under the circumstances, the result can hardly be described as an "unequivocal verdict for stability". The conclusion drawn at another part of your article that "the electorate hardly had an alternative. It could not trust the Ganatantra Parishad to deliver the goods..." is equally misleading in view of the accidental nature of the result.

In dealing with Orissa in the Week's Notes in your issue dated June 30, 1961 the 21 months tenure of the coalition has been described as "a pointer to a period of stagnation in administration and economic reform, on which the Coalition, by virtue of the orthodox, social and economic philosophy of the Ganatantra Parishad, could not initiate any forward-looking policies." This smacks of partisan propaganda rather than of objective journalism. Such a charge is neither borne out by the policy statement, manifesto or programme of the Ganatantra Parishad nor by facts.

The period of Coalition has been described as the best period of Orissa's administration by others. The

progressive Land Reform Act imposing ceilings on land was passed during this period. It is a pity that you have been misled by interested and irresponsible propaganda into believing that the former Princes in Orissa own 2,00,000 acres of lands which will be brought within the purview of the Land Reform Act by some new law. The fact is that the former Princes of Orissa own only 37,000 acres of land according to official figures given in the Orissa Assembly by the former Congress Government and these lands are already within the purview of the Land Reforms Act adopted by the Coalition Government. It is not understood how you missed the contradiction of the incorrect figure of 20,00,000 acres mentioned in an irresponsible statement by Shri Bijoyananda Patnaik which has already appeared in the Press.

May I request you to publish this letter in your esteemed Weekly to remove misconceptions of your readers?

Yours faithfully,
Shraddhananda Panigrahi.

Balangir, ORISSA.
July 14, 1961.

[Disparity between the votes polled and seats won by contesting parties is not a novel feature of direct elections in India or other democratic countries. The point of our emphasis was the return of a party with a clear majority which makes for stability. Stray instances can hardly affect the overall impression of absence of marked activity during the Coalition regime. It is too much to expect us to keep track of data supplied by Ministers from time to time in all the legislatures in the country. The material fact is not the area of land but the discontinuance of exemption from ceilings which was granted in the earlier land legislation. We are not aware of Mr. Patnaik having claimed the figure of 20 lakh acres, nor have we mentioned it. As for the allegation of propaganda, we have frankly criticised the Chief Minister's industrial policy as being largely wishful.—Ed.]

FROM THE CAPITAL'S CORRIDORS**COLLABORATION WITH ENI**

THE Government of India, it is learnt, has received the draft of the agreement proposed to be signed with Ente Nazionale Idrocarburi, the State-owned oil corporation of Italy, for the development of the oil industry in this country. The draft provides for a 12-year credit of \$120 million to be extended by the Italian company. Thirty-three million dollars of this amount are supposed to be provided for setting up of a refinery. Another \$33 million will be available for financing the laying of two products pipelines — one from Barauni to Calcutta and the other from Barauni to Delhi via Kanpur or Lucknow. Twenty million dollars have been offered for oil prospecting in collaboration with the Oil and Natural Gas Commission. The remaining \$34 million will be available for setting up a gas separation plant in Assam, a naphtha cracker project to manufacture petro-chemicals and a lubricating oil plant.

The Italian company, it is understood, will not initiate any oil prospecting on its own, but would act as agent to the Oil and Natural Gas Commission on such terms as would be mutually agreed upon. The drilling equipment, of course, will be supplied by the ENI. The Italian company is said to have disfavoured prospecting of oil in India on concession basis for it finds the conditions offered by the Indian Government unacceptable. According to knowledgeable sources, the minimum return that it is asking for on oil prospecting is 25 per cent (free of all taxes) on its outlay. The Burmah Oil Company, it may be recalled, only recently signed an agreement with the Government for oil prospecting in Assam, in areas adjacent to the Naharkotiya and Moran oilfields, on an assurance of a net return of 9 to 13 per cent.

The \$33 million credit available from the ENI for setting up a refinery, it is presumed, will go to finance the construction of a refining unit in South India to be based on imported crude, probably from the Soviet Union. The Nunmati and Barauni refineries, which will process Naharkotiya and Moran crude, are already being set up with financial assistance from Rumania and Russia. Russians have also agreed to provide credit for setting up the Koyali refinery near Baroda to process Ankleshwar crude.

The provision for utilisation of a part of the ENI credit for setting up a lubricating oil plant perhaps means that the Esso Standard Oil Company's lubricating oil project has come under cloud. The lubricating oil plant proposed to be set up at Barauni is already included in the Russian collaboration programme. The plant proposed to be set up with ENI's assistance is envisaged to produce such varieties of lubricating oil which would not be produced by the Barauni unit.

The Italian credit will cover the foreign exchange element in the above-mentioned projects. The rupee finance will have to be provided by the Government of India. For instance, for setting up the products pipelines pipes will have to be arranged by the Government of India, while the Italian credit will be available for financing the cost of pumping apparatus and technical know-how.

Contrary to the expectations of the Union Ministry of Oil, the agreement on the main principles governing the use of ENI credit would be signed by the local representative of the ENI, Mr. Gasperini. Separate agreements in respect of each project to be financed by this credit will be negotiated and signed at a later stage.

NUNMATI AND BARAUNI REFINERIES

The commissioning in of the Nunmati refinery, according to reports current here, is likely to be delayed by at least three months. This refinery was expected to go on stream by the end of the current year. The delay, it is said, has been caused by non-availability in adequate quantities of huge pipes to lay a pipeline from Gauhati to a place 11 miles downstream of Brahmaputra for effluent discharge.

The commissioning in of the Barauni refinery also is likely to be delayed by about six months. This refinery was originally expected to go on stream by the middle of 1962.

Meanwhile, the Union Government has finally decided to set up the refinery to process Ankleshwar crude at Koyali, a village near Bajwa railway station, about 10 miles from Baroda. The site selected is very near the Mahisagar river. This refinery will be owned by the Oil and Natural Gas Commission and will have a capacity of 2 million tons per annum.

INDIAN SHIPPING

New Delhi appears to be greatly disappointed with the attitude the Indian shipping interests have adopted in the recent past. The shipping interests have been too quick to ask for increase in freight rates even when they cannot be wholly justified. Two cases are cited in this respect. First is shipment of rice to Kerala under the Indo-Burmese Rice Agreement. Kerala, it is pointed out, was in desperate need of rice sometime ago. To expedite deliveries, the Government of India in response to a request by the shipping interests raised the rice freight rate from Rangoon to Cochin from Rs. 47 per ton to Rs. 48 per ton. It would have considered sympathetically some further increase in this rate as well if the shipping companies had responded to its call and had carried the Burmese rice to Kerala to meet the emergency. The shipping interests, however, asserted that a rise in rice freight rates was a sine qua non to any carriage of rice to Kerala.

The second case cited is that of shipment of coal by sea from East Coast ports to West Coast. The Indian shipping companies employ 36 ships in the coal trade to carry one million tons of coal and have been charging Rs. 35 per ton as freight from Calcutta to Bombay. In view of the difficulties encountered in transport of coal by railways, the Government sometime ago, decided to move another one million tons of coal by ships. The shipping interests taking advantage of this fact asked for a higher freight rate.

This attitude of the shipping interests is being resented here. It is, indeed, a paradoxical situation that while the Indian shipping interests have been demanding the right to carry Indian goods in Indian bottoms, they demand higher rates when goods are offered even to meet an emergency.

As reported earlier in these columns, the volume of opinion is growing in favour of nationalisation of the coastal shipping trade of India.

Meanwhile, a new shipping company has been floated in the private sector. The Government of India has reversed its earlier decision of carrying oil by tankers owned by its own shipping corporations and has directed the three western oil companies to negotiate with a company formed by Mr. Teja. This company proposes to acquire at least 13 ships and has asked

JWTSPPW 615A

for a loan of Rs. 20 crores in foreign exchange to be repaid in a few years from its earnings. The proposal is said to be quite an attractive one and is being seriously considered here.

MANUFACTURE OF DIESEL ENGINES

Manufacture of diesel engines in the higher ranges upto 800 H.P. may start at Poona in the near future, if the plans of Messrs Kriloskar Oil Engines are approved by the Government.

Kriloskar Oil Engines already holds licences for the manufacture of diesel engines in the ranges 100 H.P. to 330 H.P. in collaboration with MAN of Germany. The manufacture of engines in the higher ranges is proposed to be started in collaboration with the U.S. firm Commins.

The project is expected to cost Rs. 1,76,95,000. Of this, rupee expenditure will be Rs. 62,05,000 and the rest in foreign exchange — Rs. 73,50,000 in sterling and Rs. 41,40,000 in dollars. The U.S. firm will be providing the whole of the foreign exchange component in lieu of its share in the equity capital of the Indian company which is to be 60 per cent of the total.

Plans are to manufacture 210 diesel engines per month. The manufacturing programme envisages gradual reduction in the imported components from 57.2 per cent in the year in which the production is started to 32.5 per cent in the third year.

Commins engines are eminently suitable for mobile role as against the MAN engines which Kriloskar are producing for stationary role. The only engines for mobile role that are at present manufactured in this country are made by Ashok Leylands for heavy duty buses. Their generating capacity ranges from 150 H.P. to 180 H.P. Commins engines will be used in various equipments such as P and H shovels, Marion shovels

and Kamatsu tractors, whose production plans have already been finalised by the Government.

MANUFACTURE OF FOOD YEAST

No further applications for undertaking the manufacture of food yeast are likely to be entertained by the Government for the next 12 months, during which period two schemes already under consideration are expected to materialise. Messrs Sarvaraja Sugars, Chellur, are expected to set up a factory in Andhra Pradesh for the manufacture of food yeast. Foreign exchange requirements of this unit will be financed by exports of yeast. Jeypore Sugar Company of Madras is expected to undertake the manufacture of dried yeast to the tune of 150 tons per month. This company proposes to produce adequate quantities of fodder yeast for exports to the United States to earn the requisite amount of foreign exchange for its requirements. The foreign exchange component of the Jeypore Sugar Company's programme is placed at Rs. 10 lakhs.

MANUFACTURE OF SULPHURIC ACID

In view of the drain on foreign exchange resources on account of import of sulphuric acid — currently sulphuric acid imports are Rs. 3 crores per annum, but they are likely to increase to Rs. 6 crores per annum by the end of the Third Plan period — the Government of India would like the producers of sulphuric acid in the private sector to come forward with a helping hand.

Large-scale resources of pyrites, exceeding 80 million tons, are said to be available. There are plans to set up a 400-tons-a-day capacity smelter at Amjor. To manufacture sulphuric acid from these pyrites, technical collaboration has been arranged with a Norwegian firm. The Pyrites and Chemical Development Corporation, which will be setting up this smelter, has taken on hand a programme for mining pyrites on a large scale. The Corporation has also plans to set up

sulphuric acid units of 400 to 500 tons per day capacity near the fertilizers factories at Durgapur and elsewhere. The Corporation's plans envisage meeting of sulphur requirement of the country to the tune of about 50 per cent by the end of the Third Plan. The private sector, it is suggested, can fill the rest of the gap to a considerable extent.

EXPORT OF CHEMICALS

In view of there being surplus capacity for the manufacture of certain chemicals such as biochromates, hydrogen-peroxide, ammonium chloride, alum and aluminium sulphate, bleaching powder and chlorine, the Government of India thinks that there is a need for exporting these chemicals to the neighbouring countries where they are in demand. According to official calculations, India, to begin with, can export these chemicals to the tune of Rs. 1 crore per annum.

PAKISTAN CANCELS SUGAR DEAL

Pakistan has cancelled her deal to import 25,000 tons of white crystal sugar from India. It will now be importing Cuban sugar from Czechoslovakia. India had tendered to supply this sugar at £23 per long ton f.o.r. Attari. The Cuban sugar, it is learnt, is being supplied to Pakistan at Karachi at £22.15s. per long ton.

According to Pakistani sources, the deal has been cancelled because India failed to start deliveries on July 15 as contracted. The State Trading Corporation on whose behalf the Indian Sugar Mills Association was to supply sugar to Pakistan, however, contends that Pakistan herself had delayed finalisation of the deal because she wanted to pay in rupees instead of in pound-sterling. Valuable time was also lost due to Pakistan's insistence on modification of the conditions regarding inspection and arbitration. Negotiations were carried on for a longer period than warranted and the Pakistan Government finalised the deal only

on June 27. The State Trading Corporation proposed to start deliveries from August 1 and complete them by the end of September. The Pakistan Government did not indicate any revised schedule for the delivery and insisting on technicalities cancelled the deal straightaway, presumably because it had received an offer for the supply of Cuban sugar at more favourable rates.

IMPORTS FROM U.S.A. ONLY?

Reference was recently made in these columns to certain items imports of which may exclusively be reserved from the United States. The commodities under discussion are as follows:

Fertilizers; steel; copper, zinc, aluminium and their alloys; synthetic rubber; compressors, ball bearings, and similar general purpose components; tyre cord synthetic yarn; sulphur; rock phosphate; carbon black and acetylene black; pulp including rayon grade pulp; dyes; cutting tools; small tools; abrasive grains; various types of machine tools required by engineering industries; refractories and rollers for steel plants; lubricants; aviation spirit; newsprint; rutile titanium dioxide; styrene monomer; phenol; cellulose acetate butyrate; borax and boric acid; penicillin (sterile and non-sterile in bulk); Crude vitamin B₁₂ (B₁₂ intermediate); 4, 7, Dichloroquinoline; P-nitroacetophenone; P-acetyl aminophenol; 16-alpha-methyl-delta-1, 4, 9, (II)-Pregnatrien-17-alpha-21-diol-3, 20, dione-24-acetate; 3, 11, 20 Triketo 17-hydroxy-21-acetoxy-pregnane (EA ix); 5-chloro-2, 4-disulphonamide aniline; chlorothiazide (in bulk); benzathiazide (in bulk); chloramphenicol (in bulk); chlorpropamide (in bulk); nialamide (in bulk); M-aminophenol; acetazolamide (in bulk); methyl Isobutyl ketone; filteraid (supercel hyflo); acetyl sulphadiazine; diethyl carbamazone (in bulk); streptomycin (in bulk); tetracyclin and its derivatives (in bulk); trimethoprim (in bulk); and calcium petroleum coke.

TRAVEL TALK IN TUBELESS TIMES

'A tube, a tube, my kingdom for a tube', quoted Time-Master Tubophile getting his Shakespeare all mixed up.

'Listen', said the coachman. 'You ain't got a kingdom to give and we ain't got a 'tube' to travel in...so now we walk, see!'

'Zounds, Sir', thundered Time-Master Tubophile, still Shakespearean, 'you don't have to remind me that this is a tubeless land in tubeless times. Full well do I, Chairman, Tube Time Inc., know it. Not a car, train or plane for conveyance...not even a bicycle to take the ache out of travelling. Nothing to take you from here to there save a horse...and that

too run away. Such is tubeless travelling. Comforting, though, to think, there is my tubular time machine to take me back to my own well-tubed time. And back I'll go after I have seen more of these tubeless times'.

'Coachman! forward—Ho!'

The Indian Tube Company (1953) Ltd. A Tata-Stewarts & Lloyds Enterprise

TEA EXPORTS

An idea how India's tea exports would be affected by Britain's joining the European Common Market can be had from the following data. Of the total Indian tea exports, nearly 60 per cent go to the United Kingdom and 2.5 per cent to the six countries of the European Economic Community. In absolute terms, the United Kingdom imports from India about 300 million lbs. of tea (valued at approximately Rs. 82 crores), while the E.C.M. countries — France, Italy, West Germany, Netherlands, Belgium and Luxembourg — take nearly 12.50 million lbs. (valued at approximately Rs. 3.41 crores), either directly from this country or through Britain. India's tea exports to the United Kingdom and the Common Market countries have been in the recent past roughly of the following order:

IMPORTS OF TEA BY UNITED KINGDOM

(In million lbs.)

Origin	Quantity
India	300
Ceylon	140
British East Africa	40
Pakistan	10
Other Countries	30
Total	520

E.C.M. IMPORTS OF TEA

(In million lbs.)

Country	Total Imports	Imports from India
France	0.50	0.25
Italy	2.50	0.55
West Germany	14.00	7.00
Netherlands	20.00	4.50
Belgium and Luxembourg	1.00	0.20
Total	38.00	12.50

Indian tea enters Britain duty-free while Britain levies an import duty of 2d. per pound on tea imports from countries like Indonesia, Japan and Portuguese territories. This preferential treatment accorded to the tea of Commonwealth origin has to a great extent been helpful in keeping India's share in the British tea market at a sufficiently high plateau. If Britain joins the European Common Market, she will have to build up a tariff wall which not only will make tea costlier for the British people, but will also hamper re-export of tea from Britain. The position

regarding tariffs imposed by various Common Market countries on tea is as follows:

EUROPEAN COMMON MARKET TARIFFS ON TEA

Country	Import Duty	Internal Revenue Taxes	Total
France	30%	29%	59%
Italy	50%	—	50%
Germany	52%	45%	97%
Netherlands) Belgium) Luxembourg)	12%	—	12%

It would be apparant from the above fact that it would be in the interest of both India as a producing country and Britain as a major consuming country if tea from all the Commonwealth countries continues to enter Britain free of duty even after Britain joins the European Economic Community.

JUTE EXPORTS

Another major commodity whose exports from India are likely to be affected consequent upon Britain's joining the E.C.M. is jute goods. India's exports of jute goods to the United Kingdom and the Six countries of the Common Market during the year to March 31, 1961, have been as follows:

INDIA'S JUTE GOODS EXPORTS TO BRITAIN AND**E.C.M. COUNTRIES**

(In million rupees)

Exported to	Value	% of total Indian exports (Rs. 1,351.32 million)
United Kingdom	90.88	6.73
France	—	—
West Germany	26.31	1.95
Italy	3.81	0.28
Belgium	16.26	1.20
Netherlands	10.66	0.79
Luxembourg	—	—
Total	147.92	10.95

It will be observed from this table that jute goods exports to the United Kingdom earned for India more than Rs. 9 crores, equivalent to 6.73 per cent of the total value of the goods shipped overseas during the financial year ended March, 1961, while shipments to the European Common Market countries earned nearly Rs. 6 crores (4.23 per cent of the total value). Exports to France and Luxembourg were nil.

It is to be noted that India and the European jute manufacturing countries at present adhere to their own particular lines of manufacture, with India concentrating on standard hessian and sacking constructions (which constitute the bulk of the exports to Europe). The pattern of production is to some extent common to both centres and the European countries could undoubtedly cater for a much larger part of their domestic needs if they were enabled to do so by a collective trading policy and a weakening of India's competitive position. The installed capacity of the European jute industries is not fully employed, the main reason for this being (i) the access that the competitive Asian producers at present have to the European market, restricted only by such controls as the mark-up in the United Kingdom, high tariffs in France, and currency allowance in West Germany, and (ii) the fact that India has been able to recapture some of the export business in other markets that went to the European jute industries at the time when the sale of Indian jute goods was handicapped by heavy export duties. This revival of competition has led to a progressive curtailment of production in Europe, but the trend is one that could be reversed by closer economic integration in that area.

If France succeeded in maintaining its protectionist policy and created a tariff barrier against cheap Asian jute industry, the Indian jute industry would be seriously handicapped in its trade with the United Kingdom, which, at present permits free entry to Indian jute goods. It is believed that the attitude of the West German and Belgian Governments is more sympathetic, because of a growing realisation of the imbalance of trade between India and their countries.

NON-DIVIDEND PAYING COMPANIES: EXEMPTION FROM SOME PROVISIONS OF COMPANIES ACT

The Government of India has decided to exempt companies engaged in the promotion of art, commerce, science, religion, charity or any other useful object from certain provisions of the Companies Act. This step has been taken since compliance with some provisions of the Act is not as necessary in their case as in the case of companies which have been formed with the profit motive.

Under the new orders, such companies will now be able to hold their annual general meetings not only at any place within the country, but also on a public holiday and even outside the normal office hours.

They need not also file with the Registrar every year, along with the annual returns mentioned in Section 160 of the Act, the names of their members and the respective dates on which they became members and the names of persons who ceased to be members since the date of the annual general meeting of the immediately preceding year. It will not be necessary for these companies to publish their names strictly in terms of Section 147 of the Act; they will be free to indicate their names in a manner suited to their needs.

Fourteen days' notice, instead of the twenty-one days' notice which normally is required, would suffice in the case of these companies for the purpose of calling their annual general meetings. Similarly, it will hereafter be enough if such companies preserve in good order their books of accounts for four years, instead of eight years as prescribed in the Act.

By virtue of another exemption, a person intending to stand for election as a director or any member intending to propose him for election as a director will

not have to leave at the office of the company any notice signifying his candidature for the office or the intention of such member to propose him as a candidate for that office. For the same reason, a candidate for the office of a director in any of the companies will not be required to signify this consent in writing to act as a director, if appointed. He will, however, have to file with the Registrar, within thirty days of his appointment as director, his consent in writing to act as such.

Persons who have attained the age of sixty-five years will henceforth not be ineligible for appointment as directors of these companies in terms of the exemptions from the provisions of Section 280 and 282 of the Act.

The boards of the companies, by whatever name they are called, need not meet once in three calendar months, as provided in Section 285. It would be enough if they hold at least two meetings in a year. The quorum for a board meeting for such companies has been fixed at either eight directors or one-fourth of the total strength of the board, whichever is less, provided that it must not fall below two members in any case.

It will also not be necessary for these companies to notify the changes in their boards of directors, managers or secretaries at any time during the year. The names of the members of the board, managers, secretaries, etc., are, however, required to be filed with the Registrar once every year along with the annual returns as provided in Section 160 of the Act.

THIRD SILO

An agreement has been signed between the Government of India and the Polish organisation CEKOP, under which the latter would prepare a project report for the construction of a 50,000-ton port silo, either in Bombay or Madras. The report is required to be submitted within three months.

In May, 1960, a credit agreement was concluded with Poland, one of the items being the construction of a silo for bulk storage of foodgrains. Subsequently, a technical team from Poland visited this country to collect data for the preparation of a project report.

India already has two silos (grain elevators) — one at Hapur in Uttar Pradesh and the other, recently completed, in Calcutta. Each of these is of 10,000-ton capacity, but it is intended to augment the capacity of the Calcutta silo to about 20,000 tons. Both these silos were constructed with the aid received from the U.S. Technical Co-operation Mission.

INDIA'S TRADE WITH MOROCCO

A protocol has been signed between the Government of India and the Kingdom of Morocco bringing the trade agreement between the two countries, negotiated in September last, into force from August 1, 1961. The revised arrangements provide for exchange of goods between India and Morocco on a larger scale than previously envisaged, but on a balanced basis. Morocco is likely to offer a substantial outlet for Indian green tea. Non-traditional items like diesel engines and engineering and electrical equipment are also likely to be exported from India. India will be importing from Morocco mainly rock phosphate, lead and cork.

In 1960, India exported to Morocco goods worth Rs. 48 lakhs. Imports from Morocco during this year amounted to Rs. 52 lakhs.

COMPANY AFFAIRS

INDORE MALVA

During the year to December 31, 1960, the Indore Malva United Mills Ltd. improved its trading conditions. To some extent, however, the advantages were offset by the increase in the prices of raw cotton, heavier wage bill and enhanced prices for stores, chemicals etc. During the year under review even cotton output was lower and prices of most varieties of cotton pierced ceilings. Import of foreign cotton, though, rendered the situation slightly better.

The Directors point out that as a result of an improved demand in cloth and yarn, the stock returned to normal. The Government of India urged the industry to reduce the prices of cloth and it affected this company considerably because it has been manufacturing cloth of coarse and medium counts.

The Company has started producing additional yarn to cater to the fast growing demand of the decentralised sector of the industry. For this purpose the mills have started running third shift of its spinning section since May 1960.

The profit during the year, after providing depreciation for the years 1958-1960 and development rebate reserve, comes to Rs. 16.94 lakhs. The Directors have proposed a dividend at the rate of Rs. 8.50 per share subject to deduction of tax.

NEW FLOATATIONS

Consent to the issue of capital of Rs. 943.74 lakhs was granted by the Controller of Capital Issues (during the period 15th May to 15th June, 1961). The amount was divided among 18 companies.

Consents for a total of Rs. 1 crore or more have been granted to the following three companies:

- (1) Mysore Paper Mills .. Rs. 1 crores
- (2) United Malleable Co. Pvt. .. Rs. 1.25 crores
- (3) Asian Cables Corporation .. Rs. 1.55 crores

The three companies, which have foreign collaboration, are: (1) Asian Cable Corporation, (2) T. I. Miller Private and (3) United Malleable Company Private, the share of their collaborators being Rs. 55.00 lakhs, Rs. 2.50 lakhs and Rs. 4.00 lakhs respectively.

The following are the companies in which Government participation in share capital is more than fifty per cent, in respect of which the consent by the Controller of Capital Issues was granted during 1960:

Name of Company	Business	Amount consented to (Rs. lakhs)
The Singareni Collieries Company Limited.	Production of non-coking coal	531.78
Neyveli Lignite Corporation Limited	Mining of lignite etc	1,900.00
National Coal Development Corporation Ltd.	Raising of coal	1,500.00
Pyrites and Chemicals Development Co. Ltd.	Prospecting and exploring of mines	100.00
National Industrial Development Corp. Ltd.	To promote and operate schemes for the industrial development of India	15.00
Bolani Ores (Private) Limited	Raising and supplying iron ore	30.00
National Mineral Development Corp. Ltd.	Production of iron ore	200.00
The Hutti Gold Mines Company Limited	Gold mining	19.50
The Kalyani Spinning Mills Limited	Manufacture of cotton yarn	250.00
Assam Spun Silk Mills Limited	Spinning of silk yarn and oil	66.00
Tungabhadra Steel Products Limited	Fabrication of iron and steel structural, castings and forgings	50.00
Hindustan Aircraft Ltd. Heavy Electrical Ltd.	Aircraft project Manufacture of heavy electrical equipments	519.75
Radio and Electricals Manufacturing Co. Ltd.	Manufacture of radios, electricity meters and extrusion of plastic wires, cables, etc.	858.00
Hindustan Teleprinters Limited	Manufacture of teleprinters and ancillary equipments	75.00
Hindustan Organic Chemicals Limited	Manufacture of basic chemicals	70.00
Andhra Pradesh Fertilizers & Chemicals Ltd.	Manufacture of nitrogenous and mixed fertilizers	200.00
Hindustan Chemicals & Fertilizers Limited	Fertilizer factory	969.70
The Fertilizers Corporation of India Limited	Production, distribution and research relating fertilizers heavy chemicals, heavy water, etc.	393.55
Indian Refineries Ltd.	To construct, operate and maintain and control oil refineries	800.00
Hindustan Housing Factory Limited	Production of pre-cast and pre-stressed concrete and ordinary reinforced concrete products for building industry	5.00
National Instruments Limited	Manufacture of scientific and precision instruments of all types and descriptions	90.52
National Building Construction Corporation Private Limited	Construction of buildings, roads and other civil works throughout India	15.00
National Projects Construction Corporation Ltd.	Execution of work on the river projects	5.00
Assam Government Marketing Corporation Ltd.	To undertake the marketing of small scale industries	20.00
Andhra Pradesh Industrial Development Corporation Limited	Development of large and medium scale industries	100.00
The Eastern Shipping Corporation Limited	Cargo services	580.35
The Western Shipping Corporation Limited	Shipping trade	1,005.00
TOTAL:		Rs. 13,950.21

As already reported, the Eastern and Western Shipping Corporation are being amalgamated into one Corporation. It is expected that the new company will be incorporated on October 2, 1961.

COMMODITY NEWS AND NOTES

SUGAR PRODUCTION

According to the Indian Sugar Mills Association the Sugar Production during the month of June 1961, was 43,000 tons as against 2,000 tons during the corresponding period last season. This brings the total production for the season 1960-61 upto 30-6-1961 at 29,49,000 tons as against 24,01,000 tons produced last season by this date. The off-take of sugar from factories during the month of June 1961, was 1,89,000 tons as against 1,98,000 tons during the corresponding period last season. The total despatches including despatches for exports upto 30-6-1961 were 14,23,000 tons as against 1,24,000 tons by the same date last season. The total closing stock of sugar with factories on the 30th June, 1961, was 20,65,000 tons as against 12,19,000 tons on the same date last season.

WHEAT PRODUCTION HIGHEST EVER

An all-time record in production and an increase of 8.2 per cent in yield per acre over last year's figure are features of the 1960-61 All-India Final Estimate of Wheat. According to the Directorate of Economics and Statistics of the Ministry of Food and Agriculture, the area covered by wheat and the production of this cereal in 1960-61 were 31,751,000 acres and 10,648,000 tons, respectively. Compared with the partially revised estimates for 1959-60 of 32,542,000 acres and 10,089,000 tons, the estimates for 1960-61 show a decrease of 791,000 acres in area, or 2.4 per cent, but an increase of 559,000 tons, or 5.5 per cent, in production. The yield per acre works out at 751 lbs. as against 694 lbs. last year. Decreases in area in 1960-61 were reported mainly from the States of Rajasthan, Madhya Pradesh and Gujarat, while increases occurred in Uttar Pradesh, Maharashtra, Punjab and Mysore. Production rose mainly in Uttar Pradesh and Punjab, due to increase in area and to favourable weather conditions during the growing period of the crop. It fell in Madhya Pradesh and Rajasthan.

REBATE OF EXCISE DUTY ON EXPORTED GOODS

The Government of India have decided to extend the procedure under the Central Excise Rules of export out of India articles under claims for rebate of duty on the goods used in their manufacture, to Cotton Ropes as well. The Cotton Yarn component in the ropes will be eligible for such rebate. This concession is already applicable to ready-made apparel, tents, sugar products, cotton bags, umbrellas, chaddars, pillow cases, table covers and several other articles.

Manufacturers of Cotton Ropes who wish to export them under this procedure may contact the Collector of Central Excise in whose jurisdiction their factory is situated, for further information.

ALL-INDIA FINAL ESTIMATE OF DRY CHILLIES 1960-61

The All-India Final Estimate of Dry Chillies, 1960-61 puts the current year's area and production at 1,492,000 acres and 363,000 tons respectively, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. As compared with the partially revised estimates of 1,472,000 acres and 337,000 tons for 1959-60, the estimates for 1960-61 show an increase of 20,000 acres or 1.4 per cent in area and 26,000 tons or 7.7 per cent in production. There is slight increase in the overall acreage under chillies. The increase in area has been reported mainly by the States of Rajasthan and the Punjab due to favourable weather conditions at the sowing time. The increase in area has, however, been offset to some extent by the decreases reported by Andhra Pradesh, Maharashtra and Mysore. The increase in production during the current year is accounted for mainly by Rajasthan and Maharashtra and to some extent by the Punjab and is attributed mainly to favourable weather conditions during the period of growth of the crop.

ALL-INDIA FINAL ESTIMATE OF BARLEY, 1960-61

The All-India Final Estimate of Barley for 1960-61 shows that in spite of a decrease in acreage the current year's production of the crop has increased as compared to last year's, thus showing a higher yield per acre. According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the current year's area and production are placed at 7,916,000 acres and 2,734,000 tons respectively. As compared with the partially revised estimates of 8,345,000 acres and 2,674,000 tons, the estimates for 1960-61 show a decrease of 429,000 acres or 5.1 per cent in area but an increase of 60,000 tons or 2.2 per cent in production. The decrease in area during the current year has occurred mainly in the States of Rajasthan, Bihar, the Punjab and West Bengal and is attributed generally to unfavourable weather conditions at the sowing time. The increase in the current year's production is accounted for mainly by Uttar Pradesh and is attributed to favourable climatic conditions during the growing period of the crop. This increase in production has, however, been offset to a considerable extent by the decrease reported by Rajasthan and Madhya Pradesh.

The Comic Crisis and Economic Confusion

THE curious, almost comic, crisis in Delhi, revolving round Mr. Manubhai Shah, Minister of Industry, and the reshuffling of the portfolios in the Ministry of Commerce and Industry, which has absorbed all Delhi this week carries only one immediate advantage to the country. This is that it has shown, or at least has purported to display, an immediate recognition of the need for India's export promotion policies to be drastically recast. If this were the prelude to action of a dramatic kind, it might be reckoned an advantage worth the price in distracted thinking which has occupied at least five days of the week. That a crisis in exports exists one need not deny; the comedy was in the supposition that it could be resolved merely by two ministerial transfers. Nevertheless, it is a blessing in disguise that in the highest place of all it is now recognized that our export effort has to be revolutionised. It is, however, not merely our export effort which needs thus to be challenged today and every day; nor can a mere personal equation (however vigorous the personalities involved) change the fundamentals of India's current inadequacies. Following last week's Leading Article on 'Accent on Accelerated Growth', it is necessary this week to indicate at least three of the directions where fierce and unrelenting effort is necessary if India is to break through the obstacles which keep her at the bottom of the international table in economic growth.

To deal with exports first, since they have acquired current topical interest, more than the other weaknesses of the body economic, one need only point to the historical fact that India has reached a high cost structure so early in the industrial race that her capacity to export, albeit with rising internal production, has never been commensurate with her rise in production. It is not generally known that the Indian Index of Industrial Production, with base 1951 = 100, underestimates over the decade India's rise of industrial production by something like 30 per cent. Between 1951 and 1960 India's industrial production, according to the latest calculations of the Indian Institute of Public Opinion, rose to 110 per cent as against a little over 70 per cent in the official

index; even this takes insufficient account of entirely new industries not weighted at all in the official index. The fraction of these industrial exports which have found their way abroad is so petty as hardly to deserve either study or correlation with this seemingly impressive rate of industrial progress. The reason for failure is simply that, with a domestic market yielding such high prices, both the incentives and the feasibility of exports at low prices abroad have been small. In the net result India continues to operate on the basis of an inefficient high cost structure of industry in a world in which her vital balance of payments problem depends immediately upon her building up a surplus to repay her foreign loans.

It is obvious that production by itself is not enough, though since our rate of economic growth is still so low in comparison with all the countries noted in the table last week, there is need for more, and not less, internal production. For exports, however, productivity and low cost output is more important than the total volume of production, meaning, in fact, that India will only be able to balance her payments when her structure of costs is such that she is competitive on an international basis. The means to productivity is not all labour-saving; indeed in many cases an approach to productivity might well mean more employment, not less. In a Special Article in *The Eastern Economist* written by Morris J. Solomon in the issue of February 17, 1961, it was pointed out that, even in India's best factories, actual time at which machines were fully operated was somewhat less in most cases than half a working shift. Labour has little to do with these errors which are the basic responsibilities of managements, though there are a wide number of cases where labour is unwilling to raise productivity when management applies the higher norms required by improved technology.

It is obvious except to the blind that much of the non-competitive character of Indian industry has been caused by Government regulations which restrict competition within or discourage improved technology otherwise called rationalisation. The idea that great pools of Indian industry

can be kept stagnant in order to maintain employment and, at the same time, Indian industry can meet its payment liabilities is Utopian. India's surplus, in order to repay her foreign loans must arise from efficient exports. Whether these can subsist or not alongside inefficient industries provides a nice academic debate. Professor Galbraith argues that both conditions must co-exist. There is something to be said for the maintenance of employment at almost any price. But where a ring of restrictions have to be inserted round efficient industry in order to maintain inefficient operation, the total effect on the economy must mean that India's rate of economic progress will be further reduced and her balance of payments problem left more obdurate than ever. Fortunately efficiency cannot be pursued everywhere at the same time; but we need not strive officiously (and officially) to keep inefficiency alive.

It should be clear that the rate of economic progress in the Indian Union can now only be substantially raised well beyond the target of the Third Plan by releasing energies on a scale far exceeding those now impounded. In the first place, the bottlenecks of power and transport must be allowed to be opened by the private sector if the public sector is unable, as it has patently shown, to provide adequate plants and efficient working. For this purpose there should be no objection to the private sector being allowed to import power plants provided it arranges its own foreign exchange, and the servicing charge in terms of foreign exchange is compensated fully by additional export earnings. The breaking of bottleneck in the power field would be a major release from the creeping paralysis. Power is a single front of attack.

It is obvious that if progress is to be rapid much the most important factor

should be releasing entrepreneurship from the deadening weight of official scrutinies and sanctions which often take over a year before the blue print of a project begins to be translated into construction. India needs to consider at once a drastic reorientation in its Planning Commission apparatus and the vast range of authorities who have to concur for a single industrial approach. It ought to be possible, within three months of an examination, for all the details of a scheme to be sanctioned and for the necessary arrangements to be made for negotiations on as wide a range as is possible. Similarly, in agriculture which has frequently been our Achilles heels and may still be — now that complacency has invaded another Ministry — there is need for an efficient apparatus of processing by which the needs of agriculturists largely ill-equipped for presenting their grievances to Delhi or State capitals, are anticipated and adequately met.

All this implies a radical approach to current economic thinking in the country. The philosophy of the approach is neither socialistic nor is it opposite. It is primarily to obtain the rapid economic development which other countries have attained by one or other means, or by the virtues of the mixed economy, which we proudly profess, but never exploit. It is essential that before we commit ourselves to the targets of the Plan we should recognise how much more we can do with existing capital equipment and with the freedom which will enhance it in the quickest possible time with no net burden on the balance of payments or on the weaker sections of India's population. The stakes are heavy; the time is short. But the rewards are unlimited. For who can measure the happiness of four hundred and thirty-eight million released in one grand sweep from the crushing burdens of useless and pitiless destitution?

The Battle for Berlin

THIS week the battle for Berlin has been joined. On July 26, President Kennedy asked the Congress of the United States for \$3,500 million in new defence funds in preparation for a possible showdown with the Soviet Union. On July 31, the Congress gave the President full authority to put 250,000 military reservists into uniform and to extend for any period the claim on 2.5 million members of the ready reserves. On the other side, Russia chose Soviet Navy Day to display its naval might in a review stated to be the greatest ever seen, and Marshal Malinovsky's order of the day called for the strengthening of "military discipline and an increase in military preparedness". The gilt is thus on both sides off the gingerbread, and we are in for a gruelling time, in the oven banking new. The Armed Neutrality rises again with the passionate belief that armed might, amongst other things, increases bargaining power at the conference table. No one need deny this as a central principle of high diplomacy, but there are dangerous limits within which the theory of peace-through-strength must be contained.

It is obvious that, while the world is seeing on both sides a stupendous increase of armaments and deeper determination to drive differences to a trial of strength, negotiations must take place before the Soviet Union concludes its treaty with East Germany. These negotiations assume that there must be something to give on both sides.

The real difficulty is that Berlin itself is not negotiable, in that it is generally agreed in the West that access to Berlin must not be dependent on permission of the East German Government. What then can, in fact, be negotiated? Those who know the pressures behind the Iron Curtain, are well aware of the insecurity on the Oder-Neisse line directly affecting Poland, but indirectly Czechoslovakia, and even to some extent Russia itself. This is as real an issue as Berlin itself. This line has already been guaranteed by the treaty between Poland and East Germany, but the fact that West Germany has not recognised the line implies that it is, by no means, determined. With the German elections due in the middle of September, it is impossible for the Chancellor now to make any concession which would anger the vast refugee vote inside West Germany. But it is not beyond the bounds of possibility that the Chancellor, under strong Allied pressure, might concede that, even after German unification, should it ever come, Germany's border in the East will not be extended beyond the current line. Again, if a treaty is signed with East Germany, East Germany, under Russian guarantees, must provide that there will be no change in the *status quo* in Berlin so far as accessibility and other relevant matters are concerned. It is the view of *The Eastern Economist* that war can be averted by an agreement on these lines. On the other

hand, if agreement is not reached, there should not be any doubt that the West would be justified in maintaining its rights in Berlin at the risk of total war.

This is the time for recognition that countries in the neutral group, in terms of Realpolitik, are unlikely to weigh in the international scene on Berlin. This is not to say that the Neutral Nations Conference at Belgrade should not be concerned with Berlin. It is vital that it should be. But it

is even more vital that, in doing so, it should not create the impression that it is in any way deviating from neutrality. The Russian claim looks so plausible that many Indian observers have been readily deceived; and the Troika is a Trojan horse. It is the path of wisdom, at this hour of crisis, to desist from a course of armchair advice which will be mistaken by our friends on either side. True neutrality should serve as a bridge, not a new irritant which prevents a bridge from being built when anger is mounting on both sides.

Sugar: A Conspiracy Against the Consumer

THE annual meeting of the Indian Sugar Mills Association made it clear that the conspiracy against the Indian consumer of sugar in the form of maintenance of high prices, unbearable excise duty, high cane prices, industrial wages and profits, is to be continued, notwithstanding the fact that the consumer has a vote which apparently is larger in volume than that of cane-growers, industrialists and sugar workers. Any attempt today to deny the existence of a serious crisis in the sugar industry is a triumph of political blindness over economic realities. It is unfortunate that the dynamic Minister for Food and Agriculture, Mr. S. K. Patil, should have made himself the presiding deity of both complacency and political expediency in preventing a quick solution to this growing and unbearable crisis. There is no justification for this conspiracy to be continued.

There is no denying the fact that the sugar mill industry today faces a crisis born out of its own abundance. The 1960-61 production of sugar is estimated to touch 29.8 lakh tons, which with a carry-over of nearly 5 lakh tons from the previous year brings the total availability of sugar this year to around 35 lakh tons. Allowing for exports to the tune of 3.5 lakh tons, internal consumption of the order of 20 to 21 lakh tons and a carry-over of 5 lakh tons to the next year, there remains a balance of 6.5 lakh tons stock to service which the industry's resources have been strained to the utmost. Mr. Patil may prefer to call the problem created by this surplus stock anything but a crisis, but the situation obviously is a serious one and calls for immediate attention.

A solution of the crisis created by the current surplus production of sugar has, in fact, been long overdue. It had become apparent as long back as March last that the country this year would have sugar output of the order of nearly 30 lakh tons, which would create a difficult problem unless energetic action was taken. But the measures taken so far by the Union Food and Agriculture Ministry and the industry to relieve the situation have only been half-hearted and leave much to be desired. It is time that all heads are put together to hammer out a solution to the problem.

The current sugar crisis has obviously been caused by the incentives given by the Government to the industry and the cane-growers in the shape of 50 per cent rebate in excise duty on production in excess of the previous year and maintaining of cane price at Rs. 1.62 nP. per maund. That the consumer has been asked to pay for the prosperity of the industry and the cane-grower is a fact that cannot be denied. To expect him to bear any further burden in an attempt to relieve the situation through exports is apparently unjustified. The loss on export of sugar, justice demands, should be borne by the industry, the Government

and the cane-growers who have benefitted by the incentives given at the expense of the consumer.

Exports of sugar alone cannot solve the problem at the present juncture; firstly, because there are limitations on export arising out of India becoming a member of the International Sugar Agreement, and secondly, the high cost of production of sugar is an inhibiting factor. But every effort has to be made to avoid such costly mistakes as have been committed in the matter of exports of sugar to Pakistan. The real solution of the present-day sugar crisis lies in stepping up the internal consumption which, according to the Indian Sugar Mills Association's President, has shown a downward trend during the last two years. High sugar price is undoubtedly an important reason which has hampered increase in consumption despite a growing population. But a far more important factor in our view is the defective and cumbersome system of sugar distribution that has been allowed to continue despite a bumper output. There are still pockets in the country today where consumption of sugar can be appreciably increased even at the current controlled or fair prices, provided the commodity is made available in the required quantities. The cases in point are Assam and Kerala where sugar in the free market is being sold at anything upto Rs. 1.75 nP. per seer. That transport bottleneck is not, in any way, responsible for this situation is apparent from the fact that there are agencies in these areas — trade and others — which are prepared to move sugar expeditiously provided their quotas are enhanced. The first step towards a solution of the current crisis in the sugar industry has thus to be found in abolition of all controls and restrictions on distribution and movement of sugar. This will help in alleviating the distress in the scarcity pockets in the country.

The second step that is immediately called for is the lowering of sugar prices in general — say by about 10 per cent. This can be achieved by reduction in excise duty which was stepped up in 1957 with a view to curb consumption, and some relaxation in price control. It is, indeed, intriguing that the industry which only a year ago was clamouring for price decontrol should be finding serious disadvantages in this remedial measure. The objection of the industry to decontrol of sugar prices at the present juncture emanates from fears that it would lead to slump in the market. The objection is hardly tenable; the fears are unwarranted. If releases of the commodities from factories are judiciously regulated, there is no reason why a calamitous fall should occur in sugar prices. A mild recession in prices, of course, cannot be ruled out. But that will be a good incentive for increase in consumption.

A DELHI DIARY

THE PRESIDENT

ON Tuesday this week, the President left Dr. Sen's Nursing Home and returned to Rashtrapati Bhavan. I have only one impertinent question to ask at this stage. Why was no public hospital in Delhi fit to receive the President in this emergency? There are great medical institutions and the largest of them, near the Safdarjung Hospital, is reputed to be equipped with the latest gimmicks for surgery, therapy and all associated sciences. Can it be that even in a field like medicine and public health, in which the public sector has never displayed a want of resources, that the private sector is still necessary? I ask this question which I think many others in Delhi are asking. Something must be wrong with public hospitals in New Delhi if the Head of the State cannot be committed to their care. For my part, I am by no means against a 'mixed economy' in medicine, but what will the Accountant General say when he finds expenditure incurred on a private institution when a public institution had all the requisite funds for the purpose? For the rest, let me only repeat what I said last week that the President's return in greatly improved health to Rashtrapati Bhavan has been marked by great rejoicing amongst all his admirers.

CONCENTRATION: WHERE?

This is probably not the most tactful time to make an observation in regard to the relations between the President of the Indian Union and the Cabinet, and more particularly the Prime Minister. But, rushing in where angels fear to tread, I make the point that the President does not provide a brake on the Prime Minister. During the week a quite remarkable affair arose in connection with the shuffle of portfolios in the Ministry of Commerce and Industry. People are asking the question as to who advised the Prime Minister hastily to precipitate a crisis in this Ministry on an issue on which some little reflection must have shown that the disturbance was far greater than any possible advantage which may accrue in the short period. Surely we are arriving at a stage where the Prime Minister's personal ascendancy over the political apparatus is fraught with some dangers to the country. In the Preface to his great book "The General Theory" Keynes has drawn attention to the extraordinarily unwise things that the great men are prone to think in isolation. What he said of economics is certainly applicable to politics or to that 'mixed marriage' often called political economy. The truth seems to be that on these matters the Prime Minister is thinking alone. This, if I might speak rashly, is a major error.

ANIMATED SUSPENSE: WHY?

Whether it is an error or not, there is only one opinion on the point that, when a decision has been taken by the Prime Minister, either it should be carried through or reversed without unnecessary speculation or delay. For seven whole days the Press has been kept in animated suspense whether or not to report Mr. Manubhai Shah's acceptance or rejection of the Prime Minister's directions. This is not merely bad for the Press, which has chosen, at least in two cases that I recall, to stand on both sides of the fence, indicating a compromise without being enabled to confirm it. But it is bad for industry not to know with whom to deal, and it is bad for the public at large to speculate on changes in personnel rather than on problems. The real difficulty seems to have been a premature announcement that the change was contemplated; now both the Prime Minister and the Minister for Industry are impaled on prestige issues which make accommodation more difficult. It is sincerely to be hoped that the unwisdom of, firstly, deciding a matter without prior consultation, and, secondly, letting it escape to the Press while reconsideration is being undertaken, will not be repeated again.

COMMON MARKETS IN FASHION

We have now been flooded with common markets and common market talk. I shall refrain from saying 'I told you so' in regard to Britain's entering the European Common Market, which I had prophesied—not that I expect to be called a great astrologer—a fortnight ago. The application is shortly to be made and it seems Denmark is to follow suit. Various noises are appearing from other members of the Free Trade Area, the net effect of which—I again prophesy—will be that there will be several additional members. If the whole European Free Trade Area comes about and the 'Sixes' and 'Sevens' make up the terrible figure of Thirteen, there will, the statisticians tell me, be 300 million people in the greatest market the world will ever see. I can feel the importance of this market, and it does seem to me that other common markets now in fashion are very petty game by comparison. But practically each day this week has produced notes in one paper or another of new Common Market proposals. As far as I can remember, amongst the old contenders was an African common market proposed by both Egypt and Ghana for different reasons. Will some deep scholar of African affairs tell us exactly what is happening on that front? Meanwhile, there has been talk about a South-East Asian common market in which presumably, India is to have a place, though curiously she has not been approached to be a sponsor. Again, there is the proposal that those Commonwealth countries "dispossessed" form some sort of trade association which—to be in the fashion again—is to be called a Common Market. This includes Australia, New Zealand, and presumably, ourselves, and perhaps Canada. Let us call it the Commonwealth Common Market, if Hamlet can really be played without the Prince, and decisions taken without association with the Mother of Parliaments. This does not exhaust the list of the common markets proposed. The latest is a Pacific Common Market which is to have the Philippines, Japan and Canada as Pacific powers, but will (since the Indian Ocean also belongs!) attract India, Pakistan, Burma, South-East Asia and Australia. All this must give the great planners magnificent opportunities for paper planning which, no doubt, they will accept in due measure. But would not it be a good idea for a plan to be prepared before the announcement in the papers that a new common market has been born? Cannot the thought come first and the wishes be based on a more practical understanding of the effects of the Common Markets in question? For my own part, I would like to see India in with the 300 million market in Europe: let us play big or not at all. This might sound snobbish, even a little un-Afro-Asian, but after all where the carcass is, there will the eagles be gathered!

THE PLAN: AUSPICIOUS HOUR?

I am commanded by the Editor to write this Delhi Diary on Wednesday since 'The Eastern Economist' is to make a supreme effort to come out on Thursday evening or Friday morning. I can, therefore, only "think" of a major event which has been planned for Thursday in the Planning Commission, which means that, like so much else, it may not materialise. Nevertheless, the signing of India's Third Plan is fixed for Thursday at 5 p.m. in the magnificent new building of the Planning Commission, happily situated opposite 'The Eastern Economist' Office in Parliament Street. While I am in no position to criticise the Plan, may I say that inconvenient questions are asked that it is to be signed at an auspicious hour? It is launched on its exacting career, therefore, with the blessing of the stars; will it enjoy equal consideration by mortals dressed in all-too-brief authority? Equally, dogmatic, I answer in the negative!

ARGUS.

THE WEEK'S NOTES

British Economy

STRENGTH OF STERLING

MR. SELWYN LLOYD has more than justified the anticipation that he means business in administering a strong dose of monetary as well as fiscal measures to revitalise the British economy. The measures announced on July 25 constitute the first strategy and aim at a tough policy of short-term deflation. But they are to be followed by long-term measures of which the Chancellor has given an indication. It was too much to expect that he should state them in something like precise terms. But there can be little doubt that they are in the offing. The short-term policy aims at restricting expenditure which means a defensive strategy. Positive action will depend upon to what extent the long-term policy will give a sustained stimulus to production. Both the policies will be calculated to aim at imparting strength to sterling—the basic indicator of the health of the economy. Already sterling has started gaining in strength in the London Market and a psychological climate has been created that the question of maintaining its par value is just not open to debate. A change is ruled out. The IMF credit will be ready at hand to meet excess liabilities of external payments, if necessary.

Putting up the Bank Rate by 2 per cent to 7 per cent is a ruthless measure, but ruthlessness is what was needed in the short-run. The flight of short-term capital will be arrested and the strain on the reserve will be eased. The lead given by this hard stroke of monetary policy will be followed up in other ways. The Bank of England has called for additional deposits from the banks. Reduction in their liquidity will restrict bank credit. Then there are to be restrictions on credit for hire-purchase, speculative building, property development and speculative activity in general. Most of the measures announced will show results next year.

Overseas expenditure is to be reduced by 20 per cent next year. Defence expenditure abroad is to be brought into alignment with what the economy can bear. £65 million out of £80 million is spent in West Germany and talks for reallocation are to be opened for which the NATO Council has been given an intimation. Economic aid abroad is not to be cut back, but any increases are ruled out. This means adjusting the rising requirements of aid-receiving countries within the same volume. At home public expenditure will be axed.

The economic regulators authorised by an extraordinary provision in this year's Finance Act have been brought into play in the fullest measure. The surcharge of 10 per cent has been levied on excise and customs duties as well as on the purchase tax on the permissible items. This stroke of fiscal strategy aims at mopping up £210 million worth of purchasing power in a full year.

The weapon which Mr. Selwyn Lloyd is using is double-edged. If its deflationary edge is sharper, the likely inflationary effects cannot be altogether ignored—higher cost of credit producing its repercussions on industrial output and the surcharges perhaps exerting pressure on wages, for instance. The sharp stroke of the axe may bring some measure of recession and unemployment. But the deflationary policy, whatever the extent of its immediate painful results, raises hope for the British economy of early emergence from stagnation. Real expansion, however, will have to await long-term policy for positive stimulation. Britain's decision to seek entry in the ECM is a correct step to put the

era of recurring stagnation behind and to enable the economy to take a big leap forward.

Economic Growth

THE PERIL OF COMPLACENCY

MR. H. V. R. IENGAR'S Madon Memorial lecture of Wednesday last week seeks to put up an unconvincing defence for the tardy rate of the growth of the Indian economy during the first decade of planning. The critical verdict which the slow rate has invited cannot be taken lightly as an indulgence in the denegation of India's economic progress. It is fully vindicated by the substantial shortfall in the target fixed at a moderate point for the Second Five-Year Plan—a shortfall of 7 to 8 per cent in the projected increase of 25 per cent in the national income—even if the remarkable rates achieved by other countries are to be ignored for a moment. Explanations are not lacking for this sizeable underfulfilment of the target. They could not but be taken as plausible in view of the large share of responsibility which must be apportioned to human failure arising from avoidable causes. When growth—consciousness has become a driving force behind the effort for economic development everywhere and it is substantiated by the records in growth rates attained by industrialised as well as economically backward countries in the last ten years, this apologia threatens to create a sense of complacency that we are lagging behind because of factors beyond our control.

Some searching introspection and not complacency would queer the pitch for a determined drive to eliminate the tardiness in the tempo of our growth. Mr. Iengar himself has elaborated the point that a cause of serious concern in our economic policies is the absence of the corrective of a reversal of the pronounced trend of inflation by short phases of deflation. If, as he puts it squarely, at no time during the period of the Second Plan was price inflation punctuated by calculated reduction, it was a serious failure of policy for which human judgment and absence of objectivity ought to share a blame. The Governor's rather elaborate exposition of the monetary policy pursued by the Reserve Bank was perhaps not altogether unconnected with an effort at defence. It is not only the price policy which has detracted from the results of planning in real terms. Recurring failures in the supplies of transport, power, fuel and raw materials have imposed the penalty of keeping installed capacity of a wide range of industries idle. Even now the necessary moral is not being drawn and new capacity is being added in the current plan, while there is no reasonable certainty that under-utilisation of the existing potential will not be allowed to recur. But the major cause of retardation of progress must be found in the lopsided emphasis on the creation of a welfare State, when the foundation of a self-sustaining growth potential is still to be firmly laid.

Russia

THE 20-YEAR PLAN

IT IS an imposing array of targets which highlights the spectacular features of Russia's Twenty-Year Plan—1961-80. The Plan is to be formally approved at the 22nd Congress of the Communist Party in October. The targets, when achieved, will see Russia rise to the position of the world's No. 1 power in economic potential. The confidence has been expressed in emphatic terms that in 10 years' time Russia will exceed the industrial

output of contemporary America. The industrial output is to be raised by 150 per cent at the end of the first 10 years and by 500 per cent when the life of the plan expires. The target for steel at the end of twenty years is pitched at 250 million tons per annum. In agriculture the first half of the plan period will see an increase of 150 per cent and the plan period as whole will achieve an increase of 250 per cent in output. The national income will increase by 150 per cent in the first ten years and by 400 per cent over the twenty-year period, the latter giving an average annual growth of 20 per cent. The shortening of the week to 36 hours is a clear indication that it is technology on which the planners rely to do the trick. Whether the increase in industry will be stepped up precisely as planned is problematic. Total collectivisation of farming raises greater doubts (as evidenced by current failure in spite of the retention of the benefit of private initiative and enterprise) about the target assigned for agriculture. But it would be dangerous complacency to dismiss this tall order of targets as wishful a product of ideology.

The arrival of the millenium is promised after the plan is half way through. Food, clothing, housing, transport, electricity and a wide range of goods and utilities of everyday life are promised free to every citizen. So are education, medical attention, drugs, and so forth. The interesting aspect of the targets and distribution of welfare is that, while a sizeable part of the national income cake will be eaten away by the social services, enough will be left for other normal requirements and also for investment to achieve an average rate of growth at 20 per cent per annum. There is a significant secret let out about the free supply that has been announced — half the income of the earner will accrue in the form of the free provision of goods and services. It is a free supply with payment of 50 per cent of the income. The nation has been warned to bear fully in mind the possibility of imperialist aggression and regular forces as also security forces are exhorted to be ever alert. If thermo-nuclear arms are to be produced for competitive and progressive stockpiling as a defence against imperialist aggression, it is a matter for inference how much the residual national income will leave for rapid improvement in the standard of living. Is the bourgeois contagion of higher standard of comfort (as typified by America) to be resisted as a corrupting influence?

Southern Rhodesia

CONSEQUENCES OF THE REFERENDUM

IT IS idle to pretend that Southern Rhodesia's referendum of July 26 on the new constitution was anything but a farce. Referendum for whose verdict? Among the registered electorate of 83,486, Africans, who constitute 94 per cent of the population, numbered a mere 4,000. The surprise is that in the votes cast 21,846 were for and 4,949 against acceptance of the constitution. With the Africans expected to give their verdict by abstaining from voting, if not en bloc, by an overwhelming majority, the number of adverse votes amounts to a record figure. This is easily a censure on the proposed constitution and in the face of it Sir Edgar Whitehead's claim to the effect that the referendum amounts to a solid verdict of approval is not in the least sustainable. Out of the approximate 5,000 adverse votes, presumably most were cast by the Dominion Party whose grievance was that Africans were allotted 15 seats in the advisory Constitutional Council of 80. In the earlier unofficial referendum, held by Mr. Joshua Nkomo's National Democratic Party, 15,000 votes were recorded — all against the constitution. But even this poll was superfluous.

The Constitution is patently untanable in the long-term perspective. Southern Rhodesia, which is to be a part of the Central African Federation, comprising Northern Rhodesia, Nyasaland and Southern Rhodesia, will retain its present distinct personality as an internally self-governing entity and its legislature will have the power to override any federal legislation by amendments carried out by a majority of two-thirds, the only exceptions being the constitutional position of the Sovereign and the Governor, international obligations and certain loan obligations to Britain to which Southern Rhodesia stands committed. The two-thirds majority is virtually assured for the veto. The Bill of Rights is a paper charter so far as Africans are concerned and the advisory Constitutional Council can be bypassed on the plea of emergency.

It is incomprehensible how Mr. Duncan Sandys — or more correctly, the British Cabinet — believes that a constitution which denies the people's sovereignty can be propped up in a democratic set-up. There was an enlightened section of the white population of Southern Rhodesia which recognized the eventual African rule and argued for adaptation to it over a sufficient period of transition. It is now likely to lose heavily in strength. The drift will cause polarisation on a racial basis and the emergence of the South African spirit is not an imaginary possibility. Whether in the short or long run, the prospect is one of acute disharmony and a bitter struggle for political power.

France

PRIDE AND PRESTIGE

PRESIDENT DE GAULLE has never made a secret of his contempt for the United Nations and, as if to give an emphatic demonstration of his attitude to the world organization, France's representative at the Security Council flatly refused to participate in the debate on the Bizerta dispute, although present at the session. Nothing but a feeling of pride and a sense of prestige, assumed to be France's own by inherent right, can explain the contempt with which President de Gaulle has decided to treat the authority of the Security Council. The United Nations Charter has vested the five permanent members of the Security Council with the veto, but it has not conferred on them immunity from its jurisdiction. Whatever the present weaknesses of the United Nations, its eventual evolution into an effective world authority is the only hope of substituting the method of peaceful settlement of international disputes for the discredited method of war. To put self-righteous considerations of pride and prestige above considerations of respecting the United Nations authority is to do a great disservice of undermining it. The rank discourtesy shown to Mr. Hammarskjöld by the French paratroopers was yet another act not only of a personal affront to the Secretary-General but of disrespect to the organization which he represents. Mr. Khrushchev might be laughing in his sleeve at the acquisition of an ally from an unexpected quarter.

France's readiness to enter into direct negotiations with Tunisia stands in a class outside the conventional settlement of disputes out of court. Her new-found claim that retention of the Bizerta base is vital for the defence of the free world squares ill with this offer. The untentability of this self-imposed obligation apart, it may be interpreted by Tunisia as a preliminary condition for the settlement. The earlier President de Gaulle appreciates that statesmanship lies in abandoning bases where the sovereign power demands their restoration, the better it would be for France to help avert further alienation of Africa where she has a valued stake.

The World Abroad

DO YOU WANT ANOTHER MUNICH?

By
ODYSSEUS

SIR BASIL BLACKWELL, that amiable publisher, and proprietor of the famous book shop on Broad Street, Oxford (to whom so many of us have owed so much, both while and since we were undergraduates at that ancient seat of wit and wisdom), has once more earned our gratitude (and something more, if we buy copies of them) by publishing four volumes entitled "They Saw It Happen", respectively covering the period 55 B.C. to 1485 A.D., 1486 to 1688, 1688 to 1897, and now 1897 to 1940. They are anthologies of eye-witness accounts of momentous events in British history. The first volume began with the inside story of the invasion of Britain by its organiser, Julius Caesar. The new volume begins with a description of Queen Victoria's Diamond Jubilee and ends with Winston Churchill's appointment as Prime Minister in the darkest days of the U.K.'s long (and as some of us hope) as yet unfinished story.

I was particularly interested in this volume because in my various capacities as foreign correspondent, Government of India bureaucrat, and columnist of this journal, I have reported, watched, or commented upon, many of the events recorded.

MYTHS OF OUR OWN TIMES

That events in a distant past should need disentangling from the mythology that has grown up around them, one takes for granted. But perusal of these pages reminds one that there is a mythology of the recent, as well as of the distant, past, and also leads one to fear that we may be in danger of repeating some of the tragic mistakes of the years between the World Wars.

It is, I think, around the "betrayal" of Abyssinia to Mussolini by the Hoare-Laval plan of December, 1935, and of Czechoslovakia to Hitler by Neville Chamberlain at the Munich Conference of September, 1938, that mythology's thickest mists have gathered. The popular belief is that Stanley Baldwin's Conservative-dominated Coalition government sold the Abyssinians to Mussolini, and that Chamberlain's Conservative government sold the Czechs to Hitler — just like that.

Now, before examining the facts, I want to make it clear that I defend neither of these transactions, which revealed British foreign policy as its weakest and most inglorious. At the same time, let us put the blame fairly where it is due. After the holocaust of World War I a natural war-weariness gradually gathered pace. The peoples of France, Britain, and the United States, refused to face the unpleasant truth that with the seizure of power, first, by Mussolini in Italy in 1921, and then by Hitler in Germany in 1933, world peace was threatened by two states whose leaders proclaimed their belief in brute force. Both the USA and the UK had for all practical purposes, disarmed. The USA had retired into "holier than thou" isolationism, that is to say the Americans were ready to tell everyone else to stand up to the international gangsters, but were not themselves ready to stir a finger to help. In the UK, "collective security" became the gospel. The theory was that if any power violated the peace, the powers would declare it the "aggressor" at the League of Nations in Geneva, and would then collectively enforce economic sanctions, and if they proved insufficient, would pool their armed forces against the aggressor. In practice, "collective security" meant that what was every nation's responsibility was the individual responsibility of none.

France certainly maintained a large army, but as was subsequently proved in her early surrender in World War II, that great nation's will to survive seemed to have been undermined by the 1,397,388 casualties that she had suffered in the blood-letting of 1914-18. She became obsessed by the defensive Maginot line mentality, and was so riddled by internal dissensions, with her star dust of political parties and series of toppling nine-pin governments, that she was capable of no positive foreign policy. In the UK, war weariness, combined with the League mystique, led to unilateral disarmament and reliance on "collective security".

"COLLECTIVE SECURITY"

Today, faced with the Communist bloc threat, "collective security" in the form of the North Atlantic Treaty Organisation exists, but between 1919 and 1939, the free countries made no attempt, even on paper, to set up a similar deterrent to Mussolini and Hitler. Malcolm Muggeridge, whose Leftist sympathies make him an unimpeachable witness in this context, described the atmosphere thus in his book "The Thirties" (H. Hamilton):

"Like a reformed drunkard eagerly reiterating his renunciation of drink whenever an opportunity offers, the European Powers continued to assert their pacific intentions, and jointly and severally to swear solemn oaths that they would never under any circumstances again resort to war. Parliamentary candidates vied with one another in proclaiming their enthusiasm for the League of Nations; clergymen made League activities the burden of their sermons and addresses, and sometimes prayers, and the League of Nations Union had on its governing body distinguished Conservative, Liberal and Labour politicians, as well as archbishops and bishops, professors, peers, and other eminent persons. A large amount of propaganda was carried on, most well-intentioned, whose effect was to persuade the public that by supporting the League they would prevent the necessity ever again arising of having to shed their blood in defence of what blood had been shed to gain. The League came to seem like one of those much advertised life insurance policies which the prudent take out to guard against finding themselves in old age forlorn and destitute. Improvident nations which neglected thus to insure against the contingency of war, might have to endure another Armageddon; but the provident ones had their policy, stamped and witnessed and paid up to date, their Covenant to procure them exemption."

It was this state of public opinion (prevailing with local variations throughout France, the UK and the USA) which caused such an outcry against the "betrayal" of Abyssinia when the Hoare-Laval compromise was revealed. But although Sir Samuel Hoare was forced to resign, there was never any possibility of enforcing sanctions against Italy because, while everyone screamed "collective security," no NATO existed to enforce it.

HITLER'S "PEACEFUL CHANGES"

Neither Conservatives nor Socialists are in a position to throw mud at each other in all this. The Conservatives argued that the middle of a depression was not the time to build up armed forces, while the Labour party not only denied the need for them but insisted that the Tories were not to be trusted with armaments.

The failure to stop Mussolini in Abyssinia led directly to the second "betrayal" at Munich. Hitler's rise brought the question of "peaceful change" of frontiers to the fore. Hitler accompanied each breach of the Treaty of Versailles with fervent promises that he had no further claims. But after his successful, unopposed entry into the Rhineland and his defiant rebuilding of the German air force, his peaceful professions were naturally accompanied by threats to devastate any country which opposed him.

At this point some Communist comrade will perhaps remind me that the USSR joined the League in 1934 in order to uphold collective security. True, but since the USSR's policy was combined with Communist propaganda and penetration in the West, no one could trust the USSR's sincerity.

Ironically, the first definite advocacy in an important national journal that the frontiers of Czechoslovakia should be rectified "peacefully" seems to have been made (according to Professor Sir Charles Webster writing in "International Affairs" of April, 1961) in — of all papers! — the "New Statesman" of August 27, 1938. With the honourable exceptions of the permanent officials of the British Foreign Office (headed by the much execrated Vansittart) in private, and of Winston Churchill in public — voices crying individually in the collective wilderness — Chamberlain's policy of appeasement had support for virtually all sections of British opinion. Chamberlain returned from Munich with well-nigh universal acceptance of his belief that the cession of the Sudetenland minority sector of Czechoslovakia to Germany was the necessary preliminary to further negotiations with Hitler to produce a peaceful world. The cheers of the London crowds echoed round the globe. The bitterest critics of Munich were

in neutralist America, yet President Roosevelt's constant exhortations to keep the peace, and his persistent refusal of any material aid if war came, had reinforced the policy of appeasement. The president's own relief was shown by the praise which he gave Chamberlain after Munich.

That we have suffered no "betrayal" over Korea or Berlin, or over the problems of the Congo and Laos, is because a working majority of countries have learned the lessons of Munich. Appeasement of an armed aggressor by a virtually disarmed non-aggressor is suicidal. To disarm unilaterally is not an example of courage and wisdom but of cowardice and folly. If the USA were to give up nuclear weapons today without simultaneous agreement with the USSR, she would merely hand us all, bound hand and foot, over to the USSR. By all means let us work for agreed disarmament, but until it is secured, peace will only be maintained by the closest co-operation between threatened states.

"They Saw It Happen" is so full of well-chosen eye-witness accounts that it may seem ungracious to carp. But as further editions are certain to be published I suggest that the editor, Professor Asa Briggs, of Leeds University, should insert an extract bringing out the points that I have tried to make here, namely, that neither political party can escape blame for failing to warn public opinion that "collective security" without the equivalent of a NATO was merely collective illusion. He, and you, might look at Professor Sir Charles Webster's article "Munich Reconsidered: A Survey of British Policy" in the April, 1961, issue of "International Affairs" (Price 7 sh. from the Oxford University Press, Neasden, London N. W. 10).

WHY TAKE CHANCES?

In what you do every day, you are taking many chances. For example, take the things that you buy in the market. Are you always sure of their quality? Do you get good value for the money you spend?

And yet, you *can be sure* if you know that the goods you buy have been made to a given standard. Standardization benefits not only you, the consumer, but also the producer, the distributor and indeed, the country as a whole.

The Indian Standards Institution has prescribed standards for industrial as well as consumer goods. To manufacturers producing to relevant standards, ISI grants licences to apply on their goods its certification mark which is the guarantee of quality. The next time you buy anything, don't take a chance; look for the ISI mark.

EUROPE'S BOOM AND INDIA'S EXPORTS

From Our Special West European Correspondent

PARIS, July 31.

ALTHOUGH it has contributed to the more cautious mood now reigning in European stock markets, the uncertain international situation has had no effect on economic activity in this region. Professional operators in shares have struck a balance, as best they can, between two contradictory influences: economic news, and notably corporate news, which inclines them to bullish optimism; and political dangers, in Berlin and North Africa, which suggest considerable caution. The point at which they have chosen to strike the balance is quite arbitrary, in that these two opposing influences are totally unconnected and have no common measure. This, in the past, has usually not been the case: Europe's economic problems were generally closely related to her political situation, as during the imperialist period and between the World Wars. Now, however, economics and international politics seem to have got on to two different planes. Current international questions relate to the tidying up of the sequels of a half-forgotten past — the war and colonialism. In economic activity, Europeans are engrossed solely by the future, and not the remote future but the immediate prospect of bringing their living standards up to American levels.

Thus, business men and politicians seem, more than is usually the case, to be living in two different worlds: in one, there is nothing but rising consumption, bigger investments and swelling company profits; in the other, there are the dangers stemming from absurd rearguard actions on the colonial front (Bizerta, Algeria) and from byzantine disputes about the aftermath of the last war. One hears expressed, perhaps somewhat naively, the opinion in the stock market that these two levels, the future and the past, could never really get entangled — that is, the international situation holds no threat for economic prosperity — because, after all, the same contradiction must be evident on the other side, in Russia, where there is the same confidence in the immediate economic future and a similar horror at the thought of its immense promise being clouded by military conflict. "War can't happen when business is so good", sums up the opinion of Continental optimists.

The recovery in the USA is proceeding very slowly, it is true, but then the recession also developed slowly and was not deep; President Kennedy's decision to increase military outlays should stimulate progress from here on. Until this week, activity in the UK, despite the long period of virtual stagnation, had been maintained and was supporting business in Europe and in the developing countries. Now, however, the restrictions enforced by the Chancellor for the sake of the currency might cause a depression unless British export industries are able, thanks to expansion on the Continent and in the USA, to keep industry working at the same pitch for the export markets. Pessimists who doubt that this can be done are predicting a setback in Britain that would constitute a retarding factor for expansion on the Continent and overseas. Business men in the Common Market will be content if the Chancellor's moderately sanguine forecast is confirmed: a pause of six months, followed by a 3 per cent growth rate for the next five years. This is notably slower than on this side of the Channel but — in a period in which the Continent relies less on Britain than Britain relies on the Common Market — it would be enough to ensure that Britain's necessary spell of re-adjustment did not restraint progress abroad.

The prospects for international trade being, therefore, satisfactory, the Common Market economies are confident they can keep expanding faster than was foreseen at the start of the year, although more slowly than was the case last year. The World Economic Survey, published this month by the U.N., gave the following forecasts of percentage increase in GNP in 1961 (with last year's figure in brackets); West Germany 5.5 (8), France 5 (5), Italy 5 (7) and Holland 4 (9). For industrial production it forecast: West Germany 9 (11), France 6 (11) and Holland 6 (13); for Italy it guessed that last year's 15 per cent increase would be approached without being equalled. For the six-nation region as a whole, the Euromarket Commission in its latest report declines to make any pretence at a precise forecast; it had predicted in March that industrial production would rise by 6 to 7 per cent over the year, compared with last year's 12 per cent, yet in its June report it admits that output has grown so far this year by 8 per cent. At all events, it is plain that the long-term European boom continues and, although the pace may vary from time to time, there is no sign of it ceasing.

To judge by the increases in GNP, this boom seems to be more marked in some Common Market countries than in others. In fact, when one separates out the two factors that lead to increase in GNP (on the one hand, the rise in the active population and, on the other hand, the rise in productivity per person employed), it emerges that all the differences from country to country are due to the first factor. The rise in productivity is constant, notable and more or less equal throughout the region. To illustrate: in the ten years of the 1950's GNP rose by 89 per cent in West Germany, 63.5 per cent in Italy and 45.5 per cent in France (against 34 per cent in the USA and 22 per cent in Britain). But in the same period, the active labour force rose by 24 per cent in Germany (because of the refugees), 12 per cent in Italy (because of reduced unemployment) and only by 1 per cent in France. It follows that the increase in productivity per worker was almost identical: 4.8 per cent a year in Germany, 4.6 per cent a year in France and 4.5 per cent a year in Italy. The French Finance Minister, M. Baumgartner, expresses this by saying that growth varies quantitatively throughout the region but is qualitatively the same.

This is an important fact, since it shows that the European boom is solidly based on a long-term investment programme for technological progress that is being implemented at an equal pace in all parts of the Common Market. This constitutes the invisible undercurrent, and the waves on the surface are due to variations in the supply of labour. Gross progress has been slower in France as long as the working population was steady but it will quicken now as the larger post-war generation comes of age. Progress in West Germany was faster than elsewhere as long as the refugee influx lasted, it slowed down when labour became short last year but will quicken again now as tens of thousands of East Germans cross the border. It could slow down for a longer period in Holland, where manpower is scarce, and in Italy where almost all the unemployed who are immediately employable without training are now in work. Yet none of these slowdowns is serious (as was mistakenly thought last year when the

manpower shortage was expected to put a stop to German expansion) because all the time the increase in productivity is maintained, and in those circumstances (as the French case shows) substantial increases in output can continue to be achieved with a stable labour force. Moreover, the Six have just taken the first steps to ensure free movement of labour throughout their region, which could eventually mitigate even the surface fluctuations due to availability of manpower. Thus, the expansion of the Common Market is more assured and more harmonious than the gross figures suggest.

The fact stands that inflationary dangers are created by sustained investment in technology, higher wages and rising living standards, especially because the farming class demands to share in this advance and thus has to be overpaid (in comparison with free market prices) for its production. Fortunately, the payments surplus of the Common Market and the solidity of its members' reserves make it possible to contain this inflationary pressure without clamping down on domestic demand. The Euromarket Commission, accordingly, has just advised members to limit price rises by importing more and by reducing their tariffs. The remark was addressed mainly to West Germany, but it applies to the region as a whole. In France there has been talk of another universal and unilateral reduction in import duties, of the sort that was effected at the end of last winter — despite the fact that France is refusing to hasten tariff disarmament within the Common Market unless her partners agree on a joint agricultural policy. In other words, we would have the paradox of France refusing to grant

a reciprocal reduction in tariffs by more than the statutory 10 per cent to her partners, while she granted an unrequited reduction in tariffs to all the world. Her situation is typical; all the Common Market countries need, and can well afford, freer imports from outside to stifle the inflationary threat contained in their current boom.

The considerable importance of this for India is that it creates ideal conditions for persuading the Continentals to import more from India, thereby easing the pain of an eventual loss of Commonwealth preferences. This situation contributed to the success of the Geneva conference on world textile trade, where the Continentals agreed to buy more Asian yarn, cloth and piece-goods. It will also ensure a good hearing to the Euromarket Commission's proposal to reduce tariffs over a range of tropical produce, including beverages, fruit and food. Some people in India are so busy lamenting the possible loss of preferential access to the limited British market that they are in danger of missing the fact that circumstances have never in a century been so propitious to an export drive aimed at the Continent. For some products, this would have to be preceded by a diplomatic campaign to clear away some of the obstacles (tariffs, quotas and internal excises) to an expansion of Indian trade with this region; the circumstances are eminently propitious for that too. To the extent that a large increase in Indian sales of certain goods to the Continent would entail some contraction of the corresponding European industries, this would be more readily accepted in a period, such as the present, of full employment, technological re-organisation and rising standards.

PROMOTION**

THE latest attempt to encourage India's exports has come from the Export Risks Insurance Corporation, a public sector undertaking set up only four years ago. All delegations which have been sent abroad for purposes of export promotion and all export promotion councils have stressed the need for exploring overseas markets through the relatively new and more scientific technique of marketing research. Indian exporters have not, in the past, made use of this valuable weapon for locating new overseas markets for Indian products. Attempts made hitherto by the Government of India through its embassies to procure marketing data about certain products have often resulted in wooden and ineffective reports which are of no immediate use to the exporter, not the least because they are published so late.

The exporter has, on the other hand, hesitated to investigate many foreign markets for one reason or the other, the most important being the high cost of investigation. Sometimes it so happens that a marketing survey for a particular product conducted by an exporter in a particular land produces negative results. It means that the exporter is forced to incur an expenditure which may not result in locating a new market for him, while it may add to his immediate financial burdens. A couple of such attempts are likely to discourage him because of the time and money involved. The Export Risks Insurance Corporation, having visualised all these obstacles in the path of the enterprising exporter, has planned a new type of insurance policy which would assist the exporter in recovering a part of his expenditure for market development in case the results of the findings are of a negative nature. In the last few days, the Corporation has made known details regarding the arrangements for issuing to the exporters a 'Market Development Policy' which would cover half of any possible loss arising from the export promotion efforts undertaken by the exporter or manufacturer in the initial stages. This is an imaginative application of insurance principles to a complex problem and a new path-breaking approach which would certainly be of great help in locating India's new foreign markets if the Corporation is able to publicise its new schemes widely. Unfortunately, the Corporation has not publicised its activities in a manner which may help it in attaining its due status in the economic structure of the country.

According to the preliminary details made available by the Corporation, it is proposed to issue the new Market Development Policy in three different forms, dealing with three different facets of the problem, namely, (a) the marketing survey (b) the advertising campaign, and (c) the sales promotion activities. Under whatever head the policy is issued by the Corporation, the exporter is assured that 50 per cent of the loss incurred by him will be covered by the Corporation for all the initial export promotion effort which may fail to produce sufficient revenue and may not bring forth even the cost during the stipulated period.

Here is a specific illustration of the policy. Let us assume that the manufacturer or exporter of an oil engine or a fan or a sewing machine feels that a reasonably responsive market for his product can be cultivated in East Africa and for that purpose, he will have to undertake some initial expenditure either by way of

a market survey or publicity or by way of keeping his stocks in that country with some of the stockists or in maintaining a technician or an engineer there. Let us suppose he incurs an expenditure of Rs. 60,000 in that country in the first three years so as to build up an annual sale valued at Rs. 6,00,000. It is supposed that this volume of sales would be sufficient to cover the initial cost of Rs. 60,000. If, however, the events do not turn out to be favourable to the exporter and the actual sales do not exceed Rs. 3,00,000, he will have, according to these tentative computations, suffered a loss of about Rs. 30,000. The insurance policy taken out by the exporter with the Corporation will entitle him to a sum of Rs. 15,000 so as to cover half the loss on initial promotion.

It is not necessary that an exporter should lock up his stocks for Rs. 6,00,000 in East Africa in order to locate the potentials of the market. He can commission a marketing organisation to conduct a marketing survey of the area to find out if there is any potential demand for his product. If the survey shows that the product cannot be sold in that particular market, he would have lost all the expenditure over the survey. ERIC's new policy safeguards him upto 50 per cent of the expenditure on the market survey if the exporter takes out a "Marketing Survey Policy" before placing the order for a marketing survey with the marketing agency. Even if the marketing survey shows reasonable prospects but subsequent sales for one reason or another (which may not be in operation at the time of conducting the survey) do not rise to expectations, the policy not only assures half the cost of the marketing survey but also "an agreed percentage of the value of the ensuing sales made by the exporter in the market over an agreed period".

This also applies to any expenditure incurred on advertising. In order to build up a large volume of sales, the exporter may have gone in for a big advertising campaign and other sales promotion expenditure; if later performance does not come up to expectations, he is entitled to 50 per cent of the promotion expenses as well as 50 per cent of all possible losses which he may suffer if the cost of his sales promotion activities is not recovered by the sales.

For certain products such as engineering goods, it may be necessary to maintain high stocks in a foreign country. Maintenance of stocks is needed not only for display purposes but also for making supplies available on spot to meet urgent demand. If the stocks are not cleared within the expected time, there are likely to be some losses and the Corporation's "stocks policy" covers the exporter upto 50 per cent of any loss on this account.

The new policies being issued by the Corporation need wide publicity so that exporters as well as manufacturers may know the facilities which are available for assisting them in the expansion of the markets for their products. Insurance cover has been available for years for a variety of risks but this particular type of policy being issued by the Corporation is anticipated to be of great use to the businessmen in order to encourage them for extending their promotional activities. This is a positive contribution to the searching problem of raising India's exports and any steps taken in the next two years in this direction cannot fail to show concrete results.

THE BUSINESS WORLD

"High Theme of Economic Progress"

By CROESUS

THERE are very few people in our country who can expound important economic issues in a way that even laymen can grasp the implications thereof. Many are apparently disposed to avoid such issues as "high theme of economic progress", as Alfred Marshall described them. It is this fact which explains why these still continue to form "a mystique intelligible only to the chosen few", although there is no reason why this should be so as Mr. H. V. R. Iengar, Governor, Reserve Bank of India, remarked in the course of an illuminating lecture under the auspices of the B.F. Madon Memorial Fund of the Indian Merchants' Chamber Economic Research and Training Foundation, Bombay. In a single lecture, he discussed the question of economic development in India from the point of view of the growth of national income, the maintenance of the stability of the currency and the role of monetary and fiscal policy in stimulating development without endangering stability. One cannot improve upon the summary given by Mr. Iengar himself of what he said to give the gist of his lecture. To quote him, "the rate of growth of national income in India in the last ten years, having regard to the difficulties facing us, could not have been really better; and this growth has been achieved with reasonable stability, though some strains have emerged in the last five years requiring corrective action. But...no one can remain satisfied with the current rate of progress. It is essential to step up the rate of growth, because, at the current rate, it will take us years before even the barest essentials of existence are available to our rapidly increasing population."

No one can dispute these conclusions as such, but, in presenting them, Mr. Iengar chose to have a dig at the critics of the Government and also made no secret about his dislike of those "who are prone to exaggerate our difficulties and to work ourselves into a mood of gloom".

The first shaft that the Governor of the Reserve Bank had at the critics of the present process of economic development was directed towards what he described as "the frequent attempt to denigrate our present rate of progress." He said he was astonished that, "while distinguished foreigners and great organisations like the World Bank paid tribute to Indian plans for economic development and, generally speaking, the manner in which these were being carried out, there should be so much attempt on the part of some of our own people to decry the value of what we are doing." If this is astonishing, one may ask: is it not equally astonishing that we accept all the good things said about our achievements by the foreigners, conveniently forgetting their criticisms and, perhaps, what is worse, not caring to get over the shortcomings pointed out by experts in the field? Had official spokesmen given equal prominence in their pronouncements to the criticisms of the foreigners as to their praises, the psychological reaction from the public might have been different.

Mr. Iengar was justifiably critical of the attempt to compare the rate of growth of income in India with the rates of growth in countries like Germany and Japan and to draw the conclusion that, while these countries are making spectacular progress, Indian achievement has been negligible. The various limitations that a student of economics is confronted with in making a dispassionate comparison of the economic progress made by different countries mentioned by Mr. Iengar are noteworthy. "The size of country, the nature of its resources-endowment and its investment pattern, the importance of export industries in national output and world demand conditions for its export and, finally, the economic state of the country during the base year on which growth rates are calculated", as he said, differ from country to country. Comparison even with countries in a more or less corresponding stage of economic development like Mexico and Brazil is not without its limitations. The density of population, the state of literacy, the political status of the country concerned before growth, and the pet ideologies of the authorities are also factors which influence the course and pace alike of economic progress. In a brief article like this, it is hardly possible to deal with all of these at length, but I would commend to all students of economics to peruse the full text of Mr. Iengar's lecture for a fuller and proper understanding of the subject.

No exception can be taken to Mr. Iengar's definition of the saving of the community as "the quantum that remains between total production, on the one hand, and depreciation and consumption, on the other," but I suppose, it is permissible to point out that the effect saving of the community even in identical situations could differ with the extent of waste involved. If, for instance, there is relatively more waste as unfortunately we have in India—this, I daresay, even Mr. Iengar will not dispute—the quantum of saving would diminish correspondingly—this is important—avoidably. By the same token, it would take sooner to reach a higher stage of economic development if all waste could be eliminated.

At this point, a reference would seem to be necessary to the relation between the rate of growth of savings and that of national income mentioned by Mr. Iengar. The Governor of Reserve Bank said that, in the U.K. and the U.S.A., despite a higher rate of savings (about 10 per cent), the rate of growth of national income has been of the order of only 25 to 33-1/3 per cent of the rate of growth of savings and added that these comparisons would be inappropriate, because "the base of the national income of these countries is very high and even a small rate of growth means a substantial increase in real resources available to the community". At the same time, any comparison ceases to be relevant, it would appear, after a country has reached a very high stage of economic growth. For, while spectacular records can easily be established when the

KRUPP

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-port level-luffing wharf cranes.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

leeway to be made up is very large, the scope for doing so becomes narrower and narrower after fully advanced stages of economic growth.

Be that as it may, after having sounded a note of caution, Mr. Iengar went on to say: "On the whole, taking everything into account, comparison between India and other countries at a somewhat similar stage of economic evaluation seems to me reasonably valid and leads to the conclusion that, seen against the background of economic history, our current rate of progress is by no means unsatisfactory." This is no doubt so, absolutely speaking, but the question remains whether our rate of progress would not have been even more satisfactory, had we taken care to eliminate the several items of waste that have bedevilled many of our projects, as stated already.

There is one particular observation of Mr. Iengar which requires to be carefully looked into. It was, in my opinion, somewhat dogmatic on his part to declare that "one of the major causes for the decline in the Indian economy was the doctrinaire adherence of Government to a policy of 'Laissez Faire'." Apart from the fact that it was a sort of diarchy in 'Laissez Faire'—'Laissez Faire' only for the Britishers but not so for Indians—the era of 'laissez faire' in other countries has had a completely opposite effect. In other words, instead of bringing about the decline, as Mr. Iengar maintained with regard to the Indian economy, there was a tremendous growth in economy in those countries.

Evidently, Mr. Iengar has no quarrel with the present public sector expanding bias in the economic policy of the Government of India, judging from the approving reference he made to the economic progress of Japan as being "partly the result of massive initiative taken by the State in the whole process of economic development and partly the result of the capacity of the people of that country to adapt these to rapid changes in technology." He might well have added that it was also the result of the capacity of the Government of that country also to adapt itself likewise. Instead of that, we find the powers-that-be in our country still clinging to antiquated techniques in the name of handlooms and so called cottage industries. It is perhaps this which prompted Mr. Iengar to describe the effort to push the country up in the direction of technological progress as one of tremendous difficulty.

Broadly speaking, one must agree with what Mr. Iengar said about the role of monetary policy, viz. "that of maintaining reasonable stability in the economy while stimulating development". Translating this formula into figures, he saw no reason for alarm and despondency "in a price increase of 2 to 3 per cent per year for periods, provided it is possible for us to keep the price level steady for a time and possibly to secure some reduction in it at times, particularly in respect of certain essential commodities". It is significant that, although Mr. Iengar tried to explain away the sharp rise of 35 per cent in the wholesale price index between

the 1955-56 average and the 1960-61 average, he had no hesitation in adding that "the continuous increase in price at the rate of about 6 per cent per year, without being punctuated by a reduction in the price level except for temporary seasonal fluctuations of minor consequences could not be ignored". Indeed, he regarded this as "really a matter for concern." Accordingly, said Mr. Iengar: "consistently with assisting the process of development, this need to arrest a further increase in price level forms a focal point of policy for the immediate future".

Proceeding, Mr. Iengar dealt succinctly with the meaning of monetary and fiscal policy and their interrelations. There are two important points that Mr. Iengar made while on this subject. First, he said: "in recent years the public sector activities have become more and more important with the consequence that fiscal policy is assuming pronounced importance in the general shaping of the economy." Secondly, stemming from this, he referred to the need of mutual harmony between fiscal and monetary policies. Pointing to the dangers of a conflict between the views of the Reserve Bank and the Government, he assured his audience that there was complete identity of views between the two and instanced how, before the last budget the Reserve Bank had advised the Government to increase the tax burden and reduce the budgetary deficit and how this advice had been acted upon.

Finally, Mr. Iengar brought out very nicely the point that, although the whole philosophy as well as the investment policy of the centrally planned economies are basically different and are calculated to yield the maximum results in a short period, the social cost and sacrifices involved cannot be enforced in a democratic set up. Hence, while affirming that "no one can remain satisfied with the current rate of progress" and that "it is essential to step up the rate of growth, because, at the current rate, it will take up years before even the barest essentials of existence are available to our rapidly increasing population", he raised the relevant issue: "how to do this without sacrificing individual freedom and the democratic process is the real problem before the country." The answer that he himself gave with reference to this poser will, I have no doubt, form the main theme of the introductory chapter to the Third Five-Year Plan which the Prime Minister is reported to have drafted himself. "What is essential for the success of our plans is that the country must recapture some of the spirit of the patriots—both big men and humble people—who fought for the freedom of India." So also the following peroration: "Let us make no mistake about it; in the field of economic development, we are making definite, systematic progress and are laying foundations on which we can build a more rapid rate of growth. In a short period—10 to 15 years—I am confident we shall have reached a stage of self-sustaining growth which will enable us progressively to make the degrading poverty of the present no more than an unhappy memory." That indeed, is a fine thought to end this piece on.

Business Notes

Foreign Aid

ASSISTANCE FROM THE WEST

Although assistance to the tune of \$2,225 million has been offered by the Aid-India Club for the first two years of the current Plan, firm commitments have been made only for the first year during which India will be receiving aid to the extent of \$1,055 million from the

consortium countries and \$250 million from the World Bank and the International Development Association. No firm commitment has yet been made in regard to the second year during which the rest of the aid offered is to be made available. The lack of any firm commitment in respect of the second year is explained by the fact that the five consortium members other than the U.S.A. have yet to make up their minds and come forward with a matching contribution to the aid offered by the United

States. If they, along with the new countries that may join the consortium, fail to step up their contribution for the second year from the indicated level of \$270 million to \$500 million, the United States may also have to cut its contribution.

According to official assessment, India will be needing from the consortium members firm commitments to the tune of \$3,285 million to see the Third Plan through during the first two years of its operation. The assistance promised so far by the Aid-India Club, therefore, falls short of our requirements by \$1,060 million. This gap, however, has been narrowed down by \$250 million through arranging of credit from the International Monetary Fund.

India's foreign aid requirements for the whole of the Third Five-Year Plan are estimated around \$5,500 million. Of this, \$800 million are expected to be available from the East European countries. Another \$600 million are available as carry-forward from the Second Plan. Approximately \$300 million are expected to be the net inflow of foreign private investment. This will leave \$3,800 million to be provided by the consortium countries, the World Bank and the International Development Association. These figures, however, do not take into account the adverse effect which Britain's joining the European Economic Community may have on India's balance of payments. The foreign exchange requirements will go up to the tune to which India's exports are hampered if Britain joins the Common Market. No firm assessment has yet been made of the quantum to which India's exports are likely to suffer by Britain's entry into the Common Market. As there is always time-lag between initiation and completion of a project, total aid to be committed by the West will have to be something more than \$3,800 million. The Aid-India Club is meeting again in November. It is expected to step up its assistance for the development of this country to the required extent.

Finance

ANDHRA STATE FINANCE CORPORATION

THE INCREASING tempo of industrial development in the Indian Union has enhanced the significance of State Financial Corporations set up only a few years ago. This fact is revealed by the recent annual report of the Andhra Pradesh State Finance Corporation. Between 1957 and 1961, the Corporation's outstanding loans have increased from Rs. 30.42 lakhs to Rs. 81.87 lakhs. Its working has improved in various other ways too. For instance, the loans sanctioned during 1960-61 are considerably more than those during the previous year—Rs. 55.9 lakhs against Rs. 42.0 lakhs. Apart from the increased industrial activity, this encouraging performance is also on account of the fact that the Corporation has liberalised its terms of lending for units established in the Private Industrial Estates. As an experimental measure, the Corporation has agreed to provide them finance upto 70 per cent of the cost of construction of building including services, and 75 per cent of the cost of machinery excluding erection charges. This is likely to provide the necessary incentive to the entrepreneurs to promote new units. The Corporation, however, is aware of the risks attendant on such liberalisation, because it has to function on a commercial pattern by looking to the safety of the money lent. The Corporation has, nevertheless, departed from the traditional financing methods and has assumed more than the normal risk.

The guarantee scheme introduced by the Central Government for approved credit institutions for sharing the risks involved in lending to small-scale industrial

units is likely to be of considerable assistance to the Corporation. A few centres have been selected in each State as an experimental measure where the scheme is made applicable. On payment of a nominal guarantee commission, protection is offered to the lending institutions against the risks involved in financing small-scale units which are inherently weak in their financial structure. One provision of the scheme is that the period of loan has to be limited to seven years. It may be pointed out that the Corporation has been lending normally for periods from 10 to 12 years. It seems the Corporation would not find it difficult to operate within the limits of this guarantee scheme because it would find it worthwhile to take advantage of this facility.

At the annual general meeting of the Corporation, Mr. Bikkani Venkataratnam, Chairman of the Corporation, made a pointed reference to the fact that the conditions during the last 10 years have considerably changed and many of the rigidities originally incorporated in the State Financial Corporation Act might have to be done away with. As an instance he pointed out that the upper limit of Rs. 10 lakhs over which the Corporation cannot lend to a single concern is a provision which might have been desirable at that time, but has definitely outlived its utility now. An amendment to the Act in this connection is an absolute necessity. In view of the widening scope of such lending institutions and the increasing needs of certain industrial units where the requirements go beyond the limit of Rs. 10 lakhs, the amendment is evidently a must.

Exports

ONLY SOLUTION TO EXPORT PROMOTION

"A STABLE price level is essential if the targets of the Third Plan are to be achieved and, to maintain a stable level of prices and remove the existing imbalance deflationary measures of the type already adopted by the authorities, effective action to check tax evasion and a more realistic rather than an ideological fiscal policy are the necessary steps. For we cannot afford to waste scarce resources by putting prestige ahead of real need, by ignoring hard economic facts and by refusing to mobilise productive capital, while we debate the respective roles of public and private enterprises or the merits of capitalism." Such is the note of caution sounded by Messrs. Premchand Roychand & Sons, Bombay, in their latest Annual Market Review, 1960, which is in keeping with the customary high standard that readers have come to expect of this publication.

The observations about deficit financing made by the review are interesting. Making a comparison of the amount of deficit financing envisaged under the Third Plan with that actually incurred during the Second Plan period, the review remarks that the Rs. 550 crores deficit financing proposed during the Third Five-Year Plan is less than half of Rs. 1,175 crores actually incurred during the Second Plan. A significant point to which attention has been drawn by it is the fact that, during the Second Plan, as much as 64 per cent deficit financing was done in the first two years alone. While this may have enabled the State to get better value for the "created money," because it was exchanged for goods and services before it had full impact on the price level, the review has expressed the view that "a more regulated and gradual release of 'created' money supply would have enabled the authorities to exercise better control over the price level." On the other hand, it apprehends that the extensive tax effort envisaged in the Third Plan may offset this advantage by generating power-

ful inflationary forces by pushing up costs and reducing savings. In the opinion of the publishers, "taxation, both direct and indirect is so high that it has materially reduced the incentives that are necessary in a democratic system to increase per capita production."

The review is particularly critical of the system of export incentives. Such "gimmicks as permitting sale at high profit margin of essential raw materials imported against export earning can only increase domestic costs and, in the long run, hamper exports and not promote them."

It has in this connection put forward a rather common thesis that, once the gestation period of our newly established industries (which has taken longer than anticipated) is over and growing internal competition begins to be effective, the seller's market within the country will disappear and force the manufacturers to find export markets. Plausible as this sounds, we are afraid, the review has overshot the mark in adding that "this is the only real solution to the problem of export promotion."

Machine Tools

OUTPUT UP

THE PRODUCTION of machine tools in this country is increasing by leaps and bounds. While the production was valued at only Rs. 50 lakhs in 1951, it rose to Rs. 10 crores in 1960. The major contribution, of course, has come from the Hindustan Machine Tools which earned the praise of the Advisory Mission from Britain as far back as 1957 that called it a first class unit in the light-medium range and now of the Prime Minister who visited Bangalore recently. The congratulations offered by Mr. Nehru to Hindustan Machine Tools Ltd. will be widely echoed. This by no means is less of an achievement that there has been created a second factory from its own internal resources and without any foreign technical assistance. During 1960-61 Hindustan Machine Tools produced 1,000 machines against the plan target of 400 machines, thus exceeding the Plan target of 250 per cent. Whether the example set by Hindustan Machine Tools will be followed by other public sector industries is still to be seen. It can well be that those factors which have given it characteristic ascendancy may not come together in other ventures, but that does not mean that efforts should not be made in right earnest. The pleasing precedent that has been set at Bangalore can certainly be emulated.

It is encouraging that to obtain a sizable increase in indigenous production, which could be related to the effective requirement for machine tools, several schemes have been undertaken. These include doubling the capacity of Hindustan Machine Tools and expansion of the Praga Tools Corporation in Hyderabad for the manufacture of light and medium varieties of machine tools. Among the new manufacturing units to be set up in the public sector, the factory to be set up in Punjab will have a production capacity of 1,000 machine tools per year. The Heavy Machine Tools Plant at Ranchi, which is to be set up by the Heavy Engineering Corporation is expected to have Rs. 8 crores worth of annual output. Schemes are also being evolved to set up two medium type machine tool factories during the Third Five-Year Plan. To improve the quality of indigenous production, the Government has also decided to set up prototype training-cum-production centres in different parts of the country in addition to the assistance already being given through Small Industries Organization. The expectation is that by 1965-66, the value of machine tools produced in the country would reach a figure of about Rs. 45 crores per year, with public sector producing about Rs. 18 to 20 crores, private sector large-scale

units about Rs. 15 to 20 crores and small-scale industrial sector about Rs. 10 crores. The demand for machine tools is expected to be of the order of Rs. 60 crores. This means that machine tools worth about Rs. 15 crores will still have to be imported by 1965-66.

Builders Hardware

PROGRESS AND PROBLEMS

MR. AJOYENDER PAUL, Chairman, Builders Hardware Industries Association of India, pointed out at the seventh annual general meeting of the Association that the builders' hardware industry was well on the road to progress. It has attained self-sufficiency in almost all the items of builders hardware and fittings such as hinges, pad-locks, pad-bolts, tower-bolts etc. Production of all types of hinges had also increased from 9,52,545 in 1955 to 22,04,662 in 1960. And if sufficient quantity of raw material was made available, the Chairman opined, production would be much more. The need of the hour was, however, diversification of production. The urgency of it arises from the fact that the National House Building Programme has been envisaged in the Third Plan period and the export promotion drive had to be strengthened. With the coming into operation of the various steel plants at Durgapur, Bhilai and Rourkela and the one proposed to be set up in Bokaro under the Third Five-Year Plan, it was likely that the steel, shortage for the industry may be removed. And it was, in the interests of the manufacturers that new items such as hydraulic door closure, superior type of butt hinges, cabinet hardware, mortise locks and other door and window fittings required for modern house construction be manufactured.

The industry, of course, had its own troubles—short supply of raw materials being a notable one. And so long as steel plants were not in a position to supply flat products, it was imperative that actual users should be allowed to import raw materials depending upon the availability of foreign exchange. There had also been difficulty in the supply of sheet cuttings and cold rolled steel strips. Since the production of cold rolled steel strips was limited, the Chairman pleaded, that the Government should arrange to issue import licences immediately at least for some quantity to the manufacturers as a special case to keep their factories going.

The position on the export front was satisfactory. The value in rupees of exports of builders hardware had risen from Rs. 19,05,273 in 1956 to Rs. 24,59,944. The decline in 1960 was to be attributed to the fact that there was shortage of raw materials. The Chairman considered that if adequate supply of steel for economic working of factories and supply of steel consumed for exports at retention prices could be ensured, the industry was bound to make a further headway in the export drive.

New Issues

CHEMICOAT LIMITED

A NEW company, Chemicoat Limited, has been set up to carry on the business of vacuum metalising of paper, plastics, yarn fibres, films, packaging materials, decorative materials, radio, telephone, television and other electronic equipment parts and materials. It would also carry on business of manufactures, importers, exporters, dealers in paper, plastic films, natural and synthetic yarns, fibres and films, publicity, decorations of all kinds and other materials coated with metals, chemicals and other substances. The factory of the company will be located in Baroda (Gujarat) and is expected to

go in production in 1962. Technical collaboration has been entered into with Metal Coating Establishment, Vaduz, Liechtenstein. This German firm would supply to the Indian company necessary machinery and spare parts, train Indian personnel in its plant in Germany and supply technical personnel for guidance in the erection and starting of the plant. It will also provide technical know-how for the production of new products. About Rs. 30,000 would be paid as fees to the German concern for the services rendered by it.

The resources of Rs. 33 lakhs are proposed to be raised by going in the market, by a foreign exchange loan to be obtained from the Industrial Credit and Investment Corporation of India Ltd., and by share capital subscribed by directors, promoters, their friends and associates. The present issue offered to the public is of Rs. 10 lakhs consisting of 10,000 equity shares of Rs. 100 each. With application Rs. 25 per share will have to be paid and on allotment again Rs. 25. The balance will be paid by two calls of Rs. 25 each. Applications must be made for a minimum of five shares and a multiple thereof and in all cases must be accompanied by a remittance of the amount payable on application. The subscription list will open on August 7 and will close on August 12 or earlier at the discretion of the Directors, but not before August 9. The capital subscribed by Directors and their friends is also of Rs. 10 lakhs. Loans by the ICICI is to the tune of Rs. 13 lakhs and will bear an interest at the rate of 7½ per cent per annum payable in half-yearly instalments commencing from November, 1963 and ending on 1st November, 1970. The response of the public to this issue is likely to be favourable on account of the developing market in India that may be able to absorb the full output of the company's plant. Tax benefits offered to the company are expected to help the company to a certain degree.

TENSILE STEEL

WITH THE establishment of a factory to manufacture high tensile steel wire at Baroda, a good deal of shortage of this wire is expected to be removed within the country. Tensile Steel Limited have obtained an industrial licence from the Government for this new industrial undertaking. The company has entered into technical and financial collaboration with one of the largest commercial houses of Japan, M/s. Kobe Steel Works Ltd., M/s. C. Itoh and Co. Ltd. and M/s. Shinko Wire Co. Ltd. who will design, manufacture and supply the plants and equipments for the factory.

The authorised capital of the company is Rs. 1,00,00,000. Issued capital is Rs. 45,00,000, consisting of 45,000 equity shares of Rs. 100 each, out of which 15,600 shares have been reserved for allotment to the Company's Japanese collaborators. Out of the balance 29,400 equity shares, promoters, directors, their associates and friends have subscribed 9,994 shares and the Life Insurance Corporation of India to 5,000 shares. The balance of 14,406 shares is now offered at par for public subscription. The entire issue offered to the public is underwritten by the Industrial Credit and Investment Corporation of India and the Devkaran Nanjee Banking Co. Ltd., Bombay.

Since there is a wide scope for the use of this wire in all concrete constructions, a favourable response of the public to this issue is a foregone conclusion. The subscription list which opened on August 3 will close on August 12 or earlier at the discretion of the directors but not before August 7.

Travancore Rayons

FOURTH CELLULOSE FILM PLANT

TO MEET the increasing demand for Trayophane, the Travancore Rayons Limited has plans to instal a fourth

Cellulose Film Plant which will increase the daily production of trayophane to 18 tons a day from the present production of 13 tons. A licence to step up production of rayon yarn to about 18.56 tons per day in terms of 120 deniers from the present production of 6.88 tons has also been obtained by the company and orders have been almost finalised for the plant and machinery. To procure quality raw materials the company is producing important raw materials like sulphuric acid and carbon disulphide. Now, it is proposed that the production of carbon disulphide should be increased by five tons per day by installing an electrical plant before the end of this year. In regard to rayon grade pulp, the company has already received a licence for the manufacture of pulp from cotton linters. The initial capacity of the plant will be 10 tons per day. Production is scheduled to commence by the latter half of 1962.

In order to meet the demand of moisture proof heat sealing transparent film in recent years, the company has stepped up production from two tons per day to five tons by the installation of a new machine. To satisfy the packaging requirements of certain products, a laminating machine will now be installed before the end of this year. One more bag making machine, a new type, called the Simplex Automatic Heat Sealing Type, will be installed in the factory shortly. The company has recently erected a new printing machine capable of printing four different colours. The plans, as they are laid down are of an expanding nature and are expected to give a boost to the company's products.

Hotel Industry

U.S. LOAN FOR OBEROI HOTEL

THE OBEROI INTER-CONTINENTAL HOTEL in the metropolis of India is likely to be completed and ready for occupation in mid-1962, now that the authorisation of loans totalling \$2.3 million (Rs. 1.1 crores) to East India Hotels Ltd., that would remove the financial hurdles existing in the way, has been announced by the U.S. Government. It would make it possible to import the necessary equipment which so far could not be procured on account of foreign exchange difficulties. The construction of the hotel, which will have 350 rooms, besides special suites for visiting dignitaries of high status, was started in 1957.

Of the American loans, one for \$717,000 (Rs. 34 lakhs) in U.S. currency is being given by the U.S. Export-Import Bank to meet foreign exchange needs. The other loan for Rs. 76 lakhs is in Indian currency to meet local costs. This is being provided out of the PL 480 counterpart funds. The Oberoi Hotel will also receive services from Inter-Continental Hotel Corporation of New York, a subsidiary of Pan-American Airways, by becoming a part of international group of hotels.

This hotel on its completion would compare with any first rate hotel in the world and would help increase facilities for tourists.

Oils and Oilseeds

RISING COSTS

ALTHOUGH THERE has been a general rise in the prices of all commodities, the price increase in respect of oils and oilseeds has been of particularly serious proportions. Thus, when the wholesale prices of raw cotton in 1960-61 were a bare one per cent above those in the first year of the Second Plan and those of sugarcane only 12 per cent higher, the corresponding rise in the wholesale prices of groundnut was as much as 32 per cent, while that in the case of copra it was even higher at 60 per cent! A price rise of such a magnitude in the case of any commodity, let alone oils or oilseeds, is bound to impair our competitive capacity. To take the

ASP/ST-20

case of copra, the price of indigenous copra was as much as Rs. 1,530 per ton, as against only Rs. 820 per ton in Ceylon.

As Mr. J. R. D. Tata, Chairman of Tata Oil Mills Co. Ltd., has observed, the Indian growers might benefit more by this higher price—a fair price for their copra not only compensating them adequately for their investment and labour, but also encouraging them to increase production by planting more trees and improving their yield—but, then, as he added, "there is no justification for copra prices consistently soaring above the prices of other agricultural raw materials in India" like this.

As Mr. Tata suggested, prices have to be brought under control either by increasing indigenous production or by importing or by a combination of both. It is, however, evident that an immediate increase in the indigenous production is not possible. Nor can imports be increased, as the Government is unwilling to sanction large imports in view of the foreign exchange crisis. When appreciating this plight of the Government, the soap industry offered to release a substantial quantity of groundnut oil for export, provided it was allowed to import an equivalent quantity of cheaper oils, such as palm oil, one thought the authorities would readily seize the offer. For, on balance, the country would have gained in foreign exchange, but, for some inexplicable reason, the Government did not favour the proposal. What will happen at this rate is that Indian soaps, which are already uncompetitive in the foreign markets, will become much more so. This is a strange way, indeed, of promoting India's exports.

Jute

HIGHER OUTPUT

THE CENTRAL Supervisory Body for Jute at a recent meeting in Calcutta was apprised by the representatives of the State Governments that there had been a general increase in jute production. It was estimated at about 25 per cent in West Bengal, over 50 per cent in Bihar, 35 per cent in Orissa, almost 100 per cent in Uttar Pradesh and 66 per cent in Tripura. Since the weather has been favourable, the yield per acre is expected to be better than last year. The estimate of the acreage under mesta, which normally accounts for roughly 25 per cent of the total fibre supply, however, is not yet available.

At the meeting, it was emphasised that the minimum price for jute every season be fixed well in advance of the sowing time. Although the statistical position of jute was such that any possibility of the prices of the fibre being depressed could be ruled out, the States' representatives were of the view that some firm indication of the floor price even for the 1961-62 crop would be welcome. This they thought would not only inspire confidence but would also help in carrying on the campaign for intensive cultivation of jute. The floor price for jute, of course, must be in parity with world price of jute goods as jute industry will have to sell its pro-

duction in world markets in highly competitive conditions. Particular attention was drawn towards the jute industry in Pakistan, the comparative costs of which will have to be borne in mind. In this context, it may be pointed out that the IJMA have already submitted to the Central Government a buffer stock scheme for jute, which would ensure effective price support.

Import Policy

IMPORT OF GIANT TYRES, TUBES AND FLAPS

The Union Government, it is learnt, has now decided to consider applications from State Transport Undertakings, Transport Co-operative Societies and owners with a fleet of at least 25 vehicles for import of giant tyres, tubes and flaps of different sizes from rupee payment sources. The Controller of Imports and Exports will entertain applications for the import of tyres, tubes or flaps of the following sizes:

- 9.25 x 20 of 10 x 12 ply ratings
- 7.50 x 20 of 10 x 12 ply ratings
- 9.00 x 20 of 10 x 12 ply ratings

The current import policy provided for import of these items through established importers. Such imports from rupee payment sources have also been allowed through the State Trading Corporation of India.

The supply position in respect of giant tyres and tubes has considerably eased and adequate supplies are now available with the State Trading Corporation. With the decision of the Government to allow imports by State Transport Undertakings, Transport Co-operative Societies, etc., it is hoped that these items will be freely available to all consumers.

IMPORT OF NEWSPRINT

The Government of India has decided to permit newspaper establishments to utilise their licences valid for import of newsprint from rupee account countries for importing newsprint from the United States and Canada as well upto 50 per cent of the face value of these licences. Hitherto, newspapers, whose entitlement was 100 tons or above, were given licences to the extent approximately 33-1/3 per cent for imports from free sources and the balance of 66-2/3 per cent from rupee payment countries against contracts entered into by the State Trading Corporation.

Imports from U.S.A. will be made against free foreign exchange, which will be released for the purpose. Imports from Canada will be allowed under the Colombo Plan Aid Programme. Licences for import of newsprint from Canada will be issued to newspaper establishments or the State Trading Corporation on the basis of c.i.f. value, with the endorsement on the Exchange Control copy that they will be permitted to remit exchange to the extent of 15 per cent of the face value of the licences towards freight and insurance charges (provided insurance is not done through Indian companies). The face value of the newsprint will be paid to the supplier in Canada by the Canadian Government from the Colombo Plan funds.

FROM THE CAPITAL'S CORRIDORS

ALUMINIUM IN THE THIRD PLAN

FOUR new aluminium projects have been approved by the Government of India. Three of them envisage setting up of new aluminium smelters, two in the private sector and one in the public sector. The fourth project relates to the expansion of a private sector aluminium manufacturing unit now under construction.

The expansion of the aluminium industry under the Third Plan to over 87,500 tons output envisaged initially under the Third Plan has been necessitated by an assessment made by the Committee set up some time ago by the Union Ministry of Commerce and Industry under the chairmanship of the Senior Industrial Adviser, Mr. G. P. Kane. This Committee has come to the conclusion that total requirements of electrical grade aluminium by the end of the Third Five-Year Plan will be of the order of 55,000 tons per annum, made up as follows:

	(Tons)
(i) Transmission and Distribution Lines	40,000
(ii) Bus bars and die-castings	6,000
(iii) Substitution in power cables and house wiring	5,000
(iv) Miscellaneous	4,000
TOTAL	55,000

The requirements of commercial grade aluminium for various industrial purposes in 1965-66 are estimated as follows:

	(Tons)
Domestic utensils, etc.	25,000
Transportation and aluminium alloys	12,000
Packaging (foils)	7,500
Building construction	4,000
Food, Farming, Sugar Industries, etc.	4,000
Miscellaneous, including, the requirements of steel industries and normal exports	8,000
TOTAL	60,500

The total requirements of aluminium at the end of the Third Plan period thus come to 1,15,500 tons. By then about 10,000 tons of aluminium per annum will be available from secondary sources. The requirements of new metal are, therefore, expected to be of the order of 1,05,500 tons.

In arriving at the above estimate, the Kane Committee, it is understood, has taken into account the following facts:

- There will be increasing use of aluminium in electrical industries in place of copper.
- In the field of domestic utensils and other requirements substitution of copper and brass by aluminium will only be marginal.
- For export purposes only a nominal provision of 1,000 tons per year (as at present) has been made. All other exports of aluminium, whether for discharging the repayment obligations incurred on account of import of plant and equipment for setting up the new units or for earning foreign exchange otherwise in view of the foreign exchange shortage, have not been taken into consideration in arriving

at the above estimate. Exports over and above 1,000 tons per annum will require additional capacity to be set up.

EXPORT POTENTIAL

There is sufficient potential for export of aluminium from India to the neighbouring countries. Messrs. Raynolds, of U.S.A., who have shown keen interest in collaborating in the establishment of a large-sized aluminium smelter in this country, have expressed the belief that the potential export market for Indian aluminium will grow with time just as with the increasing application of aluminium to different purposes the world demand for the commodity is increasing. Annual aluminium imports of the countries in the close proximity to India are estimated at 25,000 tons ingots and 19,000 tons semis out of the total world export trade of 6,37,000 tons ingots and 120,000 tons semis and manufactures. In view of the advantage that India has got in manufacture of aluminium due to availability of bauxite reserves in abundance and owing to comparatively low labour costs, India can very well make its mark in the export market.

There is also scope for stepping up exports of aluminium from India to Communist countries which are generally short of bauxite. Two or three of these countries have already displayed keen interest in entering into long-term arrangements with India for meeting a part of their aluminium requirements.

In view of these facts, the Committee thinks that India, on a conservative estimate, should be in a position to export about 30,000 tons of aluminium per year by the end of the Third Plan. Exports can even be higher if some determined effort is made.

Another consideration that probably has weighed with the Government for allowing higher aluminium manufacturing capacity to be installed is the long period of gestation required for an aluminium plant to come to fruition. The normal gestation period for an aluminium plant is anything between 3 and 5 years.

NEW ALUMINIUM PROJECTS

The following are the details of the four projects approved by the Government of India last week:

(1) **Murari Valda-Reynolds Project:** This project will be located in the Hubli-Karwar region of Mysore State. Its annual output will be of the order of 30,000 tons aluminium ingots. Fabrications will be done to the tune of 75 per cent of ingots output. The exact product-mix will be determined by the foreign collaborators, Messrs. Reynolds, International Inc., Hamilton, Bermuda. It is proposed to produce at this smelter electric grade ingots upto 60 per cent of the total output. Bauxite will be available for this project from Belgaum and the adjoining uncommitted areas in Maharashtra and Kutch. The Mysore Government will be providing 60,000 to 75,000 kw. of power as initial block by 1963-64 from the Sharavathi Hydro-Electric Project. The total cost of this scheme is estimated to be around Rs. 36.934 crores—Rs. 20.063 crores in rupees and Rs. 16.871 crores in foreign exchange. Of the Rs. 20.063 crores rupee expenditure, Rs. 7.37 crores will be available from the share capital and Rs. 12.676 crores will be raised as loans. The foreign exchange component, Rs. 16.871 crores, is envisaged to be provided partly (to the tune of Rs. 4.924 crores) by the foreign collaborators in the form of their contribution to the equity capital of the company. The rest Rs. 11.947 crores will be secured through loans

from the U.S. Export-Import Bank, Development Loan Fund and other foreign financing agencies. The D.L.F. assistance that might be negotiated for this project, it is understood, will not affect the assistance otherwise available from this source.

(2) **J.K.-A.I.A.G. Project:** This project is proposed to be undertaken by J.K. Industries Private Limited in collaboration with Messrs. Aluminium-Industries-Aktien-Gesellschaft (AIAG) Zurich, Switzerland. The smelter will be located at Annapore, near Amarkantak, or at a site near Korba, in Madhya Pradesh. It will have a capacity to produce 20,000 tons of aluminium ingots per annum. They will be fabricated into products like sheets, circles, foils and extrusions. Enough bauxite reserves—it is stated they can support a smelter of the capacity of 1,00,000 tons per annum—are available in the Amarkantak region. The Madhya Pradesh Electricity Board is said to have assured for this project power supply to the tune of 50,000 kw. to start with. The project is estimated to cost about Rs. 20 crores, of which the foreign exchange component will be nearly Rs. 12 crores. The rupee expenditure of Rs. 8 crores is proposed to be met by equity capital to the tune of Rs. 4 crores and raising of loan for the remaining Rs. 4 crores from the Industrial Finance Corporation or from the PL 480 counterpart funds or from other financial institutions or banks. Foreign collaborators will be providing nearly Rs. 2 crores in foreign exchange in lieu of their share in the equity capital. The contribution of the foreign collaborators will be serviced through foreign exchange to be earned by the company by exports of its products. Remaining Rs. 10 crores foreign exchange expenditure is proposed to be met through raising of loans in the United States or from Continental financial agencies and private investors.

(3) **Hindustan Aluminium Corporation:** The capacity of the Hindustan Aluminium Corporation's smelter at present under construction at Pipri, near Rihand, in Uttar Pradesh, is to be increased from 20,000 tons to 50,000 tons per annum. The Hindustan Aluminium Corporation is a public limited company in which Birlas have controlling share. Kaiser Engineers of the United States are the foreign collaborators. Bauxite requirements of this expansion programme will be met from Lohardaga and Amarkantak areas for which mining leases have already been secured. The total cost of the expansion programme is estimated to be around Rs. 18 crores. Another Rs. 11 crores will be required for setting up a thermal electricity plant. The foreign exchange component of the expansion programme is put at Rs. 8 crores. Part of this will be made available by the foreign collaborators in lieu of their increased share in the equity capital. The rest is proposed to be arranged through loans from the U.S. Export-Import Bank or from the Development Loan Fund.

(4) **Public Sector Project:** The smelter to be set up under this project of the Government with technical assistance from Hungary will have a capacity to produce 25,000 tons of aluminium ingots per year.

STEPPING UP COAL OUTPUT

The National Coal Development Corporation proposes to undertake 19 new projects to raise an additional 18.5 million tons of coal per annum during the Third Plan period, instead of 17 million tons as originally envisaged. This output will be in addition to the three million tons to be produced by the Corporation from its Singareni collieries. The increased allocation of coal output by the N.C.D.C., it is understood, is meant to serve as a cushion.

Five countries have offered assistance to the N.C.D.C. for stepping up coal output under the Third

Plan. They are: United States, United Kingdom, France, West Germany and Poland.

The United States has sent out a senior coal-mining adviser to assist the N.C.D.C. in the survey of Ramgarh mines which are expected to yield one million tons of coking coal per annum. A coal washery is also to be set up there. Another team of U.S. experts will be arriving later to assist in the preparation of a project report for these mines.

The United Kingdom will be assisting in the development of coal mines in the Jarandih area where mines were closed down about three decades ago because they were found to be full of gas. Development of this area is expected to result in the production of one million tons of coal per annum.

Poland will render assistance to the N.C.D.C. for undertaking deep-mining in Sudamtih (Jharia) area. French and West German assistance will be available for the development of coal mines elsewhere. Two French experts are already here to advise the N.C.D.C. on various coal matters. Two experts from West Germany are expected to arrive next month.

The Government of India has also received the project report prepared by Soviet experts for the underground mines at Korba. It is proposed to raise a million tons of coal from these mines.

For the development of coal mining in the private sector negotiations for a loan of Rs. 30 crores are understood to have been successfully concluded with the World Bank. Announcement in this regard is expected to be made shortly. The loan will be routed through the Government of India. A World Bank expert, Mr. D. Jeffries has arrived to explore the possibility of assisting the development of Chasnallah coalfields of the Indian Iron and Steel Company. The proposal envisages construction of a ropeway to connect the coalfields with the steelworks.

INDUSTRIAL POLICY RESOLUTION: RELAXATION IN THE OFFING?

The Economic Secretaries Committee, it is understood, has recommended to the Government of India to relax the Industrial Policy Resolution of 1956 so as to promote the manufacture of certain categories of electrical goods in the private sector. Hitherto, manufacture of these categories has been reserved for the public sector. If the Government accept this recommendation, English Electricals, Madras, Kirloskar Jyoti, Mysore, and the Mysore Government's electrical factory would be able to manufacture transformers, electric motors and switchgears in higher ranges. Two other applicants also are likely to benefit by this relaxation. One of them is Westinghouse.

WORLD BANK AID FOR RAILWAYS

Negotiations for a World Bank loan for the development and expansion of railways in India are expected to start in Washington in the middle of next month. The Indian delegation will be led by Mr. Karnail Singh who has got an extension as Chairman of the Railway Board for one year. The Railway Board Chairman, it is understood, is not going to specify any figure for this loan. He will only indicate to the World Bank that the railways' Third Plan of Rs. 1,250 crores involves foreign exchange expenditure to the tune of Rs. 186 crores. It is proposed to be left to the discretion of the World Bank to make available whatever loan it thinks proper.

The 7-member World Bank Mission, consisting of railway experts from Canada, which visited India early this year and had discussions with the Railway Board, the heads of the railway zones and visited the various railway enterprises to assess the progress made by the

railways in the Second Plan period and the possibilities of their expansion in the Third Plan, it is learnt, has submitted its report to the International Bank for Reconstruction and Development. The report, it is understood, is quite complimentary to the working of the Indian railways. The Mission is understood to have appreciated the difficult task that lies ahead under the Third Plan for the Indian railways. It is in the light of this report that the World Bank will be deciding on the help which it can extend in the form of loans for development of railways in this country.

Since Independence, the World Bank has advanced \$328 million in five instalments, for the development of Indian railways. The last instalment of \$70 million was drawn by India in 1960.

It is expected that the new loan which would be negotiated next month will be utilised for import of steel for wagon-building, for implementation of the dieselisation and electrification programme of the railways and for procurement of such equipment which is not indigenously manufactured, either in public sector or in the private sector.

There are also possibilities of some loan being granted by the Development Loan Fund to help the Indian railways to fulfil their Third Plan Targets.

GREATER ALLOCATION FOR RAILWAYS' DEVELOPMENT

Meanwhile, current thinking in the Planning Commission is understood to be in favour of stepping up the allocation in the Third Plan for development of railways by Rs. 50 to 70 crores. This increased provision will be wholly earmarked for laying of new railway lines in the South.

MANUFACTURE OF ELECTRIC LOCOMOTIVES

The first India-made electric locomotive is expected to roll out of the Chittaranjan Locomotive Works next month. The Chittaranjan Works at present have on hand manufacture of 10 DC electric locomotives. The mechanical parts of these locomotives are being completely manufactured and fabricated at Chittaranjan. Only the electric equipment has been imported from abroad.

Plans are on hand to create a capacity to manufacture 60 electric locomotives per year at the Chittaranjan Works, in addition to the normal manufacture of 104 steam locomotives per annum during the Third Plan period. Preliminary work for undertaking the manufacture of AC electric freight locomotives is also said to be progressing satisfactorily.

The first DC locomotive coming out of the Chittaranjan Works will be commissioned on the Central railway system after the usual testing operations.

MANUFACTURE OF SMALL CAR

The Chairman of Renault Corporation, Mr. Pierre Dreyfus, has arrived here for negotiations with the Government of India on the manufacture of Renault's latest model small car Dauphine. The manufacture of this model in India has been recommended by the Pande Committee which has indicated that if 50,000 units of this car are manufactured, the ex-factory price can be Rs. 5,100. If, however, only 20,000 units are manufactured, the cost of production will be Rs. 6,150. The market price of this car on the basis of 20,000 units production per year is estimated around Rs. 7,700.

The French Corporation is expected to provide an adequate loan in foreign exchange to cover the cost of the plant required for setting up this

project. A meeting of the Economic Secretaries was held here recently to discuss the project, but no definite decision could be taken on going in for this project during the Third Plan period. Opinion is yet divided on whether this project should be included in the Third Plan or not. The Union Minister for Industry, Mr. Manubhai Shah, and other officials of his way of thinking are said to be in favour of including this project in the Third Plan. The Planning Commission, however, is understood to be not in favour of this proposition. It is asserted by the Planning Commission that the small car project will not fit into the general conception of the socialistic pattern of society. Moreover, even if the Renault Corporation is prepared to grant adequate loan for financing the purchase of the plant without any liability for repayment during the Third Plan period, the launching of the project is bound to increase India's import bill in respect of raw materials and equipment.

Another argument also is sometimes heard against the inclusion of the small car project in the Third Plan. It is to the effect that if a small car is manufactured in the country, it is bound to affect the saving drive. In the absence of availability of a small car, the middle class people are expected to invest more in Government securities.

INDUSTRIAL LICENSING REVIEW COMMITTEE RECONSTITUTED

The Reviewing Sub-Committee of the Central Advisory Council of Industries has been reconstituted under the chairmanship of Mr. H. N. Kunzru, M.P. The new members of the Committee are: Mr. A. V. Poddar, Mr. A. Ramaswami Mudaliar, M.P., Mr. D. C. B. Pilkington, Mr. N. D. Sahukar, Mr. Karam Chand Thapar, Mr. N. Stenhouse, Mr. S. R. Vasavada and Mr. S. A. Dange, M.P.

The Sub-Committee will review all licences issued, refused, varied, amended or revoked from time to time and also advise the Government on the general principles to be followed in issuing licences for establishing new undertakings or substantial expansion of the existing units.

OIL EXPLORATION IN ASSAM

Formal agreement covering the grant of approximately 1,800 sq. miles, in the vicinity of Naharkotiya-Moran oilfields, for oil prospecting to Oil India (Private) Limited was signed here on Thursday. The agreement on main heads in this connection was signed on May 31, 1961.

The formal agreement has been signed by Mr. M. M. Kohli, Deputy Secretary, Department of Mines and Fuel, on behalf of Government of India, and Mr. M. J. Condon on behalf of Burmah Oil Company and Assam Oil Company. Oil India (Private) Limited was represented by Mr. W. B. Metre.

Under the agreement, Oil India will be reconstituted on the basis of parity between the two partners—the Government of India and the Burmah Oil Company. The foreign exchange requirements of exploration and development of oil in the new concession area will be provided by the Burmah Oil Company. The Government of India will make available the required rupee finance.

LOK SABHA'S MONSOON SESSION

The Lok Sabha is meeting on August 7 for its "Monsoon Session." Two important statements are expected to be made on behalf of the Government; one on the likely impact of Britain's joining the European Common Market and the other on the economic assistance offered by the Aid-India Club for the first two years of the Third Plan.

In all, about 16 new Bills will be introduced in this session. One very important Bill that is to be introduced in this session is to the effect of making disturbance of communal harmony and promotion of enmity between different classes of citizens specific offences. The Bill will amend the Indian Penal Code.

The Representation of the People Acts, 1950 and 1951, are to be amended through a Bill so as to remove certain lacunae experienced in the working of these two Acts.

The scope of the Act on voluntary surrender of salaries is to be extended to make it applicable to all classes of salaried employees. The High Court Judges (Conditions of Service) Amendment Bill, is being brought to provide for grant of death-cum-retirement gratuity, etc., to High Court Judges in addition to pension and additional pension admissible at present.

One bill will define the duties and powers of the Comptroller and Auditor General of India. Another, the Extradition Bill, 1961, will seek to replace the existing Extradition Act, 1903.

The maximum amount payable to victims of passenger train accidents will be increased from Rs. 10,000 to Rs. 20,000, through an amendment of the Railways Act. The same measure, the Indian Railways (Second Amendment) Bill, 1961, will also provide for a minimum and enhanced deterrent punishment under certain sections of the parent Act.

To validate the sugarcane cess levies of some States, the Sugarcane Cess (Validation) Bill, 1961, will also be introduced.

The programme of training apprentices in industry will be regulated through another Bill. Yet another Bill will extend the Industries (Development and Regulation) Act to the State of Jammu and Kashmir.

The slum clearance work in Delhi is sought to be quickened through an amendment of the Slum Areas (Improvement and Clearance) Act. This amending Bill will give protection to Ameldars against eviction. Another Bill will replace the existing Atomic Energy Act, 1948.

Certain amendments are proposed in the Delhi Municipal Corporation Act. The main purpose is to make provision for single member wards for election of Municipal Councillors. For holding elections on the basis of adult franchise in the Union Territory of Manipur, the Assam Municipal Act, 1956, which has been extended to the area, will be amended.

Upto certain specific limits, the deposits of commercial banks are to be insured. For this purpose, the Deposit Insurance Corporation Bill will be introduced. The life of the Newspapers (Price and Page) Act, 1956, will also be extended for a further period.

The Third Five-Year Plan will also be discussed in the next session of Parliament. The other things to come up include the Second and Third Reports of the Commissioner for Linguistic Minorities and the Report of the Aligarh Muslim University Enquiry Committee.

Discussion will also take place on the Tenth Annual Report of the Union Public Service Commission, on the Supplementary Demands for Grants (General), 1961-62, and on the Report of the University Grants Commission for April 1959 — March 1960.

UPGRADING OF CITIES

On the basis of the provisional 1961 census figures, the Government of India has decided to upgrade Delhi from the category of 'B' Class cities to 'A' Class cities. This brings the total number of cities in 'A' Class to three. The other two 'A' Class cities are Bombay and Calcutta.

Varanasi and Agra have been upgraded from Class

'C' to Class 'B', bringing the total number of cities in this category to 11. Twenty-six more cities have been listed in Class 'C', bringing the total number of cities in this category to 90. The new cities that have been listed in Class 'C' are:

States	Cities
(1) Andhra Pradesh	Bandar (Masulipatnam), Eluru, Kakinada, Kurnool, Nellore.
(2) Bihar	Darbhanga, Muzaffarpur.
(3) Jammu & Kashmir	Jammu.
(4) Madhya Pradesh	Raipur, Sagar.
(5) Madras	Nagercoil, Tuticorin.
(6) Maharashtra	Ahmednagar, Akola, Amravati, Malegaon, Nasik, Ulhasnagar.
(7) Mysore	Belgaum.
(8) Punjab	Patiala
(9) Rajasthan	Kotah, Udaipur.
(10) Uttar Pradesh	Mirzapur.
(11) West Bengal	Bally, Burdwan, Kamarhati.

This reclassification is to have effect from July 1, 1961. It is, however, subject to review when the final census figures become available. The reclassification entitles Central Government employees to increased compensatory (city) and house rent allowances.

THE CALCUTTA PROJECT

The Ford Foundation has announced two related grants, totalling \$1.4 million, for solving the problems of Calcutta city. One grant, of the value of \$8,00,000, will be made available for financing the cost of provision of technical consultants to help in building a permanent Metropolitan Planning Organisation for Calcutta. The second grant, valued at \$6,00,000, will go to the Institute of Public Administration in the United States for undertaking urban research and training based primarily on the Calcutta project. The Institute will conduct research on housing and industrial design, urban community planning, utilisation of regional resources etc., on the request of the Foundation's consultants whose services are made available to the Calcutta Metropolitan Organisation under the first grant.

BRIEFS

The Government of India has decided to allocate nearly Rs. 6 crores during the Third Plan period for doubling the output of motor buses and for stepping up the production of motor cars by 150 per cent.

The Kashmir Government has signed an agreement with a Jullunder firm for setting up a ceramics and sanitary fittings plant in the State. The State Government will have 51 per cent share in this undertaking whose authorised capital will be Rs. 1 crore.

The Government of India has released 60,000 bales of cotton for export. This export quota is to be equally divided between Bengal Deshi and other cottons stapling 1" and below.

The Rs. 7.5 crores Ammonia Plant of the Bourkela Fertilizer Project is reported to be fast nearing completion. Production at this plant is expected to start by October. Production to full capacity is expected to be achieved by January, 1962.

The Government of India has approved a contract made by the Assam Government with Sofregaz of France for the engineering work on the transportation and distribution network for natural gas from the Nahorkatiya deposits along the middle Brahmaputra.

DRINK JAY SHREE TEA

COMPANY AFFAIRS

TELCO PLANS EXPANSION

Tata Engineering & Locomotive Company Ltd. during the year to March 31, 1961 recorded a profit of Rs. 146 lakhs, a figure substantially higher than the previous year's profit of Rs. 114 lakhs. The Directors of the Company were able to recommend an increase of 16 per cent over the previous year in the rate of distribution on ordinary shares, i.e. Rs. 14.50 gross or Rs. 10.15 tax free per share subject to relief under Section 15C of the Income Tax Act.

After negotiations with the Government of India, the pattern of the Company's future capital investment has become clear. The proposal submitted to Government to increase the output of diesel vehicles to 24,000 units per year has been approved and a licence has been granted to the Company. The expansion envisaged is of a major nature for which substantial additional funds will be required. A portion of these funds will be available from retained earnings. It is proposed to secure the balance mainly through a long-term credit from the Development Loan Fund to which a loan application for an amount of \$22.89 million has recently been submitted by the Company with the concurrence of the Government of India. The Controller of Capital Issues has sanctioned the issue of 5 per cent mortgage debentures of the value of Rs. 5 crores ranking pari passu in all respects, except date of repayment, with the existing 5 per cent mortgage debentures of the Company.

Most of the plant and equipment for the expansion programme will have to be imported from the U.S.A. in terms of the DLF Loan. For the special production devices and certain essential items that will have to be purchased from West Germany, the Company hopes that the Government of India will find it possible to licence imports under the German Credits granted to India by the Federal Republic of West Germany.

The Company made substantial effort to complete according to schedule the expansion programme and raise the output of automobile division to 12,000 vehicles per annum where the indigenous content was nearly 78.8 per cent per vehicle. Despite this substantial increase in the output of Tata-Mercedes-Benz vehicles during the year under review, the gap between the rapidly increasing demand and available supplies has increased further. Naturally, therefore, the Directors want the expansion programme to go ahead.

Another significant feature, according to the annual report of the Company, is that during the year under review 100 locomotives were delivered, each locomotive having an indigenous content of 98 per cent. The 16-year agreement between the Company and the Railway Board for the manufacture of steam locomotives and boilers came to an end on May 31, 1961. The Railway Board have placed with the Company ad hoc orders to be delivered during the five-year period ending 31st March, 1966.

MULTIPLE SHIFTS FOR TEXTILES

It is common knowledge that the Third Plan has set 5,800 million yards as the target for mill-made cloth. This represents an increase of 800 million yards over the Second Plan target. In order to achieve the target (5,800 million yards) the present installed capacity is

admittedly inadequate and has to be considerably augmented. If only regional considerations are not imported to satisfy certain sections, Mr. Naval H. Tata, Chairman, Ahmedabad Advance Mills Ltd. told the annual general meeting that the existing units themselves could meet the enhanced target, provided the existing units were allowed to have the necessary balancing equipment and work multiple shifts. This would not only be economical but also save much needed foreign exchange that would otherwise be required for textile machinery for establishing new units, Mr. Tata further noted. By multiple-shift working, he said, the textile industry could also absorb as many as 125,000 additional workers. To facilitate this, he, of course, emphasised the need for suitable incentives to industry by way of rebate of excise duty on additional production in excess of the average production of the past few years, even as for diverting for export a part of the increased production.

THE INDIAN OVERSEAS BANK

It is reported that the net profit of the Indian Overseas Bank Ltd. for the half year ended June 30, 1961, subject to audit including the sum of Rs. 1.92 lakhs brought forward from the last year's account, amounts to Rs. 19.97 lakhs.

HONGKONG BANK GROUP INTERIM DIVIDEND

The Hongkong and Shanghai Banking Corporation has declared an interim dividend of 5s. a share on its paid-up capital of 3,161,845 shares (£4,940,383). This interim dividend is a distribution of £790,461 and is unchanged from that declared in July 1960. The Hongkong and Shanghai Banking Corporation is the parent Company in a group comprising the Mercantile Bank Ltd. and The British Bank of the Middle East.

**AUSTRALIA'S LARGEST COMMERCIAL BANK
CAN HELP YOU TO PROMOTE TWO-WAY
TRADE WITH AUSTRALIA,
NEW ZEALAND, AND FIJI**

Want to sell? Want to buy? Want market information? The International Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries.

The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Enquiries may be made through your own bankers or direct to

Association Meeting

INDIAN SUGAR MILLS ASSOCIATION

Presidential Address by Shri D. D. Puri

RECORD SUGAR PRODUCTION AND STOCKS

SUGAR INDUSTRY FACES SERIOUS PROBLEMS OF STORAGE AND FINANCE

In his Presidential address at the 28th Annual General Meeting of the Indian Sugar Mills Association, held at New Delhi on 31st July, 1961, Shri D. D. Puri, President of the Association said:

RECORD PRODUCTION AND CRISIS OF SURPLUS

On the sugar front, we are meeting under the shadow of deep crisis. Every day that passes deepens the shadow. We have moved far ahead of the time when scarcity of sugar was the order of the day. With the shift of emphasis in the Government policy from mere regulatory and distributive measures to maximising production, adopted last year, we have not only turned the corner so far as the availability of supplies is concerned, but paradoxically enough, are now in the midst of what I have called a crisis of surplus.

In the current season production has almost reached the figure of 30 lakh tons. Here is the Third Plan target in the bag, five years ahead of schedule.

STATIC CONSUMPTION TREND

The consumption of sugar on the other hand has not shown the corresponding increase. In fact, contrary to the Plan premises, there was a slight fall last year. As against 20.66 lakh tons in 1958-59, consumption last year was only 20.24 lakh tons showing a decrease of more than 40,000 tons from the previous year. It was expected that this year with increased production and better availability, consumption would pick up. But these expectations have not materialised and the current rate of off-take is practically the same as last year. By the end of June, two-thirds of the current sugar season being over the off-take from factories for internal consumption has been 13.31 lakh tons against 13.28 lakh tons for the corresponding period last year.

HUGE STOCKS CREATE PROBLEMS OF STORAGE AND FINANCE

Increased production accompanied by lower consumption last year left the industry with a large carry over stock of 5.5 lakh tons on November 1, last, against only 153,000 tons a year earlier. Production this year has reached 29.5 lakh tons and with a further addition of about 25,000 tons before the year comes to a close, it will have reached about 29.75 lakh tons. After accounting for the off-take during the remaining part of the year, I do not expect consumption this year to exceed 20.5 lakh tons. This will leave the Industry an unmanageable stock of 14.75 lakh tons (less the quantity exported) at the time when the next crushing operations start.

Unless some satisfactory arrangement is made to solve this problem, the future prospects are indeed bleak. Obviously, at the moment export is the only solution. Exports are possible only at a heavy loss because the World Free Market prices are much below our cost of production. Exports can, therefore, be effected only if adequate compensation for the loss in-

volved is provided, and without exports I shudder to imagine the consequences.

We are thankful to Government for having appreciated this position, as a consequence of which the Food Minister announced in the Lok Sabha in April last that the losses involved in further exports would not be borne by the Industry. On our part, we have agreed to share a part of the loss on exports to the U.S.A. Earlier, we had to meet the total loss on the first one lakh tons already sold for exports. Besides in response to Government's appeal, the Industry agreed to implement the Wage Board Award even though both the export loss and increase in wages were not provided for in the controlled price of sugar.

POSITION REGARDING EXPORTS

The actual exports that we have so far been able to contract for do not, however, give much cause for comfort. We have so far exported one lakh tons to Malaya and West Asian countries. On present indications, it may be possible to export another half a lakh tons this year, besides the U.S. quota of about 2 lakh tons, bringing the total to about 3.5 lakh tons at the outside. This will hardly touch the fringe of the problem. After providing for a carry over of 5 lakh tons, there will still be an exportable surplus of 0.5 lakh tons. This is a burden too big to be carried by the industry and is beyond its maximum financial storage resources. Unless a sizeable portion of it finds an outlet and quickly, the survival of the industry will be in serious jeopardy. The position is getting so serious that the industry may be forced to curtail production in the next season. The next crushing season is due to start in another three months. According to the reports now available, the sowings are even better than last year's, and, if the present favourable trend continues till harvest time, we will have a bumper cane crop to take care of. And, unless a sizeable quantity of the surplus stocks is taken off from the factories through further exports etc., it may not be possible for them to be ready to start crushing in time. Such a development will cause grievous loss to the industry as well as to millions of canegrowers who have been increasing acreage under cane in the belief that there will be a readily available market for their produce. It will also deal a blow to the developing economy of the country.

LOW PER CAPITA CONSUMPTION

But while exports might help in reducing excessive stocks, as a long term solution something has to be done so that the consumption rate internally moves up. It is a well-known fact that our per capita consumption is among the lowest in the World. Against 48.6 kilos in the U.K. and 43.4 kilos in the U.S.A., our per capita consumption here does not exceed 13.9 kilos. This is far short of the level achieved in other countries and

is also much less than the minimum of 20.5 kilos considered necessary for a well-balanced nutritive diet for an adult person in this country. There is, therefore, considerable scope for improving the present low rate of consumption here.

While consumption did increase, though not to the estimated extent, till 1957-58, a contrary trend developed in the last two years to which I have already referred. This is due to the increase in the price of sugar occasioned by increase in the cost of cane and high taxation. That does not mean that the Indian consumer pays a higher price than is the position elsewhere. As a matter of fact the price of sugar in India is lower than in many leading sugar producing countries. The Indian prices are also lower than in most of the neighbouring countries like Pakistan, Ceylon, U.A.R., Cambodia, Japan, Iran and Thailand. But the fact remains that the present prices have checked the rise in consumption and a time has come when it has become necessary to reduce taxation substantially to increase consumption. I venture to suggest that if properly handled, a substantial reduction in Excise duty would not result in loss of revenue to the extent as may appear at first sight. In a great measure it would be off-set by increase in internal consumption. I commend this suggestion for the immediate consideration of Government. Besides, there exist some irksome procedures and practices which tend to discourage consumption and create pockets of artificial scarcity in the country. The removal of these is already overdue. States are raising sizeable revenues from sugar distribution. I would respectfully submit that the time for this is also over and this practice should be stopped forthwith. Another matter demanding attention is the transport bottleneck. I urge greater attention to these problems. These matters if attended to, will improve consumption. But this will solve only a part of the problem.

INDUSTRY NEEDS CONDITIONS OF STABILITY

Another factor of major importance to the industry is stability. Prices of sugar must never be allowed to fluctuate violently, for many reasons. The most notable is that cane prices must inevitably move up and down with prices of sugar, for cane is the predominant content of the sugar price. Violent fluctuations in cane prices and their effect on our rural economy are extremely undesirable. We must never forget that the cane grower has to plan his crop far ahead of its delivery to the factory. Once planted, cane yields more than one crop. So the grower, once he switches over to cane cultivation is committed to it for a number of years. Any violent fluctuations in the cane price would seriously disturb his economy. Variations in cane price should be carefully planned and announced very much in advance. Another reason for steering clear of violent fluctuations is that the industry at present is carrying heavy stocks. If prices vary by Re. 1 per maund, it would mean a difference of about Rs. 6 crores on the present stocks alone. This may wipe out of existence many marginal factories especially those placed in geographically weak areas.

BACKWARD STATE OF CANE CULTIVATION

With regard to cane price, this constitutes the highest single item of cost in the production of sugar. Much of its high incidence could be reduced if the present backward state of cane cultivation could be improved. Our average yield of 1.4 tons of sugar per acre makes a poor comparison with the yield of 5 to 8 tons of Hawaii, Java and Formosa. In fact, the yield

in North India is about the lowest in the World, and yet covers the largest area in the country and, viewing it from the human angle, involves the largest number of canegrowers. The low yields in the North can be rectified if cane development is undertaken on the requisite scale. We have urged repeatedly that the cane cess realised by the States should be spent entirely on cane development. We have been harping on this theme in season and out. We must state once again in clear and unequivocal terms that if cane development is not undertaken seriously and with all resources at our command the industry in the North will go down and with it the millions of canegrowers who derive their sustenance from sugarcane.

REASSESSMENT OF CAPACITY NECESSARY

Along with efforts to raise internal consumption we must try to adjust our production in future to our needs so as to avoid repetition of the critical situation that the industry is presently facing. This would underline the need for reassessing the present capacity and the targets for the future. The potential of sugar production in the World today is much greater than its consumption and a vast majority of the exporting countries, and even some of the importers, have regulated and curtailed sugar production. The largest importer of sugar, the U.S., had till recently statutory restrictions on beet and cane acreages. As a matter of fact practically every importing country plans for self-sufficiency in sugar.

The Second Five-Year Plan estimated our consumption for the current year at 22.50 lakh tons whereas, as I have already pointed out, it would hardly reach a level of 20.5 lakh tons. Statistics for the last three years show that our consumption is static. We are now in the first year of the Third Plan, the draft outline of which mentioned a production target of 30 lakh tons. Subsequently, however, Government spokesman stated that the target was being raised to 35 lakh tons. It came to us as a rude shock, as there have been no developments in respect of internal consumption which could justify a higher target. On the contrary, the trend of consumption would call for a lower target. This trend indicates that even 28 lakh tons consumption will not be achieved by the end of the Third Plan period. It will be sound policy to let the consumption develop before expanding capacity, because capacity when once installed has to be kept going. We have enough stocks and are likely to have them over the next 5 years, to afford a safe cushion for a sudden spurt in consumption. Furthermore, capacity for manufacture of sugar machinery exists within the country. We could instal additional capacity without undue delay or difficulty. There is, therefore, no need to instal capacity in a rush.

NEED FOR REHABILITATION ALLOWANCE

In response to the request of the Industry, Government made a reference of the price question to the Tariff Commission. The Tariff Commission determined regional cost schedules which were very rigid and based on the performance of sampled factories which were above average in all the regions. On top of that the return allowed by the Commission provided, only, in the words of the Commission, "sufficient funds for each unit to meet its commitments under bonus, gratuity, interest on borrowed capital and debentures, dividend on preference shares, managing agents commission and income-tax and finally leave a residue to a large majority of units in all the regions to declare reasonable dividends". From this it is apparent that

no margin was left to cover rehabilitation or to provide for reserves.

I would confine my observations here only to rehabilitation. Rehabilitation is meant to cover the difference between depreciation which is allowed as an item of cost on the original historical costs of assets and the depreciation on the present day replacement costs. After all, depreciation is allowed to enable replacement of assets on expiry of their useful life. The replacement costs have gone up many times and depreciation allowed is quite insufficient to replace use-less assets. The difference between depreciation allowed and depreciation on present day costs is a legitimate item of cost and should be recognised as such in determining the price of sugar.

Rehabilitation was disallowed by the Tariff Commission on three short grounds.

- The industry had employed all available funds in expanding capacity to earn more profits.
- It was socially unjust for the consumer to be burdened with rehabilitation.
- Rehabilitation cost could be met by borrowings.

It was, however, not realised that reduction in costs achieved by expansion had been neutralised by the Commission working out the schedules with reference to actual costs in 1957-58 which included the economy effected on account of expansion. And then the benefit of reduced costs on utilisation of available funds on expansion went to the consumer alone and it would

have been quite in keeping with considerations of social justice, if the consumer paid for the benefit enjoyed at the cost of Industry. Thirdly, if rehabilitation had to be met by borrowings, some margin should have been allowed for servicing these loans and for their repayment. I may clarify here that interest on borrowed capital and debentures allowed by the Commission does not include any additional amount to cover interest on proposed borrowings for rehabilitation.

As stated earlier, the Tariff Commission determined cost schedules on the basis of the relevant data for 1957-58. Since then there have been major increases in costs which have to be provided for while fixing fair price for sugar. Ours is essentially a controlled industry and a fair price for sugar whether statutory or notional has to be determined by Government. There is thus no escape from determination of cost of production and variations therein every now and again. Because of frequent fluctuations in costs it would not be practical to entrust this determination to the Tariff Commission every time. The Commission prepared its report with reference to the cost for 1957-58 and it was already out of date when it was submitted in 1959. I would, therefore, recommend that there should be a standing body functioning all the time presided over by a person of the status of a Supreme Court Judge which should bring the cost of production data relating to sugar up-to-date. A standing body like this would ensure upto the minute availability of costs and other relevant data by an impartial body of the highest integrity and repute. This alone would meet the needs of the situation.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

1. India & the World and India in 1950 Rs. 5/-
2. A Social History of the Indian People & India in 1951 Rs. 5/-
3. India & the Free World and India in 1952 Rs. 5/-
4. India in Asia & India in 1953 Rs. 5/-
5. India in South East Asia and India in 1954 Rs. 5/-
6. India & the Communist World and India in 1955 Rs. 5/-
7. India in 1975, A Study of the next Twenty Years & India in 1956 Rs. 7.50
8. India & the Middle East and India in 1958 Rs. 7.50
9. India and Europe & India in 1959 Rs. 10/-
10. India & North America and India in 1960 Rs. 10/-

Please take advantage of this offer and mail your enquiries to:

THE EASTERN ECONOMIST LTD.,
United Commercial Bank Bldg.,
Parliament St., Post Box No. 34,
NEW DELHI.

THE ISAAC HOLDENS MILL AT JAGATDAL, WEST BENGAL

LIGHTING BY PHILIPS

At Jagatdal, near Calcutta, the Isaac Holdens Wool Combing Mill—the first and only one of its kind in the country—stands out as an important landmark covering 114,000 sq. ft. ... twice the size of a hockey field. Workers here are engaged in wool selection, washing, breaking and combing—operations that require a high and even level of illumination.

Naturally, the mill management specified Philips lighting.

Philips' modern, streamlined fittings provide the right amount of illumination and thereby contribute towards the overall efficiency and high productivity achieved in this mill.

Philips' exclusive lighting—consisting of lamps, fittings and accessories—ensures ultimate

economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of research and development aimed to meet the ever-growing demand for better lighting. And hand-in-hand with Philips' unrivalled quality comes the invisible *plus* of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

AUGUST 18, 1961

The Unity of India

THE fast "unto death" which Master Tara Singh commenced on Independence Day is fraught with dangerous consequences. This is a singularly inopportune time to resort to this extreme instrument of compulsion. With the general elections just six months away, any untoward happening will charge emotions making a rational appeal to the electorate impossible. Again, the Prime Minister has committed himself—unwisely in the opinion of *The Eastern Economist*—to a significant absence from the country from August 31. If a storm should arise in his absence, there is no one with authority enough to ride it. These might be deemed from the point of the view of the Akali Dal good bargaining counters; but hardly anyone can say, when passions are aroused, if this calculation will prove a good one. On balance, it may prove effective at a great price in goodwill which the Sikh community can ill afford to pay.

Now, however, that the die has been thrown, it is right that one should recognise that the Prime Minister's arguments against the Punjabi Suba demand would carry much more conviction if they were universal instead of particular to this case. Thus, as Mr. Asoka Mehta has pointed out, there are other border areas in addition to the Punjab which, if security was an overruling objective, should not have been allowed the right of self-determination. Himachal Pradesh is, it is true, a Centrally administered area, more or less; but it is a separate State. Again the border areas of West Bengal and Uttar Pradesh are not less important than the Punjab. And who will contend that, leaving the Sikhs dissatisfied, strengthens our border security? Again on language, why should principles adopted elsewhere in the re-organisation of States be irrelevant to the Punjab? It is true that here there is a religion as well as a language. But, here again, the fact is the Sikhs feel as strongly on their religion as their language. A special status has already been given to Gurdwaras and their religious privileges—kirpan and all—have been given a special position. This does not mean that division is desirable; but it does seem that the arguments to resist it are by no means convincing to all.

Let the issue be faced frankly. It is one of political expediency. When political pressures have been great enough—as in Maharashtra and Gujarat and Andhra before them—all the Prime Minister's arguments have fallen like a pack of cards. It is these concessions which have prompted the view that the Prime Minister can be forced to concede something in this case also. How deep the pressure is it is difficult to say. If something should happen to Master Tara Singh, *The Eastern Economist* believes that the political pressure to concede on language at least—making Punjabi in Gurmukhi script the language of the Punjab—will be irresistible. If this is so, would it not be wise to make the concession now, before the situation was exacerbated by passion and possibly violence? *The Eastern Economist* believes it would be the course of political wisdom to make a concession on language and ask Master Tara Singh to withdraw his proposal for a separate Sikh State.

The meetings of the Chief Ministers on national unity do not seem to reckon with the need of the hour. Dr. B. C. Roy's practical proposal on multilingual States—an excellent face-saving formula for the Punjab—was unwisely rejected for "practical" reasons. Stiffening the law on secession to deal with the D.M.K. might be good and necessary; but it is far more important to integrate dissatisfied persons than threaten them under the Indian Penal Code. The truth is this is a live political issue, not a legal one. And a measure of the inadequacy of New Delhi's thinking is to be found in the Punjab stalemate. For years this dispute has gone on; and painful reiteration on both sides is now reaching a breaking point. India's unity has still to be forged. But it can be found in diversity with greater emotional integration. The Sikhs cannot be allowed to nurse their bitterness further. The Prime Minister's exhortations must take a more practical shape in the Punjab as elsewhere. The unity of India has gained each time an irresistible political demand has been conceded. It is unwise not to read the lesson of our own recent past.

Uniformity in Banking

MR. H. V. R. IENGAR'S policy announcement of last week on the reconstruction of the pattern of banking on the basis of a single type of banks is to be welcomed as a reform which was long overdue. In the future pattern of banking, about a couple of years from now, no quarter is to be given to the unlicensed operation of banks and this stroke of policy should suffice to do away with the indefensible and bewildering variety of scheduled or non-scheduled banks operating with or without a licence. The two ingredients of uniformity are legal permission to carry on the business of banking only on the basis of a licence from the Reserve Bank and membership of the Deposit Insurance Fund. In deciding upon a single type for the pattern of banks, the Reserve Bank has made a pragmatic approach to the future of the small banks. Leaving the controversy over the respective merits or otherwise of unit banking and branch banking for academic discussion, the Bank has decided that, wherever the criteria of soundness and viability are fulfilled, small banks would be permitted to retain their distinct individuality for intensive local service. There is to be no imposition of merger on them, but doubts can hardly be entertained about the eventual outcome of the trend towards merger.

The mood of complacency with the Reserve Bank's vigilance and strict supervisory control of the scheduled banks in particular received some rude shocks in the aftermath of the crash of the Palai Central Bank. Among them, the revelation made by Mr. B. Gopala Reddi, Minister for Revenue and Expenditure, disclosing the existence of unlicensed scheduled banks had a special impact on the depositor. The Governor of the Reserve Bank in his last week's speech has put in a strong plea that the Bank's legal powers to rectify the detected defects in the working of the scheduled banks were quite limited and inadequate and, barring the drastic remedy of forcing the recalcitrant units into liquidation, there was no power of compulsion vested in it. This defence is far from convincing and its validity could be easily questioned. Having granted reasonable time to the intransigent units to set their house in order, if the Reserve Bank had come with a heavy hand upon them, the effect would have been quite salutary. Threat of drastic action, maybe actual drastic action in a few cases of persistent defiance, would have served the twofold purpose of restoring the confidence of the public, particularly of the depositor, and driving a sharp sense of discipline in the managements of such banks which misconstrued the Bank's liberal attitude as indulgence or perhaps weakness.

Guest Editorial

Rescue Operation for Sterling

By PAUL BAREAU

THE Selwyn Lloyd measures for meeting the British crisis have now been reinforced by massive help from the International Monetary Fund. In its biggest individual operation since the Fund opened for business fifteen years ago, it has agreed to make available the equivalent of \$2,000 million support of the foreign payments position of Great Britain. Of this total \$1,500 million is being

Nevertheless, the amended procedure for moratorium provides an expeditious and reasonably satisfactory remedy for dealing with banks of doubtful potential for survival. Since the Amendment Act was passed, as many as 35 banks have been placed under moratoria—in 75 per cent cases on the Bank's initiative and in 25 per cent cases on their own motion. This ratio indicates their reluctance to face the final destiny and meantime to drag on as independent entities. The very purpose of the amendment is to obviate such a morbid state of affairs by bringing about schemes of their amalgamation with big and sound banks. This isolated and somewhat concentrated attention on the weaker units cannot be misinterpreted as a reflection on the banking system as a whole. It is an indisputable sign of the basic strength of Indian banking that 95 per cent of its deposits are safe in the hands of units run on principles and practices of sound banking. The 35 banks which were put under moratoria last year account for a small amount of Rs. 19 crores worth of deposits, while the deposits of the unlicensed banks taken together are a little over Rs. 100 crores. The problem of reform through amalgamation is, therefore, confined to modest dimensions. But it does not, on this account, lose its importance inasmuch as even stray failures at any level may produce adverse repercussions on the system. A voluntary move by the weaker banks for amalgamation would advance the extinction of the unlicensed category and set the tone for the next phase of merger into bigger-sized units.

Perhaps of greater significance is the Governor's pronouncement on the setting up of a statutory Insurance Deposit Fund. Insurance of bank deposits makes a radical departure from the basic principle of insurance that there should be a direct correlation between the risk covered and the premia paid. In this special category it is based on the principle of ability to pay and not on the magnitude of the risk covered. This factor perhaps explains one major cause of the long time taken in the formulation of the scheme. The membership of the Fund seems to be intended to be obligatory, since Mr Iengar's explicit statement that the single type of banking envisages licensed banks coming within the purview of the Insurance Deposit Fund can hardly convey any other meaning. Compulsory membership promises to assure the scheme with adequate resources to safeguard the interests of the depositor, especially in the vulnerable sector which is now being rationalised.

drawn immediately in no less than nine different currencies, which include U.S. and Canadian dollars, marks, French francs, Italian lire and Dutch guilders. The balance, equivalent to \$500 million, will be made available as a standby credit to be drawn on at any time during the next twelve months.

Of the equivalent of \$1,500 million which has been drawn, rather more than one-third will be required over the next month or so to repay the European central banks which in the last four months have come to the rescue of sterling under the so-called "Basle agreement" by holding larger amounts of sterling than would be their normal custom. They have held this sterling with, it should be added, the protection against any possible devaluation of sterling, but for a limited period and in anticipation of more permanent measures to meet the temporary deficit in the British balance of payments. Those more permanent arrangements include the facilities that have now been made available by the I.M.F. Out of these drawings the equivalent of about £200 million will be used to repay the central banks.

This operation by the Fund is remarkable, not only by reason of its size, but also because of the diversity of currencies which are being made available to Great Britain. The Fund is adapting its techniques to the changing needs of the international payments situation. Sterling and the dollar, as the two main reserve currencies of the world, are both under potential pressure, by reason of the function they perform. The actual pressure on sterling is not so much a pressure that has been exerted from the side of the dollar but from that of the European currencies. If, therefore, the Fund had followed the precedent set by its operation in the past and had made its assistance available in U.S. dollars, the result might well have been to shift the pressure in the exchange markets from sterling to the dollar. If Britain would have repaid its central banking debts to Germany, France and other countries in dollars, then these dollars would probably have been converted into gold, thus setting off once against a gold outflow from the United States which might all too easily have unleashed a more general worldwide run on the dollar.

That danger has been avoided by providing the assistance in the currencies which Britain needed. The Fund has modest amounts of the currencies in question at its disposal but it will reconstitute part at least of its holdings of these currencies by sales of gold to the countries in question. The scope for more diversified Fund operations will be considerably increased if the present proposals for increasing the borrowing powers of the Fund from its member countries are agreed and put into operation after the next Annual Meeting.

This particular rescue operation has been successful because it has been spectacular. If these affairs are to be effective they must be big — indeed so big that the credits put at the disposal of the borrowing country do not in fact have to be used at all. That, apart from the amount needed to repay central banks, looks like being the fate of the \$2,000 million facilities which have been made available for the support of sterling.

The effect of the news from the I.M.F. on sterling has been little short of miraculous. Its rate against the U.S. dollar, which two or three weeks ago was plumbing depths at which the Bank of England had to give it support, has risen well above parity and sterling has also been strengthening against all Continental currencies.

The intervention of the Fund has put all fears of devaluation out of court. This in its turn has revealed the extraordinarily strong technical position of sterling in the exchange markets. In anticipation of devaluation of sterling, the whole world had gone short of this currency. Payments in sterling by non-sterling countries had been postponed, requirements of foreign currencies by sterling countries had been anticipated, every conceivable device had been used by foreign bankers and traders to borrow in the London market. The "leads and lags" were at the extreme arc of their swing against sterling. Now that the assumption, on the basis of which this semi-speculative position had been built, is shown to have been false, the world is covering its short positions. As a result, not only has the I.M.F. credit not had to be used but the Exchange Equalisation Account has been able to undo part of its earlier supporting operations and has been selling sterling and increasing its reserve of dollars and other currencies on a substantial scale.

So far, then, so good. But this rescue operation from the Fund, like most of Mr. Selwyn Lloyd's measures, including the 7 per cent Bank Rate, are only effective for the short run. They do not tackle the more fundamental causes that lie behind the recent weakness of sterling. They may even hide them. For example, the effect of the 7 per cent Bank Rate is already making itself apparent in the reattraction to London of substantial amounts of foreign hot money. This is the last form of assistance the British authorities desire if only because at the present rates that have to be paid on these foreign deposits this hot money represents a heavy burden on the balance of payments. This is one of the reasons why it is not generally expected that Bank Rate will remain at the penal level of 7 per cent for longer than is strictly necessary.

All things considered, the spectre of an early devaluation of sterling has now vanished. But what lies beyond the next few months is still wrapt in a good deal of uncertainty. The first hurdle to be cleared before any confidence can be felt about the longer term prospects for sterling, is the round of wage negotiations which will open this autumn. In 1957 a 7 per cent Bank Rate was in fact followed by a period of wage and price stability which provided the base from which the spectacular expansion of the British economy in 1959 was begun. It has yet to be shown whether a comparable result will attend the 1961 dose of deflation.

Beyond this, too, lies the tremendous task of improving the balance of payments to the extent required not only to strengthen the reserve but to repay to the I.M.F. the massive debts that are being incurred. This is a problem that faces not only Britain but a number of other sterling area countries which have of late been overdrawing their international payments account, and have had to receive assistance from the Fund. The major effort must, however, be made by Britain. The sincerity of its determination to make that effort is indicated by the decision to start negotiations for membership of the Common Market. Such membership and all it implies for the vigour, resilience and competitiveness of British industry will be a major test of the capacity to solve the long term problem of sterling.

THE WEEK'S NOTES

National Income

FACT AND IMAGE

THE NATIONAL income figures presented in the Third Five-Year Plan are based on 1960-61 prices and not on 1952-53 prices as in the Second Plan or on 1950-51 prices as in the First Five-Year Plan. This departure makes a significant difference. India's Second Five-Year Plan had held out the promise that per capita income in 1960-61 would rise to Rs. 331 at 1952-53 prices. The Third Plan has indicated that this target in per capita income was attained in 1960-61 but unfortunately not at 1952-53 prices but at 1960-61 prices. What is the order of difference between this "achievement" and the "promise" made? The table below sets out the national income estimates for 1950-51, 1955-56 and 1960-61 at 1952-53 and 1960-61 prices. It is seen that price inflation assumed in these estimates is of the order of 11 to 12 per cent in the Second Plan period as against a rise of 34.9 per cent indicated by the Wholesale Price Index or 29.2 per cent as indicated in the all-India Consumer Price Index. In any case, it obviously signifies a major shortfall even if the price inflation assumed by the Planning Commission is to be taken as correct. The failure in the per capita income rise was born out of two basic reasons. In the first place, the net increase in output in the Second Plan was below 20 per cent signifying a rate of growth of less than 4 per cent per annum (simple) and 3.6 per cent (compound). Coupled with this discouraging rate of growth came the unexpected results of India's census which indicated that the population had risen at more than 2 per cent per annum during the decade as against the 1.3 per cent rise assumed in the Second Plan. Thus, the anticipated rise in the living standards of the Indian people has not been achieved in the manner in which it was promised in the Second Plan.

The long-term projections set out in the Third Plan on the basis of 1960-61 prices, however, continue to hold out the promise that India's national income would be doubled in seventeen years—the same period as was stipulated in the Second Plan. It may be remarked that the First Plan had anticipated a minimum period of 21 years for doubling the national income. It seems that the guarded terminology in which the crucial paragraph on national income has been phrased in the Third Five-Year Plan indicates that the planners themselves do not seem to have full faith in the forecasts made by them for doubling India's national income in 1967-68 over 1950-51. It seems that the forecast made in the First Plan, when no historical evidence regarding India's future growth was available, may come out to be true as against the Second Plan forecast which was put out with great confidence generated by the over-fulfilment of the First Plan.

NATIONAL INCOME (At 1952-53 and 1960-61 Prices)

Year	(In Rs. Abja)		
	1952-53 Prices	1960-61 Prices	(3) as a percentage of (2)
1950-51	92.6	102.4	110.6
1955-56	109.2	121.3	111.1
1960-61	128.8	145.0	112.6

Abja=100 crores or 1000 million.

Berlin

TOWARDS NEGOTIATIONS?

THE WESTERN Foreign Ministers' Conference was held specially to deal with the burning question of the Berlin crisis. The discussion was exclusively confined to the defensive and economic measures which the crisis calls for. It was right that the question of defence of the West's position in Berlin should be given priority at the conference. In any strategy

for defence the conventional forces have undoubtedly their vital place, since a non-nuclear war rather than a nuclear war, if it takes place at all, seems likely in the immediate context. President Kennedy's demand for strengthening forces and calling up the reserves could not but be met with approval by Congress in the present situation and it would appear that he expected the allies to keep this eventuality in view.

But the counterpart of this preparedness is also a factor to be equally taken into consideration. Mr. Khrushchev has already announced his decision to strengthen his own conventional forces and recall the reserves. The big size of his reserves and his capacity to recall them at short notice are stark realities to reckon with. In addition, he has also announced the additional strategy of deploying Russian forces to the Western frontier.

This warlike posture adopted by both the sides does not lead to a resolution of the deadlock. There is an influential school of thought among the Western allies, fortunately small in size, which believes in an attitude of firmness which means no offer to negotiate with Russia. Until the general elections in West Germany, due to be held on September 17 next, it is not necessary to change the status quo. But the magnitude of the danger inherent in the posture now adopted is clear. The Western allies have to look beyond September 17 and move in the direction of adopting a policy which must avert even a conventional war.

Mr. Khrushchev has been insisting on the recognition of East Germany as a sovereign State and on the conclusion of the treaty to that end. As an integral part of this proposal, he contends that West Berlin should be provided with the status of a demilitarized free city. In the absence of an agreement between the four powers, he has repeated his threat of unilateral action. The current closure of the East Berlin border is a tactic in the war of nerves. Actually what would happen after the signing of a separate treaty by Russia and East Germany would be to transfer the control of the supply line to West Berlin to the East German Government. This is quite explicit in Mr. Khrushchev's warning that after the treaty the rights of the Western powers in Berlin would be nullified. But in the same breath he has invited Western allies to a conference table.

The implications of this crisis are of such a far-reaching magnitude that all possibilities of negotiations ought to be explored. Opinion in the Western countries appears to veer round to the view that even if it comes to some sort of recognition of East Germany as a State (and the present division of Germany, it is argued, is a fact), this eventuality may be accepted in return for specific and effective guarantees for West Berlin. These guarantees include her defence and are totally inconsistent with a demilitarized status. The West's right to station the troops will be the minimum condition for such a compromise. It would mean that the issue of German reunification may be deferred longer, but the position of West Berlin would be thoroughly safeguarded in the meantime.

Language Policy

CHIEF MINISTERS' FORMULA

ONE OF THE welcome achievements of last week's conference of the Chief Ministers was the adoption of a flexible formula for the language policy. Stress was, of course, laid on the adoption of Hindi for communications at the Central and inter-State levels, but English was to enjoy the associate status. It was urged that the safeguards for linguistic minorities, as already agreed upon, should be carried out in the real spirit in which they were conceived. A special committee

has been set up to supervise the discharge of this obligation. A realistic view has been taken of the difficulties as well as attitudes of linguistic minorities. Greater accommodation is to be shown to them in the matter of translations in their languages of official documents intended for public circulation. Significantly enough, a vital principle has been recognised that, if the minority constitutes 60 per cent of the population in any district, the minority's language should enjoy the status of the official language in that district alongside the official language of the State. If the majority in some areas is apt to be intolerant, the tendency on the part of the minority in some cases to use pressure tactics to wring concessions in excess of what has been agreed is no less annoying. Both are to be discouraged and curbed.

There is some muddle in the thinking on the medium of instruction at the university level. The regional language will be the full medium in due course of time, and a wise decision has been taken to retain an international language (obviously English) to secure the benefits of the continuous advances in science and technology. So far there is clarity. But there is superfluous confusion when preference for Hindi as a medium of instruction is urged on the plea that the adoption of the regional languages as media would lead to isolation and difficulties of migration of teachers and students. This fear is flatly contradicted by the proved experience of other multilingual States. In this context it ought not to be ignored (though it may appear uncharitable to put it plainly) that Hindi is far less developed than some other Indian languages. In making a passionate plea for the adoption of a uniform script, namely, Devanagari, for all the Indian languages, the Chief Ministers were apparently oblivious of the fact that they were gratuitously sowing the seeds of another acute controversy. Uniformity may be vehemently opposed in some areas as regimentation. How does diversity of scripts come in the way of integration?

P.L. 480 Funds

ACTUAL MAGNITUDE

IN HIS valedictory presidential address to the annual session of the Institute of Bankers held on August 10 last, Mr H. V. R. Iengar stressed the point that the phase of stagnation in the deposits of scheduled banks was very shortlived, but that the real picture was distorted by the PL 480 funds and the procedural change introduced in last May in their placement. To prove his contention, he has provided the comparative figures in the past five years of the "normal deposits", which would exclude the abnormal ingredient of PL 480 deposits. It is easily a great merit of his speech that the actual magnitude of the P.L. 480 funds can be gathered by straight deduction from the total deposits of the "normal deposits" in respect of which the figures have been authoritatively disclosed for the first time on behalf of the Reserve Bank. The position is tabulated below. It is presumed that this position represents the situation as obtaining on the last Friday of each calendar year inasmuch as the Governor's speech does not expressly state that it represents the annual average for each year:

Scheduled Bank Deposits

Year	(Rs. Crore:)			
	(1) Total Deposits	(2) Normal Deposits	(3) P.L.480 Funds	(4)
1956	1,101	1,047	54	
1957	1,368	1,186	182	
1958	1,574	1,318	256	
1959	1,827	1,474	353	
1960	1,828	1,566	262	

An intriguing point is the volume of PL 480 funds in 1960. The new procedure introduced two changes in this year, namely, (1) stoppage of additional funds into the State Bank deposits from May and (2) transfer of

the accumulated volume from the State Bank to the Reserve Bank at the monthly rate of Rs. 11 crores from July. At this rate Rs. 66 crores have been withdrawn from the total pool in column (2) above during 1960. The large gap of Rs. 91 crores (as against the difference between the inflow of additional deposits between January-April and the transfer of Rs. 66 crores between July-December) calls for clarification. Presumably, the gap should be smaller.

Incidentally, it is an error to argue that the growth in the "normal deposits" was not tardy last year. In 1959 these deposits and advances (including bills purchased and discounted) showed an almost even increase over the previous year at 11.8 per cent and 11.4 per cent respectively. But in 1960 the normal deposits increased above 1959 by merely 6.2 per cent as against a rise of 21.5 per cent in advances. To measure the adequacy or tardiness in growth in absolute figures is to use a misleading yardstick.

Jomo Kenyatta

BACK TO POLITICS

AFTER NINE YEARS of imprisonment, detention and house confinement, Mr Jomo Kenyatta finds freedom restored to him — freedom to return to politics. It is idle to speculate what difference his release in March last would have made to the political scene in Kenya. But much has happened in these past six months to add to the complexity of the situation in that country. The Kenya African National Union and the Kenya African Democratic Union have thrown their weight in reverse directions. The KANU stayed aloof from the new government, making Mr Kenyatta's release a condition precedent to its participation, while the KADU, by taking the attitude of responsive co-operation, has incurred the charge of playing false to Kenya's nationalist interests. The KANU considered itself especially entitled to the patronage and active support of Mr Kenyatta, but it could hardly believe that a complete surprise was in store for it. On his arrival in his new home at Gatundu, near Nairobi, Mr Kenyatta made his position clear beyond doubt to Press representatives that he would not align himself with either of the parties. This had a specific implication as he amplified later in answer to another question, that he belonged to both, he would like to see both of them identify themselves and work as one, but merger was a matter for their decision.

The weight of responsibility generally produces a sobering influence. It would appear that Mr Kenyatta, who is now returning to politics in a changed climate, may emerge as a different leader. The major problem before Kenya, as he readily replied to his questioners, was to forge unity. Apparently this reflection had reference to what had taken place in Kenya in the recent past, but perhaps the extreme example of the Congo was not absent from his mind. Settlers in Kenya, European as well as Asian, are keen and anxious to know Mr Kenyatta's attitude to them. Whether and to what extent their apprehensions would be dispelled could be gathered over time. For the present, he has hinted in very general terms that they would be welcome partners if they considered themselves as nationals of the country and desisted from claiming any privileges — the latter apparently a reference to the status of the European immigrants. Mr Kenyatta is cautious in his reaction to another vital issue. He has described the proposal of the East African Federation — comprising Kenya, Tanganyika and Uganda — as a "grand idea" and parried the question whether he would be its first President by answering that he would be content to fill any role of service to his people. He has no illusions about external saviours and has characterised the two power blocs as working for their own interests — not Africa's. Here is food for thought for the Kremlin. Africa cannot be taken for granted.

STATE GOVERNMENT LOANS 1972

Name of State	Amount	Issue Price Per Cent
1. ANDHRA PRADESH	Rs. 10 crores	Rs. 99.75
2. BIHAR	Rs. 3 crores	Rs. 99.50
3. GUJARAT	Rs. 6 crores	Rs. 100.00
4. KERALA	Rs. 4 crores	Rs. 99.50
5. MADHYA PRADESH	Rs. 5 crores	Rs. 99.50
6. MADRAS	Rs. 10 crores	Rs. 99.75
7. MAHARASHTRA	Rs. 10 crores	Rs. 100.00
8. MYSORE	Rs. 7 crores	Rs. 99.75
9. ORISSA	Rs. 5 crores	Rs. 99.50
10. PUNJAB	Rs. 3 crores	Rs. 99.50
11. RAJASTHAN	Rs. 4 crores	Rs. 99.50
12. UTTAR PRADESH	Rs. 6 crores	Rs. 99.75
13. WEST BENGAL	Rs. 7 crores	Rs. 99.75

All the State Governments reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

All the above loans will be repaid at par on 4th September, 1972.

THE LOANS WILL OPEN FOR SUBSCRIPTION ON 4TH SEPTEMBER, 1961, AND CLOSE ON 9TH SEPTEMBER, 1961, OR EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

All the loans will bear interest from 4th September, 1961.

Subscriptions may be in the form of CASH/CHEQUE in respect of all the loans.

Securities of 3% Tapi Irrigation Development Loan 1961 and 3½% Cochin Loan 1956-61 will be accepted AT PAR for conversion into the new loans of the Governments of Maharashtra and Kerala respectively. Securities of Mysore Government 3% Loan 1956-61, Madras Government 2½% Loan 1961 and 2½% Uttar Pradesh Loan 1961 will also be accepted for conversion AT PAR into the new loans of the respective State Governments.

Interest due on the securities of the loans tendered for conversion will be paid as under:

NAME OF LOAN	RATE OF INTEREST PER CENT PER ANNUM
(1) 3% Tapi Irrigation Development Loan 1961	@ 3% upto and including 30th April, 1961 and @ 4½% from 1st May, 1961, to 3rd September, 1961 inclusive.
(2) 3½% Cochin Loan 1956-61	@ 3½% upto and including 31st May, 1961 and @ 4½% from 1st June, 1961 to 3rd September, 1961, inclusive.
(3) Mysore Government 3% Loan 1956-61	@ 3% upto and including 19th April, 1961 and @ 4½% from 20th April, 1961 to 3rd September, 1961 inclusive.
(4) Madras Government 2½% Loan 1961) (5) 2½% Uttar Pradesh Loan 1961)	@ 2½% upto and including 31st August, 1961, and @ 4½% from 1st September, 1961 to 3rd September, 1961 inclusive.

APPLICATIONS FOR ALL THE LOANS WILL BE RECEIVED AT THE OFFICES OF THE RESERVE BANK OF INDIA AT BANGALORE, BOMBAY, CALCUTTA, MADRAS AND NEW DELHI.

APPLICATIONS will also be received at PLACES WITHIN THE RESPECTIVE STATES as follows:-

- (i) At the office of the Reserve Bank of India at Nagpur in the case of Maharashtra Loan.
- (ii) At the branches of the State Bank of India and at treasuries and sub-treasuries in the case of Andhra Pradesh, Bihar, Gujarat, Kerala Madhya Pradesh, Madras, Maharashtra, Orissa, Punjab, Rajasthan and Uttar Pradesh Loans.
- (iii) At the branches of the State Bank of India in the case of West Bengal Loan.
- (iv) At the branches and treasury pay offices of the State Bank of Hyderabad in the case of Andhra Pradesh and Maharashtra State Loans.
- (v) At the branches and treasury pay offices of the State Bank of Mysore (except at Bangalore, Mangalore and Gulbarga), the State Bank of India, the State Bank of Hyderabad and at Government Taluk treasuries in Mysore State in the case of Mysore State Loan.
- (vi) In the case of Gujarat Loan the State Bank of Saurashtra at Bhavnagar and its branches in the State of Gujarat will collect applications and forward them to the nearest receiving office.

Copies of Notification and Application Forms may be obtained at any Receiving Office.

Applicants tendering their applications at the offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras and New Delhi will, in the event of oversubscription to the loan applied for, be given the option of transferring their cash refunds to any of the other State Government loans which may not be fully subscribed by that time. To avail of this facility, the persons tendering their applications should complete the SPECIAL OPTION FORM copies of which are available on application from any of the abovementioned offices of the Reserve Bank of India.

COMPETITION VERSUS SOCIAL STABILITY

By

ODYSSEUS

EVER SINCE ADAM SMITH attacked the morass of rules and regulations, survivals of the static economy of the Middle Ages and of the Mercantile System—propounded by Thomas Mun (1571-1641), that forgotten member of the old East India Company — and advocated the virtues of free trade, most economists have upheld competition as a matter of course. Not unnaturally, most industrialists dependent on exports, and business men engaged in importing, have preached the same doctrine, but workers in industry and agriculture and manufacturers and farmers have, more often than not, been less convinced of the blessings of free trade. They tend to prefer domestic markets regulated by wage and price agreements and protected by tariffs from foreign competition.

There can be no doubt that the more the state intervenes to regulate wages, prices, and competition, the less flexible, the less dynamic is the economy, the greater the difficulty in discarding old techniques, and adapting to new materials and inventions. On the other hand, there can also be no doubt that, in the short run, unrestricted competition can inflict great hardships on employers and workers engaged in an existing industry exposed to sweeping changes in demand or in technique.

These hardships are sympathetically examined in a newly published book "The Industrial Revolution in Coventry" (Oxford Univ. Press. London. 1960. Price 21sh) by Mr John Prest. Far from writing a mere parochial history, Mr Prest uses the tribulations of Coventry's ribbon-makers in the first quarter of the 19th century to illustrate economic and moral questions of permanent and universal importance. As long as economies are subject to change and growth, as long as men are inventive and enterprising, sooner or later the fate that overtook Coventry's unfortunate ribbon-makers must threaten every existing industry in every progressive country.

A STABLE SOCIAL STRUCTURE

In the 1820's Coventry's ribbon-making industry was run by a dozen master manufacturers, who manufactured partly in their own factories, but were more largely dependent on distributing silk to "first hand" journeymen, who wove it into ribbons in their own homes on looms which belonged to them. The masters enjoyed a high standard of living, entertained in fine houses, kept good cellars, could afford to be generous with their weavers, and took pride in the established ethics of their trade.

The first hand journeymen were respectable bourgeois of some social standing, many of them free-men of the city. The custom of the trade allotted them two-thirds of the "list price" for their products, which was revised periodically in amicable and dignified meetings between masters and men. There was no class war. A diligent journeyman could earn enough to save up to rent a modest but good house, buy half a dozen looms, and enjoy his pint of the best ale of an evening. Below the first hand man came the ordinary journeyman, who fluctuated between working in a factory or for a first hand man. His ambition was to save enough to buy a loom and move up to become a first hand journeyman.

The trade was turned upside down by the boom during the Napoleonic wars, when many weavers were away in the army. The London wholesalers, disregarding their trade connexion with the established masters, discovered that they could get ribbons more cheaply by going to Coventry themselves and making their own arrangements direct with weavers. They threw the trade open to competition and anyone with a little credit could now enter it. The London merchants gave five months credit for silk, and a crop of new small masters emerged who were able to sell the finished product to the wholesale ribbon houses three months before their bills became due. The dozen old masters now had to compete with fifty small masters who, having little capital (and no traditions) lived from hand to mouth. They did not observe the agreed list prices and paid their weavers as little as they could.

The old established masters shared the weavers' desire for agreed prices, the traditional social structure, and a stable trade. They wanted Parliament to prescribe wage scales by law.

For a variety of reasons, the traditionally minded majority of masters and weavers were able to maintain the old system, albeit with ever increasing difficulty, until 1860 when the ribbon trade was finally disrupted by a great strike. This ended in ruin for all but a handful of masters and in the dispersal of the vast majority of weavers either to work in expanding industries in other cities or to emigrate to America.

ENTER THE OLD ADAM (SMITH)

Mr Prest records that the majority of the masters and men continued to observe the customs of their trade during these years, neither offering to pay, nor accepting, too low a wage. "Unfortunately, the few bad masters and bad men, having passed beyond the effective control of the majority, were always tending, as the natural result of competition, to bring the good majority down to their own level." Mr Prest says that had Parliament listened to them, they would have been capable of governing the trade themselves, because the majority, prior to the emergence of competition, had always been able to agree on what constituted a "just price." Unfortunately, says Mr Prest, Parliament, obsessed by the doctrines of Adam Smith, thought that any attempt to regulate a trade must end in a conspiracy to defraud consumers, and refused to co-operate with the ribbon masters and weavers to re-establish effective self-government in their trade.

Mr Prest compares the situation in industry at any given time to Locke's "state of nature" in which human beings are without government, which is akin to a state of war. "Men in industry are always striving to bring the state of nature to an end, but their attempts to do so must often be, and can always be represented to be, a brake on technical progress and a threat to the consumer. The difficulty in a democracy is to decide how high a price the community as a whole can afford to pay for the desirable object of letting masters and men in different trades govern themselves."

Mr Prest draws a harrowing, and I am sure an accurate, picture of the suffering endured by the

Coventry ribbon-makers in the forty odd years in which they were engaged in stubborn rearguard action against competition. But what I feel is lacking in his readable and thoughtful book is an estimate of the price that the community would have had to pay to enable the ribbon-makers to enjoy their stable social and economic structure, not forgetting that once it was conceded that ribbon-makers could decide their own standard of living, this privilege could not have been denied to every other industry in the U.K.

The list prices covered agreed wages for the various types of work done in making the different types of ribbons, but Mr Prest does not tell us how these wage scales were related to the selling prices obtainable in the market, and that seems to be the basic point. It is clear that if the Coventry ribbon-makers had had a world monopoly, because no other country had their secrets, or a domestic monopoly enforced by a prohibitive tariff, they could have paid what wages they thought just and charged what prices they liked to consumers. But who is to decide whether a price structure so created is a reasonable one that the community can afford to pay? In a competitive market, if consumers consider the price of ribbons unreasonable, they cease to wear them. But if the prices of all commodities were regulated in accordance with employers and workers ideas of fair wages, the chances are that the cost of living would become prohibitive.

In fact, of course, something like this is happening in such strongly unionised countries as the USA and

the UK in which organised workers insist on an annual wage increase, regardless of the community's interests. The result is twofold; (1) cost-push inflation, and (2) an ever widening spread of the "Do-it-yourself" habit among consumers in revolt. The worst hit are the professional classes, on whom economic progress depends. Their leisure, instead of being used for rest and recuperation, is increasingly spent in repairs, maintenance, the interior decoration of their homes, and so on.

Even the balance of payments comes into this. As "The Economist" said in a review (May 20) of W. Ashworth's "Economic History of England 1870-1939" (Methuen, 1960. 36 sh), one cannot fail to be struck by the constant recurrence of concern about the balance of payments and export prospects in the 1880's, the 1890's, and in the interwar years. Is this merely periodic bad luck? Or does it indicate deep-seated and persistent habits, which impede Britain's performance? For the failure of British exports to do as well as those of their main rivals before 1939 there were plausible explanations: for historical reasons Britain concentrated on exporting to primary producing markets types of exports, particularly textiles, for which world demand was expanding least rapidly. But since 1939, the UK has been moderately successful in tailoring her own basic industries to meet the changes in the world economy. Yet her anxieties persist. One cannot help feeling that the explanation is not that Britain had an industrial revolution to liquidate but lies in the social structure of an old and stable society, much less open and acquisitive than the American.

GOOD ENOUGH IS JUST NOT GOOD ENOUGH!

The work of standardization and certification is precise and exacting. Goods produced to standards qualify for carrying the ISI certification mark of the Indian Standards Institution.

Before, and even after, a licence for affixing the ISI mark on any product is granted, exacting tests and inspections are carried out at various stages of its manufacture. Certified goods are picked up from the manufacturers' works and sent to independent laboratories for testing. ISI inspectors constantly check whether the manufacturer is complying with required standards. Certified goods are also collected at random, from the distributor and the retailer, and tested for quality. Legal sanctions are available against abuse or unauthorised use of the ISI mark.

Nothing, therefore, is left to chance. With ISI "good enough" is just not good enough. For, the interest of the consumer as well as the good name of Indian industry have to be protected.

Maharashtra State Development Loan 1972

ISSUE PRICE AT PAR OPEN ON THE 4TH SEPTEMBER 1961

The loan will be closed as soon as total of approximately Rs. 10 crores has been subscribed and in any case not later than the close of business on the 9th September, 1961.

The applications for the loan will be received at—

- the offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras, Nagpur and Bangalore,
- the branches of the State Bank of India within the State of Maharashtra, except at Bombay and Nagpur and at places mentioned in (C) below,
- the branches and Treasury Pay Offices of the State Bank of Hyderabad within the State of Maharashtra, except at Bombay,
- the Government treasuries, and sub-treasuries in the State of Maharashtra at places where there is no branch or Treasury Pay Office of the aforesaid Bank.

Full particulars can be obtained at any of the offices mentioned above.

The European Scene

ITALY AS AN INDUSTRIAL POWER

From Our Special West European Correspondent

PARIS, August 14.

THE importance of Italy's recent economic progress is now sufficiently widely recognised to make it worth while taking a closer look at the details. Foreigners tend to take a brief and benevolent interest in newspaper articles about Italy's advance, as though they were hearing an edifying success-story which, though pleasant, really only concerned the Italians. I suggest that this is quite wrong. Current Italian expansion is not a mere flash in the pan that will have only local significance, like, say, the rapid Belgian recovery after the war, under Camille Gutt. It is, rather, the sign of the emergence of a new industrial power which within 10 or 15 years will be comparable in many respects to that of West Germany and France, countries of roughly equal population which today stand in the second rank, after the two super-powers, as influences on world trade and investment. (Italy's population is 49 million, France's under 45 million and West Germany's 54 million.) In other words, what we are seeing in Italy is not just a burst of prosperity but the sort of mutation in an economy that some writers have tried to express in terms like take-off, break-through and industrial revolution. The appearance of a new Germany or France is, of course, of more than local interest, although its first effects will be felt regionally, in the Mediterranean and in the Common Market.

A supposition such as this is naturally based on extrapolating into the near future present production curves. That is always hazardous, but less so than usual in the Italian case because all the conditions seem eminently favourable to maintaining current rates of expansion. Notably, all the things that have counted against Italy in this century — her excessive population, low living standards, her general backwardness and the existence of an under-developed territory in her South — now count as evidence for the assumption that the growth-rate of 1951-61 can be kept up for a decade or more without encountering limits such as shortage of labour or a saturation of home markets. Moreover, the foreign exchange difficulty that bedevils rapid expansion elsewhere (not only in India, but in France and England) exists to a much smaller extent in Italy, for the following reasons. The country starts with immense foreign exchange reserves, bigger, for her trade, than Germany's, Britain's or France's. Foreign investment (especially American, Swiss and German) is pouring into the peninsula: over 37,000 million lire last year. She has the world's sixth merchant fleet: 5,130,000 tons to carry her trade without paying in foreign currency. She has the world's biggest tourist traffic: 331,000 million lire was left by holiday-makers in the country in 1959, whereas Italians touring abroad spent only one-seventh as much. Finally, her loyal children who have migrated (many to the world's richest countries, America and Australia) continue to send home sums that seem fabulous to those who do not know the depth of family affection among the Italians. Colonial possessions make no contribution to the country's wealth, as they did for Britain, France, Belgium and Holland, so there is nothing to be lost on that account.

In this situation, it is not overbold to guess that Italy can go on for some years yet overtaking her richer neighbours at the pace of 1958-60, when her total industrial production grew by 28 per cent, Ger-

many's by 19 per cent, France's by 15 per cent — and the rest of the world, saving Japan, by less. Germany, and France, of course, will be the last to complain of being overtaken in this way, since that will constitute the harmonisation of economic and social conditions that is one of the aims of their Common Market. The existence of that Market, too, is a further guarantee of Italy's continued growth, for the 15 per cent increase in intra-regional trade that occurred in the first six months of this year counts among the stimuli now at work on the peninsula's economy. Italian industry envisages calmly the extension of the association to include Great Britain, a new member from whom Italy has less to fear than, in some sectors, from Greece who was admitted this year.

More instructive than the gross figure of 28 per cent increase in industrial output since 1958 are the details of the transformation in various sectors of industry. I realise that those who are not really interested in economics (which includes many who talk about economics) find the details fastidious — which is why they fall hook, line and sinker for nice simple theories of economic growth like the notion of "leading sectors" or "basic, fundamental and strategic industries" or "plan priorities". These are excuses for concentrating attention or effort on one or two branches which are reputed, in the absence of any evidence, to lead to rest of the economy into a golden future; they serve to rationalise a fixation on isolated, spectacular achievements. Italian experience, on the contrary, reveals that advance occurs over a very wide front in a period of genuine economic progress; if the following figures prove only that much, they will be useful.

First, compare the movement of the general industrial production index in the three main Continental economies (1953 equals 100):-

	1958	1959	1960
West Germany	151	162	180
France	150	156	173
Italy	142	158	182

Then single out specifically manufacturing industry, in contrast to transforming activities:

	1958	1959	1960
West Germany	154	165	183
France	154	163	176
Italy	143	159	184

Not one or two, but a large number of industries did better than this, i.e. had production index numbers well over 184 in the year 1960:

	1958	1959	1960
Precision engineering	241	275	398
Man-made textile fibres	183	238	285
Chemicals	175	209	242
Metallurgy	171	184	228
Coal and oil derivatives	180	193	228
Transport vehicles	171	189	228

The outstanding advance of precision engineering is especially due to the calculating-machine industry: 230,000 data-processing units produced in 1958, 262,000 in 1959, 417,000 in 1960—and probably 550,000 this year! A similar success in typewriters: 397,000 in 1958, 506,000 last year and may be 600,000 this year. Sewing machines remained an important branch, but grew more slowly, from 442,000 machines in 1958 to 483,000 machines last year.

In man-made fibres, it was the synthetics that led, as elsewhere in the West. Output of rayon and rayon staple fibre increased in 1958-60 moderately, from 141,000 to 166,000 tons, but production of synthetics, after being multiplied by seven between 1953 and 1958, was doubled in the next two years. Tonnages are still well below that of France and Germany, but the industry is rapidly becoming one of Italy's most important.

In the large chemical department, progress was considerable in numerous lines, but most of all in plastics where growth is stupendous. Barely begun in the early 1950's, production of plastics attained the index number 377 in 1958 and topped 880 a few months ago; it will reach 1,000 next year, i.e. output of plastics will be ten times what it was in 1953. The boom in coal and oil has concerned notably the refining of petrol, where Italy has become one of Europe's biggest producers and one of the world's biggest exporters.

In metallurgy we find the familiar story of Italy's small but dynamic steel industry: 8.2 million tons produced last year in a country virtually without coal or iron ore. The entry "transport vehicles" covers motor cars, where output moved from 370,000 to 600,000 in 1958-60 (whereas there was an automobile recession in many other countries), but it also covers trucks and tractors where progress has been no less notable.

Among miscellaneous industries, output of tyres grew 50 per cent in 1958-60, of furniture and of paper and carboard by 25 per cent each. The transformation of hides and skins and the manufacture of shoes reported index numbers in 1960 of 136 and 157, which was below the average but still remarkable because these industries have ceased to expand in Western industrialised nations. Mining, too, was a little behind the average, with an index number of 180 last year, but then mining industries in West Germany and France had a struggle to maintain production in 1960 at only 120 per cent of the 1953 figure.

Most of the above results have been achieved by half the country, the North; the poor Mezzogiorno has made very little contribution. As long as the South is undeveloped, Italy is fighting with one arm tied behind her back. A trend toward an equalisation of revenues between the two halves of the country has at last begun, and this opens up enormous opportunities for industry. To take the measure of them, one does not have to speculate on what Italian production would be if consumption per head were up to the American level, or even up to the French and West German level; it suffices to see what industry will be called upon to produce in order to bring the Italian national average up to the level now taken for granted by millions in Lombardy, Piedmont and Liguria. This equalisation is bound to take place because, to the long-standing political pressure in that direction and to the Government's economic plan, has now been added a deliberate and dynamic investment programme by private industry, seeking to put to work the natural and human resources of the South. Sustained Italian expansion seems assured for a decade to come, and it will have an impact on world trade and investment that should not be under-estimated.

THE COST OF THE STEEL CRISIS

INDIA'S Second Five-Year Plan had envisaged a production target of 6 million tons of ingot steel which in terms of saleable steel amounted to 4.68 million tons. The expansion in capacity was planned by setting up three new steel factories in the public sector and by expanding the capacities of the Tata Iron and Steel Company, the Indian Iron and Steel Company and the Mysore Works. The expansion programme was planned in the manner shown in Table I below. It is clear from this table that the public sector plants alone were

did not add up to even 0.2 million tons. Is it possible to evaluate this failure in financial terms? While it may not be easy to estimate the employment opportunities lost due to this grave setback, it is feasible to calculate the degree of pressure on India's foreign exchange reserves and the loss of output in the indigenous industries which are heavily dependent on supplies of steel.

In the first place, the shortfall in the output of steel has been reflected directly in a substantial curtailment of the production of general engineering goods. Table III sets out the index numbers of production of electrical and engineering goods which depend to a large extent on the supply of steel. It is true that their

TABLE I
SECOND PLAN TARGETS OF STEEL OUTPUT
(Million Tons)

	Steel Ingots	Saleable Steel
By the expansion of existing works		
TISCO	2.0	1.50
IISCO	0.9	0.80
Mysore Iron & Steel Works	0.1	0.10
By establishment of new works		
In public sector		
Rourkela Plant	1.0	0.72
Bhilai Plant	1.0	0.77
Durgapur Plant	1.0	0.79
TOTAL	6.0	4.68

expected to produce no less than 2.3 million tons of finished steel in 1960-61. Their performance has, however, been quite discouraging, resulting in a severe strain on India's foreign exchange reserves and in retarding the pace of industrial growth in the economy. An estimate of the failures of the public sector plants leading to serious shortfalls can be had from Table II below which shows the actual output of all the units, both in the public and the private sectors, in 1959 and 1960. As against the target of 2.3 million tons of finished steel, the total output of the public sector units

TABLE II
PRODUCTION OF FINISHED STEEL

	1959 tons	1960 metric tons

TABLE III
INDEX NUMBERS OF PRODUCTION STEEL OUTPUT AND ENGINEERING GOODS (Base 1951 = 100)

Year	Iron and Steel		General Engineering and Electrical Engineering	
	Index	% change over the pre-Production ceeding year	Index	% change over the pre-Production ceeding year
1952	102.2	—	92.8	—
1953	95.7	- 6.4	108.9	+17.3
1954	113.2	+18.3	151.9	+39.5
1955	113.3	+ 0.1	183.3	+20.7
1956	119.4	+ 5.4	218.1	+19.0
1957	119.3	- 0.1	241.3	+10.6
1958	119.1	- 0.2	254.1	+5.3
1959	163.1	+36.9	287.8	+13.3
1960	208.8	+28.0	350.2	+21.7

production has kept up a pace of growth higher than that of finished steel, yet it needs to be remembered that this was made possible by augmenting the imports of iron and steel. Despite the severe pressure on India's foreign exchange reserves, import licences had to be issued to actual users for those categories of steel which were expected to be obtained from the present plants but could not be made available. The purchases of steel by the Iron and Steel Controller had to be continued against D.L.F. aid and from countries agreeing to accept payment in rupees. Some imports were also made against exports of pig iron, ingots, blooms, billets, scraps and ore. All these imports totalled up to the sizable figure of more than a million tons costing nearly Rs. 120 crores in 1960-61. The details of these imports in terms of value as well as volume are set out in Table IV which brings home the fact that imports of certain varieties of steel could have been avoided if the public sector units had attained even half of the targets fixed for them. In one year alone, the pressure due to the imports of additional iron and steel increased by Rs. 38 crores from Rs. 84.29 crores in 1959-60 to Rs. 120.30 crores in 1960-61.

Past losses cannot be redeemed, but at least their moral must be learnt. More anxious attention needs to be paid for impending losses of the future. The

manner in which the plan's have been functioning since the beginning of this year shows that they may take anything from two to three years to rise to their full capacity. In case they take a minimum of three years to reach production to full capacity, India will be constrained to import iron and steel worth at least Rs. 300 to 400 crores. This is the apprehended cost of this crisis in terms of foreign exchange alone. It will also produce a serious impact by keeping the tempo of industrialisation at a lower level during the next three years than we are planning because imports of iron and steel will be regulated by the rationing of foreign exchange and not the demand which would remain unsatisfied to a large extent.

The shortage in the supply of structural, bars, (which seem to be in excess supply currently) will also slacken the tempo of construction activity that is likely to rise steeply when the Third Plan projects gather momentum. It will result in reducing employment opportunities inasmuch as the Third Plan leans very heavily on construction activities for additional employment. Nearly 2.3 million non-agricultural jobs are anticipated to be created by new construction activities and the slackness in the steel industry will certainly jeopardise the achievement of this target in employment.

Great hopes were raised in the last week of this year when the Wide Strip Mill at Rourkela was pressed into service. The ministerial pronouncements at that time had declared that with the inauguration of this mill the shortage of heavy plates would become a thing of the past. Tin plate would be available in India in abundance and it would accelerate the growth of those industries which depend upon tin plate. The performance of this unit during the last few months has not justified the exuberance displayed at that time.

TABLE IV
IMPORT OF IRON AND STEEL
(Twelve months ended March, 1961)

Item	(Quantity in '000 tons)	
	(Value in '000 Rs.)	
Item	Quantity	Value
Pig Iron and steel sponge iron including iron and steel powder	11.0	54.07
Ferro Alloys	5.7	66.11
Ingots blooms slabs billets sheet bars and tin plate bars and equivalent primary forms	37.0	2,19.15
Joists Girders angles shapes sections bars and concrete reinforcement rounds including tube rounds and squares	175.9	15,35.60
Universal plates and sheets	397.4	34,73.63
Hoop and strip including tube strip and steel strip for springs coated or not	35.2	5,05.66
Plates and sheets coated	157.7	15,94.52
Railway Rails	176.0	11,70.73
Railway Track construction accessories and rails	88.6	5,18.29
Wire rods and wire coated or not auto soler wire	146.2	12,89.68
Steel tubes and fittings welded or drawn	76.8	11,55.02
Pipes and fittings cast whether grey iron or malleable iron	2.2	60.51
Castings and forgings unworked NES cast iron plates	15.4	3,86.67
TOTAL	1,325.1	120,29.66

THE BUSINESS WORLD

Banking: Dispelling Popular Notions!

By CROESUS

WITH a steadily increasing portion of the nation's savings going into bank deposits, it is but natural that anything pertaining to banking should evoke more and more public interest. Indeed, it is "a subject of continuous topical interest," as Mr H. V. R. Iengar, Governor of the Reserve Bank of India, told the 34th annual general meeting of the Indian Institute of Bankers, in his capacity as President of the Institute. At the same time, Mr. Iengar added, "the discussions that take place are not always well-informed, largely because the basic facts, though available in statistical publications, have nowhere been explained in an easily intelligible manner." Possibly, the manner of compilation of some statistical publications and the inordinate delay in their publication are also to blame for this. Anyway, the Reserve Bank Governor was able to establish that discussions could be ill-informed—or should we say differently slanted?—even in generally well-informed quarters when he ruled off certain statistics regarding the trend of bank deposits. It must be said here, in fairness to Mr. Iengar, that he also mentioned the causes contributing to this—in this case, it is the confusion in the public mind occasioned by the fact that "figures of bank deposits in the published statistics have been distorted by the inclusion of figures relating to P.L. 480 Funds." So long as these—P.L. 480 Funds—were included, the trend and deposits seemed to be upward and, once they ceased to be included, following a change in the official procedure of recording these, the impression that one got was that the trend had been reversed. The correct position as regards bank deposits, however, was different, being as follows, according to Mr. Iengar:—

Year	(Rs. crores) Total deposits (excluding P.L. 480 Funds)
1956	1,047
1957	1,186
1958	1,318
1959	1,474
1960	1,566

This upward trend continued in the first half of the current year also, as the increase of deposits in that six-month period was Rs. 98 crores, which was higher than the increase of deposits during the first half of any year since 1956. The Reserve Bank Governor also mentioned at least two factors that are known not to conduce to an upward trend in deposits, namely, the reduced scale of deficit financing and the larger pressure on our external reserves. Could all these and the recent "impressive advance" in the index of bank share prices (from 185.9 to 225.3, as against the rise from 176.4 to 182.8 over the year ended July 15, 1961) have provided additional provocation for the proposals of the Reserve Bank to strengthen the banking system of the country by regulating the ratio of banks' capital funds to deposits, as well as by changes in cash and liquidity ratios, all in the interests of depositors? One thought that, after the acceptance by the commercial

banks, albeit after initial hesitation, of the scheme for compulsory insurance of bank deposits, the interests of the depositors had been taken care of adequately. But the latest proposals obviously belie that pious hope and the banks may be expected to stomach this further dose of regulation also, if only as the lesser of two evils, the other evil, of course, being nationalisation of banks. Evidently, with the Sword of Democles constantly dangling above their heads, thanks to our ever alert leftist friends in Parliament, the Reserve Bank perhaps feels it can drive even such a hard bargain. If it succeeds in doing so, even in a modified form of the present proposals, may I predict Mr. Iengar can count upon telling the next annual meeting of the Institute of Bankers that the index of bank shares has again receded to mid-1960 levels.

The Reserve Bank Governor, it seems, was on an even stronger wicket when he disapproved the contention that the Reserve Bank had imposed a credit squeeze and that this had adversely affected genuine productive enterprise. "This was neither intended, nor is it, in fact, the case, to the best of my knowledge," asserted Mr. Iengar. This has, of course, reference to "the directive issued by the Reserve Bank last year by which credit provided to the commercial banks is subjected to slab rates of interest rising from 4 per cent, which is the official bank rate, to 6 per cent." The Reserve Bank Chief explained that all that the Bank wanted by the use of this technique was "to impose some discipline in the money market in the sense of requiring people to be more circumspect in their demand for money", and he further claimed: "The Reserve Bank has been liberal in regard to the total quantum of credit that it is prepared to provide." In support of this claim, he added that, although during the last busy season, the Reserve Bank had fixed a limit of Rs. 138 crores under the Bill Market Scheme, as against only Rs. 54 crores in the preceding year when all accommodation was available at 4 per cent, the highest volume of accommodation taken by the banks during any particular week was only Rs. 46 crores! The conclusion he drew from this was that the commercial banks did not utilise the greater part of the money that the Reserve Bank was prepared to lend. While on this point, one would like to know whether the higher limits were made known to the banks in advance, for, if the answer is in the affirmative, Mr. Iengar's contention receives further support.

The Reserve Bank Governor also examined whether the higher rate had the effect of a credit squeeze as such, by cutting into the margin of profit of banks as a result of the rise in the cost of Reserve Bank Credit and established that it was not the case. To do this, it only required him to point out that whereas "the banks had to pay a higher rate of interest than in the past on the marginal amounts—marginal in the sense that such borrowings were a very small fraction of their total deposits—they borrowed from the Reserve Bank,

they were enabled to increase their rates on all advances, thanks to the Reserve Bank's simultaneous directive compulsorily to raise their rate of interest on advances by a minimum of $\frac{1}{2}$ per cent. This may seem to raise the issue whether the banks were morally justified in increasing their advance rates by half a per cent all round. Prima facie, they were not. But could they ignore the directive of the Reserve Bank? After placing the banks in this invidious position, it cannot lie in the mouth of the Reserve Bank Governor to score a point, as it were, by disclaiming all responsibility for the adverse effect, if any, on productive enterprise. But this is not to concede that the banks were right in conveniently not having actually raised this question, after making sure that their side of the bread was buttered all right. Be that as it may, the cumulative effect certainly of the banks not utilising the limits under the Usance Bills Scheme to a greater extent (assuming that the genuine difficulty as regards the high ratio of their advances to deposits was not there) and their charging a higher rate of interest on all advances, has since been reflected in banks profits, which, in turn, explains the increase in the index of bank shares lately.

Mr Iengar also dwelt on the controversial question of whether or not the ratio of advance to deposits in this country should be allowed to go up higher than now—it is 79 per cent now—as in Japan. His answer to this was a categorical no, at any rate in the present conditions. Mr. Iengar showed how greatly conditions in Japan—for instance, her mixed banking tradition, her narrower capital market, the ability of Japanese economy to risk the "overload" position and the discipline of the people of Japan—differed from those in this country safely to emulate the former.

The Governor of the Reserve Bank then went on to discuss the question of interest rates generally and here, again, he dispelled some wrong notions about the pattern of interest rates. While doing so, however, he reiterated his belief that, as between the agriculturist, the small trader or the small industrialist, and the big organised enterprise and Government, it is the organised enterprise

and Government that get credit at relatively low rates. So long have they been accustomed to relatively cheap rates for money that they now find difficulty in adjusting to the idea of an increase in rates, he said. While this cannot be disputed, one may ask two questions: (i) How is it that, in spite of all official efforts to channelise credit to the agriculturist, the small trader and the small industrialist, they have still been unable to reap the benefit? (ii) What will be the effect on prices if credit is made more costly to organised enterprise as well as to Government?

While on the same question of interest rates, Mr. Iengar made some post-script to his last year's observations on Bank Rate changes and stressed the significant point that "Bank Rate changes in India are symptomatic of fundamental shifts in the pattern of interest rates." That is why, he maintained, such changes are "necessarily infrequent." He also maintained that "by using the technique of slab rates, we have met with a considerable measure of success in bringing about suitable adjustments in the Reserve Bank's lending rates, without disrupting the securities market." After reading this remark, a wag whispered to me that, with more and more holdings of Government securities in the hands of public corporations, like the L.I.C., Provident Fund, etc. on the one hand, and the open market policy of the Reserve Bank, on the other, it should not be very difficult (in fact, much easier than before) for the Reserve Bank to adjust its interest rates without necessarily disrupting the securities market.

Before concluding, let me not omit to mention—I can do no more with the space at my disposal, I am afraid—the most important theme of Mr. Iengar's address to the Institute of Bankers, namely the need to have only "one single type of bank in our country, both big and small, having a licence and coming within the purview of deposit insurance," in the place of the present four confusing types—scheduled licensed banks, scheduled unlicensed banks, non-scheduled licensed banks and non-scheduled unlicensed banks. I make bold to say that all are bound to endorse Mr. Iengar's proposal that we ought to have just one type of banks. Of course, they would all have to be licensed.

Business Notes

State Loans

RS. 80 CRORES TO BE RAISED

THIRTEEN OUT of the fifteen States of the Indian Union have announced their borrowing programmes for the current year. In all, they will be raising Rs. 80 crores at 4½ per cent for a period of 11 years. Three States—Andhra Pradesh, Madras and Maharashtra—have planned to borrow Rs. 10 crores each. Two States—Mysore and West Bengal—will be raising Rs. 7 crores each. Another two States—Gujarat and Uttar Pradesh—will be borrowing Rs. 6 crores each. Madhya Pradesh and Orissa have programmed to raise Rs. 5 crores each. Kerala and Rajasthan are going in for loans to the tune of Rs. 4 crores each. Bihar and Punjab are floating loans for Rs. 3 crores each. The two States which have not yet come out with their borrowing programmes this year are Assam and Jammu and Kashmir; they might be raising loans at a later stage. Assam is not borrowing for the second year in succession.

Six States—Bihar, Kerala, Madhya Pradesh, Orissa, Punjab and Rajasthan—are floating loans at a discount of 50 nP. per Rs. 100. Five States—Andhra Pradesh, Madras, Mysore, Uttar Pradesh and West Bengal—are raising loans at a discount of 25 nP. only. Maharashtra and Gujarat are borrowing at par. Five States have offered conversion facilities for their loans which mature this year. The outstanding amount of these loans

is Rs. 12.96 crores. The net borrowings of the State Government this year, the first of the current Five-Year Plan, will thus be Rs. 87.04 crores. The maturing loans that can be converted into the new loans are 2½ per cent 1961 Madras loan (outstanding amount Rs. 3.82 crores), 2-3/4 1961 U.P. loan (Rs. 2.16 crores), 3 per cent 1961 Tapi Irrigation Development Loan of Maharashtra (Rs. 68 lakhs), 3 per cent 1956-61 Mysore loan (Rs. 6 crores) and 3½ per cent 1956-61 Cochin Loan (Rs. 30 lakhs). The subscription lists open on September 4 and will close on September 9 or earlier as soon as subscriptions approximate to the amount of each issue. All the loans mature on September 4, 1972. The State Governments have a right to retain subscriptions up to 10 per cent in excess of the amount notified.

The current yield on the six loans offered at a discount of 50 nP. per Rs. 100 works out to 4.27 per cent and that on loans floated at a discount of 25 nP. per Rs. 100 to 4.26 per cent. The redemption yield in the two cases works out to 4.3 per cent and 4.27 per cent respectively. The terms offered for the new loans, thus, are quite favourable compared to the return on the existing comparable loans.

All the loans can be expected to be fully subscribed before the official closing date. The demand for State loans has been broadening in the recent years; firstly, because provident fund has been introduced in almost all the major industries and even in business houses and some trading concerns; secondly, because

institutional investors in general have been showing preference for certain State loans; and, thirdly, because Life Insurance Corporation has been resorting to large-scale investments in Government securities, particularly State loans, which yield higher interest than the Central loans. Another factor that ensures the success of the current loans is the persuasive effort which has become a practice with some States.

The loan programme of the States for the current year augurs well for the Third Five-Year Plan for the attainment of whose financial target of Rs. 7,500 crores, a sum of Rs. 325 crores is to be raised by the State Governments as market loans. The net borrowings of the State Governments during the first year of the Plan will be over Rs. 67 crores, which is slightly more than one-fifth of the total amount to be raised by them during the five years to 1965-66.

Steel

RAW MATERIALS AND OUTPUT

MR. J. R. D. TATA, Chairman of the Tata Iron and Steel Company, in a statement to the shareholders accompanying the annual report of the company, has admitted that the company is not yet in sight of its rated production of two million tons of ingots or 1.5 million tons of finished steel. This, he added, may not materialize for the next two years. The principal contributing factor which had caused this delay in the achievement of production to full capacity, Mr. Tata said, was the non-availability of raw materials of required quality. Ash content in coal continued to be high. This has affected the output of not only the Tata Iron and Steel Company, but also of the other steel manufacturing units. Mr. Tata pointed out that for every one per cent increase in the ash content of coal, production of iron at the blast furnaces declined by 5 per cent or even more, while the consumption of coke and lime stone increased by 5 per cent. Thus the operations were doubly penalised. At present, TISCO did not have spare coking capacity and the high coking consumption per ton meant that it had to supplement its requirement by purchases from outside which were not always of the required quality.

The company, Mr. Tata added, had planned to improve its blast furnace operation by reducing the ash content of coal from its own collieries from 17.6 per cent to 17.1 per cent from October, 1960, by washing the entire coal output at its two washeries at Jamadoba and West Bokaro. The effort, however, was frustrated by allocations to the company's works of inferior grades of market coal with an ash content as high as 18.5 per cent. Consequently, coke consumption per ton of iron increased further and the requirements of blast furnaces could not be met fully from the company's coke ovens even though coke production was 6.4 per cent more than in 1959-60. The problem, Mr. Tata said, would be solved only when the washery which the Government was building at Bhojudih to wash the coal supplied from outside collieries was completed and had gone into full operation. It was planned to be commissioned last year. Had it gone into production according to schedule, there would have been a marked improvement in the output and costs of the company.

The output of iron at the TISCO works, Mr. Tata stated, continued to be hampered not only by the inferior quality of coke supplied to Jamshedpur but also by further deterioration in the quality of iron ore. To counteract the deterioration in the quality of iron ore, consequent upon the replacement of handpicking at Noamundi by mechanised mining, the company has been considering a long-range programme for the beneficiation of ore and mines and for its sizing, blending and storage at Jamshedpur. The programme is aimed at en-

suring uniformity of quality and size of ore fed to the sinter plant and the blast furnaces. Detailed investigations are being carried out to determine the quality of company's various ores and the mineral reserves and tests have been started on a pilot plant to ascertain suitability of the heavy media separation process for the ores. Apart from other problems, if the Tata Iron and Steel Company is able to get over the problem of raw materials—coke and iron ore—it is likely to show much better results.

Electricity

INVESTORS IN ELECTRICITY UNDERTAKINGS

ALTHOUGH IT is heartening to note that a higher allocation (Rs. 1,089 crores) has been made for the development of electric power supply in the Third Plan, it is feared that the increase envisaged would still be inadequate to meet the proposed increasing power requirements of this country. It was generally conceded that the existing Thermal Plants should be expanded, but the several factors actually preventing the implementation of this programme would appear to have defied all calculations. Highlighting this point and, at the same time, emphasising the urgent need for quicker expansion, the Chairman of the Bombay Suburban Electric Supply Ltd., Mr. A. N. Haksar, told the shareholders at the annual general body meeting, a few days ago, that the demand for power in the Company's area of supply, would reach nearly 200 MW in another 15 years, according to a preliminary study conducted by the B.S.E.S. As against this prospect, he disclosed that the hopes of getting a bulk supply of power from the Koyna Project had been belied, as the present signs would seem to indicate that the authorities are contemplating to divert the power to western Maharashtra region. Evidently, the recent havoc wrought by the floods in Poona has left them no other alternative. The task before the B.S.E.S. in these circumstances, is to expand its plant, which involves a considerably large amount of investment. Unfortunately, according to Mr Haksar, "investment in the Electric Supply industry is being impeded by the financial regulations governing it." Thus, the return of 2% over the Bank rate prescribed by the Electricity (Supply) Act, inadequate as it is, has been rendered more so by this return being made subject to tax deduction. This apart, as the B.S.E.S. Chief pointed out, any successful rehabilitation of the industry and efforts to raise capital for development can only be achieved by the removal of certain primary impediments. Of these, he first referred to the changes brought about in the tax pattern by the Finance Act 1959, which abolished the practice of grossing up of dividends in the hands of shareholders, on the one hand, and the deduction of tax at source, on the other. While these changes are, to some extent, beneficial to other industries, so far as the electricity industry is concerned, it comes to be otherwise, inasmuch as an electrical undertaking cannot take advantage of the compensating tax reliefs offered by the Finance Act, as the other industrial undertakings can. Further, as Mr. Haksar observed, it was all along generally understood that all the forms of taxes levied under the Electricity (Supply) Act were to be ultimately borne by the consumer. But the present position does not seem to be so. Hence his plea for "such changes in the Electricity Act as would make the return free of all tax liability, be it to the undertakings or to the investor."

Secondly, the B.S.E.S. Chief pointed out that, in a capital-intensive industry like the Electric Supply industry, a greater reliance on long-term finance was inevitable, as the requirements for development of the industry were, more or less insatiable. In view of this, he submitted that the fixation of returns should be made on a broader perspective, so that it would not only arrest dis-investment in the industry but attract more

capital for expansion. Unfortunately, however, the three-tier interest rate fixed by the Reserve Bank, he complained, had resulted in an average lending rate of about 5% which, in turn, had put the official bank rate out of focus in relation to money market conditions. This, in turn, has had the effect of further diluting even the limited return permitted to the investor in this industry.

FOURTH POWER UNIT AT TROMBAY

FROM THE statement of Mr. J. D. Choksy, Chairman of the Tata Hydro-Electric Power Supply Company, the Tata Power Company and Andhra Valley Power Company, it is evident that the Government has agreed to the companies proceeding with the project for the expansion at Trombay with a fourth power unit. The project would cost Rs. 12 crores and its foreign exchange cost would be to the extent of 70 per cent. It is satisfying to note that the group's planned programme has been completed and the companies now look to Koyna for power to meet additional load needs. The latest information is that the Tata companies will receive by December 1962 a total of 115 MW of power.

Talks have been concluded with DLF for a loan and it is heartening to observe that loan for this fourth power unit would be available on satisfactory terms. There is also a silver-lining in the cloud that an amendment to the Electricity Supply Act will improve the return to utilities, such as these companies.

The financial difficulties in undertaking the expansion are, of course, by now well-known. Mr. Choksy, states that a further relevant point in securing long-term borrowings concerns the "assured life" of Tata electric companies, whose licences are valid only up to 1975. The discussions with the State Governments seem to be successful, and to meet the difficulty, the State Governments might consider a short extension of the licences.

New Issues

INDIA FORGE AND DROP STAMPINGS

AN IMPORTANT capital issue that is coming in the market this month is that of India Forge and Drop Stampings Limited, the first public limited company to undertake manufacture of commercial steel and non-ferrous forgings and stampings which are of essential use in automobiles, railways, motor cycles and electrical industries. The company's plant is to be located at a place eight miles from Madras.

The total authorised capital of the company is Rs. 100 lakhs, divided into 7,50,000 equity shares of Rs. 10 each and 25,000 redeemable cumulative preference shares of Rs. 100 each, carrying a return of 9.286 per cent, free of company's tax but subject to deduction of tax at source at the prescribed rate. Capital worth Rs. 15 lakhs, all in equity shares, has already been subscribed by the signatories to the Memorandum of the company, its directors and their friends. Another issue of Rs. 35 lakhs is being made now in the form of 2,50,000 equity shares and 10,000 preference shares. Of this, 50,000 equity shares and 5,000 preference shares will be taken up by the Life Insurance Corporation. The rest of Rs. 25 lakhs worth of capital is being offered for public subscription—Rs. 20 lakhs worth in equity shares and Rs. 5 lakhs worth in preference shares. The lists open on August 24 and will be closed on August 31 or earlier at the discretion of the company but not earlier than August 28.

The company has entered into technical collaboration arrangements with Messrs. B. & S. Messey Limited, Manchester (U.K.), who will be helping it in the

designing, erection and start-up of the plant. The total cost of setting up and running the plant to a capacity of 3,000 tons per annum of steel forgings and drop stampings on single shift basis, is estimated at Rs. 88 lakhs. As only Rs. 50 lakhs, after the proposed issue, will be available on account of share capital, it is proposed to borrow Rs. 27 lakhs from the Industrial Credit and Investment Corporation of India at 7-3/4 per cent interest per annum for the period ending November, 1970. The remaining Rs. 11 lakhs and any additional sums required to meet incidental increases in estimated costs will be secured by raising loans from the company's bankers and other sources. The Industrial Credit and Investment Corporation has already agreed in principle to grant the loan of Rs. 27 lakhs, subject to the approval of the International Bank of Reconstruction and Development. The loan from the I.C.I.C.I. will meet in full the foreign exchange component of setting up the plant.

The principal raw materials required by the company during the first few years of production will be plain carbon and medium carbon steel billets and bars which are presumed to be available indigenously. Some alloy steel will also be required, but this will have to be imported till such time as the proposed tool and alloy steel plants are commissioned into production during the current Plan period. Electric supply to the tune of 150 KVA has already been obtained from the Madras Electricity System. Further supply to the extent of 500 KVA from this system has been promised by the end of the current year. Adequate water supply is also available at the site. In view of the likely rapid growth of railways, automobiles, motor cycles, and electrical industries in the coming years, the company's products will obviously have a ready market.

BARODA ELECTRIC METERS

EARLY IN September the Baroda Electric Meters Ltd., a new venture to produce electric meters, will enter the capital market. The company has obtained a licence for producing 60,000 single-phase AC meters and 24,000 polyphase AC meters per year. The company has negotiated technical know-how collaboration with the well-known German firm Messrs. Beutische Zahler—Geussel Schaft, Hamburg, one of the oldest manufacturing concerns of West Germany. A part of equipment is expected to be received from the rupee payment area. The fast growing demand of meters during the next decade in the wake of electrification in the country makes this output quite modest. The present annual demand is estimated to be nearly 10 lakhs single phase meters and 2.5 lakh multiphase meters. Till recently polyphase meters were not manufactured in India, but now the Government of India has started encouraging the existing units and new units to manufacture these meters. The plant of the company to be located at Vallabh Vidyanagar near Anand is likely to be commissioned towards the end of 1962.

The company was formed with an authorised capital of Rs. 1 crore and has decided to issue 40,000 shares of Rs. 100 each. Of this issue, the Life Insurance Corporation has underwritten with a firm allotment of 5,000 shares of the total value of Rs. 5 lakhs. In view of the soundness of the project, the shares are likely to receive a good response in the market.

General Insurance

PROGRESS & PROSPECTS

MR. T. M. TELANG, Chairman of the Indian Insurance Companies' Association, underlined at the 23rd annual

general meeting of the association that the progressive implementation of the various schemes of the Third Five-Year Plan would give ample opportunities to the general insurers to extend further the scope of their service. The speech of the Chairman was read by Mr. P. U. Patel in his absence. At the meeting it was made clear that emphasis will have to be on uncovering new insurance prospects, and efficient field organisation will be required to create insurance-mindedness among the people. Proper publicity will also have to be put into gear on a larger scale to spread the gospel of general insurance in the country.

Reviewing the progress of general insurance Mr. Telang pointed out that although the premium income has steadily been rising, it was hardly commensurate with the size of the country's population and expanding economy. There were vast new fields to be explored and for that it is very essential that there should be well-organized and good market composed of financially sound and viable healthy units operating in a proper atmosphere.

The Chairman welcomed the scheme of non-diversion and mutual assistance sponsored recently by some leading insurers. So far as the revised code of conduct for general insurance is concerned, the Chairman averred that it had not been a conspicuous success. Despite some improvement, wasteful competition continued.

Referring to compulsory insurance, the Chairman said that the hundred per cent increase in the volume of premium to be called on account of the Government controlled unit coming into picture, was likely to affect the trading profits of insurance companies. This, however, goes without saying that a radical rationalisation of the working of the industry in its various aspects and suitable changes in its present set up of controls and regulations governing the industry is the need of the hour.

Chemical Industry

GROWING IMPORTANCE

THE SOONER we realise the importance of chemical industry, particularly dye-stuffs, detergents, plastics, synthetic rubber etc. the better it is. This was the theme of the two lectures delivered in Madras by Dr. G. P. Kane, Senior Industrial Adviser, Government of India, under the auspices of Sir A. L. Mudaliar Endowment Lectures on Technology. The theme was wisely chosen as desirability of producing organic intermediates from basic raw materials, which are likely to be available as a result of the expansion of the steel industry during the Third Five-Year Plan, can hardly be over-emphasised. The unfortunate fact, however, is that the dye-stuff industry has not made much headway. While its production target was 28 million lbs. in the Second Plan, actual production was only of the order of 11.5 million lbs. Efforts to step up production are now being made and it is hoped that by the end of the Third Plan, production of dyestuffs would increase to 18 million lbs.

So far as the production of synthetic rubber is concerned, Dr. Kane pointed out that one synthetic rubber factory had already been licensed; it was expected to go into production in another 18 months' time. In all parts of the world synthetic rubber is now being increasingly used and with the increasing industrialisation, its use in this country is likely to grow at a much faster rate. Hence, said Dr. Kane, it was time that increased attention was paid for the development of this industry. The Third Plan production target for synthetic rubber has been put at 50,000 tons. It may not be sufficient to cope with the demand. Dr. Kane pointed out that there was

still yawning gap to be met by the synthetic rubber industry, demand being far in excess of production.

In the field of plastics, a target of 85,000 tons has been set in the Third Plan and a wide of place has been assigned to polyolefines (polyethylene etc.); their share in the overall target is 27,000 tons. Dr. Kane described the importance of polyvinyl chloride, a plastic material, owing to its use in the manufacture of leather footwear. The demand for it, he said, was likely to grow further. At present, there are only 3 units licensed in this field with a capacity of 3,000 tons per year. Keeping in view the immense demand likely to crop up in the near future, it was imperative that this capacity be doubled or trebled.

Indian Copper

GOOD PROGRESS

THAT THE Indian Copper Corporation has made good progress in 1960 is evident from the address of the Company's Chairman, Mr. Patrick E.G.W. Parish, delivered at the recent annual general meeting. Production at 8,769.30 long tons was 1,216 tons higher as compared to the previous year. Active prospecting was continued throughout the year and although no startling discoveries were made, the new small mine at Surda contributed towards the company's efforts to increase production. The reserves increased by 88,695 short tons and at the end of the year stood at 4,292,242 short tons, which is a satisfactory position for a company mining deep copper ore deposits. Despatches of finished products, which have a direct relationship to profits, were maintained at a satisfactory level. It is also encouraging to note that a start has been made by the completion of modifications to the Aerial Ropeway to carry the anticipated output from the mine to the works.

So far as the electrolytic project of the company is concerned, satisfactory progress is said to have been made on the ordering of equipment. Work has also been started on the foundations of the new buildings. To earn foreign exchange, the drive of the company remains unabated. Exports of kyanite during 1960 amounted to 21,242 long tons. The profits for the year before providing for taxation, depreciation and reserves amounted to £1,307,982, as against £1,202,259 in 1959. Dividend is maintained at 27 per cent, subject to tax.

Referring to the question of bonus share issue, Mr. Parish underlined that the company was not thinking of issuing these shares for the present. The Chairman was of the opinion that it was not worth the candle to pay 12½ per cent on the bonus shares. Although it is true that tax on bonus shares was reduced from 30 per cent to 12½ per cent in this year's budget, still this tax is unreasonable in the chairman's view when reserves, which have been built up out of taxed profits, are converted into bonus shares.

World Bank

SATISFACTORY WORKING

THE FINANCIAL statement of the World Bank for the year ended June 30, 1961, appears to be quite satisfactory. Since the increase in the authorised capital of the Bank from \$10 billion to \$21 billion on September 15, 1959, 62 members have doubled their subscription and 29 members have subscribed \$1,369.9 million in addition to their 100 per cent increase. During the fiscal year, Cuba and the Dominican Republic withdrew from membership and Nigeria and Portugal became members of the Bank with capital subscriptions of \$66.7 million and \$80 million respectively. At present the total membership of the Bank amounts to 68. The subscribed capital of the Bank amounted to \$20093 million on June 30, 1961.

Twenty-seven loans totalling the equivalent of \$610 million were made by the Bank during the fiscal year compared with a total of \$659 million last year. Argentina, British Guiana, Burma, Ceylon, Chile, Columbia, Costa Rica, El Salvador, India, Israel, Japan, Mexico, Norway, Pakistan, Panama, Peru, Thailand, Uganda and Yugoslavia, were the main beneficiaries. This brought the gross total of loan commitments on June 30 to \$5,790.5 million.

The total reserves of the Bank increased to \$601.8 million. Additions were made up of net earnings of \$83.2 million, net profit of \$3.3 million from revaluations of three members' currencies, and loan commissions of \$23.8 million. The earnings and profits were placed in the Supplemental Reserve against losses on loans and guarantees and the loan commissions were credited to the Special Reserve. Gross income, exclusive of loan commissions was \$166.6 million compared with \$151 million in the preceding year. The outstanding funded debt of the Bank amounted to \$2,228 million on June 30, 1961, reflecting a net increase of \$155.5 million over the past year. In this period there was a gross increase in borrowings of \$837.5 million consisting of three public bond issues, two in Swiss franc equivalent to \$37.3 million and one in Netherlands guilders equivalent to \$13.8 million; the private placement of bonds and notes equivalent to \$736 million, partly to raise new funds and partly as refunding operations (\$508 million in U.S. dollars, \$220.2 million in Deutsche marks and \$7.8 million in Swiss francs); the delivery of \$14.5 million of bonds and \$23.8 million in Deutsche marks notes of issues sold previously subject to delayed delivery arrangements; and \$12.1 million equivalent which was added to the funded debt as a result of the revaluation of outstanding Netherlands guilder, Canadian dollar and Deutsche marks bonds and notes.

Floods

POONA DAM BURSTS AND AFTER

IT IS not surprising that Mr. Lalchand Hirachand, President Maharashtra Chamber of Commerce, devoted the major portion of his address at the third quarterly meeting of the Chamber to the recent Poona floods. The suffering and sorrow that the people of Poona have had to go through on account of the collapse of the Panshet and the Khadakvasla dams has no parallel in their living memory. Although an enquiry commission has been set up to probe into the causes of the collapse to ascertain whether the catastrophe was a natural calamity or a man-made one, immediate task is to rehabilitate the

flood victims who have suffered for no fault of theirs. Pinpointing this need, Mr. Lalchand pleaded for the establishment, forthwith, of Poona Rehabilitation Authority with the wide powers to re-construct Poona. Such an Authority, according to him, should be vested with powers to raise loans and debentures, negotiate foreign help, also seek assistance from financial institutions and chalk out plans for the rehabilitation of the distressed people of Poona. He referred in this context to the constitution, by the Maharashtra Economic Development Council, of a separate body, the Maharashtra Commerce and Industries Rehabilitation Society, to mobilise funds from all the Chambers and create a permanent fund to make constructive use of all the receipts by helping commercial and industrial life in Poona to revive. Mr. Lalchand felt that this fund should be utilised as a sort of "guarantee fund" to create a base for the loans to be given. In this connection, he further suggested that the scheme accepted by the Reserve Bank and other authorities in assessing the credit-worthiness of a farmer (whether he owns any land or not, a loan is advanced to him on the assumption that he is creditworthy i.e. that he makes good use of the credit to increase his produce and agrees to pay off the loan out of the proceeds of the crop) should be extended to the people of Poona also in the present circumstances. He appealed to the financial institutions to apply this principle vis-a-vis shop-owners, craftsmen, and industrial units. The M.C.C. Chief also made a number of other suggestions, such as seeking aid from foreign agencies like the World Bank, the Ford Foundation, the Rockefeller Foundation and so on, besides long-term loans by the State Government and investment loans by institutions like the Life Insurance Corporation. He urged the State Government to provide free lands for the construction of houses for the homeless.

While stressing the need for these immediate measures, the M.C.C. President was not oblivious of certain urgent long-term measures which pertain not only to Maharashtra but to the whole country. As he pointed out, "the question of earthen dams is not restricted to a State" and so it should be the responsibility of the Central Government and the Planning Commission to study the merits and demerits of earthen dams, he said. Speaking of earthen dams, Mr. Lalchand also cautioned the Government to investigate the present condition of all old dams and projects and study survey reports of experts, for he felt that many of these, including the Mulshi dam (the first earthen dam to be built in the State) might need urgent check-up and attention. After this, the Central Water and Irrigation Department cannot say that it has not been alerted well in advance, if—God forbid—there should be any more dam bursts.

NATIONAL PRODUCTIVITY COUNCIL

PRODUCTIVITY JOURNAL

Special issue on PERSONNEL MANAGEMENT

August-September '61 issue of the PRODUCTIVITY JOURNAL of NPC is special issue on Personnel Management. It contains competent analysis of various aspects of Personnel Management by top experts of India and other countries. A special Supplement on Personnel Administration is free with this issue. All Managements in the country can derive benefit from this Journal. Old subscription rates (Rs. 25/- for three years and Rs. 9/- for one year) available till October 15. Thereafter the rates will be Rs. 32/- for three years and Rs. 12/- for one year. We solicit your subscription to the Journal. Please write to the Information Officer, National Productivity Council, 38, Golf Links, New Delhi.

IT DAGGER BRAND REAMERS FOR LASTING PRECISION PERFORMANCE

BACKED BY YEARS OF TRADITION and rigid control at every stage of production DAGGER BRAND REAMERS (available in inch and metric sizes) assure precision performance. They are made of superior quality steel, specially heat-treated to ensure long life and manufactured in India's biggest and most modern factory for small tools.

FROM THE CAPITAL'S CORRIDORS

FINANCE MINISTER'S TWO STATEMENTS

The Union Finance Minister, Mr. Morarji Desai, has made two important statements in the Lok Sabha. One related to the current foreign exchange situation of the country and the other to Britain's possible membership of the European Economic Community.

In his statement on the foreign exchange situation, Mr. Desai disclosed that the Government had decided not to permit entering any more into deals involving short-term foreign credits and deferred payment arrangements such as were approved during the Second Plan period. This, he said, had been done to avoid an embarrassing accumulation of repayment liabilities.

Mr. Desai added that the recent developments in regard to foreign exchange reserves of the country were "clearly a matter of concern". The Government, he pointed out, had to draw, in various foreign currencies, an amount equivalent to \$250 million from the International Monetary Fund to increase the country's foreign exchange reserves. These reserves, according to the weekly returns of the Reserve Bank of India, have shown an improvement of Rs. 54.63 crores during the week ending August 4, 1961, due to the drawing on the IMF to the tune of Rs. 58.3 crores or \$122.5 million. The rest of the \$127.5 million out of the IMF accommodation have been utilised for clearing the previous indebtedness of India to the Fund.

Though receipts on account of exports during the quarter April-June, 1961, have been about Rs. 25 crores higher than in the corresponding period of 1960, the net decline in foreign exchange reserves between April and July, 1961, has been Rs. 26 crores higher than during April-July, 1960. The Finance Minister listed the following three reasons for this:

(1) The level of imports has been steadily going up as a result of growing industrialisation of the country. Contrary to the popular belief, industrialisation, instead of cutting down the import bill, has increased it. More industries have meant higher imports on account of raw materials and spare parts (maintenance imports). Imports to build up ancillary services such as transport, power and communications have also gone up.

(2) Payments out of the country's own resources have had to be made for a mass of imports which were necessary for the development of the country and for which no external aid was available. In this category of imports are included imports of such items as fertilizers, non-ferrous metals, etc.

(3) Repayment of short-term credits made use of during the Second Plan period is also adding to the drain on the country's foreign exchange reserves. As the periods of repayments of these credits were short, there was accumulation of repayment liabilities at the beginning of the Third Plan.

To meet the foreign exchange requirements of the Third Five-Year Plan, the Finance Minister pointed out that only Rs. 2,600 crores were envisaged to be available from external aid. The rest of the foreign exchange requirements have to be met out of our own resources, that is from our export earnings. He, therefore, called for an intensive export drive.

Mr. Desai expressed satisfaction over the fact that the Aid-India Club would be providing loans for the Third Plan for much longer periods and on much easier terms than was done during the first two Plan periods. He was hopeful that foreign assistance would be forthcoming to the extent envisaged in the Third Plan.

Giving details of the aid already underwritten for the Third Plan, the Finance Minister stated that at the beginning of the Third Plan there was a carry-forward of Rs. Rs. 368 crores of aid from the Second Plan avail-

able for utilization during the Third Plan period. In addition, agreements had been concluded with the U.S.S.R., Czechoslovakia, Yugoslavia, Poland and Switzerland for credits to the tune of Rs. 238 crores, Rs. 23 crores, Rs. 19 crores, Rs. 14 crores and Rs. 11 crores respectively. This brought the total foreign aid available for the Third Plan at the beginning of April to Rs. 673 crores. The assistance promised by the Aid-India Club at its last meeting is about Rs. 1,100 crores (\$2,286 million).

BRITAIN'S JOINING THE E.C.M.

Making the statement on India's reaction to the United Kingdom's decision to negotiate for entry into the European Economic Community, the Finance Minister stated that India would "acquiesce in" the termination of her preferential trade arrangements with Britain — which is implied in Britain's becoming a member of the European Common Market — if she were granted three compensations: (1) suitable transitional arrangements for a gradual ending of the preferences so as not to damage and disturb India's export earnings; (2) general lowering of Common Market tariffs on imports from non-Common Market countries; and (iii) abolition of all quantitative restrictions on Indian exports to the "Inner-Six".

Mr. Desai reiterated that the decision on whether to join the Common Market or not rested only with the United Kingdom. India, he said, however, would "greatly regret" the ending of her preferential arrangements with Britain which had led to expansion of trade between the two countries.

In regard to the likely impact of Britain's joining the E.C.M. on India's export earnings, the Finance Minister stated: "The amount of effect this will have on our export trade will depend upon the kind of tariffs and the kind of commercial policies which are ultimately evolved. It is not possible for me, therefore, at this stage to attempt any kind of assessment of the effects of the U.K. joining the Common Market on our export earnings."

Explaining India's basic stand on the issue, Mr. Desai pointed out that it was fully in line with the principles adopted by the GATT. The GATT is against any new preferences being created. It, however, recognizes that in order not to disturb the pattern of trade established through decades of preferential treatment, the preferential concessions in operation prior to the coming into force of the GATT should be allowed to continue. The GATT, he said, had accepted the principle that if preferences were reduced, countries which benefited from the reduction in preferences should offer tariff concessions. This stand of India, Mr. Desai added, had been made clear to Mr. Peter Thorneycroft, U.K.'s Minister of Aviation, who visited New Delhi recently to have India's reactions to Britain's joining the Common Market.

In the long run, the Union Finance Minister declared, India would view the disruption of preferences as a result of the U.K. joining the Common Market as a challenge to the country's industries to adjust themselves to face the competition in the world markets. This competition, he said, should be on equal terms. By this he meant that all industrialised countries should give access to their markets, on specially favourable but not-discriminatory basis, to the products of the developing countries whether these were raw materials like metallic ores and rubber or beverages like coffee, cocoa and tea or simple processed goods like tanned hides and skins, vegetable oils and grey textiles.

Mr. Desai disclosed that Mr. Peter Thorneycroft fully agreed with the Indian viewpoint on the need for a gradual tapering off of preferential trade arrange-

ments between India and Britain and on the principles of general lowering of Common Market tariffs and abolition of quantitative restrictions on Indian exports to the Common Market. The Finance Minister further indicated that India proposed to impress these points on the Common Market countries as well. India would emphasize on them the importance of trade in reducing the dependence on aid.

FINANCE MINISTER'S NOTE TO THE PLANNING COMMISSION

Apart from the above two statements which the Finance Minister made in the Lok Sabha last week, he is said to have addressed a communication to the Planning Commission, expressing his strong disapproval of some Ministries coming up with proposals for projects which are outside the Third Plan. Mr. Desai is understood to have candidly pointed out that resources, both internal and external, are hardly adequate to finance even all the projects included in the Third Plan. He, it is further surmised, has characterized the proposals for expenditure on projects outside the Plan not only unrealistic, but capable of diverting the attention of the public from the more important problems on hand.

The Finance Minister, it is understood, has also drawn the attention of the planning Commission to the fact that the aid-giving countries have promised assistance on a definite blueprint of the Plan which should not be jumped over by inclusion of new projects. The Second Plan foreign exchange crisis, he is said to have pointed out in the communication, had been to a great extent the result of lack of strictness in including new projects in the Plan at a later stage.

The provocation for this communication from the Finance Minister appears to have come from the Planning Commission's decision to include three new projects in the Plan. One of these relates to the expansion of Hindustan Antibiotics Ltd., Pimpri, at a cost of Rs. 60 lakhs. The second project envisages setting up of a Central Design Institute for Machine Tools at an estimated expenditure of Rs. 93 lakhs. The third project seeks to expand Hindustan Cables Ltd., Roopnarpur, at a cost of Rs. 14 lakhs. There are some other projects also which are awaiting political pressure to be brought for their inclusion in the Third Plan. The more important among them are the Heavy Compressors and Pumps Project, Economy Car Project, Salt Works Project, setting up of an aluminium manufacturing plant in the public sector, putting up a naphtha cracker unit in the public sector, electrification of Durgapur, establishment of slag cement manufacturing units at the three public sector steel plants, Electrical Steel Sheets Project of Rourkela, Alloy Steel and Stainless Steel Project of Bhadravati (Mysore), setting up of a caustic soda plant as an adjunct of NEPA Newsprint Mills and the Phosphorous Plant Project.

OIL EXPLORATION IN JAISELMER AREA

An understanding has been reached between the Oil and Natural Gas Commission and the French Petroleum Institute—a French Government undertaking—for carrying out oil exploration work in the Jaiselmer Area (in Rajasthan) for a period of three years. Under the arrangement, the Oil and Natural Gas Commission and the French Petroleum Institute will form an Indo-French collaboration team for carrying out the exploration work. The entire risk of exploration will be borne by the Commission. The French Petroleum Institute experts will function as technical advisers and assistants to the Oil and Natural Gas Commission.

The foreign exchange expenditure involved in this exploration project is estimated around \$8.4 million (nearly Rs. 4 crores). All this will be met out of the credit which the French Government would be providing for this country's Third Plan. The details of the

credit agreement are being negotiated between the two Governments.

The French Petroleum Institute has a vast experience in oil prospecting in desert areas. The Institute has agreed to train Indian personnel at its headquarters in Paris.

The reaching of the understanding between the O.N.G.C. and the French Petroleum Institute means that the Esso Standard Oil Company is finally out of the picture so far as oil prospecting in Jaiselmer area is concerned. Grant of a licence for oil exploration to this company can now only be in some other area hitherto unexplored.

DEAL WITH ENI

The Union Ministry of Finance, it is understood, has cleared the Oil Minister, Mr. K. D. Malaviya's negotiated deal with the ENI under which the latter would be providing a credit to the tune of \$120 million for the development of oil industry in the public sector. The main hitch why this credit could not be cleared earlier, it now transpires, was that the draft agreement on it envisaged payment to the extent of \$13 million "cash down" at the time of the delivery of the equipment by ENI. The rest of the \$100 million credit was to be repaid over a period of 12 years with an interest at 6 per cent per annum. It appears that the Union Finance Ministry has agreed to payment of \$4.8 million "cash down" on the delivery of the equipment by the Italian firm. It is presumed that ENI would agree to payment of the remaining \$8.2 million which were to be paid at the time of the delivery of the equipment on instalment basis.

The 12-year repayment period for the Italian credit, it is understood, is not permitted under the Italian law. It should, therefore, be presumed that the credit would be available in the first instance for six years. There will, however, be an understanding that this 6-year period would be extended by another six years.

NAPHTHA SUPPLIES TO VISAKHAPATNAM FERTILIZER PLANT

Owing to the directive of the Union Oil Ministry to the private sector oil companies to restrict their imports of crude oil to the 1960 level, the management of the Caltex Refinery, it is understood, has informed the Government of India that it would not be possible for it to supply naphtha required for the 80,000-ton capacity fertilizer manufacturing unit, recently sanctioned to be installed by Parry and Company at Visakhapatnam in collaboration with the U.S. firm, California Chemicals Limited.

Will the Visakhapatnam fertilizer plant have to be abandoned? An answer to this question depends on whether the Government would permit import of naphtha from abroad or alternatively, the Caltex Refinery is permitted to import crude oil to the extent it was given to understand when its expansion programme was sanctioned.

SOLVING SUGAR CRISIS

The current crisis on the sugar front arising out of surplus production this year was the subject matter of a short, but heated, debate in the Lok Sabha. The cane-grower found several Members of Parliament, belonging both to the Treasury Benches and the Opposition espousing his cause. Replying to the debate, the Union Food and Agriculture Minister, Mr. S. K. Patil, stated that the Government was not contemplating any reduction in the price of sugarcane. He added that he wanted to give the cane-grower more money for his produce. For the present, however, Mr. Patil said, he was suggesting that in respect of exports of sugar, everyone, including the cane-grower and the manufacturer, should make some sacrifice to earn the much-needed foreign exchange for the country.

Mr. Patil reiterated his view that the problem arising out of the current sugar surplus did not tantamount to a crisis. Taking into

missioners. On the amount actually drawn an interest at the rate of 5½ per cent per annum is to be paid. There will be in all 41 semi-annual payment instalments, the first instalment falling due on May 15, 1966. The last date for the drawal of the loan would be September 30, 1965. The Government will be guaranteeing the repayment of the loan on behalf of Calcutta Port Commissioners.

DEVELOPMENT OF CALCUTTA-CUTTACK ROAD

The International Development Association, an affiliate of the World Bank, has agreed to advance a credit of Rs. 12.69 crores for the development of Calcutta-Cuttack Road. The credit will cover the following works:

- Four-lane road from Vivekanand Bridge (near Calcutta) to Joypurbeel.
- Two-lane road from Joypurbeel, in West Bengal, to Subernrekha Bridge on the Bihar/Orissa border, including the construction of bridges over the Rupnarain and Kangsabati rivers.
- Single-lane road from Subernrekha Bridge to Cuttack, including the construction of bridges over the Mahanadi, Birupa, Brahamani, Kharswan, Baitarni, Salandi, Nuniajhari and Budabalang rivers.

STC'S WORKING

The fourth annual report of the State Trading Corporation discloses that during the nine months to March 31, 1960, the total turnover of the Corporation from direct sales increased to Rs. 42.82 crores from Rs. 35.95 crores during the twelve months July 1, 1958 to June 30, 1959.

As in the previous years, mineral ores constituted the bulk of Corporation's business in exports. The total turnover of mineral ores increased from Rs. 18.28 crores in 1958-59 to Rs. 18.83 crores in the nine months of 1959-60. There was also a substantial increase in the exports of low-grade iron ore and chrome ore. Other items exports of which registered an increase were jute bags, shoes and mica. New items on the export list were bauxite, pig iron, coking coal and cotton yarn.

On the import side, the Corporation handled a wide variety of products essential for the country's industrial and other needs. Non-ferrous metals, soda ash, raw silk, ammonium sulphate and skimmed milk powder accounted for the major portion of increase in imports. New items on the import list were flour-spar, rayon grade caustic soda and rock phosphate.

Another import of significance during this year was that of giant tyres, tubes and flaps to bridge the gap between the demand and indigenous production; 26,000 sets of tyres valued at Rs. 66.5 lakhs were imported.

The financial results of the working of the Corporation during the period in question as compared to the previous year were as follows:

	(Rs. Crores)	
	1958-59	1959-60 (9 months to March 31)
Paid-up capital	2.00	2.00
Direct Trade	35.95	42.82
Indirect trade (value) of export and import through S.T.C.)	21.37	13.47
Gross Profit	3.69	3.13
Net Profit	1.28	1.40

Out of the surplus accrued in the Cement Agency Account up to June, 1959, a sum of Rs. 2.40 crores was paid to the Government. The accretion to this account during this period was much less due to the increase in the incidence of freight and packing charges. The surplus on March 31, 1960, held on behalf of the Government was Rs. 1.40 crores.

BRIEFS

The Japanese steel industry has agreed to purchase from India 6 million tons of 65/62 grade iron ore during the period 1961-63. The terms and conditions for the supply of this iron ore are to be finalised in the near future between the Japanese steel mills and the State Trading Corporation. Negotiations in respect of sale of 65/65 and 62/60 grade iron ore to Japan are still in progress.

Two private sector companies—Sardesai Brothers Ltd., Ahmedabad, and Cellulose Products of India Ltd., Ahmedabad—have been granted licences under the Industries Act to manufacture sodium carboxy methyl cellulose to the tune of 1,200 tons and 1,500 tons per annum respectively.

The Coal Mining Machinery Plant at Durgapur will go into production by the end of 1963. It is designed to manufacture centrifugal pumps, sand pumps, direct haulages, endless haulages, main axial fans, booster fans, scrapper chain conveyers and belt conveyers. Winding engines are also expected to be manufactured at this plant in the year 1965.

**all round service
to the nation**

Yoked to the country's economy and the National Five Year Plans the J. K. Organisation with a multitude of strings formed of Industrial, Commercial and Financial units is pulling its weight towards economic progress and straining towards the "take off stage." Before the III Plan is ended, several more strings of varied line not seen so far in the country would be welded and the Organisation's pulling power increase the pace of the PROGRESS.

J.K. ORGANISATION

India's Great Industrial & Commercial Combine

KANPUR • BOMBAY • CALCUTTA (INDIA)

consideration the total output of sugar, including gur and khandasari, the surplus was about 5 per cent of the total production. One factor, he said, that had resulted in the current sugar surplus was that area under cane crop had gone up by nearly 90 lakh acres in the past two years. Mr. Patil was of the view—in fact he had been pleading, he said—that areas under sugarcane should be regulated. But at the present juncture, he added, the State Governments found unable to do so under the existing laws. The Centre, Mr. Patil pointed out, was helpless in the matter since agriculture is a State subject.

Earlier replying to a question, Mr. Patil indicated that although distribution of sugar in the country was a responsibility of the State Governments, the Centre was consulting the States on liberalisation of the procedure so as to increase consumption in the country.

A more important announcement in regard to sugar, however, was made by Mr. A. V. Thomas, Deputy Minister for Food and Agriculture. He said that the Government had decided not to license any further capacity in the sugar industry for the present in view of the surplus production of the commodity this year. All the pending applications for setting up new sugar manufacturing units would be taken up for decision only when it was decided to resume licensing of fresh capacity in this industry, he stated. Mr. Thomas also disclosed that the Government had received Tariff Commission's report on the revision of the price-linking formula for sharing of sugar industry's profits between the factories and the cane-growers. The recommendations of the Tariff Commission, he said, were under examination of the Government.

ROURKELA SLABBING MILL BREAKDOWN

The Government of India has set up a committee to investigate the causes of the breakdown of the slabbing mill motor at the Rourkela Steel Plant. Mr. M. Hayath, Director, Heavy Electricals Ltd., will be the Chairman of this Committee. Its other members are: Prof. B. Sen Gupta, Director, Indian Institute of Technology, Madras, Mr. Brahma Prakash, Chief Metallurgist, Atomic Energy Commission, Bombay, and Mr. H. M. Crowe, of the International Construction Company.

The Committee has been asked to investigate the actual reasons for the breakdown of the twin drive bottom motor and ascertain the steps necessary to prevent a similar breakdown in future. It will also examine the design features of the motor for ascertaining its suitability for service in the blooming and slabbing mill. The Committee is required to submit its report within a month.

The Rourkela blooming and slabbing mill had to suspend rolling on June 17, 1961, following the failure of the twin drive bottom motor. The damage has since been repaired and the mill was re-commissioned into production on August 3, 1961. The company which supplied the blooming mill has already communicated to Hindustan Steel Limited, the authority which looks after the Rourkela Steel Plant, its views on the reasons of the breakdown. It has also submitted a report to the Government of India giving full details about the methods adopted when calculating and designing the coupling.

SMALL AND ANCILLARY INDUSTRIES FOR ROURKELA

Meanwhile, the following list has been finalised of the small and ancillary industries which can be set up at Rourkela:

Ancillary Industries: (1) Industrial fasteners; (2) Mild steel washers; (3) Foundry; (4) Drum and barrels; (5) Pipe fittings; (6) Leather footwear; (7) Paper bags; (8) Industrial brushes; (9) Industrial hand gloves; (10) Mining implements; (11) Polythene-lined jute bags.

Market-Oriented Industries: (1) Phenyl; (2) Steel furniture; (3) Builders' hardware; (4) Washing Soap; (5) Bakery and confectionery; (6) Bicycle parts; (7) Mechanical toys; (8) Motor tyre retreading and vulcanising; (9) Soft drinks; (10) Buckets; and (11) Office supplies including book binding.

An industrial estate has been set up at Rourkela for the location of small-scale industries utilising the end-products of the steel plant and for working as ancillary units for the supply of the requirements of the steelworks and the other large-scale industries coming up there. An industrial extension centre for engineering industries has also been provided at this estate.

WORLD BANK LOAN FOR COAL MINING IN PRIVATE SECTOR

As already indicated in this column last week, the World Bank has made available to the Government of India a loan equivalent to \$35 million to assist the Indian private sector coal mining industry to expand its production during the Third Plan period. The loan is repayable in 15 years; the first instalment of repayment falls due in May, 1966. It will bear interest at the rate of 5-3/4 per cent per annum, including the one per cent commission which is to be allocated to the Bank's special reserve.

Four private banks—The Bank of American National Trust and Savings Association, Irving Trust Company, Wells Fargo Bank American Trust Company and the New York Agency of the Hongkong Shanghai Banking Corporation—are participating in this loan, without World Bank's guarantee, to the extent of \$8,75,000, which represents a portion of the first maturity of the loan falling due in May, 1966.

The Third Plan coal target has been fixed at 97 million tons, which means that by the end of the Third Plan, India's coal production will have to be increased by some 80 per cent per annum above the present output (approximately 54 million tons). The private sector collieries are expected to expand their existing facilities and open new mines to increase their annual production from 44 million tons to 61 million tons. The total cost of this expansion programme is estimated around \$116 million. The rupee expenditure is envisaged to be provided by the companies themselves.

A sum of \$30 million out of the World Bank Loan is being provided to meet the cost of imported spare parts, replacements and equipment required during the first two years of the Plan period for the expansion of the existing mines. The remaining \$5 million are meant for import of machinery and equipment for opening certain new mines.

Several hundred private collieries will be participating in the expansion programme for which the World Bank Loan has been made. They represent all the segments of the industry, from small industrial units to those forming large complexes of the companies controlled by managing agents.

In view of the importance of the private sector coal industry to the attainment of the goal of 97 million tons coal output by 1965-66, the Government, it may be recalled, has taken a number of steps to enable the private companies to expand their production. They include a system of subsidies for mines with difficult operating conditions, permission to open new mines and an assurance of policies favourable to continued production by private companies.

DEVELOPMENT OF CALCUTTA PORT

The World Bank it is learnt has also agreed to grant a loan, in various foreign currencies, equivalent to \$21 million (Rs. 10 crores) for the development of Calcutta port. A formal agreement in this regard is expected to be signed shortly. The loan will be repayable in 25 years, including five years of grace. A commitment charge of 1 per cent will be payable with effect from 60 days after the agreement is signed on the amount not drawn upon by the Calcutta Port Com-

THE SIGNS OF THE TIMES

All over India signs like these are springing up—signs showing the surge of development that has been sweeping over the country in these 14 years of freedom.

The LIC is contributing vitally to this development, by channelling the premiums of its policyholders towards national undertakings—undertakings which result in more schools, more hospitals, more roads, more bridges, more railway lines, more industries and more of everything that would ensure a good standard of living for its citizens. Thus, besides guaranteeing the financial security of an individual policyholder, the LIC is helping to erect signs of progress on the road to a better life.

Life Insurance Corporation of India

COMPANY AFFAIRS

NEWS ISSUES

Consents have been granted by the Controller of Capital Issues to five companies for the issue of capital totalling Rs. 1.5 crores. The consent is valid for one year in each case. These companies are:

Rajesh Textile Mills Limited, Ahmedabad, have been granted consent to the issue of Rs. 50 lakhs capital divided into 50,000 equity shares of Rs. 100 each for cash at par. The shares will be offered to the shareholders of Sayaji Mills and the proceeds will be utilised in purchasing the assets of Sayaji Mills No. 2 in Bombay.

The Central India Coalfields Limited, Calcutta, has been granted a consent to the issue of 30,000 debentures of Rs. 100 each carrying interest at a rate not exceeding 7 per cent. The debentures are redeemable after 10 years and will be issued for development of the company's coal mines. The paid up capital of the company is Rs. 49,97,750.

The Indian Gelatine Industries Private Ltd., Bombay, have been granted consent to the issue of capital of Rs. 26 lakhs divided into equity shares of Rs. 100 each, for cash at par. The proceeds will be utilised for establishing the manufacture of edible and photographic gelatine and glue.

The Swan Mills Limited, Bombay, have been granted consent to the issue of bonus shares of the value of Rs. 24 lakhs divided into equity shares of Rs. 100 each to be issued in ratio of 2 shares for every 3 shares held on capitalisation of the company's reserves to a like extent. The company is engaged in the manufacture of cotton textiles and cotton and rayon tyre-cord. The present paid up capital is Rs. 36 lakhs.

Ahmedabad Jaya Bharat Cotton Mills Limited, Ahmedabad, have been accorded consent to issue further capital of Rs. 20 lakhs divided into Rs. 15 lakhs in equity shares of Rs. 100 each and Rs. 5 lakhs in 4½ per cent per annum (taxable) redeemable cumulative preference shares of Rs. 100 each. The shares will be issued for consideration other than cash and allotted to the shareholders of M/s. C. Parakh and Company (India) Private Limited for the purpose of amalgamation of the latter with the former company. The present paid up capital of Ahmedabad Jaya Bharat Cotton Limited is Rs. 30 lakhs divided equally in preference and equity shares. The consent is subject to the approval of the Scheme of amalgamation by the High Court of Gujarat.

PARTICIPATION WITH THE U.S.

During the period April 1, 1956 to March 31, 1961, consents have been given to 24 new issues of capital in which participation by U.S. companies was proposed. This, however, did not include cases of technical collaboration between U.S. and Indian companies approved by the Government of India.

The activities of these new companies, started with U.S. capital participation, cover a wide field, including the manufacture of automobile ancillaries, surgical and pharmaceutical products, pulp and paper, ferro manganese and other alloys, aluminium, cement, synthetic rubber, tyres and tubes, artificial silk or rayon, forge shop, carbon black, antibiotics, electrical equipments, etc.

The structure of capital participation between American and Indian interests varies from company to company but generally U.S. participation has been on a minority share-holding basis. However, only in very few out of the 24 cases mentioned earlier, the U.S. firms hold majority shares.

The Government has not invested in any of these joint collaboration firms.

SIMPLEX MILLS

The Directors of the Simplex Mills Company Limited report that the pattern of production of the

Company's Mills has undergone considerable change. Previously the Mills were producing coarse and grey cloth, the production of which has now been replaced substantially by that of higher medium wearable varieties. The above change in the pattern of production, coupled with the efficiency and vigilance of the management, have largely contributed towards the very satisfactory results for the year under review. The year's profits have practically been the highest during the post-war period.

During the year to March 31, 1961, the Company recorded a profit of Rs. 34.78 lakhs. After making usual provisions for depreciation and taxation and writing off the loss carried forward from the previous year, the Directors have recommended that a sum of Rs. 12 lakhs be transferred from the balance of Rs. 12.39 lakhs to General Reserve No. 2 and the balance be carried forward to next year's account. The Company's Rehabilitation and Modernisation plan as envisaged has created a need for larger financial resources and the Directors are of the opinion that the profits of the Company should be ploughed back to meet the demand for additional finance at least to some extent. The Directors have decided not to recommend any dividend for the year ended 31st March, 1961. With a view to reduce the existing imbalance between the Subscribed Capital of the Company and its net Fixed Assets, the Directors have recommended that, subject to the sanction of the Government, a sum of Rs. 10,08,000 out of the General Reserve No. 2 be capitalised and such amount be utilised in issuing one fully paid Equity share, as Bonus for every five existing shares held by the Shareholders.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

UNDERWRITING COMMISSION AND BROKERAGE

The Underwriters are entitled to an underwriting commission of 2½ per cent on the Capital underwritten by them.

Brokerage at the rate of 10 naye Paise per Equity share and Re. 1 per Preference share will be paid on all allotments made in respect of applications bearing the stamp of a Bank or a recognised Broker including the Underwriters and Brokers to the issue.

OBJECTS

To start and work an up-to-date commercial Forge Shop and Drop Stamping Works near the city of Madras for mass production of commercial steel and non-ferrous Forgings and Stampings for supply to automobile and internal combustion engine industry, railways, motor cycle and cycle industry, defence and aircraft industry, electrical industry and all other allied industries and carry out the business of iron and steel foundries, mechanical engineers, wagon and coach builders, tool and die makers, etc.

PROSPECTS

The Steel Forging industry is one of the basic industries which supplies the raw materials essential to a number of industries, viz., Automobile, Internal Combustion Engine, Defence and Aircraft, Motor cycle and Cycle, Railways and Rail Roads, Tractors and Heavy Earth Moving Equipment, Agricultural Machinery, Electrical and General Engineering Industries, etc. The requirements of the automobile and allied industry alone are expected to be in the neighbourhood of 1,00,000 tons per annum at the end of the Third Five-Year Plan. The majority of the manufacturers of engineering products, the automobile industry and others, are importing the bulk of their requirements of steel Forgings and Stampings. After a careful market research, Madras has been chosen for locating the present Factory and this has received the approval of the Government of India. Madras has also the advantage of availability of skilled labour. The proposed unit at Madras will be the first public limited Company to be established in the country for mass production of commercial steel Forgings and Drop Stampings similar to the units established in Europe and other industrially advanced countries.

FOREIGN EXCHANGE LOAN

The Industrial Credit and Investment Corporation of India Ltd., Bombay, have agreed in principle, subject to the consent of the International Bank of Reconstruction and Development, to grant to the Company a loan in Foreign Exchange to the extent of U.S. \$570,000 (equivalent to Rs. 27 lakhs approximately) secured by a first mortgage of the Company's assets and repayable in 15 half-yearly instalments starting from November 1963 and ending in November 1970, which will bear interest at 7½ per cent per annum. So long as the loan or any part thereof is outstanding. The Industrial Credit and Investment Corporation of India Ltd., shall be entitled to appoint a Director on the Board of the Company, who shall not be liable to retire by rotation nor shall be required to hold qualification shares.

TECHNICAL COLLABORATION AGREEMENT

The Company with the approval of the Government of India proposes to enter into a consultants and Technical Collaboration Agreement with Messrs. B. & S. Massey Ltd., Manchester, England, for a period of three years covering the design, erection and start-up of the plant and also for providing the technical know-how

with regard to the design and manufacture of Drop Stamping Dies. Messrs. B. & S. Massey Ltd., will provide the Company with various services besides acting as the Company's Consultants and Technical Advisers in connection with the design and manufacture of Drop Forging Dies for use with Massey Marathon Hammers or conventional type friction Drop Stampings, and instructing and training the personnel of the Company at their works in Manchester, England.

Messrs. B. & S. Massey have a wide experience in the design and manufacture of Drop Stamping Dies of various types and produce in their own Works at Manchester approximately 7,000 tons of Drop Stampings per annum.

SITE, RAW MATERIALS, POWER AND WATER SUPPLY

Application has been made to the Government of Madras for acquiring the necessary land in Padi and Muggapper villages about 8 miles from Madras, on the Madras-Avadi Road. Acquisition proceedings are in progress.

Plain Carbon steel and medium carbon steel billets and bars will be the principal raw materials required in the next few years. Adequate supply of these is available from the Indian Steel units. Alloy steel will also be required and will have to be imported until such time as the proposed Tool and Alloy Steel plants go into production in the Third Five-Year Plan.

The sanction for supply of 150 KVA electric power has already been obtained from the Madras Electricity System who have also promised to give 500 KVA by the end of 1961.

Adequate water is available at the site.

PRODUCTION AND PROFITABILITY

Production is expected to commence in 1962. The Directors have indications that the consumer demand will absorb the entire output of the proposed plant.

Adequate provision has been made in the plant lay-out to take care of future expansion. The estimates of profit margins are such as to ensure a reasonable return on the equity capital.

PRELIMINARY EXPENSES AND EXPENSES OF ISSUES

The preliminary expenses incurred by the Promoters in respect of the Registration of the Company, procurement of industrial licence, etc., etc., have amounted to Rs. 33,230 which amount has been reimbursed by the Company.

The estimated amount of expenses of this Issue including underwriting commission and brokerage is Rs. 2,00,000 and will be borne by the Company.

RIGHT OF PREFERENCE SHARES

The Preference Shares will confer upon the holders thereof the right to a fixed cumulative preferential dividend of 9.286 per cent (free of Company's tax, but subject to deduction of tax at source at the prescribed rates) on the capital for the time being paid up. The said shares are redeemable, at par at Company's option at any time after 10 years but not later than 15-6-1972. Any further issue of preference shares ranking *pari passu* with this issue shall be made only with the consent of the holders of not less than three-fourths of the value of Preference Shares outstanding.

CAPITAL OUTLAY AND MINIMUM SUBSCRIPTION

The minimum subscription in respect of the public issue on which the Directors will proceed to allot is

Rs. 25,00,000. Subscription of the amount is assured as the entire public issue has been underwritten. The total capital required to reach a capacity (on single shift basis) of 3,000 tons per annum of Steel Forgings and Drop Stampings is estimated to be as follows:

	Rs.
(a) Lands, buildings and other facilities	6,30,000
(b) Plant and machinery including cost of erection.	47,30,000
(c) Pre-operation expenses from the date of its incorporation until commencement of production	6,90,000
(d) Underwriting Commission, brokerage and other expenses of this issue	2,00,000
(e) Working capital	25,00,000
Total	88,00,000

SOURCE OF FUNDS

	Rs.
(1) Equity shares	40,00,000
(2) Preference shares	10,00,000
(3) Loan from Industrial Credit and Investment Corporation of India Ltd.	27,00,000

It is intended that the balance of Rs. 11,00,000 and any increase in the actual cost over estimated cost, including provision for working capital will be raised by loans from the Company's Bankers or other sources.

APPLICATION FOR SHARES

Applications for equity shares must be for 50 and for preference shares for 5 or multiples thereof. Applications together with cheques/drafts must be delivered before the closing of the subscription list to the Registered Office of the Company, or the Office of the underwriters or brokers to the issue or to any of the bankers at their offices mentioned below:

Ahmedabad, Bangalore, Bombay, Calcutta, Coch'n, Hyderabad, Kanpur, Mangalore, Nagpur, New Delhi, Surat, Trichy.

Association Meeting

INDIAN INSURANCE COMPANIES' ASSOCIATION

Review of General Insurance

"The progressive implementation of the various schemes under the Third Five-Year Plan will give ample opportunities to General insurers to extend further the scope of their service," observed Shri T. M. Telang, Chairman of the Indian Insurance Companies' Association, at the 33rd Annual General Meeting of the Association held in Bombay on August 14. In the unavoidable absence of the Chairman, the speech was read by Shri P. U. Patel.

PROGRESS OF GENERAL INSURANCE

Reviewing the progress of General insurance, Shri Telang averred that while the premium income had been steadily rising, it was hardly commensurate with the size of the country's population, its wealth and its expanding economy. It also suffered by comparison with its counterpart in other countries. There should be no room for complacency, especially when the companies had not touched even a fringe of the potential business. Shri Telang also stressed that a well-organised and integrated market, composed of financially sound, viable and healthy units, operating in a proper atmosphere, where every unit had an opportunity to expand, was a desideratum for General insurance to come into its own.

CONDITIONS IN THE MARKET

Proceeding, Shri Telang observed that the revised Code of Conduct for General insurers had not been a conspicuous success. Despite some improvement, wasteful competition continued. The question called for fresh thinking on the part of insurers and a pragmatic approach on the part of the authorities. The linking of the quantum of expenses of management to the

gross premium had led to a scramble for direct business and indiscriminate underwriting. The prescribed limits were not consistent with the prevailing living costs and prices. Shri Telang hoped that the newly reconstituted Executive Committee would suggest a more realistic basis, fair and equitable to the various sectors of the trade.

NON-DIVERSION AGREEMENT

The Chairman emphasised that the companies should concentrate their energies on developing new business. That would help to bring down the cost of acquisition and enable them to improve their financial position. He welcomed, in this context, the Scheme of Non-Diversion and Mutual Assistance sponsored recently by some leading insurers. Given goodwill, co-operation and mutual trust, he felt confident, the Scheme would enable companies to break new ground and pave the way for the rapid development of General insurance business on sound and healthy lines.

COMPULSORY REINSURANCE

Referring to the recent provision for compulsory reinsurance, the Chairman said that the hundred per cent increase overnight in the volume of premium to be ceded, on account of the Government-controlled unit coming into the picture, was likely to affect the trading profits of insurance companies. Now that the industry had been confronted with a 'fait accompli', he only hoped that the professed objective of arresting the foreign exchange drain would be achieved and the two professional reinsurers would succeed in bringing to the Indian market an increasing volume of profitable business from abroad.

Company Meetings

THE INDIAN IRON & STEEL COMPANY LTD.

STATEMENT BY THE CHAIRMAN,

SIR BIREN MOOKERJEE

DEALING WITH THE YEAR ENDED 31ST MARCH, 1961

The following statement by Sir Biren Mookerjee, Chairman of the Indian Iron & Steel Company Ltd., dealing with Company's working for the year ended 31st March, 1961, has been issued to shareholders. The Annual General Meeting of the Company will be held on Tuesday, the 5th September, 1961, at 3 p.m. at the Royal Exchange Hall of the Bengal Chamber of Commerce & Industry, 6, Netaji Subhas Road, Calcutta-1.

Production of iron for the year at 1,160,576 tonnes and of steel ingots at 914,159 tonnes showed an improvement over the previous year and constituted a fresh record for the Company. As will be seen from the Report of your Directors, there are however no grounds for complacency for with the serious deterioration in the quality of raw materials there can under existing conditions be no possibility of achieving the output envisaged at the time the expansion of our plant was planned, and in fact serious difficulties are foreseen even in maintaining production at the 1960-61 level.

ACCOUNTS :

In a consideration of the financial accounts for the year under review it should be borne in mind that the results disclosed are based on provisional steel sales realisation figures which are subject to revision according to the decision of Government on the pending enquiry by the Tariff Commission as to the steel retention prices to apply from the 1st April, 1960. To obviate hardship while the matter is under reference, Government have granted a provisional price increase as from the 1st April, 1960, but the true results for the year can naturally not be known until the final revised steel retention prices have been determined.

Nor can too much be built on any comparison of the provisional profit for the year with the profit of the previous year for previous sales figures, and in consequence previous profits, were distorted by the method adopted under the five-year price fixation that expired at the 31st March, 1960 of compensating the limited items of cost increases for which the Company under its agreement with the Government could claim adjustment. Under this method, with the exception of the increase of the steel excise duty, compensation for an increase of cost was effected not by increasing correspondingly the retention prices from the date of such increase, but by averaging the incidence of the increase over the whole five-year period with retrospective effect. The result was accordingly that while in total full compensation was effected, a part of the compensation was in fact assigned to a period before the increase in cost took place with corresponding reduction of the benefit to the subsequent period. The tendency was therefore to increase the profits of the earlier years and decrease those of the later years, the effect being of course most marked in the last year of the price fixation period, namely the year 1959-60.

It will also be appreciated that while giving a correct result in total, the effect of averaging the price increases over the five years was that the adjusted retention prices current from time to time during the period did not reflect the full amount of the cost increases, the shortfall gradually increasing over the period to a maximum in 1959-60. The new retention prices to be fixed from the 1st April, 1960 must naturally include

the full amount of the cost increases and from that date there must therefore on this account alone be a considerable apparent increase in the retention prices which in fact represents no additional benefit to the Company. Viewed against this background it will be seen that so far as the Company is concerned the provisional price increase granted by Government pending enquiry by the Tariff Commission represents an effective increase falling far short of the amount by which the retention prices have actually been raised. In the opinion of your Directors a larger increase is warranted by the circumstances of the case and the matter will be fully represented to the Tariff Commission in the course of its enquiry.

PRODUCTION DIFFICULTIES :

In view of my opening remarks regarding the present impossibility of achieving the iron and steel output envisaged under our expansion programmes and the difficulties of maintaining production even at the 1960-61 level, I should perhaps explain in as simple terms as possible what in fact are these difficulties with which we have to contend.

The main difficulty is the extremely high and varying ash content in presently available metallurgical coal coupled with erratic supplies and the fact that owing to the transport position our stock of coal is diminishing so severely that unless the position rapidly improves, we shall be forced to curtail the production of iron. Even given adequate quantity of coal in total, regularity of supply and transport from the no less than twenty-three different collieries over which our requirements have now been compulsorily spread is a further essential without which we are unable to blend the coal to effect some measure of consistency in working conditions. The consequence is that not only is the ash content of our coke ridiculously high but that this ash content varies widely from day to day with inevitable prejudicial effect on production. Under normal circumstances we would select our coal supplies to give the lowest ash consistent with the desired volatile content to suit the designed operation of our coke ovens. Conditions are such however that we have been forced in large measure to disregard volatile content and to concentrate on ash content, having regard to blast furnace practice. This position is most unsatisfactory as regards the operation of our coke ovens and is necessarily a cause of considerable concern on this account.

A high ash content in the coke means increased consumption of coke to attain the blast furnace operating temperature and in consequence a larger volume of slag produced. Since the cubic capacity of a blast furnace is constant, a larger volume of slag means in turn a reduced volume of iron produced. This high ash content makes additionally for very difficult operational

conditions, and I think I may claim that in the history of blast furnace operation we have the doubtful honour of being pioneers for never before to my knowledge has such high and fluctuating ash coke been charged to blast furnaces as is at present the case at Burnpur.

The plea of our operational executives is that if the quality of raw materials must be bad, then at least let it be regularly bad, for in that case whatever the difficulties, some measure of consistency of operation could be achieved. This however the erratic transport position effectively precludes and with the daily fluctuations it becomes impossible to produce a standard grade of iron, a position which is still further prejudiced by the present severe deterioration in the quality of limestone supplies, the percentage of free lime varying between 42% and 24%.

The tale then moves to the Melting Shop where consistency of quality of steelmaking iron is an essential for efficient working. With this consistency lacking, with some inevitable carry over of slag from the blast furnaces and with excessive impurities, in particular sulphur, in the hot metal, production difficulties become acute. Furnace time per melt is increased with consequent loss of production and operational temperature has to be increased leading to burning out of refractories and a consequent increase in the time the furnaces are out of commission for rebricking. The excessive sulphur content of the hot metal is a source of serious difficulty in the Melting Shop practice. This perhaps could, at a price, be overcome by adoption of the expensive soda ash refining process but the position is that adequate supplies of soda ash are not locally available.

Until therefore the raw materials position improves, which I fear cannot be for some years to come, operation must perforce be carried on under extremely difficult and restrictive conditions. In fact, it would seem that before improvement takes place, the position must yet further deteriorate, for there remain still three more blast furnaces to be brought into operation in the public sector plants. I view with the greatest disquiet the consequences of this impending further demand in relation to the existing shortage of coal and transport.

I would make it clear that we have abundantly proved that given working conditions in any way approaching those assumed at the time the extensions were planned, our plant, as now expanded, possesses the full designed output potential. This has been conclusively demonstrated on those unfortunately rare occasions when a combination of fortuitous circumstances has enabled us to operate temporarily under reasonably normal conditions.

EXPORT OF STEEL:

India, at present, stands on the threshold of a golden opportunity to secure a place for herself in the world market for steel. It is now for the Government advantageously to utilise this position and thereby tap a vast source for earning the foreign exchange which is so vital to the progress of the country. I shall therefore attempt briefly to describe the difficulties to be surmounted in marketing Indian steel even in the nearest neighbouring countries, for unless adequate measures are taken immediately there is, in my opinion, grave danger of allowing this opportunity to escape.

In most of the under-developed or developing countries there is almost a greater hunger for iron and steel, judging by the policy of their leaders, than for food and many other necessities of life. East of Suez and in most parts of Africa, there is a vast and growing demand for iron and steel at present. India is in an enviable position to meet these requirements being basically one of the cheapest producers of iron and steel in the world, having been abundantly endowed by nature with prac-

tically all the essential raw materials and the manpower. This position is however obscured by the inflation of production costs by the large contributions which directly or indirectly are levied on the industry for the benefit of governmental revenues.

Our iron ore resources are noted as being not only practically exhaustless but also of the highest quality. Yet for the reason I have mentioned we find ourselves in the unfortunate position of being outpriced in so far as our competitive position is concerned vis-a-vis the other exporting countries of the world except, perhaps, the U.S.A. I will illustrate my remarks with facts for your information so that it may be judged how we stand in regard to export. Taking two of the common categories which India can immediately afford to export, namely, 'Light Bars' and 'Structurals', the build-up of the approximate landed cost of these materials at Karachi, Colombo or Singapore from various sources is as follows:

TABLE NO. 1
Comparison of Indian Steel Prices
with Domestic Prices Abroad

	Rs. per metric ton					
	U.K.	Ger- many	Bel- gium	U.S.A.	Japan	India
	1	2	3	4	5	6
Light Bars	520	507	513	709	470	636
Structurals	502	515	521	686	518	645

Prices 1 to 4 are based on the (U.K.) Iron & Steel Board's Annual Report, 1960, published on 20th June, 1961. Japan's price is based on Metal Bulletin, March 30, 1961.

TABLE NO. 2
Approximate Average Freight Rate to Karachi,
Singapore or Colombo from the following exporting
countries

1. U.K., Germany, Belgium	£4.5	=Rs. 60/-	per tonne
2. U.S.A.	\$20	=Rs. 96/-	"
3. Japan		=Rs. 70/-	"
4. India		=Rs. 60/-	"

TABLE NO. 3
Indian Steel Prices effective from April, 1960
Rs. per metric ton for tested quality

	Light Bars Rs./M. Ton	Structurals Rs./M. Ton
1. Selling Price to consumers at all railheads in India	636	645
2. Government surcharge including freight equalisation amount	100	126
3. Retention price allowed to Main Producers (1-2)	536	519
4. Freight including adjustment for the equalisation fund, from Works to Docks	40	40
5. Incidental charges	5	5
6. Approximate freight from Calcutta to Colombo, Singapore, Karachi	60	60
*7. Landed cost at Karachi, Colombo or Singapore	641	624
8. Rebate of Excise Duty allowed to main producers in prices for export	53	53
9. Landed cost less rebate allowed at present	588	571

*Shipping & Hoisting charges, river dues and other Port Commissioners' charges are not included.

TABLE NO. 4
Approximate C & F prices of Steel from various
countries to Colombo, Singapore or Karachi
Rs. per metric ton

	U.K.	Ger- many	Bel- gium	U.S.A.	Japan	India
1. Light Bars	580	567	573	805	540	641 (unre- bated) 588 (re- bated)
2. Structurals	562	575	581	782	588	624 (unre- bated) 571 (re- bated)

In this comparison Retention Prices have been used for Indian steel as these prices are realisable and reflect the minimum prices at which producers can afford to export. Additionally, remuneration has to be allowed for agents and/or producers' representatives or branch offices to cover the expenses, if they are to handle the business. Furthermore the retention prices quoted in the above comparisons are current provisional prices only which must be increased on finalisation due to increased cost of production and overheads. It will thus be seen that even after deducting the rebate of Excise Duty of Rs. 53/- per metric ton allowed to the exporters in India, they are not at all happily placed in comparison with the U.K., Germany, Japan and Belgium. It is therefore very important that the gravity of the situation should be realised and that suitable steps should be taken by Government to stabilise conditions to create and increase competitive power so that it will be possible and practicable for the producers of steel in India to export. We must aim to enter the export market before our competitors have time to monopolise it and it may be that the country should, if necessary, starve itself temporarily and export rather than wait for the not far distant time when surplus production is available. Opportunity may not knock at our door again in future.

INCENTIVE FOR EXPORT:

The Government at present allows an export rebate of approximately Rs. 53/- per metric ton of finished steel equivalent to the Excise Duty levied on the steel ingot. From the figures quoted above, it will be seen that even after taking advantage of the rebate so allowed by Government, the Indian producer cannot compete with the prominent steel exporting countries, namely the U.K., Japan, Belgium and Germany. To strengthen the position of the Indian producer I feel that Government should give serious consideration to the adoption of measures which will enable the producers to reduce their production cost as much as is possible under present working conditions. These measures would include improvement of transport facilities, establishing of coal washeries, stabilisation of labour costs and regularisation of supply of raw materials and fluxes—matters which I will refer to in more detail at a later stage. Further incentives might be offered by way of rebate in the railway freight, remission of certain levies and taxes imposed by the State and Central Governments and reduction in the Port Commissioners' charges. The Government Inspectorate (D.G.S. & D.) might also be required to inspect the materials for export expeditiously and at nominal cost. The exporters should be allowed to retain any additional money they are able to realise over and above the incentives offered by the Government by virtue of their business acumen. This would enable the producers to establish and maintain their offices

abroad or to appoint agents. It must be borne in mind that for every ton of steel that is exported, foreign exchange, which is needed so badly, would be earned to the extent of £40 to £45. It is not with any motive for profit that I am suggesting increase in the incentives. The effective incentives will provide a cushion against the possibility of intensified competition by our foreign rivals. I would add that since regularity of supply would be a pre-requisite to the building up of an export market there should be no limitation to the export of certain categories of steel for which India has established adequate and probably surplus capacity, namely structurals and bars.

LABOUR:

I referred last year to the persistent rise in our Works cost despite the increase in our production. Much of this increased cost is due to the severe Governmental revenue imposts inflicted on industry in the shape of excise duties, increased customs duties, cesses, sales tax and the like, which either directly, as in the case of the steel excise duty, or indirectly by their effect on the delivered cost of goods, enter into our cost of production. Outside these items however, perhaps the most serious single factor is the persistent and inflationary rise in labour costs which again reflects directly or indirectly on our cost of production.

Labour in the Indian steel industry is better off by and large than similar labour employed in other industries in the private sector and in all industries in the public sector. As I pointed out in my Statement last year, we in India suffer from a malignant disease which thwarts our efforts even for the stabilisation much less the reduction of labour costs, namely the system of automatic annual increments as opposed to an assigned pay for each job, and of enforced increases in the rates of wages, allowances and incentive bonus. It must be remembered that any increase in basic wages is not confined to the amount of such increase for the effect snowballs by reason of consequential increase in overtime, incentive bonus, Provident Fund bonus, retiring gratuity, State Insurance contributions etc. If the Government fails to stabilise labour costs at this juncture, it will perhaps be impossible for the country even to be in a position to export any sizable quantity of steel.

Coupled with and directly bearing on the pay to be assigned to a job is the question of manning. In our own case we are at present compelled to employ at least twice as many men as are necessary having regard to the almost complete mechanisation of our plant, and to keep them in employment irrespective of our needs or of our costs.

I would make it clear that I do not for one moment suggest the imposition of a ceiling on the income of any workman. What I do suggest however is in effect a ceiling on the labour cost per ton of output, which is a vastly different matter. If industry is to continue to suffer from over-manning and low productive effort, then wages cannot be increased without inflation and loss of competitive power in world markets. Given the opportunity the Indian workman can hold his own with the workman of any other country and with reasonable manning and a link of wages with production, there is scope for very great improvement in individual earning power. Without this link, however, chaos only can result and yet it would appear that this essential has up to now been overlooked and that industrial labour which forms only a fractional part of the population of the country has been singled out for the conferment on it of benefit after benefit irrespective of productive effort or economic manning.

TRANSPORT :

The present shortage of transport is one of the most serious causes standing in the way of achievement of the planned targets for industry, impairing productive efficiency and raising all production costs. It is the primary duty of Government to develop as expeditiously as possible the availability of transport. Heavy industries, particularly the iron and steel industry, have to follow a continuous process of manufacture. Any shortage, interruption, irregularity or disorder in the transportation and delivery to the Works of the necessary materials in proper sequence leads to heavy loss of production. It is our bitter experience that raw materials are not received at the Works to our scheduled programme because of the shortage of railway rolling stock. Deficit of wagon placements builds up and is corrected by a sudden inflow congesting the internal traffic arrangements of the Works and taxing our unloading facilities to the utmost. The position is at all times aggravated by the number of wagons of unsuitable type that are allotted. Although our mechanised coal handling plant was, with the concurrence of the Railway Board, laid down on the understanding that at least 90% of our coal supplies would be in open 4-wheeler wagons, we now receive approximately 50% only in open wagons and the balance in covered wagons, with the result that our mechanised equipment stands partly idle and we have to revert to the outdated method of handling coal by manual labour. By giving us more covered wagons than we can handle each day, the Railways create periodic congestion in the Exchange Yard and advantage is at times taken of this congestion as an excuse to apply a cut on further allotments. It is clear that there is a very grave shortage of open wagons in the transport system.

Similarly, when iron ore should be brought in BOBS wagons we are forced to accept BOX wagons which disrupts the internal handling and transport arrangements in our Works and increases our cost of handling. BOBS wagons were designed for bringing iron ore to our Works and our mechanical handling equipment in turn was, again with the approval of the Railway Board, designed to handle these wagons only. There are instances when only 60% of our requirements of BOBS wagons have been met in a month and we have had manually to unload and load to and from stock extremely heavy quantities of iron ore, putting a tremendous strain on our labour resources. It is essential that immediate steps be taken by the Railways to increase the number of BOBS wagons in service.

The railway staff have a very difficult task to perform and I willingly acknowledge that they have been doing their best to endeavour that supplies to the steel works do not suffer. But what can they do when the wagons are physically not there? Pressure on carrying capacity is so great that it appears that in an endeavour to meet requirements large numbers of condemned wagons are being retained in service for we ourselves receive many with mechanical defects and in a bad general state of repair, with the result that either we are unable to utilise these wagons for out-ward traffic or can only so utilise them after effecting emergency repairs ourselves.

It is for Government to take suitable and immediate measures to make good the shortage of wagons in general and in particular of wagons of the right type for the steel industry. In this connection I understand that some of the wagon manufacturing concerns are working only to 40% of their capacity due to shortage of matching steel and some bought out steel castings such as axle boxes. This is a position which in the national interest should obviously be corrected so that the indigenous wagon building capacity may be uti-

lised to the fullest extent to meet the emergency.

The magnitude of the transport problem can be easily visualised in so far as the iron and steel industry is concerned, if it is kept in mind that under present day conditions the total quantity of raw materials to be transported to each works in order to produce one ton of ingot steel is in the neighbourhood of 5 tons. Taking six million tons of ingots as the estimated present installed annual production capacity of the main producers, this means that 30 million tons of raw materials are to be transported annually to their works. To this must be added the transport requirement for the production of 1 million tons of foundry iron, say an additional five million tons of raw materials per annum. In addition there will be about 4.5 million tons of semis and finished steel together with 1 million tons of pig iron to distribute all over the country. I have not taken into account the transport required for movement of food grains and other consumable items and stores, bricks, cement and sand which are all essential for those persons dwelling in the surroundings of the steel works, who constitute a large and fast growing population.

COAL :

So many complaints have been made by the consumers of coal and so many unfulfilled promises have been made by the Government to meet such complaints that it is not necessary for me now to repeat them in this Statement. All I say is that before launching on such a vast scale development of the iron and steel industry and the inclusion of some State cokeries, steps should have been taken to see that sufficient coking coal would be available to meet the requirements of these plants.

Simultaneously with the shortage of the quantity of coal there has also been a continuous deterioration in its quality, the ash content sometimes reaching as high as 27%. This has on the one hand considerably increased the cost of iron by larger consumption of the consequently inferior coke per ton of iron, and on the other has retarded the productivity of the Blast Furnaces and thereby reduced the available productive capacity of iron and steel in this country.

I gratefully acknowledge the assistance that has at all times been afforded by the Coal Controller who has been doing his utmost to help the industry in the face of a series of adverse circumstances over which he has but little control. The inadequate supply of wagons to the Collieries by the Railways, the Collieries not supplying the proper grade of coal they are expected to, the inadequacy of sufficient washed coal to meet the requirements of the Steel Works, are some of the problems which confront the industry. A further review by Government of these problems and also of the overall development of the coal resources of the country is essential if the Steel Works both now and under the Third Five-Year Plan are to have normal facilities to enable them to achieve their planned production capacities.

In this connection, I have to emphasize that there has been a lamentable delay in the provision of the coal washeries so necessary for reducing the quantity of ash and otherwise improving the quality of coking coal. We ourselves are particularly adversely placed in regard to supply of washed coal as the washed coal received by us at present constitutes only 7% of our total requirements of coking coal, whereas, it is understood, the programmed figures for other producers are as follows:—

TISCO	..	55%	of total requirement of coking coal
Durgapur	..	37%	"
Rourkela	..	37%	"
Bhilai	..	34%	"

The programmed quantity in our case is only 10% compared to the other Steel Works. By and large, even the unwashed coal received by the other Steel Works is by fortuitous circumstances of a better quality than that which we receive despite the co-operative assistance of the Coal Controller. The importance of establishing additional washeries of adequate capacity cannot, therefore, be overemphasized.

FLUXING MATERIALS :

It is regrettable that competition has recently developed for supplies of limestone for fluxing purposes brought about by the lack of planning on the part of the Public Sector Steel Plants which has created a position of scarcity for this material. Due to these circumstances, even inferior grade material with a high percentage of insolubles, which normally would not have been acceptable by the Steel Works, has perforce had to be consumed. Difficulties are intensified partly due to the Railways not providing adequate transport to the regular suppliers and partly because of the indifferent attitude of the suppliers to meet their commitments. There are ample reserves of good quality fluxing materials in India though away from present railheads and if steps had been taken by the Government to develop these sources and instal the necessary transport facilities the position would not have deteriorated to the present extent. Recently, there was a case

in which the Public Sector entered into competition with the Private Sector for the purchase of limestone and agreed to pay a price much higher than that being paid by the Private Sector. This naturally resulted in the producers of limestone asking the latter for a corresponding increase. Unthoughtful actions of this nature on the part of the Public Sector can lead only to a spiralling of prices of raw materials and intensification of inflationary trends.

ACKNOWLEDGMENTS :

In conclusion I would express on behalf of your Directors our appreciation of the services rendered by the General Manager, Mr. J. McCracken, and his executive staff throughout the year. The production achieved in the face of the constant operational difficulties I have outlined is itself testimony to these services, and while it is perhaps invidious to make distinction where so much depends on team-work, I feel I should make special mention of the Blast Furnace and Steel Melting Shop supervisory staff who have so ably faced up to the problems with which they have been, and continue to be, confronted in the maintenance of production under existing conditions.

The above statement is not a document purporting to be a report of the proceedings of the Annual General Meeting.

BOMBAY SUBURBAN ELECTRIC SUPPLY LIMITED

Speech by the Chairman, Shri A. N. Haksar

The Report and Accounts already before you reflect a satisfactory record of operations during the year ended 31st March 1961. Increase in sales energy has kept up the trend of the past average of 20%. The pace of increase in the coming year should, if anything, be steeper; this is, of course, assuming that bulk power in sufficient quantity will be available to meet the needs in the Company's area of supply.

From a preliminary study of the power requirements in the Company's System, it is estimated that the demand by 1976 would be in the region of 200 MW. In this context studies are, therefore, now under way to formulate a 15-year development plan. This involves appraisal, both technical and financial, of the future design of the whole system. Substantial progress in the study of the problem is expected to be made during the current year.

All these future developments involve considerable investment; but investment in the Electric Supply Industry is being impeded by the financial regulations governing it. The fact that the return at present prescribed by the Electricity (Supply) Act, namely, 2% over the Reserve Bank rate of 4%, which again is subject to deduction of tax, is definitely inadequate, has been obvious for some time, and persistent efforts are being made to obtain a measure of relief. This involves important amendments to the Electricity (Supply) Act.

Indications at present are that the proposals to amend the Electricity (Supply) Act may be brought into effect from 1st April 1962, and I earnestly hope that this expectation will materialise. In the meantime, in some of the States, including Maharashtra, the State Governments have permitted undertakings, as a special appropriation, the tax saving represented by the difference between the pre-1959 tax rate of 51.5% and the new rate of 45% based on the Finance Act of 1959. This interim relief, is, I think, an earnest

of the authorities' acceptance of the Industry's case for a fair deal.

I would now like to make some comments on the extent of relief required to rehabilitate the Industry, and enable it to raise capital for development. Two primary factors have tended to depress equity values in the Electric Supply Industry. These, in broad terms, are —

1. The change in the tax pattern introduced by the Finance Act, 1959, whereby the grossing up of dividends in the hands of shareholders was abolished, and in addition the law provided for deduction of tax at source at the prescribed rate (currently 30%). While this is a common feature affecting Industry at large, the Electric Supply Industry is placed in a position of not being able to take advantage of the tax relief offered by the Finance Act in other directions, in that whereas in other industries this relief has accrued to the benefit of the investor, in the case of the Electric Supply Industry this has not been so. This certainly is not in conformity with the scheme of the Electricity (Supply) Act. One would have thought that with the Electricity (Supply) Act providing for all taxes on income and profits being charged up to the consumer's account, taxation in all forms on the Electric Supply Industry would have automatically become the consumer's liability. As things have shaped this position has not been achieved. The priority from the Industry's point of view, therefore, is the need for such changes in the Electricity (Supply) Act as would make the return free of all tax liability, be it to the undertaking or to the investor.
2. The second issue has directly arisen out of the official Bank Rate (to which is linked the return permitted to the investor in the Industry) lag-

ing behind the realistic interest rates. In a capital intensive industry like Electric Supply, greater reliance has to be placed on long term finance as the industry's requirements for development finance are, by and large, insatiable. Consequently the return fixed from time to time should be at such level as would firstly arrest dis-investment and secondly continue to attract capital for expansion. The recent change in the Reserve Bank's lending rate to Scheduled Banks as an instrument of the credit squeeze involves three-tier interest rates: first Rs. 50 lakhs at 4%, follow on Rs. 50 lakhs at 5% and the balance at 6%, producing a resulting average lending rate of about 5%. This, by itself, has put the official Bank Rate out of focus in relation to money market conditions. Another aspect which has significant relevance is that inflation has had its effect in diluting the limited return permitted to the investor in the industry. In the light of these considerations it is only proper that the permissible return should be upgraded suitably.

I have in my opening remarks referred to your Company's expansion being dependent on the quantum of bulk power which would be available in the years to come. For the present the power supply position is far from easy, and releases of power to consumers is subject to control under the Bombay Electricity (Special Powers) Act. A measure of decontrol is, however, in existence in that the Licensees in the area have been empowered to connect up small demands up to 20 kW for industries and domestic connections are permitted freely up to 5 kW. These decontrol measures provide a degree of normal growth. To what extent relief will be available after the commissioning of the first set of the Koyna Hydro Electric Project early next year is too early to say. At one stage it was thought that the bulk of the power from the Koyna Project would be available for use in Bombay/Poona area, but currently there are indications that a sizeable portion of the Koyna power will be reserved for use in Western Maharashtra. This has led to the possibility of the Tata Hydro Companies being permitted to extend their Trombay Thermal Station and, in addition, the Maharashtra Electricity Board considering installation of a new thermal station. This trend emphasises that the power needs of the Bombay/Poona area on which base area must perforce depend industrial development elsewhere in the State, will be met. Your Company's plans for expansion should therefore proceed on the basis that it, along with other Licensees in the region, will be able to obtain sufficient bulk power releases.

From this premise will arise the question: How best the Company can finance its future development? For the present development has been sustained by Bank finance and before the current financial year is out the need for raising further finance will arise in all seriousness. By that time the proposals to modify the Electricity (Supply) Act will, we hope, have reached finality and I hope will produce a measure of incentive to the investor in the industry. Your Board will then be in a better position to consider this matter further.

The large scale development in the Company's power system, involving massive investment in the coming years, will pose the problem as to whether the rates for supply now in force will produce a sufficiency of earnings to service adequately the capital employed, and meet in addition the enlarged operational expenses inherent in development. While there is no doubt that the enlarged scope of operations will tend to spread overhead costs, one must reckon with the inflationary factor. One way to hold the price line in electric supply is to diversify the sale so as to obtain a higher

load factor, that is, secure the beneficial utilisation of the power facilities more fully. There are, of course, limitations in this direction, as consumer choice is not a thing which can be rigidly endorsed. A strict watch on expenditure is yet another remedy to control operational costs, but here again there are limits beyond which a public utility cannot go. For example, in a basic service like electric supply, continuity of supply overshadows all other considerations, and no undertaking can risk diluting its service facilities for economic considerations which are marginal. The need to supply power at the lowest economic cost must therefore be circumscribed by the greater need to maintain reliability and continuity of supply. This assumes greater importance in your Company's area of supply which has to contend with rigorous monsoon weather and unfavourable atmospheric conditions. A higher standard of maintenance of the Company's supply system is, therefore, necessary.

In the immediate years ahead the distributing Licensees in the Bombay/Poona area may have to face an increase in the bulk supply rate consequent to the injection of the Koyna power into the System. There is also the likelihood of higher fuel costs applicable to bulk power supply which might tend to curtail net earnings as the Company's rates for supply do not contain an escalator clause to take care of adjustments in fuel prices. This has been so because until recently bulk supply in the area has been from hydro sources, but this situation has been altered by the coming into being of a larger thermal component than existed before. To what extent the first cause may have its impact on your Company's overall earnings is too early to visualise at this stage. The second cause is the more immediate one to be reckoned with, and your management are now considering how best the situation can be met. It is possible that your Company may have to consider introducing a fuel adjustment clause to ensure that the rise or fall in fuel costs applicable to bulk supply will automatically be on account of the consumer.

Dealing with the Accounts, I would like to clarify the Reserve created to augment production facilities, and the appropriations so far made to that Reserve. The first instalment of appropriation to this Reserve was made in the year 1959-60 consequent to the Maharashtra Government permitting the Company, along with other Licensees in the State, a special appropriation of 6½% of the tax saving about which reference has been made earlier. When the accounts for 1959-60 were finalised, it was not certain as to what form the relief available would take. It was then thought that the amount permitted as special appropriation would be available for distribution to shareholders, but as events developed the scope of the sanction was limited to ploughing back the sum into the business without deduction from the Capital Base. It was in this context that the sum of Rs. 1,01,656 was taken into the Dividend Equalisation Reserve in the Accounts for 1959-60 and which amount has since been transferred to a Reserve to augment production facilities in the light of the subsequent Government sanction. This Reserve now stands at Rs. 2,06,130 taking into account the sum of Rs. 1,04,474 appropriated for the year under review, for which the sanction of the State Government is yet to be secured. Although the amount standing in this Reserve is not available for distribution, the benefit which will be derived by the shareholders is not slight, as the assets acquired will remain the property of the Company and the return on the amount ploughed back will also be available for the benefit of the shareholders.

Note: This does not purport to be the proceedings of the Annual General Meeting which can be seen by any shareholder on request.

* Average of Fridays. **Includes (i) paid-up-capital of Rs. 5 crores and (ii) reserve fund of Rs. 5 crores up to June 28, 1957 and of Rs. 80 crores from July 5, 1957. †Includes National Agricultural Credit (Long-Term Operations) Fund of Rs. 15 crores from July 6, 1956, and Rs. 20 crores from July 5, 1957 and of Rs. 25 crores from July 4, 1958 and National Agricultural Credit (Stabilisation) Fund of Rs. 1 crore from July 6, 1956 and of Rs. 2 crores from July 5, 1957 and of Rs. 3 crores from July 4, 1958. §Includes cash and short-term securities.

PUBLIC SECTOR PROJECTS

INDUSTRIAL PROJECTS OF CENTRAL GOVERNMENT

Name of the Scheme	Location	Total investment (Rs. crores)	Foreign exchange component (Rs. crores)	Capacity in 1965-66 (final capacity in the case of expansion)
A. Projects under execution and carried over from the Second Plan (a)				
1. Completion of the three steel plants	Rourkela) Bhilai) Durgapur)	50.0	20.0	3 million tons of steel ingots and 700,000 tons of pig iron for sale.
2. Rourkela fertiliser factory	Rourkela			120,000 tons of nitrogen.
3. Heavy machinery plant	Ranchi)			45,000 tons of finished machinery.
4. Foundry forge shop	Ranchi)	80.0	55.0	94,000 tons of casting and forgings.
5. Mining machinery plant	Durgapur)			30,000 tons of mining machinery.
6. Heavy electrical plant	Bhopal	16.0	7.0	Rs. 12.5 crores worth of electrical equipment.
7. Drug projects				Rs. 6.4 crores worth of drugs.
(a) Synthetic drug plant	Sanatnagar (Andhra Pradesh)			
(b) Antibiotics plant	Rishikesh (Uttar Pradesh)			Rs. 25.8 crores worth of antibiotics.
(c) Phyto-chemical plant	Munnar (Kerala)	30.0	15.0	Rs. 77 lakhs worth of phyto-chemicals
(d) Surgical instruments plant	Guindy (Madras)			Rs. 2.8 crores worth of instruments.
8. Organic intermediates plant	Near Panvel (Maharashtra)	11.0	6.6	25,000 tons of organic intermediates.
9. Expansion of Hindustan antibiotics	Pimpri (Maharashtra)	0.5 neg.		45,000 kgs. of streptomycin and 1.5 tons of tetracyclines.
10. Trombay fertiliser factory	Trombay (Maharashtra)	25.0	13.0	90,000 tons of nitrogen.
11. Nahorkatiya fertiliser factory	Nahorkatiya (Assam)	12.0	7.0	32,500 tons of nitrogen.
12. Neiveli fertiliser factory		15.68	11.56	70,000 tons of nitrogen.
13. Briquetting and carbonisation plant	Neiveli (Madras)	13.84	8.61	380,000 tons of carbonized briquettes.
14. Neiveli thermal power plant		9.67	5.86	250 MW.
15. Nunmati oil refinery	Nunmati (Assam)	8.5	4.9	0.75 million tons of crude oil.
16. Barauni oil refinery	Barauni (Bihar)	23.0	7.5	2.0 million tons of crude oil.
		295.19	161.4	
B. New projects for which external credits are already assured, wholly or partly				
17. Expansion of heavy machinery plant	Ranchi	14.0	11.0	80,000 tons of finished machinery.
18. Expansion of foundry forge	Ranchi	10.0	5.5	153,000 tons of castings and forgings.
19. Expansion of mining machinery plant	Durgapur	15.0	10.0	45,000 tons of mining machinery.
20. Second and third heavy electrical projects	Not yet decided	69.0	45.0	Scope yet to be finally decided in the case of the third project.
21. Heavy machine tool projects	Ranchi	11.0	9.0	Rs. 3.4 crores worth of machine tools.
22. Precision instrument project	Not yet decided	8.0	6.0	Rs. 20 crores worth of instruments.
23. Ophthalmic glass project	Durgapur	2.6	2.0	300 tons of ophthalmic glass.
24. Raw film project	Ootacamund	8.0	5.0	6.3 million sq. meters of raw films, photographic paper etc.
25. Watch factory	Bangalore	2.5	1.5	360,000 watches.
26. Expansion of Bhilai steel plant	Bhilai	138.0	56.0	2.5 million tons of steel ingots and 30,000 tons of pig iron for sale.
27. Expansion of Durgapur steel plant	Durgapur	56.0	27.0	1.6 million tons of steel ingots and 30,000 tons of pig iron for sale.
28. Expansion of Rourkela Steel plant	Rourkela	90.0	50.0	1.8 million tons of steel ingots.
29. Expansion of Hindustan Machine Tools	Bangalore	3.0	2.0	Rs. 7 crores worth machine tools.

INDUSTRIAL PROJECTS OF CENTRAL GOVERNMENT (CONTD.)

Name of the Scheme	Location	Total investment (Rs. crores)	Foreign exchange component (Rs. crores)	Capacity in 1965-66 (final capacity in the case of expansion)
30. Basic refractories project	Bhilai	3.0	1.5	Scope yet to be decided.
31. New machine tool works in Punjab	Exact location not yet decided	5.0	3.0	1,000 machine tools Rs. 3.5 crores).
32. Gujarat oil refinery	Exact location not yet decided	30.0	15.0	2 million tons of crude oil.
33. Expansion of Praga Tools	Secunderabad (Andhra Pradesh)	1.0	0.5	Rs. 1 crore worth of machine tools.
34. Heavy structural works	Not yet decided	6.0	4.0	10,000 tons heavy structural on single shift basis.
35. Heavy plate and vessel works	Not yet decided			18,000 — 20,000 tons of chemical machinery on single shift basis.
36. Gorakhpur fertiliser factory	Gorakhpur	18.0	8.0	80,000 tons of nitrogen.
37. Security paper mill	Hoshangabad (Madhya Pradesh)	5.5	4.0	1,500 tons of security paper.
38. Expansion of Hindustan cables	Rupnarainpur West Bengal)	3.5	1.2	2,000 miles of dry core cables and 500 miles of plastic insulated city cables on double shift basis.
		499.1	267.2	
C. Other Projects (b)				
39. Bokaro steel project	Bokaro	200.0	100.0	One million tons of steel ingots and 350,00 tons of pig iron for sale.
40. Alloy and tool steels plant	Durgapur	50.0	20.0	48,000 tons of finished products.
41. Expansion of Bhopal heavy electrical plant	Bhopal	19.0	8.0	Rs. 25 crores worth of electrical equipment.
42. Expansion of Hindustan Shipyard (expansion and subsidy)	Visakhapatnam	10.0	1.5	
43. Dry dock project of the Hindustan Shipyard	Visakhapatnam	2.0	0.5	50,000 — 60,000 DWT.
44. Second shipyard	Cochin	20.0	5.0	
45. Expansion of FACT	Alwaye (Kerala)	8.0	5.6	60,000 tons of nitrogen.
46. Expansion of Nepa mills	Nepanagar (Madhya Pradesh)	4.0	3.0	60,000 tons of newsprint.
47. Salt development		3.0	0.8	
48. Heavy compressors & pumps project	Net yet decided	15.0	10.0	Scope yet to be decided.
49. Ball and roller bearing project	Net yet decided	8.0	6.0	2 million bearings.
50. Additional capacity for machine tools	Net yet decided	15.0	10.0	Scope yet to be decided.
51. Second heavy structural works	Net yet decided	3.0	1.5	
52. Second plate & vessel works	Net yet decided			
53. Marine diesel engine factory	Net yet decided			
54. Expansion and modernisation of the Govt. alkaloid factory	Ghazipur (Uttar Pradesh)	0.4	neg.	
55. Lubricating oil plant		12.0	6.0	100,000 tons of HVI lubricants
56. Low temperature carbonisation plans		22.0	15.0	2.2 million tons of coal.
57. Neiveli lignite high temperature carbonisation plant and connected facilities for pig iron production	Neiveli (Madras)	25.0	13.0	1 million tons of lignite
58. Townships	At project sites	50.0		
		466.4	205.9	
		1,260.60	634.5	

(x) According to the latest estimates these projects will cost Rs. 10.1 crores and will need foreign exchange

INDUSTRIAL PROJECTS OF STATE GOVERNMENTS

Name of the Scheme	Location	Total in-vestment (Rs. crores)	Foreign exchange component (Rs. crores)	Annual capacity in 1965-66 (final capacity in the case of expansion)
Schemes with a total outlay of Rs. 50 lakhs or more				
A. Projects spilling over from the Second Plan (a)				
1. Expansion of Andhra Paper Mills.	Rajamundry (Andhra Pradesh)	4.00	2.49	18,000 tons of paper.
2. Expansion of Mysore Iron and Steel Works	Bhadravati (Mysore)			
(a) Steel expansion programme		2.00*	3.50	100,000 tons of steel ingots.
(b) Expansion of the ferro-silicon plant		0.95	0.37	20,000 tons of ferro-silicon.
3. Expansion of Government electric factory	Bangalore (Mysore)	0.90	0.48	electric transformers: 200,000 KVA electric motors: 60,000 h.p. switchgear and switchboards worth Rs. 40 lakhs.
4. Durgapur coke ovens	Durgapur (West Bengal)			
(a) Gas grid		2.25		7.5 million c.ft. of gas per day.
(b) Tar distillation plant		0.50	0.17	100 tons of tar per day. Coke: 650,000 tons. Benzene: 0.725 million gallons. Toluene: 0.235 million gallons. Napthalene: 1,200 tons; and road tar.
(c) Doubling of coke oven and by-products plant		4.20		
B. New Projects included in the Third Plan (b)				
5. Natural gas distribution	(Assam)	1.65	0.30	
6. Gas fractionation and transmission scheme	(Assam)	1.50	0.50	
7. Expansion of Bihar superphosphate factory	Sindri (Bihar)	0.50	0.15	46,000 tons of superphosphate.
8. Expansion of high tension insulator factory	Ranchi (Bihar)	0.58	0.17	4,800 tons of insulators.
9. Fertiliser project*		20.00	10.00	80,000 tons of nitrogen.
10. Cotton spinning mill	Samba (Jammu & Kashmir)	0.50	0.25	12,000 spindles
11. Pilot iron and steel plant	(Madras)	0.75		
12. Steel rolling mill	(Madras)	1.00		20,000 tons of rolled products.
13. Distribution of gas in Bombay	(Bombay)	0.50		20 million c.ft. of gas per day.
14. Reorganisation of the workshop at Nangal	Nangal (Punjab)	0.50		
15. Refractories plant	Churk (Uttar Pradesh)	0.85	0.30	24,000 tons of refractories.
16. Expansion of the precision instruments factory.	Lucknow (Uttar Pradesh)	0.69	0.22	
17. Organic chemicals scheme**	Durgapur (West Bengal)	4.00	2.00	Caustic soda: 6,600 tons. Phenol: 6,600 tons. Chlorine: 5,800 tons. Phthalic Anhydride: 6,600 tons. Formaldehyde: 5,000 tons. Penta-chlorophenol: 1,000 tons. 25,000 spindles.
18. Cotton spinning mill	(West Bengal)	0.65	0.08	
Miscellaneous schemes costing less than Rs. 50 lakhs each		15.61	4.00	
		64.08	24.98	

* Provisionally indicated in the State sector. Final decision about location and agency are yet to be taken.
 ** Private participation on a minority basis in the equity capital of the project is envisaged.

COUNTRIES WE EXPORT TO...1

THE UNITED STATES OF AMERICA HAS FROM JANUARY TO
JUNE 1961 PURCHASED 590000 PAIRS OF FOOTWEAR

FROM **Bata** INDIA

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose 'KORES' when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear,

On behalf of twentysix Kores Companies.

KORES (INDIA) LTD.

For your Kores-ponden

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

- PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
- STORES ORGANISATION • CONSUMABLE STORES CONTROL
- RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
- TRANSPORTATION METHODS • MECHANICAL HANDLING
- PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
- WORK STUDY • BUDGETARY CONTROLS
- VALUATION OF PLANT & BUILDINGS
- DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

- METHOD AND WORK STUDY • PRODUCTIVITY INDICES
- TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
- JOB EVALUATION • WAGE STRUCTURES
- PERSONNEL RECORDS • LABOUR POLICIES
- HUMAN RELATIONS • COMMUNICATION
- REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

- MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
- CLERICAL PROCEDURE • MANAGEMENT CONTROLS
- WORK MEASUREMENT • BUDGET FORECASTS

AUGUST 25, 1961.

The Plan, the Prime Minister and the People

THE debate on India's Third Plan in the Lok Sabha this week has been deeply disappointing. This is not because it failed to uncover any constructive suggestion or that it failed to release enthusiasm even amongst Congress members; it is basically because of its strong positive reflection of the feeling of apathy in the country as a whole. If the Lok Sabha fails to be stirred—and, indeed, is predominantly apathetic to the grand vision contained in the Third Plan—how can its vision be carried to millions of people, some of whom are illiterate and most of whom lack the elementary means of participation? This, and not the content of the Plan, should be our major source of anxiety. However good the transmitting end contained within the 777 pages of India's Third Plan, the receiving end is as nearly inert as possible. This Plan will fail unless something drastic, and even revolutionary, is done to awaken participation and enthusiasm in the people. This was said by several speakers in Parliament, and not by Opposition speakers only. But there was a ring in the speeches of Acharaya J. B. Kripalani and Mr. A. B. Vajapayee which struck an answering chord in the House as well as in many people in the country. There was certainly point in Mr. Vajapayee's criticism that this Plan cannot claim 'national' status. It was framed without consultation of other political parties as such and, of course, the Congress Party will claim its virtues in the elections; the Opposition will, therefore, be forced to exploit its shortfalls and failings. The Congress Party itself has never enjoyed a majority political vote; how then can it claim to speak for everybody? The attempt to sell the Plan as a combined effort will, therefore, fail; it should not have been attempted. The claim only encouraged the strong rebuff that it received.

Not even the Prime Minister's prestige seems now to be able to give life to India's plans of economic progress. For one thing the vision is not exciting enough. *The Eastern Economist* has for the last four weeks argued that the rate of economic progress has to be raised by at least 2 per cent in order to meet our needs, apart from the current aspirations of the Indian people. But even if this is done, a major programme of explanation in detail as to how the common man is to benefit will have to accompany more spacious targets of income and of production. Acharaya Kripalani was certainly right in reflecting the mood of the common man which is one of indifference. The Prime Minister's stately phrases on dedication and so on at the beginning of the Plan, and his even vaguer appeals for treating the

Plan as a "national" effort have fallen on stony ground. This is partly because the Prime Minister's leadership itself has lost its edge; and it is right that one should recognise that without the Prime Minister's leadership this country is even less prepared for sacrifice than it would normally be. Thus it looks as though a major crisis in national psychology is upon us. This is not a matter of national unity and integration; it is basically a matter of individual interest in what is claimed to be a national effort, but which, somehow or other, is never seen as such.

One of the great difficulties is the Prime Minister's own method of explanation. There is too much talk of the public sector as an instrument of redemption. To the great majority of Indian people the words 'public sector' have no more meaning than the words 'private sector', that is, they both imply an apparatus removed from themselves. In the one case power is associated with the Ministers and civil servants; in the other case, profits are associated with shareholders and managing agency houses. The workers are on the fringe of both and are not caught within the exercise either of power or participation in profits. In effect, the Indian people rightly judge that this Plan is only very secondarily for them; the beneficiaries in power are the politicians, in riches the business community. It is a mistake to believe that what has been put together in Delhi, largely by intellectuals who have a feeling of exultation in their work, and by politicians who are primarily concerned with the exercise of power, represents the mass of the Indian people. An even greater mistake is to suppose that the private sector by itself is a solution, for there is an equal or greater distrust of the managing agency houses or of private business as it takes place in the market place. What is required is a new look in terms of decentralised operation of both the public sector and the private sector by which responsibility and leadership as well as participation belong to many groups among the Indian people.

It seems certain that this challenge of throwing incentives back to individual men and women is the basic problem to be solved in India. It has been partially solved in Yugoslavia by the creation of decentralised enterprises where the Central and State Governments take themselves out of the picture whilst providing the capital for development through the Federal Bank of Yugoslavia. It has also been partially solved, both there and elsewhere, by workers' participation in industries not merely by higher wages, but also by the feeling

that the enterprise is producing products or performing tasks which are a national challenge. It may be that some of this spirit has been caught in public and private sector undertakings. Certainly the claim is made that the Hindustan Machine Tools has so operated. Whether this is so or not, basically, the division of authority and leadership in the country is such that enthusiasm at a mass level is largely lacking. That, and no

other, is the central failure of our Plans. The fact that the Prime Minister and the Planning Commission failed to recognise that they are now operating under a receding Revolution, in which their authority can work no more miracles, needs to be brought home with a brutal frankness. This is the time for the birth of different institutions to harness mass enthusiasm to the task. Who will bring them forth?

The Indian Press: Circulation

HAS there been a rise or decline or no-change in the circulation of newspapers and periodicals in India during 1960 as compared to 1959? No analyst, howsoever cautious and careful in the interpretation of the published official statistics, can be confident of his conclusions. Such conclusions as he is able to draw must be expressly qualified as tentative. How tentative they are and what is the probable margin of error, he will not be in a position to state. Two serious handicaps from which the statistics released by the Registrar of Newspapers in his Annual Reports suffer are the nature of their coverage and their quality.

Take the Annual Report for 1960 placed before the Lok Sabha last week. There is warrant to draw the *prime facie* conclusion that, although an overall increase took place in 1960 as compared to 1959, the rate of increase has been lower than in 1959 relative to 1958. But here again the area of comparability is narrow because of the coverage of the newspapers submitting their statistics in time to be included in the reports and—this is no less significant—the quality (and therefore, the dependability) of the statistics. These two vital factors bear some elaboration.

Meantime, the basic limitation must be underscored that, when more ample statistics are tendered, the whole structure of interpretation changes in a marked degree. The total average circulation of 4,651 newspapers and periodicals in various languages (including that dominant component of the Press in English) was 182.19 lakhs in 1960 as compared to 172.70 lakhs for 4,738 papers which reported in 1959 before the compilation of the report. The tentative conclusion to be drawn is that of an overall increase in 1960. But the annual statements of *more* (though not all) papers in respect of 1959, which became available subsequently, disclose a substantial improvement above what was reported last year—the revised total circulation of 5,239 newspapers reached the mark of 186.03 lakhs. Can one venture the inference that the reported circulation of the order of 182.19 lakhs in 1960 shows a declining trend? Who can give a conjecture of the revised figure for this year when more ample became available?

To make the best of the situation, the Registrar of Newspapers has selected 3,489 papers for which statistics are available for the years 1959 and 1960 and drawn the inference that the overall increase in 1960 was 8.3 per cent above 1959. He then goes on to point out that a *similar* (not *identical*) study shows that the increase in the average circulation was of the order of 11.2 per cent in 1959 and 8.8 per cent in 1958 as compared to the previous year's position. The coverages are not comparable for the two sets of years and this explains why he confines the comparative figures of percentage increases in respect of papers in the English and language Press to

1959 and 1960 only. The conclusion, tentative though it is, that the rate of increase in 1960 was lower than in 1959 ought to be circumscribed by these limitations.

But this is not all. The quality of the statistics demands attention and due weight. The earlier returns tendered by the newspapers had a bias towards inflating the volume of circulation. It is naive to suppose that this bias was without any calculated purpose. The weakness for inflation may have been influenced possibly by considerations of prestige, newsprint quotas, and so on. But certain checks have operated to bring a greater degree of precision in reporting. The publication of figures of circulation in the Annual Report provoked complaints relating to authenticity. Then followed verification through the State Governments, by the Registrar with the help of expert accountants and introduction of a new formula for certification by chartered accountants or auditors. The change which has been wrought in reporting last year accounts for the apparent decline in 1960, but its magnitude should not be exaggerated.

Subject to these qualifications, there has occurred a decline in the rate of growth in the circulation of papers in all languages—English as well as Indian. The decline in the case of English papers has been small—from 9.0 per cent in 1959 to 7.3 per cent in 1960. But there are lower declines recorded by some language papers, for example, Gujarati 7.7-6.6 and bilingual papers 14.7-14.4. However, the disparity in the growth rates in the two years has been substantial in most cases—Assamese 26.8-15.6, Hindi 11.8-3.1 and Punjabi 15.4-10.7. The declines in the cases of Bengali 10.3-6.0, Marathi 16.3-11.6 and Tamil 18.3-11.2 are partly attributable to the higher levels already achieved. Telugu papers recorded the impressive growth rate 10.6-29.5. But the decrease in Kannada 5.2 to -2.8 and the general decline in a large number of other language papers represent the essential circulation trend of the last year.

Why has this stagnation in the growth rate emerged at a time when the trend could easily be swerved the other way? Undoubtedly war-time and post-war prosperity, derived both from advertisement and circulation revenues, has generated a mood of complacency. To what extent the page-price schedule had a share in the decline cannot be discussed as the subject is *sub judice*. But there can be no two opinions that the rapid growth of literacy and the spread of the newspaper reading habit have come in handy for managements. There is danger in a lapse into mechanical production—a great disservice to the role of the Fourth Estate. Money comes more easily; not so imagination. On the whole, the Indian Press with greater financial resources is short of imagination on both the editorial and managerial sides.

Guest Editorial

Reading Between the Non-Lines

By ANDREW BOYD

PROFESSOR Parkinson is best known as the author of the famous law on the inevitable growth of bureaucracies. His other works also repay study. One in particular came to my mind as I contemplated the approach of the Belgrade Conference of Non-Aligned Countries. Non-alignment is a tricky thing to define. Indeed, the sponsors of the Belgrade "Summit" meeting have themselves found great difficulty in reaching an agreed definition; hence the long wrangle about who was to be invited to Belgrade. But, as of an elephant, so of non-alignment, you can say that although you cannot precisely define it, you recognise it when you see it. And today non-alignment looms over the international scene with a truly elephantine bulk.

The Parkinsonian analysis of voting in assemblies starts with the argument that the seating plan is all-important. Where, as in the British House of Commons, seats are arranged in two opposing halves—an arrangement attributable to the national passion for team games—a two-party system becomes inevitable. Any other arrangement makes a simple division into two parties impossible. And, without a two-party system, there is bound to emerge what may be called a "centre bloc". On any particular issue, there must be two definitely opposed groups, one for, the other against (otherwise there would not be an issue); neither of these groups has a clear majority (otherwise there would, again, be no issue, as the majority would already have imposed its will); the uncommitted or non-aligned (with whom Parkinson would include the unconcerned, the uninformed, and the uncomprehending) make up the centre bloc; and "the issue is actually decided, in the end, by the votes of the centre bloc".

One need look no farther than the United Nations Assembly for a present-day demonstration of these truths. Somebody at the UN has, indeed, taken note of another Parkinsonian theory: the theory that victory will go to whichever group can steer the more weak-willed members of the centre bloc into seats where they can be successfully led to vote as their partisan neighbours vote. It is to prevent this, evidently, that all seating at the United Nations has been made strictly by alphabetical order (to the discomfort, in particular, of the delegate of Israel, who used to have to sit between Iraq and Jordan, which both cold-shouldered him; fortunately, the admission of Ireland and Italy has eased this situation). However, regardless of the seating order, in a near-universal gathering such as the UN Assembly those factions that are specially concerned to get a given resolution approved have at least some possibility of influencing the uncommitted. But what of Belgrade? Once the uncommitted or non-aligned take to meeting by themselves, what then?

Obviously, they cannot in such circumstances be wooed and won by either of the "committed" groups. But, equally obviously, in the absence of the committed, what issues are the uncommitted to discuss? If they cling to the proposition that the only thing to which they can commit themselves is to remain uncommitted, they are not likely to say anything definite at all. On the other hand, if a natural eagerness to say some-

thing leads them to search out issues on which they do not feel obliged to remain uncommitted, a real danger lies before them. Alignments may appear among the non-aligned. A new division into contending groups may take shape within the select body from which contention had been supposedly excluded. Nor is it likely to be only a simple division into two new groups (unless the Belgrade Conference surprises the world by adopting the seating plan of the House of Commons). Between the opposing lines (or non-lines) a new centre bloc of ultra-uncommitted habits is liable to appear. Theoretically, this process of fragmentation could go on indefinitely through a series of smaller and small gatherings.

Theory, luckily, is not practice. In practice, awareness of the perils of fragmentation ought to serve as a counsel of moderation at Belgrade. This awareness is clearly widespread; one can see that from a preliminary skimming of the newspapers of most of the countries concerned. From Yugoslavia to Indonesia, the air is full of stern warnings against a show of disunity at Belgrade. President Sukarno has personally reassured his people that there is no danger of the conference opening up fresh rifts. *Borba*, the principal Yugoslav communist newspaper, has been insisting that none of the differences in policy which, it admits, exist among the participating nations must be allowed to jeopardise the general harmony of the conference. (*Borba* has poured particular scorn upon the Indonesian communist paper, *Harian Rakjat*, which had called the non-aligned countries "unreliable" and had publicly doubted whether their policies were peaceful.)

Now, I do not always agree with *Borba*, but it seems to me fully justified in stressing the perils of visible disunity at the Belgrade conference. One might, indeed, go further. *Borba* is silent about the long haggling over invitations to the conference. The efforts of some of the original sponsors to restrict invitations to a curiously narrow group of countries have already, I believe, done a certain amount of damage to the spirit of natural unity which ought to exist among the nations of Asia, Africa and Latin America; not to mention the exclusion from Belgrade of such non-aligned European countries as Ireland, Finland and Sweden, which have made common cause with those nations in so many other respects. India's pressure for wider participation was as intelligent as its hesitation about taking part itself in a narrowly circumscribed gathering. In a world of over a hundred sovereign states the voice of Belgrade will ring more loudly if the conference is seen to have brought together a large and representative group.

It may, however, ring hollowly if the outcome is no more than a set of pious appeals to the great powers and their associates to compose their differences, and, of course, to avoid sin. The role that the non-aligned countries now play on the world stage imposes grave responsibilities on them. To play their part effectively, they have not only to raise their voices in reminder of the general interest in averting conflict, but also to offer practical counsel about ways of averting it. The extent to which they can offer good counsel will be the real test of the success of the Belgrade conference.

A DELHI DIARY

EXIT BUT NO ESCAPE

AS my (disappointed?) readers will have noticed, I was absent from Delhi last week. Since I always tell the truth—in the grand manner of George Washington—I must confess I ran away from it all. Neither the Red Fort speech nor the President's At-Home makes Independence Day in Delhi an exciting occasion. I am beginning to feel that the formality of all this ritual is a little deadening. I, therefore, escaped on this occasion to look at India somewhat differently; of exhortations we have had enough. I planned to test reactions on the spot with large "samples"—fashionable word—in Madras, Bangalore, Hyderabad and Bombay so as to assist me in forgetting the problem of the Punjab which is now pressing heavily on the minds of everyone sensitive in Delhi. One of the great responsibilities of Delhi at the present time arises from its proximity to the Punjab. I suppose we can count on problems every day from now on until Punjabi Suba is conceded and perhaps thereafter. I am no expert in Punjab politics, but I can see that the hour of decision is at hand. The real interest in Indian politics has been captured by Master Tara Singh. Before I speak of my sample survey, let me, therefore, unburden myself on the Punjab. No doubt, I shall be burnt at the stake some time, but, since Mr. Asoka Mehta has done it, I cannot claim to be the first offender. May he kindly be chosen as the first martyr!

THE UNEQUAL FIGHT

I cannot see that on this occasion the Government's current stand has brought us any good. Worse still, I see that concession is almost certain to be made and that in the concession the prestige of the Prime Minister will again be shaken. The argument that this is a communal cry, as Mr Asoka Mehta points out, is a mistaken one, since Sikhs are only asking that, in the case of the new State, the borders should be designed not to exclude non-Sikhs but to include the appropriate Gurmukhi area. In other words, the old linguistic principle has come home to roost. It is no use crying ourselves hoarse on a communal question because a great majority of Gurmukhi users happens to be Sikhs. At the same time, there is no equality in the pressures that have been brought to bear on the Indian people by the fasts of Master Tara Singh and Swami Rameshwaranand. In the one case—that of Master Tara Singh—it is evident that a leader of a whole community is pressing on with the threat of political martyrdom and his act does, in fact, engage the passions of the very large majority of the Sikhs in the Indian Union. In the other case, however great the respect the Swami enjoys, I discovered in the course of my tours, that a great majority of members of his faith is indifferent. The Arya Samajists might work up some passion on the Hindi issue, but on balance the two fasts are at very different (political) levels. I argue, perhaps improperly, that this means that Master Tara Singh is going to win. Exactly how, I do not know, but I predict that before August 31, a major concession by the Government of India will have been made; and that will not be the end of the Punjab as a problem province. Nice prospect: for whom?

THE DECLINE OF PARLIAMENT

This is not my only song of distress this week. Those of us who have listened to the debate on the Third Plan have been bitterly disappointed at the apathy shown. Even more so the prestige of Parliament is lower this week than it has been any time

in previous five years. I can understand that a Parliament which is shortly to die cannot attract a great deal of interest—vested or otherwise—and Government's official legislation in this session is packed with matters of little moment. The Foreign Policy debate with its painful reiteration of inactivity almost everywhere—but officials to support the Government—also seems to have brought Parliament debates to a low level of interest. Almost nothing seems to have been said on the floor of the House which is calculated to stir or excite or even enrage. I am hoping very much that whatever might be done in terms of Party strategy we will have more vigour and excitement after the General Election. Meanwhile, Members of Parliament are seeking Prime Minister's support to obtain Congress tickets, which means that Congress members are even more on their good behaviour which, as far as I can see, implies even less criticism on the floor of the House.

NATIONAL INTEGRATION

They are all talking about national integration and I see that the Prime Minister is now proposing a conference by the end of September to analyse the terrible weaknesses of the Indian people in fighting or at least non-cooperating among themselves. I suppose that we will be told that we are small and petty, that the grand vision is totally absent from us, and that if only we could discover India again we would be better men, better Indians and, no doubt, better world citizens. I have tried this conversation in my "sample" surveys in Madras, Bangalore, Hyderabad and Bombay and I can say that it arouses no interest. This effort from on high is probably as much an ivory tower project as any I know.

THE PLAN

People might be indifferent to the Plan so far as they themselves are concerned, but it is a subject of interest and continued conversation. It was a little unfair of me to expect, when the Plan was only placed before Parliament on August 7, that it should be taken as read the following week. But it is surprising how much knowledge there is. The main features of the Plan have been absorbed from the excellent publicity that the newspapers have given to the Planning documents. I have been personally promised a summary of the Plan which apparently would be much more valuable to laymen like myself than the original weighty 777-page document. No doubt, it will arrive; meanwhile I might record that I am on page 300 of the original document and am still labouring manfully to complete my homework by the end of this month. I can record happily not only the results of the sample survey, but will measure my own enthusiasm on what is described on the Stapel Scale as +5. For the present let me say that a plan for national integration is a non-starter, but a Plan for economic progress is very much a starter; though in many respects we wish to see a different plan. But as for work, it is a slow business. Everyone seems to think that this is a Plan for everyone else but himself. How does one start to convince people that a Plan for everyone is also a Plan for each individual? Anyone who obtains the answer to the problem of how a national plan is basically an individual plan will have obtained the secret power in a democracy. It seems much easier to devise national plans than to translate those plans into 440 million individual assessments of personal interest. Until this is done I fear that what is called public participation will remain what it is—a small and insignificant apology for public enthusiasm. Here endeth the first chapter.

ARGUS

THE WEEK'S NOTES

U.S. Aid Bill

A SETBACK

THE IMAGINATIVE programme of the Kennedy Administration to place foreign economic aid on a long-term basis has received a serious setback from Congress. President Kennedy had asked for authority to borrow from the Treasury the unprecedented sum of \$8.8 billion over a period of five years to finance programmes of aid to the underdeveloped countries of Asia, Africa and Latin America by long-term commitments to give them the assurance in advance of continuity of American loan assistance. The purpose was to enable them to prepare their own development schemes in the full confidence that the foreign exchange outlay, of which they are substantially short in their own resources, would provide no insuperable obstacle in going ahead with integrated expansion programmes. The initial reverse came when a cut of \$800 million was applied to the loan authorisation from the Treasury. The subsequent blow denying authority to draw from the Treasury for a period of 5 years came after the Bill passed through critical ups and downs in the Senate as well as the House. The hope that a compromise formula would satisfy the viewpoints of Congress and the Administration by making it obligatory on the latter to submit for the approval of Congress each loan proposal of \$5 million or above was also dashed to the ground. Ironically enough, it was the motion of the Indian-born Representative Saund which was eventually responsible for knocking out the five-year period and restricting the President's authority to Congressional appropriations from year to year.

In part the blow to the long-term basis of aid may be traced to the universal trend, noticeable in every democratic country, on the part of the legislature jealously safeguarding its control of the purse and not delegating liberal and discretionary power of expenditure to the executive. Congress had sometimes looked with scepticism on the Administration's aid commitments and the way in which certain programmes were drawn up. But this inherent conflict between the legislature and the executive cannot fully explain the reverse with which the Aid Bill had to meet. There is something more significant in it. President Kennedy's earnest appeal to Congress to adopt a firm bipartisan policy of solidarity in the crucial matter of foreign economic aid and his gentle reminder of the manner in which the Democrats lent support and established a sort of convention of bipartisan unity during Mr. Eisenhower's Republican Administration were of little avail. What is surprising is that there was not only lack of response to the request for bipartisan solidarity but some of the Democratic members, including several from the South, voted against the Bill.

It is true that the rejection of the long-term authorisation to the President to draw funds from the Treasury for external aid does not imply that the size of the actual aid that would be extended would be cut down. In the yearly appropriations, which the Administration will now have to seek, aid amounts may very likely be voted by Congress on the dimensions asked for. But the element of uncertainty about the availability of American aid will hover over the planners in the underdeveloped countries and; since very few programmes of expansion can be drawn up fully on a short-term basis, there will be the basic handicap for them to enter into longer commitments of overseas plans of developmental purchases which many schemes entail. A certain flexibility will need to be maintained to meet the contingency of aid being slow to materialise

at the requisite time. It is this prospect of flexibility which has detracted in some measure from the tone of confidence that should have inspired our Third Plan.

The Presidency

TWO TERMS IN RASHTRAPATI BHAVAN

MR. BHUPESH GUPTA'S Bill, seeking to amend the Constitution, to limit holding of the office of the President of the Indian Union by the same incumbent to two terms, involved an important issue of principle and as such it merited a sober discussion. It is unfortunate that the Prime Minister, who, significantly enough, agreed without reservation to the limitation of two terms, treated the Bill rather indifferently. The sentiment and emotion he imported into the debate, which ought to have been held on the high plane of an objective discussion, were totally uncalled for. He appears to have lost sight of the sequence of the events leading to the preliminary debate, while expressing his disapproval that the subject was raised at a delicate time "when our revered President is passing through a severe illness". It was a regrettable coincidence that the discussion on the Bill came up on the agenda of the Rajya Sabha at this stage. In fact, the Bill was introduced during the last session presumably in view of the forthcoming Presidential election. Mr. Gupta dispelled any possible misgivings by wholeheartedly associating himself with the feeling of deep concern over Dr. Rajendra Prasad's health. The affection and reverence which he has earned as Head of State and the grandeur and dignity with which he has invested this supreme office during its first decade are acknowledged on all hands.

The office of President is not merely symbolic, but it carries responsibilities which demand capacity to solve critical problems. These problems may be constitutional, political or personal. It is given unto the President to use his personal influence for moderation and patience when the cabinet is likely to show questionable haste. If certain critical situations arise, his status as Supreme Commander of the Defence Forces of the Union may not necessarily be regarded as titular. The President can bring the weight of his personality to bear on important decisions of policy.

Under Article 57 the President is eligible for re-election which may in some cases mean re-election for a third or even a fourth term, considering the provision of Article 58 (1) (b) declaring a person of 35 years of age to be eligible for election to this office. It may mean holding the office for 15 years and theoretically even for longer periods. Re-election for a second term is itself a great distinction. No personal equation is involved in limiting the office to two terms and grace could have been imparted to the spirit of the Bill by including a clause that President Prasad could stand for a third term at his discretion. He himself has opposed the idea of another term. The purpose of the limitation is two-fold—to give one individual a reasonably adequate tenure and to secure the benefit of the good offices of a succession of luminaries to shoulder the responsibility as also to add variety and colour to the office. The regional touch is a consideration which cannot be altogether ignored.

The Bill was withdrawn on the Prime Minister's solemn assurance on the floor of the House that a statutory provision was not necessary, but the principle of two terms would be honoured and upheld by means of a strict convention. In the absence of a statutory limitation, the convention would serve the purpose.

Uttar Pradesh

THE CENSURE MOTION

THE PARTY in office as well as all the opposition parties and groups in the U.P. Legislative Assembly displayed solidarity during the discussion on the censure motion against the Government this week. Its fate was foredoomed. All the opposition parties put themselves under the leadership of Mr. S. K. D. Paliwal and launched a vigorous attack on the Ministry. This was probably a move to bring a greater weight in the attack on the eve of the forthcoming general elections. Hopes that the dissident group in the party in power would create embarrassments for the Gupta Ministry were completely belied. Mr. M. P. Shukla, a Deputy Minister in Dr. Sampurnanand's cabinet, gave a fitting reply to the opposition speaker, who tried to make capital out of the group differences in the Congress Party, asserting that they were the domestic concern of the party and outsiders could not hope to profit by them. If the same spirit of putting the party above group interests and loyalties is fortified, the Congress Party will emerge with greater strength to fight the general elections.

All the charges made by the opposition members may not be dismissed as frivolous or propagandist. It is difficult to disagree with the allegation that the group rivalries in the ruling party have demoralised the administration in some degree. The propriety of moving the Education Amendment Bill to the Act which was passed by Dr. Sampurnanand's Ministry only a few months back and was yet to be given a trial for testing its deficiencies, if any, was rightly questioned. It savours of a desire to reverse some of the provisions to which Mr. C. B. Gupta's Ministry takes exception for reasons known to itself. But the other charges were unconvincing. In this category can be listed the grievance ventilated against the appointment of members of the Upper House as Ministers, use of nominated members in the local bodies and co-operative societies to gain control over them and the transfers of officers with the purpose of influencing the elections in particular constituencies. If the opposition parties are strong on their own ground, there is nothing to prevent them from capturing power either in the local self-governing institutions or in the legislatures.

Nyasaland

VERDICT ON FEDERATION

DR. HASTINGS BANDA took up the challenge of the first election under the new constitution and averred that he would treat the election as a referendum on the federation. This was an extreme claim to make, but there cannot be an iota of doubt which way the electorate gave its verdict. Dr. Banda's Malawi Congress Party captured all the 20 lower roll seats — 14 in regular contests and 6 unopposed. Sir Roy Welensky's United Federal Party as well as the Christian Liberal Party met with a smashing reverse, all the candidates put up by both the parties having forfeited their deposits. The poll was as heavy as 90 per cent. Sir Roy could have done well not to raise the plea of intimidation. Ninety per cent of the electorate cannot be intimidated and driven to the polling booths like herds, unless the contention is that the ordinary administrative machinery had broken down. Facts speak otherwise. Dr. Banda is a personal friend of Governor Sir Glyn Jones. In the recent past he has spoken in moderate tones about the civil service as well as the European settlers. The election campaign was conducted by and large in a peaceful manner, the secrecy of the ballot was well maintained and there is no evidence

that there was scope for the play of terror tactics. Of the upper roll seats, the Malawi Congress Party won 2 and an independent backed by it was also elected. The United Federal Party got 5 seats in this restricted franchise. The Malawi Congress Party has emerged victorious and its leader is confident of the power derived from an absolute majority in the State legislature. Together with 5 official nominees, there will be 10 members outside the Malawi Congress Party. In the Executive Council Dr. Banda will get for his party 3 ministerial posts for the lower roll seats and he can claim 1 more for the upper roll.

There are, of course, constitutional technicalities which will bar unilateral decision on secession. But equally strongly there is the hard reality that with Nyasaland determined to break away from the Federation, it is difficult to see how the federal chariot will move forward. In the Executive Council the Governor will be confronted with the unenviable task of seeking to reconcile the MCP and the UFP irreconcilable wings. The Monckton Commission made no attempt to conceal the fact of intense hatred for the federal idea in Nyasaland. The election has given a formal proof of this feeling and a verdict against the federation. Already discontent is surging in North Rhodesia and Mr. Kenneth Kaunda's United National Independence Party is organizing its own variety of non-violent resistance. Whether non-violence is feasible on a large scale when racial feelings strain patience is another issue. But the outlook being one of mass dissatisfaction, statesmanship ought to be directed to evolving a modus vivendi for dismantling the federal structure of the constitution.

The Income-Tax Bill

MODERATE MODIFICATIONS

THE CHANGED form in which the Income-tax Amendment Bill has appeared after the report of the Joint Select Committee does not satisfy the major demands for modifications, such as those relating to the determination of the period over which the development rebate should be claimed and the basis on which depreciation may be written off. Some of the anomalies amounting to a double standard are retained. These are only illustrative cases. But credit ought to be given to the Finance Minister for accepting the recommendations which could be regarded as moderate. Section 23(A) companies can now satisfy authority about the genuineness of their difficulties in the distribution of disposable profits when the question of the levy of the penalty rate of supertax arises. The exemption of foreign technicians from taxation has been limited to six months which would be an incentive for the import of technical knowhow, but considering the longer periods for which the retention of their services is becoming increasingly necessary, the period of exemption could have been enlarged. Actually what happens is that the technician does not himself bear the incidence of the tax in several cases. In effect, the new project bears the additional burden of taxation costs. The rank discrimination of taxing gratuities in the private sector has been removed. Nevertheless, it has been provided that exemption should be available on the amount of gratuity upto a maximum of Rs. 24,000 or the salary of 15 months on the basis of the average salary drawn in the last three years, whichever is less. Likewise charitable trusts will not be penalised if they retain substantial parts of their profits for future contingencies. Nevertheless, a limit has been imposed that they will be taxed on the amount of retained profit in excess of 25 per cent if they do not declare in advance their intention to retain the excess and the retained amount is not invested in Government securities.

AVB CEMENT-MAKING MACHINERY equal to the World's Best TREMENDOUS BOOST TO CEMENT AND ALLIED INDUSTRIES

ACC-VICKERS-BABCOCK LTD., the powerful new engineering enterprise, will 'tailor-make' for industry the very latest cement-making machinery.

The AVB Plant at Durgapur is in the final stages of construction. It is equipped with some of the world's most up-to-date machine tools and staffed by highly skilled technicians and experienced design engineers. AVB are now ready to accept orders for cement-making machinery which will be 'tailor-made' to specific requirements.

Now in a position to make a major contribution to the cement industry, AVB will help the nation achieve the Third Five Year Plan target of 15,000,000 tons of cement every year.

AVB will be able to draw on the vast technical knowledge and rich experience of three famous engineering concerns;

THE ASSOCIATED CEMENT COMPANIES LTD.
INDIA'S PIONEERS IN THE MANUFACTURE OF CEMENT AND CEMENT-MAKING MACHINERY AND

VICKERS LTD., London, WORLD-RENOUNDED MANUFACTURERS OF HEAVY EQUIPMENT FOR MANY LEADING INDUSTRIES

IN CLOSE COLLABORATION WITH
FULLER COMPANY, CATASAUQUA, PA., U.S.A.,
THE WORLD-FAMOUS MANUFACTURERS OF FULLER COOLERS AND OTHER FULLER EQUIPMENT WHO HAVE UNRIVALED ENGINEERING AND RESEARCH FACILITIES

... a powerful partnership for progress

ACC-VICKERS-BABCOCK LTD.
16, Queen's Road Estate, Bombay 1
Calcutta Office, Ilaco House, 1 & 3 Brabourne Road, Calcutta
Works: Durgapur, West Bengal

MR. TUBOPHILE BUILDS IN TUBELESS TIMES

"Hang on friend Tubophile", shouted the Master Builder encouragingly. "hang on, for help is on the way". "How dare you say 'hang on'", roared back Mr Tubophile, now beginning to purple, "that's precisely what I am doing—hanging on—and that for dear life, from your rotten scaffoldings. By the sacred crocodiles of the Nile, never again will I undertake a building job in tubeless times. No future in it, except a chance to break your neck. Call yourself a Master Builder! The cheek of it when you haven't the wit to use safe and sound tubular steel scaffolding. Could have done the job in half the time and no risks attached. Lucky for you Master Builder, there are no Workers' Unions in your tubeless Egyptian times. Or you would have been for the high jump too. As for me, no more building without tubular steel scaffolding. Now get me down from here."

THE STATUS OF BUSINESS MEN: PROFITS WITHOUT HONOUR

By

ODYSSEUS

WHY IS THE BUSINESS MAN held in low repute in India?

Civil servants, doctors, the armed forces, lawyers, artists, journalists, professors, even politicians, regard themselves as enjoying an honoured status in the community, to which (they believe—justifiably for the most part) they make useful contributions. But you need only introduce a business man to their company to unite them in a common antagonism. A minority are charitable: "That manufacturing fellow, Chatterjee, is a decent enough chap. But beyond making money, he hasn't an idea in his head." The majority are hostile. To them business men are "hard-faced", money grubbing "capitalists", anti-social types, whose sole interest is the exploitation of the (shameful) acquisitive instinct.

One reason why the business man arouses antagonism in India is a matter of history. The integration of India's 19th century social structure was threatened by the new exchange economy being introduced by the British. Indians who adopted European ways and went into industry and commerce were associated with alien ideas. The profit motive had no place in an economy which had been static for centuries. The caste and joint family systems had, on the one hand, enabled India's cultural heritage to be preserved against succeeding waves of foreign invaders, and, on the other, had enabled the individual to enjoy economic security, fulfilling his allotted task, from the cradle to the grave.

Without debating the merits of the old and the new systems, we may note one historical fact. The enforcement of law and order by the British raj, the gradual spread of irrigation, of public health, and other measures, meant that the growth of the population was no longer restrained by war, famine, and pestilence. Prior to 1800, India's population is estimated to have remained fairly constant around 100,000,000. By 1850, it was estimated at 150,000,000. The census of 1931 gave it as 353,000,000. For (divided) India today it is over 400,000,000. And it continues to grow. The traditional social structure had long ceased to be capable of supporting these millions.

BRITAIN'S EXPERIENCE

It is relevant to recall that the business man is unpopular not only in India but in other old established communities. The integration of Britain's 18th century social structure, based on a landed aristocracy supported by professional classes, who knew (and enjoyed) their appointed places was threatened by the thrusting entrepreneurs of the Industrial Revolution, who were feared and despised by the Establishment of the day. An uneasy compromise followed, which persists even now: the new industrialists made themselves acceptable by taking over the Establishment's ideals of culture and amateurism. A woollen merchant who led the life of a country gentleman, who deprecated the sordid business of money-making, or a banker who valued his translations of Homer higher than any business coup, were respected as representative of English culture—in splendid contrast to their U.S. opposite numbers, who were despised for their unashamed admiration of success in business.

Thanks in good measure to the activities of the British Institute of Management—which has recently opened a branch in New Delhi—British business men have become alive to the need for organised training in management, and for research in managerial problems. But in Britain, as in India, a prior condition for real success in such training is a fundamental change of attitude on the part of public opinion towards the business man's status.

Every profession has a distinguishing attribute, of which it prides itself, and which others respect as its special contribution to the community, the doctor on his humane care for suffering, the civil servant on his incorruptible, non-party administration, the teacher on his responsibility to youth, and so on.

The business man's distinguishing attribute is that he is good at making money. The bigger his profits, the more satisfaction in his job and pride in his status should he, on the one hand, feel, and the more should the community, on the other, applaud. But here we encounter a second reason for antagonism. Whereas civil servants, teachers, and others, are supposed to find their primary reward in working for the community the fashionable opinion is that the business man works primarily for his own selfish gain. Does he? Do we lose by his special attribute? If every business man in India had, in selfless response to present criticism, dropped dead yesterday, we should starve. For, who creates the wealth which pays for education, health services, pensions, the civil services, all wages and professional salaries, whether in public or private enterprise, and most of our imports? Who expands wealth?

The greatest part of the wealth necessary to foot this vast bill is created by business men in private enterprise.

Those who reject the acquisitive instinct should join the African Bantus, who enjoy an egalitarian society in which there are no stratifications by income. The economy has been dreamily static for centuries. It is disconcerting, however, to find that every African state tries to transform these static pockets into exchange economies by ensuring that the individual is allowed to retain the wealth that he creates instead of handing it over to the tribe, i.e., they inculcate the acquisitive instinct.

Of course, the business man should not occupy a privileged position. But his gift for profit making should be respected as being as valuable and dignified an attribute, and as complementary, as those of the civil servant, teacher, and other professions.

WHICH CAME FIRST?

Of course, material values should not dominate society. But that we may care better for the aged and the sick, promote education, and enjoyment of the arts, the business man must be allowed to create enough wealth for us to afford these aims. Unless we cultivate our acquisitive instinct, we won't have the money, the leisure, to cultivate our other-regarding instincts. Which came first—the Birla jute mills or the Birla Education Trust?

Welfarism cultivates what is bad in the acquisitive instinct by fostering on a nation-wide scale the appetite for acquiring as much as possible for nothing. Acquisition by personal effort is a contribution to the community. Acquisition by electoral bribes is not.

As, increasingly, from the end of the Napoleonic wars, Adam Smith's doctrines released the acquisitive instinct from its mediaeval repressions, the wealth of Europe advanced prodigiously year after year. It was in those (unfortunately vast) areas of the world where, for one reason or another, Adam Smith's doctrines did not penetrate, or only touched the fringes of society, that traditional social structures persisted, so that today they remain underdeveloped countries.

In these matters, I believe that India could profit by the U.K.'s experience. As I have mentioned before in this column, British economists have been drawing attention to the fact that whereas the U.K. pioneered the Industrial Revolution, and multiplied her wealth tremendously until around the third quarter of the 19th century, there then began a persisting recurrence of anxiety about the balance of payments: in the 1880's, the 1890's, the 1930's, and today; and they are suggesting that this persistence may be in large measure due to the social habits of an old and stable society, which increasingly damped down the acquisitive instinct up to 1939, and to which since 1946 an envious egalitarianism has added a sense of guilt to the business man's frustration.

Britain's decision to seek entry into the European Economic Community has created overnight a new and bracing urgency in British business, which should do much to restore the business man's confidence in himself. The British Institute of Management has suggested an

Advisory Centre to promote research, to keep tabs on results achieved, on what directions further research is needed, and on the types and levels of training courses provided throughout the country. The need for more scientists and technologists is widely stressed but the B.I.M. reasonably doubts whether a degree course is the best training for all of them. It is as important to train those who will be managing the technologists. Industry and educationists should ensure that these managers, who are likely to be allrounders, and not necessarily the most brilliant intellectually, are fitted to be leaders of industry.

Technological advances are revolutionising British management. In the past, a young man could enter industry, pick up a working knowledge of the simple forms of mechanical equipment used, and climb by easy stages to the top. The future will distinguish sharply between men controlled by computers and men who provide computers with the material of control. The stages to climb will not be easy. Isolated groups cannot solve such problems. There must be collaboration between industry, schools, and universities, to provide courses adapted to contemporary needs. Rightly, the B.I.M. emphasises that the universities should inaugurate full courses for men between 40 and 50, especially for those without previous higher education.

It is to be hoped that India's planners will also realise that the business man requires these professional disciplines because the creation of wealth—profit-making—is a vocation, as honourable as that of any of the "non-acquisitive" professions, and that they will cut down their spending on new physical investment to release substantial sums for similar training schemes. This would enable existing plants to be exploited to maximum profit.

BIRDS

are

stepping

up

it

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	2,000,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,000,000 tons
Limestone	2,000,000 tons	2,500,000 tons
Refractories	100,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

The European Scene

WASTEFUL INVESTMENT IN EUROPE

From Our Special West European Correspondent

PARIS, August 21.

IT is beginning to seem likely that by 1965 the Europeans will have followed the Americans a fair way along the path of over-investment in certain major industries, with the result that they will have the choice between leaving excess capacity lie idle or of producing unsaleable surpluses. Specifically, they are in danger of having permanent and structural excess capacity (as distinct from temporary or cyclical excess capacity) in steel, automobiles, coal and food. The surpluses of food and coal, indeed, are already with us; coal production is being cut back at great expense, thereby wasting the large investments made in the mines after 1956, but the food surplus has got out of hand and will go on accumulating. Automobile capacity, in my view, is already excess and I do not see anything passing or accidental in the recent slump in this industry, although it affected producers very unequally. The steel surplus has not yet appeared but anyone can see it coming in the investment plans of the West European producers.

American capacity in all these departments is already excess, as well as in numerous other industries besides. That is the real reason for the long, slow, mild depression in the American economy, for the very poor growth rate in that country and for its vast pool of unemployed. It is not at all that the USA is suffering another periodic cyclical recession that can be cured by, e.g., Keynesian techniques. It is rather that much American industry is over-equipped to produce goods that are not required in such quantities, either by Americans or by the people they trade with. This is obvious with American agriculture: no one can buy the output that American farms are capable of, and farmers have to be paid not to produce, and much of what they do produce has to be given away. It is just as clear in the case of the US steel industry, which earlier this year stopped, for shame, the practice of publishing monthly output figures as a percentage of total capacity. Some quite sophisticated motive was alleged for this discretion, but it is plain that the dismal monthly announcement that mills had operated at 75 per cent or less of installed capacity was a humiliating reminder of the wasteful investment that had taken place in steel.

Hiding the facts, however, does not change them and the main fact is that huge sums of capital have been tied up in industries that cannot hope to work at full pitch, making capital scarce for other occupations and, incidentally, leaving millions of men without jobs. As things are at present, business could never get so good in the USA that everybody could be at work: if they were all put to work on the machines that have been created by the last decade's investments they would be turning out too much of things that nobody wants. The steel industry's failure is not, of course, isolated; it is the basic producer for hundreds of other industries and its inability to work anything like at capacity reflects the over-investment that has taken place in many other sectors, of which automobiles and shipping are familiar examples. In short, the American economy has, in numerous fields, taken a wrong path and the problem is no longer to "stimulate business", to quicken the rate of expansion—which would only mean heading blindly further along the wrong path—but the infinitely more difficult and painful process of writing much investment off and transferring capital to industries where it can work better.

It would be interesting to calculate how many American astronauts could have been sent to the moon by now if the money and manpower wasted in creating excess steel capacity had been allocated to space research. That allocation would have been, economically, no more wasteful than leaving plant idle and men jobless. However, that is not my point. This American digression serves to introduce some remarks on similar tendencies that are becoming obvious in West Europe. The craze for investing in steel and automobiles—"craze" is not too strong a word, because, globally, current investments reach an absurd total, however justified each investor might think his outlay may be—is promising to produce a similar situation over here. The High Authority of the CECA (coal and steel pool) has published its forecasts of utilization of installed capacity in 1965 in the Common Market region: they are as low as 45 to 48 per cent in hot strip mills and no higher than 70 per cent in other branches of steel making. Given the very different capital structure of the European steel industry, it could scarcely afford to operate further from capacity than the giant American mills, so these figures spell not only waste but danger. And yet—despite the fact that these forecasts are known to the industry—a Franco-Belgo-Luxembourg combine is planning to install a new mill at Ghent in Belgium with an initial capacity of 1,500,000 tons which might be doubled later! Almost all Continental steel producers are expanding their capacity at existing plant, while an immense new mill is being built on piles over the water at Dunkirk and similar ventures are being studied for Rotterdam, Brest and Bordeaux, not to mention the projected mill at Bone in Algeria.

A mere enumeration of projected new plant would not give the measure of the threat of steel over-production if one did not add that the productivity of all existing mills, and much more so of new mills, is being increased mightily by recent advances in steel technology. One would need to take account, too, of the rapid expansion of the aluminium and plastics industries in Europe; these are two of the fastest growing sectors and both are capable of stealing markets from steel. In considering export markets, one would have to reckon with the astonishing progress of the Russian, Chinese and Japanese steel industries, as well as of the expansion of steel production in India and several other developing countries. In sum, present production plans in Europe are incapable of justification in terms of likely demand, domestic and foreign, in the next five years. Nevertheless, each producer is pressing ahead with expansion plans, anxious to achieve economies of scale that are essential in order to compete with rivals who are expanding too. Precisely the same situation exists in the West European automobile industry, worsened here by the role of the Americans, whose European subsidiaries are setting the pace in breakneck expansion.

The layman is inclined to shrug off this spectacle of anarchic competition, with the observation that 'it's their funeral'. But the money for these wasteful investments does not grow on trees. It comes from auto-financing by the companies themselves, from higher selling prices, from government subsidies and—to a very small extent—from the raising of fresh capital. Reserves devoted by companies to auto-financing in these absurd adventures would have been better used by being distributed to shareholders, whereupon it would have gone (to a large extent, since it would be the income of investors) into new industries that can

use capital more rationally. The same is true, and more obviously, of government money, of which a fair amount (Belgian as it happens) will go to the Ghent steel project, while a good deal went into the big coalmine investments of five years ago and some goes into the automobile investments now in course. As for price rises decided simply in order to finance hazardous expansion schemes, the case is even clearer. French automobile producers raised their prices lately in the midst of a slump, when everything indicated price reductions—everything except the need to expand production chains in order to meet the competition from other expanding manufacturers. French steel prices will shortly be raised, for no better reason. So it is not just their funeral, but everybody's; an economy that allows wasteful investment in industries where it is plain that excess capacity is being created is depriving itself of other facilities of which it has greater need.

Since I have mentioned French participation in this Europe-wide orgy of over-investment, you would be entitled to ask: "What about the French planning techniques lately so much in the news, and which are supposed to bring producers together voluntarily to avoid just this sort of thing?" This is where one sees the disruptive effect of the Common Market as long as it lacks any central authority able to co-ordinate various national producers. French industrialists do indeed meet under governmental auspices to adjust their long-term investment plans to likely demand, but

there is no similar forum for all European producers, and much less for the Americans who operate through their powerful affiliates. Once the Germans and Americans are expanding their plant and are promising to achieve economies of scale, the French planners cannot deny their producers the right to follow suit except at the risk of seeking their national industry undercut in the unified no-tariff market of tomorrow.

Thus sensible and liberal attempts at forward planning at the national level are undermined by the unification of national markets in a common market that has no central authority, no plan for all producers and where nationalistic considerations ("You surely do not want to see our industry wiped out by foreigners!") outweigh economic rationality. The situation will become worse if and when Britain joins the Common Market: in automobiles, because the fusion of American interests in Britain and Germany will allow the U.S. corporations to make further economies; and in coal because the British coal authorities will seek to exploit the cheapness of sea transport to the Atlantic seaboard of the Continent in order to undercut inland Continental mines whose pitheads are already piled high with unsold coal. If the Europeans do not wish to repeat the American demonstration that over-investment in highly competitive industries can lead nations into waste, idleness and unemployment, they will have to extend the system of voluntary planning to the international plane.

4 1/4 % ORISSA GOVERNMENT LOAN, 1972.

ISSUE PRICE Rs. 99.50 %

Opens on the 4th September, 1961.

The loan will be closed as soon as a total of approximately Rs. 500 lakhs has been subscribed and in any case not later than the close of business on the 9th September, 1961.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras and Bangalore, at the branches of the State Bank of India in Orissa and at the Treasuries and Sub-Treasuries in the State of Orissa at places where there is no branch of the State Bank of India.

Full particulars can be obtained at any of the offices of the Reserve Bank of India or branches of the State Bank of India or at any treasury or sub-treasury in the State of Orissa.

Economic Report from the U.S.

IMPACT OF THE STEPPED-UP DEFENCE PROGRAMME

By GUY SIMS FITCH

WASHINGTON, August 16.

IT is difficult at this stage to foretell the precise impact of the stepped-up defence programme on the U.S. economic advance. But of one thing there is no doubt: as things stand now that advance, already well under way, will continue to be based primarily on activity in the civilian sectors of the economy. Public spending will have its effect, of course. But even that effect will be derived in large part from civilian rather than defence activities. It is well to keep in mind, in this regard, that roughly two-thirds of the total output of goods and services in the United States is accounted for by consumer purchases, and another 13 per cent or so by business investment. This leaves 21 per cent, according to the most recent data, attributable to government outlay. There is nothing preordained in these percentages, of course; they arise from the normal functioning of the economy as it progresses to meet the varied demands of a growing population and the national interests.

Nearly one-half of the public spending, moreover, is done by state and local governments, rather than the Federal Government. These state and local outlays, constituting about 10 per cent of the U.S. economy's total output, are concentrated by and large in such clearly civilian fields as education, hospitals, roads, housing, water supply, sewers, and similar public services and facilities. Furthermore, not all Federal spending goes for defence and related activities. National security outlays are figured at about nine per cent of the economy's output, while the total in Federal spending account for eleven per cent. Helping to clarify these points is the following table, depicting the total output of the U.S. economy during the second quarter of this year, in thousands of millions of dollars at seasonally adjusted annual rates:

Total output of the U.S. economy	..	..	..	..	\$515.0
Consumer spending	..	..	..	..	336.0
Business investment	..	..	..	..	68.0
Net exports	..	..	..	..	3.5
Government purchases	..	..	..	..	107.5
Federal	..	..	..	..	56.5
Defence	..	..	..	..	48.7
Other	..	..	..	..	8.3
State and local	..	..	..	..	51.0

State and local governments, with their concentration on public services and facilities, have contributed markedly to this growth of the public sector. While Federal outlays have not quite doubled, state and local expenditures have increased more than five-fold in the last 15 years. But the private sectors remain the bulwark of economic activity in the United States. Thus, economists are paying as much attention to the trends in consumer buying as to the projected rise in Federal purchases. New government defence orders, of course, will mean more activity for American industry, hence more production. About half of the \$3,500 million in additional defence funds just authorized by the U.S. Congress will be spent on equipment. And one of the key industries in all this obviously will be steel. Nevertheless, it is to the automobile industry, histori-

cally the largest consumer of steel, to which the steel industry continues to look for its strongest support in the months ahead. And the automobile industry, in turn, will be relying on the buying method of the American consumer. So far, the American people seem to have rejected any resort to "scare" buying in the face of the new defence build-up. In this, they appear to be reflecting the mood of their government, stated by President Kennedy as one of determination to stand firm on the international rights and commitments of the United States, but without panic or hasty action. At the same time, consumers in recent months have been showing a growing confidence in the economic future. This is evident not only in the steady expansion of their total spending, but also in their willingness to commit more of their current earnings to finance purchases of goods and services. While instalment buying of automobiles and other items is still relatively low, compared to some other years, credit purchases have begun to rise slightly. This rising trend in consumer credit has been characteristic of every post-war recovery period and, so far at least, bears little direct relationship to the government's expanding purchases.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

Special Article**PLANNING IN FREE BRITAIN**By **PAUL BAREAU**

THERE will be some wry smiles in New Delhi when more information becomes available about the plunge into economic planning which the British Government is now contemplating. The decision is hardly surprising. "Conservative freedom" has not proved conspicuously successful in solving the basic conundrum of British economic policy, that of marrying a satisfactorily high rate of expansion with balance of payments solvency. Let it be said, however, that the absence of adequate growth in the British economy over the past two years has not been due to any shortage of demand. On the contrary it has been the result of trying to do too much and in this way of putting excessive strain on the economy, causing overfull employment with all the wastage which this creates—labour indiscipline, increases in restrictive practices, clinging to under-employed skilled labour by employers and, lastly, a softening of export incentive owing to excessive demand in the home market.

The Chancellor of the Exchequer hinted at his conversion to the principle of planning when towards the end of July he announced his supplementary measures to deal with the economic crisis. He said at the time that he was not afraid of the word "planning" but that what he had in mind was an early discussion with all sides of industry of the ways and means in which he could secure their collaboration in setting targets for the growth of the economy. These discussions have now begun. It should straightway be stressed that what is envisaged is neither the elaboration of a socialist pattern of society in Britain nor a return to the physical controls that were applied during the war and which continued to be operated by the Labour Government in the immediate post-war years. That kind of planning may have been inevitable and desirable at the time. It would be sadly out of keeping with the spirit of 1961, the intended move into the Common Market and all that this implies.

The main impulse behind the Government's decision to launch into five-year planning is the growing conviction that the main reason why expansion and national solvency have been incompatible in recent years is to be found in wage induced inflation. It is because expansion and full employment have led to increases in wages and costs that there has been no corresponding expansion in British exports. As a result the balance of payments has swung into deficit, the economic levers have had to be put into reverse and economic expansion arrested in its tracks. The only way to stop this damaging and negative sequence is to create that sense of collaboration and truly national endeavour which would short circuit this inflationary circle, by checking the wage induced inflation at its source.

This is easier said than done. The Chancellor in his "little budget" made an emotion-charged plea for a pause in wage increases. It has so far received very short shrift from organised labour. All the unions which have declared themselves on the subject, including the usually docile teachers and civil servants organisations, have adamantly refused to have anything to do with any wages freeze and have announced that they will go forward even at the cost of industrial strife, with the implementation of their wage demands.

It is in this aspect of the situation that lies the main threat to the short-term prospect of the Chancellor's measures. Already the good psychological impact of the International Monetary Fund's rescue operations for sterling is being undermined in the exchange market by fears of the alternative prospect of further wage

concessions or damaging industrial disputes.

The Chancellor's hope of cutting through this tangle of difficulties is to elaborate a five-year plan with the assistance of employers and workers in industry, commerce and finance. There are many bodies in Britain which look into the future, assess prospective production and demand and provide the raw material out of which economic policy is then fashioned. Most of this work, however, is done within the civil service. It only sees the light of day when the Chancellor of the Exchequer convenes the National Production Advisory Committee, a very large and representative body, but one which like most advisory organisations, is ineffective in the extreme.

The intention is to merge this and the more formative planning organisations into a small Planning Board on which the trades unions, the Federation of British Industries and the Employers' Confederation will be represented. The Planning Board will do the sums. It will set a target for the desirable and reasonable growth of the economy, bearing in mind the available resources and the likely effect of this expansion on the balance of payments. If agreement can be reached by all concerned regarding the maximum rate of growth that can be safely achieved, agreement should also be secured on the logical deductions to be made from this exercise and particularly on the growth of money incomes that can be secured without destroying the plan through inflation and, therefore, through disruption of the balance of payments.

Used in this context planning is, therefore, largely a psychological exercise, an endeavour to secure the full co-operation of organised labour and of employers in the formulation of the plans and, consequently, in accepting the deductions in the matter of money incomes which have to be drawn from the inexorable arithmetic of these calculations. This, however, does not provide the whole answer to the wages problem. Even if it can be assumed that responsible trade union leaders will give their collaboration to the Planning Board, it does not by any means follow that the rank and file of organised labour will accept its recommendations. The most superficial glance at the recent history of labour relations in Britain shows that the problem of labour discipline is far from solved.

The proposed exercise in planning will also have a psychological or emotional facet in the mere fact of setting a target for the expansion of the economy. The only such target that has been vouchsafed to the British people during recent years was the promise by Mr. R. A. Butler, when he was Chancellor of the Exchequer, that the standard of living would be doubled in 25 years. In effect this does not imply a very ambitious rate of progress but the very fact of its proclamation unquestionably had a stimulating and encouraging effect. It is part of the function of leadership to set and define the goal to be attained by those who are led.

The exercise which is to be undertaken should have some practical, useful results. The consultation which will be involved and in which all sides of industry will join should avoid duplication and wastage. Successful planning of this kind has been achieved by the steel industry, even after its denationalisation. There is no reason why it should not be extended to the economy as a whole. It can do a great deal of good, provided always it is not regarded as an excuse for not pursuing the right policy. Planning could make the best of a good or a bad situation; what it cannot do is to make an inherently bad situation good.

**THE
BUSINESS WORLD****What Inhibits Full Utilization
of Installed Capacity?**

By CROESUS

IN having failed to adjust the sights to the three commanding heights demanded by the Third Plan, viz., power, transport, and administration, the planners have written failure into the Third Plan", declared the Editor of "The Eastern Economist" when he last week addressed a meeting of the Forum of Free Enterprise in Bombay on "Obstacles to the Fulfilment of the Third Five-Year Plan". Elaborating this thesis of his, he appropriately attributed the lack of adequate utilization of installed productive capacity to the shortages of power, transport, and administrative talent, the need for all of which, as one must expect, continues to grow with the progress the country has been making in its programmes of economic development. But fuller utilization of installed productive capacity is also stalled, I notice, by the inadequate supply of raw materials and components, both indigenous and imported. There would appear to be an inherent defect in the prevailing system of quota licensing which covers the distribution of practically all scarce raw materials. Thanks to this scarcity, priorities are determined and quotas fixed taking into consideration not only such understandable factors as the total availability of the raw materials in question and the total demand for these raw materials from various sectors of industry, but also past consumption. Now the past consumption by an industry of any given raw material, whether indigenous or imported, necessarily limits the quota to be made available to the industry, and it is still an unresolved paradox to me as to why we continue to talk of expanding our economy when we refuse to give up thinking and acting in terms of past consumption. How could there be any relationship between past consumption and the present, if not future, needs in an expanding economy? While not rejecting the past consumption criterion altogether, I feel, a more satisfactory criterion for fixing quotas would be the outstanding orders on the Order Books of manufacturing firms and their actual production programmes for a given period.

There should be no difficulty for any industry to provide this information. At any rate, in the case of the textile machinery manufacturing industry, according to Mr. Prabhu V. Mehta, Chairman of the Textile Machinery Manufacturers' Association (T.M.M.A.), "almost all the manufacturers are in a position to give their production programme to the Textile Commissioner and such information as required to justify their needs. Every month, a return of production is made, as well as a return of outstanding orders. The needed raw materials can be calculated from the past experience as well as the past production as to how much quantity is needed for each unit and by applying the quantity so arrived with the production programme submitted. The machinery manufacturers would be answerable if they fail to keep up with this programme without good and valid reasons. Such a procedure would certainly go a long way in increasing the production of the number of units manufactured by each manufacturer."

Making due allowances for the limitations imposed by total availability, which is the 'raison de etre' of the existing system of quotas and licensing, I believe, a re-orientation in the method of calculation and supply of scarce raw materials to industry would appear to be imperative. This is all the more so, if the country has to fulfil the exacting expectations of our exuberant and enthusiastic Union Minister for Industry, Mr. Manubhai Shah. When he addressed the second annual general meeting of the T.M.M.A., recently, he told them that only through national self-sufficiency in machine-building would it be possible to avoid imports. In view of this pet thesis of his, Mr. Shah was naturally pleased with the fulfilment of the targets by the textile machinery manufacturing industry, and he attributed this to what he called "the right kind of the leadership at all levels—the trade, the industry, and the Government". Even so, he was not satisfied with only this much, for he urged the manufacturers to be a little more resourceful so as to save as much of our meagre foreign resources as possible by telling them, 'inter alia', to see the at least 75 per cent of the bill of structural goods was made within the country itself. He also saw no reason why the textile machinery manufacturers should not extend their activities to include the manufacture of machines for making rayon, woollen, silk and other textiles. This shows that he is evidently not satisfied with the extent of response by the industry to the appeal made by him last year in this behalf, the relevant explanation by the Chairman of the T.M.M.A. notwithstanding. According to the latter, there would appear to be no difficulty with regard to producing machines for the rayon industry, but production of woollen machinery would not be economical, because of the absence of adequate demand and also the need for the textile machinery manufacturers to restrict consumption of the limited quantities of raw materials. However convincing Mr. Prabhu's reason was for his industry not being as enthusiastic as the Union Minister for Industry about the textile machinery manufacturing industry manufacturing machines for making textiles other than cotton, Mr. Shah would not be satisfied. "We are not a nation of assemblers", he declared with an air of utter impatience, and wanted the maximum indigenous production in any programme of machinery manufacturing in the country.

While all that Mr. Shah said about the role of skilled technicians, draughtsmen and designers, as also about the need to inculcate quality consciousness in the minds of our manufacturers, is understandable, one cannot help feeling that he is trying to make the industry gallop when it is still not able to trot, if not to run. Often times, I am afraid, such overvaunting enthusiasm is bound to land the country in great difficulties. The country's experience with the cement machinery manufacturing industry, as reflected in the present acute scarcity of cement, is a case in point. Even before a single unit of the cement manufacturing plant was

ready, except it be in blueprint or in somebody's imagination, a ban was placed on the import of not only cement-making machinery but on components as well. Competent observers have pointed out that, if there is one single factor more than any other that has contributed to the present cement shortage, it is this short-sighted policy. This is not to say that we must not go in for cent per cent manufacturing of machinery of any industry in this country over a time also. But we should ensure that, at least until the industry concerned is in a position to effect deliveries of complete units, nothing is done to prevent the import of at least such parts or components as are not, or have yet to be made, in this country.

Take the case of the textile industry. Thanks to the remarkable progress of this industry, it is expected that the country would be in a position to meet 75 to 85 per cent of the machinery requirements of the industry within the next few years, in fact earlier than what the Third Plan has envisaged. Given an adequate supply of raw materials and components according to a time schedule, the industry maintains that it will be in a position to make the country completely self-sufficient, as Mr. Manubhai Shah would insist. But merely on the strength of this re-assuring declaration of intention

and capacity by the industry, if the authorities were to rush to place a complete ban on imports of all the parts and components of textile machinery, the result would be disastrous, as in the case of the cement machinery manufacturing industry. Any such move would adversely affect the fulfilment of the target of cotton cloth production in the country. This apart, the textile machinery industry would avoidably be blamed for not having come up to expectations. Even in an era that has been witnessing the revolution of rising expectation, it would be asking for the moon to telescope progress within a shorter space of time than what the circumstances of the case permit. As in all economic laws we speak of the important proviso "all things remaining equal", certain results could follow only if the given assumptions are fulfilled. Failure of any one of these, irrespective of whether it is due to causes within or beyond one's control, is bound to upset all calculations and to put off indefinitely the attainment of the goal in view. Unfortunately, what is more and more in evidence lately in this country is that, in our impatience to achieve certain goals which we have set before ourselves, we seem blissfully to forget to make allowances not only for the imponderables but even for those which are reasonably ponderable.

The Case for Some Reduction in Oil Prices

THE complex problem of fixation of "reasonable" prices for the various petroleum products of indigenous production continues to elude solution. Much hope has been fixed on the Damle Committee which was set up about six months ago to rationalise the price structure of major petroleum products. The Union Ministry of Oil, reports suggest, is not, however, favourably inclined to accept the various "unanimous" recommendations of this Committee because it is supposed to have upheld the contention of the oil companies that they were not making undue high profits.

The rejection or shelving of the Damle Committee's report by the Government, if it comes, will obviously be setting an unwholesome precedent, since this Committee was appointed by the Oil Ministry itself in preference to referring of the question to the Tariff Commission. If the Committee has reached certain conclusions on the basis of the facts placed before it, it would be imprudent to reject its recommendations only because they do not suit the intentions of the Oil Ministry.

The Oil Ministry appears to the consumer to be indulging in dangerous double talk on prices. On the one hand it professes an ardent desire to bring down the prices of petroleum products by cutting the profit margin of the oil companies and by expanding the public sector in oil. On the other hand, it has been allowing the Central Exchequer to usurp the concessions given by the oil companies in the past three years, instead of passing them on partially to the consumer in the form of reduced prices of petroleum products. Had these concessions been such that they could not have brought down the prices of petroleum products by more than a couple of naye paise, there would not have been any objection to their being withheld from the consumer for the benefit of the Central Exchequer. But during the two and half years to the end of 1960, as much as Rs. 45 crores are understood to have been diverted to the Central Treasury under the ad hoc agreements in force between the private sector oil companies and the Government for the pricing of the major petroleum products. During the current year, another Rs. 30 crores are expected to be collected from the oil companies on this account for the benefit of the Central Exchequer.

The consumer, obviously, has a right to share these

concessions at least partly, notwithstanding the fact that prices of petroleum products in India are amongst the lowest in the world; the consumer is paying pretty heavily in the form of other taxes on road transport. According to an expert estimate, the total ad hoc levies collected by the Government under the Mineral Oils (Additional Duties of Excise and Customs) Act, 1958, could enable reduction in the prices of some of the petroleum products — motor spirit, kerosene, high-speed diesel oil and furnace oil, to name only a few — by anything from 12 nP. per gallon to 23 nP. per gallon. Concentrated on a single product, the possible reduction in kerosene prices can be of the order of 47 nP. per gallon or in the prices of motor spirit to the extent of Rs. 1.11 per gallon. In view of the shortages being experienced in kerosene and high-speed diesel oil, it may not be prudent to effect any cut in their prices, but to keep the prices of motor spirit and furnace oil rigged up is apparently hard to justify.

There is surplus production of gasoline in the country today and the demand for it too is not picking up due to switch-over to HSD. Exports of this commodity also are not feasible on any appreciable scale owing to its overall surplus supply in the world. The case of furnace oil is on a slightly different footing. A reduction in its price is warranted for the simple reason that furnace oil is a substitute energy producing material for industries in Western India where it is becoming more and more difficult to move coal from the Eastern Coal Belt. Cambay crude is supposed to be supplied to industrialists in Gujarat and Maharashtra for use as furnace oil. To fix its price in the very first instance at a level about 1.5 times the landed cost of coal cannot be expected to lead to any large-scale switch-over to this energy producing liquid.

Reduction in gasoline prices will be a step in the right direction also due to the fact that the Government proposes to go in for the manufacture of small car. Popularisation of the small car in this country will ultimately depend upon how cheaply it can be run by the owner. And gasoline price is the most important item of cost in this regard. The demand for small cars must be built primarily on cheap maintenance. Otherwise an initial low capital cost will be defeated by the failure to use the car enough to justify the pleasure anticipated.

Business Notes

Banking

URBAN CO-OPERATIVE BANKS GET A GOOD CHIT

THE REPORT on the Survey of Urban Co-operative Banks, which is the result of a sample survey undertaken by the Reserve Bank of India in 1958 on the recommendation of the first Bombay State Co-operative Banks' Conference held in 1957, is a fairly comprehensive study of the organisation, methods of business and role of urban co-operative banks in financing small-scale industries. The Survey related to 93 selected urban co-operative banks of ten States and one Union Territory. According to the findings of the Survey, the average membership of the urban banks has risen by nearly 20 per cent during the three-year period (1955-58). But, even so, the members constituting, as they do, only 5 to 15 per cent of the population in the area of the banks' operations, we are told, there is great scope for increasing the membership of these banks. It is noteworthy that, out of the total members of these banks, 57 per cent were engaged in "trade", "profession and service", while only a small proportion (8 per cent) was engaged in industries. This has not prevented the Survey from stressing the suitability of these banks for catering to the needs of individuals living in urban centres and engaged in a variety of industrial activities.

Referring to loans by these banks, the Report observes that the greater proportion of loans advanced by the banks represented more or less fixed loans, whereas the short-term loans accounted for more than 78 per cent of the total loans. While long-term loans were conspicuously absent, in nearly all the surveyed States, medium-term loans were predominant in Assam, Madhya Pradesh and Orissa. Further, out of the total loans advanced, 48 per cent were given against personal security, while those advanced against merchandise, bullion and real estate individually formed less than 20 per cent. State-wise, Assam, Bombay and Mysore accounted for a greater part of their loans against personal security, but Andhra Pradesh, Madhya Pradesh, Orissa and West Bengal had a considerable proportion of loans against real estate. Loans against bullion and ornaments constituted a high percentage in Punjab and Delhi, it is stated.

Interest rates on the outstanding loans would appear to have been reasonable on the whole: they stood between 7 and 9 per cent per annum in all the States surveyed, except in Assam and West Bengal, where a substantial portion of the outstanding loans carried interest ranging between 9 and 12 per cent per annum. Contrary to the experience of commercial banks, it would seem, the average earnings of the urban co-operative banks rose by 26 per cent in 1955-58, while the parallel rise in average expenses was of the order of only 25.5 per cent. No wonder that, on the whole, the average profits of the urban co-operative banks rose by 25 per cent over the period covered.

It is gratifying to know that the overall picture of co-operative urban banking is "one of a fairly wide-spread, financially sound, expanding framework of banking institutions which have their own place of importance in the banking structure of a large part of the country." Having granted this certificate, the Report goes on to suggest that the expansion—also diversification—of activities of these banks should be accelerated in consonance with the rapid pace of economic development, so that the urban banks may cater to the credit needs of the urban population to a much greater extent than now.

Steel

RIISING COSTS AND EXPORTS

SIR BIREN MOOKERJEE, Chairman of the Indian Iron and Steel Company Limited, in a statement issued in connection with the annual general meeting of the company has pointed out that serious deterioration in the quality of raw materials was hampering the achievement of the planned output of steel. Although the company's output of iron at 1.16 million tons and steel ingots at 0.91 million tons showed an improvement over the previous year and constituted a fresh record for the company, it was a level below the target planned for 1960-61. One major factor that caused this deterioration was the high and varying ash content in presently available metallurgical coal as well as the erratic supplies of raw materials due to transport bottlenecks. A high ash content in coke, the Chairman pointed out, meant increased consumption to attain the blast furnace operating temperature and in consequence a large volume of slag. Since the capacity of blast furnace was constant, a large volume of slag meant in turn a reduced volume of iron produced. He added that in the history of the blast furnace operations, never such coke with fluctuating ash contents was charged to blast furnaces as in the present case at Burnpur. He pleaded that if the quality of raw materials has to be bad then at least it should be so uniformly. But in the case of coke supplied at present ash content varied widely from day to day with inevitable prejudicial effect on production. A similar state existed as far as limestone was concerned. He observed that there has been a severe deterioration in the quality of limestone supplies; the percentage of free lime varied between 42 per cent and 24 per cent.

Due to these drawbacks in raw materials, in spite of the fact that India had a high quality of iron ore, the production costs were unusually higher as compared to many other countries. This had the obvious effect that Indian iron was priced out in so far as its competitive position was concerned against the supplies from other exporting countries. Sir Mookerjee quoted instances by taking two items — Light bars and Structural — where Indian costs were higher than those of Japan, the U.K., Germany and Belgium in the markets of Karachi, Colombo and Singapore. It was true that the Government at present allowed an export rebate of Rs. 53 per metric ton of finished steel equivalent to the excise levied on the steel ingot, it may be observed that Indian producers could not even then compete with the prominent steel exporting countries. In order to strengthen their position the Chairman has suggested that the Government should give serious consideration to the adoption of measures which would enable the producers to reduce their production costs. These measures included improvement of transport facilities, setting up of coal washeries and regularisation of supply of raw material for the steel plants.

Textiles

'MODEL MILLS' AND MORE SPINDLES

THE UNION GOVERNMENT proposes to license five 'model mills' with modern machinery having a capacity of 500 looms and 25,000 spindles each, as a measure of export drive. This proposal was made at a meeting of the Informal Consultative Committee for the Union Commerce and Industry Ministry where deep concern was expressed over the setback to the Indian cotton

textiles in the world market as a result of the keen competition from Japan and China. Cloth exports in 1960 fell below the level of 1956. In 1960, 723,687,000 yards of cloth of various varieties were exported against 743,842,000 yards in 1956. Exports touched an all-time high in 1957 when 877,960,000 yards were exported. Two years later, in 1959, the figure was 850,182,000 yards. Only in 1958, the exports fell below the 1960 level when only 616,740,000 yards were exported.

It was recognised that the market for Indian textiles was limited to some extent by the pattern of production. Until recently Indian exports have been mostly of coarse and medium varieties for which the markets are quite limited. To meet the challenge from Japan and China, an additional measure proposed by Mr. K. C. Reddy, Union Minister for Commerce and Industry, was to licence new capacity to the extent of two million spindles on regional basis. Another one million spindles are to be allocated to make the existing spinning units come up to an economic size and to provide for a balance between spinning capacity and weaving capacity.

Against the target of 9,300 million yards of cloth production envisaged under the Third Five-Year Plan, 5,800 million yards are to be produced in the organised sector and the balance in the decentralised sector. To ensure the production of this quantity of cloth as well as to maintain exports of yarn, the production of yarn has to be nearly 2,250 million lbs. It has, therefore, been decided that a substantial increase in spindlage should be immediately provided for. It was pointed out that in determining the allocation for each State, careful consideration would be given to relevant factors, such as the current production of yarn and cloth, the existing distribution of spindlage, the concentration on handlooms and the overall needs of the decentralised sector. Sufficient provision would also be made for giving additional spinning capacity to make the existing spinning units come up to an economic size and to provide for a balance between spinning capacity and weaving capacity. The need for increased utilisation of existing capacity by working three shifts would also be considered. This allocation of additional spindlage is likely to provide sufficient fillip to production.

Engineering

EXPORT PROMOTION

SEVERAL INDIAN engineering goods have been well received in various foreign markets and it is realized that export earnings from this sector can be enhanced significantly if proper encouragement is provided to the exporters and manufacturers. The Centre was, therefore, actively considering a proposal for reducing the prices of iron and steel supplied to engineering industries with a view to giving fillip to the export of engineering goods. This was indicated recently by Mr. Satish Chandra, the Union Deputy Minister for Commerce and Industry. He, however, added that the import entitlement provided under the current export promotion scheme for engineering goods was 'sufficiently liberal' and the Government did not contemplate any further increase at the present time. But it had been decided to widen the benefits under the scheme to cover exporters who were not manufacturers themselves, provided they complied with certain conditions.

The Government had set up a freight investigation board to make specific suggestions for reducing ship-

ping freight applicable to engineering goods wherever such a move was justified. The provision of other possible incentives to boost engineering goods exports were also being considered. If the Centre is able to make the proposed assistance practicable, the manufacturers and exporters would definitely find themselves in a better position to compete and larger export earnings would certainly be ensured.

New Issues

CHAMUNDI CHEMICALS AND FERTILIZERS

IN VIEW of the importance given to the production of chemical fertilizers in the Third Five-Year Plan, the floating of the company "Chamundi Chemicals and Fertilizers Limited" is a welcome development. At present, indigenous output of phosphatic fertilizers is totally inadequate to meet the demand. The Third Plan envisages stepping up of production of phosphatic fertilizers from 55,000 tons to 4,00,000 tons in terms of phosphoric acid.

The plant of the company will be set up at Munirabad, about two miles from Tungabhadra dam in Mysore State. The Phosphate Acidulating Corporation of New York and Mr. S. A. Slack, their European Representative for Broadfield Superphosphate Process, have agreed to provide technical and foreign collaboration for the superphosphate plant of the company. The company proposes to enter into collaboration arrangements with them through their Indian associates, the DCM Chemical Works, for the supply of complete automatic plant for the manufacture of superphosphate and an automatic sulphuric acid plant. The foreign collaborators are of international repute and the Broadfield process of superphosphate manufacture is said to be the most modern.

To meet the foreign exchange cost of the project, the Industrial Credit and Investment Corporation of India has agreed in principle to grant a loan of Rs. 6 lakhs. The loan is repayable in sixteen half-yearly instalments.

The authorised capital of the company is Rs. 1 crore. Issued capital is Rs. 40 lakhs, consisting of 400,000 equity shares for Rs. 10 each. Shares worth Rs. 6 lakhs have already been subscribed by the promoters, directors of the company and their friends and associates. The directors and their friends and associates have agreed to subscribe another Rs. 6 lakhs. Shares worth Rs. 4 lakhs have been set apart for allotment to the Industrial Credit and Investment Corporation. The Life Insurance Corporation has underwritten shares worth Rs. 4 lakhs. The rest of the issued capital, Rs. 20 lakhs, is being offered for public subscription. The subscription list opens on August 28 and will close on September 2, or earlier at the discretion of the Directors but not before August 30.

At present the Mysore State's requirements of phosphatic fertilizers are assessed at more than 50,000 tons per annum, against a production of about 8,000 tons. The production of this factory will be of the order of 40,000 tons. The product of the company, therefore, can be expected to have a ready and assured market.

WINDOW GLASS LIMITED

ANOTHER COMPANY which is entering the market next week for raising capital is Window Glass Limited.

Its authorised capital is Rs. 1 crore, divided into 10,00,000 equity shares of Rs. 10 each. The issue offered to the public is Rs. 12.25 lakhs. Subscription list opens on August 29 and will close on September 5, or earlier at the discretion of the Company, but not earlier than September 2. Rs. 2.50 per share are to be paid with the application and another Rs. 2.50 on allotment. The balance of Rs. 5 will be paid on call or calls to be made after six months of allotment.

The Company has entered into collaboration arrangements for the supply of plant and equipment with a famous Polish firm. The plant and equipment to be imported will cost £126,909. It will be paid in Indian rupees. The factory will be located in West Bengal at a place called Bansberia, near Bandel. Production is expected to start by the end of 1962.

Indian Dyestuff

EXPANSION PLANS

MR. ARVIND N. MAFATLAL, Chairman, Indian Dyestuff Industries, revealed at the recent annual general meeting of the shareholders of the company that expansion plans of the concern relating to the production of intermediates and increase in the range and quantity of items being manufactured at present were under the consideration of the management. The total outlay on this expansion programme is expected to be Rs. 4.50/5 crores. It is hoped that on completion of the expansion programme, the sales of the company would amount to Rs. 5.5/6 crores.

It is well-known fact that the delay in the execution of this expansion programme was caused by foreign exchange difficulties and the delay in the delivery of the plant. Indications are that part of the plant might go into production by the end of the current year. The rest of it would be commissioned by the middle of next year.

The company has no intentions of resorting to a rights issue in order to finance the expansion programme. Instead, it is proposed to meet the cost through the company's own profits, reserves and by bank borrowings. This course is considered to be better than the issue of right shares at a high premium. The Chairman was of the view that it may be more prudent to increase the capital at a later stage by issuing bonus shares.

The technical know-how for the expansion programme is to be obtained from the company's Italian collaborators, which are also participating in the equity capital of the company. The Chairman gave an indication that the scheme for the manufacture of basic raw materials was also under consideration. So far as the setting up of the 50-ton sulphuric acid plant is concerned, Mr. Mafatlal pointed out that the company had obtained a licence, but the scheme had not been implemented as yet because of foreign exchange difficulties. Certain firms have offered to fabricate the plant in India. A decision on these offers would be taken in the next three or four months.

Lantern Industry

THE PROBLEM OF HIGH COSTS

IN A speech at the sixth annual general meeting of the Lantern Manufacturers Association, Mr. M. Hruska tried

to remove the widespread belief that the demand for lanterns would diminish with the electrification projects coming into operation within the next few years. His contention was that even if electrification was completed within the next 10 to 15 years, it would not be possible to provide pacca houses in villages throughout the country where electricity could be used, and the use of lanterns will continue for many years to come. While it cannot be denied that the use of hurricane lanterns would dwindle as more electricity becomes available, the fact is that it still would continue to play a useful role for multifarious jobs and a standby in case of electric breakdowns. From the available figures it is evident that the industry has made considerable progress. Its annual production amounts to nearly 50 lakhs of lanterns valued at over a crore of rupees. In fact the industry has progressed to such an extent that now it is in a position to meet the entire demand of the country, leaving a fair quantity of surplus for export.

If, however, the industry has been able to raise its production only to the extent of 51,50,400 lanterns per annum against a target of 60,00,000 lanterns during the Second Plan period, it is mostly due to the fact that the supply of raw materials has been irregular. So naturally Mr. Hruska's complaint was in this field. He was also disturbed on the score that there has been a fall in exports. The main difficulty which has caused the virtual stoppage of exports is, of course, the high cost of raw materials, i.e., tinplate waste and galvanized wire, which, owing to stiff licensing during the past three years have not been made available to all the units in sufficient quantities. The result was that the manufacturers had to depend to a greater extent on purchases from the open market at considerably higher rates which naturally was reflected in the higher production costs and increased sale prices in general. Excise duties imposed too had their share in the high cost of production. Since it is the general policy that exporters be encouraged, it is time to look into the difficulties of this industry.

Photographic Goods

GOVERNMENT-OWNED COMPANY REGISTERED

A fully Government-owned company has been registered, under the name "Hindustan Photo Films Manufacturing Company Limited", in Madras for implementing the project to manufacture cinema raw films, photographic films and paper, X-ray films and other sensitized materials. Technical know-how for this project has been secured from Ets. Bauchet of France. It is proposed to manufacture the following materials at this plant:

- | | |
|------------------------------------|-------------------------------|
| (1) Cinema raw films | 3.8 Million sq. m. per year. |
| (2) Photo films (rolls and sheets) | 0.71 million sq. m. per year. |
| (3) X-ray films | 0.60 million sq. m. per year. |
| (4) Photographic paper | 2.50 million sq. m. per year. |

Installed coating capacity of this unit will be 12.0 million sq. m. per year.

Commercial production at the plant is expected to start by December, 1962. The plant will be running to full capacity and producing Rs. 5 crores worth of the above materials per annum by the end of the Third Plan.

'ENGLISH ELECTRIC'

HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR	H. R. C. CARTRIDGE FUSE-LINKS Hermetically sealed construction— Non-deteriorating— ASTA certified for 35 MVA rupturing capacity— Visible indication of operation— Ratings up to 300 amps. 
COMBINATION FUSE-SWITCHES Ratings from 30 to 750 amps— Rugged construction, fully shrouded and interlocked— Type tested for 35 MVA rupturing capacity 	COMBINATION FUSE-SWITCHBOARDS Incorporating Combination Fuse-Switches upto 750 amps— Robust and compact construction— Readily modified and extended— Type tested for 35 MVA rupturing capacity. 
DISTRIBUTION FUSE-BOARDS Robust, dust and moisture proof construction— Type tested for 35 MVA rupturing capacity— Ratings from 15 to 100 amps. 	OVERHEAD BUSBAR EQUIPMENT Flexibility of power distribution— Can be installed without disturbing existing layout or production— Avoids chasing of floors for ducting— Approved by Fire Insurance Authorities. 

A complete range of distribution equipment manufactured at the Madras Works of The English Electric Company of India (Private) Ltd.

FROM THE CAPITAL'S CORRIDORS

EXPANSION OF PRIVATE OIL REFINERIES

OIL has again been in the news. Replying to various question put to him in Parliament last week, the Union Minister for Oil, Mr. K. D. Malaviya, clarified Government's attitude towards allowing the expansion of the private sector oil refineries. Mr. Malaviya stated that the Government was not prepared to consider any expansion of the refining capacity of the three private sector refineries as long as the existing agreements between them and the Government were not revised. The obvious inference from this remark should be that the Government would be prepared to allow the private sector refineries to expand after the existing agreements between them and the Government have been revised.

The Government stand apparently is justified to some extent. The Standard Vacuum Oil Company and Burmah Shell have recently negotiated an agreement with the Pakistan Government which is said to be far more favourable to Pakistan than the existing agreements of these two companies with the Government of India. If Mr. Malaviya insists on a revision of the agreements with these two companies, especially in view of the fact that during the past two or three years they have been voluntarily foregoing some protection given to them, he is surely on a sound footing. Of course, the Government cannot take the initiative on its own as long as the agreements last. It can only persuade the oil companies to take the initiative and seek a revision of their existing agreements.

INCREASE OF EXCISE DUTIES ON PETROLEUM PRODUCTS

Meanwhile, in terms of the *ad hoc* agreements in force since May, 1958, between the oil companies and the Government for the pricing of major petroleum products, certain additional sums have accrued in favour of the Government. To authorise transfer of the funds to the Central Exchequer, the Union Ministry of Finance has increased, with effect from August 16, 1961, the additional duties levied under the Mineral Oils (Additional Duties of Excise and Customs) Act, 1958, on motor spirit, refined diesel oils and vapourising oil, diesel oil and furnace oil. There will be no increase in the retail prices of these petroleum products; the increased additional duties will be borne entirely by the oil companies.

DAMLE COMMITTEE'S REPORT

The Damle Committee has also submitted its report to the Government on scientific fixation of prices of major petroleum products. The Committee was set up nearly six months ago.

The Committee's report is at present being examined by the Oil Ministry. Government's resolution on its findings is expected to be released shortly.

OIL PRODUCTION AT ANKLESHWAR

Production of oil was started at Ankleshwar on Independence Day when the first 10 tons of crude were extracted from the bowels of the earth. The daily production is being stored at the field. The first consignment of 200 tons of this crude oil will be leaving for the Burmah Shell refinery at Bombay in the beginning of next month. The supply will be stepped up to 1,500 tons a day from January, 1962. Out of the 15 wells drilled so far in the Ankleshwar area, 13 have yielded oil. The remaining two have proved to be only dry holes.

Production has been started at the Cambay oilfield also. The rate of production here is 25 tons a day. The Cambay crude will be supplied to the neigh-

bouring towns to be used as furnace oil. Out of the 17 wells so far drilled in the Cambay area, 11 have yielded oil. Two have proved to be dry holes. The remaining wells are being tested.

THE PUBLIC SECTOR REFINERIES

Progress in the planning and construction of the three public sector refineries was detailed last week by Mr. K. D. Malaviya to the members of the Informal Consultative Committee of Parliament for the Ministry of Steel, Mines and Fuel. The construction of the Nunmati Refinery, Mr. Malaviya stated, was going on as scheduled. The refinery, he said, was expected to be put on stream by the end of the current year. Although laying of the pipeline could not be completed due to heavy rains in the region, the Minister added, the operation schedule of the refinery would not be affected as arrangements were being made to start production by transporting crude by means of tank wagons from Nahorkatiya to Nunmati.

About the Barauni refinery, Mr. Malaviya stated the detailed project report of this refinery was received in December last. A small change has been made in the product pattern of this refinery which will increase its cost by Rs. 50 to 60 lakhs. The construction work has been taken in hand and the refinery would go into production by the end of 1962, as scheduled.

About the refinery to be set up at Koyali, near Baroda, to process Ankleshwar-Cambay crude, the Minister for Oil stated that the Soviet Union had agreed to supply credit to meet the foreign exchange component of the cost of this refinery. Crude from this area has been sent for analysis on the results of which the product pattern of this refinery would be determined. It would take 10 to 15 months after the determination of the product pattern to prepare a project report for the refinery. According to present indications, the Koyali refinery is likely to be commissioned into production by the middle of 1964. This schedule, Mr. Malaviya stated, however, could be advanced if part of the refinery equipment was made available by the heavy machine building plants being set up on the country.

PIG IRON PLANT FOR SOUTH

The Union Minister for Steel, Mines and Fuel, Sardar Swaran Singh, disclosed at the Consultative Committee meeting that large-scale raisings of lignite from Neyveli area would commence towards the end of this year. Arrangements, he added, were being made to despatch bulk samples of this lignite for tests abroad immediately thereafter. Further steps in regard to designing and setting up of a pig iron plant based on the Neyveli lignite deposits and the Salem iron ore reserves, the Minister stated, would be taken up only when the results of the contemplated tests on lignite were known. Some small samples of lignite have already been sent to Norway and West Germany for laboratory tests.

MAINTENANCE IMPORTS

The Committee on Maintenance Imports, set up by the Union Government early this year, has reported that the provision of Rs. 3,650 crores made in the Third Plan to cover the cost of maintenance imports is likely to be exceeded by about Rs. 200 crores. It has accordingly suggested various economy measures to keep the expenditure on such imports within the ceiling prescribed in the Plan. The following are its main recommendations:

(1) In the field of durable consumer goods, such as bicycles, refrigerators, air-conditioning equipment, and household electrical appliances, it would be desirable to

WEST BENGAL LOAN, 1972

INTEREST AT 4 1/4 PER CENT

ISSUE PRICE RS. 99.75

OPENS ON THE 4TH SEPTEMBER, 1961.

+

The loan will be closed without notice as soon as the total subscriptions amount approximately to Rs. 7 crores and in any case not later than the close of business on 9th September, 1961.

The loan will be issued in the form of —

- (1) Stock, the applicants for which will be given Stock Certificates, or
- (2) Promissory notes, which will be in denominations of Rs. 100, Rs. 500, Rs. 1,000, Rs. 5,000, Rs. 10,000, Rs. 25,000, Rs. 50,000 and Rs. 1,00,000.

APPLICATIONS for the loan must be for Rs. 100, or for a multiple of that sum and will be received at:

- (a) The offices of the Reserve Bank of India, at Calcutta, Bombay, New Delhi, Madras and Bangalore; and
- (b) The branches of the State Bank of India within the State of West Bengal except at Calcutta.

+

Full particulars and application forms are available from any of the offices mentioned above.

follow a policy of tight import allocation. Supplementary allocations may, however, be made on the basis of export earnings.

(2) Foreign exchange earnings from export of those categories of steel for which there is surplus capacity should equal the expenditure on imports of deficit categories (other than alloy and tool steels) even if this involves raising of domestic prices for the latter varieties. The supply of steel for purposes of construction and manufacture of durable consumer goods should be reduced to the absolute minimum. There can be a cut in the supplies of galvanized sheets.

(3) The provision made for the import of non-ferrous metals for other than electrical purposes can be reduced further. The Committee has estimated a 10 per cent growth in the demand for aluminium utensils and 6 per cent growth in the demand for copper and brass utensils. It has, therefore, suggested that consumption should be restricted till indigenous supplies of aluminium are available, although this may result in price increases.

(4) In the field of automobile and allied industries, it should be possible to reduce the provision for cars, thus securing a foreign exchange saving. It may be possible to recoup part of the foreign exchange allotment for scooters by linking the import allotment to export earnings. Scooters are in any event a good item from the export point of view, as costs would be economic if there is production on an adequate scale.

(5) Further capacity for drugs and dyes manufacture should be established on the basis of indigenous intermediates.

(6) In the event of a shortfall in the production of vegetable oils, facilities should be provided for the export of groundnut oil and import of copra and palm oil, to take advantage of differences in the relative prices of these products in India and abroad, subject to the net foreign exchange outlay not exceeding whatever amount can be allocated. This would secure the best value for the foreign exchange expended.

(7) There is no justification for any import whatsoever of cotton cloth. As regards silk goods, since raw silk is imported, export of silk fabrics should be undertaken even at a loss.

(8) Imports of synthetic fibres should be confined to the requirements of manufacture of yarn and filament in the country rather than of finished art silk yarn.

(9) A number of plastic products enter into relatively non-essential consumption. It will be difficult to secure supplies for essential purposes unless the overall quantum of supplies is adequate. Any substantial import of the finished product or processing on the basis of imported intermediates should be avoided. Adequate production from indigenous sources should be ensured before expanding consumption in this line.

(10) While imports of newsprint and of cheap paper for text books etc., are of high priority and have to be continued, some of the imports of finer quality papers can be dispensed with.

(11) Control in respect of items allowed to be imported by small-scale industries is not as strict as it might be, though the total amount involved is not as yet large. Every incentive should be given to the growth of small-scale industries, but it would be wrong to encourage development in the less essential lines on the basis of imported raw materials.

(12) In the case of petroleum products, the Committee feels there is scope for savings particularly with regard to import of kerosene, if suitable fiscal measures are adopted.

(13) Most imports of non-essential consumer goods such as spices and dates are on the basis that the trading partners will purchase from India goods which she cannot otherwise export. The Committee has recommended that profits arising from imports of such high profit items should be utilised to promote earnings.

(14) In many instances, industrial units are permitted to retain stocks to cover well above six months' requirements. A reason why firms try to build up large stocks is the delay in obtaining import licences. The Committee recommends that a procedure of automatic issue of licences early in the licensing period to cover a portion of requirements should be adopted and that at the same time the allowance for stocks should be reduced wherever possible. This would minimise the rise in levels of stocks that must accompany increase in consumption.

The Committee says that the estimates for export earnings in the Plan take credit also for earnings from the rupee payment area. In its opinion, there is no justification for permitting imports of relatively low-priority from these countries. What is needed is to make an intensive effort to secure the really essential requirements on a rupee payment basis. This may mean that commitments need to be entered into well in advance, as these countries undertake production only on the basis of long-term plans. The Committee has, therefore, recommended that a concerted effort should be made to arrange such imports, licences being granted with a sufficiently long validity period. The countries concerned should be encouraged to provide full information and advice to intending purchasers in this country, and Indian technicians and businessmen should be enabled to visit these countries.

STEPPING UP EXPORTS TO EUROPEAN COMMON MARKET

As a result of the possible entry of Britain into the European Common Market and with a view to step up exports to the Common Market countries, the Government of India has decided to transfer the offices of the Indian Commissioner-General for Economic Affairs from London to Brussels where the headquarters of the European Economic Community are situated. Mr. K. B. Lall, I.C.S., will be taking over as India's Commissioner-General for Economic Affairs in Brussels. Mr. T. Swaminathan who is at present holding this office in London, is returning to New Delhi. He is expected to succeed Mr. Lall as Additional Secretary, Ministry of Commerce and Industry. Before proceeding to Brussels, Mr. Lall will be joining the Ministry of Finance, in the Department of Economic Affairs, for a short period.

SHIPPING FREIGHT RATES

The Consultative Committee of Shipping Interests in the Indian Overseas Trade, which met here this Monday, decided that wherever there was any anomaly in the freight rates it should be looked into with a view to effect unification of tariffs.

The freight rate for woollen carpets has been reduced from \$59.20 to \$52. Further reduction in the rate for dry prawn powder from Cochin to Singapore and Penang has also been agreed to. The reduction in this case is to be effected from 146 sh. 6d. to 123 sh. 6d. per thousand kilograms.

The question of reduction of freight rates, it was agreed at the meeting, would be expeditiously dealt with by shipowners. The shipowners also agreed to consider reduction in freight rates for coir yarn and coir manufactures from Malabar coast to the United Kingdom and the Continent.

The shipowners have further agreed to change the freight rates on rolled hessian, linoleum and carpet

backing from Calcutta to the U.K. and the Continent on the basis of weight instead of measurement. The freight rates in the latter case work out to be slightly higher. Freight rates to the East Asia and the Persian Gulf countries, it was decided, should be suitably drawn up so as to be more realistic to the present-day conditions.

Inaugurating the meeting, Mr. G. Venkateswara Ayyar, Secretary, Department of Transport, Union Ministry of Transport and Communications, expressed serious concern at the reported announcement of India-U.K.-Continent Conference of a general 10 per cent increase in freight rates on east-bound cargo. Increase in freight on import cargoes, he said, would add considerably to India's import bill and accentuate the difficulties already being experienced on the foreign exchange front. The sustained effort which was being made to expand and diversify India's export trade would be hampered, if not thwarted, as a consequence to this increase in freight rates, he opined.

FOREIGN CAPITAL PARTICIPATION IN INDIAN INDUSTRIES

The Union Minister for Industry, Mr. Manubhai Shah, stated in the Rajya Sabha last week that when foreign collaborators sought majority holdings in the capital of the new Indian industries, it was considered by the Government only when three conditions were satisfied. These conditions were: firstly, that the project had a high priority for the fulfilment of Plan targets; secondly, that the main contribution of the project was in the field of technology where little progress had so far been made and a great deal of additional development was essential; and lastly, where the amount of foreign exchange needed for the project was such that, unless the foreigners were allowed to have a majority share, the Government would itself have to find a substantial amount of foreign exchange from its resources and when no alternative method of long-term finance was found practicable.

Mr. Shah emphasized that, as a rule, the Government preferred that majority interest in ownership and effective control of the company should be in Indian hands. The Minister disclosed that in 1960, majority capital participation by foreign collaborators was allowed in 26 cases. During the first half of the current year, the number of such cases approved was eleven.

DLF LOANS FOR POWER PROJECTS

The Government of India has signed three agreements with the U.S. Development Loan Fund for three credits totalling \$62.9 million (Rs. 30 crores) for financing the foreign exchange cost of three power projects—the second stage of the Sharavati Hydro-electric Project, Mysore State, the thermal station to be set up at Talcher, Orissa, and another thermal station to be constructed at Amlai, Madhya Pradesh. The rupee expenditure on these projects, totalling Rs. 32.3 crores, is intended to be met through loans from the sale proceeds of the agricultural commodities supplied to India under U.S. Public Law 480.

Like the other loans given to India by the U.S. Development Loan Fund, the new credits are repayable in Indian rupees. These rupee payments are not earmarked to pay for exports of goods from this country and as such will not be a charge against India's balance of payments.

The three projects will together generate over 7,50,000 kws. of electric power.

The United States has already helped in financing the first stage of the Sharavati Project, one of the biggest hydro-electric projects in Asia. Work on the second stage has also been taken up. On the completion of this stage, 4,45,000 kws. of electricity will be avail-

able. The electricity potential created by the first stage of the project was 1,80,000 kws. From the standpoint of cost per installed kilowatt, Sharavati is said to be one of the most economical hydro-electric projects in the world.

The Telcher thermal station will be producing 2,50,000 kws. of power which will be utilised for exploiting Orissa's vast industrial potential. The Amlai thermal plant will be generating 60,000 kws. of power and will make possible the exploitation of the abundant resources of the north-eastern region of Madhya Pradesh. Power produced by this plant would be supplied to cement, paper and pulp, coal mining, diamond mining and aluminium manufacturing industries. Some of this power will also be used for electrification of railways in the region.

KHETRI COPPER PROJECT

Details are now available of the agreement signed by the National Mineral Development Corporation in May last with Messrs. Western Machinery Company, of the United States, for securing consultancy services for the Khetri Copper Project. The agreement provides for the completion of the project preferably within a period 36 months from the date of announcement of the agreement, i.e. May 23, 1961.

The agreement envisages production of electrolytic copper at this plant to the extent of 10,000 tons per annum. The U.S. company will be supplying technical consultancy services in three phases. Under the first phase, the consultants shall assess the ore reserves and physical and technical characteristics of the Khetri copper mines and prepare a project report recommending the proper grade and quantity of ore required for the contemplated annual output. The project report shall discuss in details alternate methods for the mining, concentration, smelting and refining of copper and for recovery of by-products and associated metals etc., as may be economically feasible. The agreement stipulates that the consultants should make available to the Corporation the project report at the earliest possible date keeping in view a target of seven months from the date of announcement of the agreement. Within three months after the submission of the project report the National Mineral Development Corporation will be required to convey to the consultants its decision on it. This will mark the beginning of the second phase under which the U.S. consultants shall prepare detailed engineering drawings and specifications. Phase III relates to installation, construction and initial operation of the plant.

The consultants will be entitled to a lump sum payment of \$1,10,000 in U.S. currency and another \$10,000 in Indian rupees (\$1,20,000) for their services under the first phase. No amount of payment has been specified in the agreement for the consultancy services to be rendered by the consultants during the phases II and III. It is, however, stipulated that the total payment to them under all the three phases should not exceed 6 per cent of the "installed" cost of the operating mine, including all mine development costs and the cost of putting up the concentrator, smelter and refinery, but excluding the capital cost of water supply and electricity arrangements (the total cost of which is estimated at \$14.4 million). The consultants' estimate of charges for the second and third phases on this basis comes to \$7,44,000. The total payment to be made to the consultants for their services thus comes to \$8,54,000.

The consultants will have to complete the second and third phases of the project keeping in view the overall target of 36 months for setting up and operating the plant.

pyrites for manufacture of sulphur, are stated to have indicated to the Government of India, after preliminary tests conducted on these pyrites at their works, that there is need for more extensive plant tests before any definite conclusions can be reached on manufacture of sulphur from these pyrites. The Government of India has under consideration the question of sending a larger quantity of pyrites ores for such further tests. If the results prove to be satisfactory, a detailed project report would be commissioned and extensive exploitation of the pyrites deposits at Amjhore would be undertaken for the production of sulphur in the country.

DURGAPUR CHEMICAL PLANT

The Durgapur Chemical Plant will be a State enterprise in which Government of West Bengal will have 51 per cent share. The West Bengal Government proposes to associate two Indian firms and the general public also in the remaining 49 per cent equity capital of this plant. Technical collaboration is intended to be sought from a French firm which will also be supplying the foreign exchange required for import of capital equipment.

The plant will utilise the by-products of the Durgapur Coke Oven and produce synthetic phenol, phthalic anhydride, pentachlore phenol, caustic soda and chlorine. It is expected to be commissioned into production by the end of 1963.

MACHINE TOOL DESIGNS INSTITUTE

The Government of India has decided to set up, with Czech co-operation, an autonomous institute at Bangalore to design and develop machine tools. The decision of the Government follows the recommendations of a ten-member Experts Committee set up by it some time ago under the chairmanship of Professor M. S. Thacker, Director-General of Scientific and Industrial Research.

The Institute, according to the recommendation of this Committee, will be vested with the following functions:

- Design and development of machine tools, standardisation of machine tools element, tools and tooling; manufacture, testing and assessment of prototypes.
- Training of designers and designing personnel.
- Research in the methods of calculations in the design of machine tools, behaviour of machine tools and elements and on hydraulic, electrical, and electronic control systems in relation to machine tools.
- Research in metal cutting, production processes, measuring laboratory, tools and study of mechanability.
- Information and documentation.

The project report for the Institute will be prepared by the Czechoslovak Government which has agreed to bear the cost of capital equipment and expenditure on technical experts. Pending receipt of the final project report, the Government has taken steps to register a company under the Societies Registration Act 1960 to set up this Institute.

ECONOMIC ASSISTANCE FROM JAPAN

As a result of the discussions held at Tokyo in the past few days, an understanding has been reached between the Government of India and the Japanese Government on the utilisation of the 28.8 billion yen (Rs. 38.57 crores) credit made available by Japan for the first two years of India's Third Plan. The credit will be supplied by the Export-Import Bank of Japan in collaboration with some private Japanese banks. It will be used for such projects that may be agreed upon between the two Governments from time to time as

well as for purchases from Japan of plants, machinery and equipment in principal of the same category of capital goods as financed through the 18 billion yen credit extended to India by Japan during the Second Plan period.

The credit is repayable in 15 years, including a 5-year period of grace.

I.D.A. FUNDS FOR INDIAN HIGHWAYS

The following projects are proposed to be financed through the \$60 million credit advanced by the International Development Association for the improvement of national highways in India:

WEST BENGAL: National Highway No. 2. — Bypass from Vivekanand bridge (near Calcutta) to Saptagram via Baidyabati, Four-lane road from Vivekanand bridge to Joypurbeel, Two-lane road from Joypurbeel to Saptagram; National Highway No. 6 — Two-lane road from Joypurbeel to West Bengal/Bihar border, Bridge over the river Rupnarayan, Bridge over the river Kangsabati.

BIHAR: National Highway No. 6 — Two-lane road from Chichara on West Bengal/Bihar border to Subarnarekha Bridge on Bihar/Orissa border; National Highway No. 2. — Bridge over the river Sone; National Highway No. 33 — Two-lane road, Ranchi-Jamshedpur-Baharagora; National Highway No. 31 — Single-lane road from Barauni to Phulberia, Bridge over the river Mahananda at Dinghraghat, Bridge over the Kosi at Kursela, Bridge over the Burhi Gandak; National Highway No. 28 — Single-lane road from Barauni to Muzaffarpur.

ORISSA: National Highway No. 5 — Subarnarekha bridge on the Bihar/Orissa border to Cuttack (Single-lane), Bridge over the river Mahanadi, Bridge over the river Birupa, Bridge over the river Brahmani, Bridge over the river Kharswan, Bridge over the river Baitarni, Bridge over the river Salandi, Bridge over the river Nuniahari, Bridge over the Budabalong river.

MAHARASHTRA: Eastern Expressway in Bombay (Four-lane Divided Highway); National Highway No. 8 — Ghodbunder-Manor section (Two-lane), Bridge over the Bassein creek, Bridge over the river Tons, Bridge over the river Vaitarna, Bridge over the river Vandri, Bridge over the Kuman creek.

In addition, the credit includes a provision (\$300,000) for a traffic study of the Bombay city.

BRIEFS

The Government of India has agreed in principle to the proposal of the Gujarat Government to set up a fertilizers factory in that State. Details of the project, it is stated, are being worked out by the State Government. They will be examined by the Government of India in due course when an application for the grant of a licence is received.

Allis Chalmers International, U.S.A., has informed the Controller of Capital Issues that its application for the grant of consent to the issue of capital for setting up a factory in Madras to manufacture heavy-earth-moving equipment should be rejected for the present. The U.S. firm, however, has stated that it will be glad to collaborate with private industrialists in India who may like to manufacture the products of its design.

The Union Government has decided that the scheme envisaging public participation in the share capital of State enterprises need not be pursued at present.

COMPANY AFFAIRS

CENTRAL INDIA COAL-FIELDS

The performance of the Central India Coal-Fields Ltd. improved considerably during the year to March 31, 1961, when the raisings were recorded at 4.39 lakh tons against 3.81 lakh tons during the previous year. Despatches too were higher at 4.26 lakh tons against 3.80 lakh tons last year. At the Orient Colliery, construction of the railway siding was completed and the siding put in operation during the year under review. The working at the Pure Chirimiri Colliery continued to be difficult due to bad roof conditions. There was a fire in one section of its working and the section had to be sealed off; there is no danger to the rest of the mine. The directors have pointed out that the reserves of coal at this colliery are fast depleting and according to estimates, the colliery is expected to work only upto the end of this year, after which it shall have to be closed down. The directors have under active consideration proposals to replace the output of this colliery, by gradually increasing the output at its other collieries. The working of Badjna seam at the Khas Badjna Colliery was also difficult due to several intrusions in the seam and bad roof conditions. A quarry has been opened at that colliery in the Brindabanpur seam.

The Company has submitted plans for increase in production during the Third Five-Year Plan at its mines and these have received the general approval of the Government. Working at the collieries, after the end of the year, continues to be as before. The inadequacy of wagon supplies is causing a setback at the Orient Colliery, due to accumulation of stock.

Profit during the year after making provision for depreciation and taxation comes to Rs. 7.54 lakhs against Rs. 6.19 lakhs during the previous year. The directors have proposed to transfer Rs. 1.45 lakhs to development reserve. They have recommended the payment of dividend at the rate of Re. 1 per equity shares of Rs. 10 each, which will absorb nearly Rs. 5 lakhs.

NEW ISSUES

The Controller of Capital Issues has granted consent to the issue of a total capital of over Rs. 2 crores to six companies. One of them is a new company from Delhi. The consent is valid for a period of 12 months in each case. Following are the details:

Bombay Wire Ropes Limited (Bombay), has been accorded consent to issue capital of Rs. 1 crore (including Rs. 10 lakhs already issued under the exemption) divided into 10,00,000 equity shares of Rs. 10 each for cash at par. The proceeds would be utilised for manufacturing wire ropes.

Walchandnagar Industries Limited, (Bombay), en-

gaged in the production of sugar, vegetable ghee, sugar making machinery etc., have been accorded consent to the issue of 3rd debentures of the total value of Rs. 60 lakhs carrying a rate of interest not exceeding 7 per cent per annum and repayable after 15 years, for cash at par. The paid-up capital of the Company is Rs. 1,51,00,000.

Lepetit Renbaxy Laboratories Private Limited, a new company registered on June 16, 1961 in Delhi to undertake manufacture of chloramphenicol has been accorded consent to issue capital of Rs. 25 lakhs in equity shares of Rs. 100 each for cash at par, out of which shares of the value not more than Rs. 12.5 lakhs will be issued to the foreign collaborators.

Chowgule & Company (Hind) Private Limited, (Bombay), has been granted consent to the issue of capital of Rs. 15.95 lakhs into 1,257 equity and 338 (9.285 per cent) Preference shares of Rs. 1,000 each. Out of this, 400 equity and 338 preference shares will be issued to Messrs. Chemische Works, Albert, West Germany, against payment to be made by them to suppliers of machinery. The present subscribed capital is Rs. 5 lakhs in equity shares.

Pangal Nayak Bank Limited, Udipi (Mysore), has been granted consent to the issue of further capital of Rs. 5 lakhs divided into 50,000 'B' class ordinary shares of Rs. 10 each for cash at par. The proceeds will be utilised for strengthening the banking company's capital base. The present paid-up capital is Rs. 5 lakhs divided into 2,000 'A' class ordinary shares and 30,000 'B' class ordinary shares of Rs. 10 each.

Carritt, Moran & Company Private Limited, (Calcutta), a Company engaged in business as tea brokers, has been granted consent to the issue of 3,000 bonus shares of Rs. 100 each on capitalisation of its reserves to the extent of Rs. 3 lakhs. The existing capital of the Company is Rs. 1½ lakhs. It is proposed to issue 2 bonus share for each share held now.

Maharashtra Sugar Mills Limited (Bombay), has been accorded consent to issue bonus shares of the total value of Rs. 27 lakhs to be offered to the existing shareholders in the proportion of 2 bonus shares for every five shares held, on capitalisation of the Company's reserves to a like extent. The Company carries on business as manufacturers of white crystal sugar, sugarcane growers etc. and has a paid-up capital of Rs. 72.50 lakhs.

Globe Auto Electricals Limited (Bombay), have been accorded consent to the issue of capital of Rs. 20 lakhs in equity shares of Rs. 100 each. The proceeds will be utilised for manufacturing electrical accessories such as wind shield wipers, ignition coils, cendensors and parts of such electrical equipments.

How to get the most out of your Bank

Do not regard your bank merely as a convenience for depositing and withdrawing money. There are extra services available to you.

When you have a *current account* with State Bank, you can ask that commercial bills and pay or pension bills be collected and credited to your account; you can also instruct the Bank to pay periodically on your behalf house rent, school fees, club subscriptions, insurance premia, etc. and thus save yourself a lot of bother.

A *savings bank account* enables you to earn interest. It permits the facility of withdrawal once a week; the system of withdrawal by cheque is in force at all our branches.

For full particulars of these and many other facilities State Bank provides, please consult or write to the nearest office.

The State Bank with its background of years of sound banking traditions is waiting to solve your problems. Why not have them solved for you?

STATE BANK OF INDIA
INDIA'S LEADING BANK

What was once a dream...

Over four years ago, when the Prime Minister of India visited Bhilai, the groundwork for the foundation of the steelworks was being made. "What was once a dream," he wrote in the Visitors' Book, "begins to take shape and come true—a symbol and a portent of the India of the future."

On his second visit to Bhilai in October last year to inaugurate the Rail and Structural Mill, he saw the dream come true. The one-million-ton steelworks is virtually complete and what was a blueprint only a few years ago is now an impressive network of towering structures on a waste-land of yesterday.

Bhilai has been the largest supplier of pig iron to the nation's foundries for quite sometime and one of the largest suppliers of billets to the re-rolling mills. And now, the products of the Rail and Structural Mill are feeding another vital section of our country's economy—the railways and engineering industries. On an average, two train loads of iron and steel have been leaving Bhilai every day and a part of its products has even been exported.

BOOK REVIEWS

AFRICAN AFFAIRS

Africa Quarterly: A journal on African affairs; published by the Indian Council for Africa; 1-W 5, Curzon Road Barracks, New Delhi; Vol. I, No. 1; Pp. 80; Price Rs. 3 per copy or Rs. 10 for the year.

The spotlight is likely to be on Africa during the sixties just as it was on Asia during the fifties. It is right, therefore, that efforts should be made to educate the Indian public opinion on the rapid developments in "emergent" Africa where a wind of change is currently sweeping away the remnants of colonialism. The Indian Council for Africa needs to be congratulated for its pioneering effort in bringing out a first-rate quarterly journal, bearing entirely on African problems. The first issue is at once a scholarly and detached exposition of the problems which the African countries face.

Here is a brief report on the aspects covered in the current issue. The first article is an abridged version of the address delivered by the Prime Minister while inaugurating a seminar on Africa early this year. He has rightly pointed out that the people of Africa are not interested in the cold war controversies since they are primarily interested in their own freedom. Dr. U. R. Ehrenfels has very ably expounded the theme of Panafrikanism in all its facets. Dr. Amba Prasad has made a very comprehensive analysis of the problems of Indians in East Africa. Mr. Dinesh Singh, M.P., has traced the history of the freedom fight in Algeria and has emphasised the right of the Algerian people to self-determination and independence—a right which has already been recognised by the United Nations.

The Quarterly, in fact, contains much valuable material for the researcher who wants to delve deep into the African problems. The journal has been printed in a very elegant manner, and holds out a promise of maintaining high standards in journalism and research.

PROBLEM IN MARKETING

Agricultural Marketing in India and Abroad: By R. S. Srivastava; Published by Vora & Co., Publishers, Private Ltd., 3 Round Building, Bombay-2; Pp. 243; Price Rs. 12.50.

The present volume attempts to compare the conditions on marketing in India as compared to other advanced countries. It brings out the out-moded character of Indian markets and shows the volume of work which needs to be done for improving the channels of marketing as well as for reducing the cost of distribution. The book will be of immense use to students, administrators and marketing organisations.

Mr. Srivastava has made a heroic effort to dig out statistical information regarding certain aspects of the Indian markets which were scattered over numerous publications. The estimates of the marketing surplus in the case of agricultural commodities for the year 1950-51, is illuminating. It is suggested that Mr. Srivastava should try to bring this table up-to-date in

order to make it more useful to the administrators. The holding of the price line in the case of food, according to some theoretical economists, hinges on the volume of the market surplus, and up-to-date information for this vital sector of the economy is not readily available from any public source.

Despite certain bad mistakes in proofreading, the present volume is without doubt a learned attempt on the marketing of agricultural produce in the Indian Union and will be found useful by all those who wish to learn fully about the hazards of marketing in this country.

GROWTH OF THE CORPORATE SECTOR

The Corporate Sector in India: A factual representation of long and short-term trends by Raj K. Nigam and N. C. Chaudhuri; published by the Research and Statistics Division, Department of Company Law Administration, Ministry of Commerce & Industry, Government of India, New Delhi; Pp. 194; Price Rs. 13.50 nP.

The corporate sector in the Indian economy has grown at a very fast rate during the last decade. The number of companies in 1960 was a little less than 27,000 with a paid up capital of nearly Rs. 1,600 crores owned by nearly half a million shareholders. The assets in the corporate sector are nearly Rs. 4,000 crores. These few figures bring out the importance of the corporate sector in India. The authors have done a valuable service in putting together all the material available on this subject. Attention has been focussed mostly on the last ten years, though long-term series have also been presented wherever figures are available. The contribution of the Reserve Bank of India is sizeable in view of the fact that a systematic analysis of the balance sheets of nearly 1,000 public and private limited companies has been presented by the Research and Statistical Division of the Bank during the last few years. The authors have spared no pains in presenting an objective picture of the growth and structure of the corporate sector and have touched upon almost all the important facets of the problem. The volume will be of considerable value to the planners, to the researchers and the students.

COMPANY LAW

A Guide to the Companies Act (Act I of 1956): As amended by the Amendment Act LXV of 1960; by A. Ramaiya; published by The Madras Law Journal Office, Madras-4; Pp. 933; Price Rs. 20.

The Company Law in this country has become very much complicated during the last few years. The frequent revisions of the various clauses have complicated matters further. Mr. Ramaiya has done a splendid job in explaining the various implications of all the important clauses and sub-clauses in a very concise and clear manner. Brief notes attached to every clause explain the significance of the revisions. It is a very profound study containing copious notes on the cases decided by the courts regarding the various issues involved in the controversial clauses. This is a guide which should be on the table of every secretary and manager.

Ease out of that profit squeeze...

Decentralisation and lower profit margins make the profit-and-loss statement the real measure of each plant's efficiency. That's why it is increasingly important for management to study methods to ease out of the profit squeeze. Planned Lubrication gives management such an opportunity for savings.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

CALTEX (INDIA) LIMITED Bombay · New Delhi · Calcutta · Madras

The Eastern Economist

SEPTEMBER 1, 1961.

The Prime Minister

ON Wednesday, August 30, the Prime Minister left New Delhi for the Neutral Nations' Conference at Belgrade. There are many who consider that his absence from the country at this time, in view of the uncertain situation in the Punjab, is a grave error. Perhaps, the absence of his dominating personality is a condition of the creation of full responsibility elsewhere. But the Prime Minister's absence on this occasion does not imply freedom to anyone faced with a critical situation to deal with the matter as circumstances demand in each case. The Prime Minister has very firmly tied the hands of his Home Minister by his last statement in the Lok Sabha, with its painful reiteration of the correctness of his own stand and the almost total absence of any field for negotiations in any respect. This is a grave error. In a situation which might require flexibility—in the view of *The Eastern Economist* it already does—the fierce rigidity which surrounds the Prime Minister's pronouncements on the subject has made it impossible for the Central Government to negotiate, should circumstances arise in the Prime Minister's absence requiring a last minute round of negotiations. This is the price that India is paying for the supreme concentration of power in the Prime Minister, and for his refusal to delegate responsibility to anyone to deal with a difficult situation which, at any moment, can resolve itself into a deep crisis ending in bloodshed and in disorder.

The short period issue in the Punjab might look like a law and order situation. So, indeed, one might argue, was the great Calcutta Killing in those terrible days in 1946 when the inevitability of Pakistan forced itself upon thinking men and women on both sides of our current borders. It is obvious that the Punjabi Suba agitation has nothing like the same dimensions, and it does not confront the whole body-politic with a major decision in regard to the coming of Independence as did the great dilemma posed by Pakistan. But there are other issues as great and as seemingly

terrible as the differences which culminated in Pakistan. The most important of these is the question as to whether, in the last analysis, the separatist idea, apparently uncanvassed and unsupported in the rest of India, has nevertheless a secure place in future history. In the view of *The Eastern Economist* the journey might be a long and arduous one, but the substance of the Sikh demand will eventually be conceded. This is not because of the weakening of the Prime Minister's resolve, nor necessarily because some of his arguments are irrelevant. It is primarily because a great emotional upheaval, which might take place with Master Tara Singh's death, will place the Sikh community at a point of no return, just as events in 1946—dominated by the Great Calcutta Killing—charted the course of Pakistan more firmly than the full-voiced agitation for a decade preceding.

The question whether a point of no return arises in these matters is not rational and, in the last analysis, may not even be capable of analysis. But we have given hostages to fortune in this case by reason of the fact that elections are to be held within six months. Almost surely, as in the Gurdwara elections, the Akali Dal will prove its immense influence in the Sikh area, and, inevitably, Hindus in the Punjab will rally round not the Congress whose resolution on this matter will be doubted by militant Hindu groups, but round the Jan Sangh, Hindu Mahasabha and allied groups. In fact, political power in the State of Punjab will thus pass away from the Congress. Once this has occurred, a compromise between the Hindu and Sikh elements will be inevitable if an ordered democratic government is to be sustained. The Centre will not be able to maintain its present stand in the event of no Congress instrument in the State to carry out its behests or capable of maintaining the law and order situation. Neither the Akali Dal or whatever the associated party comes to power with its support, nor the Jan Sangh and allied parties can fill the place of the Congress as a secular force capable of riding

the Punjab in double harness. This involves inevitably the failure of the Central Government's current proposals and, less happily, the prestige of the Prime Minister.

During the current week the Prime Minister's prestige has suffered another bitter blow as a result of the error in his original statement on Berlin in regard to the Western Powers' right of access to Berlin with the suggestion that access could be lawfully hindered by the East German Government. The great outburst of indignation in the United States and elsewhere in the West has apparently compelled the Prime Minister not merely to revise his opinion, but to append to his speech on the Plan a correction—the more damaging, because his first speech had already been exploited by the Soviet Union in the great Berlin debate. In the net result, we have pleased no one, but have created the impression that our views on the Berlin question can be changed by protests after being originally misconceived in

terms of the documents and clear legal proofs available in abundance.

Whether on Berlin or on the Punjab the Indian people must now be convinced that responsibility rests too heavily on the shoulders of one man. The Prime Minister has no time to do what he described this week as "solid" work, because of his preoccupations with VIP's and numerous details which should never be a Prime Minister's concern. It is time, whilst not belittling the great gifts with which he has been endowed and his tremendous services to the Indian Union, that we should recognise that he can no longer carry the burden of office in these times without some delegation of powers and some considerable dispersion of authority. When he returns in a fortnight, it is sincerely to be hoped the Prime Minister will himself recognise that he is living beyond his capacity and that the country's need for delegation of authority in response to the present events has become more desperate than ever.

A Summary Debate

THE Income-Tax Bill was passed by the Lok Sabha on Monday this week in the altered form in which it emerged after the Select Committee's report and now it goes to the Upper House. This comprehensive piece of legislation is admittedly something more than a mere consolidation of the law on income-tax into a cohesive whole, seeking to integrate the piece-meal amendments made over nearly four decades since 1922. The major purpose of the Bill is undoubtedly to codify the law, but the codification is not intended to proceed on the basis of a straight rearrangement of the numerous sections and chapters in their logical sequence or topical relationship. There are important procedural as well as substantive amendments. Considering the nature of the amendments and the significance of the subject-matter of the Bill, a summary debate—for it was nothing more than that—to rush it through the Lower House in ten days within the limited time allotted to it was hardly fair. It speaks for the inadequate justice done by Parliament to its legislative function—a direct consequence of the plethora of legislation with which the agenda is overloaded from session to session.

Important provisions, such as those relating to the depreciation allowance, were disposed of with scant attention. Fortunately, no time was wasted in flogging the dead horse of the controversy over corporate donations to political parties on which the party in power has adopted an unbending attitude in enlightened self-interest. Enthusiasts were not lacking who could not restrain their zeal to insist on the taxation of the privy purses of the former princes, no matter if it involved a breach of solemn commitments made during an important stage of our constitutional evolution. An objective critic might interpret this attitude as irritation with some princes who participate in the elections to the legislatures in opposition to the ruling party. This summary debate, however, attracted ample discussion of three issues—directors' liability for company taxes in certain situations, gratuities paid to the private sector employees and policy on charitable trusts.

A new concept of directors' liability is being incorporated in the law by an amendment which specifically lays down that where any tax, which is assessed on the income of a Section 23A Company, before, during or after its liquidation, cannot be recovered from its assets, every person who was its director at the relevant time would be liable to pay the tax jointly as well as severally. Obviously this new tax liability has no relation to the director's shareholding and could go far beyond it. Mr. Masani fought a vain battle once again against the iniquity of violating the principle of limited liability which is the corner-stone of the capital structure of joint stock companies. Its other direct effect would be to deprive private companies of the benefits of the services of honest persons on the Boards of Directors for fear of this penal provision. This novel amendment is a gift made by the Direct Taxes Administration Enquiry Committee which has dismissed the objection as an attempt to exaggerate the sanctity of the principle of limited liability. It is of little consequence to the Committee that, in the present difficult era of scarce finance for the corporate sector, private companies are invited to play an increasingly onerous part.

The Finance Minister deserves credit for taking second thoughts on his inflexible attitude to the taxation of gratuities paid to employees in the private sector. The invidious discrimination is now being removed. Tax exemption is granted to this class of gratuities, but some of the grace with which the unanimous demand for the abolition of the discrimination has been conceded is taken away by the ceiling which has been put on the amount of gratuities eligible for exemption. Gratuities to the extent of Rs. 24,000 or 15 months' salary on the basis of the average of the salaries received in the last three years, whichever is less, will not be taxed. Once the principle of exemption is conceded, it ought to be applied to the full amount where an employer pays gratuities in excess of the ceiling fixed in the Bill.

The rigidity of the amendments in the original Bill in the form of the withdrawal of tax exemp-

tion for charitable or religious trusts has not been removed to the reasonable extent. Accumulation of income in excess of 25 per cent in any year is not to be penalised by assessment, subject to specified conditions. But the revocation of exemption of income-tax for trusts which will be created hence-forward for the benefit of any religion, community or caste has been retained. It is ordinary human nature that the settlor should seek to extend the benefits of his munificence to those for whom he feels a special affinity. If freedom of religion is guaranteed by the Constitution, it is inconsistent with the exercise of this right to debar a philanthropist from creating a trust for the objects specified. This point of constitutional validity was raised by Mr. M. S. Aney; but

without effect. Funds flowing from charitable trusts are a very important source of finance particularly for the educational institutions of religious minorities or communities. But apart from these weighty considerations, the reasoning on which the ban is imposed is unconvincing. Mr. Morarji Desai stressed that this policy was aimed at creating a "national consciousness". In a multi-religious society or multi-caste community, charitable trusts are likely to have the bias which is sought to be expunged by the law. So long as it is confined within *bona fide* limits, how does it militate against national integration? The probable effect of this disqualification will be not to promote national consciousness but to discourage the setting up of a good number of trusts.

Life Insurance : Heads I Win, Tails You Lose?

THE Chairman of the Life Insurance Corporation of India, Mr. P. A. Gopalkrishnan, made in his very interesting annual address a provocative statement regarding the relationship between the cost of life insurance and the rising tendency of prices in India. The Chairman said, "In a world of ever increasing commodity prices, life insurance policies in India cost less today than at any time during the last fifteen years or so". Elsewhere in his speech he also indicated that wholesale prices had risen by 30 per cent during the Second Plan period and consumer prices by 24 per cent. Thus, in a daringly simple manner, he attempted to compare a life insurance policy to a "commodity" whose price should normally move with the general trend in prices. What was implied in his statement was that the premium rates offered by L.I.C. were much lower than the prevalent level of prices in general, and the recent demands by the public for scaling down the premium rates were unwarranted.

What "commodity" does the Corporation sell? In fact, it is a mistake to call a life insurance policy a commodity. It is nothing more than a contract between the Corporation and the life insured. It is a promise by the Life Insurance Corporation to pay to the insurer a certain sum of money on death if it is a whole life policy, or on maturity if it is an endowment, unless payment becomes necessary due to earlier death. Ninety per cent of insurance policies currently being sold by the Corporation are endowment policies with the risk-cum-investment characteristics. There is no mention of the purchasing power of money in this contract. Thus, the promise of the Corporation to pay the sum assured a few years hence is in terms of money which is constantly depreciating. The commodities which the insurer buys are real assets whose prices are likely to increase. The two are, therefore, not at all comparable as the one moves on a rising curve of purchasing power while the other moves on a declining one.

This fact needs to be illustrated with reference to a policyholder who bought an endowment policy, say, in 1939 and also in relation to a policyholder who bought a policy in the current year. In the case of a policyholder who got himself insured for Rs. 1,000 in 1939 under the endowment without profit policy for 20 years, he had to pay roughly a sum of Rs. 1,000 during the 20-year period when the rupee had a declining purchasing

power. Deflating the money value of these instalments paid to L.I.C. to the 1939 level of prices, it is found that the life assured paid a sum of Rs. 411 while the Corporation, on the other hand, paid to the life assured Rs. 233 only in terms of 1939 prices, showing a loss of 44 per cent in real terms.

The fate of the current policyholder is not likely to be very different. Unofficial estimates indicate that even during the Third Five-Year Plan prices are likely to rise by about 5 per cent per annum. In other words, even policies currently underwritten have no protection against the erosion caused by price inflation. It is estimated that the erosion in purchasing power will be not less than 20 to 25 per cent for the policyholders during the next decade. In fact no one buys the equivalent real value of an insurance policy written into the contract.

The Chairman of the Life Insurance Corporation, however, ignored the basic reasons for which demands were made for reducing the premium rates. There has been a steady improvement in the expectation of life of the insuring public in the Indian Union and since the premium rates are calculated on the basis of mortality rates prevalent in India almost 20 years ago, there is no reason why the Actuarial Department of the L.I.C. should not place the true facts before the Chairman in this regard so as to lower the rates. Another factor which enters the calculations of premium rates is the rate of interest. Since the Bank rate has steadily risen during the last decade from 3 to 4 per cent and the market rate is double that level, the L.I.C. must lower rates on this count as well. These arguments stand apart from considerations of the falling purchasing power of the rupee which goes to increase the profits of the Corporation and cuts the real value of benefit available to the insurer.

The Chairman of the L.I.C. has done a distinguished job in reorganising the Corporation. He has placed the Government—and possibly the nation—in his debt. But he is totally wrong in his calculation of the equivalence of current premia with current real receipts. Will he not recognise that lower premia are necessary to redress the inflation from which the Corporation profits?

A DELHI DIARY

THE BAR OF THE HOUSE

WHAT is the Bar of the Lok Sabha? This question was constantly being asked before Tuesday when it was known that Mr. R. K. Karanjia, Editor of 'Blitz', was to be brought before the "Bar". The word 'bar' in a country overpowered by prohibition has an unseemly sound, and some foreigners were wondering why we have followed the precedent of the House of Commons in using the word 'bar' which, as far as I can remember, was an ancient ritual derived from the City of London's barricade at the entrance to the old city — still recognized by an appropriate monument in Fleet Street. There was no bar in India's Lok Sabha until Tuesday. A three-tiered wooden barrier had to be manufactured just inside the Chamber in the doorway facing the Speaker. This was by no means a perfect setting seeing that the large number of interested spectators in the Gallery missed Mr. Karanjia.

A large number of newspapers described this as a Lok Sabha "ceremony" implying rather more than, I think, the occasion demanded. All the Delhi newspapers carried the news on the front page as though it were a major event. I suppose it had at least two marks of novelty; firstly, it was the first time that the Lok Sabha had called anyone to the Bar and, secondly, it was the first time that an Editor of an Indian newspaper has been publicly reprimanded. Whether this has been a good thing or a bad thing for the Press has been ignored in the general opinion that the sovereignty of Parliament has been fully vindicated. Mr. Karanjia was unwise; but may I say he took his punishment like a man? He entered with dignity and received his reprimand in silence as, I believe, he was expected to do but which was, in this age of surprises, not necessarily inevitable. The Lok Sabha functions as the High Court of the Parliament but the proceedings do not permit of a submission by the offender. I wonder what the practice is in the Mother of Parliaments.

In Delhi at least opinions do not differ on the need to exercise restraint by the Press and the need for Parliament to exercise its jurisdiction of protecting members from ridicule when they are pursuing their lawful avocations. I am told that the authority of Parliament to sit as a High Court has been vindicated by the new precedent and now that the Supreme Court has upheld its decision in the 'Searchlight' case, Editors have to recognise a new source of authority against libel and irresponsibility. This is all to the good though how much nicer it would be if the Press did not need an additional restraint upon itself in the form of sanctions vested in other bodies? Many of us have regretted deeply that Indian journalism has chosen sometimes in order to pander to mass circulation to stoop to levels which cannot be justified under any code of conduct. Except for Communist Party members who absented themselves from the "ceremony" and Mr. Kripalani — who showed dignity in not being present, as though to avoid an impression of victory—Parliament was full and happy that its rights had been vindicated at last. May it not be that if Parliament had acted earlier on these lines many errors against good taste might have been avoided?

BELGRADE: WHAT OF HER?

I am moving, skilfully I hope, over troubled waters such as those implied in the Punjabi Suba and the Neutral Nations' Conference — whose common meeting point is the Prime Minister — to deal with the "environment" which surrounds the Neutral Nations' Conference opening on September 1. There is something to be said for studying environment by itself. Did not Professor A. C. Pigou, the noted economist, say somewhere that environments, like human beings, have children? Whether citizens of Belgrade can claim that they are begotten of their

"environments" or not, I cannot say. But I know of no city in the world which is more mixed in its upbringing than the city of Belgrade. In the heart of the city there is the old Turkish Fort, rugged like our own Tughlakabad, an impressive, though now graceless, protection against old fashioned technology. Not very far is the great Cathedral of the Orthodox Church, living now in a garden, but full of its own sadness because of the emptiness within. Very few people attend the church and though the candles are burnt brightly from time to time, it is difficult to believe that this church has any great part to play in the life of this restless city.

Marks of the Austrian Civil Service and the stately Franco-Austrian architecture, which it built round itself, are abundant; many Belgrade Federal offices are still in pre-World War I buildings. The Austrian administration, great in its capacity for detail, has left a true legacy in Yugoslavia in at least two respects; the magnificently high rate of literacy in Slovenia — the gift of Maria Theresa's forward education policy — and the high traditions of the Civil Service in Belgrade. Then comes the whole of modern Belgrade — beginning with the Hotel Metropol, the joint enterprise in which American methods of hotel management are living alongside Continental systems of service. There are also the new Secretariat buildings, not yet fully occupied; the largest modern monument, though not, perhaps, in terms of architecture, the most sublime. Not very far are the long rows of blocks built by students themselves now serving as University hostels. Thus it all is Greek, Russian, Turkish, Austrian, American, and in between, — and presumably above it all — the flexible Serbian artistic temper, mixing now with Slovenians and Croats in an agreeable emotional solution in which the old animosities have died away.

I am hoping the VIP visitors to Belgrade this week will see her many-sided life in this or in some other way; otherwise the city does not come into life at all. It has not only the glory of Rome, the sparkle of Paris or the perennial splendour of London; it has not the wealth of Milan or Dusseldorf and the eternal novelty of Vienna, but if one searches deeply, one perhaps can find traces of all these here and there. The Danube flows steadily on; and the Turks live too. One will find Turkish coffee at one's elbow almost every hour of the day. Yugoslavs keep it standing in little copper jugs from which one pours out a concoction of which I think I can state with assurance that nothing more potent than the coffee line has ever been produced.

HAPPY LANDING

The Prime Minister left for Belgrade on Wednesday evening. I shall say nothing about his absence except to produce, without comment, the uncharitable version of my naughty cartoonist!

What a Life!

ARGUS.

THE WEEK'S NOTES

Hungarian P.M.

A FRUITFUL VISIT

THE VISIT of Dr. Ferenc Munnich, Prime Minister of Hungary, to the capital city for three days from August 24, was a welcome event, whose significance could not but be fully grasped in spite of the fact that it happened to coincide with a grave internal problem over which the minds of our Cabinet as well as of the masses were very much exercised. No proof of the appreciation by the public of the message of friendship and co-operation which Dr. Munnich brought with him could be more eloquent than the public enthusiasm which marked the civic reception accorded to him in the Red Fort. Dr. Munnich recalled his career as a socialist and a revolutionary which dates back to the October Revolution of 1917. On this public occasion as well as in his talks with the Prime Minister, he declared his country's faith in peace and the liquidation of the remaining outposts of colonialism which is one of the preconditions of world peace. He made an unequivocal reference to Portugal's colonial pockets in India and urged that they must disappear without delay. Berlin was naturally an issue which was in the forefront of the discussion between the two Prime Ministers and there was full agreement between them about the urgency of a peaceful settlement of this explosive problem by negotiation. India and Hungary are beginning to come closer on the plane of contacts and the conclusion of a cultural agreement between the two is a matter of only a short time.

But it is economic co-operation which promises to give a solid content to the growing contacts. Hungary has shown readiness to extend collaboration to India in setting up an aluminium plant in the public sector. Simultaneously with the visit of Dr. Munnich, the Hungarian Aluminium Mission, led by Mr. Istvan Gebefugi, one of the Directors of Industrial Planning and directly concerned with the expansion of the aluminium industry in Hungary, was here on a five-day visit for inspection of a site for the aluminium plant. The choice of the location may lie chiefly between Mysore and Madhya Pradesh States and the claim of Amarkantak in the latter is being vigorously pressed. When the agreement for the plant comes to be signed between the two governments, an important concrete step will have been taken to pave the way of greater economic collaboration in the years to come.

Nagaland

THE ASSASSINATION OF DR. AO

THE MURDER of Dr. Inkongliba Ao has deprived the Nagaland People's Convention of a great leader, who combined the qualities of realism and moderation with firmness of conviction. It was no matter of ordinary courage to fight in opposition to the forces of Dr. Phizo. It was his patience and perseverance which ultimately succeeded in giving a practical lead to the majority of the people of Nagaland to fulfil their aspiration of autonomy in their own affairs. But it will do no good either to the Government of India or to the people of the Nagaland to ignore the impact of Dr. Ao's murder in broad day-light in a public street in Mokokchano. Its painful meaning is that the forces of fanaticism still dare to operate in public places and greater measures

of security will be needed to protect the lives of the members of the Executive Council for the Nagaland area as well as of the Interim Body. It would appear that Dr. Phizo's followers are driven to desperation as a consequence of their demoralisation. Dr. Phizo's attempt to enlist support in the UK for his case for an independent and sovereign Nagaland has failed and further his recent attempt to apply for British citizenship (which has posed an awkward problem for the UK Home Ministry) might quite reasonably be taken by his followers as an indication of his faltering decision to return to Nagaland to conduct the underground operations in person. The armed forces of the Indian Union are already engaged in combing out the fanatic rebels and greater energy and determination must be displayed at this critical juncture to vindicate the futility of their misguided operations.

But on the constructive side, imaginative action needs to be taken without loss of time. While the Interim Body of 42 members will need to address itself to the task of framing constitutions for the local councils as well as for an assembly for the Nagaland, tangible proof ought to be offered to the people that they are rapidly becoming the masters of the affairs in their own homes. There is an impression that the Indian officials are slow to delegate real authority to the Executive Council. A solution would lie in setting up a comprehensive team of civil administrators to conduct the normal administration and, on the analogy of the Interim Government in India before 1947, the members of the Executive Council ought to be given the status of ministers. The question of greater delegation of power is likely to come up for discussion on September 6 between the Executive Council and the Governor of Assam. Quick decision, accompanied by swift army operations, would prove an effective two-pronged approach to the Nagaland problem.

British Guiana

DR. JAGAN'S PROBLEMS

THE FIRST election under British Guiana's revised constitution has swept Dr. Cheddi Jagan's People's Progressive Party into power. One remarkable fact about the result of the poll is that this Party has won a decisive majority of 20 in a House of 35. All pre-election misgivings about probability of none of the three major parties being able to muster a clear majority turned to be misplaced. Basically, at the present time, party alignment in British Guiana has been on racial lines. The principal contestants at the election were Dr. Jagan's People's Progressive Party with its Indian complexion and Mr. L. F. S. Burnham's People's National Congress with its African domination. But it is significant that Dr. Jagan's Party could attract some African votes. A new Guianese nationalism is emerging as it is bound to.

It is internal self-Government which Dr. Jagan is taking over as Premier. Full independence is to follow soon and cannot be deferred longer than a year. What are Dr. Jagan's problems and how is he likely to face them? Between the last episode of his rise and overthrow in 1953 and now, the political climate has changed considerably. Some have attempted to draw a parallel between Dr. Castro and Dr. Jagan. There is hardly much common between them except that they

are both leftists in their own way. Dr. Jagan cannot disclaim his Marxist faith and there is undoubtedly an element of hard boiled communists in his Party. But he cannot be slow to draw the necessary moral from Cuba. Many observers, competent to judge the Guianese scene, agree that he is turning a realist first and anything else afterwards. He envisages an independent Guiana within the Commonwealth. He faces the responsibility of giving his people a feel of freedom, which means tangible proof in economic terms. His programme of co-operative rice and sugar farming on a limited scale with State support does not necessarily signify a beginning in the process of nationalisation. He is fully aware of his country's dearth in trained personnel and the Government's dearth of revenue to nationalise foreign enterprises with heavy investment in sugar plantations, bauxite mining and manganese exploitation. More than nationalisation he has to concentrate on economic expansion and attract foreign investment. But the least to which he must adhere is neutralism and acceptance of aid without strings. The two Western powers interested in this country will find in tactful relations with him a policy of far-sightedness.

Retired Officials

RE-EMPLOYMENT

THE RE-EMPLOYMENT of retired government officials in the private sector (as also under the auspices of the public sector) has become a marked phenomenon in recent years. Its beginning can be traced to the war-time emergency requirements of personnel at various levels. Therein lies the real explanation of this growing trend which has lent itself to conflicting interpretations. One section looks upon it with a suspicious eye and imputes objectionable motives both to the post-retirement employer and the employee. This attitude is based on the impression that the patronage is extended by the employer in anticipation of deriving improper benefit from it. In the Lok Sabha Mr. Arjun Singh Bhadauria moved a resolution urging upon the Government to introduce a Bill to prohibit the re-employment of retired government officials in private as well as government or semi-government establishments mainly on these grounds.

Mr. B. N. Datar, Minister of State in the Ministry of Home Affairs, rejected the suggestion out of hand. His exposition of the Government's policy on this question was well reasoned and amply supported by his Ministry's consistent attitude. In pointing out that the prevailing shortage of trained personnel of the requisite talent had compelled employers, including those in the public sector, to lean upon the limited pool of retired government officials, he hit the nail on the head. His further clarification of the official procedure for granting permission for re-employment should set at rest any lingering doubts on this question. It was a rule imposed on all government officers that they must not seek re-employment after their retirement for a period of two years without the prior permission of the Government. In granting this permission the Home Ministry weighed with proper care whether the prospective employer had any connections with the official during his tenure. Permission was withheld where the chance of improper advantage was real. Between 1956 and 1959, 176 retired government officials had sought the Home Ministry's permission for re-employment out of which 9 were unable to get it. The result of an indiscriminate ban based on prejudice would be to deprive the establishments in the private and public sectors of the available talent for which a suitable alternative is not ready at hand. Permission for re-employment has its humanitarian aspect too. Retirement confronts the official with the prospect of having to maintain himself on a pension

whose value in real terms is substantially deflated. While the capacity for work exists, it would only be fair to allow the retired official to supplement his inadequate pension.

Motor Transport

RELIEF IN SIGHT?

THE INAUGURAL address of Mr. A. K. Sen, the Union Law Minister, to the annual meeting of the Calcutta branch of the Indian Roads and Transport Development Association last week, holds out a hope that the long awaited measures of relief to motor transport would be partially available some time in the near future. But in the absence of positive commitments by the Minister, enthusiasm must be restrained by road transport operators. In vague terms, Mr. Sen announced that the Amendment Bill to the prevailing legislation would incorporate modifications to give the motor transport industry the benefit of the latest developments as strongly urged by the Masani Committee. This may mean anything in view of the comprehensive coverage of the Masani Committee's recommendations. But in so far as the most urgent relief from the heavy burden of taxation is concerned, Mr. Sen could do no more than to reiterate that the State Governments had been approached and pressed by the Centre from time to time to alleviate the tax burden and agree to a single tax on motor vehicles. This process of pressure does not bring any new knowledge to the industry. How many States have responded?

It was welcome news for the industry that the provision of the Hire Purchase Bill governing motor vehicles would be revised in the light of the recommendations made by the Road and Inland Water Transport Advisory Committee recently. The amendments would restore the status quo entitling the financier to take back possession of the hired vehicle in case of default in the payment of the instalment before the hirer becomes a full-fledged owner. The hirer is to be enabled to effect transfers of the vehicles with the express prior consent of the financier. These amendments would go a good way in removing the threatened drastic impediments to the industry.

Maharashtra State Development Loan 1972

ISSUE PRICE AT PAR OPEN ON THE 4TH SEPTEMBER 1961

The loan will be closed as soon as total of approximately Rs. 10 crores has been subscribed and in any case not later than the close of business on the 9th September, 1961.

The applications for the loan will be received at—

- the offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras, Nagpur and Bangalore,
- the branches of the State Bank of India within the State of Maharashtra, except at Bombay and Nagpur and at places mentioned in (C) below,
- the branches and Treasury Pay Offices of the State Bank of Hyderabad within the State of Maharashtra, except at Bombay,
- the Government treasuries and sub-treasuries in the State of Maharashtra at places where there is no branch or Treasury Pay Office of the aforesaid Bank.

Full particulars can be obtained at any of the offices mentioned above.

COMPETITION AND PLANNING

By
ODYSSEUS

THE CLASSICAL CONCEPT of competition was that when a manufacturer saw an opportunity to increase profits by expanding production, or by introducing a new commodity, the prospect of increased profits caused other manufacturers to do the same, until profit margins narrowed, and a new equilibrium was reached. In "Information and Investment" (Oxford Univ. Press, 1960. Price 21 sh.), Mr. G. B. Richardson is among the many economists who have no difficulty in showing that this theory implies perfect knowledge of market conditions, sources of supply, and potential demand, which would constitute a business man's paradise in which he could never make a mistaken judgment. The theory also ignores innumerable other uncertainties, e.g., the degree to which one manufacturer is dependent on unknown complementary investment decisions taken by his suppliers, or on the unforeseeable repercussions of strikes, wars, or crop failures.

Entrepreneurs try to reduce the uncertainties in which they flounder by building up regular market connexions, e.g., through goodwill, by offering loyal customers rapid delivery or servicing facilities, by taking on special and not very lucrative orders, by refraining from charging the highest obtainable price in times of scarcity. The practice of keeping prices steady irrespective of changes in demand is relevant to the problem of the availability of information on which investment decisions have to be taken. If demand and supply are continuously equalised by a flexible price, little evidence is provided about the magnitude of the changes in demand for which producers should plan. Futures dealings may ward off uncertainty for a few months ahead, but they cannot provide the certainty which will justify an investment decision which will commit a manufacturer for years. Producers may seek to decrease uncertainties by agreements with their competitors, but experience suggests that these are mostly of limited value, especially today when it is difficult to think of any commodity — ranging all the way from steel to tea — for which there is no substitute.

RESTRAINTS ON COMPETITION

Nevertheless open to unforeseeable risks as these and many other ways of decreasing uncertainties are, such "market connexions" do afford entrepreneurs a more secure basis on which to make investment decisions than if they did not exist at all. These restraints on pure competition increase the information available in a free economy. Restraints on competition are no doubt bad, but like the law itself, which restricts freedom, they are a necessary evil.

Could all risks and uncertainties be eliminated by forming bigger and bigger companies, pooling their information and their resources, until one company covered a whole industry? Or group of industries? Or, carried to its logical conclusion, until one company covered all industries?

Before a firm willingly amalgamates with another, its owners need to be assured that amalgamation will increase their incomes. They would wish to compare the size and certainty of the expected income of their own firm, acting independently, with the income expectable after amalgamation, which would depend on the amount both of the profits of the united enterprise and of their own share of them. But it may be difficult for an entrepreneur to estimate what the total

profits of the group would be. From his viewpoint, quite apart from whatever the reality might be, the future income of his own firm will generally be less uncertain than that which he expects to be earned by others, because he has more detailed knowledge of his own firm's affairs. It follows that his estimate of the amalgamation will be subject to appreciable uncertainty, even if he is ready to grant that amalgamation would not reduce the efficiency of (a) investment decisions and (b) of management. Contested take-over bids are evidence of such disagreements, when the unwilling directors believe that the company's future earnings, remaining independent, will exceed the compensation offered by the take-over bidder.

The basic assumption in a free enterprise economy is that if the individual benefits by a wise and profitable business decision, he must also bear the losses. Individual liability derives from the institution of private property, which is itself the hallmark of a competitive economy. Yes, says the Socialist, but if you abolish private property, investment decisions become a public rather than private liability. Reluctance to invest in undertakings, such as roads or schools, in which the return was uncertain would be eliminated and resources invested rationally.

Before dealing with this objection, remember that the profits or losses for an entrepreneur's investment decision affect (1) his future command of productive resources, and (2) his personal income. That is, individual liability is a competitive economy's means of (1) selecting entrepreneurs, as the successful become more powerful, while the unsuccessful are weeded out, and (2) providing incentives which give a motive to make as careful and unbiased estimates of yields as possible.

HEADACHES FOR PLANNERS

A planned economy must find a substitute for individual liability. The Planner-in-Chief must in practice delegate his authority to a great extent. Selection of managers is no longer automatic, and is, inevitably, influenced by actual performance, in which the contributions of luck and judgment are difficult to assess. Managers are human: their hopes of promotion and fears of demotion reduce readiness to undertake risks. If you give them bigger salaries, corresponding to their responsibilities, then you reintroduce inequality. Private enterprise minimises the working of Parkinson's law. State enterprise maximises it, because the state has no automatic system of selection and incentive.

The mandate which is given to entrepreneurs in a competitive economy by the possession of capital allows them to allocate resources in any way that they choose. On the other hand, in a planned economy, the mandates given to managers are those of delegated authority. Managers cannot allocate resources except in accordance with the plan for the whole economy. In a competitive economy different estimates of investment yields may lead to contradictory decisions. Differences of opinion will, of course, also exist among planners, but being subject to an ultimate authority, will not usually lead to actual investment decisions. In a competitive economy, where thousands of individual entrepreneurs are taking decisions, guided by their individual liability and their desire for profit, the errors of different entrepreneurs, being uncorrelated, cancel out. In a planned

Open on the 4TH SEPTEMBER, 1961.

The Loan will be closed without notice as soon as the subscriptions amount to Rs. 10 Crores approximately, and in any case not later than the close of the business on the 9th September, 1961.

The applications will be received at the Offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras and Bangalore; at the branches of the State Bank of India and the branches and Treasury Pay offices of the State Bank of Hyderabad within the State of Andhra Pradesh, and the Government Treasuries and sub-treasuries in the State of Andhra Pradesh at places where there is no branch of the State Bank of India or branch or Treasury Pay Office of the State Bank of Hyderabad.

FULL PARTICULARS CAN BE OBTAINED

at any of the Offices or Branches mentioned above or at any Treasury or sub-Treasury in the State of Andhra Pradesh.

economy, however, estimates are not independent, but are subject to revision by higher authority, and the errors to which they are liable are likely to be correlated, and thus to be magnified.

Mr. Richardson submits that realisation of the inevitable imperfection of human knowledge should induce humility and lead us to welcome diversity both in action and in opinion. By setting out on many paths, we discover which are better. The failure of some policies, the success of others, and the gradual accumulation of knowledge and experience, enable a competitive society to improve individual decisions.

Competitive private enterprise, though not in itself ensuring diversity, favours it. Private property, by allowing individuals to devote resources to any lawful purpose, is a bulwark of non-conformity; it enables thousands to take independent initiatives and so to further freedom and variety in action, without which freedom and variety in thought and discussion lose much of their power to promote material and moral progress. Central economic direction, on the other hand, though it need not eliminate diversity, is hostile to it. Economic progress depends not merely on economic activity, but on the energy, initiative, and imagination of individuals, qualities more likely to be developed by opportunities for independent decisions.

It is interesting to note that a study sponsored by the Institute of Economics of the (Communist) Hungarian Academy says that in a Socialist society the development of individuals capable of independent creative action, of shouldering responsibilities, and of courageous thought, is hampered by the excessive use of instructions, which transform administrators into passive tools of the government. "A characteristic social type has emerged . . . the top manager who is reluctant

to make decisions independently, i.e. in the absence of instructions or the approval of central authority. It is not that he is a coward from the outset, rather he has become accustomed to doing everything in accordance with instructions."

Mr. Richardson's analysis implies that planned co-ordination of investment decisions may be necessary in some circumstances and not in others, and that centralisation may lead to losses as well as gains. Without some measures of planning and co-operation, harmony between competitive or complementary investment decisions may not be achieved, market uncertainty may not be brought within tolerable limits, and firms may therefore be deterred from risky but worth while enterprises. Without some degree of competition, on the other hand, it is difficult (1) to check monopolies, (2) for the central authority to allocate resources to those most fitted to use them, (3) for diversity to be preserved, and (4) for the springs of individual energy and initiative, on which all progress depends, to be kept unchoked.

Mr. Richardson's conclusion suggests the methods of the French Planning Commission (outlined here on May 12), which brings together voluntary committees of employers, workers, economists, and government officials, in each industry to pool ideas and information and to create a mystique of growth. These working groups have created emulation and secured a valuable degree of economic harmonisation by voluntary consultation, which neither eliminates competition nor kills individual initiative.

Mr. Richardson has written a thoughtful and authoritative study, addressed to advanced students of economics. Ordinary mortals, like you (and me) will find some of it pretty hard going.

Bank vaults are always made of steel . . .
because steel is so dependable!

symbol of security!

Through the years Steel has come to be considered the symbol of security . . . not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries . . . the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability . . . Steel that she can hold up to the world as a symbol of her security.

The European Scene

BRITAIN'S SOVEREIGNTY AND THE SIX

From Our West European Correspondent

PARIS, August 25.

THERE is considerable difference of opinion about how much of her "economic sovereignty" Britain will have to sacrifice if she joins the Common Market. On the one side, some are saying that by signing the Rome Treaty she will sign away her right to an independent national economic policy; on the other side, it is replied that membership of the Common Market will entail virtually no new obligations. Thus, I have seen an absurd and rather hysterical article by a British MP warning the readers of a big London daily that once Britain has signed, German parachute troops will be likely to land on the island to arbitrate domestic political conflicts! A soberer Sunday paper answers that the sole effect of Britain's membership will be to stimulate competition in private industry. Mr. Menzies warns that Britain will "no longer be an independent nation", while Mr. Macmillan's friends hint that, far from losing independence, Britain will be able to dominate the Continentals more effectively by joining their association. The Danish Premier favours following Britain's lead, because, he explains calmly, signature on the scrap of paper drafted in Rome entails no more obligations than signing the U.N. Charter; but the Swedish Premier refuses to follow Britain into the Roman trap because it will involve such loss of sovereignty as to make Swedish neutrality impossible.

What is the truth of the matter? Or, if that is too complex to be stated briefly, which of these contradictory statements is nearer the truth than the others? It all depends on whether Britain adheres to the spirit or to the letter of the treaty of European unity. If she has decided to joint without *arrière-pensée* the movement toward economic integration as this is conceived by the architects of the Common Market, then she must be reconciled to the prospect of gradually (very gradually) surrendering part of her sovereignty in exchange for the benefits and restrictions of a joint management of regional affairs. If, on the contrary, she has decided to subscribe to the written obligations clearly stated in the Rome Treaty, to seek exemptions from as many of them as possible, and to "interpret" the others as lawyers can "interpret" a contract, then the loss of sovereignty will be negligible. The evident lack of enthusiasm with which Britain has applied for admission rules out the first hypothesis.

A detail in her application suggests that the second is correct. The Rome Treaty spoke of "adaptations" that might be required in the event of new members joining, apparently referring to the re-distribution of voting rights that would then be necessary. Mr. Macmillan translated this as "amendments" and announced that Britain would be calling for many such amendments "as foreseen in the Treaty"; of course, he had in mind much more extensive changes than a mere re-weighting of members' votes. A consistent and successful exploitation of this tactic of "interpreting" the letter of the Treaty would indeed have the result that membership of the Common Market would make little difference to Britain—but a lot of difference to the Common Market, which would be emptied of its long-term significance. The Treaty is riddled with escape clauses, pretexts for procrastination and deliberate vagueness. This is so for two main reasons. When they wrote the Rome Treaty, the Six over-estimated the difficulties of creating a common market in industrial manufactures and naturally wanted to walk into the water gingerly; the

more nervous members insisted on precautions that today are realised to have been unnecessary, and have seldom been invoked. Secondly, on many matters the Six were agreed to increase their collaboration but did not know in advance how to do so, and thus left many clauses purposely vague; they sought merely to indicate the direction they would follow, but it was taken for granted that they really would follow that path as far and as fast as was practicable.

A new member who was determined not to go very far or very fast could therefore invoke the letter of the Treaty to justify, if not obstruction, then a restriction of integration to a bare minimum. I shall illustrate this in regard to the important subject of harmonisation of short-term economic policies, e.g. the co-ordination of interest rates and other credit policies, and the matching of budgets and expansion rates. Now, first of all one needs to notice that some such harmonisation is required of Western nations in general today, whether or not the Common Market exists. This is one of the subjects dealt with by the OECD for all West Europe and North America, and it will be discussed at the Vienna meetings of the World Bank and Fund. All the industrialised nations, and not only the Six, have made their currencies convertible at least for non-residents, they have abandoned direct economic controls in most spheres, they are abolishing quotas and reducing tariffs, and above all they are realising that they must co-operate more closely if they are to keep ahead of the Communist bloc while increasing aid to the developing nations. Thus, their economies are more inter-dependent than ever before and they will have to co-operate constantly, if necessary, by surrendering particles of their economic sovereignty. A rigid and jealous nationalism is out of date, for reasons having little to do with the Common Market.

So a nation that consented to that degree of harmonisation could not claim that it was meeting the particular obligations of the Rome Treaty. That document foresees more intimate collaboration, made necessary by the objectives of completely free movement of goods, labour and capital within the region and, eventually, a joint commercial policy toward outsiders. There is no doubt about the means that the architects of the Treaty had in mind to attain that sort of integration: a gradual but extensive transfer of national power to a central authority which would one day issue a single European currency. It would have been quixotic to try to write the constitution of such a central authority in 1957 or to set a time-table for its elaboration, but the Treaty was written with that end in view. The ideal of complete economic integration informs every chapter of the document; it is the reason for the system of consultations that the Treaty requires. If the Six have not done a lot yet in practice to build the central economic authority, they have done nothing inconsistent with that goal and they have pressed ahead with studies about how it is to be reached. For example, when the West Germans, whose budget year used to begin on April 1, came into line with the four members whose fiscal year coincides with the calendar year, this was intended as a small but essential step toward fiscal unity. The Italians, who remain the only odd man because their budget year dates from July 1, are organising the change-over now, in the same spirit.

A new member who joined in this cautious process would be committed to the prospect, distant perhaps

but real, of far-reaching economic integration. Warnings about eventual loss of sovereignty would be, not alarmist, but simple honesty. Yet a member who joined with the intention of sticking to the letter of the Treaty would find that he was committed to virtually nothing, because on this important subject the Treaty contains no binding obligations to anything but periodic consultations—i.e. to no more than what is required of any Western nation whether or not it joins the Common Market. The black-on-white juridical terms of the Treaty refer to the harmonisation of short-term economic policies only in the articles 103 to 109; let us see what they say.

Article 103 simply says, "Member-States consider short-term economic policy to be a question of common interest. They consult together, and with the Commission, about the measures to take in various circumstances. . . . The procedure foreseen in the present article applies also in cases of shortages in the supply of certain products". That last sentence was written during the oil shortage caused by the Suez crisis and is meant to imply collaboration in the distribution of scarce commodities; it does not say so because it seemed unnecessary and difficult to specify a strict procedure in every case. As it stands, article 103 will oblige Britain to nothing if she signs with her tongue in her cheek.

Articles 104 to 109 appear under the heading "Balance of Payments", which is enough to show that co-operation is not required until a discrepancy between various national policies is causing payments difficulties; there is no explicit demand for constant harmonisation. This chapter states the general objectives of payments equilibrium, full employment and stable prices and asks governments to consult each other on how they are securing these things. If one member gets into serious difficulties and if it asks the aid of its partners, then

the Commission has the right to make an enquiry and make recommendations, which have no force of obligation. If the member follows this advice, but is still in trouble, the Commission can recommend measures of mutual aid. If the other members fail to provide that aid, then the member in difficulty can begin imposing restrictions (e.g. import quotas) but the Commission can amend or prohibit such restrictions, "except in case of emergency". In sum, there is no supranational compulsion at any point: nations are asked to consult each other and if one gets out of line there are conditions imposed on its receiving mutual assistance. Juridically, every member-nation's economic autonomy is left intact. There is no more alienation of sovereignty than is entailed by joining the old EOEC.

That is literally all that the Treaty says about harmonisation of policy. All the interesting, and encouraging, essays in closer co-operation that have been going on between the Six (unification of statistics, joint economic surveys, preparation of national, global budgets, rationalisation of governmental budgeting, unofficial quarterly meetings of Finance Ministers and various other Ministers, the monetary committee and sundry six-member working groups) belong to the customary law of the Six and not to their written law. They are required by the spirit of economic integration and not by the letter of the Treaty. A new member could claim that he was not obliged to take part in any of them; or, if he decided to play the game according to the unwritten rules, he could still limit his participation to mere consultation without admitting any binding force in the consensus that appeared. Therefore, how much sovereignty Britain surrenders by joining the Six will be determined, not by the bare requirements of the Treaty, but by the sincerity of her attachment to the ideal of European economic integration.

4¼ % ORISSA GOVERNMENT LOAN, 1972.

ISSUE PRICE Rs. 99.50 %

Opens on the 4th September, 1961.

The loan will be closed as soon as a total of approximately Rs. 500 lakhs has been subscribed and in any case not later than the close of business on the 9th September, 1961.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, New Delhi, Madras and Bangalore, at the branches of the State Bank of India in Orissa and at the Treasuries and Sub-Treasuries in the State of Orissa at places where there is no branch of the State Bank of India.

Full particulars can be obtained at any of the offices of the Reserve Bank of India or branches of the State Bank of India or at any treasury or sub-treasury in the State of Orissa.

Economic Report from the U.S.

ECONOMIC ASSISTANCE FOR LATIN AMERICA

WASHINGTON, Aug. 22.

THE nations of the American Continent have forged the machinery of a regional programme that promises to help Latin America to move in the direction of economic and social progress. The programme, of course, is President Kennedy's Alliance for Progress, the charter for which was approved last week by representatives of the United States and 19 Latin American countries at the inter-American ministerial meeting at Punta Del Este, Uruguay seaside resort.

The alliance for progress emerges as a concerted programme of self-help on the part of the Latin Americans, buttressed by large-scale financial and technical assistance from the United States and other quarters. U.S. Treasury Secretary, Douglas Dillon, who headed the U.S. delegation, has indicated that upwards of \$20,000 million in outside public and private assistance would be flowing to Latin America under the programme in the next 10 years. Well over half of this huge sum would come from the United States.

In signing the charter of the Alliance for Progress, the Latin Americans were in effect pledging a major effort to improve their own economic and social conditions as a basis for the effective use of the aid to be supplied by the United States and other supporters of their development aspirations. From all indications, there is general satisfaction that the nations of Latin America will undertake the kind of self-help that is needed to make the programme succeed.

One of the principal goals of the programme is the mobilization of social and financial resources to boost Latin American living standards by at least 2.5 per cent a year, as against the present annual gain of something less than one per cent, on the average. With Latin American population rising at a rate of 2.5 per cent a year, this implies an economic growth objective in the neighbourhood of five per cent a year or more. A related goal is the more equitable distribution of the fruits of the increased output among the people. Other specific goals include agrarian reform, raising of educational standards and eradication of illiteracy, improvement of health and sanitation, provision of better housing, effective maintenance of sound monetary and fiscal policies, and stimulation of private enterprise so that this important economic sector can be a significant and constructive contributor to the over-all economic advance. The broad-ranging alliance for progress charter also expresses approval of the kind of Latin American economic co-operation and integration already begun under the Central American customs union and the Latin American Free Trade Association.

As contemplated at present, the \$2,000 million or so a year needed in outside assistance to help the Latin Americans attain these goals would be drawn from several sources. About \$1,100 million, it is estimated, might come from the U.S. Government; \$300 million from international lending agencies, such as the World Bank and the newly operative Inter-American Development Bank; \$300 million from U.S. private investors; and another \$300 million from public and private sources in Western Europe and Japan. To help get the programme started quickly, the U.S. Government may be able to allocate about \$1,000 million in the year that began last March, when President Kennedy first announced the Alliance for Progress. This would con-

sist of both grants and loans, as circumstances require. The loans would be long-term—up to 50 years—and at low or no interest rates.

To assist the programme, experts will be available to help the Latin American countries in formulating and examining National Development Plans. This, it is believed, could help channel the combined efforts of the Latin American nations and those providing outside aid into the most productive directions, and thus help secure the success of the programme.

As is so often the case in international discussion, some differences of opinion were evident among the participants at Punta Del Este. It may be that not every aspect of the Alliance for Progress charter meets with the complete approval of every signatory nation. Whatever differences may have existed, however, were hammered out in careful and free deliberation, despite the diversionary tactics of the delegation from Castro's Cuba and its attempts to upset the proceedings.

What has emerged, in the view of the experts, is a constructive agreement which sets the stage for the wide-ranging economic and social development projects that can make the Alliance for Progress a meaningful reality to the peoples of Latin America.

ALLAHABAD BANK LIMITED

Established: 1865

Affiliated to the Chartered Bank

**

Registered Office:

CALCUTTA

14, India Exchange Place,

A Branch of the Bank has been opened at
Shiamganj, Bareilly on 14th August, 1961.

4 1/4 % STATE GOVERNMENT LOANS 1972

Name of State	Amount	Issue Price Per Cent
1. ANDHRA PRADESH	Rs. 10 crores	Rs. 99.75
2. BIHAR	Rs. 3 crores	Rs. 99.50
3. GUJARAT	Rs. 6 crores	Rs. 100.00
4. KERALA	Rs. 4 crores	Rs. 99.50
5. MADHYA PRADESH	Rs. 5 crores	Rs. 99.50
6. MADRAS	Rs. 10 crores	Rs. 99.75
7. MAHARASHTRA	Rs. 10 crores	Rs. 100.00
8. MYSORE	Rs. 7 crores	Rs. 99.75
9. ORISSA	Rs. 5 crores	Rs. 99.50
10. PUNJAB	Rs. 3 crores	Rs. 99.50
11. RAJASTHAN	Rs. 4 crores	Rs. 99.50
12. UTTAR PRADESH	Rs. 6 crores	Rs. 99.75
13. WEST BENGAL	Rs. 7 crores	Rs. 99.75

All the State Governments reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

All the above loans will be repaid at par on 4th September, 1972.

THE LOANS WILL OPEN FOR SUBSCRIPTION ON 4TH SEPTEMBER, 1961, AND CLOSE ON 9TH SEPTEMBER, 1961, OR EARLIER WITHOUT NOTICE AS SOON AS SUBSCRIPTIONS APPROXIMATE TO THE AMOUNT OF EACH ISSUE.

All the loans will bear interest from 4th September, 1961.

Subscriptions may be in the form of CASH/CHEQUE in respect of all the loans.

Securities of 3% Tapi Irrigation Development Loan 1961 and 3 1/2% Cochin Loan 1956-61 will be accepted AT PAR for conversion into the new loans of the Governments of Maharashtra and Kerala respectively. Securities of Mysore Government 3% Loan 1956-61, Madras Government 2 1/2% Loan 1961 and 2 1/2% Uttar Pradesh Loan 1961 will also be accepted for conversion AT PAR into the new loans of the respective State Governments.

Interest due on the securities of the loans tendered for conversion will be paid as under:

NAME OF LOAN	RATE OF INTEREST PER CENT PER ANNUM
(1) 3% Tapi Irrigation Development Loan 1961	@ 3% upto and including 30th April, 1961 and @ 4 1/4% from 1st May, 1961, to 3rd September, 1961 inclusive.
(2) 3 1/2% Cochin Loan 1956-61	@ 3 1/2% upto and including 31st May, 1961 and @ 4 1/4% from 1st June, 1961 to 3rd September, 1961, inclusive.
(3) Mysore Government 3% Loan 1956-61	@ 3% upto and including 19th April, 1961 and @ 4 1/4% from 20th April, 1961 to 3rd September, 1961 inclusive.
(4) Madras Government 2 1/2% Loan 1961)	@ 2 1/2% upto and including 31st August, 1961,
(5) 2 1/2% Uttar Pradesh Loan 1961)	and @ 4 1/4% from 1st September, 1961 to 3rd September, 1961 inclusive.

APPLICATIONS FOR ALL THE LOANS WILL BE RECEIVED AT THE OFFICES OF THE RESERVE BANK OF INDIA AT BANGALORE, BOMBAY, CALCUTTA, MADRAS AND NEW DELHI.

APPLICATIONS will also be received at PLACES WITHIN THE RESPECTIVE STATES as follows:-

- At the office of the Reserve Bank of India at Nagpur in the case of Maharashtra Loan.
- At the branches of the State Bank of India and at treasuries and sub-treasuries in the case of Andhra Pradesh, Bihar, Gujarat, Kerala Madhya Pradesh, Madras, Maharashtra, Orissa, Punjab, Rajasthan and Uttar Pradesh Loans.
- At the branches of the State Bank of India in the case of West Bengal Loan.
- At the branches and treasury pay offices of the State Bank of Hyderabad in the case of Andhra Pradesh and Maharashtra State Loans.
- At the branches and treasury pay offices of the State Bank of Mysore (except at Bangalore, Mangalore and Gulbarga), the State Bank of India, the State Bank of Hyderabad and at Government Taluk treasuries in Mysore State in the case of Mysore State Loan.
- In the case of Gujarat Loan the State Bank of Saurashtra at Bhavnagar and its branches in the State of Gujarat will collect applications and forward them to the nearest receiving office.

Copies of Notification and Application Forms may be obtained at any Receiving Office.

Applicants tendering their applications at the offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras and New Delhi will, in the event of oversubscription to the loan applied for, be given the option of transferring their cash refunds to any of the other State Government loans which may not be fully subscribed by that time. To avail of this facility, the persons tendering their applications should complete the SPECIAL OPTION FORM copies of which are available on application from any of the abovementioned offices of the Reserve Bank of India.

UNDER-DEVELOPED COUNTRIES: A MULTILATERAL TRADING SCHEME

By ANDRES D. GOSECO*

EXPANDING the trade between underdeveloped countries has long been recognised as a way of accelerating badly needed development in these countries which in recent years has been felt even more pressing because of lagging exports to, and deteriorating terms of trade with, developed countries. Mostly exchange-starved, underdeveloped countries have been held back from importing more from each other, and have generally made use of direct barter and other soft currency transactions to gain whatever additional foreign trade could be obtained this way. Because such transactions restrict opportunities for exchange to only two or at most a limited number of countries and could consequently only include commodities produced in the countries involved, their impact on trade has so far been relatively meagre. It is for the purpose of increasing their workability by linking them together in a clearing system without at the same time upsetting current effort toward convertibility and trade liberalisation that this scheme is proposed.

THE PROPOSAL

Establishment of a clearing system and the supporting machinery wherein only countries with non-convertible currencies may become eligible to trade: it revolves around the use of "commodity credit notes" which represent a firm offer on the part of issuing traders or countries to deliver a given quantity of a commodity at some quoted price. The "commodity credit notes" are to be broken up into convenient units (i.e. rice, Grade "X": 1 ton, 10 tons, 100 tons etc.) and may be advertised and traded as available on the basis of prevailing international trade practices; they may in fact be negotiated in the same way as warehouse receipts are traded in the commodity market.

The arrangement is intended to facilitate the meeting of needs which are impeded in bilateral transactions because of the limited choice of commodities and consequently the difficulty of finding suitable exchanges. Thus, if country D advertises that it has a quantity of rubber to offer which country F wants but is unable to buy because it does not have a commodity (meat) that country D wants in exchange but instead has another commodity (cocoa), it (country F) may, in the system, find a third country E which may want cocoa and not rubber but has the meat wanted by country D. Country F may accept meat credit notes from country E in exchange for cocoa, after which country F may turn to country D and offer its acquisition of meat credit notes in exchange for rubber; country D may then turn the meat credit notes over to country E for a shipment of meat. Such a transaction would not have been possible in a bilateral deal, and while it represents no more than a simple triangular transaction, the use of "commodity credit notes" and the participation of many countries in the system would multiply the number of possible exchanges by many more times than is possible in the model presented. This is so because each of the participating countries may have more than one commodity to offer and may want a little of many commodities, which may come from several countries in exchange. Again, country C may take both cotton and rice credit notes from country B in exchange for rice. Being a cotton producer, country B may raise the cotton credit notes from within the country; but the rice credit notes it may use partly to cover its rice imports from country C

which could come from country E where they (rice credit notes) may have been accepted in exchange for meat exports to country C. In its turn, country C may use its acquisition of cotton credit notes to obtain finished products from country A which may then turn the (cotton credit notes) over to country B to cover its (country A) imports of cotton. This illustrates how easily a multi-country transaction can be linked through the use of the "commodity credit notes". Under the arrangement such "notes" may be allowed to circulate for as long as no suitable exchanges are found. Actual delivery of a commodity may only be effected when a country in possession of the corresponding "credit notes" calls for it. The all-important features is that all transactions can be made under one roof and need not be the subject of comprehensive and usually time-consuming negotiations.

A transaction may run as follows: A trader in Burma might offer to exchange a certain quantity of rice at some quoted price in kyats (which may vary from day to day) with the indication that he would like to have certain approximate amounts of meat and cocoa similarly offered in the scheme along with a shipment of jute products, in return. An interested Indian trader might in turn ask for an option to deal on the offering terms—it does not have to be for the entire lot—and could in the scheme look for the commodities wanted in Burma. He might obtain a quantity of meat credit notes offered from Argentina in exchange for jute credit notes and some cocoa credit notes from Indonesia for a shipment of Indian bicycles, (also

* The author is an economist of the Food and Agriculture Organization of the United Nations. His views as expressed in the article do not, however, necessarily reflect those of the Organization.

obtained within the scheme) bearing in mind, for each intermediate transaction, the exchange value of his acquisitions in terms of the Burmese rice: he would not, of course, involve himself in any transaction which will in the end, as he sells his acquisition of Burmese rice, net him less than the rupee equivalent of his original investment in jute products and bicycles (allowing for transportation and other expenses). The Indian trader may then turn around and offer his acquisition of the required meat and cocoa credit notes along with the appropriate quantity of credit notes for jute products to finish off the deal with the rice trader in Burma. Commodity offerings may include indications as to what and how much of other commodities are desired in exchange to facilitate the matching of needs and offerings by traders. Thus, the Indian trader might, as soon as he knows of the Burmese offering and needs and after obtaining the option to deal with the Burmese trader, indicate his readiness to accept meat credit notes for jute products etc. to raise the required meat and cocoa asked for (which is also an offering of jute products and bicycles).

The exact terms of exchange may in all cases be negotiated individually between the parties concerned in much the same way as they are dealt with in ordinary trade. In practice, the arrangement would work as though a line of commodities of specified quantities were declared eligible for soft currency exchanges and traded on the basis of the direct conversion rates of the currencies used—a sort of convertibility among eligible soft currencies operated outside the pale of the hard currency market.

All the traders concerned could buy their stocks in local currencies and at prices comparable with those paid by exporters to hard currency markets since they could sell their own acquisitions at prices comparable with those applied for goods acquired with hard currencies. The similarity, however, ends here because transactions within the scheme can be made *without* the use of hard currencies even though they are exchanges of *mutually wanted* commodities. Thus, in the model presented, the Indian trader might have wanted to sell only in convertible currency for his jute export to Argentina had he not known of the feasibility of converting his jute products into Argentine meat and then exchanging the latter with Burmese rice which he wanted in the first place. Enabling him to get what he wants (and so with the Burmese and Argentine traders) with equal facility and on comparable terms even without using hard currencies, makes him just as happy with the arrangement.

In other words, what an underdeveloped country can sell for hard currency, it can also sell in the scheme with the use of soft currencies, but not vice versa. The criticism expressed that the scheme would not work on account of the highly variable, and large differences in the "free market" exchange rates of soft currencies is in fact of little relevance since pricing and payments within the scheme will be made in terms of the local currency equivalents of the prices paid for exports in hard currency *without* actually using the latter currencies.

The jute-for-meat transaction—which is an exchange between primary producing countries of their natural exports, would be the more common type of transaction likely to be involved in the scheme. A somewhat different type of transaction would be the exchange of finished products, which is represented in the model in the form of bicycle exports from India to Indonesia. It has been argued that finished products manufactured in underdeveloped countries, which we shall assume as more expensively produced, cannot compete in the markets of equally underdeveloped countries with low-cost imports from industrialized

countries. This argument would hold true only if the purchase price, vis-a-vis the import cost, were the principal determinant of the selling price. Such, however, is not the case in underdeveloped countries with foreign exchange restrictions because in these countries prices of imported products are determined more by the condition of their supply—which is almost always short—relative to demand. It may thus be that because bicycles are scarce in Indonesia, high prices prevail regardless of how cheaply they could be imported from industrially more advanced countries. Up to a point, therefore, presumably high-cost Indian bicycles obtainable by bartering exportable Indonesian cocoa (assumed as unsaleable for hard currency)—which is in effect lowering of its export price—may still be sold competitively.

To expand the area of possible transactions, importing countries may be allowed to pay in their currencies (naturally soft) in the event that no commodity or commodities acceptable to the exporting country are immediately available in the scheme. Alternatively, the exporting country may accept credit in exchange for the commodity taken by the importing country. Soft currency or credit so acquired may be circulated and discounted within the system and may be used by whichever country holds it last in paying for imports from the country of origin. As already noted, the same operation may apply to the "commodity credit notes" (or their equivalent in soft currencies), which may be bought, sold and discounted like ordinary commercial bills. They would, in fact, acquire some of the characteristics of money, namely, divisibility and a considerable degree of liquidity and negotiability. Partial convertibility is thus achieved. The use of credit as a means of payment should, however, be limited as it would allow countries with no real export potential to import: this could lead to an undue accumulation of inconvertible foreign exchange. On the other hand, the use of "commodity credit notes" as against straight soft currency deals has the important advantage of restricting transactions to commodities already available but unsaleable because of the impossibility of direct and quick exchanges between potential exporters and importers burdened by payments problems. This feature would have the effect of limiting the convertibility envisaged in the scheme to truly exportable surpluses. Needs will, in any case, have plenty of time to meet, and the more commodities and countries are involved, the more chances there will be for needs to coincide.

SOME IMPLICATIONS

The scheme will above all require a supporting machinery which may incorporate a clearing house. The system may operate on more or less business lines and may collect fees on transactions to cover its operational and maintenance expenses. It may work through the regular commercial and banking network at the national level. The scheme, if established, might initially aim at linking existing bilateral and limited multilateral trading arrangements, possibly as no more than a pilot project. It may as such work its way through the difficult world of trade and the veritable jungle of monetary policies wherein it must somehow adapt itself, and overcome such obstacles and prejudices as may lay in the way. Consistent, however, with the requirements of trade stability as well as with the end-all aim of achieving universal convertibility, the objective should be to broaden its operations and increase its competence since it could only function effectively if participating countries and eligible commodities are many and varied. This may mean breaking off with some much cherished notions on how best to foster trade and bring about convertibility and it may call for rare boldness on the part of those who decide.

THE BUSINESS WORLD

What People Want from the L.I.C. Today?

By

CROESUS

ALTHOUGH one may not agree with all the changes in the prevailing life insurance practice in India proposed by Dr. V. K. R. V. Rao, Director of the Institute of Economic Growth, at the fourth foundation anniversary of the Delhi Insurance Institute, some of them at least deserve more careful notice than they seem to have received. Among others, Dr. Rao made the following notable suggestions:

- i. The present rate of life insurance premiums should be reduced.
- ii. The amount of a life insurance policy on its maturity should be related to the value of money at that time.
- iii. The payment of an insurance policy need not be in terms of money alone; it could be in physical targets, such as, say, a house.
- iv. The pattern of investment by life insurance companies (Dr. Rao must have meant only the L.I.C.) should be changed to allow for greater investment than now in stocks and shares.

Some of these may be novel, indeed, but they are by no means fantastic. Of course, there is the question of feasibility, but even before one has carefully gone into that aspect, taking all the relevant factors into consideration, it would be unfair to scoff at the suggestions.

Now, I do not think any one would oppose a reduction in the present life insurance premium rates. True, since the L.I.C. took over, these have ere now been brought down somewhat, but not as much as one feels they ought to be. Apart from the reasons adduced by Dr. Rao, the insuring public insists on a reduction, because the Life Insurance Corporation claims to have underwritten in 1960 peak business and earned huge profits, and also because the Union Finance Ministry spokesmen have been saying that the Government is considering the question of a reduction in these rates. The case for a reduction in premium rates would acquire even greater support if, as is believed, the L.I.C. were to declare lower rates of bonuses than the insuring public has all along been led to believe. Add to these what Dr. Rao pointed out about the increase in the average life of an Indian as a result of improved health service. No more convincing proof to establish this fact is needed than the decrease in the rate of mortality disclosed by the last Census and the consequent increase in the annual rate of increase in the population of this country which has sufficiently embarrassed our planners. It is only proper that those in charge of life insurance business ought to take note of these changes in the pattern of India's vital statistics and adapt their tables of premium and schemes of insurance accordingly.

In this connection, I feel I ought to draw attention to an anomalous feature of the present life insurance practice of considering the 55th year, the official age of superannuation, as also the age after which the normal duration of a policy and the normal premium

rates could not hold good. How out of tune such is with the prevailing conditions is obvious from the fact that the number of people past the age of 55 in active service, be it government, business or politics, is today larger than at any time in the past. There is an explanation for this in the addition to the ranks of our educated unemployed. If, after completing their studies, their sons do not get employed, the burden of earning the bread for the family must perforce continue to be borne by the parent even if he has become superannuated. If any parent is good enough for this arduous task, I fail to see why he should be regarded as "abnormal" or "sub-normal" for purposes of life insurance, unless we are not prepared to abandon some old notions. Granting, for argument's sake, that there are sufficient valid reasons for this artificial demarcation of "normal" and "sub-normal" lives, if the authorities are keen on stepping up domestic savings — and Dr. Rao says that "unless domestic savings are raised, it will not be possible to achieve many of the targets set under the Third Plan" — they should encourage superannuated people to have the lives of their unemployed sons insured by extending to them the same concession as the insured now enjoy of a rebate of income-tax on these premiums, although the premiums may not be paid by the insured themselves. This, however, is only by the way.

Dr. Rao need not take any credit for originality — nor has he done so, to be fair to him — for suggesting that "the amount of an insurance policy on its maturity should be related to the value of money at that time." For such a practice, or rather a different version of it, is believed to be in vogue in some countries like Canada. I recall a controversy, years ago, over the accidental issue of a policy containing what is called a "gold clause" by a Canadian life insurance company to an insurer in India and the refusal of the said company to meet the claim of the insured on the maturity of the policy in question, on the score that the policy form used was not intended for use in India but in Canada only! Be that as it may, what concerns us here is the principle underlying the so-called "gold clause" life insurance policy, namely the underwriter's undertaking to meet the claim of the insured in terms of the world price of gold at the time of maturity. What Dr. Rao has suggested is only a variation of this formula; instead of basing the payment of the claim at the time of maturity on world gold prices, he has suggested the linking of it to the value of money, that is, presumably, the cost of living index. Dr. Rao has stated that it is essential to provide necessary safeguards against depreciation of money's value in order "to popularise" life insurance. I would go further and say in order "not to defraud" the unfortunate insured of their life's savings, which, in quite a few cases, is probably all his savings. For it is nothing short of that when the insurer receives from the insured say, Rs. 1,000 when the rupee is worth 100 nP. by way of premiums over a period and, on maturity, repays to the insured only 20 nP. This is precisely what has been happening

to many middle-aged policy-holders; for no fault of theirs, when their need has increased, they stand to receive, in terms of purchasing power, very much less than what they bargained for when they took out a life policy. According to Dr. Rao, this trend — i.e. of the purchasing power becoming less and less — will continue because of the country's expanding economy — or is it the expanding expenditure under our Five-Year Plans? — wherefore, it is imperative that "the insured persons must be compensated for the loss of money's value." Otherwise, as he warned, there would be a shift towards investment in shares or immovable property. I do not know why he did not (reportedly) mention gold. Talking of gold, I am reminded of a conversation between two economists (both in Government service) as they were comparing notes about their investments. Both of them had evidently taken out reasonably large insurance policies which had just matured. Force of habit prompted them to compare the gains or losses to each of them due to the change in the value of money over the period, and it was no surprise at all that, instead of any capital appreciation, the investments of both (in the form of life insurance policies) had depreciated in money value or purchasing power. The two professors then began to ask themselves whether, with all their background of economics, they were better investors or the unsophisticated village folk who stuck to their centuries-old habit of investing in gold. The answer was clear. It is to be seriously considered whether, at a time when the country requires as much of its savings as possible to be mobilised, such thoughts should be allowed to take roots by the pursuit of unimaginative or out-moded practices. As Dr. Rao said, "there is a general awakening among the people. In the years to come, they will expect more and more out of their investment in the Life Insurance Corporation. The idea of buying a policy to cover risk has become outmoded. The LIC should be prepared to meet this challenge".

It is the third proposal of Dr. Rao that has evoked most controversy. This concerns payment of the policy amount on maturity in terms other than money, such as, say, a house. This proposal has been condemned as "theoretically untenable" and "clearly impracticable". True, the proposal entails considerable sorting out of such ticklish issues as the policy-holder's choice of the site and the type of house desired, the time when this choice is to be made — whether taking out the policy or after maturity — and, perhaps, also by whom (this will arise if the policy-holder dies when the policy has some more years to mature, in the event of their being no nomination, or more than one nominee) and the most important question, already discussed, as to who should bear the difference in the agreed cost of the

house at the time of taking out the policy and that at the time of actual construction, due to the variations in the value of money. All these, however, should not make us shy away from even considering the proposal on its merits. But, if one views the proposal from the angle of whether it would make a sizable contribution to the solution of the housing problem, one cannot feel very enthusiastic about it. For the LIC has as yet no specialised experience in this field; even its record of maintenance of the buildings it has inherited from a number of life insurance companies still leaves much to be desired. There is, however, one direction in which the LIC can really be more purposefully effective, and that is, if it is prepared to relax its terms for granting loans against life insurance policies for building houses. In the alternative, the LIC should invest a larger portion of its resources in the form of loans to State Co-operative Housing Finance Societies and similar apex house-financing bodies. If need be, the LIC may stipulate that, if loans are made by these housing financing bodies to any of its policy-holders, a token rebate of interest should be given. This way, I visualise, the LIC would prove more useful to its policy-holders.

Coming as it has from Dr. Rao, the fourth proposal really came as somewhat of a surprise to me. This proposal questions — and rightly so — the wisdom of investing almost everything in government securities. If we ignore that this is a precious prop to the government securities market, which undoubtedly influenced the decision to nationalise life insurance, apart from putting all the eggs in one basket, this affects the LIC's income adversely. Investment in sound equities offers a comparatively higher yield any day. There may also be other and relatively more paying lines of investment, if only the LIC has the enterprise and is prepared to explore. But, for obvious reasons, it is too much to expect any radical departure from the present policy of investment of its funds by the LIC. From the point of view of the policy-holder, this Hobson's choice is rather unfortunate, inasmuch as he has to be a helpless witness to an investment policy which inhibits prospects of a probably higher bonus. In any case, many policy-holders seem to have abandoned all hopes of a higher bonus and would be content if at least the existing rates of bonuses are maintained. The days of differential rates of bonuses also seem to be numbered. At this rate, I guess that old school which has been advocating one uniform type of policies, all without profits, may soon have its way. It will now argue vehemently: if we can't have handsome bonuses, even after paying higher premiums, why go in for such policies; let us all be content to have "without profit" policies and have them at appreciably lower rates of premium than today.

Business Notes

Banking

TEMPO OF RISE IN DEPOSITS SLACKENS

"THE STATISTICAL Tables Relating to Banks in India, 1960," just released by the Reserve Bank, serves to corroborate, as is only to be expected, the latest trends in banking which were referred to by Mr H. V. R. Iengar, in his address to the Indian Institute of Bankers, recently. Only they give a more complete break-down of the figures of deposits, advances, etc., of all the banks in the country.

The publication shows, for example, that the increase recorded in the deposits of scheduled banks in 1960 was much smaller than the increase recorded in 1959. The deposits and loans of non-scheduled banks,

on the other hand, witnessed a decline, in contrast to a rise recorded in 1959. Thus, the total deposits of scheduled banks (excluding P.L. 480 funds) rose by only Rs. 92 crores to Rs. 1,566 crores in 1960, while the increase of deposits in 1959 was as much as Rs 156 crores. The downward trend experienced in the rate of increase in deposits, according to the Reserve Bank Governor, was due mainly to two factors, namely, the reduced scale of deficit financing in contrast to the extent of such in previous years and the larger pressure on our external reserves, which has been evident since some time past.

On the other hand, the total earnings of banks in 1960 were larger as compared with their earnings in 1959. This was mainly due to the marked increase in the level of advances, and partly also to the rise in the

lending rates of the banks. As a matter of fact, the scheduled banks had the advantage of a higher interest rate on all their advances, whereas they were required to pay a higher rate of interest to the Reserve Bank only on a portion of their borrowings from the Central Banking Institution, as Mr. Iengar pointed out. Anyway, as a result of the increase in advances, the ratio of advances to deposits (excluding P.L. 480 funds) went up to as high as 79. Drawing pointed attention to this, the Governor of the Reserve Bank observed that, normally, even in countries like the U.K. and the U.S.A., the ratio tended to be near 50 : 50.

The publication further indicates that, the earnings in respect of loans and advances of the Indian scheduled banks registered an increase of Rs. 6 crores (to Rs. 45.9 crores), as compared to a rise of only Rs. 3 crores (to Rs. 39.9 crores) in 1959. The earnings from investments, however, remained more or less static. As a result, the total operating earnings also rose by only Rs. 9.2 crores (to Rs. 92.4 crores), as compared to a rise of Rs. 11.4 crores in 1959.

In the case of current operating expenses, the increase of Rs. 5.0 crores in the year under review compared with a rise of Rs. 8.1 crores in 1959. The current operating earnings of foreign scheduled banks alone showed an increase of Rs. 2.5 crores (to Rs. 18 crores).

The number of scheduled banks offices in the country in 1960 increased by 233, as compared to a rise of 297 in 1959 and 356 in 1958. In the case of non-scheduled banks, however, the number of offices continued to decline. At seventy-eight, the net increase in the offices of the State Bank of India also was lower; the net increase in the offices of this bank being of the order of 111 in 1959 and 90 in 1958.

New Issues

CAMPHOR AND ALLIED PRODUCTS LTD.

THREE COMPANIES have announced plans to raise public subscriptions for their share capital.

Camphor and Allied Products Limited proposes to offer for public subscription, at par, 23,560 equity shares of Rs. 100 each and 5,000 cumulative redeemable preference shares also of Rs. 100 each. The preference shares carry a fixed dividend of 9.23 per cent per annum, free of company's income-tax, but subject to deduction of tax at source at the prescribed rates. The lists open on September 4 and will close on September 12 or earlier at the discretion of the directors, but not before September 7.

The authorised capital of the company is Rs. 100 lakhs, divided into 50,000 equity shares of Rs. 100 each, 10,000 cumulative preference shares of Rs. 100 each and 40,000 unclassified shares also of Rs. 100 each. The total issued capital, including the offer that the company has made to the public, is Rs. 60 lakhs—Rs. 50 lakhs in equity shares and Rs. 10 lakhs in preference shares. The promoters, directors, their associates, friends, and nominees will be holding capital worth Rs. 19.52 lakhs, all in equity shares. The Life Insurance Corporation has a firm allotment to its credit against underwriting arrangements to the tune of Rs. 10 lakhs, equally divided into equity shares and preference shares. The foreign engineers and constructors of the company, Messrs. American Hydrotherm Corporation, New York, will be given 1,920 equity shares, provided the Government of India approves of it.

Camphor and Allied Products Limited will be the first company to manufacture synthetic camphor in India. All the present requirements of the commodity, which is finding increasing use in the production of drugs and pharmaceuticals, are being met through imports.

The factory of the company, which is expected to go into production by the end of the 1962, will be located at Clutterbuckganj, near Bareilly in Uttar Pradesh. It will have a capacity of 900 tons of camphor output per annum. Technical collaboration has been arranged with Messrs. E. I. Du Pont De Nemours and Company, Wilmington, Delaware, U.S.A., who are one of the leading manufacturers of chemicals in the world. The U.S. company will be deputing one of its experienced engineers to supervise the commissioning of the plant. The company has also secured for two years the services of Dr. Gastau Etzel, one of the leading experts in the production of camphor in the world, who is retiring from Du Pont this year.

The total cost of setting up and operating the plant is estimated at Rs. 1.30 crores. Of this, Rs. 60 lakhs will be available from the share capital of the company. The rest of the funds are envisaged to be secured through loans from the Industrial Credit and Investment Corporation of India, the Industrial Finance Corporation of India and from the company's bankers. The ICICI has sanctioned, in principle, a loan of Rs. 24 lakhs in foreign currencies and another of Rs. 6 lakhs in Indian currency. The Industrial Finance Corporation has also sanctioned, in principle, a loan of Rs 18 lakhs.

KIRLOSKAR OIL ENGINES

KIRLOSKAR OIL Engines Limited is offering for public subscription, at par, 1,50,000 redeemable cumulative participating preference shares of Rs. 100 each. A sum of Rs. 5 per share is to be deposited along with the application and the remaining Rs. 5 on allotment. The shares will be carrying a dividend at a graduated scale from 8 to 10 per cent per annum. They will rank pari passu with the existing similar shares and will be participating in the dividend which may be declared in respect of the year ending March 31, 1962, in the proportion of the amount paid-up thereon and the respective periods between actual date of payment of the money on allotment and March 31, 1962. They are redeemable any time after March 31, 1975, and not later than March 31, 1980. The list opens at 10-30 A.M. on September 1 and closes at 3-30 P.M. on September 4, or later at the discretion of the directors.

The proceeds from the issue will be utilised for financing the expansion programme of the company, which consists of extension of not only the existing lines of its manufacture, but also production of 3 BHP engines with technical assistance from Ricardo and Company Engineers Ltd., of England, manufacture of a range of engines from 80 to 440 BHP under a licence agreement with Maschinenfabrik Augsburg-Nurnberg AG, West Germany, and production of AGROM air-cooled engines in the ranges 20 to 50 BHP in technical collaboration with Societe Agriculture Grosshans Olliers Marep of Paris. Part of the proceeds are also envisaged to meet the increase in the cost of machinery already ordered, due to higher customs duties and exchange rates. The expansion programme is expected to be completed by the end of 1965.

The authorised capital of the company is Rs. 100 lakhs, divided into 6 lakh equity shares of Rs. 10 each and 4 lakh redeemable cumulative participating preference shares also of Rs. 10 each. The capital already issued and mostly subscribed consists of 375,000 equity shares and 2,50,000 preference shares.

BARODA ELECTRIC METERS LIMITED

THE THIRD company which will be entering the market next week for raising capital is Baroda Electric Meters Limited. Its authorised capital is also Rs. 100 lakhs divided into 75,000 equity shares of Rs. 100 each and 25,000 unclassified shares of Rs. 100 each. It is raising, in the first instance, Rs. 40 lakhs, all through issue of equity shares. The directors and their friends

are subscribing Rs. 12.50 lakhs. Capital to the tune of Rs. 5 lakhs will be taken up by the Life Insurance Corporation. The rest of Rs. 22.50 lakhs issued capital is being offered for public subscription. The list opens on September 6 and will close on September 19, or earlier at the discretion of the Board of Directors but not before September 9.

The company will be undertaking manufacture of electric meters (A.C.), both single-phase and polyphase, to the tune of 60,000 pieces and 24,000 pieces per annum respectively. The present demand in the country for single-phase meters is estimated at 10 lakhs pieces per year and for polyphase meters at about 2.5 lakh pieces. Total production of single-phase meters during the year ended June 30, 1961, was of the order of 4.8 lakh pieces. Till recently no polyphase meters were manufactured in the country. Demand for both single-phase and polyphase meters is envisaged to go up to 2.1 million pieces per annum by the end of the Third Plan. The company's products, thus, can be expected to have a ready market.

For setting up the factory, the company has entered into technical collaboration with Messrs. Deutsche Sahler-Gesellschaft, Hamburg, for ten years during which period it will be able to draw upon the experience and research of the foreign collaborators. The German firm will be rendering help in all technical matters, from preparing of the blueprint of the plant to supplying of equipment and training of Indian technicians in Germany. About two-thirds of the equipment (worth about Rs. 6.57 lakhs) required will be imported from West Germany. The remaining one-third equipment (worth nearly Rs. 3.98 lakhs) will be imported from East European countries. Government of India has sanctioned the necessary foreign exchange for these imports. The Industrial Credit and Investment Corporation of India has agreed, in principle, to grant a loan in foreign currencies equivalent to US \$105,000 (approximately Rs. 5 lakhs). The factory is expected to go into production by the end of 1962.

Oil

AGREEMENT WITH ENI

THE UNION MINISTRY OF OIL has signed an agreement with Ente Nazionale Idrocarburi, the State-owned oil corporation of Italy, under which the Italian company will be providing a credit upto 60 billion lire (equivalent to nearly Rs. 46 crores) to cover the foreign exchange cost of several petroleum projects to be set up in the public sector. The projects fall into two categories. The first category includes such projects as laying of products pipelines from Barauni to Delhi and from Barauni to Calcutta, setting up of a gas fractionation plant, establishment of a liquid petroleum gas bottling plant and distribution facilities, putting up of a lubricating oil plant, arranging of distribution of petroleum products, and contract drilling in areas specified by the Oil and Natural Gas Commission. General provision has already been made for these projects in the Third Five-Year Plan. In the second category come projects like petro-chemicals and some others which are yet to be finalised by the Government.

Agreements for individual projects will be signed separately. The credit, it is understood, is to be repaid within 10 years of the acceptance of the project reports for these projects and the start of the supply of equipment from Italy. It will carry interest at the rate of 6 per cent per annum. As the detailed project reports are yet to be prepared, it is difficult to say what repayment liability of this credit will fall due within the Third Plan period.

The Oil Ministry has also under consideration an offer of \$20 million further credit from ENI for oil

prospecting in Kutch area. ENI proposes to supply its specialised services and equipment for this exploration programme and will be assisting the Oil and Natural Gas Commission without participating in the risks of the venture.

The ENI credit and the arrangement concluded recently with the French Petroleum Institute for oil prospecting in Jaiselmer area will enable the public sector to emerge as the biggest investor in the Indian oil industry.

NAHORKATIYA - MORAN OIL AND GAS RESERVES

THE PROVED and indicated oil reserves of Nahorkatiya and Moran oilfields are now placed at 304.4 million barrels or 47 million long tons, as against 284.2 million barrels or 44 million long tons estimated in 1960. The latest estimate of proved crude reserve is 207.4 million barrels and of indicated reserves 97 million barrels. Since crude to the tune of 8.1 million barrels has already been produced, the Nahorkatiya and Moran oilfields will be yielding a total of 312.5 million barrels.

The latest estimate puts gas reserves of these oilfields at 741,428 million cubic feet, as against 719,034 million cubic feet estimated at the end of 1960.

One hundred and nine wells have been completed upto now in these two oilfields—94 in the Nahorkatiya region and 15 in Moran area. Three more wells are being drilled at present—one in Nahorkatiya and two in Moran. Of the 109 wells completed, 74 wells—66 in Nahorkatiya and 8 in Moran—have yielded oil. Eight wells—7 in Nahorkatiya and one in Moran—have produced gas. Fourteen wells—8 in Nahorkatiya and 6 in Moran—have been abandoned because they neither yielded oil nor produced gas. Thirteen wells have yet to be tested. Eighty seven of the wells drilled so far have thus proved to be successful. The ratio of successful wells to the total number of wells drilled in Nahorkatiya oilfield is as high as 91.5 per cent. It is about 60 per cent in the case of Moran oilfield.

Textiles

ALLOCATION OF ADDITIONAL SPINDLAGE

IN ORDER to achieve the target of 800 million yards additional cotton cloth output by 1965-66, the Government of India has decided to license immediately three million more spindles. Of these, slightly more than two million spindles have been allocated to States for setting up new units. The remaining spindles will be licensed to the existing units for balancing their spinning and weaving capacities.

State-wise, the distribution of new spindlage is as follows:

State	Spindles Sanctioned
Maharashtra	75,000
Gujarat	75,000
Madras	75,000
Andhra Pradesh	2,25,000
Bihar	2,25,000
Uttar Pradesh	2,25,000
Orissa	1,50,000
Assam	1,50,000
Kerala	1,50,000
Madhya Pradesh	1,50,000
Punjab	1,50,000
Rajasthan	1,50,000
Mysore	1,00,000
West Bengal	1,00,000
Manipur and Tripura	50,000
TOTAL	20,50,000

The spindlage allocated to Maharashtra, Gujarat and Madras covers the need for setting up five purely export-oriented model textile mills. The new units that will be established with these spindles will be having a minimum of 12,000 spindles and a maximum of 25,000 spindles. The possibility of Maharashtra, Gujarat and Madras getting extra spindlage is not ruled out, since the targets fixed for some other States may not be fulfilled. In making the above allocations the Union Government has taken into consideration such factors as the population of a State, current production of yarn and cloth in a State, the existing distribution of spindlage in the country, concentration of handlooms and the overall needs of the decentralised sector.

Iron & Steel

THE PROBLEM OF EXPORTS

IN HIS presidential address at the annual general meeting of Steel Importers' Association of India, Mr. P. L. Master highlighted the fact that proper attention had to be paid to the subject of steel exports too. He argued that the Government should evolve a definite and long-term policy in this respect though at present the actual exports were not very substantial. As against exports of 50,000 tons during the preceding year, exports during 1960-61 were recorded at around 1,15,000 metric tons. The items exported were mostly basic pig iron and semi-finished steel. The exports, he pointed out, were made possible only because there was a marginal surplus available with the public sector plants consequent on the delays in the starting up of their finishing mills. But these exports had to be taken more seriously because, when our steel plants reach their production targets, we may be forced to develop export markets for our surpluses. It would be proper if the exporters are encouraged even now to set up organizations and seek contacts. He suggested that each producer should be allowed to set aside a percentage of his output, say 10 per cent, for purposes of export regardless of the indigenous demand. Within reasonable limits, this policy might prove quite practicable.

In dealing with the question of Barter Contracts, he pointed out that the contractors had been allowed to effect imports in advance against evidence of an Export Contract supported by a 15 per cent Bond which would be released only on completion of the exports. The exporters found themselves in an impossible situation when the Iron and Steel Control authorities issued export licences against such contracts for the export of billets and the public sector steel plants suddenly suspended the supply of billets against such orders under the instructions of the Iron and Steel Controller on the plea that the needs of the re-rollers in the country had to be met first. This affected the exporters adversely because this threatened them with the loss of their deposits of 15 per cent. It seems reasonable to argue that exporters should be allowed to complete their commitments, estimated at about 25,000 tons, which represent barely one per cent of the annual billet requirements of the re-rollers estimated at 2 million tons.

Engineering

EXPORT PROMOTION

EXPORT OF engineering goods during the first five months of 1961 have earned Rs. 390 lakhs, as compared to Rs. 311 lakhs during the corresponding period in 1960, thus showing an increase of about Rs. 80 lakhs. Mr. A. K. Bhattacharya, Chairman, Engineering Export Promotion Council, indicated recently that this performance was not very encouraging when seen in the context of the fact that exports fell short of the target by 20

per cent. Outlining the difficulties which inhibited exports of engineering goods, Mr. Bhattacharya recounted that while supplies of pig iron had improved, shortage of steel still continued to be experienced by the engineering industry. To this had been added the shortage of coal and coke over the past few months with the result that available supplies of pig iron could not be fully utilised. Moreover, the cost of raw materials has been increasing from year to year, although the value of gross output has not gone up to the same extent. This is, indeed, a disconcerting feature for the industry and does not enable it to compete in foreign markets. Mr. Bhattacharya illustrated his point with the following figures:

INDICES OF MATERIALS CONSUMED AND GROSS VALUE OF OUTPUT

Year	Materials Consumed	Gross Output
1953	100	100
1954	132.4	130.1
1955	167.6	160.3
1956	226.0	206.2
1957	271.4	249.3
1958	285.6	261.7
1959	325.6	299.9
1960	393.3	361.0

Mr. Bhattacharya added that exports of some items of railway track like fishplates and bearing plates had been controlled. Large orders for these were coming in, but they could not be accepted, because the Government did not allow their exports.

There is obviously need to have a dynamic approach to the problems of the engineering goods industry; it can play a very important role in diversifying our exports. Stocks of raw materials should be built up at important centres and made available to the exporting industries immediately on demand. Similarly, prices of pig iron and steel should be brought down as suggested by the Steel Prices Committee.

S.T.C. Report

RISE IN EXPORTS

THE PERFORMANCE of the State Trading Corporation during the eight month period from December 1960 to July 1961 indicates a significant improvement over the corresponding period in the preceding year. The total volume of exports during this period was nearly Rs. 26 crores. The non-mineral commodities exported in the order of importance were shoes valued at Rs. 82.67 lakhs, cement valued at Rs. 70.80 lakhs, coffee (entirely to Italy) valued at Rs. 43.20 lakhs and tobacco (entirely to the U.S.S.R.) valued at Rs. 27.68 lakhs. The total export value of all the minerals such as iron ore, manganese ore, manganese dioxide, ferro-manganese, chrome ore, kyanite, bauxite, mica and salt came to Rs. 22 crores. This analysis shows that the minerals do occupy a very important place in the exports of the State Trading Corporation but the volume of other commodities such as cement, coffee, tobacco and shoes etc. is by no means small. As in the past, there is likely to be a certain amount of loss on manganese ore which will be made up by gains from other commodities such as cement, jute bags, shoes etc.

The statistical details in regard to the structure of exports are given in Table I below. Table II gives S.T.C.'s long-term contracts for exports of iron ore to Japan extending as far as 1980-81 and, in the case of Yugoslavia and Rumania extending upto 1965-66. There is no doubt that the Corporation will be able to show sizeable profits for this year again, though it is hard;

possible at this time to conjecture whether the dividend would be raised beyond the 9 per cent declared last year.

TABLE I.
STATEMENT SHOWING THE COMMODITIES EXPORTED BY THE STATE TRADING CORPORATION FROM DECEMBER 1960 TO JULY 1961 AND EARNINGS ACCRUED FROM SUCH EXPORTS

(In rupees)	
Commodity	Earning accrued
Iron Ore	10,83,00,000
Manganese Ore	6,02,96,000
Manganese Dioxide	3,49,000
Chrome Ore	23,59,000
Ferro-Manganese	5,29,12,000
Kayanite	1,46,000
Bauxite	9,63,000
Mica	27,88,000
Salt	18,59,460
Cement	70,80,000
Stone Boulders	1,09,000
Pulses	11,03,810
Jute Bags	13,21,084
Coffee	43,20,000
Tobacco	27,68,533
Opium	21,00,000
Shellac	3,66,952
Sugar Bags	1,25,500
Shoes	82,67,021
Woollen Textiles	15,75,590
TOTAL	25,91,09,950

TABLE II.
STATE TRADING CORPORATION'S LONG-TERM CONTRACTS FOR EXPORTS OF IRON ORE

Country	Grade	Quantity (Tons)	Period of Supply
Japan	65/62	72,00,000	1957-58 to 1961-62
	62/60	4,50,000	1959-60 to 1961-62
	63/60	2,00,00,000	1964-65 to 1973-74
Czechoslovakia	65/63-		
	62/60	6,00,00,000	1966-67 to 1980-81
	65/63	7,50,000	1960 to 1961
	62/60	2,00,000	1960 to 1961
Poland	60/58	2,20,000	1960 to 1961
	65/63	6,00,000	1961 to 1963
German Democratic Republic	65/63	3,00,000	1961 to 1963
Rumania	65/65	17,00,000	1962 to 1966
	62/60	9,50,000	1962 to 1966
Yugoslavia	65/65	5,70,000	1961 to 1965
	62/60	6,15,000	1961 to 1965
	65/63	1,40,000	1961 to 1965
(Magnetite)			

Jute

COST OF RENOVATION

SIR JOHN BROWN, Chairman, Howrah Mills Co. Ltd., commenting on the state of the Indian jute industry, on the occasion of the annual general meeting of the company, stated that if the industry was to retain its significant position in the country's economy, and if it was to exploit its full installed capacity, it was absolutely essential that all those interested in the industry—the representatives of capital, management, labour and the State—examined closely the shape of things to come during the next decade or so. He opined that "the

outlook (for the industry) is not nearly so grim as is sometimes painted". But he qualified this statement by saying: "My belief is subject to one important reservation and that is that our costs are reduced and reduced very substantially. Nothing will be gained, I am sure, from evading this issue".

It was quite logical, Sir John said, that the cultivator would have to earn his reward from increased production per acre and labour's wages, if in the long run had to be higher, could be practicable only through better utilisation of improved mechanical methods. It could not be denied, he added, that jute companies were making desperate efforts to modernise their units by incurring heavy expenditure on machinery in their various departments. It appeared, however, that in order to compete in the world markets, the mills would have to incur further capital expenditure on modernisation of the weaving departments. Sir John was nevertheless apprehensive of the fact that this further expenditure might be beyond the capacity of the majority of companies, at least immediately. He said, therefore, and perhaps, rightly so, that the true national interest demanded that means were found to enable the mills to shoulder further liabilities. The Government could definitely advance a helping hand.

Sugar

APPROVAL FOR HIGHER OUTPUT

THE GOVERNMENT OF INDIA has allowed fifteen sugar mills—nine in U.P., four in Maharashtra and one each in Bihar and Andhra—to increase their cane-crushing capacity to the tune of 4,818 tons per day. The Government had taken this decision before it was decided not to allow any more expansion in the sugar industry for sometime. The expanded capacity of these sugar mills will make them better economic units.

The following is the list of the mills which have been allowed to expand their cane-crushing capacity.

Company	Additional crushing capacity per day (Tons) sanctioned
1. Shankar Sugar Mills (U.P.)	295
2. Sriram Sahakari Sakar Karkhana Ltd. (Maharashtra)	200
3. Phalton Sugar Works Ltd. (Maharashtra)	200
4. The Malegaon Sahakari Sakar Karkhana Ltd. (Maharashtra)	250
5. Shri Anand Sugar Mills Ltd. (U.P.)	350
6. Raza Buland Sugar Co. Ltd. (U.P.)	500
7. Sasa Musa Sugar Works Pt. Ltd. (Bihar)	200
8. UpperDoab Sugar Mills Ltd. (U.P.)	750
9. Pannijee Sugar & General Mills Ltd. (U.P.)	500
10. Andhra Kirlampudi Sugar Mills Ltd. (Andhra)	900
11. The Ganesh Sugar Mills Ltd. (U.P.)	200
12. The Amritsar Sugar Mills Co. Ltd. (U.P.)	300
13. The Lakshmi Sugar & Oils Mills Ltd. (U.P.)	300
14. The Belapur Co. Ltd. (Maharashtra)	200
15. Lakshmi Devi Sugar Mills Pt. Ltd. (U.P.)	273

FROM THE CAPITAL'S CORRIDORS

RAILWAYS' DEVELOPMENT PROGRAMME

The rapid growth of the Indian economy over the past decade has placed heavy demands on the country's transport system. The main burden, of course, has fallen on railways. The originating traffic on railways has shot up from 91.5 million tons in 1950-51 to 154 million tons in 1960-61. The average lead of freight traffic has gone up from 292 miles to 354 miles. In terms of tons originating, the volume of traffic carried by railways has, thus, increased by 69 per cent. In terms of ton-miles, it has gone up by over 100 per cent. But still stresses and strains continue as is evidenced by the terrific bottleneck in the movement of coal.

Passenger traffic has also shown a marked increase during the past ten years. The increase has been relatively much larger in suburban traffic than in the inter-city traffic carried by railways. The volume of suburban traffic has increased from 4,247 million passenger-miles in 1951-52 to 7,500 million passenger-miles in 1960-61, i.e., by 77 per cent. The overall increase in passenger-miles during this period has been around 24 per cent.

The number of wagons on the rails, in terms of four-wheelers, has gone up under the first two Plans from 222,441 to 341,041. The number of coaches (units) has increased from 20,502 to 28,271. The increase in locomotives in operation has been of the order of 2,093; locomotives in service at the end of the Second Plan period were 10,554. To meet the increasing demands of traffic, about 1,300 miles of railway track have been doubled and 800 miles electrified. Nearly 1,200 miles of new lines have been added to the railway system during the fifties. Another 400 miles dismantled during the war have also been restored.

The railways' Third Plan has been formulated on the basis of an expected originating traffic of 245 million tons in 1965-66—91 million tons more than what railways handled at the end of the Second Plan period. The increase in passenger traffic is envisaged to be of the order of 3 per cent in non-suburban traffic and slightly more in the suburban traffic. Of the total increase of 91 million tons of goods traffic estimated to accrue during the Third Plan period, 79.5 million tons is estimated to be the traffic originating on account of movement of coal, steel and raw materials for steel plants, cement, iron ore for export etc. The remaining 11.5 million tons represent the expected increase in the general goods traffic.

The total cost of the railways' development programme under the Third Plan as estimated at present will be of the order of Rs. 1,325 crores. The Planning Commission envisages a review of the development programmes for various modes of transport when the final report of the Committee on Transport Policy and Co-ordination is available.

The Rs. 1,325 crores expenditure expected to be incurred on development of railways during the five years to 1965-66 is made up of the following programmes:

Programme	(Rs. crores)
Estimated cost.	
Rolling stock	510
Workshops, machinery and plant	62
Track renewal	170
New lines	147
Electrification	70
Signalling and safety works	25
Traffic facilities (line capacity works)	183

Programme	Estimated cost
Bridge works	25
Other electrical works	8
Other structural works	15
Staff quarters and staff welfare	50
Users' amenities	15
Road services	10
Stores suspense	35
Total	1,325

As many as 90,447 wagons (four-wheelers), 5,025 coaching vehicles and 1,150 locomotives are proposed to be added to the rolling stock during the Third Plan period, besides the replacement of the over-aged stock. Manufacture of electric locomotives at Chittaranjan Works, in collaboration with Heavy Electricals, Bhopal, is envisaged to be stepped up to 60 units per annum; production of electric locos at Chittaranjan has already been taken on hand. Production of diesel locos is also proposed to be undertaken in the public sector during the Third Plan period.

AUGMENTING LINE CAPACITY

So far as augmenting of line capacity is concerned, the Third Plan development programme of railways envisages doubling of 1,600 miles of single track, re-modelling of certain yards, opening of crossing stations and provision of crossing loops, besides construction of some new lines and electrification of some additional sections. The railways would be concentrating during the current Plan period on strengthening the trunk routes and the lines on which traffic in heavy commodities is required to be moved in increased quantities. The programme of electrification provides mainly for completion of works on those sections which have already been taken on hand. Electrification of the Moghulsarai-Kanpur section has also been included in the Plan. Track renewals will be undertaken on about 5,000 miles, rail renewals on 2,500 miles and renewal of sleepers on about 2,250 miles.

About 1,200 miles of new lines will be constructed. Work on some of these lines was started during the Second Plan period. It will be completed during the Third Plan period. Plans are to lay 12 additional lines, besides those spilled over from the Second Plan. The 12 new lines to be constructed include one from Madhopur to Kathua (in Kashmir) and another connecting Haldia port to its hinterland. There is provision to construct 200 miles of new lines in connection with the development of the coal industry. Laying of four such lines—Manipur-Hassan, Bangalore-Salem, Manamadhurai-Virudhunagar and the rail link from Sukinda/Daitari mining area in Orissa to be main line and from Kharagpur to Cuttack—is under consideration.

The other engineering works proposed to be undertaken during the Third Plan period are completion of the Brahmaputra bridge and a bridge over the Jamuna near Delhi, the completion of some other bridges on which work was started during the Second Plan, improvement of signalling and tele-communication facilities including the inter-locking of some sections, and provision of centralised traffic control on the link route leading to Assam.

A provision of Rs. 50 crores has been made for staff welfare. Of this Rs. 35 crores will be spent on construction of staff quarters. A sum of Rs. 15 crores is envisaged to be spent on provision of further amenities for railway passengers.

RAILWAYS' SELF-SUFFICIENCY DRIVE

So far as the self-sufficiency drive of the railways is concerned, substantial increase in capacity for the manufacture of rolling stock has been achieved. All the steam locos, coaches and wagons needed by the railways are manufactured in the country. Complete self-sufficiency has been achieved in respect of mechanical signalling equipment. Capacity is also being created to produce the entire supplies of track materials needed by the railways. To the extent possible, efforts will be made during the Third Plan period to manufacture indigenously those items of railway equipment which are still being imported. It includes manufacture of diesel and electric locomotives. A few items of specialised equipment will, however, have to be imported even after 1965-66. The total cost of these imports during the five years of the Third Plan is estimated around Rs. 186 crores. During the Second Plan period as much as Rs. 332 crores had to be spent on imports of equipment and raw materials, especially steel required for the production of rolling stock.

LABOUR CONFERENCE

The next meeting of the Indian Labour Conference is scheduled to be held at Bangalore on October 9 and 10. Among other things, the Conference will be discussing, and taking a decision if possible on, three important issues—(1) Revival of the Labour Appellate Tribunal; (2) Compulsory deductions from employees' salaries in the interest of stepping up savings drive; and (3) Integration of various social security schemes.

The revival of the Labour Appellate Tribunal was first considered at the Indian Labour Conference in 1959 in the context of the recommendations of the Law Commission which had remarked that "the files of the Supreme Court are full of appeals on labour matters and relief should be given to that Court by enabling parties to file appeals in these matters either to the High Court or to a special tribunal constituted for the purpose." At present, a separate Bench of the Supreme Court is dealing with labour cases. During 1960 as many as 125 appeals relating to labour matters were filed before this Bench which with 222 appeals brought forward from the previous year, brought the total number of pending cases before it to 347. Of these, 249 cases were disposed of during the year, leaving 98 cases still pending.

The State Governments who had been asked to make an assessment of factual material such as disposal of cases, reducing of references to High Courts and to the Supreme Court, have generally expressed against the revival of the Labour Appellate Tribunal.

To expedite disposal of labour cases it is proposed to amend the Industrial Disputes Act in the next batch of amendments with a view to enabling the appointment of serving or retired District Judges as presiding officers of labour tribunals.

COMPULSORY DEDUCTIONS

The second issue which will be considered by the Conference at its forthcoming meeting is whether legislation should be undertaken to enable compulsory deduction of a part of the salaries of employees, both industrial and non-industrial, in the public as well as private sectors, for investment in Government securities under a non-contributory provident fund scheme. It is pointed that while there is no intention of enforcing compulsory deductions in the immediate future, the idea is that the Government should have power to enforce such deductions if and when it may become expedient, with a view to ensuring adequate savings in the economy in national interest.

Details of this scheme have yet to be worked out. It is, however, intended to exclude from this scheme

employees covered by the Employees' Provident Fund Scheme, temporary employees who have not completed six months' service, employees working in establishments with less than 20 persons and those drawing salaries less than about Rs. 75 per month. The actual rates of deduction would be changed from time to time with certain ceilings which might vary from 10 per cent in the case of employees drawing less than Rs. 300 per month to about 20 per cent in the case of those drawing about Rs. 1,000 per month. These deductions would be inclusive of the payments now being made by employees by way of contribution to provident fund or as life insurance premia. The proposal is to have a single comprehensive legislation at the Centre in this regard. This, it is stated, will bring about uniformity throughout the country by the application of the compulsory deductions scheme to the employees serving under the Central Government, State Governments, Municipal, local or private employment. The State Governments are being consulted on the question. The representatives of employers and workers will also be provided an opportunity to express their views on the matter before bringing the employees in the private sector within the scope of this scheme.

INTEGRATION OF SOCIAL SECURITY SCHEMES

The third important item on the agenda of the forthcoming Labour Conference is a proposal to incorporate all the existing social security schemes, such as employees' state insurance and employees' provident fund. The Conference will also be discussing conversion of the various provident fund schemes into a statutory scheme of old age, invalidity and survivorship and pension-cum-gratuity. The scheme has already been approved by the Tripartite Standing Labour Committee and has been included in the Ministry's Third Plan proposals. Setting up of a single agency, it is believed will result in two advantages—laying of comprehensive security programme and reduction of overhead expenditure on individual schemes.

The other items on the agenda for the next meeting of the Indian Labour Conference are: (1) Productivity and welfare of workers; (2) Reduction of hours of work in hazardous occupations; (3) Representation of technicians, supervisory staff etc. by representative unions; (4) Rights of a recognised union under the Code of Discipline vis-a-vis an unrecognised union; (5) Abolition of contract labour where feasible; (6) Ensuring of satisfactory conditions of work for contract labour where abolition of contract labour is not feasible; (7) Working of the implementation machinery; (8) Considering of the report of the sixth session of the Committee on Conventions; and (9) Convening of meetings of Industrial Committees.

BRITAIN AND THE EUROPEAN ECONOMIC COMMUNITY

India has asked for, and it is expected will be given, a seat as an observer at the forthcoming meeting of the members of the Treaty of Rome to consider Britain's application for becoming a member of the European Economic Community. It is expected that till such time arrangements are made for the transfer of the headquarters of the Indian Commissioner-General for Economic Affairs from London to Brussels, the present incumbent of the job, Mr. T. Swaminathan, will continue to represent this country as an observer at the meeting.

India has also enquired of the British Government of its plans for setting up the consultative machinery in connection with the negotiations on Britain's joining the European Common Market. The issue is expected to dominate the Commonwealth Prime Ministers' Conference scheduled to be held at Accra in the second week of this month.

STEPPING UP COAL OUTPUT

The Government of India has accepted the following offers from foreign countries for their collaboration with the National Coal Development Corporation for stepping up coal output in the public sector:

Country	No. of experts assigned	Purpose of assignment
1. United Kingdom	3	For preparing a project report for opening up and for developing the abandoned Jarandih mine.
2. France	2	For technical advice on depillaring steeply inclined thick seams in Karanpura coalfields and providing training facilities to Indian technical personnel in France.
3. U.S.A.	5	For developing of Ramgarh mines in Hazaribagh—Bihar.
4. West Germany	2	For layouts and management of workshops and coal preparation installations.

Two experts from France, two from West Germany and one from the United States have already arrived in India. They are visiting the N.C.D.C. collieries with the development of which they are to be associated. The proposed period of their stay here varies from one month to three years.

Meanwhile, under the Indo-Polish agreement on economic co-operation, the National Coal Development Corporation has entered into two agreements with CEKOP of Poland, one for the preparation of project reports for the development of a deep-shaft mine and an inclined mine at Sudamdih, in Jharia coalfields, and the other for the supply of shaft-sinking machinery. The preparation of the project reports will cost Rs. 3.80 lakhs. Another Rs. 60,000 will be required for preparation of designs and collection of data for starting the sinking of shafts. The machinery and equipment which Poland will be supplying under the second agreement will be delivered by March 31, 1962, excepting a few items which will be made available by August 31, 1962. The machinery to be purchased would be costing Rs. 36 lakhs.

PRIVATE SECTOR COLLIERIES

The estimated foreign exchange requirements of the development of coal mining in the private sector during 1961-62 are placed at Rs. 348 lakhs—Rs. 198 lakhs for the first half of the year and Rs. 150 lakhs for the second half. An allocation of Rs. 30 lakhs together with a likely commitment of Rs. 20 lakhs has already been made under the Indo-Polish agreement for the import of coal mining machinery and equipment. The World Bank has also granted a loan of \$35 million (Rs. 16.67 crores) for the development of private sector collieries during the first two years of the current Plan.

ORISSA MINING CORPORATION

The Government of Orissa has proposed to the Government of India that it would like the Orissa Mining Corporation to be fully State-owned and State-operated

concern. The Central Government is understood to have agreed to the State Government's proposal. Action is being taken to give effect to this decision. All the interest of the Centre in this Corporation will be secured by the State Government.

The Corporation is at present operating three iron ore mines in Mayurbhanj and Keonjhar districts. It has secured mining leases or prospecting licences over some additional areas as well for mining and prospecting of iron ore, manganese and chromite. The Third Plan programme of the Corporation, involving a capital investment of Rs. 86 lakhs, envisages production of 8 lakh tons of iron ore, 25,000 tons of chromite and 20,000 tons of manganese by the end of 1965-66. There are possibilities of extending the operations of the Corporation further through acquiring of more leases and raising of the targeted production. The State Government has formulated a scheme to develop iron ore mines through the Corporation in the Sukinda area with a view to export two million tons of iron ore by 1964-65. Securing of equipment will be placed shortly.

SIKKIM MINING CORPORATION

The programme of the Sikkim Mining Corporation to exploit mines in the Sikkim State for preparation of concentrates of copper, lead and zinc, which was to start in June last, has been delayed due to non-completion of the Rongni Hydel Project and also owing to some delay in the delivery of imported materials. The underground work on these mines is now expected to commence in November or early December, by which time electricity will be available from the Rongni Project and the equipment would have been imported from abroad. Actual production from the mines at the rate of 100 tons of ore per day is expected to be achieved during the first half of 1962. Ore production of this order is expected to yield 11 tons of concentrates of copper, lead and zinc. Tenders for the milling plant have been finalised by the Corporation. Orders for securing of equipment will be placed shortly.

TRAINED PERSONNEL FOR STEEL PLANTS

The Minister for Steel, Sardar Swaran Singh, in reply to various questions in the Lok Sabha in regard to availability of trained personnel for the public sector steel plants in general and the Rourkela Plant in particular, gave the following replies:

(i) "The exact requirements of technical personnel for the Third Five-Year Plan have not been worked out. It is, however, estimated that for the expansions of the Bhilai, Rourkela and Durgapur, the Alloy and Special Steels Plant at Durgapur, Bokaro, and the Central Designs Organisation, 1,626 engineers, 2,075 operators and 14,400 skilled workers will be required. With the training institutes at Rourkela and Bhilai and the institute coming up at Durgapur, Hindustan Steel hopes to have adequate facilities to train the bulk of the personnel required for expansion themselves."

(ii) "The main difficulty now facing Rourkela Steel Plant is the shortage of sufficiently experienced operational personnel and the usual "teething" troubles experienced in any new plant. A large number of young men fresh from the universities and technical schools have been recruited and trained either in India or abroad, but even the best training is not a substitute for experience. The teething troubles are also more numerous owing to the highly mechanised and complex nature of the plant. Accordingly, Hindustan Steel have taken steps to recruit some experienced personnel from West Germany."

(iii) "Government have agreed to Hindustan Steel Limited's proposal to recruit up to 225 German technicians for the operation and maintenance of the various units of the Rourkela Steel Plant for periods up to three years. Hindustan Steel Limited have also recruited and trained a large number of Indian technicians

However, they still lack the experience necessary to operate and maintain successfully a complex steel plant like the one at Rourkela. The German technicians who are now being recruited will help and guide Indian technicians. It is expected that by the time Germans are ready to leave, the Indian staff of Rourkela will be fully competent to run this plant."

(iv) "The report of the two-member U.S. Steel Mission, which came to India to assist the Hindustan Steel Limited in the establishment of an overall training plan, has made the following recommendations:

"(a) A separate training division should be established in the Head Office of Hindustan Steel Limited, Ranchi.

"(b) A Management Training Institute should also be set up at Ranchi to prepare a supervisory training course for implementation at the Plants and to conduct Company Management training courses at the Institute.

"(c) Hindustan Steel should take advantage of the Hyderabad Staff Training College as well as the new Management Institutions that are being set up in the country for training of their senior executives.

"(d) The General Superintendent of each plant should assume full responsibilities for the training of all personnel in the works both management and non-management. The Superintendent of Training in each plant should be responsible directly to the General Superintendent.

"(g) An 'In-plant Training Service' should be established for training of existing working personnel under an Assistant Superintendent of In-plant Training Service who should be assisted by Training Engineers.

"(f) Seminars for the benefit of Training Staff should be arranged.

"(g) Programmes for the training of artisan operatives and graduate apprentices should be revised with emphasis on 'In-plant Training'."

RAW JUTE SUPPLIES AND MANUFACTURE OF JUTE GOODS

Presumably due to increasing arrivals of raw jute in the market, the Indian Jute Mills Association, it is learnt has agreed to unseal additional 9 per cent looms sealed in August last. These looms will be re-commissioned into production in the first week of September.

A two-member delegation of the Indian Jute Mills Association has had discussions here with Mr. D. S. Joshi, Additional Secretary, and some other senior officials of the Ministry of Commerce and Industry on stabilisation of jute prices.

The Indian Jute Mills Association, it is learnt, has agreed to urge its member mills to step up their jute purchases with a view to steadying the market. The Association has also agreed to do away with the quota system hitherto in force so that there will be no limitation on what each member mill may buy. The Jute Commissioner will check the rate of purchases by the mills in order to ensure that adequate purchases are made. It is hoped that these measures will help to stabilise raw jute prices.

It was emphasised by the Government at the discussions with IJMA representatives that reasonable prices of jute should be assured. The Government has under consideration a scheme for market operations to stop falling of raw jute prices below economic levels. The Indian Jute Mills Association, it is understood, has

promised its full support for the successful operation of this scheme. Consequent upon the discussions with the IJMA delegation and a conference between Dr. B. C. Roy, Chief Minister of West Bengal, and three Central Ministers, Mr. S. K. Patil, Mr. K. C. Reddy and Mr. Nityanand Kanungo, the Government of India, it is understood, has decided, in principle, to fix a fair minimum price for jute so as to prevent its prices falling below economic levels.

DISTRIBUTION OF SUGAR

Restrictions on the retail sale of the sugar have been removed in most of the States. This was disclosed by the Union Food and Agriculture Minister, Mr. S. K. Patil, at the last week's meeting of the Informal Consultative Committee for the Ministry of Food and Agriculture. The Governments of U.P. and Bihar, Mr. Patil said, had allowed wholesalers to sell in the free market such sugar as was not lifted by the authorised retailers within a particular period. The Governments of West Bengal and Orissa had similarly permitted wholesalers to sell such sugar in the free market as was surplus or was not required for distribution through controlled channels. The Government of Rajasthan has also withdrawn restriction on sugar sales at the wholesale stage.

In reply to a question regarding the possibility of higher allocations of sugar for free sale within the country, Mr Patil pointed out that whereas the Central Government was releasing sugar at the rate of 24 lakh tons per year, the States were lifting at the rate of only 20.5 lakh tons.

Talking about the extension of area under sugarcane cultivation, the Minister disclosed that during the Second Plan period area under sugarcane cultivation had gone up by 12 lakh acres to 57 lakh acres. This year's sowings, the Minister stated, showed that area under cane cultivation would go up by another 4 lakh acres. This diversion of area to sugarcane cultivation has been at the expense of wheat, rice and other crops and has been the result of there being no restrictions on cane cultivation.

Referring to sugar exports, Mr. Patil stated that of the recently announced U.S. quota for sugar imports from India to the tune of 1.87 lakh long tons, about 1,40,000 tons had already been "booked for sale". The entire quantity, he stressed, would have to be not only sold, but would have to reach American shores by the end of December this year. If all the sugarcane produced in India were crushed into crystal sugar, India, Mr. Patil observed, would be producing something like 10 million tons of sugar. He pointed out that against this, it is contemplated at the moment to export only half a million tons of sugar.

Mr. Patil also dwelt at the Consultative Committee meeting on the availability of chemical fertilisers. The position this year in this regard, he said, was much better than in the previous years. The Ministry of Food and Agriculture had allotted to the States whatever quantities they had demanded. It was, however, noticed that in several cases, the full allocations had not been lifted. The Minister stressed the importance of fertilizers being properly used.

Talking about the role of minor irrigation under the Third Plan, Mr. Patil stated that as many as Rs. 300 crores were expected to be spent on implementation of the minor irrigation schemes included in the Third Plan, as against Rs. 145 crores spent during the Second Plan period. It was proposed, he added, to continue the practice of holding regional minor irrigation conferences during the Third Plan period.

COMPANY AFFAIRS

NEW ISSUES

The Controller of Capital Issues has granted consent to five companies for the issue of a total capital of Rs. 1.2 crores. The consent is valid for twelve months in each case. The following are the details:

Sen Raleigh Industries of India Ltd., Calcutta: Issue of further capital of Rs. 65 lakhs, divided into equity shares of Rs. 10 each for cash at a premium of Rs. 4 per share. Out of this 644,015 shares will be offered to Messrs. Raleigh Industries Limited of Nottingham. The present paid-up capital is Rs. 1 crore.

Pimpri Glass Works Private Ltd., Bombay, (a new company: Issues of Rs. 20 lakhs for cash at par divided into 16,000 equity shares of Rs. 100 each and 4,000 Cumulative preference shares of Rs. 100 each carrying a dividend of 9.5 per cent free of company's tax but subject to deduction of taxes at source at the prescribed rates. The proceeds will be utilized to manufacture fluorescent rods, tubes, incandescent lamps, ampules and chemical tubes.

Fort William Co. Ltd., Calcutta: Issue of 210,000 equity shares of Rs. 10 each to be issued to its existing shareholders at a premium of Rs. 3.50 per share in the ratio of one new share for every share now held. The present capital is Rs. 31 lakhs. The new capital will be utilized to manufacture steel wire ropes.

Dharamsi Morarji Chemical Co. Ltd., Bombay: 18,190 bonus shares of Rs. 50 each on capitalization of Rs. 9,09,500 of reserves to be made in the ratio of 4 bonus shares for every 10 shares held. The company manufactures superphosphate fertilizer, mixtures and various types of heavy chemicals and acids. The company has a paid-up capital of Rs. 22,73,800 in equity shares of Rs. 30 each.

Indian Tool Manufactures Ltd., Bombay: Issue of Rs. 5 lakhs bonus capital divided into equity shares of Rs. 100 each. The shares will be allotted to the existing shareholders of the company in the ratio of one bonus share for every two shares held.

THE GANGES ROPE COMPANY

The production of the Ganges Rope Company Limited was maintained at a satisfactory level during the year to March 31, 1961. The directors of the company have reported that higher sales—Rs. 88.88 lakhs during the year against Rs. 79.47 lakhs during the previous year—were despite constant difficulties experienced in obtaining essential raw materials from indigenous as well as foreign exchange sources. There was considerable competition and even then the total sales increased. As a result of the representation made to the Government of India by the Indian Rope Manufacturers' Association, some relaxation was made in the issue of licences which has enabled the industry as a whole to import larger volume of Manila and Sisal fibres. The directors of the company hoped that Government will continue to pursue this enlightened policy also for import of machinery to replace the old and worn out plant, as in the case of Jute Mills.

During the year under review a profit of Rs. 8.57 lakhs was recorded after making provision for taxation etc. The directors proposed to transfer a sum of Rs. 2.32 lakhs to general reserve. They have proposed to distribute a dividend at a rate of Rs. 20 per share subject to deduction of tax for the year under review which will absorb Rs. 2.80 lakhs.

BRITANNIA BISCUITS

The Britannia Biscuits Company Limited continued with its programme of expansion during the year to

March 31, 1961. The company spent Rs. 26.13 lakhs on building new plants and machinery financed from internal resources. This increasing capital expenditure and additional working capital is an evidence of the company's gradual expansion and this has partly been achieved by a retention of a portion of the profits.

The directors have reported that last year they decided to implement the second phase of a plant replacement and modernisation programme and they are trying to arrange manufacture of equipment in India to conserve foreign exchange. It appears that the company may have to be allowed to import a part of the machinery which cannot be manufactured in India at the moment.

The company, it seems, is fully alive to the fact that biscuits can be an important item of export and has made endeavours during the last three years to raise the export of biscuits. Although it is essentially an industry which has to pave its own way in the foreign markets, the Government cannot fail to recognise that a part of the responsibility rests with them too. It is hoped the Government will assist the company by giving some concessions so that the company's products can compete in the foreign markets.

During the year under review the company made a profit of Rs. 31.68 lakhs after providing Rs. 6.71 lakhs for depreciation and Rs. 24 lakhs for taxation. The directors have transferred a sum of Rs. 12.70 lakhs to general reserve, Rs. 1.50 lakhs to debenture redemption reserves and Rs. 2.96 lakhs towards development rebate reserve. The half yearly dividend on preference shares at the rate of 4 per cent and interim dividend of 6 per cent on ordinary shares was paid in December 1960. The directors have now recommended the payment of a final dividend on preference shares at the rate of 4 per cent subject to deduction of tax. A final dividend of 19 per cent subject to deduction of tax making 25 per cent for the year on ordinary shares has been recommended to be paid. A special bonus of 5 per cent subject to deduction of tax on ordinary shares has also been recommended to be paid.

THE PUNJAB NATIONAL BANK

The working of the Punjab National Bank Ltd., for the half year ended 30th June, 1961 indicates that the Bank has made satisfactory progress. Subject to audit, the net profit of the Bank for the half year ended 30th June, 1961 after providing a sum of Rs. 5.90 lakhs for payment to the Gratuity Fund Trust and making necessary provisions amounts to Rs. 75.96 lakhs as against Rs. 45.37 lakhs for the corresponding half year in 1960. After adding a sum of Rs. 4.23 lakhs carried forward the amount available for appropriations is Rs. 80.19 lakhs. The Directors have decided to pay an interim dividend for the current year at the rate of Re. 1 gross per share amounting to Rs. 12.50 lakhs leaving a balance of Rs. 67.69 lakhs to be carried forward to the next half year's account. The Bank has 430 offices in India, Burma & Pakistan and offers all types of banking and foreign exchange facilities.

THE PREMIER AUTOMOBILES LTD.

The total turnover of the Premier Automobiles Ltd. for the year 1960-61 amounted to about Rs. 22.72 crores. The company sold 6,913 cars and 6,075 trucks during the year. The turnover of the company for the year 1959-60 amounted to about Rs. 20.95 crores when 5,729 cars and 5,997 trucks were sold during the period. The company has, therefore, made a significant progress during the year under review.

A Letter to the Editor

HOLLAND AND INDONESIA

Dear Sir,

I got the May 19 issue of your "The Eastern Economist" on my desk and I read with interest your West European Correspondence about colonists coming home.

Indeed, from the economic point of view it was not overdifficult to give Dutch nationals from Indonesia a reasonable place in Holland. But as the majority were from mixed Dutch-Indonesian origin and most of them lived their whole lifetime in Indonesia, the physical and social adaptation was harder, especially for the older people. But they are welcome and as citizens no better and no worse than ordinary Dutchmen.

However, you said that Holland lost 30 per cent of her revenue when Indonesia cut adrift. I am not clear about the meaning of that figure, I only can state that following a pre-war report of our Central Bureau of Statistics, the income for Holland out Indonesia (including also the secondary benefits) was in 1938 about 15 per cent of the total national income of the Netherlands.

I think that in general but at least in regard to my country the amount of revenues extracted from the colonies is overstressed, whilst on the other hand the benefits for the colonies from the occupying country are underrated;—that is to say from the economic point of view.

Whatever it may be the loss of Indonesia certainly has not been such a deadly blow as often was said; on the contrary it seems that the greater part of the losses have already been overcome;—at least we try to make the best of the changed situation.

Yours etc.,

(Ir J. H. de Haan),

Landutilisation for the Tropics.

Wageningen,
Netherlands,
July 26, 1961.

[Our Correspondent clarifies the point as follows: "The 30 per cent decline was in Holland's export revenues. The decline in the national income was indeed about half that percentage. As for the exaggeration of the economic benefits of imperialism, I thoroughly agree with M. de Haan. The assertion that colonies are profitable for every class in the imperialist nation is what I called the Big Lie in the article 'Belgium and the Colonial Fallacy', in the issue of January 20, 1961. Holland's progress since the loss of her Indonesian ball-and-chain is constantly referred to by the anti-colonialist party in France."—Ed.]

UNIVERSITY OF MALAYA IN KUALA LUMPUR

A Research Fellowship in rice Economics and Statistics has been instituted in the Department of Economics, University of Malaya in Kuala Lumpur as a result of a grant received from the Lee Foundation.

The Research Fellow is expected to carry out a comprehensive investigation of the Economics and Statistics of rice consumption and production in the Federation of Malaya. Ministries concerned have agreed to make available data on rice production and trade in the country and some relevant material is available in the Department of Economics.

Intending applicants should have a good Honours degree in Economics or equivalent qualifications. Experience in handling cereal statistics, particularly rice, would be an advantage. Subject to University entry requirements being met, part of the research material may be used to obtain a higher degree in the University of Malaya.

The fellowship is tenable for a period of fifteen to twenty months, and would cover the following: (i) An all-in monthly stipend of between M\$1,300/- to M\$1,800/- (US\$1 = M\$3) depending on qualifications and experience; (ii) Return passage for the Fellow (if married, for wife and children below age of 12); (iii) accommodation; (iv) Medical charges in accordance with University regulations; (v) Funds for travelling and field research.

Applications should be made in accordance with the prescribed form (12 copies). Further particulars and application forms are obtainable from the Registrar, University of Malaya in Kuala Lumpur, Pantai Valley, Kuala Lumpur.

The closing date for the receipt of applications is 15th October, 1961. (Ref. (30)68[1]).

Company Meeting

HOWRAH MILLS COMPANY, LIMITED.

Statement of the Chairman, Sir John Brown, to the 136th Annual General Meeting held at 4, Clive Row, Calcutta, at 12 o'clock noon on Wednesday, 23rd August, 1961.

Gentlemen,

Before I move the first resolution I feel it is appropriate in the circumstances facing the Mills today that I should supplement the information regarding the Company's working contained in the report of the Directors dated the 7th July, which has been in your hands for some time.

From the Report you will have seen that from May, 1960 there have been successive reductions either in working hours or in the number of looms being worked. In view of statements which have been made from many quarters and which have recently received a wide currency in the daily press, I should make it clear that every cut in production means an increased cost of production to mill owners on account of increased overheads per ton and therefore either a smaller profit or a larger loss. It is difficult in the circumstances to understand the criticism which is directed at mill owners as it must be obvious that no one will willingly increase his cost of production of an article which to a very great extent has to be disposed of in the World's markets in competition not only with the jute industries of other countries but also with substitute packaging materials. What then is the reason which has forced the member mills of the Indian Jute Mills Association to restrict production? For two successive years the jute crop both in India and Pakistan has been a short one with the result that supplies of raw material reaching the mills in Calcutta have dwindled and naturally have increased in price in accordance with the ordinary laws of supply and demand. As a matter of fact, the total stocks of raw jute with mills at the 30th June in each of the last five years were as follows:

1957	..	10.95	lakh bales
1958	..	10.95	" "
1959	..	16.70	" "
1960	..	12.46	" "
1961	..	4.48	" "

Supplies at 30th June, 1961 represented barely 4 weeks' consumption on the basis of working then in force. Our own stocks were the equivalent of 3½ weeks' consumption and when I tell you that we normally regard 8 weeks' stock actually in the mill as a safe working minimum you will get some idea of the extent of the deficiency and the practical difficulties facing the staff and our operatives. Since the end of June the new season's crop has started to reach up-country markets and also Calcutta but as yet supplies are restricted and even now they do not match consumption. This situation was foreseen by the Committee of the Indian Jute Mills Association and in agreement with the Central and State Government authorities arrangements

were made for a block closure of the mills for one week in each of the months of June and July. While there is no doubt that this action was instrumental in avoiding a scramble for material which was in hopelessly short supply, and resulted in spreading the burden of the loss involved over the workers as a whole and the mill companies, it is unfortunate that more recently an acute controversy has developed in regard to the necessity or otherwise for a further cut in production between the beginning of August and the time when the mills can reasonably expect to start to replenish short stocks from arrivals.

Criticism of the mills is mainly on two counts; namely, that they are using coercive measures to inflict loss and suffering on the workers engaged in the industry with a view to influencing the decisions of the Wage Board which is now considering the wage structure of the industry, and secondly, that they are attempting by refraining from purchasing jute to depress its price and thereby inflict loss on the cultivators. The mills are also accused of a failure to have regard to what is described as the national interest in this matter.

Let me say rightaway that speaking for the Board and management of your Company, and I am sure for the managements of all the other Mills in the membership of the Indian Jute Mills Association, the first criticism, namely that we are trying to harass and cause loss to our workers, is totally unfounded. The losses suffered by our operatives are much to be deplored, but they are only a small part of the loss suffered by the industry as a whole in recent months. I read recently a criticism that the wages in this industry were low. It is true that they are by no means the highest wages paid in this State, but any criticism on this score should take account of the fact that ours is an industry which has to dispose of its output largely in foreign markets and we have to accept the price which the foreign buyer is prepared to pay; and he is not obliged to buy our goods unless it suits his convenience. We read a great deal these days, both in the daily press and in the financial journals, of India's need to increase her exports in order to meet the country's mounting foreign exchange liabilities and the increasing demands of her expanding industry. We in this trade and industry have a long experience of the economics of export and we are therefore, I believe, in a position to express a responsible opinion on this subject. The export trade requires a very considerable attention to detail on the part of those engaged in it but its two outstanding requirements are, firstly, to produce an article which the overseas buyer wants and secondly, to produce it at a price which he is prepared to pay. Looking at the Indian scene today I think there are many who would agree with me that we are more

likely to succeed in the first of these objectives than in the second. The price at which a manufacturer can afford to sell his goods is determined by his costs and the need to service his capital. In the jute mill industry the two largest single items of cost are raw material and labour and I have seen it suggested in some of the many press reports on meetings concerning the present situation in the industry that mill owners, instead of allegedly adopting oppressive tactics against their labour and the cultivators, should reduce the expenses of management. In industry the battle to reduce costs is a constant one and I can assure you that so far as this Company is concerned it is not confined to reducing labour costs and the price at which we buy jute, which is in any case determined by supply and demand in the market. Those responsible for the comment to which I have just referred are almost certainly not aware of the fact that, for many mills engaged in the production of standard constructions of cloth and bags, in the past three months losses would have been incurred even if management and overhead expenses, including depreciation, had been eliminated altogether; in other words, the cost of the raw material plus the labour cost alone exceeded the price at which the goods produced could be sold. It will be appreciated that this is a state of affairs which clearly cannot last for long if the industry is to survive at all and continue to contribute any significant part of India's foreign exchange earnings.

The suggestion that mill owners are attempting to oppress the cultivator by withholding purchases and thereby artificially depressing the price of raw jute is equally unwarranted. Such figures as are available indicate that arrivals of raw jute in Calcutta at the present time do not match consumption even on the basis of present restricted working. It would be a simple matter no doubt for one or two of the bigger groups to enter the market and buy up all the jute that was offering and thereby leave all other groups without any source of raw material. I cannot see, however, how that would in any way improve the situation from the point of view of the production of the industry as a whole and therefore of its workers. What the mills have done is to attempt to regulate their working to the amount of the raw material of the qualities required which is in hand or in sight in the immediate future and to avoid as far as possible the total closure of individual units which, I suggest, would entail far greater hardship to the workers involved. In the case of this Company we have had to seal temporarily a further 322 looms, representing 15 per cent of our registered complement. It is indeed unfortunate that notwithstanding the efforts of managements certain mills were forced to close completely last week due to a shortage of raw material. I do not think that it can be seriously suggested that mill owners are so short-sighted as to see any advantage in bringing ruin to cultivators, as some of the more exaggerated press reports suggest is their object, and thereby jeopardising their future supplies of raw jute, leading in turn inevitably to further price increases.

Jute goods are not a luxury but an essential packaging or process material used in many other industries and, from the buyer's point of view, while naturally he would wish to get his goods as cheaply as possible, most buyers whom I have met and with whom I have discussed this matter agree that stability of price is very nearly just as important as the actual price level. The question then is: at what level is stability to be determined? I have seen it suggested recently that the Central or the State Government should somehow or other lay down a minimum price of Rs. 50 per maund for jute. This may sound fantastic to you, as it was to me to read it; but it does serve to indicate how far away from reality

are some of the present critics of our industry. I have already referred to the necessity for us to compete with the jute mill industries of other countries and in today's terms that means particularly Pakistan. On the day on which I drafted this statement the difference between the price of raw jute in the Calcutta market and the price in the Narayangunj market was as much as Rs. 10 per maund; in other words, the Pakistan mills were getting their raw material at a price which was 24 per cent less than the Indian mills had to pay for a fibre of what is generally admitted to be inferior quality. From the mill owner's point of view it is indeed immaterial what price he pays for his raw material as long as he can sell his goods at a price which covers his costs and leaves him some margin of profit to put back into his business after paying a modest dividend to the shareholders. Other things being equal, it is in his interest to see that the grower is well rewarded for his efforts as this will ensure an adequate supply of raw material for the future. We inevitably get back, however, to the question of how much the buyer abroad is prepared to pay, since we do not live in a protected internal market where demand exceeds supply. Therefore, the question of a minimum price for jute has to be considered in relation to the price at which our production can be sold. Although it is admittedly not easy, I am sure that it is not beyond the wit of all the interests involved to devise a system of minimum price fixation which takes all these considerations into account and ensures that the positions of the mills on the one hand and the cultivator on the other are equitably regarded. Such a system might well be linked with a scheme for the setting up of a buffer stock of raw jute in the mutual interests of mills and growers. This is a matter which I understand is currently engaging the attention of the Indian Jute Mills Association and the Central and State Governments and I am sure we must all hope that a speedy solution acceptable to both the cultivators and the mills will be found.

Among the many exhortations to industry generally these days is an appeal to be prepared to export, even at a loss. This is exactly what the jute mill industry has been doing for some time; and it is not just a loss incurred in respect of simply a small portion of its production which can be absorbed in the higher profits which are obtainable in many other industries on the internal market. Nevertheless, if we are to survive and keep our mills running, we have to be prepared to incur such losses as indeed we have not infrequently had to do from time to time in the past. I would, however, suggest that it would be not unreasonable to expect that in these circumstances we should be entitled to at least some sympathy instead of being pilloried by sectional interests in the raw jute trade as well as by labour leaders generally. It appears to have been overlooked in recent controversies that as far back as December last year, the mills agreed to reduce working hours rather than to seal more looms in order to lessen the impact of the situation on the workers and this has resulted in additional losses to the mills during the intervening months, thus aggravating the already difficult position arising from the disparity between raw jute and manufactured goods prices, the only reason for which is the high price of jute caused by a physical shortage of fibre.

I have already referred to criticism of mills and their managements for an alleged failure to consider the national interest in this matter of adjustment of production in line with available supplies of raw material. Such criticism, I feel, is greatly to be deplored. The term "national interest" may be interpreted in a variety of ways but to me a factor which must always find a place in any consideration of its meaning in the contribution which the particular policy

which is advocated is going to make to the future of this country, the building up of its industry and an increase in the standard of living of its people. Who is it who is looking to the national interest in considering the solution of the present difficulties of our industry? Is it those who are clamouring for a jute price of Rs. 45 per maund or even Rs. 50 per maund when our competitors in foreign markets can buy their raw material at Rs. 32 per maund at present with a prospect of a substantial further fall? Is it those who claim to be representing our workers and who demand higher wages without any change in work loads and without any reduction in the numbers presently employed? Or is it those who look ahead five or ten years and who on the basis of the history of the past thirty or forty years realise that while the world's consumption of packaging materials has gone up enormously, consumption of jute goods has not risen proportionately and furthermore that a major jute industry is being built up right on our doorstep so that international competition can only be intensified, leading to keener and keener prices and demanding reduced costs with ever increasing efficiency at all levels if the future of the Indian cultivator, the mill worker and the shareholder are to be safeguarded? It is no use blaming the foreign buyer and complaining that he should pay more for his goods. The remedy is to be found much nearer home. It is in the hands of all those who have an interest in this industry, whether as growers of the raw material, as workers in the mills, as managements or as shareholders, not forgetting the Central and State Governments whose overall interest is to see that a broad equity is maintained as between all those engaged in the industry while, particularly so far as the Central Government is concerned, ensuring that the industry's capacity to earn foreign exchange for the country is not impaired in the long term by sectional interests.

Criticism of the mills, particularly by raw jute and labour interests, seems to overlook the fact that as a class shareholders in jute mill companies have not only not as yet benefited in terms of income from the heavy capital expenditure which has already been incurred on modernisation but, practically alone among equity holders, have also seen a substantial decline in the value of their investment, not only since the partition of the country in 1947 but even since 1952-53, on which year the Reserve Bank of India's indices are based. This is indeed a poor reward to those who have provided the financial sinews of what was last year once again the country's leading export industry in terms of foreign exchange earnings.

If this industry is to continue to occupy the place in the country's economy which it has made for itself, and if it is to expand its production to anywhere near the limit of the present installed capacity, it is absolutely essential that all of those who are concerned in it, whether they represent capital, management, labour or the Central or State Governments, should examine closely the probable trend of events over the next ten years or so. I am one who believes that the outlook is not nearly so grim as it is sometimes painted; but my belief is subject to one important reservation and that is that our costs of production are reduced, and reduced very substantially. Nothing will be gained, I am sure, from evading this issue. The cultivator will have to get his reward from an increased outturn per acre; in other words, with the aid of fertilisers and improved seeds he will have to produce more jute without having to himself employ more labour, either his own or his neighbour's. It is unthinkable that labour wages can be reduced and therefore if a solution satisfactory in the long term is to be found to this question of wage rates

it must be by the employment of improved mechanical methods as a result of which higher wages can be paid to a reduced number of workers. From the point of view of the mills, the majority of them are still endeavouring to amortise the heavy capital expenditure incurred in recent years in modernising the preparing and spinning departments. Technological advances indicate that a stage will shortly be reached when, in order to compete in the world's markets, the mills will have to face further heavy capital expenditure on the modernisation of their weaving departments. While some companies are relatively well found financially, I fear that the financial burden involved in this further expenditure may be beyond the capacity of the majority of companies, at least immediately. I suggest, however, that the true national interest demands that means be found to enable mills to shoulder the further liabilities to which I have referred. This can only be done if the cost structure of the industry is such that it can operate efficiently at such a profit as will enable it to amortise not only existing debt but also the fresh debt which it will have to incur. In the case of your own Company, since the date of the Directors' Report, the Board has sanctioned further capital expenditure in the factory and it will be our policy to continue to do so as far as we can within the resources at our disposal. I cannot, however, conclude this statement without making it clear that the Company has suffered very severe losses since the month of May and this setback will undoubtedly result in a slowing down of the modernisation process. I and my colleagues, however, feel that this is not a time to stand still and with faith in our ultimate future we intend to equip ourselves to be as competitive as we can in the years ahead.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting referred to.

AUSTRALIA'S LARGEST COMMERCIAL BANK CAN HELP YOU TO PROMOTE TWO-WAY TRADE WITH AUSTRALIA, NEW ZEALAND, AND FIJI

Want to sell? Want to buy? Want market information? The International Division of the Bank of New South Wales can tell you about the opportunities for trade offering with these countries. The Bank's complete banking service includes such specialized facilities as trade introductions to buyers and sellers, industrial enquiries, economic and market information, and a complete travel service. The Bank is closely and constantly in touch with industry, business, and agriculture in the areas it serves through more than 1,100 branches and agencies.

Enquiries may be made through your own bankers or direct to

Corporation's Meeting

"IN A WORLD OF EVER INCREASING COMMODITY PRICES, LIFE INSURANCE POLICIES IN INDIA COST LESS TODAY THAN AT ANY TIME DURING THE LAST FIFTEEN YEARS OR SO," SAYS L.I.C. CHAIRMAN.

STATEMENT BY SHRI P. A. GOPALKRISHNAN, ICS, CHAIRMAN

At the 64th Meeting of the Life Insurance Corporation of India, held in Bombay on 28th August, 1961 to discuss Annual Report and Audited Accounts for the year 1960.

Gentlemen,

I have great pleasure in welcoming you all to this fifth anniversary meeting of the Corporation. We have assembled here today to consider the draft of the Annual Report and Audited Accounts of the Corporation to be submitted to Government under Section 27 of the Life Insurance Corporation Act. These have already been circulated to all the Members.

NEW BUSINESS:

2. The Corporation is now five years old. During this period, the Second Five-Year Plan of the country has come to a close and considerable progress has been made in all fields of economic activity. The national income at current prices has risen from Rs. 9,980 crores in 1955-56 to Rs. 12,840 crores in 1959-60. On the other hand, the general price level has also increased hitting middle-classes with fixed incomes. These classes form the bulk of our policyholders and we have been finding it extremely hard to get business from them. To add to our difficulty, there were in 1960 widespread floods in Punjab, Uttar Pradesh, Bihar and Orissa, drought in Mysore and Andhra Pradesh and linguistic disturbances in Assam. Our business in these areas was adversely affected by these factors. We had also to contend with rival demands made by the various forms of savings propagated by banks and the Government.

3. In spite of all the above factors, our new business last year was Rs. 498 crores covering 1.26 million policies as compared with Rs. 429 crores in 1959 covering 1.15 million policies. The premium income increased from Rs. 84 crores in 1959 to Rs. 97 crores in 1960 and the total income exclusive of refund of tax from Rs. 105 crores to Rs. 122 crores. In 1955, the year immediately preceding nationalisation of life insurance, the premium income of all the companies was only Rs. 58 crores and the total income Rs. 74 crores.

RURAL DEVELOPMENT:

4. We have been able to achieve these results and hope to improve upon them during the current year owing to our policy of systematically expanding business in the rural area. Field Officers have been allotted exclusive rural territories in which they are building up a net-work of agency force. In some States, we have been utilizing the agency of Panchayats and Co-operative Societies for securing rural business. Rural publicity has been intensified and life insurance literature is now distributed through Community Development Blocks and village panchayats, in addition to our normal channel of distribution through our own branch and sub-offices. Jeeps have been supplied to all divisions and a mobile publicity van equipped with projector and films has been provided to each zone as an

experimental measure. These vans visited over 3,400 centres in 1960 and secured spot business of about Rs. 37 lakhs. Approximately, 26 lakhs of people attended the meetings convened by the officers-in-charge of these vans. Seeing the future prospects for rural business revealed by this mobile van publicity, we have supplied an additional van to each zone during the current year. The spot business secured by these vans during the first half of 1961 is as much as Rs. 61 lakhs. In the Southern Zone, we have gone a step further by converting the mobile publicity van into a mobile insurance office. This Office underwrites business and issues policies on the spot. The experiment has been recently extended to the Northern Zone also and will be extended to other areas if it proves a success.

NON-MEDICAL BUSINESS:

5. Another significant step that we have taken in the current year is to extend non-medical business, i.e., insurance without medical examination, to all those within certain age groups whose total insurance does not exceed Rs. 2,000. This will help us to secure more and more business from the rural areas. Non-medical business to special categories of persons in civil employment has been increased upto a limit of Rs. 5,000 and to category 'A-I' of the Commissioned Officers in the Armed Forces upto a limit of Rs. 10,000.

FOREIGN BUSINESS:

6. In the foreign countries, where we operate, conditions were not quite favourable for life insurance business in 1960. Political uncertainty in East Africa led to a flight of capital and fall in the business secured from the Indian community. In 1960, however, we started insuring African lives and we got a certain amount of business from this source. There was considerable damage in Mauritius by a cyclone and in Fiji Islands by a prolonged strike of cane growers. Nevertheless, we completed in all Rs. 9.7 crores of new business during the year as against Rs. 9.47 crores in the previous year.

FOREIGN EXCHANGE EARNINGS:

7. Although our foreign business is very small compared to the business that we are doing in India, it is very important from the point of view of foreign exchange. Our net earnings of foreign exchange per year amount approximately to Rs. 2.5 crores.

BUSINESS IN FORCE:

8. The total business in force at the end of 1960 was Rs. 2,285 crores covering 7.7 million policies as compared with Rs. 1,958 crores covering 6.9 million policies at the end of 1959. These figures include the business outside India which increased from Rs. 103

crores in December 1959 to Rs. 109 crores at the end of 1960. In this connection, I would like to refer to the phenomenal growth of life insurance in India during the last ten years and, particularly, after nationalisation of the industry five years ago. The life business in force in India has almost trebled during this period. To this remarkable increase, the contribution made by the private sector companies during 1950-55 was Rs. 380 crores. During the following five years, the increase has been as much as Rs. 1,048 crores. Expressed as a percentage of the national income, life business in force has increased in the country from about 11 per cent in 1955 to 17 per cent at the end of 1960. As these figures do not include the comparatively small amounts of business on the books of the Postal Department and a few State Governments, the percentage of business in force at the end of 1960 should be more than 17.

YIELD FROM INVESTMENTS:

9. The income from interest, dividends and rents before deduction of income-tax rose to Rs. 23.96 crores from Rs. 20.98 crores in 1959. During the five years from 1955 to 1960, the income from this source has more than doubled. The gross interest yield on the Life Fund was 4.58 per cent as compared with 4.54 per cent in 1959 and 4.52 per cent in 1958. This steady increase in the yield on our investments has been brought about mainly by the judicious manner in which we are making investments from year to year.

LIFE FUND AND ASSETS:

10. The Corporation's Life Fund has registered a significant increase from Rs. 495 crores in 1959 to Rs. 560 crores in 1960. The total assets have similarly increased from Rs. 554 crores in 1959 to Rs. 622 crores in 1960. Net investments of all kinds made in 1960 amounted to Rs. 63.62 crores as compared with Rs. 35.04 crores in the previous year. The total Stock Exchange investments as on 31st December, 1960 had a book value of Rs. 471 crores. Their market value on the same date was higher by nearly a crore of rupees. There is, moreover, a reserve of Rs. 13.41 crores to offset any future fall in the market value of these investments and it is proposed to keep this reserve in tact for the present.

HOUSING:

11. Owing to the acute housing shortage in the country, the Corporation decided to build its own staff and officers' quarters at different places and step up housing loans to State Governments, Co-operative Housing Finance Societies and other institutions. Besides, in granting mortgage loans against the security of buildings, the Corporation shows special consideration to applicants wanting loans for constructing or completing residential buildings for their own use. From the commencement of these schemes within the last two years up to March of this year, the total housing loans sanctioned by the Corporation amount to Rs. 23.05 crores. These loans have not yet been fully utilised by the agencies which received them. According to information available with us the State Governments have so far sanctioned loans for the construction of 3,859 middle class houses and 4,238 State employees' houses. The Co-operative Housing Finance Societies and other institutions have disbursed loans for the construction of 2,795 houses and the Corporation itself has constructed 264 quarters in India besides sanctioning loans to its employees' Co-operatives for building 116 houses. The number of houses, for whose construction or completion mortgage loans have been sanctioned is 95. Thus, the total number of houses constructed or under construction in the country with the aid of L.I.C. funds is 11,367. The Corporation has also indirectly helped the relief of housing shortage by putting up or completing office buildings worth Rs. 3.91 crores during the last five years.

EXPENSES OF MANAGEMENT:

12. Turning to expenses of management, 1960 was a difficult year. The cost of administration has been going up owing to various reasons such as increase in the prices of stationery and printing and of conveyances and their maintenance. Higher rates of conveyance and travelling allowances had to be sanctioned for certain categories of touring officers. The penetration of the rural area and organization of publicity in the villages are costing more than the procurement of business in the cities and towns. Above all, we had to sanction from 1st April, 1960 an ad-hoc increase of Rs. 15 in the dearness allowance paid to all our officers and staff drawing upto a salary of Rs. 500 per month. This alone increased our expenditure in 1960 by Rs. 46.44 lakhs. However, by effecting economies, wherever possible, and keeping a strict control on recruitment of staff, it has been possible for us to keep down our expenses of management. The overall expense ratio of the Corporation fell from 28.7 per cent in 1959 to 28.4 per cent in 1960 but the renewal expense ratio, which is the real indicator of economy of management, remained practically constant at 12.9 per cent. Had it not been for the factors mentioned above, the renewal expense ratio might have been nearer 12 per cent than 13 per cent.

CLAIMS PAID:

13. Maturity benefits to owners of policies amounted during the year to Rs. 23 crores and death benefits to Rs. 8 crores. The total claims during the year thus amounted to Rs. 31 crores as compared with Rs. 28 crores during 1959. During the four years and four months ending with December 1960, the total benefits to our policyholders and their beneficiaries by way of claims amounted to Rs. 113 crores.

PREMIUM RATES:

14. There has been a suggestion in certain quarters that since competition has been eliminated after nationalisation of life insurance and overheads have been reduced, the Corporation should examine the possibility of reduction in premium rates. I would like to point out in this connection that the premium rates charged by us are much lower than those charged in the past by Indian companies. For example, the rates charged by the Oriental Government Security Life Assurance Co. Ltd. from 1947 to 1953 under main insurance plans were 5% to 35% higher than the Corporation's rates. In 1954, there was a drastic reduction in premium rates by all the Indian companies, including "Oriental", and these reduced rates continued upto the date of nationalisation. In spite of this drastic reduction, the 'Oriental' reduced rates were higher than the Corporation's rates by Rupee 1 per thousand sum assured or anything from 1 per cent to 5 per cent under various plans. Thus, while the price of every other commodity has been increasing, life insurance policies cost less today than at any time during the last fifteen years or more. It is true that our mortality experience has been showing steady improvement and death claims have been going down as compared with the volume of business in force. While these factors should enable premium rates to be reduced, inflation and the resultant increase in the cost of administration and the higher cost involved in the expansion of rural business work in the opposite direction. All these problems are constantly under study in our Actuarial Department and if and when we find it possible, we shall certainly consider further reduction of premium rates.

LAPSE RATIO:

15. During the Second Plan Period, the general price level is estimated to have increased by 30 per cent and the working class cost of living index by 24 per cent. Inflationary pressures thus generated have begun

to be reflected in the net lapse ratio of the Corporation. The lapse ratio which was 9.1 per cent in 1956 came down to 6.4 per cent in 1957 and to 5.1 per cent in 1958. In 1959, it rose to 6.0 per cent and in 1960 to 6.6 per cent. The abnormal drop in the ratio of 1958 is partly accounted for by a necessary alteration in our system of treating policies as lapsed. Even so, it is clear that the net lapse ratio which gradually fell after nationalisation, has begun to rise again. There are also certain other disquieting signs which show that some policyholders with fixed incomes and increasing commitments are finding it difficult to save enough and keep their policies alive. Loans to policyholders, which used to increase by roughly Rs. 1 crore per year till 1959, increased by Rs. 3 crores in 1960. Outstanding premiums, which similarly used to increase by Rs. 1 crore per year, have increased in 1960 by Rs. 2.5 crores. If inflationary pressures increase during the period of the Third Five-Year Plan, it is bound to accentuate these tendencies and make it extremely difficult for the Corporation to keep down its lapse ratio. The only gratifying fact is that the 1960 lapse ratio of 6.6 per cent is still well below the lapse ratio of 7.6 per cent in the last year of life insurance management by the private sector companies.

ADMINISTRATIVE EFFICIENCY:

16. The efficiency of our administrative offices has been steadily improving as a result of our training programmes and better supervision and control by the officers-in-charge. Practically, every Divisional Office has one or more instructors to train newly recruited assistants and also existing assistants who need training. Our Officers' Training College at Nagpur has already trained 536 officers and supervisory personnel. As more and more of our administrative staff are trained at these institutions, further improvement of the efficiency of our offices may be expected to take place. The improvement that has already resulted is evident from the big drop in the number of complaints received and also from the increase in the average output of our offices. In 1959, the monthly average of the number of complaints received in our various Divisional Offices and major I.H.O. Units was 3,274. In 1960, the number fell to 2,171 representing a fall of 33.7 per cent, despite the increase in the number of policies. Similarly, the increased output of our offices will be evident from the fact that, while between 1957 and 1960, the number of new policies increased by 55 per cent and the total number of policies on our books increased by 36 per cent, the total staff of the Corporation increased only by 30 per cent. Further steps are being taken to improve our systems and procedures for more expeditious despatch of business and also to assess the minimum staff requirements of each office on a more scientific basis than hitherto. These steps are bound to bear fruit in future years.

FIELD EFFICIENCY:

17. The Development Training Centres which we have started in all the Zones have been systematically training our field officers and agents. The number of persons trained so far is 5,214 field officers and 4,844 agents. This training as well as the experience gained by the field officers during the last five years have enabled them to increase their average output of new business from year to year. The average output in 1957 was Rs. 4.9 lakhs and it has increased by 60 per cent to Rs. 7.8 lakhs in 1960. The average output of an active agent has increased by 55 per cent from about Rs. 31,000 in 1957 to about Rs. 47,900 in 1960. This improvement in average output is only partly accounted for by a 14 per cent increase in the average size of a policy issued between 1957 and 1960.

INCOME-TAX:

18. The Corporation pays tax to Government just as the life insurance companies in the private sector used to pay in the past. Assessments upto the end of 1958 have been completed and the tax assessed amounts to Rs. 4.36 crores. During 1959 and 1960, tax deducted at source amounted to Rs. 10.19 crores which will be adjusted against future tax assessments.

DIVIDEND TO GOVERNMENT:

19. The capital invested by Government in the Corporation is Rs. 5 crores and, under Section 28 of the Life Insurance Corporation Act, upto 5 per cent of the surplus that emerges at each valuation may be utilized for such purposes and in such manner as the Government may determine. The Government have indicated that in respect of 1957 to 1959 Valuation the entire 5 per cent should be credited to them. At the 1957 Valuation, the share of Government was Rs. 1.45 crores. Deducting from this figure an amount of Rs. 71.5 lakhs which Government have agreed to contribute in respect of the policies of deficit companies taken over by the Corporation, the return to Government amounts to 11 per cent per annum on their capital. In respect of the 1959 Valuation it is estimated that the Government's share of the surplus would give them a dividend of 13 per cent for each of the years 1958 and 1959.

BONUS ANNOUNCEMENT:

20. Our policyholders have been making anxious enquiries about the bonuses that would attach to their policies as a result of the 1957 and 1959 Valuations. Our field officers and agents have also been experiencing difficulty in securing with-profit proposals since bonuses have not yet been declared by the Corporation. I had hoped that it would have been possible for us to declare bonuses on the different groups of policies on our books by the middle of this year. The work involved took a slightly longer time, but everything was finalised sometime back and the regulations framed in this respect were submitted to Government for their approval. As soon as the approval is received, it will be possible for the Corporation to make its bonus announcement.

21. Five years is too short a period in the life of a new institution but we can be justifiably proud of what we have achieved during this period. We are aware of our deficiencies and are constantly trying to overcome them. If we persist in our endeavour in a spirit of dedication, a day will soon come, much sooner than we expect, when we will be able to announce that we are much nearer the goals promised at the time of nationalisation than we are today. All that I can say is that we must hope and strive.

22. Before I close this statement, I sincerely thank all the Members of the Board and of the Investment Committee for their unstinting co-operation during the last three years and more that I have been Chairman of this organization. My thanks are also due as Chief Executive of the Corporation to all the senior officers who have loyally co-operated with me and performed their duties. Above all, I am indebted to the thousands and thousands of our field officers and agents, without whose unrelenting efforts, the Corporation would not have been able to show such remarkable results during the last five years. Last but not the least, I am grateful to all those steady workers in the Corporation's offices who have not only kept up but improved upon the efficiency of the Corporation.

MEDICINE MAN MR. AL FOIL F.G.S.P.P. . . .

"... Fellow of the Grand Society for the Protection of Pills" said Mr. Foil, greatly impressing the awed Chemist who had never heard of the degree before. "That is just one of many honours conferred on me", continued Mr. Foil modestly, "by Pharmacists for having rendered valuable packaging service to the medicine manufacturing industry. Whatever the pharmaceutical product, be it pills or potions, aluminium foil wrapping safely seals in the prophylactic and curative properties for long periods and effectively protects them from contamination, moisture and dirt ... And that," finished Mr. Foil, "is just what the doctor ordered."

Long and extensive experience as Manufacturers of Aluminium Foils for packaging goods in the Cigarette, Pharmaceutical, Confectionery, Tea and many other industries

VENESTA FOILS LTD.

KAMARHATI, 24 PARGANAS, WEST BENGAL.

Branches at: BOMBAY, CALCUTTA, MADRAS, NEW DELHI

Selling Agents: Tea Chest Linings: WILLIAMSON, MAGOR & CO. LTD., Calcutta.

more and more coffee
is now being grown in

India

there are two main
varieties: **ARABICA** and
ROBUSTA

one abounds in flavour
the other in body
they make a delicious

A New Look at Exports

NOTHING has been so encouraging in economic policy in the last year as the final determination of the Government of India to compel exports, an outline of which was given by Mr. Gulzarilal Nanda in the Rajya Sabha last week. Mr. Nanda announced that Government was studying legislation to compel private industrial units to set apart quantities for export "by setting limits on internal sales." He very rightly spoke of our export performance "as a very vulnerable part of the Plan." While the Government was examining the export problem "in its general and specific implications", the tone of his speech was clear enough that now, at long last, the Government of India is determined on action. The weak incentives that it has attempted to apply over the last three years have ended in dismal failure. This is the time for categorical imperatives, both in the public, and in the private, sectors.

The first need is to dispel confusion. In the private sector in the Indian Union at the present time there is a rooted objection to exports 'at a loss'. The assumption is constantly made that any additional compulsion will be necessarily a reduction of profits, being a subtraction from the volume of profitable internal sales. This is probably Government's own thinking on the subject, but it is not necessarily written into a situation in which export targets are now to be fixed. It is possible to fix the internal and export targets at a level above the existing targets of the Plan, provided the necessary imports to be financed by foreign exchange are earned by additional exports and provided existing capacity can be utilised to cover the increased targets of production. This—and not the cutting back of the internal supply which will lead to a rise in the internal prices—is the answer to the problem. Mr. Nanda cannot have it both ways. He speaks confidently about maintaining the price line, but proposes in the same breath higher excise duties to restrain demand and the diversion of supplies to export markets, both of which will be strongly inflationary. The only

way in which the export targets can be maintained whilst maintaining internal price levels and supplies is by increased targets of production to cover internal and export needs.

This, and no other, is the central problem now to be solved. Is it possible for India to add—not subtract—new export figures to our internal production targets? If so, how is the foreign exchange component for raw materials and possibly some balancing plants to be met? Secondly, what particular effort will need to be made internally so that production is obtained so as to satisfy internal demand fully whilst providing the proposed margin for exports? If raw material guarantees, where they need be provided, are not made, the Government of India will be imposing on Indian industrialists an impossible choice and on the price level an ineffectual decree to stay where it is. The first of the studies to be undertaken by the Planning Commission should, therefore, relate to those commodities in which the raw material allocations can be immediately made; secondly, the fixing of new targets for the "quick" utilisation of unutilised capacity. In the Blue Supplement, published with the issue of *The Eastern Economist* of August 11, 1961, an indication was given of the wide range of unutilised capacity in Indian industry. Some at least of this lack of utilisation is connected with the absence of spares and raw materials, though probably much less than the private sector would have the country to believe. The first step must be the guarantee of all additional raw material requirements connected with the "additional" exports proposed. This is possible since the earnings from exports would always be substantially greater than the raw materials required to sustain those additional exports. On the other hand, it cannot be that every industry is equally placed in this respect. In some cases the additional charge for raw material imports might be so heavy in relation to export earnings that they should receive low priority. What is needed is an immediate balance sheet of priorities and import and

export demands of raw materials required to export additionally in order to meet our balance of payments.

The problem of losses to be incurred in order to export at a world price as against the high Indian domestic price also needs to be solved by additional, not by a diversion of internal, production.

Indian export policy is by no means unique. Most countries are exporting at a figure below their domestic price of production. India has erred in allowing her domestic production in some commodities to move unduly far from the international price. The case of sugar where the international price is Rs. 400 per ton as against the domestic price of Rs. 700 per ton without excise duties, is the most glaring of our failures. But it is not necessarily true that our capacity to export is greatly limited by the high cost of internal production. If existing capacity is fully utilised, and our full overheads are not thrown on our exports, there is a very large number of industries in which India is still competitive. Sir Biren Mookerjee, Chairman of the Indian Iron and Steel Company, has pointed out that we are on the threshold of great opportunities in steel and engineering provided we can now frame a policy in the right terms. What are the elements of that policy? Surely they are, firstly, that where there is installed capacity, additional production is to be sold abroad covering prime costs and not necessarily full costs including overheads. There will be some margin in many industries to permit of ex-

ports, if costs are reckoned without full domestic overheads which have already been covered by the internal sales. Profits will vary greatly. But so long as there are no excessive losses there should be no unwillingness on the part of private industry to export covering prime costs only when internal sales are not reduced.

It is sincerely to be hoped that Sir Ramaswami Mudaliar Committee, reporting at the end of this year, will place this particular problem in perspective by enunciating the right priorities and principles by which a vastly expanded export effort can be based on the supply of additional raw materials to exporting industries so that they might utilise capacity which is now idle. In these terms neither private industry nor the country needs to export at a loss. They can, indeed, be made to export at a profit. But in any case, the policy cannot wait for a nice calculation of profitability in each case. Again, the task of gaining exports is too urgent for it to be dealt with by any more political statements of which we have already had too many. This is the time for action under imperatives which should admit of no exception. Let the Government frame export targets within the month; industry will soon find ways of raising production (and in the process reducing costs); more slowly, it will find the capacity to export. The country will then realise what has been impossible for four years can be accomplished by the power of will. That will be, truly, the beginning of wisdom.

The Neutral Summit

IT is a cruel irony, but an undeniable fact, that if Moscow had not shocked the conscience of the world with the pronouncement of the Soviet Union's decision to resume the nuclear tests, the deliberations of the neutral nations' summit conference would have rambled over a vague field and the utmost that could have emerged would have been a reaffirmation of the familiar platitudes and slogans. Before the conference ended, Russia held three nuclear tests in amazing succession in the briefest span known to atomic history. Whether the timing of the pronouncement and the actual resumption of the tests were intended to convey any special meaning to the delegates at the conference will remain a subject of speculation, but it would be naive to presume that there was no such design. It should be clear, however, that Russia made a miscalculation in the timing inasmuch as the reaction of the heads of State or Government assembled at Belgrade was patently adverse to her.

The first two days of the conference, occupied with the plenary session, gave the clear impression of a feast of speeches, most of the leaders enlarging on conventional problems like colonialism, racialism, general disarmament, co-existence, and so forth. These subjects, of course, were not without their individual merits and relevance to the international situation at the present time. Among other issues of discussion emerged the question of the limited reorganisation of the United Nations. There were no specific proposals in this behalf, but one could discern the earnest desire of the spokesmen of the African nations for a fairer representation for them and a greater accommodation for

their voice to be heard. The Communist gain, if it can be so called, was the added support which the spokesmen gave to the immediate admission of Communist China to the United Nations. But what was left unsaid on the real issue of re-organisation was of far deeper significance to Russia than what was advocated on behalf of China. Not one of the delegates endorsed Russia's proposal of the re-organisation of the United Nations on the troika pattern. That in itself was the most eloquent testimony of the unanimous rejection of this move, which was obviously seen as a device to neutralise the United Nations as a potential force.

Germany and West Berlin which lie at the root of the current crisis of assumption of warlike postures by the big powers inevitably figured in the forefront of the discussion and the leaders of the neutral nations urged upon the West to accept the fact of the existence of two Germanys and impressed upon Russia the urgency of guaranteeing West Berlin's free access to the outside world. This was to pronounce opinion on the merits of the two facets of this burning problem, but to go no further in making any tangible proposals. Mr. Nehru's weight on this question was considerably weakened by the positions he took with regard to West Berlin and subsequently corrected them. A passing reference was all he could allow himself on this subject.

But his real contribution to the deliberations of the conference (and in fact its sole solid achievement) was his successful and impassioned advocacy of giving overriding priority to the gravest of threats of war held by the sudden shift in

Russia's strategy to resume nuclear tests and America's retort to it. It was this advocacy which gave a sense of direction and some substance to the business transacted at the conference. In making the most fervent appeal to Russia and America to halt this dangerous race and to come together at the conference table for talks on reimposing the ban on nuclear tests in the first instance, the

neutral nations are doing the utmost that lies in their power to pull the world from the brink of the deadliest of wars. The neutral summit thus ended in a passionate plea for the potential summit of the Big Two to save the world from disaster. How soon and how effectively will the plea be heard? Thereby hangs a big and tormenting question mark.

Guest Editorial

The Decision to Test Again

By WILLIAM REES-MOGG

THE Russian decision to resume nuclear testing is a very extraordinary one. The arguments against taking such a decision must have been very strong, even in the Kremlin. Apart from the real danger from fallout it provides the United States with an extremely important propaganda victory. It must alienate the non-committed powers, and will affect Russia's standing in the United Nations. It makes the whole paraphernalia of the peace campaign look ridiculous.

Nor are the military reasons in favour of resuming testing at all self-evident. Until the decision was announced the Americans who wanted to resume tests argued that the United States, with rockets of comparatively small load capacity, needed to resume testing in order to produce light weight nuclear warheads with a destructive power equal to the heavy pay-load of the Russian rockets.

This argument was not itself convincing, but it did point to the fact that Russian nuclear capacity and rocket systems are capable of destroying any conceivable enemy or group of enemies, with a wide margin to spare. The same, of course, is true of the United States. If the deterrent is already adequate, and likely to remain adequate in any conceivable circumstances, why then should the Russians feel the need to experiment further?

The American view is that this represents part of the move by Russia into her period of strength. The Russians feel that their physical military power is now the greatest in the world and that, therefore, they can afford to use bullying tactics in order to get what they want. The threats on Berlin, the resumption of tests, the deliberate creation of an atmosphere of crisis, are all signs of a consciousness of a new military superiority, and of the determination to use it to overawe the world.

This may well be the right theory, or at least partly right. It does, however, imply that Russian thinking is strangely naive. When two men are standing with pistols to each other's heads the calibre of the pistols is not particularly important. No power can start a nuclear war without itself being certainly annihilated. The room for military bluff must therefore be limited.

What must be true, however, is that in Russia, military needs, or fancied military needs, are bound to be given excessive weight, simply because defence takes up so large a part of the national expenditure. With about 40 per cent of the United States national income Russia mounts a similar scale of defence effort. Whereas this effort takes about 10 per cent of the disposable resources

of the American nation, in Russia it takes about 25 per cent. These figures need to be treated with some caution, but they are an indication of orders of magnitude. Both sets of figures include the space programme under defence — and rightly so.

There are two questions which need to be asked about the Russian defence effort. The first is how a country can be persuaded to devote a quarter of its income to defence? — and the second is what effects such a policy is likely to have?

There can be little doubt that the reason Russia is able to devote such a disproportionate share of wealth to its defence programme is, quite simply, that total State ownership leads to an exaggeration of the functions of the State, and an impoverishment of the functions of the individual. This is the precise opposite of the case Professor Galbraith makes in his book, "The Affluent Society".

Professor Galbraith in effect complains that American individualism means that money is spent on things which the individual wants which ought to go on the needs of the community — too many Cadillacs and too few hospitals. The Russian system is subject to exactly the opposite bias. Too many resources are devoted to the service of the State, and too few to the service of the individual — guns before butter was the old phrase for it.

The effects of this policy must almost all be bad. There is, of course, a gross economic distortion — Russia has a wonderful growth record, but in a real sense it is growth in the wrong direction. There must also be a political distortion.

The purges under Stalin, or the role of the army in maintaining Mr. Khrushchev in power, show that you cannot give a set of soldiers control of a quarter of the national income without also giving them a very strong potential influence on national policy. No doubt the politicians are jealous of their own power, but they can only preserve it by conciliating or by massacring so important an interest group.

Tyrannies tend to be militarist—because the State depends on the army. It does not follow that they are genuinely warlike. It is a comforting thought that in the next war half the Red Generals would be dead in the first twenty-four hours. That must weigh with them as an argument for prudence. Even Stalin did not act so quickly.

A DELHI DIARY

MOSCOW GETS TOUGH

THIS Diary partakes of the surrounding gloom. I cannot remember any time since 1939 when the international signs looked so threatening. Naturally it is difficult in Delhi to get a measure of the extreme tension in Berlin and the new "resolution" on both sides. But there seems little doubt even from peaceful Delhi that Moscow is getting tough. Toughness, as a policy in the Kremlin, is not new. Under Stalin it was an everyday affair. The chances then were that Russians themselves would be its victims much less than the neighbouring States. It is to be remembered that the greatest challenge that Stalin faced, according to his own account, was in the collectivisation of the thirties. Many—too many!—Russians know what toughness means. But toughness in Comrade Khrushchev somehow or another strikes an anachronistic note. His very built is that of a jovial dispenser of friendship and, at any rate, in India the picture of him is more of a Father Christmas rather than of Great Avenger. It has, therefore, been almost impossible for those of us in Delhi who have not understood the zig-zag course of Communist doctrine to recognise that a man like this can cease to be the spearhead and become an instrument of a grim machine. The machine, for reasons which are not entirely clear, has suddenly changed its character. Dr. Jekyll has become Mr. Hyde. It is determined to get what it wants at almost any price and Mr. Khrushchev is now talking the language of force, and what is more has acted aggressively twice within a fortnight. The first of this, the blocking of Berlin, looked like Mr. Ulbricht's work, but it was soon seen that great walls of concrete which now divide East and West Berlin were a Soviet invention. This was followed by the unilateral rejection of the nuclear test ban treaty and current reports suggest that within the week, the Russians have tested three Hydrogen Bombs in the "intermediate" range. Any one of these bombs could wipe out three or four cities of the size of Delhi in a few minutes! The word 'intermediate', therefore, should give us no consolation.

THE NUCLEAR TEST ISSUE

While people in Delhi are still trying to understand the significance of these events—on which they are necessarily uninformed because some of the technical literature on this subject is so difficult to follow—there has been much wishful thinking on the Neutral Nations' Conference. It is almost certain now, notwithstanding the Neutral Nations' Conference, that America

will be forced to follow suit and perhaps other countries, will resume testing later. It is right that one should recognise that this new danger is far greater than the raising of walls between East and West Berlin. The Prime Minister is now in Moscow but he does not have a chance, it would seem, of bringing his influence to bear on the Russian Prime Minister. Did not Comrade Khrushchev say on July 10, 1961: "Even if all the countries of the world adopted a decision that did not accord with the interests of the Soviet Union and threatened its security, the Soviet Union would not recognise such a decision but would uphold its rights, relying on force"?

THE PRIME MINISTER AT MOSCOW

In the face of this utterance few of us have been disposed to attach much importance to the Prime Minister's Moscow visit. We are naturally proud of the part the Prime Minister has played at Belgrade Conference and of his success in giving the Conference perspective, taking it away from petty issues which are unrelated to the major threat to peace posed by the current Berlin problem and by the refusal of the U.S.S.R. to stop nuclear testing. It is interesting to note that even President Tito deprecated a statement on this issue, but the Prime Minister declared himself unambiguously that he was against nuclear testing "at any place and at any time." That at least is the kind of dynamic neutrality that India—and the world— sorely needs. There is no doubt that if the Prime Minister's personal weight can have an effect on Soviet policy (which many of us take the liberty of doubting) it must be in the acceptance of some restriction on nuclear testing which rightly the Prime Minister considers a major retrograde step. But did not the Conference, except for the Prime Minister, give forth a very uncertain sound? It looked as though it were afraid to come out openly against nuclear testing. Have the neutral nations only the capacity to make appeals? If so, their role looks pretty petty or should I have said pretty pitiful?

HARRY CURRAN

Let me pass from disagreeable nations to a very agreeable person. I am choosing Harry Curran, Representative of the World Bank (who left New Delhi on Wednesday for his new post in Paris) as my Man of the Year. To my (happily expanding) reading public, I expect, Harry Curran means very little; I have known no one in Delhi who has so assiduously kept his light under a bushel. Ten years ago as Treasury Representative for the United Kingdom, he helped us to find a formula which, in those uncertain times, allowed us to draw any amount we liked from our sterling balances. Those who saw what use we made of this liberty in 1957-58 may think less happily of Harry Curran's efforts. But I am old-fashioned enough to think that the capacity to use the sterling balances helped us to escape from the extreme diffidence which presided over our First Five-Year Plan. Don't forget its original national income target was 11 per cent in five years and our population was increasing at 2.1 per cent per year. Will you kindly figure out how much per capita progress our First Plan provided if both figures enclosed us at the time.

However, Harry Curran's claim to India's gratitude is based on his work of helping in underwriting our foreign exchange for the Third Plan. I dare say—comparisons remain odious!—that, of all those in Delhi, his has been the greatest contribution. This is not merely because of his fine judgment and advocacy; it is because of the high esteem in which he is held by the Bank's President, Eugene Black, whose name has worked many revolutionary changes under a conservative guise. Now, apparently, Mr. Black thinks there is no more great work to be done in Delhi: they say the greatest organisers in the world are those that make themselves unnecessary at the point of operation!

ARGUE.

What a Life!

THE WEEK'S NOTES

U.S. Aid Bill

A HAPPY HALF-WAY HOUSE

IT IS some compensation that Congressional opposition to the authorisation for the President to draw directly from the Treasury a total foreign economic aid amount of \$8.8 million during the period of five years and thereby dispensing with annual appropriations did not maintain its original rigidity. The joint House-Senate committee has struck a compromise formula and it is to be trusted that when the Bill passes the final legislative stage and goes for the President's signature, it will not be diluted any further. President Kennedy's imaginative policy of long-term aid and the amount of hard work he poured into trying to get Congress to agree to it have not met with the response they merited. At one stage the Administration showed its readiness to accept authorisation for three years, but the proposal could not find acceptance with Congress. In this context it is worth while recalling that Congress maintained its jealous control of the purse with greater care during Mr. Eisenhower's second term of office and granted somewhat smaller appropriations than he had asked for.

The formula forged by the joint House-Senate committee does not relax Congressional right of appropriations year by year. For the current fiscal year aid of the aggregate amount of \$1.2 billion has been voted as asked for. But the distinctive and attractive feature of the formula is that the President has been empowered to enter into commitments of long-term aid with the receiving countries totalling \$6 billion, with a stipulation of an annual ceiling of \$1.5 billion for the next four years. The half-way house thus marks an improvement granting authorisation to the President to commit the Administration to long period aid and reserving actual appropriations year after year for Congress. Here there is a moral obligation on the part of Congress to honour the Administration's commitments when they come up for the annual vote. This procedure cannot, however, be equated with the blanket authority to make promises of assistance and provide the finance by straight drawings of funds from the Treasury without bringing Congress in the picture each year. Although the commitments will be ordinarily backed by appropriations, the known sympathies of Congress or its disfavour for certain programmes of aid or economic and political policies pursued by some beneficiary countries or for the way they utilize the aid will operate as a vital consideration for the Administration in entering into the individual long period commitments now authorised.

Penal Code

SUPPRESSING COMMUNALISM

THE INDIAN PENAL CODE (AMENDMENT) BILL, which was passed by the Lok Sabha last week, has for its purpose the object of providing a more effective punishment via Section 153A for promoting or attempting to promote enmity or hatred as between groups of various descriptions—religious, racial, linguistic, caste or communal. In essence, it aims at suppressing the resurgent communalism in the body politic. One major objection raised by the Opposition speakers was that the timing of the Amendment Bill clearly indicated the intention of the ruling party to put the opposition parties in a position of disadvantage by invoking the amended law. While Mr. Shastri conceded that it was during the general election campaigns that communal passion or hatred or enmity was aroused by some propagandists, he would forthwith give the assurance that the amended law would not be abused in the manner alleged. His assurance ought to be accepted at face value.

An astonishing provision of the Amendment Bill is that it places on the accused the onus of proof of absence of his guilt. This runs counter to the general principle of criminal jurisprudence that the burden of proof should be on the prosecution. In vindication of the shift in onus it is pointed out that the prosecution finds difficulty in getting witnesses with knowledge to tender evidence in the open in the law courts. Would the accused not suffer from the same handicap when the cases of this class create, as they are expected to create in a large number, a sensation in the local area concerned?

The efficacy of law for the suppression of communalism by deterrent or higher punishment is to be seriously doubted. Communalism once suppressed may rear its head. The proper remedy is to eradicate it by creating the necessary climate—social, political and economic. The Government's vain effort for the past several weeks, intensive though it has been, to evolve some formula to ban communal parties should bring a realisation of this basic difficulty and of the need of the right approach. What two elder Congress members said during the debate on this Bill should come as a painful home truth to the party in power. Mr. M. S. Aney said that the supporters of Master Tara Singh and Sant Fateh Singh should be punished rigorously, but those who created communal disharmony and bear responsibility for the Jabalpur riots should also be visited with similar punishment. The sting, of course, is in the reference to Jabalpur. Whom does the cap fit? Mr. Arun Chandra Guha was blunt in castigating the Government for having to introduce a Bill of this character fourteen years after independence. Are those parties which select their candidates at the elections according to the communal or caste bias in the constituencies less guilty of promoting communalism than persons who do so openly? Can the Congress Party vouchsafe that it is free from this bias?

Brazil

BRAKE ON LEFTWARD MOVE

THE SUDDEN resignation of President Quadros, followed by his departure to Britain, marks the culmination of a crisis that was developing for the past few weeks. The rest of Latin America cannot be indifferent to the forces that lie behind the crisis, because in a continent studded with small republics Brazil stands out as a giant, commanding an economic and political potential to give guidance to the rising urge for a new order and greater independence of action. During the brief span of office which he allowed to himself, Mr. Quadros achieved quite a good deal in every direction. The major problem of fighting inflation was being successfully tackled with a right strategy. A boost was given to production by means of greater incentives to private investment, consumer subsidies were being cut down, the exchange racket was being put down with a stern hand, coffee exports were being stimulated by a ruthless insistence on quality and the tax collection machinery was being tightened where the need was most pressing—in the upper income brackets. Further, a programme of the reform of land tenures was under preperation.

In the sphere of foreign affairs, Mr. Quadros was striving to establish the policy of neutralism. His trade agreements of bilateral balance with the countries of the communist bloc and the loan aid of about \$200 million from the United States were typically characteristic of neutralism—but in economic affairs. His advocacy of enabling Cuba to reduce its dependence on Russia, on whom it is leaning to a point of negation of real independence, also found general acquiescence.

But some of his adventures in the field of international politics were too much to swallow — at least for the right wing parties which are still numerous in strength and the army. His commitment to support Peking's membership of the United Nations brought matters to a head and his action in honouring Major Guevara of Cuba with one of the highest military awards of Brazil filled the cup to overflowing.

President Quadros attributed his precipitate decision to resign to the pressures of reactionary forces which threatened to neutralise his capacity to function. But he seems to have let the truth slip when he announced that, if he were called upon to stage a comeback, it would not be in a democratic set-up. The army, it appears, was planning to put a curb on the presidential powers by means of constitutional changes. The question of a successor to Mr. Quadros was not a little embarrassing. Vice-President Goulart, who was away on a goodwill mission to the Far East, hurried back to his country. But his avowed greater leftist leanings and his background as the most popular trade union leader in his home province of Rio Grande do Sul created more complications in his claim to the presidency, which, however, could not be brushed aside. The army generals from Rio Grande showed signs of mutiny and the dismissal of three of them could not promise to settle the issue. As we go to Press, Mr. Goulart has received a unanimous invitation from the army to assume office, but not before the Chamber of Deputies and the Senate were prevailed upon to change the presidential system under the Constitution to the British pattern of the Cabinet Government. What modifications it takes in the Brazilian set-up, time will decide. For the present, a brake has been applied to rapid change to the left.

Deposit Insurance

THE SECRECY CLAUSE

OPINION WAS overwhelmingly behind the proposal for setting up a statutory organization for the insurance of bank deposits and its urgency was being pressed in the past few months as a part of the programme of the rationalisation and reinforcement of the structure of banking in the light of a few weaknesses which attracted attention after the failure of the Palai Central Bank. It is nobody's case that deposit insurance offers a fool-proof protection or a substitute for sound bank management practices. But it is undeniable that it buttresses confidence in the safety of deposits in the small and medium-sized sector of banking. The scheme of the Deposit Insurance Corporation has been soundly conceived after drawing upon the experience of the United States in particular. The major provisions of the Deposit Insurance Corporation Bill will be found set out in our separate feature, "From the Capital's Corridors", elsewhere in this issue.

Clauses 34 to 38 of the Bill deal with a delicate issue relating to this sensitive industry. In pursuance of them the insured banks are placed under an obligation to submit returns and information on matters specified by the Corporation and this would involve divulgence of information now protected from disclosure under the law. Similarly, the Corporation may ask the Reserve Bank to conduct an inspection or investigation into the affairs of an insured bank. But the report prepared and furnished on the basis of the inspection or investigation is entitled to privilege against compulsory production in a court of law or before an arbitrator or a similar authority.

Real delicacy attaches to the returns and information inasmuch as the Corporation's Board of Directors is to include two nominated non-officials, although of undoubtedly high standing. Information which could

be legitimately claimed as confidential will thus be exposed to outside knowledge. But it is difficult to see how the Corporation could function as a sound insurer without access to such information. The Governor of the Reserve Bank is the ex-officio Chairman of the Corporation and if knowledge of this type of information was exclusively confined to him (and to the Bank) by delegating this authority to him, the Board of Directors will need to accept his decisions and discretionary recommendations for the management of the Corporation's affairs touching these questions. In that case the directors may find their status reduced to that of passive members in matters arising out of the issues concerned and to that extent the corporate personality of the organization will suffer. To get over the difficulty posed, Clause 39 provides that the directors, auditors, officers and other employees of the Corporation shall take an oath of fidelity and secrecy in the form prescribed in the First Schedule. This should serve as a satisfactory safety valve. Nevertheless, this extraordinary power must be used by the Corporation with great circumspection.

Law and Order

TRAGIC TRENDS

TO WHAT a deplorable condition the maintenance of and order is reduced in some cases and in some areas is tragically demonstrated by the strong strictures passed against a police official in Uttar Pradesh by Mr. Justice A. N. Mulla. The strictures would have hardly merited pointed attention, if they could be treated as condemnation in an isolated case. But, if the Press agency report of the judgment is accurate, they go far beyond and are expressly meant to denounce a state of affairs which the Judge has generalised with righteous indignation. The matter arose out of a petition made by inspector of police to the Lucknow Bench of the Allahabad High Court in the course of the proceedings started against him for fabricating false evidence in a prosecution for an offence punishable with transportation for life. It was with great hesitation and reluctance that the Judge accepted the apology tendered by the petitioner, the primary consideration which is said to have weighed in the adoption of this attitude of leniency being that "where every fish stinks, it is idle to pick out one or two and say that these only stink". But the purposeful generalisation which Mr. Justice Mulla is reported to have made bears quotation for the gravity of the situation it exposes: "I say it with all sense of responsibility that there is not a single lawless group in the whole of country whose record of crimes is anywhere near the record of that organised unit which is known as the Indian Police Force." These are solemn words, presumably based on the long experience of a Judge, who is on the verge of retirement.

There is yet another aspect of the manner in which lawlessness is shielded and encouraged in a most flagrant manner. The case came for attention on the floor of the Orissa State Legislative Assembly and the Law Minister confessed to a sense of disgrace about it. Certain persons convicted by a law court are at large and the sentence passed against them remains unexecuted for no other reason than that they are taking this licence with the connivance of officials. Some may question whether there is a chain of connivance and, if so, how high it goes. The Law Minister has started an enquiry into this affair and the expectations are that the convicted persons will be lodged where the law orders them to be confined and those responsible for enabling them to be at large will be brought to book and punished severely. To what extent the second expectation may be fulfilled needs to be watched.

The World Abroad

INSIDE A VANISHED INDIA

By
ODYSSEUS

RARELY HAVE I ENJOYED a book so much as "Punjabi Century: 1857-1947" (Chatto & Windus, London, Price 21sh.), by Mr Prakash Tandon, the first Indian to become Vice-Chairman of Unilevers in Bombay. I take it that, to hold down so responsible a post, he must be an able businessman. His book reveals him as much more—a gifted writer, who has a vivid, indeed a poetic, command of the English language. He has done for the countryside of the Punjab what another superb writer, Sudhin N. Ghose did for the folk-lore of the Santal Parganas in "Cradle of the Clouds," and Nirad C. Chaudhuri for the backwaters of Mymensingh in his "Autobiography of An Unknown Indian."

Nothing, says Mr Maurice Zinken in an introduction to Mr Tandon's book, is more important to the illumination of history than good autobiography. It is particularly valuable in times of transition. Documents and statistics can give the facts of change, but only Cicero's letters tell us what the fall of the Roman Empire meant to those whom the Republic mattered. Domesday Book provides the land records after the Norman conquest of Britain, but what would we not give for a Saxon peasant's first hand account of what happened when the Normans established their raj? Of third century B.C. Magadha, we have tantalising glimpses through Kautilya's "Arthashastra," and Asoka's rock edicts, but as, thereafter, the empire crumbled into its component parts, how fascinating it would have been if some Indian John Gunther had travelled around gathering eye-witness accounts for an "Inside Magadha." We, and posterity, should be grateful to Mr. Tandon for his record of life in the Punjab before and during its break-up.

THE PRE-BRITISH PUNJAB

In three generations, between 1857 and 1947, staggering changes have transformed India's mofussil and social structure. Mr Tandon's account of these changes is and must remain unique, for nobody will ever again be in the position that he is. Mr Tandon has the good fortune of a retentive memory, which enables him to set down the stories told him by his grandfather and granduncle, who knew the pre-British Punjab. He follows this with the story of the career and times of his father, one of the first Indian canal engineers to be trained at Thomason College, Roorkee. Mr Tandon himself stardles the last tumultuous decade of the British raj and the first of the new India.

Now, as India settles into its new, managerial world of industrialisation, and imposes the Socialist, on the ancient, pattern, the generation which is growing to power no longer knows what the old India was like. But the ancient pattern had its set of values, in the security of social and family obligations, in the intimate contact between townsman and villager, and its own charm in the leisurely pace of life with its unsophisticated pleasures.

We are apt to pity the peasantry of India for the monotony and drabness of their lives. Mr Tandon's sparkling descriptions of wedding tamashas, the hospitality due to visiting relatives and guests, the conscious artistry and choice selection of classical language of a carefully organised, and hugely enjoyed, day-long quarrel between women, the varied round of festivals—Lohri, Basant, the farmers' boisterous thanks giving;

Holi; Besakhi, a secular feast in which Hindus, Muslims and Sikhs all participated; Rakhri, the festival of the protection tie; Dusserah, the performance of the entire cycle of the Ramayan by the villagers themselves, in which all the small boys vied with each other to secure the envied part of a monkey in Hanuman's army; and Diwali, the festival of the home when families unite; the uproarious antics of the Mirasis, a caste who beat drums and played the shehnai (a flute with a trumpet end) at weddings and other celebrations, and whose speciality was the wit and repartee which they let loose, with traditional immunity, on the highest and lowest in society; the farmers who danced the Bhangra; the hereditary Bazikars (acrobats); Madaris (jugglers); Saperas (snake charmers); the Behroopia (whose speciality was to disguise himself and act a role at a party—as, for example, of a toothless old hag—which took everyone in, until he threw off his disguise and revealed his true identity, provoking amazement and laughter); the Punjabi love of good food—curds, buttermilk, thick chappatis, sarson sag, cooked mustard leaves, and pinnis (made of equal parts of sugar, ghee, and roasted gram flour); Mr. Tandon's nostalgic descriptions of these, and so many other colourful customs, do not suggest monotony but a satisfying, vigorous life. It is Mr Tandon's gift to posterity that, himself one of the outstanding members of the new generation, he had been able to catch, and describe in glowing prose, the flavour of these vanished, or vanishing times.

Mr Tandon recalls that when he was at school, his history text book ended with a chapter on the blessings of the raj—law, order, irrigation, roads, bridges, schools, railways, telegraphs, public health, and so on. In his generation, he says, these were taken for granted, but to his grandfather the new order meant much.

To those who had lived through the break-up of the Sikh empire, human rights and respect for life and property came as revelations: "They really understood what it meant not to be harrassed any more by marauding groups of disbanded soldiers.... If our generation began to be amused at the text book blessings of the British raj, my grandfather's took them seriously and praised unreservedly. So did my father and his generation, at least to begin with." His father "sometimes spoke to us of his stay at Roorkee as a dream. The thought that in two years he might become an engineer—he had never in his life met one—in one of the coveted Government services, with a fixed salary of an amount that he would hardly know what to do with, spurred him to work.... It is difficult to imagine his elation, and I find it hard to compare with anything in my life. Perhaps my joining a British commercial firm marked among us something just as new and daring...."

Indeed, it was. Those of Mr Tandon's generation (he is about 50 years of age) made a big contribution to transforming the India of their fathers. Thirty years ago, when Indian chartered accountants scarcely existed, he went off to England to become one. In England, he did not confine himself narrowly to the society of his own compatriots but carved out for himself a successful university career—reveling in the academic and social freedom of university life—enriching his experience by mingling with all sorts and conditions of men and women, without ever losing light of his Indian heritage. Over twenty years ago, when Indian executives in big British firms were rare, and

when business to many Indians was far from being an honoured profession, he recognised that industry had a contribution to make to the India of tomorrow. He met with some rebuffs from both Indian and British firms. The Indians were reluctant to pay him a living wage and the British had not yet reached the stage when they were seeking out young Indians. But honour where honour is due: Unilevers had the vision to snap up a capable man when they saw one.

RANCOURS FORGOTTEN

As he made his way up the Unilever ladder, Mr Tandon has again and again been the first Indian to hold his position: the first Indian in market research, the first Indian head of a division, the first Indian on the board, the first Indian Vice-Chairman. That Mr Tandon's generation has taken over from Englishmen the keys of Indian society makes their experience wholly different from that of their fathers and of their sons alike. Just as Mr Tandon's father took for granted the law and order which amazed his grandfather, but was elated by the strangeness of becoming an Indian canal engineer, so Mr Tandon's sons will take their right to be leaders in their own society for granted, and know nothing of their father's elation as a pioneer—save by reading his book.

One point that makes Mr Tandon's pages especially pleasant and encouraging is that they suggest that the political rancours that were unavoidable between Indians and British of my generation are happily dead. We meet today as equals, who have much to learn from

each other, in political and economic cooperation, and cultural and social good fellowship.

As for the past, anyone who has the curiosity, and the leisure, will add to his enjoyment of Mr Tandon's earlier pages, covering the Punjab's first years under the British raj, by reading Percival Spear's "Twilight of the Moghuls" (Cam. Univ. Press, 1951), which describes the advance of the British to the Punjab and what they found there, and, secondly, "A Year on the Punjab Frontier in 1848-49" by the redoubtable Herbert Edwardes. This was published in 1851 and presumably is only obtainable from a public library. It provides a fascinating background to Mr Tandon's recollections of his grandfather, Maya Das, who lived through the stirring events that Edwardes describes. Mr Tandon's father helped to turn the deserts, over which Edwardes marched and fought, into the smiling canal colonies which Mr Tandon knew as a boy.

As for the future: let us be mischievously embarrassing and ask: What next for Mr Tandon? The first Indian Chairman of Unilevers? Eventually the first Indian chairman of the parent company in London? Mr Tandon ends his story in 1947. If, occupying the key positions of ever increasing importance that he has, Mr Tandon, with his imaginative insight into men and affairs, and his gift for English prose, fails to write a sequel covering the tremendous first decade of independence, may rakshasas pursue him from re-incarnation to re-incarnation! Mr Tandon: You have been warned.

ORIENT PAPER MILLS LIMITED.

Regd. Office: Brajrajnagar (Orissa)

NOTICE is hereby given that the Forty-Third Annual General Meeting of the ORIENT PAPER MILLS LIMITED will be held at the registered office of the Company at Brajrajnagar in the district of Sambalpur (Orissa) on Friday, 29th September, 1961 at 3 P.M. for the following purposes:

- To receive and consider the report of the directors and to adopt the audited accounts of the company for the year ended 31st March, 1961.
- To declare dividends on Preference and Ordinary Shares.
- To elect Directors in place of Shri Shavax A. Lal who retires by rotation and in place of Shri R. K. Somany who retires by rotation as well as under Section 261 of the Companies Act, 1956.

Shri R. K. Somany is an associate of the Managing Agents and has been on the Board of Directors since almost the inception of the Company. It is considered desirable to avail of his valuable advice by retaining him as a director of the Company. The Company has received the requisite special notice from a shareholder and accordingly the special notice is hereby given to the shareholders for passing the following special resolution for re-appointment of Shri R. K. Somany as a director of the Company.

"RESOLVED that Shri R. K. Somany, an associate of the Managing Agents, be and is hereby re-elected as a director of the Company".

- To appoint Auditors for the current year and to fix their remuneration.

By order of the Board,
B. K. VYAS,
Secretary.

8, India Exchange Place,
Calcutta, the 21st August, 1961.

- N.B. (i) A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.
- (ii) The Share Registers and Transfer Books of the Company will remain closed from the 29th August to 14th September, 1961, both days inclusive.
- (iii) The dividends, when declared, will be payable to registered shareholders as on the 14th September, 1961 on or after the 25th October, 1961.

The European Scene

PARIS AND MR. H

From Our Special West European Correspondent

PARIS, September 2.

IN the hostility that France now shows the United Nations and its Secretary-General, one needs to distinguish two different elements. First, there is the animosity that French Government and much of the French people would be bound to display toward that organisation when it interferes in the process of decolonisation that France is carrying through, extremely clumsily but nevertheless sincerely and irrevocably. Secondly, there is the peculiar contribution of President de Gaulle, who has ideas on the role of Great Powers in maintaining world peace, which do not coincide with the views of most of his countrymen but which do coincide with the opinion of Mr. Khrushchev. The President, who nowhere more clearly than on this issue appears a man of the 19th century, exploits the first sort of hostility to put across his view that Mr. Hammarskjöld's motley rabble of minor powers should not usurp the responsibility of the Great Powers, apparently believing that any such usurpation must always be to the disadvantage of France and the other Western Allies.

Yet if that were so, one would have to explain why Mr. Khrushchev pursues Mr. H with a ferocity and crudity of which French diplomacy is incapable. While Paris accuses the Secretary-General of partiality to the Tunisian cause and of lending quite unnecessary support to a move to hold an Assembly meeting that was bound to degenerate into anti-colonialist demagoguery, Moscow calls the same person "the valet of the colonialists", the friend of Moses Tschombe, the accomplice of the assassins of Lumumba, etc. Both cannot be right—or can they? Could it be that in using the UN as a machine to protect small nations, Mr. H is embarrassing a Great Power like France who is not liquidating her colonial positions quickly enough but he is also making difficult or impossible the policy that Moscow is counting on to extend the empire of Communism?

If this were the case, French reactions to UN interference would be extremely short-sighted. It could, at worst, complicate and envenom a painful retreat to which France is committed in any event, UN or no UN; but, over the longer term, it could, at best, check the spread of Soviet penetration which represents a much greater threat to France than material and moral losses suffered during an ungracious decolonisation. A confusion of this sort is pardonable in public opinion, which naturally reacts emotionally to appearances, but a longer view might be expected of statesmen. Among the other Western Powers, one sees a just appreciation of the issues only in Britain, where the insults and humiliation inflicted at the time of Suez have not blinded Government and opinion to the long-range effects of Mr. H's policy. Despite American patience with the UN one cannot be sure that there is the same realisation in the USA. Americans have so far little to complain of, because they have managed by skulduggery to keep their worst enemies, the Chinese, out of the UN and they have succeeded in blocking the organisation's interest in Latin America, even at the moment of the Cuban invasion. On both these points, the days of American obstruction are numbered. The necessary and logical development of Mr. H's policy is that he should befriend former US dependents as ostentatiously as he now does former French dependents in Africa. We shall see then whether Washington avoids the confusion into which Paris has fallen.

The hostility of a majority of UN members toward France and the disgust most Frenchmen feel for the UN are both richly deserved, but relatively unimportant. Without any prodding from the UN but learning

from her previous costly errors, France has in recent years given the UN more new members than any other nation, thus manufacturing the majority that will vote against her when she runs into trouble with some more intricate exercise in decolonisation. The verve with which Communist hypocrites and slave-trading sheikhs fall upon these temporary failures in an immense process whose liberal trend cannot be doubted is, of course, exasperating. Yet, fundamentally, the differences between France and the UN majority—arrogant huffs on the one side and hysterical impeachments on the other—come down to impatience to see concluded a process whose end no one doubts, but whose ultimate difficulties are underestimated by some (as in the case of Algeria) or overestimated by Paris (as in the case of Bizerta's evacuation). Obviously, in a year or so these affairs will be settled; the UN's ambition to regulate international life presents no permanent threat to France.

Quite the contrary in Russia's case. Mr. H's pretention to make the UN Secretariat an international executive entrusted with maintaining order and preventing conflicts, in the interest of the smaller nations, would be the undoing of Moscow's strategy for the encirclement of capitalism. That strategy depends on winning over to alliance with Communism one by one the ex-colonies that still supply the West with its raw materials—and meanwhile refusing any embryo of a world government that is not Communist-controlled or subject to a paralysing Communist veto. Several years ago, Moscow was entitled to think that this programme had a real chance of success, as Egypt, Guinea, Mali, Ghana, Cuba successively fell into its camp—not in becoming Communist states, but in joining the anti-Western coalition that would make the UN a Russian instrument for the reduction of every "capitalist" position. The Western Powers were unable to prevent this drift of many poor nations into Russian service. Capitals that had ordered the invasions of Suez and of Cuba were powerless to enlist a faithful following in the UN for very long. Their situation would become much more serious if (as is quite probable) the treasures the USA is lavishing in Latin America failed to stop the crumbling of her domination over the two score republics of that continent. Besides, the leaders of many newly independent countries seemed themselves powerless to control this drift into the Russian retinue; the "reasons" the leaders of Guinea and Mali gave for breaking with the West were so insubstantial as to appear frivolous.

In a world divided into two power-blocs and without any prospect of a supra-national authority (and hence, incidentally, no earthly hope of disarmament), one bloc's loss was inevitably the other bloc's gain. Since, at least, the neutrals refused (and were unable because of their own differences) to form a third bloc, and since all the recruits to neutralism after Tito must come from the Western side, the enlargement of the so-called neutral camp was tantamount to the increasing isolation of the capitalist world—which is the goal of Mr. Khrushchev's "peaceful co-existence". The process was hastened by the inability of the Great Powers to police international conflicts, as they did in days gone by, from the Pax Romana down to the period of British hegemony. Every local conflict brought the two blocs face to face, from Laos to the Congo, and their opposition meant that no local solution was possible without the country involved falling into the orbit of one or other bloc; at one point of the Congo and Laos affairs, Moscow was entitled to feel confident that it would always be the gainer, if necessary by the detour of a local partition of short duration.

Now Mr. H's effort to constitute a clientele for the UN, composed of small nations that break with the West without falling into Russian service, promises to ruin Moscow's plausible calculation. By vigorous, independent action of the sort he undertook in the Congo, in Laos and latterly in Tunisia he has shown that the UN can do the job previously done by a Great Power, it can police minor conflicts without bringing the power blocs face to face, so that the upshot need not be the passage of yet another raw-material producer from one camp to the other. Naturally, this policy requires Mr. H to show no sympathy for the Western powers and if necessary to defy them, as he dealt unceremoniously with Belgium in the Congo, with France at Bizerta and as he no doubt would with the USA if Cuba or another Latin American question falls into his province. The implication of Mr. H's programme is certainly the end of all Western "spheres of influence", but this is not unduly alarming for the European ex-imperialists, who have virtually wound up their empires in any event; and it might not upset the Americans either if they were sure that South American republics would fall behind Mr. H and not do as Castro was forced to do: embrace the Russians simply to signify his independence of the USA.

To carry his policy really far, Mr. H would need to get his hands on the one thing that tempts poverty-stricken small nations into one camp or the other: money.

If the day ever comes when the UN can distribute development aid on a substantial scale, the Western industrialised nations will have lost many political advantages they enjoy today because of their capital exports—but Moscow will, more importantly, have said good-bye to its dream of isolating and encircling the capitalist world. Even now, without much money to offer, Mr. H has demonstrated that political co-operation of small nations around the blue banner can limit the extent of the cold war and stop the expansion of one power-bloc at the expense of the other. Nothing he has done or could hope to do lends any colour to the nonsensical notion of a "world government", which, if ever it came, would be the work of one, or two, Super Powers to the disadvantage of all other nations. But he has shown that an independent UN Secretariat representing all the nations liable to be an object of competition between the big nations could be an influential force. In restricting the area of Western domination it would do little damage, because the West is already reconciled to this prospect and in fact has begun to profit from decolonisation. In restricting the area of Russian influence, it would ruin hopes of a progressive triumph of Communism. When Mr. Khrushchev attacks Mr. H, he is assailing the most serious opponent he has yet encountered. When Paris attacks Mr. H, it is reacting emotionally to insults that are indeed undeserved but break no bones.

MR. TUBOPHILE GOES WATER DIVINING IN TUBELESS TIMES

"It's here, it's here", screamed the Water Diviner, all excitement, "oceans of fresh water underground... enough to cultivate this land for ever and a day. In fact," continued the Water Diviner, when he had got his breath back, "there's water, water everywhere"... "All right, all right, but meanwhile there's not a drop to drink, and I am dying of thirst in the middle of this tubeless land," retorted Mr. Tubophile, really irritated. "Look here, chum, I've had enough of your tubeless mumbo jumbo. I ask for running 'hot and cold' and you take me to a dirty water hole! Then I ask for a drink of water and you suggest I burrow underground like a rodent. The truth, Sir, is simple. No tubes, no water! In fact, life without tubes is apt to be life without water and that's no life at all."

Economic Report from the U.S.

DR. HELLER ON U.S. ECONOMY

WASHINGTON, Aug. 31.

THE Chairman of President Kennedy's Council of Economic Advisers has given one of the clearest summations yet of the Administration's thinking on the current economic progress and policies of the United States. In the words of Dr. Walter Heller the U.S. economy is "well on its way to a strong and buoyant recovery." The rebound of the past several months, he remarked, has already carried production to new highs. In fact, it is his conclusion that the current upswing is even stronger than anticipated, and carries with it the prospect that significant inroads will soon be made into the sticky unemployment situation.

At the same time, despite the rapid pace of the upturn, he continues to favour the relatively 'easy' monetary and fiscal policies now in effect, and cautions against the adoption of restrictive policies that might choke off the recovery too soon. Dr. Heller made these views known last week in a speech at the University of Wisconsin's School of Banking. In so doing, he was returning to old and rather familiar haunts. Wisconsin is his native State, and it was at its State university that he received his graduate training in economics, although much of his teaching career was spent at the neighbouring University of Minnesota. The University of Wisconsin, incidentally, is considered a pioneer in the so-called pragmatic approach to economics. This is an approach based not so much on unrelated theory as on the practical investigation of the facts, and from this a delineation of policies designed to meet current and prospective problems most effectively.

Dr. Heller sees several basic factors that promise a continuing upswing in the U.S. economy. Among these are inventory restocking by business; a pick-up of investment in plant expansion and modernization by industry; an expansion of consumer activity; and Government stimulants, including the impact of the President's programme to meet the Soviet challenge in Berlin and elsewhere. Given these factors, he notes, economic policy must be alert to the dangers that lurk in any vigorously expanding economy. In particular, these involve at present a new round of inflation and a deterioration of the improving U.S. balance of pay-

ments position. However, in Dr. Heller's view inflationary pressures do not seem strong, and the deficit in the nation's balance of international payments promises to be considerably smaller than in 1960. For these reasons, in his words, "there exists a consensus within the Administration that present circumstances call for a continuation of a policy of monetary ease."

Such a policy, which is being followed today by the independent U.S. Federal Reserve Board, means holding interest rates down and making lendable funds available to the nation's banking system. It thus tends to act as stimulant to over-all economic activity. Nor does the President's Economic Adviser believe that present circumstances call for any sharp change in budget or fiscal policy. He holds that a shift from the currently contemplated budget deficit for the present fiscal year—now estimated at about \$5,300 million—to an anticipated budget surplus in the coming fiscal year will not be of such proportions as to slow the recovery.

In common with other Kennedy Administration officials, Dr. Heller sees in the 1959-60 experience a lesson against encouraging too drastic a switch in Government policy. It is his view that the economic upturn of those years was retarded and eventually stalled by two basic factors. One was a gigantic swing, in just one year, in the federal budget (from a deficit of \$12,400 million to a surplus of \$1,200 million). The other was an especially swift rise in long term interest rates—a rise which was influenced by tighter credit curbs imposed by an inflation-wary Federal Reserve Board. This does not mean that the Kennedy Administration is taking an inflexible stand on monetary and fiscal policy. On the contrary, Dr. Heller has indicated clearly that policy will be fitted to the requirements of the day. "It is fully recognized," he told his Wisconsin audience, "that if recovery turns into boom, if inflation threatens, if the payments balance worsens, central banking policy, as our most flexible instrument, can be quickly revised to become an instrument of restriction instead of a generator of expansion." On balance, however, his view is that today's prospects appear favourable to a continuation of policies that will encourage rather than retard the current economic expansion.

Special Article

THE THIRD PLAN, THE BANKS AND BANKING REFORM

By DR. OM. P. NUHAWAN*

AN attempt has been made in this article to study:

- (1) the important role the commercial banks are playing in our developing economy,
- (2) the requirements imposed by the Third Five-Year Plan on the banking system, and
- (3) the compatibility of recent banking reform proposals with the role the commercial banks may be called upon to play in the successful implementation of the Third Plan programmes.

Deposits of scheduled banks in India increased from Rs. 846.21 crores in 1951 to Rs. 1,022.32 crores in 1955 and further stood at Rs. 1,693.69 crores at the end of March 1961 (excluding P.L. 480 deposits). There has been a tremendous increase in the resources of the scheduled banks since 1955. This points to the fact that a greater part of national savings accruing from deficit finance and otherwise from an increase in national income have been flowing to the banking system by way of deposits. In fact for many years before 1960, the rate of increase of deposits with commercial banks has been more than the rate of increase of their advances. The rapid growth of industrial production during the last year of the Second Plan, however, created greater demand for funds on the banking system than it could meet. That the flow of savings into the banking system has increased considerably is also evident from the fact that while during 1950-51 only 2.61 per cent of total savings at current prices were attracted by the banking system by way of deposits, during 1954-55 this percentage increased to 13.8 and further to about 29 in 1957-58. However, it cannot yet be claimed that the banking system in India has acquired the importance and efficiency in mobilizing savings at the level of its counterparts in some of the more industrialised countries of the world. The increasing importance that the commercial banks in India have assumed in the matter of mobilizing national savings is also evident from the fact that while during 1950-51 total deposits of scheduled banks constituted only 9.3 per cent of the national income at current prices, during 1959-60, this percentage increased to 14.8. The extent of possibilities of mobilizing national savings may, however, be judged by the experience of some more industrialized countries. Against a percentage of deposits to national income of 14.8 for scheduled banks in India in 1959-60, this percentage in the U.S.A. in 1960 was 42.25, in the U.K. 32.12, in West Germany 36.30 and in Japan 60.79. Given due encouragement, the scope of expansion of banking activity in India is tremendous.

Apart from the increasing role commercial banks have been playing in mobilizing savings in the economy, their lending policies have also been changing consistent with the needs of the economy. During the first two Plans while total credit extended by scheduled banks increased from Rs. 546 crores to Rs. 1,333 crores, industrial credit upto October, 1960 increased by Rs. 410 crores or two-thirds of the total increase in scheduled banks' credit during the period, raising the relative share of credit to industry from 32 per cent to over 51 per cent. The importance of banks in the matter of industrial finance is also evident from the fact that in case of 1001 companies (representing about 77 per cent of the total paid-up capital of public limited companies

in the private sector) recently surveyed by the Reserve Bank of India, scheduled banks contributed 43.56 per cent to the total borrowings of these major companies in India and the share of bank finance in their total capital and liabilities stood at a considerably high figure of 11.70 per cent. Commercial banks in India are, thus, not only financing short-term working capital needs of the Indian industry, but by providing medium-term credit they are also aiding the capital formation of the private sector of the Indian economy. The genuine demand for funds from the industry for working capital and expansion and modernization purposes is increasing very rapidly. Due to a relatively lesser rate of growth of deposits, banks are already finding it difficult to meet this demand. In addition, the commercial banks are taking increasing interest in financing small-scale industries. With all this the resources of commercial banks in India are already strained.

THE CHALLENGE

The programme of the Third Five-Year Plan entails an investment effort of Rs. 10,500 crores compared to Rs. 6,750 crores during the Second Plan and Rs. 3,360 crores during the First Plan. It is noteworthy that investment in village and small-scale industries and organised industry and minerals will increase from Rs. 1,810 crores during the Second Plan to Rs. 2,995 crores during the Third Plan, an increase of over 65 per cent. In the private sector alone investment in fixed assets of industry is estimated to total Rs. 1,350 crores during the Third Plan. Investments of the magnitude envisaged during the Third Plan impose certain requirements on the banking system—that it must be geared to the needs of the developmental programmes of the Third Plan.

It is very difficult to visualize exactly what the requirements of the Third Plan may be. There are, however, various methods to make rough estimates of the requirements of the Third Plan on the banking system. Four different projections are made:

- (1) The Reserve Bank of India has stated that the business of commercial banks in India during the Third Plan will double itself. This means that at the end of the plan deposits of scheduled banks would attain a level of Rs. 3,388 crores and advances Rs. 2,673 crores, giving an advance-deposit ratio of 78.9 per cent which is considerably higher than the highest reached so far.
- (2) At the end of the Second Plan period (1960-61) deposits of all scheduled banks accounted for 11.7 per cent of the national income and advances 9.2 per cent. If we assume that national income will continue to bear the same relationship with deposits and advances of scheduled banks at the end of the Third Plan, deposits will reach a level of Rs. 2,223 crores and advances Rs. 1,748 crores, giving an advance-deposit ratio of 78.6 per cent.
- (3) The fact that deposits as percentage to national income increased from 9.3 per cent in March, 1951 to 11.7 per cent in March, 1961 and advances as percentage to national income increased from 5.7 per cent to 9.2 per cent during the same period, points to the fallacy of the above assumption. The

* The author is economist of the Punjab National Bank Ltd. His views as expressed in this article do not, however, necessarily reflect those of the organization.

increase in these percentages, more than anything else, shows that the monetary sector of the Indian economy has been expanding. In view of this it would be valid if we assume that due to developing banking habit, increased monetization of the already non-monetized sector of the Indian economy, and with the increase in economic activity and ensuing increased national income, deposits and advances as percentage to national income will increase by the same percentage points during the Third Plan period as they did during the decade 1951-61 (the investment efforts during the Third Plan being almost of the same magnitude as undertaken during the decade 1951-61). With this assumption deposits by 1965-66 should increase to 13.8 per cent of the national income or to Rs. 2,622 crores and advances to 12.7 per cent of the national income or to Rs. 2,413 crores, giving an advance-deposit ratio of 92.0 per cent.

- (4) There is, yet, another way, how we may project deposits and advances of scheduled banks during the Third Plan. During the decade 1951-61 deposits of scheduled banks (excluding P.L. 480 deposits) increased by 91.85 per cent and advances by 144.36 per cent. Should there be the percentage increase in deposits and advances during the Third Plan equal to the one experienced during the first two Plans, the level of advances at Rs. 3,265 crores would increase the level of deposits to Rs. 3,249 crores, giving an advance-deposit ratio of over 100 per cent.

Whatever the validity of the assumptions underlying the above estimates, an average of deposits and advances thus arrived at may be taken. This will give us estimated deposits of Rs. 2,870 crores and advances of Rs. 2,525 crores at the end of the Third Plan, giving an advance-deposit ratio of about 88 per cent.

A high degree of accuracy is not claimed for the above varying estimates. The idea is to bring out the demand that the investment efforts of the magnitude of Rs. 10,500 crores is likely to create on the banking system. The experience of commercial banks in India with respect to the accretion of deposits in relation to the demand for funds from commerce and industry during the past year has not been a happy one. The estimates made here show that the demand for funds from the banking system is likely to grow at a greater rate than the accumulation of deposits with banks during the Third Plan. The high anticipated advance-deposit ratio points to an unhappy situation with regard to the expected inability of the banking system to cope with the demand for funds that would be created due to the high magnitude of investments envisaged during the Third Plan period. Commercial banks will have to put in a concerted effort to increase the flow of deposits into the banking system. The efforts of commercial banks alone may not be able to accomplish the task. Without a definite lead from the Reserve Bank of India and the formulation of policies conducive to the expansion of the banking system, the task will become difficult of achievement.

THE REFORM PROPOSALS

Since the failure of the Palai Bank in July, 1960 there has been considerable confusion in all circles as to the stability, strength and the effectiveness of the banking system in India. It seems as if the failure of one bank has all of a sudden created some awakening in the minds of our policy-makers and strengthening the banking system has become the objective of our banking policy. Hence, legislation is being sought to achieve various reforms. While it is a welcome awakening, we have to be careful, lest in speedy legislation sought we lose sight of the role that the banking system

is called upon to play in the programme of regeneration of our national economy. In fact, it may be more important to strengthen the institutional channels and modes of behaviour than to institute reforms which would hinder the developmental process of the economy.

In principle the declining trend in capital-deposit ratio and liquidity of banks should not only be arrested but improved. Whatever the pros and cons of the proposals may be, fixing of a statutory ratio of capital to deposits would certainly limit the expansion of banking activity in the country. In as much as the banks are not able to raise the capital required for maintaining that fixed ratio, they shall have to limit their activities towards attracting deposits as well, which is hardly desirable in a developing economy and is inconsistent with the objectives of the Plan.

Further, the increase in reserve requirements and the liquidity ratio will limit the potential ability of banks to provide much needed finance for increased economic activity during the Third Plan period. Increasing the liquidity ratio will also mean some inflexibility in the earning assets of commercial banks. This along with limited resources would not permit them to vary credit to meet the seasonal needs of the industry. With a very high investment portfolio banks will also become susceptible to losses due to increases in the rates of interest. It will be in the interest of safety and stability of banks that their resources are built up to meet this contingency also. But a high level of interest-bearing deposits of banks in India and a higher liquidity ratio will affect the profitability of banks and hence their reserves adversely.

The proposed high liquidity ratio can create a vicious circle for banks in India. The high liquidity ratio will lower the profitability of banks which will not induce public investments for raising the fresh capital required to maintain the statutory capital-deposit ratio (the return on bank capital is already lower than in most of the industries). The non-availability of the required capital will put a limit on the flow of deposits into the banking system, resulting in an all-round stagnation of banking activity in India.

The implications of the proposed measures for strengthening the banking system, thus, do not seem to be consistent with the 'challenge' of the Third Plan which requires financing institutions to place increasing amounts at the disposal of entrepreneurs who are able to organize productive units. While these measures may not help in improving the working of banks, they are sure to limit the deposit attracting capacity, lending potential and profitability of banks in India and hence stagnate the banking activity.

The ultimate aim of the Reserve Bank's proposals is to provide a cushion to depositors in the event of a bank failure. It will, however, be more important to make banks safe so that such a contingency does not arise. The proposed introduction of deposit insurance should be helpful. Certain other measures like strengthening of reserves and for improving banking practices may also be taken.

Even with the liberal estimates of deposits made in this article for the end of the Third Plan, the credit requirements of the Plan would shoot up the advance-deposit ratio of banks to over 88 per cent which is considerably high for the Indian conditions. As such it may be suggested that any proposal for strengthening the banking system in India which would hinder the growth of deposits or which does not create environments for an accelerated growth of bank deposits is not worthy to be implemented for, that will never permit commercial banks to play the role which the magnitude of the Third Plan calls for.

THE BUSINESS WORLD

The Problems of Small-Scale Industries

A SPECIAL small-scale industries information exhibition organised in New Delhi in the first week of this month focussed attention on the numerous and varied problems which the small-scale industries have faced in the recent past. A number of guest speakers drew the attention of the Government to certain vital questions which deserve special attention if the targets set in the Third Five-Year Plan for these industries are to be achieved. By and large, small-scale industries have suffered in the past from paucity of finance, shortage of raw materials, absence of marketing facilities, out-moded techniques of production and lack of proper management. All these hurdles are basically born out of the smallness of the units. The various steps taken hitherto by the Government such as the establishment of the National Small-Scale Industries Corporation Limited and the setting up of the office of the Development Commissioner for Small Scale Industries have gone a long way in solving some of the problems, but much still remains to be done.

The fact that small-scale industries had not advanced even at the average rate of the over-all growth of the economy was clearly indicated by the National Income data. On the eve of independence, 10 per cent of India's national income originated from small-scale and cottage industries. Its share had dwindled to about 8 per cent of the total income. It by no means implies that the size of the small-scale industries' sector has in any way dwindled. On the other hand, it has steadily progressed with the only drawback that it has not kept pace with the general growth of the economy. Mr. Manubhai Shah, India's dynamic Minister for Industry, illustrated by citing relevant figures the "rapid" strides taken by the small-scale industries' sector. He said that nearly one lakh units had received extension assistance from the Government and a chain of Small-Industry Services' Institutes was organised in different parts of the country. There were no less than 16 Institutes, 4 Branch Institutes and 54 Extension and Production-cum-Training Centres for furthering the sphere of small-scale industries. During the Second Plan, a sum of Rs. 11 crores was spent to extend the industrial estate programme while a sum of Rs. 30 crores was proposed to be spent during the Third Plan for the same objective.

Amongst the various problems listed by the critics, finance takes the pride of place. Financial institutions have hitherto been shy of providing credit facilities to these industries. They had to depend mostly on the unorganised banking institutions and paid out heavy rates of interest. The commercial banks in particular have not participated in the adventures of the small entrepreneurs while the State Bank has advanced, under pressure of the Government, not even 5 crores of rupees which is hardly 2 per cent of its total advances. Mr. Morarji Desai, India's Finance Minister, indicated

at one of the lectures that he would take necessary steps so as to extend the volume of credit facilities offered by the State Bank of India to small-scale industries. The Minister believed that within a very short period the State Bank would be able to allocate more than 10 per cent of its total advances to the small-scale units.

The shortage of raw materials in particular continues to hamper the growth of these industries. Many of these industries had to buy their raw materials in the open market at exorbitant prices in order to keep their units in production. It is a pity that the small-scale industries are not well organised so as to take advantage of the benefits offered by the Government and its various agencies. It is necessary that all the controlled raw materials to these small units should be provided through their own organisations. The Government must encourage the establishment of associations of the small industrialists with the objective of helping them in getting their applications processed through various government agencies. The small-scale industrialists have to deal with a number of agencies such as the State Director of Industries, Director of Small Scale Industries Service Institute, the Development Commissioner of Small Scale Industries, the State Government's Industrial Estates, Industrial Colonies and the National Small Scale Industries Corporation Limited. The small entrepreneurs have little legal or technical knowledge to get their applications processed smoothly in all these offices and the creation of an association of their own would considerably help them in getting their grievances redressed.

In certain States, the sales-tax imposes an additional burden due to the factors of localisation. In Delhi and Madras, in particular, the small-scale industrialists have to pay four times the sales-tax paid by their counterparts in any of the neighbouring States for machinery purchased through the National Small Industries Corporation. These anomalies need to be removed if the Government desires a rapid progress of these industries.

Last, but not least, is the dissemination of technical knowledge to these small entrepreneurs who may, with all their enthusiasm and availability of finance, not be able to make much progress. Unfortunately, very little has been done in this particular sphere by the official agencies. Nine times out of ten when the small industrialist feels the necessity of technical guidance, he does not know the official agency or even the non-official agencies to whom he may turn for the solution of his problems. There needs to be a well-organised unit for technical guidance with the National Small Industries Corporation as well as with the Development Commissioner of Small Scale Industries for assisting the small entrepreneur.

Socialistic Pattern Slant in Life Insurance?

By CROESUS

WHEN I wrote my last despatch on Life Insurance, I knew I was commending some rather unorthodox practices for the consideration of the L.I.C. But I find that the Corporation Chairman, Mr. P. A. Gopalakrish-

nan, has proved to be far more unorthodox than I had been in the remarks that he offered on some aspects of Life Insurance administration to the Bombay Insurance Institute, last week. This came as a complete

surprise to me, especially after my experience of the last press conference held by him to release the fifth annual statement of the L.I.C. From his replies then, no one could have imagined that Mr. Gopalakrishnan could be so breathlessly unconventional as he has since turned out to be. I wonder whether there will be much need for actuaries in this country, if the suggestions of Mr. Gopalakrishnan are accepted. The actuarial profession, it was felt—rightly or wrongly—had lost a sure field of employment with the nationalisation of Life Insurance. But the impact of the suggestions of the shortly-to-retire Chairman of the L.I.C. may be even more. For, without saying in so many words, he seemed to convey the impression that much of the value of all the actuarial work that is now being indulged in is lost because of the long delay in the availability of their results. The present actuarial technique, it would seem, according to him is out of place in the existing scheme of things. Indeed, Mr. Gopalakrishnan wants a revolution in actuarial technique. To quote him, "a mass revolution in the business of Life Insurance can be brought about only by a similar revolution in our actuarial technique." Such a revolution "will not merely enlarge the Life Insurance business on a mass scale but will revolutionize also the present methods of life insurance administration."

I must hasten, however, to add that all these remarks were made in connection with his plea for transforming the **individual approach** involved in the use of averages by the actuarial technique into a **mass approach** in order to obtain mass business. To put it more precisely, the LIC chief wants that, "instead of issuing individual policies with different rates of premium depending upon the age at entry and the duration of the policy, mass policies should be issued to the industrial and commercial establishments, army personnel and workers in Government departments, insuring them at a standard amount. There will be no medical examination and no requirement of age proof." Of course, any such scheme is bound to swell the volume of life business. More or less a similar technique, albeit a little more rigid, prevailed in some of the erstwhile princely States in this country—e.g. Mysore—and the scheme is not without its attraction. Thus "there will be no payment of first year's or renewal commission, no administrative work dealing with field officers and agents, and no payment of medical fees. For millions of policies, the number of premium notices and receipts to be issued will be only a few thousands. The renewal expense ratio for this mass business will be reduced to one to two per cent and premium rates can be reduced to astonishingly low levels."

But is it all so simple, and will there not be any opposition to this novel experiment? Mr. Gopalakrishnan himself felt there would be objections to the scheme. For instance, he said: "Actuarial purists may object that a mass policy of the type described will benefit those on the verge of retirement far more than those who have been just employed." But he wanted actuaries to regard insurance cover as an amenity provided by the employer. Moreover, he pointed out, "a mass policy is only an extension in a certain way of the essential principle underlying life insurance, namely that every policyholder, whatever his longevity, pays for the mortality of other policyholders." It is not clear if the actuarial purists will be satisfied with this. Not that it matters very much. For unlike "actuarial purists" and traditional life insurance men, the L.I.C. Chairman was motivated by considerations other than pure life insurance, that is to further the socialistic pattern objective of the Government. "Our country is wedded to the objective of a socialistic pattern and it is the duty of a nationalised corporation", he reasoned, "to extend the benefit of life insurance to more and

more millions of people every year." Apparently he does not consider the present rate of expansion of business as effective enough to enable the Corporation to take a big leap forward. Hence the special responsibility of the LIC to work out the mass technique which alone will enable it "to treble or quadruple its business or even increase it ten times in a very short time!"

Throughout his address, I could not help feeling that Mr. Gopalakrishnan was having only the urban masses at the back of his mind. Could this be his understandable reaction to the woefully poor response to the too-much-boosted Janata policy? In any case, it is a pity that, when there is more prosperity in the rural areas than ever before and there is also no dearth of organisations—what with panchayats, community projects, national extension services, co-operatives and small savings institutions, to mention only a few—whose services could be harnessed to carry the gospel of life insurance to the doors of every villager, the head of the L.I.C. had nothing concrete to offer to the rural masses. Yet we continue to hear the slogan "India lives in her villages" glibly repeated on every conceivable occasion. But this is not to minimise the risk inherent in any drive for mass coverage in the rural areas, such as the relatively heavier costs of procurement, the unlimited scope for non-disclosure or mis-statements by the prospective insured of material data, greater chances of impersonation, prevalence of a large measure of illiteracy, etc. But, even in the urban areas, there are risks, and it is in the interest of the L.I.C. itself to take note of these. For instance, it is necessary to ensure that, in the craze for mass business, standards of medical check-up, particularly when insurance of heavy sums is proposed, are not relaxed unduly.

I should now like to revert to the L.I.C. Chief's other references to the work of actuaries. Although these were made in connection with the need for statistical techniques other than annual accounts and periodical valuations "to enable the top management to formulate policies and consciously control the cost at the various levels of management," they are significantly suggestive. Thus, while Mr. Gopalakrishnan admitted that the study by the actuaries of the mortality rates from year to year and their comparison with the rates assured in the premium tables was "one of the important investigations which help the fixation of revision of premium rates," he said that one need not have to wait for these studies for finding out the general trends. Taking figures of increase in the business in force and of death claims over the last decade, he showed how one could get a significant enough pointer to the improvement of mortality rates among the insured. Again, in regard to lapses, Mr. Gopalakrishnan stated that "the analysis of lapses of the entire organisation by the Actuarial Department is merely a **post-mortem** report." I do not know whether to describe this as "assenting with civil leer" or "damning with faint praise."

In saying all these, the LIC chief was presumably only trying to impress upon insurance men not to wait for the belated results of these studies but to try and anticipate them by personal studies of the trends on the spot, which, with some application and intelligent interest in their work, they can easily do. As he rightly said, "the purpose of the various statistical analyses made at the headquarters of an insurance organisation (especially a mammoth organisation like the LIC) is largely defeated, since these analyses come long after the harm is done." This, in fact, is the **raison de etre** of his call for a rough and ready method regularly to improve the position as regards lapses as well as death claims in time, at the lowest level. This call was obviously needed to remove the impression at the lower

levels (branches and divisions) that mortality rates, lapse ratios, etc. are "the special pigeon of the actuaries" and that they are not concerned with them. As Mr. Gopalakrishnan tried to impress upon them, "they are very much concerned and it is they and they alone

Road And Rail Traffic

SOME very interesting figures have been produced by the Neogy Committee on Transport Policy. They should go to prove that there has been in the recent past a marked shift from the consumption of petrol by road transport towards dieselisation and that the high freight traffic is being increasingly diverted from the railways to road transport. The data which the Committee has produced is based on the material supplied by the Railway Board and a survey organised by the Committee itself during some specific weeks on five important routes—Amritsar-Delhi, Delhi-Kanpur, Calcutta-Patna, Bombay-Bangalore and Bangalore-Madras. The findings of the Committee obviously are of considerable import for formulation of future policy of the Government in regard to consumption of diesel oil and rail-road co-ordination.

The survey carried out by the Committee over the afore-mentioned five routes has revealed that nearly 87 per cent of the vehicles operating on these routes are run by diesel instead of petrol. To check this growing shift towards dieselisation of road transport it is imperative to lower the price of gasoline in which petroleum product the country is not only self-sufficient but has also a sizeable surplus.

PETROL AND DIESEL VEHICLES IN OPERATION ON ROUTES SURVEYED BY NEOGY COMMITTEE

(Percentage)

Route	Petrol	Diesel	Total
Amritsar - Delhi	3	97	100
Delhi - Amritsar	3	97	100
Delhi - Kanpur	3	97	100
Kanpur - Delhi	4	96	100
Patna - Calcutta	18	82	100
Calcutta - Patna	19	81	100
Bombay - Bangalore	23	77	100
Bangalore - Bombay	22	78	100
Madras - Bangalore	12	88	100
Bangalore - Madras	9	91	100
All routes	13	87	100

The data produced by the Committee on diversion of high freight traffic from railways during the past three years is all the more revealing.

On Amritsar-Delhi route, there was a significant drop in traffic on the railways in 1958-59 as compared with the previous year in the case of sugar and gur (69.4 per cent), mineral oils (73.9 per cent), wood and timber (80.6 per cent), fruits and vegetables (44 per cent), and foodgrains (19.4 per cent). On this route, the groups of commodities wholly or mainly moved by road as compared with rail during the survey period (November 23, 1959 to November 30, 1959) included (from Delhi to Amritsar and Amritsar to Delhi respectively): provisions (100 per cent and 100 per cent) animal and animal products (98.2 per cent, 74.3 per cent), finished products (90.4 per cent, 99.1 per cent), products of forests (100 per cent, 100 per cent), and manufactures (96.9 per cent, 99.1 per cent); and from Delhi to Pathankot and Pathankot to Delhi, products of agriculture (100 per cent, 99.5 per cent), provisions (100 per cent, 100 per cent), finished products (84.6 per cent, 100 per cent), and manufactures (98.9 per cent, 100 per cent).

who can improve the position", of course, by adopting the methods that were outlined by him for their benefit. It is to be hoped that, while this desideratum follows, the actuaries will not feel that their contribution has been belittled, even if only unwittingly.

On Delhi-Kanpur route, the traffic in sugar and gur by rail suffered a perceptible decline (46.8 per cent) in 1958-59 as compared with 1957-58. On this route, the groups of commodities moving mainly by road from say, Delhi to Kanpur and Kanpur to Delhi during the survey week included products of agriculture (98.8 per cent, 100 per cent) and manufactures (99.8 per cent, 99.8 per cent).

On Calcutta-Patna route, there was a decline in coal and coke (15.9 per cent) traffic by rail during the period under consideration, viz., 1958-59 as compared with 1957-58. The goods moving mainly by road during the period 5-1-1960 to 12-1-1960 on this route included from Calcutta to Asansol, provisions (100 per cent), finished goods (96.8 per cent), mineral oils (99.2 per cent) and manufactures (96.6 per cent); from Calcutta to Raniganj, products of agriculture (99.4 per cent), provisions (100 per cent), finished goods (98.1 per cent), and iron and steel (99.8 per cent; from Raniganj to Calcutta, products of agriculture (100 per cent) and coal and coke (72.5 per cent).

On Bombay-Bangalore route, the commodities which suffered a substantial decline in traffic by rail during the period under consideration included cotton and jute raw (68.1 per cent), cotton manufactures (31.2 per cent), provisions (31.7 per cent), iron and steel wrought (26.5 per cent) and foodgrains (13.6 per cent). The commodities which were mainly moved by road during the period 11-2-1960 to 18-2-1960 included from Bombay to Bangalore and Bangalore to Bombay, provisions (96.7 per cent and 100 per cent respectively), finished goods (92.1 per cent, 96.2 per cent), iron and steel (81 per cent, 99.6 per cent) and textiles (95.4 per cent, 96 per cent; from Bombay to Sholapur and Sholapur to Bombay, cotton and jute raw (99.8 per cent, 92.6 per cent) provisions (100 per cent, 100 per cent), textiles (99.9 per cent, 96.6 per cent), and from Bombay to Kolhapur and Kolhapur to Bombay, provisions (100 per cent, 100 per cent), finished goods (95.6 per cent, 100 per cent), mineral oils (75 per cent, 100 per cent), iron and steel (87.1 per cent, 100 per cent) and textiles (100 per cent, 100 per cent).

In the case of Madras-Bangalore route, the traffic which moved mainly by road as compared with the railways during the period 9-3-1960 to 16-3-1960 from Madras to Bangalore and Bangalore to Madras included provisions (100 per cent, 100 per cent), animal and animal products (100 per cent, 77.8 per cent) and textiles (100 per cent, 100 per cent).

The total quantity of goods traffic carried by road on the five routes surveyed by the Neogy Committee during the particular survey weeks and the ton-miles performed on these routes were as follows:

GOODS TRAFFIC CARRIED AND TON-MILES PERFORMED BY VEHICLES

Route	Quantity (Tons)	Ton-miles
Amritsar - Delhi	19,764.44	29,41,169
Delhi - Amritsar	25,022.70	34,33,244
Delhi - Kanpur	23,230.86	24,28,516
Kanpur - Delhi	22,294.09	26,76,767
Patna - Calcutta	31,610.58	42,70,464
Calcutta - Patna	20,228.11	32,63,987
Bombay - Bangalore	26,576.79	45,55,797
Bangalore - Bombay	25,182.85	41,43,366
Madras - Bangalore	13,173.40	19,11,810
Bangalore - Madras	14,887.79	19,56,699
All routes:	2,21,971.61	315,81,819

Part of the decline in goods traffic carried by railways during the years 1957, 1958 and 1959 can be attributed to fall in output of various commodities and recession in imports and exports. For instance, production of oilseeds in 1958 declined by 5 per cent as compared to 1957, that of cotton (raw and manufactures) by 14.1 per cent, of jute (raw and manufactures) 5 per cent, of sugarcane and sugar by 21.3 per cent, of tea by 3.1 per cent and of ores by 2.8 per cent. Similarly, there was a fall in 1958 in the quantum of exports of cotton piecegoods to the tune of 30.8 per cent and in that of manganese ore to the extent of 44.1 per cent, compared to the previous year. The value of imports of raw cotton and raw jute in that year also declined by 36.9

per cent and 52.1 per cent respectively. But, despite this, the data produced by the Neogy Committee should be sufficient to lead one to the conclusion that there had been some diversion of high freight from railways to road transport. The Committee has, however, been cautious in interpreting this data when it says that to arrive at a firm conclusion in this regard would require some more detailed data which are not available.

This diversion of high freight traffic from railways to road transport, it can be safely assumed, has been further accentuated during 1960 due to transport requirements growing at a much faster rate than the railways could cope with.

Business Notes

Trade

EXPORT PROMOTION

INDIAN EXPORTS this year are expected to show considerable improvement over the 1960 level. This optimism is borne out of two facts; firstly, exports during the first seven months of the current year, at Rs. 368.97 crores, have been nearly Rs. 31 crores higher than during the corresponding period last year, and secondly, output of various agricultural crops especially tea, oilseeds and sugarcane, has recorded an increase this year.

To step up exports the Government has in the recent past taken some energetic action. It should also prove helpful. Besides constituting a Cabinet Subcommittee for reviewing the progress of exports and the measures taken in the field of export promotion, setting up a Committee of Secretaries, with the Cabinet Secretary as its Chairman, to ensure quick implementation of the measures designed to step up exports and reorganising the work of various authorities dealing with exports, the Government has extended the list of export items on which drawback of excise duty is allowed. The list now includes such items as beer, toys fitted with magnets, aluminium articles, shrimp cartons for packing sea food, paper products, low-tension switchgears, motor starters, umbrellas and umbrella ribs, books, hacksaw blades, fireworks, alumina ferric, thermit portions (material for welding of rails) etc. Fifty per cent rebate on rail freight has similarly been extended to such items as confectionery, biscuits, radios railway track stoves, guar gum and seeds, window glass and sheet glass, verticle turbine pumps, electric motors, alcohol, etc.

Along with this grant of rebate on rail freight, Conference lines have been persuaded to reduce ocean freight in respect of items like groundnut-in-shell, cardamoms, coffee, rice bran, steel furniture, mild steel bolts and nuts, fish products, plywood, bicycle rims and steel tubes. To facilitate exports from the south-west coast of India, which is emerging as a major exporter of such goods as tea, coffee, cashewnuts and essential oils, an Honorary Adviser has been appointed for this area, much on the lines of the advisers appointed previously for Bombay, Madras and Calcutta regions. A Port Advisory Committee under the Chairmanship of the Adviser at Cochin has also been set up to look after promotion of exports from Cochin. A Freight Investigating Board is being set up to take the place of the Freight Investigation Bureau. This Board would investigate all matters relating to ocean freight and other connected problems.

The number of Export Promotion Councils has been increased to 13 by the setting up of an Export Promotion Council for marine products. Provisional recognition has been accorded to the setting up of two export houses to develop export of difficult items to non-traditional markets. The programme of publicity of Indian goods abroad is also being stepped up. In pursuance of the recommendations of the Ad Hoc Committee on Quality Control and Pre-shipment Inspection, it is pro-

posed to exercise compulsory quality control and pre-shipment inspection on export goods through rationalisation of quality standards and setting up of an Export Inspection Council.

The Union Government has also under active consideration the recommendations of the Committee set up under the Chairmanship of the Managing Director of Exports Risks Insurance Corporation to go into the question of provision of credit facilities to exporters. The Committee, it may be recalled, had recommended (1) modification of foreign exchange regulations of 1952, (2) extension of long-term credits for capital goods and certain engineering goods, (3) grant of advances and permission for discounting against export bills, and (4) modification of the working of the Refinance Corporation so as to enable it to grant export credit for medium term. The Government is also considering legislation for ensuring compulsory exports and for giving some tax rebate for export-earning industries. Sir Ramaswami Mudaliar Committee, set up early this year in response to a request from the trade and industry for rationalisation and streamlining of the procedure adopted under the Import and Export Trade Control regulations is expected to submit its report by the end of the current year.

Chemicals Industry

SODA ASH PRICES MUST BE REVISED

THE TARIFF COMMISSION is currently examining the question of continuance of protection to the soda ash industry beyond December 31, 1961. Opening the public inquiry in this behalf, Mr. K. R. P. Ayyangar, the Tariff Commission Chairman, did well to underline the economic significance of this important industrial raw material. According to him, there are at present four units engaged in the production of soda ash (light), viz., (1) Tata Chemicals, (2) Dharanghadhra Chemical Works, (3) Saurashtra Chemicals and (4) Sahu Chemicals and Fertilizers, while a fifth unit — Khan Bahadur M. M. D. H. Bhiwandiwalla & Co., Bombay, licensed in 1957 — is expected to go into production by October, 1963.

The present installed capacity for the manufacture of soda ash is, 2,68,000 tons, as against 46,800 tons over a decade ago. During the last three and a half years, (1958, 1959, 1960 and January-June, 1961), the respective figures of output were 89,804 tons, 92,288 tons, 1,45,012 tons, and 90,386 tons. Thus, by the end of the Second Five-Year Plan period, the annual production rose to more than four and a half times, compared to the production some ten years ago. As regards heavy soda ash, only a beginning has been made by one of the existing units, so that the production thereof is still very small. However, Mr. Ayyangar indicated that all the four units had their plans to embark upon the manufacture of heavy soda ash. The Third Five-Year Plan envisages a capacity of 5,30,000 tons, including heavy soda ash, by the end of 1965-66. The actual production of soda ash, both light and heavy, is estimated to go up to about 4,50,000 tons by 1966.

With regard to demand, the latest available annual consumption of about 2,42,000 tons has actually exceeded the Tariff Commission's estimates of consumption for 1961 made by it in 1958 by about 3,000 tons. The latest estimates of the country's requirements of soda ash, as indicated by the Development Wing, the producers and the other interests, vary from 2,26,000 tons to 2,60,000 tons, while a further rise in the annual demand is expected from 2,60,000 tons, in 1961, to 4,50,000 tons, that is the actual production target to be reached by the end of 1965.

The industry, which has been enjoying protection for more than a decade, has achieved all-round progress. The quality of the domestic producers too has improved considerably. That the quality of the indigenous product has really improved is borne out by the fact that even manufacturers of glass and glass bangles, who were reluctant at one time to use light soda ash, have begun to use it in larger and larger quantities. Accordingly, it is believed, the Tariff Commission itself has agreed to earmark 25 per cent of the indigenous consumption of soda ash by glass manufacturers as the margin of consumption of light soda ash required by these interests. According to the spokesmen of the industry, there would appear to be a good case for raising this percentage even to 50, considering that several glass factories have reportedly been using indigenous light soda ash without the admixture of imported heavy soda ash. In other words, the old myth of the glass industry having to depend only on heavy soda ash has since been exploded. It would now seem that, with slight modifications and adjustments in the proportion of mixing, coupled with the plans for indigenous manufacture of heavy soda ash on an appreciable scale, the authorities could drastically reduce, if not altogether do away with, imports of heavy soda ash.

As regards light soda ash also, it is becoming no less obvious that further imports are not at all needed — not even to oblige the S.T.C.! For the light soda ash that is available in the country today so far exceeds the actual demand that, at times, the indigenous manufacturers find themselves competing with each other in marketing their product and offering, it is alleged, rebates of as much as Rs. 35 to Rs. 40 per ton on the price fixed by the Government. This does not mean that they can afford to forgo so much out of the price fixed, but, as between the two evils of complete closure and selling at a loss, they probably feel that this is the lesser one.

In regard to price, the industry has admittedly a good case for an increase. There must be an upward revision of the selling prices in view of the substantial rise that has taken place in manufacturing costs all round since the last enquiry was held. Costs of production have increased due to (1) increase in labour costs, (2) rise in raw material prices, and (3) higher packing charges, among others. It is these factors, rather than the artificially low prices arising out of the acute competition among the producers, that ought to influence the decision of the Tariff Commission in fixing prices. The Tariff Commission, or rather the authorities, must not consider that their responsibility is over, once the fair selling prices have been fixed. It must be the T.C.'s endeavour, as also of the authorities in New Delhi, to ensure that the fair selling prices as fixed by the Tariff Commission are, in fact, realised by the manufacturers. Perhaps the surest way to ensure this is by properly regulating imports. If the authorities continue to import large quantities, even if it be through the S.T.C., the result would be that the quality of the indigenous production would avoidably suffer. It would do so to the extent that the price actually realised by the manufacturers falls short of the economic price.

Woollens Industry

WHY THIS STEP-MOTHERLY TREATMENT?

AFTER ITS bitter experience of the raw material import policy for the 1960-61 licensing period, the composite section of the Indian woollen industry may well ask: why this step-motherly treatment? This section is not only disappointed but distressed at the alleged discrimination and disparity between the composite units and the spinning units generally and even as between one unit and another inter se. Its disappointment is all the greater in the context of its contribution to the country's economy, which can be judged from the following table:

Particulars	All India	Federation's Share
Installed Capacity:		
(a) Worsted (Spindles)	1,26,284	81,392
(b) Woollen and Shoddy (Spindles)	69,031	53,245
(c) Powerlooms — Composite and Exciseable (No.)	1,835	1,563
Amount of Excise Duty Paid (In Rs.)	1,30,14,000	1,20,23,604
Value of Government Orders Executed (In Rs.)	3,12,00,000	2,50,50,998
Value of Exports of Piecegoods (In Rs.)	50,00,000	47,99,482
Quantity of Indigenous Raw Wool Consumed (In lbs.)	1,00,00,000	63,25,288
Total Number of persons Employed	20,000	18,561

The above table shows that the members of the Federation of the Woollen Manufacturers in India (FWMI), which represents the composite units, account for the major part of the installed capacity (64.44 per cent worsted, 77.13 per cent woollen and shoddy, and 85.12 per cent power looms) of the organised woollen industry in India; they pay the largest amount of excise duty (92.39 per cent) to the Exchequer; they are responsible for turning out the largest number of Government orders (80.20 per cent); the total value of their exports amounts to 95.98 per cent; they consume the largest quantity (63.25 per cent) of indigenous raw wool (without taking into account the consumption by the carpet industry), and they employ the largest number of persons (92.80 per cent.)

It is inconceivable how, in spite of the useful role played by the composite units, the authorities could afford to treat them so cavalierly. That the members of the Federation should have been intrigued and incensed to such an extent as to demand a thorough probe is, therefore, quite understandable. But what is important and pertinent now is that the wrong that has been perpetrated already should on no account be perpetuated. In this connection, the plea of the FWMI Committee to revise the ceiling and the floor for the imported raw materials to Rs. 700 and Rs. 600 per spindle, respectively, deserves to be sympathetically considered. The representatives of the Federation are already believed to have placed all these facts before the Union Minister for Commerce and Industry (through the Textile Commissioner), and it is to be presumed that they have been able to convince the Minister of the gross injustice done to them.

New Issue

AMERICAN REFRIGERATOR COMPANY LIMITED
THE AMERICAN REFRIGERATOR COMPANY LIMITED, CALCUTTA, which was converted into a public limited concern on August 26, 1961, is to increase its issued, subscribed and paid-up capital from Rs. 7,94,700 to Rs. 17,05,300 through the issue of 1,70,530 equity

shares. The authorised capital of the company is Rs. 50 lakhs, divided into 4,00,000 equity shares of Rs. 10 each and 10,000 preference shares of Rs. 100 each. Out of the new issue, the directors and their friends have agreed to subscribe for 48,030 shares. The remaining 1,22,500 shares are being offered for public subscription. The list opens on September 11 and will close on September 16 or earlier at the discretion of the directors but not before September 14.

The new capital is to be utilized for providing part of the finance needed for the expansion programme of the company which started manufacture and assembling of various refrigeration products in 1957. The present production of the company — a monthly turnover of Rs. 5 lakhs (approximately) — is less than half its licensed capacity. The directors have decided to raise the output to the full licensed capacity. At the completion of the expansion programme, the company's annual turnover will be of the order of Rs. 1.32 crores for the equipment to be manufactured and another Rs. 60 lakhs from the engineering and service departments. The expansion programme is expected to cost Rs. 34 lakhs. As the new issue will be yielding only Rs. 17,05,300, the rest of the requirements are envisaged to be met through raising of loans from the company's bankers. The West Bengal State Finance Corporation has agreed to grant a loan of Rs. 1.75 lakhs, at 6½ per cent interest, repayable within a period of 12 years. The company has not yet decided to avail of this loan. If it does, the borrowings of the company from its bankers would be reduced to this extent.

The company, it is stated, has the largest plant in India to manufacture refrigeration coils required by the refrigeration and air-conditioning industries and also for various industrial applications of heat transfer in textile mills, rayon mills, tea industry and chemical processing plants.

Technical collaboration for the expansion programme has been secured for a period of five years from Messrs. Dunham-Bush of the United States. One of the partners of this U.S. firm, the Bush Manufacturing Company Inc., has been collaborating with the Indian concern since 1955. Technical collaborators have given the company exclusive rights of manufacture of its products in the refrigeration and air-conditioning heat transfer fields, barring "Burner" line and cast aluminium heat transfer products, for consumption in India and sale abroad except in countries where they provide designs, drawings, technical know-how and other technical data to local companies.

In view of the expanding demand for the company's various lines of manufacture during the Third Plan period — demand for air-conditioning equipment in 1965-66 is expected to increase to 50,000 numbers (value Rs. 13 crores) and for water coolers 20,000 numbers (value Rs. 4 crores) from the current estimated demand of 25,000 numbers (value Rs. 6.8 crores) and 3,000 numbers (value at Rs. 60 lakhs) respectively — the company is not likely to encounter any difficulty in marketing its products, provided they are of satisfactory quality.

Insurance

RUBY GENERAL

MR. B. M. BIRLA, Chairman of the Ruby General Insurance Company, at the annual general meeting held recently at Calcutta, expressed satisfaction on account of the company's notable progress during the short span of its existence. It is quite remarkable to observe that the net premium of the company nearly doubled in fire and miscellaneous accident departments between 1955 and 1960. The marine department fared comparatively less satisfactorily. The fall in premium in the department was due to reduction in overseas hull business. The department, however, has shown a profit

this year. The Chairman was of the opinion that unrestricted competition brought cargo rates down to uneconomic level. He added, therefore, that a comprehensive Tariff for internal transit could definitely help to improve the situation. This is quite a sound suggestion and it is hoped the Government will give thought to it.

It was observed by Mr. Birla that the Government directed its business mostly towards the LIC subsidiaries, which was not very fair in the sense that healthy competition could not grow under these conditions. It is indeed heartening to note that the Federation of Indian Chambers of Commerce and Industry has taken initiative to draw the attention of Indian industrialists and businessmen to providing of support to Indian insurance. In view of the fact that the industry was passing through a period of transition and the public was not still fully insurance-minded, Mr. Birla said it would be proper for the industry to spend a part of its earnings on propaganda.

Mr. Birla asserted that there was a paramount need of vigilance against fire and road accidents which led to a large national loss. He was of the opinion that the Insurance Association should take up a programme to educate the public in fire preventive methods. This indeed was an important point to raise because it has been generally observed that in many fires the people around appear absolutely helpless, and usually it was too late when the assistance arrived. The Insurance Association would do a real service to the country by following Mr. Birla's advice. This was also true as far as motor accidents were concerned. A large number of road accidents could definitely be avoided only if the people were taught proper road habits and the roads were kept in proper condition. Apart from saving damages to vehicles, which was only a marginal gain, this would result in saving of many precious lives.

Electricity

SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LIMITED

AT THE 21st Annual general meeting of the South Madras Electric Supply Corporation Ltd., Mr. K. A. P. Visvanatham, Chairman of the Company revealed that the revenue earnings this year of the company has nearly touched Rs. 1 crore and it has been able to maintain the usual 9 per cent dividend on equity shares subject to tax. As regards dividend on preference shares, Mr. Visvanatham pointed out that an extra 30 per cent over and above this stipulated dividend will be paid as required under law. The gross dividend works out to 7.15 per cent in terms of the Preference Shares Regulation Act, 1960.

Mr. H. K. Rangaswamy, Director of the Managing Agency and ex-officio Director of this company had been abroad between April and July and among other things he has been examining possibilities of securing foreign collaboration for a switchgear and electrical domestic equipment manufacture. Though no concrete proposals have been received, it is likely that in the course of time, the company may be in a position to suggest a diversification of its activities, by entering into manufacture as the directors believe that as a long range policy it would be the right thing to do.

The Chairman further stated that the company has drawn up a programme to take up works amounting to Rs. 20 to Rs. 25 lakhs a year having regard to availability of materials and power supply from the Electricity Board's Power Generating plants. It is now hoped that the company would be able to get about Rs. 20 lakhs as loan to take up schemes specified by the Government. Totally a loan of Rs. 45 lakhs has been asked for from the Madras Government for various schemes.

FROM THE CAPITAL'S CORRIDORS

INSURANCE OF BANK DEPOSITS

The long-awaited Deposit Insurance Corporation Bill to provide for the establishment of a corporation to insure deposits of scheduled banks was introduced in the Lok Sabha last week by the Union Finance Minister, Mr. Morarji Desai. The Bill envisages the establishment at an early date of the proposed Deposit Insurance Corporation as a wholly State-owned subsidiary of the Reserve Bank. Its paid-up capital will be Rs. 1 crore. Its headquarters will be at Bombay.

The Corporation will insure all deposits with commercial banks, including the State Bank and its subsidiaries. Deposits of the Central Government, State Governments and foreign Governments with the State Bank or its subsidiaries and with the other commercial banks will, however, be exempt from this insurance. Deposits with the Indian scheduled banks at their foreign branches will also not be covered by this scheme.

The limit of insurance cover will be Rs. 1,500 per deposit, but it can be raised by the Corporation with the previous approval of the Central Government. Premium rates will be determined by the Corporation from time to time in consultation with the Central Government; the maximum rate for which provision is being made in the Bill is 15 nP. per Rs. 100 per annum. In the event of default in the payment of the premium by any insured bank, the Corporation will collect interest on the arrears at a rate not exceeding 8 per cent.

Every existing banking company shall be registered with the Corporation as an insured bank within 30 days of the Corporation's coming into being. All the new banking companies shall be required to register themselves with the Corporation as insured banks as soon as they receive a licence under the Banking Companies Act. The registration of a banking company as an insured bank with the Corporation will stand cancelled the moment it is prohibited from receiving fresh deposits, as a consequence to cancellation of its licence by the Reserve Bank or the refusal of the Reserve Bank to issue to it a licence or on amalgamation or voluntary liquidation of the company. The Madras Industrial Investment Corporation will not be required to register itself with the Deposit Insurance Corporation because though technically it is a banking company as defined in the Banking Companies Act, it actually performs the functions of a State Financial Corporation.

The Corporation will be managed and directed by a Board of Directors, whose chairman will be the Governor of the Reserve Bank. The other members of this Board will be the Deputy Governor of the Reserve Bank, an officer of the Central Government and two non-officials, not actively connected with any scheduled bank but having specialised knowledge of banking, commerce, industry or finance. The last three members will be nominated by the Central Government in consultation with the Reserve Bank.

The Bill sets out at length the manner in which the Corporation will pay off the depositors in the case of liquidation or reconstitution of an insured bank. Provision has also been made for payment directly to the depositors in case this proves to be either necessary or desirable. Payments due to depositors within the prescribed limits of the insurance cover will be made by the Corporation within five months, either directly or through the liquidator or through the transferee bank or insured bank to be credited to his account as the case may be in the event of an insured bank going into liquidation or amalgamation with some other bank.

The Corporation will maintain two funds — a De-

posit Insurance Fund and a General Fund. The Deposit Insurance Fund will be built up for meeting the liabilities of the Corporation on account of insured deposits, from the premium payments made by the insured banks. In the event of a deficiency in this Fund for meeting the liabilities which may have to be made from it, a temporary transfer to it would be made from the General Fund or through obtaining temporarily a sum not exceeding Rs. 5 crores from the Reserve Bank on such terms as may be approved by the Central Government. All incomes arising from the investments made by the Corporation will also go to this Fund. All other moneys will go to the General Fund. All moneys belonging to the Deposit Insurance Fund or the General Fund which may not be immediately required by the Corporation would be allowed to be invested in promissory notes, stock or securities of the Central Government. All other amounts are to be deposited with the Reserve Bank.

The Bill provides wide powers to the Corporation for inspection of insured banks and for obtaining statements and information relating to their deposits, notwithstanding the provisions of the Banking Law or any other law in force. The Corporation can not only inspect the books of accounts or investigate the affairs of any insured bank but is also empowered to publish in a consolidated form any information obtained by it, after consulting the Reserve Bank, in a manner as considered expedient. The Corporation will have free access to all records of insured banks and every insured bank is required to furnish within the specified time any statement or information relating to deposits of the bank that the Corporation may ask for. In pursuance of these clauses, the Bill has made ample provision to safeguard the interests and the legal standing of the Corporation and its directors so that no suit or legal proceedings can be instituted against the Corporation or its Board of Directors or its agencies to whom the Board of Directors might have delegated its powers or the Reserve Bank for any damage caused or likely to be caused by the operation of the Act.

Any dispute regarding the amount of premium due from any insured bank is to be settled by the Central Government. The Bill provides for penalty upto three years' imprisonment for supplying of false information by an insured bank or making of wrongful statement by it or its failure to comply with such requests from the Corporation.

The Corporation is specifically excluded from the purview of the Company's Act and the Insurance Act. It will not be liable to pay any income-tax or super-tax on any of its income, profits or gains for the first five years, including the year of its establishment.

IMPLEMENTATION OF TEXTILE WAGE BOARD'S RECOMMENDATIONS

According to an official spokesman, the Union Labour Ministry is of the view that all avenues of persuasion must be fully explored to secure implementation of the Textile Wage Board's recommendations, before resorting to legislative measures.

In pursuance of its policy of voluntary approach to the solution of industrial disputes, the spokesman said on Tuesday, the Labour Ministry had recently convened a tripartite meeting to seek employers' co-operation in bringing in line the recalcitrant units. That this step was taken even when repeated efforts had failed earlier and a Bill had already been introduced in the Rajya

Sabha clearly showed how keen the Labour Ministry was to ensure the success of the voluntary principle — and how keen to avoid legislation, the spokesman added. The employers, he further said, were represented on the Wage Board and were a party to its recommendations. They should, therefore, now honour the recommendations, made by their own representative, by voluntarily implementing them.

Regarding the small and financially weak units, the spokesman said, the Government resolution on the Textile Wage Board and the Bill introduced in the Rajya Sabha had both provided for exemption of these units. There was, however, absolutely no justification for the financially sound units for not implementing the recommendations. The spokesman pointed out that if there was any one such unit which had not implemented the recommendations of the Wage Board, it was a constant reminder of the non-implementation of jointly agreed decisions. This attitude, he opined, was not likely to be acceptable to the workers and not even to those employers who had taken the decision to implement the Wage Board's recommendations. This cuts at the very root of the voluntary principle which must be protected by resort to all possible measures. It was in this background, the official spokesman stressed, that Mr. G. L. Nanda, Union Labour Minister had said that necessary legislation would be brought forward even if it was for the sake of one recalcitrant unit.

The spokesman expressed the hope that persuasive efforts would bear fruit and the financially sound textile mills which had not implemented the Textile Wage Board's recommendations so far would do so, thus obviating the need for legislation.

COTTON TEXTILE INDUSTRY

There are at present 480 cotton textile mills in India — 287 composite mills and 193 spinning mills. The composite mills have 10.60 million spindles and 1.98 lakh looms. The spinning mills have 3.05 million spindles. There has been an increase in spindlage to the tune of 1.6 million during the Second Plan period. The number of looms has remained more or less static.

In order to achieve the target of 9,300 million yards cloth output — 5,800 million yards in the organised mill sector and the balance in the decentralised sector — the Government has decided to license new yarn producing capacity to the extent of three million spindles. Two million spindles have been allocated (details of this were published in this column last week) on regional basis after careful consideration of all the relevant factors such as current production of yarn and cloth in a State, existing distribution of spindlage in the country, concentration of handlooms and the overall needs of the decentralised sector. The remaining one million spindles are to be licensed to the existing units to enable them to come up to economic size and to bring about a balance between the spinning and the weaving capacity. Wherever licences previously granted have been revoked, steps are being taken to reallocate them in the same State. To ensure production of yarn sufficient to meet the Third Plan cloth output requirements as well as those of exports, it is estimated that there would be need to produce 2,250 million lbs. of yarn over and above the current output.

Efforts are to be continued during the Third Plan period to secure better utilization of the existing installed capacity by increasing the number of spindles and looms in the second and third shifts. There has been a slow but steady increase in the spindles and looms

worked in all the three shifts during the past three years as is evident from the following table:

DAILY AVERAGE NUMBER OF SPINDLES AND LOOMS WORKER IN

	1st Shift	2nd Shift	3rd Shift
Spindles (millions)			
1959 ..	11.3	10.9	5.2
1960 ..	11.8	11.6	6.1
1961 ..	12.0	11.8	5.9
Looms (Numbers)			
1959 ..	175,968	168,254	37,416
1960 ..	178,975	173,010	42,774
1961 ..	181,935	176,132	46,925

No spectacular increase in third shift working, however, is envisaged in the short run since there are several practical difficulties in the way such as shortage of power and coal, the worn-out condition of the machinery, commitments under labour laws, etc.

TEXTILE EXPORTS TO U.K.

Exports of cotton textiles from India to the United Kingdom, hitherto operated through London, will henceforward be licensed by the Joint Chief Controller of Imports and Exports, Bombay, according to an understanding reached between the two Governments. Goods reaching the United Kingdom from the beginning of 1962 are envisaged to be covered by the export licences to be issued in India.

As in the past, major part of these exports will be handled by established exporters who will be given licences on the basis of their past performance. The basic period for the establishment of the quotas will be any two consecutive calendar years between 1957 and 1960 — 1957 and 1958 or 1958 and 1959 or 1959 and 1960. The actual choice of the basic period will be left to the exporters.

While the actual licences will be issued by the Joint Chief Controller of Imports and Exports, Bombay, the scrutiny of the documents relating to past exports and the establishment of quotas based thereon will be done by the Cotton Textiles Export Promotion Council. Part of the exports will also be handled by manufacturer-exporters.

It is understood that India may get next year another 20 million yards export quota in addition to the current quota of 175 million yards. The additional quota will materialise should the United Kingdom accept Hong Kong's plea for enhancing the ceiling on its imports from that colony. It may be recalled that exports of cotton cloth from India, Pakistan and Hong Kong are regulated by export quotas voluntarily fixed by them in consultation with British textile interests.

N.I.D.C.'S ASSISTANCE TO TEXTILE INDUSTRY

Upto July 1, 1961, National Industrial Development Corporation had sanctioned long-term loans of the total value of Rs. 14.52 crores to 53 applicants from the textile industry. The amount actually drawn by the applicants from the Corporation was about Rs. 2.76 crores. These loans are repayable in 15 equal annual instalments and carry interest at the rate of 6 per cent per annum. They are secured against the fixed assets of the borrowers.

Steam... Industry's greatest power

SINCE 1782, when the first Rotative Steam Engine enabled the use of steam power to motivate machinery, steam has played an ever increasing part in industry throughout the world.

Not only is steam today's most important source of power for the civilised world, but it must remain so for many years to come. Even atomic power is yet in its infancy and can only be applied as an alternative source of heat. Steam is indeed the real power of industry.

While this is but an outline of the extensive and continually growing part that steam plays in power generation and industry throughout the world, it indicates quite clearly the unparalleled importance of steam power in the industrial growth of India... and, therefore, the urgent need to manufacture vital steam-raising plant in this country to meet the demands of expanding industry.

This is one of the needs which has led to the formation of a new and powerful industrial group, ACC-Vickers-Babcock Limited (AVB). The vast technical knowledge and extensive practical experience available to it will enable the new company to make an important contribution to Indian industry — and help Indian engineers overcome some of the difficulties which have faced them for so long.

The new AVB plant is nearing completion on a 700-acre site at Durgapur. The workshops, designed on modern lines, will have built into the structure electric overhead travelling cranes with 70 tons lifting capacity. All workshops have been designed to allow for progressive expansion so that it will be possible to lift 200 tons without making structural alterations. Up-to-date machine tools are being installed. When completed, they will include a 3000 ton hydraulic press capable of bending steel plates up to 5' thick for use in the manufacture of high pressure boiler drums, and pressure vessels required for the fertiliser, chemicals and oil refining industries. The new plant will make it possible to manufacture steam-raising equipment in the high pressure range — for the first time in India.

ACC-VICKERS-BABCOCK LTD. offers the industrialist his best chance to ensure a fully integrated installation comprising the boiler plant itself and a wide range of equipment from the fuel handling and preparation plant to the ash plant and dust disposal installation.

Besides, the industrialist has the confidence that he will get after-sales service of the highest quality from AVB!

...a Powerful Partnership for Progress

ACC-VICKERS-BABCOCK LTD.

Butyl Alcohol

As a latent solvent and coupler in nitrocellulose lacquers "Union Carbide" Butyl Alcohol offers:

- BETTER RESIN COMPATIBILITY
- INCREASED BLUSH RESISTANCE
- BETTER FLOW-OUT AND LEVELLING

Extensively used in the production of plasticizers, "Union Carbide" Butyl Alcohol also serves as a diluent in hydraulic fluids... an extractant in the manufacture of antibiotics, vitamins and hormones... and in a host of other industrial applications.

For your requirements of Butyl Alcohol or for further information write to your nearest Union Carbide India Office.

SWTUC 248A

The Corporation has also been helping the textile industry with short-term loans for installation of indigenous machinery by financing the purchase of the machinery. The machinery is made available by the Corporation on hire-purchase basis, the value of the machinery together with the interest thereon being repayable in a period of 5 years. The Corporation had upto July 1, 1961, sanctioned loans of the total value of Rs. 35 lakhs to 7 applicants on this account.

The short-term loans advanced by the Corporation to the textile industry are aimed at giving a fillip to the modernisation and rehabilitation programme of the industry.

ENI. CREDIT

Some further details are now available of the agreement signed by the Union Oil Ministry with the Italian State-owned oil corporation, Ente Nazionale Idrocarburi, last week. The agreement provides for repayment of the Rs. 46 crores credit to be made available by the Italian company for setting up of various petroleum projects in the public sector in the following manner: 5 per cent of the foreign exchange cost of a project would be payable at the time of signing of the individual agreement for the project; another 3 per cent of the cost will be required to be paid 12 months after the signing of an agreement; the balance will be payable in 20 equal half-yearly instalments starting two years after the signing of each agreement. The Government of India will be entitled to pay 50 per cent of the amount under the first four instalments; the remaining 50 per cent would be added proportionately to the other 16 instalments.

The chief value of the agreement lies in the fact that neither the Italian company would be called upon to provide the full amount of credit at one time, nor India would be liable to make repayment in a lump sum. Agreement for each project would be negotiated and signed separately and the repayment liability for the credit made available for a project would fall due in the manner stated above.

Among the projects for which the ENI credit will be available is included a refinery. But it will be set up as an adjunct to the lubricating oil plant. The refinery will be established only if the Italian company can show that setting up of the refinery would be more economical if grouped with the lubricating oil plant.

Setting up of a lubricating oil plant in the public sector with ENI's assistance does not rule out the establishment of a similar plant by the Esso Standard Oil Company in equal partnership with the Government of India. The Esso Standard Oil Company's proposal, it is understood, is being seriously examined by the Oil Ministry.

MOVEMENT OF COAL BY ROAD

The Government of India, it is understood, has under consideration a scheme to move nearly 6 million tons of coal by road. For the present, the Government, it is further learnt, has decided that free movement of coal of Grade II and below should be allowed by road from the Karanpura coalfields to the consumers in North Bihar and Uttar Pradesh.

The scheme has been drawn up as a sequel to the recommendation of the Committee on Transportation set up by the Ministry of Steel, Mines and Fuel some time ago to assess the scope for utilising road transport for movement of coal, especially to industries located not far away from the coalfields, particularly in the Bengal-Bihar region. The Committee had recommended that movement of coal by rail within short distances should be completely stopped except for meeting the requirements of the steel plants and those of the railways.

SHIP-BUILDING AND REPAIRS

The Indian shipping companies have been negotiating with the Yugoslav Shipyards for the construction of three or four ships under the credit offered by that country. The specifications for the types of vessels to be ordered have been settled. No settlement, however, has yet been reached on the construction price of these ships.

Meanwhile, the Government of India has laid down that the loans advanced to the Indian shipping companies would carry a stipulation that each loanee shall have to purchase, at least, one ship from the Hindustan Shipyard.

So far as repair work of ships by Indian firms is concerned, it is observed from the replies received from the various ship repairing firms in the country that they are reluctant to undertake any expansion or modernisation of their installations. A few firms have indicated that they could consider schemes of development of their installations provided they were assured by the Government of financial assistance and provision of adequate repair work. The Government, it is understood, is unable to give any assurance to the industry for providing adequate repair work. Requests for financial assistance would, however, be considered on merits of each case.

The Government also proposes to set up local Advisory Committees at Calcutta and Bombay to deal with matters concerning general improvement in repair facilities, repair berth and dry dock programmes, availability of ship repair material etc. It is hoped that these Committees in their reports would make recommendations for assistance to ship repair firms for undertaking the development and modernisation of their works. If any such recommendations are received, the Government would consider whether any general scheme for the grant of financial assistance to the ship repairing industry is necessary.

ONE SHIPPING CORPORATION

The Eastern and Western Shipping Corporations, it is understood, will be merged into a single unit, to be named the Shipping Corporation of India, with effect from October 2. The authorised capital of the new Corporation will be Rs. 35 crores, of which Rs. 23 crores will be paid-up. The Corporation will have on that date a total tonnage of 1,30,000 GRT (approximately), made up of 14 dry cargo vessels, two passenger-cum-cargo ships and two tankers for coastal service. Orders for some more vessels of the Lubecker and Mitsubishi type have been placed with the Hindustan Shipyard.

The fleet of the Corporation will operate between India and Japan, Australia, the U.S.S.R., Poland and East Africa, besides on coastal routes.

The Corporation has been admitted to the India-U.K. Conference which comprises shipping companies operating in this region. It will automatically become a member of the India-U.K. — Continent Conference to which the Western Shipping Corporation had already been admitted as a member.

CREDIT FOR SMALL INDUSTRIES

The Union Minister for Finance, Mr. Morarji Desai, has stated that credit facilities offered by the State Bank of India for small-scale industries might be expanded. He indicated that shortly the State Bank would be able to allocate over 10 per cent of its total advances to small-scale units. Commercial banks were also being persuaded to fall in line with the State Bank so that the problem of financing small-scale industries was solved, Mr. Desai added.

TRADE FOLLOWS AID

As mentioned earlier in this column, India's trade pattern has been somewhat changing in the recent past consequent upon the availability of aid from various countries. The United Kingdom which has been the traditional supplier to India of machinery for paper and plastic industries, is now being replaced by the United States. Indian importers of these two types of machinery have been asked by the Government to meet their future requirements from the United States. It is due to the fact that the credit to finance these imports is being made available by the U.S.A.

Power units below 15,000 kW. capacity are now being imported from the rupee payment countries.

IMPORT DUTY ON RAW JUTE GOES

After taking account of the supply position of raw jute and in order to promote exports of jute goods, the Government of India has decided to remove, with effect from September 1, 1961, the existing levy of 35 per cent on raw jute imports. This measure, it is stated, will enable Indian jute mills to obtain supplies of raw jute from abroad at competitive prices, thus enabling them to sell jute manufactures at reasonable prices in the world market.

AMERICAN TECHNICIANS FOR ROURKELA

Hindustan Steel Limited has entered into a contract with American Consulting Corporation for securing 19 experts for a period of 2 years for operating the hot strip and cold rolling mills of Rourkela Steel Works. This, it is stated, has been done because operating personnel with sufficient experience are not available either in India or in West Germany. The American firm specialises in the running of rolling mills and is expected to help Hindustan Steel to get production from the hot strip and cold rolling mills of Rourkela to their rated capacity. The total cost of the stay of the 19 experts from the United States will be Rs. 6.2 million.

MANUFACTURE OF SCOOTER ENGINES

Messrs. Enfield India Limited have entered into an agreement with Villiers Engineering Company, Wolverhampton (U.K.), to manufacture scooter engines of the British firm's make. These engines will be manufactured at the existing factory of Enfield India where motor cycles are already being manufactured. Besides manufacturing Villiers scooter engines, Enfield India will be producing at these works Royal Enfield scooters as well.

Villiers Engineering Company has also permitted Cycle Equipment (Private) Limited of Okhla, Delhi, to produce Villiers free-wheels.

Enfield India will have a capacity to manufacture 9,600 Villiers engines per annum. The capacity of Cycle Equipment (Private) Limited will be 500,000 free-wheels a year.

CENTRAL ADVISORY COUNCIL FOR INDUSTRIES

The Central Advisory Council for Industries is scheduled to meet here on October 28. Besides reviewing the general economic situation in the country and considering the annual report of the Development Council, it would discuss the industrial development programme of the Third Plan, with particular reference to export promotion. The Council will also review the progress achieved in the field of machine manufacturing industry.

RUBBER PLANTING

The Planning Commission, after considering the Kerala Government's schemes regarding new planting

of rubber in the State has reached the conclusion that the following programme will be a realistic one:

	Acreage	Estimated Cost (Rs. lakhs)
(i) Planting by Government Company	20,000	250.00
(ii) Small holders (Unit of 10 acres)	75,000	380.00
(iii) Landless and poor peasants (Unit of 7 acres)	10,000	60.00
Total	105,000	690.00

RURAL ELECTRIFICATION

A provision of about Rs. 105 crores has been made in the Third Plan for rural electrification. The tentative State-wise break-up of this provision is as follows:

State	Provision (Rs. crores)
1. Andhra Pradesh	9.45
2. Assam	0.25
3. Bihar	3.00
4. Gujarat	7.00
5. Jammu and Kashmir	1.86
6. Kerala	4.00
7. Madhya Pradesh	6.75
8. Madras	30.00
9. Maharashtra	8.33
10. Mysore	4.25
11. Orissa	1.50
12. Punjab	7.00
13. Rajasthan	1.11
14. Uttar Pradesh	13.90
15. West Bengal	0.40
16. Union Territories	5.88
TOTAL	104.68 (or say Rs. 105 crores)

The scope of rural electrification programme in each State is determined by the State Government concerned, having regard to the need for funds required for other sectors and also the need for a balance between increased generating capacity and extensions in transmission, distribution and rural electrification.

RESERVE BANK AND STATE BANK NEW CHIEFS

Mr. P. C. Bhattacharyya, at present Chairman of the State Bank of India, will take over as Governor of the Reserve Bank with effect from March 1, 1962, in succession to Mr. H. V. R. Iengar, who is retiring. Mr. Bhattacharyya will be succeeded in the State Bank by Mr. S. Ranganathan, at present Secretary to the Government of India, Ministry of Commerce and Industry.

BRIEFS

A 10-kilometer section between Koderma and Gujhandi on the main line of Eastern Railway was energized on August 31, 1961. This fills an important gap in the electrification of the Durgapur-Gaya section.

India has secured orders for another 1,10,000 pairs of shoes from Russia and 28,000 pairs from East Germany.

COMPANY AFFAIRS

NEW CAPITAL ISSUES

The Controller of Capital Issues has granted consent for the issue of a total capital of Rs. 1 crore to three companies. Of these one is a new company which will manufacture pneumatic tyre and tube valves in collaboration with an American firm. The consent is valid for a period of 12 months in each case. The following are the details.

Utkal Machinery Limited, Bombay, with its factory at Rourkela, Orissa, has been granted consent to the issue of further capital of Rs. 55 lakhs divided into equity shares of Rs. 10 each for cash at par. Out of this further issue the three existing German collaborating firms will be offered shares of the value of Rs. 26.25 lakhs and the balance will be subscribed by Indians. The company's existing paid-up capital is Rs. 100 lakhs in equity shares of Rs. 10 each.

Schrader-Scovill Duncan Limited, a new company incorporated in West Bengal, has been granted consent to the issue of capital of Rs. 35 lakhs divided into 3,50,000 equity shares of Rs. 10 each for cash at par. The company has obtained an industrial licence for the establishment of an undertaking at Bombay for the manufacture of pneumatic tyre and tube valves. Fifty-one per cent of the issued capital will be subscribed by the foreign collaborators, Messrs. Scovill Manufacturing Company of the USA which will be utilized in meeting the foreign exchange requirements for import of machinery. Messrs. Duncan Brothers & Co. Limited, who are proposed to be appointed as Secretaries and Treasurers, will subscribe 87,472 shares and 84,028 shares will be offered for public subscription.

International Computers and Tabulators (India) Private, Bombay, carrying on business of dealers in tabulating machines have been accorded consent to issue a capital of Rs. 16,93,600 in equity shares of Rs. 100 each at par, of which shares of the value of Rs. 49,194 will be for cash and balance for consideration other than cash. The shares will be allotted to Messrs. International Computers and Tabulators Limited, London, in discharge of the loan due to Power-Samas Accounting Machine (Sales) Ltd. The present paid-up capital of the company is Rs. 27,06,400.

MUKAND IRON

The working of Mukand Iron during the year to March 31, 1961 shows a considerable improvement over the previous year. The production of steel castings and rolled products at 5,624 metric tons and 69,552 metric tons show an increase over last year of 31 per cent and 50 per cent respectively. The sales of the two products at Rs. 1.78 crores and Rs. 4.59 crore were higher by 55 per cent and 50 per cent respectively over the previous year.

The Company has commenced regular supplies of Centre Buffer Couplers to the Indian Railways. There has also been good progress in the production of roller bearing axle-boxes, automobile components and castings for sugar machinery manufacture. The directors have pointed out that the supply of billets was easy during the year under review and this has enabled the Company to show improved results. "We could have even rolled half as much more, had supplies been better. Although the Government of India have indicated that that billets will be allocated to the re-rolling industry in the current year on the basis of its performance for

the year ended 31st March, 1961, the supplies are not commensurate with these indications." The Government should devise measures to prevent deterioration. A three-year expansion programme for the foundry at the Kurla Works of the Company has been planned. In the first stage, which will be spread over two years, the capacity is proposed to be increased to 750 tons and in the second stage to 1000 tons per month.

The Company's relations with employees have entered a new phase with the conclusion of a five-year agreement effective from 1st October, 1960. This agreement provides for increased wage scales and other benefits. Under the agreement the workers have agreed not to raise any demand, which imposes a monetary burden on the Company, save that relating to the annual bonus.

The gross profit of the Company during the year under review after provision of depreciation comes to Rs. 53.18 lakhs against Rs. 31.49 lakhs during the previous year. After provision of taxes etc. there is a balance of Rs. 19.98 lakhs out of which Rs. 10 lakhs have been transferred to general reserve. The Directors have recommended the payment of a dividend of Rs. 1.20 on ordinary shares of Rs. 10 each. A dividend of Rs. 0.60 has been proposed to be paid on new ordinary shares.

DHRANGADHRA CHEMICALS

It is reported that the caustic soda unit of Dhrangadhra Chemical Works Ltd. recorded a lower output as compared to the previous year because of power shut-offs now and then. The directors have reported that net realisation on account of caustic soda was lower because special rebates had to be given to clear off the accumulated stocks which in turn were due to excessive imports and unco-ordinated releases in the market by the State Trading Corporation even when the indigenous product was available. The company could not run its salt works because of unfavourable weather conditions and it had to purchase salt from outside during the year under review. The production of soda ash however went up by nearly 12 per cent as compared to last year's output, which was 8 per cent better than that of the preceding year. The advantages derived from the increase in production were offset to some extent by the rise in costs of packing, higher depreciation and maintenance, and amenities to staff and labour. The company with other producers of soda ash has made representation with the Government of India during December last for an increase in selling prices of soda ash to cover the steadily rising costs of manufactures. The directors have reported that the Government has increased the selling price of soda ash by nearly Rs. 10 per metric ton which is very small. It is expected that the Tariff Commission will make an enquiry shortly to consider the working of soda ash industry.

During the year under review the company made a profit of Rs. 51.82 lakhs. After making provision for depreciation etc., the directors have proposed to transfer Rs. 5.30 lakhs from the general reserve. A dividend at the rate of 7.8 per cent per annum on cumulative redeemable preference shares has been proposed to be paid and a dividend at the rate of 6 per cent per annum on old ordinary shares has been proposed to be paid on the paid-up amount thereon.

There is a surer way of getting your rightful share of the rich export market. If you exercise strict quality control in the manufacture of your goods, maintain regular supplies, produce according to the buyer's specifications, arrange for after sales service facilities, a tidy sum in foreign exchange is yours. In the Export markets you are competing face to face with the highly industrialised countries of the west. For the buyer to select your goods in preference to those of other countries you have to compete on quality.

Company Meetings

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LIMITED

Tiruchirapalli

Chairman's Speech

Addressing the Twenty-First Annual General Meeting of the Company, on 30th August, 1961, Mr. K. A. P. Visvanatham, Chairman, said:

"The capital expenditure during this year on rural and urban extensions amounted to Rs. 17.46 lakhs as against an expenditure of Rs. 10.35 lakhs incurred in the previous year. You will find the progress is satisfactory in spite of the difficulties of getting materials like posts, hardware and cement for the extensions.

The Government of Madras had sanctioned a loan of Rs. 12 lakhs for rural electrification schemes of which we were able to draw a sum of Rs. 9,97,860 only due to certain procedural difficulties connected with capital issues. The balance of Rs. 2,02,140 is expected to be received this year. We have also applied to the Government of Madras for a loan to cover schemes estimated to cost over Rs. 45 lakhs. We are hoping to get about Rs. 20 lakhs to take up schemes specified by the Government as it is understood that a larger allocation is proposed to be made this year for financial assistance to licensees. The demand for electric power supply is ever increasing and there is therefore no dearth for work. We have drawn up a programme to take up works amounting to Rs. 20 to 25 lakhs a year having regard to availability of materials and power supply from the Electricity Board's Power Generating plants and I believe this will be realistic.

The great flood havoc which seriously affected the agricultural and domestic economy of the Tiruchirapalli and Tanjore Districts fortunately left us with light damages. The villages Ayyampalayam, Amur, Gunaseelam, Peramur, Evur, Kodunthurai and Thinnakkonam in the Tiruchirapalli district were without supply for about a week and the villages of Palamaneri, Tirukkattupalli, Budalur, and Sengipatti in Tanjore district were affected for a day. Supply was promptly restored because of the ceaseless and indefatigable energy of the staff.

Mr. H. K. Ramaswami, Director of the Managing Agency House and Ex-officio Director of this Company who had been abroad between April and July had, among other things, been examining the possibility of securing reputed foreign collaboration for switchgear and electrical domestic equipment manufacture. Though no concrete proposals have been secured, it is likely that in course of time the company may be in a position to suggest to you a diversification of its activities, by entering into manufacture as the Directors believe that as a long-range policy it would be the right thing to do.

I would like to draw your special attention to the reserve of Rs. 1,26,000 created on the basis of the notional difference in income-tax levels prevailing now and previously. The Federation of Electricity Undertakings is striving to get this money available to us either for dividends or for augmenting our capital sources. It may take sometime to have this settled and I hope the Government's decision will be favourable to you. I may also add that the Federation has been actively trying to secure modification to the VI Schedule to the Electricity Supply Act so as to enable undertakings to pay more attractive dividends and thus attract capital to this industry which is necessary if the power development plans envisaged in the Third Plan are to succeed.

Power supply position was satisfactory except for a short-period of restriction due to low water conditions. A 50 per cent cut in consumption of all H.T. and L.T. industrial consumers excepting rice mills and cement factories and essential services was ordered to be enforced by the Government with effect from 16-5-61 and new connections for industrial or agricultural purposes were also ordered to be stopped with effect from that date. But due to improved conditions the cut was reduced from 50 to 25 per cent from 27-5-1961 and it was completely relaxed with effect from 1-6-1961 owing to the onset of the monsoon. Also restrictions on temporary supplies, etc., and on connecting up of new services were lifted from that date. Though this had no effect on our revenue for that month it had caused some inconvenience to our consumers which is beyond our control.

The revenue earnings this year have nearly touched Rs. 1 crore and we have been able to maintain the usual 9 per cent dividend on equity shares subject to tax. As regards dividend on Preference Shares an extra 30 per cent over and above the stipulated dividend will be paid as required under Law. The gross dividend works out to 7.15 per cent in terms of the Preference Shares Regulation Act, 1960.

The staff relations continued to be very cordial.

I am glad to inform you that the Central Government have decided to establish a Regional Engineering College in Tiruchi with a strength of 250 students to start with. The college is expected to function from the next academic year. In view of this, the proposal to start a private college in Tiruchi as indicated in my last year's speech is dropped. However, the Seshasayee Institute of Technology is being carefully nursed to grow in its stature and to keep its pride of place among polytechnics in the State—a distinction it has achieved. The Government have sanctioned a larger intake of students, thus providing for 180 students as against 120 hitherto admitted. A junior polytechnic to train middle school boys as skilled craftsmen is also sanctioned and this is now under implementation.

I have also pleasure in informing you that the Central Government have decided to locate one of the heavy electrical industries in Tiruchirapalli, near Tiruverumbur, and there is also a move to establish a Steel Rolling Mill near Ariamangalam.

It is thus gratifying to note that the industrial development of this district is growing rapidly and we hope to play our part in this achievement.

I now move that the Directors' Report and Audited Balance Sheet as on 31-3-1961 and the Profit & Loss Account for the year ended 31-3-1961 be approved and adopted."

N.B. The above does not purport to be the report of the Proceedings of the 21st Annual General Meeting of the Company held on 30th August, 1961.

RUBY GENERAL INSURANCE CO., LTD., SUMMARY OF CHAIRMAN'S SPEECH

The following is the summary of the Speech of the Chairman, Shri B. M. Birla, delivered at the Twenty-fifth Annual General Meeting of the Company on August 30, 1961.

Gentlemen,

It gives me great pleasure to welcome you to the Twenty-fifth Annual General Meeting of the Company. The occasion is of special significance as it marks the completion of 25 years of the Company's foundation. I convey to you all my warmest greetings on this occasion.

The notable progress which your Company has made during the short span of its existence is due to the excellent support and co-operation it has received from its patrons and is a matter of satisfaction and pride for all of us.

The figures given below depict the remarkable growth of your Company during the past decade:

Net Premium	1950 Rupees	1955 Rupees	1960 Rupees
Fire	21,17,345	36,66,678	70,50,917
Misc. Accident ..	34,79,055	45,41,216	87,38,252
Marine	10,39,455	15,76,162	14,76,333
	66,35,855	97,84,056	1,72,65,502
Capital & Funds	79,50,003	92,21,200	1,46,73,639

FIRE DEPARTMENT:

The Fire Business of the Company has again yielded good results despite the reduction in the Fire rates which came into effect from 1st January, 1960. The net profit in this Department is Rs. 4,99,375/- and Reserves have increased by Rs. 7,68,896/-.

I would like to draw your attention to the huge national loss due to the recurrence of a large number of fires every year in the country. The paramount need today is for nation-wide vigilance for avoiding Fire wastage.

MOTOR AND MISCELLANEOUS DEPARTMENT:

The net premium in this Department has increased from Rs. 57,13,473/- in 1959 to Rs. 87,38,252/- in the year under review and the Reserve increased from Rs. 27,71,034/- to Rs. 43,69,126/-. The large number of road accidents resulting not only to heavy damages to the vehicles but loss of valuable lives is a constant cause of anxiety to the Underwriters not only in India but all over the world.

MARINE DEPARTMENT:

The net premium in this Department amounted to Rs. 14,76,333/- as compared to Rs. 20,03,826/- in the previous year. The fall in the premium has been due to reduction in the Overseas Hull business which had been showing disappointing results. The Department has shown a profit after many years.

The unrestricted competition has brought cargo rates down to an uneconomic level. A comprehensive tariff for internal transit will no doubt help to improve the situation. Careful handling of cargo at the Ports and by the carriers is essential.

The insurance business has a very important role to play in the development of country's economy in keeping with the programme of rapid industrialisation. The Government should lend its support to all the Indian Insurance Companies in an equitable way so that the Insurance Industry as a whole can develop on a sound and healthy basis. The industry is passing through a period of transition and the public are still not insurance-minded. As compared to other countries, premium income in India is very small.

Your Company enjoys a very strong financial position which has been further strengthened during the year under review because of the large increase in Reserves. The Capital and Funds at the end of the year stand at Rs. 1,46,73,639/- as against Rs. 1,27,80,763/- at the end of 1959.

Note: This does not purport to be a record of the proceedings of the above Annual General Meeting.

Due to increased and diversified activities
the name of the Company which was hitherto known as

"KESORAM COTTON MILLS LIMITED"

has been changed to

KESORAM INDUSTRIES & COTTON MILLS LIMITED

with effect from 30th day of August '61 after obtaining
the consent of the Central Government.

The Import-Export Dilemma

THE meetings of the Import and Export Advisory Councils on Monday and Tuesday this week, if they did nothing else, have served to focus attention on the unpleasant horns of the dilemma in which India is fairly and squarely placed at least for the next five years. The first of these is, undoubtedly, the problem of maintaining increased development in the spacious pattern of the Third Plan, whilst providing existing industries with the raw materials they require. This is often called the dilemma of maintenance versus development. The second problem is related to it, but is now considered separately; it is how to expand exports with a highly inelastic bill for raw materials. The two horns of the dilemma might, theoretically, be jumped by a decision to bias imports very heavily in favour of maintenance, subject to the condition that all these additional maintenance imports are used for exports and, when the export earnings increase, there could conceivably be some large margin for development. One thing, however, the meetings made clear was that, with all the passion for exports in the immediate future, the Government of India was firmly set in its current development plans. In other words, no solution to the import-export dilemma can be found in these terms; both politics and dogma are firmly against even a policy of temporary consolidation.

Opinions may well differ as to the extent to which in his eloquent speech, in reply to the criticism that development has been overdone at the expense of the utilisation of the current capacity, Mr. Manubhai Shah argued that the character of the choice did not admit of this over-simplification. Much of the development was currently associated with providing raw materials and spares and was, therefore, true "maintenance". Besides, here was a large political issue involved in that it was quite impossible for leading States of the Indian Union to further advance their lead whilst the backward States were denied a chance of development by reason of diversion of all the available foreign exchange to existing units. There was also the question of allocation of resources not only to units but to men, and the Minister of Industry perhaps made his most valuable point when he said that a part of the process of development was the building of the men who were to carry the development of India not for five

years but for as long as the eye can see. There was also, undoubtedly, great force in his argument that a freezing of new capital investment would only result in "vested" interests, unfortunately already too well entrenched, and the rise of political dissatisfaction with the inequalities thus made more acute.

While there was much cogency as well as sweet reasonableness in the Government's case, the dilemma remains as acute as before. If this policy is pursued it can only result, as the Minister for Commerce and Industry admitted, in a further deterioration in India's balance of payments. Nor can the problem of diversion of capacity to export be any solution, for, as was pointed out at the Import Advisory Council's meeting, any reduction of sales in the internal market will be inflationary, and Government promises of holding the price line will not be any better than the paper on which so many have been written. Again, the only chance of making India competitive — with labour costs in money terms rigid and large rationalisation not possible because of the Trade Union resistance — is by exploiting the principle of increasing returns. In other words, the level of costs can only be reduced by additional production which in turn is based on additional imports in some cases. The fixing of new targets for exports must imply additions to, not subtractions from, the current level of internal consumption.

If this point is realised, it should be possible without too much departure from current policy to make a substantial contribution to exports. It will probably be necessary, as Mr. R. G. Saraiya advocated, to have more specialised export houses and warehouses at the ports to enable quick and inexpensive additional knowledge and "facilities". It may also be necessary, as Mr. Neville Wadia pointed out, to reconsider allocations of raw materials as in cotton, by means of additional rebates on export performance which, as he estimated for cotton, might bring in Rs. 6 crores of foreign exchange. Again, as Mr. K. K. Birla indicated, exports in time might win us additional quotas under the International Sugar Agreement. All these can and should be done. Another proposal that was considered was that some con-

cession on income tax related to exports would add incentives hitherto conspicuous by their absence.

Whether exports are to be made compulsory by legislation or not—*The Eastern Economist* favours compulsion — certain precise lines of policy can be demarcated even before the Ramaswami Mudaliar Committee reports at the end of the year. Firstly, some additional export targets should be fixed with the agencies responsible for their execution. Secondly, there must be a dovetailing of raw material imports with additional export performance in such a manner that efforts are not

frustrated by the absence of raw materials and spares. Thirdly, all the incentives possible should be put in operation on income tax, export houses, warehouses, additional quotas, additional rebates, and not least of all, costs of transport. These are not by any means impossible or even difficult jobs in theory. The question is whether or not the Government's determination is really as great as its declarations purport to be. The real trouble seems to be that the country believes the Government is only half-hearted in its decision. How can conviction be carried to those who have had good reason to doubt the ineffective words they have often heard in the past?

Roads to the Rescue?

NEITHER the parliamentary debate on the Third Plan nor the tireless efforts of the Railway Ministry to defend its performance (the latest example is highlighting the improvement in the supply of wagons for coal movements in the slack season) are helpful for an appraisal of the transport situation. A sense of crisis about the outlook for transport in the coming years is hardly in evidence and a discussion of the issue gets bogged down in concern over transient problems. It is unfortunately one of the serious drawbacks of Indian planning, whether in the context of the short run of five years or in the long-term perspective, that scant attention is paid to the infra-structure of the economy and there is almost exclusive preoccupation with the superstructure. The precious little that is devoted to perspective planning in the Third Plan ignores the basic requirements of the economy in respect of transport and power. Transport is dismissed with a bare mention of the target of freight traffic for the railways in 1970-71 and that too is expressed in terms of the originating traffic of the order of 380-420 million tons which cannot give any indication of the effective demand which will be generated for rail capacity.

This sorry state of affairs would appear to arise from the fact that the Planning Commission has allowed itself to be rendered a prisoner of the high pressure which the Railway Ministry is in a position to exert on questions involving the relative weights to be assigned to rail and road transport in the development programmes of the economy. The railways have not shown, in the Second Plan period, a capacity for flexibility. A slackening of the tempo of economic activity in the wake of the crisis of foreign exchange pushed them to raise the bogey of acute competition from motor transport with the result that the Planning Commission has been unable to make up its mind on several issues of transport development in the Third Plan and it has made no secret of the fact that it would prefer these matters to await the final report of the Neogy Committee on Transport Policy and Co-ordination.

All it has ventured to do is to record its tentative view that "prima facie, it is desirable that financially the Indian railways should not take the downward path followed by the railway system in some other countries." It is not understandable why it should betray diffidence and express a *prima facie* opinion, when it has not been argued by any responsible section of opinion in the country that a halt should be cried to any further expansion of the railways. *The Eastern Economist* has held the view that the railways will retain for the present their dominant rank among the different modes of domestic transport.

In the Third Plan the capital-at-charge of the railways is to be increased from Rs. 1,559 crores in 1960-61 to Rs. 2,313 crores in 1965-66 — an increase of Rs. 754 crores in five years as against an increase of Rs. 725 crores in the first two Plan periods combined. This question is beside the point, which concerns the root of the transport problem.

That point is: Given this order of investment and ancillary outlay, will the railways provide the capacity for which the transport user will make a demand? No answer has been provided by the Planning Commission to this question. The railway freight target for the Third Plan has been expressed in terms of originating tons and put at 245 million tons. The increase in the average lead has not been assessed over the next five years even by a rule of thumb to arrive at a target in ton miles which is the real indicator of demand. The numerous qualifications and guarded reservations noticeable throughout the Planning Commission's analysis of the freight transport problem hardly leave room for doubt that the railways will be unable to cope with the traffic likely to arise. That is the crux of the transport problem.

The Planning Commission is apparently not prepared to admit that the long-delayed age of the roads is arriving. Its arrival does not mean that the relative scales of the importance of rail and road will be reversed overnight. In positive terms it means that roads will emerge progressively and rapidly with a potential to supply the transport capacity which the economy would require and they must be liberated from the shackles placed on them in the context of an altogether different situation when cut-throat competition ran riot for a limited volume of traffic. If due recognition is not given to the fact of the arrival of the roads and transport policy continues to move in the conventional rut, as in the tentative assumptions made by the Planning Commission, nothing can save the economy from a transport crisis of unmanageable proportions. Assuming a freight target for the railways of the order of 400 million originating tons in 1970-71 and the average lead to rise to 425 miles, is there any reasonable ground to suppose that the railways will manage to move 170,000 million ton miles as against their estimated performance of 54,700 million ton miles in 1960-61?

It is roads alone which can come to the rescue of the economy. Neither coastal shipping nor inland waterways possess that potential. During 1950-51 to 1960-61, road transport, hamstrung by legal restrictions, trebled its freight performance from 3,358 million ton miles to 10,600 million ton miles. Freed from the shackles, it can go a long

way to fight the challenge of the mounting demand for transport. But in the Third Plan it is allocated a mere Rs. 300 crores. The economies in investment and the increase in capacity available from the truck-trailer combination have been demonstrated in other countries. Assuming that the payload is raised from a 6-ton vehicle (which is not common at present) to 12-ton truck-trailer, the cost of carriage per ton mile would be nearly

halved. A decision to permit truck-trailer services on some selected routes is imperative now, but the very term truck-trailer has been banished from the text of the Plan. Expansion of road transport has its counterpart in expansion of the automobile manufacturing industry and both require a medium period of gestation. Failure to plan road development now will make transport shortage in the Third and Fourth Plans insoluble.

Guest Editorial

Fear Becomes Lost in Habit

By WILLIAM REES-MOGG

THE paradox of Berlin is that in the West there is a belief in crisis, but hardly any belief in the possibility of war itself. The public reaction in Britain and in most of Europe, though not in Germany itself, is that the crisis will be resolved somehow, and peacefully. If war came, the public would feel surprise, though there might only be a brief time in which to feel it.

This reaction is important, and deserves to be analyzed further. In the first place it assumes the effectiveness of the deterrent—it assumes that the deterrent will in fact deter. This has been shown also by the change of mind in the trade unions and the Labour Party in Britain about nuclear disarmament. The belief that nuclear weapons are a defence of Britain is more widely held than before.

The second point is that the Russian tactics of alternating periods of conciliation with periods of bullying is also having less effect. It has never been easy to be sure whether in fact this hot and cold policy was deliberate, or whether it represented some natural cycle in Russian policy.

Those who argued that it was calculated regard the conditioned reflex of Pavlov's psychological theories as their basis of Russian purpose. Apparently a dog which has been conditioned in a particular way becomes bewildered and hysterical if it is subjected to an alternation of the expected and the unexpected response. Sometimes when a bell rings it gets food—sometimes it gets a jug of water thrown over it—the result is a nervous collapse.

Certainly this psychological technique has been used deliberately to induce hysterical confessions in prisoners. Now there is harsh confinement and now again kind words and the offer of cigarettes. It is plausible to suppose therefore that the apparently irrational alterations of Russian foreign policy are a matter of calculation, and that their purpose is nothing less than to brainwash the world by tightening and relaxing the tension in a preconceived rhythm.

If this is the purpose, it would seem to have failed. The world is becoming less and less preoccupied with the conduct of the Russians: it has begun to assume that there is no difference, or very little difference, between periods of crisis and periods of comparative friendship. Indeed some people have come to think that if war were intended it would be preceded by a period of calm in order to achieve the maximum element of surprise.

However this all rests on the fundamental assumption that Russian policy is consistent and

rational in a way that is true of no other country. A very superficial communist might believe this, out of a sort of hero-worship of the supposedly scientific character of Russian Government. Any serious Marxist would not believe it, because Marxism is a doctrine which stresses the relative importance of underlying historic causes, particularly those of an economic character, and the relative unimportance of the anxious purposes of governments.

Any ordinary observer of human affairs would also suspect any theory which rests upon so high a degree of sophisticated consistency over so long a period. It is simpler to suppose that, for causes which remain unknown, Russian policies veer from hard to soft and back again as other countries switch their political parties in government, or suffer from trade cycles. The inability to explain the causes of the cycle is not of over-riding importance—the causes of the trade cycle remain pretty obscure after two hundred years of study.

If either theory is correct then it can do little good to remove the immediate causes of irritation. If we were not having a crisis over Berlin we would be having a crisis over something else—Laos perhaps, or Formosa, or even Yugoslavia if the Russians felt it had to be in Europe. There can never be a shortage of trouble spots in the world, in any of which a crisis can be created.

It is necessary to remember the simple tool of analysis which Lenin himself used: "Who, Whom?" There is not a single post-war crisis, except possibly those of Suez and Cuba, in which the communist bloc was not the agent and the rest of the world the sufferer. Even Suez and Cuba had little relationship to the immediate interests of the Soviet Union.

In each case therefore it has been open to Russia to lower the tension, because Russia has always in effect been the protagonist, looking for an opening. The same is true of China. The Russians did not need to start the Berlin crisis: they did not need to start nuclear testing: they could stop both at any moment of their choice. It is the Russians who are pressing the West, not the other way round.

Yet this is also a factor of hope. Precisely because Russia is in control of the situation the common public judgment of the deterrent is justified. The situation is not out of control. There can be a settlement over Berlin; there will be a settlement over Berlin; the Kremlin has no wish to be destroyed on this issue, or indeed on any other.

A DELHI DIARY

THE PRIME MINISTER'S RETURN

ACCORDING to schedule, the Prime Minister returned on Monday and equally according to schedule, he returned looking well and fit. I say 'according to schedule' because it always seems that, after an absence from India, the Prime Minister's spirits revive, however arduous the trip. In this particular case—as he explained to journalists—on one night he had no sleep, while the resolutions at the Belgrade Conference were being drafted, or rather hammered out on an anvil, in which I prefer not to describe the nations at the receiving end. Reports in Delhi, now confirmed by Mr. Sulzberger in the "New York Times", suggest that the Prime Minister had some effect in reducing tension, at least to the extent of encouraging Mr. Khrushchev to meet Mr. Kennedy. Now, however,—so contrary is the world!—it seems that Mr. Kennedy does not wish to meet Mr. Khrushchev because the subject of negotiations on Berlin has been left wide open. However, I still consider the Prime Minister has led to a softening in the Kremlin. Does it follow by Newton's Third Law of Motion that he must harden at home? That, however, seems to be the impression since he has now made it quite plain to the Akalis that he is not amenable to any reduction of his somewhat hard conditions for a settlement. In the end, it looks as though there will be less peace at home even if there is more abroad!

THE BATTLE OF THE PUNDITS

Meanwhile, conducted most peacefully, but nevertheless with much excitement, there has been in two meetings—those of the Import and Export Advisory Councils—heated controversy on matters no more important than rupees, annas and pies, or their more important (equivalents?) pounds, shillings and pence, or dollars and cents. The debate started when Dr. P. S. Lokanathan, Director-General, National Council of Applied Economic Research, in the Import Advisory Council, argued for a radical rethinking of Indian import and export policy. Firstly, priorities should now be rigidly defined so that imports would be tied to exports: would it not be a good thing, therefore, if the Import and Export Advisory Councils merged? Mr. K. C. Reddy, Minister for Commerce and Industry—who must also be worried about the time taken by the two Councils separately—was quick to agree that this looked to him an excellent suggestion. Secondly, Dr. Lokanathan thought that internal consumption should be frozen to provide for exports. Thirdly—and here he was on far vaguer ground—he spoke about the substitution of labour for capital implying that capital goods could be largely substituted in some manner by more intensive working of existing capacity at home with additional labour. This was a bone of contention on which Mr. G. L. Bansal, Secretary-General, Federation of Indian Chambers of Commerce and Industry, was quick to reply. According to Mr. Bansal, a great deal of current production was not capable of labour substitution in the facile manner in which Dr. Lokanathan had suggested. Secondly, in regard to development schemes there was a very large number of techniques which could not thus be milled about; it would not be a practicable policy greatly to change current development spasmodically if there were a temporary shortage of foreign exchange. Therefore, the end of export promotion had to be attained by better utilisation where possible, but it would be difficult to argue that there was much room to manoeuvre. Everything seems to be marginal in the best (or worst) of all marginal worlds!

"MAINTENANCE-DEVELOPMENT"

Attempts by other members to provide a bridge between the opposing views proved in the event not very helpful, and it was left to the Minister of Industry, Mr. Mansubhai Shah, in a most eloquent speech, to justify

Government policy which was neither opposed to maintenance nor development, but was beautifully poised on a new point or slogan which he described as 'maintenance development' or 'development maintenance'. At the end of his persuasive address everyone believed what the Minister thought, which was that the Government's judgment was, in fact, a splendid substitution for a doctrine on maintenance or development. It was, in fact, a recognition that maintenance of existing industries involved development of raw material industries; that the development of raw material industries evidently involved more "maintenance"; and, therefore, while Government had sometimes difficult decisions to make, because they made them with a much wider array of facts than are available to the members of the Council, they were generally "right". They recognised the hardships of the moment, but this was what a great nation had to face to struggle through the terrible poverty line. This was the part of the glorious price that was to be paid for this break-through. All in all, all was for the best in the best of all possible worlds!

EXPORTS WITHOUT TEARS

On the next day, when the Export Advisory Council was to meet, a neat little bomb-shell was placed before the Council by Mr. K. C. Reddy, Minister for Commerce and Industry, in the form of a proposal to legislate for compulsory exports. As with all explosives, the reaction was immediate, and most members of the Council, drawn largely from private industry, protested loudly against the defects of legislation for a purpose which could easily be accomplished by other measures, notably by the Government of India's recognising its own weaknesses of administration and rushing through licences, quotas, raw materials and everything else. In the end, whilst the Government's stand was ostensibly maintained, Mr. Reddy agreed that he would initiate these new measures only after consultation with the Federation and other Chambers of Commerce and Industry. Thus it looked as though exports would not be as compulsory as they first appeared, and would take place at least without tears openly shed.

WITH BLINKERS ON?

There are a few who are of the general feeling that we were getting on as best as we could in the very difficult times in which Providence had placed us. There were, however, a few others who seemed to think that India's balance of payments problem was running into a crisis so deep and profound that it would affect the entire planning for the future. This was not—happy thought!—the result of the coming of the European Common Market which curiously on this occasion was viewed without alarm, contrary to the frightened declarations of the Ministry of Finance when Mr. Thorneycroft was here. The real trouble in the minds of the optimists is that somehow or another aid will go along, and, somehow or another we will manage to service it. In the minds of the pessimists this is a counsel of complacency. In view of the current international situation—and the feeling that a "hard" look is to be taken at aid both by West Germany and the United States—one cannot assume the Aid-India Club commitments will run through according to plan or at least without some little elongation of the time that has been mentioned. In the result no one quite knows where we stand, but everyone is as hopeful as before and the Stock Exchanges on Monday and Tuesday registered their belief that all was well, by rising steadily, after fifteen days of depression, and even disaster. Such, it seems, is the mercurial character of the Indian business community. Long may it impart its optimism to the world of dismal prophets!

ARGUS.

THE WEEK'S NOTES

Berlin

AFTER BELGRADE

ONE THING which is becoming clearer beyond doubt is that the three Western allied powers are determined in their firm resolve not to let Russia thrust any psychological defeat on them. While a nuclear war is not feared in the near future, the threat of miscalculation precipitating war always hangs over the world and the Western powers do not underrate its magnitude. But in the immediate wake of the neutral summit, they have made it quite clear to Mr. Khrushchev in their joint note on the use of the air corridors from three sides to West Berlin, that they will not tolerate any blockade. The firm tone in which they trace the history of the legal sanction behind the air corridors and its inviolability except by a four-power modification are clear proofs of this attitude. The right to access cannot be the subject of negotiation, although the procedure of access may be. The joint note does not of course disclose the Western proposals for negotiations, since the Foreign Ministers of the three countries were scheduled to meet for this purpose in Washington on Thursday this week. Reports from Washington on the appeal of the Belgrade powers for an early summit of the Big Two to reimpose the ban on nuclear tests indicate that the U.S. considers this proposal premature. President Soekarno and President Modibo Keita of Mali will, of course, receive a courteous welcome, but prompt acceptance of the Belgrade appeal is too much to expect at this stage.

Meantime, in his speech delivered at the Indo-Soviet rally on the occasion of Mr. Nehru's visit to Moscow, Mr. Khrushchev reiterated the Soviet position, which, in effect, is tantamount to no relaxation of the rigid attitude taken by him. The Soviet Premier has put the responsibility for his decision to resume nuclear tests on the U.S. and has issued a veiled warning that no delays in the negotiations can prolong the conclusion of a treaty between Russia and East Germany. He has also reiterated the status of Berlin as envisaged by Russia, namely, that of a demilitarised free city and, on top, he has affirmed that the question of negotiations on West Berlin would be a matter of settlement with the State of East Germany. There is thus little relaxation in the tempo of the war of nerves. But the door is kept open for negotiations as it should be. That is apparent from Mr. Khrushchev's statement that he would be prepared for business-like talks with the West. But he was cautious not to make any commitment on a summit of the Big Two. It is particularly noteworthy that Mr. Khrushchev's speech followed Mr. Nehru's appeal in terms of the Belgrade resolution.

Prohibition

THE PRECIPITATE DECISION

AS IF the problem of foreign exchange and the challenge of exports at any cost are not sufficient to weigh down the Government during the Third Plan period, Mr. Shriman Narayan and Mr. B. N. Datar have taken up the crusade against liquor and snatched the opportunity of the Central Prohibition Committee's recent decision to translate into action the slogan of total

prohibition throughout the breadth and length of the country by the end of the Third Plan. The Central Prohibition Committee is not the formal authority to lay down any official policies, although the voice of the States is represented on it. But they get the sanction for enforcement only on approval by the State Governments. It surpasses comprehension why an issue, which has so many complicated implications, should not be left by the Centre to the discretion of the State Governments for final determination as it has done hitherto. The Union Home Ministry has snatched the opportunity of the decision of the Central Prohibition Committee and reportedly it has called upon the State Governments to prepare their plans for complete prohibition during the Third Plan period and tender them to it in a matter of only thirty days. Apparently this is to shut out any dissentient views and to adopt a uniform-cum-regimented policy of phasing out total prohibition within five years.

The ostensible cost of enforcing a policy Statewise has not been estimated at all and it is too much to presume that the State Governments would ever be in a position to formulate genuine plans of prohibition without making realistic calculations of the financial pros and cons of this policy. The Centre has gone forward with the offer to meet half the loss resulting to the State Governments from the enforcement of complete prohibition and by a rule of thumb the Centre's proposed liability has been placed somewhere at Rs. 75 crores during the five years. It is in vain to expect that the States can recoup their loss of excise revenue from additional receipts from the sales tax as the Finance Minister is said to have impressed upon them. The outlook for the rupee resources for the Third Plan is no less worrying than the outlook for the foreign exchange resources. To take only one glaring example. The Third Plan in its final version explicitly states that during the Second Plan period only Rs. 300 crores out of Rs. 780 crores of public loans were subscribed by the public and the commercial banks representing the genuine savings of the community. The bulk of the balance was subscribed by the Reserve Bank, which, in plain terms, means extra deficit financing. The Third Plan affirms that the target of deficit financing must be held at Rs. 500 crores and the element of the Reserve Bank's subscription to the market loans must be eliminated or reduced to the minimum. This in itself is a serious problem in the rupee component of the resources. The proposed policy of prohibition will add to the burdens of the problem of rupee finance both for the Centre and the State Governments. Apart from the financial aspect, illicit distillation, boot-legging and other devices including smuggling will assert themselves to defeat the policy of prohibition. On any count, therefore, the wisdom of this sentimental decision is to be seriously questioned.

Afghanistan

THE DIPLOMATIC BREAK-OFF

AFGHANISTAN'S DECLARATION of September 8, on the rupture of diplomatic relations with Pakistan is to be highly regretted. It could be asked whether this extreme step with a neighbour with whom Afghanistan basically requires friendly relations was at all advisable and how far it would advance the cause for which Afghanistan presumably is taking it. Much has hap-

pened particularly in the last half-year to strain the relations between the two neighbours. Time and again, Afghanistan has agitated the question of Pakhtoonistan and in the tribal clashes and the bombardments on the frontiers that followed, the governments of both the countries acted beyond the needs of the situation. The heavy casualties inflicted by Pakistan in the bombing from the air of the Bajaur area were far too excessive and probably the intention was to administer a deterrent against intermittent and endless pinpricks. This view may perhaps appear exaggerated, but it would seem that for the last five or six months the two governments are not in a mood to iron out their differences tactfully. It is rather curious that Afghanistan should fall back every now and then on the technique of rekindling the embers of the Pakhtoonistan issue. The irritating exchange of communications that took place between the two need not be magnified. By the consensus of opinion, Pakistan has succeeded where the British Government failed — in maintaining relatively peaceful and friendly relations with the frontier tribes.

The basic grievance of Afghanistan is the demand of a readjustment of the line of demarcation of the frontier between the two countries. Since 1947 Afghanistan has taken the position that she will not be bound by the Durand Line as the frontier, but this position is at variance with her previous tenor of conduct with the former British Government in India. For more than half a century she acquiesced in the Durand Line. In the last analysis, there must be some finality to the border line between any two countries based on treaty, as far as possible, or on history, tradition and usage. Afghanistan has had age-old friendly relations with India before partition and her geographical position, giving her the peculiar character of a land-locked country, certainly should actuate relations of friendliness with Pakistan, through which she can have a normal and natural access route for her external trade. It is to be sincerely expected that this latest recurrence of strained relations will be overcome and friendly relations will be established by the two neighbouring countries.

M.P.s

TALKING TO CIVIL SERVANTS

IT WAS in the fitness of things that the first year's commemoration series of lectures under the auspices of the Pheroze Smarak Samiti dealt directly with a subject that has a vital bearing on parliamentary democracy to which the late Mr. Pheroze Gandhi made a substantial contribution an individual was capable of making. Sir Paul Gore-Booth, British High Commissioner in India, spoke on "M.P.s. and Civil Servants". Since the British parliamentary democracy is the prototype chosen by us, it is desirable that many of the conventions that have been evolved in the working of British democracy should also be looked upon as useful guides by us without, of course, sacrificing opportunities of drawing upon the experience of other countries under different forms of democracy. The essence of Sir Paul's argument was that there was much to be said for the valuable benefits that could be derived from greater contacts between Members of Parliament and civil servants. A Member of Parliament, who had a keen interest in a specific subject, but suffered under the handicap of full knowledge of that subject, would fruitfully develop personal contacts and acquire light from the expert civil servant, deeply versed in his subject over the years. Any transgression of the limits of such contacts might do greater harm than good, but it was always difficult to define the limit of propriety. It redounds to the maturity that the British

civil service and M.P.s have developed that this limit has normally been observed in practice.

How far should these contacts be encouraged in India? In trying to appraise this problem, the difference in the stages of the growth of parliamentary democracy reached in Britain and India is a vital factor. Mr. Lal Bahadur Shastri, who presided over the occasion, showed a keen but subtle practical sense, when he uttered a warning against haste in M.P.s. developing such contacts. Few would disagree with his counsel that whenever M.P.s. felt the urge to discuss any issue with the members of the civil service for a proper appreciation of its elements, the wise course would be for them to approach the civil servant through the Minister. Such a course would safeguard administrative discipline. It must however be added that it would also safeguard something more than discipline. Sir Paul made a passing reference to the cruder forms of interference with civil servants which were a feature of British politics as far back as the 18th and early 19th centuries. It would be unfair to venture the assertion that such a situation exists in this country today. But its existence in a much lighter form need not necessarily be doubted. It is not a rare thing to hear whispers going round that legislators sometimes contact the civil servants, not essentially for acquiring any expert light, but for other apparent purposes and failure of response creates embarrassments for the civil servants. This is something as important as administrative discipline that needs to be guarded. Development of healthy contacts must be a gradual process.

Capital Punishment

SHOULD IT GO?

ON THE last day of the monsoon session a private resolution on the abolition of the capital punishment evoked a debate on a subject which has been discussed in many countries, but without leading to any positive conclusion. The discussion in the Rajya Sabha last Friday was no more helpful. Briefly the case for the abolition of capital punishment rests on the ground that infliction of this extreme penalty has little relevance to the incidence of the crime of homicide. There may be low incidence of this crime or its upsurge depending upon different factors governing the social, economic, political or industrial environment. The deterrent effect of the penalty of death is thus not borne out by the experience of society in different countries. There is still another ground urged against the death penalty which merits some attention, but it is less cogent than the earlier one. In not a few cases a wrong person is hanged and confessions have come forth or detection has succeeded in proving that the real culprit was a different person. In a few cases capital punishment turns out to have been inflicted for the murder of a person who is resurrected from the unknown into which he had vanished.

But granting that the first argument carries considerable force and the second one implies horrible victimisation of the innocent, the question remains unanswered what should be done in the generality of cases of genuine convictions for murder. Society certainly deserves protection against the crime of murder and if the death penalty is abolished the likelihood is that cases of murder might increase. The weight of practical wisdom is on the side of retention, though not in the present form. Different degrees of the crime of murder could be classified and it would seem advisable to prescribe the punishment of death, where the crime takes a heinous form.

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH AIR-INDIA AND QANTAS

150 YEARS

1811 - 1961

KRUPP

For 150 years, the name of Krupp has been identified with superb workmanship and enduring quality.

The name of Krupp is also linked with outstanding pioneer work, past and present, in many fields of industrial research, planning and manufacture.

The results achieved have caused the name of Krupp to be permanently associated with progress in engineering throughout the world. Illustrated on this page is one of the more than 3,000 items contained in our Catalogue "KRUPP PRODUCTS AND SERVICES": Full-portal level-luffing wharf cranes.

Products and Services:

Exploration of mineral deposits · Engineering of mining schemes · Design, layout, and supply of plant for the production and processing of ferrous and non-ferrous metals · Preparation and dressing plant for ore, coal, and other minerals · Chemical-process plant · Cement, lime, and gypsum plant · Bridges, hydraulic structures, and reinforced-concrete structures · Materials, pressure vessels, and tanks for nuclear reactors · Castings and forgings · Rolls · WIDIA-sintered carbide · Magnetic materials · Cable-making and stranding machines · Hydraulic extruders · Machinery for the rubber and plastics industries · Edible oil extraction plant · Sheet-metal working and can-making machinery · Mobile water purifiers · Plate and sheet-metal fabrications · Pneumatic tools · Motor trucks, buses, and special-purpose vehicles · Diesel and electric locomotives · Special-purpose freight cars · Ocean-going vessels and river craft · Diesel engines · Giant excavators and bulk-handling plant · Power shovels and cranes.

EFFICIENCY IN STATE ENTERPRISES

By

ODYSSEUS

THE WORD "NATIONALISATION" arouses such opposite emotions in the upholders of state and private enterprise that a dispassionate discussion of the real difficulties, in securing efficiency, faced by those responsible for managing public corporations has become almost impossible.

Yet, since, with the notable exception of Germany, no state seems likely to return its public enterprises to private control, an attempt to shift the whole argument away from vituperation to constructive discussion is imperative.

The basic question is: Why are public enterprises less efficient than private? What can be done to raise their efficiency?

The policies and day to day decisions of the directors of a private enterprise are primarily conditioned by their estimates of the return on capital market from which the money must be raised. They will promote a young man on his merits over the heads of executives senior to him in age or experience, and they will not hesitate to transfer or dismiss an unsatisfactory executive. In other words, their primary concern is efficiency.

On the other hand, because the directors of a nationalised industry are ultimately subject to Parliamentary control, their decisions are primarily conditioned not by considerations of efficiency but by fear of a political row. Nationalised industries are usually basic to the whole economy, e.g., coal, electricity, or transport, so that their decisions on prices, salaries, investment, the opening of new, or the closing of existing, facilities, directly affect vast cross-sections of the electorate. Any decision taken is bound to disturb what some existing interest regards as its legitimate rights, and will supply the Parliamentary Opposition with ammunition to snipe at the government of the day.

The Socialists, who nationalised leading U.K. industries after the war, were anxious to narrow the field for political interference as far as possible, and to ensure that the nationalised industries were left alone to get on with their jobs in peace. Mr. Herbert Morrison was the protagonist of the solution adopted, namely, that the coal, electricity, and other industries should be managed by independent public corporations, whose Boards were to be subject to broad directives on policy from the appropriate Minister. But neither he nor Parliament were to interfere with matters of day to day administration.

In his admirable study, "Nationalised Industry and Public Ownership" (Allen & Unwin. London. 1960), discussed here on May 26, June 2, and June 9 last, Mr. W. A. Robson claimed that the U.K.'s public corporations "constitute a creative achievement of high value on the part of our democracy." On the other hand, Mr. A. H. Hanson of Leeds University, demonstrates factually in his "Parliament and Public Ownership" (just published for the Hansard Society by Cassel & Co., London) that the concept of an autonomous public corporation, left free for most of the time to "pursue the public interest in all respects", and having only occasional contact, of a rather formal kind, with a remote ministerial master, while Parliament periodically debates the general pro-

gress of the nationalised industries at infrequent intervals, and from time to time holds the Minister to account for the exercise of his statutory powers of policy directives, bears no relation to the facts. It has proved impossible to separate day to day administrative matters from issues of policy.

If, e.g., the National Coal Board was, in fact, employing excessive numbers of non-industrial staff, or failing to discharge its responsibilities on subsidence in mines, or using its publicity department to spread political propaganda, or refusing to make up shortage of British miners by taking on Italians, or if the Electricity Board was, in fact, refusing to electrify certain rural areas, or if the nationalised air lines were failing to get first class pilots because of bad pay conditions, or the Coal Board, or the Railways, were piling up deficits because they were not charging commercial prices, or if they were failing to invest enough capital, or investing it wastefully, or closing (or failing to close) mines or railway stations in the interests of economy — were these questions of day to day administration, which the Minister could legitimately refuse to answer in the House, or were they matters of policy?

MONOPOLIES ACCOUNTABLE TO NOBODY

Nobody likes being questioned in public by a political opponent and, as a duck takes to water, Ministers adopted the habit of replying that the question raised was not within their jurisdiction but within that of the public corporation concerned. The existence of a public corporation was theoretically justified by the fact that it was accountable to the nation, whereas private enterprise was not, but as time went on even Labour M.P.'s felt that the nationalised industries were "not more accountable to the general public, but less accountable." Private enterprise, after all, was held in check by inquisitive shareholders, stockbrokers, banks, insurance companies, by Company Law and, not least, by competition. But coal, electricity, etc. seemed safe from any inquisition and, above all, were monopolies, whose consumers had no choice but to take what was offered at the price demanded. The impression grew that the public corporations sheltered themselves from criticism or enquiry behind the Minister, while the Minister sheltered himself behind the corporations by blandly disclaiming his power to intervene in their day to day affairs.

In fact, of course, the Minister's intervention in the "day to day" affairs of the nationalised industries in the U.K. is all pervading. It must be, because virtually every decision taken — from the closing of a few miles of railway, to the dismissal or recruiting of one man or of ten thousand, to the price charged for coal or electricity or freight — must have political repercussions if carried out by a state, as opposed to a private, enterprise. As Mr. Hanson observes, no power on earth can prevent a Minister from consulting the Board members, whom he has appointed, and whom he can dismiss. They do not want such severance, and he can't afford it politically. It is through such consultations that the policies of the U.K.'s nationalised industries are, in fact, made and their operation is continuously watched and checked by the man who, in the last resort, can't avoid taking responsibility for them.

in Parliament. The distinction between (a) consulting with a Minister and (b) receiving a Ministerial policy directive is imperceptible. For, although the Minister may never use his statutory powers of directive, he has the whip hand. Admittedly, he may, on occasion, be restrained from using it as he would like by threats of resignation or of a politically damaging public exposure of the differences that have arisen. But the friendly, day to day, "old boy" personal relationship that is cultivated by any wise Minister with his appointees makes this unlikely, and to the extent that the Board members become "career" men recruited from within the industry, the probability of revolt is even less likely.

THE GOVERNMENT'S RESPONSIBILITY

As I said earlier, nationalised industries in any country are normally basic to the national economy for the direction of which the government of the day cannot escape responsibility. If they are performing well, it is the Government which gets the credit; if badly, it is the Government which gets the blame. Hence the Ministers directly in contact with nationalised industries cannot confine themselves to sporadic interventions. They cannot afford to make nice distinctions between broad policy and day to day administration.

That it has taken so long for all this to be clearly admitted in the U.K. has been because the practical issue — Who is to be accountable for management? — has been confused partly by party warfare on the

totally different question — Should nationalisation be extended, or not, to other industries? — and partly by the Morrisonian theory of non-interference in day to day management.

Mr. Hanson shows that in Australia and New Zealand, where Ministerial responsibilities for nationalised industries are as fully acknowledged as those for the post office in most countries, parliamentarians do not single out the nationalised industries for special attack any more than they do other government departments, and the efficiency of the industries has not suffered from undue interference. Part of the trouble in the U.K. has been that Ministerial evasiveness has served to prevent the work of nationalised industries from being adequately publicised, and has spread the suspicion that they all have multitudes of skeletons in their cupboards to conceal.

As Ministerial admission of responsibility has increased in the U.K., the nationalised industries have begun to benefit from a better public understanding of their problems, and the questions successfully asked and answered in Parliament have constructively added to their efficiency, and have not demoralised their executives.

The most hopeful development in promoting (a) public accountability of the U.K. public corporations and (b) increasing their efficiency has been the inauguration of the Select Committee on Nationalised Industries. Next week, I propose to outline how this works and what it has achieved.

The European Scene

WIDER STILL AND WIDER

From Our Special West European Correspondent

PARIS, September 10.

WHEN Mr. K. B. Lal, I.C.S., comes to take over his new office as India's Commissioner-General for Economic Affairs in Brussels, he will have the charge of watching India's interests over a vast area whose boundaries are at present unknown but which seem sure to expand in various directions in the years ahead. At the moment, the economic unit to which he will be accredited more or less coincides with the Empire over which Charlemagne ruled in the eighth century, which was bounded by the Atlantic, the North Sea, the Elbe, Bohemia, the Garigliano (between Rome and Naples), and the Pyrenees. The Rashtrakuta dynasty, which built an empire in India at that time, would never have dreamed of sending Mr. Lal to Charlemagne's court, supposing they heard of it, because the Western Empire was, and has remained substantially to our day, a land-power whereas, among Europeans, India has had to deal solely with sea-powers. (That they were land-powers, the English express by calling Rome, Prussia and modern France "militarist", taking care not to invent the word "navalist" to describe English policy.) Mr. Lal is being sent to the temporary economic headquarters of this new Carolingian empire only because a number of sea-powers are seeking to join it: Britain, Norway, Denmark and Portugal.

If and when its boundaries swell to include those nations, it will no longer be possible to describe the Common Market as a group of continental land-powers nor (as Lord Attlee did lately, with a rare arrogance) as a club of states that Britain defeated or saved in the last war. As its boundaries change, so must its nature, inevitably; no association can swallow Britain and remain what it was, and nor for that matter could it incorporate Switzerland or Spain or Turkey without revising its character. So the first question is where the limits of the Greater Europe are to be set, and this will perhaps not be decided before one or two years; Britain's entry, alone, may take 12 months to negotiate. By running briefly through the list of possible candidates, we may form an idea of the territory that one day could fall into Mr. Lal's province.

Greece was the first to seek association and, ultimately, full membership of the six-nation group and her application was accepted this year in a treaty that foresees her gradual accession to equal rank, over a period of at least 20 years. Neglecting for the moment Turkey's more ticklish application and Israel's overtures (which will be ignored), Britain was the next serious applicant; her case is so important as to have given rise to ample discussion already. Denmark's followed inevitably, because she is an exporter of agricultural produce whose two principal clients are Britain and the Six, mainly West Germany. The existence of the Common Market has been a cause of serious anxiety for her, for she was torn between her two main export markets; as long as Holland was inside the Common Market, the Danes agreed reluctantly to leave the Dutch take the Continental market, while they hung on to Britain. With Britain inside the Common Market too, all their anxieties dissolve, for they will find themselves back again on a footing of equality with the Dutch and with equal access to both their traditional markets. Once the commercial problem is solved, this small nation will no doubt become as ardent an apostle of European unification as the Benelux trio, since her recent history

taught her, as well as them, the impossibility of isolation and the inadequacy of mere treaty protection. Within a few months of Britain entering the Common Market, Denmark will be in too, and will be a member of Euratom and the Coal and Steel Pool, as well as of any other political or military organisms the Europeans form.

The admission of Norway, also a member of NATO, is almost as certain, granted that Britain's application is successful. There would have been a formal Norwegian application by now, in all probability, were it not for the accident that general elections are being held in the country this month, and so momentous a decision is better left to a government with a fresh mandate. The Commerce Minister and the Foreign Under-Secretary have already left Oslo on a mission that will take them to all the capitals of the Six and the Seven, in order to prepare a decision that will be taken within a few weeks. Unlike Britain, who feels the need of the stimulation of the more expansive Continental atmosphere to revivify her stagnant economy, Norway is enjoying a healthy boom: industrial production rose 7 per cent last year and is running 6.5 per cent ahead of that so far this year. But the trade deficit has grown, and the country must follow the mainstream of European commerce. Her fishing, aluminium and ferro-alloy industries, and above all her merchant fleet (the world's third largest) would find excellent opportunities inside the Common Market.

Leaving the two other members of the Nordic Union, Sweden and Finland, to be considered with the neutrals, there is the minor case of Britain's two Catholic camp-followers, Eire and Portugal. Both have announced their intention to seek admission to the Common Market, but this cannot be taken literally. To subscribe to the conditions of the Rome Treaty would mean the undoing of their slothful economies. Their announcement means simply that, reconciled to spending eternity as half-parasites, half-colonies of the British economy, they cannot conceive the future without her, and are determined to trail along at her skirts, by hook or by crook. How the problem of their relations with Europe will be solved, one cannot imagine at this stage, and it is a matter of considerable indifference to the Six. It is just conceivable that these two relics might be shocked into economic independence and resolve to undertake economic expansion and to trade with the rest of the world. To be fair, there have been signs of such revolutionary thinking in Eire in the last 12 months, but none that I know in Portugal.

Spain was toying with the idea of seeking entry into either the Common Market or EFTA a year ago, but now that the latter is being wound up Madrid says she is not interested in joining the former. This is a typical example of what Generalissimo Franco thinks is brilliant diplomacy: wherever there is division, seek to set Spain up for auction between the two parties, but when division ceases (as when the Axis collapsed), then retreat into isolation. When the Six and the Seven seemed to be at loggerheads, Madrid could hope to get favourable terms for an entry into one or the other by egging on rival bidders; now that there is only one bidder, the Common Market, offers are too low, so Spain withdraws. To be sure, in the meantime Spanish economy has been revived, with the aid of American and European loans, and there is the hope of further gradual progress without opening up the country to competition,

provided foreign capital continues to back the renovation. A free Spain would no doubt seek admission to the Common Market, thereby setting the "Europeans" (as Spaniards call folk north of the Pyrenees) a problem they are anxious not to meet: it is harder to arrange the integration of a backward country into a free-trade area than to accommodate another industrial power.

This is confirmed at the other end of the Mediterranean, where Turkey's candidature is still pending. Put off until after the Greek negotiations and now in danger of being postponed until the British case is settled, Turkey's application raises the question of considerable loans from Brussels, even in order to bring her to associate status, with full membership somewhere in the remote future. There is no doubt that when more pressing affairs are settled, Turkey will receive from the "rest of Europe" (as Turks call folk west of the Bosphorus) sufficient support to keep her trade in the free world. Yet this will perhaps be secured by a simple treaty between the Common Market and Turkey, rather than by integration of the Turkish economy.

There remain the neutrals, who cannot consider joining an association whose political objectives are inconsistent with their neutrality. The two shot-gun neutrals, Finland and Austria, would not in any event be allowed by Russia to adhere to the Common Market; the mere discussion of the possibility in Vienna has already brought a Russian demand for explanations. The two voluntary neutrals, Sweden and Switzerland, must be left for some time to settle the conflict between their conscience and their cashbox. The view in Brussels

is that the rest of Europe is under no special obligation to do anything for these two well-fed and prosperous nations, and certainly no such obligation has been created by the ill-advised British escapade of forming a "free-trade zone" whose corpse she does not know how to dispose of. Commercial isolation is, of course, extremely embarrassing for the Swiss, as a glance at a map will show, but the very substantial advantages of neutrality (and the immense profits this has brought the Swiss in our time) must presumably be paid for somehow.

The view that there is nothing to be done for the neutrals is not yet admitted in London, where it is regarded as callous; to be sure, for Britain to leave them in the lurch would entail breaking promises too lightly given. However, this is also the view of Washington, consistent with the Americans' unwavering policy on the Common Market. European economic unification will cost the USA dollars, so it must bring political dividends in the shape of increased West European ability to resist Communist encroachment. To accommodate neutrals would mean further damaging US trade without any political gain. At the most, an arrangement might be made to ensure favourable access for Swiss and Swedish exports (and perhaps Austrian and Finnish too) into the Common Market, but any such arrangement would have to be made in the OECD, to which the USA belongs, rather than inside the Common Market to which she does not belong. The Swiss, Swedes and Austrians will no doubt form a sort of defence association soon, to negotiate some such symbolic connection when they are left out in the cold.

Our West German Letter

THE FEDERAL DEVELOPMENT ASSISTANCE

By DR. GABRIELE WUELKER

IT was only after her economic and social recovery in the early fifties that the Federal Republic started to contribute to development assistance. To begin with, she granted smaller amounts here and there and participated in certain projects. Although during the last three years the Federal Republic has assumed great responsibility for development policies over the world, there is no central board so far, which solely decides on the policy. No less than six Ministries are dealing with development assistance: The Ministry of Economy, the Foreign Office, the Ministry of Finances, of the Interior, Food and Agriculture and the Ministry of the Federal Property. In order to co-ordinate their decision all the six Ministries, the Federal Chancellery and the Federal Bank (Deutsche Bundesbank) are represented in the so-called "Interministerial Committee for Development Assistance". If need be, representatives of the Development Assistance Bank and of other Federal Ministries attend the conferences as observers. This main board has two sub-committees to prepare the preliminaries and to procure the necessary information: The "Committee for Capital Assistance" and the "Committee for Technical Assistance". The Committee for Capital Assistance is under the Ministry of Economy. It deals with the granting of long-term credits for development projects and programmes. The Technical Assistance Committee is administered by the Foreign Office.

The chair of the conferences of the main Interministerial Committee is held alternately by the Foreign Office and the Ministry of Economy. This main board discusses each development project in which the Federal Government is concerned. Here the key-projects and the expenses of the Federal Budget for development assistance are decided. The principles of financial and technical assistance and trade terms with developing countries are elaborated. The Western German development assistance is here as far as possible brought in line with the principles of international assistance. Special questions such as training and preparation of German experts and teachers going to developing countries as well as the co-operation with economic research are furthermore dealt with by this board. Lately decisions are being prepared to have the two Christian churches participate in development assistance, since they have gained profound experience in the co-operation between Afro-Asian and Western countries.

Needless to say that if so many Ministries are sharing the responsibility there will be double work, overlapping competition and even red-tape. However, the Federal Government deems this structure necessary in order to guarantee the considerations of all angles and aspects of development assistance.

The Federal Budget is subject to control of the Bundestag and of the Audit-office. The latter Federal Office checks on each public expenditure, even down to stationeries of the Ministries and any funds granted from the Budget to private or semi-official organisations. This office is a somewhat paternalistic financial control, with a long historical tradition. It strictly watches, that public money is spent in an economic way and under rational administration. The board functions independently from the legislative and executive boards, in order to fight against any manipulations or incorrect use of public funds. Such a bureaucratic set-up has, of course, its pros and cons. The tax-payer is entitled to know that his money is not abused. A rigid financial control, on the other hand, does not promote initiative and evolution. This is particularly felt in the case of

development aid. It has to come under public control to avoid abuse of public funds; and yet it will hardly be in line with regulations once laid down for national expenses. These problems have been recognised and attempts are made to find practical solutions.

On principle the Federal Government advocates a development policy which is as liberal as possible. The prerequisite for any assistance are the following: the country itself has to apply for the assistance and to contribute by its own efforts. The project has to fit in an overall programme and to promote the economic and social development of the respective country, which has to guarantee that the project initiated by means of development aid can be continued without foreign help.

Any application for a credit is carefully controlled by the Interministerial Committee, according to political and economic viewpoints. Therefore, both the Foreign Office and the Ministry of Economy hold the chair in rotation. Recently a special department for the co-ordination of development policies was created within the Foreign Office. This department is headed by an expert for international trade and commerce.

Various committees convened by deputies of the Bundestag concern themselves with development aid. A special board of the Governmental Party (CDU) recently elaborated directives and methods for the development assistance granted by the Federal Republic. Their expert opinion is a concise of the Federal principles practised so far:

In Western Germany private development assistance receives priority before public assistance. As far as the developing countries are concerned they have to decide on the extent of public or private initiative within their economy. Although the Federal Government by no means interferes with this decision she recommends — according to her own experience — to introduce as soon as possible the principles of a free market and free economy.

With respect to bilateral or multilateral assistance no one-sided decision can be made. Each individual case has to be checked. Bilateral assistance, however, fosters international contacts and offers larger possibilities of close co-operation. On the whole the concentration on certain key-projects is not recommended, although priorities within the various countries have to be earmarked to avoid too great a dispersion of money and efforts. Any assistance should be adjusted to the stage of development to prevent failures, frustration and financial losses. An international co-ordination of development assistance is necessary to avoid political and economic competition and overlapping of the aids. By all means development aid has to be granted apart from any military aid.

A concentration on technical assistance is planned because it has been realised that a certain level of education and knowledge is the pre-condition of any economic development. Financial and economic assistance alone will never suffice. Western Germany certainly has special experience in training experts in handicraft, industry and administration.

Apart from the Federal Government and the Bundestag, industry and commerce and the two Christian churches, some hundreds of German private organisations concern themselves with the theory and practice of development assistance. There is a lot of good will and initiative. The co-ordination of all the measures of these institutions is still a serious problem, although on the Governmental level this co-ordination is being promoted.

Economic Report from the U.S.**SPACE SATELLITES**

By GUY SIMS FITCH

WASHINGTON, Sept. 6.

THE space satellites placed in orbit by the United States now number more than 50 — an unmatched milestone that was passed within the last few weeks. They include scientific, weather, communications and navigation satellites, and both lunar and solar probes. Yet it is not this fact alone that prompts the present line of thought. Nor is it the fact that these U.S. successes have been achieved in so short a time — in something less than four years. It is, rather, the prospect of future challenge and future progress opened up by this dawning of what is rapidly taking shape as a new age of space.

The United States stands committed to a truly gigantic space programme, one that may well be changing the face of the U.S. economy. Over the next 10 years it will cost about \$50,000 million — and this is a conservative estimate. Within this time, the United States in all probability will be landing a man on the moon. One of the significant aspects of this developing programme is its increasingly civilian orientation. True, military missiles helped give space work an early impetus. It is also true that one cannot overlook the military potential of U.S. space achievements. Nevertheless, the spotlight focuses ever more brightly on the peaceful applications and benefits of the U.S. programme. Already, the activities of the essentially civilian national aeronautics and space agency outweigh in men, money and effort the space programme of the Defence Department. And this is a trend which is growing constantly.

Such are the vast demands of space research, that the government obviously has played a prominent role in it. But a number of private companies now have begun their own programmes. Satellites already practicable promise to revolutionize world wide communications, and U.S. industry has signified its readiness to invest millions of dollars on their development. In addition, air and sea navigation will be made safer and surer as a result of U.S. space research, and long-range weather forecasting more accurate. Underlying these practical applications, of course, will be the continued gain in basic scientific knowledge of the universe — and perhaps man's place in it. It is safe to predict that new companies and enterprises will become important on the U.S. economic scene. Many of them will be making the delicate and intricate instruments and components of a growing space industry. New materials not only will help to make space exploration a reality, but will help transform the technology and products of U.S. industry, and with them, perhaps, the lives of the American people. According to the estimates, these advances will open up at least one million new jobs directly related to the space programme. These jobs will require higher levels of education, new skills and new training. Thus, they may well hasten the disappearance of the unskilled worker, already a dwindling factor in U.S. industry. This prospect of a new world of new knowledge and new achievements may seem overdrawn to some — and perhaps it is. But let it not be forgotten that within the memory of living men there were no electric lights, no automobiles, no airplanes — in the United States or anywhere else.

As recently as 20 years ago, when this writer still retained much of the arrogance of youth, he knew an economist whose avocation was the study of science and the writing of science fiction. It was this man's

unshaken belief — one, alas, that was greeted with too much scorn — that within our life times man would be exploring the reaches of space. Can anyone say with certainty at this juncture that our sons, or our sons' sons, will not be flying space ships to the distant planets one day? One other thought comes to mind. The United States undoubtedly will continue to be in the forefront of this new age of space exploration, just as it historically has been in the forefront of two centuries of economic, social, political and scientific advances — advances which have broadened man's knowledge and have pointed his way to new horizons of hope, freedom, personal dignity and material betterment. In this sense, the United States remains, as it always has been, a developing nation, albeit one that has reached a stage of advancement to which others — particularly those newer to the family of nations — still aspire. But the yearning for progress is an experience Americans share with other peoples. So those who would call the United States old because it may be further advanced, economically, should remember that the vision of the future burns as brightly for Americans as for others. It was the poet Robert Browning who said, "Grow old along with me, the best is yet to be."

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

Special Article**THE THIRD PLAN UNDER STRESS**

THE pressures of the Cold War may or may not have affected the thinking of friendly nations in regard to the economic aid to the developing countries, whether committed or uncommitted. Newspaper reports about a possible change in the attitude of Kennedy Administration need to be studied with care in this country in so far as they are likely to influence the programmes laid down in India's Third Five-Year Plan. While signing the Bill authorising \$4.25 billion for foreign aid during the current year, Mr. Kennedy is reported to have said: "It is my belief that in the administration of these funds we should give great attention and consideration to those nations who have our views of the world crisis". If under the stress of the changed international political climate, the United States opted more for its allies than for the non-aligned nations in the matter of foreign aid, the other Western nations, particularly West Germany, are also likely to follow suit.

In case of a total war, the Third Plan would be reduced to nothing but an academic exercise with very little prospect of fulfilment. Even in the case of a localised war, say over Berlin, the attention of the Western world would be diverted from the development plans of the developing countries and it is just possible that most of the Western countries would fail on their foreign assistance commitments. If that should happen, the Third Plan which was presented to Parliament only six weeks ago is likely to be seriously hurt in its foreign aid calculations. The total external assistance expected from abroad during the Third Plan period is

of the order of Rs. 2,600 crores, or Rs. 520 crores per year, on the average. Table I below sets out the estimates of the Planning Commission in regard to foreign exchange earnings, external assistance and imports. Assuming that 1100 crores of rupees already promised for the first two years of the Third Plan are made available, there is every chance of a default on part of the balance of Rs. 1,500 crores. What would be the implications of a reduction of the balance from Rs. 1500 crores to Rs. 750 crores? It goes without saying that the sector to be most vitally affected would be industry. Steel plants in particular would have a hesitant expansion while the Bokaro plant will have to be put in the cold storage for another five years. Thus industries' output would suffer and would be reflected in lower income generation both in the secondary and tertiary sectors. The likely fall in the targeted production of the major industries is shown in Table II below.

The agricultural sector is likely to be affected the least. Power and transport will also need to be cut in spite of greater awareness about the necessity of their expansion. The employment market particularly is likely to be very rudely shaken. Even with the present size of the Plan, the backlog of the unemployed is likely to increase at the end of the Plan as compared to the backlog at the beginning. In case of a reduction in the size of the Plan, the situation will be much worse.

Under these circumstances, it is inevitable that the price level should also come under pressure and the

TABLE I
FINANCING OF FOREIGN EXCHANGE REQUIREMENTS FOR THE THIRD PLAN

Item	Rs. crores)			
	Total Second Plan	Total Third Plan	1961-62	Annual Average Third Plan
A. Receipt				
1. Exports	3,053	3,700	667	740
2. Invisibles (net) (excluding official donations)	420*	nil	22	nil
3. Capital Transactions (net) (excluding receipts of official loans and private foreign investment)	-172	-550	-133	-110
4. External assistance	927@	2,600	575**	520
5. Draft on Foreign Exchange Reserves	598	nil	nil	nil
Total (1 to 5)***	4,826	5,750	1,131	1,150
B. Payment				
1. Imports of machinery and equipment for Plan Projects		1,900	325	380
2. Components, Intermediate Products etc. for raising production of capital goods	4,826	200	60	40
3. Maintenance Imports		3,650	746	730
Total (1 to 3)***	4,826	5,750	1,131	1,150

* Includes reimbursements from the U.S.A. for freight expenses on P.L. 480 imports initially incurred by India.

** Represents external assistance required for financing imports.

*** P.L. 480 imports are excluded from both sides — about Rs. 534 crores for the Second Plan and Rs. 600 crores for the Third Plan.

@ Including net drawing on the I.M.F.

story of the Second Plan may be repeated in this particular regard. The only hope in saving the Plan seems to be in making better use of the available capacity in industry. It was demonstrated in the Blue Supplement in "The Eastern Economist" dated April 11, 1961 that even with the present capacity of the plant and machinery, India's industrial production can be raised by 30 per cent. To that extent the pressure on the Plan may be reduced. Also, stimulating exports by legislative compulsion is another way of meeting the essential demands both for maintenance and development. But shortage of foreign exchange coupled with compulsory exports cannot fail to

disturb the internal price situation. The contingency of war may be an unlikely one. Indeed, currently opinion in Delhi, as elsewhere, is that a nuclear war is impossible. If the clouds on the international horizon get lifted, the prospects of the successful implementation of the Third Plan would become as bright as ever. Perhaps with an assured neutrality the terms of trade may also be favourable to us as after the Korean War. All in all, the chances of added orders on Indian idle capacity are currently not small. To present an extreme contingency is not to argue that it will necessarily arrive; it is merely to show the worst that may befall.

TABLE II
REVISED INDUSTRIAL PLAN

Item/Unit	1960-61	1965-66 Targets	Percentage in-Reduced crease in 1965- 66 Targets	Percentage increase in 1965-66 (Reduced Targets) over 1960-61

Role of Private Enterprise in Developing Economies

By G. L. MEHTA*

"TAKE-OFF", no doubt, is common to speakers, to spacemen and to economies. And all these require a strong base. When one looks at the Indian economy, one does become aware of a subtle change in the atmosphere, no less real because it has few external manifestations. We have not seen during the last two years any change in the broad frame-work within which the economy has to work: the industrial policy, enunciated in 1956, has not in any way been modified; the concrete measures for advance which we call the Five-Year Plans remains the same—our Government have just brought out the economic horoscope for the next five years under the title of the Third Five-Year Plan; no broad legislative measures affecting the private sector have been brought forward—the Companies Amendment Act, enacted in 1960, was in gestation for quite long; the Income-tax Act, now in the throes of birth, is basically a tidying-up measure: its major impact may be on lawyers' income rather than on the private sector's growth.

As I said earlier, therefore, in the broad fields of industrial and economic policy, of planning, of legislation—in these fields, there has been little change. At the same time, there have been changes, almost innumerable, in the details which affect private enterprise—many of such changes have been for the better, changes which account for the improvement in the atmosphere within which private enterprise works. I should like to enumerate here some of these changes, leaving it to you to evaluate their importance.

Firstly, I would like to refer to the change in the foreign exchange situation in the country. When I spoke in 1959, we were trying to work our way out of the foreign exchange crisis by appraising and re-appraising the Second Plan. Today, the situation is different. I do not say we have got over our foreign exchange difficulties or that our Third Plan is less voracious of foreign exchange. But, thanks to the initiative of the World Bank and the imaginative approach of friendly Western countries—and, among these, I would particularly like to single out the U.S.A.—, as I said, thanks to these, we are better equipped to face the problems of the next five years.

Much of the proposed aid is, of course, on Government-to-Government level and, you will naturally ask me: how does this help the private sector? I should straight-away say, in many ways. Firstly, it has enabled us to get rid of deferred payment terms. Deferred payment terms which private enterprise had to arrange, when foreign exchange shortage was acute, had many disadvantages, in the short run as well as in the long run. In the short run, it tended to shift the responsibility of obtaining foreign exchange from the Government to the Indian entrepreneur and through him, to the plant supplier. This necessarily restricted the freedom of action of the Indian entrepreneur—his choice of equipment was limited and his bargaining power weakened. Often, he had to pay more for a piece of equipment which he did not consider the best. This, in its turn, reduced, in the long run, his ability to produce at a low cost and, therefore, his capacity to

compete. And while he may hope to be protected in the home market from external competition, it acted unfairly on the Indian consumer and reduced the export capacity of an enterprise—which, we are now beginning to realise, is vital for the success of our development effort.

One of the consequences of the easing of the foreign exchange situation is the greater willingness on the part of the Government to give cash import licences. This, of course, does not solve the problems of an Indian entrepreneur; he still has to find rupees to pay for the import licence—but, as I shall mention later, this is not very difficult these days; he has still to negotiate at New Delhi for the import licence—but this is a fact of life to which we have all become accustomed in the last ten years; and, because Government aid in "tied", his choice for purchase may still be restricted—but to a country rather than to a company as before. The Indian entrepreneur's path to setting up an enterprise is not all roses still, but it is not as frustrating as it used to be only three or four years back.

A second development is what I might call the unclogging of the capital market in the country, as reflected in the response to new issues offered to the public. This phenomenon has to be understood more clearly—both in India and abroad. To any economic observer, it is apparent that this does not represent a sudden increase in the propensity to save. Nor is India unaware of sudden frenzies of speculation or transient fancy for industrial investment—we have known all this before: in the sixties and seventies of the last century when there was speculation in cotton and real estate and in the first decade of this century when Indians, believing in the enterprise and management of Tatas, came forward to invest in capital which could not be raised in London. What distinguishes the present boom is its strength—it has now lasted almost two years and while the earlier excesses have tended to disappear, its innate momentum still continues to lead to over-subscription, at earthlier levels, of worthwhile issues.

This trend, as I mentioned earlier, needs a closer look. Since it is not based on a wider base of saving, it reflects a shift in people's investment preference. This is a transformation through which all advanced economies have passed at one stage or another and one which we have possibly just reached. Such a shift, making people conversant with modes of investment in industry, has a more enduring value, whatever the temporary set-backs caused by market forces.

This increasing public interest in industrial investment has eased the task of entrepreneurs in raising capital. Provided complementary resources are available—and, as I mentioned earlier, the foreign exchange situation has improved to some extent—there appears to be enough scope for rapid industrial advance in the economy.

You will, no doubt, remind me that industrialisation also requires entrepreneurship—do we have enough of it? This is one of those intangibles where economic 'pundits' differ. I personally feel that, given the atmosphere, there is no lack of entrepreneurship in India.

* Address before the International Industrial Conference, San Francisco, on September 14, 1961.

Industry on factory lines is more than a hundred years old in India. Indian entrepreneurs ventured into such advanced lines as iron and steel manufacture and shipping in the first two decades of this century. Before the Second War began, India was self-sufficient—no doubt at the relatively low levels of consumption then prevailing—in cloth, sugar, cement and jute. What was lacking was not entrepreneurship but conditions requisite for its exercise. A national government and planning have provided these.

In India, setting up an industrial enterprise is subject to licensing, and this, you may fear, may dampen entrepreneurial ardour. In fact, in the last two years, this has not been so. Since, consequent upon the foreign exchange shortage, scarcities began to appear on the Indian market, entrepreneurs have come forward to put up capacity in a large variety of industries. The Government itself has given a relatively free rein to enterprise by giving licences freely to projects which appeared satisfactory to it after scrutiny.

Foreign enterprise, as much as Indian enterprise, is subject to the influence of the climate for investment—a climate which has turned for the better. Owing to the foreign exchange crisis, foreign enterprise is coming to be increasingly recognised as supplementing the foreign exchange resources available to the economy. The investing public has also come to associate foreign enterprise with advanced management techniques; consequently, over-subscription, to which I referred a little while ago, has been particularly heavy in cases where there is financial and technical collaboration with a good foreign company. Finally, as new and difficult lines are being taken up, foreign enterprise is seen as an important adjunct to indigenous entrepreneurship.

These advantages are recognised not only by our entrepreneurs but also by our Government, which has recently taken various measures to encourage the flow of foreign capital and know-how. In the last budget of the Union Government, the effective rate on royalties was reduced from 63 per cent to 50 per cent. The Government always insists on royalty agreements being entered on taxable terms, and foreign collaborators have generally sought to obtain a certain carry-home return for the supply of know-how. The revised tax-rate should help to remove one of the main obstacles to the development of the trade in technique between advanced countries and India.

A second change introduced by the recent Budget is the equalisation of tax burden on companies which are subsidiaries or have minority participation of foreign companies. This equalisation has been brought about mainly by a reduction in the rate of taxation. I would like you to note that the opportunity to rationalise the tax structure was not used to raise the tax rates—as so often happens these days.

A third matter of interest to foreign investors is the establishment of the Indian Investment Centre. Its primary function is to encourage the flow of foreign capital into India by helping prospective foreign investors in various ways—in their dealings with the Government, in finding suitable Indian parties to collaborate with, in putting Indian industrialists in touch with their foreign counterparts, by providing information on the Indian economic situation. I am almost tempted to say that the Investment Centre will provide to foreign investors technical know-how—the know-how relating to problems of operating in India.

Both the receptivity of the Government and the Indian entrepreneurs in relation to foreign capital and the conditions under which it can come in and operate have considerably improved in recent times. Many

foreign firms—small as well as large, U.S. as well as non-U.S.—have come in during the last couple of years. In the first quarter of 1961 alone, the Government of India approved 101 technical collaboration agreements. The Investment Centre is also handling a large number of inquiries for foreign participation and collaboration.

In this connection, I should like to mention, that capital flows need not necessarily be associated with the flow of technical "know-how". In the past, particularly before the first World War, capital used to flow across national frontiers according to profitability. While today individuals may not be expected to undertake investment in companies in under-developed economies both because the political and economic risks are too great and they may not have the necessary expertise in judging investment, I suggest that investment institutions—insurance companies, investment trusts, and so on—should examine the possibility of investing in such companies. Such institutions have the necessary expertise to judge the long-term prospects of stocks and the necessary resources to absorb any shocks that may arise out of political and exchange risks. Such stocks have, besides higher profitability, very favourable growth prospects; such investment will also help to diversify the portfolio of the investment institutions. I feel that a small beginning can be made in such investment; if this is fruitful, I believe it can be an important source of a free supply—free in the sense of not being attached to technical or other control—of foreign exchange to under-developed countries.

Summing up, I would say that while the broad structure of economic policy has remained unchanged, its implementation has become more flexible and in many ways more favourable to the exercise of the private sector, both indigenous and foreign.

I would not, of course, deny that the Government still has considerable power over economic policy decisions. The very scale of Government operations has increased considerably under the Plans: the Government invested in industry about Rs. 60 crores during the First Plan period and is scheduled to invest Rs. 1,500 crores during the Third Plan period. In many lines—to name a few, iron and steel, machine tools, antibiotics, fertilisers, coal, cement—the Government and the private sector operate side by side as competitors; in some of these, the relationship is that of buyer-and-seller.

Many fields of enterprise—a recent addition to this is oil—still remain closed to private enterprise. On the other hand, Government has shown greater flexibility in its attitude towards participation and expansion of private enterprise in some others, for example, fertilisers and basic chemicals. If licensing has ceased to be an obstacle, it still remains an irritant to a prospective investor.

I should like to emphasize that in most under-developed economies private enterprise is on probation. In many ex-colonial countries, private enterprise has been under suspicion mainly because it was identified with the imperial power. The newly developing economies are like people in a hurry—they are keen to reach the destination as quickly as possible irrespective of the means adopted to achieve the end.

In India much water has flowed under the bridge during the last ten years. As events have shown, Government's attitude towards private enterprise has been more understanding. However, the Government still retains in its armoury a wide range of powers which, if circumstances or attitudes change, may be sought to be used.

The milieu within which private enterprise functions today is far different from that prevailing in the

MR. AL FOIL GOES OVERSEAS

"Westward Ho!" shouted Mr. Foil, importantly perched upon a tea chest, "I go as a Protector of Tea (Aluminium lining for tea chests and packages) and come back with foreign exchange. Busy voyage ahead, though," Mr. Foil continued shouting, "What with having to keep out the damp devil and keep in the tea flavour. But I am not worried. Have long experience in the matter of lining tea chests with aluminium foils which stand up to all sorts of ill usage like rough crossings and wet weather (the Bay of Biscay and the Channel y'know)... In fact, aluminium foil packaging keeps the tea full flavoured and factory fresh right up to the tea lover's table... to England, America or any place in the world... I, Al Foil, alumnus of aluminium, guarantee satisfaction".

Long and extensive experience as Manufacturers of Aluminium Foils for packaging goods in the Cigarette, Pharmaceutical, Confectionery, Tea and many other industries.

VENESTA FOILS LTD. KAMARHATI, 24 PARGANAS, WEST BENGAL

Branches at: BOMBAY, CALCUTTA, MADRAS, NEW DELHI

Selling Agents: Tea Chest Linings: WILLIAMSON, MAGOR & CO. LTD., Calcutta.

As you need two hands to clap, so the country needs the combined efforts of man and machine to bring about industrial growth and prosperity.

Today, through the Five-Year Plans, the country is striving to create such a unity of effort where all will have enough.

It is our privilege to participate in this historic adventure of building a new India.

eighteenth and the nineteenth centuries. Private enterprise is no longer taken for granted, and its justification is no longer sought to be measured only by the profit-rate it is able to earn. Private enterprise will be judged by—and its survival depend upon—its social utility to the economy. This casts a heavy responsibility upon those who sponsor, organise, finance and operate private enterprise.

Private enterprise has, indeed, to play a role which has to be in consonance with the social philosophy of the times. In the nineteenth century, private enterprise was able to bring about, consistent with its own objective of individual profit, rapid development of the economies, considerable improvement in the living standards of the common people, and tremendous growth in the social and cultural development of the community. These were often by-products of the growth of private enterprise in the advanced economies. These goals will need to be kept more consciously in view in the future. Private enterprise in India has not always been unconscious of these requirements. Many educational institutions in India owe their existence to the munificence of private industrialists. Even today, a consider-

able portion of the dividend income from the largest steel company in India goes to finance charitable purposes.

Responsibility always goes with power. The advantage of private enterprise has been to share this power and this responsibility—to bring about its wider distribution. To every individual's power—whether it be the power of ownership of means of production or of employment of individuals—there exists under private enterprise the countervailing power of another who is a competitor or a customer, and, ultimately, of the State which acts as arbiter in case of conflict of interests.

Private enterprise, in brief, cannot expect to be a vested interest in itself. Like any social institution, it must stand ready to be judged by the results it produces. By its nature, it is dynamic and resilient as phenomenal developments in your country, in the U.K., in West Germany and other countries show. I am sure that it will not be found wanting in the challenge it faces in the emergent economies.

Stepping up Rayon Output

SOME interesting details have been made available recently in respect of rayon industry which indicate that the industry is making earnest efforts to achieve the Third Plan targets. Originally the capacity for rayon filament yarn was agreed at 68.3 million lbs for the Second Plan period, which in view of the rising demand was subsequently raised to 100 million lbs. Every effort is now being made to assist the companies engaged in the production of rayon fibre of various types. The targets proposed in the Third Plan period are 140 million lbs. for viscose rayon and 75 million lbs. for staple fibre inclusive of synthetic fibres. The present installed capacity — 108.3 million lbs. — it is evident from Table I below, is far below this target. A detailed breakdown in respect of the companies producing various types are also given in the table.

TABLE I

PRESENT INSTALLED CAPACITY

(million lbs.)

I. (a) Viscose Rayon

1. National Rayon, Bombay	19.5
2. Century Rayons, Bombay	9.6
3. Travancore Rayons, Rayonpuram	7.2
4. J. K. Rayons	4.0
5. Keshoram Rayons	8.0
Total	48.3

(b) Acetate Rayon Yarn

Sirsilk Limited, Andhra Pradesh	4.0
Grand Total	52.3

II. Viscose Staple Fibre

1. Gwalior Rayon Silk Mfg. Co. Birlagram, Nagda	48.0
2. South India Viscose, Coimbatore	8.0
Total	56.0

Several units have been licensed for additional capacity to the extent of 82.3 million lbs. under various types of rayon yarn and another 35 million lbs. of high tenacity rayon yarn. As is clear from Table II below, there are new entrants in the field like India Rayon Corporation, Baroda Rayons, Modi Rayons, Modern Mills, Swadeshi Cotton, Nanubhai Industries, Prabhulal Bhikhubhai, Arthur Imports, I.C.I., Delhi

Cloth Mills, who have planned to produce rayons of various types.

TABLE II
NEW LICENSED CAPACITY

(Million lbs.)

(a) Viscose Rayon

1. South India Viscose, Coimbatore	8.0
2. Indian Rayon Corporation, Bombay	8.0
3. Baroda Rayons, Bombay	6.0
4. Century Rayons, Bombay	5.3
5. J. K. Rayons, Kanpur	4.0
6. Travancore Rayons, Kerala	4.0
Total	35.3

(b) Acetate Rayon

1. Sirsilk, Andhra Pradesh	4.0
2. Modi Rayons, Modinagar	8.0
3. Modern Mills, Bombay (Factory in Mysore State)	3.0
Total	15.0

(c) Sundatta Foods and Fibres, Bombay (Modern Mills)

1. Sundatta Foods and Fibres, Bombay (Modern Mills)	5.0
2. Swadeshi Cotton Mills, Bangalore	8.0
Total	13.0

(d) Synthetic Yarn

1. J. K. Investment Trust, Kanpur	0.5
2. Nanubhai Industries, Bombay	3.0
3. Prabhulal Bhikubhai, Bombay	4.0
4. Arthur Imports & Exports Co., Bombay	2.4
5. Century Rayons, Bombay	1.6
Total	14.5

(e) Terylene Staple Fibre

I.C.I., Calcutta (Factory in Bombay)	4.5
Total (a to e)	82.3

High Tenacity Yarn

(f) Tyre Cord: (Rayon and Nylon)

1. National Rayon Corporation, Bombay	15.0
2. Century Rayons, Bombay	10.0
3. Delhi Cloth Mills, Delhi	8.0
4. Nanubhai, Bombay	2.0
Total	35.0

At present the total quantity of yarn both imported and indigenous for mill and the handloom weaving sectors is not enough. In fact during 1957-58 and 1958-59 the quantity available was far short as compared that in 1956-57. The present licensing of additional units is, therefore, quite timely. Table III alongside indicates the year to year availability of yarn, both by way of imports and indigenous sources.

TABLE III
AVAILABILITY OF RAYON YARN
(In million lbs.)

Year	Production			Imports		
	Rayon		Total	Rayon		Total
	Filament	Staple		Filament	Staple	
1956-57	21.3	18.2	39.5	61.8	41.8	103.6
1957-58	26.6	19.3	45.9	40.9	15.5	56.4
1958-59	35.0	35.3	70.3	44.5	0.1	44.6
1959-60	42.2	47.9	90.1	43.3	4.9	48.2

Business Notes

Textiles

DISAPPOINTING TREND IN EXPORTS

IT IS extremely disheartening to note that last year India could not keep pace with the tempo of expansion in cotton textiles exports in international trade, nor even maintain her own performance in the previous year. During the first half of this year also, whereas our total exports have gone up, our cotton textiles have registered a further decline, and, in fact, it is apprehended that India's total exports of cotton textiles in 1961 may be lower than in 1960!

The overall expansion of cotton textiles exports stood at 11 per cent over the previous year in international trade, but India's cotton textile exports actually declined by 14.7 per cent. Thus, our exports of cotton textiles in 1960 amounted to 694.83 million yards, as against 814.60 million yards in 1959. This steep decline was attributable, in the main, to the crisis in raw cotton supply last year which, in turn, brought about an unprecedented shortage in the volume of manufacture of the normal export varieties. True, the industry was hit hard by this and various other factors, but, as Mr. Neville N. Wadia, Chairman, of the Cotton Textiles Export Promotion Council remarked in his speech, at the seventh annual meeting held in Bombay, a few days ago, besides shortages, "the domestic price spiral and distribution controls which, in turn, put the price line out of gear, also hit the export performance of many mills". The cotton crisis has since passed, but, panicked by the first sign of a declining trend in cotton prices, the Government has resorted to pressure on the industry to continue cotton purchases at much higher levels than the average intake of previous normal years. This is certainly not the way of making Indian cotton textiles competitive in world markets. Conditions in the world markets have changed greatly. For one thing, there are more countries producing—and also exporting—cotton textiles today. Secondly, some of these countries have not only the natural advantage of better varieties of cotton, but also the adventitious advantage of coming late into textile manufacturing field which carries with it the benefit of more up-to-date and specialised machinery. Thirdly, there is a tendency for closer grouping of different regions on an economic basis, as, for example, the EFTA and the ECM, and the latest threat, particularly to India's exports, is the early prospect of the U.K. joining the European Common Market.

Be that as it may, commenting on the action of the Government of India referred to above—namely insisting on higher prices to be paid for cotton—the Texprocil Chief declared: "No one wishes the farmer to

suffer, but when one considers that the floor prices fixed by the Government were in no way in danger of being reached, it is surprising that action was taken so quickly". The result has been, as Mr. Wadia put it appropriately, "the expected assistance, which a fall could have given to exports, is nullified, a consideration which seems to have been of secondary importance to Government!"

While the situation at home has remained distressing thus, on the international front, the prospects have been, more or less, gloomy. Major importing countries, such as Sudan, East Africa, Ethiopia, Iran, and Somaliland, have slashed a major part of their usual offtake from this country through import controls and changes in tariff structure, etc. Elsewhere also, due to the higher price disadvantage, our exports have suffered, as for example, in some of the Asian and African markets. The only redeeming feature has been that our exports to Europe, America and Oceania have improved slightly. Even so, the net result, as Mr. Wadia noted, has been that our exports have been in the neighbourhood of only Rs. 54.70 crores in 1960, as against to 54.72 crores in 1959.

In order to meet the stiff competition abroad and increase our production at home on an economic basis, much depends, as Mr. Wadia noted, on how sound a footing our textile industry is placed. Whatever incentives are given to the industry, as the Chairman of Texprocil observed, they serve only as a palliative to stave off a difficult situation; they could never be a permanent and effective cure, so long as the industry continues to be "tied hand and foot with curbs on production and expansion, resistance to rationalization and modern machinery, and numerous other impositions of excise duties on finished products, as well as on large number of the items used in the course of manufacture." With so many fetters restraining the industry, neither can it make any further progress nor earn enough money with which to renovate its equipment or expand production to keep in tune with the ever increasing demand. If a country with an abundant supply of its own raw cotton such as ours were surpassed by any other country in textiles production, it would not only be unfortunate but also a sad reflection on the (unhelpful) nature of the economic policies of the powers-that-be, on the one hand, and also the absence of sufficient imagination and enterprise on the part of our cotton mill industry, on the other. Save for some severely few redeeming exceptions, it is regrettable that the Indian cotton mill industry generally cannot as yet claim for itself either a commendable export-consciousness or an earnest export effort.

Tinplate

WANTED: CHANGE IN IMPORT POLICY

A PARADOXICAL situation appears to have developed in the supply market of tinplates. While tinplate sheets of the specifications required for the manufacture of 4-gallon tins, consumed by oil companies and bulk packers of hydrogenated oil, are selling at a discount over the controlled prices, some of the other major users of tinplate are experiencing great difficulty in obtaining supplies required for their purpose. With the Tata's billet mill due to be closed for overhaul and the Rourkela Steel Plant not expected to commence tinplate production till the end of this year, many industries requiring small sized tin packages are obviously in for difficult times.

Tinplate sheets, which are suitable for making 4-gallon tins and whose supplies have been augmented in the recent past through permitting of imports under the Development Loan Fund Scheme and utilisation by the exporters of manganese ore of their import entitlement for tinplate, are not suited for the manufacture of small consumer packages which are made use of by a number of growing industries such as food processing, cooking media, paints, pharmaceuticals, toiletries, etc. Their use in the production of small packages involves a good deal of wastage for which the consumer has to pay unnecessarily. Moreover, it leads to considerable loss of printing capacity and photographic materials.

Petroleum packs—principally the kerosene 4-gallon—account for only about 36 per cent of the present annual demand of tinplate. The rest of the demand requires import of tinplate sheets of certain other standard sizes and gauges. If unnecessary wastage in the use of tinplate is to be avoided, it is obvious that the import policy regarding this commodity has to undergo a change.

Ferro-Alloys

THE PROPOSED SYMPOSIUM

WITH A view to focus attention on the latest research conducted in India and abroad in respect of ferro-alloy industry, a symposium is being organised by the National Metallurgical Laboratory wherein various people associated with the industry—engineers, metallurgists, industrialists, consumers—are likely to participate. Modern steel production technology has made significant advances, which, it appears, have been exceedingly slow in travelling to India. As an instance, it may be pointed out that till very recently the attempts to produce high-grade ferro-alloys at industrial scale were only sporadic. The significance of this industry could not be minimised because the ratio of alloy, tool and special steels to those of carbon steels was usually 5 to 15 per cent of the latter. On this basis the target for the Third Plan would necessitate an output figure of $\frac{1}{2}$ to $1\frac{1}{2}$ million tons of alloy, tool and special steels, which in turn would demand indigenous availability and production of ferro-alloys in sufficiently large quantities.

The National Metallurgical Laboratory has already embarked upon some research and major development projects to study the amenability of Indian raw materials for the production of diverse range of ferro-alloys. After exhaustive investigations, a pilot smelting furnace with a capacity of one ton of ferro-alloy per day is being installed for the first time in India. The Laboratory would accept raw materials on contract basis for investigation of their amenability. The technical data obtained from this project would be useful for the plants that would be set up later on industrial scale.

The scope of the symposium, to be held early in February 1962 would cover a survey of raw materials in terms of their metallurgical quality and availability in India, evaluation of electro-thermal techniques in the development of different types of ferro-alloys, study of basic physico-chemical and thermo-dynamic principles involved in the production of ferro-alloys, study of latest advances in the production technology of ferro-alloys, utilisation of by-products obtained in ferro-alloys industry, standard specifications for different grades of indigenous ferro-alloys and the present status of ferro-alloy industry in India with special reference to its future expansion programme. The proceedings of this symposium would certainly be beneficial to the industry.

Engineering

NEW STANDARD ENGINEERING COMPANY LTD

MR. R. G. SARAIYA in a speech delivered at the annual general meeting of New Standard Engineering Company Ltd., stated that the year 1960-61 had been a year of solid accomplishment for the company. Total sales of the company, for example, had increased by Rs. 26,26,220 to Rs. 1,19,09,106, resulting in a gross profit of Rs. 18,04,704—an increase of 54.68 per cent over the last year. The dividend recommended by the Board of Directors for the year is 9 per cent on equity shares subject to deduction of tax as against 12 per cent subject to taxation declared last year. On the 6.3 per cent tax-free preference shares, the company's Directors have recommended a dividend of 9 per cent subject to deduction of tax, as in the last year.

In the field of development and expansion, there had been an intense activity. The first phase of the expansion project, viz. structural steel plant has been completed and is in full operation now. Besides, there has been a successful commissioning of the first Trutzschler-NSE Blow Room line to be manufactured in the country. The successful conclusion of the collaboration agreement with Forni Electrici A. Togliaberi of Milan, Italy, for the manufacture of low frequency induction furnaces has been another notable achievement. This is an item of vital importance to the Metallurgical and Engineering industries and is one of the pioneering activities undertaken by NSE. The design of a modern foundry has also been completed by NSE engineers and designs of the structural shed are now under progress. The expectation is that the foundry will be commissioned in the first quarter of the calendar year 1962.

While these have been the achievements of the year under review, future prospects are considered to be no less bright. Higher targets have been set for the year 1962 in tune with the increased production during last year and the previous years. Method and motion studies in all important production departments will be carried out and more and more of company's manufacturing activities will be transferred to Goregaon, where under a centralised command, NSE will be able to forge ahead at a rapid rate of growth. So far as additional finances for the execution of various projects are involved, Mr. Saraiya revealed, they are being constantly reviewed by the Directors. The picture, therefore, is one of bright prospects.

Paper

TITAGHUR PAPER MILLS LIMITED

IN THE statement made recently by Mr. Walter Michelmore, Chairman of the Titaghur Paper Mills Company Ltd., it was revealed that results of the company for the year ended March 31, 1961, were somewhat disappointing. This has occurred because of the fact that there has been a lowering of selling prices, increase in

the cost of chemicals and coal, and the loss sustained at No. 3 mill. It may, for instance, be noted that since the last statement was made, the company had to suffer an excise duty on caustic soda of Rs. 40 per tonne, an increase in the cost of coal of 78.7 nP. per tonne, and an increase in the cost of power supplied by the Calcutta Electricity Supply Corporation arising out of the higher coal price. Now it has been declared that the company's contribution to the employees provident fund will be increased from 6½ per cent to 8½ per cent. The result of all this is that net profit after providing for depreciation and taxation, has shown a sharp fall to Rs. 23.19 lakhs from Rs. 55.42 lakhs. The dividend recommended by the Directors is only Rs. 2 per share less tax, both on the A and B ordinary shares against Rs. 2.50 paid previously.

Sir Michelmore took the opportunity to lash out against the excise duty and the higher price that they have to pay for coal. His contention was that basic raw material like caustic soda was not a suitable material for excise duty and if it was to be, the levy should be kept at a reasonable rate and within the capacity of the consumer to pay. In regard to coal, Sir Michelmore pointed out that the company was paying as much as Rs. 1 lakh per month extra as transport charges for coal brought to the mills by road and now the company was paying sometimes Rs. 16,000 per month extra cess on all coal receipts.

The target of paper production for the Third Plan is 7 lakh tons, i.e. double the present output. This is to be achieved by the creation of additional mills or expansion of existing units to bring the total capacity to 9 lakh tons. Against this, the total capacity licensed or approved by the Government is just over 1,200,000 tons. This very high figure, Sir Michelmore remarked, seems to indicate the expectation that not more than half the new schemes will reach completion.

UPASI

PROBLEMS OF THE PLANTATION INDUSTRY

AT THE 68th Annual Conference of the United Planters Association of Southern India, Mr. H. C. Kothari, in his presidential address, dwelt at length on the various problems facing the plantation industry. This industry has been assigned an important role in the Third Five-Year Plan and it is, therefore, imperative that its problems be tackled in a realistic manner. The points raised by Mr. Kothari are important and mostly relate to production, exports and taxation. In regard to taxation, UPASI's President has reiterated that the Government should appoint a Committee whose terms of reference should include the examination of the effect of taxation at the current level on the plantation industry. A committee of this type has been appointed in Ceylon. The matter is of great urgency here because of the fact that there are more Governments involved in our country, each demanding its share of taxation, without a proper consideration of the total effect of taxation on the industry as a whole. The current level of taxation in India has been crippling the industry. A committee of investigation, it is considered, would be able to study all the aspects both in the light of the industry's own developing economy and with a view to promoting Government's efforts to increase foreign exchange earnings for the financing of the Plan. Since the development of this industry is very essential, it is important that some such probe be carried out.

On production and exports, Mr. Kothari takes the view that both these targets are a little on the high side in the Third Plan. And he tries to prove his point by facts and figures. While the all-India tea production has increased since 1959 at an average rate

of only 12 million lbs. a year, to reach the target of 900 million lbs., an average increase of about 40 million lbs. a year over the next five years will be necessary. Considering the small increase in planted acreage that has occurred in recent years, it is quite simple that new planting will not be able to add greatly to production.

The need to export more tea no doubt is great but the question is: will we be able to achieve the target set forth in the Third Plan with all the incentives provided for export promotion? Mr. Kothari is convinced that these steps will not be sufficient to absorb the whole of the proposed increase in production. Therefore, he urges that efforts should be made to increase domestic consumption alongside with exports. If this was not done, the fear is that a crisis of over-production may occur. This, however, goes without saying that for increasing exports of tea, there should be close consultation between the Government and industry. The scope for increasing exports in the Common Market countries is certainly considerable where only 40 million lbs. of tea are consumed by a population of 170 million. In the U.K., as compared to this, the consumption is 500 million lbs. by a population of 50 million. But can any progress be envisaged in the Common Market region in the face of high tariffs? The increase in exports can, of course, be possible in the ECM region only if tea is admitted duty-free or is subject to only a nominal duty after Britain's entry into it. Without this, it would be just a pious hope.

Maharashtra

THE STATE'S ECONOMY

COMMENTING ON Maharashtra's economy, Mr. D. C. Sutaria made two important points in his presidential address on the occasion of the second quarterly general meeting of the Nag-Vidharbha Chambers of Commerce, Nagpur. The first was in connection with the bill to establish Maharashtra Industrial Development Corporation and the other in respect of the manganese industry in the State. He welcomed the State Government's decision to introduce the bill to establish the Maharashtra Industrial Development Corporation as a statutory body to look after an orderly growth of industries in the State. The Corporation was aimed at providing assistance in the rapid and orderly establishment and growth of industries by setting up and managing industrial estates and by assisting entrepreneurs financially to move their factories to the best locations. The Corporation would be authorised to acquire land for industrial purposes and to provide other amenities to the producers. In a way the Corporation would help to hasten the pace of industrial development in the under-developed areas of Konkan, Marathwada and Vidharbha.

The manganese industry in Maharashtra, Mr. D. C. Sutaria pointed out, was getting deeper in its difficulties and both production and exports had been falling. The Indian exports which rose to 17.15 lakh tons in 1957, had declined to 11.62 lakh tons in 1960 and the foreign exchange earned from the manganese exports had deteriorated in comparison to 1957, when it stood at about Rs. 31.93 crores, to about Rs. 14 crores in 1960. Thus it was not only the export which had gone down, but also the foreign exchange earned per ton which had been reduced to a great extent. This, he pointed out, was on account of a rise in world production of manganese ore, the development of new mining areas in the proximity of the consuming countries and increasing competition from Russia. To face this challenge the Government would do well to follow the suggestion put forward by Mr. Sutaria that a substantial reduction in railway freight, royalty and port charges be effected.

**WE
IN
BIRDS
MEET
THE
DEMAND**

Rising steel production requires more and more vital raw material, iron and manganese ore, limestone, coal, dolomite, and refractories... New plants need essential water treatment processes... Agriculture requires tubewells in greater volume... the country's growing markets demand more jute products, paper, electricity, steel structurals and castings. And the Birds/Heilgers group is always there to spur their production... to meet these demands. But expansion doesn't stifle achievement. Nearly a hundred years of experience and research continues as Birds strive harder to bring you better products and better materials to keep pace with India's fast expanding economy.

**BIRD & CO. (PRIVATE) LTD.
AND
F. W. HEILGERS & CO. (PRIVATE) LTD.**

PROUD OF INDIA'S FIRSTS...

Gently, he sticks the last strip of tissue-paper over the frail balsa fuselage. A little glue, a little patience and he is proud of his HF-24, supersonic jet plane.

Someday soon he will know that putting together India's first supersonic jet wasn't so easy. It would have been impossible to

weld and fabricate the sleek aluminium body he admires so much without Argon.

A rare gas, Argon welds difficult metals and is now produced in India for the first time by Indian Oxygen. Like HF-24 indigenous Argon will save India much foreign exchange.

INDIAN OXYGEN LIMITED

IOC-22

FROM THE CAPITAL'S CORRIDORS

ROURKELA STEEL PLANT

SOME details are now available of the Rourkela steel plant's expansion programme which will raise its capacity from one million tons ingots to 1.8 million tons ingots per annum. The total cost on the expansion plan is estimated around Rs. 77.6 crores. Of this, approximately Rs. 46.5 crores will be the expenditure in foreign exchange.

After the completion of the expansion programme and on the basis of the anticipated demand for the plant's products, the following product-mix has been suggested:

	(Tons)
(1) Wide and Heavy Plates	280,000
(2) Hot rolled sheets, narrow light plates and strips	300,000
(3) Cold rolled sheets and strips	300,000
(4) Hot dipped tin plates	50,000
(5) Electrolytic tin plates	100,000
(6) Galvanized sheets	180,000
(7) Electrical steel sheets	50,000
TOTAL	1,240,000

The present product-mix of the plant is as follows:

	(Tons)
(1) Wide and heavy plates	200,000
(2) Hot rolled sheets, narrow light plates and strips	300,000
(3) Cold rolled sheets and strips	170,000
(4) Hot dipped tin plates	50,000
TOTAL	720,000

The expansion programme, it is understood, will not involve any duplication of the primary mills of the plant; after minor extensions, they are capable of meeting the increased demands of its various sections.

RAW MATERIALS

The annual requirements of different raw materials after the expansion of the plant are estimated as follows:

	(Tons)
(1) Coal	
(a) Coking quality	2,380,000
(b) Steam quality	112,000
(2) Iron Ore	
(a) Lumps (—80 mm. to +12mm.)	1,411,000
(b) Fines (Below 12 mm.)	1,008,000
(3) Manganese Ore	136,000
(4) Limestone	
(a) Blast Furnace quality	842,000
(b) O.H. quality	315,000
(5) Dolomite	
(a) Blast Furnace Quality	266,000
(b) Fettling and Converter lining quality	66,000
(6) Quartzite	63,000
(7) Flourspar/Bauxite	10,000

The plant at present is being run with coal supplies of which 75 per cent are washed at Kargali and 25 per cent unwashed. Due to shortage of good metallurgical coal deposits, a certain amount of weakly coking coals, such as those available at Argada and Sirkha, may have to be used. Steam coal will be supplied from Korba, in Madhya Pradesh, and Hingri-Rampur mines of the Hingri-Talcher coal belt.

Iron ore will continue to be supplied by the company's own mines at Barsua, which have a capacity to produce 3 million tons per annum on two shift basis and 4 to 4.5 million tons on three shift basis. No additional mining capacity will be required to be created in this regard since it is proposed to utilise the fines also after proper beneficiation. Additional handling and storage facilities will, however, have to be provided.

Some additional facilities are proposed to be provided at Purnapani from where the plant gets its supplies of blast furnace quality limestone. This quarry is owned by Hindustan Steel. At present, it has equipment and facilities for the production of 7,50,000 tons of limestone per annum. Limestone with lower acid insolubles will continue to be obtained from Satna-Maihar until a suitable deposit is found out at a nearer place.

Raw dolomite and sub-quality dolomite with lower silicon and alumina contents will also continue to be obtained from Birmitrapur and Hiri, as at present. Manganese ore will continue to be purchased from outside sources. Bauxite will be obtained from Lohardaga. Flourspar will have to be imported till the time indigenous deposits, recently discovered in Madhya Pradesh and Rajasthan, are exploited.

COAL STORAGE

To regularise coal supplies, it is proposed to build an intermediate coal storage bunker having a capacity of 22,500 tons—sufficient for about 3 days' normal coal requirements of the plant—and expand the capacity of the coal yard at the steelworks to approximately 70,000 tons—about 10 days' requirements. The building up of the intermediate coal storage bunker is necessitated by the fact that coal has to be brought to the steel plant over a distance of about 450 kilometers from washeries and it has to pass through some very heavily loaded sections of the railway system. To expedite unloading of coal at the works and at the intermediate storage bunker, two wagon tipplers will be installed. The coke oven section is to be expanded by an addition of 100 ovens—divided into two batteries of 50 ovens each, each battery being further sub-divided into sub-batteries of 25 ovens. After the completion of the expansion programme the coke ovens will have to produce approximately 14,76,000 tons of plus 40 mm. size coke per year. After setting up of the new coke ovens, the maximum gas-make would be approximately 1,08,000 Ncbm per hour. Since the existing two streams of the by-product plant have a capacity to handle a gas volume of only 70,000 Ncbm per hour plus an over-load of 10 per cent, a new gas stream will be built.

The by-product ammonia, which will be available from the by-product plant, will be utilised for the manufacture of ammonium sulphate. It is not proposed to set up as ammonia purification plant for it involves a cost of about Rs. 1.2 crores which is considered to be uneconomical. Similarly, ammonia is not to be utilised for the manufacture of calcium cyanamide gas. For this also ammonia has to be purified to remove all the organic impurities involving a high cost. An ammonium sulphate plant is, therefore, envisaged to be set up having a capacity of 80 tons per day. Sulphuric acid to be used for the manufacture of ammonium sulphate will also be produced locally. For this a sulphuric acid plant with a capacity of 60 tons of 60°Be acid per day will be set up. The total cost of setting up the ammonium sulphate plant and the sulphuric acid plant is estimated at Rs. 70 lakhs, compared to Rs. 1.2 crores required for setting up an ammonia purification plant.

Similarly, instead of recovering benzol at a pressure of 15 atmospheres, it is proposed to have a low pressure benzol recovery plant which will cost less, both in capital investment and operating costs. The existing distillation plants for tar and benzol have ample capacities to deal with the additional crude tar and crude benzol which will be available from the two new batteries of coke ovens. No expansion of these units is, therefore, envisaged.

The additions and modifications of the other units of the Rourkela Steelworks consequent upon its expan-

sion to a capacity of 1.8 million tons ingots per annum would be as follows:

(1) **Blast Furnaces:** After the expansion, the plant's annual requirements of pig iron will be 1,600,000 tons. To allow for the furnace relining and down time from other causes, this production will have to be achieved in 340 days, i.e. at a rate of 4,700 tons per day. At present there are 3 furnaces, normally rated at 1,000 tons. The additional production will be obtained, partly from increased production of the existing furnaces by the use of improved operating technique, and partly from a new furnace to be installed. The new furnace will be rated for a daily production of 1,500 tons, but will be capable of producing upto 1,800 tons per day by the use of sinter and under favourable operating conditions. Each of the present three blast furnaces will be required to produce about 1200 tons per day through use of improved techniques.

(2) **Blast Furnace Blowers:** For the existing three blast furnaces, four blowers are provided, three normally operating and one as a standby. Each of these blowers is rated for a normal blast supply of 120,000 Ncbm per hour and maximum continuous supply of 160,000 Ncbm per hour. They are designed for a maximum discharge pressure of 2.3 atmospheres absolute. The normal blast requirements of the new 1,500 ton per day furnace will be 160,000 Ncbm per hour. It is proposed to provide a new blower of the same capacity as the existing ones and install it in the space already provided in the power station. Thus, the blowers will be interchangeable and with a total of five blowers installed one will be standby.

(3) **Gas Cleaning Plant:** The present gas clearing plant consists of six identical units designed for cleaning a total gas volume of 500,000 Ncbm per hour. With the installation of the new 1,500-ton per day capacity furnace, the maximum crude gas-make in the four furnaces will be approximately 660,000 Ncbm per hour. To take care of the additional 160,000 Ncbm per hour of gas, it is proposed to install two additional units of the same capacity as the existing ones. The gas-make of 660,000 Ncbm per hour is the maximum rate from the four furnaces together. In practice, the four furnaces will seldom be working to their maximum capacities simultaneously. It is found that the average gas-make is 15 to 20 per cent lower than the theoretical maximum rate. Thus, it would be possible to clean the total gas from all the four furnaces in seven cleaning units, when one of the units is down for maintenance.

(4) **Steel Melting Shop:** The steel melting shop consists of four 80-ton open hearth furnaces and three 40-ton L.D. converters. Though laid out for a production of 1,000,000 tons of ingot steel per year, its inherent capacity is such that up to 1,300,000 tons of steel per annum can be produced without additional equipment. Extensions will have to be done to get the remaining 500,000 tons of steel to make a total production of 1,800,000 tons per year. On the open hearth side, it is possible to increase the capacity by another 100,000 tons per year by the addition of a fifth open hearth furnace, for which space is left, and by operating all the furnaces with basic roof and oxygen lancing. The balance of 400,000 tons per year to make a total additional production of 500,000 tons, will have to be obtained by increasing the capacity of the L.D. plant by providing two more converters of about the same capacity as at present. Alternatively it is also possible to get the entire additional production of 500,000 tons by extension to the L.D. side alone by the installation of two more converters of slightly higher capacity. Since the latter alternative will be cheaper both in capital outlay and operating costs, it is proposed to extend the L.D. side only to achieve the proposed production of 1.8 million tons per annum.

(5) **Converters:** The expansion programme will require two additional 50-ton converters. However, it is proposed to provide the additional converters of 60-ton capacity. The extra cost involved for the 60-ton converters as compared to 50-ton converters is small, whereas the higher capacity converters will provide greater flexibility and the plant will be able to produce more steel as and when the mills can take it. Further, installation of higher capacity converters will enable increase in capacity of the steel plant to beyond 1.8 million tons, if required.

(6) **Dust Cleaning Arrangement:** The existing L.D. converters are not provided with any dust cleaning arrangement. As the L.D. fumes pollute the plant atmosphere, it is essential to clean the fumes. Out of the five converters, only three will be in operation. It is proposed to install one precipitator type central gas cleaning plant to clean the gas produced from any three converters in operation. The piping system between the converters and the central gas cleaning system will be so arranged that the fumes will be taken to the gas cleaning plant through a common duct with shut-off valves at suitable places to disconnect any converter not in operation.

(7) **Hot Metal Handling:** In the existing plant, there are two 1,100-ton mixers and space has been left for the installation of a third mixer, by the side of the existing mixers, situated in between the L.D. and open hearth plants. Two hot metal tracks enter the mixer building at an angle of 45° and on these tracks the hot metal ladles can be brought under the two mixer cranes. With four blast furnaces in operation, the steel melting shop will receive upto about 4,800 tons of hot metal per day at the rate of 3 to 4 ladles an hour. This number of ladles cannot be handled with the existing two mixer cranes and the layout does not permit in tallation of a third crane. It is, therefore, proposed to install the third mixer at the south-west end of the converter plant with a new mixer crane and with facility to bring the hot metal ladles on two tracks entering at 45° within the reach of the mixer crane. This arrangement permits handling of the hot metal at two independent points and also allows feeding of the mixer metal to the converters from either end, thus giving maximum flexibility in operation. Further, this arrangement permits expansion of the steel plant capacity to beyond 2 million tons in future by the installation of a sixth converter and a fourth mixer.

(8) **Lime and Dolomite Calcining Plant:** The existing plant consists of three vertical shaft kilns for calcining lime and two vertical shaft kilns for calcining dolomite. The vertical shaft kilns for dolomite have not yet operated satisfactorily. It cannot be said, with any degree of certainty, if the dolomite available will lend itself to satisfactory calcining in vertical gas fired kilns. To meet the increased requirements of lime under the expansion programme, it is necessary to install two additional lime kilns. Therefore, instead of adding two more lime kilns, it is proposed to convert the two dolomite kilns into lime kilns and install a new rotary kiln, of 100 ton per day capacity, for producing the entire requirement of dead burnt dolomite after the expansion.

(9) **Oxygen Plant:** To meet the additional requirement of oxygen for the new L.D. converters and additional scarfing to be done in the rolling mill, it is necessary to install two more oxygen producing units, one unit being of the same capacity as the existing units and the other of a higher capacity. One of the two additional units shall be able to produce 99.5 per cent pure gaseous oxygen and 99.99 per cent pure nitrogen, as at present. The second additional unit is not required to produce nitrogen for the fertilizer plant. This unit, however, will be designed for producing oxygen partly as gaseous oxygen and partly as liquid oxygen.

(10) **Rolling Mills:** The main units of the hot rolling mills have adequate capacity to process the 1.8 million tons of ingots to be produced after the expansion. Soaking pits and the slab reheating furnace capacities will have to be increased. Facilities for hot scarfing of slabs will be provided and one more coiler will be added after the strip mill. Major expansion will be on the cold rolling mills. In addition to increasing the cold rolling capacity by the installation of a 5-stand tandem cold rolling mills, facilities will be provided for electrolytic tinning and continuous galvanizing. A new plant for the production of hot rolled electrical sheets will be installed.

(11) **Plate Mill:** 280,000 tons of finished plates are planned to be produced in the existing 3.1 million ton plate mill. The mill and the finishing equipment are adequate for this production. The production from the plate mill depends on the width and thickness of the plates to be rolled. Based on an average mixed product the plate mill can roll 300,000/350,000 tons per annum. In future, when the demand for plates has increased, and the 2 million wide strip mill planned at Bokaro has come into operation, all plates below 1,850 mm. width and 10 mm. thickness can be planned on that strip mill. This will leave only wide plates and plates above 10 mm. thickness to be rolled in this plate mill. Under these conditions, it will be possible to produce upto half a million tons of plates per year from this mill. The finishing equipment already provided is adequate to deal with this increased production.

(12) **Strip Mill:** The 1,700 mm. wide strip mill has a roughing train and a finishing train. The roughing train consists of one reversing and one non-reversing 4-high stands. The finishing train consists of six 4-high stands in tandem. After the expansion, approximately 1,140,000 tons of slabs will have to be rolled to strips. There is ample capacity in the mill for this. With favourable product-mix and under good operation and maintenance, the strip mill is capable of rolling appreciably more than is required under the expansion to 1.8 million ton. In America and Russia, mills of this size are now rolling over 2 million tons of slabs per year. After the expansion, the strip mill will be operating three shifts and in order to maintain the mill production, it is essential to have three coilers. A third coiler will, therefore, be provided in the space already left in the existing layout.

(13) **Finishing Lines—Slitting Knives:** There are two finishing lines in the existing plant, one for finishing coiled strips and the other for finishing divided strips into finished plates and sheets. The coiled strip finishing line is designed for slitting wide strips into narrower widths and also for finishing both wide and slit strips into finished sheets and plates as required. In this line strips upto 5 mm. thickness can be recoiled after trimming and slitting. Strips above 5 mm. thickness can be finished into sheets and plates. The rotary knives and spacer rings, already provided with this line, are capable of slitting strips to minimum 33 mm. width. It is proposed to provide additional rotary knives and spacer rings to enable this line to slit strips down to minimum 80 mm. width of which this line is capable. Based on average product-mix, this finishing line is capable of an output of 190,000 tons of finished products per year. The divided strip finishing line is designed for finishing dividad strips into finished sheets and plates. This line is also provided with one pair of slitting knives for slitting plates when required. With average product-mix, this line is capable of giving a finished output of 210,000 tons per year. The finished hot rolled products from the strip mill after the expansion will be about 250,000 to 300,000 tons per year. The combined capacity of the above two finishing lines is 390,000 tons per year. Therefore, no additional facilities are required.

(14) **Cold Sheet Finishing Lines:** In the present installation, there are two cold rolled sheet finishing lines, each capable of an output of 120,000 tons per year. After the expansion, the total production of cold rolled finished sheets will be 300,000 tons per year. To deal with the additional production, it is proposed to install one more finishing line of the same capacity as the existing ones. In the existing cold rolling mill, there is facility to slit cold rolled strip to minimum 250 mm. width. As there is demand for cold rolled strips in widths down to 12.5 mm., it is proposed to install two slitting lines designed to slit strips of a maximum width of 300 mm. down to 12.5 mm., with provision for recoiling. Each of these lines will be capable of giving an output of approximately 10,000 tons per year.

(15) **Electrolytic Tinning Lines:** For the planned production of 100,000 tons of electrolytic tinplates, it is proposed to install an acid ferrostan line. This line will be designed for a maximum operating speed of 1,200 ft. per minute. The line will be located in the new bay adjacent to the present cold rolling mills building. A trimming shear has been incorporated in the tinning line itself to side trim the strips. As there is no demand for tinplates in coils, no coilers have been planned in this tinning line. However, space will be left in the layout for installation of two coilers in the future. The line will be initially designed with four plating tanks, and will have a capacity to produce 100,000 tons per year of electrolytic tinplates when operated 6,000 hours a year and 130,000 tons per year when operated 8,000 hours a year. It should be possible to operate upto 8,000 hours after the operating and maintenance personnel have acquired the requisite skill. Space has been left in the layout to add four more plating tanks in future. With additional plating tanks, the capacity of this line can be increased upto about 130,000 tons per year based on 6,000 operating hours a year and upto 175,000 tons per year by operating 8,000 hours a year.

The patent for Ferrostan lines is held by United States Steel Corporation and a licence agreement will have to be signed between Hindustan Steel Limited and the United States Steel Corporation before the ferrostan line can be installed.

The patent for the Armco-Sendizimir continuous strip galvanising line is held by Messrs. Armco-International Corporation of the U.S.A. Therefore, to install these galvanising lines, it will be necessary to enter into a licence agreement with Messrs. Armco-International Corporation.

(16) **Foundry:** The existing foundry has got a capacity of 30,000 tons per year of iron castings consisting of ingot moulds, bottom plates and miscellaneous casting. Three cold blast cupolas, each having a capacity of 9 tons per hour are provided. Provision exists for converting the existing cupolas into hot blast ones thereby raising the capacity of each cupola to 12 tons per hour. Under the expansion programme, it is proposed to increase the grey iron foundry capacity to 64,000 tons per year and to add a steel foundry and non-ferrous foundry. The steel and non-ferrous foundry will be located in a separate building and will include a 5-ton electric furnace for steel and a 0.5 ton gas fired crucible furnace for non-ferrous metal.

INVESTMENT COST

The total estimated cost for the expansion is Rs. 776,000,000. This cost includes the investment required for such additional processing plants as electrolytic tinning plant, continuous galvanising plant and electrical sheet mill. Inclusion of these units has increased the capital investment of the expansion without increasing the total output, but it has considerably increased the sale value of the final products.

Out of the above estimated cost of Rs. 776,000,000, approximately Rs. 465,000,000 will be the expenditure in foreign exchange.

The total cost of the present 1 million ton plant as per the latest revised estimate is Rs. 1,700,000,000 which works out to an investment cost of Rs. 1,700 per ton of ingot steel capacity. For increasing the capacity by 800,000 tons of ingot steel per year, the additional investment is Rs. 776,000,000 which works out to Rs. 970 per ton. Taking the entire installation after the expansion, the overall investment cost will be Rs. 1,375 per ton of ingot steel capacity. This figure is attractive and compares favourably with the corresponding cost for similar installations abroad.

THE CABINET COMMITTEE ON EXPORT PROMOTION

The Cabinet Committee on Export Promotion has approved a comprehensive export incentive scheme which includes increased rebate on articles of export for which it has approved a provision of nearly Rs. 10 crores. The Committee has also endorsed the export plan for 1961-62 worked out by the Committee of Economic Secretaries. This plan provides for larger export quotas than was envisaged in the Third Plan particularly in regard to engineering products. It has approved various measures for different commodities which would contribute to higher exports.

The Committee is also understood to have discussed proposals for legislation to vest the Government with powers to take steps for promotion of exports. Some of the steps suggested are—(i) steady increase in agricultural and industrial production; (ii) restraint on consumption of certain commodities; (iii) rebate or remission of income tax; (iv) reduction costs; (v) increasing productivity by the industries and improving relative profitability of export sales; (vi) provision of foreign exchange facilities for trade promotion work; (vii) conducting of market surveys for exploring foreign markets; (viii) establishing of servicing organisations for exports of engineering goods; (ix) reduction of railway freight; (x) increased draw-back of excise duties; (xi) provision of liberal credit facilities; (xii) imposition of suitable quality control and pre-shipment inspection measures; (xiii) supply of fertilizers for increasing the cash crops linked with export performance; and (xiv) supply of indigenous raw materials on concessional rates for manufacture of goods intended to be exported.

The Committee has also approved various measures in respect of several commodities which could contribute to larger exports. In the case of manganese ore, for instance, the Indian prices were higher than the international prices by \$4 to \$6 per ton. The Committee has suggested that one way to increase its capacity to compete in the foreign market was to reduce railway freights, may be by 50 per cent for a period of six months to begin with. This would, however, apply to ore transported from distances of over 200 miles to the nearest ports. The position is to be reviewed after six months.

In case of tea, it was suggested that regular supply of fertilizer to the tea industry was essential in order to step up the production and consequently the exports. At present fertilizers were being distributed to the tea planters through the State Governments. It was suggested some time back that fertilizers should be distributed to the planters through the Tea Board and special allocation of fertilizers be made to this industry.

As far as vegetable oils were concerned, it was realised that a scheme of subsidy would act as an incentive to exports. Internal high prices have been largely responsible for the decline in exports of vegetable oils. At present there was a disparity of Rs. 600 per ton in groundnut oil and Rs. 400 per ton in the linseed oil over the international prices. The Ministry

of Commerce and Industry has suggested, therefore, a subsidy to equalise prices in order to promote export of these two oils.

About cotton textiles, the Committee has agreed that sufficient foreign exchange be allocated to enable the mills to undertake a programme of rationalisation and modernisation. This indeed was very necessary in view of the fact that exports of Indian cotton textiles have been declining and the industry has to be prepared to compete in the foreign markets.

The Committee has reported that for improving the exports of hides and skins, liberal imports of raw skins were necessary. Further large-scale programme for better collection of fallen hides and for introduction of improved methods for flaying were necessary. Moreover, a large number of abattoirs run on hygienic lines by local bodies could be of great use.

As far as new manufactures like light engineering goods, chemical industries, plastic industries, etc. were concerned, their exports could be stepped up considerably provided raw materials for their manufacture were made available to the producers at the rate at which they could produce their goods at competitive international prices.

DURGAPUR COKE OVEN PLANT

The present capacity of the Durgapur coke oven plant—13,000 tons of coal and coke breeze plus recovery of such by-products as ammonia, coal tar, crude benzol, etc.—is to be doubled during the Third Plan period, according to a scheme prepared by the Durgapur Industries Board. The expansion programme will also require setting up of a new coal washery.

The annual requirements of raw coal for doubling the plant's capacity has already been taken into account while fixing the coal production target under the Third Plan. The transport requirements both for the movement of raw coal into the plant and despatch of hard coke from it have similarly been taken note of in the Plan and communicated to the railways for inclusion in their expansion programme.

The expansion programme of the Durgapur coke oven plant has been prepared in the light of the recommendations of the Committee set-up in 1958 under the Chairmanship of Mr. P. M. Nayak, the then Coal Controller, to assess the demand for hard coke in the Third Plan period. This Committee, it may be recalled, had recommended that "the coke oven plant set up by the Durgapur Industries Board at Durgapur should be doubled. Doubling of this plant may create more capacity, but having regard to the rate of increase in demand, excess capacity may not last for more than a year." The Committee had also laid great stress on recovery of by-products such as crude benzol for which demand during the Third Plan period was expected to grow at a phenomenal rate.

Your credit is better than a millionaire's...

When you Become a Member of The Diners' Club.

Exaggeration? Not at all! How many millionaires can get unquestioned and instant credit all over India? Very few. But you can! And so simply too—join the Diners' Club! With a Diners' Club Credit Card you can sign for just about anything—from a bouquet of flowers to an airline ticket around the world!

For a small membership fee of just Rs. 30 a year, every member gets

- instant and unquestioned credit in over 600 leading hotels, restaurants and shops throughout the country.
- an accurate, permanent record of monthly expenses invaluable for tax purposes
- the facility of paying for all monthly expenses by just one cheque
- a copy of the Diners' Club magazine every month.

COMPANY AFFAIRS

THE BIRLA COTTON

The Directors of the Birla Cotton Spinning and Weaving Mills Limited in their report for the year to March 31, 1961, have pointed out that the textile section of the Company carried out significant expansion. The latest types of winding and warping machines namely the Barber Colman type have been added to the textile mills. Several other machines also have been ordered for replacement of old machinery for improving the various processes. An application has also been made to the Government of India for permission to instal additional spindles for balancing the existing ratio of looms to spindles. This new installation is likely to result in larger out-put and naturally will affect favourably the cost of production of the Company.

The cost of production in the textile industry, it is reported, has further increased as a result of steep rise in the prices of cotton, a substantial increase in the wages of workers under the recommendation of the Wage Board and several other factors. In addition to this, the Company, in line with the policy accepted by the textile industry, made voluntary reductions in prices of cloth. For the convenience of consumers, a system of stamping of prices on each piece of cloth was also introduced.

The Company, however, made a steady progress. Profits during the year were recorded at Rs. 42.15 lakhs against Rs. 21.31 lakhs during the previous year. A sum of Rs. 18.50 lakhs was provided for taxation against Rs. 6 lakhs provided during the previous year. A sum of Rs. 7 lakhs was transferred to General Reserve. The Directors have recommended the payment of a dividend subject to deduction of income tax on ordinary shares of Rs. 10 each at the rate of Rs. 2 per share which will absorb Rs. 7.99 lakhs.

PARRYS CONFECTIONERY

Parrys Confectionery Limited during the year to March 31, 1961, recorded a profit of Rs. 10.16 lakhs before providing for taxation. While the total sales of the Company were higher at Rs. 1.17 crores against Rs. 1.14 crores during the previous year, it was essentially due to higher costs that the profits were lower than the previous year though by a small margin. The Directors have recommended the transfer of Rs. 50,000 to Capital Reserves and Rs. 1 lakh to General Reserve. An interim dividend at the rate of 10 per cent was paid and now a final dividend at the rate of 20 per cent subject to deduction of tax on Company's ordinary share capital as increased by the Right Issue made on May 4, 1961, has been proposed to be paid.

NEW CAPITAL ISSUES

Five cotton mills engaged in the manufacture of cotton cloth, spinning and ginning have been granted consent by the Controller of Capital Issues to the issue of a total capital of Rs. 3.35 crores. The consent is valid for 12 months in each case.

The following are the details:

The Swadeshi Cotton Mills Company Limited, Kanpur, has been accorded consent to issue capital of Rs. 87.50 lakhs viz Rs. 17.50 lakhs in bonus shares on capitalisation of the Company's reserves to a like extent and Rs. 70 lakhs at par on right basis. The proceeds of the cash issue will be utilised for repayment of the Company's borrowings in part and for improving its liquid position. The Company is engaged in the manufacture of textiles, and has a paid-up capital of Rs. 210.00 lakhs.

The Vishnu Cotton Mills Limited, Bombay, has been granted consent to the issue of further capital of Rs. 73,60,000 divided into 57,600 equity shares of Rs. 100 each and 6,400 first cumulative preference shares of Rs. 250 each, carrying a dividend of 5½ per cent (subject to deduction of taxes at the prescribed rates. The shares will be issued for consideration other than cash in terms

of the scheme of amalgamation of the Lakshmi Cotton Manufacturing Company Limited, with the Vishnu Cotton Mills Limited. The present paid-up capital of the Company is Rs. 47,66,500 divided into 32,000 ordinary shares of Rs. 100 each and 3,313 seven per cent cumulative preference shares of Rs. 500 each.

The Delhi Cloth and General Mills Limited, Delhi, has been granted consent to the issue of further capital of Rs. 150 lakhs, divided into 4 lakh ordinary shares of Rs. 25 each at a premium of Rs. 5 per share, 2 lakh preference shares of Rs. 25 each at par with dividend not exceeding 9 per cent per annum free of Company's tax but subject to deduction of taxes at source at prescribed rates, and debenture stock of the value of Rs. 250 lakhs carrying interest at 6½ per cent per annum. The proceeds of the issue will be utilised for financing the manufacture of P.V.C. and tyre cord rayon at Kotah in Rajasthan. The Company's present paid-up capital is Rs. 410.75 lakhs.

The Mysore Spinning and Manufacturing Company Limited, Bombay, has been granted consent to the issue of capital of Rs. 19,86,150 in equity shares of Rs. 50 each for cash at par. The proceeds will be utilised for renovation and expansion of the mills. The present paid-up capital is Rs. 47,13,300 divided into 79,365 equity shares of Rs. 50 each and 1,490, 4½ per cent preference shares of Rs. 50 each.

The Aryodaya Ginning and Manufacturing Company Limited, Ahmedabad, has been granted consent to issue 3,465 bonus shares of Rs. 200 each on capitalisation of Rs. 693,000 from the share premium account, to be allotted to the equity shareholders of the Company in the proportion of one bonus share for every 4 equity shares held.

Company Meetings

THE TITAGHUR PAPER MILLS CO., LTD.

'Statement by the Chairman, Sir Walter Michemore.

It gives me pleasure once more to review the Company's affairs and to comment on the state of the Paper Industry.

The results for the year ended 31st March, 1961 have been somewhat disappointing and the fall in profit has resulted from a combination of lower selling prices, increases in the cost of chemicals and coal and a loss sustained at No. 3 Mill. Your Directors have, therefore, decided to declare a final dividend of one rupee on the ordinary shares, making a total of two rupees for the year. To do so it has been necessary to transfer to the credit of the profit and loss account the sum of Rs. 7 lakhs from Dividend Equalisation Reserve.

Your Company has this year felt the full force of the cuts in selling prices recommended by the Tariff Commission which has resulted in a drop of 3.8 per cent in the value of sales. The prices of our raw materials, chemicals and coal, however, show no signs of going down and since my last statement your Company has had to suffer an excise duty on caustic soda of Rs. 40 per tonne, an increase in the cost of coal of 78.7 nP. per tonne, an increase in the cost of power supplied by the Calcutta Electric Supply Corporation arising out of the higher coal price and, as I write, there is a probability that the Company's contribution to the Employees' Provident Fund will be increased from 6½ per cent to 8-1/3 per cent. Your Directors are alive to the necessity of making economies to offset the slow but steady rise in costs, and some success has been achieved. I trust, nevertheless, that Government will show some sympathy with the predicament in which the Industry at present finds itself and give due consideration to the modification of paper selling prices where it is clear that they are too low.

The results at No. 3 Mill during the year have been disappointing, as the teething troubles inescapable in a project of this size and complexity have not been overcome as quickly as had been hoped, and a loss has again been incurred. The Mill was started up with a single machine and it was considered advisable not to hurry the transfer of the second machine from No. 2 Mill until the workers at No. 3 Mill, most of whom were recruited locally and were, therefore, unskilled in the operation of a Paper Mill, had become reasonably proficient. Since the Mill was designed to produce 1,000 tonnes per month, one-machine operation could not be economic. Your Managing Agents felt, however, that this disability should be accepted in the initial stages and the second machine used to the best possible advantage at No. 2 Mill during the intervening period. This was done, and therefore part of the profit at No. 2 Mill can be considered in a manner of speaking to be attributable to No. 3 Mill. Trade Unionism is well developed in Orissa, even in its infant industries; and it was not long before inter-union rivalry developed at No. 3 Mill. This has unsettled the workers and has greatly affected the efficiency of the Mill. Despite this disability, however, it was considered that the

transfer of the second machine could no longer be delayed; this is, therefore, now well in hand and the machine should be in operation shortly, after which we anticipate that before long the Mill will be on a profit-making basis.

The Mills in West Bengal ran satisfactorily in the year under review and continue to do so in the current year. At one stage stocks of both bamboo and coal were dangerously low and it was necessary to supplement bamboo by using paddy straw and bagasse and to bring in coal by lorry which is extremely expensive. The Railways, still contending with major transport difficulties, have done their best to help us and have staved off any serious closure due to lack of supplies.

A special reference is necessary to the problem of the supply of coal to the Mills. We have not, during the period under review, experienced any major shut-down in the Mills in West Bengal owing to shortage of coal. But it must be realised that this has been achieved solely by the extremely costly expedient of moving to the Mills by road coal which it is the duty of the Railway to have been able to move by rail. A new and remarkable feature of this failure by the Railways to implement their obligations is the imposition by the Central Government of a cess of 80 nP. per ton on all despatches of coal to all consumers wherever situated. The purpose of this cess is that for coal consumers in Southern and Western India to whom the Railways cannot convey their coal by rail the "difference between the actual freight by the rail-coast-sea route and the freight by the all-rail route will be made good to the consumer in the form of a subsidy." (My quotation is from a recent answer by a Union Minister to a question in the Lok Sabha). So we have the position in our Company that on the one hand we are paying as much as Rs. 1,00,000 per month extra in transport charges for coal brought to the Mills by road and at the same time we are now paying something like Rs. 16,000 per month extra cess on all our coal receipts, the benefit of which goes entirely to other companies — including no doubt some of our own competitors — located in South and West India. This gross discrimination seems to require much more attention than it has yet received from the Industrialists, and indeed the Governments concerned, in North East India.

Another point I should like to make is on the subject of the excise duties. The correct purpose of these duties is to spread the taxation net more widely among the teeming millions of the country and to bring into it some of those who escape the very limited numerical scope of corporate and personal taxation. I therefore do not quarrel with the excise duty on paper, provided it is kept at a reasonable rate and within the capacity of the consumer to pay. Excise should not, however, be used to increase the already high cost of manufacturing industries. A case in point is the excise duty on caustic soda to which I have already referred

and which is a heavy burden on your Company. Basic materials such as caustic soda, whose sole use is as a raw material in other industries, are not, I suggest, a suitable subject for excise duty as their imposition serves only to increase manufacturing costs which are already high.

In view of the vital importance of economies and operational efficiency, Messrs. Urwick Orr & Partners, as I mentioned in my last statement, made a survey of the organisation of the Company and of the costing system, and their recommendations are in process of being implemented.

The Paper Industry is now at the commencement of the Third Plan period, having virtually achieved the targets set for the First and Second Plans. The target for the Third Plan is a production of 700,000 tons, double the present output, and this is supposed to be achieved by the creation of additional Mills or expansion of existing units to bring the total capacity to 900,000 tons. Against this the total capacity licensed or approved by Government is just over 1,200,000 tons. This very high figure seems to indicate the expectation that not much more than half the new schemes will reach completion.

With the output of paper having doubled during the Second Five-Year Plan, there are indications that the supply position has eased considerably. It seems to me doubtful that demand will continue to double each five years and, as I said last year, there may well be an excess of supply over demand by 1965. While in general the supply position has eased beyond anything thought possible two years ago, our Mills remain heavily

committed. A consistent policy of quality and service in good times and bad, is undoubtedly responsible for our full order books. The severe shortage of railway wagons has seriously hampered despatches, but all possible steps have been taken to deliver supplies in time for various seasonal requirements. I have no doubt that in the light of recent experience, our Mills will be able to improve their performance still further. Our Sales force is being strengthened and expanded solely with a view to improving liaison between the Mills and our customers.

Although a reference to the efforts of the staff generally closes a Chairman's statement, this does not mean they are last in importance and I am sure you will wish me to thank them for the very hard and constructive work they continue to do on your behalf, often under circumstances of considerable difficulty. I should like to mention in particular the staff of the bamboo forest organisation who are responsible for the cutting and extraction of bamboo from an area covering large tracts of jungle in Orissa, Bihar and Assam. This is a lonely and exacting task carried out in conditions never easy and often of extreme discomfort, if not danger, and you will agree with me that their efforts on your behalf are highly valued.

Note: The above statement is not a report of the proceedings for the Annual General Meeting, which will be held on the 29th September, 1961.

THE INDIA CEMENTS LIMITED MADRAS-2

Speech delivered by Sri P. Suryanarayana at the 15th Annual General Meeting of the Company held on Monday, the 4th September, 1961.

Gentlemen,

On behalf of the Management and on my own behalf, I extend to you all a cordial welcome to the Fifteenth Annual General Meeting of your Company and place before you the Annual Accounts of the Company and the Report of the Board of Directors for the year ended 31st March, 1961. Printed copies of these have been circulated to all the Members, and with your kind permission, I will take them as read.

You are aware that the Third Five-Year Plan which marks a vital phase in India's progress towards a self generating economy, was presented to the nation on the 7th July, 1961 with a call for an overall investment of Rs. 10,400 crores. The final report of the Plan says that the range and magnitude of the task will strain the country's resources to the utmost. One of the principal objectives of the Third Plan is to expand basic industries like Steel, Fuel and Chemicals to accelerate industrialisation. To attain the objectives, this Plan Report has prescribed a total investment of Rs. 10,400 crores in the next five years, which represents a 54 per cent increase over the Second Plan investment of Rs. 6,750 crores. Of the proposed investment, Rs. 6,300 crores is to be in the Public Sector; and Rs. 4,100 crores in the Private Sector. The roles of the Public and Private Sectors are conceived of as complementary to each other. The Planners look forward to the stepping up of the industrial output by 70 per cent. In 1965-66 the general index of industrial production is expected to reach the level of 329 (1950-51 base) against 194 provisionally estimated for 1960-61, and 139 for the last year of the First Plan.

In this new set up, the Cement Industry has an assigned place. It has made considerable progress. The installed capacity of cement industry at present is 8.93 million tonnes per annum. This is to be raised to 15 million tonnes in the Third Five-Year Plan. Its production was 7.89 million tonnes in 1960-61 and is expected to go up by 1 million tonnes this year. All these show that the Industry has a bright future before it. Recent trends in the demand for cement indicate that the estimated requirements for 1960-61 might have been somewhat on the low side. This matter is expected to be reviewed in the subsequent year. The possibility of having to revise the cement target upwards cannot be ruled out, if the construction activities—besides the need to repair the damages caused by the recent floods all over the land—are allowed to have their way.

As regards the working of your Company during the year under review, you would have noted that the Gross Profit (without deducting depreciation and Managing Agents' Commission) has increased only by 3.52 lakhs as compared to the previous year.

Production of Clinker, Cement and Sales were higher at 4,51,540 metric tonnes, 4,64,295 metric tonnes and 4,62,083 metric tonnes respectively. This was due to the fact that the benefit of higher production arising out of the operation of our 3rd Unit was available to the Company throughout the year as against a partial period during the previous year. There has thus been a 27 per cent increase in the production of clinker during the year under review though, however, there has been no proportionate increase in the profits earned.

This is particularly due to the fact that the cost of production had gone up during the current year, for instance, coal was not only not available in required

quantities, but a much higher quantity had to be moved by sea-cum-rail route which in effect, had increased the cost of coal delivered at the Factory. Due to the extremely difficult position in regard to coal supplies, we had to switch on to the use of furnace oil for one of the kilns. The use of furnace oil was quite prohibitive from the point of view of cost and was not covered in the existing retention price available for our factory. In order to maintain production to the extent possible, we have had to resort to this mode of usage of fuel.

Wages and salaries for various categories of staff were also revised during the year in conformity with the recommendations of the Central Wage Board for Cement Industry, but the increase on this account was, however, reimbursed to the Company by way of enhancement of retention price. The cost of spare parts and stores have registered substantial increases.

The cost of gunnies required for packing cement had spurted considerably in the latter half of 1960 and in spite of this abnormal increase in rates, the Government of India did not choose to effect an upward revision in the quarterly packing charges till the 20th January, 1961. The Government of India, by this time, had reversed their previous decision and permitted the use of old gunnies so as to offset the increase in the price of new bags. However, this sudden decision of the Government was of no immediate benefit inasmuch as the revival of the organisation set up for the collection of gunnies had necessarily to take some time to yield results.

Subsequently, from the third week of February 1961, the Government also enhanced the packing charges though by this time, the Company had already sustained losses on this account.

In effect, therefore, it may be noted that for a very small increase in the gross profit, an increase of production of 27 per cent as compared to the previous year was necessary to offset the increases in cost under various items.

The Tariff Commission have now taken up the question of revision of cement prices and your Company have made necessary representation to the Commission in this regard. It is hoped that the Commission would take into account all matters pertaining to the cost of production in the case of your factory and fix a reasonable price for cement produced.

I am pleased to inform you that the Government of Andhra Pradesh have issued orders sanctioning mining rights over the area applied for by us. Your Company has also submitted an application to the Central Government for the issue of a licence to start a cement factory in Salem District.

The State Government have been pleased to accord sanction to construct 450 tenements under the Subsidised Industrial Housing Scheme and work in this connection is in progress.

I am indeed happy to report that our relation with labour continues to be very cordial as usual. Before I conclude, I should, both on your behalf and on my own, like to tender our sincere thanks for their co-operation and hard work. The Company looks forward to their devoted service in the years to come.

NOTE: This does not purport to be the full proceedings of the Annual General Body Meeting.

"Do LIC actually invest at the rate of Rs. 1½ million a day?"

"More! In fact they're the largest investors in the country."

PEOPLE ARE TALKING ABOUT LIC

With LIC's mounting business turnover, comes a steady increase in its premium income. A large part of this income is invested in the country's economy—averaging more than Rs. 1½ million every day.

These investments stimulate the economy, creating new wealth. By helping to finance industries LIC catalyses more jobs, more incomes and more goods.

Today there is increasing recognition everywhere of the part which LIC is playing towards domestic and national stability.

Life Insurance Corporation of India

Where on
earth is

Mogadiscio?

Frankly, till somebody in Mogadiscio ordered BINNY's cloth, we too didn't know that it was the capital of Somalia in East Africa.

Today BINNY's cloth is imported by 50 countries—superb fabrics made from cotton of the best quality and dyed with the fastest colours or so carefully bleached that the full strength of the cloth is preserved.

Rigid Quality Control* ensures maximum durability and perfect finish.

Quality Control:

Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is laboratory testing to eliminate defects at every stage of production. That's why BINNY'S fabrics stay smart so long.

*Testing cloth for defects
Every yard of cloth from the looms is examined thoroughly for defects before it is passed for dyeing or bleaching and finishing.

BINNY'S manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:

Shirtings . Khaki Drills . Bleached & Dyed Drills . Towels . Anticrease Suitings . Tussores Union Fabrics . Silk Sarees etc. etc.

BINNY—a great name in textiles

The Buckingham & Carnatic Company Limited
The Bangalore Woollen, Cotton & Silk Mills Company Limited
Subsidiaries of Binny & Co. (Madras) Ltd.

Buy your requirements of BINNY'S fabrics at controlled rates from authorised BINNY Stockists who display this sign board.
